Abstract

This is the MySQL™ Reference Manual. It documents MySQL 5.6 through 5.6.47, as well as NDB Cluster releases based on versions 7.3 and 7.4 of NDB through 5.6.46-ndb-7.3.27 and 5.6.46-ndb-7.4.26, respectively. It may include documentation of features of MySQL versions that have not yet been released. For information about which versions have been released, see the MySQL 5.6 Release Notes.

MySQL 5.6 features. This manual describes features that are not included in every edition of MySQL 5.6; such features may not be included in the edition of MySQL 5.6 licensed to you. If you have any questions about the features included in your edition of MySQL 5.6, refer to your MySQL 5.6 license agreement or contact your Oracle sales representative.

For notes detailing the changes in each release, see the MySQL 5.6 Release Notes.

For legal information, including licensing information, see the Preface and Legal Notices.

For help with using MySQL, please visit the MySQL Forums, where you can discuss your issues with other MySQL users.

## Table of Contents

Preface and Legal Notices ........................................................................................................... xxv
1 General Information .................................................................................................................. 1
  1.1 About This Manual ................................................................................................................ 2
  1.2 Typographical and Syntax Conventions ............................................................................. 3
  1.3 Overview of the MySQL Database Management System .................................................. 4
    1.3.1 What is MySQL? ............................................................................................................ 4
    1.3.2 The Main Features of MySQL ....................................................................................... 6
    1.3.3 History of MySQL .......................................................................................................... 9
  1.4 What Is New in MySQL 5.6 ................................................................................................. 9
  1.5 MySQL Information Sources .............................................................................................. 22
    1.5.1 MySQL Websites ........................................................................................................... 22
    1.5.2 MySQL Community Support at the MySQL Forums .................................................... 22
    1.5.3 MySQL Enterprise ....................................................................................................... 23
  1.6 How to Report Bugs or Problems ....................................................................................... 23
  1.7 MySQL Standards Compliance ............................................................................................ 27
    1.7.1 MySQL Extensions to Standard SQL ............................................................................. 29
    1.7.2 MySQL Differences from Standard SQL ...................................................................... 32
    1.7.3 How MySQL Deals with Constraints .......................................................................... 33
  1.8 Credits ................................................................................................................................ 37
    1.8.1 Contributors to MySQL ............................................................................................... 37
    1.8.2 Documenters and translators ....................................................................................... 41
    1.8.3 Packages that support MySQL ..................................................................................... 43
    1.8.4 Tools that were used to create MySQL ...................................................................... 43
    1.8.5 Supporters of MySQL .................................................................................................. 44
  2 Installing and Upgrading MySQL ............................................................................................ 45
  2.1 General Installation Guidance ............................................................................................. 48
    2.1.1 Which MySQL Version and Distribution to Install ....................................................... 48
    2.1.2 How to Get MySQL ..................................................................................................... 49
    2.1.3 Verifying Package Integrity Using MD5 Checksums or GnuPG .................................. 49
    2.1.4 Installation Layouts ....................................................................................................... 63
    2.1.5 Compiler-Specific Build Characteristics ..................................................................... 63
  2.2 Installing MySQL on Unix/Linux Using Generic Binaries .................................................. 63
  2.3 Installing MySQL on Microsoft Windows ............................................................................ 66
    2.3.1 MySQL Installation Layout on Microsoft Windows ....................................................... 69
    2.3.2 Choosing an Installation Package .................................................................................. 70
    2.3.3 MySQL Installer for Windows ....................................................................................... 71
    2.3.4 Installing MySQL on Microsoft Windows Using a noinstall ZIP Archive .................. 97
    2.3.5 Troubleshooting a Microsoft Windows MySQL Server Installation ....................... 106
    2.3.6 Windows Postinstallation Procedures ......................................................................... 107
    2.3.7 Windows Platform Restrictions .................................................................................... 109
  2.4 Installing MySQL on OS X .................................................................................................. 111
    2.4.1 General Notes on Installing MySQL on OS X ............................................................. 111
    2.4.2 Installing MySQL on OS X Using Native Packages .................................................. 112
    2.4.3 Installing a MySQL Launch Daemon ........................................................................... 118
    2.4.4 Installing and Using the MySQL Preference Pane ....................................................... 120
  2.5 Installing MySQL on Linux ................................................................................................ 125
    2.5.1 Installing MySQL on Linux Using the MySQL Yum Repository ............................... 126
    2.5.2 Replacing a Third-Party Distribution of MySQL Using the MySQL Yum Repository .. 130
    2.5.3 Installing MySQL on Linux Using the MySQL APT Repository ............................... 132
    2.5.4 Installing MySQL on Linux Using the MySQL SLES Repository ............................. 133
    2.5.5 Installing MySQL on Linux Using RPM Packages from Oracle ............................... 133
MySQL 5.6 Reference Manual

8.8.1 Optimizing Queries with EXPLAIN ................................................................. 1101
8.8.2 EXPLAIN Output Format ................................................................................. 1102
8.8.3 Extended EXPLAIN Output Format ............................................................... 1115
8.8.4 Estimating Query Performance ..................................................................... 1117
8.9 Controlling the Query Optimizer ................................................................. 1118
  8.9.1 Controlling Query Plan Evaluation .............................................................. 1118
  8.9.2 Switchable Optimizations ........................................................................... 1119
  8.9.3 Index Hints .................................................................................................. 1122
8.10 Buffering and Caching .................................................................................. 1124
  8.10.1 InnoDB Buffer Pool Optimization .............................................................. 1124
  8.10.2 The MyISAM Key Cache .......................................................................... 1125
  8.10.3 The MySQL Query Cache ........................................................................ 1129
  8.10.4 Caching of Prepared Statements and Stored Programs ......................... 1136
8.11 Optimizing Locking Operations ..................................................................... 1138
  8.11.1 Internal Locking Methods ......................................................................... 1138
  8.11.2 Table Locking Issues ................................................................................ 1140
  8.11.3 Concurrent Inserts ................................................................................... 1142
  8.11.4 Metadata Locking ..................................................................................... 1143
  8.11.5 External Locking ....................................................................................... 1146
8.12 Optimizing the MySQL Server ....................................................................... 1147
  8.12.1 System Factors ......................................................................................... 1147
  8.12.2 Optimizing Disk I/O ................................................................................ 1148
  8.12.3 Using Symbolic Links .............................................................................. 1149
  8.12.4 Optimizing Memory Use ......................................................................... 1152
  8.12.5 Optimizing Network Use ......................................................................... 1156
8.13 Measuring Performance (Benchmarking) ..................................................... 1160
  8.13.1 Measuring the Speed of Expressions and Functions ............................... 1161
  8.13.2 The MySQL Benchmark Suite .................................................................. 1161
  8.13.3 Using Your Own Benchmarks ................................................................. 1162
  8.13.4 Measuring Performance with performance_schema .............................. 1162
8.14 Examining Thread Information .................................................................... 1163
  8.14.1 Thread Command Values ....................................................................... 1164
  8.14.2 General Thread States .............................................................................. 1166
  8.14.3 Delayed-Insert Thread States .................................................................. 1172
  8.14.4 Query Cache Thread States ...................................................................... 1173
  8.14.5 Replication Master Thread States ............................................................. 1174
  8.14.6 Replication Slave I/O Thread States ......................................................... 1174
  8.14.7 Replication Slave SQL Thread States ....................................................... 1175
  8.14.8 Replication Slave Connection Thread States .......................................... 1176
  8.14.9 NDB Cluster Thread States .................................................................... 1177
  8.14.10 Event Scheduler Thread States ............................................................... 1177
9 Language Structure ......................................................................................... 1179
  9.1 Literal Values ................................................................................................ 1179
    9.1.1 String Literals ......................................................................................... 1179
    9.1.2 Numeric Literals ..................................................................................... 1182
    9.1.3 Date and Time Literals .......................................................................... 1182
    9.1.4 Hexadecimal Literals ............................................................................. 1185
    9.1.5 Bit-Value Literals ................................................................................... 1187
    9.1.6 Boolean Literals ..................................................................................... 1188
    9.1.7 NULL Values ........................................................................................... 1188
  9.2 Schema Object Names .................................................................................... 1189
    9.2.1 Identifier Length Limits ........................................................................ 1190
    9.2.2 Identifier Qualifiers ............................................................................... 1191
    9.2.3 Identifier Case Sensitivity ....................................................................... 1193
## Data Types

11.1 Data Type Overview ............................................................... 1316
   11.1.1 Numeric Type Overview ................................................. 1316
   11.1.2 Date and Time Type Overview ....................................... 1320
   11.1.3 String Type Overview .................................................. 1322

11.2 Numeric Types ................................................................. 1326
   11.2.1 Integer Types (Exact Value) - INTEGER, INT, SMALLINT, TINYINT, MEDIUMINT, BIGINT ................................................. 1326
   11.2.2 Fixed-Point Types (Exact Value) - DECIMAL, NUMERIC .............. 1327
   11.2.3 Floating-Point Types (Approximate Value) - FLOAT, DOUBLE .......... 1327
   11.2.4 Bit-Value Type - BIT .................................................... 1328
   11.2.5 Numeric Type Attributes .............................................. 1328
   11.2.6 Out-of-Range and Overflow Handling .................................. 1329

11.3 Date and Time Types .......................................................... 1331
   11.3.1 The DATE, DATETIME, and TIMESTAMP Types ......................... 1332
   11.3.2 The TIME Type ................................................................ 1334
   11.3.3 The YEAR Type ............................................................. 1334
   11.3.4 YEAR(2) Limitations and Migrating to YEAR(4) ......................... 1335
   11.3.5 Automatic Initialization and Updating for TIMESTAMP and DATETIME .... 1338
   11.3.6 Fractional Seconds in Time Values .................................... 1342
   11.3.7 Conversion Between Date and Time Types .............................. 1343
   11.3.8 Two-Digit Years in Dates ............................................... 1344

11.4 String Types ........................................................................ 1345
   11.4.1 The CHAR and VARCHAR Types ......................................... 1345
   11.4.2 The BINARY and VARBINARY Types .................................... 1347
   11.4.3 The BLOB and TEXT Types .............................................. 1348
   11.4.4 The ENUM Type ............................................................ 1349
   11.4.5 The SET Type .................................................................. 1353

11.5 Spatial Data Types ............................................................... 1355
   11.5.1 Spatial Data Types ......................................................... 1357
   11.5.2 The OpenGIS Geometry Model .......................................... 1358
   11.5.3 Supported Spatial Data Formats ......................................... 1363
   11.5.4 Creating Spatial Columns ............................................... 1366
   11.5.5 Populating Spatial Columns ............................................. 1367
   11.5.6 Fetching Spatial Data ..................................................... 1368
   11.5.7 Optimizing Spatial Analysis ............................................ 1368
   11.5.8 Creating Spatial Indexes .................................................. 1369
   11.5.9 Using Spatial Indexes ...................................................... 1370

11.6 Data Type Default Values ..................................................... 1372

11.7 Data Type Storage Requirements .......................................... 1373

11.8 Choosing the Right Type for a Column ................................... 1377

11.9 Using Data Types from Other Database Engines ...................... 1378
# MySQL 5.6 Reference Manual

12.1 Function and Operator Reference ................................................................. 1381
12.2 Type Conversion in Expression Evaluation .................................................. 1392
12.3 Operators ........................................................................................................ 1394
   12.3.1 Operator Precedence ............................................................................. 1396
   12.3.2 Comparison Functions and Operators .................................................. 1397
   12.3.3 Logical Operators .............................................................................. 1403
   12.3.4 Assignment Operators ...................................................................... 1405
12.4 Control Flow Functions .................................................................................. 1406
12.5 String Functions and Operators ..................................................................... 1408
   12.5.1 String Comparison Functions and Operators ....................................... 1425
   12.5.2 Regular Expressions ......................................................................... 1428
   12.5.3 Character Set and Collation of Function Results ............................... 1435
12.6 Numeric Functions and Operators .................................................................. 1436
   12.6.1 Arithmetic Operators ........................................................................ 1437
   12.6.2 Mathematical Functions .................................................................... 1439
12.7 Date and Time Functions .............................................................................. 1448
12.8 What Calendar Is Used By MySQL? .............................................................. 1470
12.9 Full-Text Search Functions ........................................................................... 1470
   12.9.1 Natural Language Full-Text Searches ................................................ 1472
   12.9.2 Boolean Full-Text Searches ............................................................... 1475
   12.9.3 Full-Text Searches with Query Expansion ......................................... 1481
   12.9.4 Full-Text Stopwords ......................................................................... 1481
   12.9.5 Full-Text Restrictions ....................................................................... 1486
   12.9.6 Fine-Tuning MySQL Full-Text Search ............................................... 1487
   12.9.7 Adding a Collation for Full-Text Indexing ........................................ 1490
12.10 Cast Functions and Operators ...................................................................... 1491
12.11 XML Functions .............................................................................................. 1498
12.12 Bit Functions and Operators ........................................................................ 1509
12.13 Encryption and Compression Functions ...................................................... 1511
12.14 Locking Functions ....................................................................................... 1520
12.15 Information Functions .................................................................................. 1522
12.16 Spatial Analysis Functions ........................................................................... 1532
   12.16.1 Spatial Function Reference .............................................................. 1532
   12.16.2 Argument Handling by Spatial Functions ......................................... 1535
   12.16.3 Functions That Create Geometry Values from WKT Values .......... 1536
   12.16.4 Functions That Create Geometry Values from WKB Values .......... 1537
   12.16.5 MySQL-Specific Functions That Create Geometry Values .......... 1539
   12.16.6 Geometry Format Conversion Functions ....................................... 1540
   12.16.7 Geometry Property Functions ....................................................... 1541
   12.16.8 Spatial Operator Functions .............................................................. 1549
   12.16.9 Functions That Test Spatial Relations Between Geometry Objects ... 1551
12.17 Functions Used with Global Transaction IDs .............................................. 1554
12.18 MySQL Enterprise Encryption Functions .................................................... 1556
   12.18.1 MySQL Enterprise Encryption Installation ...................................... 1557
   12.18.2 MySQL Enterprise Encryption Usage and Examples ..................... 1557
   12.18.3 MySQL Enterprise Encryption Function Reference ....................... 1560
   12.18.4 MySQL Enterprise Encryption Function Descriptions .................... 1560
12.19 Aggregate (GROUP BY) Functions ............................................................ 1564
   12.19.1 Aggregate (GROUP BY) Function Descriptions .............................. 1564
   12.19.2 GROUP BY Modifiers ..................................................................... 1569
   12.19.3 MySQL Handling of GROUP BY ..................................................... 1572
12.20 Miscellaneous Functions .............................................................................. 1574
12.21 Precision Math ............................................................................................. 1581
   12.21.1 Types of Numeric Values ................................................................. 1581
13 SQL Statement Syntax .............................................................. 1589
  13.1 Data Definition Statements ............................................. 1590
      13.1.1 ALTER DATABASE Syntax ................................... 1590
      13.1.2 ALTER EVENT Syntax ..................................... 1591
      13.1.3 ALTER FUNCTION Syntax .................................. 1593
      13.1.4 ALTER LOGFILE GROUP Syntax ........................... 1593
      13.1.5 ALTER PROCEDURE Syntax ................................ 1595
      13.1.6 ALTER SERVER Syntax ................................... 1595
      13.1.7 ALTER TABLE Syntax ..................................... 1595
      13.1.8 ALTER TABLESPACE Syntax ................................. 1616
      13.1.9 ALTER VIEW Syntax ...................................... 1617
      13.1.10 CREATE DATABASE Syntax ................................. 1617
      13.1.11 CREATE EVENT Syntax .................................. 1618
      13.1.12 CREATE FUNCTION Syntax ............................... 1623
      13.1.13 CREATE INDEX Syntax .................................. 1623
      13.1.14 CREATE LOGFILE GROUP Syntax ........................ 1629
      13.1.15 CREATE PROCEDURE and CREATE FUNCTION Syntax ...... 1630
      13.1.16 CREATE SERVER Syntax ................................ 1635
      13.1.17 CREATE TABLE Syntax .................................. 1637
      13.1.18 CREATE TABLESPACE Syntax .............................. 1671
      13.1.19 CREATE TRIGGER Syntax ................................ 1673
      13.1.20 CREATE VIEW Syntax ................................... 1675
      13.1.21 DROP DATABASE Syntax ................................ 1679
      13.1.22 DROP EVENT Syntax .................................... 1681
      13.1.23 DROP FUNCTION Syntax ................................ 1681
      13.1.24 DROP INDEX Syntax .................................... 1681
      13.1.25 DROP LOGFILE GROUP Syntax ........................... 1682
      13.1.26 DROP PROCEDURE and DROP FUNCTION Syntax ........... 1682
      13.1.27 DROP SERVER Syntax ................................... 1682
      13.1.28 DROP TABLE Syntax .................................... 1683
      13.1.29 DROP TABLESPACE Syntax ............................... 1684
      13.1.30 DROP TRIGGER Syntax ................................ 1684
      13.1.31 DROP VIEW Syntax .................................... 1685
      13.1.32 RENAME TABLE Syntax ................................ 1685
      13.1.33 TRUNCATE TABLE Syntax ................................ 1686
  13.2 Data Manipulation Statements .......................................... 1687
      13.2.1 CALL Syntax ............................................. 1687
      13.2.2 DELETE Syntax ......................................... 1689
      13.2.3 DO Syntax .............................................. 1693
      13.2.4 HANDLER Syntax ....................................... 1693
      13.2.5 INSERT Syntax ......................................... 1695
      13.2.6 LOAD DATA Syntax ....................................... 1705
      13.2.7 LOAD XML Syntax ....................................... 1715
      13.2.8 REPLACE Syntax ......................................... 1723
      13.2.9 SELECT Syntax ......................................... 1726
      13.2.10 Subquery Syntax ...................................... 1742
      13.2.11 UPDATE Syntax ......................................... 1756
  13.3 Transactional and Locking Statements ............................... 1759
      13.3.1 START TRANSACTION, COMMIT, and ROLLBACK Syntax ...... 1759
      13.3.2 Statements That Cannot Be Rolled Back ...................... 1762
MySQL 5.6 Reference Manual

13.3.3 Statements That Cause an Implicit Commit .......................................................... 1762
13.3.4 SAVEPOINT, ROLLBACK TO SAVEPOINT, and RELEASE SAVEPOINT Syntax ... 1763
13.3.5 LOCK TABLES and UNLOCK TABLES Syntax ......................................................... 1763
13.3.6 SET TRANSACTION Syntax ..................................................................................... 1769
13.3.7 XA Transactions ..................................................................................................... 1772
13.4 Replication Statements ............................................................................................... 1777
13.4.1 SQL Statements for Controlling Master Servers .................................................... 1777
13.4.2 SQL Statements for Controlling Slave Servers ..................................................... 1779
13.5 Prepared SQL Statement Syntax ................................................................................ 1790
13.5.1 PREPARE Syntax ................................................................................................... 1793
13.5.2 EXECUTE Syntax ................................................................................................... 1794
13.5.3 DEALLOCATE PREPARE Syntax ......................................................................... 1794
13.6 Compound-Statement Syntax ...................................................................................... 1795
13.6.1 BEGIN ... END Compound-Statement Syntax ...................................................... 1795
13.6.2 Statement Label Syntax ......................................................................................... 1795
13.6.3 DECLARE Syntax .................................................................................................. 1796
13.6.4 Variables in Stored Programs ............................................................................... 1796
13.6.5 Flow Control Statements ....................................................................................... 1798
13.6.6 Cursors .................................................................................................................. 1803
13.6.7 Condition Handling ............................................................................................... 1805
13.7 Database Administration Statements .......................................................................... 1831
13.7.1 Account Management Statements ....................................................................... 1831
13.7.2 Table Maintenance Statements ............................................................................ 1852
13.7.3 Plugin and User-Defined Function Statements ..................................................... 1862
13.7.4 SET Syntax ........................................................................................................... 1865
13.7.5 SHOW Syntax ........................................................................................................ 1870
13.7.6 Other Administrative Statements ......................................................................... 1921
13.8 Utility Statements ....................................................................................................... 1932
13.8.1 DESCRIBE Syntax ................................................................................................. 1932
13.8.2 EXPLAIN Syntax .................................................................................................. 1932
13.8.3 HELP Syntax .......................................................................................................... 1934
13.8.4 USE Syntax ............................................................................................................ 1936
14 The InnoDB Storage Engine ......................................................................................... 1937
14.1 Introduction to InnoDB ............................................................................................... 1939
14.1.1 Benefits of Using InnoDB Tables ....................................................................... 1940
14.1.2 Best Practices for InnoDB Tables ....................................................................... 1941
14.1.3 Checking InnoDB Availability ............................................................................ 1942
14.1.4 Testing and Benchmarking with InnoDB ............................................................. 1942
14.1.5 Turning Off InnoDB ............................................................................................ 1943
14.2 InnoDB and the ACID Model ..................................................................................... 1944
14.3 InnoDB Multi-Versioning ........................................................................................... 1945
14.4 InnoDB Architecture ................................................................................................ 1946
14.5 InnoDB In-Memory Structures .................................................................................. 1947
14.5.1 Buffer Pool ............................................................................................................ 1947
14.5.2 Change Buffer ....................................................................................................... 1952
14.5.3 Adaptive Hash Index ......................................................................................... 1956
14.5.4 Log Buffer ........................................................................................................... 1956
14.6 InnoDB On-Disk Structures ....................................................................................... 1957
14.6.1 Tables ................................................................................................................... 1957
14.6.2 Indexes .................................................................................................................. 1977
14.6.3 Tablespaces ........................................................................................................... 1984
14.6.4 InnoDB Data Dictionary ....................................................................................... 1996
14.6.5 Doublewrite Buffer ............................................................................................ 1996
14.6.6 Redo Log .............................................................................................................. 1996
14.15.6 InnoDB INFORMATION_SCHEMA Metrics Table .................................................. 2194
14.16 InnoDB Integration with MySQL Performance Schema ........................................ 2202
14.16.1 Monitoring InnoDB Mutex Waits Using Performance Schema .................... 2204
14.17 InnoDB Monitors ............................................................................................. 2208
14.17.1 InnoDB Monitor Types ................................................................................. 2208
14.17.2 Enabling InnoDB Monitors ........................................................................ 2209
14.17.3 InnoDB Standard Monitor and Lock Monitor Output ................................. 2212
14.17.4 InnoDB Tablespace Monitor Output ......................................................... 2217
14.17.5 InnoDB Table Monitor Output ................................................................. 2219
14.18 InnoDB Backup and Recovery ......................................................................... 2223
14.18.1 InnoDB Backup ......................................................................................... 2223
14.18.2 InnoDB Recovery ...................................................................................... 2224
14.19 InnoDB and MySQL Replication ...................................................................... 2226
14.20 InnoDB memcached Plugin ............................................................................. 2228
14.20.1 Benefits of the InnoDB memcached Plugin ................................................ 2228
14.20.2 InnoDB memcached Architecture ............................................................. 2230
14.20.3 Setting Up the InnoDB memcached Plugin ................................................ 2233
14.20.4 Security Considerations for the InnoDB memcached Plugin .................... 2239
14.20.5 Writing Applications for the InnoDB memcached Plugin ........................... 2241
14.20.6 The InnoDB memcached Plugin and Replication ...................................... 2254
14.20.7 InnoDB memcached Plugin Internals .......................................................... 2258
14.20.8 Troubleshooting the InnoDB memcached Plugin ...................................... 2262
14.21 InnoDB Troubleshooting ............................................................................... 2264
14.21.1 Troubleshooting InnoDB I/O Problems ....................................................... 2265
14.21.2 Forcing InnoDB Recovery .......................................................................... 2265
14.21.3 Troubleshooting InnoDB Data Dictionary Operations ............................... 2267
14.21.4 InnoDB Error Handling .............................................................................. 2270
15 Alternative Storage Engines ........................................................................... 2273
15.1 Setting the Storage Engine .............................................................................. 2277
15.2 The MyISAM Storage Engine .......................................................................... 2278
15.2.1 MyISAM Startup Options .......................................................................... 2280
15.2.2 Space Needed for Keys .............................................................................. 2282
15.2.3 MyISAM Table Storage Formats ............................................................... 2282
15.2.4 MyISAM Table Problems .......................................................................... 2285
15.3 The MEMORY Storage Engine ..........................
18.2.7 Safe Shutdown and Restart of NDB Cluster .......................................................... 2626
18.2.8 Upgrading and Downgrading NDB Cluster ............................................................ 2627
18.3 Configuration of NDB Cluster .................................................................................. 2630
  18.3.1 Quick Test Setup of NDB Cluster ....................................................................... 2630
  18.3.2 Overview of NDB Cluster Configuration Parameters, Options, and Variables ........ 2633
  18.3.3 NDB Cluster Configuration Files ........................................................................ 2651
  18.3.4 Using High-Speed Interconnects with NDB Cluster ............................................ 2826
18.4 NDB Cluster Programs ............................................................................................. 2826
  18.4.1 ndbd — The NDB Cluster Data Node Daemon ..................................................... 2827
  18.4.2 ndbinfo_select_all — Select From ndbinfo Tables ........................................... 2834
  18.4.3 ndbmtd — The NDB Cluster Data Node Daemon (Multi-Threaded) .................... 2836
  18.4.4 ndb_mgm — The NDB Cluster Management Server Daemon ............................ 2837
  18.4.5 ndb_mgm — The NDB Cluster Management Client ......................................... 2846
  18.4.6 ndb_blob_tool — Check and Repair BLOB and TEXT columns of NDB Cluster Tables ........................................................................................................... 2848
  18.4.7 ndb_config — Extract NDB Cluster Configuration Information .......................... 2850
  18.4.8 ndb_cpcd — Automate Testing for NDB Development ................................. 2860
  18.4.9 ndb_delete_all — Delete All Rows from an NDB Table .................................... 2860
  18.4.10 ndb_desc — Describe NDB Tables ................................................................... 2861
  18.4.11 ndb_drop_index — Drop Index from an NDB Table ........................................ 2865
  18.4.12 ndb_drop_table — Drop an NDB Table ............................................................ 2866
  18.4.13 ndb_error_reporter — NDB Error-Reporting Utility ....................................... 2867
  18.4.14 ndb_index_stat — NDB Index Statistics Utility ............................................. 2868
  18.4.15 ndb_move_data — NDB Data Copy Utility ....................................................... 2874
  18.4.16 ndb_print_backup_file — Print NDB Backup File Contents ............................. 2877
  18.4.17 ndb_print_file — Print NDB Disk Data File Contents ...................................... 2877
  18.4.18 ndb_print_frag_file — Print NDB Fragment List File Contents .......................... 2878
  18.4.19 ndb_print_schema_file — Print NDB Schema File Contents ............................ 2879
  18.4.20 ndb_print_sys_file — Print NDB System File Contents .................................... 2879
  18.4.21 ndb_redo_log_reader — Check and Print Content of Cluster Redo Log ........... 2880
  18.4.22 ndb_restore — Restore an NDB Cluster Backup ............................................. 2883
  18.4.23 ndb_select_all — Print Rows from an NDB Table ........................................... 2905
  18.4.24 ndb_select_count — Print Row Counts for NDB Tables .............................. 2908
  18.4.25 ndb_setup.py — Start browser-based Auto-Installer for NDB Cluster ............. 2909
  18.4.26 ndb_show_tables — Display List of NDB Tables ............................................ 2913
  18.4.27 ndb_size.pl — NDBCLUSTER Size Requirement Estimator .............................. 2914
  18.4.28 ndb_waiter — Wait for NDB Cluster to Reach a Given Status ......................... 2917
  18.4.29 Options Common to NDB Cluster Programs — Options Common to NDB Cluster Programs ........................................................................................................... 2920
18.5 Management of NDB Cluster ..................................................................................... 2925
  18.5.1 Summary of NDB Cluster Start Phases ............................................................... 2926
  18.5.2 Commands in the NDB Cluster Management Client ........................................... 2928
  18.5.3 Online Backup of NDB Cluster ........................................................................... 2932
  18.5.4 MySQL Server Usage for NDB Cluster ............................................................... 2937
  18.5.5 Performing a Rolling Restart of an NDB Cluster ............................................... 2938
  18.5.6 Event Reports Generated in NDB Cluster ......................................................... 2940
  18.5.7 NDB Cluster Log Messages .............................................................................. 2951
  18.5.8 NDB Cluster Single User Mode ......................................................................... 2966
  18.5.9 Quick Reference: NDB Cluster SQL Statements ............................................... 2967
  18.5.10 ndbinfo: The NDB Cluster Information Database ........................................... 2969
  18.5.11 NDB Cluster Security Issues ............................................................................ 3005
  18.5.12 NDB Cluster Disk Data Tables ........................................................................ 3012
  18.5.13 Online Operations with ALTER TABLE in NDB Cluster ................................. 3020
  18.5.14 Adding NDB Cluster Data Nodes Online ......................................................... 3023
20.6 Stored Object Access Control ................................................................. 3193
20.7 Stored Program Binary Logging .............................................................. 3195
20.8 Restrictions on Stored Programs ............................................................. 3201
20.9 Restrictions on Views ........................................................................... 3205
21 INFORMATION_SCHEMA Tables ................................................................. 3209
21.1 Introduction ......................................................................................... 3210
21.2 The INFORMATION_SCHEMA CHARACTER_SETS Table ......................... 3213
21.3 The INFORMATION_SCHEMA COLLATIONS Table ..................................... 3214
21.4 The INFORMATION_SCHEMA COLLATION_CHARACTER_SET_APPLICABILITY Table ........................................................................ 3214
21.5 The INFORMATION_SCHEMA COLUMNS Table ....................................... 3215
21.6 The INFORMATION_SCHEMA COLUMN_PRIVILEGES Table .................. 3217
21.7 The INFORMATION_SCHEMA ENGINES Table ....................................... 3218
21.8 The INFORMATION_SCHEMA EVENTS Table ......................................... 3219
21.9 The INFORMATION_SCHEMA GLOBAL_STATUS and SESSION_STATUS Tables ................................................................. 3223
21.10 The INFORMATION_SCHEMA GLOBAL_VARIABLES and SESSION_VARIABLES Tables ........................................................................ 3223
21.11 The INFORMATION_SCHEMA KEY_COLUMN_USAGE Table ..................... 3223
21.12 The INFORMATION_SCHEMA OPTIMIZER_TRACE Table ......................... 3225
21.13 The INFORMATION_SCHEMA PARAMETERS Table .................................. 3225
21.14 The INFORMATION_SCHEMA PARTITIONS Table .................................... 3227
21.15 The INFORMATION_SCHEMA PLUGINS Table ...................................... 3230
21.16 The INFORMATION_SCHEMA PROCESSLIST Table ............................... 3231
21.17 The INFORMATION_SCHEMA PROFILING Table ................................... 3233
21.18 The INFORMATION_SCHEMA REFERENTIAL_CONSTRAINTS Table .......... 3234
21.19 The INFORMATION_SCHEMA ROUTINES Table ...................................... 3235
21.20 The INFORMATION_SCHEMA SCHEMATA Table .................................... 3238
21.21 The INFORMATION_SCHEMA PRIVILEGES Table ................................... 3238
21.22 The INFORMATION_SCHEMA STATISTICS Table .................................. 3239
21.23 The INFORMATION_SCHEMA TABLES Table ........................................... 3241
21.24 The INFORMATION_SCHEMA TABLESPACES Table .............................. 3244
21.25 The INFORMATION_SCHEMA TABLE_CONSTRAINTS Table .................. 3245
21.26 The INFORMATION_SCHEMA TABLE_PRIVILEGES Table ...................... 3246
21.27 The INFORMATION_SCHEMA TRIGGERS Table ...................................... 3247
21.28 The INFORMATION_SCHEMA USER_PRIVILEGES Table ....................... 3249
21.29 The INFORMATION_SCHEMA VIEWS Table ........................................... 3249
21.30 INFORMATION_SCHEMA InnoDB Tables ............................................... 3251
21.30.1 The INFORMATION_SCHEMA INNODB_BUFFER_PAGE Table 3251
21.30.2 The INFORMATION_SCHEMA INNODB_BUFFER_PAGE_LRU Table 3254
21.30.3 The INFORMATION_SCHEMA INNODB_BUFFER_POOL_STATS Table 3257
21.30.4 The INFORMATION_SCHEMA INNODB_CMP and INNODB_CMP_RESET Tables ........................................................................ 3260
21.30.5 The INFORMATION_SCHEMA INNODB_CMPMEM and INNODB_CMPMEM_RESET Tables ........................................................................ 3262
21.30.6 The INFORMATION_SCHEMA INNODB_CMP_PER_INDEX and INNODB_CMP_PER_INDEX_RESET Tables ........................................................................ 3263
21.30.7 The INFORMATION_SCHEMA INNODB_FT_BEING_DELETED Table 3265
21.30.8 The INFORMATION_SCHEMA INNODB_FT_CONFIG Table 3266
MySQL Performance Schema

22 MySQL Performance Schema

22.1 Performance Schema Quick Start

22.2 Performance Schema Build Configuration

22.3 Performance Schema Startup Configuration

22.4 Performance Schema Runtime Configuration

22.5 Performance Schema Queries

22.6 Performance Schema Instrument Naming Conventions

22.7 Performance Schema Status Monitoring

22.8 Performance Schema Atom and Molecule Events

22.9 Performance Schema Tables for Current and Historical Events

22.10 Performance Schema Statement Digests

22.11 Performance Schema General Table Characteristics

22.12 Performance Schema Table Descriptions

22.12.1 Performance Schema Table Index

22.12.2 Performance Schema Setup Tables

22.12.3 Performance Schema Instance Tables

xxii
Preface and Legal Notices

This is the Reference Manual for the MySQL Database System, version 5.6, through release 5.6.47. Differences between minor versions of MySQL 5.6 are noted in the present text with reference to release numbers (5.6.x). For license information, see the Legal Notices.

This manual is not intended for use with older versions of the MySQL software due to the many functional and other differences between MySQL 5.6 and previous versions. If you are using an earlier release of the MySQL software, please refer to the appropriate manual. For example, MySQL 5.5 Reference Manual covers the 5.5 series of MySQL software releases.

If you are using MySQL 5.7, please refer to the MySQL 5.7 Reference Manual.

Licensing information—MySQL 5.6. This product may include third-party software, used under license. If you are using a Commercial release of MySQL 5.6, see the MySQL 5.6 Commercial Release License Information User Manual for licensing information, including licensing information relating to third-party software that may be included in this Commercial release. If you are using a Community release of MySQL 5.6, see the MySQL 5.6 Community Release License Information User Manual for licensing information, including licensing information relating to third-party software that may be included in this Community release.

Licensing information—MySQL NDB Cluster 7.3. This product may include third-party software, used under license. If you are using a Commercial release of NDB Cluster 7.3, see the MySQL NDB Cluster 7.3 Commercial Release License Information User Manual for licensing information relating to third-party software that may be included in this Commercial release. If you are using a Community release of NDB Cluster 7.3, see the MySQL NDB Cluster 7.3 Community Release License Information User Manual for licensing information relating to third-party software that may be included in this Community release.

Licensing information—MySQL NDB Cluster 7.4. This product may include third-party software, used under license. If you are using a Commercial release of NDB Cluster 7.4, see the MySQL NDB Cluster 7.4 Commercial Release License Information User Manual for licensing information relating to third-party software that may be included in this Commercial release. If you are using a Community release of NDB Cluster 7.4, see the MySQL NDB Cluster 7.4 Community Release License Information User Manual for licensing information relating to third-party software that may be included in this Community release.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-
specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the
programs, including any operating system, integrated software, any programs installed on the hardware,
and/or documentation, shall be subject to license terms and license restrictions applicable to the programs.
No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management
applications. It is not developed or intended for use in any inherently dangerous applications, including
applications that may create a risk of personal injury. If you use this software or hardware in dangerous
applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other
measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages
caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks
of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks

The MySQL™ software delivers a very fast, multithreaded, multi-user, and robust SQL (Structured Query Language) database server. MySQL Server is intended for mission-critical, heavy-load production systems as well as for embedding into mass-deployed software. Oracle is a registered trademark of Oracle Corporation and/or its affiliates. MySQL is a trademark of Oracle Corporation and/or its affiliates, and shall not be used by Customer without Oracle’s express written authorization. Other names may be trademarks of their respective owners.

The MySQL software is Dual Licensed. Users can choose to use the MySQL software as an Open Source product under the terms of the GNU General Public License (http://www.fsf.org/licenses/) or can purchase a standard commercial license from Oracle. See http://www.mysql.com/company/legal/licensing/ for more information on our licensing policies.

The following list describes some sections of particular interest in this manual:

- For a discussion of MySQL Database Server capabilities, see Section 1.3.2, "The Main Features of MySQL".

- For an overview of new MySQL features, see Section 1.4, “What Is New in MySQL 5.6”. For information about the changes in each version, see the Release Notes.

- For installation instructions, see Chapter 2, Installing and Upgrading MySQL. For information about upgrading MySQL, see Section 2.11, “Upgrading MySQL”.

- For a tutorial introduction to the MySQL Database Server, see Chapter 3, Tutorial.
About This Manual

- For information about configuring and administering MySQL Server, see Chapter 5, *MySQL Server Administration*.

- For information about security in MySQL, see Chapter 6, *Security*.

- For information about setting up replication servers, see Chapter 17, *Replication*.

- For information about MySQL Enterprise, the commercial MySQL release with advanced features and management tools, see Chapter 25, *MySQL Enterprise Edition*.

- For answers to a number of questions that are often asked concerning the MySQL Database Server and its capabilities, see Appendix A, *MySQL 5.6 Frequently Asked Questions*.

- For a history of new features and bug fixes, see the *Release Notes*.

**Important**

To report problems or bugs, please use the instructions at Section 1.6, “How to Report Bugs or Problems”. If you find a sensitive security bug in MySQL Server, please let us know immediately by sending an email message to <secalert_us@oracle.com>. Exception: Support customers should report all problems, including security bugs, to Oracle Support.

### 1.1 About This Manual

This is the Reference Manual for the MySQL Database System, version 5.6, through release 5.6.47. Differences between minor versions of MySQL 5.6 are noted in the present text with reference to release numbers (5.6.x). For license information, see the *Legal Notices*.

This manual is not intended for use with older versions of the MySQL software due to the many functional and other differences between MySQL 5.6 and previous versions. If you are using an earlier release of the MySQL software, please refer to the appropriate manual. For example, *MySQL 5.5 Reference Manual* covers the 5.5 series of MySQL software releases.

Because this manual serves as a reference, it does not provide general instruction on SQL or relational database concepts. It also does not teach you how to use your operating system or command-line interpreter.

The MySQL Database Software is under constant development, and the Reference Manual is updated frequently as well. The most recent version of the manual is available online in searchable form at https://dev.mysql.com/doc/. Other formats also are available there, including HTML, PDF, and EPUB versions.

The Reference Manual source files are written in DocBook XML format. The HTML version and other formats are produced automatically, primarily using the DocBook XSL stylesheets. For information about DocBook, see http://docbook.org/

If you have questions about using MySQL, join the MySQL Community Slack, or ask in our forums; see Section 1.5.2, “MySQL Community Support at the MySQL Forums”. If you have suggestions concerning additions or corrections to the manual itself, please send them to the http://www.mysql.com/company/contact/.

This manual was originally written by David Axmark and Michael “Monty” Widenius. It is maintained by the MySQL Documentation Team, consisting of Chris Cole, Paul DuBois, Margaret Fisher, Edward Gilmore, Stefan Hinz, David Moss, Philip Olson, Daniel Price, Daniel So, and Jon Stephens.
1.2 Typographical and Syntax Conventions

This manual uses certain typographical conventions:

- **Text in this style** is used for SQL statements; database, table, and column names; program listings and source code; and environment variables. Example: “To reload the grant tables, use the `FLUSH PRIVILEGES` statement.”

- **Text in this style** indicates input that you type in examples.

- **Text in this style** indicates the names of executable programs and scripts, examples being `mysql` (the MySQL command-line client program) and `mysqld` (the MySQL server executable).

- **Text in this style** is used for variable input for which you should substitute a value of your own choosing.

- **Text in this style** is used for emphasis.

- **Text in this style** is used in table headings and to convey especially strong emphasis.

- **Text in this style** is used to indicate a program option that affects how the program is executed, or that supplies information that is needed for the program to function in a certain way. Example: “The `--host` option (short form `-h`) tells the `mysql` client program the hostname or IP address of the MySQL server that it should connect to.”

- File names and directory names are written like this: “The global `my.cnf` file is located in the `/etc` directory.”

- Character sequences are written like this: “To specify a wildcard, use the ‘%’ character.”

When commands are shown that are meant to be executed from within a particular program, the prompt shown preceding the command indicates which command to use. For example, `shell>` indicates a command that you execute from your login shell, `root-shell>` is similar but should be executed as `root`, and `mysql>` indicates a statement that you execute from the `mysql` client program:

```
shell> type a shell command here
root-shell> type a shell command as root here
mysql> type a mysql statement here
```

In some areas different systems may be distinguished from each other to show that commands should be executed in two different environments. For example, while working with replication the commands might be prefixed with `master` and `slave`:

```
master> type a mysql command on the replication master here
slave> type a mysql command on the replication slave here
```

The “shell” is your command interpreter. On Unix, this is typically a program such as `sh`, `csh`, or `bash`. On Windows, the equivalent program is `command.com` or `cmd.exe`, typically run in a console window.

When you enter a command or statement shown in an example, do not type the prompt shown in the example.

Database, table, and column names must often be substituted into statements. To indicate that such substitution is necessary, this manual uses `db_name`, `tbl_name`, and `col_name`. For example, you might see a statement like this:
Overview of the MySQL Database Management System

1.3 Overview of the MySQL Database Management System

1.3.1 What is MySQL?
MySQL, the most popular Open Source SQL database management system, is developed, distributed, and supported by Oracle Corporation.

The MySQL website (http://www.mysql.com/) provides the latest information about MySQL software.

- **MySQL is a database management system.**

  A database is a structured collection of data. It may be anything from a simple shopping list to a picture gallery or the vast amounts of information in a corporate network. To add, access, and process data stored in a computer database, you need a database management system such as MySQL Server. Since computers are very good at handling large amounts of data, database management systems play a central role in computing, as standalone utilities, or as parts of other applications.

- **MySQL databases are relational.**

  A relational database stores data in separate tables rather than putting all the data in one big storeroom. The database structures are organized into physical files optimized for speed. The logical model, with objects such as databases, tables, views, rows, and columns, offers a flexible programming environment. You set up rules governing the relationships between different data fields, such as one-to-one, one-to-many, unique, required or optional, and “pointers” between different tables. The database enforces these rules, so that with a well-designed database, your application never sees inconsistent, duplicate, orphan, out-of-date, or missing data.

  The SQL part of “MySQL” stands for “Structured Query Language”. SQL is the most common standardized language used to access databases. Depending on your programming environment, you might enter SQL directly (for example, to generate reports), embed SQL statements into code written in another language, or use a language-specific API that hides the SQL syntax.

  SQL is defined by the ANSI/ISO SQL Standard. The SQL standard has been evolving since 1986 and several versions exist. In this manual, “SQL-92” refers to the standard released in 1992, “SQL:1999” refers to the standard released in 1999, and “SQL:2003” refers to the current version of the standard. We use the phrase “the SQL standard” to mean the current version of the SQL Standard at any time.

- **MySQL software is Open Source.**

  Open Source means that it is possible for anyone to use and modify the software. Anybody can download the MySQL software from the Internet and use it without paying anything. If you wish, you may study the source code and change it to suit your needs. The MySQL software uses the GPL (GNU General Public License), http://www.fsf.org/licenses/, to define what you may and may not do with the software in different situations. If you feel uncomfortable with the GPL or need to embed MySQL code into a commercial application, you can buy a commercially licensed version from us. See the MySQL Licensing Overview for more information (http://www.mysql.com/company/legal/licensing/).

- **The MySQL Database Server is very fast, reliable, scalable, and easy to use.**

  If that is what you are looking for, you should give it a try. MySQL Server can run comfortably on a desktop or laptop, alongside your other applications, web servers, and so on, requiring little or no attention. If you dedicate an entire machine to MySQL, you can adjust the settings to take advantage of all the memory, CPU power, and I/O capacity available. MySQL can also scale up to clusters of machines, networked together.

  MySQL Server was originally developed to handle large databases much faster than existing solutions and has been successfully used in highly demanding production environments for several years. Although under constant development, MySQL Server today offers a rich and useful set of functions. Its connectivity, speed, and security make MySQL Server highly suited for accessing databases on the Internet.
• **MySQL Server works in client/server or embedded systems.**

The MySQL Database Software is a client/server system that consists of a multithreaded SQL server that supports different back ends, several different client programs and libraries, administrative tools, and a wide range of application programming interfaces (APIs).

We also provide MySQL Server as an embedded multithreaded library that you can link into your application to get a smaller, faster, easier-to-manage standalone product.

• **A large amount of contributed MySQL software is available.**

MySQL Server has a practical set of features developed in close cooperation with our users. It is very likely that your favorite application or language supports the MySQL Database Server.

The official way to pronounce “MySQL” is “My Ess Que Ell” (not “my sequel”), but we do not mind if you pronounce it as “my sequel” or in some other localized way.

### 1.3.2 The Main Features of MySQL

This section describes some of the important characteristics of the MySQL Database Software. In most respects, the roadmap applies to all versions of MySQL. For information about features as they are introduced into MySQL on a series-specific basis, see the “In a Nutshell” section of the appropriate Manual:

• MySQL 8.0: What Is New in MySQL 8.0
• MySQL 5.7: What Is New in MySQL 5.7
• MySQL 5.6: Section 1.4, “What Is New in MySQL 5.6”
• MySQL 5.5: What Is New in MySQL 5.5

**Internals and Portability**

• Written in C and C++.

• Tested with a broad range of different compilers.

• Works on many different platforms. See [https://www.mysql.com/support/supportedplatforms/database.html](https://www.mysql.com/support/supportedplatforms/database.html).

• For portability, uses **CMake** in MySQL 5.5 and up. Previous series use GNU Automake, Autoconf, and Libtool.

• Tested with Purify (a commercial memory leakage detector) as well as with Valgrind, a GPL tool ([http://developer.kde.org/~sewardj/](http://developer.kde.org/~sewardj/)).

• Uses multi-layered server design with independent modules.

• Designed to be fully multithreaded using kernel threads, to easily use multiple CPUs if they are available.

• Provides transactional and nontransactional storage engines.

• Uses very fast B-tree disk tables (**MyISAM**) with index compression.

• Designed to make it relatively easy to add other storage engines. This is useful if you want to provide an SQL interface for an in-house database.
The Main Features of MySQL

- Uses a very fast thread-based memory allocation system.
- Executes very fast joins using an optimized nested-loop join.
- Implements in-memory hash tables, which are used as temporary tables.
- Implements SQL functions using a highly optimized class library that should be as fast as possible. Usually there is no memory allocation at all after query initialization.
- Provides the server as a separate program for use in a client/server networked environment, and as a library that can be embedded (linked) into standalone applications. Such applications can be used in isolation or in environments where no network is available.

Data Types

- Many data types: signed/unsigned integers 1, 2, 3, 4, and 8 bytes long, FLOAT, DOUBLE, CHAR, VARCHAR, BINARY, VARBINARY, TEXT, BLOB, DATE, TIME, DATETIME, TIMESTAMP, YEAR, SET, ENUM, and OpenGIS spatial types. See Chapter 11, Data Types.
- Fixed-length and variable-length string types.

Statements and Functions

- Full operator and function support in the SELECT list and WHERE clause of queries. For example:

  ```
  mysql> SELECT CONCAT(first_name, ' ', last_name)
  -> FROM citizen
  -> WHERE income/dependents > 10000 AND age > 30;
  ```

- Full support for SQL GROUP BY and ORDER BY clauses. Support for group functions (COUNT(), AVG(), STD(), SUM(), MAX(), MIN(), and GROUP_CONCAT()).
- Support for LEFT OUTER JOIN and RIGHT OUTER JOIN with both standard SQL and ODBC syntax.
- Support for aliases on tables and columns as required by standard SQL.
- Support for DELETE, INSERT, REPLACE, and UPDATE to return the number of rows that were changed (affected), or to return the number of rows matched instead by setting a flag when connecting to the server.
- Support for MySQL-specific SHOW statements that retrieve information about databases, storage engines, tables, and indexes. Support for the INFORMATION_SCHEMA database, implemented according to standard SQL.
- An EXPLAIN statement to show how the optimizer resolves a query.
- Independence of function names from table or column names. For example, ABS is a valid column name. The only restriction is that for a function call, no spaces are permitted between the function name and the "()" that follows it. See Section 9.3, “Keywords and Reserved Words”.
- You can refer to tables from different databases in the same statement.

Security

- A privilege and password system that is very flexible and secure, and that enables host-based verification.
- Password security by encryption of all password traffic when you connect to a server.
Scalability and Limits

- Support for large databases. We use MySQL Server with databases that contain 50 million records. We also know of users who use MySQL Server with 200,000 tables and about 5,000,000,000 rows.

- Support for up to 64 indexes per table. Each index may consist of 1 to 16 columns or parts of columns. The maximum index width for InnoDB tables is either 767 bytes or 3072 bytes. See Section 14.6.1.6, “Limits on InnoDB Tables”. The maximum index width for MyISAM tables is 1000 bytes. See Section 15.2, “The MyISAM Storage Engine”. An index may use a prefix of a column for CHAR, VARCHAR, BLOB, or TEXT column types.

Connectivity

- Clients can connect to MySQL Server using several protocols:
  - Clients can connect using TCP/IP sockets on any platform.
  - On Windows systems, clients can connect using named pipes if the server is started with the named_pipe system variable enabled. Windows servers also support shared-memory connections if started with the shared_memory system variable enabled. Clients can connect through shared memory by using the --protocol=memory option.
  - On Unix systems, clients can connect using Unix domain socket files.
  - MySQL client programs can be written in many languages. A client library written in C is available for clients written in C or C++, or for any language that provides C bindings.
  - APIs for C, C++, Eiffel, Java, Perl, PHP, Python, Ruby, and Tcl are available, enabling MySQL clients to be written in many languages. See Chapter 23, Connectors and APIs.
  - The Connector/ODBC (MyODBC) interface provides MySQL support for client programs that use ODBC (Open Database Connectivity) connections. For example, you can use MS Access to connect to your MySQL server. Clients can be run on Windows or Unix. Connector/ODBC source is available. All ODBC 2.5 functions are supported, as are many others. See MySQL Connector/ODBC Developer Guide.
  - The Connector/J interface provides MySQL support for Java client programs that use JDBC connections. Clients can be run on Windows or Unix. Connector/J source is available. See MySQL Connector/J 5.1 Developer Guide.
  - MySQL Connector/NET enables developers to easily create .NET applications that require secure, high-performance data connectivity with MySQL. It implements the required ADO.NET interfaces and integrates into ADO.NET aware tools. Developers can build applications using their choice of .NET languages. MySQL Connector/NET is a fully managed ADO.NET driver written in 100% pure C#. See MySQL Connector/NET Developer Guide.

Localization

- The server can provide error messages to clients in many languages. See Section 10.12, “Setting the Error Message Language”.

- Full support for several different character sets, including latin1 (cp1252), german, big5, ujis, several Unicode character sets, and more. For example, the Scandinavian characters “å”, “ä” and “ö” are permitted in table and column names.

- All data is saved in the chosen character set.

- Sorting and comparisons are done according to the default character set and collation. is possible to change this when the MySQL server is started (see Section 10.3.2, “Server Character Set and
Collation”). To see an example of very advanced sorting, look at the Czech sorting code. MySQL Server supports many different character sets that can be specified at compile time and runtime.

- The server time zone can be changed dynamically, and individual clients can specify their own time zone. See Section 5.1.12, “MySQL Server Time Zone Support”.

### Clients and Tools

- MySQL includes several client and utility programs. These include both command-line programs such as mysqldump and mysqladmin, and graphical programs such as MySQL Workbench.

- MySQL Server has built-in support for SQL statements to check, optimize, and repair tables. These statements are available from the command line through the mysqlcheck client. MySQL also includes myisamchk, a very fast command-line utility for performing these operations on MyISAM tables. See Chapter 4, MySQL Programs.

- MySQL programs can be invoked with the --help or -? option to obtain online assistance.

### 1.3.3 History of MySQL

We started out with the intention of using the mSQL database system to connect to our tables using our own fast low-level (ISAM) routines. However, after some testing, we came to the conclusion that mSQL was not fast enough or flexible enough for our needs. This resulted in a new SQL interface to our database but with almost the same API interface as mSQL. This API was designed to enable third-party code that was written for use with mSQL to be ported easily for use with MySQL.

MySQL is named after co-founder Monty Widenius’s daughter, My.

The name of the MySQL Dolphin (our logo) is “Sakila,” which was chosen from a huge list of names suggested by users in our “Name the Dolphin” contest. The winning name was submitted by Ambrose Twebaze, an Open Source software developer from Swaziland, Africa. According to Ambrose, the feminine name Sakila has its roots in SiSwati, the local language of Swaziland. Sakila is also the name of a town in Arusha, Tanzania, near Ambrose’s country of origin, Uganda.

### 1.4 What Is New in MySQL 5.6

This section summarizes what has been added to, deprecated in, and removed from MySQL 5.6.

- Features Added in MySQL 5.6

- Features Deprecated in MySQL 5.6

- Features Removed in MySQL 5.6

#### Features Added in MySQL 5.6

The following features have been added to MySQL 5.6:

- **Security improvements.** These security improvements were made:

  - MySQL now provides a method for storing authentication credentials encrypted in an option file named `.mylogin.cnf`. To create the file, use the mysql_config_editor utility. The file can be read later by MySQL client programs to obtain authentication credentials for connecting to a MySQL server. mysql_config_editor writes the `.mylogin.cnf` file using encryption so the credentials are not stored as clear text, and its contents when decrypted by client programs are used only in memory.
In this way, passwords can be stored in a file in non-cleartext format and used later without ever needing to be exposed on the command line or in an environment variable. For more information, see Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.

• MySQL now supports stronger encryption for user account passwords, available through an authentication plugin named sha256_password that implements SHA-256 password hashing. This plugin is built in, so it is always available and need not be loaded explicitly. For more information, including instructions for creating accounts that use SHA-256 passwords, see Section 6.4.1.4, “SHA-256 Pluggable Authentication”.

• The mysql.user system table now has a password_expired column. Its default value is 'N', but can be set to 'Y' with the new ALTER USER statement. After an account's password has been expired, all operations performed in subsequent connections to the server using the account result in an error until the user issues a SET PASSWORD statement to establish a new account password. For more information, see Section 13.7.1.1, “ALTER USER Syntax”, and Section 6.2.10, “Server Handling of Expired Passwords”.

• MySQL now has provision for checking password security:

  • In statements that assign a password supplied as a cleartext value, the value is checked against the current password policy and rejected if it is weak (the statement returns an ER_NOT_VALID_PASSWORD error). This affects the CREATE USER, GRANT, and SET PASSWORD statements. Passwords given as arguments to the PASSWORD() and OLD_PASSWORD() functions are checked as well.

  • The strength of potential passwords can be assessed using the new VALIDATE_PASSWORD_STRENGTH() SQL function, which takes a password argument and returns an integer from 0 (weak) to 100 (strong).

Both capabilities are implemented by the validate_password plugin. For more information, see Section 6.4.3, “The Password Validation Plugin”.

• mysql_upgrade now produces a warning if it finds user accounts with passwords hashed with the older pre-4.1 hashing method. Such accounts should be updated to use more secure password hashing. See Section 6.1.2.4, “Password Hashing in MySQL”

• On Unix platforms, mysql_install_db supports a new option, --random-passwords, that provides for more secure MySQL installation. Invoking mysql_install_db with --random-passwords causes it to assign a random password to the MySQL root accounts, set the “password expired” flag for those accounts, and remove the anonymous-user MySQL accounts. For additional details, see Section 4.4.3, “mysql_install_db — Initialize MySQL Data Directory”.

• Logging has been modified so that passwords do not appear in plain text in statements written to the general query log, slow query log, and binary log. See Section 6.1.2.3, “Passwords and Logging”.

  The mysql client no longer logs to its history file statements that refer to passwords. See Section 4.5.1.3, “mysql Client Logging”.

• START SLAVE syntax has been modified to permit connection parameters to be specified for connecting to the master. This provides an alternative to storing the password in the master.info file. See Section 13.4.2.5, “START SLAVE Syntax”.

• MySQL now sets the access control granted to clients on the named pipe to the minimum necessary for successful communication on Windows. Newer MySQL client software can open named pipe connections without any additional configuration. If older client software cannot be upgraded immediately, the new named_pipe_full_access_group system variable can be used to give a
Windows group the necessary permissions to open a named pipe connection. Membership in the full-access group should be restricted and temporary.

- **MySQL Enterprise.** The format of the file generated by the audit log plugin was changed for better compatibility with Oracle Audit Vault. See Section 6.4.4, “MySQL Enterprise Audit”, and Section 6.4.4.3, “Audit Log File Formats”.

MySQL Enterprise Edition now includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable Enterprise applications to perform the following operations:

  - Implement added data protection using public-key asymmetric cryptography
  - Create public and private keys and digital signatures
  - Perform asymmetric encryption and decryption
  - Use cryptographic hashing for digital signing and data verification and validation

For more information, see Section 12.18, “MySQL Enterprise Encryption Functions”.

The audit log plugin included in MySQL Enterprise Edition now has the capability of filtering audited events based on user account and event status. Several new system variables provide DBAs with filtering control. In addition, audit log plugin reporting capability has been improved by the addition of several status variables. For more information, see Section 6.4.4.4, “Audit Log Logging Control”, and Audit Log Plugin Status Variables.

MySQL Enterprise Edition now includes MySQL Enterprise Firewall, an application-level firewall that enables database administrators to permit or deny SQL statement execution based on matching against whitelists of accepted statement patterns. This helps harden MySQL Server against attacks such as SQL injection or attempts to exploit applications by using them outside of their legitimate query workload characteristics. For more information, see Section 6.4.5, “MySQL Enterprise Firewall”.

- **Changes to server defaults.** Beginning with MySQL 5.6.6, several MySQL Server parameter defaults differ from the defaults in previous releases. The motivation for these changes is to provide better out-of-box performance and to reduce the need for database administrators to change settings manually. For more information, see Section 5.1.2.1, “Changes to Server Defaults”.

- **InnoDB enhancements.** These InnoDB enhancements were added:

  - You can create **FULLTEXT** indexes on InnoDB tables, and query them using the **MATCH() .. AGAINST** syntax. This feature includes a new proximity search operator (**@**) and several new configuration options and **INFORMATION_SCHEMA** tables: See Section 14.6.2.3, “InnoDB FULLTEXT Indexes” for more information.

  - Several **ALTER TABLE** operations can be performed without copying the table, without blocking inserts, updates, and deletes to the table, or both. These enhancements are known collectively as **online DDL**. See Section 14.13, “InnoDB and Online DDL” for details.

  - **InnoDB** now supports the **DATA DIRECTORY='directory'** clause of the **CREATE TABLE** statement, which allows you to create InnoDB file-per-table tablespaces (**.ibd** files) in a location outside the MySQL data directory. This enhancement provides the flexibility to create file-per-table tablespaces in locations that better suit your server environment. For example, you could place busy tables on an **SSD** device, or large tables on a high-capacity **HDD** device.

For additional information, see Section 14.6.3.4, “Creating a Tablespace Outside of the Data Directory”.
- **InnoDB** now supports the notion of "transportable tablespaces", allowing file-per-table tablespaces (.ibd files) to be exported from a running MySQL instance and imported into another running instance without inconsistencies or mismatches caused by buffered data, in-progress transactions, and internal bookkeeping details such as the space ID and LSN.

  The `FOR EXPORT` clause of the `FLUSH TABLE` command writes any unsaved changes from **InnoDB** memory buffers to the .ibd file. After copying the .ibd file and a separate metadata file to the other server, the `DISCARD TABLESPACE` and `IMPORT TABLESPACE` clauses of the `ALTER TABLE` statement are used to bring the table data into a different MySQL instance.

  This enhancement provides the flexibility to move file-per-table tablespaces around to better suit your server environment. For example, you could move busy tables to an SSD device, or move large tables to a high-capacity HDD device. For more information, see Section 14.6.3.5, “Copying Tablespaces to Another Instance”.

- You can now set the **InnoDB** page size for uncompressed tables to 8KB or 4KB, as an alternative to the default 16KB. This setting is controlled by the `innodb_page_size` configuration option. You specify the size when creating the MySQL instance. All **InnoDB** tablespace within an instance share the same page size. Smaller page sizes can help to avoid redundant or inefficient I/O for certain combinations of workload and storage devices, particularly SSD devices with small block sizes.

- Improvements to the algorithms for adaptive flushing make I/O operations more efficient and consistent under a variety of workloads. The new algorithm and default configuration values are expected to improve performance and concurrency for most users. Advanced users can fine-tune their I/O responsiveness through several configuration options. See Section 14.8.3.4, “Configuring Buffer Pool Flushing” for details.

- You can code MySQL applications that access **InnoDB** tables through a NoSQL-style API. This feature uses the popular memcached daemon to relay requests such as **ADD**, **SET**, and **GET** for key-value pairs. These simple operations to store and retrieve data avoid the SQL overhead such as parsing and constructing a query execution plan. You can access the same data through the NoSQL API and SQL. For example, you might use the NoSQL API for fast updates and lookups, and SQL for complex queries and compatibility with existing applications. See Section 14.20, “InnoDB memcached Plugin” for details.

- Optimizer statistics for **InnoDB** tables are gathered at more predictable intervals and can persist across server restarts, for improved plan stability. You can also control the amount of sampling done for **InnoDB** indexes, to make the optimizer statistics more accurate and improve the query execution plan. See Section 14.8.11.1, “Configuring Persistent Optimizer Statistics Parameters” for details.

- New optimizations apply to read-only transactions, improving performance and concurrency for ad-hoc queries and report-generating applications. These optimizations are applied automatically when practical, or you can specify `START TRANSACTION READ ONLY` to ensure the transaction is read-only. See Section 8.5.3, “Optimizing InnoDB Read-Only Transactions” for details.

- You can move the **InnoDB** undo log out of the system tablespace into one or more separate tablespaces. The I/O patterns for the undo log make these new tablespaces good candidates to move to SSD storage, while keeping the system tablespace on hard disk storage. For details, see Section 14.6.3.3, “Undo Tablespaces”.

- You can improve the efficiency of the **InnoDB** checksum feature by specifying the configuration option `innodb_checksum_algorithm=crc32`, which turns on a faster checksum algorithm. This option replaces the `innodb_checksums` option. Data written using the old checksum algorithm (option value `innodb`) is fully upward-compatible; tablespaces modified using the new checksum algorithm...
Features Added in MySQL 5.6

(option value \texttt{crc32}) cannot be downgraded to an earlier version of MySQL that does not support the \texttt{innodb_checksum_algorithm} option.

- The \texttt{InnoDB} redo log files now have a maximum combined size of 512GB, increased from 4GB. You can specify the larger values through the \texttt{innodb_log_file_size} option. The startup behavior now automatically handles the situation where the size of the existing redo log files does not match the size specified by \texttt{innodb_log_file_size} and \texttt{innodb_log_files_in_group}.

- The \texttt{--innodb-read-only} option lets you run a MySQL server in read-only mode. You can access \texttt{InnoDB} tables on read-only media such as a DVD or CD, or set up a data warehouse with multiple instances all sharing the same data directory. See Section 14.8.2, “Configuring InnoDB for Read-Only Operation” for usage details.

- A new configuration option, \texttt{innodb_compression_level}, allows you to select a compression level for \texttt{InnoDB} compressed tables, from the familiar range of 0-9 used by \texttt{zlib}. You can also control whether compressed pages in the buffer pool are stored in the redo log when an update operation causes pages to be compressed again. This behavior is controlled by the \texttt{innodb_log_compressed_pages} configuration option.

- Data blocks in an \texttt{InnoDB} compressed table contain a certain amount of empty space (padding) to allow DML operations to modify the row data without re-compressing the new values. Too much padding can increase the chance of a compression failure, requiring a page split, when the data does need to be re-compressed after extensive changes. The amount of padding can now be adjusted dynamically, so that DBAs can reduce the rate of compression failures without re-creating the entire table with new parameters, or re-creating the entire instance with a different page size. The associated new configuration options are \texttt{innodb_compression_failure_threshold_pct}, \texttt{innodb_compression_pad_pct_max}.

- Several new \texttt{InnoDB}-related INFORMATION_SCHEMA tables provide information about the \texttt{InnoDB} buffer pool, metadata about tables, indexes, and foreign keys from the \texttt{InnoDB} data dictionary, and low-level information about performance metrics that complements the information from the Performance Schema tables.

- To ease the memory load on systems with huge numbers of tables, \texttt{InnoDB} now frees up the memory associated with an opened table using an LRU algorithm to select tables that have gone the longest without being accessed. To reserve more memory to hold metadata for open \texttt{InnoDB} tables, increase the value of the \texttt{table_definition_cache} configuration option. \texttt{InnoDB} treats this value as a “soft limit” for the number of open table instances in the \texttt{InnoDB} data dictionary cache. For additional information, refer to the \texttt{table_definition_cache} documentation.

- \texttt{InnoDB} has several internal performance enhancements, including reducing contention by splitting the kernel mutex, moving flushing operations from the main thread to a separate thread, enabling multiple purge threads, and reducing contention for the buffer pool on large-memory systems.

- \texttt{InnoDB} uses a new, faster algorithm to detect deadlocks. Information about all \texttt{InnoDB} deadlocks can be written to the MySQL server error log, to help diagnose application issues.

- To avoid a lengthy warmup period after restarting the server, particularly for instances with large \texttt{InnoDB} buffer pools, you can reload pages into the buffer pool immediately after a restart. MySQL can dump a compact data file at shutdown, then consult that data file to find the pages to reload on the next restart. You can also manually dump or reload the buffer pool at any time, for example during benchmarking or after complex report-generation queries. See Section 14.8.3.5, “Saving and Restoring the Buffer Pool State” for details.
• As of MySQL 5.6.16, innochecksum provides support for files greater than 2GB in size. Previously, innochecksum only supported files up to 2GB in size.

• As of MySQL 5.6.16, new global configuration parameters, innodb_status_output and innodb_status_output_locks, allow you to dynamically enable and disable the standard InnoDB Monitor and InnoDB Lock Monitor for periodic output. Enabling and disabling monitors for periodic output by creating and dropping specially named tables is deprecated and may be removed in a future release. For additional information, see Section 14.17, “InnoDB Monitors”.

• As of MySQL 5.6.17, Online DDL support is extended to the following operations for regular and partitioned InnoDB tables:
  • OPTIMIZE TABLE
  • ALTER TABLE ... FORCE
  • ALTER TABLE ... ENGINE=INNODB (when run on an InnoDB table)

  Online DDL support reduces table rebuild time and permits concurrent DML. See Section 14.13, “InnoDB and Online DDL”.

• As of MySQL 5.6.42, the zlib library version bundled with MySQL was raised from version 1.2.3 to version 1.2.11. MySQL implements compression with the help of the zlib library.

  If you use InnoDB compressed tables, see Section 2.11.3, “Changes in MySQL 5.6” for related upgrade implications.

• Partitioning. These table-partitioning enhancements were added:
  • The maximum number of partitions is increased to 8192. This number includes all partitions and all subpartitions of the table.
  • It is now possible to exchange a partition of a partitioned table or a subpartition of a subpartitioned table with a nonpartitioned table that otherwise has the same structure using the ALTER TABLE ... EXCHANGE PARTITION statement. This can be used, for example, to import and export partitions. For more information and examples, see Section 19.3.3, “Exchanging Partitions and Subpartitions with Tables”.
  • Explicit selection of one or more partitions or subpartitions is now supported for queries, as well as for many data modification statements, that act on partitioned tables. For example, assume a table t with some integer column c has 4 partitions named p0, p1, p2, and p3. Then the query SELECT * FROM t PARTITION (p0, p1) WHERE c < 5 returns only those rows from partitions p0 and p1 for which c is less than 5.

  The following statements support explicit partition selection:
  • SELECT
  • DELETE
  • INSERT
  • REPLACE
  • UPDATE
- **LOAD DATA.**
- **LOAD XML.**

For syntax, see the descriptions of the individual statements. For additional information and examples, see Section 19.5, “Partition Selection”.

Partition lock pruning greatly improves performance of many DML and DDL statements acting on tables with many partitions by helping to eliminate locks on partitions that are not affected by these statements. Such statements include many `SELECT`, `SELECT ... PARTITION`, `UPDATE`, `REPLACE`, `INSERT`, as well as many other statements. For more information, including a complete listing of the statements whose performance has thus been improved, see Section 19.6.4, “Partitioning and Locking”.

- **Performance Schema.** The Performance Schema includes several new features:
  - Instrumentation for table input and output. Instrumented operations include row-level accesses to persistent base tables or temporary tables. Operations that affect rows are fetch, insert, update, and delete.
  - Event filtering by table, based on schema and/or table names.
  - Event filtering by thread. More information is collected for threads.
  - Summary tables for table and index I/O, and for table locks.
  - Instrumentation for statements and stages within statements.
  - Configuration of instruments and consumers at server startup, which previously was possible only at runtime.

- **MySQL NDB Cluster.** MySQL NDB Cluster is released as a separate product; the most recent GA releases are based on MySQL 5.6 and use version 7.3 of the NDB storage engine. Clustering support is not available in mainline MySQL Server 5.6 releases. For more information about MySQL NDB Cluster 7.3, see Chapter 18, *MySQL NDB Cluster 7.3 and NDB Cluster 7.4*. The latest current development version is MySQL NDB Cluster 7.4, based on version 7.4 of the NDB storage engine and MySQL Server 5.6. MySQL NDB Cluster 7.4 is currently available for testing and evaluation. The most recent MySQL NDB Cluster 7.4 release can be obtained from [https://dev.mysql.com/downloads/cluster/](https://dev.mysql.com/downloads/cluster/).

For more information and an overview of improvements made in MySQL NDB Cluster 7.4, see Section 18.1.4.2, “What is New in NDB Cluster 7.4”.

MySQL NDB Cluster 7.2, the previous GA release, is based on MySQL Server 5.5, and is still available for use in production, although we recommend that new deployments use MySQL NDB Cluster 7.3. For more information about MySQL NDB Cluster 7.2, see [MySQL NDB Cluster 7.2](https://dev.mysql.com/doc/refman/5.6/en/mysql-cluster.html).

MySQL NDB Cluster 7.1 is also still available and supported (although we recommend that new deployments use the latest GA release series, currently MySQL NDB Cluster 7.3). These versions of NDB Cluster are based on MySQL Server 5.1 and documented in the *MySQL 5.1 Manual*; see [https://dev.mysql.com/doc/refman/5.1/en/mysql-cluster.html](https://dev.mysql.com/doc/refman/5.1/en/mysql-cluster.html), for more information.

- **Replication and logging.** These replication enhancements were added:
  - MySQL now supports transaction-based replication using *global transaction identifiers* (also known as “GTIDs”). This makes it possible to identify and track each transaction when it is committed on the originating server and as it is applied by any slaves.
Features Added in MySQL 5.6

Enabling of GTIDs in a replication setup is done primarily using the new `gtid_mode` and `enforce_gtid_consistency` system variables. For information about additional options and variables introduced in support of GTIDs, see Section 17.1.4.5, “Global Transaction ID Options and Variables”.

When using GTIDs it is not necessary to refer to log files or positions within those files when starting a new slave or failing over to a new master, which greatly simplifies these tasks. For more information about provisioning servers for GTID replication with or without referring to binary log files, see Section 17.1.3.3, “Using GTIDs for Failover and Scaleout”.

GTID-based replication is completely transaction-based, which makes it simple to check the consistency of masters and slaves. If all transactions committed on a given master are also committed on a given slave, consistency between the two servers is guaranteed.

For more complete information about the implementation and use of GTIDs in MySQL Replication, see Section 17.1.3, “Replication with Global Transaction Identifiers”.

• MySQL row-based replication now supports row image control. By logging only those columns required for uniquely identifying and executing changes on each row (as opposed to all columns) for each row change, it is possible to save disk space, network resources, and memory usage. You can determine whether full or minimal rows are logged by setting the `binlog_row_image` server system variable to one of the values `minimal` (log required columns only), `full` (log all columns), or `noblob` (log all columns except for unneeded `BLOB` or `TEXT` columns). See System Variables Used with Binary Logging, for more information.

• Binary logs written and read by the MySQL Server are now crash-safe, because only complete events (or transactions) are logged or read back. By default, the server logs the length of the event as well as the event itself and uses this information to verify that the event was written correctly. You can also cause the server to write checksums for the events using CRC32 checksums by setting the `binlog_checksum` system variable. To cause the server to read checksums from the binary log, use the `master_verify_checksum` system variable. The `--slave-sql-verify-checksum` system variable causes the slave SQL thread to read checksums from the relay log.

• MySQL now supports logging of master connection information and of slave relay log information to tables as well as files. Use of these tables can be controlled independently, by the `--master-info-repository` and `--relay-log-info-repository` server options. Setting `--master-info-repository` to `TABLE` causes connection information to be logged in the `slave_master_info` table; setting `--relay-log-info-repository` to `TABLE` causes relay log information to be logged to the `slave_relay_log_info` table. Both of these tables are created automatically, in the `mysql` system database.

In order for replication to be resilient to unexpected halts, the `slave_master_info` and `slave_relay_log_info` tables must each use a transactional storage engine, and beginning with MySQL 5.6.6, these tables are created using `InnoDB` for this reason. (Bug #13538891) If you are using a previous MySQL 5.6 release in which both of these tables use `MyISAM`, this means that, prior to starting replication, you must convert both of them to a transactional storage engine (such as `InnoDB`) if you wish for replication to be resilient to unexpected halts. You can do this in such cases by means of the appropriate `ALTER TABLE ... ENGINE=...` statements. You should not attempt to change the storage engine used by either of these tables while replication is actually running.

See Section 17.3.2, “Handling an Unexpected Halt of a Replication Slave”, for more information.

• `mysqlbinlog` now has the capability to back up a binary log in its original binary format. When invoked with the `--read-from-remote-server` and `--raw` options, `mysqlbinlog` connects
Features Added in MySQL 5.6

- MySQL now supports delayed replication such that a slave server deliberately lags behind the master by at least a specified amount of time. The default delay is 0 seconds. Use the new `MASTER_DELAY` option for `CHANGE MASTER TO` to set the delay.

  Delayed replication can be used for purposes such as protecting against user mistakes on the master (a DBA can roll back a delayed slave to the time just before the disaster) or testing how the system behaves when there is a lag. See Section 17.3.10, “Delayed Replication”.

- A replication slave having multiple network interfaces can now be caused to use only one of these (to the exclusion of the others) by using the `MASTER_BIND` option when issuing a `CHANGE MASTER TO` statement.

- The `log_bin_basename` system variable has been added. This variable contains the complete filename and path to the binary log file. Whereas the `log_bin` system variable shows only whether or not binary logging is enabled, `log_bin_basename` reflects the name set with the `--log-bin` server option.

  Similarly, the `relay_log_basename` system variable shows the filename and complete path to the relay log file.

- MySQL Replication now supports parallel execution of transactions with multithreading on the slave. When parallel execution is enabled, the slave SQL thread acts as the coordinator for a number of slave worker threads as determined by the value of the `slave_parallel_workers` server system variable. The current implementation of multithreading on the slave assumes that data and updates are partitioned on a per-database basis, and that updates within a given database occur in the same relative order as they do on the master. However, it is not necessary to coordinate transactions between different databases. Transactions can then also be distributed per database, which means that a worker thread on the slave can process successive transactions on a given database without waiting for updates to other databases to complete.

  Since transactions on different databases can occur in a different order on the slave than on the master, simply checking for the most recently executed transaction is not a guarantee that all previous transactions on the master have been executed on the slave. This has implications for logging and recovery when using a multithreaded slave. For information about how to interpret binary logging information when using multithreading on the slave, see Section 13.7.5.35, “SHOW SLAVE STATUS Syntax”.

- **Optimizer enhancements.** These query optimizer improvements were implemented:

  - The optimizer now more efficiently handles queries (and subqueries) of the following form:

    ```sql
    SELECT ... FROM single_table ... ORDER BY non_index_column [DESC] LIMIT [M,]N;
    ```

    That type of query is common in web applications that display only a few rows from a larger result set. For example:

    ```sql
    SELECT col1, ... FROM t1 ... ORDER BY name LIMIT 10;
    SELECT col1, ... FROM t1 ... ORDER BY RAND() LIMIT 15;
    ```

    The sort buffer has a size of `sort_buffer_size`. If the sort elements for `N` rows are small enough to fit in the sort buffer (`M+N` rows if `M` was specified), the server can avoid using a merge file and perform the sort entirely in memory. For details, see Section 8.2.1.16, “LIMIT Query Optimization”.

---

17
• The optimizer implements Disk-Sweep Multi-Range Read. Reading rows using a range scan on a secondary index can result in many random disk accesses to the base table when the table is large and not stored in the storage engine’s cache. With the Disk-Sweep Multi-Range Read (MRR) optimization, MySQL tries to reduce the number of random disk access for range scans by first scanning the index only and collecting the keys for the relevant rows. Then the keys are sorted and finally the rows are retrieved from the base table using the order of the primary key. The motivation for Disk-sweep MRR is to reduce the number of random disk accesses and instead achieve a more sequential scan of the base table data. For more information, see Section 8.2.1.10, “Multi-Range Read Optimization”.

• The optimizer implements Index Condition Pushdown (ICP), an optimization for the case where MySQL retrieves rows from a table using an index. Without ICP, the storage engine traverses the index to locate rows in the base table and returns them to the MySQL server which evaluates the \textsc{where} condition for the rows. With ICP enabled, and if parts of the \textsc{where} condition can be evaluated by using only fields from the index, the MySQL server pushes this part of the \textsc{where} condition down to the storage engine. The storage engine then evaluates the pushed index condition by using the index entry and only if this is satisfied is base row be read. ICP can reduce the number of accesses the storage engine has to do against the base table and the number of accesses the MySQL server has to do against the storage engine. For more information, see Section 8.2.1.5, “Index Condition Pushdown Optimization”.

• The \textsc{explain} statement now provides execution plan information for \textsc{delete}, \textsc{insert}, \textsc{replace}, and \textsc{update} statements. Previously, \textsc{explain} provided information only for \textsc{select} statements. In addition, the \textsc{explain} statement now can produce output in JSON format. See Section 13.8.2, “\textsc{explain} Syntax”.

• The optimizer more efficiently handles subqueries in the \textsc{from} clause (that is, derived tables). Materialization of subqueries in the \textsc{from} clause is postponed until their contents are needed during query execution, which improves performance. In addition, during query execution, the optimizer may add an index to a derived table to speed up row retrieval from it. For more information, see Section 8.2.2.4, “Optimizing Derived Tables”.

• The optimizer uses semijoin and materialization strategies to optimize subquery execution. See Section 8.2.2.1, “Optimizing Subqueries with Semijoin Transformations”, and Section 8.2.2.2, “Optimizing Subqueries with Materialization”.

• A Batched Key Access (BKA) join algorithm is now available that uses both index access to the joined table and a join buffer. The BKA algorithm supports inner join, outer join, and semijoin operations, including nested outer joins and nested semijoins. Benefits of BKA include improved join performance due to more efficient table scanning. For more information, see Section 8.2.1.11, “Block Nested-Loop and Batched Key Access Joins”.

• The optimizer now has a tracing capability, primarily for use by developers. The interface is provided by a set of \texttt{optimizer_trace \_xxx} system variables and the \textsc{information\_schema}._\textsc{optimizer\_trace} table. For details, see MySQL Internals: Tracing the Optimizer.

• \textbf{Condition handling.} MySQL now supports the \textsc{get diagnostics} statement. \textsc{get diagnostics} provides applications a standardized way to obtain information from the diagnostics area, such as whether the previous SQL statement produced an exception and what it was. For more information, see Section 13.6.7.3, “\textsc{get diagnostics} Syntax”.

In addition, several deficiencies in condition handler processing rules were corrected so that MySQL behavior is more like standard SQL:
Features Added in MySQL 5.6

• Block scope is used in determining which handler to select. Previously, a stored program was treated as having a single scope for handler selection.

• Condition precedence is more accurately resolved.

• Diagnostics area clearing has changed. Bug #55843 caused handled conditions to be cleared from the diagnostics area before activating the handler. This made condition information unavailable within the handler. Now condition information is available to the handler, which can inspect it with the GET DIAGNOSTICS statement. The condition information is cleared when the handler exits, if it has not already been cleared during handler execution.

• Previously, handlers were activated as soon as a condition occurred. Now they are not activated until the statement in which the condition occurred finishes execution, at which point the most appropriate handler is chosen. This can make a difference for statements that raise multiple conditions, if a condition raised later during statement execution has higher precedence than an earlier condition and there are handlers in the same scope for both conditions. Previously, the handler for the first condition raised would be chosen, even if it had a lower precedence than other handlers. Now the handler for the condition with highest precedence is chosen, even if it is not the first condition raised by the statement.

For more information, see Section 13.6.7.6, “Scope Rules for Handlers”.

• Data types. These data type changes have been implemented:

• MySQL now permits fractional seconds for TIME, DATETIME, and TIMESTAMP values, with up to microseconds (6 digits) precision. See Section 11.3.6, “Fractional Seconds in Time Values”.

• Previously, at most one TIMESTAMP column per table could be automatically initialized or updated to the current date and time. This restriction has been lifted. Any TIMESTAMP column definition can have any combination of DEFAULT CURRENT_TIMESTAMP and ON UPDATE CURRENT_TIMESTAMP clauses. In addition, these clauses now can be used with DATETIME column definitions. For more information, see Section 11.3.5, “Automatic Initialization and Updating for TIMESTAMP and DATETIME”.

• In MySQL, the TIMESTAMP data type differs in nonstandard ways from other data types in terms of default value and assignment of automatic initialization and update attributes. These behaviors remain the default but now are deprecated, and can be turned off by enabling the explicit_defaults_for_timestamp system variable at server startup. See Section 11.3.5, “Automatic Initialization and Updating for TIMESTAMP and DATETIME”, and Section 5.1.7, “Server System Variables”.

• Host cache. MySQL now provides more information about the causes of errors that occur when clients connect to the server, as well as improved access to the host cache, which contains client IP address and host name information and is used to avoid DNS lookups. These changes have been implemented:

• New Connection_errors_xxx status variables provide information about connection errors that do not apply to specific client IP addresses.

• Counters have been added to the host cache to track errors that do apply to specific IP addresses, and a new host_cache Performance Schema table exposes the contents of the host cache so that it can be examined using SELECT statements. Access to host cache contents makes it possible to answer questions such as how many hosts are cached, what kinds of connection errors are occurring for which hosts, or how close host error counts are to reaching the max_connect_errors system variable limit.
• The host cache size now is configurable using the `host_cache_size` system variable.

For more information, see Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”, and Section 22.12.10.1, “The host_cache Table”.

• **OpenGIS.** The OpenGIS specification defines functions that test the relationship between two geometry values. MySQL originally implemented these functions such that they used object bounding rectangles and returned the same result as the corresponding MBR-based functions. Corresponding versions are now available that use precise object shapes. These versions are named with an `ST_` prefix. For example, `Contains()` uses object bounding rectangles, whereas `ST_Contains()` uses object shapes. For more information, see Section 12.16.9, “Functions That Test Spatial Relations Between Geometry Objects”.

### Features Deprecated in MySQL 5.6

The following features are deprecated in MySQL 5.6 and may be or will be removed in a future series. Where alternatives are shown, applications should be updated to use them.

For applications that use features deprecated in MySQL 5.6 that have been removed in a higher MySQL series, statements may fail when replicated from a MySQL 5.6 master to a higher-series slave, or may have different effects on master and slave. To avoid such problems, applications that use features deprecated in 5.6 should be revised to avoid them and use alternatives when possible.

• The `ERROR_FOR_DIVISION_BY_ZERO`, `NO_ZERO_DATE`, and `NO_ZERO_IN_DATE` SQL modes are deprecated and setting the `sql_mode` value to include any of them generates a warning. In MySQL 5.7, these modes do nothing. Instead, their effects are included in the effects of strict SQL mode (`STRICT_ALL_TABLES` or `STRICT_TRANS_TABLES`). The motivation for the change in MySQL 5.7 is to reduce the number of SQL modes with an effect dependent on strict mode and make them part of strict mode itself.

To make advance preparation for an upgrade to MySQL 5.7, see SQL Mode Changes in MySQL 5.7. That discussion provides guidelines to assess whether your applications will be affected by the SQL mode changes in MySQL 5.7.

• Relying on implicit `GROUP BY` sorting in MySQL 5.6 is deprecated. To achieve a specific sort order of grouped results, it is preferable to use an explicit `ORDER BY` clause. `GROUP BY` sorting is a MySQL extension that may change in a future release; for example, to make it possible for the optimizer to order groupings in whatever manner it deems most efficient and to avoid the sorting overhead.

• Pre-4.1 passwords and the `mysql_old_password` authentication plugin. Passwords stored in the older hash format used before MySQL 4.1 are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords and the `mysql_old_password` authentication plugin are now deprecated. To prevent connections using accounts that have pre-4.1 password hashes, the `secure_auth` system variable is now enabled by default. (To permit connections for accounts that have such password hashes, start the server with `--secure_auth=0`. However, because pre-4.1 passwords are deprecated, disabling `secure_auth` is also deprecated.)

DBAs are advised to convert accounts that use the `mysql_old_password` authentication plugin to use `mysql_native_password` instead. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.

The `OLD_PASSWORD()` function generates pre-4.1 password hashes, as does `PASSWORD()` if the `old_passwords` system variable is set to 1. `OLD_PASSWORD()` and `old_passwords=1` are deprecated.

• The `--skip-innodb` option and its synonyms (`--innodb=OFF`, `--disable-innodb`, and so forth).
Features Removed in MySQL 5.6

The following items are obsolete and have been removed in MySQL 5.6. Where alternatives are shown, applications should be updated to use them.

For MySQL 5.5 applications that use features removed in MySQL 5.6, statements may fail when replicated from a MySQL 5.5 master to a MySQL 5.6 slave, or may have different effects on master and slave. To avoid such problems, applications that use features removed in MySQL 5.6 should be revised to avoid them and use alternatives when possible.

• The `innodb_locks_unsafe_for_binlog` system variable.
• The `date_format`, `datetime_format`, and `time_format` system variables, which are unused.
• The `have_profiling`, `profiling`, and `profiling_history_size` system variables.
• The `innodb_use_sys_malloc` and `innodb_additional_mem_pool_size` system variables.
• The `timed_mutexes` system variable. It does nothing and has no effect.
• The `--language` option. Use the `--lc-messages-dir` and `--lc-messages` options instead.
• The `IGNORE` clause for `ALTER TABLE`. `ALTER IGNORE TABLE` causes problems for replication, prevents online `ALTER TABLE` for unique index creation, and causes problems with foreign keys (rows removed in the parent table).
• The `msql2mysql`, `mysql_convert_table_format`, `mysql_find_rows`, `mysql_fix_extensions`, `mysql_setpermission`, `mysql_waitpid`, `mysql_zap`, `mysqlaccess`, and `mysqlbug` utilities.
• The `mysqlhotcopy` utility. Alternatives include `mysqldump` and MySQL Enterprise Backup.

Features Removed in MySQL 5.6

The following items are obsolete and have been removed in MySQL 5.6. Where alternatives are shown, applications should be updated to use them.

For MySQL 5.5 applications that use features removed in MySQL 5.6, statements may fail when replicated from a MySQL 5.5 master to a MySQL 5.6 slave, or may have different effects on master and slave. To avoid such problems, applications that use features removed in MySQL 5.6 should be revised to avoid them and use alternatives when possible.

• The `--log` server option and the `log` system variable. Instead, use the `general_log` system variable to enable the general query log and the `general_log_file` system variable to set the general query log file name.
• The the `log_slow_queries` system variable. Instead, use the `slow_query_log` system variable to enable the slow query log and the `slow_query_log_file` system variable to set the slow query log file name.
• The `--one-thread` server option. Use `--thread_handling=no-threads` instead.
• The `--safe-mode` server option.
• The `--skip-thread-priority` server option.
• The `--table-cache` server option. Use the `table_open_cache` system variable instead.
• The `--init-rpl-role` and `--rpl-recovery-rank` options, the `rpl_recovery_rank` system variable, and the `Rpl_status` status variable.
• The `engine_condition_pushdown` system variable. Use the `engine_condition_pushdown` flag of the `optimizer_switch` variable instead.
• The `have_csv`, `have_innodb`, `have_ndbcluster`, and `have_partitioning` system variables. Use `SHOW PLUGINS` or query the `PLUGINS` table in the `INFORMATION_SCHEMA` database instead.
• The `sql_big_tables` system variable. Use `big_tables` instead.
1.5 MySQL Information Sources

This section lists sources of additional information that you may find helpful, such as MySQL websites, mailing lists, user forums, and Internet Relay Chat.

1.5.1 MySQL Websites

The primary website for MySQL documentation is https://dev.mysql.com/doc/. Online and downloadable documentation formats are available for the MySQL Reference Manual, MySQL Connectors, and more.

The MySQL developers provide information about new and upcoming features as the MySQL Server Blog.

1.5.2 MySQL Community Support at the MySQL Forums

The forums at http://forums.mysql.com are an important community resource. Many forums are available, grouped into these general categories:

- Migration
- MySQL Usage
- MySQL Connectors
- Programming Languages
- Tools
- 3rd-Party Applications
- Storage Engines
- MySQL Technology
- SQL Standards
• Business

1.5.3 MySQL Enterprise

Oracle offers technical support in the form of MySQL Enterprise. For organizations that rely on the MySQL DBMS for business-critical production applications, MySQL Enterprise is a commercial subscription offering which includes:

• MySQL Enterprise Server
• MySQL Enterprise Monitor
• Monthly Rapid Updates and Quarterly Service Packs
• MySQL Knowledge Base
• 24x7 Technical and Consultative Support

MySQL Enterprise is available in multiple tiers, giving you the flexibility to choose the level of service that best matches your needs. For more information, see MySQL Enterprise.

1.6 How to Report Bugs or Problems

Before posting a bug report about a problem, please try to verify that it is a bug and that it has not been reported already:

• Start by searching the MySQL online manual at https://dev.mysql.com/doc/. We try to keep the manual up to date by updating it frequently with solutions to newly found problems. In addition, the release notes accompanying the manual can be particularly useful since it is quite possible that a newer version contains a solution to your problem. The release notes are available at the location just given for the manual.

• If you get a parse error for an SQL statement, please check your syntax closely. If you cannot find something wrong with it, it is extremely likely that your current version of MySQL Server doesn't support the syntax you are using. If you are using the current version and the manual doesn't cover the syntax that you are using, MySQL Server doesn't support your statement.

If the manual covers the syntax you are using, but you have an older version of MySQL Server, you should check the MySQL change history to see when the syntax was implemented. In this case, you have the option of upgrading to a newer version of MySQL Server.

• For solutions to some common problems, see Section B.4, “Problems and Common Errors”.

• Search the bugs database at http://bugs.mysql.com/ to see whether the bug has been reported and fixed.

• You can also use http://www.mysql.com/search/ to search all the Web pages (including the manual) that are located at the MySQL website.

If you cannot find an answer in the manual, the bugs database, or the mailing list archives, check with your local MySQL expert. If you still cannot find an answer to your question, please use the following guidelines for reporting the bug.

The normal way to report bugs is to visit http://bugs.mysql.com/, which is the address for our bugs database. This database is public and can be browsed and searched by anyone. If you log in to the system, you can enter new reports.
How to Report Bugs or Problems

Bugs posted in the bugs database at http://bugs.mysql.com/ that are corrected for a given release are noted in the release notes.

If you find a sensitive security bug in MySQL Server, please let us know immediately by sending an email message to <secalert_us@oracle.com>. Exception: Support customers should report all problems, including security bugs, to Oracle Support at http://support.oracle.com/.

To discuss problems with other users, you can use the MySQL Community Slack.

Writing a good bug report takes patience, but doing it right the first time saves time both for us and for yourself. A good bug report, containing a full test case for the bug, makes it very likely that we will fix the bug in the next release. This section helps you write your report correctly so that you do not waste your time doing things that may not help us much or at all. Please read this section carefully and make sure that all the information described here is included in your report.

Preferably, you should test the problem using the latest production or development version of MySQL Server before posting. Anyone should be able to repeat the bug by just using mysql test <script_file> on your test case or by running the shell or Perl script that you include in the bug report. Any bug that we are able to repeat has a high chance of being fixed in the next MySQL release.

It is most helpful when a good description of the problem is included in the bug report. That is, give a good example of everything you did that led to the problem and describe, in exact detail, the problem itself. The best reports are those that include a full example showing how to reproduce the bug or problem. See Section 24.5, “Debugging and Porting MySQL”.

Remember that it is possible for us to respond to a report containing too much information, but not to one containing too little. People often omit facts because they think they know the cause of a problem and assume that some details do not matter. A good principle to follow is that if you are in doubt about stating something, state it. It is faster and less troublesome to write a couple more lines in your report than to wait longer for the answer if we must ask you to provide information that was missing from the initial report.

The most common errors made in bug reports are (a) not including the version number of the MySQL distribution that you use, and (b) not fully describing the platform on which the MySQL server is installed (including the platform type and version number). These are highly relevant pieces of information, and in 99 cases out of 100, the bug report is useless without them. Very often we get questions like, “Why doesn’t this work for me?” Then we find that the feature requested wasn’t implemented in that MySQL version, or that a bug described in a report has been fixed in newer MySQL versions. Errors often are platform-dependent. In such cases, it is next to impossible for us to fix anything without knowing the operating system and the version number of the platform.

If you compiled MySQL from source, remember also to provide information about your compiler if it is related to the problem. Often people find bugs in compilers and think the problem is MySQL-related. Most compilers are under development all the time and become better version by version. To determine whether your problem depends on your compiler, we need to know what compiler you used. Note that every compiling problem should be regarded as a bug and reported accordingly.

If a program produces an error message, it is very important to include the message in your report. If we try to search for something from the archives, it is better that the error message reported exactly matches the one that the program produces. (Even the lettercase should be observed.) It is best to copy and paste the entire error message into your report. You should never try to reproduce the message from memory.

If you have a problem with Connector/ODBC (MyODBC), please try to generate a trace file and send it with your report. See How to Report Connector/ODBC Problems or Bugs.

If your report includes long query output lines from test cases that you run with the mysql command-line tool, you can make the output more readable by using the --vertical option or the \G statement terminator. The EXPLAIN SELECT example later in this section demonstrates the use of \G.
Please include the following information in your report:

- The version number of the MySQL distribution you are using (for example, MySQL 5.7.10). You can find out which version you are running by executing `mysqladmin version`. The `mysqladmin` program can be found in the `bin` directory under your MySQL installation directory.

- The manufacturer and model of the machine on which you experience the problem.

- The operating system name and version. If you work with Windows, you can usually get the name and version number by double-clicking your My Computer icon and pulling down the “Help/About Windows” menu. For most Unix-like operating systems, you can get this information by executing the command `uname -a`.

- Sometimes the amount of memory (real and virtual) is relevant. If in doubt, include these values.

- The contents of the `docs/INFO_BIN` file from your MySQL installation. This file contains information about how MySQL was configured and compiled.

- If you are using a source distribution of the MySQL software, include the name and version number of the compiler that you used. If you have a binary distribution, include the distribution name.

- If the problem occurs during compilation, include the exact error messages and also a few lines of context around the offending code in the file where the error occurs.

- If `mysqld` died, you should also report the statement that crashed `mysqld`. You can usually get this information by running `mysqld` with query logging enabled, and then looking in the log after `mysqld` crashes. See Section 24.5, “Debugging and Porting MySQL”.

- If a database table is related to the problem, include the output from the `SHOW CREATE TABLE db_name.tbl_name` statement in the bug report. This is a very easy way to get the definition of any table in a database. The information helps us create a situation matching the one that you have experienced.

- The SQL mode in effect when the problem occurred can be significant, so please report the value of the `sql_mode` system variable. For stored procedure, stored function, and trigger objects, the relevant `sql_mode` value is the one in effect when the object was created. For a stored procedure or function, the `SHOW CREATE PROCEDURE` or `SHOW CREATE FUNCTION` statement shows the relevant SQL mode, or you can query `INFORMATION_SCHEMA` for the information:

```
SELECT ROUTINE_SCHEMA, ROUTINE_NAME, SQL_MODE
FROM INFORMATION_SCHEMA.Routines;
```

For triggers, you can use this statement:

```
SELECT EVENT_OBJECT_SCHEMA, EVENT_OBJECT_TABLE, TRIGGER_NAME, SQL_MODE
FROM INFORMATION_SCHEMA.TRIGGERS;
```

- For performance-related bugs or problems with `SELECT` statements, you should always include the output of `EXPLAIN SELECT ...`, and at least the number of rows that the `SELECT` statement produces. You should also include the output from `SHOW CREATE TABLE tbl_name` for each table that is involved. The more information you provide about your situation, the more likely it is that someone can help you.

The following is an example of a very good bug report. The statements are run using the `mysql` command-line tool. Note the use of the `\G` statement terminator for statements that would otherwise provide very long output lines that are difficult to read.
How to Report Bugs or Problems

mysql> SHOW VARIABLES;
mysql> SHOW COLUMNS FROM ...
mysql> <output from SHOW COLUMNS>
mysql> EXPLAIN SELECT ...
mysql> <output from EXPLAIN>
mysql> FLUSH STATUS;
mysql> SELECT ...;
mysql> <A short version of the output from SELECT, including the time taken to run the query>
mysql> SHOW STATUS;
mysql> <output from SHOW STATUS>

• If a bug or problem occurs while running mysqld, try to provide an input script that reproduces the anomaly. This script should include any necessary source files. The more closely the script can reproduce your situation, the better. If you can make a reproducible test case, you should upload it to be attached to the bug report.

If you cannot provide a script, you should at least include the output from mysqladmin variables extended-status processlist in your report to provide some information on how your system is performing.

• If you cannot produce a test case with only a few rows, or if the test table is too big to be included in the bug report (more than 10 rows), you should dump your tables using mysqldump and create a README file that describes your problem. Create a compressed archive of your files using tar and gzip or zip. After you initiate a bug report for our bugs database at http://bugs.mysql.com/, click the Files tab in the bug report for instructions on uploading the archive to the bugs database.

• If you believe that the MySQL server produces a strange result from a statement, include not only the result, but also your opinion of what the result should be, and an explanation describing the basis for your opinion.

• When you provide an example of the problem, it is better to use the table names, variable names, and so forth that exist in your actual situation than to come up with new names. The problem could be related to the name of a table or variable. These cases are rare, perhaps, but it is better to be safe than sorry. After all, it should be easier for you to provide an example that uses your actual situation, and it is by all means better for us. If you have data that you do not want to be visible to others in the bug report, you can upload it using the Files tab as previously described. If the information is really top secret and you do not want to show it even to us, go ahead and provide an example using other names, but please regard this as the last choice.

• Include all the options given to the relevant programs, if possible. For example, indicate the options that you use when you start the mysqld server, as well as the options that you use to run any MySQL client programs. The options to programs such as mysqld and mysql, and to the configure script, are often key to resolving problems and are very relevant. It is never a bad idea to include them. If your problem involves a program written in a language such as Perl or PHP, please include the language processor's version number, as well as the version for any modules that the program uses. For example, if you have a Perl script that uses the DBI and DBD::mysql modules, include the version numbers for Perl, DBI, and DBD::mysql.

• If your question is related to the privilege system, please include the output of mysqladmin reload, and all the error messages you get when trying to connect. When you test your privileges, you should execute mysqladmin reload version and try to connect with the program that gives you trouble.

• If you have a patch for a bug, do include it. But do not assume that the patch is all we need, or that we can use it, if you do not provide some necessary information such as test cases showing the bug that your patch fixes. We might find problems with your patch or we might not understand it at all. If so, we cannot use it.
If we cannot verify the exact purpose of the patch, we will not use it. Test cases help us here. Show that the patch handles all the situations that may occur. If we find a borderline case (even a rare one) where the patch will not work, it may be useless.

- Guesses about what the bug is, why it occurs, or what it depends on are usually wrong. Even the MySQL team cannot guess such things without first using a debugger to determine the real cause of a bug.

- Indicate in your bug report that you have checked the reference manual and mail archive so that others know you have tried to solve the problem yourself.

- If your data appears corrupt or you get errors when you access a particular table, first check your tables with **CHECK TABLE**. If that statement reports any errors:

  - The InnoDB crash recovery mechanism handles cleanup when the server is restarted after being killed, so in typical operation there is no need to “repair” tables. If you encounter an error with InnoDB tables, restart the server and see whether the problem persists, or whether the error affected only cached data in memory. If data is corrupted on disk, consider restarting with the innodb_force_recovery option enabled so that you can dump the affected tables.

  - For non-transactional tables, try to repair them with **REPAIR TABLE** or with myisamchk. See Chapter 5, *MySQL Server Administration*.

If you are running Windows, please verify the value of `lower_case_table_names` using the `SHOW VARIABLES LIKE 'lower_case_table_names'` statement. This variable affects how the server handles lettercase of database and table names. Its effect for a given value should be as described in Section 9.2.3, “Identifier Case Sensitivity”.

- If you often get corrupted tables, you should try to find out when and why this happens. In this case, the error log in the MySQL data directory may contain some information about what happened. (This is the file with the .err suffix in the name.) See Section 5.4.2, “The Error Log”. Please include any relevant information from this file in your bug report. Normally mysqld should never crash a table if nothing killed it in the middle of an update. If you can find the cause of mysqld dying, it is much easier for us to provide you with a fix for the problem. See Section B.4.1, “How to Determine What Is Causing a Problem”.

- If possible, download and install the most recent version of MySQL Server and check whether it solves your problem. All versions of the MySQL software are thoroughly tested and should work without problems. We believe in making everything as backward-compatible as possible, and you should be able to switch MySQL versions without difficulty. See Section 2.1.1, “Which MySQL Version and Distribution to Install”.

### 1.7 MySQL Standards Compliance

This section describes how MySQL relates to the ANSI/ISO SQL standards. MySQL Server has many extensions to the SQL standard, and here you can find out what they are and how to use them. You can also find information about functionality missing from MySQL Server, and how to work around some of the differences.

The SQL standard has been evolving since 1986 and several versions exist. In this manual, “SQL-92” refers to the standard released in 1992. “SQL:1999”, “SQL:2003”, “SQL:2008”, and “SQL:2011” refer to the versions of the standard released in the corresponding years, with the last being the most recent version. We use the phrase “the SQL standard” or “standard SQL” to mean the current version of the SQL Standard at any time.
One of our main goals with the product is to continue to work toward compliance with the SQL standard, but without sacrificing speed or reliability. We are not afraid to add extensions to SQL or support for non-SQL features if this greatly increases the usability of MySQL Server for a large segment of our user base. The HANDLER interface is an example of this strategy. See Section 13.2.4, “HANDLER Syntax”.

We continue to support transactional and nontransactional databases to satisfy both mission-critical 24/7 usage and heavy Web or logging usage.

MySQL Server was originally designed to work with medium-sized databases (10-100 million rows, or about 100MB per table) on small computer systems. Today MySQL Server handles terabyte-sized databases, but the code can also be compiled in a reduced version suitable for hand-held and embedded devices. The compact design of the MySQL server makes development in both directions possible without any conflicts in the source tree.

We are not targeting real-time support, although MySQL replication capabilities offer significant functionality.

MySQL supports ODBC levels 0 to 3.51.

MySQL supports high-availability database clustering using the NDBCLUSTER storage engine. See Chapter 18, MySQL NDB Cluster 7.3 and NDB Cluster 7.4.

We implement XML functionality which supports most of the W3C XPath standard. See Section 12.11, “XML Functions”.

**Selecting SQL Modes**

The MySQL server can operate in different SQL modes, and can apply these modes differently for different clients, depending on the value of the sql_mode system variable. DBAs can set the global SQL mode to match site server operating requirements, and each application can set its session SQL mode to its own requirements.

Modes affect the SQL syntax MySQL supports and the data validation checks it performs. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers.

For more information on setting the SQL mode, see Section 5.1.10, “Server SQL Modes”.

**Running MySQL in ANSI Mode**

To run MySQL Server in ANSI mode, start mysqld with the --ansi option. Running the server in ANSI mode is the same as starting it with the following options:

```
--transaction-isolation=SERIALIZABLE --sql-mode=ANSI
```

To achieve the same effect at runtime, execute these two statements:

```
SET GLOBAL TRANSACTION ISOLATION LEVEL SERIALIZABLE;
SET GLOBAL sql_mode = 'ANSI';
```

You can see that setting the sql_mode system variable to 'ANSI' enables all SQL mode options that are relevant for ANSI mode as follows:

```
mysql> SET GLOBAL sql_mode='ANSI';
mysql> SELECT @@GLOBAL.sql_mode;
   -> 'REAL_AS_FLOAT,PIPES_AS_CONCAT,ANSI_QUOTES,IGNORE_SPACE,ANSI'
```
Running the server in ANSI mode with `--ansi` is not quite the same as setting the SQL mode to 'ANSI' because the `--ansi` option also sets the transaction isolation level.

See Section 5.1.6, “Server Command Options”.

### 1.7.1 MySQL Extensions to Standard SQL

MySQL Server supports some extensions that you probably will not find in other SQL DBMSs. Be warned that if you use them, your code will not be portable to other SQL servers. In some cases, you can write code that includes MySQL extensions, but is still portable, by using comments of the following form:

```sql
/*! MySQL-specific code */
```

In this case, MySQL Server parses and executes the code within the comment as it would any other SQL statement, but other SQL servers will ignore the extensions. For example, MySQL Server recognizes the `STRAIGHT_JOIN` keyword in the following statement, but other servers will not:

```sql
SELECT /*! STRAIGHT_JOIN */ col1 FROM table1,table2 WHERE ...
```

If you add a version number after the `!` character, the syntax within the comment is executed only if the MySQL version is greater than or equal to the specified version number. The `KEY_BLOCK_SIZE` clause in the following comment is executed only by servers from MySQL 5.1.10 or higher:

```sql
CREATE TABLE t1(a INT, KEY (a)) /*!50110 KEY_BLOCK_SIZE=1024 */;
```

The following descriptions list MySQL extensions, organized by category.

- **Organization of data on disk**

MySQL Server maps each database to a directory under the MySQL data directory, and maps tables within a database to file names in the database directory. This has a few implications:

  - Database and table names are case-sensitive in MySQL Server on operating systems that have case-sensitive file names (such as most Unix systems). See Section 9.2.3, “Identifier Case Sensitivity”.

  - You can use standard system commands to back up, rename, move, delete, and copy tables that are managed by the MyISAM storage engine. For example, it is possible to rename a MyISAM table by renaming the `.MYD`, `.MYI`, and `.frm` files to which the table corresponds. (Nevertheless, it is preferable to use `RENAME TABLE` or `ALTER TABLE ... RENAME` and let the server rename the files.)

- **General language syntax**

  - By default, strings can be enclosed by " as well as '. If the `ANSI_QUOTES` SQL mode is enabled, strings can be enclosed only by ' and the server interprets strings enclosed by " as identifiers.

  - `\` is the escape character in strings.

  - In SQL statements, you can access tables from different databases with the `db_name.tbl_name` syntax. Some SQL servers provide the same functionality but call this User space. MySQL Server doesn't support tablespaces such as used in statements like this: `CREATE TABLE ralph.my_table ... IN my_tablespace`.

- **SQL statement syntax**
• The `ANALYZE TABLE`, `CHECK TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` statements.

• The `DO` statement.

• `EXPLAIN SELECT` to obtain a description of how tables are processed by the query optimizer.

• The `FLUSH` and `RESET` statements.

• The `SET` statement. See Section 13.7.4.1, “SET Syntax for Variable Assignment”.

• The `SHOW` statement. See Section 13.7.5, “SHOW Syntax”. The information produced by many of the MySQL-specific `SHOW` statements can be obtained in more standard fashion by using `SELECT` to query `INFORMATION_SCHEMA`. See Chapter 21, `INFORMATION_SCHEMA Tables`.

• Use of `LOAD DATA`. In many cases, this syntax is compatible with Oracle `LOAD DATA`. See Section 13.2.6, “LOAD DATA Syntax”.

• Use of `RENAME TABLE`. See Section 13.1.32, “RENAME TABLE Syntax”.

• Use of `REPLACE` instead of `DELETE` plus `INSERT`. See Section 13.2.8, “REPLACE Syntax”.

• Use of `CHANGE col_name`, `DROP col_name`, or `DROP INDEX`, `IGNORE` or `RENAME` in `ALTER TABLE` statements. Use of multiple `ADD`, `ALTER`, `DROP`, or `CHANGE` clauses in an `ALTER TABLE` statement. See Section 13.1.7, “ALTER TABLE Syntax”.

• Use of index names, indexes on a prefix of a column, and use of `INDEX` or `KEY` in `CREATE TABLE` statements. See Section 13.1.17, “CREATE TABLE Syntax”.

• Use of `TEMPORARY` or `IF NOT EXISTS` with `CREATE TABLE`.

• Use of `IF EXISTS` with `DROP TABLE` and `DROP DATABASE`.

• The capability of dropping multiple tables with a single `DROP TABLE` statement.

• The `ORDER BY` and `LIMIT` clauses of the `UPDATE` and `DELETE` statements.

• `INSERT INTO tbl_name SET col_name = ...` syntax.

• The `DELAYED` clause of the `INSERT` and `REPLACE` statements.

• The `LOW_PRIORITY` clause of the `INSERT`, `REPLACE`, `DELETE`, and `UPDATE` statements.

• Use of `INTO OUTFILE` or `INTO DUMPFILE` in `SELECT` statements. See Section 13.2.9, “SELECT Syntax”.

• Options such as `STRAIGHT_JOIN` or `SQL_SMALL_RESULT` in `SELECT` statements.

• You don't need to name all selected columns in the `GROUP BY` clause. This gives better performance for some very specific, but quite normal queries. See Section 12.19, “Aggregate (GROUP BY) Functions”.

• You can specify `ASC` and `DESC` with `GROUP BY`, not just with `ORDER BY`.
MySQL Extensions to Standard SQL

- The ability to set variables in a statement with the := assignment operator. See Section 9.4, “User-Defined Variables”.

Data types
- The MEDIUMINT, SET, and ENUM data types, and the various BLOB and TEXT data types.
- The AUTO_INCREMENT, BINARY, NULL, UNSIGNED, and ZEROFILL data type attributes.

Functions and operators
- To make it easier for users who migrate from other SQL environments, MySQL Server supports aliases for many functions. For example, all string functions support both standard SQL syntax and ODBC syntax.
- MySQL Server understands the || and && operators to mean logical OR and AND, as in the C programming language. In MySQL Server, || and OR are synonyms, as are && and AND. Because of this nice syntax, MySQL Server doesn't support the standard SQL || operator for string concatenation; use CONCAT() instead. Because CONCAT() takes any number of arguments, it is easy to convert use of the || operator to MySQL Server.
- Use of COUNT(DISTINCT value_list) where value_list has more than one element.
- String comparisons are case insensitive by default, with sort ordering determined by the collation of the current character set, which is latin1 (cp1252 West European) by default. To perform case-sensitive comparisons instead, you should declare your columns with the BINARY attribute or use the BINARY cast, which causes comparisons to be done using the underlying character code values rather than a lexical ordering.
- The % operator is a synonym for MOD(). That is, \( N \% M \) is equivalent to MOD(\( N, M \)). % is supported for C programmers and for compatibility with PostgreSQL.
- The =, <>, <=, <, >=, >, <<>, <=>, AND, OR, or LIKE operators may be used in expressions in the output column list (to the left of the FROM) in SELECT statements. For example:

```
mysql> SELECT col1=1 AND col2=2 FROM my_table;
```
- The LAST_INSERT_ID() function returns the most recent AUTO_INCREMENT value. See Section 12.15, “Information Functions”.
- LIKE is permitted on numeric values.
- The REGEXP and NOT REGEXP extended regular expression operators.
- CONCAT() or CHAR() with one argument or more than two arguments. (In MySQL Server, these functions can take a variable number of arguments.)
- The BIT_COUNT(), CASE, ELT(), FROM_DAYS(), FORMAT(), IF(), PASSWORD(), ENCRYPT(), MD5(), ENCODE(), DECODE(), PERIOD_ADD(), PERIOD_DIFF(), TO_DAYS(), and WEEKDAY() functions.
- Use of TRIM() to trim substrings. Standard SQL supports removal of single characters only.
- The GROUP BY functions STD(), BIT_OR(), BIT_AND(), BIT_XOR(), and GROUP_CONCAT(). See Section 12.19, “Aggregate (GROUP BY) Functions”.
1.7.2 MySQL Differences from Standard SQL

We try to make MySQL Server follow the ANSI SQL standard and the ODBC SQL standard, but MySQL Server performs operations differently in some cases:

- There are several differences between the MySQL and standard SQL privilege systems. For example, in MySQL, privileges for a table are not automatically revoked when you delete a table. You must explicitly issue a `REVOKE` statement to revoke privileges for a table. For more information, see Section 13.7.1.6, “REVOKE Syntax”.

- The `CAST()` function does not support cast to `REAL` or `BIGINT`. See Section 12.10, “Cast Functions and Operators”.

1.7.2.1 SELECT INTO TABLE Differences

MySQL Server doesn't support the `SELECT ... INTO TABLE` Sybase SQL extension. Instead, MySQL Server supports the `INSERT INTO ... SELECT` standard SQL syntax, which is basically the same thing. See Section 13.2.5.1, “INSERT ... SELECT Syntax”. For example:

```
INSERT INTO tbl_temp2 (fld_id)
SELECT tbl_temp1.fld_order_id
FROM tbl_temp1 WHERE tbl_temp1.fld_order_id > 100;
```

Alternatively, you can use `SELECT ... INTO OUTFILE` or `CREATE TABLE ... SELECT`.

You can use `SELECT ... INTO` with user-defined variables. The same syntax can also be used inside stored routines using cursors and local variables. See Section 13.2.9.1, “SELECT ... INTO Syntax”.

1.7.2.2 UPDATE Differences

If you access a column from the table to be updated in an expression, `UPDATE` uses the current value of the column. The second assignment in the following statement sets `col2` to the current (updated) `col1` value, not the original `col1` value. The result is that `col1` and `col2` have the same value. This behavior differs from standard SQL.

```
UPDATE t1 SET col1 = col1 + 1, col2 = col1;
```

1.7.2.3 Foreign Key Differences

The MySQL implementation of foreign keys differs from the SQL standard in the following key respects:

- If there are several rows in the parent table that have the same referenced key value, InnoDB acts in foreign key checks as if the other parent rows with the same key value do not exist. For example, if you have defined a `RESTRICT` type constraint, and there is a child row with several parent rows, InnoDB does not permit the deletion of any of those parent rows.

  InnoDB performs cascading operations through a depth-first algorithm, based on records in the indexes corresponding to the foreign key constraints.

- A `FOREIGN KEY` constraint that references a non-`UNIQUE` key is not standard SQL but rather an InnoDB extension.

- If `ON UPDATE CASCADE` or `ON UPDATE SET NULL` recurses to update the same table it has previously updated during the same cascade, it acts like `RESTRICT`. This means that you cannot use self-referential `ON UPDATE CASCADE` or `ON UPDATE SET NULL` operations. This is to prevent infinite loops resulting from cascaded updates. A self-referential `ON DELETE SET NULL`, on the other hand, is
How MySQL Deals with Constraints

possible, as is a self-referential **ON DELETE CASCADE**. Cascading operations may not be nested more than 15 levels deep.

- In an SQL statement that inserts, deletes, or updates many rows, foreign key constraints (like unique constraints) are checked row-by-row. When performing foreign key checks, **InnoDB** sets shared row-level locks on child or parent records that it must examine. MySQL checks foreign key constraints immediately; the check is not deferred to transaction commit. According to the SQL standard, the default behavior should be deferred checking. That is, constraints are only checked after the *entire SQL statement* has been processed. This means that it is not possible to delete a row that refers to itself using a foreign key.

For information about how the **InnoDB** storage engine handles foreign keys, see Section 14.6.1.5, “**InnoDB and FOREIGN KEY Constraints**”.

### 1.7.2.4 ‘--’ as the Start of a Comment

Standard SQL uses the C syntax /* this is a comment */ for comments, and MySQL Server supports this syntax as well. MySQL also support extensions to this syntax that enable MySQL-specific SQL to be embedded in the comment, as described in Section 9.6, “Comment Syntax”.

Standard SQL uses “--” as a start-comment sequence. MySQL Server uses # as the start comment character. MySQL Server also supports a variant of the -- comment style. That is, the -- start-comment sequence must be followed by a space (or by a control character such as a newline). The space is required to prevent problems with automatically generated SQL queries that use constructs such as the following, where we automatically insert the value of the payment for `payment`:

```sql
UPDATE account SET credit=credit-payment
```

Consider about what happens if `payment` has a negative value such as -1:

```sql
UPDATE account SET credit=credit--1
```

`credit--1` is a valid expression in SQL, but -- is interpreted as the start of a comment, part of the expression is discarded. The result is a statement that has a completely different meaning than intended:

```sql
UPDATE account SET credit=credit
```

The statement produces no change in value at all. This illustrates that permitting comments to start with -- can have serious consequences.

Using our implementation requires a space following the -- for it to be recognized as a start-comment sequence in MySQL Server. Therefore, `credit--1` is safe to use.

Another safe feature is that the `mysql` command-line client ignores lines that start with --.

### 1.7.3 How MySQL Deals with Constraints

MySQL enables you to work both with transactional tables that permit rollback and with nontransactional tables that do not. Because of this, constraint handling is a bit different in MySQL than in other DBMSs. We must handle the case when you have inserted or updated a lot of rows in a nontransactional table for which changes cannot be rolled back when an error occurs.

The basic philosophy is that MySQL Server tries to produce an error for anything that it can detect while parsing a statement to be executed, and tries to recover from any errors that occur while executing the statement. We do this in most cases, but not yet for all.
How MySQL Deals with Constraints

The options MySQL has when an error occurs are to stop the statement in the middle or to recover as well as possible from the problem and continue. By default, the server follows the latter course. This means, for example, that the server may coerce invalid values to the closest valid values.

Several SQL mode options are available to provide greater control over handling of bad data values and whether to continue statement execution or abort when errors occur. Using these options, you can configure MySQL Server to act in a more traditional fashion that is like other DBMSs that reject improper input. The SQL mode can be set globally at server startup to affect all clients. Individual clients can set the SQL mode at runtime, which enables each client to select the behavior most appropriate for its requirements. See Section 5.1.10, “Server SQL Modes”.

The following sections describe how MySQL Server handles different types of constraints.

1.7.3.1 PRIMARY KEY and UNIQUE Index Constraints

Normally, errors occur for data-change statements (such as INSERT or UPDATE) that would violate primary-key, unique-key, or foreign-key constraints. If you are using a transactional storage engine such as InnoDB, MySQL automatically rolls back the statement. If you are using a nontransactional storage engine, MySQL stops processing the statement at the row for which the error occurred and leaves any remaining rows unprocessed.

MySQL supports an IGNORE keyword for INSERT, UPDATE, and so forth. If you use it, MySQL ignores primary-key or unique-key violations and continues processing with the next row. See the section for the statement that you are using (Section 13.2.5, “INSERT Syntax”, Section 13.2.11, “UPDATE Syntax”, and so forth).

You can get information about the number of rows actually inserted or updated with the mysql_info() C API function. You can also use the SHOW WARNINGS statement. See Section 23.8.7.35, “mysql_info()”, and Section 13.7.5.41, “SHOW WARNINGS Syntax”.

Only InnoDB tables support foreign keys. See Section 14.6.1.5, “InnoDB and FOREIGN KEY Constraints”.

1.7.3.2 FOREIGN KEY Constraints

Foreign keys let you cross-reference related data across tables, and foreign key constraints help keep this spread-out data consistent.

MySQL supports ON UPDATE and ON DELETE foreign key references in CREATE TABLE and ALTER TABLE statements. The available referential actions are RESTRICT (the default), CASCADE, SET NULL, and NO ACTION.

Note
NDB does not support ON UPDATE CASCADE actions where the referenced column is the parent table's primary key.

SET DEFAULT is also supported by the MySQL Server but is currently rejected as invalid by InnoDB and NDB. Since MySQL does not support deferred constraint checking, NO ACTION is treated as RESTRICT. For the exact syntax supported by MySQL for foreign keys, see Section 13.1.17.6, “Using FOREIGN KEY Constraints”.

MATCH FULL, MATCH PARTIAL, and MATCH SIMPLE are allowed, but their use should be avoided, as they cause the MySQL Server to ignore any ON DELETE or ON UPDATE clause used in the same statement. MATCH options do not have any other effect in MySQL, which in effect enforces MATCH SIMPLE semantics full-time.
MySQL requires that foreign key columns be indexed; if you create a table with a foreign key constraint but no index on a given column, an index is created. Exception: NDB Cluster requires an explicit unique key (or primary key) on the foreign key column.

You can obtain information about foreign keys from the `INFORMATION_SCHEMA.KEY_COLUMN_USAGE` table. An example of a query against this table is shown here:

```sql
mysql> SELECT TABLE_SCHEMA, TABLE_NAME, COLUMN_NAME, CONSTRAINT_NAME
>    FROM INFORMATION_SCHEMA.KEY_COLUMN_USAGE
> WHERE REFERENCED_TABLE_SCHEMA IS NOT NULL;
```

```
+--------------+---------------+-------------+-----------------+
<table>
<thead>
<tr>
<th>TABLE_SCHEMA</th>
<th>TABLE_NAME</th>
<th>COLUMN_NAME</th>
<th>CONSTRAINT_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>fk1</td>
<td>myuser</td>
<td>myuser_id</td>
<td>f</td>
</tr>
<tr>
<td>fk1</td>
<td>product_order</td>
<td>customer_id</td>
<td>f2</td>
</tr>
<tr>
<td>fk1</td>
<td>product_order</td>
<td>product_id</td>
<td>f1</td>
</tr>
</tbody>
</table>
+--------------+---------------+-------------+-----------------+
3 rows in set (0.01 sec)
```

Information about foreign keys on InnoDB tables can also be found in the `INNODB_SYS_FOREIGN` and `INNODB_SYS_FOREIGN_COLS` tables, in the `INFORMATION_SCHEMA` database.

### 1.7.3.3 Constraints on Invalid Data

By default, MySQL is forgiving of invalid or improper data values and coerces them to valid values for data entry. However, you can enable strict SQL mode to select more traditional treatment of bad values such that the server rejects them and aborts the statement in which they occur. See Section 5.1.10, “Server SQL Modes”.

This section describes the default (forgiving) behavior of MySQL, as well as the strict SQL mode and how it differs.

If you are not using strict mode, then whenever you insert an “incorrect” value into a column, such as a `NULL` into a `NOT NULL` column or a too-large numeric value into a numeric column, MySQL sets the column to the “best possible value” instead of producing an error: The following rules describe in more detail how this works:

- If you try to store an out of range value into a numeric column, MySQL Server instead stores zero, the smallest possible value, or the largest possible value, whichever is closest to the invalid value.

- For strings, MySQL stores either the empty string or as much of the string as can be stored in the column.

- If you try to store a string that does not start with a number into a numeric column, MySQL Server stores 0.

- Invalid values for `ENUM` and `SET` columns are handled as described in Section 1.7.3.4, “ENUM and SET Constraints”.

- MySQL permits you to store certain incorrect date values into `DATE` and `DATETIME` columns (such as `'2000-02-31'` or `'2000-02-00'`). In this case, when an application has not enabled strict SQL mode, it up to the application to validate the dates before storing them. If MySQL can store a date value and retrieve exactly the same value, MySQL stores it as given. If the date is totally wrong (outside the server’s ability to store it), the special “zero” date value `'0000-00-00'` is stored in the column instead.

- If you try to store `NULL` into a column that doesn’t take `NULL` values, an error occurs for single-row `INSERT` statements. For multiple-row `INSERT` statements or for `INSERT INTO ... SELECT` statements, MySQL Server stores the implicit default value for the column data type. In general, this is
How MySQL Deals with Constraints

0 for numeric types, the empty string ('') for string types, and the “zero” value for date and time types. Implicit default values are discussed in Section 11.6, “Data Type Default Values”.

- If an INSERT statement specifies no value for a column, MySQL inserts its default value if the column definition includes an explicit DEFAULT clause. If the definition has no such DEFAULT clause, MySQL inserts the implicit default value for the column data type.

The reason for using the preceding rules in nonstrict mode is that we can't check these conditions until the statement has begun executing. We can't just roll back if we encounter a problem after updating a few rows, because the storage engine may not support rollback. The option of terminating the statement is not that good; in this case, the update would be “half done,” which is probably the worst possible scenario. In this case, it is better to “do the best you can” and then continue as if nothing happened.

You can select stricter treatment of input values by using the STRICT_TRANS_TABLES or STRICT_ALL_TABLES SQL modes:

```
SET sql_mode = 'STRICT_TRANS_TABLES';
SET sql_mode = 'STRICT_ALL_TABLES';
```

STRICT_TRANS_TABLES enables strict mode for transactional storage engines, and also to some extent for nontransactional engines. It works like this:

- For transactional storage engines, bad data values occurring anywhere in a statement cause the statement to abort and roll back.

- For nontransactional storage engines, a statement aborts if the error occurs in the first row to be inserted or updated. (When the error occurs in the first row, the statement can be aborted to leave the table unchanged, just as for a transactional table.) Errors in rows after the first do not abort the statement, because the table has already been changed by the first row. Instead, bad data values are adjusted and result in warnings rather than errors. In other words, with STRICT_TRANS_TABLES, a wrong value causes MySQL to roll back all updates done so far, if that can be done without changing the table. But once the table has been changed, further errors result in adjustments and warnings.

For even stricter checking, enable STRICT_ALL_TABLES. This is the same as STRICT_TRANS_TABLES except that for nontransactional storage engines, errors abort the statement even for bad data in rows following the first row. This means that if an error occurs partway through a multiple-row insert or update for a nontransactional table, a partial update results. Earlier rows are inserted or updated, but those from the point of the error on are not. To avoid this for nontransactional tables, either use single-row statements or else use STRICT_TRANS_TABLES if conversion warnings rather than errors are acceptable. To avoid problems in the first place, do not use MySQL to check column content. It is safest (and often faster) to let the application ensure that it passes only valid values to the database.

With either of the strict mode options, you can cause errors to be treated as warnings by using INSERT IGNORE or UPDATE IGNORE rather than INSERT or UPDATE without IGNORE.

1.7.3.4 ENUM and SET Constraints

ENUM and SET columns provide an efficient way to define columns that can contain only a given set of values. See Section 11.4.4, “The ENUM Type”, and Section 11.4.5, “The SET Type”.

With strict mode enabled (see Section 5.1.10, “Server SQL Modes”), the definition of a ENUM or SET column acts as a constraint on values entered into the column. An error occurs for values that do not satisfy these conditions:

- An ENUM value must be one of those listed in the column definition, or the internal numeric equivalent thereof. The value cannot be the error value (that is, 0 or the empty string). For a column defined as ENUM('a','b','c'), values such as '', 'd', or 'ax' are invalid and are rejected.
• A **SET** value must be the empty string or a value consisting only of the values listed in the column definition separated by commas. For a column defined as `SET('a','b','c')`, values such as 'd' or 'a,b,c,d' are invalid and are rejected.

Errors for invalid values can be suppressed in strict mode if you use `INSERT IGNORE` or `UPDATE IGNORE`. In this case, a warning is generated rather than an error. For **ENUM**, the value is inserted as the error member (0). For **SET**, the value is inserted as given except that any invalid substrings are deleted. For example, 'a,x,b,y' results in a value of 'a,b'.

1.8 Credits

The following sections list developers, contributors, and supporters that have helped to make MySQL what it is today.

1.8.1 Contributors to MySQL

Although Oracle Corporation and/or its affiliates own all copyrights in the MySQL server and the MySQL manual, we wish to recognize those who have made contributions of one kind or another to the MySQL distribution. Contributors are listed here, in somewhat random order:

• Gianmassimo Vigazzola &lt;qwerg@mbox.vol.it&gt; or &lt;qwerg@tin.it&gt;
  The initial port to Win32/NT.

• Per Eric Olsson
  For constructive criticism and real testing of the dynamic record format.

• Irena Pancirov &lt;irena@mail.yacc.it&gt;
  Win32 port with Borland compiler. `mysqlshutdown.exe` and `mysqlwatch.exe`.

• David J. Hughes
  For the effort to make a shareware SQL database. At TcX, the predecessor of MySQL AB, we started with mSQL, but found that it couldn't satisfy our purposes so instead we wrote an SQL interface to our application builder Unireg. `mysqladmin` and `mysql` client are programs that were largely influenced by their mSQL counterparts. We have put a lot of effort into making the MySQL syntax a superset of mSQL. Many of the API's ideas are borrowed from mSQL to make it easy to port free mSQL programs to the MySQL API. The MySQL software doesn't contain any code from mSQL. Two files in the distribution (`client/insert_test.c` and `client/select_test.c`) are based on the corresponding (noncopyrighted) files in the mSQL distribution, but are modified as examples showing the changes necessary to convert code from mSQL to MySQL Server. (mSQL is copyrighted David J. Hughes.)

• Patrick Lynch

• Fred Lindberg
  For setting up qmail to handle the MySQL mailing list and for the incredible help we got in managing the MySQL mailing lists.

• Igor Romanenko &lt;igor@frog.kiev.ua&gt;
  `mysqldump` (previously `msqldump`, but ported and enhanced by Monty).
• Yuri Dario
  For keeping up and extending the MySQL OS/2 port.

• Tim Bunce
  Author of mysqlhotcopy.

• Zarko Mocnik <zarko.mocnik@dem.si>
  Sorting for Slovenian language.

• "TAMITO" <tommy@valley.ne.jp>
  The _MB character set macros and the ujis and sjis character sets.

• Joshua Chamas <joshua@chamas.com>
  Base for concurrent insert, extended date syntax, debugging on NT, and answering on the MySQL mailing list.

• Yves Carlier <Yves.Carlier@rug.ac.be>
  mysqlaccess, a program to show the access rights for a user.

• Rhys Jones <rhys@wales.com> (And GWE Technologies Limited)
  For one of the early JDBC drivers.

• Dr Xiaokun Kelvin ZHU <X.Zhu@brad.ac.uk>
  Further development of one of the early JDBC drivers and other MySQL-related Java tools.

• James Cooper <pixel@organic.com>
  For setting up a searchable mailing list archive at his site.

• Rick Mehalick <Rick_Mehalick@i-o.com>
  For xmysql, a graphical X client for MySQL Server.

• Doug Sisk <sisk@wix.com>
  For providing RPM packages of MySQL for Red Hat Linux.

• Diemand Alexander V. <axeld@vial.ethz.ch>
  For providing RPM packages of MySQL for Red Hat Linux-Alpha.

• Antoni Pamies Olive <toni@readysoft.es>
  For providing RPM versions of a lot of MySQL clients for Intel and SPARC.

• Jay Bloodworth <jay@pathways.sde.state.sc.us>
  For providing RPM versions for MySQL 3.21.

• David Sacerdote <davids@secnet.com>
  Ideas for secure checking of DNS host names.
Contributors to MySQL

- Wei-Jou Chen <jou@nematic.ieo.nctu.edu.tw>
  Some support for Chinese(BIG5) characters.
- Wei He <hewei@mail.ied.ac.cn>
  A lot of functionality for the Chinese(GBK) character set.
- Jan Pazdziora <adelton@fi.muni.cz>
  Czech sorting order.
- Zeev Suraski <bourbon@netvision.net.il>
  FROM_UNIXTIME() time formatting, ENCRYPT() functions, and bison advisor. Active mailing list member.
- Luuk de Boer <luuk@wxs.nl>
  Ported (and extended) the benchmark suite to DBI/DBD. Have been of great help with crash-me and running benchmarks. Some new date functions. The mysql_setpermission script.
- Alexis Mikhailov <root@medinf.chuvashia.su>
  User-defined functions (UDFs); CREATE FUNCTION and DROP FUNCTION.
- Andreas F. Bobak <bobak@relog.ch>
  The AGGREGATE extension to user-defined functions.
- Ross Wakelin <R.Wakelin@march.co.uk>
  Help to set up InstallShield for MySQL-Win32.
- Jethro Wright III <jetman@li.net>
  The libmysql.dll library.
- James Pereria <jpereira@iafrica.com>
  Mysqlmanager, a Win32 GUI tool for administering MySQL Servers.
- Curt Sampson <cjs@portal.ca>
  Porting of MIT-pthreads to NetBSD/Alpha and NetBSD 1.3/i386.
- Martin Ramsch <m.ramsch@computer.org>
  Examples in the MySQL Tutorial.
- Steve Harvey
  For making mysqlaccess more secure.
- Konark IA-64 Centre of Persistent Systems Private Limited
  Help with the Win64 port of the MySQL server.
- Albert Chin-A-Young.
Configure updates for Tru64, large file support and better TCP wrappers support.

- John Birrell
  Emulation of `pthread_mutex()` for OS/2.

- Benjamin Pflugmann
  Extended `MERGE` tables to handle `INSERTS`. Active member on the MySQL mailing lists.

- Jocelyn Fournier
  Excellent spotting and reporting innumerable bugs (especially in the MySQL 4.1 subquery code).

- Marc Liyanage
  Maintaining the OS X packages and providing invaluable feedback on how to create OS X packages.

- Robert Rutherford
  Providing invaluable information and feedback about the QNX port.

- Previous developers of NDB Cluster
  Lots of people were involved in various ways summer students, master thesis students, employees. In total more than 100 people so too many to mention here. Notable name is Ataullah Dabaghi who up until 1999 contributed around a third of the code base. A special thanks also to developers of the AXE system which provided much of the architectural foundations for NDB Cluster with blocks, signals and crash tracing functionality. Also credit should be given to those who believed in the ideas enough to allocate of their budgets for its development from 1992 to present time.

- Google Inc.
  We wish to recognize Google Inc. for contributions to the MySQL distribution: Mark Callaghan's SMP Performance patches and other patches.

Other contributors, bugfinders, and testers: James H. Thompson, Maurizio Menghini, Wojciech Tryc, Luca Berra, Zarko Mocnik, Wim Bonis, Elmar Haneke, `<jehambym@lightside>`, `<psmith@BayNetworks.com>`, `<duane@connect.com.au>`, Ted Deppner `<ted@psyber.com>`, Mike Simons, Jaakko Hyvatti.

And lots of bug report/patches from the folks on the mailing list.

A big tribute goes to those that help us answer questions on the MySQL mailing lists:

- Daniel Koch `<dkoch@amcity.com>`
  Irix setup.

- Luuk de Boer `<luuk@wxs.nl>`
  Benchmark questions.

- Tim Sailer `<tps@users.buoy.com>`
  `DBD::mysql` questions.

- Boyd Lynn Gerber `<gerberb@zenez.com>`
Documenters and translators

SCO-related questions.

- Richard Mehalick <RM186061@shellus.com>
  xmysql-related questions and basic installation questions.

- Zeev Suraski <bourbon@netvision.net.il>
  Apache module configuration questions (log & auth), PHP-related questions, SQL syntax-related questions and other general questions.

- Francesc Guasch <frankie@citel.upc.es>
  General questions.

- Jonathan J Smith <jsmith@wtp.net>
  Questions pertaining to OS-specifics with Linux, SQL syntax, and other things that might need some work.

- David Sklar <sklar@student.net>
  Using MySQL from PHP and Perl.

- Alistair MacDonald <A.MacDonald@uel.ac.uk>
  Is flexible and can handle Linux and perhaps HP-UX.

- John Lyon <jlyon@imag.net>
  Questions about installing MySQL on Linux systems, using either .rpm files or compiling from source.

- Lorvid Ltd. <lorvid@WOLFENET.com>
  Simple billing/license/support/copyright issues.

- Patrick Sherrill <patrick@coconet.com>
  ODBC and VisualC++ interface questions.

- Randy Harmon <rjharmon@uptimecomputers.com>
  DBD, Linux, some SQL syntax questions.

### 1.8.2 Documenters and translators

The following people have helped us with writing the MySQL documentation and translating the documentation or error messages in MySQL.

- Paul DuBois
  Ongoing help with making this manual correct and understandable. That includes rewriting Monty's and David's attempts at English into English as other people know it.

- Kim Aldale
  Helped to rewrite Monty's and David's early attempts at English into English.
Documenters and translators

• Michael J. Miller Jr. <mke@terrapin.turbolift.com>
  For the first MySQL manual. And a lot of spelling/language fixes for the FAQ (that turned into the MySQL manual a long time ago).

• Yan Cailin
  First translator of the MySQL Reference Manual into simplified Chinese in early 2000 on which the Big5 and HK coded versions were based.

• Jay Flaherty <fty@mediapulse.com>
  Big parts of the Perl DBI/DBD section in the manual.

• Paul Southworth <pauls@etext.org>, Ray Loyzaga <yar@cs.su.oz.au>

• Therrien Gilbert <gilbert@ican.net>, Jean-Marc Pouyot <jmp@scalaire.fr>
  French error messages.

• Petr Snajdr, <snajdr@pvt.net>
  Czech error messages.

• Jaroslaw Lewandowski <jotel@itnet.com.pl>
  Polish error messages.

• Miguel Angel Fernandez Roiz
  Spanish error messages.

• Roy-Magne Mo <rmo@www.hivolda.no>
  Norwegian error messages and testing of MySQL 3.21.xx.

• Timur I. Bakeyev <root@timur.tatarstan.ru>
  Russian error messages.

• <brenno@dewinter.com> & Filippo Grassilli <phil@hyppo.com>
  Italian error messages.

• Dirk Munzinger <dirk@trinity.saar.de>
  German error messages.

• Billik Stefan <billik@sun.uniag.sk>
  Slovak error messages.

• Stefan Saroiu <tzoompy@cs.washington.edu>
  Romanian error messages.

• Peter Feher
Hungarian error messages.

- Roberto M. Serqueira
  Portuguese error messages.
- Carsten H. Pedersen
  Danish error messages.
- Arjen Lentz
  Dutch error messages, completing earlier partial translation (also work on consistency and spelling).

### 1.8.3 Packages that support MySQL

The following is a list of creators/maintainers of some of the most important API/packages/applications that a lot of people use with MySQL.

We cannot list every possible package here because the list would then be way too hard to maintain. For other packages, please refer to the software portal at [http://solutions.mysql.com/software/](http://solutions.mysql.com/software/).

- Tim Bunce, Alligator Descartes
  For the DBD (Perl) interface.
- Andreas Koenig <a.koenig@mind.de>
  For the Perl interface for MySQL Server.
- Jochen Wiedmann <wiedmann@neckar-alb.de>
  For maintaining the Perl DBD::mysql module.
- Eugene Chan <eugene@acenet.com.sg>
  For porting PHP for MySQL Server.
- Georg Richter
  MySQL 4.1 testing and bug hunting. New PHP 5.0 mysqli extension (API) for use with MySQL 4.1 and up.
- Giovanni Maruzzelli <maruzz@matrice.it>
  For porting iODBC (Unix ODBC).
- Xavier Leroy <Xavier.Leroy@inria.fr>
  The author of LinuxThreads (used by the MySQL Server on Linux).

### 1.8.4 Tools that were used to create MySQL

The following is a list of some of the tools we have used to create MySQL. We use this to express our thanks to those that has created them as without these we could not have made MySQL what it is today.

- Free Software Foundation
From whom we got an excellent compiler (gcc), an excellent debugger (gdb) and the libc library (from which we have borrowed strto.c to get some code working in Linux).

- Free Software Foundation & The XEmacs development team
  For a really great editor/environment.

- Julian Seward
  Author of valgrind, an excellent memory checker tool that has helped us find a lot of otherwise hard to find bugs in MySQL.

- Dorothea Lütkehaus and Andreas Zeller
  For DDD (The Data Display Debugger) which is an excellent graphical front end to gdb).

1.8.5 Supporters of MySQL

Although Oracle Corporation and/or its affiliates own all copyrights in the MySQL server and the MySQL manual, we wish to recognize the following companies, which helped us finance the development of the MySQL server, such as by paying us for developing a new feature or giving us hardware for development of the MySQL server.

- VA Linux / Andover.net
  Funded replication.

- NuSphere
  Editing of the MySQL manual.

- Stork Design studio

- Intel
  Contributed to development on Windows and Linux platforms.

- Compaq
  Contributed to Development on Linux/Alpha.

- SWSoft
  Development on the embedded mysqld version.

- FutureQuest
  The --skip-show-database option.

This chapter describes how to obtain and install MySQL. A summary of the procedure follows and later sections provide the details. If you plan to upgrade an existing version of MySQL to a newer version rather than install MySQL for the first time, see Section 2.11, “Upgrading MySQL”, for information about upgrade procedures and about issues that you should consider before upgrading.

If you are interested in migrating to MySQL from another database system, see Section A.8, “MySQL 5.6 FAQ: Migration”, which contains answers to some common questions concerning migration issues.

Installation of MySQL generally follows the steps outlined here:

1. **Determine whether MySQL runs and is supported on your platform.**
   
   Please note that not all platforms are equally suitable for running MySQL, and that not all platforms on which MySQL is known to run are officially supported by Oracle Corporation. For information about those platforms that are officially supported, see https://www.mysql.com/support/supportedplatforms/database.html on the MySQL website.

2. **Choose which distribution to install.**
   
   Several versions of MySQL are available, and most are available in several distribution formats. You can choose from pre-packaged distributions containing binary (precompiled) programs or source code. When in doubt, use a binary distribution. Oracle also provides access to the MySQL source code for those who want to see recent developments and test new code. To determine which version and type of distribution you should use, see Section 2.1.1, “Which MySQL Version and Distribution to Install”.

3. **Download the distribution that you want to install.**
   
   For instructions, see Section 2.1.2, “How to Get MySQL”. To verify the integrity of the distribution, use the instructions in Section 2.1.3, “Verifying Package Integrity Using MD5 Checksums or GnuPG”.

4. **Install the distribution.**
To install MySQL from a binary distribution, use the instructions in Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

To install MySQL from a source distribution or from the current development source tree, use the instructions in Section 2.9, “Installing MySQL from Source”.

5. Perform any necessary postinstallation setup.

After installing MySQL, see Section 2.10, “Postinstallation Setup and Testing” for information about making sure the MySQL server is working properly. Also refer to the information provided in Section 2.10.4, “Securing the Initial MySQL Accounts”. This section describes how to secure the initial MySQL user accounts, which have no passwords until you assign passwords. The section applies whether you install MySQL using a binary or source distribution.

6. If you want to run the MySQL benchmark scripts, Perl support for MySQL must be available. See Section 2.13, “Perl Installation Notes”.

Instructions for installing MySQL on different platforms and environments is available on a platform by platform basis:

- **Unix, Linux, FreeBSD**

  For instructions on installing MySQL on most Linux and Unix platforms using a generic binary (for example, a .tar.gz package), see Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

  For information on building MySQL entirely from the source code distributions or the source code repositories, see Section 2.9, “Installing MySQL from Source”.

  For specific platform help on installation, configuration, and building from source see the corresponding platform section:
  - Linux, including notes on distribution specific methods, see Section 2.5, “Installing MySQL on Linux”.
  - Solaris, including PKG and IPS formats, see Section 2.7, “Installing MySQL on Solaris”.
  - IBM AIX, see Section 2.7, “Installing MySQL on Solaris”.
  - FreeBSD, see Section 2.8, “Installing MySQL on FreeBSD”.

- **Microsoft Windows**

  For instructions on installing MySQL on Microsoft Windows, using either the MySQL Installer or Zipped binary, see Section 2.3, “Installing MySQL on Microsoft Windows”.

  For information about managing MySQL instances, see MySQL Notifier Overview.

  For details and instructions on building MySQL from source code using Microsoft Visual Studio, see Section 2.9, “Installing MySQL from Source”.

- **OS X**

  For installation on OS X, including using both the binary package and native PKG formats, see Section 2.4, “Installing MySQL on OS X”.

  For information on making use of an OS X Launch Daemon to automatically start and stop MySQL, see Section 2.4.3, “Installing a MySQL Launch Daemon”.

For information on the MySQL Preference Pane, see Section 2.4.4, “Installing and Using the MySQL Preference Pane”.

2.1 General Installation Guidance

The immediately following sections contain the information necessary to choose, download, and verify your distribution. The instructions in later sections of the chapter describe how to install the distribution that you choose. For binary distributions, see the instructions at Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries” or the corresponding section for your platform if available. To build MySQL from source, use the instructions in Section 2.9, “Installing MySQL from Source”.

2.1.1 Which MySQL Version and Distribution to Install

MySQL is available on a number of operating systems and platforms. For information about those platforms that are officially supported, see https://www.mysql.com/support/supportedplatforms/database.html on the MySQL website.

When preparing to install MySQL, decide which version and distribution format (binary or source) to use.

First, decide whether to install a development release or a General Availability (GA) release. Development releases have the newest features, but are not recommended for production use. GA releases, also called production or stable releases, are meant for production use. We recommend using the most recent GA release.

The naming scheme in MySQL 5.6 uses release names that consist of three numbers and an optional suffix; for example, mysql-5.6.1-m1. The numbers within the release name are interpreted as follows:

- The first number (5) is the major version number.
- The second number (6) is the minor version number. Taken together, the major and minor numbers constitute the release series number. The series number describes the stable feature set.
- The third number (1) is the version number within the release series. This is incremented for each new bugfix release. In most cases, the most recent version within a series is the best choice.

Release names can also include a suffix to indicate the stability level of the release. Releases within a series progress through a set of suffixes to indicate how the stability level improves. The possible suffixes are:

- mN (for example, m1, m2, m3, ...) indicates a milestone number. MySQL development uses a milestone model, in which each milestone introduces a small subset of thoroughly tested features. Following the releases for one milestone, development proceeds with another small number of releases that focuses on the next set of features. From one milestone to the next, feature interfaces may change or features may even be removed, based on feedback provided by community members who try these early releases. Features within milestone releases may be considered to be of pre-production quality.
- rc indicates a Release Candidate (RC). Release candidates are believed to be stable, having passed all of MySQL’s internal testing. New features may still be introduced in RC releases, but the focus shifts to fixing bugs to stabilize features introduced earlier within the series.
- Absence of a suffix indicates a General Availability (GA) or Production release. GA releases are stable, having successfully passed through the earlier release stages, and are believed to be reliable, free of serious bugs, and suitable for use in production systems.

Development within a series begins with milestone releases, followed by RC releases, and finally reaches GA status releases.
After choosing which MySQL version to install, decide which distribution format to install for your operating system. For most use cases, a binary distribution is the right choice. Binary distributions are available in native format for many platforms, such as RPM packages for Linux or DMG packages for OS X. Distributions are also available in more generic formats such as Zip archives or compressed tar files. On Windows, you can use the MySQL Installer to install a binary distribution.

Under some circumstances, it may be preferable to install MySQL from a source distribution:

- You want to install MySQL at some explicit location. The standard binary distributions are ready to run at any installation location, but you might require even more flexibility to place MySQL components where you want.

- You want to configure mysqld with features that might not be included in the standard binary distributions. Here is a list of the most common extra options used to ensure feature availability:
  
  - `-DWITH_LIBWRAP=1` for TCP wrappers support.
  - `-DWITH_ZLIB={system|bundled}` for features that depend on compression
  - `-DWITH_DEBUG=1` for debugging support

  For additional information, see Section 2.9.7, “MySQL Source-Configuration Options”.

- You want to configure mysqld without some features that are included in the standard binary distributions. For example, distributions normally are compiled with support for all character sets. If you want a smaller MySQL server, you can recompile it with support for only the character sets you need.

- You want to read or modify the C and C++ code that makes up MySQL. For this purpose, obtain a source distribution.

- Source distributions contain more tests and examples than binary distributions.

### 2.1.2 How to Get MySQL

Check our downloads page at [https://dev.mysql.com/downloads/](https://dev.mysql.com/downloads/) for information about the current version of MySQL and for downloading instructions. For a complete up-to-date list of MySQL download mirror sites, see [https://dev.mysql.com/downloads/mirrors.html](https://dev.mysql.com/downloads/mirrors.html). You can also find information there about becoming a MySQL mirror site and how to report a bad or out-of-date mirror.

For RPM-based Linux platforms that use Yum as their package management system, MySQL can be installed using the MySQL Yum Repository. See Section 2.5.1, “Installing MySQL on Linux Using the MySQL Yum Repository” for details.

For Debian-based Linux platforms, MySQL can be installed using the MySQL APT Repository. See Section 2.5.3, “Installing MySQL on Linux Using the MySQL APT Repository” for details.

For SUSE Linux Enterprise Server (SLES) platforms, MySQL can be installed using the MySQL SLES Repository. See Section 2.5.4, “Installing MySQL on Linux Using the MySQL SLES Repository” for details.

To obtain the latest development source, see Section 2.9.5, “Installing MySQL Using a Development Source Tree”.

### 2.1.3 Verifying Package Integrity Using MD5 Checksums or GnuPG

After downloading the MySQL package that suits your needs and before attempting to install it, make sure that it is intact and has not been tampered with. There are three means of integrity checking:
Verifying Package Integrity Using MD5 Checksums or GnuPG

- MD5 checksums
- Cryptographic signatures using GnuPG, the GNU Privacy Guard
- For RPM packages, the built-in RPM integrity verification mechanism

The following sections describe how to use these methods.

If you notice that the MD5 checksum or GPG signatures do not match, first try to download the respective package one more time, perhaps from another mirror site.

### 2.1.3.1 Verifying the MD5 Checksum

After you have downloaded a MySQL package, you should make sure that its MD5 checksum matches the one provided on the MySQL download pages. Each package has an individual checksum that you can verify against the package that you downloaded. The correct MD5 checksum is listed on the downloads page for each MySQL product, and you will compare it against the MD5 checksum of the file (product) that you download.

Each operating system and setup offers its own version of tools for checking the MD5 checksum. Typically the command is named `md5sum`, or it may be named `md5`, and some operating systems do not ship it at all. On Linux, it is part of the GNU Text Utilities package, which is available for a wide range of platforms. You can also download the source code from [http://www.gnu.org/software/textutils/](http://www.gnu.org/software/textutils/). If you have OpenSSL installed, you can use the command `openssl md5 package_name` instead. A Windows implementation of the `md5` command line utility is available from [http://www.fourmilab.ch/md5/](http://www.fourmilab.ch/md5/). `winMd5Sum` is a graphical MD5 checking tool that can be obtained from [http://www.nullriver.com/index/products/winmd5sum](http://www.nullriver.com/index/products/winmd5sum). Our Microsoft Windows examples will assume the name `md5.exe`.

**Linux and Microsoft Windows examples:**

```
shell> md5sum mysql-standard-5.6.47-linux-i686.tar.gz
aaab65abbec64d5e907dcd41b8699945  mysql-standard-5.6.47-linux-i686.tar.gz

shell> md5.exe mysql-installer-community-5.6.47.msi
aaab65abbec64d5e907dcd41b8699945  mysql-installer-community-5.6.47.msi
```

You should verify that the resulting checksum (the string of hexadecimal digits) matches the one displayed on the download page immediately below the respective package.

**Note**

Make sure to verify the checksum of the archive file (for example, the `.zip`, `.tar.gz`, or `.msi` file) and not of the files that are contained inside of the archive. In other words, verify the file before extracting its contents.

### 2.1.3.2 Signature Checking Using GnuPG

Another method of verifying the integrity and authenticity of a package is to use cryptographic signatures. This is more reliable than using MD5 checksums, but requires more work.

We sign MySQL downloadable packages with GnuPG (GNU Privacy Guard). GnuPG is an Open Source alternative to the well-known Pretty Good Privacy (PGP) by Phil Zimmermann. Most Linux distributions ship with GnuPG installed by default. Otherwise, see [http://www.gnupg.org/](http://www.gnupg.org/) for more information about GnuPG and how to obtain and install it.
To verify the signature for a specific package, you first need to obtain a copy of our public GPG build key, which you can download from http://pgp.mit.edu/. The key that you want to obtain is named mysql-build@oss.oracle.com. Alternatively, you can copy and paste the key directly from the following text:

-----BEGIN PGP PUBLIC KEY BLOCK-----

Verifying Package Integrity Using MD5 Checksums or GnuPG

Version: GnuPG v1
Verifying Package Integrity Using MD5 Checksums or GnuPG

JeKkFqwB4y0Nv7BzkFkMp+V/k+krVr+/Dyz9B/z+54
JeKkFqwB4y0Nv7BzkFkMp+V/k+krVr+/Dyz9B/z+54
Verifying Package Integrity Using MD5 Checksums or GnuPG
Verifying Package Integrity Using MD5 Checksums or GnuPG

To import the build key into your personal public GPG keyring, use `gpg --import`. For example, if you have saved the key in a file named `mysql_pubkey.asc`, the import command looks like this:

```
shell> gpg --import mysql_pubkey.asc
gpg: key 5072E1F5: public key "MySQL Release Engineering <mysql-build@oss.oracle.com>" imported
gpg: Total number processed: 1
gpg:               imported: 1
```

You can also download the key from the public keyserver using the public key id, 5072E1F5:

```
shell> gpg --recv-keys 5072E1F5
gpg: requesting key 5072E1F5 from hkp server keys.gnupg.net
```

To import the key into your personal public GPG keyring, use `gpg --import`. For example, if you have saved the key in a file named `mysql_pubkey.asc`, the import command looks like this:

```
shell> gpg --import mysql_pubkey.asc
gpg: key 5072E1F5: public key "MySQL Release Engineering <mysql-build@oss.oracle.com>" imported
gpg: Total number processed: 1
gpg:               imported: 1
```

You can also download the key from the public keyserver using the public key id, 5072E1F5:

```
shell> gpg --recv-keys 5072E1F5
gpg: requesting key 5072E1F5 from hkp server keys.gnupg.net
```

If you want to import the key into your RPM configuration to validate RPM install packages, you should be able to import the key directly:

```
shell> rpm --import mysql_pubkey.asc
```
If you experience problems or require RPM specific information, see Section 2.1.3.4, “Signature Checking Using RPM”.

After you have downloaded and imported the public build key, download your desired MySQL package and the corresponding signature, which also is available from the download page. The signature file has the same name as the distribution file with an .asc extension, as shown by the examples in the following table.

Table 2.1 MySQL Package and Signature Files for Source files

<table>
<thead>
<tr>
<th>File Type</th>
<th>File Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution file</td>
<td>mysql-standard-5.6.47-linux-i686.tar.gz</td>
</tr>
<tr>
<td>Signature file</td>
<td>mysql-standard-5.6.47-linux-i686.tar.gz.asc</td>
</tr>
</tbody>
</table>

Make sure that both files are stored in the same directory and then run the following command to verify the signature for the distribution file:

```
shell> gpg --verify package_name.asc
```

If the downloaded package is valid, you will see a “Good signature” similar to:

```
shell> gpg --verify mysql-standard-5.6.47-linux-i686.tar.gz.asc
gpg: Signature made Tue 01 Feb 2011 02:38:30 AM CST using DSA key ID 5072E1F5
gpg: Good signature from "MySQL Release Engineering <mysql-build@oss.oracle.com>"
```

The Good signature message indicates that the file signature is valid, when compared to the signature listed on our site. But you might also see warnings, like so:

```
shell> gpg --verify mysql-standard-5.6.47-linux-i686.tar.gz.asc
gpg: Signature made Wed 23 Jan 2013 02:25:45 AM PST using DSA key ID 5072E1F5
gpg: checking the trustdb
ngpg: no ultimately trusted keys found
gpg: Good signature from "MySQL Release Engineering <mysql-build@oss.oracle.com>"
gpg: WARNING: This key is not certified with a trusted signature!
gpg: WARNING: This key is not certified with a trusted signature!
gpp: PRIMARY KEY fingerprint: A4A9 4068 76FC BD3C 4567 70C8 8C71 8D3B 5072 E1F5
```

That is normal, as they depend on your setup and configuration. Here are explanations for these warnings:

- **gpg: no ultimately trusted keys found**: This means that the specific key is not "ultimately trusted" by you or your web of trust, which is okay for the purposes of verifying file signatures.
- **This key is not certified with a trusted signature! There is no indication that the signature belongs to the owner.**

That is normal, as they depend on your setup and configuration. Here are explanations for these warnings:

- **This key is not certified with a trusted signature! There is no indication that the signature belongs to the owner.**

That is normal, as they depend on your setup and configuration.

See the GPG documentation for more information on how to work with public keys.

### 2.1.3.3 Signature Checking Using Gpg4win for Windows

The Section 2.1.3.2, “Signature Checking Using GnuPG” section describes how to verify MySQL downloads using GPG. That guide also applies to Microsoft Windows, but another option is to use a GUI...
tool like Gpg4win. You may use a different tool but our examples are based on Gpg4win, and utilize its bundled Kleopatra GUI.

Download and install Gpg4win, and then load Kleopatra. The dialog should look similar to:

**Figure 2.1 Kleopatra: Initial Screen**

![Kleopatra: Initial Screen](image)

Next, add the MySQL Release Engineering certificate. Do this by clicking File, Lookup Certificates on Server. Type "MySQL Release Engineering" into the search box and press Search.

**Figure 2.2 Kleopatra: Lookup Certificates on Server Wizard: Finding a Certificate**

![Kleopatra: Lookup Certificates on Server](image)

Select the "MySQL Release Engineering" certificate. The Fingerprint and Key-ID must be "5072E1F5", or choose Details... to confirm the certificate is valid. Now, import it by clicking Import. An import dialog will be displayed, choose Okay, and this certificate will now be listed under the Imported Certificates tab.
Next, configure the trust level for our certificate. Select our certificate, then from the main menu select Certificates, Change Owner Trust.... We suggest choosing I believe checks are very accurate for our certificate, as otherwise you might not be able to verify our signature. Select I believe checks are very accurate to enable "full trust" and then press OK.

Figure 2.3 Kleopatra: Change Trust level for MySQL Release Engineering

Next, verify the downloaded MySQL package file. This requires files for both the packaged file, and the signature. The signature file must have the same name as the packaged file but with an appended .asc extension, as shown by the example in the following table. The signature is linked to on the downloads page for each MySQL product. You must create the .asc file with this signature.

Table 2.2 MySQL Package and Signature Files for MySQL Installer for Microsoft Windows

<table>
<thead>
<tr>
<th>File Type</th>
<th>File Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution file</td>
<td>mysql-installer-community-5.6.47.msi</td>
</tr>
<tr>
<td>Signature file</td>
<td>mysql-installer-community-5.6.47.msi.asc</td>
</tr>
</tbody>
</table>

Make sure that both files are stored in the same directory and then run the following command to verify the signature for the distribution file. Either drag and drop the signature (.asc) file into Kleopatra, or load the dialog from File, Decrypt/Verify Files..., and then choose either the .msi or .asc file.
Figure 2.4 Kleopatra: The Decrypt and Verify Files Dialog

Click Decrypt/Verify to check the file. The two most common results will look like the following, and although the yellow warning looks problematic, the following means that the file check passed with success. You may now run this installer.

Figure 2.5 Kleopatra: the Decrypt and Verify Results Dialog: All operations completed

Seeing a red "The signature is bad" error means the file is invalid. Do not execute the MSI file if you see this error.
The Section 2.1.3.2, “Signature Checking Using GnuPG” section explains why you probably don’t see a green Good signature result.

2.1.3.4 Signature Checking Using RPM

For RPM packages, there is no separate signature. RPM packages have a built-in GPG signature and MD5 checksum. You can verify a package by running the following command:

```
shell> rpm --checksig package_name.rpm
```

Example:

```
shell> rpm --checksig MySQL-server-5.6.47-0.linux_glibc2.5.i386.rpm
MySQL-server-5.6.47-0.linux_glibc2.5.i386.rpm: md5 gpg OK
```

Note

If you are using RPM 4.1 and it complains about (GPG) NOT OK (MISSING KEYS: GPG#5072e1f5), even though you have imported the MySQL public build key into your own GPG keyring, you need to import the key into the RPM keyring first. RPM 4.1 no longer uses your personal GPG keyring (or GPG itself). Rather, RPM maintains a separate keyring because it is a system-wide application and a user’s GPG public keyring is a user-specific file. To import the MySQL public key into the RPM keyring, first obtain the key, then use rpm --import to import the key. For example:
Installation Layouts

Installation Layouts

The installation layout differs for different installation types (for example, native packages, binary tarballs, and source tarballs), which can lead to confusion when managing different systems or using different installation sources. The individual layouts are given in the corresponding installation type or platform chapter, as described following. Note that the layout of installations from vendors other than Oracle may differ from these layouts.

- Section 2.3.1, “MySQL Installation Layout on Microsoft Windows”
- Section 2.9.3, “MySQL Layout for Source Installation”
- Table 2.3, “MySQL Installation Layout for Generic Unix/Linux Binary Package”
- Table 2.10, “MySQL Installation Layout for Linux RPM Packages from the MySQL Developer Zone”
- Table 2.6, “MySQL Installation Layout on OS X”

2.1.5 Compiler-Specific Build Characteristics

In some cases, the compiler used to build MySQL affects the features available for use. The notes in this section apply for binary distributions provided by Oracle Corporation or that you compile yourself from source.

icc (Intel C++ Compiler) Builds

A server built with icc has these characteristics:

- SSL support is not included.

2.2 Installing MySQL on Unix/Linux Using Generic Binaries

Oracle provides a set of binary distributions of MySQL. These include generic binary distributions in the form of compressed tar files (files with a .tar.gz extension) for a number of platforms, and binaries in platform-specific package formats for selected platforms.

This section covers the installation of MySQL from a compressed tar file binary distribution on Unix/Linux platforms. For other platform-specific binary package formats, see the other platform-specific sections in this manual. For example, for Windows distributions, see Section 2.3, “Installing MySQL on Microsoft Windows”. See Section 2.1.2, “How to Get MySQL” on how to obtain MySQL in different distribution formats.

MySQL compressed tar file binary distributions have names of the form mysql-VERSION-OS.tar.gz, where VERSION is a number (for example, 5.6.47), and OS indicates the type of operating system for which the distribution is intended (for example, pc-linux-i686 or winx64).

Warnings

- If you have previously installed MySQL using your operating system native package management system, such as Yum or APT, you may experience
problems installing using a native binary. Make sure your previous MySQL installation has been removed entirely (using your package management system), and that any additional files, such as old versions of your data files, have also been removed. You should also check for configuration files such as /etc/my.cnf or the /etc/mysql directory and delete them.

For information about replacing third-party packages with official MySQL packages, see the related APT guide or Yum guide.

- MySQL has a dependency on the libaio library. Data directory initialization and subsequent server startup steps will fail if this library is not installed locally. If necessary, install it using the appropriate package manager. For example, on Yum-based systems:

  ```
  shell> yum search libaio  # search for info
  shell> yum install libaio  # install library
  ```

  Or, on APT-based systems:

  ```
  shell> apt-cache search libaio  # search for info
  shell> apt-get install libaio1  # install library
  ```

- SLES 11: As of MySQL 5.6.37, the Linux Generic tarball package format is EL6 instead of EL5. As a side effect, the MySQL client bin/mysql needs libtinfo.so.5.

  A workaround is to create a symlink, such as `ln -s libncurses.so.5.6 /lib64/libtinfo.so.5` on 64-bit systems or `ln -s libncurses.so.5.6 /lib/libtinfo.so.5` on 32-bit systems.

To install a compressed tar file binary distribution, unpack it at the installation location you choose (typically /usr/local/mysql). This creates the directories shown in the following table.

**Table 2.3 MySQL Installation Layout for Generic Unix/Linux Binary Package**

<table>
<thead>
<tr>
<th>Directory</th>
<th>Contents of Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin, scripts</td>

<td>Benchmarks</td>
</tr>
<tr>
<td>support-files</td>
<td>Miscellaneous support files, including sample configuration files</td>
</tr>
</tbody>
</table>

Debug versions of the `mysqld` binary are available as `mysqld-debug`. To compile your own debug version of MySQL from a source distribution, use the appropriate configuration options to enable debugging support. See Section 2.9, “Installing MySQL from Source”.
To install and use a MySQL binary distribution, the command sequence looks like this:

```shell
# Create mysql group

shell> groupadd mysql

# Create mysql user

shell> useradd -r -g mysql -s /bin/false mysql

# Change directory to /usr/local

shell> cd /usr/local

# Unpack the distribution

shell> tar zxvf /path/to/mysql-VERSION-OS.tar.gz

# Create symbolic link

shell> ln -s full-path-to-mysql-VERSION-OS mysql

# Change directory to mysql subdirectory

shell> cd mysql

# Initialize the database

shell> scripts/mysql_install_db --user=mysql

# Run mysqld_safe in the background

shell> bin/mysqld_safe --user=mysql &

# Next command is optional

shell> cp support-files/mysql.server /etc/init.d/mysql.server
```

**Note**

This procedure assumes that you have root (administrator) access to your system. Alternatively, you can prefix each command using the sudo (Linux) or pfexec (Solaris) command.

**Note**

The procedure does not assign passwords to MySQL accounts. To do so, use the instructions in Section 2.10.4, “Securing the Initial MySQL Accounts”.

`mysql_install_db` creates a default option file named `my.cnf` in the base installation directory. This file is created from a template included in the distribution package named `my-default.cnf`. For more information, see Section 5.1.2.2, “Using a Sample Default Server Configuration File”.

A more detailed version of the preceding description for installing a binary distribution follows.

### Create a mysql User and Group

If your system does not already have a user and group to use for running `mysql`, you may need to create them. The following commands add the `mysql` group and the `mysql` user. You might want to call the user and group something else instead of `mysql`. If so, substitute the appropriate name in the following instructions. The syntax for `useradd` and `groupadd` may differ slightly on different versions of Unix/Linux, or they may have different names such as `adduser` and `addgroup`.

```shell
# Create mysql group

shell> groupadd mysql

# Create mysql user

shell> useradd -r -g mysql -s /bin/false mysql
```

**Note**

Because the user is required only for ownership purposes, not login purposes, the `useradd` command uses the `-r` and `-s /bin/false` options to create a user that does not have login permissions to your server host. Omit these options if your `useradd` does not support them.

### Obtain and Unpack the Distribution

Pick the directory under which you want to unpack the distribution and change location into it. The example here unpacks the distribution under `/usr/local`. The instructions, therefore, assume that you have permission to create files and directories in `/usr/local`. If that directory is protected, you must perform the installation as root.
Perform Postinstallation Setup

Obtain a distribution file using the instructions in Section 2.1.2, “How to Get MySQL”. For a given release, binary distributions for all platforms are built from the same MySQL source distribution.

Unpack the distribution, which creates the installation directory. `tar` can uncompress and unpack the distribution if it has `z` option support:

```
shell> tar zxvf /path/to/mysql-VERSION-OS.tar.gz
```

The `tar` command creates a directory named `mysql-VERSION-OS`.

To install MySQL from a compressed `tar` file binary distribution, your system must have GNU `gunzip` to uncompress the distribution and a reasonable `tar` to unpack it. If your `tar` program supports the `z` option, it can both uncompress and unpack the file.

GNU `tar` is known to work. The standard `tar` provided with some operating systems is not able to unpack the long file names in the MySQL distribution. You should download and install GNU `tar`, or if available, use a preinstalled version of GNU `tar`. Usually this is available as `gnutar`, `gtar`, or as `tar` within a GNU or Free Software directory, such as `/usr/sfw/bin` or `/usr/local/bin`. GNU `tar` is available from http://www.gnu.org/software/tar/.

If your `tar` does not have `z` option support, use `gunzip` to unpack the distribution and `tar` to unpack it. Replace the preceding `tar` command with the following alternative command to uncompress and extract the distribution:

```
shell> gunzip < /path/to/mysql-VERSION-OS.tar.gz | tar xvf -
```

Next, create a symbolic link to the installation directory created by `tar`:

```
shell> ln -s full-path-to-mysql-VERSION-OS mysql
```

The `ln` command makes a symbolic link to the installation directory. This enables you to refer more easily to it as `/usr/local/mysql`. To avoid having to type the path name of client programs always when you are working with MySQL, you can add the `/usr/local/mysql/bin` directory to your `PATH` variable:

```
shell> export PATH=$PATH:/usr/local/mysql/bin
```

Perform Postinstallation Setup

The remainder of the installation process involves setting distribution ownership and access permissions, initializing the data directory, starting the MySQL server, and setting up the configuration file. For instructions, see Section 2.10, “Postinstallation Setup and Testing”.

2.3 Installing MySQL on Microsoft Windows

```
Important
MySQL Community 5.6 Server requires the Microsoft Visual C++ 2010 Redistributable Package to run on Windows platforms. Users should make sure the package has been installed on the system before installing the server. The package is available at the Microsoft Download Center.
```

MySQL Installer Method

MySQL is available for Microsoft Windows, for both 32-bit and 64-bit versions. For supported Windows platform information, see https://www.mysql.com/support/supportedplatforms/database.html.

There are different methods to install MySQL on Microsoft Windows.

MySQL Installer Method

The simplest and recommended method is to download MySQL Installer (for Windows) and let it install and configure all of the MySQL products on your system. Here is how:

   
   **Note**
   Unlike the standard MySQL Installer, the smaller "web-community" version does not bundle any MySQL applications but it will download the MySQL products you choose to install.

2. Choose the appropriate Setup Type for your system. Typically you will choose Developer Default to install MySQL server and other MySQL tools related to MySQL development, helpful tools like MySQL Workbench. Or, choose the Custom setup type to manually select your desired MySQL products.
   
   **Note**
   Multiple versions of MySQL server can exist on a single system. You can choose one or multiple versions.

3. Complete the installation process by following the instructions. This will install several MySQL products and start the MySQL server.

MySQL is now installed. If you configured MySQL as a service, then Windows will automatically start MySQL server every time you restart your system.

- **Note**
  You probably also installed other helpful MySQL products like MySQL Workbench and MySQL Notifier on your system. Consider loading Chapter 26, MySQL Workbench Overview to check your new MySQL server connection, and MySQL Notifier Overview to view the connection's status. By default, these two programs automatically start after installing MySQL.

This process also installs the MySQL Installer application on your system, and later you can use MySQL Installer to upgrade or reconfigure your MySQL products.

Additional Installation Information

It is possible to run MySQL as a standard application or as a Windows service. By using a service, you can monitor and control the operation of the server through the standard Windows service management tools. For more information, see Section 2.3.4.7, “Starting MySQL as a Windows Service”.

Generally, you should install MySQL on Windows using an account that has administrator rights. Otherwise, you may encounter problems with certain operations such as editing the PATH environment variable or accessing the Service Control Manager. When installed, MySQL does not need to be executed using a user with Administrator privileges.

For a list of limitations on the use of MySQL on the Windows platform, see Section 2.3.7, “Windows Platform Restrictions”.

67
In addition to the MySQL Server package, you may need or want additional components to use MySQL with your application or development environment. These include, but are not limited to:

- To connect to the MySQL server using ODBC, you must have a Connector/ODBC driver. For more information, including installation and configuration instructions, see MySQL Connector/ODBC Developer Guide.
  
  **Note**
  MySQL Installer will install and configure Connector/ODBC for you.

- To use MySQL server with .NET applications, you must have the Connector/NET driver. For more information, including installation and configuration instructions, see MySQL Connector/NET Developer Guide.
  
  **Note**
  MySQL Installer will install and configure MySQL Connector/NET for you.

MySQL distributions for Windows can be downloaded from https://dev.mysql.com/downloads/. See Section 2.1.2, “How to Get MySQL”.

MySQL for Windows is available in several distribution formats, detailed here. Generally speaking, you should use MySQL Installer. It contains more features and MySQL products than the older MSI, is simpler to use than the compressed file, and you need no additional tools to get MySQL up and running. MySQL Installer automatically installs MySQL Server and additional MySQL products, creates an options file, starts the server, and enables you to create default user accounts. For more information on choosing a package, see Section 2.3.2, “Choosing an Installation Package”.

- A MySQL Installer distribution includes MySQL Server and additional MySQL products including MySQL Workbench, MySQL Notifier, and MySQL for Excel. MySQL Installer can also be used to upgrade these products in the future.

  For instructions on installing MySQL using MySQL Installer, see Section 2.3.3, “MySQL Installer for Windows”.

- The standard binary distribution (packaged as a compressed file) contains all of the necessary files that you unpack into your chosen location. This package contains all of the files in the full Windows MSI Installer package, but does not include an installation program.

  For instructions on installing MySQL using the compressed file, see Section 2.3.4, “Installing MySQL on Microsoft Windows Using a noinstall ZIP Archive”.

- The source distribution format contains all the code and support files for building the executables using the Visual Studio compiler system.

  For instructions on building MySQL from source on Windows, see Section 2.9, “Installing MySQL from Source”.

**MySQL on Windows Considerations**

- **Large Table Support**

  If you need tables with a size larger than 4 GB, install MySQL on an NTFS or newer file system. Do not forget to use `MAX_ROWS` and `AVG_ROW_LENGTH` when you create tables. See Section 13.1.17, “CREATE TABLE Syntax”.
• **MySQL and Virus Checking Software**

Virus-scanning software such as Norton/Symantec Anti-Virus on directories containing MySQL data and temporary tables can cause issues, both in terms of the performance of MySQL and the virus-scanning software misidentifying the contents of the files as containing spam. This is due to the fingerprinting mechanism used by the virus-scanning software, and the way in which MySQL rapidly updates different files, which may be identified as a potential security risk.

After installing MySQL Server, it is recommended that you disable virus scanning on the main directory (\*datadir\*) used to store your MySQL table data. There is usually a system built into the virus-scanning software to enable specific directories to be ignored.

In addition, by default, MySQL creates temporary files in the standard Windows temporary directory. To prevent the temporary files also being scanned, configure a separate temporary directory for MySQL temporary files and add this directory to the virus scanning exclusion list. To do this, add a configuration option for the \*tmpdir\* parameter to your my.ini configuration file. For more information, see Section 2.3.4.2, “Creating an Option File”.

• **Running MySQL on a 4K Sector Hard Drive**

Running the MySQL server on a 4K sector hard drive on Windows is not supported with innodb_flush_method=async_unbuffered, which is the default setting. The workaround is to use innodb_flush_method=normal.

### 2.3.1 MySQL Installation Layout on Microsoft Windows

For MySQL 5.6 on Windows, the default installation directory is \C:\Program Files\MySQL\MySQL Server 5.6\ for installations performed with MySQL Installer. If you use the ZIP archive method to install MySQL, you may prefer to install in C:\mysql. However, the layout of the subdirectories remains similar (exceptions are indicated).

All of the files are located within this parent directory, using the structure shown in the following table.

#### Table 2.4 Default MySQL Installation Layout for Microsoft Windows

<table>
<thead>
<tr>
<th>Directory</th>
<th>Contents of Directory</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin, scripts</td>
<td>mysql server, client and utility programs</td>
<td></td>
</tr>
<tr>
<td>%PROGRAMDATA%\MySQL\MySQL Server 5.6\</td>
<td>Log files, databases</td>
<td>The Windows system variable %PROGRAMDATA% defaults to C:\ProgramData.</td>
</tr>
<tr>
<td>data</td>
<td>Pristine templates</td>
<td></td>
</tr>
<tr>
<td>docs</td>
<td>Release documentation</td>
<td>With MySQL Installer, use the Modify operation to select this optional folder.</td>
</tr>
<tr>
<td>include</td>
<td>Include (header) files</td>
<td></td>
</tr>
<tr>
<td>lib</td>
<td>Libraries</td>
<td></td>
</tr>
</tbody>
</table>
Choosing an Installation Package

<table>
<thead>
<tr>
<th>Directory</th>
<th>Contents of Directory</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>share</td>
<td>Miscellaneous support files, including error messages, character set files, sample configuration files, SQL for database installation</td>
<td></td>
</tr>
<tr>
<td>mysql-test, scripts, and sql-bench</td>
<td>Debug binaries and test suite</td>
<td>ZIP archive only.</td>
</tr>
</tbody>
</table>

The packages create and set up the data directory that the installed server will use and also creates a pristine “template” data directory named `data` under the installation directory. After an installation has been performed using this package, the template data directory can be copied to set up additional MySQL instances. See Section 5.7, “Running Multiple MySQL Instances on One Machine”.

2.3.2 Choosing an Installation Package

For MySQL 5.6, there are multiple installation package formats to choose from when installing MySQL on Windows. The package formats described in this section are:

- MySQL Installer
- MySQL noinstall ZIP Archives
- MySQL Docker Images

Program Database (PDB) files (with file name extension `pdb`) provide information for debugging your MySQL installation in the event of a problem. These files are included in ZIP Archive distributions (but not MSI distributions) of MySQL.

MySQL Installer

This package has a file name similar to `mysql-installer-community-5.6.47.0.msi` or `mysql-installer-commercial-5.6.47.0.msi`, and utilizes MSIs to automatically install MySQL server and other products. MySQL Installer will download and apply updates to itself, and for each of the installed products. It also configures the installed MySQL server (including a sandbox InnoDB cluster test setup) and MySQL Router. MySQL Installer is recommended for most users.

MySQL Installer can install and manage (add, modify, upgrade, and remove) many other MySQL products, including:

- Applications – MySQL Workbench, MySQL for Visual Studio, MySQL Notifier, MySQL for Excel, MySQL Utilities, MySQL Shell, MySQL Router
- Connectors – MySQL Connector/C, MySQL Connector/C++, MySQL Connector/NET, Connector/ODBC, MySQL Connector/Python, MySQL Connector/J, MySQL Connector/Node.js
- Documentation – MySQL Manual (PDF format), samples and examples

MySQL Installer operates on all MySQL supported versions of Windows (see [https://www.mysql.com/support/supportedplatforms/database.html](https://www.mysql.com/support/supportedplatforms/database.html)).

**Note**

Because MySQL Installer is not a native component of Microsoft Windows and depends on .NET, it will not work on minimal installation options like the Server Core version of Windows Server.
For instructions on how to install MySQL using MySQL Installer, see Section 2.3.3, “MySQL Installer for Windows”.

MySQL noinstall ZIP Archives

These packages contain the files found in the complete MySQL Server installation package, with the exception of the GUI. This format does not include an automated installer, and must be manually installed and configured.

The noinstall ZIP archives are split into two separate compressed files. The main package is named `mysql-VERSION-winx64.zip` for 64-bit and `mysql-VERSION-win32.zip` for 32-bit. This contains the components needed to use MySQL on your system. The optional MySQL test suite, MySQL benchmark suite, and debugging binaries/information components (including PDB files) are in a separate compressed file named `mysql-VERSION-winx64-debug-test.zip` for 64-bit and `mysql-VERSION-win32-debug-test.zip` for 32-bit.

If you choose to install a noinstall ZIP archive, see Section 2.3.4, “Installing MySQL on Microsoft Windows Using a noinstall ZIP Archive”.

MySQL Docker Images

For information on using the MySQL Docker images provided by Oracle on Windows platform, see Section 2.5.8.3, “Deploying MySQL on Windows and Other Non-Linux Platforms with Docker”.

Warning

The MySQL Docker images provided by Oracle are built specifically for Linux platforms. Other platforms are not supported, and users running the MySQL Docker images from Oracle on them are doing so at their own risk.

2.3.3 MySQL Installer for Windows

MySQL Installer is a standalone application designed to ease the complexity of installing and configuring MySQL products that run on Microsoft Windows. It supports the following MySQL products:

• MySQL Servers

MySQL Installer can install and manage multiple, separate MySQL server instances on the same host at the same time. For example, MySQL Installer can install, configure, and upgrade a separate instance of MySQL 5.6, MySQL 5.7, and MySQL 8.0 on the same host. MySQL Installer does not permit server upgrades between major and minor version numbers, but does permit upgrades within a release series (such as 5.7.18 to 5.7.19).

Note

MySQL Installer cannot install both Community and Commercial (Standard Edition and Enterprise Edition) releases of MySQL server on the same host. If you require both releases on the same host, consider using the ZIP archive distribution to install one of the releases.

• MySQL Applications

MySQL Workbench, MySQL Shell, MySQL Router, MySQL for Visual Studio, MySQL for Excel, MySQL Notifier, and MySQL Utilities.

• MySQL Connectors
MySQL Installer for Windows

MySQL Connector/.NET, MySQL Connector/Python, MySQL Connector/ODBC, MySQL Connector/J, MySQL Connector/C, and MySQL Connector/C++.

Note
To install MySQL Connector/Node.js, see https://dev.mysql.com/downloads/connector/nodejs/. Connector/Node.js does not provide an .msi file for use with MySQL Installer.

• Documentation and Samples
MySQL Reference Manuals (by version) in PDF format and MySQL database samples (by version).

Installation Requirements
MySQL Installer requires Microsoft .NET Framework 4.5.2 or later. If this version is not installed on the host computer, you can download it by visiting the Microsoft website.

MySQL Installer Community Release
Download software from https://dev.mysql.com/downloads/installer/ to install the Community release of all MySQL products for Windows. Select one of the following MySQL Installer package options:

• Web: Contains MySQL Installer and configuration files only. The web package downloads only the MySQL products you select to install, but it requires an internet connection for each download. The size of this file is approximately 2 MB; the name of the file has the form mysql-installer-community-web-VERSION.N.msi where VERSION is the MySQL server version number such as 8.0 and N is the package number, which begins at 0.

• Full or Current Bundle: Bundles all of the MySQL products for Windows (including the MySQL server). The file size is over 300 MB, and the name has the form mysql-installer-community-VERSION.N.msi where VERSION is the MySQL Server version number such as 8.0 and N is the package number, which begins at 0.

MySQL Installer Commercial Release
Download software from https://edelivery.oracle.com/ to install the Commercial (Standard Edition or Enterprise Edition) release of MySQL products for Windows. The Commercial release includes all of the current and previous GA versions in the Community release (excludes development-milestone versions) and also includes the following products:

• Workbench SE/EE
• MySQL Enterprise Backup
• MySQL Enterprise Firewall

The Commercial release integrates with your My Oracle Support (MOS) account. For knowledge-base content and patches, see My Oracle Support.

2.3.3.1 MySQL Installer Initial Setup
• Choosing a Setup Type
• Path Conflicts
• Check Requirements
MySQL Installer Configuration Files

When you download MySQL Installer for the first time, a setup wizard guides you through the initial installation of MySQL products. As the following figure shows, the initial setup is a one-time activity in the overall process. MySQL Installer detects existing MySQL products installed on the host during its initial setup and adds them to the list of products to be managed.

**Figure 2.7 MySQL Installer Process Overview**

MySQL Installer extracts configuration files (described later) to the hard drive of the host during the initial setup. Although MySQL Installer is a 32-bit application, it can install both 32-bit and 64-bit binaries.

The initial setup adds a link to the Start menu under the MySQL group. Click **Start, All Programs, MySQL, MySQL Installer** to open MySQL Installer.

**Choosing a Setup Type**

During the initial setup, you are prompted to select the MySQL products to be installed on the host. One alternative is to use a predetermined setup type that matches your setup requirements. By default, both GA and pre-release products are included in the download and installation with the **Developer Default**, **Client only**, and **Full** setup types. Select the **Only install GA products** option to restrict the product set to include GA products only when using these setup types.

Choosing one of the following setup types determines the initial installation only and does not limit your ability to install or update MySQL products for Windows later:

- **Developer Default**: Install the following products that complement application development with MySQL:
  - **MySQL Server** (Installs the version that you selected when you downloaded MySQL Installer.)
  - MySQL Shell
  - MySQL Router
  - MySQL Workbench
  - MySQL for Visual Studio
  - MySQL for Excel
  - MySQL Notifier
  - **MySQL Connectors** (.NET / Python / ODBC / Java / C / C++)
  - MySQL Utilities
  - MySQL Documentation
  - MySQL Samples and Examples
MySQL Installer for Windows

- **Server only**: Only install the MySQL server. This setup type installs the general availability (GA) or development release server that you selected when you downloaded MySQL Installer. It uses the default installation and data paths.

- **Client only**: Only install the most recent MySQL applications and MySQL connectors. This setup type is similar to the Developer Default type, except that it does not include MySQL server or the client programs typically bundled with the server, such as `mysql` or `mysqladmin`.

- **Full**: Install all available MySQL products.

- **Custom** The custom setup type enables you to filter and select individual MySQL products from the MySQL Installer catalog.

Use the Custom setup type to install:

- A product or product version that is not available from the usual download locations. The catalog contains all product releases, including the other releases between pre-release (or development) and GA.

- An instance of MySQL server using an alternative installation path, data path, or both. For instructions on how to adjust the paths, see Section 2.3.3.2, “Setting Alternative Server Paths with MySQL Installer”.

- Two or more MySQL server versions on the same host at the same time (for example, 5.6, 5.7, and 8.0).

- A specific combination of products and features not offered as a predetermine setup type. For example, you can install a single product, such as MySQL Workbench, instead of installing all client applications for Windows.

**Path Conflicts**

When the default installation or data folder (required by MySQL server) for a product to be installed already exists on the host, the wizard displays the Path Conflict step to identify each conflict and enable you to take action to avoid having files in the existing folder overwritten by the new installation. You see this step in the initial setup only when MySQL Installer detects a conflict.

To resolve the path conflict, do one of the following:

- Select a product from the list to display the conflict options. A warning symbol indicates which path is in conflict. Use the browse button to choose a new path and then click Next.

- Click Back to choose a different setup type or product version, if applicable. The Custom setup type enables you to select individual product versions.

- Click Next to ignore the conflict and overwrite files in the existing folder.

- Delete the existing product. Click Cancel to stop the initial setup and close MySQL Installer. Open MySQL Installer again from the Start menu and delete the installed product from the host using the Delete operation from the dashboard.

**Check Requirements**

MySQL Installer uses entries in the `package-rules.xml` file to determine whether the prerequisite software for each product is installed on the host. When the requirements check fails, MySQL Installer displays the Check Requirements step to help you update the host. The following figure identifies and describes the key areas of this step.
Figure 2.8 Check Requirements

Description of Check Requirements Elements

1. Shows the current step in the initial setup. Steps in this list may change slightly depending on the products already installed on the host, the availability of prerequisite software, and the products to be installed on the host.

2. Lists all pending installation requirements by product and indicates the status as follows:
   - A blank space in the **Status** column means that MySQL Installer can attempt to download and install the required software for you.
   - The word **Manual** in the **Status** column means that you must satisfy the requirement manually. Select each product in the list to see its requirement details.

3. Describes the requirement in detail to assist you with each manual resolution. When possible, a download URL is provided. After you download and install the required software, click **Check** to verify that the requirement has been met.

4. Provides the following set operations to proceed:
   - **Back** – Return to the previous step. This action enables you to select a different the setup type.
   - **Execute** – Have MySQL Installer attempt to download and install the required software for all items without a manual status. Manual requirements are resolved by you and verified by clicking **Check**.
   - **Next** – Do not execute the request to apply the requirements automatically and proceed to the installation without including the products that fail the check requirements step.
   - **Cancel** – Stop the installation of MySQL products. Because MySQL Installer is already installed, the initial setup begins again when you open MySQL Installer from the Start menu and click **Add** from the dashboard. For a description of the available management operations, see **Product Catalog**.
MySQL Installer Configuration Files

All MySQL Installer files are located within the C:\Program Files (x86) and C:\ProgramData folders. The following table describes the files and folders that define MySQL Installer as a standalone application.

Note

Installed MySQL products are neither altered nor removed when you update or uninstall MySQL Installer.

Table 2.5 MySQL Installer Configuration Files

<table>
<thead>
<tr>
<th>File or Folder</th>
<th>Description</th>
<th>Folder Hierarchy</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL Installer for</td>
<td>This folder contains all of the files needed to run MySQL Installer and</td>
<td>C:\Program Files (x86)</td>
</tr>
<tr>
<td>Windows</td>

2.3.3.2 Setting Alternative Server Paths with MySQL Installer

You can change the default installation path, the data path, or both when you install MySQL server. After you have installed the server, the paths cannot be altered without removing and reinstalling the server instance.

To change paths for MySQL server

1. Identify the MySQL server to change and display the Advanced Options link.
   a. Navigate to the Select Products and Features step by doing one of the following:
      i. If this is an initial setup of MySQL Installer, select the Custom setup type and click Next.
      ii. If MySQL Installer is installed already, launch it from the Start menu and then click Add from the dashboard.
   b. Click Edit to apply a filter on the product list shown in Available Products (see Locating Products to Install).
   c. With the server instance selected, use the arrow to move the selected server to the Products/Features To Be Installed list.
d. Click the server to select it. When you select the server, the Advanced Options link appears. For details, see the figure that follows.

2. Click Advanced Options to open a dialog box where you can enter alternative path names. After the path names are validated, click Next to continue with the configuration steps.

**Figure 2.9 Change MySQL Server Path**

---

### 2.3.3.3 Installation Workflow with MySQL Installer

MySQL Installer provides a wizard-like tool to install and configure new MySQL products for Windows. Unlike the initial setup, which runs only once, MySQL Installer invokes the wizard each time you download or install a new product. For first-time installations, the steps of the initial setup proceed directly into the steps of the installation. For assistance with product selection, see Locating Products to Install.

**Note**

Full permissions are granted to the user executing MySQL Installer to all generated files, such as *my.ini*. This does not apply to files and directories for specific products, such as the MySQL server data directory in `%ProgramData%` that is owned by **SYSTEM**.

Products installed and configured on a host follow a general pattern that might require your input during the various steps. If you attempt to install a product that is incompatible with the existing MySQL server version (or a version selected for upgrade), you are alerted about the possible mismatch.

MySQL Installer loads all selected products together using the following workflow:

- **Product download.** If you installed the full (not web) MySQL Installer package, all `.msi` files were loaded to the `Product Cache` folder during the initial setup and are not downloaded again. Otherwise,
click **Execute** to begin the download. The status of each product changes from **Downloading** to **Downloaded**.

- **Product installation.** The status of each product in the list changes from **Ready to Install**, to **Installing**, and lastly to **Complete**. During the process, click **Show Details** to view the installation actions.

  If you cancel the installation at this point, the products are installed, but the server (if installed) is not yet configured. To restart the server configuration, open MySQL Installer from the Start menu and click the **Reconfigure** link next to the appropriate server in the dashboard.

- **Product configuration.** This step applies to MySQL Server, MySQL Router, and samples only. The status for each item in the list should indicate **Ready to Configure**.

  Click **Next** to start the configuration wizard for all items in the list. The configuration options presented during this step are specific to the version of database or router that you selected to install.

  Click **Execute** to begin applying the configuration options or click **Back** (repeatedly) to return to each configuration page. Click **Finish** to open the **MySQL Installer dashboard**.

- **Installation complete.** This step finalizes the installation for products that do not require configuration. It enables you to copy the log to a clipboard and to start certain applications, such as MySQL Workbench and MySQL Shell. Click **Finish** to open the **MySQL Installer dashboard**.

### MySQL Server Configuration with MySQL Installer

MySQL Installer performs the initial configuration of the MySQL server. For example:

- For the MySQL 8.0 release series, a server can be configured to run as a standalone database, as a sandbox InnoDB cluster on a single host, or to create a production InnoDB cluster inside a local network (see **High Availability**).

- It creates the configuration file (**my.ini**) that is used to configure the MySQL server. The values written to this file are influenced by choices you make during the installation process. Some definitions are host dependent. For example, query_cache is enabled if the host has fewer than three cores.

  **Note**

  Query cache was deprecated in MySQL 5.7 and removed in MySQL 8.0 (and later).

- By default, a Windows service for the MySQL server is added.

- Provides default installation and data paths for MySQL server. For instructions on how to change the default paths, see Section 2.3.3.2, “Setting Alternative Server Paths with MySQL Installer”.

- It can optionally create MySQL server user accounts with configurable permissions based on general roles, such as DB Administrator, DB Designer, and Backup Admin. It optionally creates a Windows user named **MysqlSys** with limited privileges, which would then run the MySQL Server.

  User accounts may also be added and configured in MySQL Workbench.

- Checking **Show Advanced Options** enables additional **Logging Options** to be set. This includes defining custom file paths for the error log, general log, slow query log (including the configuration of seconds it requires to execute a query), and the binary log.

  During the configuration process, click **Next** to proceed to the next step or **Back** to return to the previous step. Click **Execute** at the final step to apply the server configuration.
The sections that follow describe the server configuration options that apply to MySQL server on Windows. The server version you installed will determine which steps and options you can configure. Configuring MySQL server may include some or all of the steps.

High Availability

MySQL Installer enables you to install, configure, and deploy MySQL Server as a standalone instance or as a member of a highly available cluster using MySQL Group Replication. In either case, MySQL Installer restricts the installation and configuration of the server (or servers) to the local Windows host computer.

• Standalone MySQL Server / Classic MySQL Replication (default)

Select this option to configure one MySQL instance to run as a standalone database server. This option is ideal if you intend to set up classic replication later and then to include this server in your custom solution. The remaining configuration steps are described in the sections that follow, starting with Type and Networking.

• InnoDB cluster

Select this option to create or extend an InnoDB cluster solution that is based on MySQL Group Replication (see Introducing InnoDB Cluster). You can configure (or reconfigure) a minimum of three server instances to perform a basic setup as a test-only sandbox cluster on a single computer or to create a production cluster inside a local network.

InnoDB Cluster Log Verbosity Level. This configuration step includes an adjustable log that captures information during the configuration of each server instance in the production or sandbox cluster. The values are: MINIMAL, MEDIUM (default), and DEBUG. If the cluster configuration fails, use the Reconfigure action from the MySQL Installer dashboard to restart the configuration and then set the verbosity level to DEBUG to gather additional information during your next attempt.

MySQL Installer provides the following configuration variations to deploy an InnoDB cluster:

• Set Up a Local Server Cluster for Testing Only

Select Create a Sandbox InnoDB cluster for Testing to enable this option. When prompted, define the number of server sandbox instances in the cluster, set a password for the root user, and adjust the InnoDB cluster log verbosity level as needed. For a more detailed description of the configuration, see Deploying a Sandbox InnoDB Cluster with MySQL Installer. This setup requires MySQL 5.7.17 or higher.

• Create or Join an InnoDB cluster

To set up a highly available InnoDB cluster using MySQL Installer, you must have a minimum of three computers on a local network. If you require a more advanced setup, use MySQL Shell to configure some or all of the server instances in the cluster. For details about how to perform a local-network cluster setup, see Setting up an InnoDB cluster with MySQL Installer. This setup requires MySQL 8.0.0 or higher.

InnoDB cluster was designed to operate with MySQL Shell, which enables you to perform advanced cluster administration, and MySQL Router to automate the connections made between client applications and server instances. Neither MySQL Shell nor MySQL Router are required to deploy a cluster on Windows using MySQL Installer.

Deploying a Sandbox InnoDB Cluster with MySQL Installer

A sandbox deployment includes multiple server sandbox instances that run together on the same computer. Because all server instances reside on the same computer, a sandbox cluster does not meet the...
requirements of a highly available solution. Instead, this deployment option simulates an environment from which you can explore the techniques associated with InnoDB cluster administration.

When you select **Create a Sandbox InnoDB cluster for Testing**, a follow-on step prompts you to select a cluster consisting of three, five, seven, or nine MySQL server instances. Unlike the other server setups provided by MySQL Installer, the sandbox deployment skips the usual server configuration steps (except Authentication Method). The resulting cluster, named `sandboxCluster`, is available on selected ports that are configured for you.

**Note**

MySQL Installer deletes ports 3310 to 3390 during the configuration, if those ports were set for the sandbox InnoDB cluster manually using MySQL Shell.

Each sandbox instance is configured to run as a process (not a Windows service). You must start each instance in the sandbox cluster manually after restarting the computer.

After you create the test cluster, click the **Summary** tab to view the specific ports that apply to your cluster. To modify the number of server instances within the existing cluster or to adjust the logging level, use the **Reconfigure** quick action from the MySQL Installer dashboard.

**Warning**

MySQL Installer deletes all existing sandbox cluster data when the cluster is reconfigured or when the server instances within the sandbox cluster are upgraded.

MySQL Installer stores all sandbox InnoDB cluster configuration entries in the `installer_config.xml` file. By default, MySQL Installer creates the sandbox instances in `%userprofile%\MySQL\mysql-sandboxes` on the local host.

### Setting up InnoDB Cluster with MySQL Installer

To create a single InnoDB cluster, select **InnoDB Cluster** as the High Availability option and then select **Create a New InnoDB Cluster**. Adjust the log verbosity level (as needed), and click **Next** to configure the first server instance. This setup process involves installing and running MySQL Installer on multiple computers.

Define the first server instance (or seed) by providing the following configuration information:

- **InnoDB Cluster Name:**
  
  The default cluster name is `myCluster`. If you intend to configure multiple clusters, replace the default name with one that is meaningful within your solution. Alphanumeric characters, spaces, and underscore (`_`) characters are valid for this field. The limit is 40 characters.

- **Cluster Admin User Name:**

  The default cluster administrator name is `ic`. You can reuse the same MySQL administrative account across multiple clusters. You will be prompted for this account name (and password) later when you configure other server instances to join the cluster. The limit is 32 characters.

- **Cluster Admin Password:**

  Enter a password for the cluster administrator account (minimum length is four characters). MySQL Installer will evaluate the strength of the MySQL password as you type. Use the **Repeat Password** field to confirm the password.

- **Host Address:**
Select the host name or IP address of the local host from the list. When joining additional server instances to the cluster, you will be prompted to identify the seed instance by the host name or IP address.

- **Server ID:**

  The default value is 1. This identifier is required to record the events of a server instance in the binary log. The ID of each server instance within a cluster must be unique; however, you can reuse the same number in a different cluster. The server ID you specify in this field also appears later in Advanced Options step. If you change the value in Advanced Option, the number is changed for the InnoDB cluster Setup too.

Click Next and then complete the remaining configuration steps, which are described in the sections that follow, starting with Type and Networking. After the seed instance is added and the cluster is created, it requires more instances for full tolerance. At this point, the status is **OK_NO_TOLERANCE**.

To add the second and third server instances to the cluster, you must use a separate computer inside the local network for each. Some of the configuration details of the seed instance are required to complete the join operation.

After you start MySQL Installer and install the server instance on the next computer, begin the configuration by selecting **InnoDB Cluster** as the High Availability option and then select **Add Local MySQL Server Instance to an InnoDB Cluster**. Adjust the **InnoDB Cluster Log Verbosity Level** (as needed) and then click Next.

Define the joining server instance by providing the following configuration information:

- **Seed Instance Address:**

  Enter the host name or IP address of the computer that hosts the seed instance.

- **Seed Instance Port:**

  The default value is 3306, which is the port for classic MySQL. Use the same TCP port that you configured for the seed instance.

- **Cluster Admin User Name:**

  The default cluster administrator name is ic. If you assigned a different name when you configured the seed instance, enter the alternative cluster administrator name.

- **Cluster Admin Password:**

  Enter the password assigned to the cluster administrator account.

- **Host Address:**

  Select the host name or IP address of the local host from the list.

- **Server ID:**

  The default value is 1. This identifier is required to record the events of a server instance in the binary log. The ID of each server instance within a cluster must be unique; however, you can reuse the same number in a different cluster. The server ID you specify in this field also appears later in Advanced Options step. If you change the value in Advanced Option, the number is changed for the InnoDB cluster Setup too.

- **Test Connection**
Use this button to verify the connection between the local server instance and the seed instance defined for the cluster. A valid connection is required to proceed.

Click Next and then complete the remaining configuration steps, which are described in the sections that follow, starting with Type and Networking.

With one seed instance and a second server instance in the cluster, the status is OK_NO_TOLERANCE. After you add the third server instance, the status is OK, which indicates that the cluster now is tolerant to the failure of one instance.

**Type and Networking**

- **Server Configuration Type**

  Choose the MySQL server configuration type that describes your setup. This setting defines the amount of system resources (memory) that will be assigned to your MySQL server instance.

  - **Development**: A machine that will host many other applications, and typically this is your personal workstation. This option configures MySQL to use the least amount of memory.

  - **Server**: Several other applications will be running on this machine, such as a web server. This option configures MySQL to use a medium amount of memory.

  - **Dedicated**: A machine that is dedicated to running the MySQL server. Because no other major applications will run on this server, such as a web server, this option configures MySQL to use the majority of available memory.

- **Connectivity**

  Connectivity options control how the connection to MySQL is made. Options include:

  - **TCP/IP**: You may enable TCP/IP Networking here as otherwise only local host connections are permitted. Also define the Port (for the classic MySQL protocol), X Protocol Port (for MySQL as a document store), and whether to open the firewall port for network access. If the port number is in use already, you will see the information icon (⚠️) next to the default value and Next is disabled until you provide a new port number.

  - **Named Pipe**: Enable and define the pipe name, similar to setting the named_pipe system variable. The default name is MySQL.

  - **Shared Memory**: Enable and then define the memory name, similar to setting the shared_memory system variable. The default name is MySQL.

- **Advanced Configuration**

  Check **Show Advanced and Logging Options** to set custom logging and advanced options in later steps. The Logging Options step enables you to define custom file paths for the error log, general log, slow query log (including the configuration of seconds it requires to execute a query), and the binary log. The Advanced Options step enables you to set the unique server ID required when binary logging is enabled in a replication topology.

- **MySQL Enterprise Firewall (Enterprise Edition only)**

  The **Enable Enterprise Firewall** check box is selected by default. For post-installation instructions, see Section 6.4.5, “MySQL Enterprise Firewall”. 
Authentication Method

The Authentication Method step is visible only during the installation or upgrade of MySQL 8.0.4 or higher. It introduces a choice between two server-side authentication options. The MySQL user accounts that you create in the next step will use the authentication method that you select in this step.

MySQL 8.0 connectors and community drivers that use `libmysqlclient` 8.0 now support the `mysql_native_password` default authentication plugin. However, if you are unable to update your clients and applications to support this new authentication method, you can configure the MySQL server to use `mysql_native_password` for legacy authentication. For more information about the implications of this change, see caching_sha2_password as the Preferred Authentication Plugin.

If you are installing or upgrading to MySQL 8.0.4 or higher, select one of the following authentication methods:

- Use Strong Password Encryption for Authentication (RECOMMENDED)

  MySQL 8.0 supports a new authentication based on improved, stronger SHA256-based password methods. It is recommended that all new MySQL server installations use this method going forward.

- Use Legacy Authentication Method (Retain MySQL 5.x Compatibility)

  Using the old MySQL 5.x legacy authentication method should be considered only in the following cases:

  - Applications cannot be updated to use MySQL 8.0 connectors and drivers.
  - Recompilation of an existing application is not feasible.
  - An updated, language-specific connector or driver is not available yet.

Accounts and Roles

- Root Account Password

  Assigning a root password is required and you will be asked for it when performing other MySQL Installer operations. Password strength is evaluated when you repeat the password in the box provided. For descriptive information regarding password requirements or status, move your mouse pointer over the information icon (⚠️) when it appears.

- MySQL User Accounts (Optional)

  Click Add User or Edit User to create or modify MySQL user accounts with predefined roles. Next, enter the required account credentials:

  - User Name: MySQL user names can be up to 32 characters long.
  - Host: Select localhost for local connections only or <All Hosts (%)> when remote connections to the server are required.
Role: Each predefined role, such as DB Admin, is configured with its own set of privileges. For example, the DB Admin role has more privileges than the DB Designer role. The Role drop-down list contains a description of each role.

Password: Password strength assessment is performed while you type the password. Passwords must be confirmed. MySQL permits a blank or empty password (considered to be insecure).

MySQL Installer Commercial Release Only: MySQL Enterprise Edition for Windows, a commercial product, also supports an authentication method that performs external authentication on Windows. Accounts authenticated by the Windows operating system can access the MySQL server without providing an additional password.

To create a new MySQL account that uses Windows authentication, enter the user name and then select a value for Host and Role. Click Windows authentication to enable the authentication_windows plugin. In the Windows Security Tokens area, enter a token for each Windows user (or group) who can authenticate with the MySQL user name. MySQL accounts can include security tokens for both local Windows users and Windows users that belong to a domain. Multiple security tokens are separated by the semicolon character (;) and use the following format for local and domain accounts:

- Local account
  Enter the simple Windows user name as the security token for each local user or group; for example, finley;jeffrey;admin.

- Domain account
  Use standard Windows syntax (domain\domainuser) or MySQL syntax (domain\\domainuser) to enter Windows domain users and groups.

  For domain accounts, you may need to use the credentials of an administrator within the domain if the account running MySQL Installer lacks the permissions to query the Active Directory. If this is the case, select Validate Active Directory users with to activate the domain administrator credentials.

  Windows authentication permits you to test all of the security tokens each time you add or modify a token. Click Test Security Tokens to validate (or revalidate) each token. Invalid tokens generate a descriptive error message along with a red X icon and red token text. When all tokens resolve as valid (green text without an X icon), you can click OK to save the changes.

Windows Service

On the Windows platform, MySQL server can run as a named service managed by the operating system and be configured to start up automatically when Windows starts. Alternatively, you can configure MySQL server to run as an executable program that requires manual configuration.

- Configure MySQL server as a Windows service (Selected by default.)

  When the default configuration option is selected, you can also select the following:

- Start the MySQL Server at System Startup

  When selected (default), the service startup type is set to Automatic; otherwise, the startup type is set to Manual.

- Run Windows Service as

  When Standard System Account is selected (default), the service logs on as Network Service.
The **Custom User** option must have privileges to log on to Microsoft Windows as a service. The **Next** button will be disabled until this user is configured with the required privileges.

A custom user account is configured in Windows by searching for “local security policy” in the Start menu. In the Local Security Policy window, select **Local Policies, User Rights Assignment**, and then **Log On As A Service** to open the property dialog. Click **Add User or Group** to add the custom user and then click **OK** in each dialog to save the changes.

- Deselect the Windows Service option

**Logging Options**

This step is available if the **Show Advanced Configuration** check box was selected during the **Type and Networking** step. To enable this step now, click **Back** to return to the **Type and Networking** step and select the check box.

Advanced configuration options are related to the following MySQL log files:

- **Error Log**
- **General Log**
- **Slow Query Log**
- **Bin Log**

**Note**

The binary log is enabled by default for MySQL 5.7 and higher.

**Advanced Options**

This step is available if the **Show Advanced Configuration** check box was selected during the **Type and Networking** step. To enable this step now, click **Back** to return to the **Type and Networking** step and select the check box.

The advanced-configuration options include:

- **Server ID**

  Set the unique identifier used in a replication topology. If binary logging is enabled, you must specify a server ID. The default ID value depends on the server version. For more information, see the description of the **--server-id** option.

  **Tip**

  If you specified an ID for a server instance of an InnoDB cluster, then MySQL Installer adjusts the ID (shown on this page) to match the previous identifier.

- **Table Names Case**

  You can set the following options during the initial and subsequent configuration the server. For the MySQL 8.0 release series, these options apply only to the initial configuration of the server.

  - **Lower Case**
Sets the `lower_case_table_names` option value to 1 (default), in which table names are stored in lowercase on disk and comparisons are not case sensitive.

- **Preserve Given Case**

  Sets the `lower_case_table_names` option value to 2, in which table names are stored as given but compared in lowercase.

### Apply Server Configuration

All configuration settings are applied to the MySQL server when you click **Execute**. Use the **Configuration Steps** tab to follow the progress of each action; the icon for each toggles from white to green (with a check mark) on success. Otherwise, the process stops and displays an error message if an individual action times out. Click the **Log** tab to view the log.

When the installation completes successfully and you click **Finish**, MySQL Installer and the installed MySQL products are added to the Microsoft Windows Start menu under the **MySQL** group. Opening MySQL Installer loads the **dashboard** where installed MySQL products are listed and other MySQL Installer operations are available.

### MySQL Router Configuration with MySQL Installer

MySQL Installer downloads and installs a suite of tools for developing and managing business-critical applications on Windows. The suite consist of applications, connectors, documentation, and samples.

During the **initial setup**, choose any predetermined setup type, except **Server only**, to install the latest GA version of the tools. Use the **Custom** setup type to install an individual tool or specific version. If MySQL Installer is installed on the host already, use the **Add** operation to select and install tools from the MySQL Installer dashboard.

### MySQL Router Configuration

MySQL Installer provides a configuration wizard that can bootstrap an installed instance of MySQL Router 8.0 or later to route traffic between MySQL applications and an InnoDB cluster. When configured, MySQL Router runs as a local Windows service. For detailed information about using MySQL Router with an InnoDB cluster, see Routing for MySQL InnoDB cluster.

### Note

You are prompted to configure MySQL Router after the initial installation and when you reconfigure an installed router explicitly. In contrast, the upgrade operation does not require or prompt you to configure the upgraded product.

To configure MySQL Router, do the following:

1. Set up InnoDB cluster. For instructions on how to configure a sandbox InnoDB cluster on the local host using MySQL Installer, see High Availability.

   For general InnoDB cluster information, see InnoDB Cluster.

2. Using MySQL Installer, download and install the MySQL Router application. After the installation finishes, the configuration wizard prompts you for information. Select the **Configure MySQL Router for InnoDB cluster** check box to begin the configuration and provide the following configuration values:

   - **Hostname**: Host name of the primary (seed) server in the InnoDB cluster (*localhost* by default).
• **Port**: The port number of the primary (seed) server in the InnoDB cluster (3310 by default).

• **Management User**: An administrative user with root-level privileges.

• **Password**: The password for the management user.

• **Classic MySQL protocol connections to InnoDB cluster**

  **Read/Write**: Set the first base port number to one that is unused (between 80 and 65532) and the wizard will select the remaining ports for you.

The figure that follows shows an example of the MySQL Router configuration page, with the first base port number specified as 6446 and the remaining ports set by the wizard as 6447, 6448, and 6449.

**Figure 2.10 MySQL Router Configuration**

3. Click **Next** and then **Execute** to apply the configuration. Click **Finish** to close MySQL Installer or return to the MySQL Installer dashboard.

After installing a production cluster with MySQL Router, the root account only exists in the user table as **root@localhost** (local), instead of **root@%** (remote). Regardless of where the router or client are located, even if both are located on the same host as the seed server, any connection that passes through the router is viewed by server as being remote, not local. As a result, a connection made to the server using the local host (see the example that follows), does not authenticate.

```shell
shell> \c root@localhost:6446
```

2.3.3.4 MySQL Installer Product Catalog and Dashboard

• **Product Catalog**
MySQL Installer for Windows

- MySQL Installer Dashboard
- Locating Products to Install
- Upgrading MySQL Installer

This section describes the MySQL Installer product catalog and the dashboard.

**Product Catalog**

The product catalog stores the complete list of released MySQL products for Microsoft Windows that are available to download from MySQL Downloads. By default, and when an Internet connection is present, MySQL Installer updates the catalog daily. You can also update the catalog manually from the dashboard (described later).

An up-to-date catalog performs the following actions:

- Populates the **Available Products** pane of the Select Products and Features step. This step appears when you select:
  - The **Custom** setup type during the initial setup.
  - The **Add** operation from the dashboard.
- Identifies when product updates are available for the installed products listed in the dashboard.

The catalog includes all development releases (Pre-Release), general releases (Current GA), and minor releases (Other Releases). Products in the catalog will vary somewhat, depending on the MySQL Installer release that you download.

**MySQL Installer Dashboard**

The MySQL Installer dashboard is the default view that you see when you start MySQL Installer after the initial setup finishes. If you closed MySQL Installer before the setup was finished, MySQL Installer resumes the initial setup before it displays the dashboard.
Description of MySQL Installer Dashboard Elements

1. MySQL Installer dashboard operations provide a variety of actions that apply to installed products or products listed in the catalog. To initiate the following operations, first click the operation link and then select the product or products to manage:

   • **Add**: This operation opens the Select Products and Features page. From there, you can filter the product in the product catalog, select one or more products to download (as needed), and begin the installation. For hints about using the filter, see *Locating Products to Install*.

   • **Modify**: Use this operation to add or remove the features associated with installed products. Features that you can modify vary in complexity by product. When the **Program Shortcut** check box is selected, the product appears in the Start menu under the **MySQL** group.

   • **Upgrade**: This operation loads the Select Products to Upgrade page and populates it with all the upgrade candidates. An installed product can have more than one upgrade version and requires a current product catalog.

Important server upgrade conditions:

- MySQL Installer does not permit server upgrades between major release versions or minor release versions, but does permit upgrades within a release series, such as an upgrade from 5.7.18 to 5.7.19.

- Upgrades between milestone releases (or from a milestone release to a GA release) are not supported. Significant development changes take place in milestone releases and you may encounter compatibility issues or problems starting the server.
• For upgrades to MySQL 8.0.16 server and higher, a check box enables you to skip the upgrade check and process for system tables, while checking and processing data dictionary tables normally. MySQL Installer does not prompt you with the check box when the previous server upgrade was skipped or when the server was configured as a sandbox InnoDB cluster. This behavior represents a change in how MySQL Server performs an upgrade (see What the MySQL Upgrade Process Upgrades) and it alters the sequence of steps that MySQL Installer applies to the configuration process.

If you select **Skip system tables upgrade check and process. (Not recommended)**, MySQL Installer starts the upgraded server with the `--upgrade=MINIMAL` server option, which upgrades the data dictionary only. If you stop and then restart the server without the `--upgrade=MINIMAL` option, the server upgrades the system tables automatically, if needed.

The following information appears in the **Log** tab and log file after the upgrade configuration (with system tables skipped) is complete:

```
WARNING: The system tables upgrade was skipped after upgrading MySQL Server. The server will be started now with the --upgrade=MINIMAL option, but then each time the server is started it will attempt to upgrade the system tables, unless you modify the Windows service (command line) to add --upgrade=MINIMAL to bypass the upgrade.

FOR THE BEST RESULTS: Run mysqld.exe --upgrade=FORCE on the command line to upgrade the system tables manually.
```

To choose a new product version:

a. Click **Upgrade**. Confirm that the check box next to product name in the **Upgradeable Products** pane has a check mark. Deselect the products that you do not intend to upgrade at this time.

   **Note**
   For server milestone releases in the same release series, MySQL Installer deselects the server upgrade and displays a warning to indicate that the upgrade is not supported, identifies the risks of continuing, and provides a summary of the steps to perform a logical upgrade manually. You can reselect server upgrade at your own risk. For instructions on how to perform a logical upgrade with a milestone release, see Logical Upgrade.

b. Click a product in the list to highlight it. This action populates the **Upgradeable Versions** pane with the details of each available version for the selected product: version number, published date, and a **Changes** link to open the release notes for that version.

MySQL Installer upgrades all of the selected products in one action. Click **Show Details** to view the actions performed by MySQL Installer.

• **Remove**: This operation opens the Remove Products page and populates it with the MySQL products installed on the host. Select the MySQL products you want to remove (uninstall) and then click **Execute** to begin the removal process. During the operation, an indicator shows the number of steps that are executed as a percentage of all steps.

To select products to remove, do one of the following:

• Select the check box for one or more products.

• Select the **Product** check box to select all products.
To remove a local MySQL server:

a. Determine whether the local data directory should be removed. If you retain the data directory, another server installation can reuse the data. This option is enabled by default (removes the data directory).

b. If the local server is a member of an InnoDB cluster, reconfigure the cluster as follows:

i. Type the administrator password for the cluster affected when the local server is removed and then click **Test Connection** to verify the credentials. MySQL Installer can perform the following actions, depending on the configuration of the existing cluster:

   • If the local server is a seed instance and the number of instances in the cluster is one, dissolve the cluster when you remove the local server.

   • If the local server is a seed instance and the number of instances in the cluster is greater than one, remove the instance from the cluster or dissolve the cluster when you remove the local server.

   • If the local server is a slave instance within the cluster and the number of instances in the cluster is greater than two, remove the local instance from the cluster. (A single slave instance within a cluster reverts to a seed instance automatically.)

   • If the local server is configured as a sandbox InnoDB cluster, remove all instances created for the sandbox server installation.

ii. When prompted, do one of the following:

   • Select an action to apply to the cluster and click **Next**.

   • Click **Next** without selecting an action. In most cases, MySQL Group Replication can manage the cluster when the local server becomes unavailable. A warning message reminds you that skipping the step may result in an inconsistent InnoDB cluster configuration.

c. Click **Execute** to begin uninstalling the local server. Note that all products that you selected to remove are also uninstalled at this time.

d. (Optional) Click the **Log** tab to display the current actions performed by MySQL Installer.

2. The **Reconfigure** link in the Quick Action column next to each installed server loads the current configuration values for the server and then cycles through all configuration steps enabling you to change the options and values. You must provide credentials with root privileges to reconfigure these items. Click the **Log** tab to show the output of each configuration step performed by MySQL Installer.

   On completion, MySQL Installer stops the server, applies the configuration changes, and restarts the server for you. For a description of each configuration option, see MySQL Server Configuration with MySQL Installer. Installed Samples and Examples associated with a specific MySQL server version can be also be reconfigured to apply new feature settings, if any.

3. The **Catalog** link enables you to download the latest catalog of MySQL products manually and then to integrate those product changes with MySQL Installer. The catalog-download action does not perform an upgrade of the products already installed on the host. Instead, it returns to the dashboard and displays an arrow icon in the Version column for each installed product that has a newer version. Use the **Upgrade** operation to install the newer product version.
You can also use the Catalog link to display the current change history of each product without downloading the new catalog. Select the Do not update at this time check box to view the change history only.

4. The MySQL Installer About icon (Θ) shows the current version of MySQL Installer and general information about MySQL. The version number is located above the Back button.

Tip
Always include this version number when reporting a problem with MySQL Installer.

In addition to the About MySQL information (Θ), you can also select the following icons from the side panel:

- License icon (Θ) for MySQL Installer.

This product may include third-party software, used under license. If you are using a Commercial release of MySQL Installer, the icon opens the MySQL Installer Commercial License Information User Manual for licensing information, including licensing information relating to third-party software that may be included in this Commercial release. If you are using a Community release of MySQL Installer, the icon opens the MySQL Installer Community License Information User Manual for licensing information, including licensing information relating to third-party software that may be included in this Community release.

- Resource links icon (Θ) to the latest MySQL product documentation, blogs, webinars, and more.

5. The MySQL Installer Options icon (Θ) includes the following tabs:

- **Product Catalog**: Manages the daily automatic catalog updates. By default, catalog updates are scheduled at a fixed hour. When new products or product versions are available, MySQL Installer adds them to the catalog and then displays an arrow icon (Θ) next to the version number of installed products listed in the dashboard.

Use this option to enable or disable automatic catalog updates and to reset the time of day when the MySQL Installer updates the catalog automatically. For specific settings, see the task named ManifestUpdate in the Windows Task Scheduler.

- **Connectivity Settings**: Several operations performed by MySQL Installer require internet access. This option enables you to use a default value to validate the connection or to use a different URL, one selected from a list or added by you manually. With the Manual option selected, new URLs can be added and all URLs in the list can be moved or deleted. When the Automatic option is selected, MySQL Installer attempts to connect to each default URL in the list (in order) until a connection is made. If no connection can be made, it raises an error.

**Locating Products to Install**

MySQL products in the catalog are listed by category: MySQL Servers, Applications, MySQL Connectors, and Documentation. Only the latest GA versions appear in the Available Products pane by default. If you are looking for a pre-release or older version of a product, it may not be visible in the default list.
To change the default product list, click **Add** on the dashboard to open the Select Products and Features page, and then click **Edit** to open the filter dialog box (see the figure that follows). Modify the product values and then click **Filter**.

**Figure 2.12 Filter Available Products**

![Filter Available Products](image)

Reset one or more of the following values to filter the list of available products:

- **Text**: Filter by text.
- **Category**: All Software (default), MySQL Servers, Applications, MySQL Connectors, or Documentation (for samples and documentation).
- **Maturity**: Current Bundle (appears initially with the full package only), Pre-Release, Current GA, or Other Releases.

**Note**
The Commercial release of MySQL Installer does not display any MySQL products when you select the Pre-Release age filter. Products in development are available from the Community release of MySQL Installer only.

- **Already Downloaded** (the check box is deselected by default).
- **Architecture**: Any (default), 32-bit, or 64-bit.

**Upgrading MySQL Installer**

MySQL Installer remains installed on your computer, and like other software, MySQL Installer can be upgraded from the previous version. In some cases, other MySQL software may require that you upgrade MySQL Installer for compatibility. This section describes how to identify the current version of MySQL Installer and how to upgrade MySQL Installer manually.

**To locate the installed version of MySQL Installer:**

1. Start MySQL Installer from the search menu. The MySQL Installer dashboard opens.
2. Click the MySQL Installer About icon (ثقة). The version number is located above the **Back** button.

**To initiate an on-demand upgrade of MySQL Installer:**

1. Connect the computer with MySQL Installer installed to the internet.
2. Start MySQL Installer from the search menu. The MySQL Installer dashboard opens.

3. Click **Catalog** on the bottom of the dashboard to open the Update Catalog window.

4. Click **Execute** to begin the process. If the installed version of MySQL Installer can be upgraded, you will be prompted to start the upgrade.

5. Click **Next** to review all changes to the catalog and then click **Finish** to return to the dashboard.

6. Verify the (new) installed version of MySQL Installer (see the previous procedure).

### 2.3.3.5 MySQLInstallerConsole Reference

MySQLInstallerConsole.exe provides command-line functionality that is similar to MySQL Installer. It is installed when MySQL Installer is initially executed and then available within the MySQL Installer directory. Typically, that is in `C:\Program Files (x86)\MySQL\MySQL Installer\`, and the console must be executed with administrative privileges.

To use, invoke the command prompt with administrative privileges by choosing **Start**, **Accessories**, then right-click on **Command Prompt** and choose **Run as administrator**. And from the command line, optionally change the directory to where MySQLInstallerConsole.exe is located:

```
C:\> cd Program Files (x86)\MySQL\MySQL Installer for Windows
C:\Program Files (x86)\MySQL\MySQL Installer for Windows> MySQLInstallerConsole.exe help
```

```
attempting to update manifest.
initializing product requirements
loading product catalog
checking for product catalog snippets
checking for product packages in the bundle
categorizing product catalog
finding all installed packages.
your product catalog was last updated at 11/1/2016 4:10:38 PM
```

The following commands are available:

- **Configure** - Configures one or more of your installed programs.
- **Help** - Provides list of available commands.
- **Install** - Install and configure one or more available MySQL programs.
- **List** - Provides an interactive way to list all products available.
- **Modify** - Modifies the features of installed products.
- **Remove** - Removes one or more products from your system.
- **Status** - Shows the status of all installed products.
- **Update** - Update the current product catalog.
- **Upgrade** - Upgrades one or more of your installed programs.

MySQLInstallerConsole.exe supports the following commands:

- **Note**
  
  Configuration block values that contain a colon (":"), must be wrapped in double quotes. For example, `installdir="C:\MySQL\MySQL Server 8.0"`.

- **configure** `[product1]:[setting]=[value]; [product2]:[setting]=[value]; [...]`

  Configure one or more MySQL products on your system. Multiple setting=value pairs can be configured for each product.
Switches include:

- `-showsettings` : Displays the available options for the selected product, by passing in the product name after `-showsettings`.

- `-silent` : Disable confirmation prompts.

```
C:\> MySQLInstallerConsole configure -showsettings server
C:\> MySQLInstallerConsole configure server:port=3307
```

- `help [command]`

Displays a help message with usage examples, and then exits. Pass in an additional command to receive help specific to that command.

```
C:\> MySQLInstallerConsole help
C:\> MySQLInstallerConsole help install
```

- `install [product]:[features]:[config block]:[config block]:[config block]; [...]`

Install one or more MySQL products on your system. If pre-release products are available, both GA and pre-release products are installed when the value of the `-type` switch is `Developer`, `Client`, or `Full`. Use the `-only_ga_products` switch to restrict the product set to GA products only when using these setup types.

Switches and syntax options include:

- `-only_ga_products` : Restricts the product set to include GA products only.

- `-type=[SetupType]` : Installs a predefined set of software. The "SetupType" can be one of the following:

<table>
<thead>
<tr>
<th>SetupType</th>
</tr>
</thead>
<tbody>
<tr>
<td>Developer: Installs a complete development environment.</td>
</tr>
<tr>
<td>Server: Installs a single MySQL server</td>
</tr>
<tr>
<td>Client: Installs client programs and libraries</td>
</tr>
<tr>
<td>Full: Installs everything</td>
</tr>
<tr>
<td>Custom: Installs user selected products. This is the default option.</td>
</tr>
</tbody>
</table>

- `-showsettings` : Displays the available options for the selected product, by passing in the product name after `-showsettings`.

- `-silent` : Disable confirmation prompts.

- `[config block]`: One or more configuration blocks can be specified. Each configuration block is a semicolon separated list of key value pairs. A block can include either a "config" or "user" type key, where "config" is the default type if one is not defined.
Configuration block values that contain a colon character (:) must be wrapped in double quotes. For example, `installdir=C:\MySQL\MySQL Server 8.0`.

Only one "config" type block can be defined per product. A "user" block should be defined for each user that should be created during the product's installation.

Note
Adding users is not supported when a product is being reconfigured.

- **[feature]**: The feature block is a semicolon separated list of features, or an asterisk character (*) to select all features.

An example that passes in additional configuration blocks, separated by ^ to fit:

```
C:\> MySQLInstallerConsole install server;5.6.25:*:port=3307;serverid=2:type=user;username=foo;password=bar;
C:\> MySQLInstallerConsole install server;5.6.25;x64 -silent
```

- **list**

Lists an interactive console where all of the available MySQL products can be searched. Execute `MySQLInstallerConsole list` to launch the console, and enter in a substring to search.

```
C:\> MySQLInstallerConsole list
```

- **modify [product1:-removelist|+addlist] [product2:-removelist|+addlist] [...]**

Modifies or displays features of a previously installed MySQL product.

- **-silent**: Disable confirmation prompts.

```
C:\> MySQLInstallerConsole modify server
C:\> MySQLInstallerConsole modify server:+documentation
C:\> MySQLInstallerConsole modify server:-debug
```

- **remove [product1] [product2] [...]**

Removes one or more products from your system.

- **-continue**: Continue the operation even if an error occurs.
- **-silent**: Disable confirmation prompts.

```
C:\> MySQLInstallerConsole remove *
C:\> MySQLInstallerConsole remove server
```

- **status**
Provides a quick overview of the MySQL products that are installed on the system. Information includes product name and version, architecture, date installed, and install location.

C:\> MySQLInstallerConsole status

• **update**

Downloads the latest MySQL product catalog to your system. On success, the download catalog will be applied the next time either MySQLInstaller or MySQLInstallerConsole is executed.

C:\> MySQLInstallerConsole update

**Note**

The **Automatic Catalog Update** GUI option executes this command from the Windows Task Scheduler.

• **upgrade [product1:version] [product2:version] [..]**

Upgrades one or more products on your system. Syntax options include:

• * : Pass in * to upgrade all products to the latest version, or pass in specific products.

• ! : Pass in ! as a version number to upgrade the MySQL product to its latest version.

• -silent : Disable confirmation prompts.

C:\> MySQLInstallerConsole upgrade *
C:\> MySQLInstallerConsole upgrade workbench:6.3.5
C:\> MySQLInstallerConsole upgrade workbench:!
C:\> MySQLInstallerConsole upgrade workbench:6.3.5 excel:1.3.2

### 2.3.4 Installing MySQL on Microsoft Windows Using a *noinstall* ZIP Archive

Users who are installing from the *noinstall* package can use the instructions in this section to manually install MySQL. The process for installing MySQL from a ZIP Archive package is as follows:

1. Extract the archive to the desired install directory
2. Create an option file
3. Choose a MySQL server type
4. Start the MySQL server
5. Secure the default user accounts

This process is described in the sections that follow.

#### 2.3.4.1 Extracting the Install Archive

To install MySQL manually, do the following:

1. If you are upgrading from a previous version please refer to Section 2.11.8, “Upgrading MySQL on Windows”, before beginning the upgrade process.
2. Make sure that you are logged in as a user with administrator privileges.
Installing MySQL on Microsoft Windows Using a `noinstall` ZIP Archive

3. Choose an installation location. Traditionally, the MySQL server is installed in `C:\mysql`. If you do not install MySQL at `C:\mysql`, you must specify the path to the install directory during startup or in an option file. See Section 2.3.4.2, “Creating an Option File”.

Note
The MySQL Installer installs MySQL under `C:\Program Files\MySQL`.

4. Extract the install archive to the chosen installation location using your preferred file-compression tool. Some tools may extract the archive to a folder within your chosen installation location. If this occurs, you can move the contents of the subfolder into the chosen installation location.

2.3.4.2 Creating an Option File

If you need to specify startup options when you run the server, you can indicate them on the command line or place them in an option file. For options that are used every time the server starts, you may find it most convenient to use an option file to specify your MySQL configuration. This is particularly true under the following circumstances:

- The installation or data directory locations are different from the default locations (`C:\Program Files\MySQL\MySQL Server 5.6` and `C:\Program Files\MySQL\MySQL Server 5.6\data`).
- You need to tune the server settings, such as memory, cache, or InnoDB configuration information.

When the MySQL server starts on Windows, it looks for option files in several locations, such as the Windows directory, `C:\`, and the MySQL installation directory (for the full list of locations, see Section 2.3.2.2, “Using Option Files”). The Windows directory typically is named something like `C:\WINDOWS`. You can determine its exact location from the value of the `WINDIR` environment variable using the following command:

```
C:\> echo %WINDIR%
```

MySQL looks for options in each location first in the `my.ini` file, and then in the `my.cnf` file. However, to avoid confusion, it is best if you use only one file. If your PC uses a boot loader where `C:` is not the boot drive, your only option is to use the `my.ini` file. Whichever option file you use, it must be a plain text file.

Note
When using the MySQL Installer to install MySQL Server, it will create the `my.ini` at the default location. And as of MySQL Server 5.5.27, the user running MySQL Installer is granted full permissions to this new `my.ini`.

In other words, be sure that the MySQL Server user has permission to read the `my.ini` file.

You can also make use of the example option files included with your MySQL distribution; see Section 5.1.2, “Server Configuration Defaults”.

An option file can be created and modified with any text editor, such as Notepad. For example, if MySQL is installed in `E:\mysql` and the data directory is in `E:\mydata\data`, you can create an option file containing a `[mysqld]` section to specify values for the `basedir` and `datadir` options:

```
[mysqld]
# set basedir to your installation path
basedir=E:/mysql
# set datadir to the location of your data directory
datadir=E:/mydata/data
```
Microsoft Windows path names are specified in option files using (forward) slashes rather than backslashes. If you do use backslashes, double them:

```
[mysqld]
# set basedir to your installation path
basedir=E:\mysql
# set datadir to the location of your data directory
datadir=E:\mydata\data
```

The rules for use of backslash in option file values are given in Section 4.2.2.2, “Using Option Files”.

The data directory is located within the AppData directory for the user running MySQL.

If you would like to use a data directory in a different location, you should copy the entire contents of the data directory to the new location. For example, if you want to use E:\mydata as the data directory instead, you must do two things:

1. Move the entire data directory and all of its contents from the default location (for example C: \Program Files\MySQL\MySQL Server 5.6\data) to E:\mydata.
2. Use a --datadir option to specify the new data directory location each time you start the server.

### 2.3.4.3 Selecting a MySQL Server Type

The following table shows the available servers for Windows in MySQL 5.6.

<table>
<thead>
<tr>
<th>Binary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mysqld</td>
<td>Optimized binary with named-pipe support</td>
</tr>
<tr>
<td>mysqld-debug</td>
<td>Like mysqld, but compiled with full debugging and automatic memory allocation checking</td>
</tr>
</tbody>
</table>

All of the preceding binaries are optimized for modern Intel processors, but should work on any Intel i386-class or higher processor.

Each of the servers in a distribution support the same set of storage engines. The `SHOW ENGINES` statement displays which engines a given server supports.

All Windows MySQL 5.6 servers have support for symbolic linking of database directories.

MySQL supports TCP/IP on all Windows platforms. MySQL servers on Windows also support named pipes, if you start the server with the `named_pipe` system variable enabled. It is necessary to enable this variable explicitly because some users have experienced problems with shutting down the MySQL server when named pipes were used. The default is to use TCP/IP regardless of platform because named pipes are slower than TCP/IP in many Windows configurations.

### 2.3.4.4 Starting the Server for the First Time

This section gives a general overview of starting the MySQL server. The following sections provide more specific information for starting the MySQL server from the command line or as a Windows service.

The information here applies primarily if you installed MySQL using the `noinstall` version, or if you wish to configure and test MySQL manually rather than with the GUI tools.

**Note**

MySQL server will automatically start after using MySQL Installer, and MySQL Notifier can be used to start/stop/restart at any time.
Installing MySQL on Microsoft Windows Using a noinstall ZIP Archive

The examples in these sections assume that MySQL is installed under the default location of `C:\Program Files\MySQL\MySQL Server 5.6`. Adjust the path names shown in the examples if you have MySQL installed in a different location.

Clients have two options. They can use TCP/IP, or they can use a named pipe if the server supports named-pipe connections.

MySQL for Windows also supports shared-memory connections if the server is started with the `shared_memory` system variable enabled. Clients can connect through shared memory by using the `--protocol=MEMORY` option.

For information about which server binary to run, see Section 2.3.4.3, “Selecting a MySQL Server Type”.

Testing is best done from a command prompt in a console window (or “DOS window”). In this way you can have the server display status messages in the window where they are easy to see. If something is wrong with your configuration, these messages make it easier for you to identify and fix any problems.

To start the server, enter this command:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqld" --console
```

For a server that includes InnoDB support, you should see the messages similar to those following as it starts (the path names and sizes may differ):

```
InnoDB: The first specified datafile c:\ibdata\ibdata1 did not exist:
InnoDB: a new database to be created!
InnoDB: Setting file c:\ibdata\ibdata1 size to 209715200
InnoDB: Database physically writes the file full: wait...
InnoDB: Log file c:\iblogs\ib_logfile0 did not exist: new to be created
InnoDB: Setting log file c:\iblogs\ib_logfile0 size to 31457280
InnoDB: Log file c:\iblogs\ib_logfile1 did not exist: new to be created
InnoDB: Setting log file c:\iblogs\ib_logfile1 size to 31457280
InnoDB: Log file c:\iblogs\ib_logfile2 did not exist: new to be created
InnoDB: Setting log file c:\iblogs\ib_logfile2 size to 31457280
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: creating foreign key constraint system tables
InnoDB: foreign key constraint system tables created
011024 10:58:25 InnoDB: Started
```

When the server finishes its startup sequence, you should see something like this, which indicates that the server is ready to service client connections:

```
mysqld: ready for connections
Version: '5.6.47'  socket: ''  port: 3306
```

The server continues to write to the console any further diagnostic output it produces. You can open a new console window in which to run client programs.

If you omit the `--console` option, the server writes diagnostic output to the error log in the data directory (`C:\Program Files\MySQL\MySQL Server 5.6\data` by default). The error log is the file with the `.err` extension, and may be set using the `--log-error` option.

**Note**

The accounts that are listed in the MySQL grant tables initially have no passwords. After starting the server, you should set up passwords for them using the instructions in Section 2.10.4, “Securing the Initial MySQL Accounts”.

100
2.3.4.5 Starting MySQL from the Windows Command Line

The MySQL server can be started manually from the command line. This can be done on any version of Windows.

Note
MySQL Notifier can also be used to start/stop/restart the MySQL server.

To start the mysqld server from the command line, you should start a console window (or “DOS window”) and enter this command:

C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqld"

The path to mysqld may vary depending on the install location of MySQL on your system.

You can stop the MySQL server by executing this command:

C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqladmin" -u root shutdown

Note
If the MySQL root user account has a password, you need to invoke mysqladmin with the -p option and supply the password when prompted.

This command invokes the MySQL administrative utility mysqladmin to connect to the server and tell it to shut down. The command connects as the MySQL root user, which is the default administrative account in the MySQL grant system.

Note
Users in the MySQL grant system are wholly independent from any operating system users under Microsoft Windows.

If mysqld doesn't start, check the error log to see whether the server wrote any messages there to indicate the cause of the problem. By default, the error log is located in the C:\Program Files\MySQL\MySQL Server 5.6\data directory. It is the file with a suffix of .err, or may be specified by passing in the --log-error option. Alternatively, you can try to start the server with the --console option; in this case, the server may display some useful information on the screen that will help solve the problem.

The last option is to start mysqld with the --standalone and --debug options. In this case, mysqld writes a log file C:\mysqld.trace that should contain the reason why mysqld doesn't start. See Section 24.5.3, “The DBUG Package”.

Use mysqld --verbose --help to display all the options that mysqld supports.

2.3.4.6 Customizing the PATH for MySQL Tools

Warning
You must exercise great care when editing your system PATH by hand; accidental deletion or modification of any portion of the existing PATH value can leave you with a malfunctioning or even unusable system.

To make it easier to invoke MySQL programs, you can add the path name of the MySQL bin directory to your Windows system PATH environment variable:
Installing MySQL on Microsoft Windows Using a *noinstall* ZIP Archive

- On the Windows desktop, right-click the **My Computer** icon, and select **Properties**.

- Next select the **Advanced** tab from the **System Properties** menu that appears, and click the **Environment Variables** button.

- Under **System Variables**, select **Path**, and then click the **Edit** button. The **Edit System Variable** dialogue should appear.

- Place your cursor at the end of the text appearing in the space marked **Variable Value**. (Use the **End** key to ensure that your cursor is positioned at the very end of the text in this space.) Then enter the complete path name of your MySQL **bin** directory (for example, `C:\Program Files\MySQL\MySQL Server 5.6\bin`).

  **Note**
  
  There must be a semicolon separating this path from any values present in this field.

Dismiss this dialogue, and each dialogue in turn, by clicking **OK** until all of the dialogues that were opened have been dismissed. The new **PATH** value should now be available to any new command shell you open, allowing you to invoke any MySQL executable program by typing its name at the DOS prompt from any directory on the system, without having to supply the path. This includes the servers, the **mysql** client, and all MySQL command-line utilities such as **mysqladmin** and **mysqldump**.

You should not add the MySQL **bin** directory to your Windows **PATH** if you are running multiple MySQL servers on the same machine.

### 2.3.4.7 Starting MySQL as a Windows Service

On Windows, the recommended way to run MySQL is to install it as a Windows service, so that MySQL starts and stops automatically when Windows starts and stops. A MySQL server installed as a service can also be controlled from the command line using **NET** commands, or with the graphical **Services** utility. Generally, to install MySQL as a Windows service you should be logged in using an account that has administrator rights.

**Note**

MySQL Notifier can also be used to monitor the status of the MySQL service.

The **Services** utility (the Windows **Service Control Manager**) can be found in the Windows Control Panel. To avoid conflicts, it is advisable to close the **Services** utility while performing server installation or removal operations from the command line.

### Installing the service

Before installing MySQL as a Windows service, you should first stop the current server if it is running by using the following command:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqladmin" -u root shutdown
```

**Note**

If the MySQL **root** user account has a password, you need to invoke **mysqladmin** with the **-p** option and supply the password when prompted.
Installing MySQL on Microsoft Windows Using a noinstall ZIP Archive

This command invokes the MySQL administrative utility `mysqladmin` to connect to the server and tell it to shut down. The command connects as the MySQL root user, which is the default administrative account in the MySQL grant system.

Note

Users in the MySQL grant system are wholly independent from any operating system users under Windows.

Install the server as a service using this command:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqld" --install
```

The service-installation command does not start the server. Instructions for that are given later in this section.

To make it easier to invoke MySQL programs, you can add the path name of the MySQL bin directory to your Windows system PATH environment variable:

- On the Windows desktop, right-click the My Computer icon, and select Properties.
- Next select the Advanced tab from the System Properties menu that appears, and click the Environment Variables button.
- Under System Variables, select Path, and then click the Edit button. The Edit System Variable dialogue should appear.
- Place your cursor at the end of the text appearing in the space marked Variable Value. (Use the End key to ensure that your cursor is positioned at the very end of the text in this space.) Then enter the complete path name of your MySQL bin directory (for example, C:\Program Files\MySQL\MySQL Server 5.6\bin), and there should be a semicolon separating this path from any values present in this field. Dismiss this dialogue, and each dialogue in turn, by clicking OK until all of the dialogues that were opened have been dismissed. You should now be able to invoke any MySQL executable program by typing its name at the DOS prompt from any directory on the system, without having to supply the path. This includes the servers, the mysql client, and all MySQL command-line utilities such as mysqladmin and mysqldump.

You should not add the MySQL bin directory to your Windows PATH if you are running multiple MySQL servers on the same machine.

Warning

You must exercise great care when editing your system PATH by hand; accidental deletion or modification of any portion of the existing PATH value can leave you with a malfunctioning or even unusable system.

The following additional arguments can be used when installing the service:

- You can specify a service name immediately following the --install option. The default service name is MySQL.
- If a service name is given, it can be followed by a single option. By convention, this should be --defaults-file=file_name to specify the name of an option file from which the server should read options when it starts.

The use of a single option other than --defaults-file is possible but discouraged. --defaults-file is more flexible because it enables you to specify multiple startup options for the server by placing them in the named option file.
You can also specify a `--local-service` option following the service name. This causes the server to run using the LocalService Windows account that has limited system privileges. If both `--defaults-file` and `--local-service` are given following the service name, they can be in any order.

For a MySQL server that is installed as a Windows service, the following rules determine the service name and option files that the server uses:

- If the service-installation command specifies no service name or the default service name (MySQL) following the `--install` option, the server uses the service name of MySQL and reads options from the `[mysqld]` group in the standard option files.

- If the service-installation command specifies a service name other than MySQL following the `--install` option, the server uses that service name. It reads options from the `[mysqld]` group and the group that has the same name as the service in the standard option files. This enables you to use the `[mysqld]` group for options that should be used by all MySQL services, and an option group with the service name for use by the server installed with that service name.

- If the service-installation command specifies a `--defaults-file` option after the service name, the server reads options the same way as described in the previous item, except that it reads options only from the named file and ignores the standard option files.

As a more complex example, consider the following command:

```bash
C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqld"
        --install MySQL --defaults-file=C:\my-opts.cnf
```

Here, the default service name (MySQL) is given after the `--install` option. If no `--defaults-file` option had been given, this command would have the effect of causing the server to read the `[mysqld]` group from the standard option files. However, because the `--defaults-file` option is present, the server reads options from the `[mysqld]` option group, and only from the named file.

**Note**
On Windows, if the server is started with the `--defaults-file` and `--install` options, `--install` must be first. Otherwise, `mysqld.exe` will attempt to start the MySQL server.

You can also specify options as Start parameters in the Windows Services utility before you start the MySQL service.

Finally, before trying to start the MySQL service, make sure the user variables `%TEMP%` and `%TMP%` (and also `%TMPDIR%`, if it has ever been set) for the operating system user who is to run the service are pointing to a folder to which the user has write access. The default user for running the MySQL service is LocalSystem, and the default value for its `%TEMP%` and `%TMP%` is `C:\Windows\Temp`, a directory LocalSystem has write access to by default. However, if there are any changes to that default setup (for example, changes to the user who runs the service or to the mentioned user variables, or the `--tmpdir` option has been used to put the temporary directory somewhere else), the MySQL service might fail to run because write access to the temporary directory has not been granted to the proper user.

**Starting the service**

After a MySQL server instance has been installed as a service, Windows starts the service automatically whenever Windows starts. The service also can be started immediately from the Services utility, or by using an `sc start mysqld_service_name` or `NET START mysqld_service_name` command. `SC` and `NET` commands are not case-sensitive.
When run as a service, `mysqld` has no access to a console window, so no messages can be seen there. If `mysqld` does not start, check the error log to see whether the server wrote any messages there to indicate the cause of the problem. The error log is located in the MySQL data directory (for example, C:\Program Files\MySQL\MySQL Server 5.6\data). It is the file with a suffix of .err.

When a MySQL server has been installed as a service, and the service is running, Windows stops the service automatically when Windows shuts down. The server also can be stopped manually using the Services utility, the sc stop mysqld_service_name command, the NET START mysqld_service_name command, or the mysqladmin shutdown command.

You also have the choice of installing the server as a manual service if you do not wish for the service to be started automatically during the boot process. To do this, use the --install-manual option rather than the --install option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqld" --install-manual
```

### Removing the service

To remove a server that is installed as a service, first stop it if it is running by executing SC STOP mysqld_service_name or NET STOP mysqld_service_name. Then use SC DELETE mysqld_service_name to remove it:

```
C:\> SC DELETE mysql
```

Alternatively, use the mysqld --remove option to remove the service.

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqld" --remove
```

If `mysqld` is not running as a service, you can start it from the command line. For instructions, see Section 2.3.4.5, “Starting MySQL from the Windows Command Line”.

If you encounter difficulties during installation, see Section 2.3.5, “Troubleshooting a Microsoft Windows MySQL Server Installation”.

For more information about stopping or removing a Windows service, see Section 5.7.2.2, “Starting Multiple MySQL Instances as Windows Services”.

### 2.3.4.8 Testing The MySQL Installation

You can test whether the MySQL server is working by executing any of the following commands:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqlshow"
C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqlshow" -u root mysql
C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysqladmin" version status proc
C:\> "C:\Program Files\MySQL\MySQL Server 5.6\bin\mysql" test
```

If `mysqld` is slow to respond to TCP/IP connections from client programs, there is probably a problem with your DNS. In this case, start mysqld with the --skip-name-resolve option and use only localhost and IP addresses in the Host column of the MySQL grant tables. (Be sure that an account exists that specifies an IP address or you may not be able to connect.)

You can force a MySQL client to use a named-pipe connection rather than TCP/IP by specifying the --pipe or --protocol=PIPE option, or by specifying . (period) as the host name. Use the --socket option to specify the name of the pipe if you do not want to use the default pipe name.

If you have set a password for the root account, deleted the anonymous account, or created a new user account, then to connect to the MySQL server you must use the appropriate -u and -p options with the
Troubleshooting a Microsoft Windows MySQL Server Installation

When installing and running MySQL for the first time, you may encounter certain errors that prevent the MySQL server from starting. This section helps you diagnose and correct some of these errors.

Your first resource when troubleshooting server issues is the error log. The MySQL server uses the error log to record information relevant to the error that prevents the server from starting. The error log is located in the data directory specified in your my.ini file. The default data directory location is C:\Program Files\MySQL\MySQL Server 5.6\data, or C:\ProgramData\Microsoft\MySQL on Windows 7 and Windows Server 2008. The C:\ProgramData directory is hidden by default. You need to change your folder options to see the directory and contents. For more information on the error log and understanding the content, see Section 5.4.2, "The Error Log".

For information regarding possible errors, also consult the console messages displayed when the MySQL service is starting. Use the SC_START mysqld_service_name or NET START mysqld_service_name command from the command line after installing mysqld as a service to see any error messages regarding the starting of the MySQL server as a service. See Section 2.3.4.7, "Starting MySQL as a Windows Service".

The following examples show other common error messages you might encounter when installing MySQL and starting the server for the first time:

- If the MySQL server cannot find the mysql privileges database or other critical files, it displays these messages:

```
System error 1067 has occurred.
Fatal error: Can't open and lock privilege tables:
Table 'mysql.user' doesn't exist
```

These messages often occur when the MySQL base or data directories are installed in different locations than the default locations (C:\Program Files\MySQL\MySQL Server 5.6 and C:\Program Files\MySQL\MySQL Server 5.6\data, respectively).

This situation can occur when MySQL is upgraded and installed to a new location, but the configuration file is not updated to reflect the new location. In addition, old and new configuration files might conflict. Be sure to delete or rename any old configuration files when upgrading MySQL.

If you have installed MySQL to a directory other than C:\Program Files\MySQL\MySQL Server 5.6, ensure that the MySQL server is aware of this through the use of a configuration (my.ini) file. Put the my.ini file in your Windows directory, typically C:\WINDIR. To determine its exact location from the value of the WINDIR environment variable, issue the following command from the command prompt:

```
C:\> echo %WINDIR%
```

You can create or modify an option file with any text editor, such as Notepad. For example, if MySQL is installed in E:\mysql and the data directory is D:\MySQLdata, you can create the option file and set up a [mysqld] section to specify values for the basedir and datadir options:

```
[mysqld]
```
# set basedir to your installation path
basedir=E:/mysql

# set datadir to the location of your data directory
datadir=D:/MySQLdata

Microsoft Windows path names are specified in option files using (forward) slashes rather than backslashes. If you do use backslashes, double them:

[mysqld]
# set basedir to your installation path
basedir=C:\Program Files\MySQL\MySQL Server 5.6
# set datadir to the location of your data directory
datadir=D:\MySQLdata

The rules for use of backslash in option file values are given in Section 4.2.2.2, “Using Option Files”.

If you change the `datadir` value in your MySQL configuration file, you must move the contents of the existing MySQL data directory before restarting the MySQL server.

See Section 2.3.4.2, “Creating an Option File”.

- If you reinstall or upgrade MySQL without first stopping and removing the existing MySQL service and install MySQL using the MySQL Installer, you might see this error:

```
Error: Cannot create Windows service for MySql. Error: 0
```

This occurs when the Configuration Wizard tries to install the service and finds an existing service with the same name.

One solution to this problem is to choose a service name other than `mysql` when using the configuration wizard. This enables the new service to be installed correctly, but leaves the outdated service in place. Although this is harmless, it is best to remove old services that are no longer in use.

To permanently remove the old `mysql` service, execute the following command as a user with administrative privileges, on the command line:

```
C:\> SC DELETE mysql
[SC] DeleteService SUCCESS
```

If the `SC` utility is not available for your version of Windows, download the `delsrv` utility from [http://www.microsoft.com/windows2000/techinfo/reskit/tools/existing/delsrv-o.asp](http://www.microsoft.com/windows2000/techinfo/reskit/tools/existing/delsrv-o.asp) and use the `delsrv mysql` syntax.

## 2.3.6 Windows Postinstallation Procedures

GUI tools exist that perform most of the tasks described in this section, including:

- **MySQL Installer**: Used to install and upgrade MySQL products.
- **MySQL Workbench**: Manages the MySQL server and edits SQL statements.
- **MySQL Notifier**: Starts, stops, or restarts the MySQL server, and monitors its status.
- **MySQL for Excel**: Edits MySQL data with Microsoft Excel.

On Windows, you need not create the data directory and the grant tables. MySQL distributions for Windows include the grant tables with a set of preinitialized accounts in the `mysql` database under the data directory.
Regarding passwords, if you installed MySQL using the MySQL Installer, you may have already assigned passwords to the accounts. (See Section 2.3.3, “MySQL Installer for Windows”.) Otherwise, use the password-assignment procedure given in Section 2.10.4, “Securing the Initial MySQL Accounts”.

Before assigning passwords, you might want to try running some client programs to make sure that you can connect to the server and that it is operating properly. Make sure that the server is running (see Section 2.3.4.4, “Starting the Server for the First Time”). You can also set up a MySQL service that runs automatically when Windows starts (see Section 2.3.4.7, “Starting MySQL as a Windows Service”).

These instructions assume that your current location is the MySQL installation directory and that it has a bin subdirectory containing the MySQL programs used here. If that is not true, adjust the command path names accordingly.

If you installed MySQL using MySQL Installer (see Section 2.3.3, “MySQL Installer for Windows”), the default installation directory is C:\Program Files\MySQL\MySQL Server 5.6:

C:\> cd "C:\Program Files\MySQL\MySQL Server 5.6"

A common installation location for installation from a ZIP archive is C:\mysql:

C:\> cd C:\mysql

Alternatively, add the bin directory to your PATH environment variable setting. That enables your command interpreter to find MySQL programs properly, so that you can run a program by typing only its name, not its path name. See Section 2.3.4.6, “Customizing the PATH for MySQL Tools”.

With the server running, issue the following commands to verify that you can retrieve information from the server. The output should be similar to that shown here.

Use mysqlshow to see what databases exist:

C:\> bin\mysqlshow

The list of installed databases may vary, but will always include the minimum of mysql and information_schema.

The preceding command (and commands for other MySQL programs such as mysql) may not work if the correct MySQL account does not exist. For example, the program may fail with an error, or you may not be able to view all databases. If you installed MySQL using MySQL Installer, the root user will have been created automatically with the password you supplied. In this case, you should use the -u root and -p options. (You must use those options if you have already secured the initial MySQL accounts.) With -p, the client program prompts for the root password. For example:

C:\> bin\mysqlshow -u root -p
Enter password: (enter root password here)
If you specify a database name, `mysqlshow` displays a list of the tables within the database:

```
C:\> bin\mysqlshow mysql
Database: mysql
+---------------------------+
|          Tables           |
+---------------------------+
| columns_priv              |
| db                        |
| event                     |
| func                      |
| general_log               |
| help_category             |
| help_keyword              |
| help_relation             |
| help_topic                |
| innodb_index_stats        |
| innodb_table_stats        |
| ndb_binlog_index          |
| plugin                    |
| proc                      |
| procs_priv                |
| proxies_priv              |
| servers                   |
| slave_master_info         |
| slave_relay_log_info      |
| slave_worker_info         |
| slow_log                  |
| tables_priv               |
| time_zone                 |
| time_zone_leap_second     |
| time_zone_name            |
| time_zone_transition      |
| time_zone_transition_type |
| user                      |
+---------------------------+
```

Use the `mysql` program to select information from a table in the `mysql` database:

```
C:\> bin\mysql -e "SELECT User, Host, plugin FROM mysql.user" mysql
+------+-----------+-----------------------+
| User | Host      | plugin                |
+------+-----------+-----------------------+
| root | localhost | mysql_native_password |
+------+-----------+-----------------------+
```

For more information about `mysql` and `mysqlshow`, see Section 4.5.1, “mysql — The MySQL Command-Line Client”, and Section 4.5.6, “mysqlshow — Display Database, Table, and Column Information”.

### 2.3.7 Windows Platform Restrictions

The following restrictions apply to use of MySQL on the Windows platform:

- **Process memory**

  On Windows 32-bit platforms, it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).
Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**

  When using MyISAM tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL data directory location.

  This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main .frm files in the default data directory configured with the datadir option.

- **Limited number of ports**

  Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

  For more information about this problem, see [http://support.microsoft.com/default.aspx?scid=kb;en-us;196271](http://support.microsoft.com/default.aspx?scid=kb;en-us;196271).

- **DATA DIRECTORY and INDEX DIRECTORY**

  The DATA DIRECTORY option for CREATE TABLE is supported on Windows only for InnoDB tables, as described in Section 14.6.3.4, “Creating a Tablespace Outside of the Data Directory”. For MyISAM and other storage engines, the DATA DIRECTORY and INDEX DIRECTORY options for CREATE TABLE are ignored on Windows and any other platforms with a nonfunctional realpath() call.

- **DROP DATABASE**

  You cannot drop a database that is in use by another session.

- **Case-insensitive names**

  File names are not case-sensitive on Windows, so MySQL database and table names are also not case-sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See Section 9.2.3, "Identifier Case Sensitivity".

- **Directory and file names**

  On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

  ```
  datadir="C:/私たちのプロジェクトのデータ"
  ```

  The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in LOAD DATA.

- **The \\ path name separator character**

  Path name components in Windows are separated by the \ character, which is also the escape character in MySQL. If you are using LOAD DATA or SELECT ... INTO OUTFILE, use Unix-style file names with / characters:
2.4 Installing MySQL on OS X

For a list of OS X versions that the MySQL server supports, see https://www.mysql.com/support/supportedplatforms/database.html.

MySQL for OS X is available in a number of different forms:

- Native Package Installer, which uses the native OS X installer (DMG) to walk you through the installation of MySQL. For more information, see Section 2.4.2, “Installing MySQL on OS X Using Native Packages”. You can use the package installer with OS X. The user you use to perform the installation must have administrator privileges.

- Compressed TAR archive, which uses a file packaged using the Unix tar and gzip commands. To use this method, you will need to open a Terminal window. You do not need administrator privileges using this method, as you can install the MySQL server anywhere using this method. For more information on using this method, you can use the generic instructions for using a tarball, Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

In addition to the core installation, the Package Installer also includes Section 2.4.3, “Installing a MySQL Launch Daemon” and Section 2.4.4, “Installing and Using the MySQL Preference Pane”, both of which simplify the management of your installation.

For additional information on using MySQL on OS X, see Section 2.4.1, “General Notes on Installing MySQL on OS X”.

2.4.1 General Notes on Installing MySQL on OS X

You should keep the following issues and notes in mind:
As of MySQL server 5.6.26, the DMG bundles a launchd daemon instead of the deprecated startup item. Startup items do not function as of OS X 10.10 (Yosemite), so using launchd is preferred. The available MySQL preference pane under OS X System Preferences was also updated to use launchd.

You may need (or want) to create a specific mysql user to own the MySQL directory and data. You can do this through the Directory Utility, and the mysql user should already exist. For use in single user mode, an entry for _mysql (note the underscore prefix) should already exist within the system /etc/passwd file.

Because the MySQL package installer installs the MySQL contents into a version and platform specific directory, you can use this to upgrade and migrate your database between versions. You will need to either copy the data directory from the old version to the new version, or alternatively specify an alternative datadir value to set location of the data directory. By default, the MySQL directories are installed under /usr/local/.

You might want to add aliases to your shell's resource file to make it easier to access commonly used programs such as mysql and mysqladmin from the command line. The syntax for bash is:

```bash
alias mysql=/usr/local/mysql/bin/mysql
alias mysqladmin=/usr/local/mysql/bin/mysqladmin
```

For tcs, use:

```bash
alias mysql /usr/local/mysql/bin/mysql
alias mysqladmin /usr/local/mysql/bin/mysqladmin
```

Even better, add /usr/local/mysql/bin to your PATH environment variable. You can do this by modifying the appropriate startup file for your shell. For more information, see Section 4.2.1, “Invoking MySQL Programs”.

After you have copied over the MySQL database files from the previous installation and have successfully started the new server, you should consider removing the old installation files to save disk space. Additionally, you should also remove older versions of the Package Receipt directories located in /Library/Receipts/mysql-VERSION.pkg.

Prior to OS X 10.7, MySQL server was bundled with OS X Server.

### 2.4.2 Installing MySQL on OS X Using Native Packages

**Note**

Before proceeding with the installation, be sure to stop all running MySQL server instances by using either the MySQL Manager Application (on OS X Server), the preference pane, or mysqladmin shutdown on the command line.

To install MySQL using the package installer:

1. Download the disk image (.dmg) file (the community version is available here) that contains the MySQL package installer. Double-click the file to mount the disk image and see its contents.
2. Double-click the MySQL installer package. It will be named according to the MySQL version and the OS X version you have chosen. For example, if you have downloaded the package for MySQL 5.6.47 and OS X 10.8, double-click `mysql-5.6.47-osx-10.8-x86_64.pkg`.

3. You will be presented with the opening installer dialog. Click **Continue** to begin installation.
4. If you have downloaded the community version of MySQL, you will be shown a copy of the relevant GNU General Public License. Click Continue and then Agree to continue.

5. From the Installation Type page you can either click Install to execute the installation wizard using all defaults, click Customize to alter which components to install (MySQL server, Preference Pane, Launchd Support -- all enabled by default).

Note

Although the Change Install Location option is visible, the installation location cannot be changed.
Figure 2.15 MySQL Package Installer: Installation Type
6. Click **Install** to begin the installation process.

7. Once the installation has been completed successfully, you will be shown an **Install Succeeded** message with a short summary. Now, **Close** the wizard and begin using the MySQL server.
MySQL server is now installed, but it is not loaded (or started) by default. Use either launchctl from the command line, or start MySQL by clicking "Start" using the MySQL preference pane. For additional information, see Section 2.4.3, "Installing a MySQL Launch Daemon", and Section 2.4.4, "Installing and Using the MySQL Preference Pane". Use the MySQL Preference Pane or launchd to configure MySQL to automatically start at bootup.

When installing using the package installer, the files are installed into a directory within `/usr/local` matching the name of the installation version and platform. For example, the installer file `mysql-5.6.47-osx10.8-x86_64.dmg` installs MySQL into `/usr/local/mysql-5.6.47-osx10.8-x86_64/`. The following table shows the layout of the installation directory.

<table>
<thead>
<tr>
<th>Directory</th>
<th>Contents of Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin, scripts</td>
<td><code>mysqlld</code> server, client and utility programs</td>
</tr>
<tr>
<td>data</td>
<td>Log files, databases</td>
</tr>
<tr>
<td>docs</td>
<td>Helper documents, like the Release Notes and build information</td>
</tr>
<tr>
<td>include</td>
<td>Include (header) files</td>
</tr>
<tr>
<td>lib</td>
<td>Libraries</td>
</tr>
<tr>
<td>man</td>
<td>Unix manual pages</td>
</tr>
</tbody>
</table>
Directory | Contents of Directory
--- | ---
mysql-test | MySQL test suite
share | Miscellaneous support files, including error messages, sample configuration files, SQL for database installation
sql-bench | Benchmarks
support-files | Scripts and sample configuration files
/tmp/mysql.sock | Location of the MySQL Unix socket

During the package installer process, a symbolic link from `/usr/local/mysql` to the version/platform specific directory created during installation will be created automatically.

### 2.4.3 Installing a MySQL Launch Daemon

OS X uses launch daemons to automatically start, stop, and manage processes and applications such as MySQL.

**Note**

Before MySQL 5.6.26, the OS X builds installed startup items instead of launchd daemons. However, startup items do not function as of OS X 10.10 (Yosemite). The OS X builds now install launchd daemons.

By default, the installation package (DMG) on OS X installs a launchd file named `/Library/LaunchDaemons/com.oracle.oss.mysql.mysqld.plist` that contains a plist definition similar to:

```xml
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE plist PUBLIC "-//Apple Computer//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
  <dict>
    <key>Label</key> <string>com.oracle.oss.mysql.mysqld</string>
    <key>ProcessType</key> <string>Interactive</string>
    <key>Disabled</key> <false/>
    <key>RunAtLoad</key> <true/>
    <key>KeepAlive</key> <true/>
    <key>SessionCreate</key> <true/>
    <key>LaunchOnlyOnce</key> <false/>
    <key>UserName</key> <string>_mysql</string>
    <key>GroupName</key> <string>_mysql</string>
    <key>ExitTimeOut</key> <integer>600</integer>
    <key>Program</key> <string>/usr/local/mysql/bin/mysqld</string>
    <key>ProgramArguments</key> <array>
      <string>/usr/local/mysql/bin/mysqld</string>
      <string>--user=_mysql</string>
      <string>--basedir=/usr/local/mysql</string>
      <string>--datadir=/usr/local/mysql/data</string>
      <string>--plugin-dir=/usr/local/mysql/lib/plugin</string>
      <string>--log-error=/usr/local/mysql/data/mysqld.local.err</string>
      <string>--pid-file=/usr/local/mysql/data/mysqld.local.pid</string>
    </array>
    <key>WorkingDirectory</key> <string>/usr/local/mysql</string>
  </dict>
</plist>
```
Installing a MySQL Launch Daemon

Note

Some users report that adding a plist DOCTYPE declaration causes the launchd operation to fail, despite it passing the lint check. We suspect it's a copy-n-paste error. The md5 checksum of a file containing the above snippet is 60d7963a0bb2994b69b8b9c123db09df.

To enable the launchd service, you can either:

- Click **Start MySQL Server** from the MySQL preference pane.

**Figure 2.18 MySQL Preference Pane: Location**
• Or, manually load the launchd file.

shell> cd /Library/LaunchDaemons
shell> sudo launchctl load -F com.oracle.oss.mysql.mysqld.plist

• To configure MySQL to automatically start at bootup, you can:

shell> sudo launchctl load -w com.oracle.oss.mysql.mysqld.plist

Note
When upgrading MySQL server, the launchd installation process will remove the old startup items that were installed with MySQL server 5.6.25 and below.

2.4.4 Installing and Using the MySQL Preference Pane

The MySQL Installation Package includes a MySQL preference pane that enables you to start, stop, and control automated startup during boot of your MySQL installation.

This preference pane is installed by default, and is listed under your system's System Preferences window.
To install the MySQL Preference Pane:

1. Download the disk image (.dmg) file (the community version is available [here](#)) that contains the MySQL package installer. Double-click the file to mount the disk image and see its contents.
2. Go through the process of installing the MySQL server, as described in the documentation at Section 2.4.2, "Installing MySQL on OS X Using Native Packages".

3. Click **Customize** at the **Installation Type** step. The "Preference Pane" option is listed there and enabled by default; make sure it is not deselected.
4. Complete the MySQL server installation process.

Note

The MySQL preference pane only starts and stops MySQL installation installed from the MySQL package installation that have been installed in the default location.

Once the MySQL preference pane has been installed, you can control your MySQL server instance using the preference pane. To use the preference pane, open the System Preferences... from the Apple menu. Select the MySQL preference pane by clicking the MySQL icon within the preference panes list.
Figure 2.23 MySQL Preference Pane: Location
The MySQL Preference Pane shows the current status of the MySQL server, showing **stopped** (in red) if the server is not running and **running** (in green) if the server has already been started. The preference pane also shows the current setting for whether the MySQL server has been set to start automatically.

- **To start the MySQL server using the preference pane:**
  
  Click **Start MySQL Server**. You may be prompted for the username and password of a user with administrator privileges to start the MySQL server.

- **To stop the MySQL server using the preference pane:**
  
  Click **Stop MySQL Server**. You may be prompted for the username and password of a user with administrator privileges to stop the MySQL server.

- **To automatically start the MySQL server when the system boots:**
  
  Check the check box next to **Automatically Start MySQL Server on Startup**.

- **To disable automatic MySQL server startup when the system boots:**
  
  Uncheck the check box next to **Automatically Start MySQL Server on Startup**.

You can close the **System Preferences...** window once you have completed your settings.

### 2.5 Installing MySQL on Linux

Linux supports a number of different solutions for installing MySQL. We recommend that you use one of the distributions from Oracle, for which several methods for installation are available:
Table 2.7 Linux Installation Methods and Information

</table>

As an alternative, you can use the package manager on your system to automatically download and install MySQL with packages from the native software repositories of your Linux distribution. These native packages are often several versions behind the currently available release. You will also normally be unable to install development milestone releases (DMRs), as these are not usually made available in the native repositories. For more information on using the native package installers, see Section 2.5.7, “Installing MySQL on Linux from the Native Software Repositories”.

Note

For many Linux installations, you will want to set up MySQL to be started automatically when your machine starts. Many of the native package installations perform this operation for you, but for source, binary and RPM solutions you may need to set this up separately. The required script, `mysql.server`, can be found in the `support-files` directory under the MySQL installation directory or in a MySQL source tree. You can install it as `/etc/init.d/mysql` for automatic MySQL startup and shutdown. See Section 4.3.3, “mysql.server — MySQL Server Startup Script”.

2.5.1 Installing MySQL on Linux Using the MySQL Yum Repository

The MySQL Yum repository for Oracle Linux, Red Hat Enterprise Linux, and CentOS provides RPM packages for installing the MySQL server, client, MySQL Workbench, MySQL Utilities, MySQL Router, MySQL Shell, Connector/ODBC, Connector/Python and so on (not all packages are available for all the distributions; see Installing Additional MySQL Products and Components with Yum for details).

Before You Start

As a popular, open-source software, MySQL, in its original or re-packaged form, is widely installed on many systems from various sources, including different software download sites, software repositories, and so on. The following instructions assume that MySQL is not already installed on your system using a third-party-distributed RPM package; if that is not the case, follow the instructions given in Section 2.11.5, “Upgrading MySQL with the MySQL Yum Repository” or Section 2.5.2, “Replacing a Third-Party Distribution of MySQL Using the MySQL Yum Repository”.

126
Steps for a Fresh Installation of MySQL

Follow the steps below to install the latest GA release of MySQL (from the MySQL 5.7 series currently) with the MySQL Yum repository:

Adding the MySQL Yum Repository

First, add the MySQL Yum repository to your system's repository list. This is a one-time operation, which can be performed by installing an RPM provided by MySQL. Follow these steps:

b. Select and download the release package for your platform.

c. Install the downloaded release package with the following command, replacing `platform-and-version-specific-package-name` with the name of the downloaded RPM package:

```
shell> sudo yum localinstall platform-and-version-specific-package-name.rpm
```

For an EL6-based system, the command is in the form of:

```
shell> sudo yum localinstall mysql57-community-release-el6-{version-number}.noarch.rpm
```

For an EL7-based system:

```
shell> sudo yum localinstall mysql57-community-release-el7-{version-number}.noarch.rpm
```

The installation command adds the MySQL Yum repository to your system's repository list and downloads the GnuPG key to check the integrity of the software packages. See Section 2.1.3.2, “Signature Checking Using GnuPG” for details on GnuPG key checking.

You can check that the MySQL Yum repository has been successfully added by the following command:

```
shell> yum repolist enabled | grep "mysql.*-community.*"
```

Note

Once the MySQL Yum repository is enabled on your system, any system-wide update by the `yum update` command will upgrade MySQL packages on your system and also replace any native third-party packages, if Yum finds replacements for them in the MySQL Yum repository; see Section 2.11.5, “Upgrading MySQL with the MySQL Yum Repository” and, for a discussion on some possible effects of that on your system, see Upgrading the Shared Client Libraries.

Selecting a Release Series

When using the MySQL Yum repository, the latest GA series (currently MySQL 5.7) is selected for installation by default. If this is what you want, you can skip to the next step, Installing MySQL.

Within the MySQL Yum repository, different release series of the MySQL Community Server are hosted in different subrepositories. The subrepository for the latest GA series (currently MySQL 5.7) is enabled
by default, and the subrepositories for all other series (for example, the MySQL 5.6 series) are disabled by default. Use this command to see all the subrepositories in the MySQL Yum repository, and see which of them are enabled or disabled:

```
shell> yum repolist all | grep mysql
```

To install the latest release from the latest GA series, no configuration is needed. To install the latest release from a specific series other than the latest GA series, disable the subrepository for the latest GA series and enable the subrepository for the specific series before running the installation command. If your platform supports `yum-config-manager`, you can do that by issuing these commands, which disable the subrepository for the 5.7 series and enable the one for the 5.6 series:

```
shell> sudo yum-config-manager --disable mysql57-community
shell> sudo yum-config-manager --enable mysql56-community
```

Besides using `yum-config-manager` command, you can also select a release series by editing manually the `/etc/yum.repos.d/mysql-community.repo` file. This is a typical entry for a release series' subrepository in the file:

```
[mysql57-community]
name=MySQL 5.7 Community Server
baseurl=http://repo.mysql.com/yum/mysql-5.7-community/el/6/$basearch/
enabled=1
gpgcheck=1
gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-mysql
```

Find the entry for the subrepository you want to configure, and edit the `enabled` option. Specify `enabled=0` to disable a subrepository, or `enabled=1` to enable a subrepository. For example, to install MySQL 5.6, make sure you have `enabled=0` for the above subrepository entry for MySQL 5.7, and have `enabled=1` for the entry for the 5.6 series:

```
# Enable to use MySQL 5.6
[mysql56-community]
name=MySQL 5.6 Community Server
baseurl=http://repo.mysql.com/yum/mysql-5.6-community/el/6/$basearch/
enabled=1
gpgcheck=1
gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-mysql
```

You should only enable subrepository for one release series at any time. When subrepositories for more than one release series are enabled, the latest series will be used by Yum.

Verify that the correct subrepositories have been enabled and disabled by running the following command and checking its output:

```
shell> yum repolist enabled | grep mysql
```

## Installing MySQL

Install MySQL by the following command:

```
shell> sudo yum install mysql-community-server
```

This installs the package for MySQL server (`mysql-community-server`) and also packages for the components required to run the server, including packages for the client (`mysql-community-`
Installing MySQL on Linux Using the MySQL Yum Repository

client), the common error messages and character sets for client and server (mysql-community-common), and the shared client libraries (mysql-community-libs).

Starting the MySQL Server

Start the MySQL server with the following command:

```
shell> sudo service mysqld start
```

This is a sample output of the above command:

```
Starting mysqld:[ OK ]
```

You can check the status of the MySQL server with the following command:

```
shell> sudo service mysqld status
```

This is a sample output of the above command:

```
mysqld (pid 3066) is running.
```

Securing the MySQL Installation

The program mysql_secure_installation allows you to perform important operations like setting the root password, removing anonymous users, and so on. Always run it to secure your MySQL installation:

```
shell> mysql_secure_installation
```

It is important to remember the root password you set. See Section 4.4.5, “mysql_secure_installation — Improve MySQL Installation Security” for details.

For more information on the postinstallation procedures, see Section 2.10, "Postinstallation Setup and Testing".

Note

Compatibility Information for EL7-based platforms: The following RPM packages from the native software repositories of the platforms are incompatible with the package from the MySQL Yum repository that installs the MySQL server. Once you have installed MySQL using the MySQL Yum repository, you will not be able to install these packages (and vice versa).

- akonadi-mysql

Installing Additional MySQL Products and Components with Yum

You can use Yum to install and manage individual components of MySQL. Some of these components are hosted in sub-repositories of the MySQL Yum repository: for example, the MySQL Connectors are to be found in the MySQL Connectors Community sub-repository, and the MySQL Workbench in MySQL Tools Community. You can use the following command to list the packages for all the MySQL components available for your platform from the MySQL Yum repository:

```
shell> sudo yum --disablerepo=* --enablerepo=mysql*-community* list available
```

Install any packages of your choice with the following command, replacing package-name with name of the package:
Replacing a Third-Party Distribution of MySQL Using the MySQL Yum Repository

For example, to install MySQL Workbench:

```
shell> sudo yum install mysql-workbench-community
```

To install the shared client libraries:

```
shell> sudo yum install mysql-community-libs
```

Updating MySQL with Yum

Besides installation, you can also perform updates for MySQL products and components using the MySQL Yum repository. See Section 2.11.5, “Upgrading MySQL with the MySQL Yum Repository” for details.

2.5.2 Replacing a Third-Party Distribution of MySQL Using the MySQL Yum Repository

For supported Yum-based platforms (see Section 2.5.1, “Installing MySQL on Linux Using the MySQL Yum Repository”, for a list), you can replace a third-party distribution of MySQL with the latest GA release (from the MySQL 5.7 series currently) from the MySQL Yum repository. According to how your third-party distribution of MySQL was installed, there are different steps to follow:

Replacing a Native Third-Party Distribution of MySQL

If you have installed a third-party distribution of MySQL from a native software repository (that is, a software repository provided by your own Linux distribution), follow these steps:

1. Backing Up Your Database

   To avoid loss of data, always back up your database before trying to replace your MySQL installation using the MySQL Yum repository. See Chapter 7, Backup and Recovery, on how to back up your database.

2. Adding the MySQL Yum Repository

   Add the MySQL Yum repository to your system's repository list by following the instructions given in Adding the MySQL Yum Repository.

3. Replacing the Native Third-Party Distribution by a Yum Update

   By design, the MySQL Yum repository will replace your native, third-party MySQL with the latest GA release (from the MySQL 5.7 series currently) from the MySQL Yum repository when you perform a `yum update` command on the system, or a `yum update mysql-server`.

   After updating MySQL using the Yum repository, applications compiled with older versions of the shared client libraries should continue to work. However, if you want to recompile applications and dynamically link them with the updated libraries, see Upgrading the Shared Client Libraries, for some special considerations.

Replacing a Nonnative Third-Party Distribution of MySQL

If you have installed a third-party distribution of MySQL from a nonnative software repository (that is, a software repository not provided by your own Linux distribution), follow these steps:
Replacing a Third-Party Distribution of MySQL Using the MySQL Yum Repository

**Back up Your Database**

To avoid loss of data, always back up your database before trying to replace your MySQL installation using the MySQL Yum repository. See Chapter 7, *Backup and Recovery*, on how to back up your database.

**Stopping Yum from Receiving MySQL Packages from Third-Party, Nonnative Repositories**

Before you can use the MySQL Yum repository for installing MySQL, you must stop your system from receiving MySQL packages from any third-party, nonnative Yum repositories.

For example, if you have installed MariaDB using their own software repository, get a list of the installed MariaDB packages using the following command:

```
shell> yum list installed mariadb*
```

This is a sample output for the command:

<table>
<thead>
<tr>
<th>Package</th>
<th>Version</th>
<th>Repository</th>
</tr>
</thead>
<tbody>
<tr>
<td>MariaDB-common.i686</td>
<td>10.0.4-1</td>
<td>@mariadb</td>
</tr>
<tr>
<td>MariaDB-compat.i686</td>
<td>10.0.4-1</td>
<td>@mariadb</td>
</tr>
<tr>
<td>MariaDB-server.i686</td>
<td>10.0.4-1</td>
<td>@mariadb</td>
</tr>
</tbody>
</table>

From the command output, we can identify the installed packages (*MariaDB-common*, *MariaDB-compat*, and *MariaDB-server*) and the source of them (a nonnative software repository named mariadb).

As another example, if you have installed Percona using their own software repository, get a list of the installed Percona packages using the following command:

```
shell> yum list installed Percona*
```

This is a sample output for the command:

<table>
<thead>
<tr>
<th>Package</th>
<th>Version</th>
<th>Repository</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percona-Server-client-55</td>
<td>5.5.39-rel36.0.el6</td>
<td>@percona-release-i386</td>
</tr>
<tr>
<td>Percona-Server-server-55</td>
<td>5.5.39-rel36.0.el6</td>
<td>@percona-release-i386</td>
</tr>
<tr>
<td>Percona-Server-shared-55</td>
<td>5.5.39-rel36.0.el6</td>
<td>@percona-release-i386</td>
</tr>
<tr>
<td>percona-release.noarch</td>
<td>0.1-3</td>
<td>@/percona-release-0.1-3.noarch</td>
</tr>
</tbody>
</table>

From the command output, we can identify the installed packages (*Percona-Server-client*, *Percona-Server-server*, *Percona-Server-shared*, and *percona-release.noarch*) and the source of them (a nonnative software repository named percona-release).

If you are not sure which third-party MySQL fork you have installed, this command should reveal it and list the RPM packages installed for it, as well as the third-party repository that supplies the packages:

```
shell> yum --disablerepo=* provides mysql*
```

The next step is to stop Yum from receiving packages from the nonnative repository. If the `yum-config-manager` utility is supported on your platform, you can, for example, use this command for stopping delivery from MariaDB:

```
shell> sudo yum-config-manager --disable mariadb
```

And use this command for stopping delivery from Percona:

```
shell> sudo yum-config-manager --disable percona-release
```
You can perform the same task by removing the entry for the software repository existing in one of the repository files under the `/etc/yum.repos.d/` directory. This is how the entry typically looks like for MariaDB:

```
[mariadb] name = MariaDB
baseurl = [base URL for repository]
gpgkey = [URL for GPG key]
gpgcheck =1
```

The entry is usually found in the file `/etc/yum.repos.d/MariaDB.repo` for MariaDB—delete the file, or remove entry from it (or from the file in which you find the entry).

**Note**

This step is not necessary for an installation that was configured with a Yum repository release package (like Percona) if you are going to remove the release package (`percona-release.noarch` for Percona), as shown in the uninstall command for Percona in Step 3 below.

### Uninstalling the Nonnative Third-Party MySQL Distribution of MySQL

The nonnative third-party MySQL distribution must first be uninstalled before you can use the MySQL Yum repository to install MySQL. For the MariaDB packages found in Step 2 above, uninstall them with the following command:

```
shell> sudo yum remove MariaDB-common MariaDB-compat MariaDB-server
```

For the Percona packages we found in Step 2 above:

```
shell> sudo yum remove Percona-Server-client-55 Percona-Server-server-55 Percona-Server-shared-55.i686 percona-release
```

### Installing MySQL with the MySQL Yum Repository

Then, install MySQL with the MySQL Yum repository by following the instructions given in Section 2.5.1, “Installing MySQL on Linux Using the MySQL Yum Repository”.

**Important**

- If you have chosen to replace your third-party MySQL distribution with a newer version of MySQL from the MySQL Yum repository, remember to run `mysql_upgrade` after the server starts, to check and possibly resolve any incompatibilities between the old data and the upgraded software. `mysql_upgrade` also performs other functions; see Section 4.4.7, “mysql_upgrade — Check and Upgrade MySQL Tables” for details.

- For EL7-based platforms: See Compatibility Information for EL7-based platforms [129].

### 2.5.3 Installing MySQL on Linux Using the MySQL APT Repository

The MySQL APT repository provides `deb` packages for installing and managing the MySQL server, client, and other components on Debian and Ubuntu platforms.
Instructions for using the MySQL APT Repository are available in A Quick Guide to Using the MySQL APT Repository.

2.5.4 Installing MySQL on Linux Using the MySQL SLES Repository

The MySQL SLES repository provides RPM packages for installing and managing the MySQL server, client, and other components on SUSE Enterprise Linux Server.

Instructions for using the MySQL SLES repository are available in A Quick Guide to Using the MySQL SLES Repository.

Note

The MySQL SLES repository is now in development release. We encourage you to try it and provide us with feedback. Please report any bugs or inconsistencies you observe to our Bugs Database.

2.5.5 Installing MySQL on Linux Using RPM Packages from Oracle

The recommended way to install MySQL on RPM-based Linux distributions is by using the RPM packages provided by Oracle. There are two sources for obtaining them, for the Community Edition of MySQL:

• From the MySQL software repositories:
  • The MySQL Yum repository (see Section 2.5.1, “Installing MySQL on Linux Using the MySQL Yum Repository” for details).
  • The MySQL SLES repository (see Section 2.5.4, “Installing MySQL on Linux Using the MySQL SLES Repository” for details).
  • From the MySQL Downloads page in the MySQL Developer Zone.

Note

RPM distributions of MySQL are also provided by other vendors. Be aware that they may differ from those built by Oracle in features, capabilities, and conventions (including communication setup), and that the installation instructions in this manual do not necessarily apply to them. The vendor's instructions should be consulted instead.

If you have such a third-party distribution of MySQL running on your system and now want to migrate to Oracle's distribution using the RPM packages downloaded from the MySQL Developer Zone, see Compatibility with RPM Packages from Other Vendors below. The preferred method of migration, however, is to use the MySQL Yum repository or MySQL SLES repository.

There are two kinds of RPM packages for installing MySQL 5.6:

• The older kind: Their package names started with MYSQL-. They are available from the MySQL Downloads page in the MySQL Developer Zone. The instructions given in this section are for using these packages.

• The newer kind: Their package names started with mysql-community- or mysql-commercial-. They are available from the MySQL Yum repository and MySQL SLES repository. If, instead of configuring your system to install these RPM directly from the MySQL repositories (which is recommended), you are downloading the packages from the repositories and then installing them
manually in separate steps, use the installation commands given for the MySQL 5.7 RPMs in Installing MySQL on Linux Using RPM Packages from Oracle, but consult this section for information like installation layout, server initialization, root password, and so on.

RPM packages for MySQL are listed in the following tables:

**Table 2.8 RPM Packages for MySQL Community Edition**

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL-server</td>
<td>Database server and related tools</td>
</tr>
<tr>
<td>MySQL-client</td>
<td>MySQL client applications and tools</td>
</tr>
<tr>
<td>MySQL-devel</td>
<td>Development header files and libraries for MySQL database client applications</td>
</tr>
<tr>
<td>MySQL-shared</td>
<td>Shared libraries for MySQL database client applications</td>
</tr>
<tr>
<td>MySQL-shared-compat</td>
<td>Shared compatibility libraries for previous MySQL installations</td>
</tr>
<tr>
<td>MySQL-embedded</td>
<td>MySQL embedded library</td>
</tr>
<tr>
<td>MySQL-test</td>
<td>Test suite for the MySQL server</td>
</tr>
</tbody>
</table>

Dependency relationships exist among some of the packages. If you plan to install many of the packages, you may wish to download the RPM bundle `tar` file instead, which contains all the RPM packages listed above, so that you need not download them separately.

The full names for the RPMs have the following syntax:

```
packagename-version-distribution-arch.rpm
```

The `distribution` and `arch` values indicate the Linux distribution and the processor type for which the package was built. See the table below for lists of the distribution identifiers:

**Table 2.9 MySQL Linux RPM Package Distribution Identifiers**

<table>
<thead>
<tr>
<th>distribution Value</th>
<th>Intended Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>el6, el7</td>
<td>Red Hat Enterprise Linux/Oracle Linux/CentOS 5, 6, or 7</td>
</tr>
<tr>
<td>sles11, sles12</td>
<td>SUSE Linux Enterprise Server 11 or 12</td>
</tr>
<tr>
<td>linux_glibc2.5</td>
<td>Distribution independent; run on any RPM-based Linux distribution</td>
</tr>
</tbody>
</table>

To see all files in an RPM package (for example, `MySQL-server`), use the following command:

```
shell> rpm -qpl MySQL-server-version-distribution-arch.rpm
```

In most cases, you need to install the `MySQL-server` and `MySQL-client` to get a functional, standard MySQL installation. To perform such a standard, minimal installation, go to the folder that contains all those
packages (and, preferably, no other RPM packages with similar names), and issue the following command (replace `yum` with `zypper` for SLES systems):

```
shell> yum install MySQL-{server,client}-*
```

While it is much preferable to use a high-level package management tool like `yum` to install the packages, users who prefer direct `rpm` commands can replace the `yum install` command with the `rpm -Uvh` command; however, using `rpm -Uvh` instead makes the installation process more prone to failure, due to potential dependency issues the installation process might run into.

To install only the client programs, you can skip installing the `MySQL-server` package; issue the following command (replace `yum` with `zypper` for SLES systems):

```
shell> yum install MySQL-client-*
```

A standard installation of MySQL using the RPM packages result in files and resources created under the system directories, shown in the following table.

### Table 2.10 MySQL Installation Layout for Linux RPM Packages from the MySQL Developer Zone

<table>
<thead>
<tr>
<th>Files or Resources</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client programs and scripts</td>
<td>/usr/bin</td>
</tr>
<tr>
<td><code>mysqld</code> server</td>
<td>/usr/sbin</td>
</tr>
<tr>
<td>Data directory</td>
<td>/var/lib/mysql</td>
</tr>
<tr>
<td>Error log file</td>
<td>For RHEL, Oracle Linux, or CentOS: /var/lib/mysql/host_name.err</td>
</tr>
<tr>
<td></td>
<td>For SLES: /var/log/mysql/mysqld.log</td>
</tr>
<tr>
<td>System V init script</td>
<td>/etc/init.d/mysql</td>
</tr>
<tr>
<td>Systemd service</td>
<td>mysql</td>
</tr>
<tr>
<td>Pid file</td>
<td>/var/lib/mysql/host_name.pid</td>
</tr>
<tr>
<td>Unix manual pages</td>
<td>/usr/share/man</td>
</tr>
<tr>
<td>Include (header) files</td>
<td>/usr/include/mysql</td>
</tr>
<tr>
<td>Libraries</td>
<td>/usr/lib/mysql</td>
</tr>
<tr>
<td>Socket</td>
<td>/var/lib/mysql/mysql.sock</td>
</tr>
<tr>
<td>Miscellaneous support files (for example, error messages, and character set files)</td>
<td>/usr/share/mysql</td>
</tr>
</tbody>
</table>

The installation also creates a user named `mysql` and a group named `mysql` on the system.

MySQL is not automatically started at the end of the installation process. Use the following command to start MySQL:

```
shell> service mysql start
```

At the initial start up of the server, the server is initialized if the data directory of the server is empty. `mysql_install_db` is invoked with the `--random-passwords` option, which assigns a random password to the MySQL root accounts and sets the “password expired” flag for those accounts.
It will be necessary after installation to start the server, connect as root using the initial random password, and assign a new root password. Until this is done, root cannot do anything else. This must be done for each root account you intend to use. To change the password, you can use the SET PASSWORD statement (for example, with the mysql client). You can also use mysqladmin or mysql_secure_installation. For additional details (including where to find the assigned random root password), see Section 4.4.3, “mysql_install_db — Initialize MySQL Data Directory”. (Install operations using RPMs for Unbreakable Linux Network are unaffected because they do not run mysql_install_db.)

During an upgrade installation using RPM packages, if the MySQL server is running when the upgrade occurs then the MySQL server is stopped, the upgrade occurs, and the MySQL server is restarted. One exception: if the edition also changes during an upgrade (such as community to commercial, or vice-versa), then MySQL server is not restarted.

If something goes wrong during installation, you might find debug information in the error log file /var/lib/mysql/host_name.err.

Compatibility with RPM Packages from Other Vendors. If you have installed packages for MySQL from your Linux distribution’s local software repository, it is much preferable to install the new, directly-downloaded packages from Oracle using the package management system of your platform (yum or zypper), as described above. The command replaces old packages with new ones to ensure compatibility of old applications with the new installation; for example, the old MySQL-shared package is replaced with the MySQL-shared-compat package, which provides a replacement-compatible client library for applications that were using your older MySQL installation. If there was an older version of MySQL-shared-compat on the system, it also gets replaced.

If you have installed third-party packages for MySQL that are NOT from your Linux distribution’s local software repository (for example, packages directly downloaded from a vendor other than Oracle), you should uninstall all those packages before installing the new, directly-downloaded packages from Oracle. This is because conflicts may arise between those vendor’s RPM packages and Oracle’s: for example, a vendor’s convention about which files belong with the server and which belong with the client library may differ from that used for Oracle packages. Attempts to install an Oracle RPM may then result in messages saying that files in the RPM to be installed conflict with files from an installed package.

Debug Package. A special variant of MySQL Server compiled with the debug package has been included in the server RPM packages. It performs debugging and memory allocation checks and produces a trace file when the server is running. To use that debug version, start MySQL with /usr/sbin/mysqld-debug, instead of starting it as a service or with /usr/sbin/mysqld. See Section 24.5.3, “The DBUG Package” for the debug options you can use.

Note
The default plugin directory for debug builds changed from /usr/lib64/mysql/plugin to /usr/lib64/mysql/plugin/debug in 5.6.39. Previously, it was necessary to change plugin_dir to /usr/lib64/mysql/plugin/debug for debug builds.

Rebuilding RPMs from source SRPMs. Source code SRPM packages for MySQL are available for download. They can be used as-is to rebuild the MySQL RPMs with the standard rpmbuild tool chain.

Important
RPMs for NDB Cluster. Standard MySQL server RPMs built by MySQL do not provide support for the NDBCLUSTER storage engine. For more information about installing NDB Cluster from RPMs, see Section 18.2, “NDB Cluster Installation”.
Installing MySQL on Linux Using Debian Packages from Oracle

2.5.6 Installing MySQL on Linux Using Debian Packages from Oracle

Oracle provides Debian packages for installing MySQL on Debian or Debian-like Linux systems. The packages are available through two different channels:

- The MySQL APT Repository, supporting Debian and Ubuntu platforms. For details, see Section 2.5.3, "Installing MySQL on Linux Using the MySQL APT Repository".

- The MySQL Developer Zone’s Download Area. For details, see Section 2.1.2, “How to Get MySQL”. The following are some information on the Debian packages available there and the instructions for installing them:

  - You may also need to install the `libaio` library if it is not already present on your system:

    ```shell
    sudo apt-get install libaio1
    ```

  - For Debian 7 and 8, and Ubuntu 12, 14, and 15:

    - Various Debian packages are provided in the MySQL Developer Zone for installing different components of MySQL. The preferred method is to use the tarball bundle, which contains the packages needed for a basic setup of MySQL. The tarball bundles have names in the format of `mysql-server_MVER-DVER_CPU.deb-bundle.tar`. `MVER` is the MySQL version and `DVER` is the Linux distribution version. The `CPU` value indicates the processor type or family for which the package is built, as shown in the following table:

    | CPU Value | Intended Processor Type or Family |
    |-----------|----------------------------------|
    | i386      | Pentium processor or better, 32 bit |
    | amd64     | 64-bit x86 processor |

    - After downloading the tarball, unpack it with the following command:

      ```shell
      tar -xvf mysql-server_MVER-DVER_CPU.deb-bundle.tar
      ```

    - In general, install the `deb` packages unpacked from the tarball with the command (see explanations below for the extra steps required for installing the server package):

      ```shell
      sudo dpkg -i package-name.deb
      ```

      There are four packages to install:

      - The database common files (install this package before the other ones):

        ```shell
        sudo dpkg -i mysql-common_MVER-DVER_CPU.deb
        ```

      - The MySQL server:

        Install first the package for the database common files (see the last bullet), and then pre-configure your server installation by the following command:

        ```shell
        sudo dpkg-preconfigure mysql-community-server_MVER-DVER_CPU.deb
        ```

        You will be asked to provide a password for the root user for your MySQL installation. You might also be asked other questions regarding the installation.
Important

Make sure you remember the root password you set. Users who want to set a password later can leave the **password** field blank in the dialogue box and just press **OK**. However, it is very important that you set the password soon using the program **mysql_secure_installation**, as people can gain anonymous access to your MySQL server until you have secured the database’s root account with a password.

Next, install the server package with the following command:

```
shell> sudo dpkg -i mysql-community-server_MVER-DVER_CPU.deb
```

- The MySQL client:
  
  ```
  shell> sudo dpkg -i mysql-community-client_MVER-DVER_CPU.deb
  ```

- The MySQL shared client library:
  
  ```
  shell> sudo dpkg -i libmysqlclient18_MVER-DVER_CPU.deb
  ```

Here are where the files are installed on the system:

- All configuration files (like `my.cnf`) are under `/etc`
- All binaries, libraries, headers, etc., are under `/usr`
- The data directory is under `/var`

**For Debian 6:**

- Debian package files directly downloaded from the MySQL Developer Zone have names in the `mysql-MVER-DVER_CPU.deb` format. `MVER` is the MySQL version and `DVER` is the Debian version. The `CPU` value indicates the processor type or family for which the package is built, as shown in the following table:

<table>
<thead>
<tr>
<th><strong>CPU</strong> Value</th>
<th>Intended Processor Type or Family</th>
</tr>
</thead>
<tbody>
<tr>
<td>i686</td>
<td>Pentium processor or better, 32 bit</td>
</tr>
<tr>
<td>x86_64</td>
<td>64-bit x86 processor</td>
</tr>
</tbody>
</table>

- After downloading a Debian package, use the following command to install it;

```
shell> dpkg -i mysql-MVER-DVER-CPU.deb
```

The Debian package installs files under the `/opt/mysql/server-5.6` directory.

**Note**

Debian distributions of MySQL are also provided by other vendors. Be aware that they may differ from those built by Oracle in features, capabilities, and conventions (including communication setup), and that the instructions in this manual do not necessarily apply to installing them. The vendor’s instructions should be consulted instead.
2.5.7 Installing MySQL on Linux from the Native Software Repositories

Many Linux distributions include a version of the MySQL server, client tools, and development components in their native software repositories and can be installed with the platforms' standard package management systems. This section provides basic instructions for installing MySQL using those package management systems.

Important

Native packages are often several versions behind the currently available release. You will also normally be unable to install development milestone releases (DMRs), as these are not usually made available in the native repositories. Before proceeding, we recommend that you check out the other installation options described in Section 2.5, “Installing MySQL on Linux”.

Distribution specific instructions are shown below:

- **Red Hat Linux, Fedora, CentOS**

  Note

  For a number of Linux distributions, you can install MySQL using the MySQL Yum repository instead of the platform's native software repository. See Section 2.5.1, “Installing MySQL on Linux Using the MySQL Yum Repository” for details.

  For Red Hat and similar distributions, the MySQL distribution is divided into a number of separate packages, `mysql` for the client tools, `mysql-server` for the server and associated tools, and `mysql-libs` for the libraries. The libraries are required if you want to provide connectivity from different languages and environments such as Perl, Python and others.

  To install, use the `yum` command to specify the packages that you want to install. For example:

  ```bash
  root-shell> yum install mysql mysql-server mysql-libs mysql-server
  Loaded plugins: presto, refresh-packagekit
  Setting up Install Process

  mysql-server x86_64 5.1.48-2.fc13 updates 8.1 M
  Installing for dependencies:
  perl-DBD-MySQL x86_64 4.017-1.fc13 updates 136 k

  Transaction Summary
  ===================
  
  ```
MySQL and the MySQL server should now be installed. A sample configuration file is installed into `/etc/my.cnf`. An init script, to start and stop the server, will have been installed into `/etc/init.d/mysqld`. To start the MySQL server use `service`:

```
root-shell> service mysqld start
```

To enable the server to be started and stopped automatically during boot, use `chkconfig`:

```
root-shell> chkconfig --levels 235 mysqld on
```

Which enables the MySQL server to be started (and stopped) automatically at the specified the run levels.

The database tables will have been automatically created for you, if they do not already exist. You should, however, run `mysql_secure_installation` to set the root passwords on your server.

- **Debian, Ubuntu, Kubuntu**

  **Note**

  For Debian, Ubuntu, and Kubuntu, MySQL can be installed using the MySQL APT Repository instead of the platform’s native software repository. See Section 2.5.3, “Installing MySQL on Linux Using the MySQL APT Repository” for details.

  On Debian and related distributions, there are two packages for MySQL in their software repositories, `mysql-client` and `mysql-server`, for the client and server components respectively. You should
specify an explicit version, for example `mysql-client-5.1`, to ensure that you install the version of MySQL that you want.

To download and install, including any dependencies, use the `apt-get` command, specifying the packages that you want to install.

**Note**

Before installing, make sure that you update your `apt-get` index files to ensure you are downloading the latest available version.

A sample installation of the MySQL packages might look like this (some sections trimmed for clarity):

```
root-shell> apt-get install mysql-client-5.1 mysql-server-5.1
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following packages were automatically installed and are no longer required:
  linux-headers-2.6.28-11 linux-headers-2.6.28-11-generic
Use 'apt-get autoremove' to remove them.
The following extra packages will be installed:
  bsd-mailx libdbd-mysql-perl libdbi-perl libhtml-template-perl
  libmysqlclient15off libmysqlclient16 libnet-daemon-perl libplrpc-perl mailx
  mysql-common postfix
Suggested packages:
  dbishell libipcp-sharedcache-perl tinyca procmail postfix-mysql postfix-pgsql
  postfix-idap postfix-pcre sasl2-bin resolvconf postfix-cdb
The following NEW packages will be installed:
  bsd-mailx libdbd-mysql-perl libdbi-perl libhtml-template-perl
  libmysqlclient15off libmysqlclient16 libnet-daemon-perl libplrpc-perl mailx
  mysql-client-5.1 mysql-common mysql-server-5.1 postfix

Note

The `apt-get` command will install a number of packages, including the MySQL server, in order to provide the typical tools and application environment. This can mean that you install a large number of packages in addition to the main MySQL package.

During installation, the initial database will be created, and you will be prompted for the MySQL root password (and confirmation). A configuration file will have been created in `/etc/mysql/my.cnf`. An init script will have been created in `/etc/init.d/mysql`.

The server will already be started. You can manually start and stop the server using:

```bash
root-shell> service mysql [start|stop]
```

The service will automatically be added to the 2, 3 and 4 run levels, with stop scripts in the single, shutdown and restart levels.

**Gentoo Linux**

As a source-based distribution, installing MySQL on Gentoo involves downloading the source, patching the Gentoo specifics, and then compiling the MySQL server and installing it. This process is handled automatically by the `emerge` command.

The MySQL server and client tools are provided within a single package, `dev-db/mysql`. You can obtain a list of the versions available to install by looking at the portage directory for the package:

```bash
root-shell> ls /usr/portage/dev-db/mysql/mysql-5.6*
mysql-5.6.27.ebuild
mysql-5.6.27-r1.ebuild
mysql-5.6.28.ebuild
```

To install a specific MySQL version, you must specify the entire atom. For example:

```bash
root-shell> emerge =dev-db/mysql-5.6.27-r1
```

After installation, you should initialize the data directory and set the password for the MySQL root user (see Section 2.10.1, “Initializing the Data Directory”). Alternatively, use the configuration interface to perform those tasks:

```bash
root-shell> emerge --config =dev-db/mysql-5.6.27-r1
```

During installation, a sample configuration file is created for you in `/etc/mysql/my.cnf`, and an init script is created in `/etc/init.d/mysql`.

To enable MySQL to start automatically at the normal (default) run levels, use this command:

```bash
root-shell> rc-update add mysql default
```
2.5.8 Deploying MySQL on Linux with Docker

The Docker deployment framework supports easy installation and configuration of MySQL Server. This section explains how to use a MySQL Server Docker image.

You need to have Docker installed on your system before you can use a MySQL Server Docker image. See Install Docker for instructions.

Important

You need to either run docker commands with sudo, or create a docker usergroup, and then add to it any users who want to run docker commands. See details here. Because Docker containers are always run with root privileges, you should understand the Docker daemon attack surface and properly mitigate the related risks.

The instructions for using the MySQL Docker container are divided into two sections.

2.5.8.1 Basic Steps for MySQL Server Deployment with Docker

Warning

The MySQL Docker images maintained by the MySQL team are built specifically for Linux platforms. Other platforms are not supported, and users using these MySQL Docker images on them are doing so at their own risk. See the discussion here for some known limitations for running these containers on non-Linux operating systems.

• Downloading a MySQL Server Docker Image
• Starting a MySQL Server Instance
• Connecting to MySQL Server from within the Container
• Container Shell Access
• Stopping and Deleting a MySQL Container
• More Topics on Deploying MySQL Server with Docker

Downloading a MySQL Server Docker Image

Downloading the server image in a separate step is not strictly necessary; however, performing this step before you create your Docker container ensures your local image is up to date. To download the MySQL Community Server image, run this command:

docker pull mysql/mysql-server:tag

The tag is the label for the image version you want to pull (for example, 5.5, 5.6, 5.7, 8.0, or latest). If :tag is omitted, the latest label is used, and the image for the latest GA version of MySQL Community Server is downloaded. Refer to the list of tags for available versions on the mysql/mysql-server page in the Docker Hub.

You can list downloaded Docker images with this command:

<table>
<thead>
<tr>
<th>REPOSITORY</th>
<th>TAG</th>
<th>IMAGE ID</th>
<th>CREATED</th>
<th>SIZE</th>
</tr>
</thead>
<tbody>
<tr>
<td>mysql/mysql-server</td>
<td>latest</td>
<td>3157d7f55f8d</td>
<td>4 weeks ago</td>
<td>241MB</td>
</tr>
</tbody>
</table>

shell> docker images
Deploying MySQL on Linux with Docker

Starting a MySQL Server Instance

Start a new Docker container for the MySQL Server with this command:

```

docker run --name=mysql1 -d mysql/mysql-server:tag
```

The `--name` option, for supplying a custom name for your server container (``mysql1`` in the example), is optional; if no container name is supplied, a random one is generated. If the Docker image of the specified name and tag has not been downloaded by an earlier `docker pull` or `docker run` command, the image is now downloaded. After download completes, initialization for the container begins, and the container appears in the list of running containers when you run the `docker ps` command; for example:

```
shell> docker ps
CONTAINER ID   IMAGE                COMMAND                  CREATED             STATUS                              PORTS                NAMES
a24888f0d6f4   mysql/mysql-server   "/entrypoint.sh my..."  14 seconds ago      Up 13 seconds (health: starting)    3306/tcp, 33060/tcp  mysql1
```

The container initialization might take some time. When the server is ready for use, the `STATUS` of the container in the output of the `docker ps` command changes from `(health: starting)` to `(healthy)`.

The `-d` option used in the `docker run` command above makes the container run in the background. Use this command to monitor the output from the container:

```
docker logs mysql1
```

Once initialization is finished, the command's output is going to contain the random password generated for the root user; check the password with, for example, this command:

```
shell> docker logs mysql1 2>&1 | grep GENERATED
GENERATED ROOT PASSWORD: Axegh3kAlyjDLaRuBemecis&EShOs
```

Connecting to MySQL Server from within the Container

Once the server is ready, you can run the `mysql` client within the MySQL Server container you just started, and connect it to the MySQL Server. Use the `docker exec -it` command to start a `mysql` client inside the Docker container you have started, like the following:

```
docker exec -it mysql1 mysql -uroot -p
```

When asked, enter the generated root password (see the last step in Starting a MySQL Server Instance above on how to find the password). Because the `MYSQL_ONETIME_PASSWORD` option is true by default, after you have connected a `mysql` client to the server, you must reset the server root password by issuing this statement:

```
mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'newpassword';
```

Substitute `newpassword` with the password of your choice. Once the password is reset, the server is ready for use.

Container Shell Access

To have shell access to your MySQL Server container, use the `docker exec -it` command to start a bash shell inside the container:

```
shell> docker exec -it mysql1 bash
bash-4.2#
```

You can then run Linux commands inside the container. For example, to view contents in the server's data directory inside the container, use this command:
Installing MySQL on Linux with Docker

```
bash-4.2# ls /var/lib/mysql
auto.cnf  ca.pem  client-key.pem  ib_logfile0  ibdata1  mysql  mysql.sock.lock  private_key.pem ca-key.pem  client-cert.pem  ib_buffer_pool  ib_logfile1  ibtmp1  mysql.sock  performance_schema  public_key.pem  server-cert.pem  server-key.pem
```

Stopping and Deleting a MySQL Container

To stop the MySQL Server container we have created, use this command:

```bash
docker stop mysql1
```

docker stop sends a SIGTERM signal to the mysqld process, so that the server is shut down gracefully.

Also notice that when the main process of a container (mysqld in the case of a MySQL Server container) is stopped, the Docker container stops automatically.

To start the MySQL Server container again:

```bash
docker start mysql1
```

To stop and start again the MySQL Server container with a single command:

```bash
docker restart mysql1
```

To delete the MySQL container, stop it first, and then use the docker rm command:

```bash
docker stop mysql1
docker rm mysql1
```

If you want the Docker volume for the server’s data directory to be deleted at the same time, add the -v option to the docker rm command.

More Topics on Deploying MySQL Server with Docker

For more topics on deploying MySQL Server with Docker like server configuration, persisting data and configuration changes, server error log, and container environment variables, see Section 2.5.8.2, “More Topics on Deploying MySQL Server with Docker”.

2.5.8.2 More Topics on Deploying MySQL Server with Docker

- The Optimized MySQL Installation for Docker
- Configuring the MySQL Server
- Persisting Data and Configuration Changes
- Running Additional Initialization Scripts
- Connect to MySQL from an Application in Another Docker Container
- Server Error Log
- Docker Environment Variables

The Optimized MySQL Installation for Docker

Docker images for MySQL are optimized for code size, which means they only include crucial components that are expected to be relevant for the majority of users who run MySQL instances in Docker containers. A MySQL Docker installation is different from a common, non-Docker installation in the following aspects:
• Included binaries are limited to:
  • /usr/bin/my_print_defaults
  • /usr/bin/mysql
  • /usr/bin/mysql_config
  • /usr/bin/mysql_install_db
  • /usr/bin/mysql_tzinfo_to_sql
  • /usr/bin/mysql_upgrade
  • /usr/bin/mysqladmin
  • /usr/bin/mysqlcheck
  • /usr/bin/mysqldump
  • /usr/sbin/mysqld

• All binaries are stripped; they contain no debug information.

Configuring the MySQL Server

When you start the MySQL Docker container, you can pass configuration options to the server through the `docker run` command; for example, for the MySQL Server:

```bash
docker run --name mysql1 -d mysql/mysql-server --character-set-server=utf8mb4 --collation-server=utf8mb4_col
```

The command starts your MySQL Server with `utf8mb4` as the default character set and `utf8mb4_col` as the default collation for your databases.

Another way to configure the MySQL Server is to prepare a configuration file and mount it at the location of the server configuration file inside the container. See Persisting Data and Configuration Changes for details.

Persisting Data and Configuration Changes

Docker containers are in principle ephemeral, and any data or configuration are expected to be lost if the container is deleted or corrupted (see discussions here). Docker volumes, however, provides a mechanism to persist data created inside a Docker container. At its initialization, the MySQL Server container creates a Docker volume for the server data directory. The JSON output for running the `docker inspect` command on the container has a `Mount` key, whose value provides information on the data directory volume:

```json
shell> docker inspect mysql1
...
"Mounts": [
  {
    "Type": "volume",
    "Name": "4f2d463cfc4b4dd4b4aebcb098c97d7da3337195ed2c6572bc0b89f7e845d27652",
    "Source": "/var/lib/docker/volumes/4f2d463cfc4b4dd4b4aebcb098c97d7da3337195ed2c6572bc0b89f7e845d27652/_data",
    "Destination": "/var/lib/mysql",
    "Driver": "local",
    "Mode": ",",
    "RW": true,
    "Propagations": ","
  }
]
```
The output shows that the source folder /var/lib/docker/volumes/4f2d463cfc4bddd4baebcb098c97d7da3337195ed2c6572bc0b89f7e845d27652/_data, in which data is persisted on the host, has been mounted at /var/lib/mysql, the server data directory inside the container.

Another way to preserve data is to bind-mount a host directory using the --mount option when creating the container. The same technique can be used to persist the configuration of the server. The following command creates a MySQL Server container and bind-mounts both the data directory and the server configuration file:

```bash
docker run --name=mysql1 --mount type=bind,src=/path-on-host-machine/my.cnf,dst=/etc/my.cnf --mount type=bind,src=/path-on-host-machine/datadir,dst=/var/lib/mysql -d mysql/mysql-server:tag
```

The command mounts path-on-host-machine/my.cnf at /etc/my.cnf (the server configuration file inside the container), and path-on-host-machine/datadir at /var/lib/mysql (the data directory inside the container). The following conditions must be met for the bind-mounting to work:

- The configuration file path-on-host-machine/my.cnf must already exist, and it must contain the specification for starting the server using the user mysql:

  ```
  [mysqld]
  user=mysql
  ```

  You can also include other server configuration options in the file.

- The data directory path-on-host-machine/datadir must already exist. For server initialization to happen, the directory must be empty. You can also mount a directory prepopulated with data and start the server with it; however, you must make sure you start the Docker container with the same configuration as the server that created the data, and any host files or directories required are mounted when starting the container.

### Running Additional Initialization Scripts

If there are any .sh or .sql scripts you want to run on the database immediately after it has been created, you can put them into a host directory and then mount the directory at /docker-entrypoint-initdb.d/ inside the container. For example, for a MySQL Server container:

```bash
docker run --name=mysql1 --mount type=bind,src=/path-on-host-machine/scripts/,dst=/docker-entrypoint-initdb.d/ -d mysql/mysql-server:tag
```

### Connect to MySQL from an Application in Another Docker Container

By setting up a Docker network, you can allow multiple Docker containers to communicate with each other, so that a client application in another Docker container can access the MySQL Server in the server container. First, create a Docker network:

```bash
docker network create my-custom-net
```

Then, when you are creating and starting the server and the client containers, use the --network option to put them on network you created. For example:

```bash
docker run --name=mysql1 --network=my-custom-net -d mysql/mysql-server
```
Deploying MySQL on Linux with Docker

```bash
docker run --name=myapp1 --network=my-custom-net -d myapp
```

The `myapp1` container can then connect to the `mysq11` container with the `mysq11` hostname and vice versa, as Docker automatically sets up a DNS for the given container names. In the following example, we run the `mysql` client from inside the `myapp1` container to connect to host `mysq11` in its own container:

```bash
docker exec -it myapp1 mysql --host=mysq11 --user=myuser --password
```

For other networking techniques for containers, see the Docker container networking section in the Docker Documentation.

Server Error Log

When the MySQL Server is first started with your server container, a server error log is NOT generated if either of the following conditions is true:

- A server configuration file from the host has been mounted, but the file does not contain the system variable `log_error` (see Persisting Data and Configuration Changes on bind-mounting a server configuration file).
- A server configuration file from the host has not been mounted, but the Docker environment variable `MYSQL_LOG_CONSOLE` is `true` (the variable's default state for MySQL 5.6 server containers is `false`).

The MySQL Server's error log is then redirected to `stderr`, so that the error log goes into the Docker container's log and is viewable using the `docker logs mysqld-container` command.

To make MySQL Server generate an error log when either of the two conditions is true, use the `--log-error` option to configure the server to generate the error log at a specific location inside the container. To persist the error log, mount a host file at the location of the error log inside the container as explained in Persisting Data and Configuration Changes. However, you must make sure your MySQL Server inside its container has write access to the mounted host file.

Docker Environment Variables

When you create a MySQL Server container, you can configure the MySQL instance by using the `--env` option (`-e` in short) and specifying one or more of the following environment variables.

### Notes

- None of the variables below has any effect if the data directory you mount is not empty, as no server initialization is going to be attempted then (see Persisting Data and Configuration Changes for more details). Any pre-existing contents in the folder, including any old server settings, are not modified during the container startup.

- The boolean variables including `MYSQL_RANDOM_ROOT_PASSWORD`, `MYSQL_ONETIME_PASSWORD`, `MYSQL.Allow_EmptyPassword`, and `MYSQL.LOG_CONSOLE` are made true by setting them with any strings of nonzero lengths. Therefore, setting them to, for example, “0”, “false”, or “no” does not make them false, but actually makes them true. This is a known issue of the MySQL Server containers.

- `MYSQL_RANDOM_ROOT_PASSWORD`: When this variable is true (which is its default state, unless `MYSQL_ROOT_PASSWORD` or `MYSQL.Allow_EmptyPassword` is set to true), a random password for the server's root user is generated when the Docker container is started. The password is printed to `stdout` of the container and can be found by looking at the container's log (see Starting a MySQL Server Instance).
• **MYSQL_ONETIME_PASSWORD**: When the variable is true (which is its default state, unless `MYSQL_ROOT_PASSWORD` is set or `MYSQL_ALLOW_EMPTY_PASSWORD` is set to true), the root user's password is set as expired and must be changed before MySQL can be used normally.

• **MYSQL_DATABASE**: This variable allows you to specify the name of a database to be created on image startup. If a user name and a password are supplied with `MYSQL_USER` and `MYSQL_PASSWORD`, the user is created and granted superuser access to this database (corresponding to `GRANT ALL`). The specified database is created by a `CREATE DATABASE IF NOT EXIST` statement, so that the variable has no effect if the database already exists.

• **MYSQL_USER, MYSQL_PASSWORD**: These variables are used in conjunction to create a user and set that user's password, and the user is granted superuser permissions for the database specified by the `MYSQL_DATABASE` variable. Both `MYSQL_USER` and `MYSQL_PASSWORD` are required for a user to be created—if any of the two variables is not set, the other is ignored. If both variables are set but `MYSQL_DATABASE` is not, the user is created without any privileges.

  Note

  There is no need to use this mechanism to create the root superuser, which is created by default with the password set by either one of the mechanisms discussed in the descriptions for `MYSQL_ROOT_PASSWORD` and `MYSQL_RANDOM_ROOT_PASSWORD`, unless `MYSQL_ALLOW_EMPTY_PASSWORD` is true.

• **MYSQL_ROOT_HOST**: By default, MySQL creates the 'root'@'localhost' account. This account can only be connected to from inside the container as described in Connecting to MySQL Server from within the Container. To allow root connections from other hosts, set this environment variable. For example, the value `172.17.0.1`, which is the default Docker gateway IP, allows connections from the host machine that runs the container. The option accepts only one entry, but wildcards are allowed (for example, `MYSQL_ROOT_HOST=172.*.*.*` or `MYSQL_ROOT_HOST=%`).

• **MYSQL_LOG_CONSOLE**: When the variable is true (the variable's default state for MySQL 5.6 server containers is `false`), the MySQL Server's error log is redirected to `stderr`, so that the error log goes into the Docker container's log and is viewable using the `docker logs mysqld-container` command.

  Note

  The variable has no effect if a server configuration file from the host has been mounted (see Persisting Data and Configuration Changes on bind-mounting a configuration file).

• **MYSQL_ROOT_PASSWORD**: This variable specifies a password that is set for the MySQL root account.

  Warning

  Setting the MySQL root user password on the command line is insecure. As an alternative to specifying the password explicitly, you can set the variable with a container file path for a password file, and then mount a file from your host that contains the password at the container file path. This is still not very secure, as the location of the password file is still exposed. It is preferable to use the default settings of `MYSQL_RANDOM_ROOT_PASSWORD=true` and `MYSQL_ONETIME_PASSWORD=true` being both true.

• **MYSQL_ALLOW_EMPTY_PASSWORD**: Set it to true to allow the container to be started with a blank password for the root user.
Warning
Setting this variable to true is insecure, because it is going to leave your MySQL instance completely unprotected, allowing anyone to gain complete superuser access. It is preferable to use the default settings of `MYSQL_RANDOM_ROOT_PASSWORD=true` and `MYSQL_ONETIME_PASSWORD=true` being both true.

### 2.5.8.3 Deploying MySQL on Windows and Other Non-Linux Platforms with Docker

**Warning**

The MySQL Docker images provided by Oracle are built specifically for Linux platforms. Other platforms are not supported, and users running the MySQL Docker images from Oracle on them are doing so at their own risk. This section discusses some known issues for the images when used on non-Linux platforms.

**Known Issues for using the MySQL Server Docker images from Oracle on Windows include:**

- If you are bind-mounting on the container's MySQL data directory (see [Persisting Data and Configuration Changes](#) for details), you have to set the location of the server socket file with the `--socket` option to somewhere outside of the MySQL data directory; otherwise, the server will fail to start. This is because the way Docker for Windows handles file mounting does not allow a host file from being bind-mounted on the socket file.

### 2.5.9 Installing MySQL on Linux with Juju

The Juju deployment framework supports easy installation and configuration of MySQL servers. For instructions, see [https://jujucharms.com/mysql/](https://jujucharms.com/mysql/).

### 2.6 Installing MySQL Using Unbreakable Linux Network (ULN)

Linux supports a number of different solutions for installing MySQL, covered in [Section 2.5, “Installing MySQL on Linux”](#). One of the methods, covered in this section, is installing from Oracle’s Unbreakable Linux Network (ULN). You can find information about Oracle Linux and ULN under [http://linux.oracle.com/](http://linux.oracle.com/).

To use ULN, you need to obtain a ULN login and register the machine used for installation with ULN. This is described in detail in the ULN FAQ. The page also describes how to install and update packages. The MySQL packages are in the “MySQL for Oracle Linux 6” and “MySQL for Oracle Linux 7” channels for your system architecture on ULN.

**Note**

At the time of this writing, ULN provides MySQL 5.6 for Oracle Linux 6 and Oracle Linux 7.

Once MySQL has been installed using ULN, you can find information on starting and stopping the server, and more, in this section, particularly under [Section 2.5.5, “Installing MySQL on Linux Using RPM Packages from Oracle”](#).

If you’re updating an existing MySQL installation to an installation using ULN, the recommended procedure is to export your data using `mysqldump`, remove the existing installation, install MySQL from ULN, and load the exported data into your freshly installed MySQL.

If the existing MySQL installation you’re upgrading from is from a previous release series (prior to MySQL 5.6), make sure to read the section on upgrading MySQL, [Section 2.11, “Upgrading MySQL”](#).
2.7 Installing MySQL on Solaris

**Note**
MySQL 5.6 supports Solaris 10 (Update 11 and later), and Solaris 11 (Update 3 and later).

MySQL on Solaris is available in a number of different formats.

- For information on installing using the native Solaris PKG format, see Section 2.7.1, "Installing MySQL on Solaris Using a Solaris PKG".

- To use a standard `tar` binary installation, use the notes provided in Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”. Check the notes and hints at the end of this section for Solaris specific notes that you may need before or after installation.

To obtain a binary MySQL distribution for Solaris in tarball or PKG format, https://dev.mysql.com/downloads/mysql/5.6.html.

Additional notes to be aware of when installing and using MySQL on Solaris:

- If you want to use MySQL with the `mysql` user and group, use the `groupadd` and `useradd` commands:

  ```
  groupadd mysql
  useradd -g mysql -s /bin/false mysql
  ```

- If you install MySQL using a binary tarball distribution on Solaris, because the Solaris `tar` cannot handle long file names, use GNU `tar (gtar)` to unpack the distribution. If you do not have GNU `tar` on your system, install it with the following command:

  ```
  pkg install archiver/gnu-tar
  ```

- You should mount any file systems on which you intend to store InnoDB files with the `forcedirectio` option. (By default mounting is done without this option.) Failing to do so will cause a significant drop in performance when using the InnoDB storage engine on this platform.

- If you would like MySQL to start automatically, you can copy `support-files/mysql.server` to `/etc/init.d` and create a symbolic link to it named `/etc/rc3.d/S99mysql.server`.

- If too many processes try to connect very rapidly to `mysqld`, you should see this error in the MySQL log:

  ```
  Error in accept: Protocol error
  ```

  You might try starting the server with the `--back_log=50` option as a workaround for this.

- To configure the generation of core files on Solaris you should use the `coreadm` command. Because of the security implications of generating a core on a `setuid()` application, by default, Solaris does not support core files on `setuid()` programs. However, you can modify this behavior using `coreadm`. If you enable `setuid()` core files for the current user, they will be generated using the mode 600 and owned by the superuser.

2.7.1 Installing MySQL on Solaris Using a Solaris PKG

You can install MySQL on Solaris using a binary package using the native Solaris PKG format instead of the binary tarball distribution.
To use this package, download the corresponding `mysql-VERSION-solaris10-PLATFORM.pkg.gz` file, then uncompress it. For example:

```
shell> gunzip mysql-5.6.47-solaris10-x86_64.pkg.gz
```

To install a new package, use `pkgadd` and follow the onscreen prompts. You must have root privileges to perform this operation:

```
shell> pkgadd -d mysql-5.6.47-solaris10-x86_64.pkg
```

The following packages are available:

```
  1  mysql  MySQL Community Server (GPL)
      (i86pc) 5.6.47
```

Select package(s) you wish to process (or 'all' to process all packages). (default: all) [?,?,?,q]:

The PKG installer installs all of the files and tools needed, and then initializes your database if one does not exist. To complete the installation, you should set the root password for MySQL as provided in the instructions at the end of the installation. Alternatively, you can run the `mysql_secure_installation` script that comes with the installation.

By default, the PKG package installs MySQL under the root path `/opt/mysql`. You can change only the installation root path when using `pkgadd`, which can be used to install MySQL in a different Solaris zone. If you need to install in a specific directory, use a binary `tar` file distribution.

The `pkg` installer copies a suitable startup script for MySQL into `/etc/init.d/mysql`. To enable MySQL to startup and shutdown automatically, you should create a link between this file and the init script directories. For example, to ensure safe startup and shutdown of MySQL you could use the following commands to add the right links:

```
shell> ln /etc/init.d/mysql /etc/rc3.d/S91mysql
shell> ln /etc/init.d/mysql /etc/rc0.d/K02mysql
```

To remove MySQL, the installed package name is `mysql`. You can use this in combination with the `pkgrm` command to remove the installation.

To upgrade when using the Solaris package file format, you must remove the existing installation before installing the updated package. Removal of the package does not delete the existing database information, only the server, binaries and support files. The typical upgrade sequence is therefore:

```
shell> mysqladmin shutdown
shell> pkgrm mysql
shell> pkgadd -d mysql-5.6.47-solaris10-x86_64.pkg
shell> mysql_safe &
shell> mysql_upgrade
```

You should check the notes in Section 2.11, “Upgrading MySQL” before performing any upgrade.

### 2.8 Installing MySQL on FreeBSD

This section provides information about installing MySQL on variants of FreeBSD Unix.

You can install MySQL on FreeBSD by using the binary distribution provided by Oracle. For more information, see Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

The easiest (and preferred) way to install MySQL is to use the `mysql-server` and `mysql-client` ports available at [http://www.freebsd.org/](http://www.freebsd.org/). Using these ports gives you the following benefits:
• A working MySQL with all optimizations enabled that are known to work on your version of FreeBSD.
• Automatic configuration and build.
• Startup scripts installed in /usr/local/etc/rc.d.
• The ability to use `pkg_info -L` to see which files are installed.
• The ability to use `pkg_delete` to remove MySQL if you no longer want it on your machine.

The MySQL build process requires GNU make (`gmake`) to work. If GNU `make` is not available, you must install it first before compiling MySQL.

To install using the ports system:

```
# cd /usr/ports/databases/mysql56-server
# make
...  
# cd /usr/ports/databases/mysql56-client
# make
...  
```

The standard port installation places the server into `/usr/local/libexec/mysqld`, with the startup script for the MySQL server placed in `/usr/local/etc/rc.d/mysql-server`.

Some additional notes on the BSD implementation:
• To remove MySQL after installation using the ports system:

```
# cd /usr/ports/databases/mysql56-server
# make deinstall
...  
# cd /usr/ports/databases/mysql56-client
# make deinstall
...  
```
• If you get problems with the current date in MySQL, setting the `TZ` variable should help. See Section 4.9, “MySQL Environment Variables”.

## 2.9 Installing MySQL from Source

Building MySQL from the source code enables you to customize build parameters, compiler optimizations, and installation location. For a list of systems on which MySQL is known to run, see [https://www.mysql.com/support/supportedplatforms/database.html](https://www.mysql.com/support/supportedplatforms/database.html).

Before you proceed with an installation from source, check whether Oracle produces a precompiled binary distribution for your platform and whether it works for you. We put a great deal of effort into ensuring that our binaries are built with the best possible options for optimal performance. Instructions for installing binary distributions are available in Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

### Warning
Building MySQL with nonstandard options may lead to reduced functionality, performance, or security.

## 2.9.1 Source Installation Methods

There are two methods for installing MySQL from source:
Source Installation Prerequisites

- Use a standard MySQL source distribution. To obtain a standard distribution, see Section 2.1.2, “How to Get MySQL”. For instructions on building from a standard distribution, see Section 2.9.4, “Installing MySQL Using a Standard Source Distribution”.

  Standard distributions are available as compressed tar files, Zip archives, or RPM packages. Distribution files have names of the form `mysql-VERSION.tar.gz`, `mysql-VERSION.zip`, or `mysql-VERSION.rpm`, where `VERSION` is a number like `5.6.47`. File names for source distributions can be distinguished from those for precompiled binary distributions in that source distribution names are generic and include no platform name, whereas binary distribution names include a platform name indicating the type of system for which the distribution is intended (for example, `pc-linux-i686` or `winx64`).

- Use a MySQL development tree. For information on building from one of the development trees, see Section 2.9.5, “Installing MySQL Using a Development Source Tree”.

2.9.2 Source Installation Prerequisites

Installation of MySQL from source requires several development tools. Some of these tools are needed no matter whether you use a standard source distribution or a development source tree. Other tool requirements depend on which installation method you use.

To install MySQL from source, the following system requirements must be satisfied, regardless of installation method:

- **CMake**, which is used as the build framework on all platforms. CMake can be downloaded from [http://www.cmake.org](http://www.cmake.org).

- A good `make` program. Although some platforms come with their own `make` implementations, it is highly recommended that you use GNU `make` 3.75 or higher. It may already be available on your system as `gmake`. GNU `make` is available from [http://www.gnu.org/software/make/](http://www.gnu.org/software/make/).

- A working ANSI C++ compiler. GCC 4.2.1 or later, Sun Studio 12 or later, Visual Studio 2010 or later, and many current vendor-supplied compilers are known to work.

- An SSL library is required for support of encrypted connections, entropy for random number generation, and other encryption-related operations. To specify the library explicitly, use the `WITH_SSL` option when you invoke CMake. For additional information, see Section 2.9.6, “Configuring SSL Library Support”.

- The `ncurses` library.

- Sufficient free memory. If you encounter problems such as “internal compiler error” when compiling large source files, it may be that you have too little memory. If compiling on a virtual machine, try increasing the memory allocation.

- Perl is needed if you intend to run test scripts. Most Unix-like systems include Perl. On Windows, you can use a version such as ActiveState Perl.

To install MySQL from a standard source distribution, one of the following tools is required to unpack the distribution file:

- For a `tar.gz` compressed `tar` file: GNU `gunzip` to uncompress the distribution and a reasonable `tar` to unpack it. If your `tar` program supports the `z` option, it can both uncompress and unpack the file.

  GNU `tar` is known to work. The standard `tar` provided with some operating systems is not able to unpack the long file names in the MySQL distribution. You should download and install GNU `tar`, or if available, use a preinstalled version of GNU `tar`. Usually this is available as `gnutar`, `gtar`, or as `tar` within a GNU or Free Software directory, such as `/usr/sfw/bin` or `/usr/local/bin`. GNU `tar` is available from [http://www.gnu.org/software/tar/](http://www.gnu.org/software/tar/).
MySQL Layout for Source Installation

- For a .zip Zip archive: WinZip or another tool that can read .zip files.
- For an .rpm RPM package: The rpmbuild program used to build the distribution unpacks it.

To install MySQL from a development source tree, the following additional tools are required:

- The Git revision control system is required to obtain the development source code. The GitHub Help provides instructions for downloading and installing Git on different platforms. MySQL officially joined GitHub in September, 2014. For more information about MySQL's move to GitHub, refer to the announcement on the MySQL Release Engineering blog: MySQL on GitHub

- bison 2.1 or higher, available from http://www.gnu.org/software/bison/. (Version 1 is no longer supported.) Use the latest version of bison where possible; if you experience problems, upgrade to a later version, rather than revert to an earlier one.

  bison is available from http://www.gnu.org/software/bison/. bison for Windows can be downloaded from http://gnuwin32.sourceforge.net/packages/bison.htm. Download the package labeled "Complete package, excluding sources". On Windows, the default location for bison is the C:\Program Files \GnuWin32 directory. Some utilities may fail to find bison because of the space in the directory name. Also, Visual Studio may simply hang if there are spaces in the path. You can resolve these problems by installing into a directory that does not contain a space (for example C:\GnuWin32).

- On Solaris Express, m4 must be installed in addition to bison. m4 is available from http://www.gnu.org/software/m4/.

  Note

  If you have to install any programs, modify your PATH environment variable to include any directories in which the programs are located. See Section 4.2.6, "Setting Environment Variables".

  If you run into problems and need to file a bug report, please use the instructions in Section 1.6, "How to Report Bugs or Problems".

2.9.3 MySQL Layout for Source Installation

By default, when you install MySQL after compiling it from source, the installation step installs files under /usr/local/mysql. The component locations under the installation directory are the same as for binary distributions. See Table 2.3, "MySQL Installation Layout for Generic Unix/Linux Binary Package", and Section 2.3.1, "MySQL Installation Layout on Microsoft Windows". To configure installation locations different from the defaults, use the options described at Section 2.9.7, "MySQL Source-Configuration Options".

2.9.4 Installing MySQL Using a Standard Source Distribution

To install MySQL from a standard source distribution:

1. Verify that your system satisfies the tool requirements listed at Section 2.9.2, "Source Installation Prerequisites".
2. Obtain a distribution file using the instructions in Section 2.1.2, "How to Get MySQL".
3. Configure, build, and install the distribution using the instructions in this section.
4. Perform postinstallation procedures using the instructions in Section 2.10, "Postinstallation Setup and Testing".
MySQL uses **CMake** as the build framework on all platforms. The instructions given here should enable you to produce a working installation. For additional information on using **CMake** to build MySQL, see **How to Build MySQL Server with CMake**.

If you start from a source RPM, use the following command to make a binary RPM that you can install. If you do not have `rpmbuild`, use `rpm` instead.

```
shell> rpmbuild --rebuild --clean MySQL-VERSION.src.rpm
```

The result is one or more binary RPM packages that you install as indicated in Section 2.5.5, “Installing MySQL on Linux Using RPM Packages from Oracle”.

The sequence for installation from a compressed `.tar` file or Zip archive source distribution is similar to the process for installing from a generic binary distribution (see Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”), except that it is used on all platforms and includes steps to configure and compile the distribution. For example, with a compressed `.tar` file source distribution on Unix, the basic installation command sequence looks like this:

```
# Preconfiguration setup
shell> groupadd mysql
shell> useradd -r -g mysql -s /bin/false mysql
# Beginning of source-build specific instructions
shell> tar xzvf mysql-VERSION.tar.gz
shell> cd mysql-VERSION
shell> mkdir bld
dll> cd bld
shell> cmake ..
shell> make
shell> make install
# End of source-build specific instructions
# Postinstallation setup
shell> cd /usr/local/mysql
shell> scripts/mysql_install_db --user=mysql
shell> bin/mysqld_safe --user=mysql &
# Next command is optional
shell> cp support-files/mysql.server /etc/init.d/mysql.server
```

`mysql_install_db` creates a default option file named `my.cnf` in the base installation directory. This file is created from a template included in the distribution package named `my-default.cnf`. For more information, see Section 5.1.2.2, “Using a Sample Default Server Configuration File”.

A more detailed version of the source-build specific instructions is shown following.

---

**Note**

The procedure shown here does not set up any passwords for MySQL accounts. After following the procedure, proceed to Section 2.10, “Postinstallation Setup and Testing”, for postinstallation setup and testing.

- Perform Preconfiguration Setup
- Obtain and Unpack the Distribution
- Configure the Distribution
- Build the Distribution
- Install the Distribution
- Perform Postinstallation Setup
Perform Preconfiguration Setup

On Unix, set up the mysql user and group that will be used to run and execute the MySQL server and own the database directory. For details, see Create a mysql User and Group. Then perform the following steps as the mysql user, except as noted.

Obtain and Unpack the Distribution

Pick the directory under which you want to unpack the distribution and change location into it.

Obtain a distribution file using the instructions in Section 2.1.2, “How to Get MySQL”.

Unpack the distribution into the current directory:

- To unpack a compressed tar file, tar can uncompress and unpack the distribution if it has z option support:

  ```shell
  shell> tar zxvf mysql-VERSION.tar.gz
  ```

  If your tar does not have z option support, use gunzip to unpack the distribution and tar to unpack it:

  ```shell
  shell> gunzip < mysql-VERSION.tar.gz | tar xvf -
  ```

  Alternatively, CMake can uncompress and unpack the distribution:

  ```shell
  shell> cmake -E tar zxvf mysql-VERSION.tar.gz
  ```

- To unpack a Zip archive, use WinZip or another tool that can read .zip files.

Unpacking the distribution file creates a directory named mysql-VERSION.

Configure the Distribution

Change location into the top-level directory of the unpacked distribution:

```shell
shell> cd mysql-VERSION
```

Build outside of the source tree to keep the tree clean. If the top-level source directory is named mysql-src under your current working directory, you can build in a directory named bld at the same level. Create the directory and go there:

```shell
shell> mkdir bld
shell> cd bld
```

Configure the build directory. The minimum configuration command includes no options to override configuration defaults:

```shell
shell> cmake ../mysql-src
```

The build directory needs not be outside the source tree. For example, you can build in a directory named bld under the top-level source tree. To do this, starting with mysql-src as your current working directory, create the directory bld and then go there:

```shell
shell> mkdir bld
shell> cd bld
```
Configure the build directory. The minimum configuration command includes no options to override configuration defaults:

```
shell> cmake ..
```

If you have multiple source trees at the same level (for example, to build multiple versions of MySQL), the second strategy can be advantageous. The first strategy places all build directories at the same level, which requires that you choose a unique name for each. With the second strategy, you can use the same name for the build directory within each source tree. The following instructions assume this second strategy.

On Windows, specify the development environment. For example, the following commands configure MySQL for 32-bit or 64-bit builds, respectively:

```
shell> cmake .. -G "Visual Studio 12 2013"
shell> cmake .. -G "Visual Studio 12 2013 Win64"
```

On macOS, to use the Xcode IDE:

```
shell> cmake .. -G Xcode
```

When you run `cmake`, you might want to add options to the command line. Here are some examples:

- `-DBUILD_CONFIG=mysql_release`: Configure the source with the same build options used by Oracle to produce binary distributions for official MySQL releases.
- `-DCMAKE_INSTALL_PREFIX=dir_name`: Configure the distribution for installation under a particular location.
- `-DCPACK_MONOLITHIC_INSTALL=1`: Cause `make package` to generate a single installation file rather than multiple files.
- `-DWITH_DEBUG=1`: Build the distribution with debugging support.

For a more extensive list of options, see Section 2.9.7, “MySQL Source-Configuration Options”.

To list the configuration options, use one of the following commands:

```
shell> cmake .. -L # overview
shell> cmake .. -LH # overview with help text
shell> cmake .. -LAH # all params with help text
shell> ccmake .. # interactive display
```

If `CMake` fails, you might need to reconfigure by running it again with different options. If you do reconfigure, take note of the following:

- If `CMake` is run after it has previously been run, it may use information that was gathered during its previous invocation. This information is stored in `CMakeCache.txt`. When `CMake` starts, it looks for that file and reads its contents if it exists, on the assumption that the information is still correct. That assumption is invalid when you reconfigure.

- Each time you run `CMake`, you must run `make` again to recompile. However, you may want to remove old object files from previous builds first because they were compiled using different configuration options.

To prevent old object files or configuration information from being used, run these commands in the build directory on Unix before re-running `CMake`:
Installing MySQL Using a Standard Source Distribution

```shell
make clean
rm CMakeCache.txt
```

Or, on Windows:

```shell
devenv MySQL.sln /clean
del CMakeCache.txt
```

Before asking on the MySQL Community Slack, check the files in the CMakeFiles directory for useful information about the failure. To file a bug report, please use the instructions in Section 1.6, “How to Report Bugs or Problems”.

**Build the Distribution**

**On Unix:**

```shell
make
make VERBOSE=1
```

The second command sets `VERBOSE` to show the commands for each compiled source.

Use `gmake` instead on systems where you are using GNU `make` and it has been installed as `gmake`.

**On Windows:**

```shell
devenv MySQL.sln /build RelWithDebInfo
```

If you have gotten to the compilation stage, but the distribution does not build, see Section 2.9.8, “Dealing with Problems Compiling MySQL”, for help. If that does not solve the problem, please enter it into our bugs database using the instructions given in Section 1.6, “How to Report Bugs or Problems”. If you have installed the latest versions of the required tools, and they crash trying to process our configuration files, please report that also. However, if you get a `command not found` error or a similar problem for required tools, do not report it. Instead, make sure that all the required tools are installed and that your `PATH` variable is set correctly so that your shell can find them.

**Install the Distribution**

**On Unix:**

```shell
make install
```

This installs the files under the configured installation directory (by default, `/usr/local/mysql`). You might need to run the command as `root`.

To install in a specific directory, add a `DESTDIR` parameter to the command line:

```shell
make install DESTDIR="/opt/mysql"
```

Alternatively, generate installation package files that you can install where you like:

```shell
make package
```

This operation produces one or more `.tar.gz` files that can be installed like generic binary distribution packages. See Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”. If you run `CMake`...
with `-DCPACK_MONOLITHIC_INSTALL=1`, the operation produces a single file. Otherwise, it produces multiple files.

On Windows, generate the data directory, then create a `.zip` archive installation package:

```
shell> devenv MySQL.sln /build RelWithDebInfo /project initial_database
shell> devenv MySQL.sln /build RelWithDebInfo /project package
```

You can install the resulting `.zip` archive where you like. See Section 2.3.4, “Installing MySQL on Microsoft Windows Using a noinstall ZIP Archive”.

**Perform Postinstallation Setup**

The remainder of the installation process involves setting up the configuration file, creating the core databases, and starting the MySQL server. For instructions, see Section 2.10, “Postinstallation Setup and Testing”.

**Note**

The accounts that are listed in the MySQL grant tables initially have no passwords. After starting the server, you should set up passwords for them using the instructions in Section 2.10, “Postinstallation Setup and Testing”.

### 2.9.5 Installing MySQL Using a Development Source Tree

This section describes how to install MySQL from the latest development source code, which is hosted on GitHub. To obtain the MySQL Server source code from this repository hosting service, you can set up a local MySQL Git repository.

On GitHub, MySQL Server and other MySQL projects are found on the MySQL page. The MySQL Server project is a single repository that contains branches for several MySQL series.

MySQL officially joined GitHub in September, 2014. For more information about MySQL's move to GitHub, refer to the announcement on the MySQL Release Engineering blog: MySQL on GitHub

- Prerequisites for Installing from Development Source
- Setting Up a MySQL Git Repository

**Prerequisites for Installing from Development Source**

To install MySQL from a development source tree, your system must satisfy the tool requirements listed at Section 2.9.2, “Source Installation Prerequisites”.

**Setting Up a MySQL Git Repository**

To set up a MySQL Git repository on your machine, use this procedure:

1. Clone the MySQL Git repository to your machine. The following command clones the MySQL Git repository to a directory named `mysql-server`. The initial download will take some time to complete, depending on the speed of your connection.

```
~$ git clone https://github.com/mysql/mysql-server.git
Cloning into 'mysql-server'...
remote: Counting objects: 1035465, done.
remote: Total 1035465 (delta 0), reused 0 (delta 0)
Receiving objects: 100% (1035465/1035465), 437.48 MiB | 5.10 MiB/s, done.
Resolving deltas: 100% (855607/855607), done.
Checking connectivity... done.
```
2. When the clone operation completes, the contents of your local MySQL Git repository appear similar to the following:

```
$ cd mysql-server
~/$ ls
BUILD COPYING libmysqld regex tests
BUILD-CMAKE dbug libservices scripts unittest
client Docs man sql VERSION
cmake extra mysql-test sql-bench vio
CMakeLists.txt include mysys sql-common win
cmd-line-utils INSTALL-SOURCE packaging storage zlib
cconfig.h.cmake INSTALL-WIN-SOURCE plugin strings
configure.cmake libmysql README support-files
```

3. Use the `git branch -r` command to view the remote tracking branches for the MySQL repository.

```
~/$ git branch -r
origin/5.5
origin/5.6
origin/5.7
origin/HEAD -> origin/5.7
origin/cluster-7.2
origin/cluster-7.3
origin/cluster-7.4
```

4. To view the branches that are checked out in your local repository, issue the `git branch` command. When you cloned the MySQL Git repository, the MySQL 5.7 branch was checked out automatically. The asterisk identifies the 5.7 branch as the active branch.

```
~/$ git branch
* 5.7
```

5. To check out a different MySQL branch, run the `git checkout` command, specifying the branch name. For example, to check out the MySQL 5.6 branch:

```
~/$ git checkout 5.6
Branch 5.6 set up to track remote branch 5.6 from origin.
Switched to a new branch '5.6'
```

6. Run `git branch` again to verify that the MySQL 5.6 branch is present. MySQL 5.6, which is the last branch you checked out, is marked by an asterisk indicating that it is the active branch.

```
~/$ git branch
* 5.6
  5.7
```

The `git checkout` command is also used to switch branches. For example, to make MySQL 5.7 the active branch again, you would run `git checkout 5.7`.

7. To obtain changes made after your initial setup of the MySQL Git repository, switch to the branch you want to update and issue the `git pull` command:

```
~/$ git checkout 5.6
~/$ git pull
```

To examine the commit history, use the `git log` option:

```
~/$ git log
```

You can also browse commit history and source code on the GitHub MySQL site.
Configuring SSL Library Support

If you see changes or code that you have a question about, ask on the MySQL Community Slack. For information about contributing a patch, see Contributing to MySQL Server.

8. After you have cloned the MySQL Git repository and have checked out the branch you want to build, you can build MySQL Server from the source code. Instructions are provided in Section 2.9.4, “Installing MySQL Using a Standard Source Distribution”, except that you skip the part about obtaining and unpacking the distribution.

Be careful about installing a build from a distribution source tree on a production machine. The installation command may overwrite your live release installation. If you already have MySQL installed and do not want to overwrite it, run CMake with values for the CMAKE_INSTALL_PREFIX, MYSQL_TCP_PORT, and MYSQL_UNIX_ADDR options different from those used by your production server. For additional information about preventing multiple servers from interfering with each other, see Section 5.7, “Running Multiple MySQL Instances on One Machine”.

Play hard with your new installation. For example, try to make new features crash. Start by running make test. See Section 24.1.2, “The MySQL Test Suite”.

2.9.6 Configuring SSL Library Support

An SSL library is required for support of encrypted connections, entropy for random number generation, and other encryption-related operations. Your system must support either OpenSSL or yaSSL:

- MySQL Enterprise Edition binary distributions are compiled using OpenSSL. It is not possible to use yaSSL with MySQL Enterprise Edition.
- MySQL Community Edition binary distributions are compiled using yaSSL.
- MySQL Community Edition source distributions can be compiled using either OpenSSL or yaSSL.

Note

It is possible to compile MySQL using yaSSL as an alternative to OpenSSL only prior to MySQL 5.6.46. As of MySQL 5.6.46, support for yaSSL is removed and all MySQL builds use OpenSSL.

If you compile MySQL from a source distribution, CMake configures the distribution to use the installed OpenSSL library by default.

To compile using OpenSSL, use this procedure:

1. Ensure that OpenSSL 1.0.1 or higher is installed on your system. If the installed OpenSSL version is lower than 1.0.1, CMake produces an error at MySQL configuration time. If it is necessary to obtain OpenSSL, visit http://www.openssl.org.

2. The WITH_SSL CMake option determines which SSL library to use for compiling MySQL (see Section 2.9.7, “MySQL Source-Configuration Options”). The default is -DWITH_SSL=system, which uses OpenSSL. To make this explicit, specify that option on the CMake command line. For example:

```
cmake . -DWITH_SSL=system
```

That command configures the distribution to use the installed OpenSSL library. Alternatively, to explicitly specify the path name to the OpenSSL installation, use the following syntax. This can be useful if you have multiple versions of OpenSSL installed, to prevent CMake from choosing the wrong one:
3. Compile and install the distribution.

To check whether a `mysqld` server supports encrypted connections, examine the value of the `have_ssl` system variable:

```sql
mysql> SHOW VARIABLES LIKE 'have_ssl';
+---------------+-------+
| Variable_name | Value |
+---------------+-------+
| have_ssl      | YES   |
+---------------+-------+
```

If the value is `YES`, the server supports encrypted connections. If the value is `DISABLED`, the server is capable of supporting encrypted connections but was not started with the appropriate `--ssl-xxx` options to enable encrypted connections to be used; see Section 6.3.1, “Configuring MySQL to Use Encrypted Connections”.

To determine whether a server was compiled using OpenSSL or yaSSL, check the existence of any of the system or status variables that are present only for OpenSSL. See Section 6.3.4, “SSL Library-Dependent Capabilities”

# 2.9.7 MySQL Source-Configuration Options

The `CMake` program provides a great deal of control over how you configure a MySQL source distribution. Typically, you do this using options on the `CMake` command line. For information about options supported by `CMake`, run either of these commands in the top-level source directory:

```bash
cmake . -LH
ccmake .
```

You can also affect `CMake` using certain environment variables. See Section 4.9, “MySQL Environment Variables”.

For boolean options, the value may be specified as 1 or `ON` to enable the option, or as 0 or `OFF` to disable the option.

Many options configure compile-time defaults that can be overridden at server startup. For example, the `CMAKE_INSTALL_PREFIX`, `MYSQL_TCP_PORT`, and `MYSQL_UNIX_ADDR` options that configure the default installation base directory location, TCP/IP port number, and Unix socket file can be changed at server startup with the `--basedir`, `--port`, and `--socket` options for `mysqld`. Where applicable, configuration option descriptions indicate the corresponding `mysqld` startup option.

The following sections provide more information about `CMake` options.

- CMake Option Reference
- General Options
- Installation Layout Options
- Storage Engine Options
- Feature Options
- Compiler Flags
- CMake Options for Compiling NDB Cluster
CMake Option Reference

The following table shows the available CMake options. In the Default column, PREFIX stands for the value of the CMAKE_INSTALL_PREFIX option, which specifies the installation base directory. This value is used as the parent location for several of the installation subdirectories.

</table>

### General Options

- **-DBUILD_CONFIG=mysql_release**

  This option configures a source distribution with the same build options used by Oracle to produce binary distributions for official MySQL releases.

- **-DCMAKE_BUILD_TYPE=type**

  The type of build to produce:

  - **RelWithDebInfo**: Enable optimizations and generate debugging information. This is the default MySQL build type.

  - **Debug**: Disable optimizations and generate debugging information. This build type is also used if the WITH_DEBUG option is enabled. That is, **-DWITH_DEBUG=1** has the same effect as **-DCMAKE_BUILD_TYPE=Debug**.

- **-DCPACK_MONOLITHIC_INSTALL=bool**
This option affects whether the *make package* operation produces multiple installation package files or a single file. If disabled, the operation produces multiple installation package files, which may be useful if you want to install only a subset of a full MySQL installation. If enabled, it produces a single file for installing everything.

### Installation Layout Options

The `CMAKE_INSTALL_PREFIX` option indicates the base installation directory. Other options with names of the form `INSTALL_xxx` that indicate component locations are interpreted relative to the prefix and their values are relative pathnames. Their values should not include the prefix.

- `-DCMAKE_INSTALL_PREFIX=dir_name`
  
  The installation base directory.

  This value can be set at server startup with the `--basedir` option.

- `-DINSTALL_BINDIR=dir_name`
  
  Where to install user programs.

- `-DINSTALL_DOCDIR=dir_name`
  
  Where to install documentation.

- `-DINSTALL_DOCREADMEDIR=dir_name`
  
  Where to install README files.

- `-DINSTALL_INCLUDEDIR=dir_name`
  
  Where to install header files.

- `-DINSTALL_INFODIR=dir_name`
  
  Where to install Info files.

- `-DINSTALL_LAYOUT=name`
  
  Select a predefined installation layout:

  - `STANDALONE`: Same layout as used for `.tar.gz` and `.zip` packages. This is the default.
  - `RPM`: Layout similar to RPM packages.
  - `SVR4`: Solaris package layout.
  - `DEB`: DEB package layout (experimental).

  You can select a predefined layout but modify individual component installation locations by specifying other options. For example:

  ```
  cmake . -DINSTALL_LAYOUT=SVR4 -DMYSQL_DATADIR=/var/mysql/data
  ```

- `-DINSTALL_LIBDIR=dir_name`
  
  Where to install library files.
MySQL Source-Configuration Options

- **-DINSTALL_MANDIR=dir_name**
  Where to install manual pages.

- **-DINSTALL_MYSQLSHAREDIR=dir_name**
  Where to install shared data files.

- **-DINSTALL_MYSQLTESTDIR=dir_name**
  Where to install the `mysql-test` directory. As of MySQL 5.6.12, to suppress installation of this directory, explicitly set the option to the empty value (``-DINSTALL_MYSQLTESTDIR``).

- **-DINSTALL_PLUGINDIR=dir_name**
  The location of the plugin directory.
  This value can be set at server startup with the `--plugin_dir` option.

- **-DINSTALL_SBINDIR=dir_name**
  Where to install the `mysqld` server.

- **-DINSTALL_SCRIPTDIR=dir_name**
  Where to install `mysql_install_db`.

- **-DINSTALL_SECURE_FILE_PRIVDIR=dir_name**
  The default value for the `secure_file_priv` system variable. The default value is platform specific and depends on the value of the `INSTALL_LAYOUT` CMake option; see the description of the `secure_file_priv` system variable in Section 5.1.7, “Server System Variables”.
  This option was added in MySQL 5.6.34. To set the value for the `libmysqld` embedded server, use `INSTALL_SECURE_FILE_PRIV_EMBEDDEDDIR`.

- **-DINSTALL_SECURE_FILE_PRIV_EMBEDDEDDIR=dir_name**
  The default value for the `secure_file_priv` system variable, for the `libmysqld` embedded server. This option was added in MySQL 5.6.34.

- **-DINSTALL_SHAREDIR=dir_name**
  Where to install `aclocal/mysql.m4`.

- **-DINSTALL_SQLBENCHDIR=dir_name**
  Where to install the `sql-bench` directory. To suppress installation of this directory, explicitly set the option to the empty value (``-DINSTALL_SQLBENCHDIR``).

- **-DINSTALL_SUPPORTFILESDIR=dir_name**
  Where to install extra support files.

- **-DMYSQL_DATADIR=dir_name**
  The location of the MySQL data directory.
  This value can be set at server startup with the `--datadir` option.
MySQL Source-Configuration Options

• **-DODBC_INCLUDES=dir_name**
  The location of the ODBC includes directory, and may be used while configuring Connector/ODBC.

• **-DODBC_LIB_DIR=dir_name**
  The location of the ODBC library directory, and may be used while configuring Connector/ODBC.

• **-DSYSCONFDIR=dir_name**
  The default my.cnf option file directory.
  This location cannot be set at server startup, but you can start the server with a given option file using the **--defaults-file=file_name** option, where file_name is the full path name to the file.

• **-DTMPDIR=dir_name**
  The default location to use for the tmpdir system variable. If unspecified, the value defaults to P_tmpdir in <stdio.h>. This option was added in MySQL 5.6.16.

Storage Engine Options

Storage engines are built as plugins. You can build a plugin as a static module (compiled into the server) or a dynamic module (built as a dynamic library that must be installed into the server using the INSTALL PLUGIN statement or the **--plugin-load** option before it can be used). Some plugins might not support static or dynamic building.

The InnoDB, MyISAM, MERGE, MEMORY, and CSV engines are mandatory (always compiled into the server) and need not be installed explicitly.

To compile a storage engine statically into the server, use **-DWITH_engine_STORAGE_ENGINE=1**. Some permissible engine values are ARCHIVE, BLACKHOLE, EXAMPLE, FEDERATED, NDB or NDBCLUSTER (NDB), PARTITION (partitioning support), and PERFSCHEMA (Performance Schema). Examples:

```
-DWITH_ARCHIVE_STORAGE_ENGINE=1
-DWITH_BLACKHOLE_STORAGE_ENGINE=1
-DWITH_PERFSCHEMA_STORAGE_ENGINE=1
```

Note

**WITH_NDBCLUSTER_STORAGE_ENGINE** is supported only when building NDB Cluster using the NDB Cluster sources. It cannot be used to enable clustering support in other MySQL source trees or distributions. In NDB Cluster source distributions, it is enabled by default. See Section 18.2.2.4, “Building NDB Cluster from Source on Linux”, and Section 18.2.3.2, “Compiling and Installing NDB Cluster from Source on Windows”, for more information.

To exclude a storage engine from the build, use **-DWITHOUT_engine_STORAGE_ENGINE=1**. Examples:

```
-DWITHOUT_EXAMPLE_STORAGE_ENGINE=1
-DWITHOUT_FEDERATED_STORAGE_ENGINE=1
-DWITHOUT_PARTITION_STORAGE_ENGINE=1
```

If neither **-DWITH_engine_STORAGE_ENGINE** nor **-DWITHOUT_engine_STORAGE_ENGINE** are specified for a given storage engine, the engine is built as a shared module, or excluded if it cannot be built as a shared module.
MySQL Source-Configuration Options

Feature Options

- **-DCOMPILED_COMMENT=string**
  A descriptive comment about the compilation environment.

- **-DDEFAULT_CHARSET=charset_name**
  The server character set. By default, MySQL uses the latin1 (cp1252 West European) character set. `charset_name` may be one of binary, armsci8, ascii, big5, cp1250, cp1251, cp1256, cp1257, cp850, cp852, cp866, cp932, dec8, eucjpms, euckr, gb2312, gbk, geostd8, greek, hebrew, hp8, keybcs2, koi8r, koi8u, latin1, latin2, latin5, latin7, macce, macroman, sjis, swe7, tis620, ucs2, ujis, utf8, utf8mb4, utf16, utf16le, utf32. The permissible character sets are listed in the cmake/character_sets.cmake file as the value of CHARSETS_AVAILABLE. This value can be set at server startup with the --character_set_server option.

- **-DDEFAULT_COLLATION=collation_name**
  The server collation. By default, MySQL uses latin1_swedish_ci. Use the SHOW COLLATION statement to determine which collations are available for each character set. This value can be set at server startup with the --collation_server option.

- **-DENABLE_DEBUG_SYNC=bool**
  Whether to compile the Debug Sync facility into the server. This facility is used for testing and debugging. This option is enabled by default, but has no effect unless MySQL is configured with debugging enabled. If debugging is enabled and you want to disable Debug Sync, use -DENABLE_DEBUG_SYNC=0.

  When compiled in, Debug Sync is disabled by default at runtime. To enable it, start mysql with the --debug-sync-timeout=N option, where N is a timeout value greater than 0. (The default value is 0, which disables Debug Sync.) N becomes the default timeout for individual synchronization points.

  For a description of the Debug Sync facility and how to use synchronization points, see MySQL Internals: Test Synchronization.

- **-DENABLE_DOWNLOADS=bool**
  Whether to download optional files. For example, with this option enabled, CMake downloads the Google Test distribution that is used by the test suite to run unit tests.

- **-DENABLE_DTRACE=bool**
  Whether to include support for DTrace probes. For information about DTrace, see Section 5.8, “Tracing mysqld Using DTrace”.

- **-DENABLE_GCOV=bool**
  Whether to include gcov support (Linux only).
MySQL Source-Configuration Options

- **-DENABLE_GPROF=bool**
  Whether to enable gprof (optimized Linux builds only).

- **-DENABLED_LOCAL_INFILE=bool**
  This option controls the compiled-in default LOCAL capability for the MySQL client library. Clients that make no explicit arrangements therefore have LOCAL capability disabled or enabled according to the ENABLED_LOCAL_INFILE setting specified at MySQL build time.

  By default, the client library in MySQL binary distributions is compiled with ENABLED_LOCAL_INFILE enabled. If you compile MySQL from source, configure it with ENABLED_LOCAL_INFILE disabled or enabled based on whether clients that make no explicit arrangements should have LOCAL capability disabled or enabled, respectively.

  ENABLED_LOCAL_INFILE controls the default for client-side LOCAL capability. For the server, the local_infile system variable controls server-side LOCAL capability. To explicitly cause the server to refuse or permit LOAD DATA LOCAL statements (regardless of how client programs and libraries are configured at build time or runtime), start mysqld with local_infile disabled or enabled, respectively. local_infile can also be set at runtime. See Section 6.1.6, “Security Issues with LOAD DATA LOCAL”.

- **-DENABLED_PROFILING=bool**
  Whether to enable query profiling code (for the SHOW PROFILE and SHOW PROFILES statements).

- **-DIGNORE_AIO_CHECK=bool**
  If the -DBUILD_CONFIG=mysql_release option is given on Linux, the libaio library must be linked in by default. If you do not have libaio or do not want to install it, you can suppress the check for it by specifying -DIGNORE_AIO_CHECK=1.

- **-DINNODB_PAGE_ATOMIC_REF_COUNT=bool**
  Whether to enable or disable atomic page reference counting. Fetching and releasing pages from the buffer pool and tracking the page state are expensive and complex operations. Using a page mutex to track these operations does not scale well. With INNODB_PAGE_ATOMIC_REF_COUNT=ON (default), fetch and release is tracked using atomics where available. For platforms that do not support atomics, set INNODB_PAGE_ATOMIC_REF_COUNT=OFF to disable atomic page reference counting.

  When atomic page reference counting is enabled (default), "[Note] InnoDB: Using atomics to ref count buffer pool pages" is printed to the error log at server startup. If atomic page reference counting is disabled, "[Note] InnoDB: Using mutexes to ref count buffer pool pages" is printed instead.

  INNODB_PAGE_ATOMIC_REF_COUNT was introduced with the fix for MySQL Bug #68079. The option is removed in MySQL 5.7.5. Support for atomics is required to build MySQL as of MySQL 5.7.5, which makes the option obsolete.

- **-DMYSQL_MAINTAINER_MODE=bool**
  Whether to enable a MySQL maintainer-specific development environment. If enabled, this option causes compiler warnings to become errors. It may also cause some minor changes in generated code, to initialize some variables to 0.

- **-DMYSQL_PROJECT_NAME=name**
MySQL Source-Configuration Options

For Windows or macOS, the project name to incorporate into the project file name.

- `--DMYSQL_TCP_PORT=port_num`
  The port number on which the server listens for TCP/IP connections. The default is 3306.
  This value can be set at server startup with the `--port` option.

- `--DMYSQL_UNIX_ADDR=file_name`
  The Unix socket file path on which the server listens for socket connections. This must be an absolute path name. The default is `/tmp/mysql.sock`.
  This value can be set at server startup with the `--socket` option.

- `--DOPTIMIZER_TRACE=bool`
  Whether to support optimizer tracing. See MySQL Internals: Tracing the Optimizer.

- `--DREPRODUCIBLE_BUILD=bool`
  For builds on Linux systems, this option controls whether to take extra care to create a build result independent of build location and time.
  This option was added in MySQL 5.6.37.

- `--DWITH_ASAN=bool`
  Whether to enable AddressSanitizer, for compilers that support it. The default is off. This option was added in MySQL 5.6.15.

- `--DWITH_DEBUG=bool`
  Whether to include debugging support.
  Configuring MySQL with debugging support enables you to use the `--debug="d,parser_debug"` option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server's standard error output. Typically, this output is written to the error log.
  As of MySQL 5.6.36, enabling WITH_DEBUG also enables Debug Sync. For a description of the Debug Sync facility and how to use synchronization points, see MySQL Internals: Test Synchronization.

- `--DWITH_DEFAULT_FEATURE_SET=bool`
  Whether to use the flags from `cmake/build_configurations/feature_set.cmake`.

- `--DWITH_EDITLINE=value`
  Which `libedit/editline` library to use. The permitted values are `bundled` (the default) and `system`. `WITH_EDITLINE` was added in MySQL 5.6.12. It replaces `WITH_LIBEDIT`, which has been removed.

- `--DWITH_EMBEDDED_SERVER=bool`
  Whether to build the `libmysqld` embedded server library.

- `--DWITH_EMBEDDED_SHARED_LIBRARY=bool`
MySQL Source-Configuration Options

Whether to build a shared libmysqld embedded server library. This option was added in MySQL 5.6.17.

- **-DWITH_EXTRA_CHARSETS=**name
  Which extra character sets to include:
  - all: All character sets. This is the default.
  - complex: Complex character sets.
  - none: No extra character sets.

- **-DWITH_GMOCK=**path_name
  The path to the googlemock distribution, for use with Google Test-based unit tests. The option value is the path to the distribution Zip file. Alternatively, set the WITH_GMOCK environment variable to the path name. It is also possible to use *-DENABLE_DOWNLOADS=1* and CMake will download the distribution from GitHub.

  If you build MySQL without the Google Test-based unit tests (by configuring without WITH_GMOCK), CMake displays a message indicating how to download it.

- **-DWITH_INNODB_MEMCACHED=**bool
  Whether to generate memcached shared libraries (libmemcached.so and innodb_engine.so).

- **-DWITH_LIBEVENT=**string
  Which libevent library to use. Permitted values are bundled (default), system, and yes. If you specify system or yes, the system libevent library is used if present. If the system library is not found, the bundled libevent library is used. The libevent library is required by InnoDB memcached.

- **-DWITH_LIBEDIT=**bool
  Whether to use the libedit library bundled with the distribution.
  WITH_LIBEDIT was removed in MySQL 5.6.12. Use WITH_EDITLINE instead.

- **-DWITH_LIBWRAP=**bool
  Whether to include libwrap (TCP wrappers) support.

- **-DWITH_NUMA=**bool
  Explicitly set the NUMA memory allocation policy. CMake sets the default WITH_NUMA value based on whether the current platform has NUMA support. For platforms without NUMA support, CMake behaves as follows:
  - With no NUMA option (the normal case), CMake continues normally, producing only this warning: NUMA library missing or required version not available
  - With -DWITH_NUMA=ON, CMake aborts with this error: NUMA library missing or required version not available
  This option was added in MySQL 5.6.27.

- **-DWITH_READLINE=**bool
MySQL Source-Configuration Options

Whether to use the `readline` library bundled with the distribution. This option was removed in MySQL 5.6.5 because `readline` is no longer bundled.

- `-DWITH_SSL={ssl_type|path_name}`

  For support of encrypted connections, entropy for random number generation, and other encryption-related operations, MySQL must be built using an SSL library. This option specifies which SSL library to use.

  - `ssl_type` can be one of the following values:
    - `no`: No SSL support. This is the default before MySQL 5.6.6. As of 5.6.6, this is no longer a permitted value and the default is `bundled`.
    - `yes`: Use the system OpenSSL library if present, else the library bundled with the distribution.
    - `bundled`: Use the SSL library bundled with the distribution. This is the default from MySQL 5.6.6 through 5.6.45. As of 5.6.46, this is no longer a permitted value and the default is `system`.
    - `system`: Use the system OpenSSL library. This is the default as of MySQL 5.6.46.

    - `path_name`, permitted for MySQL 5.6.7 and after, is the path name to the OpenSSL installation to use. This can be preferable to using the `ssl_type` value of `system` because it can prevent CMake from detecting and using an older or incorrect OpenSSL version installed on the system. (Another permitted way to do the same thing is to set `WITH_SSL` to `system` and set the `CMAKE_PREFIX_PATH` option to `path_name`.)

    For additional information about configuring the SSL library, see Section 2.9.6, “Configuring SSL Library Support”.

- `-DWITH_SYMVER16=bool`

  If enabled, this option causes the `libmysqlclient` client library to contain extra symbols to be compatible with `libmysqlclient` on RHEL/OEL 5, 6, and 7; and Fedora releases. All symbols present in `libmysqlclient.so.16` are tagged with symver 16 in `libmysqlclient.so.18`, making those symbols have both symver 16 and 18. The default is OFF.

  This option was added in MySQL 5.6.31.

- `-DWITH_UNIT_TESTS={ON|OFF}`

  If enabled, compile MySQL with unit tests. The default is ON unless the server is not being compiled.

- `-DWITH_UNIXODBC=1`

  Enables unixODBC support, for Connector/ODBC.

- `-DWITH_VALGRIND=bool`

  Whether to compile in the Valgrind header files, which exposes the Valgrind API to MySQL code. The default is OFF.

  To generate a Valgrind-aware debug build, `-DWITH_VALGRIND=1` normally is combined with `-DWITH_DEBUG=1`. See Building Debug Configurations.

- `-DWITH_ZLIB=zlib_type`
Some features require that the server be built with compression library support, such as the `COMPRESS()` and `UNCOMPRESS()` functions, and compression of the client/server protocol. The `WITH_ZLIB` indicates the source of `zlib` support:

- **bundled**: Use the `zlib` library bundled with the distribution. This is the default.
- **system**: Use the system `zlib` library.

### Compiler Flags

- `-DCMAKE_C_FLAGS="flags"`

  Flags for the C Compiler.

- `-DCMAKE_CXX_FLAGS="flags"`

  Flags for the C++ Compiler.

- `-DWITH_DEFAULT_COMPILER_OPTIONS=bool`

  Whether to use the flags from `cmake/build_configurations/compiler_options.cmake`.

  **Note**

  All optimization flags were carefully chosen and tested by the MySQL build team. Overriding them can lead to unexpected results and is done at your own risk.

- `-DSUNPRO_CXX_LIBRARY="lib_name"

  Enable linking against `libCstd` instead of `stlport4` on Solaris 10 or later. This works only for client code because the server depends on C++98.

  This option was added in MySQL 5.6.20.

To specify your own C and C++ compiler flags, for flags that do not affect optimization, use the `CMAKE_C_FLAGS` and `CMAKE_CXX_FLAGS` CMake options.

When providing your own compiler flags, you might want to specify `CMAKE_BUILD_TYPE` as well.

For example, to create a 32-bit release build on a 64-bit Linux machine, do this:

```bash
mkdir bld
cd bld
cmake .. -DCMAKE_C_FLAGS=-m32 \  -DCMAKE_CXX_FLAGS=-m32 \  -DCMAKE_BUILD_TYPE=RelWithDebInfo
```

If you set flags that affect optimization (`-O` number), you must set the `CMAKE_C_FLAGS_build_type` and/or `CMAKE_CXX_FLAGS_build_type` options, where `build_type` corresponds to the `CMAKE_BUILD_TYPE` value. To specify a different optimization for the default build type (`RelWithDebInfo`) set the `CMAKE_C_FLAGS_RELWITHDEBINFO` and `CMAKE_CXX_FLAGS_RELWITHDEBINFO` options. For example, to compile on Linux with `-O3` and with debug symbols, do this:

```bash
cmake .. -DCMAKE_C_FLAGS_RELWITHDEBINFO="-O3 -g" \  -DCMAKE_CXX_FLAGS_RELWITHDEBINFO="-O3 -g"
```
CMakel CMake Options for Compiling NDB Cluster

The following options are for use when building NDB Cluster with the NDB Cluster sources; they are not currently supported when using sources from the MySQL 5.6 Server tree.

-DMEMCACHED_HOME=dir_name

Perform the build using the memcached (version 1.6 or later) installed in the system directory indicated by dir_name. Files from this installation that are used in the build include the memcached binary, header files, and libraries, as well as the memcached_utilities library and the header file engine_testapp.h.

You must leave this option unset when building ndbmemcache using the bundled memcached sources (WITH_BUNDLED_MEMCACHED option); in other words, the bundled sources are used by default.

This option was added in MySQL NDB Cluster 7.2.2.

While additional CMake options—such as for SASL authorization and for providing dtrace support—are available for use when compiling memcached from external sources, these options are currently not enabled for the memcached sources bundled with NDB Cluster.

-DWITH_BUNDLED_LIBEVENT={ON|OFF}

Use the libevent included in the NDB Cluster sources when building NDB Cluster with ndbmemcached support (MySQL NDB Cluster 7.2.2 and later). Enabled by default. OFF causes the system's libevent to be used instead.

-DWITH_BUNDLED_MEMCACHED={ON|OFF}

Build the memcached sources included in the NDB Cluster source tree (MySQL NDB Cluster 7.2.3 and later), then use the resulting memcached server when building the ndbmemcache engine. In this case, make install places the memcached binary in the installation bin directory, and the ndbmemcache engine shared library file ndb_engine.so in the installation lib directory.

This option is ON by default.

-DWITH_CLASSPATH=path

Sets the classpath for building NDB Cluster Connector for Java. The default is empty. In MySQL NDB Cluster 7.2.9 and later, this option is ignored if -DWITH_NDB_JAVA=OFF is used.

-DWITH_ERROR_INSERT={ON|OFF}

Enables error injection in the NDB kernel. For testing only; not intended for use in building production binaries. The default is OFF.

-DWITH_NDBCLUSTER_STORAGE_ENGINE={ON|OFF}

Build and link in support for the NDB (NDBCLUSTER) storage engine in mysqld. The default is ON.

This is an alias for WITH_NDBCLUSTER_STORAGE_ENGINE.

-DWITH_NDBMTD={ON|OFF}

Build the multithreaded data node executable ndbmtd. The default is ON.

-DWITH_NDB_BINLOG={ON|OFF}
Enable binary logging by default in the `mysqld` built using this option. ON by default.

- `-DWITH_NDB_DEBUG={ON|OFF}`

Enable building the debug versions of the NDB Cluster binaries. OFF by default.

- `-DWITH_NDB_JAVA={ON|OFF}`

Enable building NDB Cluster with Java support, including `ClusterJ`.

This option was added in MySQL NDB Cluster 7.2.9, and is ON by default. If you do not wish to compile NDB Cluster with Java support, you must disable it explicitly by specifying `-DWITH_NDB_JAVA=OFF` when running `CMake`. Otherwise, if Java cannot be found, configuration of the build fails.

- `-DWITH_NDB_PORT=port`

Causes the NDB Cluster management server (`ndb_mgmd`) that is built to use this `port` by default. If this option is unset, the resulting management server tries to use port 1186 by default.

- `-DWITH_NDB_TEST={ON|OFF}`

If enabled, include a set of NDB API test programs. The default is OFF.

### 2.9.8 Dealing with Problems Compiling MySQL

The solution to many problems involves reconfiguring. If you do reconfigure, take note of the following:

- If `CMake` is run after it has previously been run, it may use information that was gathered during its previous invocation. This information is stored in `CMakeCache.txt`. When `CMake` starts, it looks for that file and reads its contents if it exists, on the assumption that the information is still correct. That assumption is invalid when you reconfigure.

- Each time you run `CMake`, you must run `make` again to recompile. However, you may want to remove old object files from previous builds first because they were compiled using different configuration options.

To prevent old object files or configuration information from being used, run the following commands before re-running `CMake`:

On Unix:

```
shell> make clean
shell> rm CMakeCache.txt
```

On Windows:

```
shell> devenv MySQL.sln /clean
shell> del CMakeCache.txt
```

If you build outside of the source tree, remove and recreate your build directory before re-running `CMake`. For instructions on building outside of the source tree, see [How to Build MySQL Server with CMake](#).

On some systems, warnings may occur due to differences in system include files. The following list describes other problems that have been found to occur most often when compiling MySQL:

- To define which C and C++ compilers to use, you can define the `CC` and `CXX` environment variables. For example:
To specify your own C and C++ compiler flags, use the `CMAKE_C_FLAGS` and `CMAKE_CXX_FLAGS` CMake options. See Compiler Flags.

To see what flags you might need to specify, invoke `mysql_config` with the `--cflags` and `--cxxflags` options.

- To see what commands are executed during the compile stage, after using CMake to configure MySQL, run `make VERBOSE=1` rather than just `make`.

- If compilation fails, check whether the `MYSQL_MAINTAINER_MODE` option is enabled. This mode causes compiler warnings to become errors, so disabling it may enable compilation to proceed.

- If your compile fails with errors such as any of the following, you must upgrade your version of `make` to GNU `make`:

```
make: Fatal error in reader: Makefile, line 18:
Badly formed macro assignment
```

Or:

```
make: file `Makefile' line 18: Must be a separator (:)
```

Or:

```
pthread.h: No such file or directory
```

Solaris and FreeBSD are known to have troublesome `make` programs.

GNU `make` 3.75 is known to work.

- The `sql_yacc.cc` file is generated from `sql_yacc.yy`. Normally, the build process does not need to create `sql_yacc.cc` because MySQL comes with a pregenerated copy. However, if you do need to re-create it, you might encounter this error:

```
"sql_yacc.yy", line xxx fatal: default action causes potential...
```

This is a sign that your version of `yacc` is deficient. You probably need to install a recent version of `bison` (the GNU version of `yacc`) and use that instead.

Versions of `bison` older than 1.75 may report this error:

```
sql_yacc.yy:#####: fatal error: maximum table size (32767) exceeded
```

The maximum table size is not actually exceeded; the error is caused by bugs in older versions of `bison`.

For information about acquiring or updating tools, see the system requirements in Section 2.9, “Installing MySQL from Source”.

### 2.9.9 MySQL Configuration and Third-Party Tools
Third-party tools that need to determine the MySQL version from the MySQL source can read the `VERSION` file in the top-level source directory. The file lists the pieces of the version separately. For example, if the version is MySQL 5.7.4-m14, the file looks like this:

```
MYSQL_VERSION_MAJOR=5
MYSQL_VERSION_MINOR=7
MYSQL_VERSION_PATCH=4
MYSQL_VERSION_EXTRA=-m14
```

If the source is not for a General Availability (GA) release, the `MYSQL_VERSION_EXTRA` value will be nonempty. For the example, the value corresponds to Milestone 14.

To construct a five-digit number from the version components, use this formula:

```
MYSQL_VERSION_MAJOR*10000 + MYSQL_VERSION_MINOR*100 + MYSQL_VERSION_PATCH
```

### 2.10 Postinstallation Setup and Testing

This section discusses tasks that you should perform after installing MySQL:

- If necessary, initialize the data directory and create the MySQL grant tables. For some MySQL installation methods, data directory initialization may be done for you automatically:
  - Installation on Windows
  - Installation on Linux using a server RPM or Debian distribution from Oracle.
  - Installation using the native packaging system on many platforms, including Debian Linux, Ubuntu Linux, Gentoo Linux, and others.
  - Installation on OS X using a DMG distribution.

For other platforms and installation types, you must initialize the data directory manually. These include installation from generic binary and source distributions on Unix and Unix-like system, and installation from a ZIP Archive package on Windows. For instructions, see Section 2.10.1, “Initializing the Data Directory”.

- For instructions, see Section 2.10.2, “Starting the Server”, and Section 2.10.3, “Testing the Server”.

- Assign passwords to any initial accounts in the grant tables, if that was not already done during data directory initialization. Passwords prevent unauthorized access to the MySQL server. You may also wish to restrict access to test databases. For instructions, see Section 2.10.4, “Securing the Initial MySQL Accounts”.

- Optionally, arrange for the server to start and stop automatically when your system starts and stops. For instructions, see Section 2.10.5, “Starting and Stopping MySQL Automatically”.

- Optionally, populate time zone tables to enable recognition of named time zones. For instructions, see Section 5.1.12, “MySQL Server Time Zone Support”.

When you are ready to create additional user accounts, you can find information on the MySQL access control system and account management in Section 6.2, “Access Control and Account Management”.

#### 2.10.1 Initializing the Data Directory

After MySQL is installed, the data directory must be initialized, including the tables in the `mysql` system database:
Initializing the Data Directory

- For some MySQL installation methods, data directory initialization is automatic, as described in Section 2.10, “Postinstallation Setup and Testing”.

- For other installation methods, you must initialize the data directory manually. These include installation from generic binary and source distributions on Unix and Unix-like systems, and installation from a ZIP Archive package on Windows.

This section describes how to initialize the data directory manually for MySQL installation methods for which data directory initialization is not automatic. For some suggested commands that enable testing whether the server is accessible and working properly, see Section 2.10.3, “Testing the Server”.

In the examples shown here, the server is intended to run under the user ID of the mysql login account. This assumes that such an account exists. Either create the account if it does not exist (see Create a mysql User and Group), or substitute the name of a different existing login account that you plan to use for running the server.

1. Change location to the top-level directory of your MySQL installation, which is typically `/usr/local/mysql` (adjust the path name for your system as necessary):

   ```
   cd /usr/local/mysql
   ```

   You will find several files and subdirectories inside the directory, including the `bin` and `scripts` subdirectories, which contain the server as well as client and utility programs.

2. Initialize the data directory, including the `mysql` database containing the initial MySQL grant tables that determine how users are permitted to connect to the server. For example:

   ```
   scripts/mysql_install_db --user=mysql
   ```

   Typically, data directory initialization need be done only after you first install MySQL. (For upgrades to an existing installation, perform the upgrade procedure instead; see Section 2.11, “Upgrading MySQL”.) However, the command that initializes the data directory does not overwrite any existing privilege tables, so it is safe to run in any circumstances.

   It is important to make sure that the database directories and files are owned by the mysql login account so that the server has read and write access to them when you run it later. To ensure this if you run `mysql_install_db` as root, include the `--user` option as shown.

   The `mysql_install_db` command initializes the server’s data directory. Under the data directory, it creates directories for the `mysql` database that holds the grant tables and the `test` database that you can use to test MySQL. The program also creates privilege table entries for the initial account or accounts. `test_`. For a complete listing and description of the grant tables, see Section 6.2, “Access Control and Account Management”.

   It might be necessary to specify other options such as `--basedir` or `--datadir` if `mysql_install_db` cannot identify the correct locations for the installation directory or data directory. For example (enter the command on a single line):

   ```
   scripts/mysql_install_db --user=mysql
   --basedir=/opt/mysql/mysql
   --datadir=/opt/mysql/mysql/data
   ```

   For a more secure installation, invoke `mysql_install_db` with the `--random-passwords` option. This causes it to assign a random password to the MySQL root accounts, set the “password expired” flag for those accounts, and remove the anonymous-user MySQL accounts. For additional details,
see Section 4.4.3, "mysql_install_db — Initialize MySQL Data Directory". (Install operations using RPMs for Unbreakable Linux Network are unaffected because they do not use mysql_install_db.)

If you do not want to have the test database, you can remove it after starting the server, using the instructions in Section 2.10.4, "Securing the Initial MySQL Accounts".

If you have trouble with mysql_install_db at this point, see Section 2.10.1.1, “Problems Running mysql_install_db”.

3. In the absence of any option files, the server starts with its default settings. (See Section 5.1.2, "Server Configuration Defaults"). To specify options that the MySQL server should use at startup, put them in an option file such as /etc/my.cnf or /etc/mysql/my.cnf. (See Section 4.2.2.2, "Using Option Files".) For example, you can use an option file to set the secure_file_priv system variable.

4. To arrange for MySQL to start without manual intervention at system boot time, see Section 2.10.5, “Starting and Stopping MySQL Automatically”.

5. Data directory initialization creates time zone tables in the mysql database but does not populate them. To do so, use the instructions in Section 5.1.12, “MySQL Server Time Zone Support”.

2.10.1.1 Problems Running mysql_install_db

The purpose of the mysql_install_db program is to initialize the data directory, including the tables in the mysql system database. It does not overwrite existing MySQL privilege tables, and it does not affect any other data.

To re-create your privilege tables, first stop the mysqld server if it is running. Then rename the mysql directory under the data directory to save it, and run mysql_install_db. Suppose that your current directory is the MySQL installation directory and that mysql_install_db is located in the bin directory and the data directory is named data. To rename the mysql database and re-run mysql_install_db, use these commands.

```
mv data/mysql data/mysql.old
scripts/mysql_install_db --user=mysql
```

When you run mysql_install_db, you might encounter the following problems:

• mysql_install_db fails to install the grant tables

You may find that mysql_install_db fails to install the grant tables and terminates after displaying the following messages:

```
Starting mysqld daemon with databases from XXXXXX
mysqld ended
```

In this case, you should examine the error log file very carefully. The log should be located in the directory XXXXXX named by the error message and should indicate why mysqld did not start. If you do not understand what happened, include the log when you post a bug report. See Section 1.6, “How to Report Bugs or Problems”.

• There is a mysqld process running

This indicates that the server is running, in which case the grant tables have probably been created already. If so, there is no need to run mysql_install_db at all because it needs to be run only once, when you first install MySQL.
• Installing a second `mysqld` server does not work when one server is running

This can happen when you have an existing MySQL installation, but want to put a new installation in a different location. For example, you might have a production installation, but you want to create a second installation for testing purposes. Generally the problem that occurs when you try to run a second server is that it tries to use a network interface that is in use by the first server. In this case, you should see one of the following error messages:

```
Can't start server: Bind on TCP/IP port:
Address already in use
Can't start server: Bind on unix socket...
```

For instructions on setting up multiple servers, see Section 5.7, “Running Multiple MySQL Instances on One Machine”.

• You do not have write access to the `/tmp` directory

If you do not have write access to create temporary files or a Unix socket file in the default location (the `/tmp` directory) or the `TMPDIR` environment variable, if it has been set, an error occurs when you run `mysql_install_db` or the `mysqld` server.

You can specify different locations for the temporary directory and Unix socket file by executing these commands prior to starting `mysql_install_db` or `mysqld`, where `some_tmp_dir` is the full path name to some directory for which you have write permission:

```
TMPDIR=/some_tmp_dir/
MYSQL_UNIX_PORT=/some_tmp_dir/mysql.sock
export TMPDIR MYSQL_UNIX_PORT
```

Then you should be able to run `mysql_install_db` and start the server with these commands:

```
scripts/mysql_install_db --user=mysql
bin/mysqld_safe --user=mysql &
```

If `mysql_install_db` is located in the `scripts` directory, modify the first command to `scripts/mysql_install_db`.

See Section B.4.3.6, “How to Protect or Change the MySQL Unix Socket File”, and Section 4.9, “MySQL Environment Variables”.

There are some alternatives to running the `mysql_install_db` program provided in the MySQL distribution:

• If you want the initial privileges to differ from the standard defaults, use account-management statements such as `CREATE USER`, `GRANT`, and `REVOKE` to change the privileges after the grant tables have been set up. In other words, run `mysql_install_db`, and then use `mysql -u root mysql` to connect to the server as the MySQL root user so that you can issue the necessary statements. (See Section 13.7.1, “Account Management Statements”.)

To install MySQL on several machines with the same privileges, put the `CREATE USER`, `GRANT`, and `REVOKE` statements in a file and execute the file as a script using `mysql` after running `mysql_install_db`. For example:

```
scripts/mysql_install_db --user=mysql
bin/mysql -u root < your_script_file
```
This enables you to avoid issuing the statements manually on each machine.

- It is possible to re-create the grant tables completely after they have previously been created. You might want to do this if you are just learning how to use `CREATE USER`, `GRANT`, and `REVOKE` and have made so many modifications after running `mysql_install_db` that you want to wipe out the tables and start over.

To re-create the grant tables, stop the server if it is running and remove the `mysql` database directory. Then run `mysql_install_db` again.

## 2.10.2 Starting the Server

This section describes how start the server on Unix and Unix-like systems. (For Windows, see Section 2.3.4.4, “Starting the Server for the First Time”.) For some suggested commands that you can use to test whether the server is accessible and working properly, see Section 2.10.3, “Testing the Server”.

Start the MySQL server like this:

```
shell> bin/mysqld_safe --user=mysql &
```

It is important that the MySQL server be run using an unprivileged (non-root) login account. To ensure this if you run `mysqld_safe` as `root`, include the `--user` option as shown. Otherwise, execute the program while logged in as `mysql`, in which case you can omit the `--user` option from the command.

For further instructions for running MySQL as an unprivileged user, see Section 6.1.5, “How to Run MySQL as a Normal User”.

If the command fails immediately and prints `mysqld ended`, look for information in the error log (which by default is the `host_name.err` file in the data directory).

If the server is unable to access the data directory it starts or read the grant tables in the `mysql` database, it writes a message to its error log. Such problems can occur if you neglected to create the grant tables by initializing the data directory before proceeding to this step, or if you ran the command that initializes the data directory without the `--user` option. Remove the `data` directory and run the command with the `--user` option.

If you have other problems starting the server, see Section 2.10.2.1, “Troubleshooting Problems Starting the MySQL Server”. For more information about `mysqld_safe`, see Section 4.3.2, “`mysqld_safe` — MySQL Server Startup Script”.

### 2.10.2.1 Troubleshooting Problems Starting the MySQL Server

This section provides troubleshooting suggestions for problems starting the server. For additional suggestions for Windows systems, see Section 2.3.5, “Troubleshooting a Microsoft Windows MySQL Server Installation”.

If you have problems starting the server, here are some things to try:

- Check the error log to see why the server does not start. Log files are located in the data directory (typically `C:\Program Files\MySQL\MySQL Server 5.6\data` on Windows, `/usr/local/mysql/data` for a Unix/Linux binary distribution, and `/usr/local/var` for a Unix/Linux source distribution). Look in the data directory for files with names of the form `host_name.err` and `host_name.log`, where `host_name` is the name of your server host. Then examine the last few lines of these files. Use `tail` to display them:

```
shell> tail host_name.err
```
Starting the Server

shell> tail host_name.log

• Specify any special options needed by the storage engines you are using. You can create a `my.cnf` file and specify startup options for the engines that you plan to use. If you are going to use storage engines that support transactional tables (InnoDB, NDB), be sure that you have them configured the way you want before starting the server. If you are using InnoDB tables, see Section 14.8, “InnoDB Configuration” for guidelines and Section 14.14, “InnoDB Startup Options and System Variables” for option syntax.

Although storage engines use default values for options that you omit, Oracle recommends that you review the available options and specify explicit values for any options whose defaults are not appropriate for your installation.

• Make sure that the server knows where to find the data directory. The `mysqld` server uses this directory as its current directory. This is where it expects to find databases and where it expects to write log files. The server also writes the pid (process ID) file in the data directory.

The default data directory location is hardcoded when the server is compiled. To determine what the default path settings are, invoke `mysqld` with the `--verbose` and `--help` options. If the data directory is located somewhere else on your system, specify that location with the `--datadir` option to `mysqld` or `mysqld_safe`, on the command line or in an option file. Otherwise, the server will not work properly. As an alternative to the `--datadir` option, you can specify `mysqld` the location of the base directory under which MySQL is installed with the `--basedir`, and `mysqld` looks for the data directory there.

To check the effect of specifying path options, invoke `mysqld` with those options followed by the `--verbose` and `--help` options. For example, if you change location to the directory where `mysqld` is installed and then run the following command, it shows the effect of starting the server with a base directory of `/usr/local`:

shell> ./mysqld --basedir=/usr/local --verbose --help

You can specify other options such as `--datadir` as well, but `--verbose` and `--help` must be the last options.

Once you determine the path settings you want, start the server without `--verbose` and `--help`.

If `mysqld` is currently running, you can find out what path settings it is using by executing this command:

shell> mysqladmin variables

Or:

shell> mysqladmin -h host_name variables

`host_name` is the name of the MySQL server host.

• Make sure that the server can access the data directory. The ownership and permissions of the data directory and its contents must allow the server to read and modify them.

If you get Errorcode 13 (which means Permission denied) when starting `mysqld`, this means that the privileges of the data directory or its contents do not permit server access. In this case, you change the permissions for the involved files and directories so that the server has the right to use them. You can also start the server as root, but this raises security issues and should be avoided.
Testing the Server

Change location to the data directory and check the ownership of the data directory and its contents to make sure the server has access. For example, if the data directory is `/usr/local/mysql/var`, use this command:

```
shell> ls -la /usr/local/mysql/var
```

If the data directory or its files or subdirectories are not owned by the login account that you use for running the server, change their ownership to that account. If the account is named `mysql`, use these commands:

```
shell> chown -R mysql /usr/local/mysql/var
shell> chgrp -R mysql /usr/local/mysql/var
```

Even with correct ownership, MySQL might fail to start up if there is other security software running on your system that manages application access to various parts of the file system. In this case, reconfigure that software to enable `mysqld` to access the directories it uses during normal operation.

- Verify that the network interfaces the server wants to use are available.

If either of the following errors occur, it means that some other program (perhaps another `mysqld` server) is using the TCP/IP port or Unix socket file that `mysqld` is trying to use:

```
Can't start server: Bind on TCP/IP port: Address already in use
Can't start server: Bind on unix socket...
```

Use `ps` to determine whether you have another `mysqld` server running. If so, shut down the server before starting `mysqld` again. (If another server is running, and you really want to run multiple servers, you can find information about how to do so in Section 5.7, “Running Multiple MySQL Instances on One Machine”.)

If no other server is running, execute the command `telnet your_host_name tcp_ip_port_number`. (The default MySQL port number is 3306.) Then press Enter a couple of times. If you do not get an error message like `telnet: Unable to connect to remote host: Connection refused`, some other program is using the TCP/IP port that `mysqld` is trying to use. Track down what program this is and disable it, or tell `mysqld` to listen to a different port with the `--port` option. In this case, specify the same non-default port number for client programs when connecting to the server using TCP/IP.

Another reason the port might be inaccessible is that you have a firewall running that blocks connections to it. If so, modify the firewall settings to permit access to the port.

If the server starts but you cannot connect to it, make sure that you have an entry in `/etc/hosts` that looks like this:

```
127.0.0.1       localhost
```

- If you cannot get `mysql` to start, try to make a trace file to find the problem by using the `--debug` option. See Section 24.5.3, “The DBUG Package”.

### 2.10.3 Testing the Server

After the data directory is initialized and you have started the server, perform some simple tests to make sure that it works satisfactorily. This section assumes that your current location is the MySQL installation
Testing the Server

directory and that it has a `bin` subdirectory containing the MySQL programs used here. If that is not true, adjust the command path names accordingly.

Alternatively, add the `bin` directory to your `PATH` environment variable setting. That enables your shell (command interpreter) to find MySQL programs properly, so that you can run a program by typing only its name, not its path name. See Section 4.2.6, “Setting Environment Variables”.

Use `mysqladmin` to verify that the server is running. The following commands provide simple tests to check whether the server is up and responding to connections:

```
shell> bin/mysqladmin version
shell> bin/mysqladmin variables
```

If you cannot connect to the server, specify a `-u root` option to connect as `root`. If you have assigned a password for the `root` account already, you'll also need to specify `-p` on the command line and enter the password when prompted. For example:

```
shell> bin/mysqladmin -u root -p version
Enter password: (enter root password here)
```

The output from `mysqladmin version` varies slightly depending on your platform and version of MySQL, but should be similar to that shown here:

```
shell> bin/mysqladmin version
mysqladmin  Ver 14.12 Distrib 5.6.47, for pc-linux-gnu on i686 ...
Server version          5.6.47
Protocol version        10
Connection              Localhost via UNIX socket
UNIX socket             /var/lib/mysql/mysql.sock
Uptime:                 14 days 5 hours 5 min 21 sec
Threads: 1  Questions: 366  Slow queries: 0
Opens: 0  Flush tables: 1  Open tables: 19
Queries per second avg: 0.000
```

To see what else you can do with `mysqladmin`, invoke it with the `--help` option.

Verify that you can shut down the server (include a `-p` option if the `root` account has a password already):

```
shell> bin/mysqladmin -u root shutdown
```

Verify that you can start the server again. Do this by using `mysqld_safe` or by invoking `mysqld` directly. For example:

```
shell> bin/mysqld_safe --user=mysql &
```

If `mysqld_safe` fails, see Section 2.10.2.1, “Troubleshooting Problems Starting the MySQL Server”.

Run some simple tests to verify that you can retrieve information from the server. The output should be similar to that shown here.

Use `mysqlshow` to see what databases exist:

```
shell> bin/mysqlshow
+-------------------+
```
Testing the Server

<table>
<thead>
<tr>
<th>Databases</th>
</tr>
</thead>
<tbody>
<tr>
<td>information_schema</td>
</tr>
<tr>
<td>mysql</td>
</tr>
<tr>
<td>performance_schema</td>
</tr>
<tr>
<td>test</td>
</tr>
</tbody>
</table>

The list of installed databases may vary, but always includes at least `mysql` and `information_schema`. If you specify a database name, `mysqlshow` displays a list of the tables within the database:

```
shell> bin/mysqlshow mysql
Database: mysql

+---------------------------+
|          Tables           |
+---------------------------+
    columns_priv          
    db                    
    func                  
    general_log           
    help_category         
    help_keyword          
    help_relation         
    help_topic            
    innodb_index_stats    
    innodb_table_stats    
    ndb_binlog_index      
    plugin                
    proc                  
    procs_priv            
    proxies_priv          
    servers               
    slave_master_info     
    slave_relay_log_info  
    slave_worker_info     
    slow_log              
    tables_priv           
    time_zone             
    time_zone_leap_second 
    time_zone_name        
    time_zone_transition  
    time_zone_transition_type
    user                  
+---------------------------+
```

Use the `mysql` program to select information from a table in the `mysql` database:

```
shell> bin/mysql -e "SELECT User, Host, plugin FROM mysql.user" mysql
+------+-----------+-----------------------+
| User | Host      | plugin                |
+------+-----------+-----------------------+
    root | localhost | mysql_native_password |
+------+-----------+-----------------------+
```

At this point, your server is running and you can access it. To tighten security if you have not yet assigned passwords to the initial account or accounts, follow the instructions in Section 2.10.4, “Securing the Initial MySQL Accounts”.

For more information about `mysql`, `mysqladmin`, and `mysqlshow`, see Section 4.5.1, “mysql — The MySQL Command-Line Client”, Section 4.5.2, “mysqladmin — Client for Administering a MySQL Server”, and Section 4.5.6, “mysqlshow — Display Database, Table, and Column Information”.
2.10.4 Securing the Initial MySQL Accounts

The MySQL installation process involves initializing the data directory, including the grant tables in the mysql system database that define MySQL accounts. For details, see Section 2.10.1, “Initializing the Data Directory”.

This section describes how to assign passwords to the initial accounts created during the MySQL installation procedure, if you have not already done so.

The mysql.user grant table defines the initial MySQL user accounts and their access privileges:

- Some accounts have the user name root. These are superuser accounts that have all privileges and can do anything. If these root accounts have empty passwords, anyone can connect to the MySQL server as root without a password and be granted all privileges.

- On Windows, root accounts are created that permit connections from the local host only. Connections can be made by specifying the host name localhost, the IP address 127.0.0.1, or the IPv6 address ::1. If the user selects the Enable root access from remote machines option during installation, the Windows installer creates another root account that permits connections from any host.

- On Unix, each root account permits connections from the local host. Connections can be made by specifying the host name localhost, the IP address 127.0.0.1, the IPv6 address ::1, or the actual host name or IP address.

An attempt to connect to the host 127.0.0.1 normally resolves to the localhost account. However, this fails if the server is run with the --skip-name-resolve option, so the 127.0.0.1 account is useful in that case. The ::1 account is used for IPv6 connections.

- If accounts for anonymous users were created, these have an empty user name. The anonymous accounts have no password, so anyone can use them to connect to the MySQL server.

- On Windows, there is one anonymous account that permits connections from the local host. Connections can be made by specifying a host name of localhost.

- On Unix, each anonymous account permits connections from the local host. Connections can be made by specifying a host name of localhost for one of the accounts, or the actual host name or IP address for the other.

- The 'root'@'localhost' account also has a row in the mysql.proxies_priv table that enables granting the PROXY privilege for '@', that is, for all users and all hosts. This enables root to set up proxy users, as well as to delegate to other accounts the authority to set up proxy users. See Section 6.2.12, “Proxy Users”.

To display which accounts exist in the mysql.user system table and check whether their passwords are empty, use the following statement:

```
mysql> SELECT User, Host, Password FROM mysql.user;
```

<table>
<thead>
<tr>
<th>User</th>
<th>Host</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>root</td>
<td>localhost</td>
<td></td>
</tr>
<tr>
<td>root</td>
<td>myhost.example.com</td>
<td></td>
</tr>
<tr>
<td>root</td>
<td>127.0.0.1</td>
<td></td>
</tr>
<tr>
<td>root</td>
<td>::1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>localhost</td>
<td></td>
</tr>
<tr>
<td></td>
<td>myhost.example.com</td>
<td></td>
</tr>
</tbody>
</table>
```
Securing the Initial MySQL Accounts

This output indicates that there are several root and anonymous-user accounts, none of which have passwords. The output might differ on your system, but the presence of accounts with empty passwords means that your MySQL installation is unprotected until you do something about it:

- Assign a password to each MySQL root account that does not have one.
- To prevent clients from connecting as anonymous users without a password, either assign a password to each anonymous account or remove the accounts.

In addition, the mysql.db table contains rows that permit all accounts to access the test database and other databases with names that start with test_. This is true even for accounts that otherwise have no special privileges such as the default anonymous accounts. This is convenient for testing but inadvisable on production servers. Administrators who want database access restricted only to accounts that have permissions granted explicitly for that purpose should remove these mysql.db table rows.

The following instructions describe how to set up passwords for the initial MySQL accounts, first for the root accounts, then for the anonymous accounts. The instructions also cover how to remove anonymous accounts, should you prefer not to permit anonymous access at all, and describe how to remove permissive access to test databases. Replace new_password in the examples with the password that you want to use. Replace host_name with the name of the server host. You can determine this name from the output of the preceding SELECT statement. For the output shown, host_name is myhost.example.com.

You need not remove anonymous entries in the mysql.proxies_priv table, which are used to support proxy users. See Section 6.2.12, “Proxy Users”.

For additional information about setting passwords, see Section 6.2.9, “Assigning Account Passwords”. If you forget your root password after setting it, see Section B.4.3.2, “How to Reset the Root Password”.

To set up additional accounts, see Section 6.2.7, “Adding Accounts, Assigning Privileges, and Dropping Accounts”.

You might want to defer setting the passwords until later, to avoid the need to specify them while you perform additional setup or testing. However, be sure to set them before using your installation for production purposes.

Alternative means for performing the process described in this section:

- On Windows, you can perform the process during installation with MySQL Installer (see Section 2.3.3, “MySQL Installer for Windows”).
- On all platforms, the MySQL distribution includes mysql_secure_installation, a command-line utility that automates much of the process of securing a MySQL installation.
- On all platforms, MySQL Workbench is available and offers the ability to manage user accounts (see Chapter 26, MySQL Workbench).

Assigning root Account Passwords
Assigning Anonymous Account Passwords
Removing Anonymous Accounts
Securing Test Databases
Assigning root Account Passwords

A root account password can be set several ways. The following discussion demonstrates three methods:

- Use the `SET PASSWORD` statement
- Use the `UPDATE` statement
- Use the `mysqladmin` command-line client program

To assign passwords using `SET PASSWORD`, connect to the server as `root` and issue a `SET PASSWORD` statement for each `root` account listed in the `mysql.user` system table.

For Windows, do this:

```
shell> mysql -u root
mysql> SET PASSWORD FOR 'root'@'localhost' = PASSWORD('new_password');
mysql> SET PASSWORD FOR 'root'@'127.0.0.1' = PASSWORD('new_password');
mysql> SET PASSWORD FOR 'root'@'::1' = PASSWORD('new_password');
mysql> SET PASSWORD FOR 'root'@'%' = PASSWORD('new_password');
```

The last statement is unnecessary if the `mysql.user` table has no root account with a host value of `%`.

For Unix, do this:

```
shell> mysql -u root
mysql> SET PASSWORD FOR 'root'@'localhost' = PASSWORD('new_password');
mysql> SET PASSWORD FOR 'root'@'127.0.0.1' = PASSWORD('new_password');
mysql> SET PASSWORD FOR 'root'@'::1' = PASSWORD('new_password');
mysql> SET PASSWORD FOR 'root'@'host_name' = PASSWORD('new_password');
```

You can also use a single statement that assigns a password to all root accounts by using `UPDATE` to modify the `mysql.user` table directly. This method works on any platform:

```
shell> mysql -u root
mysql> UPDATE mysql.user SET Password = PASSWORD('new_password')
     WHERE User = 'root';
mysql> FLUSH PRIVILEGES;
```

The `FLUSH` statement causes the server to reread the grant tables. Without it, the password change remains unnoticed by the server until you restart it.

To assign passwords to the root accounts using `mysqladmin`, execute the following commands:

```
shell> mysqladmin -u root password "new_password"
shell> mysqladmin -u root -h host_name password "new_password"
```

Those commands apply both to Windows and to Unix. The double quotation marks around the password are not always necessary, but you should use them if the password contains spaces or other characters that are special to your command interpreter.

The `mysqladmin` method of setting the root account passwords does not work for the `root'@'127.0.0.1` or `root'@'::1` account. Use the `SET PASSWORD` method shown earlier.

After the root passwords have been set, you must supply the appropriate password whenever you connect as root to the server. For example, to shut down the server with `mysqladmin`, use this command:

```
shell> mysqladmin -u root -p shutdown
```
Securing the Initial MySQL Accounts

Enter password: *(enter root password here)*

The *mysql* commands in the following instructions include a `-p` option based on the assumption that you have assigned the root account passwords using the preceding instructions and must specify that password when connecting to the server.

Assigning Anonymous Account Passwords

To assign passwords to the anonymous accounts, connect to the server as root, then use either `SET PASSWORD` or `UPDATE`.

To use `SET PASSWORD` on Windows, do this:

```
shell> mysql -u root -p
Enter password: *(enter root password here)*
mysql> SET PASSWORD FOR ''@localhost' = PASSWORD('new_password');
```

To use `SET PASSWORD` on Unix, do this:

```
shell> mysql -u root -p
Enter password: *(enter root password here)*
mysql> SET PASSWORD FOR ''@localhost' = PASSWORD('new_password');
mysql> SET PASSWORD FOR ''@host_name' = PASSWORD('new_password');
```

To set the anonymous-user account passwords with a single `UPDATE` statement, do this (on any platform):

```
shell> mysql -u root -p
Enter password: *(enter root password here)*
mysql> UPDATE mysql.user SET Password = PASSWORD('new_password') 
   -> WHERE User = '>'; 
mysql> FLUSH PRIVILEGES;
```

The `FLUSH` statement causes the server to reread the grant tables. Without it, the password change remains unnoticed by the server until you restart it.

Removing Anonymous Accounts

If you prefer to remove any anonymous accounts rather than assigning them passwords, do so as follows on Windows:

```
shell> mysql -u root -p
Enter password: *(enter root password here)*
mysql> DROP USER ''@localhost';
```

On Unix, remove the anonymous accounts like this:

```
shell> mysql -u root -p
Enter password: *(enter root password here)*
mysql> DROP USER ''@localhost';
mysql> DROP USER ''@host_name';
```

Securing Test Databases

By default, the *mysql.db* table contains rows that permit access by any user to the test database and other databases with names that start with test_. (These rows have an empty User column value, which for access-checking purposes matches any user name.) This means that such databases can be used even by accounts that otherwise possess no privileges. If you want to remove any-user access to test databases, do so as follows:
The `FLUSH PRIVILEGES` statement causes the server to reread the grant tables. Without it, the privilege change remains unnoticed by the server until you restart it.

With the preceding change, only users who have global database privileges or privileges granted explicitly for the `test` database can use it. However, if you prefer that the database not exist at all, drop it:

```sql
mysql> DROP DATABASE test;
```

## 2.10.5 Starting and Stopping MySQL Automatically

This section discusses methods for starting and stopping the MySQL server.

Generally, you start the `mysqld` server in one of these ways:

- Invoke `mysqld` directly. This works on any platform.
- On Windows, you can set up a MySQL service that runs automatically when Windows starts. See Section 2.3.4.7, "Starting MySQL as a Windows Service".
- On Unix and Unix-like systems, you can invoke `mysqld_safe`, which tries to determine the proper options for `mysqld` and then runs it with those options. See Section 4.3.2, "`mysqld_safe` — MySQL Server Startup Script".
- On systems that use System V-style run directories (that is, `/etc/init.d` and run-level specific directories), invoke `mysql.server`. This script is used primarily at system startup and shutdown. It usually is installed under the name `mysql`. The `mysql.server` script starts the server by invoking `mysqld_safe`. See Section 4.3.3, "`mysql.server` — MySQL Server Startup Script".
- On OS X, install a launchd daemon to enable automatic MySQL startup at system startup. The daemon starts the server by invoking `mysqld_safe`. For details, see Section 2.4.3, "Installing a MySQL Launch Daemon". A MySQL Preference Pane also provides control for starting and stopping MySQL through the System Preferences. See Section 2.4.4, "Installing and Using the MySQL Preference Pane".
- On Solaris, use the service management framework (SMF) system to initiate and control MySQL startup.

The `mysqld_safe` and `mysql.server` scripts, Solaris SMF, and the OS X Startup Item (or MySQL Preference Pane) can be used to start the server manually, or automatically at system startup time. `mysql.server` and the Startup Item also can be used to stop the server.

The following table shows which option groups the server and startup scripts read from option files.

<table>
<thead>
<tr>
<th>Script</th>
<th>Option Groups</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mysqld</code></td>
<td><code>[mysqld], [server], [mysqld-major_version]</code></td>
</tr>
<tr>
<td><code>mysqld_safe</code></td>
<td><code>[mysqld], [server], [mysqld_safe]</code></td>
</tr>
<tr>
<td><code>mysql.server</code></td>
<td><code>[mysqld], [mysql.server], [server]</code></td>
</tr>
</tbody>
</table>

`[mysqld-major_version]` means that groups with names like `[mysqld-5.5]` and `[mysqld-5.6]` are read by servers having versions 5.5.x, 5.6.x, and so forth. This feature can be used to specify options that can be read only by servers within a given release series.
For backward compatibility, `mysql.server` also reads the `[mysql_server]` group and `mysqld_safe` also reads the `[safe_mysqld]` group. However, you should update your option files to use the `[mysql.server]` and `[mysqld_safe]` groups instead.

For more information on MySQL configuration files and their structure and contents, see Section 4.2.2.2, “Using Option Files”.

### 2.11 Upgrading MySQL

This section describes the steps to upgrade a MySQL installation.

Upgrading is a common procedure, as you pick up bug fixes within the same MySQL release series or significant features between major MySQL releases. You perform this procedure first on some test systems to make sure everything works smoothly, and then on the production systems.

#### Note

In the following discussion, MySQL commands that must be run using a MySQL account with administrative privileges include `-u root` on the command line to specify the MySQL root user. Commands that require a password for root also include a `-p` option. Because `-p` is followed by no option value, such commands prompt for the password. Type the password when prompted and press Enter.

SQL statements can be executed using the `mysql` command-line client (connect as root to ensure that you have the necessary privileges).

#### 2.11.1 Before You Begin

Review the information in this section before upgrading. Perform any recommended actions.

- Protect your data by creating a backup. The backup should include the `mysql` system database, which contains the MySQL system tables. See Section 7.2, “Database Backup Methods”.

- Review Section 2.11.2, “Upgrade Paths” to ensure that your intended upgrade path is supported.

- Review Section 2.11.3, “Changes in MySQL 5.6” for changes that you should be aware of before upgrading. Some changes may require action.

- Review Section 1.4, “What Is New in MySQL 5.6” for deprecated and removed features. An upgrade may require changes with respect to those features if you use any of them.

- Review Server and Status Variables and Options Added, Deprecated, or Removed in MySQL 5.7. If you use deprecated or removed variables, an upgrade may require configuration changes.

- Review the Release Notes for information about fixes, changes, and new features.

- If you use replication, review Section 17.4.3, “Upgrading a Replication Setup”.

- Upgrade procedures vary by platform and how the initial installation was performed. Use the procedure that applies to your current MySQL installation:
  
  - For binary and package-based installations on non-Windows platforms, refer to Section 2.11.4, “Upgrading MySQL Binary or Package-based Installations on Unix/Linux”.

  - For installations on an Enterprise Linux platform or Fedora using the MySQL Yum Repository, refer to Section 2.11.5, “Upgrading MySQL with the MySQL Yum Repository”.

Upgrade Paths

- For installations on Ubuntu using the MySQL APT repository, refer to Section 2.11.6, “Upgrading MySQL with the MySQL APT Repository”.

- For installations on SLES using the MySQL SLES repository, refer to Section 2.11.7, “Upgrading MySQL with the MySQL SLES Repository”.

- For installations on Windows, refer to Section 2.11.8, “Upgrading MySQL on Windows”.

- If your MySQL installation contains a large amount of data that might take a long time to convert after an in-place upgrade, it may be useful to create a test instance for assessing the conversions that are required and the work involved to perform them. To create a test instance, make a copy of your MySQL instance that contains the mysql database and other databases without the data. Run the upgrade procedure on the test instance to assess the work involved to perform the actual data conversion.

- Rebuilding and reinstalling MySQL language interfaces is recommended when you install or upgrade to a new release of MySQL. This applies to MySQL interfaces such as PHP mysql extensions and the Perl DBD::mysql module.

2.11.2 Upgrade Paths

- Upgrade is only supported between General Availability (GA) releases.

- Upgrade from MySQL 5.5 to 5.6 is supported. Upgrading to the latest release is recommended before upgrading to the next version. For example, upgrade to the latest MySQL 5.5 release before upgrading to MySQL 5.6.

- Upgrade that skips versions is not supported. For example, upgrading directly from MySQL 5.1 to 5.6 is not supported.

- Upgrade within a release series is supported. For example, upgrading from MySQL 5.6.x to 5.6.y is supported. Skipping a release is also supported. For example, upgrading from MySQL 5.6.x to 5.6.z is supported.

2.11.3 Changes in MySQL 5.6

Before upgrading to MySQL 5.6, review the changes described in this section to identify those that apply to your current MySQL installation and applications. Perform any recommended actions.

Changes marked as Incompatible change are incompatibilities with earlier versions of MySQL, and may require your attention before upgrading. Our aim is to avoid these changes, but occasionally they are necessary to correct problems that would be worse than an incompatibility between releases. If an upgrade issue applicable to your installation involves an incompatibility, follow the instructions given in the description. Sometimes this involves dumping and reloading tables, or use of a statement such as CHECK TABLE or REPAIR TABLE.

For dump and reload instructions, see Section 2.11.10, "Rebuilding or Repairing Tables or Indexes". Any procedure that involves REPAIR TABLE with the USE_FRM option must be done before upgrading. Use of this statement with a version of MySQL different from the one used to create the table (that is, using it after upgrading) may damage the table. See Section 13.7.2.5, “REPAIR TABLE Syntax”.

Note

Beginning with MySQL 5.6.6, several MySQL Server parameters have defaults that differ from previous releases. See the notes regarding these changes under Configuration Changes, particularly regarding overriding them to preserve backward compatibility if that is a concern.
Changes in MySQL 5.6

• Configuration Changes
• Server Changes
• InnoDB Changes
• SQL Changes

Configuration Changes

• Beginning with MySQL 5.6.6, several MySQL Server parameters have defaults that differ from previous releases. The motivation for these changes is to provide better out-of-box performance and to reduce the need for the database administrator to change settings manually. These changes are subject to possible revision in future releases as we gain feedback.

In some cases, a parameter has a different static default value. In other cases, the server autosizes a parameter at startup using a formula based on other related parameters or server host configuration, rather than using a static value. For example, the setting for `back_log` now is its previous default of 50, adjusted up by an amount proportional to the value of `max_connections`. The idea behind autosizing is that when the server has information available to make a decision about a parameter setting likely to be better than a fixed default, it will.

The following table summarizes changes to defaults. Any of these can be overridden by specifying an explicit value at server startup.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Old Default</th>
<th>New Default</th>
</tr>

</tbody>
</table>

With regard to compatibility with previous releases, the most important changes are:
Changes in MySQL 5.6

- `innodb_file_per_table` is enabled (previously disabled).

- `innodb_checksum_algorithm` is CRC32 (previously INNODB and changed back to INNODB in MySQL 5.6.7).

- `binlog_checksum` is CRC32 (previously NONE).

Therefore, if you are upgrading an existing MySQL installation, have not already changed the values of these parameters from their previous defaults, and backward compatibility is a concern, you may want to explicitly set these parameters to their previous defaults. For example, put these lines in the server option file:

```plaintext
[mysqld]
innodb_file_per_table=0
innodb_checksum_algorithm=INNODB
binlog_checksum=NONE
```

Those settings preserve compatibility as follows:

- With the new default of `innodb_file_per_table` enabled, `ALTER TABLE` operations following an upgrade will move InnoDB tables that are in the system tablespace to individual `.ibd` files. Using `innodb_file_per_table=0` will prevent this from happening.

- Setting `innodb_checksum_algorithm=INNODB` permits binary downgrades after upgrading to this release. With a setting of CRC32, InnoDB would use checksumming that older MySQL versions cannot use.

- With `binlog_checksum=NONE`, the server can be used as a replication master without causing failure of older slaves that do not understand binary log checksums.

- As of MySQL 5.6.5, pre-4.1 passwords and the `mysql_old_password` authentication plugin are deprecated. Passwords stored in the older hash format used before MySQL 4.1 are less secure than passwords that use the native password hashing method and should be avoided. To prevent connections using accounts that have pre-4.1 password hashes, the `secure_auth` system variable is now enabled by default. (To permit connections for accounts that have such password hashes, start the server with `--secure_auth=0`.)

DBAs are advised to convert accounts that use the `mysql_old_password` authentication plugin to use `mysql_native_password` instead. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.

In some early development versions of MySQL 5.6 (5.6.6 to 5.6.10), the server could create accounts with a mismatched password hash and authentication plugin. For example, if the default authentication plugin is `mysql_native_password`, this sequence of statements results in an account with a plugin of `mysql_native_password` but a pre-4.1 password hash (the format used by `mysql_old_password`):

```sql
SET old_passwords = 1;
CREATE USER 'jeffrey'@'localhost' IDENTIFIED BY 'password';
```

The mismatch produces symptoms such as being unable to connect to the MySQL server and being unable to use `SET PASSWORD` with `OLD_PASSWORD()` or with `old_passwords=1`.

As of MySQL 5.6.11, this mismatch no longer occurs. Instead, the server produces an error:
Changes in MySQL 5.6

To deal with an account affected by a mismatch, the DBA can modify either the plugin or Password column in the account’s `mysql.user` system table row to be consistent with the other column:

- Set `old_passwords` to 0, then assign a new password to the account using `SET PASSWORD` and `PASSWORD()`. This sets the Password column to have a 4.1 password hash, consistent with the `mysql_native_password` plugin. This is the preferred method of fixing the account.

- Alternatively, the DBA can change the plugin to `mysql_old_password` to make the plugin match the password hash format, then flush the privileges. This is not recommended because the `mysql_old_password` plugin and pre-4.1 password hashing are deprecated and support for them will be removed in a future version of MySQL.

Server Changes

- **Incompatible change**: It is possible for a column `DEFAULT` value to be valid for the `sql_mode` value at table-creation time but invalid for the `sql_mode` value when rows are inserted or updated. Example:

  ```sql
  SET sql_mode = '';
  CREATE TABLE t (d DATE DEFAULT 0);
  SET sql_mode = 'NO_ZERO_DATE,STRICT_ALL_TABLES';
  INSERT INTO t (d) VALUES(DEFAULT);
  ```

  In this case, 0 should be accepted for the `CREATE TABLE` but rejected for the `INSERT`. However, the server did not evaluate `DEFAULT` values used for inserts or updates against the current `sql_mode`. In the example, the `INSERT` succeeds and inserts '0000-00-00' into the `DATE` column.

  As of MySQL 5.6.13, the server applies the proper `sql_mode` checks to generate a warning or error at insert or update time.

  A resulting incompatibility for replication if you use statement-based logging (`binlog_format=STATEMENT`) is that if a slave is upgraded, a nonupgraded master will execute the preceding example without error, whereas the `INSERT` will fail on the slave and replication will stop.

  To deal with this, stop all new statements on the master and wait until the slaves catch up. Then upgrade the slaves followed by the master. Alternatively, if you cannot stop new statements, temporarily change to row-based logging (`binlog_format=ROW`) and wait until all slaves have processed all binary logs produced up to the point of this change. Then upgrade the slaves followed by the master and change the master back to statement-based logging.

- **Incompatible change**: MySQL 5.6.11 and later supports `CREATE TABLE ... [SUB]PARTITION BY ALGORITHM=n [LINEAR] KEY (...)`, which can be used to create a table whose `KEY` partitioning is compatible with a MySQL 5.1 server (n=1). (Bug #14521864, Bug #66462) This syntax is not accepted by MySQL 5.6.10 and earlier, although it is supported in MySQL 5.5 beginning with MySQL 5.5.31. `mysqldump` in MySQL 5.5.31 and later MySQL 5.5 releases includes the `ALGORITHM` option when dumping tables using this option, but surrounds it with conditional comments, like this:

  ```sql
  CREATE TABLE t1 (a INT)
  /*!50100 PARTITION BY KEY */ /*!50531 ALGORITHM = 1 */ /*!50100 ()
  PARTITIONS 3 */
  ```
When importing a dump containing such `CREATE TABLE` statements into a MySQL 5.6.10 or earlier MySQL 5.6 server, the versioned comment is not ignored, which causes a syntax error. Therefore, prior to importing such a dump file, you must either change the comments so that the MySQL 5.6 server ignores them (by removing the string `!50531` or replacing it with `!50611`, wherever it occurs), or remove them.

This is not an issue with dump files made using MySQL 5.6.11 or later, where the `ALGORITHM` option is written using `/*!50611 ... */`.

- **Incompatible change**: For `TIME`, `DATETIME`, and `TIMESTAMP` columns, the storage required for tables created before MySQL 5.6.4 differs from storage required for tables created in 5.6.4 and later. This is due to a change in 5.6.4 that permits these temporal types to have a fractional part. This change can affect the output of statements that depend on the row format, such as `CHECKSUM TABLE`. After upgrading from MySQL 5.5 to MySQL 5.6.4 or later, it is recommended that you also upgrade from MySQL 5.5 to MySQL 5.6.6 `TIME`, `DATETIME`, and `TIMESTAMP` types. `ALTER TABLE` currently allows the creation of tables containing temporal columns in both MySQL 5.5 and MySQL 5.6.4 (or later) binary format but this makes it more difficult to recreate tables in cases where `.frm` files are not available. Additionally, as of MySQL 5.6.4, the aforementioned temporal types are more space efficient. For more information about changes to temporal types in MySQL 5.6.4, see Date and Time Type Storage Requirements.

As of MySQL 5.6.16, `ALTER TABLE` upgrades old temporal columns to 5.6 format for `ADD COLUMN`, `CHANGE COLUMN`, `MODIFY COLUMN`, `ADD INDEX`, and `FORCE` operations. Hence, the following statement upgrades a table containing columns in the old format:

```
ALTER TABLE tbl_name FORCE;
```

This conversion cannot be done using the `INPLACE` algorithm because the table must be rebuilt, so specifying `ALGORITHM=INPLACE` in these cases results in an error. Specify `ALGORITHM=COPY` if necessary.

When `ALTER TABLE` does produce a temporal-format conversion, it generates a message that can be displayed with `SHOW WARNINGS:TIME/TIMESTAMP/DATETIME columns of old format have been upgraded to the new format.`

When upgrading to MySQL 5.6.4 or later, be aware that `CHECK TABLE ... FOR UPGRADE` does not report temporal columns that use the pre-MySQL 5.6.4 format (Bug #73008, Bug #18985579). In MySQL 5.6.24, two new system variables, `avoid_temporal_upgrade` and `show_old_temporals`, were added to provide control over temporal column upgrades (Bug #72997, Bug #18985760).

- Due to the temporal type changes described in the previous incompatible change item above, importing pre-MySQL 5.6.4 tables (using `ALTER TABLE ... IMPORT TABLESPACE`) that contain `DATETIME` and `TIMESTAMP` types into MySQL 5.6.4 (or later) fails. Importing a MySQL 5.5 table with these temporal types into MySQL 5.6.4 (or later) is the mostly likely scenario for this problem to occur.

The following procedures describe workarounds that use the original pre-MySQL 5.6.4 `.frm` file to recreate a table with a row structure that is compatible with 5.6.4 (or later). The procedures involve changing the original pre-MySQL 5.6.4 `.frm` file to use the Memory storage engine instead of InnoDB, copying the `.frm` file to the data directory of the destination instance, and using `ALTER TABLE` to change the table's storage engine type back to InnoDB. Use the first procedure if your tables do not have foreign keys. Use the second procedure, which has additional steps, if your table includes foreign keys.

If the table does not have foreign keys:
1. Copy the table’s original `.frm` file to the data directory on the server where you want to import the tablespace.

2. Modify the table’s `.frm` file to use the Memory storage engine instead of the InnoDB storage engine. This modification requires changing 7 bytes in the `.frm` file that define the table’s storage engine type. Using a hexadecimal editing tool:
   - Change the byte at offset position 0003, which is the `legacy_db_type`, from 0c (for InnoDB) to 06 (for Memory), as shown below:

     00000000  fe 01 09 06 03 00 00 10 01 00 00 30 00 00 10 00

   - The remaining 6 bytes do not have a fixed offset. Search the `.frm` file for “InnoDB” to locate the line with the other 6 bytes. The line appears as shown below:

     00001010  ff 00 00 00 00 00 00 06 00 49 6e 6e 6f 44 20  |.........InnoDB.|

   - Modify the bytes so that the line appears as follows:

     00001010  ff 00 00 00 00 00 00 06 00 4d 5e 50 59 00

3. Run `ALTER TABLE ... ENGINE=INNODB` to add the table definition to the InnoDB data dictionary. This creates the InnoDB table with the temporal data types in the new format. For the `ALTER TABLE` operation to complete successfully, the `.frm` file must correspond to the tablespace.

4. Import the table using `ALTER TABLE ... IMPORT TABLESPACE`.

If table has foreign keys:

1. Recreate the tables with foreign keys using table definitions from `SHOW CREATE TABLE` output. The incorrect temporal column formats do not matter at this point.

2. Dump all foreign key definitions to a text file by selecting the foreign key information from `INFORMATION_SCHEMA.TABLE_CONSTRAINTS` and `INFORMATION_SCHEMA.KEY_COLUMN_USAGE`.

3. Drop all tables and complete the table import process described in steps 1 to 4 in the procedure described above for tables without foreign keys.

4. After the import operation is complete, add the foreign keys from foreign key definitions that you saved to a text file.

   - **Incompatible change**: As of MySQL 5.6, the full-text stopword file is loaded and searched using `latin1` if `character_set_server` is `ucs2`, `utf16`, `utf16le`, or `utf32`. If any table was created with `FULLTEXT` indexes while the server character set was `ucs2`, `utf16`, `utf16le`, or `utf32`, repair it using this statement:

     REPAIR TABLE tbl_name QUICK;

   - **Incompatible change**: In MySQL 5.6.20, the patch for Bug #69477 limits the size of redo log BLOB writes to 10% of the redo log file size. As a result of this new limit, `innodb_log_file_size` should be set to a value greater than 10 times the largest BLOB data size found in the rows of your tables. No
action is required if your `innodb_log_file_size` setting is already 10 times the largest BLOB data size or your tables contain no BLOB data.

In MySQL 5.6.22, the redo log BLOB write limit is relaxed to 10% of the total redo log size (`innodb_log_file_size * innodb_log_files_in_group`). (Bug #19498877)

### InnoDB Changes

As of MySQL 5.6.42, the zlib library version bundled with MySQL was raised from version 1.2.3 to version 1.2.11.

The zlib `compressBound()` function in zlib 1.2.11 returns a slightly higher estimate of the buffer size required to compress a given length of bytes than it did in zlib version 1.2.3. The `compressBound()` function is called by InnoDB functions that determine the maximum row size permitted when creating compressed InnoDB tables or inserting rows into compressed InnoDB tables. As a result, `CREATE TABLE ... ROW_FORMAT=COMPRESSED` or `INSERT` operations with row sizes very close to the maximum row size that were successful in earlier releases could now fail.

If you have compressed InnoDB tables with large rows, it is recommended that you test compressed table `CREATE TABLE` statements on a MySQL 5.6 test instance prior to upgrading.

### SQL Changes

- Some keywords may be reserved in MySQL 5.6 that were not reserved in MySQL 5.5. See Section 9.3, “Keywords and Reserved Words”. This can cause words previously used as identifiers to become illegal. To fix affected statements, use identifier quoting. See Section 9.2, “Schema Object Names”.

- The `YEAR(2)` data type has certain issues that you should consider before choosing to use it. As of MySQL 5.6.6, `YEAR(2)` is deprecated. `YEAR(2)` columns in existing tables are treated as before, but `YEAR(2)` in new or altered tables are converted to `YEAR(4)`. For more information, see Section 11.3.4, “YEAR(2) Limitations and Migrating to YEAR(4)”. As of MySQL 5.6.6, it is explicitly disallowed to assign the value `DEFAULT` to stored procedure or function parameters or stored program local variables (for example with a `SET var_name = DEFAULT` statement). This was not previously supported, or documented as permitted, but is flagged as an incompatible change in case existing code inadvertently used this construct. It remains permissible to assign `DEFAULT` to system variables, as before, but assigning `DEFAULT` to parameters or local variables now results in a syntax error.

After an upgrade to MySQL 5.6.6 or later, existing stored programs that use this construct produce a syntax error when invoked. If a `mysqldump` file from 5.6.5 or earlier is loaded into 5.6.6 or later, the load operation fails and affected stored program definitions must be changed.

- In MySQL, the `TIMESTAMP` data type differs in nonstandard ways from other data types:

  - `TIMESTAMP` columns not explicitly declared with the `NULL` attribute are assigned the `NOT NULL` attribute. (Columns of other data types, if not explicitly declared as `NOT NULL`, permit `NULL` values.) Setting such a column to `NULL` sets it to the current timestamp.

  - The first `TIMESTAMP` column in a table, if not declared with the `NULL` attribute or an explicit `DEFAULT` or `ON UPDATE` clause, is automatically assigned the `DEFAULT CURRENT_TIMESTAMP` and `ON UPDATE CURRENT_TIMESTAMP` attributes.

  - `TIMESTAMP` columns following the first one, if not declared with the `NULL` attribute or an explicit `DEFAULT` clause, are automatically assigned `DEFAULT '0000-00-00 00:00:00'` (the “zero” timestamp). For inserted rows that specify no explicit value for such a column, the column is assigned `'0000-00-00 00:00:00'` and no warning occurs.
Those nonstandard behaviors remain the default for `TIMESTAMP` but as of MySQL 5.6.6 are deprecated and this warning appears at startup:

```
[Warning] TIMESTAMP with implicit DEFAULT value is deprecated.
Please use --explicit_defaults_for_timestamp server option (see documentation for more details).
```

As indicated by the warning, to turn off the nonstandard behaviors, enable the new `explicit_defaults_for_timestamp` system variable at server startup. With this variable enabled, the server handles `TIMESTAMP` as follows instead:

- `TIMESTAMP` columns not explicitly declared as `NOT NULL` permit `NULL` values. Setting such a column to `NULL` sets it to `NULL`, not the current timestamp.

- No `TIMESTAMP` column is assigned the `DEFAULT CURRENT_TIMESTAMP` or `ON UPDATE CURRENT_TIMESTAMP` attributes automatically. Those attributes must be explicitly specified.

- `TIMESTAMP` columns declared as `NOT NULL` and without an explicit `DEFAULT` clause are treated as having no default value. For inserted rows that specify no explicit value for such a column, the result depends on the SQL mode. If strict SQL mode is enabled, an error occurs. If strict SQL mode is not enabled, the column is assigned the implicit default of '0000-00-00 00:00:00' and a warning occurs. This is similar to how MySQL treats other temporal types such as `DATETIME`.

To upgrade servers used for replication, upgrade the slaves first, then the master. Replication between the master and its slaves should work provided that all use the same value of `explicit_defaults_for_timestamp`:

1. Bring down the slaves, upgrade them, configure them with the desired value of `explicit_defaults_for_timestamp`, and bring them back up.

   The slaves will recognize from the format of the binary logs received from the master that the master is older (predates the introduction of `explicit_defaults_for_timestamp`) and that operations on `TIMESTAMP` columns coming from the master use the old `TIMESTAMP` behavior.

2. Bring down the master, upgrade it, and configure it with the same `explicit_defaults_for_timestamp` value used on the slaves, and bring it back up.

### 2.11.4 Upgrading MySQL Binary or Package-based Installations on Unix/Linux

This section describes how to upgrade MySQL binary and package-based installations on Unix/Linux. In-place and logical upgrade methods are described.

**Note**

A logical upgrade is recommended when upgrading from a previous version. For example, use this method when upgrading from 5.5 to 5.6.

- **In-Place Upgrade**
- **Logical Upgrade**

**In-Place Upgrade**

An in-place upgrade involves shutting down the old MySQL server, replacing the old MySQL binaries or packages with the new ones, restarting MySQL on the existing data directory, and upgrading any remaining parts of the existing installation that require upgrading.
To perform an in-place upgrade:

1. If you use XA transactions with InnoDB, run `XA RECOVER` before upgrading to check for uncommitted XA transactions. If results are returned, either commit or rollback the XA transactions by issuing an `XA COMMIT` or `XA ROLLBACK` statement.

2. If you use InnoDB, configure MySQL to perform a slow shutdown by setting `innodb_fast_shutdown` to 0. For example:

   ```
   mysql -u root -p --execute="SET GLOBAL innodb_fast_shutdown=0"
   ```

   With a slow shutdown, InnoDB performs a full purge and change buffer merge before shutting down, which ensures that data files are fully prepared in case of file format differences between releases.

3. Shut down the old MySQL server. For example:

   ```
   mysqladmin -u root -p shutdown
   ```

4. Upgrade the MySQL binary installation or packages. If upgrading a binary installation, unpack the new MySQL binary distribution package. See Obtain and Unpack the Distribution. For package-based installations, install the new packages.

5. Start the MySQL 5.6 server, using the existing data directory. For example:

   ```
   mysqld_safe --user=mysql --datadir=/path/to/existing-datadir &
   ```

6. Run `mysql_upgrade`. For example:

   ```
   mysql_upgrade -u root -p
   ```

   `mysql_upgrade` examines all tables in all databases for incompatibilities with the current version of MySQL. `mysql_upgrade` also upgrades the `mysql` system database so that you can take advantage of new privileges or capabilities.

   ```
   mysql_upgrade does not upgrade the contents of the time zone tables or help tables. For upgrade instructions, see Section 5.1.12, “MySQL Server Time Zone Support”, and Section 5.1.13, “Server-Side Help Support”.
   ```

7. Shut down and restart the MySQL server to ensure that any changes made to the system tables take effect. For example:

   ```
   mysqladmin -u root -p shutdown
   mysqld_safe --user=mysql --datadir=/path/to/existing-datadir &
   ```
Logical Upgrade

A logical upgrade involves exporting SQL from the old MySQL instance using a backup or export utility such as `mysqldump`, installing the new MySQL server, and applying the SQL to your new MySQL instance.

To perform a logical upgrade:

1. Review the information in Section 2.11.1, “Before You Begin”.

2. Export your existing data from the previous MySQL installation:

   ```
   mysqldump -u root -p
   --add-drop-table --routines --events
   --all-databases --force > data-for-upgrade.sql
   ```

   **Note**
   Use the `--routines` and `--events` options with `mysqldump` (as shown above) if your databases include stored programs. The `--all-databases` option includes all databases in the dump, including the `mysql` database that holds the system tables.

3. Shut down the old MySQL server. For example:

   ```
   mysqladmin -u root -p shutdown
   ```

4. Install MySQL 5.6. For installation instructions, see Chapter 2, *Installing and Upgrading MySQL*.

5. Initialize a new data directory, as described at Section 2.10.1, “Initializing the Data Directory”. For example:

   ```
   scripts/mysql_install_db --user=mysql --datadir=/path/to/5.6-datadir
   ```

6. Start the MySQL 5.6 server, using the new data directory. For example:

   ```
   mysqld_safe --user=mysql --datadir=/path/to/5.6-datadir &
   ```

7. Load the previously created dump file into the new MySQL server. For example:

   ```
   mysql -u root -p --force < data-for-upgrade.sql
   ```

   **Note**
   It is not recommended to load a dump file when GTIDs are enabled on the server (`gtid_mode=ON`), if your dump file includes system tables. `mysqldump` issues DML instructions for the system tables which use the non-transactional MyISAM storage engine, and this combination is not permitted when GTIDs are enabled. Also be aware that loading a dump file from a server with GTIDs enabled, into another server with GTIDs enabled, causes different transaction identifiers to be generated.

8. Run `mysql_upgrade`. For example:
mysql_upgrade -u root -p

`mysql_upgrade` examines all tables in all databases for incompatibilities with the current version of MySQL. `mysql_upgrade` also upgrades the `mysql` system database so that you can take advantage of new privileges or capabilities.

**Note**

`mysql_upgrade` does not upgrade the contents of the time zone tables or help tables. For upgrade instructions, see Section 5.1.12, “MySQL Server Time Zone Support”, and Section 5.1.13, “Server-Side Help Support”.

9. Shut down and restart the MySQL server to ensure that any changes made to the system tables take effect. For example:

```bash
mysqladmin -u root -p shutdown
mysqld_safe --user=mysql --datadir=/path/to/5.6-datadir
```

### 2.11.5 Upgrading MySQL with the MySQL Yum Repository

For supported Yum-based platforms (see Section 2.5.1, "Installing MySQL on Linux Using the MySQL Yum Repository", for a list), you can perform an in-place upgrade for MySQL (that is, replacing the old version and then running the new version using the old data files) with the MySQL Yum repository.

**Notes**

- Before performing any update to MySQL, follow carefully the instructions in Section 2.11, “Upgrading MySQL”. Among other instructions discussed there, it is especially important to back up your database before the update.

- The following instructions assume you have installed MySQL with the MySQL Yum repository or with an RPM package directly downloaded from MySQL Developer Zone’s MySQL Download page; if that is not the case, following the instructions in Section 2.5.2, “Replacing a Third-Party Distribution of MySQL Using the MySQL Yum Repository”.

#### Selecting a Target Series

By default, the MySQL Yum repository updates MySQL to the latest version in the release series you have chosen during installation (see Selecting a Release Series for details), which means, for example, a 5.6.x installation will not be updated to a 5.7.x release automatically. To update to another release series, you need to first disable the subrepository for the series that has been selected (by default, or by yourself) and enable the subrepository for your target series. To do that, see the general instructions given in Selecting a Release Series. For upgrading from MySQL 5.6 to 5.7, perform the reverse of the steps illustrated in Selecting a Release Series, disabling the subrepository for the MySQL 5.6 series and enabling that for the MySQL 5.7 series.

As a general rule, to upgrade from one release series to another, go to the next series rather than skipping a series. For example, if you are currently running MySQL 5.5 and wish to upgrade to 5.7, upgrade to MySQL 5.6 first before upgrading to 5.7.

**Important**

For important information about upgrading from MySQL 5.6 to 5.7, see Upgrading from MySQL 5.6 to 5.7.
Upgrading MySQL

Upgrade MySQL and its components by the following command, for platforms that are not dnf-enabled:

```
sudo yum update mysql-server
```

For platforms that are dnf-enabled:

```
sudo dnf upgrade mysql-server
```

Alternatively, you can update MySQL by telling Yum to update everything on your system, which might take considerably more time. For platforms that are not dnf-enabled:

```
sudo yum update
```

For platforms that are dnf-enabled:

```
sudo dnf upgrade
```

Restarting MySQL

The MySQL server always restarts after an update by Yum. Once the server restarts, run `mysql_upgrade` to check and possibly resolve any incompatibilities between the old data and the upgraded software. `mysql_upgrade` also performs other functions; see Section 4.4.7, "mysql_upgrade — Check and Upgrade MySQL Tables" for details.

You can also update only a specific component. Use the following command to list all the installed packages for the MySQL components (for dnf-enabled systems, replace `yum` in the command with `dnf`):

```
sudo yum list installed | grep "^mysql"
```

After identifying the package name of the component of your choice, update the package with the following command, replacing `package-name` with the name of the package. For platforms that are not dnf-enabled:

```
sudo yum update package-name
```

For dnf-enabled platforms:

```
sudo dnf upgrade package-name
```

Upgrading the Shared Client Libraries

After updating MySQL using the Yum repository, applications compiled with older versions of the shared client libraries should continue to work.

If you recompile applications and dynamically link them with the updated libraries: As typical with new versions of shared libraries where there are differences or additions in symbol versioning between the newer and older libraries (for example, between the newer, standard 5.6 shared client libraries and some older—prior or variant—versions of the shared libraries shipped natively by the Linux distributions’ software repositories, or from some other sources), any applications compiled using the updated, newer shared libraries will require those updated libraries on systems where the applications are deployed. And, as expected, if those libraries are not in place, the applications requiring the shared libraries will fail. So, be
2.11.6 Upgrading MySQL with the MySQL APT Repository

On Debian and Ubuntu platforms, to perform an in-place upgrade of MySQL and its components, use the MySQL APT repository. See Upgrading MySQL with the MySQL APT Repository in A Quick Guide to Using the MySQL APT Repository.

2.11.7 Upgrading MySQL with the MySQL SLES Repository

On the SUSE Linux Enterprise Server (SLES) platform, to perform an in-place upgrade of MySQL and its components, use the MySQL SLES repository. See Upgrading MySQL with the MySQL SLES Repository in A Quick Guide to Using the MySQL SLES Repository.

2.11.8 Upgrading MySQL on Windows

There are two approaches for upgrading MySQL on Windows:

- Using MySQL Installer
- Using the Windows ZIP archive distribution

The approach you select depends on how the existing installation was performed. Before proceeding, review Section 2.11, “Upgrading MySQL” for additional information on upgrading MySQL that is not specific to Windows.

Note

Whichever approach you choose, always back up your current MySQL installation before performing an upgrade. See Section 7.2, “Database Backup Methods”.

Upgrades between milestone releases (or from a milestone release to a GA release) are not supported. Significant development changes take place in milestone releases and you may encounter compatibility issues or problems starting the server. For instructions on how to perform a logical upgrade with a milestone release, see Logical Upgrade.

Note

MySQL Installer does not support upgrades between Community releases and Commercial releases. If you require this type of upgrade, perform it using the ZIP archive approach.

Upgrading MySQL with MySQL Installer

Performing an upgrade with MySQL Installer is the best approach when the current server installation was performed with it and the upgrade is within the current release series. MySQL Installer does not support upgrades between release series, such as from 5.5 to 5.6, and it does not provide an upgrade indicator to prompt you to upgrade. For instructions on upgrading between release series, see Upgrading MySQL Using the Windows ZIP Distribution.

To perform an upgrade using MySQL Installer:

1. Start MySQL Installer.
2. From the dashboard, click **Catalog** to download the latest changes to the catalog. The installed server can be upgraded only if the dashboard displays an arrow next to the version number of the server.

3. Click **Upgrade**. All products that have a newer version now appear in a list.

   **Note**
   MySQL Installer deselects the server upgrade option for milestone releases (Pre-Release) in the same release series. In addition, it displays a warning to indicate that the upgrade is not supported, identifies the risks of continuing, and provides a summary of the steps to perform a logical upgrade manually. You can reselect server upgrade and proceed at your own risk.

4. Deselect all but the MySQL server product, unless you intend to upgrade other products at this time, and click **Next**.

5. Click **Execute** to start the download. When the download finishes, click **Next** to begin the upgrade operation.

6. Configure the server.

**Upgrading MySQL Using the Windows ZIP Distribution**

To perform an upgrade using the Windows ZIP archive distribution:

1. Download the latest Windows ZIP Archive distribution of MySQL from [https://dev.mysql.com/downloads/](https://dev.mysql.com/downloads/)

2. If the server is running, stop it. If the server is installed as a service, stop the service with the following command from the command prompt:

   ```
   C:\> SC STOP mysql_service_name
   ```

   Alternatively, use **NET STOP** `mysqld_service_name`.

   If you are not running the MySQL server as a service, use `mysqladmin` to stop it. For example, before upgrading from MySQL 5.5 to 5.6, use `mysqladmin` from MySQL 5.5 as follows:

   ```
   C:\> "C:\Program Files\MySQL\MySQL Server 5.5\bin\mysqladmin" -u root shutdown
   ```

   **Note**
   If the MySQL root user account has a password, invoke `mysqladmin` with the `-p` option and enter the password when prompted.

3. Extract the ZIP archive. You may either overwrite your existing MySQL installation (usually located at `C:\mysql`), or install it into a different directory, such as `C:\mysql5`. Overwriting the existing installation is recommended. However, for upgrades (as opposed to installing for the first time), you must remove the data directory from your existing MySQL installation to avoid replacing your current data files. To do so, follow these steps:

   a. Unzip the ZIP archive in some location other than your current MySQL installation.

   b. Remove the data directory.

   c. Move the data directory from the current MySQL installation to the location of the just-removed data directory.
d. Remove the current MySQL installation

e. Move the unzipped installation to the location of the just-removed installation

4. Restart the server. For example, use the `SC START mysqld_service_name` or `NET START mysqld_service_name` command if you run MySQL as a service, or invoke `mysqld` directly otherwise.

5. As Administrator, run `mysql_upgrade` to check your tables, attempt to repair them if necessary, and update your grant tables if they have changed so that you can take advantage of any new capabilities. See Section 4.4.7, "mysql_upgrade — Check and Upgrade MySQL Tables".

6. If you encounter errors, see Section 2.3.5, “Troubleshooting a Microsoft Windows MySQL Server Installation”.

2.11.9 Upgrade Troubleshooting

• If problems occur, such as that the new `mysqld` server does not start or that you cannot connect without a password, verify that you do not have an old `my.cnf` file from your previous installation. You can check this with the `--print-defaults` option (for example, `mysqld --print-defaults`). If this command displays anything other than the program name, you have an active `my.cnf` file that affects server or client operation.

• If, after an upgrade, you experience problems with compiled client programs, such as `Commands out of sync` or unexpected core dumps, you probably have used old header or library files when compiling your programs. In this case, check the date for your `mysql.h` file and `libmysqlclient.a` library to verify that they are from the new MySQL distribution. If not, recompile your programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example, from `libmysqlclient.so.15` to `libmysqlclient.so.16`).

• If you have created a user-defined function (UDF) with a given name and upgrade MySQL to a version that implements a new built-in function with the same name, the UDF becomes inaccessible. To correct this, use `DROP FUNCTION` to drop the UDF, and then use `CREATE FUNCTION` to re-create the UDF with a different nonconflicting name. The same is true if the new version of MySQL implements a built-in function with the same name as an existing stored function. See Section 9.2.5, “Function Name Parsing and Resolution”, for the rules describing how the server interprets references to different kinds of functions.

2.11.10 Rebuilding or Repairing Tables or Indexes

This section describes how to rebuild or repair tables or indexes, which may be necessitated by:

• Changes to how MySQL handles data types or character sets. For example, an error in a collation might have been corrected, necessitating a table rebuild to update the indexes for character columns that use the collation.

• Required table repairs or upgrades reported by `CHECK TABLE, mysqlcheck, or mysql_upgrade`. Methods for rebuilding a table include:

  • Dump and Reload Method
  • ALTER TABLE Method
  • REPAIR TABLE Method
Dump and Reload Method

If you are rebuilding tables because a different version of MySQL will not handle them after a binary (in-place) upgrade or downgrade, you must use the dump-and-reload method. Dump the tables before upgrading or downgrading using your original version of MySQL. Then reload the tables after upgrading or downgrading.

If you use the dump-and-reload method of rebuilding tables only for the purpose of rebuilding indexes, you can perform the dump either before or after upgrading or downgrading. Reloading still must be done afterward.

If you need to rebuild an InnoDB table because a CHECK TABLE operation indicates that a table upgrade is required, use mysqldump to create a dump file and mysql to reload the file. If the CHECK TABLE operation indicates that there is a corruption or causes InnoDB to fail, refer to Section 14.21.2, “Forcing InnoDB Recovery” for information about using the innodb_force_recovery option to restart InnoDB. To understand the type of problem that CHECK TABLE may be encountering, refer to the InnoDB notes in Section 13.7.2.2, “CHECK TABLE Syntax”.

To rebuild a table by dumping and reloading it, use mysqldump to create a dump file and mysql to reload the file:

```
mysqldump db_name t1 > dump.sql
mysql db_name < dump.sql
```

To rebuild all the tables in a single database, specify the database name without any following table name:

```
mysqldump db_name > dump.sql
mysql db_name < dump.sql
```

To rebuild all tables in all databases, use the `--all-databases` option:

```
mysqldump --all-databases > dump.sql
mysql < dump.sql
```

ALTER TABLE Method

To rebuild a table with ALTER TABLE, use a “null” alteration; that is, an ALTER TABLE statement that “changes” the table to use the storage engine that it already has. For example, if `t1` is an InnoDB table, use this statement:

```
ALTER TABLE t1 ENGINE = InnoDB;
```

If you are not sure which storage engine to specify in the ALTER TABLE statement, use SHOW CREATE TABLE to display the table definition.

REPAIR TABLE Method

The REPAIR TABLE method is only applicable to MyISAM, ARCHIVE, and CSV tables.

You can use REPAIR TABLE if the table checking operation indicates that there is a corruption or that an upgrade is required. For example, to repair a MyISAM table, use this statement:

```
REPAIR TABLE t1;
```
`mysqlcheck --repair` provides command-line access to the `REPAIR TABLE` statement. This can be a more convenient means of repairing tables because you can use the `--databases` or `--all-databases` option to repair all tables in specific databases or all databases, respectively:

```
mysqlcheck --repair --databases db_name ...
mysqlcheck --repair --all-databases
```

### 2.11.11 Copying MySQL Databases to Another Machine

In cases where you need to transfer databases between different architectures, you can use `mysqldump` to create a file containing SQL statements. You can then transfer the file to the other machine and feed it as input to the `mysql` client.

**Note**

You can copy the `.frm`, `.MYI`, and `.MYD` files for MyISAM tables between different architectures that support the same floating-point format. (MySQL takes care of any byte-swapping issues.) See Section 15.2, "The MyISAM Storage Engine".

Use `mysqldump --help` to see what options are available.

The easiest (although not the fastest) way to move a database between two machines is to run the following commands on the machine on which the database is located:

```
mysqldump db_name | mysql -h 'other_hostname' db_name
```

If you want to copy a database from a remote machine over a slow network, you can use these commands:

```
mysqldump db_name | mysql -h 'other_hostname' db_name
```

You can also store the dump in a file, transfer the file to the target machine, and then load the file into the database there. For example, you can dump a database to a compressed file on the source machine like this:

```
mysqldump --quick db_name | gzip > db_name.gz
```

Transfer the file containing the database contents to the target machine and run these commands there:

```
mysqladmin create db_name
gunzip < db_name.gz | mysql db_name
```

You can also use `mysqldump` and `mysqlimport` to transfer the database. For large tables, this is much faster than simply using `mysqldump`. In the following commands, `DUMPDIR` represents the full path name of the directory you use to store the output from `mysqldump`.

First, create the directory for the output files and dump the database:

```
mkdir DUMPDIR
mysqldump --tab=DUMPDIR db_name
```

Then transfer the files in the `DUMPDIR` directory to some corresponding directory on the target machine and load the files into MySQL there:
2.12 Downgrading MySQL

This section describes the steps to downgrade a MySQL installation.

Downgrading is a less common operation than upgrade. Downgrading is typically performed because of a compatibility or performance issue that occurs on a production system, and was not uncovered during initial upgrade verification on the test systems.

As with the upgrade procedure Section 2.11, “Upgrading MySQL”), perform and verify the downgrade procedure on some test systems first, before using it on a production system.

Note

In the following discussion, MySQL commands that must be run using a MySQL account with administrative privileges include -u root on the command line to specify the MySQL root user. Commands that require a password for root also include a -p option. Because -p is followed by no option value, such commands prompt for the password. Type the password when prompted and press Enter.

SQL statements can be executed using the mysql command-line client (connect as root to ensure that you have the necessary privileges).

2.12.1 Before You Begin

Review the information in this section before downgrading. Perform any recommended actions.

• Protect your data by taking a backup. The backup should include the mysql database, which contains the MySQL system tables. See Section 7.2, “Database Backup Methods”.

• Review Section 2.12.2, “Downgrade Paths” to ensure that your intended downgrade path is supported.

• Review Section 2.12.3, “Downgrade Notes” for items that may require action before downgrading.

Note

The downgrade procedures described in the following sections assume you are downgrading with data files created or modified by the newer MySQL version. However, if you did not modify your data after upgrading, downgrading using backups taken before upgrading to the new MySQL version is recommended. Many of the changes described in Section 2.12.3, “Downgrade Notes” that require action are not applicable when downgrading using backups taken before upgrading to the new MySQL version.

• Use of new features, new configuration options, or new configuration option values that are not supported by a previous release may cause downgrade errors or failures. Before downgrading, reverse changes resulting from the use of new features and remove configuration settings that are not supported by the release you are downgrading to.
2.12.2 Downgrade Paths

- Downgrade is only supported between General Availability (GA) releases.
- Downgrade from MySQL 5.6 to 5.5 is supported using the *logical downgrade* method.
- Downgrade that skips versions is not supported. For example, downgrading directly from MySQL 5.6 to 5.1 is not supported.
- Downgrade within a release series is supported. For example, downgrading from MySQL 5.6.\(z\) to 5.6.\(y\) is supported. Skipping a release is also supported. For example, downgrading from MySQL 5.6.\(z\) to 5.6.\(x\) is supported.

2.12.3 Downgrade Notes

Before downgrading from MySQL 5.6, review the information in this section. Some items may require action before downgrading.

**System Tables**

- The `mysql.user` system table in MySQL 5.6 has a `password_expired` column. The `mysql.user` table in MySQL 5.5 does not. This means that an account with an expired password in MySQL 5.6 will work normally in MySQL 5.5.
- The `mysql.host` table was removed in MySQL 5.6.7. When downgrading to a previous release, startup on the downgraded server fails with an error if the `mysql.host` table is not present. You can recreate the table manually or restore it from a backup taken prior to upgrading to MySQL 5.6.7 or higher. To recreate the table manually, retrieve the table definition from a pre-MySQL 5.6.7 instance using `SHOW CREATE TABLE`, or see Bug #73634.

**Data Types**

- For `TIME`, `DATETIME`, and `TIMESTAMP` columns, the storage required for tables created before MySQL 5.6.4 differs from storage required for tables created in 5.6.4 and later. This is due to a change in 5.6.4 that permits these temporal types to have a fractional part. To downgrade to a version older than 5.6.4, dump affected tables with `mysqldump` before downgrading, and reload the tables after downgrading.

The following query identifies tables and columns that may be affected by this problem. Some of them are system tables in the `mysql` database (such as `columns_priv` and `proxies_priv`). This means that `mysql` is one of the databases you must dump and reload, or server startup may fail after downgrading.

```sql
SELECT TABLE_SCHEMA, TABLE_NAME, COLUMN_NAME, DATA_TYPE
FROM INFORMATION_SCHEMA.COLUMNS
WHERE DATA_TYPE IN ('TIME', 'DATETIME', 'TIMESTAMP')
ORDER BY TABLE_SCHEMA, TABLE_NAME, COLUMN_NAME;
```

**InnoDB**

- *InnoDB* search indexes (with a type of `FULLTEXT`), introduced in MySQL 5.6.4, are not compatible with earlier versions of MySQL, including earlier releases in the 5.6 series. Drop such indexes before performing a downgrade.

*InnoDB* tables with `FULLTEXT` indexes can be identified using an `INFORMATION_SCHEMA` query. For example:
InnoDB small page sizes specified by the `innodb_page_size` configuration option, introduced in MySQL 5.6.4, are not compatible with earlier versions of MySQL, including earlier releases in the 5.6 series. Dump all InnoDB tables in instances that use a smaller InnoDB page size, drop the tables, and re-create and reload them after the downgrade.

Tables created using persistent statistics table options (`STATS_PERSISTENT`, `STATS_AUTO_RECALC`, and `STATS_SAMPLE_PAGES`) introduced in MySQL 5.6.6, are not compatible with earlier releases (Bug #70778). Remove the options from table definitions prior to downgrading. For information about these options, see Section 14.8.11.1, “Configuring Persistent Optimizer Statistics Parameters”.

The `innodb_log_file_size` default and maximum values were increased in MySQL 5.6. Before downgrading, ensure that the configured log file size is compatible with the previous release.

In MySQL 5.6.3, the length limit for index prefix keys is increased from 767 bytes to 3072 bytes, for InnoDB tables using `ROW_FORMAT=DYNAMIC` or `ROW_FORMAT=COMPRESSED`. See Section 14.6.1.6, “Limits on InnoDB Tables” for details. This change is also backported to MySQL 5.5.14. If you downgrade from one of these releases or higher, to an earlier release with a lower length limit, the index prefix keys could be truncated at 767 bytes or the downgrade could fail. This issue could only occur if the configuration option `innodb_large_prefix` was enabled on the server being downgraded.

**Replication**

- As of MySQL 5.6, the `relay-log.info` file contains a line count and a replication delay value, so the file format differs from that in older versions. See Section 17.2.2.2, “Slave Status Logs”. If you downgrade a slave server to a version older than MySQL 5.6, the older server will not read the file correctly. To address this, modify the file in a text editor to delete the initial line containing the number of lines.

- Beginning with MySQL 5.6.6, the MySQL Server employs Version 2 binary log events when writing the binary log. Binary logs written using Version 2 log events cannot be read by earlier versions of MySQL Server. To generate a binary log that is written using Version 1 log events readable by older servers, start the MySQL 5.6.6 or later server using `--log-bin-use-v1-row-events=1`, which forces the server to employ Version 1 events when writing the binary log.

- The MySQL 5.6.5 release introduced global transaction identifiers (GTIDs) for MySQL Replication. If you enabled GTIDs in MySQL 5.6 and want to downgrade to a MySQL release that does not support GTIDs, you must disable GTIDs before downgrading (see Section 17.1.3.5, “Disabling GTID Transactions”).

### 2.12.4 Downgrading Binary and Package-based Installations on Unix/Linux

This section describes how to downgrade MySQL binary and package-based installations on Unix/Linux. In-place and logical downgrade methods are described.

- **In-Place Downgrade**

- **Logical Downgrade**

**In-Place Downgrade**

In-place downgrade involves shutting down the new MySQL version, replacing the new MySQL binaries or packages with the old ones, and restarting the old MySQL version on the existing data directory.
Downgrading Binary and Package-based Installations on Unix/Linux

In-place downgrade is supported for downgrades between GA releases within the same release series. In-place downgrade is not supported for MySQL APT, SLES, and Yum repository installations.

To perform an in-place downgrade:

1. Review the information in Section 2.12.1, “Before You Begin”.

2. If you use XA transactions with InnoDB, run XA RECOVER before downgrading to check for uncommitted XA transactions. If results are returned, either commit or rollback the XA transactions by issuing an XA COMMIT or XA ROLLBACK statement.

3. If you use InnoDB, configure MySQL to perform a slow shutdown by setting innodb_fast_shutdown to 0. For example:
   
   ```
   mysql -u root -p --execute="SET GLOBAL innodb_fast_shutdown=0"
   ```

   With a slow shutdown, InnoDB performs a full purge and change buffer merge before shutting down, which ensures that data files are fully prepared in case of file format differences between releases.

4. Shut down the newer MySQL server. For example:
   
   ```
   mysqladmin -u root -p shutdown
   ```

5. After the slow shutdown, remove the InnoDB redo log files (the ib_logfile* files) from the data directory to avoid downgrade issues related to redo log file format changes that may have occurred between releases.
   
   ```
   rm ib_logfile*
   ```

6. Downgrade the MySQL binaries or packages in-place by replacing the newer binaries or packages with the older ones.

7. Start the older (downgraded) MySQL server, using the existing data directory. For example:
   
   ```
   mysqld_safe --user=mysql --datadir=/path/to/existing-datadir
   ```

8. Run mysql_upgrade. For example:
   
   ```
   mysql_upgrade -u root -p
   ```

9. Shut down and restart the MySQL server to ensure that any changes made to the system tables take effect. For example:
   
   ```
   mysqladmin -u root -p shutdown
   mysqld_safe --user=mysql --datadir=/path/to/existing-datadir
   ```

Logical Downgrade

Logical downgrade involves using mysqldump to dump all tables from the new MySQL version, and then loading the dump file into the old MySQL version.

Logical downgrades are supported for downgrades between releases within the same release series and for downgrades to the previous release level. Only downgrades between General Availability (GA) releases are supported. Before proceeding, review Section 2.12.1, “Before You Begin”.

215
To perform a logical downgrade:

1. Review the information in Section 2.12.1, “Before You Begin”.

2. Dump all databases. For example:

   ```
   mysqladmin -u root -p
   --add-drop-table --routines --events
   --all-databases --force > data-for-downgrade.sql
   ```

3. Shut down the newer MySQL server. For example:

   ```
   mysqladmin -u root -p shutdown
   ```

4. Initialize an older MySQL instance, with a new data directory. For example:

   ```
   scripts/mysql_install_db --user=mysql
   ```

5. Start the older MySQL server, using the new data directory. For example:

   ```
   mysqld_safe --user=mysql --datadir=/path/to/new-datadir
   ```

6. Load the dump file into the older MySQL server. For example:

   ```
   mysql -u root -p --force < data-for-upgrade.sql
   ```

7. Run `mysql_upgrade`. For example:

   ```
   mysql_upgrade -u root -p
   ```

8. Shut down and restart the MySQL server to ensure that any changes made to the system tables take effect. For example:

   ```
   mysqladmin -u root -p shutdown
   mysqld_safe --user=mysql --datadir=/path/to/new-datadir
   ```

### 2.12.5 Downgrade Troubleshooting

If you downgrade from one release series to another, there may be incompatibilities in table storage formats. In this case, use `mysqldump` to dump your tables before downgrading. After downgrading, reload the dump file using `mysql` or `mysqlimport` to re-create your tables. For examples, see Section 2.11.11, “Copying MySQL Databases to Another Machine”.

A typical symptom of a downward-incompatible table format change when you downgrade is that you cannot open tables. In that case, use the following procedure:

1. Stop the older MySQL server that you are downgrading to.
2. Restart the newer MySQL server you are downgrading from.
3. Dump any tables that were inaccessible to the older server by using `mysqldump` to create a dump file.
4. Stop the newer MySQL server and restart the older one.
5. Reload the dump file into the older server. Your tables should be accessible.

2.13 Perl Installation Notes

The Perl DBI module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI, you must install the DBI module, as well as a DataBase Driver (DBD) module for each type of database server you want to access. For MySQL, this driver is the DBD::mysql module.

Perl, and the DBD::MySQL module for DBI must be installed if you want to run the MySQL benchmark scripts; see Section 8.13.2, “The MySQL Benchmark Suite”.

Note

Perl support is not included with MySQL distributions. You can obtain the necessary modules from http://search.cpan.org for Unix, or by using the ActiveState ppm program on Windows. The following sections describe how to do this.

The DBI/DBD interface requires Perl 5.6.0, and 5.6.1 or later is preferred. DBI does not work if you have an older version of Perl. You should use DBD::mysql 4.009 or higher. Although earlier versions are available, they do not support the full functionality of MySQL 5.6.

2.13.1 Installing Perl on Unix

MySQL Perl support requires that you have installed MySQL client programming support (libraries and header files). Most installation methods install the necessary files. If you install MySQL from RPM files on Linux, be sure to install the developer RPM as well. The client programs are in the client RPM, but client programming support is in the developer RPM.

The files you need for Perl support can be obtained from the CPAN (Comprehensive Perl Archive Network) at http://search.cpan.org.

The easiest way to install Perl modules on Unix is to use the CPAN module. For example:

```shell
shell> perl -MCORE -e shell
cpan> install DBI
cpan> install DBD::mysql
```

The DBD::mysql installation runs a number of tests. These tests attempt to connect to the local MySQL server using the default user name and password. (The default user name is your login name on Unix, and ODBC on Windows. The default password is “no password.”) If you cannot connect to the server with those values (for example, if your account has a password), the tests fail. You can use force install DBD::mysql to ignore the failed tests.

DBI requires the Data::Dumper module. It may be installed; if not, you should install it before installing DBI.

It is also possible to download the module distributions in the form of compressed tar archives and build the modules manually. For example, to unpack and build a DBI distribution, use a procedure such as this:

1. Unpack the distribution into the current directory:
Installing ActiveState Perl on Windows

1. Unpack the distribution:
   
   ```shell>
   gunzip < DBI-VERSION.tar.gz | tar xvf -
   ```

   This command creates a directory named `DBI-VERSION`.

2. Change location into the top-level directory of the unpacked distribution:

   ```shell>
   cd DBI-VERSION
   ```

3. Build the distribution and compile everything:

   ```shell>
   perl Makefile.PL
   shell> make
   shell> make test
   shell> make install
   ```

   The `make test` command is important because it verifies that the module is working. Note that when you run that command during the `DBD::mysql` installation to exercise the interface code, the MySQL server must be running or the test fails.

   It is a good idea to rebuild and reinstall the `DBD::mysql` distribution whenever you install a new release of MySQL. This ensures that the latest versions of the MySQL client libraries are installed correctly.

   If you do not have access rights to install Perl modules in the system directory or if you want to install local Perl modules, the following reference may be useful: [http://learn.perl.org/faq/perlfaq8.html#How-do-I-keep-my-own-module-library-directory](http://learn.perl.org/faq/perlfaq8.html#How-do-I-keep-my-own-module-library-directory)

2.13.2 Installing ActiveState Perl on Windows

On Windows, you should do the following to install the MySQL `DBD` module with ActiveState Perl:

1. Get ActiveState Perl from [http://www.activestate.com/Products/ActivePerl/](http://www.activestate.com/Products/ActivePerl/) and install it.

2. Open a console window.

3. If necessary, set the `HTTP_proxy` variable. For example, you might try a setting like this:

   ```
   C:\> set HTTP_proxy=my.proxy.com:3128
   ```

4. Start the PPM program:

   ```
   C:\> C:\perl\bin\ppm.pl
   ```

5. If you have not previously done so, install `DBI`:

   ```
   ppm> install DBI
   ```

6. If this succeeds, run the following command:

   ```
   ppm> install DBD-mysql
   ```

   This procedure should work with ActiveState Perl 5.6 or higher.

   If you cannot get the procedure to work, you should install the ODBC driver instead and connect to the MySQL server through ODBC:
use DBI;
$dbh= DBI->connect("DBI:ODBC:$dsn",$user,$password) ||
   die "Got error $DBI::errstr when connecting to $dsn\n";

2.13.3 Problems Using the Perl DBI/DBD Interface

If Perl reports that it cannot find the ../mysql/mysql.so module, the problem is probably that Perl cannot locate the libmysqlclient.so shared library. You should be able to fix this problem by one of the following methods:

- Copy libmysqlclient.so to the directory where your other shared libraries are located (probably /usr/lib or /lib).

- Modify the -L options used to compile DBD::mysql to reflect the actual location of libmysqlclient.so.

- On Linux, you can add the path name of the directory where libmysqlclient.so is located to the /etc/ld.so.conf file.

- Add the path name of the directory where libmysqlclient.so is located to the LD_RUN_PATH environment variable. Some systems use LD_LIBRARY_PATH instead.

You may also need to modify the -L options if there are other libraries that the linker fails to find. For example, if the linker cannot find libc because it is in /lib and the link command specifies -L/usr/lib, change the -L option to -L/lib or add -L/lib to the existing link command.

If you get the following errors from DBD::mysql, you are probably using gcc (or using an old binary compiled with gcc):

/usr/bin/perl: can't resolve symbol '__moddi3'
/usr/bin/perl: can't resolve symbol '__divdi3'

Add -L/usr/lib/gcc-lib/... -lgcc to the link command when the mysql.so library gets built (check the output from make for mysql.so when you compile the Perl client). The -L option should specify the path name of the directory where libgcc.a is located on your system.

Another cause of this problem may be that Perl and MySQL are not both compiled with gcc. In this case, you can solve the mismatch by compiling both with gcc.

This chapter provides a tutorial introduction to MySQL by showing how to use the mysql client program to create and use a simple database. mysql (sometimes referred to as the “terminal monitor” or just “monitor”) is an interactive program that enables you to connect to a MySQL server, run queries, and view the results. mysql may also be used in batch mode: you place your queries in a file beforehand, then tell mysql to execute the contents of the file. Both ways of using mysql are covered here.

To see a list of options provided by mysql, invoke it with the --help option:

    shell> mysql --help

This chapter assumes that mysql is installed on your machine and that a MySQL server is available to which you can connect. If this is not true, contact your MySQL administrator. (If you are the administrator, you need to consult the relevant portions of this manual, such as Chapter 5, MySQL Server Administration.)

This chapter describes the entire process of setting up and using a database. If you are interested only in accessing an existing database, you may want to skip the sections that describe how to create the database and the tables it contains.

Because this chapter is tutorial in nature, many details are necessarily omitted. Consult the relevant sections of the manual for more information on the topics covered here.

3.1 Connecting to and Disconnecting from the Server

To connect to the server, you will usually need to provide a MySQL user name when you invoke mysql and, most likely, a password. If the server runs on a machine other than the one where you log in, you will
also need to specify a host name. Contact your administrator to find out what connection parameters you should use to connect (that is, what host, user name, and password to use). Once you know the proper parameters, you should be able to connect like this:

```
shell> mysql -h host -u user -p
Enter password: ********
```

*host* and *user* represent the host name where your MySQL server is running and the user name of your MySQL account. Substitute appropriate values for your setup. The `********` represents your password; enter it when *mysql* displays the *Enter password:* prompt.

If that works, you should see some introductory information followed by a *mysql>* prompt:

```
shell> mysql -h host -u user -p
Enter password: ********
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 25338 to server version: 5.6.47-
standard
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.
mysql>
```

The *mysql>* prompt tells you that *mysql* is ready for you to enter SQL statements.

If you are logging in on the same machine that MySQL is running on, you can omit the host, and simply use the following:

```
shell> mysql -u user -p
```

If, when you attempt to log in, you get an error message such as **ERROR 2002 (HY000): Can't connect to local MySQL server through socket '/tmp/mysql.sock' (2)**, it means that the MySQL server daemon (Unix) or service (Windows) is not running. Consult the administrator or see the section of *Chapter 2, Installing and Upgrading MySQL* that is appropriate to your operating system.

For help with other problems often encountered when trying to log in, see Section B.4.2, “Common Errors When Using MySQL Programs”.

Some MySQL installations permit users to connect as the anonymous (unnamed) user to the server running on the local host. If this is the case on your machine, you should be able to connect to that server by invoking *mysql* without any options:

```
shell> mysql
```

After you have connected successfully, you can disconnect any time by typing **QUIT** (or `\q`) at the *mysql>* prompt:

```
mysql> QUIT
Bye
```

On Unix, you can also disconnect by pressing Control+D.

Most examples in the following sections assume that you are connected to the server. They indicate this by the *mysql>* prompt.

### 3.2 Entering Queries
Make sure that you are connected to the server, as discussed in the previous section. Doing so does not in itself select any database to work with, but that is okay. At this point, it is more important to find out a little about how to issue queries than to jump right in creating tables, loading data into them, and retrieving data from them. This section describes the basic principles of entering queries, using several queries you can try out to familiarize yourself with how \texttt{mysql} works.

Here is a simple query that asks the server to tell you its version number and the current date. Type it in as shown here following the \texttt{mysql>} prompt and press Enter:

\begin{verbatim}
mysql> SELECT VERSION(), CURRENT_DATE;
+--------------+--------------+
| VERSION()    | CURRENT_DATE |
+--------------+--------------+
| 5.6.1-m4-log | 2010-08-06   |
+--------------+--------------+
1 row in set (0.01 sec)
mysql>
\end{verbatim}

This query illustrates several things about \texttt{mysql}:

- A query normally consists of an SQL statement followed by a semicolon. (There are some exceptions where a semicolon may be omitted. \texttt{QUIT}, mentioned earlier, is one of them. We'll get to others later.)

- When you issue a query, \texttt{mysql} sends it to the server for execution and displays the results, then prints another \texttt{mysql>} prompt to indicate that it is ready for another query.

- \texttt{mysql} displays query output in tabular form (rows and columns). The first row contains labels for the columns. The rows following are the query results. Normally, column labels are the names of the columns you fetch from database tables. If you're retrieving the value of an expression rather than a table column (as in the example just shown), \texttt{mysql} labels the column using the expression itself.

- \texttt{mysql} shows how many rows were returned and how long the query took to execute, which gives you a rough idea of server performance. These values are imprecise because they represent wall clock time (not CPU or machine time), and because they are affected by factors such as server load and network latency. (For brevity, the “rows in set” line is sometimes not shown in the remaining examples in this chapter.)

Keywords may be entered in any lettercase. The following queries are equivalent:

\begin{verbatim}
mysql> SELECT VERSION(), CURRENT_DATE;
mysql> select version(), current_date;
mysql> SeLeCt vErSiOn(), current_DATE;
\end{verbatim}

Here is another query. It demonstrates that you can use \texttt{mysql} as a simple calculator:

\begin{verbatim}
mysql> SELECT SIN(PI()/4), (4+1)*5;
+------------------+---------+
| SIN(PI()/4)      | (4+1)*5 |
+------------------+---------+
| 0.70710678118655 |      25 |
+------------------+---------+
1 row in set (0.02 sec)
mysql>
\end{verbatim}

The queries shown thus far have been relatively short, single-line statements. You can even enter multiple statements on a single line. Just end each one with a semicolon:
A query need not be given all on a single line, so lengthy queries that require several lines are not a problem. `mysql` determines where your statement ends by looking for the terminating semicolon, not by looking for the end of the input line. (In other words, `mysql` accepts free-format input: it collects input lines but does not execute them until it sees the semicolon.)

Here is a simple multiple-line statement:

```sql
mysql> SELECT
    > USER() -> CURRENT_DATE;
```

```plaintext
+---------------+--------------+
| USER()        | CURRENT_DATE |
| jon@localhost | 2010-08-06   |
+---------------+--------------+
```

In this example, notice how the prompt changes from `mysql>` to `->` after you enter the first line of a multiple-line query. This is how `mysql` indicates that it has not yet seen a complete statement and is waiting for the rest. The prompt is your friend, because it provides valuable feedback. If you use that feedback, you can always be aware of what `mysql` is waiting for.

If you decide you do not want to execute a query that you are in the process of entering, cancel it by typing `\c`:

```sql
mysql> SELECT
    > USER() -> \c
mysql>
```

Here, too, notice the prompt. It switches back to `mysql>` after you type `\c`, providing feedback to indicate that `mysql` is ready for a new query.

The following table shows each of the prompts you may see and summarizes what they mean about the state that `mysql` is in.

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mysql&gt;</code></td>
<td>Ready for new query</td>
</tr>
<tr>
<td><code>&gt;</code></td>
<td>Waiting for next line of multiple-line query</td>
</tr>
<tr>
<td><code>'</code></td>
<td>Waiting for next line, waiting for completion of a string that began with a single quote (')</td>
</tr>
<tr>
<td><code>&quot;</code></td>
<td>Waiting for next line, waiting for completion of a string that began with a double quote (&quot;)</td>
</tr>
</tbody>
</table>
Entering Queries

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&gt;</code></td>
<td>Waiting for next line, waiting for completion of an identifier that began with a backtick (`)</td>
</tr>
<tr>
<td><code>/*&gt;</code></td>
<td>Waiting for next line, waiting for completion of a comment that began with /*</td>
</tr>
</tbody>
</table>

Multiple-line statements commonly occur by accident when you intend to issue a query on a single line, but forget the terminating semicolon. In this case, `mysql` waits for more input:

```
mysql> SELECT USER()
->
```

If this happens to you (you think you've entered a statement but the only response is a `->` prompt), most likely `mysql` is waiting for the semicolon. If you don't notice what the prompt is telling you, you might sit there for a while before realizing what you need to do. Enter a semicolon to complete the statement, and `mysql` executes it:

```
mysql> SELECT USER()
-> ;
+---------------+
| USER()        |
| jon@localhost |
+---------------+
```

The `'>` and `">` prompts occur during string collection (another way of saying that MySQL is waiting for completion of a string). In MySQL, you can write strings surrounded by either ' or " characters (for example, 'hello' or "goodbye"), and `mysql` lets you enter strings that span multiple lines. When you see a `'>` or `">` prompt, it means that you have entered a line containing a string that begins with a ' or " quote character, but have not yet entered the matching quote that terminates the string. This often indicates that you have inadvertently left out a quote character. For example:

```
mysql> SELECT * FROM my_table WHERE name = 'Smith AND age < 30;
```

If you enter this `SELECT` statement, then press `Enter` and wait for the result, nothing happens. Instead of wondering why this query takes so long, notice the clue provided by the `'>` prompt. It tells you that `mysql` expects to see the rest of an unterminated string. (Do you see the error in the statement? The string 'Smith is missing the second single quotation mark.)

At this point, what do you do? The simplest thing is to cancel the query. However, you cannot just type \c in this case, because `mysql` interprets it as part of the string that it is collecting. Instead, enter the closing quote character (so `mysql` knows you've finished the string), then type \c:

```
mysql> SELECT * FROM my_table WHERE name = 'Smith AND age < 30;
"`
mysql> \c
```

The prompt changes back to `mysql>`, indicating that `mysql` is ready for a new query.

The `'>` prompt is similar to the `'>` and `">` prompts, but indicates that you have begun but not completed a backtick-quoted identifier.

It is important to know what the `'>`, `">`, and `'>` prompts signify, because if you mistakenly enter an unterminated string, any further lines you type appear to be ignored by `mysql`—including a line containing...
QUIT. This can be quite confusing, especially if you do not know that you need to supply the terminating quote before you can cancel the current query.

Note
Multiline statements from this point on are written without the secondary (→ or other) prompts, to make it easier to copy and paste the statements to try for yourself.

3.3 Creating and Using a Database

Once you know how to enter SQL statements, you are ready to access a database. Suppose that you have several pets in your home (your menagerie) and you would like to keep track of various types of information about them. You can do so by creating tables to hold your data and loading them with the desired information. Then you can answer different sorts of questions about your animals by retrieving data from the tables. This section shows you how to perform the following operations:

- Create a database
- Create a table
- Load data into the table
- Retrieve data from the table in various ways
- Use multiple tables

The menagerie database is simple (deliberately), but it is not difficult to think of real-world situations in which a similar type of database might be used. For example, a database like this could be used by a farmer to keep track of livestock, or by a veterinarian to keep track of patient records. A menagerie distribution containing some of the queries and sample data used in the following sections can be obtained from the MySQL website. It is available in both compressed tar file and Zip formats at https://dev.mysql.com/doc/.

Use the `SHOW` statement to find out what databases currently exist on the server:

```sql
mysql> SHOW DATABASES;
+----------+
| Database |
+----------+
| mysql    |
| test     |
| tmp      |
+----------+
```

The `mysql` database describes user access privileges. The `test` database often is available as a workspace for users to try things out.

The list of databases displayed by the statement may be different on your machine; `SHOW DATABASES` does not show databases that you have no privileges for if you do not have the `SHOW DATABASES` privilege. See Section 13.7.5.15, “SHOW DATABASES Syntax”.

If the `test` database exists, try to access it:

```sql
mysql> USE test
Database changed
```
Creating and Selecting a Database

USE, like QUIT, does not require a semicolon. (You can terminate such statements with a semicolon if you like; it does no harm.) The USE statement is special in another way, too: it must be given on a single line.

You can use the test database (if you have access to it) for the examples that follow, but anything you create in that database can be removed by anyone else with access to it. For this reason, you should probably ask your MySQL administrator for permission to use a database of your own. Suppose that you want to call yours menagerie. The administrator needs to execute a statement like this:

```
mysql> GRANT ALL ON menagerie.* TO 'your_mysql_name'@'your_client_host';
```

where your_mysql_name is the MySQL user name assigned to you and your_client_host is the host from which you connect to the server.

### 3.3.1 Creating and Selecting a Database

If the administrator creates your database for you when setting up your permissions, you can begin using it. Otherwise, you need to create it yourself:

```
mysql> CREATE DATABASE menagerie;
```

Under Unix, database names are case-sensitive (unlike SQL keywords), so you must always refer to your database as menagerie, not as Menagerie, MENAGERIE, or some other variant. This is also true for table names. (Under Windows, this restriction does not apply, although you must refer to databases and tables using the same lettercase throughout a given query. However, for a variety of reasons, the recommended best practice is always to use the same lettercase that was used when the database was created.)

**Note**

If you get an error such as ERROR 1044 (42000): Access denied for user 'micah'@'localhost' to database 'menagerie' when attempting to create a database, this means that your user account does not have the necessary privileges to do so. Discuss this with the administrator or see Section 6.2, "Access Control and Account Management".

Creating a database does not select it for use; you must do that explicitly. To make menagerie the current database, use this statement:

```
mysql> USE menagerie
Database changed
```

Your database needs to be created only once, but you must select it for use each time you begin a mysql session. You can do this by issuing a USE statement as shown in the example. Alternatively, you can select the database on the command line when you invoke mysql. Just specify its name after any connection parameters that you might need to provide. For example:

```
shell> mysql -h host -u user -p menagerie
Enter password: *******
```

**Important**

menagerie in the command just shown is not your password. If you want to supply your password on the command line after the -p option, you must do so with no intervening space (for example, as -ppassword, not as -p password). However,
Creating a Table

putting your password on the command line is not recommended, because doing so exposes it to snooping by other users logged in on your machine.

Note
You can see at any time which database is currently selected using `SELECT DATABASE()`.

3.3.2 Creating a Table

Creating the database is the easy part, but at this point it is empty, as `SHOW TABLES` tells you:

```
mysql> SHOW TABLES;
Empty set (0.00 sec)
```

The harder part is deciding what the structure of your database should be: what tables you need and what columns should be in each of them.

You want a table that contains a record for each of your pets. This can be called the `pet` table, and it should contain, as a bare minimum, each animal's name. Because the name by itself is not very interesting, the table should contain other information. For example, if more than one person in your family keeps pets, you might want to list each animal's owner. You might also want to record some basic descriptive information such as species and sex.

How about age? That might be of interest, but it is not a good thing to store in a database. Age changes as time passes, which means you'd have to update your records often. Instead, it is better to store a fixed value such as date of birth. Then, whenever you need age, you can calculate it as the difference between the current date and the birth date. MySQL provides functions for doing date arithmetic, so this is not difficult. Storing birth date rather than age has other advantages, too:

• You can use the database for tasks such as generating reminders for upcoming pet birthdays. (If you think this type of query is somewhat silly, note that it is the same question you might ask in the context of a business database to identify clients to whom you need to send out birthday greetings in the current week or month, for that computer-assisted personal touch.)

• You can calculate age in relation to dates other than the current date. For example, if you store death date in the database, you can easily calculate how old a pet was when it died.

You can probably think of other types of information that would be useful in the `pet` table, but the ones identified so far are sufficient: name, owner, species, sex, birth, and death.

Use a `CREATE TABLE` statement to specify the layout of your table:

```
mysql> CREATE TABLE pet (name VARCHAR(20), owner VARCHAR(20),
        species VARCHAR(20), sex CHAR(1), birth DATE, death DATE);
```

`VARCHAR` is a good choice for the `name`, `owner`, and `species` columns because the column values vary in length. The lengths in those column definitions need not all be the same, and need not be 20. You can normally pick any length from 1 to 65535, whatever seems most reasonable to you. If you make a poor choice and it turns out later that you need a longer field, MySQL provides an `ALTER TABLE` statement.

Several types of values can be chosen to represent sex in animal records, such as 'm' and 'f', or perhaps 'male' and 'female'. It is simplest to use the single characters 'm' and 'f'.

The use of the `DATE` data type for the `birth` and `death` columns is a fairly obvious choice.
Once you have created a table, `SHOW TABLES` should produce some output:

```
mysql> SHOW TABLES;
+---------------------+
| Tables in menagerie |
+---------------------+
| pet                 |
+---------------------+
```

To verify that your table was created the way you expected, use a `DESCRIBE` statement:

```
mysql> DESCRIBE pet;
+---------+-------------+------+-----+---------+-------+
| Field   | Type        | Null | Key | Default | Extra |
+---------+-------------+------+-----+---------+-------+
| name    | varchar(20) | YES  |     | NULL    |       |
| owner   | varchar(20) | YES  |     | NULL    |       |
| species | varchar(20) | YES  |     | NULL    |       |
| sex     | char(1)     | YES  |     | NULL    |       |
| birth   | date        | YES  |     | NULL    |       |
| death   | date        | YES  |     | NULL    |       |
+---------+-------------+------+-----+---------+-------+
```

You can use `DESCRIBE` any time, for example, if you forget the names of the columns in your table or what types they have.

For more information about MySQL data types, see Chapter 11, `Data Types`.

### 3.3.3 Loading Data into a Table

After creating your table, you need to populate it. The `LOAD DATA` and `INSERT` statements are useful for this.

Suppose that your pet records can be described as shown here. (Observe that MySQL expects dates in 'YYYY-MM-DD' format; this may be different from what you are used to.)

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>Harold</td>
<td>cat</td>
<td>f</td>
<td>1993-02-04</td>
<td></td>
</tr>
<tr>
<td>Claws</td>
<td>Gwen</td>
<td>cat</td>
<td>m</td>
<td>1994-03-17</td>
<td></td>
</tr>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td></td>
</tr>
<tr>
<td>Fang</td>
<td>Benny</td>
<td>dog</td>
<td>m</td>
<td>1990-08-27</td>
<td></td>
</tr>
<tr>
<td>Bowser</td>
<td>Diane</td>
<td>dog</td>
<td>m</td>
<td>1979-08-31</td>
<td>1995-07-29</td>
</tr>
<tr>
<td>Chirpy</td>
<td>Gwen</td>
<td>bird</td>
<td>f</td>
<td>1998-09-11</td>
<td></td>
</tr>
<tr>
<td>Whistler</td>
<td>Gwen</td>
<td>bird</td>
<td></td>
<td>1997-12-09</td>
<td></td>
</tr>
<tr>
<td>Slim</td>
<td>Benny</td>
<td>snake</td>
<td>m</td>
<td>1996-04-29</td>
<td></td>
</tr>
</tbody>
</table>

Because you are beginning with an empty table, an easy way to populate it is to create a text file containing a row for each of your animals, then load the contents of the file into the table with a single statement.

You could create a text file `pet.txt` containing one record per line, with values separated by tabs, and given in the order in which the columns were listed in the `CREATE TABLE` statement. For missing values (such as unknown sexes or death dates for animals that are still living), you can use `NULL` values. To
represent these in your text file, use \N (backslash, capital-N). For example, the record for Whistler the bird would look like this (where the whitespace between values is a single tab character):

| Whistler | Gwen  | bird | \N       | 1997-12-09 | \N |

To load the text file pet.txt into the pet table, use this statement:

```sql
mysql> LOAD DATA LOCAL INFILE '/path/pet.txt' INTO TABLE pet;
```

If you created the file on Windows with an editor that uses \r\n as a line terminator, you should use this statement instead:

```sql
mysql> LOAD DATA LOCAL INFILE '/path/pet.txt' INTO TABLE pet
    LINES TERMINATED BY '\r\n';
```

(On an Apple machine running OS X, you would likely want to use LINES TERMINATED BY '\r'.)

You can specify the column value separator and end of line marker explicitly in the LOAD DATA statement if you wish, but the defaults are tab and linefeed. These are sufficient for the statement to read the file pet.txt properly.

If the statement fails, it is likely that your MySQL installation does not have local file capability enabled by default. See Section 6.1.6, “Security Issues with LOAD DATA LOCAL”, for information on how to change this.

When you want to add new records one at a time, the INSERT statement is useful. In its simplest form, you supply values for each column, in the order in which the columns were listed in the CREATE TABLE statement. Suppose that Diane gets a new hamster named “Puffball.” You could add a new record using an INSERT statement like this:

```sql
mysql> INSERT INTO pet
    VALUES ('Puffball','Diane','hamster','f','1999-03-30',NULL);
```

String and date values are specified as quoted strings here. Also, with INSERT, you can insert NULL directly to represent a missing value. You do not use \N like you do with LOAD DATA.

From this example, you should be able to see that there would be a lot more typing involved to load your records initially using several INSERT statements rather than a single LOAD DATA statement.

### 3.3.4 Retrieving Information from a Table

The SELECT statement is used to pull information from a table. The general form of the statement is:

```sql
SELECT what_to_select
FROM which_table
WHERE conditions_to_satisfy;
```

what_to_select indicates what you want to see. This can be a list of columns, or * to indicate “all columns.” which_table indicates the table from which you want to retrieve data. The WHERE clause is optional. If it is present, conditions_to_satisfy specifies one or more conditions that rows must satisfy to qualify for retrieval.

#### 3.3.4.1 Selecting All Data

The simplest form of SELECT retrieves everything from a table:
Retrieving Information from a Table

```
mysql> SELECT * FROM pet;
+----------+--------+---------+------+------------+------------+
<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>Harold</td>
<td>cat</td>
<td>f</td>
<td>1993-02-04</td>
<td>NULL</td>
</tr>
<tr>
<td>Claws</td>
<td>Gwen</td>
<td>cat</td>
<td>m</td>
<td>1994-03-17</td>
<td>NULL</td>
</tr>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td>NULL</td>
</tr>
<tr>
<td>Fang</td>
<td>Benny</td>
<td>dog</td>
<td>m</td>
<td>1990-08-27</td>
<td>NULL</td>
</tr>
<tr>
<td>Bowser</td>
<td>Diane</td>
<td>dog</td>
<td>m</td>
<td>1979-08-31</td>
<td>1995-07-29</td>
</tr>
<tr>
<td>Chirpy</td>
<td>Gwen</td>
<td>bird</td>
<td>f</td>
<td>1998-09-11</td>
<td>NULL</td>
</tr>
<tr>
<td>Whistler</td>
<td>Gwen</td>
<td>bird</td>
<td>NULL</td>
<td>1997-12-09</td>
<td>NULL</td>
</tr>
<tr>
<td>Slim</td>
<td>Benny</td>
<td>snake</td>
<td>m</td>
<td>1996-04-29</td>
<td>NULL</td>
</tr>
<tr>
<td>Puffball</td>
<td>Diane</td>
<td>hamster</td>
<td>f</td>
<td>1999-03-30</td>
<td>NULL</td>
</tr>
</tbody>
</table>
+----------+--------+---------+------|------------+------------+
```

This form of `SELECT` is useful if you want to review your entire table, for example, after you've just loaded it with your initial data set. For example, you may happen to think that the birth date for Bowser doesn't seem quite right. Consulting your original pedigree papers, you find that the correct birth year should be 1989, not 1979.

There are at least two ways to fix this:

- **Edit the file `pet.txt` to correct the error, then empty the table and reload it using `DELETE` and `LOAD DATA`**:

```
mysql> DELETE FROM pet;
mysql> LOAD DATA LOCAL INFILE '/path/pet.txt' INTO TABLE pet;
```

However, if you do this, you must also re-enter the record for Puffball.

- **Fix only the erroneous record with an `UPDATE` statement**:

```
mysql> UPDATE pet SET birth = '1989-08-31' WHERE name = 'Bowser';
```

The `UPDATE` changes only the record in question and does not require you to reload the table.

### 3.3.4.2 Selecting Particular Rows

As shown in the preceding section, it is easy to retrieve an entire table. Just omit the `WHERE` clause from the `SELECT` statement. But typically you don't want to see the entire table, particularly when it becomes large. Instead, you're usually more interested in answering a particular question, in which case you specify some constraints on the information you want. Let's look at some selection queries in terms of questions about your pets that they answer.

You can select only particular rows from your table. For example, if you want to verify the change that you made to Bowser's birth date, select Bowser's record like this:

```
mysql> SELECT * FROM pet WHERE name = 'Bowser';
+--------+-------+---------+------+------------+------------+
<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bowser</td>
<td>Diane</td>
<td>dog</td>
<td>m</td>
<td>1989-08-31</td>
<td>1995-07-29</td>
</tr>
</tbody>
</table>
+--------+-------+---------+------|------------+------------+
```

The output confirms that the year is correctly recorded as 1989, not 1979.

String comparisons normally are case-insensitive, so you can specify the name as `"bowser"`, `"BOWSER"`, and so forth. The query result is the same.
You can specify conditions on any column, not just `name`. For example, if you want to know which animals were born during or after 1998, test the `birth` column:

```sql
mysql> SELECT * FROM pet WHERE birth >= '1998-1-1';
+----------+-------+---------+------+------------+-------+
| name     | owner | species | sex  | birth      | death |
+----------+-------+---------+------+------------+-------+
| Chirpy   | Gwen  | bird    | f    | 1998-09-11 | NULL  |
| Puffball | Diane | hamster | f    | 1999-03-30 | NULL  |
+----------+-------+---------+------+------------+-------+
```

You can combine conditions, for example, to locate female dogs:

```sql
mysql> SELECT * FROM pet WHERE species = 'dog' AND sex = 'f';
+-------+--------+---------+------+------------+-------+
| name  | owner  | species | sex  | birth      | death |
+-------+--------+---------+------+------------+-------+
| Buffy | Harold | dog     | f    | 1989-05-13 | NULL  |
+-------+--------+---------+------+------------+-------+
```

The preceding query uses the `AND` logical operator. There is also an `OR` operator:

```sql
mysql> SELECT * FROM pet WHERE species = 'snake' OR species = 'bird';
+----------+-------+---------+------+------------+-------+
| name     | owner | species | sex  | birth      | death |
+----------+-------+---------+------+------------+-------+
| Chirpy   | Gwen  | bird    | f    | 1998-09-11 | NULL  |
| Whistler | Gwen  | bird    | f    | NULL       | NULL  |
| Slim     | Benny | snake   | m    | 1996-04-29 | NULL  |
+----------+-------+---------+------+------------+-------+
```

`AND` and `OR` may be intermixed, although `AND` has higher precedence than `OR`. If you use both operators, it is a good idea to use parentheses to indicate explicitly how conditions should be grouped:

```sql
mysql> SELECT * FROM pet WHERE (species = 'cat' AND sex = 'm') OR (species = 'dog' AND sex = 'f');
+-------+--------+---------+------+------------+-------+
| name  | owner  | species | sex  | birth      | death |
+-------+--------+---------+------+------------+-------+
| Claws | Gwen   | cat     | m    | 1994-03-17 | NULL  |
| Buffy | Harold | dog     | f    | 1989-05-13 | NULL  |
+-------+--------+---------+------+------------+-------+
```

### 3.3.4.3 Selecting Particular Columns

If you do not want to see entire rows from your table, just name the columns in which you are interested, separated by commas. For example, if you want to know when your animals were born, select the `name` and `birth` columns:

```sql
mysql> SELECT name, birth FROM pet;
+----------+------------+
| name     | birth      |
+----------+------------+
| Fluffy   | 1993-02-04 |
| Claws    | 1994-03-17 |
| Buffy    | 1989-05-13 |
| Fang     | 1990-08-27 |
| Bowser   | 1989-08-31 |
| Chirpy   | 1998-09-11 |
+----------+------------+
```
To find out who owns pets, use this query:

```
mysql> SELECT owner FROM pet;
```

Notice that the query simply retrieves the `owner` column from each record, and some of them appear more than once. To minimize the output, retrieve each unique output record just once by adding the keyword `DISTINCT`:

```
mysql> SELECT DISTINCT owner FROM pet;
```

You can use a `WHERE` clause to combine row selection with column selection. For example, to get birth dates for dogs and cats only, use this query:

```
mysql> SELECT name, species, birth FROM pet
WHERE species = 'dog' OR species = 'cat';
```

### 3.3.4.4 Sorting Rows

You may have noticed in the preceding examples that the result rows are displayed in no particular order. It is often easier to examine query output when the rows are sorted in some meaningful way. To sort a result, use an `ORDER BY` clause.

Here are animal birthdays, sorted by date:
On character type columns, sorting—like all other comparison operations—is normally performed in a case-insensitive fashion. This means that the order is undefined for columns that are identical except for their case. You can force a case-sensitive sort for a column by using `BINARY` like so:

```
ORDER BY BINARY col_name.
```

The default sort order is ascending, with smallest values first. To sort in reverse (descending) order, add the `DESC` keyword to the name of the column you are sorting by:

```
SELECT name, birth FROM pet ORDER BY birth DESC;
```

You can sort on multiple columns, and you can sort different columns in different directions. For example, to sort by type of animal in ascending order, then by birth date within animal type in descending order (youngest animals first), use the following query:

```
SELECT name, species, birth FROM pet
ORDER BY species, birth DESC;
```

The `DESC` keyword applies only to the column name immediately preceding it (birth); it does not affect the `species` column sort order.

### 3.3.4.5 Date Calculations
MySQL provides several functions that you can use to perform calculations on dates, for example, to calculate ages or extract parts of dates.

To determine how many years old each of your pets is, use the `TIMESTAMPDIFF()` function. Its arguments are the unit in which you want the result expressed, and the two dates for which to take the difference. The following query shows, for each pet, the birth date, the current date, and the age in years. An alias (`age`) is used to make the final output column label more meaningful.

```sql
mysql> SELECT name, birth, CURDATE(),
TIMESTAMPDIFF(YEAR, birth, CURDATE()) AS age
FROM pet;
```

<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>CURDATE()</th>
<th>age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>1993-02-04</td>
<td>2003-08-19</td>
<td>10</td>
</tr>
<tr>
<td>Claws</td>
<td>1994-03-17</td>
<td>2003-08-19</td>
<td>9</td>
</tr>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
<td>2003-08-19</td>
<td>14</td>
</tr>
<tr>
<td>Fang</td>
<td>1990-08-27</td>
<td>2003-08-19</td>
<td>12</td>
</tr>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>2003-08-19</td>
<td>13</td>
</tr>
<tr>
<td>Chirpy</td>
<td>1998-09-11</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Whistler</td>
<td>1997-12-09</td>
<td>2003-08-19</td>
<td>5</td>
</tr>
<tr>
<td>Slim</td>
<td>1996-04-29</td>
<td>2003-08-19</td>
<td>7</td>
</tr>
<tr>
<td>Puffball</td>
<td>1999-03-30</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
</tbody>
</table>

The query works, but the result could be scanned more easily if the rows were presented in some order. This can be done by adding an `ORDER BY name` clause to sort the output by name:

```sql
mysql> SELECT name, birth, CURDATE(),
TIMESTAMPDIFF(YEAR, birth, CURDATE()) AS age
FROM pet ORDER BY name;
```

<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>CURDATE()</th>
<th>age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>2003-08-19</td>
<td>13</td>
</tr>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
<td>2003-08-19</td>
<td>14</td>
</tr>
<tr>
<td>Chirpy</td>
<td>1998-09-11</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Claws</td>
<td>1994-03-17</td>
<td>2003-08-19</td>
<td>14</td>
</tr>
<tr>
<td>Fang</td>
<td>1990-08-27</td>
<td>2003-08-19</td>
<td>12</td>
</tr>
<tr>
<td>Fluffy</td>
<td>1993-02-04</td>
<td>2003-08-19</td>
<td>10</td>
</tr>
<tr>
<td>Puffball</td>
<td>1999-03-30</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Slim</td>
<td>1996-04-29</td>
<td>2003-08-19</td>
<td>7</td>
</tr>
<tr>
<td>Whistler</td>
<td>1997-12-09</td>
<td>2003-08-19</td>
<td>5</td>
</tr>
</tbody>
</table>

To sort the output by `age` rather than `name`, just use a different `ORDER BY` clause:

```sql
mysql> SELECT name, birth, CURDATE(),
TIMESTAMPDIFF(YEAR, birth, CURDATE()) AS age
FROM pet ORDER BY age;
```

<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>CURDATE()</th>
<th>age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chirpy</td>
<td>1998-09-11</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Puffball</td>
<td>1999-03-30</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Whistler</td>
<td>1997-12-09</td>
<td>2003-08-19</td>
<td>5</td>
</tr>
<tr>
<td>Slim</td>
<td>1996-04-29</td>
<td>2003-08-19</td>
<td>7</td>
</tr>
<tr>
<td>Claws</td>
<td>1994-03-17</td>
<td>2003-08-19</td>
<td>9</td>
</tr>
<tr>
<td>Fluffy</td>
<td>1993-02-04</td>
<td>2003-08-19</td>
<td>10</td>
</tr>
<tr>
<td>Fang</td>
<td>1990-08-27</td>
<td>2003-08-19</td>
<td>12</td>
</tr>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>2003-08-19</td>
<td>13</td>
</tr>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
<td>2003-08-19</td>
<td>14</td>
</tr>
</tbody>
</table>
A similar query can be used to determine age at death for animals that have died. You determine which animals these are by checking whether the \texttt{death} value is \texttt{NULL}. Then, for those with non-\texttt{NULL} values, compute the difference between the \texttt{death} and \texttt{birth} values:

```
mysql> SELECT name, birth, death,
TIMESTAMPDIFF(YEAR,birth,death) AS age
FROM pet WHERE death IS NOT NULL ORDER BY age;
```

<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>death</th>
<th>age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>1995-07-29</td>
<td>5</td>
</tr>
</tbody>
</table>

The query uses \texttt{death IS NOT NULL} rather than \texttt{death <> NULL} because \texttt{NULL} is a special value that cannot be compared using the usual comparison operators. This is discussed later. See Section 3.3.4.6, “Working with NULL Values”.

What if you want to know which animals have birthdays next month? For this type of calculation, year and day are irrelevant; you simply want to extract the month part of the \texttt{birth} column. MySQL provides several functions for extracting parts of dates, such as \texttt{YEAR()}, \texttt{MONTH()}, and \texttt{DAYOFMONTH()}. \texttt{MONTH()} is the appropriate function here. To see how it works, run a simple query that displays the value of both \texttt{birth} and \texttt{MONTH(birth)}:

```
mysql> SELECT name, birth, MONTH(birth) FROM pet;
```

<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>MONTH(birth)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>1993-02-04</td>
<td>2</td>
</tr>
<tr>
<td>Claws</td>
<td>1994-03-17</td>
<td>3</td>
</tr>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
<td>5</td>
</tr>
<tr>
<td>Fang</td>
<td>1990-08-27</td>
<td>8</td>
</tr>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>8</td>
</tr>
<tr>
<td>Chirpy</td>
<td>1998-09-11</td>
<td>9</td>
</tr>
<tr>
<td>Whistler</td>
<td>1997-12-09</td>
<td>12</td>
</tr>
<tr>
<td>Slim</td>
<td>1996-04-29</td>
<td>4</td>
</tr>
<tr>
<td>Puffball</td>
<td>1999-03-30</td>
<td>3</td>
</tr>
</tbody>
</table>

Finding animals with birthdays in the upcoming month is also simple. Suppose that the current month is April. Then the month value is 4 and you can look for animals born in May (month 5) like this:

```
mysql> SELECT name, birth FROM pet WHERE MONTH(birth) = 5;
```

<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
</tr>
</tbody>
</table>

There is a small complication if the current month is December. You cannot merely add one to the month number (12) and look for animals born in month 13, because there is no such month. Instead, you look for animals born in January (month 1).

You can write the query so that it works no matter what the current month is, so that you do not have to use the number for a particular month. \texttt{DATE_ADD()} enables you to add a time interval to a given date. If you add a month to the value of \texttt{CURDATE()}, then extract the month part with \texttt{MONTH()}, the result produces the month in which to look for birthdays:
Retrieving Information from a Table

```sql
mysql> SELECT name, birth FROM pet
    WHERE MONTH(birth) = MONTH(DATE_ADD(CURDATE(), INTERVAL 1 MONTH));
```

A different way to accomplish the same task is to add 1 to get the next month after the current one after using the modulo function (MOD) to wrap the month value to 0 if it is currently 12:

```sql
mysql> SELECT name, birth FROM pet
    WHERE MONTH(birth) = MOD(MONTH(CURDATE()), 12) + 1;
```

MONTH() returns a number between 1 and 12. And MOD(something, 12) returns a number between 0 and 11. So the addition has to be after the MOD(), otherwise we would go from November (11) to January (1).

If a calculation uses invalid dates, the calculation fails and produces warnings:

```sql
mysql> SELECT '2018-10-31' + INTERVAL 1 DAY;
```

Output:

```
+-------------------------------+
| '2018-10-31' + INTERVAL 1 DAY |
| 2018-11-01                     |
```

```sql
mysql> SELECT '2018-10-32' + INTERVAL 1 DAY;
```

Output:

```
+-------------------------------+
| '2018-10-32' + INTERVAL 1 DAY |
| NULL                          |
```

```sql
mysql> SHOW WARNINGS;
```

Output:

```
<table>
<thead>
<tr>
<th>Level</th>
<th>Code</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Warning</td>
<td>1292</td>
<td>Incorrect datetime value: '2018-10-32'</td>
</tr>
</tbody>
</table>
```

3.3.4.6 Working with NULL Values

The NULL value can be surprising until you get used to it. Conceptually, NULL means “a missing unknown value” and it is treated somewhat differently from other values.

To test for NULL, use the IS NULL and IS NOT NULL operators, as shown here:

```sql
mysql> SELECT 1 IS NULL, 1 IS NOT NULL;
```

Output:

```
+-----------+---------------+
| 1 IS NULL | 1 IS NOT NULL |
|          0 |             1 |
```

You cannot use arithmetic comparison operators such as =, <, or <> to test for NULL. To demonstrate this for yourself, try the following query:

```sql
mysql> SELECT 1 = NULL, 1 <> NULL, 1 < NULL, 1 > NULL;
```

Output:

```
+----------+-----------+----------+----------+
| 1 = NULL | 1 <> NULL | 1 < NULL | 1 > NULL |
|     NULL |      NULL |     NULL |     NULL |
```

Because the result of any arithmetic comparison with NULL is also NULL, you cannot obtain any meaningful results from such comparisons.
In MySQL, 0 or NULL means false and anything else means true. The default truth value from a boolean operation is 1.

This special treatment of NULL is why, in the previous section, it was necessary to determine which animals are no longer alive using death IS NOT NULL instead of death <> NULL.

Two NULL values are regarded as equal in a GROUP BY.

When doing an ORDER BY, NULL values are presented first if you do ORDER BY ... ASC and last if you do ORDER BY ... DESC.

A common error when working with NULL is to assume that it is not possible to insert a zero or an empty string into a column defined as NOT NULL, but this is not the case. These are in fact values, whereas NULL means "not having a value." You can test this easily enough by using IS [NOT] NULL as shown:

```
mysql> SELECT 0 IS NULL, 0 IS NOT NULL, '' IS NULL, '' IS NOT NULL;
+-----------+---------------+------------+----------------+
| 0 IS NULL | 0 IS NOT NULL | '' IS NULL | '' IS NOT NULL |
+-----------+---------------+------------+----------------+
|         0 |             1 |          0 |              1 |
+-----------+---------------+------------+----------------+
```

Thus it is entirely possible to insert a zero or empty string into a NOT NULL column, as these are in fact NOT NULL. See Section B.4.4.3, "Problems with NULL Values".

### 3.3.4.7 Pattern Matching

MySQL provides standard SQL pattern matching as well as a form of pattern matching based on extended regular expressions similar to those used by Unix utilities such as vi, grep, and sed.

SQL pattern matching enables you to use _ to match any single character and % to match an arbitrary number of characters (including zero characters). In MySQL, SQL patterns are case-insensitive by default. Some examples are shown here. Do not use = or <> when you use SQL patterns. Use the LIKE or NOT LIKE comparison operators instead.

To find names beginning with b:

```
mysql> SELECT * FROM pet WHERE name LIKE 'b%';
```

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td>NULL</td>
</tr>
<tr>
<td>Bowser</td>
<td>Diane</td>
<td>dog</td>
<td>m</td>
<td>1989-08-31</td>
<td>1995-07-29</td>
</tr>
</tbody>
</table>

To find names ending with fy:

```
mysql> SELECT * FROM pet WHERE name LIKE '%fy';
```

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>Harold</td>
<td>cat</td>
<td>f</td>
<td>1993-02-04</td>
<td>NULL</td>
</tr>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td>NULL</td>
</tr>
</tbody>
</table>

To find names containing a w:
To find names containing exactly five characters, use five instances of the _ pattern character:

```
mysql> SELECT * FROM pet WHERE name LIKE '_____';
```

```
+-------+--------+---------+------+------------+-------+
| name  | owner  | species | sex  | birth      | death |
+-------+--------+---------+------+------------+-------+
| Claws | Gwen   | cat     | m    | 1994-03-17 | NULL  |
| Buffy | Harold | dog     | f    | 1989-05-13 | NULL  |
+-------+--------+---------+------+------------+-------+
```

The other type of pattern matching provided by MySQL uses extended regular expressions. When you test for a match for this type of pattern, use the REGEXP and NOT REGEXP operators (or RLIKE and NOT RLIKE, which are synonyms).

The following list describes some characteristics of extended regular expressions:

- . matches any single character.

- A character class [abc] matches any character within the brackets. For example, [abc] matches a, b, or c. To name a range of characters, use a dash. [a-z] matches any letter, whereas [0-9] matches any digit.

- * matches zero or more instances of the thing preceding it. For example, x* matches any number of x characters, [0-9]* matches any number of digits, and .* matches any number of anything.

- A regular expression pattern match succeeds if the pattern matches anywhere in the value being tested. (This differs from a LIKE pattern match, which succeeds only if the pattern matches the entire value.)

- To anchor a pattern so that it must match the beginning or end of the value being tested, use ^ at the beginning or $ at the end of the pattern.

To demonstrate how extended regular expressions work, the LIKE queries shown previously are rewritten here to use REGEXP.

To find names beginning with b, use ^ to match the beginning of the name:

```
mysql> SELECT * FROM pet WHERE name REGEXP '^b';
```

```
+-------+--------+---------+------+------------+-------+
| name  | owner  | species | sex  | birth      | death |
+-------+--------+---------+------+------------+-------+
| Buffy | Harold | dog     | f    | 1989-05-13 | NULL  |
| Bowser| Diane  | dog     | m    | 1989-08-31 | 1995-07-29 |
+-------+--------+---------+------+------------+-------+
```

To force a REGEXP comparison to be case-sensitive, use the BINARY keyword to make one of the strings a binary string. This query matches only lowercase b at the beginning of a name:

```
SELECT * FROM pet WHERE name REGEXP BINARY '^b';
```

To find names ending with fy, use $ to match the end of the name:

```
SELECT * FROM pet WHERE name REGEXP 'fy$';
```
Retrieving Information from a Table

To find names containing a \textit{w}, use this query:

\begin{verbatim}
mysql> SELECT * FROM pet WHERE name REGEXP 'w';
\end{verbatim}

\begin{verbatim}
+----------+-------+---------+------+------------+------------+
| name     | owner | species | sex  | birth      | death      |
|----------+-------+---------+------+------------+------------+
| Claws    | Gwen  | cat     | m    | 1994-03-17 | NULL       |
| Bowser   | Diane | dog     | m    | 1989-08-31 | 1995-07-29 |
| Whistler | Gwen  | bird    | NULL | 1997-12-09 | NULL       |
\end{verbatim}

Because a regular expression pattern matches if it occurs anywhere in the value, it is not necessary in the previous query to put a wildcard on either side of the pattern to get it to match the entire value as would be true with an SQL pattern.

To find names containing exactly five characters, use $^$ and $^$ to match the beginning and end of the name, and five instances of . in between:

\begin{verbatim}
mysql> SELECT * FROM pet WHERE name REGEXP '^.....$';
\end{verbatim}

\begin{verbatim}
+-------+--------+---------+------+------------+-------+
| name  | owner  | species | sex  | birth      | death |
|-------+--------+---------+------+------------+-------+
| Claws | Gwen   | cat     | m    | 1994-03-17 | NULL  |
| Buffy | Harold | dog     | f    | 1989-05-13 | NULL  |
\end{verbatim}

You could also write the previous query using the \textit{(n)} ("repeat-n-times") operator:

\begin{verbatim}
mysql> SELECT * FROM pet WHERE name REGEXP '^.{5}$';
\end{verbatim}

\begin{verbatim}
+-------+--------+---------+------+------------+-------+
| name  | owner  | species | sex  | birth      | death |
|-------+--------+---------+------+------------+-------+
| Claws | Gwen   | cat     | m    | 1994-03-17 | NULL  |
| Buffy | Harold | dog     | f    | 1989-05-13 | NULL  |
\end{verbatim}

For more information about the syntax for regular expressions, see Section 12.5.2, "Regular Expressions".

### 3.3.4.8 Counting Rows

Databases are often used to answer the question, “How often does a certain type of data occur in a table?” For example, you might want to know how many pets you have, or how many pets each owner has, or you might want to perform various kinds of census operations on your animals.

Counting the total number of animals you have is the same question as “How many rows are in the \textit{pet} table?” because there is one record per pet. \texttt{COUNT(*)} counts the number of rows, so the query to count your animals looks like this:

\begin{verbatim}
mysql> SELECT COUNT(*) FROM pet;
\end{verbatim}
Earlier, you retrieved the names of the people who owned pets. You can use `COUNT()` if you want to find out how many pets each owner has:

```
mysql> SELECT owner, COUNT(*) FROM pet GROUP BY owner;
+--------+----------+
| owner  | COUNT(*) |
+--------+----------+
| Benny  |        2 |
| Diane  |        2 |
| Gwen   |        3 |
| Harold |        2 |
+--------+----------+
```

The preceding query uses `GROUP BY` to group all records for each `owner`. The use of `COUNT()` in conjunction with `GROUP BY` is useful for characterizing your data under various groupings. The following examples show different ways to perform animal census operations.

**Number of animals per species:**

```
mysql> SELECT species, COUNT(*) FROM pet GROUP BY species;
+---------+----------+
| species | COUNT(*) |
+---------+----------+
| bird    |        2 |
| cat     |        2 |
| dog     |        3 |
| hamster |        1 |
| snake   |        1 |
+---------+----------+
```

**Number of animals per sex:**

```
mysql> SELECT sex, COUNT(*) FROM pet GROUP BY sex;
+------+----------+
| sex  | COUNT(*) |
+------+----------+
| NULL |        1 |
| f    |        4 |
| m    |        4 |
+------+----------+
```

(In this output, `NULL` indicates that the sex is unknown.)

**Number of animals per combination of species and sex:**

```
mysql> SELECT species, sex, COUNT(*) FROM pet GROUP BY species, sex;
+---------+------+----------+
| species | sex  | COUNT(*) |
+---------+------+----------+
| bird    | NULL |        1 |
| bird    | f    |        1 |
| cat     | f    |        1 |
| cat     | m    |        1 |
| dog     | f    |        1 |
| dog     | m    |        2 |
| hamster | f    |        1 |
+---------+------+----------+
```
Retrieving Information from a Table

You need not retrieve an entire table when you use `COUNT()`. For example, the previous query, when performed just on dogs and cats, looks like this:

```
mysql> SELECT species, sex, COUNT(*) FROM pet
    WHERE species = 'dog' OR species = 'cat'
    GROUP BY species, sex;
```

```
+---------+------+----------+
<table>
<thead>
<tr>
<th>species</th>
<th>sex</th>
<th>COUNT(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>cat</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>cat</td>
<td>m</td>
<td>1</td>
</tr>
<tr>
<td>dog</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>dog</td>
<td>m</td>
<td>2</td>
</tr>
</tbody>
</table>
+---------+------+----------+
```

Or, if you wanted the number of animals per sex only for animals whose sex is known:

```
mysql> SELECT species, sex, COUNT(*) FROM pet
    WHERE sex IS NOT NULL
    GROUP BY species, sex;
```

```
+---------+-------+----------+
<table>
<thead>
<tr>
<th>species</th>
<th>sex</th>
<th>COUNT(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>bird</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>cat</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>cat</td>
<td>m</td>
<td>1</td>
</tr>
<tr>
<td>dog</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>dog</td>
<td>m</td>
<td>2</td>
</tr>
<tr>
<td>hamster</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>snake</td>
<td>m</td>
<td>1</td>
</tr>
</tbody>
</table>
+---------+-------+----------+
```

If you name columns to select in addition to the `COUNT()` value, a `GROUP BY` clause should be present that names those same columns. Otherwise, the following occurs:

- If the `ONLY_FULL_GROUP_BY` SQL mode is enabled, an error occurs:

```
mysql> SET sql_mode = 'ONLY_FULL_GROUP_BY';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT owner, COUNT(*) FROM pet;
ERROR 1140 (42000): Mixing of GROUP columns (MIN(),MAX(),COUNT()...) with no GROUP columns is illegal if there is no GROUP BY clause
```

- If `ONLY_FULL_GROUP_BY` is not enabled, the query is processed by treating all rows as a single group, but the value selected for each named column is nondeterministic. The server is free to select the value from any row:

```
mysql> SET sql_mode = '';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT owner, COUNT(*) FROM pet;
```

```
+--------+----------+
<table>
<thead>
<tr>
<th>owner</th>
<th>COUNT(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Harold</td>
<td>8</td>
</tr>
</tbody>
</table>
+--------+----------+
```

1 row in set (0.00 sec)
See also Section 12.19.3, “MySQL Handling of GROUP BY”. See Section 12.19.1, “Aggregate (GROUP BY) Function Descriptions” for information about \( \text{COUNT}(\text{expr}) \) behavior and related optimizations.

### 3.3.4.9 Using More Than One Table

The `pet` table keeps track of which pets you have. If you want to record other information about them, such as events in their lives like visits to the vet or when litters are born, you need another table. What should this table look like? It needs to contain the following information:

- The pet name so that you know which animal each event pertains to.
- A date so that you know when the event occurred.
- A field to describe the event.
- An event type field, if you want to be able to categorize events.

Given these considerations, the `CREATE TABLE` statement for the `event` table might look like this:

```sql
mysql> CREATE TABLE event (name VARCHAR(20), date DATE, type VARCHAR(15), remark VARCHAR(255));
```

As with the `pet` table, it is easiest to load the initial records by creating a tab-delimited text file containing the following information.

<table>
<thead>
<tr>
<th>name</th>
<th>date</th>
<th>type</th>
<th>remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>1995-05-15</td>
<td>litter</td>
<td>4 kittens, 3 female, 1 male</td>
</tr>
<tr>
<td>Buffy</td>
<td>1993-06-23</td>
<td>litter</td>
<td>5 puppies, 2 female, 3 male</td>
</tr>
<tr>
<td>Buffy</td>
<td>1994-06-19</td>
<td>litter</td>
<td>3 puppies, 3 female</td>
</tr>
<tr>
<td>Chirpy</td>
<td>1999-03-21</td>
<td>vet</td>
<td>needed beak straightened</td>
</tr>
<tr>
<td>Slim</td>
<td>1997-08-03</td>
<td>vet</td>
<td>broken rib</td>
</tr>
<tr>
<td>Bowser</td>
<td>1991-10-12</td>
<td>kennel</td>
<td></td>
</tr>
<tr>
<td>Fang</td>
<td>1991-10-12</td>
<td>kennel</td>
<td></td>
</tr>
<tr>
<td>Fang</td>
<td>1998-08-28</td>
<td>birthday</td>
<td>Gave him a new chew toy</td>
</tr>
<tr>
<td>Claws</td>
<td>1998-03-17</td>
<td>birthday</td>
<td>Gave him a new flea collar</td>
</tr>
<tr>
<td>Whistler</td>
<td>1998-12-09</td>
<td>birthday</td>
<td>First birthday</td>
</tr>
</tbody>
</table>

Load the records like this:

```sql
mysql> LOAD DATA LOCAL INFILE 'event.txt' INTO TABLE event;
```

Based on what you have learned from the queries that you have run on the `pet` table, you should be able to perform retrievals on the records in the `event` table; the principles are the same. But when is the `event` table by itself insufficient to answer questions you might ask?

Suppose that you want to find out the ages at which each pet had its litters. We saw earlier how to calculate ages from two dates. The litter date of the mother is in the `event` table, but to calculate her age on that date you need her birth date, which is stored in the `pet` table. This means the query requires both tables:
There are several things to note about this query:

- The `FROM` clause joins two tables because the query needs to pull information from both of them.

- When combining (joining) information from multiple tables, you need to specify how records in one table can be matched to records in the other. This is easy because they both have a `name` column. The query uses an `ON` clause to match up records in the two tables based on the `name` values.

The query uses an `INNER JOIN` to combine the tables. An `INNER JOIN` permits rows from either table to appear in the result if and only if both tables meet the conditions specified in the `ON` clause. In this example, the `ON` clause specifies that the `name` column in the `pet` table must match the `name` column in the `event` table. If a name appears in one table but not the other, the row will not appear in the result because the condition in the `ON` clause fails.

- Because the `name` column occurs in both tables, you must be specific about which table you mean when referring to the column. This is done by prepending the table name to the column name.

You need not have two different tables to perform a join. Sometimes it is useful to join a table to itself, if you want to compare records in a table to other records in that same table. For example, to find breeding pairs among your pets, you can join the `pet` table with itself to produce candidate pairs of live males and females of like species:

In this query, we specify aliases for the table name to refer to the columns and keep straight which instance of the table each column reference is associated with.

### 3.4 Getting Information About Databases and Tables

What if you forget the name of a database or table, or what the structure of a given table is (for example, what its columns are called)? MySQL addresses this problem through several statements that provide information about the databases and tables it supports.

You have previously seen `SHOW DATABASES`, which lists the databases managed by the server. To find out which database is currently selected, use the `DATABASE()` function:
If you have not yet selected any database, the result is `NULL`.

To find out what tables the default database contains (for example, when you are not sure about the name of a table), use this statement:

```
mysql> SHOW TABLES;
+---------------------+
| Tables_in_menagerie |
| event               |
| pet                 |
+---------------------+
```

The name of the column in the output produced by this statement is always `Tables_in_db_name`, where `db_name` is the name of the database. See Section 13.7.5.38, “SHOW TABLES Syntax”, for more information.

If you want to find out about the structure of a table, the `DESCRIBE` statement is useful; it displays information about each of a table's columns:

```
mysql> DESCRIBE pet;
+---------+-------------+------+-----+---------+-------+
| Field   | Type        | Null | Key | Default | Extra |
+---------+-------------+------+-----+---------+-------+
| name    | varchar(20) | YES  |     | NULL    |       |
| owner   | varchar(20) | YES  |     | NULL    |       |
| species | varchar(20) | YES  |     | NULL    |       |
| sex     | char(1)     | YES  |     | NULL    |       |
| birth   | date        | YES  |     | NULL    |       |
| death   | date        | YES  |     | NULL    |       |
+---------+-------------+------+-----+---------+-------+
```

`Field` indicates the column name, `Type` is the data type for the column, `NULL` indicates whether the column can contain `NULL` values, `Key` indicates whether the column is indexed, and `Default` specifies the column's default value. `Extra` displays special information about columns: If a column was created with the `AUTO_INCREMENT` option, the value will be `auto_increment` rather than empty.

DESC is a short form of `DESCRIBE`. See Section 13.8.1, “DESCRIBE Syntax”, for more information.

You can obtain the `CREATE TABLE` statement necessary to create an existing table using the `SHOW CREATE TABLE` statement. See Section 13.7.5.12, “SHOW CREATE TABLE Syntax”.

If you have indexes on a table, `SHOW INDEX FROM tbl_name` produces information about them. See Section 13.7.5.23, “SHOW INDEX Syntax”, for more about this statement.

### 3.5 Using mysql in Batch Mode

In the previous sections, you used `mysql` interactively to enter statements and view the results. You can also run `mysql` in batch mode. To do this, put the statements you want to run in a file, then tell `mysql` to read its input from the file:
Using mysql in Batch Mode

shell> mysql < batch-file

If you are running mysql under Windows and have some special characters in the file that cause problems, you can do this:

C: \> mysql -e "source batch-file"

If you need to specify connection parameters on the command line, the command might look like this:

shell> mysql -h host -u user -p < batch-file
Enter password: ********

When you use mysql this way, you are creating a script file, then executing the script.

If you want the script to continue even if some of the statements in it produce errors, you should use the --force command-line option.

Why use a script? Here are a few reasons:

• If you run a query repeatedly (say, every day or every week), making it a script enables you to avoid retyping it each time you execute it.

• You can generate new queries from existing ones that are similar by copying and editing script files.

• Batch mode can also be useful while you’re developing a query, particularly for multiple-line statements or multiple-statement sequences. If you make a mistake, you don’t have to retype everything. Just edit your script to correct the error, then tell mysql to execute it again.

• If you have a query that produces a lot of output, you can run the output through a pager rather than watching it scroll off the top of your screen:

shell> mysql < batch-file | more

• You can catch the output in a file for further processing:

shell> mysql < batch-file > mysql.out

• You can distribute your script to other people so that they can also run the statements.

• Some situations do not allow for interactive use, for example, when you run a query from a cron job. In this case, you must use batch mode.

The default output format is different (more concise) when you run mysql in batch mode than when you use it interactively. For example, the output of SELECT DISTINCT species FROM pet looks like this when mysql is run interactively:
Examples of Common Queries

In batch mode, the output looks like this instead:

```
species
  bird
  cat
  dog
  hamster
  snake
```

If you want to get the interactive output format in batch mode, use `mysql -t`. To echo to the output the statements that are executed, use `mysql -v`.

You can also use scripts from the `mysql` prompt by using the `source` command or `.` command:

```
mysql> source filename;
mysql> . filename
```

See Section 4.5.1.5, “Executing SQL Statements from a Text File”, for more information.

### 3.6 Examples of Common Queries

Here are examples of how to solve some common problems with MySQL.

Some of the examples use the table `shop` to hold the price of each article (item number) for certain traders (dealers). Supposing that each trader has a single fixed price per article, then `(article, dealer)` is a primary key for the records.

Start the command-line tool `mysql` and select a database:

```
shell> mysql your-database-name
```

To create and populate the example table, use these statements:

```
CREATE TABLE shop (  
  article INT UNSIGNED  DEFAULT '0000' NOT NULL,  
  dealer  CHAR(20)      DEFAULT ''     NOT NULL,  
  price   DECIMAL(16,2) DEFAULT '0.00' NOT NULL,  
  PRIMARY KEY(article, dealer));
```

```
INSERT INTO shop VALUES  
  (1,'A',3.45),(1,'B',3.99),(2,'A',10.99),(3,'B',1.45),  
  (3,'C',1.69),(3,'D',1.25),(4,'D',19.95);
```

After issuing the statements, the table should have the following contents:

```
SELECT * FROM shop ORDER BY article;
```

```
+---------+--------+-------+
<table>
<thead>
<tr>
<th>article</th>
<th>dealer</th>
<th>price</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A</td>
<td>3.45</td>
</tr>
<tr>
<td>1</td>
<td>B</td>
<td>3.99</td>
</tr>
<tr>
<td>2</td>
<td>A</td>
<td>10.99</td>
</tr>
<tr>
<td>3</td>
<td>B</td>
<td>1.45</td>
</tr>
<tr>
<td>3</td>
<td>C</td>
<td>1.69</td>
</tr>
<tr>
<td>3</td>
<td>D</td>
<td>1.25</td>
</tr>
<tr>
<td>4</td>
<td>D</td>
<td>19.95</td>
</tr>
</tbody>
</table>
+---------+--------+-------+```
3.6.1 The Maximum Value for a Column

“What is the highest item number?”

```sql
SELECT MAX(article) AS article FROM shop;
```

```
+---------+
| article |
+---------+
|       4 |
```

3.6.2 The Row Holding the Maximum of a Certain Column

*Task: Find the number, dealer, and price of the most expensive article.*

This is easily done with a subquery:

```sql
SELECT article, dealer, price
FROM shop
WHERE price=(SELECT MAX(price) FROM shop);
```

```
+---------+--------+-------+
| article | dealer | price |
+---------+--------+-------+
|    0004 | D      | 19.95 |
```

Other solutions are to use a **LEFT JOIN** or to sort all rows descending by price and get only the first row using the MySQL-specific **LIMIT** clause:

```sql
SELECT s1.article, s1.dealer, s1.price
FROM shop s1
LEFT JOIN shop s2 ON s1.price < s2.price
WHERE s2.article IS NULL;
```

```sql
SELECT article, dealer, price
FROM shop
ORDER BY price DESC
LIMIT 1;
```

**Note**

If there were several most expensive articles, each with a price of 19.95, the **LIMIT** solution would show only one of them.

3.6.3 Maximum of Column per Group

*Task: Find the highest price per article.*

```sql
SELECT article, MAX(price) AS price
FROM shop
GROUP BY article
ORDER BY price;
```

```
+---------+-------+
| article | price |
+---------+-------+
```
3.6.4 The Rows Holding the Group-wise Maximum of a Certain Column

**Task:** For each article, find the dealer or dealers with the most expensive price.

This problem can be solved with a subquery like this one:

```sql
SELECT article, dealer, price
FROM   shop s1
WHERE  price = (SELECT MAX(s2.price)
                 FROM shop s2
                 WHERE s1.article = s2.article)
ORDER BY article;
```

The preceding example uses a correlated subquery, which can be inefficient (see Section 13.2.10.7, “Correlated Subqueries”). Other possibilities for solving the problem are to use an uncorrelated subquery in the `FROM` clause or a `LEFT JOIN`.

**Uncorrelated subquery:**

```sql
SELECT s1.article, dealer, s1.price
FROM shop s1
JOIN (SELECT article, MAX(price) AS price
       FROM shop
       GROUP BY article) AS s2
     ON s1.article = s2.article AND s1.price = s2.price
ORDER BY article;
```

**LEFT JOIN:**

```sql
SELECT s1.article, s1.dealer, s1.price
FROM shop s1
LEFT JOIN shop s2 ON s1.article = s2.article AND s1.price < s2.price
WHERE s2.article IS NULL
ORDER BY s1.article;
```

The `LEFT JOIN` works on the basis that when `s1.price` is at its maximum value, there is no `s2.price` with a greater value and thus the corresponding `s2.article` value is `NULL`. See Section 13.2.9.2, “JOIN Syntax”.

### 3.6.5 Using User-Defined Variables

You can employ MySQL user variables to remember results without having to store them in temporary variables in the client. (See Section 9.4, “User-Defined Variables”.)
For example, to find the articles with the highest and lowest price you can do this:

```sql
mysql> SELECT @min_price:=MIN(price),@max_price:=MAX(price) FROM shop;
```  
```sql
mysql> SELECT * FROM shop WHERE price=@min_price OR price=@max_price;
```

<table>
<thead>
<tr>
<th>article</th>
<th>dealer</th>
<th>price</th>
</tr>
</thead>
<tbody>
<tr>
<td>0003</td>
<td>D</td>
<td>1.25</td>
</tr>
<tr>
<td>0004</td>
<td>D</td>
<td>19.95</td>
</tr>
</tbody>
</table>

**Note**

It is also possible to store the name of a database object such as a table or a column in a user variable and then to use this variable in an SQL statement; however, this requires the use of a prepared statement. See Section 13.5, “Prepared SQL Statement Syntax”, for more information.

### 3.6.6 Using Foreign Keys

In MySQL, InnoDB tables support checking of foreign key constraints. See Chapter 14, *The InnoDB Storage Engine*, and Section 1.7.2.3, “Foreign Key Differences”.

A foreign key constraint is not required merely to join two tables. For storage engines other than InnoDB, it is possible when defining a column to use a `REFERENCES tbl_name(col_name)` clause, which has no actual effect, and serves only as a memo or comment to you that the column which you are currently defining is intended to refer to a column in another table. It is extremely important to realize when using this syntax that:

- MySQL does not perform any sort of check to make sure that `col_name` actually exists in `tbl_name` (or even that `tbl_name` itself exists).

- MySQL does not perform any sort of action on `tbl_name` such as deleting rows in response to actions taken on rows in the table which you are defining; in other words, this syntax induces no `ON DELETE` or `ON UPDATE` behavior whatsoever. (Although you can write an `ON DELETE` or `ON UPDATE` clause as part of the `REFERENCES` clause, it is also ignored.)

- This syntax creates a column; it does **not** create any sort of index or key.

You can use a column so created as a join column, as shown here:

```sql
CREATE TABLE person (  
id SMALLINT UNSIGNED NOT NULL AUTO_INCREMENT,  
name CHAR(60) NOT NULL,  
PRIMARY KEY (id)  
);
CREATE TABLE shirt (  
id SMALLINT UNSIGNED NOT NULL AUTO_INCREMENT,  
style ENUM('t-shirt', 'polo', 'dress') NOT NULL,  
color ENUM('red', 'blue', 'orange', 'white', 'black') NOT NULL,  
owner SMALLINT UNSIGNED NOT NULL REFERENCES person(id),  
PRIMARY KEY (id)  
);
INSERT INTO person VALUES (NULL, 'Antonio Paz');
SELECT @last := LAST_INSERT_ID();
INSERT INTO shirt VALUES
```
Using Foreign Keys

```sql
(NULL, 'polo', 'blue', @last),
(NULL, 'dress', 'white', @last),
(NULL, 't-shirt', 'blue', @last);

INSERT INTO person VALUES (NULL, 'Lilliana Angelovska');

SELECT @last := LAST_INSERT_ID();

INSERT INTO shirt VALUES
(NULL, 'dress', 'orange', @last),
(NULL, 'polo', 'red', @last),
(NULL, 'dress', 'blue', @last),
(NULL, 't-shirt', 'white', @last);

SELECT * FROM person;
+----+---------------------+
| id | name                |
+----+---------------------+
|  1 | Antonio Paz         |
|  2 | Lilliana Angelovska |
+----+---------------------+

SELECT * FROM shirt;
+----+---------+--------+-------+
| id | style   | color  | owner |
+----+---------+--------+-------+
|  1 | polo    | blue   |     1 |
|  2 | dress   | white  |     1 |
|  3 | t-shirt | blue   |     1 |
|  4 | dress   | orange |     2 |
|  5 | polo    | red    |     2 |
|  6 | dress   | blue   |     2 |
|  7 | t-shirt | white  |     2 |
+----+---------+--------+-------+

SELECT s.* FROM person p INNER JOIN shirt s
  ON s.owner = p.id
WHERE p.name LIKE 'Lilliana%'
  AND s.color <> 'white';
+----+-------+--------+-------+
| id | style | color  | owner |
+----+-------+--------+-------+
|  4 | dress | orange |     2 |
|  5 | polo  | red    |     2 |
|  6 | dress | blue   |     2 |
+----+-------+--------+-------+

When used in this fashion, the REFERENCES clause is not displayed in the output of SHOW CREATE TABLE or DESCRIBE:

```
SHOW CREATE TABLE shirt\G
*************************** 1. row ***************************
Table: shirt
Create Table: CREATE TABLE `shirt` (  `id` smallint(5) unsigned NOT NULL auto_increment,  `style` enum('t-shirt','polo','dress') NOT NULL,  `color` enum('red','blue','orange','white','black') NOT NULL,  `owner` smallint(5) unsigned NOT NULL, PRIMARY KEY (`id`) ) ENGINE=MyISAM DEFAULT CHARSET=latin1
```

The use of REFERENCES in this way as a comment or "reminder" in a column definition works with MyISAM tables.
3.6.7 Searching on Two Keys

An OR using a single key is well optimized, as is the handling of AND.

The one tricky case is that of searching on two different keys combined with OR:

```sql
SELECT field1_index, field2_index FROM test_table
WHERE field1_index = '1' OR field2_index = '1'
```

This case is optimized. See Section 8.2.1.3, “Index Merge Optimization”.

You can also solve the problem efficiently by using a UNION that combines the output of two separate SELECT statements. See Section 13.2.9.3, “UNION Syntax”.

Each SELECT searches only one key and can be optimized:

```sql
SELECT field1_index, field2_index
FROM test_table WHERE field1_index = '1'
UNION
SELECT field1_index, field2_index
FROM test_table WHERE field2_index = '1';
```

3.6.8 Calculating Visits Per Day

The following example shows how you can use the bit group functions to calculate the number of days per month a user has visited a Web page.

```sql
CREATE TABLE t1 (year YEAR(4), month INT UNSIGNED,
               day INT UNSIGNED);
INSERT INTO t1 VALUES(2000,1,1),(2000,1,20),(2000,1,30),(2000,2,2),
                      (2000,2,23),(2000,2,23);
```

The example table contains year-month-day values representing visits by users to the page. To determine how many different days in each month these visits occur, use this query:

```sql
SELECT year,month,BIT_COUNT(BIT_OR(1<<day)) AS days FROM t1
GROUP BY year,month;
```

Which returns:

```
+-------+-------+------+
<table>
<thead>
<tr>
<th>year</th>
<th>month</th>
<th>days</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>2000</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>
+-------+-------+------+
```

The query calculates how many different days appear in the table for each year/month combination, with automatic removal of duplicate entries.

3.6.9 Using AUTO_INCREMENT

The AUTO_INCREMENT attribute can be used to generate a unique identity for new rows:
Using AUTO_INCREMENT

CREATE TABLE animals (  
id MEDIUMINT NOT NULL AUTO_INCREMENT,  
name CHAR(30) NOT NULL,  
PRIMARY KEY (id))
;

INSERT INTO animals (name) VALUES  ('dog'),  ('cat'),  ('penguin'),  ('lax'),  ('whale'),  ('ostrich');

SELECT * FROM animals;

Which returns:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>name</td>
</tr>
<tr>
<td>----</td>
<td>---------</td>
</tr>
<tr>
<td>1</td>
<td>dog</td>
</tr>
<tr>
<td>2</td>
<td>cat</td>
</tr>
<tr>
<td>3</td>
<td>penguin</td>
</tr>
<tr>
<td>4</td>
<td>lax</td>
</tr>
<tr>
<td>5</td>
<td>whale</td>
</tr>
<tr>
<td>6</td>
<td>ostrich</td>
</tr>
</tbody>
</table>

No value was specified for the AUTO_INCREMENT column, so MySQL assigned sequence numbers automatically. You can also explicitly assign 0 to the column to generate sequence numbers, unless the NO_AUTO_VALUE_ON_ZERO SQL mode is enabled. For example:

INSERT INTO animals (id,name) VALUES(0,'groundhog');

If the column is declared NOT NULL, it is also possible to assign NULL to the column to generate sequence numbers. For example:

INSERT INTO animals (id,name) VALUES(NULL,'squirrel');

When you insert any other value into an AUTO_INCREMENT column, the column is set to that value and the sequence is reset so that the next automatically generated value follows sequentially from the largest column value. For example:

INSERT INTO animals (id,name) VALUES(100,'rabbit');
INSERT INTO animals (id,name) VALUES(NULL,'mouse');
SELECT * FROM animals;

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>name</td>
</tr>
<tr>
<td>----</td>
<td>-----------</td>
</tr>
<tr>
<td>1</td>
<td>dog</td>
</tr>
<tr>
<td>2</td>
<td>cat</td>
</tr>
<tr>
<td>3</td>
<td>penguin</td>
</tr>
<tr>
<td>4</td>
<td>lax</td>
</tr>
<tr>
<td>5</td>
<td>whale</td>
</tr>
<tr>
<td>6</td>
<td>ostrich</td>
</tr>
<tr>
<td>7</td>
<td>groundhog</td>
</tr>
<tr>
<td>8</td>
<td>squirrel</td>
</tr>
<tr>
<td>100</td>
<td>rabbit</td>
</tr>
<tr>
<td>101</td>
<td>mouse</td>
</tr>
</tbody>
</table>

Updating an existing AUTO_INCREMENT column value in an InnoDB table does not reset the AUTO_INCREMENT sequence as it does for MyISAM and NDB tables.
You can retrieve the most recent automatically generated `AUTO_INCREMENT` value with the `LAST_INSERT_ID()` SQL function or the `mysql_insert_id()` C API function. These functions are connection-specific, so their return values are not affected by another connection which is also performing inserts.

Use the smallest integer data type for the `AUTO_INCREMENT` column that is large enough to hold the maximum sequence value you will need. When the column reaches the upper limit of the data type, the next attempt to generate a sequence number fails. Use the `UNSIGNED` attribute if possible to allow a greater range. For example, if you use `TINYINT`, the maximum permissible sequence number is 127. For `TINYINT UNSIGNED`, the maximum is 255. See Section 11.2.1, “Integer Types (Exact Value) - INTEGER, INT, SMALLINT, TINYINT, MEDIUMINT, BIGINT” for the ranges of all the integer types.

Note

For a multiple-row insert, `LAST_INSERT_ID()` and `mysql_insert_id()` actually return the `AUTO_INCREMENT` key from the first of the inserted rows. This enables multiple-row inserts to be reproduced correctly on other servers in a replication setup.

To start with an `AUTO_INCREMENT` value other than 1, set that value with `CREATE TABLE` or `ALTER TABLE`, like this:

```
mysql> ALTER TABLE tbl AUTO_INCREMENT = 100;
```

InnoDB Notes

For information about `AUTO_INCREMENT` usage specific to InnoDB, see Section 14.6.1.4, “AUTO_INCREMENT Handling in InnoDB”.

MyISAM Notes

- For MyISAM tables, you can specify `AUTO_INCREMENT` on a secondary column in a multiple-column index. In this case, the generated value for the `AUTO_INCREMENT` column is calculated as `MAX(auto_increment_column) + 1 WHERE prefix=given-prefix`. This is useful when you want to put data into ordered groups.

```
CREATE TABLE animals (  
grp ENUM('fish','mammal','bird') NOT NULL,  
id MEDIUMINT NOT NULL AUTO_INCREMENT,  
nname CHAR(30) NOT NULL,  
PRIMARY KEY (grp,id)  
) ENGINE=MyISAM;

INSERT INTO animals (grp,name) VALUES  
('mammal','dog'),('mammal','cat'),  
('bird','penguin'),('fish','lax'),('mammal','whale'),  
('bird','ostrich');

SELECT * FROM animals ORDER BY grp,id;
```

Which returns:

```
+--------+----+---------+  
| grp    | id | name    |  
+--------+----+---------+  
| fish   |  1 | lax     |  
| mammal |  1 | dog     |  
+--------+----+---------+
```
In this case (when the `AUTO_INCREMENT` column is part of a multiple-column index), `AUTO_INCREMENT` values are reused if you delete the row with the biggest `AUTO_INCREMENT` value in any group. This happens even for MyISAM tables, for which `AUTO_INCREMENT` values normally are not reused.

- If the `AUTO_INCREMENT` column is part of multiple indexes, MySQL generates sequence values using the index that begins with the `AUTO_INCREMENT` column, if there is one. For example, if the `animals` table contained indexes `PRIMARY KEY (grp, id)` and `INDEX (id)`, MySQL would ignore the `PRIMARY KEY` for generating sequence values. As a result, the table would contain a single sequence, not a sequence per `grp` value.

**Further Reading**

More information about `AUTO_INCREMENT` is available here:

- How to assign the `AUTO_INCREMENT` attribute to a column: Section 13.1.17, “CREATE TABLE Syntax”, and Section 13.1.7, “ALTER TABLE Syntax”.

- How `AUTO_INCREMENT` behaves depending on the `NO_AUTO_VALUE_ON_ZERO` SQL mode: Section 5.1.10, “Server SQL Modes”.

- How to use the `LAST_INSERT_ID()` function to find the row that contains the most recent `AUTO_INCREMENT` value: Section 12.15, “Information Functions”.

- Setting the `AUTO_INCREMENT` value to be used: Section 5.1.7, “Server System Variables”.

- Section 14.6.1.4, “AUTO_INCREMENT Handling in InnoDB”

- `AUTO_INCREMENT` and replication: Section 17.4.1.1, “Replication and AUTO_INCREMENT”.

- Server-system variables related to `AUTO_INCREMENT` (`auto_increment_increment` and `auto_increment_offset`) that can be used for replication: Section 5.1.7, “Server System Variables”.

### 3.7 Using MySQL with Apache

There are programs that let you authenticate your users from a MySQL database and also let you write your log files into a MySQL table.

You can change the Apache logging format to be easily readable by MySQL by putting the following into the Apache configuration file:

```plaintext
LogFormat "\"%h\",%{%Y%m%d%H%M%S}t,%>s,"%b","%{Content-Type}o", \n%{User-Agent}i","%{Referer}i""
```

To load a log file in that format into MySQL, you can use a statement something like this:

```plaintext
LOAD DATA INFILE '/local/access_log' INTO TABLE tbl_name
FIELDS TERMINATED BY ',' OPTIONALLY ENCLOSED BY '"' ESCAPED BY '\'
```

The named table should be created to have columns that correspond to those that the `LogFormat` line writes to the log file.

This chapter provides a brief overview of the MySQL command-line programs provided by Oracle Corporation. It also discusses the general syntax for specifying options when you run these programs. Most programs have options that are specific to their own operation, but the option syntax is similar for all of them. Finally, the chapter provides more detailed descriptions of individual programs, including which options they recognize.

### 4.1 Overview of MySQL Programs

There are many different programs in a MySQL installation. This section provides a brief overview of them. Later sections provide a more detailed description of each one, with the exception of NDB Cluster programs. Each program's description indicates its invocation syntax and the options that it supports. Section 18.4, “NDB Cluster Programs”, describes programs specific to NDB Cluster.

Most MySQL distributions include all of these programs, except for those programs that are platform-specific. (For example, the server startup scripts are not used on Windows.) The exception is that RPM distributions are more specialized. There is one RPM for the server, another for client programs, and so forth. If you appear to be missing one or more programs, see Chapter 2, *Installing and Upgrading MySQL*, for information on types of distributions and what they contain. It may be that you have a distribution that does not include all programs and you need to install an additional package.

Each MySQL program takes many different options. Most programs provide a `--help` option that you can use to get a description of the program's different options. For example, try `mysql --help`.

You can override default option values for MySQL programs by specifying options on the command line or in an option file. See Section 4.2, “Using MySQL Programs”, for general information on invoking programs and specifying program options.

The MySQL server, `mysqld`, is the main program that does most of the work in a MySQL installation. The server is accompanied by several related scripts that assist you in starting and stopping the server:

- **mysqld**
  The SQL daemon (that is, the MySQL server). To use client programs, `mysqld` must be running, because clients gain access to databases by connecting to the server. See Section 4.3.1, "mysqld — The MySQL Server".

- **mysqld_safe**
  A server startup script. `mysqld_safe` attempts to start `mysqld`. See Section 4.3.2, "mysqld_safe — MySQL Server Startup Script".

- **mysql.server**
  A server startup script. This script is used on systems that use System V-style run directories containing scripts that start system services for particular run levels. It invokes `mysqld_safe` to start the MySQL server. See Section 4.3.3, "mysql.server — MySQL Server Startup Script".

- **mysqld_multi**
Overview of MySQL Programs

A server startup script that can start or stop multiple servers installed on the system. See Section 4.3.4, "mysqld_multi — Manage Multiple MySQL Servers".

Several programs perform setup operations during MySQL installation or upgrading:

- **comp_err**
  This program is used during the MySQL build/installation process. It compiles error message files from the error source files. See Section 4.4.1, "comp_err — Compile MySQL Error Message File".

- **mysql_install_db**
  This program initializes the MySQL data directory, creates the mysql database and initializes its grant tables with default privileges, and sets up the InnoDB system tablespace. It is usually executed only once, when first installing MySQL on a system. See Section 4.4.3, "mysql_install_db — Initialize MySQL Data Directory", and Section 2.10, "Postinstallation Setup and Testing".

- **mysql_plugin**
  This program configures MySQL server plugins. See Section 4.4.4, "mysql_plugin — Configure MySQL Server Plugins".

- **mysql_secure_installation**
  This program enables you to improve the security of your MySQL installation. See Section 4.4.5, "mysql_secure_installation — Improve MySQL Installation Security".

- **mysql_tzinfo_to_sql**
  This program loads the time zone tables in the mysql database using the contents of the host system zoneinfo database (the set of files describing time zones). See Section 4.4.6, "mysql_tzinfo_to_sql — Load the Time Zone Tables".

- **mysql_upgrade**
  This program is used after a MySQL upgrade operation. It updates the grant tables with any changes that have been made in newer versions of MySQL, and checks tables for incompatibilities and repairs them if necessary. See Section 4.4.7, "mysql_upgrade — Check and Upgrade MySQL Tables".

MySQL client programs that connect to the MySQL server:

- **mysql**
  The command-line tool for interactively entering SQL statements or executing them from a file in batch mode. See Section 4.5.1, "mysql — The MySQL Command-Line Client".

- **mysqladmin**
  A client that performs administrative operations, such as creating or dropping databases, reloading the grant tables, flushing tables to disk, and reopening log files. mysqladmin can also be used to retrieve version, process, and status information from the server. See Section 4.5.2, "mysqladmin — Client for Administering a MySQL Server".

- **mysqlcheck**
  A table-maintenance client that checks, repairs, analyzes, and optimizes tables. See Section 4.5.3, "mysqlcheck — A Table Maintenance Program".
• **mysqldump**
  A client that dumps a MySQL database into a file as SQL, text, or XML. See Section 4.5.4, “mysqldump — A Database Backup Program”.

• **mysqlimport**
  A client that imports text files into their respective tables using **LOAD DATA**. See Section 4.5.5, “mysqlimport — A Data Import Program”.

• **mysqlshow**
  A client that displays information about databases, tables, columns, and indexes. See Section 4.5.6, “mysqlshow — Display Database, Table, and Column Information”.

• **mysqlslap**
  A client that is designed to emulate client load for a MySQL server and report the timing of each stage. It works as if multiple clients are accessing the server. See Section 4.5.7, “mysqlslap — Load Emulation Client”.

MySQL administrative and utility programs:

• **innochecksum**
  An offline InnoDB offline file checksum utility. See Section 4.6.1, “innochecksum — Offline InnoDB File Checksum Utility”.

• **myisam_ftdump**
  A utility that displays information about full-text indexes in MyISAM tables. See Section 4.6.2, “myisam_ftdump — Display Full-Text Index information”.

• **myisamchk**
  A utility to describe, check, optimize, and repair MyISAM tables. See Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”.

• **myisamlog**
  A utility that processes the contents of a MyISAM log file. See Section 4.6.4, “myisamlog — Display MyISAM Log File Contents”.

• **myisampack**
  A utility that compresses MyISAM tables to produce smaller read-only tables. See Section 4.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”.

• **mysql_config_editor**
  A utility that enables you to store authentication credentials in a secure, encrypted login path file named .mylogin.cnf. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.

• **mysqlaccess**
  A script that checks the access privileges for a host name, user name, and database combination. See Section 4.6.7, “mysqlaccess — Client for Checking Access Privileges”.

• **mysqlbinlog**
Overview of MySQL Programs

A utility for reading statements from a binary log. The log of executed statements contained in the binary log files can be used to help recover from a crash. See Section 4.6.8, “mysqlbinlog — Utility for Processing Binary Log Files”.

- mysqldumpslow

A utility to read and summarize the contents of a slow query log. See Section 4.6.9, “mysqldumpslow — Summarize Slow Query Log Files”.

- mysqlhotcopy

A utility that quickly makes backups of MyISAM tables while the server is running. See Section 4.6.10, “mysqlhotcopy — A Database Backup Program”.

- mysql_convert_table_format

A utility that converts tables in a database to use a given storage engine. See Section 4.6.11, “mysql_convert_table_format — Convert Tables to Use a Given Storage Engine”.

- mysql_find_rows

A utility that reads files containing SQL statements (such as update logs) and extracts statements that match a given regular expression. See Section 4.6.12, “mysql_find_rows — Extract SQL Statements from Files”.

- mysql_fix_extensions

A utility that converts the extensions for MyISAM table files to lowercase. This can be useful after transferring the files from a system with case-insensitive file names to a system with case-sensitive file names. See Section 4.6.13, “mysql_fix_extensions — Normalize Table File Name Extensions”.

- mysql_setpermission

A utility for interactively setting permissions in the MySQL grant tables. See Section 4.6.14, “mysql_setpermission — Interactively Set Permissions in Grant Tables”.

- mysql_waitpid

A utility that kills the process with a given process ID. See Section 4.6.15, “mysql_waitpid — Kill Process and Wait for Its Termination”.

- mysql_zap

A utility that kills processes that match a pattern. See Section 4.6.16, “mysql_zap — Kill Processes That Match a Pattern”.

MySQL program-development utilities:

- msql2mysql

A shell script that converts mSQL programs to MySQL. It doesn’t handle every case, but it gives a good start when converting. See Section 4.7.1, “msql2mysql — Convert mSQL Programs for Use with MySQL”.

- mysql_config

A shell script that produces the option values needed when compiling MySQL programs. See Section 4.7.2, “mysql_config — Display Options for Compiling Clients”.

Using MySQL Programs

- **my_print_defaults**
  A utility that shows which options are present in option groups of option files. See Section 4.7.3, "my_print_defaults — Display Options from Option Files".

- **resolve_stack_dump**
  A utility program that resolves a numeric stack trace dump to symbols. See Section 4.7.4, "resolve_stack_dump — Resolve Numeric Stack Trace Dump to Symbols".

Miscellaneous utilities:

- **perror**
  A utility that displays the meaning of system or MySQL error codes. See Section 4.8.1, "perror — Display MySQL Error Message Information".

- **replace**
  A utility program that performs string replacement in the input text. See Section 4.8.2, "replace — A String-Replacement Utility".

- **resolveip**
  A utility program that resolves a host name to an IP address or vice versa. See Section 4.8.3, "resolveip — Resolve Host name to IP Address or Vice Versa".

Oracle Corporation also provides the MySQL Workbench GUI tool, which is used to administer MySQL servers and databases, to create, execute, and evaluate queries, and to migrate schemas and data from other relational database management systems for use with MySQL. Additional GUI tools include MySQL Notifier and MySQL for Excel.

MySQL client programs that communicate with the server using the MySQL client/server library use the following environment variables.

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>MYSQL_UNIX_PORT</td>
<td>The default Unix socket file; used for connections to localhost</td>
</tr>
<tr>
<td>MYSQL_TCP_PORT</td>
<td>The default port number; used for TCP/IP connections</td>
</tr>
<tr>
<td>MYSQL_PWD</td>
<td>The default password</td>
</tr>
<tr>
<td>MYSQL_DEBUG</td>
<td>Debug trace options when debugging</td>
</tr>
<tr>
<td>TMPDIR</td>
<td>The directory where temporary tables and files are created</td>
</tr>
</tbody>
</table>

For a full list of environment variables used by MySQL programs, see Section 4.9, "MySQL Environment Variables".

Use of **MYSQL_PWD** is insecure. See Section 4.1.2.1, "End-User Guidelines for Password Security".

### 4.2 Using MySQL Programs

#### 4.2.1 Invoking MySQL Programs

To invoke a MySQL program from the command line (that is, from your shell or command prompt), enter the program name followed by any options or other arguments needed to instruct the program what you want it to do. The following commands show some sample program invocations. **shell>** represents the prompt for your command interpreter; it is not part of what you type. The particular prompt you see
depends on your command interpreter. Typical prompts are $ for sh, ksh, or bash, % for csh or tcsh, and C:\> for the Windows command.com or cmd.exe command interpreters.

| shell> mysql --user=root test |
| shell> mysqladmin extended-status variables |
| shell> mysqlshow --help |
| shell> mysqldump -u root personnel |

Arguments that begin with a single or double dash (-, --) specify program options. Options typically indicate the type of connection a program should make to the server or affect its operational mode. Option syntax is described in Section 4.2.2, “Specifying Program Options”.

Nonoption arguments (arguments with no leading dash) provide additional information to the program. For example, the mysql program interprets the first nonoption argument as a database name, so the command mysql --user=root test indicates that you want to use the test database.

Later sections that describe individual programs indicate which options a program supports and describe the meaning of any additional nonoption arguments.

Some options are common to a number of programs. The most frequently used of these are the --host (or -h), --user (or -u), and --password (or -p) options that specify connection parameters. They indicate the host where the MySQL server is running, and the user name and password of your MySQL account. All MySQL client programs understand these options; they enable you to specify which server to connect to and the account to use on that server. Other connection options are --port (or -P) to specify a TCP/IP port number and --socket (or -S) to specify a Unix socket file on Unix (or named-pipe name on Windows). For more information on options that specify connection options, see Section 4.2.4, “Connecting to the MySQL Server Using Command Options”.

You may find it necessary to invoke MySQL programs using the path name to the bin directory in which they are installed. This is likely to be the case if you get a “program not found” error whenever you attempt to run a MySQL program from any directory other than the bin directory. To make it more convenient to use MySQL, you can add the path name of the bin directory to your PATH environment variable setting. That enables you to run a program by typing only its name, not its entire path name. For example, if mysql is installed in /usr/local/mysql/bin, you can run the program by invoking it as mysql, and it is not necessary to invoke it as /usr/local/mysql/bin/mysql.

Consult the documentation for your command interpreter for instructions on setting your PATH variable. The syntax for setting environment variables is interpreter-specific. (Some information is given in Section 4.2.6, “Setting Environment Variables”.) After modifying your PATH setting, open a new console window on Windows or log in again on Unix so that the setting goes into effect.

### 4.2.2 Specifying Program Options

There are several ways to specify options for MySQL programs:

- List the options on the command line following the program name. This is common for options that apply to a specific invocation of the program.

- List the options in an option file that the program reads when it starts. This is common for options that you want the program to use each time it runs.

- List the options in environment variables (see Section 4.2.6, “Setting Environment Variables”). This method is useful for options that you want to apply each time the program runs. In practice, option files are used more commonly for this purpose, but Section 5.7.3, “Running Multiple MySQL Instances on Unix”, discusses one situation in which environment variables can be very helpful. It describes a handy technique that uses such variables to specify the TCP/IP port number and Unix socket file for the server and for client programs.
Options are processed in order, so if an option is specified multiple times, the last occurrence takes precedence. The following command causes `mysql` to connect to the server running on `localhost`:

```
mysql -h example.com -h localhost
```

There is one exception: For `mysqld`, the first instance of the `--user` option is used as a security precaution, to prevent a user specified in an option file from being overridden on the command line.

If conflicting or related options are given, later options take precedence over earlier options. The following command runs `mysql` in "no column names" mode:

```
mysql --column-names --skip-column-names
```

MySQL programs determine which options are given first by examining environment variables, then by processing option files, and then by checking the command line. Because later options take precedence over earlier ones, the processing order means that environment variables have the lowest precedence and command-line options the highest.

You can take advantage of the way that MySQL programs process options by specifying default option values for a program in an option file. That enables you to avoid typing them each time you run the program while enabling you to override the defaults if necessary by using command-line options.

An option can be specified by writing it in full or as any unambiguous prefix. For example, the `--compress` option can be given to `mysqldump` as `--compr`, but not as `--comp` because the latter is ambiguous:

```
shell> mysqldump --comp
mysqldump: ambiguous option '--comp' (compatible, compress)
```

Be aware that the use of option prefixes can cause problems in the event that new options are implemented for a program. A prefix that is unambiguous now might become ambiguous in the future.

**Note**

As of MySQL 5.6.13, unambiguous prefixes are deprecated. If an unambiguous prefix is given, a warning occurs to provide feedback. Option prefixes are no longer supported as of MySQL 5.7; only full options are accepted.

### 4.2.2.1 Using Options on the Command Line

Program options specified on the command line follow these rules:

- Options are given after the command name.
- An option argument begins with one dash or two dashes, depending on whether it is a short form or long form of the option name. Many options have both short and long forms. For example, `--?` and `--help` are the short and long forms of the option that instructs a MySQL program to display its help message.
- Option names are case-sensitive. `-v` and `--v` are both legal and have different meanings. (They are the corresponding short forms of the `--verbose` and `--version` options.)
- Some options take a value following the option name. For example, `--host=localhost` indicates the MySQL server host to a client program. The option value tells the program the name of the host where the MySQL server is running.
- For a long option that takes a value, separate the option name and the value by an `=` sign. For a short option that takes a value, the option value can immediately follow the option letter, or there can be a space between: `--h=localhost` and `--h localhost` are equivalent. An exception to this
rule is the option for specifying your MySQL password. This option can be given in long form as `--password=pass_val` or as `--password`. In the latter case (with no password value given), the program interactively prompts you for the password. The password option also may be given in short form as `-p pass_val` or as `-p`. However, for the short form, if the password value is given, it must follow the option letter with no intervening space: If a space follows the option letter, the program has no way to tell whether a following argument is supposed to be the password value or some other kind of argument. Consequently, the following two commands have two completely different meanings:

```
mysql -ptest
mysql -p test
```

The first command instructs `mysql` to use a password value of `test`, but specifies no default database. The second instructs `mysql` to prompt for the password value and to use `test` as the default database.

- Within option names, dash (--) and underscore (_) may be used interchangeably. For example, `--skip-grant-tables` and `--skip_grant_tables` are equivalent. (However, the leading dashes cannot be given as underscores.)

- The MySQL server has certain command options that may be specified only at startup, and a set of system variables, some of which may be set at startup, at runtime, or both. System variable names use underscores rather than dashes, and when referenced at runtime (for example, using `SET` or `SELECT` statements), must be written using underscores:

```
SET GLOBAL general_log = ON;
SELECT @@GLOBAL.general_log;
```

At server startup, the syntax for system variables is the same as for command options, so within variable names, dashes and underscores may be used interchangeably. For example, `--general_log=ON` and `--general-log=ON` are equivalent. (This is also true for system variables set within option files.)

- For options that take a numeric value, the value can be given with a suffix of `K`, `M`, or `G` (either uppercase or lowercase) to indicate a multiplier of 1024, $1024^2$ or $1024^3$. For example, the following command tells `mysqladmin` to ping the server 1024 times, sleeping 10 seconds between each ping:

```
mysqladmin --count=1K --sleep=10 ping
```

- When specifying file names as option values, avoid the use of the `~` shell metacharacter. It might not be interpreted as you expect.

Option values that contain spaces must be quoted when given on the command line. For example, the `--execute` (or `-e`) option can be used with `mysql` to pass one or more semicolon-separated SQL statements to the server. When this option is used, `mysql` executes the statements in the option value and exits. The statements must be enclosed by quotation marks. For example:

```
shell> mysql -u root -p -e "SELECT VERSION();SELECT NOW()"
Enter password: *****
+------------+
<table>
<thead>
<tr>
<th>VERSION()</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.6.47</td>
</tr>
</tbody>
</table>
+------------+
+---------------------+
<table>
<thead>
<tr>
<th>NOW()</th>
</tr>
</thead>
<tbody>
<tr>
<td>2019-09-03 10:36:01</td>
</tr>
</tbody>
</table>
+---------------------+
shell>
```
Specifying Program Options

Note
The long form (--execute) is followed by an equal sign (=).

To use quoted values within a statement, you must either escape the inner quotation marks, or use a different type of quotation marks within the statement from those used to quote the statement itself. The capabilities of your command processor dictate your choices for whether you can use single or double quotation marks and the syntax for escaping quote characters. For example, if your command processor supports quoting with single or double quotation marks, you can use double quotation marks around the statement, and single quotation marks for any quoted values within the statement.

4.2.2.2 Using Option Files

Most MySQL programs can read startup options from option files (sometimes called configuration files). Option files provide a convenient way to specify commonly used options so that they need not be entered on the command line each time you run a program.

To determine whether a program reads option files, invoke it with the --help option. (For mysql, use --verbose and --help.) If the program reads option files, the help message indicates which files it looks for and which option groups it recognizes.

Note
A MySQL program started with the --no-defaults option reads no option files other than .mylogin.cnf.

Many option files are plain text files, created using any text editor. The exception is the .mylogin.cnf file that contains login path options. This is an encrypted file created by the mysql_config_editor utility. See Section 4.6.6, "mysql_config_editor — MySQL Configuration Utility". A “login path” is an option group that permits only certain options: host, user, password, port and socket. Client programs specify which login path to read from .mylogin.cnf using the --login-path option.

To specify an alternative login path file name, set the MYSQL_TEST_LOGIN_FILE environment variable. This variable is used by the mysql-test-run.pl testing utility, but also is recognized by mysql_config_editor and by MySQL clients such as mysql, mysqladmin, and so forth.

MySQL looks for option files in the order described in the following discussion and reads any that exist. If an option file you want to use does not exist, create it using the appropriate method, as just discussed.

Note
For information about option files used with NDB Cluster programs, see Section 18.3, “Configuration of NDB Cluster”.

On Windows, MySQL programs read startup options from the files shown in the following table, in the specified order (files listed first are read first, files read later take precedence).

Table 4.1 Option Files Read on Windows Systems

<table>
<thead>
<tr>
<th>File Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>%WINDIR%\my.ini,%WINDIR%\my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>C:\my.ini,C:\my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>BASEDIR\my.ini, BASEDIR\my.cnf</td>
<td>Global options</td>
</tr>
</tbody>
</table>
Specifying Program Options

<table>
<thead>
<tr>
<th>File Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaults-extra-file</td>
<td>The file specified with <code>--defaults-extra-file</code>, if any</td>
</tr>
<tr>
<td>%APPDATA%\MySQL .mylogin.cnf</td>
<td>Login path options (clients only)</td>
</tr>
</tbody>
</table>

- Option File Processing Order
- Option File Syntax
- Option File Inclusions

Option File Processing Order

In the preceding table, `%WINDIR%` represents the location of your Windows directory. This is commonly `C:\WINDOWS`. Use the following command to determine its exact location from the value of the `WINDIR` environment variable:

```
C:\> echo %WINDIR%
```

`%APPDATA%` represents the value of the Windows application data directory. Use the following command to determine its exact location from the value of the `APPDATA` environment variable:

```
C:\> echo %APPDATA%
```

`BASEDIR` represents the MySQL base installation directory. When MySQL 5.6 has been installed using MySQL Installer, this is typically `C:\PROGRAMDIR\MySQL\MySQL 5.6 Server` where `PROGRAMDIR` represents the programs directory (usually Program Files on English-language versions of Windows), See Section 2.3.3, “MySQL Installer for Windows”.

On Unix and Unix-like systems, MySQL programs read startup options from the files shown in the following table, in the specified order (files listed first are read first, files read later take precedence).

Note
On Unix platforms, MySQL ignores configuration files that are world-writable. This is intentional as a security measure.

Table 4.2 Option Files Read on Unix and Unix-Like Systems

<table>
<thead>
<tr>
<th>File Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc/my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>/etc/mysql/my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>SYSCONFDIR/my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>$MYSQL_HOME/my.cnf</td>
<td>Server-specific options (server only)</td>
</tr>
<tr>
<td>defaults-extra-file</td>
<td>The file specified with <code>--defaults-extra-file</code>, if any</td>
</tr>
<tr>
<td>~/.my.cnf</td>
<td>User-specific options</td>
</tr>
<tr>
<td>~/.mylogin.cnf</td>
<td>User-specific login path options (clients only)</td>
</tr>
</tbody>
</table>

In the preceding table, `~` represents the current user’s home directory (the value of `$HOME`).

`SYSCONFDIR` represents the directory specified with the `SYSCONFDIR` option to `CMake` when MySQL was built. By default, this is the `etc` directory located under the compiled-in installation directory.
**Specifying Program Options**

`MYSQL_HOME` is an environment variable containing the path to the directory in which the server-specific `my.cnf` file resides. If `MYSQL_HOME` is not set and you start the server using the `mysqld_safe` program, `mysqld_safe` attempts to set `MYSQL_HOME` as follows:

- Let `BASEDIR` and `DATADIR` represent the path names of the MySQL base directory and data directory, respectively.
- If there is a `my.cnf` file in `DATADIR` but not in `BASEDIR`, `mysqld_safe` sets `MYSQL_HOME` to `DATADIR`.
- Otherwise, if `MYSQL_HOME` is not set and there is no `my.cnf` file in `DATADIR`, `mysqld_safe` sets `MYSQL_HOME` to `BASEDIR`.

In MySQL 5.6, use of `DATADIR` as the location for `my.cnf` is deprecated.

`DATADIR` is commonly `/usr/local/mysql/data`, although this can vary per platform or installation method. The value is the data directory location built in when MySQL was compiled, not the location specified with the `--datadir` option when `mysqld` starts. Use of `--datadir` at runtime has no effect on where the server looks for option files that it reads before processing any options.

If multiple instances of a given option are found, the last instance takes precedence, with one exception: For `mysqld`, the first instance of the `--user` option is used as a security precaution, to prevent a user specified in an option file from being overridden on the command line.

### Option File Syntax

The following description of option file syntax applies to files that you edit manually. This excludes `.mylogin.cnf`, which is created using `mysql_config_editor` and is encrypted.

Any long option that may be given on the command line when running a MySQL program can be given in an option file as well. To get the list of available options for a program, run it with the `--help` option. (For `mysqld`, use `--verbose` and `--help`.)

The syntax for specifying options in an option file is similar to command-line syntax (see Section 4.2.2.1, “Using Options on the Command Line”). However, in an option file, you omit the leading two dashes from the option name and you specify only one option per line. For example, `--quick` and `--host=localhost` on the command line should be specified as `quick` and `host=localhost` on separate lines in an option file. To specify an option of the form `--loose-opt_name` in an option file, write it as `loose-opt_name`.

Empty lines in option files are ignored. Nonempty lines can take any of the following forms:

- `#comment, ;comment`
  
  Comment lines start with `#` or `;`. A `#` comment can start in the middle of a line as well.

- `[group]`
  
  `group` is the name of the program or group for which you want to set options. After a group line, any option-setting lines apply to the named group until the end of the option file or another group line is given. Option group names are not case-sensitive.

- `opt_name`
  
  This is equivalent to `--opt_name` on the command line.

- `opt_name=value`
  
  This is equivalent to `--opt_name=value` on the command line. In an option file, you can have spaces around the `=` character, something that is not true on the command line. The value optionally can be
Specifying Program Options

enclosed within single quotation marks or double quotation marks, which is useful if the value contains a comment character.

Leading and trailing spaces are automatically deleted from option names and values.

You can use the escape sequences \b, \t, \n, \r, \, and \s in option values to represent the backspace, tab, newline, carriage return, backslash, and space characters. In option files, these escaping rules apply:

- A backslash followed by a valid escape sequence character is converted to the character represented by the sequence. For example, \s is converted to a space.
- A backslash not followed by a valid escape sequence character remains unchanged. For example, \s is retained as is.

The preceding rules mean that a literal backslash can be given as \, or as if it is not followed by a valid escape sequence character.

The rules for escape sequences in option files differ slightly from the rules for escape sequences in string literals in SQL statements. In the latter context, if “x” is not a valid escape sequence character, \x becomes “x” rather than \x. See Section 9.1.1, “String Literals”.

The escaping rules for option file values are especially pertinent for Windows path names, which use \ as a path name separator. A separator in a Windows path name must be written as \ if it is followed by an escape sequence character. It can be written as \ or \ if it is not. Alternatively, / may be used in Windows path names and will be treated as .. Suppose that you want to specify a base directory of C:\Program Files\MySQL\MySQL Server 5.6 in an option file. This can be done several ways. Some examples:

```plaintext
basedir="C:\Program Files\MySQL\MySQL Server 5.6"
basedir="C:\\Program Files\\MySQL\\MySQL Server 5.6"
basedir="C:\Program Files\MySQL\MySQL Server 5.6"
basedir=C:\\Program\sFiles\\MySQL\\MySQL\sServer\s5.6
```

If an option group name is the same as a program name, options in the group apply specifically to that program. For example, the [mysqld] and [mysql] groups apply to the mysqld server and the mysql client program, respectively.

The [client] option group is read by all client programs provided in MySQL distributions (but not by mysqld). To understand how third-party client programs that use the C API can use option files, see the C API documentation at Section 23.8.7.49, “mysql_options()”.

The [client] group enables you to specify options that apply to all clients. For example, [client] is the appropriate group to use to specify the password for connecting to the server. (But make sure that the option file is accessible only by yourself, so that other people cannot discover your password.) Be sure not to put an option in the [client] group unless it is recognized by all client programs that you use. Programs that do not understand the option quit after displaying an error message if you try to run them.

List more general option groups first and more specific groups later. For example, a [client] group is more general because it is read by all client programs, whereas a [mysqldump] group is read only by mysqldump. Options specified later override options specified earlier, so putting the option groups in the order [client], [mysqldump] enables mysqldump-specific options to override [client] options.

Here is a typical global option file:

```plaintext
[client]
port=3306
socket=/tmp/mysql.sock
```
Specifying Program Options

[mysqld]
port=3306
socket=/tmp/mysql.sock
key_buffer_size=16M
max_allowed_packet=8M

[mysqldump]
quick

Here is a typical user option file:

[client]
# The following password will be sent to all standard MySQL clients
password="my password"

[mysql]
no-auto-rehash
connect_timeout=2

[mysqlhotcopy]
interactive-timeout

To create option groups to be read only by mysqld servers from specific MySQL release series, use groups with names of [mysqld-5.5], [mysqld-5.6], and so forth. The following group indicates that the sql_mode setting should be used only by MySQL servers with 5.6.x version numbers:

[mysqld-5.6]
sql_mode=TRADITIONAL

Option File Inclusions

It is possible to use !include directives in option files to include other option files and !includedir to search specific directories for option files. For example, to include the /home/mydir/myopt.cnf file, use the following directive:

!include /home/mydir/myopt.cnf

To search the /home/mydir directory and read option files found there, use this directive:

!includedir /home/mydir

MySQL makes no guarantee about the order in which option files in the directory are read.

Note

Any files to be found and included using the !includedir directive on Unix operating systems must have file names ending in .cnf. On Windows, this directive checks for files with the .ini or .cnf extension.

Write the contents of an included option file like any other option file. That is, it should contain groups of options, each preceded by a [group] line that indicates the program to which the options apply.

While an included file is being processed, only those options in groups that the current program is looking for are used. Other groups are ignored. Suppose that a my.cnf file contains this line:

!include /home/mydir/myopt.cnf

And suppose that /home/mydir/myopt.cnf looks like this:
Specifying Program Options

[mysqladmin]
force

[mysqld]
key_buffer_size=16M

If `my.cnf` is processed by `mysqld`, only the `[mysqld]` group in `/home/mydir/myopt.cnf` is used. If the file is processed by `mysqladmin`, only the `[mysqladmin]` group is used. If the file is processed by any other program, no options in `/home/mydir/myopt.cnf` are used.

The `!includedir` directive is processed similarly except that all option files in the named directory are read.

If an option file contains `!include` or `!includedir` directives, files named by those directives are processed whenever the option file is processed, no matter where they appear in the file.

For inclusion directives to work, the file path should not be specified within quotes and should have no escape sequences. For example, the following statements provided in `my.ini` will read the option file `myopts.ini`:

```ini
!include C:/ProgramData/MySQL/MySQL Server/myopts.ini
!include C:\ProgramData\MySQL\MySQL Server\myopts.ini
!include C:\\ProgramData\\MySQL\\MySQL Server\\myopts.ini
```

On Windows, if `!include /path/to/extra.ini` is the last line in the file, make sure that a newline is appended at the end or the line will be ignored.

### 4.2.2.3 Command-Line Options that Affect Option-File Handling

Most MySQL programs that support option files handle the following options. Because these options affect option-file handling, they must be given on the command line and not in an option file. To work properly, each of these options must be given before other options, with these exceptions:

- `--print-defaults` may be used immediately after `--defaults-file`, `--defaults-extra-file`, or `--login-path`.

- On Windows, if the server is started with the `--defaults-file` and `--install` options, `--install` must be first. See Section 2.3.4.7, “Starting MySQL as a Windows Service”.

When specifying file names as option values, avoid the use of the `~` shell metacharacter because it might not be interpreted as you expect.

- `--defaults-extra-file=file_name`

Read this option file after the global option file but (on Unix) before the user option file and (on all platforms) before the login path file. (For information about the order in which option files are used, see Section 4.2.2.2, “Using Option Files”.) If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

See the introduction to this section regarding constraints on the position in which this option may be specified.

- `--defaults-file=file_name`

Read only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.
Specifying Program Options

Exception: Even with `--defaults-file`, client programs read `.mylogin.cnf`.

See the introduction to this section regarding constraints on the position in which this option may be specified.

- `--defaults-group-suffix=str`

Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, the `mysql` client normally reads the `[client]` and `[mysql]` groups. If the `--defaults-group-suffix=_other` option is given, `mysql` also reads the `[client_other]` and `[mysql_other]` groups.

- `--login-path=name`

Read options from the named login path in the `.mylogin.cnf` login path file. A “login path” is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the `mysql_config_editor` utility. See Section 4.6.6, "mysql_config_editor — MySQL Configuration Utility".

A client program reads the option group corresponding to the named login path, in addition to option groups that the program reads by default. Consider this command:

```
mysql --login-path=mypath
```

By default, the `mysql` client reads the `[client]` and `[mysql]` option groups. So for the command shown, `mysql` reads `[client]` and `[mysql]` from other option files, and `[client]`, `[mysql]`, and `[mypath]` from the login path file.

Client programs read the login path file even when the `--no-defaults` option is used.

To specify an alternate login path file name, set the `MYSQL_TEST_LOGIN_FILE` environment variable. See the introduction to this section regarding constraints on the position in which this option may be specified.

- `--no-defaults`

Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read.

The exception is that client programs read the `.mylogin.cnf` login path file, if it exists, even when `--no-defaults` is used. This permits passwords to be specified in a safer way than on the command line even if `--no-defaults` is present. (.mylogin.cnf is created by the `mysql_config_editor` utility. See Section 4.6.6, "mysql_config_editor — MySQL Configuration Utility").

- `--print-defaults`

Print the program name and all options that it gets from option files.

See the introduction to this section regarding constraints on the position in which this option may be specified.

4.2.2.4 Program Option Modifiers

Some options are “boolean” and control behavior that can be turned on or off. For example, the `mysql` client supports a `--column-names` option that determines whether or not to display a row of column
names at the beginning of query results. By default, this option is enabled. However, you may want to
disable it in some instances, such as when sending the output of `mysql` into another program that expects
to see only data and not an initial header line.

To disable column names, you can specify the option using any of these forms:

```plaintext
--disable-column-names
--skip-column-names
--column-names=0
```

The `--disable` and `--skip` prefixes and the `=0` suffix all have the same effect: They turn the option off.

The “enabled” form of the option may be specified in any of these ways:

```plaintext
--column-names
--enable-column-names
--column-names=1
```

The values `ON`, `TRUE`, `OFF`, and `FALSE` are also recognized for boolean options (not case-sensitive).

If an option is prefixed by `--loose`, a program does not exit with an error if it does not recognize the
option, but instead issues only a warning:

```shell
shell> mysql --loose-no-such-option
mysql: WARNING: unknown option '--loose-no-such-option'
```

The `--loose` prefix can be useful when you run programs from multiple installations of MySQL on the
same machine and list options in an option file. An option that may not be recognized by all versions of a
program can be given using the `--loose` prefix (or `loose` in an option file). Versions of the program that
recognize the option process it normally, and versions that do not recognize it issue a warning and ignore
it.

The `--maximum` prefix is available for `mysqld` only and permits a limit to be placed on how large client
programs can set session system variables. To do this, use a `--maximum` prefix with the variable name.
For example, `--maximum-max_heap_table_size=32M` prevents any client from making the heap table
size limit larger than 32M.

The `--maximum` prefix is intended for use with system variables that have a session value. If applied
to a system variable that has only a global value, an error occurs. For example, with `--maximum-
back_log=200`, the server produces this error:

```
Maximum value of 'back_log' cannot be set
```

### 4.2.2.5 Using Options to Set Program Variables

Many MySQL programs have internal variables that can be set at runtime using the `SET` statement. See
Section 13.7.4.1, “SET Syntax for Variable Assignment”, and Section 5.1.8, “Using System Variables”.

Most of these program variables also can be set at server startup by using the same syntax that applies
to specifying program options. For example, `mysql` has a `max_allowed_packet` variable that controls
the maximum size of its communication buffer. To set the `max_allowed_packet` variable for `mysql` to a
value of 16MB, use either of the following commands:

```plaintext
mysql --max_allowed_packet=16777216
mysql --max_allowed_packet=16M
```
The first command specifies the value in bytes. The second specifies the value in megabytes. For variables that take a numeric value, the value can be given with a suffix of \textit{K}, \textit{M}, or \textit{G} (either uppercase or lowercase) to indicate a multiplier of 1024, 1024\(^2\) or 1024\(^3\). (For example, when used to set \texttt{max_allowed_packet}, the suffixes indicate units of kilobytes, megabytes, or gigabytes.)

In an option file, variable settings are given without the leading dashes:

```sql
[mysqld]
max_allowed_packet=16777216
```

Or:

```sql
[mysqld]
max_allowed_packet=16M
```

If you like, underscores in a variable name can be specified as dashes. The following option groups are equivalent. Both set the size of the server’s key buffer to 512MB:

```sql
[mysqld]
key_buffer_size=512M
```

```sql
[mysqld]
key-buffer-size=512M
```

A variable can be specified by writing it in full or as any unambiguous prefix. For example, the \texttt{max_allowed_packet} variable can be set for \texttt{mysql} as \texttt{--max_a}, but not as \texttt{--max} because the latter is ambiguous:

```shell
shell> mysql --max=1000000
mysql: ambiguous option '--max=1000000' (max_allowed_packet, max_join_size)
```

Be aware that the use of variable prefixes can cause problems in the event that new variables are implemented for a program. A prefix that is unambiguous now might become ambiguous in the future.

Suffixes for specifying a value multiplier can be used when setting a variable at program invocation time, but not to set the value with \texttt{SET} at runtime. On the other hand, with \texttt{SET}, you can assign a variable’s value using an expression, which is not true when you set a variable at server startup. For example, the first of the following lines is legal at program invocation time, but the second is not:

```shell
shell> mysql --max_allowed_packet=16M
shell> mysql --max_allowed_packet=16*1024*1024
```

Conversely, the second of the following lines is legal at runtime, but the first is not:

```sql
mysql> SET GLOBAL max_allowed_packet=16M;
mysql> SET GLOBAL max_allowed_packet=16*1024*1024;
```

### 4.2.2.6 Option Defaults, Options Expecting Values, and the = Sign

By convention, long forms of options that assign a value are written with an equals (\texttt{=}) sign, like this:

```sql
mysql --host=tonfisk --user=jon
```

For options that require a value (that is, not having a default value), the equal sign is not required, and so the following is also valid:

```sql
mysql --host tonfisk --user jon
```
Specifying Program Options

The `mysql` command allows you to connect to a MySQL server running on a host named "tonfisk" using an account with the user name "jon".

In both cases, the `mysql` client attempts to connect to a MySQL server running on the host named "tonfisk" using an account with the user name "jon".

Due to this behavior, problems can occasionally arise when no value is provided for an option that expects one. Consider the following example, where a user connects to a MySQL server running on host `tonfisk` as user `jon`:

```
shell> mysql --host 85.224.35.45 --user jon
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 3
Server version: 5.6.47 Source distribution
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.
mysql>
```

```
mysql> SELECT CURRENT_USER();
+----------------+
| CURRENT_USER() |
+----------------+
| jon@%          |
+----------------+
1 row in set (0.00 sec)
```

Omitting the required value for one of these options yields an error, such as the one shown here:

```
shell> mysql --host 85.224.35.45 --user
mysql: option '--user' requires an argument
```

In this case, `mysql` was unable to find a value following the `--user` option because nothing came after it on the command line. However, if you omit the value for an option that is not the last option to be used, you obtain a different error that you may not be expecting:

```
shell> mysql --host --user jon
ERROR 2005 (HY000): Unknown MySQL server host '--user' (1)
```

Because `mysql` assumes that any string following `--host` on the command line is a host name, `--host` and `--user` is interpreted as `--host=--user`, and the client attempts to connect to a MySQL server running on a host named "--user".

Options having default values always require an equal sign when assigning a value; failing to do so causes an error. For example, the MySQL server `--log-error` option has the default value `host_name.err`, where `host_name` is the name of the host on which MySQL is running. Assume that you are running MySQL on a computer whose host name is "tonfisk", and consider the following invocation of `mysqld_safe`:

```
shell> mysqld_safe &
[1] 11699
shell> 080112 12:53:40 mysqld_safe Logging to '/usr/local/mysql/var/tonfisk.err'.
080112 12:53:40 mysqld_safe Starting mysqld daemon with databases from /usr/local/mysql/var
shell>
```

After shutting down the server, restart it as follows:

```
shell> mysqld_safe --log-error &
[1] 11699
shell> 080112 12:53:40 mysqld_safe Logging to '/usr/local/mysql/var/tonfisk.err'.
080112 12:53:40 mysqld_safe Starting mysqld daemon with databases from /usr/local/mysql/var
shell>
```
Specifying Program Options

The result is the same, since --log-error is not followed by anything else on the command line, and it supplies its own default value. (The & character tells the operating system to run MySQL in the background; it is ignored by MySQL itself.) Now suppose that you wish to log errors to a file named my-

errors.err. You might try starting the server with --log-error my-errors, but this does not have the intended effect, as shown here:

```
shell> mysqld_safe --log-error my-errors &
[1] 31357
shell> 080111 22:53:31 mysqld_safe Starting mysqld daemon with databases from /usr/local/mysql/var
080111 22:53:34 mysqld_safe mysqld from pid file /usr/local/mysql/var/tonfisk.pid ended
[1]+  Done ./mysqld_safe --log-error my-errors
```

The server attempted to start using /usr/local/mysql/var/tonfisk.err as the error log, but then shut down. Examining the last few lines of this file shows the reason:

```
shell> tail /usr/local/mysql/var/tonfisk.err
080111 22:53:32 InnoDB: Started; log sequence number 0 46409
/usr/local/mysql/libexec/mysqld: Too many arguments (first extra is 'my-errors').
Use --verbose --help to get a list of available options
080111 22:53:32 InnoDB: Starting shutdown...
080111 22:53:34 InnoDB: Shutdown completed; log sequence number 0 46409
080111 22:53:34 mysqld_safe mysqld from pid file /usr/local/mysql/var/tonfisk.pid ended
```

Because the --log-error option supplies a default value, you must use an equal sign to assign a different value to it, as shown here:

```
shell> mysqld_safe --log-error=my-errors &
[1] 31437
shell> 080111 22:54:15 mysqld_safe Logging to '/usr/local/mysql/var/my-errors.err'.
080111 22:54:15 mysqld_safe Starting mysqld daemon with databases from /usr/local/mysql/var
```

Now the server has been started successfully, and is logging errors to the file /usr/local/mysql/var/my-

errors.err.

Similar issues can arise when specifying option values in option files. For example, consider a my.cnf file that contains the following:

```
[mysql]
host
user
```

When the mysql client reads this file, these entries are parsed as --host --user or --host=--user, with the result shown here:

```
shell> mysql
ERROR 2005 (HY000): Unknown MySQL server host '--user' (1)
```

However, in option files, an equal sign is not assumed. Suppose the my.cnf file is as shown here:

```
[mysql]
```
user jon

Trying to start `mysql` in this case causes a different error:

```
shell> mysql
mysql: unknown option '--user jon'
```

A similar error would occur if you were to write `host tonfisk` in the option file rather than `host=tonfisk`. Instead, you must use the equal sign:

```
[mysql]
user=jon
```

Now the login attempt succeeds:

```
shell> mysql
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 5
Server version: 5.6.47 Source distribution
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.
mysql> SELECT USER();
+---------------+
| USER()        |
+---------------+
| jon@localhost |
+---------------+
1 row in set (0.00 sec)
```

This is not the same behavior as with the command line, where the equal sign is not required:

```
shell> mysql --user jon --host tonfisk
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 6
Server version: 5.6.47 Source distribution
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.
mysql> SELECT USER();
+---------------+
| USER()        |
+---------------+
| jon@tonfisk   |
+---------------+
1 row in set (0.00 sec)
```

Specifying an option requiring a value without a value in an option file causes the server to abort with an error.

### 4.2.3 Command Options for Connecting to the Server

This section describes options supported by most MySQL client programs that control how client programs establish connections to the server and whether connections are encrypted. These options can be given on the command line or in an option file.

- [Command Options for Connection Establishment](#)
- [Command Options for Encrypted Connections](#)
Command Options for Connection Establishment

This section describes options that control how client programs establish connections to the server. For additional information and examples showing how to use them, see Section 4.2.4, “Connecting to the MySQL Server Using Command Options”.

Table 4.3 Connection-Establishment Option Summary

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--default-auth</td>
<td>Authentication plugin to use</td>
</tr>
<tr>
<td>--host</td>
<td>Host on which MySQL server is located</td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
</tr>
<tr>
<td>--pipe</td>
<td>Connect to server using named pipe (Windows only)</td>
</tr>
<tr>
<td>--plugin-dir</td>
<td>Directory where plugins are installed</td>
</tr>
<tr>
<td>--port</td>
<td>TCP/IP port number for connection</td>
</tr>
<tr>
<td>--protocol</td>
<td>Connection protocol to use</td>
</tr>
<tr>
<td>--secure-auth</td>
<td>Do not send passwords to server in old (pre-4.1) format</td>
</tr>
<tr>
<td>--shared-memory-base-name</td>
<td>Name of shared memory to use for shared-memory connections</td>
</tr>
<tr>
<td>--socket</td>
<td>Unix socket file or Windows named pipe to use</td>
</tr>
<tr>
<td>--user</td>
<td>MySQL user name to use when connecting to server</td>
</tr>
</tbody>
</table>

- **--default-auth=plugin**
  
  A hint about which client-side authentication plugin to use. See Section 6.2.11, “Pluggable Authentication”.

- **--host=host_name, -h host_name**
  
  The host on which the MySQL server is running. The value can be a host name, IPv4 address, or IPv6 address. The default value is localhost.

- **--password[=pass_val], -p[pass_val]**
  
  The password of the MySQL account used for connecting to the server. The password value is optional. If not given, the program prompts for one. If given, there must be no space between --password= or -p and the password following it. If no password option is specified, the default is to send no password.

Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

To explicitly specify that there is no password and that the client program should not prompt for one, use the --skip-password option.

- **--pipe, -W**

  On Windows, connect to the server using a named pipe. This option applies only if the server was started with the named_pipe system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the named_pipe_full_access_group system variable.

- **--plugin-dir=dir_name**
The directory in which to look for plugins. Specify this option if the `--default-auth` option is used to specify an authentication plugin but the client program does not find it. See Section 6.2.11, “Pluggable Authentication”.

- **--port=port_num, -P port_num**

  For TCP/IP connections, the port number to use. The default port number is 3306.

- **--protocol={TCP|SOCKET|PIPE|MEMORY}**

  This option explicitly specifies which protocol to use for connecting to the server. It is useful when other connection parameters normally result in use of a protocol other than the one you want. For example, connections on Unix to `localhost` are made using a Unix socket file by default:

  ```
  mysql --host=localhost
  ```

  To force a TCP/IP connection to be used instead, specify a `--protocol` option:

  ```
  mysql --host=localhost --protocol=TCP
  ```

  The following table shows the permissible `--protocol` option values and indicates the platforms on which each value may be used. The values are not case-sensitive.

<table>
<thead>
<tr>
<th><strong>--protocol</strong> Value</th>
<th>Connection Protocol</th>
<th>Permissible Operating Systems</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>TCP/IP connection to local or remote server</td>
<td>All</td>
</tr>
<tr>
<td>SOCKET</td>
<td>Unix socket file connection to local server</td>
<td>Unix only</td>
</tr>
<tr>
<td>PIPE</td>
<td>Named-pipe connection to local or remote server</td>
<td>Windows only</td>
</tr>
<tr>
<td>MEMORY</td>
<td>Shared-memory connection to local server</td>
<td>Windows only</td>
</tr>
</tbody>
</table>

- **--secure-auth**

  Do not send passwords to the server in old (pre-4.1) format. This prevents connections except for servers that use the newer password format. This option is enabled by default; use `--skip-secure-auth` to disable it.

  **Note**

  Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.

  **Note**

  This option is deprecated and will be removed in a future release. As of MySQL 5.7.5, it is always enabled and attempting to disable it produces an error.

- **--shared-memory-base-name=name**

  On Windows, the shared-memory name to use for connections made using shared memory to a local server. The default value is `MYSQL`. The shared-memory name is case-sensitive.
Command Options for Connecting to the Server

This option applies only if the server was started with the `shared_memory` system variable enabled to support shared-memory connections.

- `--socket=path, -S path`

On Unix, the name of the Unix socket file to use for connections made using a named pipe to a local server. The default Unix socket file name is `/tmp/mysql.sock`.

On Windows, the name of the named pipe to use for connections to a local server. The default Windows pipe name is `MySQL`. The pipe name is not case-sensitive.

On Windows, this option applies only if the server was started with the `named_pipe` system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the `named_pipe_full_access_group` system variable.

- `--user=user_name, -u user_name`

The user name of the MySQL account to use for connecting to the server. The default user name is ODBC on Windows or your Unix login name on Unix.

**Command Options for Encrypted Connections**

This section describes options that specify whether to use encrypted connections, the names of certificate and key files, and other parameters related to encrypted-connection support. They are not available unless MySQL has been built with SSL support. See Section 2.9.6, “Configuring SSL Library Support”. For examples of suggested use and how to check whether a connection is encrypted, see Section 6.3.1, “Configuring MySQL to Use Encrypted Connections”.

For information about using encrypted connections from the MySQL C API, see Section 23.8.15, “C API Encrypted Connection Support”.

**Table 4.4 Connection-Encryption Option Summary**

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--server-public-key-path</code></td>
<td>Path name to file containing RSA public key</td>
<td>5.6.6</td>
</tr>
<tr>
<td><code>--skip-ssl</code></td>
<td>Disable connection encryption</td>
<td></td>
</tr>
<tr>
<td><code>--ssl</code></td>
<td>Enable connection encryption</td>
<td></td>
</tr>
<tr>
<td><code>--ssl-ca</code></td>
<td>File that contains list of trusted SSL Certificate Authorities</td>
<td></td>
</tr>
<tr>
<td><code>--ssl-capath</code></td>
<td>Directory that contains trusted SSL Certificate Authority certificate files</td>
<td></td>
</tr>
<tr>
<td><code>--ssl-cert</code></td>
<td>File that contains X.509 certificate</td>
<td></td>
</tr>
<tr>
<td><code>--ssl-cipher</code></td>
<td>Permissible ciphers for connection encryption</td>
<td></td>
</tr>
<tr>
<td><code>--ssl-crl</code></td>
<td>File that contains certificate revocation lists</td>
<td>5.6.3</td>
</tr>
<tr>
<td><code>--ssl-crlpath</code></td>
<td>Directory that contains certificate revocation-list files</td>
<td>5.6.3</td>
</tr>
<tr>
<td><code>--ssl-key</code></td>
<td>File that contains X.509 key</td>
<td></td>
</tr>
<tr>
<td><code>--ssl-mode</code></td>
<td>Desired security state of connection to server</td>
<td>5.6.30</td>
</tr>
<tr>
<td><code>--ssl-verify-server-cert</code></td>
<td>Verify host name against server certificate Common Name identity</td>
<td></td>
</tr>
</tbody>
</table>

- `--server-public-key-path=file_name`
The path name to a file containing a client-side copy of the public key required by the server for RSA key pair-based password exchange. The file must be in PEM format. This option applies to clients that connect to the server with the \texttt{sha256_password} authentication plugin. This option is ignored for accounts that do not authenticate with that plugin. It is also ignored if RSA-based password exchange is not used, as is the case when the client connects to the server using a secure connection.

This option is available only if MySQL was built using OpenSSL.

For information about the \texttt{sha256_password} plugin, see Section 6.4.1.4, “SHA-256 Pluggable Authentication”.

\begin{itemize}
\item \texttt{--ssl, --skip-ssl}
\end{itemize}

For the MySQL server, this option specifies that the server permits but does not require encrypted connections.

For MySQL client programs, this option permits but does not require the client to connect to the server using encryption. Therefore, this option is not sufficient in itself to cause an encrypted connection to be used. For example, if you specify this option for a client program but the server has not been configured to support encrypted connections, the client falls back to an unencrypted connection.

As a recommended set of options to enable encrypted connections, consider using at least \texttt{--ssl-cert} and \texttt{--ssl-key} on the server side and \texttt{--ssl-ca} on the client side. See Section 6.3.1, “Configuring MySQL to Use Encrypted Connections”.

\texttt{--ssl} may be implied by other \texttt{--ssl-xxx} options, as indicated in the descriptions for those options.

The \texttt{--ssl} option in negated form indicates that encryption should \textit{not} be used and overrides other \texttt{--ssl-xxx} options. Specify the option as \texttt{--skip-ssl} or a synonym (\texttt{--ssl=0, --disable-ssl}). For example, you might have options specified in the \texttt{[client]} group of your option file to use encrypted connections by default when you invoke MySQL client programs. To use an unencrypted connection instead, invoke the client program with \texttt{--ssl=0} on the command line to override the options in the option file.

To require use of encrypted connections by a MySQL account, use a \texttt{GRANT} statement for the account that includes a \texttt{REQUIRE SSL} clause. This causes connection attempts by clients that use the account to be rejected unless MySQL supports encrypted connections and an encrypted connection can be established.

The \texttt{REQUIRE} clause permits other encryption-related options, which can be used to enforce security requirements stricter than \texttt{REQUIRE SSL}. For additional details about which command options may or must be specified by clients that connect using accounts configured using the various \texttt{REQUIRE} options, see the description of \texttt{REQUIRE} in Section 13.7.1.4, “GRANT Syntax”.

\begin{itemize}
\item \texttt{--ssl-ca=\textit{file_name}}
\end{itemize}

The path name of the Certificate Authority (CA) certificate file in PEM format. This option implies \texttt{--ssl}.

To tell the client not to authenticate the server certificate when establishing an encrypted connection to the server, specify neither \texttt{--ssl-ca} nor \texttt{--ssl-capath}. The server still verifies the client according to any applicable requirements established for the client account, and it still uses any \texttt{--ssl-ca} or \texttt{--ssl-capath} option values specified on the server side.

\begin{itemize}
\item \texttt{--ssl-capath=\textit{dir_name}}
\end{itemize}
The path name of the directory that contains trusted SSL certificate authority (CA) certificate files in PEM format. This option implies --ssl.

To tell the client not to authenticate the server certificate when establishing an encrypted connection to the server, specify neither --ssl-ca nor --ssl-capath. The server still verifies the client according to any applicable requirements established for the client account, and it still uses any --ssl-ca or --ssl-capath option values specified on the server side.

Support for this option depends on the SSL library used to compile MySQL. See Section 6.3.4, “SSL Library-Dependent Capabilities”.

• --ssl-cert=file_name

The path name of the SSL public key certificate file in PEM format. On the client side, this is the client public key certificate. On the server side, this is the server public key certificate. This option implies --ssl.

• --ssl-cipher=cipher_list

The list of permissible ciphers for connection encryption. If no cipher in the list is supported, encrypted connections will not work. This option implies --ssl.

For greatest portability, cipher_list should be a list of one or more cipher names, separated by colons. This format is understood both by OpenSSL and yaSSL. Examples:

```plaintext
--ssl-cipher=AES128-SHA
--ssl-cipher=DHE-RSA-AES256-SHA:AES128-SHA
```

OpenSSL supports a more flexible syntax for specifying ciphers, as described in the OpenSSL documentation at https://www.openssl.org/docs/manmaster/man1/ciphers.html. yaSSL does not, so attempts to use that extended syntax fail for a MySQL distribution compiled using yaSSL.

For information about which encryption ciphers MySQL supports, see Section 6.3.2, “Encrypted Connection TLS Protocols and Ciphers”.

• --ssl-crl=file_name

The path name of the file containing certificate revocation lists in PEM format. This option implies --ssl.

If neither --ssl-crl nor --ssl-crlpath is given, no CRL checks are performed, even if the CA path contains certificate revocation lists.

Support for this option depends on the SSL library used to compile MySQL. See Section 6.3.4, “SSL Library-Dependent Capabilities”.

• --ssl-crlpath=dir_name

The path name of the directory that contains certificate revocation-list files in PEM format. This option implies --ssl.

If neither --ssl-crl nor --ssl-crlpath is given, no CRL checks are performed, even if the CA path contains certificate revocation lists.

Support for this option depends on the SSL library used to compile MySQL. See Section 6.3.4, “SSL Library-Dependent Capabilities”.
• \texttt{--ssl-key=\texttt{file\_name}}

The path name of the SSL private key file in PEM format. On the client side, this is the client private key. On the server side, this is the server private key. This option implies \texttt{--ssl}.

If the MySQL distribution was built using OpenSSL or yaSSL and the key file is protected by a passphrase, the program prompts the user for the passphrase. The password must be given interactively; it cannot be stored in a file. If the passphrase is incorrect, the program continues as if it could not read the key.

• \texttt{--ssl-mode=\texttt{mode}}

This option is available only for client programs, not the server. It specifies the desired security state of the connection to the server:

• If this option is not specified, the default is to establish an unencrypted connection. This is like the \texttt{--ssl=0} option or its synonyms (\texttt{--skip-ssl}, \texttt{--disable-ssl}).

• If this option is specified, the only permissible value is \texttt{REQUIRED} (establish an encrypted connection if the server supports encrypted connections). The connection attempt fails if an encrypted connection cannot be established.

The \texttt{--ssl-mode} option was added in MySQL 5.6.30.

\textbf{Note}

To require encrypted connections in MySQL 5.6, the standard MySQL client programs check whether the connection is encrypted if \texttt{--ssl-mode=REQUIRED} was specified. If not, the client exits with an error. Third-party applications that must be able to require encrypted connections can use the same technique. For details, see Section 23.8.7.68, "\texttt{mysql\_ssl\_set()}".

• \texttt{--ssl-verify-server-cert}

This option is available only for client programs, not the server. It causes the client to perform host name identity verification by checking the host name the client uses for connecting to the server against the identity in the certificate that the server sends to the client:

• As of MySQL 5.6.41, if the client uses OpenSSL 1.0.2 or higher, the client checks whether the host name that it uses for connecting matches either the Subject Alternative Name value or the Common Name value in the server certificate.

• Otherwise, the client checks whether the host name that it uses for connecting matches the Common Name value in the server certificate.

The connection fails if there is a mismatch. For encrypted connections, this option helps prevent man-in-the-middle attacks. Host name identity verification is disabled by default.

\subsection{4.2.4 Connecting to the MySQL Server Using Command Options}

This section describes use of command-line options to specify how to establish connections to the MySQL server, for clients such as \texttt{mysql} or \texttt{mysqldump}. For additional information if you are unable to connect, see Section 6.2.14, "Troubleshooting Problems Connecting to MySQL".

For a client program to connect to the MySQL server, it must use the proper connection parameters, such as the name of the host where the server is running and the user name and password of your MySQL
Connecting to the MySQL Server Using Command Options

Each connection parameter has a default value, but you can override default values as necessary using program options specified either on the command line or in an option file.

The examples here use the `mysql` client program, but the principles apply to other clients such as `mysqldump`, `mysqladmin`, or `mysqlshow`.

This command invokes `mysql` without specifying any explicit connection parameters:

```
mysql
```

Because there are no parameter options, the default values apply:

- The default host name is `localhost`. On Unix, this has a special meaning, as described later.
- The default user name is `ODBC` on Windows or your Unix login name on Unix.
- No password is sent because neither `--password` nor `-p` is given.
- For `mysql`, the first nonoption argument is taken as the name of the default database. Because there is no such argument, `mysql` selects no default database.

To specify the host name and user name explicitly, as well as a password, supply appropriate options on the command line. To select a default database, add a database-name argument. Examples:

```
mysql --host=localhost --user=myname --password=password mydb
mysql -h localhost -u myname -p password mydb
```

For password options, the password value is optional:

- If you use a `--password` or `-p` option and specify a password value, there must be no space between `--password=` or `-p` and the password following it.
- If you use `--password` or `-p` but do not specify a password value, the client program prompts you to enter the password. The password is not displayed as you enter it. This is more secure than giving the password on the command line, which might enable other users on your system to see the password line by executing a command such as `ps`. See Section 6.1.2.1, “End-User Guidelines for Password Security”.
- To explicitly specify that there is no password and that the client program should not prompt for one, use the `--skip-password` option.

As just mentioned, including the password value on the command line can be a security risk. To avoid this risk, specify the `--password` or `-p` option without any following password value:

```
mysql --host=localhost --user=myname --password mydb
mysql -h localhost -u myname -p mydb
```

When the `--password` or `-p` option is given with no password value, the client program prints a prompt and waits for you to enter the password. (In these examples, `mydb` is not interpreted as a password because it is separated from the preceding password option by a space.)

On some systems, the library routine that MySQL uses to prompt for a password automatically limits the password to eight characters. That limitation is a property of the system library, not MySQL. Internally, MySQL does not have any limit for the length of the password. To work around the limitation on systems affected by it, specify your password in an option file (see Section 4.2.2.2, “Using Option Files”). Another workaround is to change your MySQL password to a value that has eight or fewer characters, but that may be unacceptable because shorter passwords tend to be less secure.

Client programs determine what type of connection to make as follows:
Connecting to the MySQL Server Using Command Options

• If the host is not specified or is `localhost`, a connection to the local host occurs:
  • On Windows, the client connects using a shared-memory connection, if the server was started with the `shared_memory` system variable to support shared-memory connections.
  • On Unix, MySQL programs treat the host name `localhost` specially, in a way that is likely different from what you expect compared to other network-based programs: the client connects using a Unix socket file. The `--socket` option or the `MYSQL_UNIX_PORT` environment variable may be used to specify the socket name.
  • On Windows, if `host` is . (period), or TCP/IP is not enabled and `--socket` is not specified or the host is empty, the client connects using a named pipe, if the server was started with the `named_pipe` system variable to support named-pipe connections. If named-pipe connections are not supported or if the user making the connection is not a member of the Windows group specified by the `named_pipe_full_access_group` system variable, an error occurs.
  • Otherwise, the connection uses TCP/IP.

The `--protocol` option enables you to establish a particular type of connection even when other options normally result in use of a different protocol. That is, `--protocol` specifies the connection protocol explicitly and overrides the preceding rules, even for `localhost`.

Only connection options that are relevant to the selected protocol are used or checked. Other connection options are ignored. For example, with `--host=localhost` on Unix, the client attempts to connect to the local server using a Unix socket file. This occurs even if a `--port` or `-P` option is given to specify a port number.

To ensure that the client makes a TCP/IP connection to the local server, use `--host` or `-h` to specify a host name value of `127.0.0.1`, or the IP address or name of the local server. You can also specify the connection protocol explicitly, even for `localhost`, by using the `--protocol=TCP` option. Examples:

```sh
mysql --host=127.0.0.1
mysql --protocol=TCP
```

If the server is configured to accept IPv6 connections, clients can connect to the local server over IPv6 using `--host=::1`. See Section 5.1.11, “IPv6 Support”.

On Windows, you can force a MySQL client to use a named-pipe connection by specifying the `--pipe` or `--protocol=PIPE` option, or by specifying . (period) as the host name. If the server was not started with the `named_pipe` system variable to support named-pipe connections or if the user making the connection is not a member of the Windows group specified by the `named_pipe_full_access_group` system variable, an error occurs. Use the `--socket` option to specify the name of the pipe if you do not want to use the default pipe name.

Connections to remote servers use TCP/IP. This command connects to the server running on `remote.example.com` using the default port number (3306):

```sh
mysql --host=remote.example.com
```

To specify a port number explicitly, use the `--port` or `-P` option:

```sh
mysql --host=remote.example.com --port=13306
```

You can specify a port number for connections to a local server, too. However, as indicated previously, connections to `localhost` on Unix use a socket file by default, so unless you force a TCP/IP connection as previously described, any option that specifies a port number is ignored.
For this command, the program uses a socket file on Unix and the `--port` option is ignored:

```bash
mysql --port=13306 --host=localhost
```

To cause the port number to be used, force a TCP/IP connection. For example, invoke the program in either of these ways:

```bash
mysql --port=13306 --host=127.0.0.1
mysql --port=13306 --protocol=TCP
```

For additional information about options that control how client programs establish connections to the server, see Section 4.2.3, “Command Options for Connecting to the Server”.

It is possible to specify connection parameters without entering them on the command line each time you invoke a client program:

- Specify the connection parameters in the `[client]` section of an option file. The relevant section of the file might look like this:

```ini
[client]
host=host_name
user=user_name
password=password
```

For more information, see Section 4.2.2.2, “Using Option Files”.

- Some connection parameters can be specified using environment variables. Examples:
  - To specify the host for `mysql`, use `MYSQL_HOST`.
  - On Windows, to specify the MySQL user name, use `USER`.
  - To specify the password, use `MYSQL_PWD`. However, this is insecure; see Section 6.1.2.1, “End-User Guidelines for Password Security”.

For a list of supported environment variables, see Section 4.9, “MySQL Environment Variables”.

### 4.2.5 Connection Compression Control

Connections to the server can use a compressed protocol that reduces the number of bytes sent over the connection. By default, connections are uncompressed, but can be compressed if the server and the client both support compression.

Compressed connections originate on the client side but affect CPU load on both the client and server sides because both sides perform compression and decompression operations. Because enabling compression decreases performance, its benefits occur primarily when there is low network bandwidth, network transfer time dominates the cost of compression and decompression operations, and result sets are large.

Compression control applies to connections to the server by client programs and by servers participating in master/slave replication. Compression control does not apply to connections for `FEDERATED` tables.

These configuration parameters are available for controlling connection compression:

- Client programs support a `--compress` command-line option to specify use of compression for the connection to the server.
Setting Environment Variables

• For programs that use the MySQL C API, enabling the MYSQL_OPT_COMPRESS option for the mysql_options() function specifies use of compression for the connection to the server.

• For master/server replication, enabling the slave_compressed_protocol system variable specifies use of compression for slave connections to the master.

In each case, when use of compression is specified, the connection uses the zlib compression algorithm if both sides support it, with fallback to an uncompressed connection otherwise.

4.2.6 Setting Environment Variables

Environment variables can be set at the command prompt to affect the current invocation of your command processor, or set permanently to affect future invocations. To set a variable permanently, you can set it in a startup file or by using the interface provided by your system for this purpose. Consult the documentation for your command interpreter for specific details. Section 4.9, “MySQL Environment Variables”, lists all environment variables that affect MySQL program operation.

To specify a value for an environment variable, use the syntax appropriate for your command processor. For example, on Windows, you can set the USER variable to specify your MySQL account name. To do so, use this syntax:

```
SET USER=your_name
```

The syntax on Unix depends on your shell. Suppose that you want to specify the TCP/IP port number using the MYSQL_TCP_PORT variable. Typical syntax (such as for sh, ksh, bash, zsh, and so on) is as follows:

```
MYSQL_TCP_PORT=3306
export MYSQL_TCP_PORT
```

The first command sets the variable, and the export command exports the variable to the shell environment so that its value becomes accessible to MySQL and other processes.

For csh and tcsh, use setenv to make the shell variable available to the environment:

```
setenv MYSQL_TCP_PORT 3306
```

The commands to set environment variables can be executed at your command prompt to take effect immediately, but the settings persist only until you log out. To have the settings take effect each time you log in, use the interface provided by your system or place the appropriate command or commands in a startup file that your command interpreter reads each time it starts.

On Windows, you can set environment variables using the System Control Panel (under Advanced).

On Unix, typical shell startup files are .bashrc or .bash_profile for bash, or .tcshrc for tcsh.

Suppose that your MySQL programs are installed in /usr/local/mysql/bin and that you want to make it easy to invoke these programs. To do this, set the value of the PATH environment variable to include that directory. For example, if your shell is bash, add the following line to your .bashrc file:

```
PATH=$PATH:/usr/local/mysql/bin
```

bash uses different startup files for login and nonlogin shells, so you might want to add the setting to .bashrc for login shells and to .bash_profile for nonlogin shells to make sure that PATH is set regardless.
If your shell is `tcsh`, add the following line to your `tcshrc` file:

```
setenv PATH $PATH:/usr/local/mysql/bin
```

If the appropriate startup file does not exist in your home directory, create it with a text editor.

After modifying your `PATH` setting, open a new console window on Windows or log in again on Unix so that the setting goes into effect.

### 4.3 MySQL Server and Server-Startup Programs

This section describes `mysqld`, the MySQL server, and several programs that are used to start the server.

#### 4.3.1 `mysqld` — The MySQL Server

`mysqld`, also known as MySQL Server, is the main program that does most of the work in a MySQL installation. MySQL Server manages access to the MySQL data directory that contains databases and tables. The data directory is also the default location for other information such as log files and status files.

**Note**

Some installation packages contain a debugging version of the server named `mysql-debug`. Invoke this version instead of `mysqld` for debugging support, memory allocation checking, and trace file support (see Section 24.5.1.2, “Creating Trace Files”).

When MySQL server starts, it listens for network connections from client programs and manages access to databases on behalf of those clients.

The `mysqld` program has many options that can be specified at startup. For a complete list of options, run this command:

```
shell> mysqld --verbose --help
```

MySQL Server also has a set of system variables that affect its operation as it runs. System variables can be set at server startup, and many of them can be changed at runtime to effect dynamic server reconfiguration. MySQL Server also has a set of status variables that provide information about its operation. You can monitor these status variables to access runtime performance characteristics.

For a full description of MySQL Server command options, system variables, and status variables, see Section 5.1, “The MySQL Server”. For information about installing MySQL and setting up the initial configuration, see Chapter 2, *Installing and Upgrading MySQL*.

#### 4.3.2 `mysqld_safe` — MySQL Server Startup Script

`mysqld_safe` is the recommended way to start a `mysqld` server on Unix. `mysqld_safe` adds some safety features such as restarting the server when an error occurs and logging runtime information to an error log. A description of error logging is given later in this section.

`mysqld_safe` tries to start an executable named `mysqld`. To override the default behavior and specify explicitly the name of the server you want to run, specify a `--mysqld` or `--mysqld-version` option to `mysqld_safe`. You can also use `--ledir` to indicate the directory where `mysqld_safe` should look for the server.
Many of the options to `mysqld_safe` are the same as the options to `mysqld`. See Section 5.1.6, “Server Command Options”.

Options unknown to `mysqld_safe` are passed to `mysqld` if they are specified on the command line, but ignored if they are specified in the `[mysqld_safe]` group of an option file. See Section 4.2.2.2, “Using Option Files”.

`mysqld_safe` reads all options from the `[mysqld]`, `[server]`, and `[mysqld_safe]` sections in option files. For example, if you specify a `[mysqld]` section like this, `mysqld_safe` will find and use the `--log-error` option:

```
[mysqld]
log-error=error.log
```

For backward compatibility, `mysqld_safe` also reads `[safe_mysqld]` sections, but to be current you should rename such sections to `[mysqld_safe]`.

`mysqld_safe` supports the following options. It also reads option files and supports the options for processing them described at Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

### Table 4.5 `mysqld_safe` Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--basedir</td>
<td>Path to MySQL installation directory</td>
</tr>
<tr>
<td>--core-file-size</td>
<td>Size of core file that mysqld should be able to create</td>
</tr>
<tr>
<td>--datadir</td>
<td>Path to data directory</td>
</tr>
<tr>
<td>--defaults-extra-file</td>
<td>Read named option file in addition to usual option files</td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
</tr>
<tr>
<td>--ledir</td>
<td>Path to directory where server is located</td>
</tr>
<tr>
<td>--log-error</td>
<td>Write error log to named file</td>
</tr>
<tr>
<td>--malloc-lib</td>
<td>Alternative malloc library to use for mysqld</td>
</tr>
<tr>
<td>--mysqld</td>
<td>Name of server program to start (in ledir directory)</td>
</tr>
<tr>
<td>--mysqld-version</td>
<td>Suffix for server program name</td>
</tr>
<tr>
<td>--nice</td>
<td>Use nice program to set server scheduling priority</td>
</tr>
<tr>
<td>--no-defaults</td>
<td>Read no option files</td>
</tr>
<tr>
<td>--open-files-limit</td>
<td>Number of files that mysqld should be able to open</td>
</tr>
<tr>
<td>--pid-file</td>
<td>Path name of server process ID file</td>
</tr>
<tr>
<td>--plugin-dir</td>
<td>Directory where plugins are installed</td>
</tr>
<tr>
<td>--port</td>
<td>Port number on which to listen for TCP/IP connections</td>
</tr>
<tr>
<td>--skip-kill-mysqld</td>
<td>Do not try to kill stray mysqld processes</td>
</tr>
<tr>
<td>--skip-syslog</td>
<td>Do not write error messages to syslog; use error log file</td>
</tr>
<tr>
<td>--socket</td>
<td>Socket file on which to listen for Unix socket connections</td>
</tr>
<tr>
<td>--syslog</td>
<td>Write error messages to syslog</td>
</tr>
<tr>
<td>--syslog-tag</td>
<td>Tag suffix for messages written to syslog</td>
</tr>
<tr>
<td>--timezone</td>
<td>Set TZ time zone environment variable to named value</td>
</tr>
</tbody>
</table>
Option Name | Description
--- | ---
--user | Run mysqld as user having name user_name or numeric user ID user_id

- --help
Display a help message and exit.

- --basedir=dir_name
The path to the MySQL installation directory.

- --core-file-size=size
The size of the core file that mysqld should be able to create. The option value is passed to ulimit -c.

- --datadir=dir_name
The path to the data directory.

- --defaults-extra-file=file_name
Read this option file in addition to the usual option files. If the file does not exist or is otherwise inaccessible, the server will exit with an error. file_name is interpreted relative to the current directory if given as a relative path name rather than a full path name. This must be the first option on the command line if it is used.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- --defaults-file=file_name
Use only the given option file. If the file does not exist or is otherwise inaccessible, the server will exit with an error. file_name is interpreted relative to the current directory if given as a relative path name rather than a full path name. This must be the first option on the command line if it is used.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- --ledir=dir_name
If mysqld_safe cannot find the server, use this option to indicate the path name to the directory where the server is located.

As of MySQL 5.6.35, this option is accepted only on the command line, not in option files.

- --log-error=file_name
Write the error log to the given file. See Section 5.4.2, “The Error Log”.

- --malloc-lib=[lib_name]
The name of the library to use for memory allocation instead of the system malloc() library. As of MySQL 5.6.33, the option value must be one of the directories /usr/lib, /usr/lib64, /usr/lib/i386-linux-gnu, or /usr/lib/x86_64-linux-gnu. Prior to MySQL 5.6.33, any library can be used by specifying its path name, but there is a shortcut form to enable use of the tcmalloc library that
is shipped with binary MySQL distributions for Linux in MySQL 5.6. It is possible that the shortcut form will not work under certain configurations, in which case you should specify a path name instead.

Note
As of MySQL 5.6.31, MySQL distributions no longer include a tcmalloc library.

The `--malloc-lib` option works by modifying the LD_PRELOAD environment value to affect dynamic linking to enable the loader to find the memory-allocation library when `mysqld` runs:

- If the option is not given, or is given without a value (`--malloc-lib=`), LD_PRELOAD is not modified and no attempt is made to use tcmalloc.

- If the option is given as `--malloc-lib=tcmalloc`, `mysqld_safe` looks for a tcmalloc library in /usr/lib and then in the MySQL pkglibdir location (for example, /usr/local/mysql/lib or whatever is appropriate). If tmalloc is found, its path name is added to the beginning of the LD_PRELOAD value for mysqld. If tmalloc is not found, `mysqld_safe` aborts with an error.

- If the option is given as `--malloc-lib=/path/to/some/library`, that full path is added to the beginning of the LD_PRELOAD value. If the full path points to a nonexistent or unreadable file, `mysqld_safe` aborts with an error.

- For cases where `mysqld_safe` adds a path name to LD_PRELOAD, it adds the path to the beginning of any existing value the variable already has.

Linux users can use the libtcmalloc_minimal.so included in binary packages by adding these lines to the my.cnf file:

```plaintext
[mysqld_safe]
malloc-lib=tcmalloc
```

Those lines also suffice for users on any platform who have installed a tcmalloc package in /usr/lib. To use a specific tcmalloc library, specify its full path name. Example:

```plaintext
[mysqld_safe]
malloc-lib=/opt/lib/libtcmalloc_minimal.so
```

- **--mysqld=prog_name**

  The name of the server program (in the ledir directory) that you want to start. This option is needed if you use the MySQL binary distribution but have the data directory outside of the binary distribution. If `mysqld_safe` cannot find the server, use the `--ledir` option to indicate the path name to the directory where the server is located.

  As of MySQL 5.6.33, this option is accepted only on the command line, not in option files.

- **--mysqld-version=suffix**

  This option is similar to the **--mysqld** option, but you specify only the suffix for the server program name. The base name is assumed to be mysqld. For example, if you use **--mysqld-version=debug**, `mysqld_safe` starts the mysqld-debug program in the ledir directory. If the argument to **--mysqld-version** is empty, `mysqld_safe` uses mysqld in the ledir directory.

  As of MySQL 5.6.33, this option is accepted only on the command line, not in option files.

- **--nice=priority**
Use the `nice` program to set the server's scheduling priority to the given value.

- `--no-defaults`

Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read. This must be the first option on the command line if it is used.

For additional information about this and other option-file options, see Section 4.2.2.3, "Command-Line Options that Affect Option-File Handling".

- `--open-files-limit=count`

The number of files that `mysqld` should be able to open. The option value is passed to `ulimit -n`.

**Note**

You must start `mysqld_safe` as `root` for this to function properly.

- `--pid-file=file_name`

The path name that `mysqld` should use for its process ID file.

- `--plugin-dir=dir_name`

The path name of the plugin directory.

- `--port=port_num`

The port number that the server should use when listening for TCP/IP connections. The port number must be 1024 or higher unless the server is started by the `root` operating system user.

- `--skip-kill-mysqld`

Do not try to kill stray `mysqld` processes at startup. This option works only on Linux.

- `--socket=path`

The Unix socket file that the server should use when listening for local connections.

- `--syslog, --skip-syslog`

`--syslog` causes error messages to be sent to `syslog` on systems that support the `logger` program. `--skip-syslog` suppresses the use of `syslog`; messages are written to an error log file.

When `syslog` is used, the `daemon.err` syslog facility/severity is used for all log messages.

`mysqld_safe` ignores `--syslog` if `--log-error` is also given.

- `--syslog-tag=tag`

For logging to `syslog`, messages from `mysqld_safe` and `mysqld` are written with identifiers of `mysqld_safe` and `mysqld`, respectively. To specify a suffix for the identifiers, use `--syslog-tag=tag`, which modifies the identifiers to be `mysqld_safe-tag` and `mysqld-tag`.

- `--timezone=timezon...`
Set the `TZ` time zone environment variable to the given option value. Consult your operating system documentation for legal time zone specification formats.

- `--user={user_name|user_id}`

  Run the `mysqld` server as the user having the name `user_name` or the numeric user ID `user_id`. ("User" in this context refers to a system login account, not a MySQL user listed in the grant tables.)

If you execute `mysqld_safe` with the `--defaults-file` or `--defaults-extra-file` option to name an option file, the option must be the first one given on the command line or the option file will not be used. For example, this command will not use the named option file:

```sql
mysql> mysqld_safe --port=port_num --defaults-file=file_name
```

Instead, use the following command:

```sql
mysql> mysqld_safe --defaults-file=file_name --port=port_num
```

The `mysqld_safe` script is written so that it normally can start a server that was installed from either a source or a binary distribution of MySQL, even though these types of distributions typically install the server in slightly different locations. (See Section 2.1.4, “Installation Layouts”.) `mysqld_safe` expects one of the following conditions to be true:

- The server and databases can be found relative to the working directory (the directory from which `mysqld_safe` is invoked). For binary distributions, `mysqld_safe` looks under its working directory for `bin` and `data` directories. For source distributions, it looks for `libexec` and `var` directories. This condition should be met if you execute `mysqld_safe` from your MySQL installation directory (for example, `/usr/local/mysql` for a binary distribution).

- If the server and databases cannot be found relative to the working directory, `mysqld_safe` attempts to locate them by absolute path names. Typical locations are `/usr/local/libexec` and `/usr/local/var`. The actual locations are determined from the values configured into the distribution at the time it was built. They should be correct if MySQL is installed in the location specified at configuration time.

Because `mysqld_safe` tries to find the server and databases relative to its own working directory, you can install a binary distribution of MySQL anywhere, as long as you run `mysqld_safe` from the MySQL installation directory:

```shell
shell> cd mysql_installation_directory
shell> bin/mysqld_safe &
```

If `mysqld_safe` fails, even when invoked from the MySQL installation directory, specify the `--ledir` and `--datadir` options to indicate the directories in which the server and databases are located on your system.

In MySQL 5.6.5 and later, `mysqld_safe` tries to use the `sleep` and `date` system utilities to determine how many times it has attempted to start this second, and—if these are present and this is greater than 5 times—is forced to wait 1 full second before starting again. This is intended to prevent excessive CPU usage in the event of repeated failures. (Bug #11761530, Bug #54035)

When you use `mysqld_safe` to start `mysqld`, `mysqld_safe` arranges for error (and notice) messages from itself and from `mysqld` to go to the same destination.

There are several `mysqld_safe` options for controlling the destination of these messages:
- **--log-error=file_name**: Write error messages to the named error file.
- **--syslog**: Write error messages to *syslog* on systems that support the *logger* program.
- **--skip-syslog**: Do not write error messages to *syslog*. Messages are written to the default error log file (*host_name.err* in the data directory), or to a named file if the **--log-error** option is given.

If none of these options is given, the default is **--skip-syslog**.

If **--log-error** and **--syslog** are both given, a warning is issued and **--log-error** takes precedence.

When *mysqld_safe* writes a message, notices go to the logging destination (*syslog* or the error log file) and *stdout*. Errors go to the logging destination and *stderr*.

### 4.3.3 *mysql.server* — MySQL Server Startup Script

MySQL distributions on Unix and Unix-like system include a script named *mysql.server*, which starts the MySQL server using *mysqld_safe*. It can be used on systems such as Linux and Solaris that use System V-style run directories to start and stop system services. It is also used by the macOS Startup Item for MySQL.

*mysql.server* is the script name as used within the MySQL source tree. The installed name might be different (for example, *mysqld* or *mysql*). In the following discussion, adjust the name *mysql.server* as appropriate for your system.

To start or stop the server manually using the *mysql.server* script, invoke it from the command line with **start** or **stop** arguments:

```
shell> mysql.server start
shell> mysql.server stop
```

*mysql.server* changes location to the MySQL installation directory, then invokes *mysqld_safe*. To run the server as some specific user, add an appropriate **user** option to the [mysqld] group of the global /etc/my.cnf option file, as shown later in this section. (It is possible that you must edit *mysql.server* if you’ve installed a binary distribution of MySQL in a nonstandard location. Modify it to change location into the proper directory before it runs *mysqld_safe*. If you do this, your modified version of *mysql.server* may be overwritten if you upgrade MySQL in the future; make a copy of your edited version that you can reinstall.)

*mysql.server stop* stops the server by sending a signal to it. You can also stop the server manually by executing *mysqladmin shutdown*.

To start and stop MySQL automatically on your server, you must add start and stop commands to the appropriate places in your /etc/rc* files:

- If you use the Linux server RPM package (*MySQL-server-VERSION.rpm*), or a native Linux package installation, the *mysql.server* script may be installed in the /etc/init.d directory with the name *mysqld* or *mysql*. See Section 2.5.5, “Installing MySQL on Linux Using RPM Packages from Oracle”, for more information on the Linux RPM packages.

- If you install MySQL from a source distribution or using a binary distribution format that does not install *mysql.server* automatically, you can install the script manually. It can be found in the *support-files* directory under the MySQL installation directory or in a MySQL source tree. Copy the script to the /etc/init.d directory with the name *mysql* and make it executable:
After installing the script, the commands needed to activate it to run at system startup depend on your operating system. On Linux, you can use `chkconfig`:

```
shell> cp mysql.server /etc/init.d/mysql
shell> chmod +x /etc/init.d/mysql
```

On some Linux systems, the following command also seems to be necessary to fully enable the `mysql` script:

```
shell> chkconfig --level 345 mysql on
```

- On FreeBSD, startup scripts generally should go in `/usr/local/etc/rc.d/`. Install the `mysql.server` script as `/usr/local/etc/rc.d/mysql.server.sh` to enable automatic startup. The `rc(8)` manual page states that scripts in this directory are executed only if their base name matches the `*.sh` shell file name pattern. Any other files or directories present within the directory are silently ignored.

- As an alternative to the preceding setup, some operating systems also use `/etc/rc.local` or `/etc/init.d/boot.local` to start additional services on startup. To start up MySQL using this method, append a command like the one following to the appropriate startup file:

```
/bin/sh -c 'cd /usr/local/mysql; ./bin/mysqld_safe --user=mysql &'
```

- For other systems, consult your operating system documentation to see how to install startup scripts.

`mysql.server` reads options from the `[mysql.server]` and `[mysqld]` sections of option files. For backward compatibility, it also reads `[mysql_server]` sections, but to be current you should rename such sections to `[mysql.server]`.

You can add options for `mysql.server` in a global `/etc/my.cnf` file. A typical `my.cnf` file might look like this:

```
[mysqld]
datadir=/usr/local/mysql/var
socket=/var/tmp/mysql.sock
port=3306
user=mysql

[mysql.server]
basedir=/usr/local/mysql
```

The `mysql.server` script supports the options shown in the following table. If specified, they must be placed in an option file, not on the command line. `mysql.server` supports only `start` and `stop` as command-line arguments.

**Table 4.6 mysql.server Option-File Options**

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>basedir</td>
<td>Path to MySQL installation directory</td>
<td>Directory name</td>
</tr>
<tr>
<td>datadir</td>
<td>Path to MySQL data directory</td>
<td>Directory name</td>
</tr>
</tbody>
</table>
### Option Names

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>pid-file</td>
<td>File in which server should write its process ID</td>
<td>File name</td>
</tr>
<tr>
<td>service-startup-timeout</td>
<td>How long to wait for server startup</td>
<td>Integer</td>
</tr>
</tbody>
</table>

- **basedir=dir_name**
  The path to the MySQL installation directory.

- **datadir=dir_name**
  The path to the MySQL data directory.

- **pid-file=file_name**
  The path name of the file in which the server should write its process ID. The server creates the file in the data directory unless an absolute path name is given to specify a different directory.

If this option is not given, `mysql.server` uses a default value of `host_name.pid`. The PID file value passed to `mysqld_safe` overrides any value specified in the [mysqld_safe] option file group. Because `mysql.server` reads the [mysqld] option file group but not the [mysqld_safe] group, you can ensure that `mysqld_safe` gets the same value when invoked from `mysql.server` as when invoked manually by putting the same `pid-file` setting in both the [mysqld_safe] and [mysqld] groups.

- **service-startup-timeout=seconds**
  How long in seconds to wait for confirmation of server startup. If the server does not start within this time, `mysql.server` exits with an error. The default value is 900. A value of 0 means not to wait at all for startup. Negative values mean to wait forever (no timeout).

## 4.3.4 `mysqld_multi` — Manage Multiple MySQL Servers

`mysqld_multi` is designed to manage several `mysqld` processes that listen for connections on different Unix socket files and TCP/IP ports. It can start or stop servers, or report their current status.

`mysqld_multi` searches for groups named `[mysqldN]` in `my.cnf` (or in the file named by the `--defaults-file` option). N can be any positive integer. This number is referred to in the following discussion as the option group number, or GNR. Group numbers distinguish option groups from one another and are used as arguments to `mysqld_multi` to specify which servers you want to start, stop, or obtain a status report for. Options listed in these groups are the same that you would use in the [mysqld] group used for starting `mysqld`. (See, for example, Section 2.10.5, “Starting and Stopping MySQL Automatically”.) However, when using multiple servers, it is necessary that each one use its own value for options such as the Unix socket file and TCP/IP port number. For more information on which options must be unique per server in a multiple-server environment, see Section 5.7, “Running Multiple MySQL Instances on One Machine”.

To invoke `mysqld_multi`, use the following syntax:

```
shell> mysqld_multi [options] {start|stop|reload|report} [GNR[, GNR] ...]
```

*start*, *stop*, *reload* (stop and restart), and *report* indicate which operation to perform. (*reload* is available as of MySQL 5.6.3.) You can perform the designated operation for a single server or multiple
servers, depending on the GNR list that follows the option name. If there is no list, mysqld_multi performs the operation for all servers in the option file.

Each GNR value represents an option group number or range of group numbers. The value should be the number at the end of the group name in the option file. For example, the GNR for a group named [mysqld17] is 17. To specify a range of numbers, separate the first and last numbers by a dash. The GNR value 10-13 represents groups [mysqld10] through [mysqld13]. Multiple groups or group ranges can be specified on the command line, separated by commas. There must be no whitespace characters (spaces or tabs) in the GNR list; anything after a whitespace character is ignored.

This command starts a single server using option group [mysqld17]:

```
shell> mysqld_multi start 17
```

This command stops several servers, using option groups [mysqld8] and [mysqld10] through [mysqld13]:

```
shell> mysqld_multi stop 8,10-13
```

For an example of how you might set up an option file, use this command:

```
shell> mysqld_multi --example
```

mysqld_multi searches for option files as follows:

- With --no-defaults, no option files are read.
- With --defaults-file=file_name, only the named file is read.
- Otherwise, option files in the standard list of locations are read, including any file named by the --defaults-extra-file=file_name option, if one is given. (If the option is given multiple times, the last value is used.)

For additional information about these and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

Option files read are searched for [mysqld_multi] and [mysqldN] option groups. The [mysqld_multi] group can be used for options to mysqld_multi itself. [mysqldN] groups can be used for options passed to specific mysqld instances.

The [mysqld] or [mysqld_safe] groups can be used for common options read by all instances of mysqld or mysqld_safe. You can specify a --defaults-file=file_name option to use a different configuration file for that instance, in which case the [mysqld] or [mysqld_safe] groups from that file will be used for that instance.

mysqld_multi supports the following options.

- --help
  Display a help message and exit.
- --example
  Display a sample option file.
- --log=file_name
Specify the name of the log file. If the file exists, log output is appended to it.

- **--mysqladmin=prog_name**
  The *mysqladmin* binary to be used to stop servers.

- **--mysqld=prog_name**
  The *mysqld* binary to be used. You can specify *mysql_safe* as the value for this option. If you use *mysql_safe* to start the server, you can include the *mysqld* or *ledir* options in the corresponding *[mysqldN]* option group. These options indicate the name of the server that *mysql_safe* should start and the path name of the directory where the server is located. (See the descriptions for these options in Section 4.3.2, “mysql_safe — MySQL Server Startup Script”.) Example:

  ```
  [mysqld38]
  mysqld = mysqld-debug
  ledir  = /opt/local/mysql/libexec
  ```

- **--no-log**
  Print log information to *stdout* rather than to the log file. By default, output goes to the log file.

- **--password=password**
  The password of the MySQL account to use when invoking *mysqladmin*. The password value is not optional for this option, unlike for other MySQL programs.

- **--silent**
  Silent mode; disable warnings.

- **--tcp-ip**
  Connect to each MySQL server through the TCP/IP port instead of the Unix socket file. (If a socket file is missing, the server might still be running, but accessible only through the TCP/IP port.) By default, connections are made using the Unix socket file. This option affects *stop* and *report* operations.

- **--user=user_name**
  The user name of the MySQL account to use when invoking *mysqladmin*.

- **--verbose**
  Be more verbose.

- **--version**
  Display version information and exit.

Some notes about *mysql_multi*:

- **Most important**: Before using *mysql_multi* be sure that you understand the meanings of the options that are passed to the *mysqld* servers and why you would want to have separate *mysqld* processes. Beware of the dangers of using multiple *mysqld* servers with the same data directory. Use separate data directories, unless you *know* what you are doing. Starting multiple servers with the same data directory does *not* give you extra performance in a threaded system. See Section 5.7, “Running Multiple MySQL Instances on One Machine”.
Important
Make sure that the data directory for each server is fully accessible to the Unix account that the specific `mysqld` process is started as. *Do not* use the Unix `root` account for this, unless you *know* what you are doing. See Section 6.1.5, “How to Run MySQL as a Normal User”.

- Make sure that the MySQL account used for stopping the `mysqld` servers (with the `mysqladmin` program) has the same user name and password for each server. Also, make sure that the account has the `SHUTDOWN` privilege. If the servers that you want to manage have different user names or passwords for the administrative accounts, you might want to create an account on each server that has the same user name and password. For example, you might set up a common `multi_admin` account by executing the following commands for each server:

```
shell> mysql -u root -S /tmp/mysql.sock -p
Enter password:
mysql> CREATE USER 'multi_admin'@'localhost' IDENTIFIED BY 'multipass';
mysql> GRANT SHUTDOWN ON *.* TO 'multi_admin'@'localhost';
```

See Section 6.2, “Access Control and Account Management”. You have to do this for each `mysqld` server. Change the connection parameters appropriately when connecting to each one. The host name part of the account name must permit you to connect as `multi_admin` from the host where you want to run `mysqld_multi`.

- The Unix socket file and the TCP/IP port number must be different for every `mysqld`. (Alternatively, if the host has multiple network addresses, you can set the `bind_address` system variable to cause different servers to listen to different interfaces.)

- The `--pid-file` option is very important if you are using `mysqld_safe` to start `mysqld` (for example, `--mysqld=myqld_safe`) Every `mysqld` should have its own process ID file. The advantage of using `mysqld_safe` instead of `mysqld` is that `mysqld_safe` monitors its `mysqld` process and restarts it if the process terminates due to a signal sent using `kill -9` or for other reasons, such as a segmentation fault.

- You might want to use the `--user` option for `mysqld`, but to do this you need to run the `mysqld_multi` script as the Unix superuser (`root`). Having the option in the option file doesn't matter; you just get a warning if you are not the superuser and the `mysqld` processes are started under your own Unix account.

The following example shows how you might set up an option file for use with `mysqld_multi`. The order in which the `mysqld` programs are started or stopped depends on the order in which they appear in the option file. Group numbers need not form an unbroken sequence. The first and fifth `[mysqldN]` groups were intentionally omitted from the example to illustrate that you can have “gaps” in the option file. This gives you more flexibility.

```
# This is an example of a my.cnf file for mysqld_multi.
# Usually this file is located in home dir ~/.my.cnf or /etc/my.cnf

[mysqld_multi]
mysqld  = /usr/local/mysql/bin/mysqld_safe
mysqladmin = /usr/local/mysql/bin/mysqladmin
user = multi_admin
password = my_password

[mysqld2]
socket = /tmp/mysql.sock2
port = 3307
```
4.4 MySQL Installation-Related Programs

The programs in this section are used when installing or upgrading MySQL.

4.4.1 comp_err — Compile MySQL Error Message File

`comp_err` creates the `errmsg.sys` file that is used by `mysqld` to determine the error messages to display for different error codes. `comp_err` normally is run automatically when MySQL is built. It compiles the `errmsg.sys` file from the text file located at `sql/share/errmsg-utf8.txt` in MySQL source distributions.

`comp_err` also generates `mysqld_error.h`, `mysqld_ename.h`, and `sql_state.h` header files.

For more information about how error messages are defined, see the MySQL Internals Manual.

Invoke `comp_err` like this:

```
shell> comp_err [options]
```

`comp_err` supports the following options.

- `--help, -?`
  Display a help message and exit.

- `--charset=dir_name, -C dir_name`
  The character set directory. The default is `../sql/share/charsets`.
mysqlbug — Generate Bug Report

- --debug=debug_options, --debug_options
  Write a debugging log. A typical debug_options string is d:t:O, file_name. The default is d:t:O, /tmp/comp_err.trace.

- --debug-info, -T
  Print some debugging information when the program exits.

- --header_file=file_name, -H file_name
  The name of the error header file. The default is mysqld_error.h.

- --in_file=file_name, -F file_name
  The name of the input file. The default is ../sql/share/errmsg-utf8.txt.

- --name_file=file_name, -N file_name
  The name of the error name file. The default is mysqld_ername.h.

- --out_dir=dir_name, -D dir_name
  The name of the output base directory. The default is ../sql/share/.

- --out_file=file_name, -O file_name
  The name of the output file. The default is errmsg.sys.

- --statefile=file_name, -S file_name
  The name for the SQLSTATE header file. The default is sql_state.h.

- --version, -V
  Display version information and exit.

4.4.2 mysqlbug — Generate Bug Report

This program is obsolete. It is deprecated as of MySQL 5.6.19 and is removed in MySQL 5.7.

The normal way to report bugs is to visit http://bugs.mysql.com/, which is the address for our bugs database. This database is public and can be browsed and searched by anyone. If you log in to the system, you can enter new reports.

4.4.3 mysql_install_db — Initialize MySQL Data Directory

mysql_install_db initializes the MySQL data directory and creates the system tables that it contains, if they do not exist. It also initializes the system tablespace and related data structures needed to manage InnoDB tables. As of MySQL 5.6.8, mysql_install_db is a Perl script and can be used on any system with Perl installed. Before 5.6.8, it is a shell script and is available only on Unix platforms.

As of MySQL 5.6.8, on Unix platforms, mysql_install_db creates a default option file named my.cnf in the base installation directory. This file is created from a template included in the distribution package named my-default.cnf. You can find the template in or under the base installation directory. When started using mysqld_safe, the server uses my.cnf file by default. If my.cnf already exists, mysql_install_db assumes it to be in use and writes a new file named my-new.cnf instead.
With one exception, the settings in the default option file are commented and have no effect. The exception is that the file sets the sql_mode system variable to NO_ENGINE_SUBSTITUTION, STRICT_TRANS_TABLES. This setting produces a server configuration that results in errors rather than warnings for bad data in operations that modify transactional tables. See Section 5.1.10, “Server SQL Modes”.

To invoke mysql_install_db, use the following syntax:

```shell
shell> mysql_install_db [options]
```

Because the MySQL server, mysqld, must access the data directory when it runs later, you should either run mysql_install_db from the same system account that will be used for running mysqld, or run it as root and specify the --user option to indicate the user name that mysqld will run as. It might be necessary to specify other options such as --basedir or --datadir if mysql_install_db does not use the correct locations for the installation directory or data directory. For example:

```shell
shell> scripts/mysql_install_db --user=mysql 
   --basedir=/opt/mysql/mysql 
   --datadir=/opt/mysql/mysql/data
```

**Note**

After mysql_install_db sets up the InnoDB system tablespace, changes to some tablespace characteristics require setting up a whole new instance. This includes the file name of the first file in the system tablespace and the number of undo logs. If you do not want to use the default values, make sure that the settings for the innodb_data_file_path and innodb_log_file_size configuration parameters are in place in the MySQL configuration file before running mysql_install_db. Also make sure to specify as necessary other parameters that affect the creation and location of InnoDB files, such as innodb_data_home_dir and innodb_log_group_home_dir.

If those options are in your configuration file but that file is not in a location that MySQL reads by default, specify the file location using the --defaults-extra-file option when you run mysql_install_db.

**Note**

If you have set a custom TMPDIR environment variable when performing the installation, and the specified directory is not accessible, mysql_install_db may fail. If so, unset TMPDIR or set TMPDIR to point to the system temporary directory (usually /tmp).

mysql_install_db supports the following options, which can be specified on the command line or in the [mysql_install_db] group of an option file. (Options that are common to mysqld can also be specified in the [mysqld] group.) Other options are passed to mysqld. For information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

<td>For internal use</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **--help**
  
  Display a help message and exit.

- **--basedir=dir_name**
  
  The path to the MySQL installation directory.

- **--builddir=dir_name**
  
  For use with --srcdir and out-of-source builds. Set this to the location of the directory where the built files reside.

- **--cross-bootstrap**
  
  For internal use. This option is used for building system tables on one host intended for another.

- **--datadir=dir_name**
  
  The path to the MySQL data directory. Beginning with MySQL 5.6.8, mysql_install_db is more strict about the option value. Only the last component of the path name is created if it does not exist; the parent directory must already exist or an error occurs.

- **--defaults-extra-file=file_name**
  
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. file_name is interpreted relative to the current directory if given as a relative path name rather than a full path name.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

---

303
mysql_install_db — Initialize MySQL Data Directory

- **--defaults-file=file_name**
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--force**
  Cause `mysql_install_db` to run even if DNS does not work. Grant table entries normally created using host names will use IP addresses instead.

- **--keep-my-cnf**
  Tell `mysql_install_db` to preserve any existing `my.cnf` file and not create a new default `my.cnf` file. This option was added in MySQL 5.6.20.

- **--ldata=dir_name**
  A synonym for **--datadir**.

- **--no-defaults**
  Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--random-passwords**
  On Unix platforms, this option provides for more secure MySQL installation. Invoking `mysql_install_db` with `--random-passwords` causes it to perform the following actions in addition to its normal operation:

    - The installation process creates a random password, assigns it to the initial MySQL root accounts, and sets the “password expired” flag for those accounts.

    - The initial random root password is written to the `.mysql_secret` file in the directory named by the HOME environment variable. Depending on operating system, using a command such as `sudo` may cause the value of HOME to refer to the home directory of the root system user.

      If `.mysql_secret` already exists, the new password information is appended to it. Each password entry includes a timestamp so that in the event of multiple install operations it is possible to determine the password associated with each one.

      `.mysql_secret` is created with mode 600 to be accessible only to the operating system user for whom it is created.

    - No anonymous-user MySQL accounts are created.

  As a result of these actions, it is necessary after installation to start the server, connect as root using the password written to the `.mysql_secret` file, and specify a new root password. Until this is done, root cannot do anything else. This must be done for each root account you intend to use. To change the password, you can use the SET PASSWORD statement (for example, with the mysql client). You can also use mysqladmin or mysql_secure_installation.
New RPM install operations (not upgrades) invoke `mysql_install_db` with the `--random-passwords` option. (Install operations using RPMs for Unbreakable Linux Network are unaffected because they do not use `mysql_install_db`.)

As of MySQL 5.6.9, new Solaris PKG install operations (not upgrades) invoke `mysql_install_db` with the `--random-passwords` option.

For install operations using a binary `.tar.gz` distribution or a source distribution, you can invoke `mysql_install_db` with the `--random-passwords` option manually to make your MySQL installation more secure. This is recommended, particularly for sites with sensitive data.

- `--rpm`

  For internal use. This option is used during the MySQL installation process for install operations performed using RPM packages.

- `--skip-name-resolve`

  Use IP addresses rather than host names when creating grant table entries. This option can be useful if your DNS does not work.

- `--srcdir=dir_name`

  For internal use. This option specifies the directory under which `mysql_install_db` looks for support files such as the error message file and the file for populating the help tables.

- `--user=user_name`

  The system (login) user name to use for running `mysqld`. Files and directories created by `mysqld` will be owned by this user. You must be the system `root` user to use this option. By default, `mysqld` runs using your current login name and files and directories that it creates will be owned by you.

- `--verbose`

  Verbose mode. Print more information about what the program does.

- `--windows`

  For internal use. This option is used for creating Windows distributions.

### 4.4.4 `mysql_plugin` — Configure MySQL Server Plugins

The `mysql_plugin` utility enables MySQL administrators to manage which plugins a MySQL server loads. It provides an alternative to manually specifying the `--plugin-load` option at server startup or using the `INSTALL PLUGIN` and `UNINSTALL PLUGIN` statements at runtime. `mysql_plugin` is available as of MySQL 5.6.3.

Depending on whether `mysql_plugin` is invoked to enable or disable plugins, it inserts or deletes rows in the `mysql.plugin` table that serves as a plugin registry. (To perform this operation, `mysql_plugin` invokes the MySQL server in bootstrap mode. This means that the server must not already be running.) For normal server startups, the server loads and enables plugins listed in `mysql.plugin` automatically. For additional control over plugin activation, use `--plugin_name` options named for specific plugins, as described in Section 5.5.1, “Installing and Uninstalling Plugins”.

Each invocation of `mysql_plugin` reads a configuration file to determine how to configure the plugins contained in a single plugin library file. To invoke `mysql_plugin`, use this syntax:
mysql_plugin — Configure MySQL Server Plugins

mysql_plugin [options] plugin {ENABLE|DISABLE}

plugin is the name of the plugin to configure. ENABLE or DISABLE (not case-sensitive) specify whether to enable or disable components of the plugin library named in the configuration file. The order of the plugin and ENABLE or DISABLE arguments does not matter.

For example, to configure components of a plugin library file named myplugins.so on Linux or myplugins.dll on Windows, specify a plugin value of myplugins. Suppose that this plugin library contains three plugins, plugin1, plugin2, and plugin3, all of which should be configured under mysql_plugin control. By convention, configuration files have a suffix of .ini and the same base name as the plugin library, so the default configuration file name for this plugin library is myplugins.ini. The configuration file contents look like this:

```
myplugins
plugin1
plugin2
plugin3
```

The first line in the myplugins.ini file is the name of the library file, without any extension such as .so or .dll. The remaining lines are the names of the components to be enabled or disabled. Each value in the file should be on a separate line. Lines on which the first character is '#' are taken as comments and ignored.

To enable the plugins listed in the configuration file, invoke mysql_plugin this way:

```
shell> mysql_plugin myplugins ENABLE
```

To disable the plugins, use DISABLE rather than ENABLE.

An error occurs if mysql_plugin cannot find the configuration file or plugin library file, or if mysql_plugin cannot start the MySQL server.

mysql_plugin supports the following options, which can be specified on the command line or in the [mysqld] group of any option file. For options specified in a [mysqld] group, mysql_plugin recognizes the --basedir, --datadir, and --plugin-dir options and ignores others. For information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

Table 4.8 mysql_plugin Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--basedir</td>
<td>The server base directory</td>
</tr>
<tr>
<td>--datadir</td>
<td>The server data directory</td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
</tr>
<tr>
<td>--my-print-defaults</td>
<td>Path to my_print_defaults</td>
</tr>
<tr>
<td>--mysqld</td>
<td>Path to server</td>
</tr>
<tr>
<td>--no-defaults</td>
<td>Do not read configuration file</td>
</tr>
<tr>
<td>--plugin-dir</td>
<td>Directory where plugins are installed</td>
</tr>
<tr>
<td>--plugin_ini</td>
<td>The plugin configuration file</td>
</tr>
<tr>
<td>--print-defaults</td>
<td>Show configuration file defaults</td>
</tr>
<tr>
<td>--verbose</td>
<td>Verbose mode</td>
</tr>
</tbody>
</table>
**mysql_plugin** — Configure MySQL Server Plugins

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--version</td>
<td>Display version information and exit</td>
</tr>
</tbody>
</table>

- **--help, -?**
  Display a help message and exit.

- **--basedir=dir_name, -b dir_name**
  The server base directory.

- **--datadir=dir_name, -d dir_name**
  The server data directory.

- **--my-print-defaults=file_name, -b file_name**
  The path to the `my_print_defaults` program.

- **--mysqld=file_name, -b file_name**
  The path to the `mysqld` server.

- **--no-defaults, -p**
  Do not read values from the configuration file. This option enables an administrator to skip reading defaults from the configuration file.

  With `mysql_plugin`, this option need not be given first on the command line, unlike most other MySQL programs that support `--no-defaults`.

- **--plugin-dir=dir_name, -p dir_name**
  The server plugin directory.

- **--plugin-ini=file_name, -i file_name**
  The `mysql_plugin` configuration file. Relative path names are interpreted relative to the current directory. If this option is not given, the default is `plugin.ini` in the plugin directory, where `plugin` is the plugin argument on the command line.

- **--print-defaults, -P**
  Display the default values from the configuration file. This option causes `mysql_plugin` to print the defaults for `--basedir`, `--datadir`, and `--plugin-dir` if they are found in the configuration file. If no value for a variable is found, nothing is shown.

  With `mysql_plugin`, this option need not be given first on the command line, unlike most other MySQL programs that support `--print-defaults`.

- **--verbose, -v**
  Verbose mode. Print more information about what the program does. This option can be used multiple times to increase the amount of information.

- **--version, -V**
  Display version information and exit.
4.4.5 mysql_secure_installation — Improve MySQL Installation Security

This program enables you to improve the security of your MySQL installation in the following ways:

- You can set a password for root accounts.
- You can remove root accounts that are accessible from outside the local host.
- You can remove anonymous-user accounts.
- You can remove the test database (which by default can be accessed by all users, even anonymous users), and privileges that permit anyone to access databases with names that start with test_.

mysql_secure_installation helps you implement security recommendations similar to those described at Section 2.10.4, “Securing the Initial MySQL Accounts”.

Invoke mysql_secure_installation without arguments:

```
shell> mysql_secure_installation
```

When executed, the script prompts you to determine which actions to perform.

4.4.6 mysql_tzinfo_to_sql — Load the Time Zone Tables

The mysql_tzinfo_to_sql program loads the time zone tables in the mysql database. It is used on systems that have a zoneinfo database (the set of files describing time zones). Examples of such systems are Linux, FreeBSD, Solaris, and OS X. One likely location for these files is the /usr/share/zoneinfo directory (/usr/share/lib/zoneinfo on Solaris). If your system does not have a zoneinfo database, you can use the downloadable package described in Section 5.1.12, “MySQL Server Time Zone Support”.

mysql_tzinfo_to_sql can be invoked several ways:

```
shell> mysql_tzinfo_to_sql tz_dir
shell> mysql_tzinfo_to_sql tz_file tz_name
shell> mysql_tzinfo_to_sql --leap tz_file
```

For the first invocation syntax, pass the zoneinfo directory path name to mysql_tzinfo_to_sql and send the output into the mysql program. For example:

```
shell> mysql_tzinfo_to_sql /usr/share/zoneinfo | mysql -u root mysql
```

mysql_tzinfo_to_sql reads your system’s time zone files and generates SQL statements from them. mysql processes those statements to load the time zone tables.

The second syntax causes mysql_tzinfo_to_sql to load a single time zone file tz_file that corresponds to a time zone name tz_name:

```
shell> mysql_tzinfo_to_sql tz_file tz_name | mysql -u root mysql
```

If your time zone needs to account for leap seconds, invoke mysql_tzinfo_to_sql using the third syntax, which initializes the leap second information. tz_file is the name of your time zone file:

```
shell> mysql_tzinfo_to_sql --leap tz_file | mysql -u root mysql
```
After running `mysql_tzinfo_to_sql`, it is best to restart the server so that it does not continue to use any previously cached time zone data.

### 4.4.7 `mysql_upgrade` — Check and Upgrade MySQL Tables

Each time you upgrade MySQL, you should execute `mysql_upgrade`, which looks for incompatibilities with the upgraded MySQL server:

- It upgrades the system tables in the `mysql` schema so that you can take advantage of new privileges or capabilities that might have been added.
- It upgrades the Performance Schema.
- It examines user schemas.

If `mysql_upgrade` finds that a table has a possible incompatibility, it performs a table check and, if problems are found, attempts a table repair. If the table cannot be repaired, see Section 2.11.10, “Rebuilding or Repairing Tables or Indexes” for manual table repair strategies.

If you install MySQL from RPM packages on Linux, you must install the server and client RPMs. `mysql_upgrade` is included in the server RPM but requires the client RPM because the latter includes `mysqlcheck`. (See Section 2.5.5, “Installing MySQL on Linux Using RPM Packages from Oracle”.)

**Note**

On Windows, you must run `mysql_upgrade` with administrator privileges. You can do this by running a Command Prompt as Administrator and running the command. Failure to do so may result in the upgrade failing to execute correctly.

**Caution**

You should always back up your current MySQL installation before performing an upgrade. See Section 7.2, “Database Backup Methods”.

Some upgrade incompatibilities may require special handling before upgrading your MySQL installation and running `mysql_upgrade`. See Section 2.11, “Upgrading MySQL”, for instructions on determining whether any such incompatibilities apply to your installation and how to handle them.

Use `mysql_upgrade` like this:

1. Ensure that the server is running.

2. Invoke `mysql_upgrade` to upgrade the system tables in the `mysql` schema and check and repair tables in other schemas:

   ```sh
   shell> mysql_upgrade [options]
   ```

3. Stop the server and restart it so that any system table changes take effect.

If you have multiple MySQL server instances to upgrade, invoke `mysql_upgrade` with connection parameters appropriate for connecting to each of the desired servers. For example, with servers running on the local host on parts 3306 through 3308, upgrade each of them by connecting to the appropriate port:

```sh
shell> mysql_upgrade --protocol=tcp -P 3306 [other_options]
shell> mysql_upgrade --protocol=tcp -P 3307 [other_options]
```
mysql_upgrade — Check and Upgrade MySQL Tables

shell> mysql_upgrade --protocol=tcp -P 3308 [other_options]

For local host connections on Unix, the --protocol=tcp option forces a connection using TCP/IP rather than the Unix socket file.

By default, mysql_upgrade runs as the MySQL root user. If the root password is expired when you run mysql_upgrade, you will see a message that your password is expired and that mysql_upgrade failed as a result. To correct this, reset the root password to unexpire it and run mysql_upgrade again:

shell> mysql -u root -p
Enter password: **** <- enter root password here
mysql> SET PASSWORD = PASSWORD('root-password');
mysql> quit
shell> mysql_upgrade [options]

mysql_upgrade executes the following commands to check and repair tables and to upgrade the system tables:

mysqlcheck --no-defaults --databases
--fix-db-names --fix-table-names mysql
mysqlcheck --no-defaults --check-upgrade --databases
--auto-repair mysql
mysql < fix_priv_tables
mysqlcheck --no-defaults --all-databases
--skip-database=mysql --fix-db-names --fix-table-names
mysqlcheck --no-defaults --check-upgrade --all-databases
--skip-database=mysql --auto-repair

Notes about the preceding commands:

• mysql_upgrade also adds --write-binlog or --skip-write-binlog to the mysqlcheck commands, depending on whether the --write-binlog option was specified on the mysql_upgrade command.

• Unless invoked with the --upgrade-system-tables option, mysql_upgrade processes all tables in all user schemas as necessary. Table checking might take a long time to complete. Each table is locked and therefore unavailable to other sessions while it is being processed. Check and repair operations can be time-consuming, particularly for large tables. Table checking uses mysqlcheck with the --all-databases and --check-upgrade option. For details about what --check-upgrade entails, see the description of the FOR_UPGRADE option of the CHECK TABLE statement in Section 13.7.2.2, “CHECK TABLE Syntax”.

• fix_priv_tables represents a script generated internally by mysql_upgrade that contains SQL statements to upgrade the tables in the mysql database.

mysql_upgrade marks all checked and repaired tables with the current MySQL version number. This ensures that the next time you run mysql_upgrade with the same version of the server, it can be determined whether there is any need to check or repair a given table again.

mysql_upgrade saves the MySQL version number in a file named mysql_upgrade_info in the data directory. This is used to quickly check whether all tables have been checked for this release so that table-checking can be skipped. To ignore this file and perform the check regardless, use the --force option.

mysql_upgrade does not upgrade the contents of the time zone tables or help tables. For upgrade instructions, see Section 5.1.12, “MySQL Server Time Zone Support”, and Section 5.1.13, “Server-Side Help Support”.
MySQL Upgrade supports the following options, which can be specified on the command line or in the [mysql_upgrade] and [client] groups of an option file. Unrecognized options are passed to mysqlcheck. For information about option files, see Section 4.2.2.2, “Using Option Files”.

Table 4.9 mysql_upgrade Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--basedir</td>
<td>Not used</td>
<td></td>

<td>--write-binlog</td>
<td>Write all statements to binary log</td>
<td></td>
</tr>
</tbody>
</table>

- `--help`

  Display a short help message and exit.

- `--basedir=dir_name`

  The path to the MySQL installation directory. This option is accepted for backward compatibility but ignored. It is removed in MySQL 5.7.

- `--character-sets-dir=dir_name`

  The directory where character sets are installed. See Section 10.15, “Character Set Configuration”.

- `--compress`

  Compress all information sent between the client and the server if possible. See Section 4.2.5, “Connection Compression Control”.

- `--datadir=dir_name`

  The path to the data directory. This option is accepted for backward compatibility but ignored. It is removed in MySQL 5.7.

- `--debug[=debug_options], -# [debug_options]`

  Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o,/tmp/mysql_upgrade.trace`.

- `--debug-check`

  Print some debugging information when the program exits.

- `--debug-info, -T`

  Print debugging information and memory and CPU usage statistics when the program exits.

- `--default-auth=plugin`

  A hint about which client-side authentication plugin to use. See Section 6.2.11, “Pluggable Authentication”.
--default-character-set=charset_name
Use charset_name as the default character set. See Section 10.15, “Character Set Configuration”.

--defaults-extra-file=file_name
Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. file_name is interpreted relative to the current directory if given as a relative path name rather than a full path name.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

--defaults-file=file_name
Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. file_name is interpreted relative to the current directory if given as a relative path name rather than a full path name.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

--defaults-group-suffix= str
Read not only the usual option groups, but also groups with the usual names and a suffix of str. For example, mysql_upgrade normally reads the [client] and [mysql_upgrade] groups. If the --defaults-group-suffix=_other option is given, mysql_upgrade also reads the [client_other] and [mysql_upgrade_other] groups.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

--force
Ignore the mysql_upgrade_info file and force execution even if mysql_upgrade has already been executed for the current version of MySQL.

--host=host_name, -h host_name
Connect to the MySQL server on the given host.

--login-path=name
Read options from the named login path in the .mylogin.cnf login path file. A “login path” is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the mysql_config_editor utility. See Section 4.6.6, "mysql_config_editor — MySQL Configuration Utility".

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

--no-defaults
Do not read any option files. If program startup fails due to reading unknown options from an option file, --no-defaults can be used to prevent them from being read.

The exception is that the .mylogin.cnf file, if it exists, is read in all cases. This permits passwords to be specified in a safer way than on the command line even when --no-defaults
is used. (.mylogin.cnf is created by the mysql_config_editor utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.)

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

•  --password[=password], -p [password]

The password of the MySQL account used for connecting to the server. The password value is optional. If not given, \texttt{mysql_upgrade} prompts for one. If given, there must be no space between --password= or -p and the password following it. If no password option is specified, the default is to send no password.

Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

To explicitly specify that there is no password and that \texttt{mysql_upgrade} should not prompt for one, use the --skip-password option.

•  --pipe, -W

On Windows, connect to the server using a named pipe. This option applies only if the server was started with the \texttt{named_pipe} system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the \texttt{named_pipe_full_access_group} system variable.

•  --plugin-dir=dir_name

The directory in which to look for plugins. Specify this option if the --default-auth option is used to specify an authentication plugin but \texttt{mysql_upgrade} does not find it. See Section 6.2.11, “Pluggable Authentication”.

•  --port=port_num, -P port_num

For TCP/IP connections, the port number to use.

•  --print-defaults

Print the program name and all options that it gets from option files.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

•  --protocol={TCP|SOCKET|PIPE|MEMORY}

The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally result in use of a protocol other than the one you want. For details on the permissible values, see Section 4.2.4, “Connecting to the MySQL Server Using Command Options”.

•  --shared-memory-base-name=name

On Windows, the shared-memory name to use for connections made using shared memory to a local server. The default value is MYSQL. The shared-memory name is case-sensitive.

This option applies only if the server was started with the \texttt{shared_memory} system variable enabled to support shared-memory connections.
MySQL Client Programs

- **--socket=path, -S path**
  
  For connections to localhost, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

  On Windows, this option applies only if the server was started with the named_pipe system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the named_pipe_full_access_group system variable.

- **--ssl* option**

  Options that begin with --ssl specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Command Options for Encrypted Connections.

- **--tmpdir=dir_name, -t dir_name**

  The path name of the directory to use for creating temporary files.

- **--upgrade-system-tables, -s**

  Upgrade only the system tables in the mysql schema, do not upgrade user schemas.

- **--user=user_name, -u user_name**

  The user name of the MySQL account to use for connecting to the server. The default user name is root.

- **--verbose**

  Verbose mode. Print more information about what the program does.

- **--version-check, -k**

  Check the version of the server to which mysql_upgrade is connecting to verify that it is the same as the version for which mysql_upgrade was built. If not, mysql_upgrade exits. This option is enabled by default; to disable the check, use --skip-version-check. This option was added in MySQL 5.6.12.

- **--write-binlog**

  Cause binary logging to be enabled while mysql_upgrade runs. In MySQL 5.6.6 and earlier, this was the default behavior. (To disable binary logging during the upgrade, it was necessary to use the inverse of this option, by starting the program with --skip-write-binlog.) Beginning with MySQL 5.6.7, binary logging by mysql_upgrade is disabled by default (Bug #14221043). Invoke the program explicitly with --write-binlog if you want its actions to be written to the binary log. (Also beginning with MySQL 5.6.7, the --skip-write-binlog option effectively does nothing.)

  When the server is running with global transaction identifiers (GTIDs) enabled (gtid_mode=ON), do not enable binary logging by mysql_upgrade.

---

4.5 MySQL Client Programs

This section describes client programs that connect to the MySQL server.

4.5.1 mysql — The MySQL Command-Line Client

mysql is a simple SQL shell with input line editing capabilities. It supports interactive and noninteractive use. When used interactively, query results are presented in an ASCII-table format. When used
noninteractively (for example, as a filter), the result is presented in tab-separated format. The output format
can be changed using command options.

If you have problems due to insufficient memory for large result sets, use the **--quick** option. This
forces **mysql** to retrieve results from the server a row at a time rather than retrieving the entire result
set and buffering it in memory before displaying it. This is done by returning the result set using the
**mysql_use_result()** C API function in the client/server library rather than **mysql_store_result()**.

Using **mysql** is very easy. Invoke it from the prompt of your command interpreter as follows:

```
shell> mysql db_name
```

Or:

```
shell> mysql --user=user_name --password db_name
Enter password: your_password
```

Then type an SQL statement, end it with ;, \g, or \G and press Enter.

Typing **Control+C** causes **mysql** to attempt to kill the current statement. If this cannot be done, or **Control
+C** is typed again before the statement is killed, **mysql** exits.

You can execute SQL statements in a script file (batch file) like this:

```
shell> mysql db_name < script.sql > output.tab
```

On Unix, the **mysql** client logs statements executed interactively to a history file. See Section 4.5.3,
“mysql Client Logging”.

### 4.5.1.1 mysql Client Options

**mysql** supports the following options, which can be specified on the command line or in the [mysql]
and [client] groups of an option file. For information about option files used by MySQL programs, see
Section 4.2.2.2, “Using Option Files”.

#### Table 4.10 mysql Client Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--auto-rehash</td>
<td>Enable automatic rehashing</td>
<td></td>
</tr>
<tr>
<td>--auto-vertical-output</td>
<td>Enable automatic vertical result set display</td>
<td></td>
</tr>
<tr>
<td>--batch</td>
<td>Do not use history file</td>
<td></td>
</tr>
<tr>
<td>--binary-as-hex</td>
<td>Display binary values in hexadecimal notation</td>
<td>5.6.37</td>
</tr>
<tr>
<td>--binary-mode</td>
<td>Disable \n to - \n translation and treatment of \0 as end-of-query</td>
<td>5.6.3</td>
</tr>
<tr>
<td>--bind-address</td>
<td>Use specified network interface to connect to MySQL Server</td>
<td>5.6.1</td>
</tr>
<tr>
<td>--character-sets-dir</td>
<td>Directory where character sets are installed</td>
<td></td>
</tr>
<tr>
<td>--column-names</td>
<td>Write column names in results</td>
<td></td>
</tr>
<tr>
<td>--column-type-info</td>
<td>Display result set metadata</td>
<td></td>
</tr>
<tr>
<td>--comments</td>
<td>Whether to retain or strip comments in statements sent to the server</td>
<td></td>

<tr>
<td>Option Name</td>
<td>Description</td>
<td>Introduced</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>
<td>--connect-expired-password</td>
<td>Indicate to server that client can handle expired-password sandbox mode.</td>
<td>5.6.12</td>
</tr>
<tr>
<td>--connect-timeout</td>
<td>Number of seconds before connection timeout</td>
<td></td>
</tr>
<tr>
<td>--database</td>
<td>The database to use</td>
<td></td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging log; supported only if MySQL was built with debugging support</td>
<td></td>
</tr>
<tr>
<td>--debug-check</td>
<td>Print debugging information when program exits</td>
<td></td>
</tr>
<tr>
<td>--debug-info</td>
<td>Print debugging information, memory, and CPU statistics when program exits</td>
<td></td>
</tr>
<tr>
<td>--default-auth</td>
<td>Authentication plugin to use</td>
<td></td>
</tr>
<tr>
<td>--default-character-set</td>
<td>Specify default character set</td>
<td></td>
</tr>
<tr>
<td>--default-extra-file</td>
<td>Read named option file in addition to usual option files</td>
<td></td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
<td></td>
</tr>
<tr>
<td>--defaults-group-suffix</td>
<td>Option group suffix value</td>
<td></td>
</tr>
<tr>
<td>--delimiter</td>
<td>Set the statement delimiter</td>
<td></td>
</tr>
<tr>
<td>--enable-cleartext-plugin</td>
<td>Enable cleartext authentication plugin</td>
<td>5.6.7</td>
</tr>
<tr>
<td>--execute</td>
<td>Execute the statement and quit</td>
<td></td>
</tr>
<tr>
<td>--force</td>
<td>Continue even if an SQL error occurs</td>
<td></td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
<td></td>
</tr>
<tr>
<td>--histignore</td>
<td>Patterns specifying which statements to ignore for logging</td>
<td>5.6.8</td>
</tr>
<tr>
<td>--host</td>
<td>Host on which MySQL server is located</td>
<td></td>
</tr>
<tr>
<td>--html</td>
<td>Produce HTML output</td>
<td></td>
</tr>
<tr>
<td>--ignore-spaces</td>
<td>Ignore spaces after function names</td>
<td></td>
</tr>
<tr>
<td>--init-command</td>
<td>SQL statement to execute after connecting</td>
<td></td>
</tr>
<tr>
<td>--line-numbers</td>
<td>Write line numbers for errors</td>
<td></td>
</tr>
<tr>
<td>--local-infile</td>
<td>Enable or disable for LOCAL capability for LOAD DATA</td>
<td></td>
</tr>
<tr>
<td>--login-path</td>
<td>Read login path options from .mylogin.cnf</td>
<td>5.6.6</td>
</tr>
<tr>
<td>--max-allowed-packet</td>
<td>Maximum packet length to send to or receive from server</td>
<td></td>
</tr>
<tr>
<td>--max-join-size</td>
<td>The automatic limit for rows in a join when using --safe-updates</td>
<td></td>
</tr>
<tr>
<td>--named-commands</td>
<td>Enable named mysql commands</td>
<td></td>
</tr>
<tr>
<td>--net-buffer-length</td>
<td>Buffer size for TCP/IP and socket communication</td>
<td></td>
</tr>
<tr>
<td>--no-auto-rehash</td>
<td>Disable automatic rehashing</td>
<td></td>
</tr>
<tr>
<td>--no-beep</td>
<td>Do not beep when errors occur</td>
<td></td>
</tr>
<tr>
<td>--no-defaults</td>
<td>Read no option files</td>
<td></td>
</tr>
<tr>
<td>--one-database</td>
<td>Ignore statements except those for the default database named on the command line</td>
<td></td>
</tr>
<tr>
<td>--pager</td>
<td>Use the given command for paging query output</td>
<td></td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
<td></td>
</tr>
<tr>
<td>Option Name</td>
<td>Description</td>
<td>Introduced</td>
</tr>
<tr>
<td>---------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>
<td>--pipe</td>
<td>Connect to server using named pipe (Windows only)</td>
<td></td>
</tr>
<tr>
<td>--plugin-dir</td>
<td>Directory where plugins are installed</td>
<td></td>
</tr>
<tr>
<td>--port</td>
<td>TCP/IP port number for connection</td>
<td></td>
</tr>
<tr>
<td>--print-defaults</td>
<td>Print default options</td>
<td></td>
</tr>
<tr>
<td>--prompt</td>
<td>Set the prompt to the specified format</td>
<td></td>
</tr>
<tr>
<td>--protocol</td>
<td>Connection protocol to use</td>
<td></td>
</tr>
<tr>
<td>--quick</td>
<td>Do not cache each query result</td>
<td></td>
</tr>
<tr>
<td>--raw</td>
<td>Write column values without escape conversion</td>
<td></td>
</tr>
<tr>
<td>--reconnect</td>
<td>If the connection to the server is lost, automatically try to reconnect</td>
<td></td>
</tr>
<tr>
<td>--i-am-a-dummy, --safe-updates</td>
<td>Allow only UPDATE and DELETE statements that specify key values</td>
<td></td>
</tr>
<tr>
<td>--secure-auth</td>
<td>Do not send passwords to server in old (pre-4.1) format</td>
<td></td>
</tr>
<tr>
<td>--select-limit</td>
<td>The automatic limit for SELECT statements when using --safe-updates</td>
<td></td>
</tr>
<tr>
<td>--server-public-key-path</td>
<td>Path name to file containing RSA public key</td>
<td>5.6.6</td>
</tr>
<tr>
<td>--shared-memory-base-name</td>
<td>Name of shared memory to use for shared-memory connections</td>
<td></td>
</tr>
<tr>
<td>--show-warnings</td>
<td>Show warnings after each statement if there are any</td>
<td></td>
</tr>
<tr>
<td>--sigint-ignore</td>
<td>Ignore SIGINT signals (typically the result of typing Control +C)</td>
<td></td>
</tr>
<tr>
<td>--silent</td>
<td>Silent mode</td>
<td></td>
</tr>
<tr>
<td>--skip-auto-rehash</td>
<td>Disable automatic rehashing</td>
<td></td>
</tr>
<tr>
<td>--skip-column-names</td>
<td>Do not write column names in results</td>
<td></td>
</tr>
<tr>
<td>--skip-line-numbers</td>
<td>Skip line numbers for errors</td>
<td></td>

<tr>
<td>--wait</td>
<td>If the connection cannot be established, wait and retry instead of aborting</td>
<td></td>
</tr>
<tr>
<td>--xml</td>
<td>Produce XML output</td>
<td></td>
</tr>
</tbody>
</table>

- **--help, --?**
  
  Display a help message and exit.

- **--auto-rehash**
  
  Enable automatic rehashing. This option is on by default, which enables database, table, and column name completion. Use `--disable-auto-rehash` to disable rehashing. That causes `mysql` to start faster, but you must issue the `rehash` command or its `\#` shortcut if you want to use name completion.

  To complete a name, enter the first part and press Tab. If the name is unambiguous, `mysql` completes it. Otherwise, you can press Tab again to see the possible names that begin with what you have typed so far. Completion does not occur if there is no default database.

- **--auto-vertical-output**
  
  Cause result sets to be displayed vertically if they are too wide for the current window, and using normal tabular format otherwise. (This applies to statements terminated by `;` or `\G`.)

- **--batch, -B**
  
  Print results using tab as the column separator, with each row on a new line. With this option, `mysql` does not use the history file.

  Batch mode results in nontabular output format and escaping of special characters. Escaping may be disabled by using raw mode; see the description for the `--raw` option.

- **--binary-as-hex**
  
  When this option is given, `mysql` displays binary data using hexadecimal notation (`0xvalue`). This occurs whether the overall output display format is tabular, vertical, HTML, or XML.

  This option was added in MySQL 5.6.37.
• **--binary-mode**

This option helps when processing `mysqlbinlog` output that may contain BLOB values. By default, `mysql` translates \r\n in statement strings to \n and interprets \0 as the statement terminator. **--binary-mode** disables both features. It also disables all `mysql` commands except `charset` and `delimiter` in noninteractive mode (for input piped to `mysql` or loaded using the `source` command).

• **--bind-address=ip_address**

On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

• **--character-sets-dir=dir_name**

The directory where character sets are installed. See Section 10.15, “Character Set Configuration”.

• **--column-names**

Write column names in results.

• **--column-type-info**

Display result set metadata.

• **--comments, -c**

Whether to strip or preserve comments in statements sent to the server. The default is **--skip-comments** (strip comments), enable with **--comments** (preserve comments).

• **--compress, -C**

Compress all information sent between the client and the server if possible. See Section 4.2.5, “Connection Compression Control”.

• **--connect-expired-password**

Indicate to the server that the client can handle sandbox mode if the account used to connect has an expired password. This can be useful for noninteractive invocations of `mysql` because normally the server disconnects noninteractive clients that attempt to connect using an account with an expired password. (See Section 6.2.10, “Server Handling of Expired Passwords”.) This option was added in MySQL 5.6.12.

• **--connect-timeout=value**

The number of seconds before connection timeout. (Default value is 0.)

• **--database=db_name, -D db_name**

The database to use. This is useful primarily in an option file.

• **--debug=[debug_options], -# [debug_options]**

Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o, /tmp/mysql.trace`.

This option is available only if MySQL was built using `WITH_DEBUG`. MySQL release binaries provided by Oracle are not built using this option.

• **--debug-check**
Print some debugging information when the program exits.

- `--debug-info`, `-T`

Print debugging information and memory and CPU usage statistics when the program exits.

- `--default-auth=plugin`

A hint about which client-side authentication plugin to use. See Section 6.2.11, "Pluggable Authentication".

- `--default-character-set=charset_name`

Use `charset_name` as the default character set for the client and connection.

This option can be useful if the operating system uses one character set and the `mysql` client by default uses another. In this case, output may be formatted incorrectly. You can usually fix such issues by using this option to force the client to use the system character set instead.

For more information, see Section 10.4, "Connection Character Sets and Collations", and Section 10.15, "Character Set Configuration".

- `--defaults-extra-file=file_name`

Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

For additional information about this and other option-file options, see Section 4.2.2.3, "Command-Line Options that Affect Option-File Handling".

- `--defaults-file=file_name`

Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

Exception: Even with `--defaults-file`, client programs read `.mylogin.cnf`.

For additional information about this and other option-file options, see Section 4.2.2.3, "Command-Line Options that Affect Option-File Handling".

- `--defaults-group-suffix=str`

Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysql` normally reads the `[client]` and `[mysql]` groups. If the `--defaults-group-suffix=_other` option is given, `mysql` also reads the `[client_other]` and `[mysql_other]` groups.

For additional information about this and other option-file options, see Section 4.2.2.3, "Command-Line Options that Affect Option-File Handling".

- `--delimiter=str`

Set the statement delimiter. The default is the semicolon character (;).

- `--disable-named-commands`
Disable named commands. Use the \* form only, or use named commands only at the beginning of a line ending with a semicolon (;). mysql starts with this option enabled by default. However, even with this option, long-format commands still work from the first line. See Section 4.5.1.2, “mysql Client Commands”.

- **--enable-cleartext-plugin**
  
  Enable the mysql_clear_password cleartext authentication plugin. (See Section 6.4.1.5, “Client-Side Cleartext Pluggable Authentication”.)

- **--execute=statement, -e statement**
  
  Execute the statement and quit. The default output format is like that produced with --batch. See Section 4.2.2.1, “Using Options on the Command Line”, for some examples. With this option, mysql does not use the history file.

- **--force, -f**
  
  Continue even if an SQL error occurs.

- **--histignore**
  
  A list of one or more colon-separated patterns specifying statements to ignore for logging purposes. These patterns are added to the default pattern list ("*IDENTIFIED*:*PASSWORD*"). The value specified for this option affects logging of statements written to the history file. For more information, see Section 4.5.1.3, “mysql Client Logging”.

- **--host=host_name, -h host_name**
  
  Connect to the MySQL server on the given host.

- **--html, -H**
  
  Produce HTML output.

- **--ignore-spaces, -i**
  
  Ignore spaces after function names. The effect of this is described in the discussion for the IGNORE_SPACE SQL mode (see Section 5.1.10, “Server SQL Modes”).

- **--init-command=str**
  
  SQL statement to execute after connecting to the server. If auto-reconnect is enabled, the statement is executed again after reconnection occurs.

- **--line-numbers**
  
  Write line numbers for errors. Disable this with --skip-line-numbers.

- **--local-infile[{0|1}]**
  
  Enable or disable LOCAL capability for LOAD DATA. For mysql, this capability is disabled by default. With no value, the option enables LOCAL. The option may be given as --local-infile=0 or --local-infile=1 to explicitly disable or enable LOCAL. Enabling local data loading also requires that the server permits it; see Section 6.1.6, “Security Issues with LOAD DATA LOCAL”

- **--login-path=name**
Read options from the named login path in the .mylogin.cnf login path file. A “login path” is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the mysql_config_editor utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• --max-allowed-packet=value

The maximum size of the buffer for client/server communication. The default is 16MB, the maximum is 1GB.

• --max-join-size=value

The automatic limit for rows in a join when using --safe-updates. (Default value is 1,000,000.)

• --named-commands, -G

Enable named mysql commands. Long-format commands are permitted, not just short-format commands. For example, quit and \q both are recognized. Use --skip-named-commands to disable named commands. See Section 4.5.1.2, “mysql Client Commands”.

• --net-buffer-length=value

The buffer size for TCP/IP and socket communication. (Default value is 16KB.)

• --no-auto-rehash, -A

This has the same effect as --skip-auto-rehash. See the description for --auto-rehash.

• --no-beep, -b

Do not beep when errors occur.

• --no-defaults

Do not read any option files. If program startup fails due to reading unknown options from an option file, --no-defaults can be used to prevent them from being read.

The exception is that the .mylogin.cnf file, if it exists, is read in all cases. This permits passwords to be specified in a safer way than on the command line even when --no-defaults is used. (.mylogin.cnf is created by the mysql_config_editor utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.)

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• --one-database, -o

Ignore statements except those that occur while the default database is the one named on the command line. This option is rudimentary and should be used with care. Statement filtering is based only on USE statements.

Initially, mysql executes statements in the input because specifying a database db_name on the command line is equivalent to inserting USE db_name at the beginning of the input. Then, for each
USE statement encountered, mysql accepts or rejects following statements depending on whether the database named is the one on the command line. The content of the statements is immaterial.

Suppose that mysql is invoked to process this set of statements:

```sql
DELETE FROM db2.t2;
USE db2;
DROP TABLE db1.t1;
CREATE TABLE db1.t1 (i INT);
USE db1;
INSERT INTO t1 (i) VALUES(1);
CREATE TABLE db2.t1 (j INT);
```

If the command line is `mysql --force --one-database db1`, mysql handles the input as follows:

- The **DELETE** statement is executed because the default database is `db1`, even though the statement names a table in a different database.
- The **DROP TABLE** and **CREATE TABLE** statements are not executed because the default database is not `db1`, even though the statements name a table in `db1`.
- The **INSERT** and **CREATE TABLE** statements are executed because the default database is `db1`, even though the **CREATE TABLE** statement names a table in a different database.
- **--pager[=command]**

Use the given command for paging query output. If the command is omitted, the default pager is the value of your `PAGER` environment variable. Valid pagers are `less`, `more`, `cat [> filename]`, and so forth. This option works only on Unix and only in interactive mode. To disable paging, use `--skip-pager`. Section 4.5.1.2, “mysql Client Commands”, discusses output paging further.

- **--password[=password], -p[password]**

The password of the MySQL account used for connecting to the server. The password value is optional. If not given, mysql prompts for one. If given, there must be no space between **--password**= or -p and the password following it. If no password option is specified, the default is to send no password.

Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

To explicitly specify that there is no password and that mysql should not prompt for one, use the **--skip-password** option.

- **--pipe, -W**

On Windows, connect to the server using a named pipe. This option applies only if the server was started with the `named_pipe` system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the `named_pipe_full_access_group` system variable.

- **--plugin-dir=dir_name**

The directory in which to look for plugins. Specify this option if the **--default-auth** option is used to specify an authentication plugin but mysql does not find it. See Section 6.2.11, “Pluggable Authentication”.

- **--port=port_num, -P port_num**
For TCP/IP connections, the port number to use.

- **--print-defaults**

Print the program name and all options that it gets from option files.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--prompt=format_str**

Set the prompt to the specified format. The default is `mysql>`. The special sequences that the prompt can contain are described in Section 4.5.1.2, “mysql Client Commands”.

- **--protocol={TCP|SOCKET|PIPE|MEMORY}**

The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally result in use of a protocol other than the one you want. For details on the permissible values, see Section 4.2.4, “Connecting to the MySQL Server Using Command Options”.

- **--quick, -q**

Do not cache each query result, print each row as it is received. This may slow down the server if the output is suspended. With this option, `mysql` does not use the history file.

- **--raw, -r**

For tabular output, the “boxing” around columns enables one column value to be distinguished from another. For nontabular output (such as is produced in batch mode or when the **--batch** or **--silent** option is given), special characters are escaped in the output so they can be identified easily. Newline, tab, NUL, and backslash are written as \n, \t, \0, and \\. The **--raw** option disables this character escaping.

The following example demonstrates tabular versus nontabular output and the use of raw mode to disable escaping:

```
% mysql
mysql> SELECT CHAR(92);
+----------+
| CHAR(92) |
+----------+
| \        |
+----------+
% mysql -s
mysql> SELECT CHAR(92);
CHAR(92)
\\n% mysql -s -r
mysql> SELECT CHAR(92);
 CHAR(92)
`
• `--safe-updates, --i-am-a-dummy, -U`

If this option is enabled, **UPDATE** and **DELETE** statements that do not use a key in the **WHERE** clause or a **LIMIT** clause produce an error. In addition, restrictions are placed on **SELECT** statements that produce (or are estimated to produce) very large result sets. If you have set this option in an option file, you can use `--skip-safe-updates` on the command line to override it. For more information about this option, see *Using Safe-Updates Mode (--safe-updates)*.

• `--secure-auth`

Do not send passwords to the server in old (pre-4.1) format. This prevents connections except for servers that use the newer password format. This option is enabled by default; use `--skip-secure-auth` to disable it.

**Note**
Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.

**Note**
This option is deprecated and will be removed in a future release. As of MySQL 5.7.5, it is always enabled and attempting to disable it produces an error.

• `--select-limit=value`

The automatic limit for **SELECT** statements when using `--safe-updates`. (Default value is 1,000.)

• `--server-public-key-path=file_name`

The path name to a file containing a client-side copy of the public key required by the server for RSA key pair-based password exchange. The file must be in PEM format. This option applies to clients that authenticate with the `sha256_password` authentication plugin. This option is ignored for accounts that do not authenticate with that plugin. It is also ignored if RSA-based password exchange is not used, as is the case when the client connects to the server using a secure connection.

This option is available only if MySQL was built using OpenSSL.

For information about the `sha256_password` plugin, see Section 6.4.1.4, “SHA-256 Pluggable Authentication”.

• `--shared-memory-base-name=name`

On Windows, the shared-memory name to use for connections made using shared memory to a local server. The default value is `MYSQL`. The shared-memory name is case-sensitive.

This option applies only if the server was started with the `shared_memory` system variable enabled to support shared-memory connections.

• `--show-warnings`

Cause warnings to be shown after each statement if there are any. This option applies to interactive and batch mode.

• `--sigint-ignore`
Ignore `SIGINT` signals (typically the result of typing `Control+C`).

- `--silent, -s`
  Silent mode. Produce less output. This option can be given multiple times to produce less and less output.
  
  This option results in nontabular output format and escaping of special characters. Escaping may be disabled by using raw mode; see the description for the `--raw` option.

- `--skip-column-names, -N`
  Do not write column names in results.

- `--skip-line-numbers, -L`
  Do not write line numbers for errors. Useful when you want to compare result files that include error messages.

- `--socket=PATH, -S PATH`
  For connections to `localhost`, the Unix socket file to use, or, on Windows, the name of the named pipe to use.
  
  On Windows, this option applies only if the server was started with the `named_pipe` system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the `named_pipe_full_access_group` system variable.

- `--ssl*`
  Options that begin with `--ssl` specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Command Options for Encrypted Connections.

- `--table, -t`
  Display output in table format. This is the default for interactive use, but can be used to produce table output in batch mode.

- `--tee=FILE_NAME`
  Append a copy of output to the given file. This option works only in interactive mode. See `mysql Client Commands`, discusses tee files further.

- `--unbuffered, -n`
  Flush the buffer after each query.

- `--user=USER_NAME, -u USER_NAME`
  The user name of the MySQL account to use for connecting to the server.

- `--verbose, -v`
  Verbose mode. Produce more output about what the program does. This option can be given multiple times to produce more and more output. (For example, `-v -v -v` produces table output format even in batch mode.)

- `--version, -V`
Display version information and exit.

- **--vertical, -E**

  Print query output rows vertically (one line per column value). Without this option, you can specify vertical output for individual statements by terminating them with \G.

- **--wait, -w**

  If the connection cannot be established, wait and retry instead of aborting.

- **--xml, -X**

  Produce XML output.

  ```
  <field name="column_name">NULL</field>
  ```

  The output when **--xml** is used with mysql matches that of mysqldump --xml. See Section 4.5.4, "mysqldump — A Database Backup Program", for details.

  The XML output also uses an XML namespace, as shown here:

  ```
  $shell> mysql --xml -uroot -e "SHOW VARIABLES LIKE 'version%'
  $<xml version="1.0">'

  <resultset statement="SHOW VARIABLES LIKE 'version%" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <row>
  <field name="Variable_name">version</field>
  <field name="Value">5.0.40-debug</field>
  </row>
  <row>
  <field name="Variable_name">version_comment</field>
  <field name="Value">Source distribution</field>
  </row>
  <row>
  <field name="Variable_name">version_compile_machine</field>
  <field name="Value">i686</field>
  </row>
  <row>
  <field name="Variable_name">version_compile_os</field>
  <field name="Value">suse-linux-gnu</field>
  </row>
  </resultset>
  ```

### 4.5.1.2 mysql Client Commands

mysql sends each SQL statement that you issue to the server to be executed. There is also a set of commands that mysql itself interprets. For a list of these commands, type help or \h at the mysql prompt:

```
mysql> help
```

List of all MySQL commands:
Note that all text commands must be first on line and end with ';
?  (\?) Synonym for 'help'.
clear (\c) Clear the current input statement.
If `mysql` is invoked with the `--binary-mode` option, all `mysql` commands are disabled except `charset` and `delimiter` in noninteractive mode (for input piped to `mysql` or loaded using the `source` command).

Each command has both a long and short form. The long form is not case-sensitive; the short form is. The long form can be followed by an optional semicolon terminator, but the short form should not.

The use of short-form commands within multiple-line /* ... */ comments is not supported.

- **help [arg], \h [arg], \? [arg], ? [arg]**

  Display a help message listing the available `mysql` commands.

  If you provide an argument to the `help` command, `mysql` uses it as a search string to access server-side help from the contents of the MySQL Reference Manual. For more information, see Section 4.5.1.4, "mysql Client Server-Side Help".

- **charset charset_name, \C charset_name**

  Change the default character set and issue a `SET NAMES` statement. This enables the character set to remain synchronized on the client and server if `mysql` is run with auto-reconnect enabled (which is not recommended), because the specified character set is used for reconnects.

- **clear, \c**

  Clear the current input. Use this if you change your mind about executing the statement that you are entering.

- **connect [db_name host_name], \r [db_name host_name]**

  Reconnect to the server. The optional database name and host name arguments may be given to specify the default database or the host where the server is running. If omitted, the current values are used.
Change the string that `mysql` interprets as the separator between SQL statements. The default is the semicolon character (`;`).

The delimiter string can be specified as an unquoted or quoted argument on the `delimiter` command line. Quoting can be done with either single quote (`'`), double quote (`"`), or backtick (```) characters. To include a quote within a quoted string, either quote the string with a different quote character or escape the quote with a backslash (`\`) character. Backslash should be avoided outside of quoted strings because it is the escape character for MySQL. For an unquoted argument, the delimiter is read up to the first space or end of line. For a quoted argument, the delimiter is read up to the matching quote on the line.

`mysql` interprets instances of the delimiter string as a statement delimiter anywhere it occurs, except within quoted strings. Be careful about defining a delimiter that might occur within other words. For example, if you define the delimiter as `X`, you will be unable to use the word `INDEX` in statements. `mysql` interprets this as `INDE` followed by the delimiter `X`.

When the delimiter recognized by `mysql` is set to something other than the default of `;`, instances of that character are sent to the server without interpretation. However, the server itself still interprets `;` as a statement delimiter and processes statements accordingly. This behavior on the server side comes into play for multiple-statement execution (see Section 23.8.16, “C API Multiple Statement Execution Support”), and for parsing the body of stored procedures and functions, triggers, and events (see Section 20.1, “Defining Stored Programs”).

- `edit, \e`

  Edit the current input statement. `mysql` checks the values of the `EDITOR` and `VISUAL` environment variables to determine which editor to use. The default editor is `vi` if neither variable is set.

  The `edit` command works only in Unix.

- `ego, \G`

  Send the current statement to the server to be executed and display the result using vertical format.

- `exit, \q`

  Exit `mysql`.

- `go, \g`

  Send the current statement to the server to be executed.

- `nopager, \n`

  Disable output paging. See the description for `pager`.

  The `nopager` command works only in Unix.

- `notee, \t`

  Disable output copying to the tee file. See the description for `tee`.

- `nowarning, \w`

  Disable display of warnings after each statement.

- `pager [command], \P [command]`
Enable output paging. By using the `--pager` option when you invoke `mysql`, it is possible to browse or search query results in interactive mode with Unix programs such as `less`, `more`, or any other similar program. If you specify no value for the option, `mysql` checks the value of the `PAGER` environment variable and sets the pager to that. Pager functionality works only in interactive mode.

Output paging can be enabled interactively with the `pager` command and disabled with `nopager`. The command takes an optional argument; if given, the paging program is set to that. With no argument, the pager is set to the pager that was set on the command line, or `stdout` if no pager was specified.

Output paging works only in Unix because it uses the `popen()` function, which does not exist on Windows. For Windows, the `tee` option can be used instead to save query output, although it is not as convenient as `pager` for browsing output in some situations.

- **print, \p**
  Print the current input statement without executing it.

- **prompt [str], \R [str]**
  Reconfigure the `mysql` prompt to the given string. The special character sequences that can be used in the prompt are described later in this section.

  If you specify the `prompt` command with no argument, `mysql` resets the prompt to the default of `mysql>`.

- **quit, \q**
  Exit `mysql`.

- **rehash, \#**
  Rebuild the completion hash that enables database, table, and column name completion while you are entering statements. (See the description for the `--auto-rehash` option.)

- **source file_name, \ . file_name**
  Read the named file and executes the statements contained therein. On Windows, specify path name separators as `/` or `\`.

  Quote characters are taken as part of the file name itself. For best results, the name should not include space characters.

- **status, \s**
  Provide status information about the connection and the server you are using. If you are running with `--safe-updates` enabled, `status` also prints the values for the `mysql` variables that affect your queries.

- **system command, \! command**
  Execute the given command using your default command interpreter.

  The `system` command works only in Unix.

- **tee [file_name], \T [file_name]**
  By using the `--tee` option when you invoke `mysql`, you can log statements and their output. All the data displayed on the screen is appended into a given file. This can be very useful for debugging
purposes also. `mysql` flushes results to the file after each statement, just before it prints its next prompt. Tee functionality works only in interactive mode.

You can enable this feature interactively with the `tee` command. Without a parameter, the previous file is used. The `tee` file can be disabled with the `notee` command. Executing `tee` again re-enables logging.

- **use db_name, \u db_name**
  
  Use `db_name` as the default database.

- **warnings, \W**
  
  Enable display of warnings after each statement (if there are any).

Here are a few tips about the `pager` command:

- You can use it to write to a file and the results go only to the file:

  ```
  mysql> pager cat > /tmp/log.txt
  ```

  You can also pass any options for the program that you want to use as your pager:

  ```
  mysql> pager less -n -i -S
  ```

- In the preceding example, note the `-S` option. You may find it very useful for browsing wide query results. Sometimes a very wide result set is difficult to read on the screen. The `-S` option to `less` can make the result set much more readable because you can scroll it horizontally using the left-arrow and right-arrow keys. You can also use `-S` interactively within `less` to switch the horizontal-browse mode on and off. For more information, read the `less` manual page:

  ```
  shell> man less
  ```

- The `-F` and `-X` options may be used with `less` to cause it to exit if output fits on one screen, which is convenient when no scrolling is necessary:

  ```
  mysql> pager less -n -i -S -F -X
  ```

- You can specify very complex pager commands for handling query output:

  ```
  mysql> pager cat | tee /dr1/tmp/res.txt \
  | tee /dr2/tmp/res2.txt | less -n -i -S
  ```

  In this example, the command would send query results to two files in two different directories on two different file systems mounted on `/dr1` and `/dr2`, yet still display the results onscreen using `less`.

You can also combine the `tee` and `pager` functions. Have a `tee` file enabled and `pager` set to `less`, and you are able to browse the results using the `less` program and still have everything appended into a file the same time. The difference between the Unix `tee` used with the `pager` command and the `mysql` built-in `tee` command is that the built-in `tee` works even if you do not have the Unix `tee` available. The built-in `tee` also logs everything that is printed on the screen, whereas the Unix `tee` used with `pager` does not log quite that much. Additionally, `tee` file logging can be turned on and off interactively from within `mysql`. This is useful when you want to log some queries to a file, but not others.

The `prompt` command reconfigures the default `mysql>` prompt. The string for defining the prompt can contain the following special sequences.
### Option | Description
--- | ---
\c | A counter that increments for each statement you issue
\D | The full current date
\d | The default database
\h | The server host
\l | The current delimiter
\m | Minutes of the current time
\n | A newline character
\o | The current month in three-letter format (Jan, Feb, …)
\o | The current month in numeric format
\P | am/pm
\p | The current TCP/IP port or socket file
\R | The current time, in 24-hour military time (0–23)
\r | The current time, standard 12-hour time (1–12)
\S | Semicolon
\s | Seconds of the current time
\t | A tab character
\U | Your full user_name@host_name account name
\u | Your user name
\v | The server version
\w | The current day of the week in three-letter format (Mon, Tue, …)
\Y | The current year, four digits
\y | The current year, two digits
\_ | A space
\ | A space (a space follows the backslash)
\' | Single quote
\" | Double quote
\\ | A literal \ backslash character
\x | x, for any “x” not listed above

You can set the prompt in several ways:

- **Use an environment variable.** You can set the `MYSQL_PS1` environment variable to a prompt string. For example:

```shell
shell> export MYSQL_PS1="(\u@\h) [\d]> "
```

- **Use a command-line option.** You can set the `--prompt` option on the command line to `mysql`. For example:

```shell
shell> mysql --prompt="(\u@\h) [\d]> "
(user@host) [database]>
```
• **Use an option file.** You can set the `prompt` option in the `[mysql]` group of any MySQL option file, such as `/etc/my.cnf` or the `.my.cnf` file in your home directory. For example:

```
[mysql]
prompt="(\u@\h) [\d]>\_
```

In this example, note that the backslashes are doubled. If you set the prompt using the `prompt` option in an option file, it is advisable to double the backslashes when using the special prompt options. There is some overlap in the set of permissible prompt options and the set of special escape sequences that are recognized in option files. (The rules for escape sequences in option files are listed in Section 4.2.2.2, “Using Option Files.”) The overlap may cause you problems if you use single backslashes. For example, \s is interpreted as a space rather than as the current seconds value. The following example shows how to define a prompt within an option file to include the current time in `hh:mm:ss` format:

```
[mysql]
prompt="\r:\m:\s> 
```

• **Set the prompt interactively.** You can change your prompt interactively by using the `prompt` (or `\R`) command. For example:

```
mysql> prompt \(\u@\h\) [\d]\>_ 
```

```
PROMPT set to '\(\u@\h\) [\d]\>_ 
```

```
(user@host) \[database]\> prompt
```

```
Returning to default PROMPT of mysql>
```

4.5.1.3 mysql Client Logging

On Unix, the `mysql` client logs statements executed interactively to a history file. By default, this file is named `.mysql_history` in your home directory. To specify a different file, set the value of the `MYSQL_HISTFILE` environment variable.

• **How Logging Occurs**

• **Controlling the History File**

**How Logging Occurs**

Statement logging occurs as follows:

• Statements are logged only when executed interactively. Statements are noninteractive, for example, when read from a file or a pipe. It is also possible to suppress statement logging by using the `--batch` or `--execute` option.

• Statements are ignored and not logged if they match any pattern in the “ignore” list. This list is described later.

• `mysql` logs each nonignored, nonempty statement line individually.

• If a nonignored statement spans multiple lines (not including the terminating delimiter), `mysql` concatenates the lines to form the complete statement, maps newlines to spaces, and logs the result, plus a delimiter.

Consequently, an input statement that spans multiple lines can be logged twice. Consider this input:
In this case, `mysql` logs the “SELECT”, “Today is”, “,”, “CURDATE()”, and “;” lines as it reads them. It also logs the complete statement, after mapping `SELECT\n'Today is'\n,\nCURDATE();` to `SELECT 'Today is', CURDATE();` plus a delimiter. Thus, these lines appear in logged output:

```
SELECT
'Today is'
, CURDATE();
SELECT 'Today is', CURDATE();
```

`mysql` ignores for logging purposes statements that match any pattern in the “ignore” list. By default, the pattern list is `'*IDENTIFIED*:*PASSWORD*'`, to ignore statements that refer to passwords. Pattern matching is not case-sensitive. Within patterns, two characters are special:

- `?` matches any single character.
- `*` matches any sequence of zero or more characters.

To specify additional patterns, use the `--histignore` option or set the `MYSQL_HISTIGNORE` environment variable. (If both are specified, the option value takes precedence.) The value should be a list of one or more colon-separated patterns, which are appended to the default pattern list.

Patterns specified on the command line might need to be quoted or escaped to prevent your command interpreter from treating them specially. For example, to suppress logging for `UPDATE` and `DELETE` statements in addition to statements that refer to passwords, invoke `mysql` like this:

```
shell> mysql --histignore="*UPDATE*:*DELETE*"
```

### Controlling the History File

The `.mysql_history` file should be protected with a restrictive access mode because sensitive information might be written to it, such as the text of SQL statements that contain passwords. See [Section 6.1.2.1, “End-User Guidelines for Password Security”](#).

If you do not want to maintain a history file, first remove `.mysql_history` if it exists. Then use either of the following techniques to prevent it from being created again:

- Set the `MYSQL_HISTFILE` environment variable to `/dev/null`. To cause this setting to take effect each time you log in, put it in one of your shell's startup files.
- Create `.mysql_history` as a symbolic link to `/dev/null`; this need be done only once:

```
shell> ln -s /dev/null $HOME/.mysql_history
```

### 4.5.1.4 mysql Client Server-Side Help

If you provide an argument to the `help` command, `mysql` uses it as a search string to access server-side help from the contents of the MySQL Reference Manual. The proper operation of this command requires
that the help tables in the `mysql` database be initialized with help topic information (see Section 5.1.13, “Server-Side Help Support”).

If there is no match for the search string, the search fails:

```
mysql> help me
Nothing found
Please try to run 'help contents' for a list of all accessible topics
```

Use `help contents` to see a list of the help categories:

```
mysql> help contents
You asked for help about help category: "Contents"
For more information, type 'help <item>', where <item> is one of the following categories:
  Account Management
  Administration
  Data Definition
  Data Manipulation
  Data Types
  Functions
  Functions and Modifiers for Use with GROUP BY
  Geographic Features
  Language Structure
  Plugins
  Storage Engines
  Stored Routines
  Table Maintenance
  Transactions
  Triggers
```

If the search string matches multiple items, `mysql` shows a list of matching topics:

```
mysql> help logs
Many help items for your request exist.
To make a more specific request, please type 'help <item>', where <item> is one of the following topics:
  SHOW
  SHOW BINARY LOGS
  SHOW ENGINE
  SHOW LOGS
```

Use a topic as the search string to see the help entry for that topic:

```
mysql> help show binary logs
Name: 'SHOW BINARY LOGS'
Description:
Syntax:
SHOW BINARY LOGS
SHOW MASTER LOGS
Lists the binary log files on the server. This statement is used as part of the procedure described in [purge-binary-logs], that shows how to determine which logs can be purged.

mysql> SHOW BINARY LOGS;
+---------------+-----------+
| Log_name      | File_size |
+---------------+-----------+
| binlog.000015 |    724935 |
| binlog.000016 |    733481 |
```
The search string can contain the wildcard characters `%` and `_`. These have the same meaning as for pattern-matching operations performed with the `LIKE` operator. For example, `HELP rep%` returns a list of topics that begin with `rep`:

```sql
mysql> HELP rep%
Many help items for your request exist.
To make a more specific request, please type 'help <item>',
where <item> is one of the following
topics:
   REPAIR TABLE
   REPEAT FUNCTION
   REPEAT LOOP
   REPLACE
   REPLACE FUNCTION
```

### 4.5.1.5 Executing SQL Statements from a Text File

The `mysql` client typically is used interactively, like this:

```sh
shell> mysql db_name
```

However, it is also possible to put your SQL statements in a file and then tell `mysql` to read its input from that file. To do so, create a text file `text_file` that contains the statements you wish to execute. Then invoke `mysql` as shown here:

```sh
shell> mysql db_name < text_file
```

If you place a `USE db_name` statement as the first statement in the file, it is unnecessary to specify the database name on the command line:

```sh
shell> mysql < text_file
```

If you are already running `mysql`, you can execute an SQL script file using the `source` command or `\.` command:

```sql
mysql> source file_name
mysql> \. file_name
```

Sometimes you may want your script to display progress information to the user. For this you can insert statements like this:

```sql
SELECT '<info_to_display>' AS ' ';  
```

The statement shown outputs `<info_to_display>`.

You can also invoke `mysql` with the `--verbose` option, which causes each statement to be displayed before the result that it produces.

`mysql` ignores Unicode byte order mark (BOM) characters at the beginning of input files. Previously, it read them and sent them to the server, resulting in a syntax error. Presence of a BOM does not cause `mysql` to change its default character set. To do that, invoke `mysql` with an option such as `--default-character-set=utf8`.

For more information about batch mode, see Section 3.5, “Using mysql in Batch Mode”.
4.5.6 mysql Client Tips

This section provides information about techniques for more effective use of mysql and about mysql operational behavior.

- Input-Line Editing
- Unicode Support on Windows
- Displaying Query Results Vertically
- Using Safe-Updates Mode (--safe-updates)
- Disabling mysql Auto-Reconnect
- mysql Client Parser Versus Server Parser

Input-Line Editing

mysql supports input-line editing, which enables you to modify the current input line in place or recall previous input lines. For example, the left-arrow and right-arrow keys move horizontally within the current input line, and the up-arrow and down-arrow keys move up and down through the set of previously entered lines. Backspace deletes the character before the cursor and typing new characters enters them at the cursor position. To enter the line, press Enter.

On Windows, the editing key sequences are the same as supported for command editing in console windows. On Unix, the key sequences depend on the input library used to build mysql (for example, the libedit or readline library).

Documentation for the libedit and readline libraries is available online. To change the set of key sequences permitted by a given input library, define key bindings in the library startup file. This is a file in your home directory: .editrc for libedit and .inputrc for readline.

For example, in libedit, Control+W deletes everything before the current cursor position and Control+U deletes the entire line. In readline, Control+W deletes the word before the cursor and Control+U deletes everything before the current cursor position. If mysql was built using libedit, a user who prefers the readline behavior for these two keys can put the following lines in the .editrc file (creating the file if necessary):

```bash
bind "^W" ed-delete-prev-word
bind "^U" vi-kill-line-prev
```

To see the current set of key bindings, temporarily put a line that says only bind at the end of .editrc. mysql will show the bindings when it starts.

Unicode Support on Windows

Windows provides APIs based on UTF-16LE for reading from and writing to the console; the mysql client for Windows is able to use these APIs. The Windows installer creates an item in the MySQL menu named MySQL command line client – Unicode. This item invokes the mysql client with properties set to communicate through the console to the MySQL server using Unicode.

To take advantage of this support manually, run mysql within a console that uses a compatible Unicode font and set the default character set to a Unicode character set that is supported for communication with the server:

1. Open a console window.
2. Go to the console window properties, select the font tab, and choose Lucida Console or some other compatible Unicode font. This is necessary because console windows start by default using a DOS raster font that is inadequate for Unicode.

3. Execute `mysql.exe` with the `--default-character-set=utf8` (or `utf8mb4`) option. This option is necessary because `utf16le` is one of the character sets that cannot be used as the client character set. See **Impermissible Client Character Sets**.

With those changes, `mysql` will use the Windows APIs to communicate with the console using UTF-16LE, and communicate with the server using UTF-8. (The menu item mentioned previously sets the font and character set as just described.)

To avoid those steps each time you run `mysql`, you can create a shortcut that invokes `mysql.exe`. The shortcut should set the console font to Lucida Console or some other compatible Unicode font, and pass the `--default-character-set=utf8` (or `utf8mb4`) option to `mysql.exe`.

Alternatively, create a shortcut that only sets the console font, and set the character set in the `[mysql]` group of your `my.ini` file:

```
[mysql]
default-character-set=utf8
```

### Displaying Query Results Vertically

Some query results are much more readable when displayed vertically, instead of in the usual horizontal table format. Queries can be displayed vertically by terminating the query with `\G` instead of a semicolon. For example, longer text values that include newlines often are much easier to read with vertical output:

```sql
mysql> SELECT * FROM mails WHERE LENGTH(txt) < 300 LIMIT 300,1\G
*************************** 1. row ***************************
  msg_nro: 3068
  date: 2000-03-01 23:29:50
  time_zone: +0200
  mail_from: Jones
  reply: jones@example.com
  mail_to: "John Smith" <smith@example.com>
  subj: UTF-8
  txt: >>>>> "John" == John Smith writes:
John> Hi. I think this is a good idea. Is anyone familiar
John> with UTF-8 or Unicode? Otherwise, I'll put this on my
John> TODO list and see what happens.

Yes, please do that.

Regards,
Jones
    file: inbox-jani-1
    hash: 190402944
1 row in set (0.09 sec)
```

### Using Safe-Updates Mode (--safe-updates)

For beginners, a useful startup option is `--safe-updates` (or `--i-am-a-dummy`, which has the same effect). Safe-updates mode is helpful for cases when you might have issued an `UPDATE` or `DELETE` statement but forgotten the `WHERE` clause indicating which rows to modify. Normally, such statements update or delete all rows in the table. With `--safe-updates`, you can modify rows only by specifying the key values that identify them, or a `LIMIT` clause, or both. This helps prevent accidents. Safe-updates mode also restricts `SELECT` statements that produce (or are estimated to produce) very large result sets.
The `--safe-updates` option causes `mysql` to execute the following statement when it connects to the MySQL server, to set the session values of the `sql_safe_updates`, `sql_select_limit`, and `max_join_size` system variables:

```sql
SET sql_safe_updates=1, sql_select_limit=1000, max_join_size=1000000;
```

The `SET` statement affects statement processing as follows:

- **Enabling `sql_safe_updates`** causes `UPDATE` and `DELETE` statements to produce an error if they do not specify a key constraint in the `WHERE` clause, or provide a `LIMIT` clause, or both. For example:

  ```sql
  UPDATE tbl_name SET not_key_column=val WHERE key_column=val;
  UPDATE tbl_name SET not_key_column=val LIMIT 1;
  ```

- **Setting `sql_select_limit` to 1,000** causes the server to limit all `SELECT` result sets to 1,000 rows unless the statement includes a `LIMIT` clause.

- **Setting `max_join_size` to 1,000,000** causes multiple-table `SELECT` statements to produce an error if the server estimates it must examine more than 1,000,000 row combinations.

To specify result set limits different from 1,000 and 1,000,000, you can override the defaults by using the `--select-limit` and `--max-join-size` options when you invoke `mysql`:

```sql
mysql --safe-updates --select-limit=500 --max-join-size=10000
```

It is possible for `UPDATE` and `DELETE` statements to produce an error in safe-updates mode even with a key specified in the `WHERE` clause, if the optimizer decides not to use the index on the key column. For example, if key comparisons require type conversion, the index may not be used (see Section 8.3.1, "How MySQL Uses Indexes"). Suppose that an indexed string column `c1` is compared to a numeric value using `WHERE c1 = 2222`. For such comparisons, the string value is converted to a number and the operands are compared numerically (see Section 12.2, "Type Conversion in Expression Evaluation"), preventing use of the index. If safe-updates mode is enabled, an error occurs.

### Disabling `mysql` Auto-Reconnect

If the `mysql` client loses its connection to the server while sending a statement, it immediately and automatically tries to reconnect once to the server and send the statement again. However, even if `mysql` succeeds in reconnecting, your first connection has ended and all your previous session objects and settings are lost: temporary tables, the autocommit mode, and user-defined and session variables. Also, any current transaction rolls back. This behavior may be dangerous for you, as in the following example where the server was shut down and restarted between the first and second statements without you knowing it:

```sql
mysql> SET @a=1;
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO t VALUES(@a);
ERROR 2006: MySQL server has gone away
No connection. Trying to reconnect...
Connection id:    1
Current database: test
Query OK, 1 row affected (1.30 sec)

mysql> SELECT * FROM t;
```
The `@a` user variable has been lost with the connection, and after the reconnection it is undefined. If it is important to have `mysql` terminate with an error if the connection has been lost, you can start the `mysql` client with the `--skip-reconnect` option.

For more information about auto-reconnect and its effect on state information when a reconnection occurs, see Section 23.8.20, “C API Automatic Reconnection Control”.

**mysql Client Parser Versus Server Parser**

The `mysql` client uses a parser on the client side that is not a duplicate of the complete parser used by the `mysqld` server on the server side. This can lead to differences in treatment of certain constructs. Examples:

- The server parser treats strings delimited by " characters as identifiers rather than as plain strings if the `ANSI_QUOTES` SQL mode is enabled.

  The `mysql` client parser does not take the `ANSI_QUOTES` SQL mode into account. It treats strings delimited by ",", and ` ` characters the same, regardless of whether `ANSI_QUOTES` is enabled.

- Within `/*! ... */` comments, the `mysql` client parser interprets short-form `mysql` commands. The server parser does not interpret them because these commands have no meaning on the server side.

  If it is desirable for `mysql` not to interpret short-form commands within comments, a partial workaround is to use the `--binary-mode` option, which causes all `mysql` commands to be disabled except \c and \d in noninteractive mode (for input piped to `mysql` or loaded using the `source` command).

### 4.5.2 `mysqladmin` — Client for Administering a MySQL Server

`mysqladmin` is a client for performing administrative operations. You can use it to check the server's configuration and current status, to create and drop databases, and more.

Invoke `mysqladmin` like this:

```shell
shell> mysqladmin [options] command [command-arg] [command [command-arg]] ...
```

`mysqladmin` supports the following commands. Some of the commands take an argument following the command name.

- **create `db_name`**

  Create a new database named `db_name`.

- **debug**

  Tell the server to write debug information to the error log. The connected user must have the `SUPER` privilege. Format and content of this information is subject to change.

  This includes information about the Event Scheduler. See Section 20.4.5, “Event Scheduler Status”.

- **drop `db_name`**
Delete the database named *db_name* and all its tables.

- **extended-status**
  Display the server status variables and their values.

- **flush-hosts**
  Flush all information in the host cache. See Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”.

- **flush-logs**
  Flush all logs.

- **flush-privileges**
  Reload the grant tables (same as *reload*).

- **flush-status**
  Clear status variables.

- **flush-tables**
  Flush all tables.

- **flush-threads**
  Flush the thread cache.

- **kill id, id, ...**
  Kill server threads. If multiple thread ID values are given, there must be no spaces in the list. To kill threads belonging to other users, the connected user must have the *SUPER* privilege.

- **old-password new_password**
  This is like the *password* command but stores the password using the old (pre-4.1) password-hashing format. (See Section 6.1.2.4, "Password Hashing in MySQL".)

- **password new_password**
  Set a new password. This changes the password to *new_password* for the account that you use with *mysqladmin* for connecting to the server. Thus, the next time you invoke *mysqladmin* (or any other client program) using the same account, you will need to specify the new password.

**Warning**

Setting a password using *mysqladmin* should be considered *insecure*. On some systems, your password becomes visible to system status programs such as *ps* that may be invoked by other users to display command lines. MySQL clients typically overwrite the command-line password argument with zeros during their initialization sequence. However, there is still a brief interval during which the value is visible. Also, on some systems this overwriting strategy is ineffective and the password remains visible to *ps*. (SystemV Unix systems and perhaps others are subject to this problem.)
If the `new_password` value contains spaces or other characters that are special to your command interpreter, you need to enclose it within quotation marks. On Windows, be sure to use double quotation marks rather than single quotation marks; single quotation marks are not stripped from the password, but rather are interpreted as part of the password. For example:

```
shell> mysqladmin password "my new password"
```

The new password can be omitted following the `password` command. In this case, `mysqladmin` prompts for the password value, which enables you to avoid specifying the password on the command line. Omitting the password value should be done only if `password` is the final command on the `mysqladmin` command line. Otherwise, the next argument is taken as the password.

**Caution**

Do not use this command used if the server was started with the `--skip-grant-tables` option. No password change will be applied. This is true even if you precede the `password` command with `flush-privileges` on the same command line to re-enable the grant tables because the flush operation occurs after you connect. However, you can use `mysqladmin flush-privileges` to re-enable the grant table and then use a separate `mysqladmin password` command to change the password.

- **ping**
  
  Check whether the server is available. The return status from `mysqladmin` is 0 if the server is running, 1 if it is not. This is 0 even in case of an error such as `Access denied`, because this means that the server is running but refused the connection, which is different from the server not running.

- **processlist**
  
  Show a list of active server threads. This is like the output of the `SHOW PROCESSLIST` statement. If the `--verbose` option is given, the output is like that of `SHOW FULL PROCESSLIST`. (See Section 13.7.5.30, “SHOW PROCESSLIST Syntax”.)

- **reload**
  
  Reload the grant tables.

- **refresh**
  
  Flush all tables and close and open log files.

- **shutdown**
  
  Stop the server.

- **start-slave**
  
  Start replication on a slave server.

- **status**
  
  Display a short server status message.

- **stop-slave**
  
  Stop replication on a slave server.
• **variables**
  Display the server system variables and their values.

• **version**
  Display version information from the server.

All commands can be shortened to any unique prefix. For example:

```shell
shell> mysqladmin proc stat
```

+----+-------+-----------+----+---------+------+-------+------------------+
<table>
<thead>
<tr>
<th>Id</th>
<th>User</th>
<th>Host</th>
<th>db</th>
<th>Command</th>
<th>Time</th>
<th>State</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>51</td>
<td>jones</td>
<td>localhost</td>
<td></td>
<td>Query</td>
<td>0</td>
<td></td>
<td>show processlist</td>
</tr>
</tbody>
</table>
+----+-------+-----------+----+---------+------+-------+------------------+

Uptime: 1473624  Threads: 1  Questions: 39487
Slow queries: 0  Opens: 541  Flush tables: 1
Open tables: 19  Queries per second avg: 0.0268

The **mysqladmin status** command result displays the following values:

• **Uptime**
  The number of seconds the MySQL server has been running.

• **Threads**
  The number of active threads (clients).

• **Questions**
  The number of questions (queries) from clients since the server was started.

• **Slow queries**
  The number of queries that have taken more than `long_query_time` seconds. See Section 5.4.5, “The Slow Query Log”.

• **Opens**
  The number of tables the server has opened.

• **Flush tables**
  The number of `flush-*`, `refresh`, and `reload` commands the server has executed.

• **Open tables**
  The number of tables that currently are open.

If you execute `mysqladmin shutdown` when connecting to a local server using a Unix socket file, `mysqladmin` waits until the server's process ID file has been removed, to ensure that the server has stopped properly.

`mysqladmin` supports the following options, which can be specified on the command line or in the `[mysqladmin]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

<td>Unix socket file or Windows named pipe to use</td>
<td></td>
</tr>
</tbody>
</table>
### Option Name | Description | Introduced
---|---|---
--ssl | Enable connection encryption | |
--ssl-ca | File that contains list of trusted SSL Certificate Authorities | |
--ssl-capath | Directory that contains trusted SSL Certificate Authority certificate files | |
--ssl-cert | File that contains X.509 certificate | |
--ssl-cipher | Permissible ciphers for connection encryption | |
--ssl-crl | File that contains certificate revocation lists | 5.6.3 |
--ssl-crlpath | Directory that contains certificate revocation-list files | 5.6.3 |
--ssl-key | File that contains X.509 key | |
--ssl-mode | Desired security state of connection to server | 5.6.30 |
--ssl-verify-server-cert | Verify host name against server certificate Common Name identity | |
--user | MySQL user name to use when connecting to server | |
--verbose | Verbose mode | |
--version | Display version information and exit | |
--vertical | Print query output rows vertically (one line per column value) | |
--wait | If the connection cannot be established, wait and retry instead of aborting | |

- **--help, --?**
  Display a help message and exit.

- **--bind-address=ip_address**
  On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

- **--character-sets-dir=dir_name**
  The directory where character sets are installed. See Section 10.15, “Character Set Configuration”.

- **--compress, -C**
  Compress all information sent between the client and the server if possible. See Section 4.2.5, "Connection Compression Control".

- **--count=N, -c N**
  The number of iterations to make for repeated command execution if the --sleep option is given.

- **--debug[=debug_options], -# [debug_options]**
  Write a debugging log. A typical debug_options string is d:t:o, file_name. The default is d:t:o, /tmp/mysqladmin.trace.

- **--debug-check**
  Print some debugging information when the program exits.
mysqladmin — Client for Administering a MySQL Server

- **--debug-info**
  Print debugging information and memory and CPU usage statistics when the program exits.

- **--default-auth=plugin**
  A hint about which client-side authentication plugin to use. See Section 6.2.11, “Pluggable Authentication”.

- **--default-character-set=charset_name**
  Use `charset_name` as the default character set. See Section 10.15, “Character Set Configuration”.

- **--defaults-extra-file=file_name**
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-file=file_name**
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

  Exception: Even with **--defaults-file**, client programs read `.mylogin.cnf`.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-group-suffix=str**
  Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysqladmin` normally reads the [client] and [mysqladmin] groups. If the **--defaults-group-suffix=_other** option is given, `mysqladmin` also reads the [client_other] and [mysqladmin_other] groups.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--enable-cleartext-plugin**
  Enable the `mysql_clear_password` cleartext authentication plugin. (See Section 6.4.1.5, “Client-Side Cleartext Pluggable Authentication”.)

- **--force, -f**
  Do not ask for confirmation for the `drop db_name` command. With multiple commands, continue even if an error occurs.

- **--host=host_name, -h host_name**
  Connect to the MySQL server on the given host.

- **--login-path=name**
Read options from the named login path in the .mylogin.cnf login path file. A “login path” is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the mysql_config_editor utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• --no-beep, -b

  Suppress the warning beep that is emitted by default for errors such as a failure to connect to the server.

• --no-defaults

  Do not read any option files. If program startup fails due to reading unknown options from an option file, --no-defaults can be used to prevent them from being read.

  The exception is that the .mylogin.cnf file, if it exists, is read in all cases. This permits passwords to be specified in a safer way than on the command line even when --no-defaults is used. (mylogin.cnf is created by the mysql_config_editor utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.)

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• --password[=password], -p[password]

  The password of the MySQL account used for connecting to the server. The password value is optional. If not given, mysqladmin prompts for one. If given, there must be no space between --password= or -p and the password following it. If no password option is specified, the default is to send no password.

  Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

  To explicitly specify that there is no password and that mysqladmin should not prompt for one, use the --skip-password option.

• --pipe, -W

  On Windows, connect to the server using a named pipe. This option applies only if the server was started with the named_pipe system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the named_pipe_full_access_group system variable.

• --plugin-dir=dir_name

  The directory in which to look for plugins. Specify this option if the --default-auth option is used to specify an authentication plugin but mysqladmin does not find it. See Section 6.2.11, “Pluggable Authentication”.

• --port=port_num, -P port_num

  For TCP/IP connections, the port number to use.

• --print-defaults
Print the program name and all options that it gets from option files.

For additional information about this and other option-file options, see Section 4.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--protocol={TCP|SOCKET|PIPE|MEMORY}**

  The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally result in use of a protocol other than the one you want. For details on the permissible values, see Section 4.2.4, “Connecting to the MySQL Server Using Command Options”.

- **--relative, -r**

  Show the difference between the current and previous values when used with the **--sleep** option. This option works only with the **extended-status** command.

- **--secure-auth**

  Do not send passwords to the server in old (pre-4.1) format. This prevents connections except for servers that use the newer password format. This option is enabled by default; use **--skip-secure-auth** to disable it. This option was added in MySQL 5.6.17.

  **Note**

  Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.

  **Note**

  This option is deprecated and will be removed in a future release. As of MySQL 5.7.5, it is always enabled and attempting to disable it produces an error.

- **--shared-memory-base-name=name**

  On Windows, the shared-memory name to use for connections made using shared memory to a local server. The default value is **MYSQL**. The shared-memory name is case-sensitive.

  This option applies only if the server was started with the **shared_memory** system variable enabled to support shared-memory connections.

- **--silent, -s**

  Exit silently if a connection to the server cannot be established.

- **--sleep=delay, -i delay**

  Execute commands repeatedly, sleeping for **delay** seconds in between. The **--count** option determines the number of iterations. If **--count** is not given, **mysqladmin** executes commands indefinitely until interrupted.

- **--socket=path, -S path**

  For connections to **localhost**, the Unix socket file to use, or, on Windows, the name of the named pipe to use.
On Windows, this option applies only if the server was started with the *named_pipe* system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the *named_pipe_full_access_group* system variable.

• **--ssl**

Options that begin with **--ssl** specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Command Options for Encrypted Connections.

• **--user=user_name, -u user_name**

The user name of the MySQL account to use for connecting to the server.

• **--verbose, -v**

Verbose mode. Print more information about what the program does.

• **--version, -V**

Display version information and exit.

• **--vertical, -E**

Print output vertically. This is similar to **--relative**, but prints output vertically.

• **--wait[=count], -w[count]**

If the connection cannot be established, wait and retry instead of aborting. If a *count* value is given, it indicates the number of times to retry. The default is one time.

You can also set the following variables by using **--var_name=value**.

• **connect_timeout**

The maximum number of seconds before connection timeout. The default value is 43200 (12 hours).

• **shutdown_timeout**

The maximum number of seconds to wait for server shutdown. The default value is 3600 (1 hour).

### 4.5.3 *mysqlcheck* — A Table Maintenance Program

The *mysqlcheck* client performs table maintenance: It checks, repairs, optimizes, or analyzes tables.

Each table is locked and therefore unavailable to other sessions while it is being processed, although for check operations, the table is locked with a *READ* lock only (see Section 13.3.5, "LOCK TABLES and UNLOCK TABLES Syntax", for more information about *READ* and *WRITE* locks). Table maintenance operations can be time-consuming, particularly for large tables. If you use the **--databases** or **--all-databases** option to process all tables in one or more databases, an invocation of *mysqlcheck* might take a long time. (This is also true for the MySQL upgrade procedure if it determines that table checking is needed because it processes tables the same way.)

*mysqlcheck* is similar in function to *myisamchk*, but works differently. The main operational difference is that *mysqlcheck* must be used when the *mysql* server is running, whereas *myisamchk* should be used when it is not. The benefit of using *mysqlcheck* is that you do not have to stop the server to perform table maintenance.
**mysqlcheck** uses the SQL statements `CHECK TABLE`, `REPAIR TABLE`, `ANALYZE TABLE`, and `OPTIMIZE TABLE` in a convenient way for the user. It determines which statements to use for the operation you want to perform, and then sends the statements to the server to be executed. For details about which storage engines each statement works with, see the descriptions for those statements in Section 13.7.2, “Table Maintenance Statements”.

The **MyISAM** storage engine supports all four maintenance operations, so **mysqlcheck** can be used to perform any of them on **MyISAM** tables. Other storage engines do not necessarily support all operations. In such cases, an error message is displayed. For example, if `test.t` is a **MEMORY** table, an attempt to check it produces this result:

```
shell> mysqlcheck test t
  test.t
  note : The storage engine for the table doesn't support check
```

If **mysqlcheck** is unable to repair a table, see Section 2.11.10, “Rebuilding or Repairing Tables or Indexes” for manual table repair strategies. This will be the case, for example, for InnoDB tables, which can be checked with `CHECK TABLE`, but not repaired with `REPAIR TABLE`.

**Caution**

It is best to make a backup of a table before performing a table repair operation; under some circumstances the operation might cause data loss. Possible causes include but are not limited to file system errors.

There are three general ways to invoke **mysqlcheck**:

```
shell> mysqlcheck [options] db_name [tbl_name ...]
shell> mysqlcheck [options] --databases db_name ...
shell> mysqlcheck [options] --all-databases
```

If you do not name any tables following `db_name` or if you use the `--databases` or `--all-databases` option, entire databases are checked.

**mysqlcheck** has a special feature compared to other client programs. The default behavior of checking tables (`--check`) can be changed by renaming the binary. If you want to have a tool that repairs tables by default, you should just make a copy of **mysqlcheck** named **mysqlrepair**, or make a symbolic link to **mysqlcheck** named **mysqlrepair**. If you invoke **mysqlrepair**, it repairs tables.

The names shown in the following table can be used to change **mysqlcheck** default behavior:

<table>
<thead>
<tr>
<th>Command</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>mysqlrepair</strong></td>
<td>The default option is <strong>--repair</strong></td>
</tr>
<tr>
<td><strong>mysqlanalyze</strong></td>
<td>The default option is <strong>--analyze</strong></td>
</tr>
<tr>
<td><strong>mysqloptimize</strong></td>
<td>The default option is <strong>--optimize</strong></td>
</tr>
</tbody>
</table>

**mysqlcheck** supports the following options, which can be specified on the command line or in the **[mysqlcheck]** and **[client]** groups of an option file. For information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

**Table 4.12 mysqlcheck Options**

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>--all-databases</strong></td>
<td>Check all tables in all databases</td>
<td></td>
</tr>
<tr>
<td><strong>--all-in-1</strong></td>
<td>Execute a single statement for each database that names all the tables from that database</td>
<td></td>
</tr>
<tr>
<td>Option Name</td>
<td>Description</td>
<td>Introduced</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>
<td>--analyze</td>
<td>Analyze the tables</td>
<td></td>
</tr>
<tr>
<td>--auto-repair</td>
<td>If a checked table is corrupted, automatically fix it</td>
<td></td>
</tr>
<tr>
<td>--bind-address</td>
<td>Use specified network interface to connect to MySQL Server</td>
<td>5.6.1</td>
</tr>
<tr>
<td>--character-sets-dir</td>
<td>Directory where character sets are installed</td>
<td></td>
</tr>
<tr>
<td>--check</td>
<td>Check the tables for errors</td>
<td></td>
</tr>
<tr>
<td>--check-only-changed</td>
<td>Check only tables that have changed since the last check</td>
<td></td>
</tr>
<tr>
<td>--check-upgrade</td>
<td>Invoke CHECK TABLE with the FOR UPGRADE option</td>
<td></td>
</tr>
<tr>
<td>--compress</td>
<td>Compress all information sent between client and server</td>
<td></td>
</tr>
<tr>
<td>--databases</td>
<td>Interpret all arguments as database names</td>
<td></td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging log</td>
<td></td>
</tr>
<tr>
<td>--debug-check</td>
<td>Print debugging information when program exits</td>
<td></td>
</tr>
<tr>
<td>--debug-info</td>
<td>Print debugging information, memory, and CPU statistics when program exits</td>
<td></td>
</tr>
<tr>
<td>--default-auth</td>
<td>Authentication plugin to use</td>
<td>5.6.2</td>
</tr>
<tr>
<td>--default-character-set</td>
<td>Specify default character set</td>
<td></td>
</tr>
<tr>
<td>--defaults-extra-file</td>
<td>Read named option file in addition to usual option files</td>
<td></td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
<td></td>
</tr>
<tr>
<td>--defaults-group-suffix</td>
<td>Option group suffix value</td>
<td></td>
</tr>
<tr>
<td>--enable-cleartext-plugin</td>
<td>Enable cleartext authentication plugin</td>
<td>5.6.28</td>
</tr>
<tr>
<td>--extended</td>
<td>Check and repair tables</td>
<td></td>
</tr>
<tr>
<td>--fast</td>
<td>Check only tables that have not been closed properly</td>
<td></td>
</tr>
<tr>
<td>--fix-db-names</td>
<td>Convert database names to 5.1 format</td>
<td></td>
</tr>
<tr>
<td>--fix-table-names</td>
<td>Convert table names to 5.1 format</td>
<td></td>
</tr>
<tr>
<td>--force</td>
<td>Continue even if an SQL error occurs</td>
<td></td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
<td></td>
</tr>
<tr>
<td>--host</td>
<td>Host on which MySQL server is located</td>
<td></td>
</tr>
<tr>
<td>--login-path</td>
<td>Read login path options from .mylogin.cnf</td>
<td>5.6.6</td>
</tr>
<tr>
<td>--medium-check</td>
<td>Do a check that is faster than an --extended operation</td>
<td></td>
</tr>
<tr>
<td>--no-defaults</td>
<td>Read no option files</td>
<td></td>
</tr>
<tr>
<td>--optimize</td>
<td>Optimize the tables</td>
<td></td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
<td></td>
</tr>
<tr>
<td>--pipe</td>
<td>Connect to server using named pipe (Windows only)</td>
<td></td>
</tr>
<tr>
<td>--plugin-dir</td>
<td>Directory where plugins are installed</td>
<td>5.6.2</td>
</tr>
<tr>
<td>--port</td>
<td>TCP/IP port number for connection</td>
<td></td>
</tr>
<tr>
<td>--print-defaults</td>
<td>Print default options</td>
<td></td>
</tr>
<tr>
<td>--protocol</td>
<td>Connection protocol to use</td>
<td></td>
</tr>
<tr>
<td>--quick</td>
<td>The fastest method of checking</td>
<td></td>
</tr>
</tbody>
</table>
my checked — A Table Maintenance Program

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--repair</td>
<td>Perform a repair that can fix almost anything except unique keys that are not unique</td>

<td></td>
</tr>
<tr>
<td></td>
<td>adds NO_WRITE_TO_BINLOG to these statements.</td>
<td></td>
</tr>
</tbody>
</table>

- --help, -?
Display a help message and exit.

- --all-databases, -A
Check all tables in all databases. This is the same as using the --databases option and naming all the databases on the command line, except that the INFORMATION_SCHEMA and performance_schema databases are not checked. They can be checked by explicitly naming them with the --databases option.

- --all-in-1, -1
Instead of issuing a statement for each table, execute a single statement for each database that names all the tables from that database to be processed.

- --analyze, -a
Analyze the tables.

- **--auto-repair**
  If a checked table is corrupted, automatically fix it. Any necessary repairs are done after all tables have been checked.

- **--bind-address=ip_address**
  On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

- **--character-sets-dir=dir_name**
  The directory where character sets are installed. See Section 10.15, “Character Set Configuration”.

- **--check, -c**
  Check the tables for errors. This is the default operation.

- **--check-only-changed, -C**
  Check only tables that have changed since the last check or that have not been closed properly.

- **--check-upgrade, -g**
  Invoke `CHECK TABLE` with the `FOR UPGRADE` option to check tables for incompatibilities with the current version of the server. This option automatically enables the `--fix-db-names` and `--fix-table-names` options.

- **--compress**
  Compress all information sent between the client and the server if possible. See Section 4.2.5, “Connection Compression Control”.

- **--databases, -B**
  Process all tables in the named databases. Normally, `mysqlcheck` treats the first name argument on the command line as a database name and any following names as table names. With this option, it treats all name arguments as database names.

- **--debug[=debug_options], -# [debug_options]**
  Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o`.

- **--debug-check**
  Print some debugging information when the program exits.

- **--debug-info**
  Print debugging information and memory and CPU usage statistics when the program exits.

- **--default-character-set=charset_name**
  Use `charset_name` as the default character set. See Section 10.15, “Character Set Configuration”.

- **--defaults-extra-file=file_name**
Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-file=file_name**

  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

  Exception: Even with `--defaults-file`, client programs read `.mylogin.cnf`.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-group-suffix=str**

  Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysqlcheck` normally reads the `[client]` and `[mysqlcheck]` groups. If the `--defaults-group-suffix=_other` option is given, `mysqlcheck` also reads the `[client_other]` and `[mysqlcheck_other]` groups.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--extended, -e**

  If you are using this option to check tables, it ensures that they are 100% consistent but takes a long time.

  If you are using this option to repair tables, it runs an extended repair that may not only take a long time to execute, but may produce a lot of garbage rows also!

- **--default-auth=plugin**

  A hint about which client-side authentication plugin to use. See Section 6.2.11, “Pluggable Authentication”.

- **--enable-cleartext-plugin**

  Enable the `mysql_clear_password` cleartext authentication plugin. (See Section 6.4.1.5, “Client-Side Cleartext Pluggable Authentication”.)

  This option was added in MySQL 5.6.28.

- **--fast, -F**

  Check only tables that have not been closed properly.

- **--fix-db-names**

  Convert database names to 5.1 format. Only database names that contain special characters are affected.

- **--fix-table-names**
Convert table names to 5.1 format. Only table names that contain special characters are affected. This option also applies to views.

- **--force, -f**
  Continue even if an SQL error occurs.

- **--host=host_name, -h host_name**
  Connect to the MySQL server on the given host.

- **--login-path=name**
  Read options from the named login path in the .mylogin.cnf login path file. A “login path” is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the mysql_config_editor utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--medium-check, -m**
  Do a check that is faster than an --extended operation. This finds only 99.99% of all errors, which should be good enough in most cases.

- **--no-defaults**
  Do not read any option files. If program startup fails due to reading unknown options from an option file, --no-defaults can be used to prevent them from being read.

  The exception is that the .mylogin.cnf file, if it exists, is read in all cases. This permits passwords to be specified in a safer way than on the command line even when --no-defaults is used. (.mylogin.cnf is created by the mysql_config_editor utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.)

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--optimize, -o**
  Optimize the tables.

- **--password[=password], -p[password]**
  The password of the MySQL account used for connecting to the server. The password value is optional. If not given, mysqlcheck prompts for one. If given, there must be no space between --password or -p and the password following it. If no password option is specified, the default is to send no password.

  Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

To explicitly specify that there is no password and that mysqlcheck should not prompt for one, use the --skip-password option.

- **--pipe, -W**
On Windows, connect to the server using a named pipe. This option applies only if the server was started with the `named_pipe` system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the `named_pipe_full_access_group` system variable.

- **--plugin-dir=dir_name**
  
  The directory in which to look for plugins. Specify this option if the `--default-auth` option is used to specify an authentication plugin but `mysqlcheck` does not find it. See Section 6.2.11, “Pluggable Authentication”.

- **--port=port_num, -P port_num**
  
  For TCP/IP connections, the port number to use.

- **--print-defaults**
  
  Print the program name and all options that it gets from option files.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--protocol={TCP|SOCKET|PIPE|MEMORY}**
  
  The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally result in use of a protocol other than the one you want. For details on the permissible values, see Section 4.2.4, “Connecting to the MySQL Server Using Command Options”.

- **--quick, -q**
  
  If you are using this option to check tables, it prevents the check from scanning the rows to check for incorrect links. This is the fastest check method.

  If you are using this option to repair tables, it tries to repair only the index tree. This is the fastest repair method.

- **--repair, -r**
  
  Perform a repair that can fix almost anything except unique keys that are not unique.

- **--secure-auth**
  
  Do not send passwords to the server in old (pre-4.1) format. This prevents connections except for servers that use the newer password format. This option is enabled by default; use `--skip-secure-auth` to disable it. This option was added in MySQL 5.6.17.

---

**Note**

Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.
**Note**
This option is deprecated and will be removed in a future release. As of MySQL 5.7.5, it is always enabled and attempting to disable it produces an error.

- **--shared-memory-base-name=name**
  
  On Windows, the shared-memory name to use for connections made using shared memory to a local server. The default value is `MYSQL`. The shared-memory name is case-sensitive.
  
  This option applies only if the server was started with the `shared_memory` system variable enabled to support shared-memory connections.

- **--silent, -s**
  
  Silent mode. Print only error messages.

- **--skip-database=db_name**
  
  Do not include the named database (case-sensitive) in the operations performed by `mysqlcheck`. This option was added in MySQL 5.6.11.

- **--socket=path, -S path**
  
  For connections to `localhost`, the Unix socket file to use, or, on Windows, the name of the named pipe to use.
  
  On Windows, this option applies only if the server was started with the `named_pipe` system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the `named_pipe_full_access_group` system variable.

- **--ssl**
  
  Options that begin with `--ssl` specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Command Options for Encrypted Connections.

- **--tables**
  
  Override the `--databases` or `-B` option. All name arguments following the option are regarded as table names.

- **--use-frm**
  
  For repair operations on MyISAM tables, get the table structure from the `.frm` file so that the table can be repaired even if the `.MYI` header is corrupted.

- **--user=user_name, -u user_name**
  
  The user name of the MySQL account to use for connecting to the server.

- **--verbose, -v**
  
  Verbose mode. Print information about the various stages of program operation.

- **--version, -V**
  
  Display version information and exit.
• --write-binlog

This option is enabled by default, so that ANALYZE TABLE, OPTIMIZE TABLE, and REPAIR TABLE statements generated by mysqldump are written to the binary log. Use --skip-write-binlog to cause NO_WRITE_TO_BINLOG to be added to the statements so that they are not logged. Use the --skip-write-binlog when these statements should not be sent to replication slaves or run when using the binary logs for recovery from backup.

4.5.4 mysqldump — A Database Backup Program

The mysqldump client utility performs logical backups, producing a set of SQL statements that can be executed to reproduce the original database object definitions and table data. It dumps one or more MySQL databases for backup or transfer to another SQL server. The mysqldump command can also generate output in CSV, other delimited text, or XML format.

• Help Options

• Internationalization Options

• Replication Options

• Format Options

• Filtering Options

• Performance Options

• Transactional Options

• Option Groups

• Examples

• Restrictions

mysqldump requires at least the SELECT privilege for dumped tables, SHOW VIEW for dumped views, TRIGGER for dumped triggers, and LOCK TABLES if the --single-transaction option is not used. Certain options might require other privileges as noted in the option descriptions.

To reload a dump file, you must have the privileges required to execute the statements that it contains, such as the appropriate CREATE privileges for objects created by those statements.

mysqldump output can include ALTER DATABASE statements that change the database collation. These may be used when dumping stored programs to preserve their character encodings. To reload a dump file containing such statements, the ALTER privilege for the affected database is required.
Note

A dump made using PowerShell on Windows with output redirection creates a file that has UTF-16 encoding:

```
shell> mysqldump [options] > dump.sql
```

However, UTF-16 is not permitted as a connection character set (see Impermissible Client Character Sets), so the dump file will not load correctly. To work around this issue, use the `--result-file` option, which creates the output in ASCII format:

```
shell> mysqldump [options] --result-file=dump.sql
```

Performance and Scalability Considerations

`mysqldump` advantages include the convenience and flexibility of viewing or even editing the output before restoring. You can clone databases for development and DBA work, or produce slight variations of an existing database for testing. It is not intended as a fast or scalable solution for backing up substantial amounts of data. With large data sizes, even if the backup step takes a reasonable time, restoring the data can be very slow because replaying the SQL statements involves disk I/O for insertion, index creation, and so on.

For large-scale backup and restore, a physical backup is more appropriate, to copy the data files in their original format that can be restored quickly:

- If your tables are primarily InnoDB tables, or if you have a mix of InnoDB and MyISAM tables, consider using the `mysqlbackup` command of the MySQL Enterprise Backup product. (Available as part of the Enterprise subscription.) It provides the best performance for InnoDB backups with minimal disruption; it can also back up tables from MyISAM and other storage engines; and it provides a number of convenient options to accommodate different backup scenarios. See Section 25.2, “MySQL Enterprise Backup Overview”.

- If your tables are primarily MyISAM tables, consider using the `mysqlhotcopy` instead, for better performance than `mysqldump` of backup and restore operations. See Section 4.6.10, "mysqlhotcopy — A Database Backup Program".

`mysqldump` can retrieve and dump table contents row by row, or it can retrieve the entire content from a table and buffer it in memory before dumping it. Buffering in memory can be a problem if you are dumping large tables. To dump tables row by row, use the `--quick` option (or `--opt`, which enables `--quick`). The `--opt` option (and hence `--quick`) is enabled by default, so to enable memory buffering, use `--skip-quick`.

If you are using a recent version of `mysqldump` to generate a dump to be reloaded into a very old MySQL server, use the `--skip-opt` option instead of the `--opt` or `--extended-insert` option.

For additional information about `mysqldump`, see Section 7.4, “Using mysqldump for Backups”.

Invocation Syntax

There are in general three ways to use `mysqldump`—in order to dump a set of one or more tables, a set of one or more complete databases, or an entire MySQL server—as shown here:

```
shell> mysqldump [options] db_name [tbl_name ...]
shell> mysqldump [options] --databases db_name ...
shell> mysqldump [options] --all-databases
```
To dump entire databases, do not name any tables following `db_name`, or use the `--databases` or `--all-databases` option.

To see a list of the options your version of `mysqldump` supports, issue the command `mysqldump --help`.

**Option Syntax - Alphabetical Summary**

`mysqldump` supports the following options, which can be specified on the command line or in the `[mysqldump]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.2.2, "Using Option Files".

### Table 4.13 mysqldump Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--add-drop-database</code></td>
<td>Add DROP DATABASE statement before each CREATE DATABASE statement</td>
<td></td>
</tr>
<tr>
<td><code>--add-drop-table</code></td>
<td>Add DROP TABLE statement before each CREATE TABLE statement</td>
<td></td>
</tr>
<tr>
<td><code>--add-drop-trigger</code></td>
<td>Add DROP TRIGGER statement before each CREATE TRIGGER statement</td>
<td></td>
</tr>
<tr>
<td><code>--add-locks</code></td>
<td>Surround each table dump with LOCK TABLES and UNLOCK TABLES statements</td>
<td></td>
</tr>
<tr>
<td><code>--all-databases</code></td>
<td>Dump all tables in all databases</td>
<td></td>
</tr>
<tr>
<td><code>--allow-keywords</code></td>
<td>Allow creation of column names that are keywords</td>
<td></td>
</tr>
<tr>
<td><code>--apply-slave-statements</code></td>
<td>Include STOP SLAVE prior to CHANGE MASTER statement and START SLAVE at end of output</td>
<td></td>
</tr>
<tr>
<td><code>--bind-address</code></td>
<td>Use specified network interface to connect to MySQL Server</td>
<td>5.6.1</td>
</tr>
<tr>
<td><code>--character-sets-dir</code></td>
<td>Directory where character sets are installed</td>
<td></td>
</tr>
<tr>
<td><code>--comments</code></td>
<td>Add comments to dump file</td>
<td></td>
</tr>
<tr>
<td><code>--compact</code></td>
<td>Produce more compact output</td>
<td></td>
</tr>
<tr>
<td><code>--compatible</code></td>
<td>Produce output that is more compatible with other database systems or with older MySQL servers</td>
<td></td>
</tr>
<tr>
<td><code>--complete-insert</code></td>
<td>Use complete INSERT statements that include column names</td>
<td></td>
</tr>
<tr>
<td><code>--compress</code></td>
<td>Compress all information sent between client and server</td>
<td></td>
</tr>
<tr>
<td><code>--create-options</code></td>
<td>Include all MySQL-specific table options in CREATE TABLE statements</td>
<td></td>
</tr>
<tr>
<td><code>--databases</code></td>
<td>Interpret all name arguments as database names</td>
<td></td>
</tr>
<tr>
<td><code>--debug</code></td>
<td>Write debugging log</td>
<td></td>
</tr>
<tr>
<td><code>--debug-check</code></td>
<td>Print debugging information when program exits</td>
<td></td>
</tr>
<tr>
<td><code>--debug-info</code></td>
<td>Print debugging information, memory, and CPU statistics when program exits</td>
<td></td>
</tr>
<tr>
<td><code>--default-auth</code></td>
<td>Authentication plugin to use</td>
<td></td>
</tr>
<tr>
<td><code>--default-character-set</code></td>
<td>Specify default character set</td>
<td></td>
</tr>
<tr>
<td><code>--defaults-extra-file</code></td>
<td>Read named option file in addition to usual option files</td>
<td></td>
</tr>
<tr>
<td>Option Name</td>
<td>Description</td>
<td>Introduced</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
<td></td>
</tr>
<tr>
<td>--defaults-group-suffix</td>
<td>Option group suffix value</td>
<td></td>
</tr>
<tr>
<td>--delayed-insert</td>
<td>Write INSERT DELAYED statements rather than INSERT statements</td>
<td></td>
</tr>
<tr>
<td>--delete-master-logs</td>
<td>On a master replication server, delete the binary logs after performing the dump operation</td>
<td></td>
</tr>
<tr>
<td>--disable-keys</td>
<td>For each table, surround INSERT statements with statements to disable and enable keys</td>
<td></td>
</tr>
<tr>
<td>--dump-date</td>
<td>Include dump date as &quot;Dump completed on&quot; comment if --comments is given</td>
<td></td>
</tr>
<tr>
<td>--dump-slave</td>
<td>Include CHANGE MASTER statement that lists binary log coordinates of slave's master</td>
<td></td>
</tr>
<tr>
<td>--enable-cleartext-plugin</td>
<td>Enable cleartext authentication plugin</td>
<td>5.6.28</td>
</tr>
<tr>
<td>--events</td>
<td>Dump events from dumped databases</td>
<td></td>
</tr>
<tr>
<td>--extended-insert</td>
<td>Use multiple-row INSERT syntax</td>
<td></td>
</tr>
<tr>
<td>--fields-enclosed-by</td>
<td>This option is used with the --tab option and has the same meaning as the corresponding clause for LOAD DATA</td>
<td></td>
</tr>
<tr>
<td>--fields-escaped-by</td>
<td>This option is used with the --tab option and has the same meaning as the corresponding clause for LOAD DATA</td>
<td></td>
</tr>
<tr>
<td>--fields-optionally-enclosed-by</td>
<td>This option is used with the --tab option and has the same meaning as the corresponding clause for LOAD DATA</td>
<td></td>
</tr>
<tr>
<td>--fields-terminated-by</td>
<td>This option is used with the --tab option and has the same meaning as the corresponding clause for LOAD DATA</td>
<td></td>
</tr>
<tr>
<td>--flush-logs</td>
<td>Flush MySQL server log files before starting dump</td>
<td></td>
</tr>
<tr>
<td>--flush-privileges</td>
<td>Emit a FLUSH PRIVILEGES statement after dumping mysql database</td>
<td></td>
</tr>
<tr>
<td>--force</td>
<td>Continue even if an SQL error occurs during a table dump</td>
<td></td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
<td></td>
</tr>
<tr>
<td>--hex-blob</td>
<td>Dump binary columns using hexadecimal notation</td>
<td></td>
</tr>
<tr>
<td>--host</td>
<td>Host on which MySQL server is located</td>
<td></td>
</tr>
<tr>
<td>--ignore-table</td>
<td>Do not dump given table</td>
<td></td>
</tr>
<tr>
<td>--include-master-host-port</td>
<td>Include MASTER_HOST/MASTER_PORT options in CHANGE MASTER statement produced with --dump-slave</td>
<td></td>
</tr>
<tr>
<td>--insert-ignore</td>
<td>Write INSERT IGNORE rather than INSERT statements</td>
<td></td>
</tr>
<tr>
<td>--lines-terminated-by</td>
<td>This option is used with the --tab option and has the same meaning as the corresponding clause for LOAD DATA</td>
<td></td>
</tr>
<tr>
<td>--lock-all-tables</td>
<td>Lock all tables across all databases</td>
<td></td>
</tr>
<tr>
<td>--lock-tables</td>
<td>Lock all tables before dumping them</td>
<td></td>
</tr>
<tr>
<td>--log-error</td>
<td>Append warnings and errors to named file</td>
<td></td>
</tr>
<tr>
<td>--login-path</td>
<td>Read login path options from .mylogin.cnf</td>
<td>5.6.6</td>
</tr>
<tr>
<td>--master-data</td>
<td>Write the binary log file name and position to the output</td>
<td></td>
</tr>
<tr>
<td>Option Name</td>
<td>Description</td>
<td>Introduced</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>
<td>--max-allowed-packet</td>
<td>Maximum packet length to send to or receive from server</td>
<td></td>
</tr>
<tr>
<td>--net-buffer-length</td>
<td>Buffer size for TCP/IP and socket communication</td>
<td></td>
</tr>
<tr>
<td>--no-autocommit</td>
<td>Enclose the INSERT statements for each dumped table within SET autocommit = 0 and COMMIT statements</td>
<td></td>
</tr>
<tr>
<td>--no-create-db</td>
<td>Do not write CREATE DATABASE statements</td>
<td></td>
</tr>
<tr>
<td>--no-create-info</td>
<td>Do not write CREATE TABLE statements that re-create each dumped table</td>
<td></td>
</tr>
<tr>
<td>--no-data</td>
<td>Do not dump table contents</td>
<td></td>
</tr>
<tr>
<td>--no-defaults</td>
<td>Read no option files</td>
<td></td>
</tr>
<tr>
<td>--no-set-names</td>
<td>Same as --skip-set-charset</td>
<td></td>
</tr>
<tr>
<td>--no-tablespaces</td>
<td>Do not write any CREATE LOGFILE GROUP or CREATE TABLESPACE statements in output</td>
<td></td>
</tr>
<tr>
<td>--order-by-primary</td>
<td>Dump each table's rows sorted by its primary key, or by its first unique index</td>
<td></td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
<td></td>
</tr>
<tr>
<td>--pipe</td>
<td>Connect to server using named pipe (Windows only)</td>
<td></td>
</tr>
<tr>
<td>--plugin-dir</td>
<td>Directory where plugins are installed</td>
<td></td>
</tr>
<tr>
<td>--port</td>
<td>TCP/IP port number for connection</td>
<td></td>
</tr>
<tr>
<td>--print-defaults</td>
<td>Print default options</td>
<td></td>
</tr>
<tr>
<td>--protocol</td>
<td>Connection protocol to use</td>
<td></td>
</tr>
<tr>
<td>--quick</td>
<td>Retrieve rows for a table from the server a row at a time</td>
<td></td>
</tr>
<tr>
<td>--quote-names</td>
<td>Quote identifiers within backtick characters</td>
<td></td>
</tr>
<tr>
<td>--replace</td>
<td>Write REPLACE statements rather than INSERT statements</td>
<td></td>
</tr>
<tr>
<td>--result-file</td>
<td>Direct output to a given file</td>
<td></td>
</tr>
<tr>
<td>--routines</td>
<td>Dump stored routines (procedures and functions) from dumped databases</td>
<td></td>
</tr>
<tr>
<td>--secure-auth</td>
<td>Do not send passwords to server in old (pre-4.1) format</td>
<td>5.6.17</td>
</tr>
<tr>
<td>--set-charset</td>
<td>Add SET NAMES default_character_set to output</td>
<td></td>
</tr>
<tr>
<td>--set-gtid-purged</td>
<td>Whether to add SET @@GLOBAL.GTID_PURGED to output</td>
<td>5.6.9</td>
</tr>
<tr>
<td>--shared-memory-base-name</td>
<td>Name of shared memory to use for shared-memory connections</td>
<td></td>
</tr>
<tr>
<td>--single-transaction</td>
<td>Issue a BEGIN SQL statement before dumping data from server</td>
<td></td>
</tr>
<tr>
<td>--skip-add-drop-table</td>
<td>Do not add a DROP TABLE statement before each CREATE TABLE statement</td>
<td></td>
</tr>
<tr>
<td>--skip-add-locks</td>
<td>Do not add locks</td>
<td></td>
</tr>
</tbody>
</table>
### Option Name | Description | Introduced
---|---|---
--skip-comments | Do not add comments to dump file | 
--skip-compact | Do not produce more compact output | 
--skip-disable-keys | Do not disable keys | 
--skip-extended-insert | Turn off extended-insert | 
--skip-opt | Turn off options set by --opt | 
--skip-quick | Do not retrieve rows for a table from the server a row at a time | 
--skip-quote-names | Do not quote identifiers | 
--skip-set-charset | Do not write SET NAMES statement | 
--skip-triggers | Do not dump triggers | 
--skip-tz-utc | Turn off tz-utc | 
--socket | Unix socket file or Windows named pipe to use | 
--ssl | Enable connection encryption | 
--ssl-ca | File that contains list of trusted SSL Certificate Authorities | 
--ssl-capath | Directory that contains trusted SSL Certificate Authority certificate files | 5.6.3 | 
--ssl-cert | File that contains X.509 certificate | 
--ssl-cipher | Permissible ciphers for connection encryption | 
--ssl-crl | File that contains certificate revocation lists | 5.6.3 | 
--ssl-crlpath | Directory that contains certificate revocation-list files | 5.6.3 | 
--ssl-key | File that contains X.509 key | 
--ssl-mode | Desired security state of connection to server | 5.6.30 | 
--ssl-verify-server-cert | Verify host name against server certificate Common Name identity | 
--tab | Produce tab-separated data files | 
--tables | Override --databases or -B option | 
--triggers | Dump triggers for each dumped table | 
--tz-utc | Add SET TIME_ZONE=’+00:00’ to dump file | 
--user | MySQL user name to use when connecting to server | 
--verbose | Verbose mode | 
--version | Display version information and exit | 
--where | Dump only rows selected by given WHERE condition | 
--xml | Produce XML output | 

### Connection Options

The `mysqldump` command logs into a MySQL server to extract information. The following options specify how to connect to the MySQL server, either on the same machine or a remote system.

- `--bind-address=ip_address`
On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

- **--compress, -C**

  Compress all information sent between the client and the server if possible. See Section 4.2.5, “Connection Compression Control”.

- **--default-auth=plugin**

  A hint about which client-side authentication plugin to use. See Section 6.2.11, “Pluggable Authentication”.

- **--enable-cleartext-plugin**

  Enable the `mysql_clear_password` cleartext authentication plugin. (See Section 6.4.1.5, “Client-Side Cleartext Pluggable Authentication”.)

  This option was added in MySQL 5.6.28.

- **--host=host_name, -h host_name**

  Dump data from the MySQL server on the given host. The default host is `localhost`.

- **--login-path=name**

  Read options from the named login path in the `.mylogin.cnf` login path file. A “login path” is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the `mysql_config_editor` utility. See Section 4.6.6, “`mysql_config_editor` — MySQL Configuration Utility”.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--password=[password], -p [password]**

  The password of the MySQL account used for connecting to the server. The password value is optional. If not given, `mysqldump` prompts for one. If given, there must be no space between `--password=` or `-p` and the password following it. If no password option is specified, the default is to send no password.

  Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

  To explicitly specify that there is no password and that `mysqldump` should not prompt for one, use the `--skip-password` option.

- **--pipe, -W**

  On Windows, connect to the server using a named pipe. This option applies only if the server was started with the `named_pipe` system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the `named_pipe_full_access_group` system variable.

- **--plugin-dir=dir_name**
The directory in which to look for plugins. Specify this option if the `--default-auth` option is used to specify an authentication plugin but `mysqldump` does not find it. See Section 6.2.11, “Pluggable Authentication”.

- `--port=port_num, -P port_num`

For TCP/IP connections, the port number to use.

- `--protocol={TCP|SOCKET|PIPE|MEMORY}`

The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally result in use of a protocol other than the one you want. For details on the permissible values, see Section 4.2.4, “Connecting to the MySQL Server Using Command Options”.

- `--secure-auth`

Do not send passwords to the server in old (pre-4.1) format. This prevents connections except for servers that use the newer password format. This option is enabled by default; use `--skip-secure-auth` to disable it. This option was added in MySQL 5.6.17.

**Note**

Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.

**Note**

This option is deprecated and will be removed in a future release. As of MySQL 5.7.5, it is always enabled and attempting to disable it produces an error.

- `--socket=path, -S path`

For connections to localhost, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

On Windows, this option applies only if the server was started with the `named_pipe` system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the `named_pipe_full_access_group` system variable.

- `--ssl*`

Options that begin with `--ssl` specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Command Options for Encrypted Connections.

- `--user=user_name, -u user_name`

The user name of the MySQL account to use for connecting to the server.

**Option-File Options**

These options are used to control which option files to read.

- `--defaults-extra-file=file_name`
Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. file_name is interpreted relative to the current directory if given as a relative path name rather than a full path name.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• --defaults-file=file_name

Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. file_name is interpreted relative to the current directory if given as a relative path name rather than a full path name.

Exception: Even with --defaults-file, client programs read .mylogin.cnf.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• --defaults-group-suffix=str

Read not only the usual option groups, but also groups with the usual names and a suffix of str. For example, mysqldump normally reads the [client] and [mysqldump] groups. If the --defaults-group-suffix=_other option is given, mysqldump also reads the [client_other] and [mysqldump_other] groups.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• --no-defaults

Do not read any option files. If program startup fails due to reading unknown options from an option file, --no-defaults can be used to prevent them from being read.

The exception is that the .mylogin.cnf file, if it exists, is read in all cases. This permits passwords to be specified in a safer way than on the command line even when --no-defaults is used. (.mylogin.cnf is created by the mysql_config_editor utility. See Section 4.6.6, "mysql_config_editor — MySQL Configuration Utility ".)

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• --print-defaults

Print the program name and all options that it gets from option files.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

DDL Options

Usage scenarios for mysqldump include setting up an entire new MySQL instance (including database tables), and replacing data inside an existing instance with existing databases and tables. The following options let you specify which things to tear down and set up when restoring a dump, by encoding various DDL statements within the dump file.

• --add-drop-database
Write a `DROP DATABASE` statement before each `CREATE DATABASE` statement. This option is typically used in conjunction with the `--all-databases` or `--databases` option because no `CREATE DATABASE` statements are written unless one of those options is specified.

- **--add-drop-table**
  Write a `DROP TABLE` statement before each `CREATE TABLE` statement.

- **--add-drop-trigger**
  Write a `DROP TRIGGER` statement before each `CREATE TRIGGER` statement.

- **--all-tablespaces, -Y**
  Adds to a table dump all SQL statements needed to create any tablespaces used by an NDB table. This information is not otherwise included in the output from `mysqldump`. This option is currently relevant only to NDB Cluster tables.

- **--no-create-db, -n**
  Suppress the `CREATE DATABASE` statements that are otherwise included in the output if the `--databases` or `--all-databases` option is given.

- **--no-create-info, -t**
  Do not write `CREATE TABLE` statements that create each dumped table.

  **Note**
  This option does *not* exclude statements creating log file groups or tablespaces from `mysqldump` output; however, you can use the `--no-tablespaces` option for this purpose.

- **--no-tablespaces, -y**
  This option suppresses all `CREATE LOGFILE GROUP` and `CREATE TABLESPACE` statements in the output of `mysqldump`.

- **--replace**
  Write `REPLACE` statements rather than `INSERT` statements.

**Debug Options**

The following options print debugging information, encode debugging information in the dump file, or let the dump operation proceed regardless of potential problems.

- **--allow-keywords**
  Permit creation of column names that are keywords. This works by prefixing each column name with the table name.

- **--comments, -i**
  Write additional information in the dump file such as program version, server version, and host. This option is enabled by default. To suppress this additional information, use `--skip-comments`.

- **--debug [=debug_options], -# [debug_options]**
Write a debugging log. A typical debug_options string is d:t:o, file_name. The default value is d:t:o,/tmp/mysqldump.trace.

- **--debug-check**
  
  Print some debugging information when the program exits.

- **--debug-info**
  
  Print debugging information and memory and CPU usage statistics when the program exits.

- **--dump-date**
  
  If the --comments option is given, mysqldump produces a comment at the end of the dump of the following form:

  ```
  -- Dump completed on DATE
  ```

  However, the date causes dump files taken at different times to appear to be different, even if the data are otherwise identical. **--dump-date** and **--skip-dump-date** control whether the date is added to the comment. The default is **--dump-date** (include the date in the comment). **--skip-dump-date** suppresses date printing.

- **--force, -f**
  
  Continue even if an SQL error occurs during a table dump.

  One use for this option is to cause mysqldump to continue executing even when it encounters a view that has become invalid because the definition refers to a table that has been dropped. Without **--force**, mysqldump exits with an error message. With **--force**, mysqldump prints the error message, but it also writes an SQL comment containing the view definition to the dump output and continues executing.

- **--log-error=file_name**
  
  Log warnings and errors by appending them to the named file. The default is to do no logging.

- **--skip-comments**
  
  See the description for the **--comments** option.

- **--verbose, -v**
  
  Verbose mode. Print more information about what the program does.

**Help Options**

The following options display information about the mysqldump command itself.

- **--help, -?**
  
  Display a help message and exit.

- **--version, -V**
  
  Display version information and exit.
Internationalization Options

The following options change how the `mysqldump` command represents character data with national language settings.

- `--character-sets-dir=dir_name`
  The directory where character sets are installed. See Section 10.15, “Character Set Configuration”.

- `--default-character-set=charset_name`
  Use `charset_name` as the default character set. See Section 10.15, “Character Set Configuration”. If no character set is specified, `mysqldump` uses `utf8`.

- `--no-set-names, -N`
  Turns off the `--set-charset` setting, the same as specifying `--skip-set-charset`.

- `--set-charset`
  Write `SET NAMES default_character_set` to the output. This option is enabled by default. To suppress the `SET NAMES` statement, use `--skip-set-charset`.

Replication Options

The `mysqldump` command is frequently used to create an empty instance, or an instance including data, on a slave server in a replication configuration. The following options apply to dumping and restoring data on replication master and slave servers.

- `--apply-slave-statements`
  For a slave dump produced with the `--dump-slave` option, add a `STOP SLAVE` statement before the `CHANGE MASTER TO` statement and a `START SLAVE` statement at the end of the output.

- `--delete-master-logs`
  On a master replication server, delete the binary logs by sending a `PURGE BINARY LOGS` statement to the server after performing the dump operation. This option automatically enables `--master-data`.

- `--dump-slave[=value]`
  This option is similar to `--master-data` except that it is used to dump a replication slave server to produce a dump file that can be used to set up another server as a slave that has the same master as the dumped server. It causes the dump output to include a `CHANGE MASTER TO` statement that indicates the binary log coordinates (file name and position) of the dumped slave's master. These are the master server coordinates from which the slave should start replicating.

  `--dump-slave` causes the coordinates from the master to be used rather than those of the dumped server, as is done by the `--master-data` option. In addition, specifying this option causes the `--master-data` option to be overridden, if used, and effectively ignored.

  The option value is handled the same way as for `--master-data` (setting no value or 1 causes a `CHANGE MASTER TO` statement to be written to the dump, setting 2 causes the statement to be written but encased in SQL comments) and has the same effect as `--master-data` in terms of enabling or disabling other options and in how locking is handled.

  This option causes `mysqldump` to stop the slave SQL thread before the dump and restart it again after.
In conjunction with `--dump-slave`, the `--apply-slave-statements` and `--include-master-host-port` options can also be used.

- **--include-master-host-port**

  For the `CHANGE MASTER TO` statement in a slave dump produced with the `--dump-slave` option, add `MASTER_HOST` and `MASTER_PORT` options for the host name and TCP/IP port number of the slave’s master.

- **--master-data[=value]**

  Use this option to dump a master replication server to produce a dump file that can be used to set up another server as a slave of the master. It causes the dump output to include a `CHANGE MASTER TO` statement that indicates the binary log coordinates (file name and position) of the dumped server. These are the master server coordinates from which the slave should start replicating after you load the dump file into the slave.

  If the option value is 2, the `CHANGE MASTER TO` statement is written as an SQL comment, and thus is informative only; it has no effect when the dump file is reloaded. If the option value is 1, the statement is not written as a comment and takes effect when the dump file is reloaded. If no option value is specified, the default value is 1.

  This option requires the `RELOAD` privilege and the binary log must be enabled.

  The `--master-data` option automatically turns off `--lock-tables`. It also turns on `--lock-all-tables`, unless `--single-transaction` also is specified, in which case, a global read lock is acquired only for a short time at the beginning of the dump (see the description for `--single-transaction`). In all cases, any action on logs happens at the exact moment of the dump.

  It is also possible to set up a slave by dumping an existing slave of the master, using the `--dump-slave` option, which overrides `--master-data` and causes it to be ignored if both options are used.

- **--set-gtid-purged=value**

  This option enables control over global transaction ID (GTID) information written to the dump file, by indicating whether to add a `SET @@GLOBAL.gtid_purged` statement to the output. This option may also cause a statement to be written to the output that disables binary logging while the dump file is being reloaded.

  The following table shows the permitted option values. The default value is `AUTO`.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>Add no <code>SET</code> statement to the output.</td>
</tr>
<tr>
<td>ON</td>
<td>Add a <code>SET</code> statement to the output. An error occurs if GTIDs are not enabled on the server.</td>
</tr>
<tr>
<td>AUTO</td>
<td>Add a <code>SET</code> statement to the output if GTIDs are enabled on the server.</td>
</tr>
</tbody>
</table>

  The `--set-gtid-purged` option has the following effect on binary logging when the dump file is reloaded:

  - `--set-gtid-purged=OFF`: `SET @@SESSION.SQL_LOG_BIN=0;` is not added to the output.
  - `--set-gtid-purged=ON`: `SET @@SESSION.SQL_LOG_BIN=0;` is added to the output.
--set-gtid-purged=AUTO; SET @@SESSION.SQL_LOG_BIN=0; is added to the output if GTIDs are enabled on the server you are backing up (that is, if AUTO evaluates to ON).

**Note**

It is not recommended to load a dump file when GTIDs are enabled on the server (gtid_mode=ON), if your dump file includes system tables. mysqldump issues DML instructions for the system tables which use the non-transactional MyISAM storage engine, and this combination is not permitted when GTIDs are enabled. Also be aware that loading a dump file from a server with GTIDs enabled, into another server with GTIDs enabled, causes different transaction identifiers to be generated.

**Format Options**

The following options specify how to represent the entire dump file or certain kinds of data in the dump file. They also control whether certain optional information is written to the dump file.

- **--compact**
  
  Produce more compact output. This option enables the --skip-add-drop-table, --skip-add-locks, --skip-comments, --skip-disable-keys, and --skip-set-charset options.

- **--compatible=name**
  
  Produce output that is more compatible with other database systems or with older MySQL servers. The value of name can be ansi, mysql323, mysql40, postgresql, oracle, mssql, db2, maxdb, no_key_options, no_table_options, or no_field_options. To use several values, separate them by commas. These values have the same meaning as the corresponding options for setting the server SQL mode. See Section 5.1.10, “Server SQL Modes”.

  This option does not guarantee compatibility with other servers. It only enables those SQL mode values that are currently available for making dump output more compatible. For example, --compatible=oracle does not map data types to Oracle types or use Oracle comment syntax.

- **--complete-insert, -c**
  
  Use complete INSERT statements that include column names.

- **--create-options**
  
  Include all MySQL-specific table options in the CREATE TABLE statements.

- **--fields-terminated-by=...**
  
  These options are used with the --tab option and have the same meaning as the corresponding FIELDS clauses for LOAD DATA. See Section 13.2.6, “LOAD DATA Syntax”.

- **--hex-blob**
  
  Dump binary columns using hexadecimal notation (for example, 'abc' becomes 0x616263). The affected data types are BINARY, VARBINARY, BLOB types, BIT, all spatial data types, and other non-binary data types when used with the binary character set.

- **--lines-terminated-by=...**
This option is used with the --tab option and has the same meaning as the corresponding LINES clause for LOAD DATA. See Section 13.2.6, “LOAD DATA Syntax”.

- --quote-names, -Q

Quote identifiers (such as database, table, and column names) within ` characters. If the ANSI_QUOTES SQL mode is enabled, identifiers are quoted within " characters. This option is enabled by default. It can be disabled with --skip-quote-names, but this option should be given after any option such as --compatible that may enable --quote-names.

- --result-file=file_name, -r file_name

Direct output to the named file. The result file is created and its previous contents overwritten, even if an error occurs while generating the dump.

This option should be used on Windows to prevent newline \n characters from being converted to \r\n carriage return/newline sequences.

- --tab=dir_name, -T dir_name

Produce tab-separated text-format data files. For each dumped table, mysqldump creates a tbl_name.sql file that contains the CREATE TABLE statement that creates the table, and the server writes a tbl_name.txt file that contains its data. The option value is the directory in which to write the files.

Note

This option should be used only when mysqldump is run on the same machine as the mysqld server. Because the server creates *.txt files in the directory that you specify, the directory must be writable by the server and the MySQL account that you use must have the FILE privilege. Because mysqldump creates *.sql in the same directory, it must be writable by your system login account.

By default, the .txt data files are formatted using tab characters between column values and a newline at the end of each line. The format can be specified explicitly using the --fields-xxx and --lines-terminated-by options.

Column values are converted to the character set specified by the --default-character-set option.

- --tz-utc

This option enables TIMESTAMP columns to be dumped and reloaded between servers in different time zones. mysqldump sets its connection time zone to UTC and adds SET TIME_ZONE='+00:00' to the dump file. Without this option, TIMESTAMP columns are dumped and reloaded in the time zones local to the source and destination servers, which can cause the values to change if the servers are in different time zones. --tz-utc also protects against changes due to daylight saving time. --tz-utc is enabled by default. To disable it, use --skip-tz-utc.

- --xml, -X

Write dump output as well-formed XML.

NULL, 'NULL', and Empty Values: For a column named column_name, the NULL value, an empty string, and the string value 'NULL' are distinguished from one another in the output generated by this option as follows.
Value: | XML Representation:
---|---
NULL (unknown value) | `<field name="column_name" xsi:nil="true" />`
'' (empty string) | `<field name="column_name"></field>`
'NULL' (string value) | `<field name="column_name">NULL</field>`

The output from the `mysql` client when run using the `--xml` option also follows the preceding rules. (See Section 4.5.1.1, “mysql Client Options”.)

XML output from `mysqldump` includes the XML namespace, as shown here:

```xml
<?xml version="1.0"?>
<mysqldump xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
<database name="world">
<table_structure name="City">
  <field Field="ID" Type="int(11)" Null="NO" Key="PRI" Extra="auto_increment" />
  <field Field="Name" Type="char(35)" Null="NO" Key="" Default="" Extra="" />

    <field name="CountryCode">AFG</field>
    <field name="District">Kabol</field>
    <field name="Population">1780000</field>
  </row>
  ...
  <row>
    <field name="ID">4079</field>
    <field name="Name">Rafah</field>
    <field name="CountryCode">PSE</field>
    <field name="District">Rafah</field>
    <field name="Population">92020</field>
  </row>
</table_data>
</database>
</mysqldump>

Filtering Options

The following options control which kinds of schema objects are written to the dump file: by category, such as triggers or events; by name, for example, choosing which databases and tables to dump; or even filtering rows from the table data using a `WHERE` clause.

- `--all-databases`, `-A`
Dump all tables in all databases. This is the same as using the --databases option and naming all the databases on the command line.

- **--databases, -B**
  Dump several databases. Normally, mysqldump treats the first name argument on the command line as a database name and following names as table names. With this option, it treats all name arguments as database names. CREATE DATABASE and USE statements are included in the output before each new database.

  This option may be used to dump the INFORMATION_SCHEMA and performance_schema databases, which normally are not dumped even with the --all-databases option. (Also use the --skip-lock-tables option.)

- **--events, -E**
  Include Event Scheduler events for the dumped databases in the output. This option requires the EVENT privileges for those databases.

  The output generated by using --events contains CREATE EVENT statements to create the events. However, these statements do not include attributes such as the event creation and modification timestamps, so when the events are reloaded, they are created with timestamps equal to the reload time.

  If you require events to be created with their original timestamp attributes, do not use --events. Instead, dump and reload the contents of the mysql.event table directly, using a MySQL account that has appropriate privileges for the mysql database.

- **--ignore-table= db_name.tbl_name**
  Do not dump the given table, which must be specified using both the database and table names. To ignore multiple tables, use this option multiple times. This option also can be used to ignore views.

- **--no-data, -d**
  Do not write any table row information (that is, do not dump table contents). This is useful if you want to dump only the CREATE TABLE statement for the table (for example, to create an empty copy of the table by loading the dump file).

- **--routines, -R**
  Include stored routines (procedures and functions) for the dumped databases in the output. This option requires the SELECT privilege for the mysql.proc table.

  The output generated by using --routines contains CREATE PROCEDURE and CREATE FUNCTION statements to create the routines. However, these statements do not include attributes such as the routine creation and modification timestamps, so when the routines are reloaded, they are created with timestamps equal to the reload time.

  If you require routines to be created with their original timestamp attributes, do not use --routines. Instead, dump and reload the contents of the mysql.proc table directly, using a MySQL account that has appropriate privileges for the mysql database.

- **--tables**
  Override the --databases or -B option. mysqldump regards all name arguments following the option as table names.
mysqldump — A Database Backup Program

• --triggers

Include triggers for each dumped table in the output. This option is enabled by default; disable it with --skip-triggers.

To be able to dump a table's triggers, you must have the TRIGGER privilege for the table.

• --where='where_condition', -w 'where_condition'

Dump only rows selected by the given WHERE condition. Quotes around the condition are mandatory if it contains spaces or other characters that are special to your command interpreter.

Examples:

```bash
--where="user='jimf'"
-w "userid>1"
-w "userid<1"
```

Performance Options

The following options are the most relevant for the performance particularly of the restore operations. For large data sets, restore operation (processing the INSERT statements in the dump file) is the most time-consuming part. When it is urgent to restore data quickly, plan and test the performance of this stage in advance. For restore times measured in hours, you might prefer an alternative backup and restore solution, such as MySQL Enterprise Backup for InnoDB-only and mixed-use databases, or mysqlhotcopy for MyISAM-only databases.

Performance is also affected by the transactional options, primarily for the dump operation.

• --delayed-insert

For those nontransactional tables that support the INSERT DELAYED syntax, use that statement rather than regular INSERT statements.

As of MySQL 5.6.6, DELAYED inserts are deprecated, so this option will be removed in a future release.

• --disable-keys, -K

For each table, surround the INSERT statements with /*!40000 ALTER TABLE tbl_name DISABLE KEYS */; and /*!40000 ALTER TABLE tbl_name ENABLE KEYS */; statements. This makes loading the dump file faster because the indexes are created after all rows are inserted. This option is effective only for nonunique indexes of MyISAM tables.

• --extended-insert, -e

Write INSERT statements using multiple-row syntax that includes several VALUES lists. This results in a smaller dump file and speeds up inserts when the file is reloaded.

• --insert-ignore

Write INSERT IGNORE statements rather than INSERT statements.

• --max-allowed-packet=value

The maximum size of the buffer for client/server communication. The default is 24MB, the maximum is 1GB.

• --net-buffer-length=value
The initial size of the buffer for client/server communication. When creating multiple-row `INSERT` statements (as with the `--extended-insert` or `--opt` option), `mysqldump` creates rows up to `--net-buffer-length` bytes long. If you increase this variable, ensure that the MySQL server `net_buffer_length` system variable has a value at least this large.

• **--opt**

This option, enabled by default, is shorthand for the combination of `--add-drop-table --add-locks --create-options --disable-keys --extended-insert --lock-tables --quick --set-charset`. It gives a fast dump operation and produces a dump file that can be reloaded into a MySQL server quickly.

Because the `--opt` option is enabled by default, you only specify its converse, the `--skip-opt` to turn off several default settings. See the discussion of `mysqldump` option groups for information about selectively enabling or disabling a subset of the options affected by `--opt`.

• **--quick, -q**

This option is useful for dumping large tables. It forces `mysqldump` to retrieve rows for a table from the server a row at a time rather than retrieving the entire row set and buffering it in memory before writing it out.

• **--skip-opt**

See the description for the `--opt` option.

**Transactional Options**

The following options trade off the performance of the dump operation, against the reliability and consistency of the exported data.

• **--add-locks**

Surround each table dump with `LOCK TABLES` and `UNLOCK TABLES` statements. This results in faster inserts when the dump file is reloaded. See Section 8.2.4.1, “Optimizing INSERT Statements”.

• **--flush-logs, -F**

Flush the MySQL server log files before starting the dump. This option requires the `RELOAD` privilege. If you use this option in combination with the `--all-databases` option, the logs are flushed for each database dumped. The exception is when using `--lock-all-tables`, `--master-data`, or `--single-transaction`: In this case, the logs are flushed only once, corresponding to the moment that all tables are locked by `FLUSH TABLES WITH READ LOCK`. If you want your dump and the log flush to happen at exactly the same moment, you should use `--flush-logs` together with `--lock-all-tables`, `--master-data`, or `--single-transaction`.

• **--flush-privileges**

Add a `FLUSH PRIVILEGES` statement to the dump output after dumping the `mysql` database. This option should be used any time the dump contains the `mysql` database and any other database that depends on the data in the `mysql` database for proper restoration.

• **--lock-all-tables, -x**

Lock all tables across all databases. This is achieved by acquiring a global read lock for the duration of the whole dump. This option automatically turns off `--single-transaction` and `--lock-tables`. 
• **--lock-tables**, `-l`  
  For each dumped database, lock all tables to be dumped before dumping them. The tables are locked with `READ LOCAL` to permit concurrent inserts in the case of MyISAM tables. For transactional tables such as InnoDB, **--single-transaction** is a much better option than **--lock-tables** because it does not need to lock the tables at all.

  Because **--lock-tables** locks tables for each database separately, this option does not guarantee that the tables in the dump file are logically consistent between databases. Tables in different databases may be dumped in completely different states.

  Some options, such as **--opt**, automatically enable **--lock-tables**. If you want to override this, use **--skip-lock-tables** at the end of the option list.

• **--no-autocommit**  
  Enclose the `INSERT` statements for each dumped table within `SET autocommit = 0` and `COMMIT` statements.

• **--order-by-primary**  
  Dump each table's rows sorted by its primary key, or by its first unique index, if such an index exists. This is useful when dumping a MyISAM table to be loaded into an InnoDB table, but makes the dump operation take considerably longer.

• **--shared-memory-base-name=name**  
  On Windows, the shared-memory name to use for connections made using shared memory to a local server. The default value is `MYSQL`. The shared-memory name is case-sensitive.

  This option applies only if the server was started with the `shared_memory` system variable enabled to support shared-memory connections.

• **--single-transaction**  
  This option sets the transaction isolation mode to `REPEATABLE READ` and sends a `START TRANSACTION` SQL statement to the server before dumping data. It is useful only with transactional tables such as InnoDB, because then it dumps the consistent state of the database at the time when `START TRANSACTION` was issued without blocking any applications.

  When using this option, you should keep in mind that only InnoDB tables are dumped in a consistent state. For example, any MyISAM or MEMORY tables dumped while using this option may still change state.

  While a **--single-transaction** dump is in process, to ensure a valid dump file (correct table contents and binary log coordinates), no other connection should use the following statements: `ALTER TABLE`, `CREATE TABLE`, `DROP TABLE`, `RENAME TABLE`, `TRUNCATE TABLE`. A consistent read is not isolated from those statements, so use of them on a table to be dumped can cause the `SELECT` that is performed by `mysqldump` to retrieve the table contents to obtain incorrect contents or fail.

  The **--single-transaction** option and the **--lock-tables** option are mutually exclusive because `LOCK TABLES` causes any pending transactions to be committed implicitly.

  To dump large tables, combine the **--single-transaction** option with the **--quick** option.
Option Groups

- The `--opt` option turns on several settings that work together to perform a fast dump operation. All of these settings are on by default, because `--opt` is on by default. Thus you rarely if ever specify `--opt`. Instead, you can turn these settings off as a group by specifying `--skip-opt`, the optionally re-enable certain settings by specifying the associated options later on the command line.

- The `--compact` option turns off several settings that control whether optional statements and comments appear in the output. Again, you can follow this option with other options that re-enable certain settings, or turn all the settings on by using the `--skip-compact` form.

When you selectively enable or disable the effect of a group option, order is important because options are processed first to last. For example, `--disable-keys --lock-tables --skip-opt` would not have the intended effect; it is the same as `--skip-opt` by itself.

Examples

To make a backup of an entire database:

```
shell> mysqldump db_name > backup-file.sql
```

To load the dump file back into the server:

```
shell> mysql db_name < backup-file.sql
```

Another way to reload the dump file:

```
shell> mysql -e "source /path-to-backup/backup-file.sql" db_name
```

`mysqldump` is also very useful for populating databases by copying data from one MySQL server to another:

```
shell> mysqldump --opt db_name | mysql --host=remote_host -C db_name
```

You can dump several databases with one command:

```
shell> mysqldump --databases db_name1 [db_name2 ...] > my_databases.sql
```

To dump all databases, use the `--all-databases` option:

```
shell> mysqldump --all-databases > all_databases.sql
```

For InnoDB tables, `mysqldump` provides a way of making an online backup:

```
shell> mysqldump --all-databases --master-data --single-transaction > all_databases.sql
```

This backup acquires a global read lock on all tables (using `FLUSH TABLES WITH READ LOCK`) at the beginning of the dump. As soon as this lock has been acquired, the binary log coordinates are read and the lock is released. If long updating statements are running when the `FLUSH` statement is issued, the MySQL server may get stalled until those statements finish. After that, the dump becomes lock free and does not disturb reads and writes on the tables. If the update statements that the MySQL server receives are short (in terms of execution time), the initial lock period should not be noticeable, even with many updates.
For point-in-time recovery (also known as “roll-forward,” when you need to restore an old backup and replay the changes that happened since that backup), it is often useful to rotate the binary log (see Section 5.4.4, “The Binary Log”) or at least know the binary log coordinates to which the dump corresponds:

```
shell> mysqldump --all-databases --master-data=2 > all_databases.sql
```

Or:

```
shell> mysqldump --all-databases --flush-logs --master-data=2
                 > all_databases.sql
```

The `--master-data` and `--single-transaction` options can be used simultaneously, which provides a convenient way to make an online backup suitable for use prior to point-in-time recovery if tables are stored using the InnoDB storage engine.

For more information on making backups, see Section 7.2, “Database Backup Methods”, and Section 7.3, “Example Backup and Recovery Strategy”.

- To select the effect of `--opt` except for some features, use the `--skip` option for each feature. To disable extended inserts and memory buffering, use `--opt --skip-extended-insert --skip-quick`. (Actually, `--skip-extended-insert --skip-quick` is sufficient because `--opt` is on by default.)

  - To reverse `--opt` for all features except index disabling and table locking, use `--skip-opt --disable-keys --lock-tables`.

**Restrictions**

*mysqldump* does not dump the `INFORMATION_SCHEMA` or `performance_schema` database by default. To dump either of these, name it explicitly on the command line. You can also name it with the `--databases` option. Also, use the `--skip-lock-tables` option.

*mysqldump* does not dump the NDB Cluster `ndbinfo` information database.

If you encounter problems backing up views due to insufficient privileges, see Section 20.9, “Restrictions on Views” for a workaround.

### 4.5.5 mysqlimport — A Data Import Program

The `mysqlimport` client provides a command-line interface to the `LOAD DATA` SQL statement. Most options to `mysqlimport` correspond directly to clauses of `LOAD DATA` syntax. See Section 13.2.6, “LOAD DATA Syntax”.

Invoke `mysqlimport` like this:

```
shell> mysqlimport [options] db_name textfile1 [textfile2 ...]
```

For each text file named on the command line, `mysqlimport` strips any extension from the file name and uses the result to determine the name of the table into which to import the file’s contents. For example, files named `patient.txt`, `patient.text`, and `patient` all would be imported into a table named `patient`.

`mysqlimport` supports the following options, which can be specified on the command line or in the `mysqlimport` and `client` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.
## Table 4.14 mysqlimport Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--bind-address</td>
<td>Use specified network interface to connect to MySQL Server</td>
<td>5.6.1</td>
</tr>
<tr>
<td>--columns</td>
<td>This option takes a comma-separated list of column names as its value</td>
<td></td>
</tr>
<tr>
<td>--compress</td>
<td>Compress all information sent between client and server</td>
<td></td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging log</td>
<td></td>
</tr>
<tr>
<td>--debug-check</td>
<td>Print debugging information when program exits</td>
<td></td>
</tr>
<tr>
<td>--debug-info</td>
<td>Print debugging information, memory, and CPU statistics when program exits</td>
<td></td>
</tr>
<tr>
<td>--default-auth</td>
<td>Authentication plugin to use</td>
<td>5.6.2</td>
</tr>
<tr>
<td>--default-character-set</td>
<td>Specify default character set</td>
<td></td>
</tr>
<tr>
<td>--defaults-extra-file</td>
<td>Read named option file in addition to usual option files</td>
<td></td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
<td></td>
</tr>
<tr>
<td>--defaults-group-suffix</td>
<td>Option group suffix value</td>
<td></td>
</tr>
<tr>
<td>--delete</td>
<td>Empty the table before importing the text file</td>
<td></td>
</tr>
<tr>
<td>--enable-cleartext-plugin</td>
<td>Enable cleartext authentication plugin</td>
<td>5.6.28</td>
</tr>
<tr>
<td>--fields-enclosed-by</td>
<td>This option has the same meaning as the corresponding clause for LOAD DATA</td>
<td></td>
</tr>
<tr>
<td>--fields-escaped-by</td>
<td>This option has the same meaning as the corresponding clause for LOAD DATA</td>
<td></td>
</tr>
<tr>
<td>--fields-optionally-enclosed-by</td>
<td>This option has the same meaning as the corresponding clause for LOAD DATA</td>
<td></td>
</tr>
<tr>
<td>--fields-terminated-by</td>
<td>This option has the same meaning as the corresponding clause for LOAD DATA</td>
<td></td>
</tr>
<tr>
<td>--force</td>
<td>Continue even if an SQL error occurs</td>
<td></td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
<td></td>
</tr>
<tr>
<td>--host</td>
<td>Host on which MySQL server is located</td>

<td>--version</td>
<td>Display version information and exit</td>
<td></td>
</tr>
</tbody>
</table>

- **--help, -?**
  Display a help message and exit.

- **--bind-address=ip_address**
  On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

- **--character-sets-dir=dir_name**
  The directory where character sets are installed. See Section 10.15, “Character Set Configuration”.

- **--columns=column_list, -c column_list**
  This option takes a list of comma-separated column names as its value. The order of the column names indicates how to match data file columns with table columns.

- **--compress, -C**
Compress all information sent between the client and the server if possible. See Section 4.2.5, “Connection Compression Control”.

- **--debug[=debug_options], -# [debug_options]**
  Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o`.

- **--debug-check**
  Print some debugging information when the program exits.

- **--debug-info**
  Print debugging information and memory and CPU usage statistics when the program exits.

- **--default-character-set=charset_name**
  Use `charset_name` as the default character set. See Section 10.15, “Character Set Configuration”.

- **--default-auth=plugin**
  A hint about which client-side authentication plugin to use. See Section 6.2.11, “Pluggable Authentication”.

- **--defaults-extra-file=file_name**
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-file=file_name**
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

  Exception: Even with `--defaults-file`, client programs read `.mylogin.cnf`.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-group-suffix= str**
  Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysqlimport` normally reads the `[client]` and `[mysqlimport]` groups. If the `--defaults-group-suffix=other` option is given, `mysqlimport` also reads the `[client_other]` and `[mysqlimport_other]` groups.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--delete, -D**
  Empty the table before importing the text file.
--enable-cleartext-plugin

Enable the mysql_clear_password cleartext authentication plugin. (See Section 6.4.1.5, “Client-Side Cleartext Pluggable Authentication”.)

This option was added in MySQL 5.6.28.

--fields-terminated-by=..., --fields-enclosed-by=..., --fields-optionally-enclosed-by=..., --fields-escaped-by=...

These options have the same meaning as the corresponding clauses for LOAD DATA. See Section 13.2.6, “LOAD DATA Syntax”.

--force, -f

Ignore errors. For example, if a table for a text file does not exist, continue processing any remaining files. Without --force, mysqlimport exits if a table does not exist.

--host=host_name, -h host_name

Import data to the MySQL server on the given host. The default host is localhost.

--ignore, -i

See the description for the --replace option.

--ignore-lines=N

Ignore the first \( N \) lines of the data file.

--lines-terminated-by=...

This option has the same meaning as the corresponding clause for LOAD DATA. For example, to import Windows files that have lines terminated with carriage return/linefeed pairs, use --lines-terminated-by="\r\n". (You might have to double the backslashes, depending on the escaping conventions of your command interpreter.) See Section 13.2.6, “LOAD DATA Syntax”.

--local, -L

By default, files are read by the server on the server host. With this option, mysqlimport reads input files locally on the client host. Enabling local data loading also requires that the server permits it; see Section 6.1.6, “Security Issues with LOAD DATA LOCAL”

--lock-tables, -l

Lock all tables for writing before processing any text files. This ensures that all tables are synchronized on the server.

--login-path=name

Read options from the named login path in the .mylogin.cnf login path file. A “login path” is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the mysql_config_editor utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

--low-priority
Use `LOW_PRIORITY` when loading the table. This affects only storage engines that use only table-level locking (such as MyISAM, MEMORY, and MERGE).

- **`--no-defaults`**

Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read.

The exception is that the `.mylogin.cnf` file, if it exists, is read in all cases. This permits passwords to be specified in a safer way than on the command line even when `--no-defaults` is used. (.mylogin.cnf is created by the `mysql_config_editor` utility. See Section 4.6.6, "`mysql_config_editor` — MySQL Configuration Utility").

For additional information about this and other option-file options, see Section 4.2.2.3, "Command-Line Options that Affect Option-File Handling".

- **`--password[=password], -p[password]`**

The password of the MySQL account used for connecting to the server. The password value is optional. If not given, `mysqlimport` prompts for one. If given, there must be no space between `--password=` or `-p` and the password following it. If no password option is specified, the default is to send no password.

Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, "End-User Guidelines for Password Security".

To explicitly specify that there is no password and that `mysqlimport` should not prompt for one, use the `--skip-password` option.

- **`--pipe, -W`**

On Windows, connect to the server using a named pipe. This option applies only if the server was started with the `named_pipe` system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the `named_pipe_full_access_group` system variable.

- **`--plugin-dir=dir_name`**

The directory in which to look for plugins. Specify this option if the `--default-auth` option is used to specify an authentication plugin but `mysqlimport` does not find it. See Section 6.2.11, "Pluggable Authentication".

- **`--port=port_num, -P port_num`**

For TCP/IP connections, the port number to use.

- **`--print-defaults`**

Print the program name and all options that it gets from option files.

For additional information about this and other option-file options, see Section 4.2.2.3, "Command-Line Options that Affect Option-File Handling".

- **`--protocol={TCP|SOCKET|PIPE|MEMORY}`**
The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally result in use of a protocol other than the one you want. For details on the permissible values, see Section 4.2.4, “Connecting to the MySQL Server Using Command Options”.

• **--replace**, -r

The `--replace` and `--ignore` options control handling of input rows that duplicate existing rows on unique key values. If you specify `--replace`, new rows replace existing rows that have the same unique key value. If you specify `--ignore`, input rows that duplicate an existing row on a unique key value are skipped. If you do not specify either option, an error occurs when a duplicate key value is found, and the rest of the text file is ignored.

• **--secure-auth**

Do not send passwords to the server in old (pre-4.1) format. This prevents connections except for servers that use the newer password format. This option is enabled by default; use `--skip-secure-auth` to disable it. This option was added in MySQL 5.6.17.

**Note**

Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.

**Note**

This option is deprecated and will be removed in a future release. As of MySQL 5.7.5, it is always enabled and attempting to disable it produces an error.

• **--shared-memory-base-name=name**

On Windows, the shared-memory name to use for connections made using shared memory to a local server. The default value is `MYSQL`. The shared-memory name is case-sensitive.

This option applies only if the server was started with the `shared_memory` system variable enabled to support shared-memory connections.

• **--silent**, -s

Silent mode. Produce output only when errors occur.

• **--socket=path, -S path**

For connections to `localhost`, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

On Windows, this option applies only if the server was started with the `named_pipe` system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the `named_pipe_full_access_group` system variable.

• **--ssl***

Options that begin with `--ssl` specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Command Options for Encrypted Connections.
mysqlshow — Display Database, Table, and Column Information

- **--user=user_name, -u user_name**
  The user name of the MySQL account to use for connecting to the server.

- **--use-threads=N**
  Load files in parallel using \( N \) threads.

- **--verbose, -v**
  Verbose mode. Print more information about what the program does.

- **--version, -V**
  Display version information and exit.

Here is a sample session that demonstrates use of mysqlimport:

```
shell> mysql -e 'CREATE TABLE imptest(id INT, n VARCHAR(30))' test
shell> ed
a
100  Max Sydow
101  Count Dracula
w imptest.txt
32
q
shell> od -c imptest.txt
0000000   1   0   0  \t   M   a   x       S   y   d   o   w  
  1   0
0000020   1  \t   C   o   u   n   t       D   r   a   c   u   l   a  

shell> mysqlimport --local test imptest.txt
test.imptest: Records: 2  Deleted: 0  Skipped: 0  Warnings: 0
shell> mysql -e 'SELECT * FROM imptest' test
+------+---------------+
<table>
<thead>
<tr>
<th>id</th>
<th>n</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>Max Sydow</td>
</tr>
<tr>
<td>101</td>
<td>Count Dracula</td>
</tr>
</tbody>
</table>
+------+---------------+
```

### 4.5.6 mysqlshow — Display Database, Table, and Column Information

The mysqlshow client can be used to quickly see which databases exist, their tables, or a table’s columns or indexes.

mysqlshow provides a command-line interface to several SQL SHOW statements. See Section 13.7.5, “SHOW Syntax”. The same information can be obtained by using those statements directly. For example, you can issue them from the mysql client program.

Invoke mysqlshow like this:

```
shell> mysqlshow [options] [db_name [tbl_name [col_name]]]
```

- If no database is given, a list of database names is shown.
- If no table is given, all matching tables in the database are shown.
- If no column is given, all matching columns and column types in the table are shown.
The output displays only the names of those databases, tables, or columns for which you have some privileges.

If the last argument contains shell or SQL wildcard characters (*, ?, %, or _), only those names that are matched by the wildcard are shown. If a database name contains any underscores, those should be escaped with a backslash (some Unix shells require two) to get a list of the proper tables or columns. * and ? characters are converted into SQL % and _ wildcard characters. This might cause some confusion when you try to display the columns for a table with a _ in the name, because in this case, `mysqlshow` shows you only the table names that match the pattern. This is easily fixed by adding an extra % last on the command line as a separate argument.

`mysqlshow` supports the following options, which can be specified on the command line or in the `[mysqlshow]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

### Table 4.15 mysqlshow Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--bind-address</td>
<td>Use specified network interface to connect to MySQL Server</td>
<td>5.6.1</td>
</tr>
<tr>
<td>--compress</td>
<td>Compress all information sent between client and server</td>
<td></td>
</tr>
<tr>
<td>--count</td>
<td>Show the number of rows per table</td>
<td></td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging log</td>
<td></td>
</tr>
<tr>
<td>--debug-check</td>
<td>Print debugging information when program exits</td>
<td></td>
</tr>
<tr>
<td>--debug-info</td>
<td>Print debugging information, memory, and CPU statistics when program exits</td>
<td></td>
</tr>
<tr>
<td>--default-auth</td>
<td>Authentication plugin to use</td>
<td>5.6.2</td>
</tr>
<tr>
<td>--default-character-set</td>
<td>Specify default character set</td>
<td></td>
</tr>
<tr>
<td>--defaults-extra-file</td>
<td>Read named option file in addition to usual option files</td>
<td></td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
<td></td>
</tr>
<tr>
<td>--defaults-group-suffix</td>
<td>Option group suffix value</td>
<td></td>
</tr>
<tr>
<td>--enable-cleartext-plugin</td>
<td>Enable cleartext authentication plugin</td>
<td>5.6.28</td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
<td></td>
</tr>
<tr>
<td>--host</td>
<td>Host on which MySQL server is located</td>
<td></td>
</tr>
<tr>
<td>--keys</td>
<td>Show table indexes</td>
<td></td>
</tr>
<tr>
<td>--login-path</td>
<td>Read login path options from .mylogin.cnf</td>
<td>5.6.6</td>
</tr>
<tr>
<td>--no-defaults</td>
<td>Read no option files</td>
<td></td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
<td></td>

<td>--socket</td>
<td>Unix socket file or Windows named pipe to use</td>
<td></td>
</tr>
<tr>
<td>--ssl</td>
<td>Enable connection encryption</td>
<td></td>
</tr>
<tr>
<td>--ssl-ca</td>
<td>File that contains list of trusted SSL Certificate Authorities</td>
<td></td>
</tr>
<tr>
<td>--ssl-capath</td>
<td>Directory that contains trusted SSL Certificate Authority certificate files</td>
<td></td>
</tr>
<tr>
<td>--ssl-cert</td>
<td>File that contains X.509 certificate</td>
<td></td>
</tr>
<tr>
<td>--ssl-cipher</td>
<td>Permissible ciphers for connection encryption</td>
<td></td>
</tr>
<tr>
<td>--ssl-crl</td>
<td>File that contains certificate revocation lists</td>
<td>5.6.3</td>
</tr>
<tr>
<td>--ssl-crlpath</td>
<td>Directory that contains certificate revocation-list files</td>
<td>5.6.3</td>
</tr>
<tr>
<td>--ssl-key</td>
<td>File that contains X.509 key</td>
<td></td>
</tr>
<tr>
<td>--ssl-mode</td>
<td>Desired security state of connection to server</td>
<td>5.6.30</td>
</tr>
<tr>
<td>--ssl-verify-server-cert</td>
<td>Verify host name against server certificate Common Name identity</td>
<td></td>
</tr>
<tr>
<td>--status</td>
<td>Display extra information about each table</td>
<td></td>
</tr>
<tr>
<td>--user</td>
<td>MySQL user name to use when connecting to server</td>
<td></td>
</tr>
<tr>
<td>--verbose</td>
<td>Verbose mode</td>
<td></td>
</tr>
<tr>
<td>--version</td>
<td>Display version information and exit</td>
<td></td>
</tr>
</tbody>
</table>

- **--help, --?**

Display a help message and exit.

- **--bind-address=ip_address**

On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

- **--character-sets-dir=dir_name**

The directory where character sets are installed. See [Section 10.15, “Character Set Configuration”](#).

- **--compress, -C**

Compress all information sent between the client and the server if possible. See [Section 4.2.5, “Connection Compression Control”](#).

- **--count**

Show the number of rows per table. This can be slow for non-[MyISAM](#) tables.

- **--debug [=debug_options], -# [debug_options]**

Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o`.

- **--debug-check**

Print some debugging information when the program exits.

- **--debug-info**
Print debugging information and memory and CPU usage statistics when the program exits.

- **--default-character-set=charset_name**
  
  Use *charset_name* as the default character set. See Section 10.15, “Character Set Configuration”.

- **--default-auth=plugin**
  
  A hint about which client-side authentication plugin to use. See Section 6.2.11, “Pluggable Authentication”.

- **--defaults-extra-file=file_name**
  
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. *file_name* is interpreted relative to the current directory if given as a relative path name rather than a full path name.
  
  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-file=file_name**
  
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. *file_name* is interpreted relative to the current directory if given as a relative path name rather than a full path name.
  
  Exception: Even with --defaults-file, client programs read .mylogin.cnf.
  
  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-group-suffix=str**
  
  Read not only the usual option groups, but also groups with the usual names and a suffix of *str*. For example, mysqlshow normally reads the [client] and [mysqlshow] groups. If the --defaults-group-suffix=_other option is given, mysqlshow also reads the [client_other] and [mysqlshow_other] groups.
  
  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--enable-cleartext-plugin**
  
  Enable the mysql_clear_password cleartext authentication plugin. (See Section 6.4.1.5, “Client-Side Cleartext Pluggable Authentication”.)
  
  This option was added in MySQL 5.6.28.

- **--host=host_name, -h host_name**
  
  Connect to the MySQL server on the given host.

- **--keys, -k**
  
  Show table indexes.

- **--login-path=name**
Read options from the named login path in the .mylogin.cnf login path file. A "login path" is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the mysql_config_editor utility. See Section 4.6.6, "mysql_config_editor — MySQL Configuration Utility".

For additional information about this and other option-file options, see Section 4.2.2.3, "Command-Line Options that Affect Option-File Handling".

• --no-defaults

Do not read any option files. If program startup fails due to reading unknown options from an option file, --no-defaults can be used to prevent them from being read.

The exception is that the .mylogin.cnf file, if it exists, is read in all cases. This permits passwords to be specified in a safer way than on the command line even when --no-defaults is used. (.mylogin.cnf is created by the mysql_config_editor utility. See Section 4.6.6, "mysql_config_editor — MySQL Configuration Utility").

For additional information about this and other option-file options, see Section 4.2.2.3, "Command-Line Options that Affect Option-File Handling".

• --password[=password], -p[password]

The password of the MySQL account used for connecting to the server. The password value is optional. If not given, mysqlshow prompts for one. If given, there must be no space between --password= or -p and the password following it. If no password option is specified, the default is to send no password.

Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, "End-User Guidelines for Password Security".

To explicitly specify that there is no password and that mysqlshow should not prompt for one, use the --skip-password option.

• --pipe, -W

On Windows, connect to the server using a named pipe. This option applies only if the server was started with the named_pipe system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the named_pipe_full_access_group system variable.

• --plugin-dir=dir_name

The directory in which to look for plugins. Specify this option if the --default-auth option is used to specify an authentication plugin but mysqlshow does not find it. See Section 6.2.11, "Pluggable Authentication".

• --port=port_num, -P port_num

For TCP/IP connections, the port number to use.

• --print-defaults

Print the program name and all options that it gets from option files.

For additional information about this and other option-file options, see Section 4.2.2.3, "Command-Line Options that Affect Option-File Handling".
mysqlshow — Display Database, Table, and Column Information

- **--protocol={TCP|SOCKET|PIPE|MEMORY}**
  The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally result in use of a protocol other than the one you want. For details on the permissible values, see Section 4.2.4, “Connecting to the MySQL Server Using Command Options”.

- **--secure-auth**
  Do not send passwords to the server in old (pre-4.1) format. This prevents connections except for servers that use the newer password format. This option is enabled by default; use **--skip-secure-auth** to disable it. This option was added in MySQL 5.6.17.
  
  **Note**
  Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.
  
  **Note**
  This option is deprecated and will be removed in a future release. As of MySQL 5.7.5, it is always enabled and attempting to disable it produces an error.

- **--shared-memory-base-name=name**
  On Windows, the shared-memory name to use for connections made using shared memory to a local server. The default value is **MYSQL**. The shared-memory name is case-sensitive.
  
  This option applies only if the server was started with the **shared_memory** system variable enabled to support shared-memory connections.

- **--show-table-type, -t**
  Show a column indicating the table type, as in **SHOW FULL TABLES**. The type is **BASE TABLE** or **VIEW**.

- **--socket=path, -S path**
  For connections to **localhost**, the Unix socket file to use, or, on Windows, the name of the named pipe to use.
  
  On Windows, this option applies only if the server was started with the **named_pipe** system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the **named_pipe_full_access_group** system variable.

- **--ssl***
  Options that begin with **--ssl** specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Command Options for Encrypted Connections.

- **--status, -i**
  Display extra information about each table.

- **--user=user_name, -u user_name**
  The user name of the MySQL account to use for connecting to the server.
mysqlslap — Load Emulation Client

- **--verbose, -v**
  Verbose mode. Print more information about what the program does. This option can be used multiple times to increase the amount of information.

- **--version, -V**
  Display version information and exit.

4.5.7 mysqlslap — Load Emulation Client

mysqlslap is a diagnostic program designed to emulate client load for a MySQL server and to report the timing of each stage. It works as if multiple clients are accessing the server.

Invoke mysqlslap like this:

```
shell> mysqlslap [options]
```

Some options such as `--create` or `--query` enable you to specify a string containing an SQL statement or a file containing statements. If you specify a file, by default it must contain one statement per line. (That is, the implicit statement delimiter is the newline character.) Use the `--delimiter` option to specify a different delimiter, which enables you to specify statements that span multiple lines or place multiple statements on a single line. You cannot include comments in a file; mysqlslap does not understand them.

mysqlslap runs in three stages:

1. Create schema, table, and optionally any stored programs or data to use for the test. This stage uses a single client connection.

2. Run the load test. This stage can use many client connections.

3. Clean up (disconnect, drop table if specified). This stage uses a single client connection.

Examples:

Supply your own create and query SQL statements, with 50 clients querying and 200 selects for each (enter the command on a single line):

```
mysqlslap --delimiter=";"
--create="CREATE TABLE a (b int);INSERT INTO a VALUES (23)"
--query="SELECT * FROM a" --concurrency=50 --iterations=200
```

Let mysqlslap build the query SQL statement with a table of two INT columns and three VARCHAR columns. Use five clients querying 20 times each. Do not create the table or insert the data (that is, use the previous test's schema and data):

```
mysqlslap --concurrency=5 --iterations=20
--number-int-cols=2 --number-char-cols=3
--auto-generate-sql
```

Tell the program to load the create, insert, and query SQL statements from the specified files, where the `create.sql` file has multiple table creation statements delimited by `';'` and multiple insert statements delimited by `';'`. The `--query` file will have multiple queries delimited by `';'`. Run all the load statements, then run all the queries in the query file with five clients (five times each):
mysqlslap supports the following options, which can be specified on the command line or in the [mysqlslap] and [client] groups of an option file. For information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

Table 4.16 mysqlslap Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--auto-generate-sql</td>
<td>Generate SQL statements automatically when they are not supplied in files or using command options</td>
<td></td>
</tr>
<tr>
<td>--auto-generate-sql-add-autoincrement</td>
<td>Add AUTO_INCREMENT column to automatically generated tables</td>
<td></td>
</tr>
<tr>
<td>--auto-generate-sql-execute-number</td>
<td>Specify how many queries to generate automatically</td>
<td></td>
</tr>
<tr>
<td>--auto-generate-sql-guild-primary</td>
<td>Add a GUID-based primary key to automatically generated tables</td>
<td></td>
</tr>
<tr>
<td>--auto-generate-sql-load-type</td>
<td>Specify the test load type</td>
<td></td>
</tr>
<tr>
<td>--auto-generate-sql-secondary-indexes</td>
<td>Specify how many secondary indexes to add to automatically generated tables</td>
<td></td>
</tr>
<tr>
<td>--auto-generate-sql-unique-query-number</td>
<td>How many different queries to generate for automatic tests.</td>
<td></td>
</tr>
<tr>
<td>--auto-generate-sql-unique-write-number</td>
<td>How many different queries to generate for --auto-generate-sql-write-number</td>
<td></td>
</tr>
<tr>
<td>--auto-generate-sql-write-number</td>
<td>How many row inserts to perform on each thread</td>
<td></td>
</tr>
<tr>
<td>--commit</td>
<td>How many statements to execute before committing.</td>
<td></td>
</tr>
<tr>
<td>--compress</td>
<td>Compress all information sent between client and server</td>
<td></td>
</tr>
<tr>
<td>--concurrency</td>
<td>Number of clients to simulate when issuing the SELECT statement</td>
<td></td>
</tr>
<tr>
<td>--create</td>
<td>File or string containing the statement to use for creating the table</td>
<td></td>
</tr>
<tr>
<td>--create-schema</td>
<td>Schema in which to run the tests</td>
<td></td>
</tr>
<tr>
<td>--csv</td>
<td>Generate output in comma-separated values format</td>
<td></td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging log</td>
<td></td>
</tr>
<tr>
<td>--debug-check</td>
<td>Print debugging information when program exits</td>
<td></td>
</tr>
<tr>
<td>--debug-info</td>
<td>Print debugging information, memory, and CPU statistics when program exits</td>
<td></td>
</tr>
<tr>
<td>--default-auth</td>
<td>Authentication plugin to use</td>
<td>5.6.2</td>
</tr>
<tr>
<td>--defaults-extra-file</td>
<td>Read named option file in addition to usual option files</td>
<td></td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
<td></td>
</tr>
<tr>
<td>--defaults-group-suffix</td>
<td>Option group suffix value</td>
<td></td>
</tr>
<tr>
<td>--delimiter</td>
<td>Delimiter to use in SQL statements</td>
<td></td>
</tr>
<tr>
<td>Option Name</td>
<td>Description</td>
<td>Introduced</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>
<td>--detach</td>
<td>Detach (close and reopen) each connection after each N statements</td>
<td></td>
</tr>
<tr>
<td>--enable-cleartext-plugin</td>
<td>Enable cleartext authentication plugin</td>
<td>5.6.7</td>
</tr>
<tr>
<td>--engine</td>
<td>Storage engine to use for creating the table</td>
<td></td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
<td></td>
</tr>
<tr>
<td>--host</td>
<td>Host on which MySQL server is located</td>
<td></td>
</tr>
<tr>
<td>--iterations</td>
<td>Number of times to run the tests</td>
<td></td>
</tr>
<tr>
<td>--login-path</td>
<td>Read login path options from .mylogin.cnf</td>
<td>5.6.6</td>
</tr>
<tr>
<td>--no-defaults</td>
<td>Read no option files</td>
<td></td>
</tr>
<tr>
<td>--no-drop</td>
<td>Do not drop any schema created during the test run</td>
<td>5.6.3</td>
</tr>
<tr>
<td>--number-char-cols</td>
<td>Number of VARCHAR columns to use if --auto-generate-sql is specified</td>
<td></td>
</tr>
<tr>
<td>--number-int-cols</td>
<td>Number of INT columns to use if --auto-generate-sql is specified</td>
<td></td>
</tr>
<tr>
<td>--number-of-queries</td>
<td>Limit each client to approximately this number of queries</td>
<td></td>
</tr>
<tr>
<td>--only-print</td>
<td>Do not connect to databases. mysqlslap only prints what it would have done</td>
<td></td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
<td></td>
</tr>
<tr>
<td>--pipe</td>
<td>Connect to server using named pipe (Windows only)</td>
<td></td>
</tr>
<tr>
<td>--plugin-dir</td>
<td>Directory where plugins are installed</td>
<td>5.6.2</td>
</tr>
<tr>
<td>--port</td>
<td>TCP/IP port number for connection</td>
<td></td>
</tr>
<tr>
<td>--post-query</td>
<td>File or string containing the statement to execute after the tests have completed</td>
<td></td>
</tr>
<tr>
<td>--post-system</td>
<td>String to execute using system() after the tests have completed</td>
<td></td>
</tr>
<tr>
<td>--pre-query</td>
<td>File or string containing the statement to execute before running the tests</td>
<td></td>
</tr>
<tr>
<td>--pre-system</td>
<td>String to execute using system() before running the tests</td>
<td></td>
</tr>
<tr>
<td>--print-defaults</td>
<td>Print default options</td>
<td></td>
</tr>
<tr>
<td>--protocol</td>
<td>Connection protocol to use</td>
<td></td>
</tr>
<tr>
<td>--query</td>
<td>File or string containing the SELECT statement to use for retrieving data</td>
<td></td>
</tr>
<tr>
<td>--secure-auth</td>
<td>Do not send passwords to server in old (pre-4.1) format</td>
<td>5.6.17</td>
</tr>
<tr>
<td>--shared-memory-base-name</td>
<td>Name of shared memory to use for shared-memory connections</td>
<td></td>
</tr>
<tr>
<td>--silent</td>
<td>Silent mode</td>
<td></td>
</tr>
<tr>
<td>--socket</td>
<td>Unix socket file or Windows named pipe to use</td>
<td></td>
</tr>
<tr>
<td>--ssl</td>
<td>Enable connection encryption</td>
<td></td>
</tr>
<tr>
<td>--ssl-ca</td>
<td>File that contains list of trusted SSL Certificate Authorities</td>
<td></td>
</tr>
<tr>
<td>--ssl-capath</td>
<td>Directory that contains trusted SSL Certificate Authority certificate files</td>
<td></td>
</tr>

</tbody>
</table>

- **--help, -?**
  Display a help message and exit.

- **--auto-generate-sql, -a**
  Generate SQL statements automatically when they are not supplied in files or using command options.

- **--auto-generate-sql-add-autoincrement**
  Add an AUTO_INCREMENT column to automatically generated tables.

- **--auto-generate-sql-execute-number=N**
  Specify how many queries to generate automatically.

- **--auto-generate-sql-g Guid-primary**
  Add a GUID-based primary key to automatically generated tables.

- **--auto-generate-sql-load-type=type**
  Specify the test load type. The permissible values are read (scan tables), write (insert into tables), key (read primary keys), update (update primary keys), or mixed (half inserts, half scanning selects). The default is mixed.

- **--auto-generate-sql-secondary-indexes=N**
  Specify how many secondary indexes to add to automatically generated tables. By default, none are added.

- **--auto-generate-sql-unique-query-number=N**
  How many different queries to generate for automatic tests. For example, if you run a key test that performs 1000 selects, you can use this option with a value of 1000 to run 1000 unique queries, or with a value of 50 to perform 50 different selects. The default is 10.

- **--auto-generate-sql-unique-write-number=N**
  How many different queries to generate for --auto-generate-sql-write-number. The default is 10.
• `--auto-generate-sql-write-number=N`
  How many row inserts to perform. The default is 100.

• `--commit=N`
  How many statements to execute before committing. The default is 0 (no commits are done).

• `--compress, -C`
  Compress all information sent between the client and the server if possible. See Section 4.2.5, “Connection Compression Control”.

• `--concurrency=N, -c N`
  The number of parallel clients to simulate.

• `--create=value`
  The file or string containing the statement to use for creating the table.

• `--create-schema=value`
  The schema in which to run the tests.

  **Note**
  If the `--auto-generate-sql` option is also given, `mysqlslap` drops the schema at the end of the test run. To avoid this, use the `--no-drop` option as well.

• `--csv[=file_name]`
  Generate output in comma-separated values format. The output goes to the named file, or to the standard output if no file is given.

• `--debug[=debug_options], -# [debug_options]`
  Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o,/tmp/mysqlslap.trace`.

• `--debug-check`
  Print some debugging information when the program exits.

• `--debug-info, -T`
  Print debugging information and memory and CPU usage statistics when the program exits.

• `--default-auth=plugin`
  A hint about which client-side authentication plugin to use. See Section 6.2.11, “Pluggable Authentication”.

• `--defaults-extra-file=file_name`
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.
For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-file=file_name**

  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

  Exception: Even with **--defaults-file**, client programs read `.mylogin.cnf`.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-group-suffix=str**

  Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysqlslap` normally reads the [client] and [mysqlslap] groups. If the **--defaults-group-suffix=_other** option is given, `mysqlslap` also reads the [client_other] and [mysqlslap_other] groups.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--delimiter=str, -F str**

  The delimiter to use in SQL statements supplied in files or using command options.

- **--detach=N**

  Detach (close and reopen) each connection after each `N` statements. The default is 0 (connections are not detached).

- **--enable-cleartext-plugin**

  Enable the `mysql_clear_password` cleartext authentication plugin. (See Section 6.4.1.5, “Client-Side Cleartext Pluggable Authentication”.)

- **--engine=engine_name, -e engine_name**

  The storage engine to use for creating tables.

- **--host=host_name, -h host_name**

  Connect to the MySQL server on the given host.

- **--iterations=N, -i N**

  The number of times to run the tests.

- **--login-path=name**

  Read options from the named login path in the `.mylogin.cnf` login path file. A “login path” is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the `mysql_config_editor` utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.
For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--no-drop**

   Prevent `mysqlslap` from dropping any schema it creates during the test run.

- **--no-defaults**

   Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read.

   The exception is that the `.mylogin.cnf` file, if it exists, is read in all cases. This permits passwords to be specified in a safer way than on the command line even when `--no-defaults` is used. (.mylogin.cnf is created by the `mysql_config_editor` utility. See Section 4.6.6, “`mysql_config_editor` — MySQL Configuration Utility”.)

   For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--number-char-cols=N, -x N**

   The number of `VARCHAR` columns to use if `--auto-generate-sql` is specified.

- **--number-int-cols=N, -y N**

   The number of `INT` columns to use if `--auto-generate-sql` is specified.

- **--number-of-queries=N**

   Limit each client to approximately this many queries. Query counting takes into account the statement delimiter. For example, if you invoke `mysqlslap` as follows, the `;` delimiter is recognized so that each instance of the query string counts as two queries. As a result, 5 rows (not 10) are inserted.

   ```shell
   mysqlslap --delimiter=";" --number-of-queries=10
   --query="use test;insert into t values(null)"
   ```

- **--only-print**

   Do not connect to databases. `mysqlslap` only prints what it would have done.

- **--password=[password], -p[password]**

   The password of the MySQL account used for connecting to the server. The password value is optional. If not given, `mysqlslap` prompts for one. If given, there must be no space between `--password=` or `-p` and the password following it. If no password option is specified, the default is to send no password.

   Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

   To explicitly specify that there is no password and that `mysqlslap` should not prompt for one, use the `--skip-password` option.

- **--pipe, -W**
On Windows, connect to the server using a named pipe. This option applies only if the server was started with the `named_pipe` system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the `named_pipe_full_access_group` system variable.

- **--plugin-dir=dir_name**
  
  The directory in which to look for plugins. Specify this option if the `--default-auth` option is used to specify an authentication plugin but `mysqlslap` does not find it. See Section 6.2.11, "Pluggable Authentication".

- **--port=port_num, -P port_num**
  
  For TCP/IP connections, the port number to use.

- **--post-query=value**
  
  The file or string containing the statement to execute after the tests have completed. This execution is not counted for timing purposes.

- **--post-system=str**
  
  The string to execute using `system()` after the tests have completed. This execution is not counted for timing purposes.

- **--pre-query=value**
  
  The file or string containing the statement to execute before running the tests. This execution is not counted for timing purposes.

- **--pre-system=str**
  
  The string to execute using `system()` before running the tests. This execution is not counted for timing purposes.

- **--print-defaults**
  
  Print the program name and all options that it gets from option files.

  For additional information about this and other option-file options, see Section 4.2.2.3, "Command-Line Options that Affect Option-File Handling".

- **--protocol={TCP|SOCKET|PIPE|MEMORY}**
  
  The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally result in use of a protocol other than the one you want. For details on the permissible values, see Section 4.2.4, "Connecting to the MySQL Server Using Command Options".

- **--query=value, -q value**
  
  The file or string containing the `SELECT` statement to use for retrieving data.

- **--secure-auth**
  
  Do not send passwords to the server in old (pre-4.1) format. This prevents connections except for servers that use the newer password format. This option is enabled by default; use `--skip-secure-auth` to disable it. This option was added in MySQL 5.6.17.
Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.

This option is deprecated and will be removed in a future release. As of MySQL 5.7.5, it is always enabled and attempting to disable it produces an error.

• --shared-memory-base-name=name
   On Windows, the shared-memory name to use for connections made using shared memory to a local server. The default value is MYSQL. The shared-memory name is case-sensitive.
   This option applies only if the server was started with the shared_memory system variable enabled to support shared-memory connections.

• --silent, -s
   Silent mode. No output.

• --socket=path, -S path
   For connections to localhost, the Unix socket file to use, or, on Windows, the name of the named pipe to use.
   On Windows, this option applies only if the server was started with the named_pipe system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the named_pipe_full_access_group system variable.

• --ssl*
   Options that begin with --ssl specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Command Options for Encrypted Connections.

• --user=user_name, -u user_name
   The user name of the MySQL account to use for connecting to the server.

• --verbose, -v
   Verbose mode. Print more information about what the program does. This option can be used multiple times to increase the amount of information.

• --version, -V
   Display version information and exit.

4.6 MySQL Administrative and Utility Programs

This section describes administrative programs and programs that perform miscellaneous utility operations.

4.6.1 innochecksum — Offline InnoDB File Checksum Utility
**innochecksum** prints checksums for InnoDB files. This tool reads an InnoDB tablespace file, calculates the checksum for each page, compares the calculated checksum to the stored checksum, and reports mismatches, which indicate damaged pages. It was originally developed to speed up verifying the integrity of tablespace files after power outages but can also be used after file copies. Because checksum mismatches cause InnoDB to deliberately shut down a running server, it may be preferable to use this tool rather than waiting for an in-production server to encounter the damaged pages. As of MySQL 5.6.16, **innochecksum** supports files greater than 2GB in size. Previously, **innochecksum** only supported files up to 2GB in size.

**innochecksum** does not support tablespaces that contain compressed pages.

**innochecksum** cannot be used on tablespace files that the server already has open. For such files, you should use CHECK TABLE to check tables within the tablespace.

If checksum mismatches are found, you would normally restore the tablespace from backup or start the server and attempt to use mysqldump to make a backup of the tables within the tablespace.

Invoke **innochecksum** like this:

```
shell> innochecksum [options] file_name
```

**innochecksum** supports the following options. For options that refer to page numbers, the numbers are zero-based.

- **-c**
  Print a count of the number of pages in the file.

- **-d**
  Debug mode; prints checksums for each page.

- **-e num**
  End at this page number.

- **-p num**
  Check only this page number.

- **-s num**
  Start at this page number.

- **-v**
  Verbose mode; print a progress indicator every five seconds.

**4.6.2 myisam_ftdump — Display Full-Text Index information**

**myisam_ftdump** displays information about FULLTEXT indexes in MyISAM tables. It reads the MyISAM index file directly, so it must be run on the server host where the table is located. Before using **myisam_ftdump**, be sure to issue a FLUSH TABLES statement first if the server is running.

**myisam_ftdump** scans and dumps the entire index, which is not particularly fast. On the other hand, the distribution of words changes infrequently, so it need not be run often.

Invoke **myisam_ftdump** like this:
myisam_ftdump — Display Full-Text Index information

shell> myisam_ftdump [options] tbl_name index_num

The **tbl_name** argument should be the name of a **MyISAM** table. You can also specify a table by naming its index file (the file with the `.MYI` suffix). If you do not invoke *myisam_ftdump* in the directory where the table files are located, the table or index file name must be preceded by the path name to the table’s database directory. Index numbers begin with 0.

Example: Suppose that the **test** database contains a table named **mytexttable** that has the following definition:

```sql
CREATE TABLE mytexttable
(
  id   INT NOT NULL,
  txt  TEXT NOT NULL,
  PRIMARY KEY (id),
  FULLTEXT (txt)
) ENGINE=MyISAM;
```

The index on **id** is index 0 and the **FULLTEXT** index on **txt** is index 1. If your working directory is the **test** database directory, invoke *myisam_ftdump* as follows:

shell> myisam_ftdump mytexttable 1

If the path name to the **test** database directory is `/usr/local/mysql/data/test`, you can also specify the table name argument using that path name. This is useful if you do not invoke *myisam_ftdump* in the database directory:

shell> myisam_ftdump /usr/local/mysql/data/test/mytexttable 1

You can use *myisam_ftdump* to generate a list of index entries in order of frequency of occurrence like this on Unix-like systems:

shell> myisam_ftdump -c mytexttable 1 | sort -r

On Windows, use:

shell> myisam_ftdump -c mytexttable 1 | sort /R

*myisam_ftdump* supports the following options:

- **--help, -h -?**
  Display a help message and exit.

- **--count, -c**
  Calculate per-word statistics (counts and global weights).

- **--dump, -d**
  Dump the index, including data offsets and word weights.

- **--length, -l**
  Report the length distribution.

- **--stats, -s**
Report global index statistics. This is the default operation if no other operation is specified.

- `--verbose,-v`

  Verboso mode. Print more output about what the program does.

### 4.6.3 myisamchk — MyISAM Table-Maintenance Utility

The `myisamchk` utility gets information about your database tables or checks, repairs, or optimizes them. `myisamchk` works with MyISAM tables (tables that have `.MYD` and `.MYI` files for storing data and indexes).

You can also use the `CHECK TABLE` and `REPAIR TABLE` statements to check and repair MyISAM tables. See Section 13.7.2.2, “CHECK TABLE Syntax”, and Section 13.7.2.5, “REPAIR TABLE Syntax”.

The use of `myisamchk` with partitioned tables is not supported.

⚠️ **Caution**

It is best to make a backup of a table before performing a table repair operation; under some circumstances the operation might cause data loss. Possible causes include but are not limited to file system errors.

Invoke `myisamchk` like this:

```
shell> myisamchk [options] tbl_name ...
```

The `options` specify what you want `myisamchk` to do. They are described in the following sections. You can also get a list of options by invoking `myisamchk --help`.

With no options, `myisamchk` simply checks your table as the default operation. To get more information or to tell `myisamchk` to take corrective action, specify options as described in the following discussion.

`tbl_name` is the database table you want to check or repair. If you run `myisamchk` somewhere other than in the database directory, you must specify the path to the database directory, because `myisamchk` has no idea where the database is located. In fact, `myisamchk` does not actually care whether the files you are working on are located in a database directory. You can copy the files that correspond to a database table into some other location and perform recovery operations on them there.

You can name several tables on the `myisamchk` command line if you wish. You can also specify a table by naming its index file (the file with the `.MYI` suffix). This enables you to specify all tables in a directory by using the pattern `*.MYI`. For example, if you are in a database directory, you can check all the MyISAM tables in that directory like this:

```
shell> myisamchk *.MYI
```

If you are not in the database directory, you can check all the tables there by specifying the path to the directory:

```
shell> myisamchk /path/to/database_dir/*.MYI
```

You can even check all tables in all databases by specifying a wildcard with the path to the MySQL data directory:

```
shell> myisamchk /path/to/datadir/*//*.MYI
```
The recommended way to quickly check all MyISAM tables is:

```shell
shell> myisamchk --silent --fast /path/to/datadir/*/MYI
```

If you want to check all MyISAM tables and repair any that are corrupted, you can use the following command:

```shell
shell> myisamchk --silent --force --fast --update-state --key_buffer_size=64M --myisam_sort_buffer_size=64M --read_buffer_size=1M --write_buffer_size=1M /path/to/datadir/*/MYI
```

This command assumes that you have more than 64MB free. For more information about memory allocation with myisamchk, see Section 4.6.3.6, “myisamchk Memory Usage”.

For additional information about using myisamchk, see Section 7.6, “MyISAM Table Maintenance and Crash Recovery”.

**Important**

You must ensure that no other program is using the tables while you are running myisamchk. The most effective means of doing so is to shut down the MySQL server while running myisamchk, or to lock all tables that myisamchk is being used on.

Otherwise, when you run myisamchk, it may display the following error message:

```plaintext
warning: clients are using or haven't closed the table properly
```

This means that you are trying to check a table that has been updated by another program (such as the mysqld server) that hasn't yet closed the file or that has died without closing the file properly, which can sometimes lead to the corruption of one or more MyISAM tables.

If mysqld is running, you must force it to flush any table modifications that are still buffered in memory by using FLUSH TABLES. You should then ensure that no one is using the tables while you are running myisamchk.

However, the easiest way to avoid this problem is to use CHECK TABLE instead of myisamchk to check tables. See Section 13.7.2.2, “CHECK TABLE Syntax”.

myisamchk supports the following options, which can be specified on the command line or in the [myisamchk] group of an option file. For information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

### Option Name | Description | Introduced | Deprecated
--- | --- | --- | ---
--quick | Achieve a faster repair by not modifying the data file. | | |
--read_buffer_size | Each thread that does a sequential scan allocates a buffer of this size for each table it scans | | |
--read-only | Do not mark the table as checked | | |
--recover | Do a repair that can fix almost any problem except unique keys that aren't unique | | |
--safe-recover | Do a repair using an old recovery method that reads through all rows in order and updates all index trees based on the rows found | | |
--set-auto-increment | Force AUTO_INCREMENT numbering for new records to start at the given value | | |
--set-collation | Specify the collation to use for sorting table indexes | | |
--silent | Silent mode | | |
--sort_buffer_size | The buffer that is allocated when sorting the index when doing a REPAIR or when creating indexes with CREATE INDEX or ALTER TABLE | | 5.6.9
--sort-index | Sort the index tree blocks in high-low order | | |
--sort_key_blocks | sort_key_blocks | | |
--sort-records | Sort records according to a particular index | | |
--sort-recover | Force myisamchk to use sorting to resolve the keys even if the temporary files would be very large | | |
--stats_method | Specifies how MyISAM index statistics collection code should treat NULLs | | |
--tmpdir | Directory to be used for storing temporary files | | |
--unpack | Unpack a table that was packed with myisampack | | |
--update-state | Store information in the .MYI file to indicate when the table was checked and whether the table crashed | | |
--verbose | Verbose mode | | |
--version | Display version information and exit | | |
--write_buffer_size | Write buffer size | | |

### 4.6.3.1 myisamchk General Options

The options described in this section can be used for any type of table maintenance operation performed by myisamchk. The sections following this one describe options that pertain only to specific operations, such as table checking or repairing.

- **--help, -?**
  Display a help message and exit. Options are grouped by type of operation.

- **--HELP, -H**
  Display a help message and exit. Options are presented in a single list.
--debug=debug_options, --debug_options

Write a debugging log. A typical debug_options string is d:t:o, file_name. The default is d:t:o,/tmp/myisamchk.trace.

--defaults-extra-file=file_name

Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. file_name is interpreted relative to the current directory if given as a relative path name rather than a full path name.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

--defaults-file=file_name

Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. file_name is interpreted relative to the current directory if given as a relative path name rather than a full path name.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

--defaults-group-suffix=str

Read not only the usual option groups, but also groups with the usual names and a suffix of str. For example, myisamchk normally reads the [myisamchk] group. If the --defaults-group-suffix=_other option is given, myisamchk also reads the [myisamchk_other] group.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

--no-defaults

Do not read any option files. If program startup fails due to reading unknown options from an option file, --no-defaults can be used to prevent them from being read.

The exception is that the .mylogin.cnf file, if it exists, is read in all cases. This permits passwords to be specified in a safer way than on the command line even when --no-defaults is used. (.mylogin.cnf is created by the mysql_config_editor utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.)

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

--print-defaults

Print the program name and all options that it gets from option files.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

--silent, -s

Silent mode. Write output only when errors occur. You can use -s twice (-ss) to make myisamchk very silent.

--verbose, -v
Verbose mode. Print more information about what the program does. This can be used with \texttt{-d} and \texttt{-e}. Use \texttt{-v} multiple times (\texttt{-vv}, \texttt{-vvv}) for even more output.

- \texttt{--version, -V}

  Display version information and exit.

- \texttt{--wait, -w}

  Instead of terminating with an error if the table is locked, wait until the table is unlocked before continuing. If you are running \texttt{mysqld} with external locking disabled, the table can be locked only by another \texttt{myisamchk} command.

You can also set the following variables by using \texttt{--var\_name=value} syntax:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>decode_bits</td>
<td>9</td>
</tr>
<tr>
<td>ft_max_word_len</td>
<td>version-dependent</td>
</tr>
<tr>
<td>ft_min_word_len</td>
<td>4</td>
</tr>
<tr>
<td>ft_stopword_file</td>
<td>built-in list</td>
</tr>
<tr>
<td>key_buffer_size</td>
<td>523264</td>
</tr>
<tr>
<td>myisam_block_size</td>
<td>1024</td>
</tr>
<tr>
<td>myisam_sort_key_blocks</td>
<td>16</td>
</tr>
<tr>
<td>read_buffer_size</td>
<td>262136</td>
</tr>
<tr>
<td>sort_buffer_size</td>
<td>2097144</td>
</tr>
<tr>
<td>sort_key_blocks</td>
<td>16</td>
</tr>
<tr>
<td>stats_method</td>
<td>nulls_unequal</td>
</tr>
<tr>
<td>write_buffer_size</td>
<td>262136</td>
</tr>
</tbody>
</table>

The possible \texttt{myisamchk} variables and their default values can be examined with \texttt{myisamchk --help}:

\texttt{sort\_buffer\_size} is used when the keys are repaired by sorting keys, which is the normal case when you use \texttt{--recover}. \texttt{myisam\_sort\_buffer\_size} is available as an alternative name to \texttt{sort\_buffer\_size}. \texttt{myisam\_sort\_buffer\_size} is preferable to \texttt{sort\_buffer\_size} because its name corresponds to the \texttt{myisam\_sort\_buffer\_size} server system variable that has a similar meaning. \texttt{sort\_buffer\_size} should be considered deprecated.

\texttt{key\_buffer\_size} is used when you are checking the table with \texttt{--extend-check} or when the keys are repaired by inserting keys row by row into the table (like when doing normal inserts). Repairing through the key buffer is used in the following cases:

- You use \texttt{--safe-recover}.

- The temporary files needed to sort the keys would be more than twice as big as when creating the key file directly. This is often the case when you have large key values for \texttt{CHAR}, \texttt{VARCHAR}, or \texttt{TEXT} columns, because the sort operation needs to store the complete key values as it proceeds. If you have lots of temporary space and you can force \texttt{myisamchk} to repair by sorting, you can use the \texttt{--sort-recover} option.

Repairing through the key buffer takes much less disk space than using sorting, but is also much slower.
If you want a faster repair, set the `key_buffer_size` and `myisam_sort_buffer_size` variables to about 25% of your available memory. You can set both variables to large values, because only one of them is used at a time.

`myisam_block_size` is the size used for index blocks.

`stats_method` influences how NULL values are treated for index statistics collection when the `--analyze` option is given. It acts like the `myisam_stats_method` system variable. For more information, see the description of `myisam_stats_method` in Section 5.1.7, “Server System Variables”, and Section 8.3.7, “InnoDB and MyISAM Index Statistics Collection”.

`ft_min_word_len` and `ft_max_word_len` indicate the minimum and maximum word length for FULLTEXT indexes on MyISAM tables. `ft_stopword_file` names the stopword file. These need to be set under the following circumstances.

If you use `myisamchk` to perform an operation that modifies table indexes (such as repair or analyze), the FULLTEXT indexes are rebuilt using the default full-text parameter values for minimum and maximum word length and the stopword file unless you specify otherwise. This can result in queries failing.

The problem occurs because these parameters are known only by the server. They are not stored in MyISAM index files. To avoid the problem if you have modified the minimum or maximum word length or the stopword file in the server, specify the same `ft_min_word_len`, `ft_max_word_len`, and `ft_stopword_file` values to `myisamchk` that you use for `mysqld`. For example, if you have set the minimum word length to 3, you can repair a table with `myisamchk` like this:

```shell
mysisamchk --recover --ft_min_word_len=3 tbl_name.MYI
```

To ensure that `myisamchk` and the server use the same values for full-text parameters, you can place each one in both the `[mysqld]` and `[myisamchk]` sections of an option file:

```plaintext
[mysqld]
ft_min_word_len=3

[myisamchk]
ft_min_word_len=3
```

An alternative to using `myisamchk` is to use the `REPAIR TABLE`, `ANALYZE TABLE`, `OPTIMIZE TABLE`, or `ALTER TABLE`. These statements are performed by the server, which knows the proper full-text parameter values to use.

### 4.6.3.2 myisamchk Check Options

`myisamchk` supports the following options for table checking operations:

- **--check, -c**
  Check the table for errors. This is the default operation if you specify no option that selects an operation type explicitly.

- **--check-only-changed, -C**
  Check only tables that have changed since the last check.

- **--extend-check, -e**
  Check the table very thoroughly. This is quite slow if the table has many indexes. This option should only be used in extreme cases. Normally, `myisamchk` or `myisamchk --medium-check` should be able to determine whether there are any errors in the table.
If you are using `--extend-check` and have plenty of memory, setting the `key_buffer_size` variable to a large value helps the repair operation run faster.

See also the description of this option under table repair options.

For a description of the output format, see Section 4.6.3.5, “Obtaining Table Information with `myisamchk`”.

- `--fast, -F`
  Check only tables that haven’t been closed properly.

- `--force, -f`
  Do a repair operation automatically if `myisamchk` finds any errors in the table. The repair type is the same as that specified with the `--recover` or `-r` option.

- `--information, -i`
  Print informational statistics about the table that is checked.

- `--medium-check, -m`
  Do a check that is faster than an `--extend-check` operation. This finds only 99.99% of all errors, which should be good enough in most cases.

- `--read-only, -T`
  Do not mark the table as checked. This is useful if you use `myisamchk` to check a table that is in use by some other application that does not use locking, such as `mysql` when run with external locking disabled.

- `--update-state, -U`
  Store information in the `.MYI` file to indicate when the table was checked and whether the table crashed. This should be used to get full benefit of the `--check-only-changed` option, but you shouldn’t use this option if the `mysql` server is using the table and you are running it with external locking disabled.

### 4.6.3.3 myisamchk Repair Options

`myisamchk` supports the following options for table repair operations (operations performed when an option such as `--recover` or `--safe-recover` is given):

- `--backup, -B`
  Make a backup of the `.MYD` file as `file_name-time.BAK`

- `--character-sets-dir=dir_name`
  The directory where character sets are installed. See Section 10.15, “Character Set Configuration”.

- `--correct-checksum`
  Correct the checksum information for the table.

- `--data-file-length=len, -D len`
  The maximum length of the data file (when re-creating data file when it is “full”).
• **--extend-check**, -e

Do a repair that tries to recover every possible row from the data file. Normally, this also finds a lot of garbage rows. Do not use this option unless you are desperate.

See also the description of this option under table checking options.

For a description of the output format, see Section 4.6.3.5, “Obtaining Table Information with myisamchk”.

• **--force**, -f

Overwrite old intermediate files (files with names like `tbl_name.TMD`) instead of aborting.

• **--keys-used=** `val`, -k `val`

For `myisamchk`, the option value is a bit value that indicates which indexes to update. Each binary bit of the option value corresponds to a table index, where the first index is bit 0. An option value of 0 disables updates to all indexes, which can be used to get faster inserts. Deactivated indexes can be reactivated by using `myisamchk -r`.

• **--no-symlinks**, -l

Do not follow symbolic links. Normally `myisamchk` repairs the table that a symlink points to. This option does not exist as of MySQL 4.0 because versions from 4.0 on do not remove symlinks during repair operations.

• **--max-record-length=** `len`

Skip rows larger than the given length if `myisamchk` cannot allocate memory to hold them.

• **--parallel-recover**, -p

Use the same technique as -r and -n, but create all the keys in parallel, using different threads. *This is beta-quality code. Use at your own risk!*

• **--quick**, -q

Achieve a faster repair by modifying only the index file, not the data file. You can specify this option twice to force `myisamchk` to modify the original data file in case of duplicate keys.

• **--recover**, -r

Do a repair that can fix almost any problem except unique keys that are not unique (which is an extremely unlikely error with MyISAM tables). If you want to recover a table, this is the option to try first. You should try --safe-recover only if `myisamchk` reports that the table cannot be recovered using --recover. (In the unlikely case that --recover fails, the data file remains intact.)

If you have lots of memory, you should increase the value of `myisam_sort_buffer_size`.

• **--safe-recover**, -o

Do a repair using an old recovery method that reads through all rows in order and updates all index trees based on the rows found. This is an order of magnitude slower than --recover, but can handle a couple of very unlikely cases that --recover cannot. This recovery method also uses much less disk space than --recover. Normally, you should repair first using --recover, and then with --safe-recover only if --recover fails.
If you have lots of memory, you should increase the value of `key_buffer_size`.

- `--set-collation=name`
  Specify the collation to use for sorting table indexes. The character set name is implied by the first part of the collation name.

- `--sort-recover,-n`
  Force `myisamchk` to use sorting to resolve the keys even if the temporary files would be very large.

- `--tmpdir=dir_name,-t dir_name`
  The path of the directory to be used for storing temporary files. If this is not set, `myisamchk` uses the value of the `TMPDIR` environment variable. `--tmpdir` can be set to a list of directory paths that are used successively in round-robin fashion for creating temporary files. The separator character between directory names is the colon (`:`) on Unix and the semicolon (`;`) on Windows.

- `--unpack,-u`
  Unpack a table that was packed with `myisampack`.

### 4.6.3.4 Other myisamchk Options

`myisamchk` supports the following options for actions other than table checks and repairs:

- `--analyze,-a`
  Analyze the distribution of key values. This improves join performance by enabling the join optimizer to better choose the order in which to join the tables and which indexes it should use. To obtain information about the key distribution, use a `myisamchk --description --verbose tbl_name` command or the `SHOW INDEX FROM tbl_name` statement.

- `--block-search=offset,-b offset`
  Find the record that a block at the given offset belongs to.

- `--description,-d`
  Print some descriptive information about the table. Specifying the `--verbose` option once or twice produces additional information. See Section 4.6.3.5, "Obtaining Table Information with myisamchk".

- `--set-auto-increment [=value],-A[value]`
  Force `AUTO_INCREMENT` numbering for new records to start at the given value (or higher, if there are existing records with `AUTO_INCREMENT` values this large). If `value` is not specified, `AUTO_INCREMENT` numbers for new records begin with the largest value currently in the table, plus one.

- `--sort-index,-S`
  Sort the index tree blocks in high-low order. This optimizes seeks and makes table scans that use indexes faster.

- `--sort-records=N,-R N`
  Sort records according to a particular index. This makes your data much more localized and may speed up range-based `SELECT` and `ORDER BY` operations that use this index. (The first time you use this option to sort a table, it may be very slow.) To determine a table's index numbers, use `SHOW INDEX`,...
which displays a table’s indexes in the same order that myisamchk sees them. Indexes are numbered beginning with 1.

If keys are not packed (PACK_KEY=0), they have the same length, so when myisamchk sorts and moves records, it just overwrites record offsets in the index. If keys are packed (PACK_KEY=1), myisamchk must unpack key blocks first, then re-create indexes and pack the key blocks again. (In this case, re-creating indexes is faster than updating offsets for each index.)

### 4.6.3.5 Obtaining Table Information with myisamchk

To obtain a description of a MyISAM table or statistics about it, use the commands shown here. The output from these commands is explained later in this section.

- **myisamchk -d tbl_name**
  
  Runs myisamchk in “describe mode” to produce a description of your table. If you start the MySQL server with external locking disabled, myisamchk may report an error for a table that is updated while it runs. However, because myisamchk does not change the table in describe mode, there is no risk of destroying data.

- **myisamchk -dv tbl_name**
  
  Adding -v runs myisamchk in verbose mode so that it produces more information about the table. Adding -v a second time produces even more information.

- **myisamchk -eis tbl_name**
  
  Shows only the most important information from a table. This operation is slow because it must read the entire table.

- **myisamchk -eiv tbl_name**
  
  This is like -eis, but tells you what is being done.

The *tbl_name* argument can be either the name of a MyISAM table or the name of its index file, as described in Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”. Multiple *tbl_name* arguments can be given.

Suppose that a table named *person* has the following structure. (The MAX_ROWS table option is included so that in the example output from myisamchk shown later, some values are smaller and fit the output format more easily.)

```
CREATE TABLE person
(
  id INT NOT NULL AUTO_INCREMENT,
  last_name VARCHAR(20) NOT NULL,
  first_name VARCHAR(20) NOT NULL,
  birth DATE,
  death DATE,
  PRIMARY KEY (id),
  INDEX (last_name, first_name),
  INDEX (birth)
) MAX_ROWS = 1000000 ENGINE=MYISAM;
```

Suppose also that the table has these data and index file sizes:

```
-rw-rw---- 1 mysql mysql 9347072 Aug 19 11:47 person.MYD
-rw-rw---- 1 mysql mysql 6066176 Aug 19 11:47 person.MYI
```
Example of `myisamchk -dvv` output:

- **MyISAM file**: `person`
- **Record format**: Packed
- **Character set**: `latin1_swedish_ci (8)`
- **File-version**: 1
- **Creation time**: 2009-08-19 16:47:41
- **Recover time**: 2009-08-19 16:47:56
- **Status**: checked, analyzed, optimized keys
- **Auto increment key**: 1 Last value: 306688
- **Data records**: 306688 Deleted blocks: 0
- **Datafile parts**: 306688 Deleted data: 0
- **Datafile pointer (bytes)**: 4 Keyfile pointer (bytes): 3
- **Datafile length**: 9347072 Keyfile length: 6066176
- **Max datafile length**: 4294967294 Max keyfile length: 17179868159
- **Recordlength**: 54

Explanations for the types of information `myisamchk` produces are given here. “Keyfile” refers to the index file. “Record” and “row” are synonymous, as are “field” and “column.”

The initial part of the table description contains these values:

- **MyISAM file**
  Name of the `MyISAM` (index) file.

- **Record format**
  The format used to store table rows. The preceding examples use **Fixed length**. Other possible values are **Compressed** and **Packed**. (Packed corresponds to what `SHOW TABLE STATUS` reports as **Dynamic**.)

- **Character set**
  The table default character set.

- **File-version**
  Version of `MyISAM` format. Always 1.

- **Creation time**
  When the data file was created.

- **Recover time**
  When the index/data file was last reconstructed.
• **Status**

Table status flags. Possible values are `crashed`, `open`, `changed`, `analyzed`, `optimized keys`, and `sorted index pages`.

• **Auto increment key, Last value**

The key number associated the table's `AUTO_INCREMENT` column, and the most recently generated value for this column. These fields do not appear if there is no such column.

• **Data records**

The number of rows in the table.

• **Deleted blocks**

How many deleted blocks still have reserved space. You can optimize your table to minimize this space. See Section 7.6.4, “MyISAM Table Optimization”.

• **Datafile parts**

For dynamic-row format, this indicates how many data blocks there are. For an optimized table without fragmented rows, this is the same as `Data records`.

• **Deleted data**

How many bytes of unreclaimed deleted data there are. You can optimize your table to minimize this space. See Section 7.6.4, “MyISAM Table Optimization”.

• **Datafile pointer**

The size of the data file pointer, in bytes. It is usually 2, 3, 4, or 5 bytes. Most tables manage with 2 bytes, but this cannot be controlled from MySQL yet. For fixed tables, this is a row address. For dynamic tables, this is a byte address.

• **Keyfile pointer**

The size of the index file pointer, in bytes. It is usually 1, 2, or 3 bytes. Most tables manage with 2 bytes, but this is calculated automatically by MySQL. It is always a block address.

• **Max datafile length**

How long the table data file can become, in bytes.

• **Max keyfile length**

How long the table index file can become, in bytes.

• **Recordlength**

How much space each row takes, in bytes.

The **table description** part of the output includes a list of all keys in the table. For each key, `myisamchk` displays some low-level information:

• **Key**

This key's number. This value is shown only for the first column of the key. If this value is missing, the line corresponds to the second or later column of a multiple-column key. For the table shown in the
example, there are two table description lines for the second index. This indicates that it is a multiple-part index with two parts.

- **Start**
  Where in the row this portion of the index starts.

- **Len**
  How long this portion of the index is. For packed numbers, this should always be the full length of the column. For strings, it may be shorter than the full length of the indexed column, because you can index a prefix of a string column. The total length of a multiple-part key is the sum of the Len values for all key parts.

- **Index**
  Whether a key value can exist multiple times in the index. Possible values are unique or multip. (multiple).

- **Type**
  What data type this portion of the index has. This is a MyISAM data type with the possible values packed, stripped, or empty.

- **Root**
  Address of the root index block.

- **Blocksize**
  The size of each index block. By default this is 1024, but the value may be changed at compile time when MySQL is built from source.

- **Rec/key**
  This is a statistical value used by the optimizer. It tells how many rows there are per value for this index. A unique index always has a value of 1. This may be updated after a table is loaded (or greatly changed) with myisamchk -a. If this is not updated at all, a default value of 30 is given.

The last part of the output provides information about each column:

- **Field**
  The column number.

- **Start**
  The byte position of the column within table rows.

- **Length**
  The length of the column in bytes.

- **Nullpos, Nullbit**
  For columns that can be NULL, MyISAM stores NULL values as a flag in a byte. Depending on how many nullable columns there are, there can be one or more bytes used for this purpose. The Nullpos and Nullbit values, if nonempty, indicate which byte and bit contains that flag indicating whether the column is NULL.
The position and number of bytes used to store NULL flags is shown in the line for field 1. This is why there are six Field lines for the person table even though it has only five columns.

- **Type**
  
The data type. The value may contain any of the following descriptors:

  - **constant**
    
    All rows have the same value.

  - **no endspace**
    
    Do not store endspace.

  - **no endspace, not_always**
    
    Do not store endspace and do not do endspace compression for all values.

  - **no endspace, no empty**
    
    Do not store endspace. Do not store empty values.

  - **table-lookup**
    
    The column was converted to an ENUM.

  - **zerofill(N)**
    
    The most significant \(N\) bytes in the value are always 0 and are not stored.

  - **no zeros**
    
    Do not store zeros.

  - **always zero**
    
    Zero values are stored using one bit.

- **Huff tree**
  
The number of the Huffman tree associated with the column.

- **Bits**
  
The number of bits used in the Huffman tree.

The Huff tree and Bits fields are displayed if the table has been compressed with myisampack. See Section 4.6.5, "myisampack — Generate Compressed, Read-Only MyISAM Tables", for an example of this information.

**Example of myisamchk -eiv output:**

```
Checking MyISAM file: person
Data records:  306688   Deleted blocks:       0
  - check file-size
  - check record delete-chain
No recordlinks
```
- check key delete-chain
  block_size 1024:
  - check index reference
  - check data record references index: 1
    Key: 1:  Keyblocks used: 98%  Packed: 0%  Max levels: 3
  - check data record references index: 2
    Key: 2:  Keyblocks used: 99%  Packed: 97%  Max levels: 3
  - check data record references index: 3
    Key: 3:  Keyblocks used: 98%  Packed: -14%  Max levels: 3
  Total:  Keyblocks used: 98%  Packed: 89%
- check records and index references
  *** LOTS OF ROW NUMBERS DELETED ***

**Records:**
- 306688  M.recordlength: 25  Packed: 83%
- Recordspace used: 97%  Empty space: 2%  Blocks/Record: 1.00
- Record blocks: 306688  Delete blocks: 0
- Record data: 7934464  Deleted data: 0
- Lost space: 256512  Linkdata: 1156096

User time 43.08, System time 1.68
Maximum resident set size 0, Integral resident set size 0
Non-physical pagefaults 0, Physical pagefaults 0, Swaps 0
Blocks in 0 out 7, Messages in 0 out 0, Signals 0
Voluntary context switches 0, Involuntary context switches 0
Maximum memory usage: 1046926 bytes (1023k)

myisamchk -eiv output includes the following information:

- **Data records**
  The number of rows in the table.

- **Deleted blocks**
  How many deleted blocks still have reserved space. You can optimize your table to minimize this space. See Section 7.6.4, “MyISAM Table Optimization”.

- **Key**
  The key number.

- **Keyblocks used**
  What percentage of the keyblocks are used. When a table has just been reorganized with myisamchk, the values are very high (very near theoretical maximum).

- **Packed**
  MySQL tries to pack key values that have a common suffix. This can only be used for indexes on CHAR and VARCHAR columns. For long indexed strings that have similar leftmost parts, this can significantly reduce the space used. In the preceding example, the second key is 40 bytes long and a 97% reduction in space is achieved.

- **Max levels**
  How deep the B-tree for this key is. Large tables with long key values get high values.

- **Records**
  How many rows are in the table.

- **M.recordlength**
The average row length. This is the exact row length for tables with fixed-length rows, because all rows have the same length.

- **Packed**
  MySQL strips spaces from the end of strings. The Packed value indicates the percentage of savings achieved by doing this.

- **Recordspace used**
  What percentage of the data file is used.

- **Empty space**
  What percentage of the data file is unused.

- **Blocks/Record**
  Average number of blocks per row (that is, how many links a fragmented row is composed of). This is always 1.0 for fixed-format tables. This value should stay as close to 1.0 as possible. If it gets too large, you can reorganize the table. See Section 7.6.4, “MyISAM Table Optimization”.

- **Recordblocks**
  How many blocks (links) are used. For fixed-format tables, this is the same as the number of rows.

- **Deleteblocks**
  How many blocks (links) are deleted.

- **Recorddata**
  How many bytes in the data file are used.

- **Deleted data**
  How many bytes in the data file are deleted (unused).

- **Lost space**
  If a row is updated to a shorter length, some space is lost. This is the sum of all such losses, in bytes.

- **Linkdata**
  When the dynamic table format is used, row fragments are linked with pointers (4 to 7 bytes each). Linkdata is the sum of the amount of storage used by all such pointers.

### 4.6.3.6 myisamchk Memory Usage

Memory allocation is important when you run myisamchk. It uses no more memory than its memory-related variables are set to. If you are going to use myisamchk on very large tables, you should first decide how much memory you want it to use. The default is to use only about 3MB to perform repairs. By using larger values, you can get myisamchk to operate faster. For example, if you have more than 512MB RAM available, you could use options such as these (in addition to any other options you might specify):

```bash
shell> myisamchk --myisam_sort_buffer_size=256M \
```
Using `--myisam_sort_buffer_size=16M` is probably enough for most cases.

Be aware that `myisamchk` uses temporary files in `TMPDIR`. If `TMPDIR` points to a memory file system, out of memory errors can easily occur. If this happens, run `myisamchk` with the `--tmpdir=dir_name` option to specify a directory located on a file system that has more space.

When performing repair operations, `myisamchk` also needs a lot of disk space:

- Twice the size of the data file (the original file and a copy). This space is not needed if you do a repair with `--quick`; in this case, only the index file is re-created. *This space must be available on the same file system as the original data file*, as the copy is created in the same directory as the original.

- Space for the new index file that replaces the old one. The old index file is truncated at the start of the repair operation, so you usually ignore this space. *This space must be available on the same file system as the original data file*.

- When using `--recover` or `--sort-recover` (but not when using `--safe-recover`), you need space on disk for sorting. *This space is allocated in the temporary directory (specified by `TMPDIR` or `--tmpdir=dir_name`).* The following formula yields the amount of space required:

\[
(largest\_key + row\_pointer\_length) \times number\_of\_rows \times 2
\]

You can check the length of the keys and the `row\_pointer\_length` with `myisamchk -dv tbl_name` (see Section 4.6.3.5, “Obtaining Table Information with myisamchk”). The `row\_pointer\_length` and `number\_of\_rows` values are the Datafile pointer and Data records values in the table description. To determine the `largest\_key` value, check the Key lines in the table description. The `Len` column indicates the number of bytes for each key part. For a multiple-column index, the key size is the sum of the `Len` values for all key parts.

If you have a problem with disk space during repair, you can try `--safe-recover` instead of `--recover`.

### 4.6.4 myisamlog — Display MyISAM Log File Contents

myisamlog processes the contents of a MyISAM log file. To create such a file, start the server with a `--log-isam=log_file` option.

Invoke `myisamlog` like this:

```
shell> myisamlog [options] [file_name [tbl_name] ...]
```

The default operation is update (`-u`). If a recovery is done (`-r`), all writes and possibly updates and deletes are done and errors are only counted. The default log file name is `myisam.log` if no `log_file` argument is given. If tables are named on the command line, only those tables are updated.

`myisamlog` supports the following options:

- `-?`, `-I`
  Display a help message and exit.

- `-c N`
  Execute only `N` commands.
myisampack — Generate Compressed, Read-Only MyISAM Tables

- \( -f \ N \)
  Specify the maximum number of open files.

- \( -F \ \text{filepath/} \)
  Specify the file path with a trailing slash.

- \( -i \)
  Display extra information before exiting.

- \( -o \ \text{offset} \)
  Specify the starting offset.

- \( -p \ N \)
  Remove \( N \) components from path.

- \( -r \)
  Perform a recovery operation.

- \( -R \ \text{record_pos_file} \ \text{record_pos} \)
  Specify record position file and record position.

- \( -u \)
  Perform an update operation.

- \( -v \)
  Verbose mode. Print more output about what the program does. This option can be given multiple times to produce more and more output.

- \( -w \ \text{write_file} \)
  Specify the write file.

- \( -V \)
  Display version information.

4.6.5 myisampack — Generate Compressed, Read-Only MyISAM Tables

The myisampack utility compresses MyISAM tables. myisampack works by compressing each column in the table separately. Usually, myisampack packs the data file 40% to 70%.

When the table is used later, the server reads into memory the information needed to decompress columns. This results in much better performance when accessing individual rows, because you only have to uncompress exactly one row.

MySQL uses \texttt{mmap()} when possible to perform memory mapping on compressed tables. If \texttt{mmap()} does not work, MySQL falls back to normal read/write file operations.

Please note the following:
myisampack — Generate Compressed, Read-Only MyISAM Tables

- If the mysqld server was invoked with external locking disabled, it is not a good idea to invoke myisampack if the table might be updated by the server during the packing process. It is safest to compress tables with the server stopped.

- After packing a table, it becomes read only. This is generally intended (such as when accessing packed tables on a CD).

- myisampack does not support partitioned tables.

Invoke myisampack like this:

```
shell> myisampack [options] file_name ...
```

Each file name argument should be the name of an index (.MYI) file. If you are not in the database directory, you should specify the path name to the file. It is permissible to omit the .MYI extension.

After you compress a table with myisampack, use myisamchk -rq to rebuild its indexes. Section 4.6.3, "myisamchk — MyISAM Table-Maintenance Utility".

myisampack supports the following options. It also reads option files and supports the options for processing them described at Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--help, -?**
  
  Display a help message and exit.

- **--backup, -b**
  
  Make a backup of each table’s data file using the name tbl_name.OLD.

- **--character-sets-dir=dir_name**
  
  The directory where character sets are installed. See Section 10.15, "Character Set Configuration".

- **--debug[=debug_options], -# [debug_options]**
  
  Write a debugging log. A typical debug_options string is d:t:o, file_name. The default is d:t:o.

- **--force, -f**
  
  Produce a packed table even if it becomes larger than the original or if the intermediate file from an earlier invocation of myisampack exists. (myisampack creates an intermediate file named tbl_name.TMD in the database directory while it compresses the table. If you kill myisampack, the .TMD file might not be deleted.) Normally, myisampack exits with an error if it finds that tbl_name.TMD exists. With --force, myisampack packs the table anyway.

- **--join=big_tbl_name, -j big_tbl_name**
  
  Join all tables named on the command line into a single packed table big_tbl_name. All tables that are to be combined must have identical structure (same column names and types, same indexes, and so forth).

  big_tbl_name must not exist prior to the join operation. All source tables named on the command line to be merged into big_tbl_name must exist. The source tables are read for the join operation but not modified.

- **--silent, -s**
  
  Silent mode. Write output only when errors occur.
myisampack — Generate Compressed, Read-Only MyISAM Tables

- **--test, -t**
  Do not actually pack the table, just test packing it.

- **--tmpdir=dir_name, -T dir_name**
  Use the named directory as the location where myisampack creates temporary files.

- **--verbose, -v**
  Verbose mode. Write information about the progress of the packing operation and its result.

- **--version, -V**
  Display version information and exit.

- **--wait, -w**
  Wait and retry if the table is in use. If the mysqld server was invoked with external locking disabled, it is not a good idea to invoke myisampack if the table might be updated by the server during the packing process.

The following sequence of commands illustrates a typical table compression session:

```bash
shell> ls -l station.*
-rw-rw-r--   1 jones    my         994128 Apr 17 19:00 station.MYD
-rw-rw-r--   1 jones    my          53248 Apr 17 19:00 station.MYI

41           | 417    | 4    | always zero | 2    |
42           | 421    | 4    | no zeros | 2    |
43           | 425    | 4    | always zero | 2    |
44           | 429    | 20   | no empty | 3    |
45           | 449    | 30   | no empty | 3    |
46           | 479    | 1    |           | 14   |
47           | 480    | 1    |           | 14   |
```
myisampack — Generate Compressed, Read-Only MyISAM Tables

```
48  481  79  no endspace, no empty          15   9
49  560  79  no empty                       2   9
50  639  79  no empty                       2   9
51  718  79  no endspace                    16   9
52  797  8   no empty                       2   9
53  805  1   17                            1   1
54  806  1   3                            9   9
55  807  20  no empty                       3   9
56  827  4   no zeros, zerofill(2)         2   9
57  831  4   no zeros, zerofill(1)         2   9
```

myisampack displays the following kinds of information:

- **normal**
  The number of columns for which no extra packing is used.

- **empty-space**
  The number of columns containing values that are only spaces. These occupy one bit.

- **empty-zero**
  The number of columns containing values that are only binary zeros. These occupy one bit.

- **empty-fill**
  The number of integer columns that do not occupy the full byte range of their type. These are changed to a smaller type. For example, a `BIGINT` column (eight bytes) can be stored as a `TINYINT` column (one byte) if all its values are in the range from `-128` to `127`.

- **pre-space**
  The number of decimal columns that are stored with leading spaces. In this case, each value contains a count for the number of leading spaces.

- **end-space**
  The number of columns that have a lot of trailing spaces. In this case, each value contains a count for the number of trailing spaces.

- **table-lookup**
  The column had only a small number of different values, which were converted to an `ENUM` before Huffman compression.

- **zero**
  The number of columns for which all values are zero.

- **Original trees**
  The initial number of Huffman trees.

- **After join**
  The number of distinct Huffman trees left after joining trees to save some header space.

After a table has been compressed, the Field lines displayed by `myisamchk -dvv` include additional information about each column:
Type

The data type. The value may contain any of the following descriptors:

- **constant**
  
  All rows have the same value.

- **no endspace**
  
  Do not store endspace.

- **no endspace, not_always**
  
  Do not store endspace and do not do endspace compression for all values.

- **no endspace, no empty**
  
  Do not store endspace. Do not store empty values.

- **table-lookup**
  
  The column was converted to an `ENUM`.

- **zerofill(N)**
  
  The most significant $N$ bytes in the value are always 0 and are not stored.

- **no zeros**
  
  Do not store zeros.

- **always zero**
  
  Zero values are stored using one bit.

- **Huff tree**
  
  The number of the Huffman tree associated with the column.

- **Bits**
  
  The number of bits used in the Huffman tree.

After you run `myisampack`, use `myisamchk` to re-create any indexes. At this time, you can also sort the index blocks and create statistics needed for the MySQL optimizer to work more efficiently:

```
shell> myisamchk -rq --sort-index --analyze tbl_name.MYI
```

After you have installed the packed table into the MySQL database directory, you should execute `mysqladmin flush-tables` to force `mysqld` to start using the new table.

To unpack a packed table, use the `--unpack` option to `myisamchk`.

4.6.6 **mysql_config_editor** — MySQL Configuration Utility

The `mysql_config_editor` utility enables you to store authentication credentials in an obfuscated login path file named `.mylogin.cnf`. The file location is the `%APPDATA%\MySQL` directory on Windows and
the current user's home directory on non-Windows systems. The file can be read later by MySQL client programs to obtain authentication credentials for connecting to MySQL Server.

The unobfuscated format of the `.mylogin.cnf` login path file consists of option groups, similar to other option files. Each option group in `.mylogin.cnf` is called a "login path," which is a group that permits only certain options: `host`, `user`, `password`, `port` and `socket`. Think of a login path option group as a set of options that specify which MySQL server to connect to and which account to authenticate as. Here is an unobfuscated example:

```
[client]
user = mydefaultname
password = mydefaultpass
host = 127.0.0.1
[mypath]
user = myothername
password = myotherpass
host = localhost
```

When you invoke a client program to connect to the server, the client uses `.mylogin.cnf` in conjunction with other option files. Its precedence is higher than other option files, but less than options specified explicitly on the client command line. For information about the order in which option files are used, see Section 4.2.2.2, "Using Option Files".

To specify an alternate login path file name, set the `MYSQL_TEST_LOGIN_FILE` environment variable. This variable is recognized by `mysql_config_editor`, by standard MySQL clients (`mysql`, `mysqladmin`, and so forth), and by the `mysql-test-run.pl` testing utility.

Programs use groups in the login path file as follows:

- `mysql_config_editor` operates on the `client` login path by default if you specify no `--login-path=name` option to indicate explicitly which login path to use.
- Without a `--login-path` option, client programs read the same option groups from the login path file that they read from other option files. Consider this command:

```
shell> mysql
```

By default, the `mysql` client reads the `[client]` and `[mysql]` groups from other option files, so it reads them from the login path file as well.

- With a `--login-path` option, client programs additionally read the named login path from the login path file. The option groups read from other option files remain the same. Consider this command:

```
shell> mysql --login-path=mypath
```

The `mysql` client reads `[client]` and `[mysql]` from other option files, and `[client]`, `[mysql]`, and `[mypath]` from the login path file.

- Client programs read the login path file even when the `--no-defaults` option is used. This permits passwords to be specified in a safer way than on the command line even if `--no-defaults` is present.

`mysql_config_editor` obfuscates the `.mylogin.cnf` file so it cannot be read as cleartext, and its contents when unobfuscated by client programs are used only in memory. In this way, passwords can be stored in a file in non-cleartext format and used later without ever needing to be exposed on the command line or in an environment variable. `mysql_config_editor` provides a `print` command for displaying the login path file contents, but even in this case, password values are masked so as never to appear in a way that other users can see them.
The obfuscation used by `mysql_config_editor` prevents passwords from appearing in `.mylogin.cnf` as cleartext and provides a measure of security by preventing inadvertent password exposure. For example, if you display a regular unobfuscated `my.cnf` option file on the screen, any passwords it contains are visible for anyone to see. With `.mylogin.cnf`, that is not true. But the obfuscation used will not deter a determined attacker and you should not consider it unbreakable. A user who can gain system administration privileges on your machine to access your files could unobfuscate the `.mylogin.cnf` file with some effort.

The login path file must be readable and writable to the current user, and inaccessible to other users. Otherwise, `mysql_config_editor` ignores it, and client programs do not use it, either.

Invoke `mysql_config_editor` like this:

```
shell> mysql_config_editor [program_options] command [command_options]
```

If the login path file does not exist, `mysql_config_editor` creates it.

Command arguments are given as follows:

- `program_options` consists of general `mysql_config_editor` options.
- `command` indicates what action to perform on the `.mylogin.cnf` login path file. For example, `set` writes a login path to the file, `remove` removes a login path, and `print` displays login path contents.
- `command_options` indicates any additional options specific to the command, such as the login path name and the values to use in the login path.

The position of the command name within the set of program arguments is significant. For example, these command lines have the same arguments, but produce different results:

```
shell> mysql_config_editor --help set
shell> mysql_config_editor set --help
```

The first command line displays a general `mysql_config_editor` help message, and ignores the `set` command. The second command line displays a help message specific to the `set` command.

Suppose that you want to establish a client login path that defines your default connection parameters, and an additional login path named remote for connecting to the MySQL server the host `remote.example.com`. You want to log in as follows:

- By default, to the local server with a user name and password of `localuser` and `localpass`
- To the remote server with a user name and password of `remoteuser` and `remotepass`

To set up the login paths in the `.mylogin.cnf` file, use the following `set` commands. Enter each command on a single line, and enter the appropriate passwords when prompted:

```
shell> mysql_config_editor set --login-path=client
    --host=localhost --user=localuser --password
Enter password: enter password "localpass" here
shell> mysql_config_editor set --login-path=remote
    --host=remote.example.com --user=remoteuser --password
Enter password: enter password "remotepass" here
```

`mysql_config_editor` uses the `client` login path by default, so the `--login-path=client` option can be omitted from the first command without changing its effect.

To see what `mysql_config_editor` writes to the `.mylogin.cnf` file, use the `print` command:
The `print` command displays each login path as a set of lines beginning with a group header indicating the login path name in square brackets, followed by the option values for the login path. Password values are masked and do not appear as cleartext.

If you do not specify `--all` to display all login paths or `--login-path=name` to display a named login path, the `print` command displays the `client` login path by default, if there is one.

As shown by the preceding example, the login path file can contain multiple login paths. In this way, `mysql_config_editor` makes it easy to set up multiple “personalities” for connecting to different MySQL servers, or for connecting to a given server using different accounts. Any of these can be selected by name later using the `--login-path` option when you invoke a client program. For example, to connect to the remote server, use this command:

```shell
shell> mysql --login-path=remote
```

Here, `mysql` reads the `[client]` and `[mysql]` option groups from other option files, and the `[client]`, `[mysql]`, and `[remote]` groups from the login path file.

To connect to the local server, use this command:

```shell
shell> mysql --login-path=client
```

Because `mysql` reads the `client` and `mysql` login paths by default, the `--login-path` option does not add anything in this case. That command is equivalent to this one:

```shell
shell> mysql
```

Options read from the login path file take precedence over options read from other option files. Options read from login path groups appearing later in the login path file take precedence over options read from groups appearing earlier in the file.

`mysql_config_editor` adds login paths to the login path file in the order you create them, so you should create more general login paths first and more specific paths later. If you need to move a login path within the file, you can remove it, then recreate it to add it to the end. For example, a `client` login path is more general because it is read by all client programs, whereas a `mysqldump` login path is read only by `mysqldump`. Options specified later override options specified earlier, so putting the login paths in the order `client, mysqldump` enables `mysqldump`-specific options to override `client` options.

When you use the `set` command with `mysql_config_editor` to create a login path, you need not specify all possible option values (host name, user name, password, port, socket). Only those values given are written to the path. Any missing values required later can be specified when you invoke a client path to connect to the MySQL server, either in other option files or on the command line. Any options specified on the command line override those specified in the login path file or other option files. For example, if the credentials in the `remote` login path also apply for the host `remote2.example.com`, connect to the server on that host like this:
mysql_config_editor General Options

mysql_config_editor supports the following general options, which may be used preceding any command named on the command line. For descriptions of command-specific options, see mysql_config_editor Commands and Command-Specific Options.

Table 4.18 mysql_config_editor General Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--debug</td>
<td>Write debugging log</td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
</tr>
<tr>
<td>--verbose</td>
<td>Verbose mode</td>
</tr>
<tr>
<td>--version</td>
<td>Display version information and exit</td>
</tr>
</tbody>
</table>

- **--help, -?**
  Display a general help message and exit.

To see a command-specific help message, invoke mysql_config_editor as follows, where `command` is a command other than `help`:

```
shell> mysql_config_editor command --help
```

- **--debug=[debug_options], -# debug_options**
  Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o,/tmp/mysql_config_editor.trace`.

- **--verbose, -v**
  Verbose mode. Print more information about what the program does. This option may be helpful in diagnosing problems if an operation does not have the effect you expect.

- **--version, -V**
  Display version information and exit.

mysql_config_editor Commands and Command-Specific Options

This section describes the permitted mysql_config_editor commands, and, for each one, the command-specific options permitted following the command name on the command line.

In addition, mysql_config_editor supports general options that can be used preceding any command. For descriptions of these options, see mysql_config_editor General Options.

mysql_config_editor supports these commands:

- **help**
  Display a general help message and exit. This command takes no following options.

To see a command-specific help message, invoke mysql_config_editor as follows, where `command` is a command other than `help`:

```
shell> mysql_config_editor command --help
```
• **print [options]**

Print the contents of the login path file in unobfuscated form, with the exception that passwords are displayed as *****.

The default login path name is **client** if no login path is named. If both **--all** and **--login-path** are given, **--all** takes precedence.

The `print` command permits these options following the command name:

• **--help, -?**

Display a help message for the `print` command and exit.

To see a general help message, use `mysql_config_editor --help`.

• **--all**

Print the contents of all login paths in the login path file.

• **--login-path=name, -G name**

Print the contents of the named login path.

• **remove [options]**

Remove a login path from the login path file, or modify a login path by removing options from it.

This command removes from the login path only such options as are specified with the **--host, --password, --port, --socket, and --user** options. If none of those options are given, `remove` removes the entire login path. For example, this command removes only the **user** option from the `mypath` login path rather than the entire `mypath` login path:

```
shell> mysql_config_editor remove --login-path=mypath --user
```

This command removes the entire `mypath` login path:

```
shell> mysql_config_editor remove --login-path=mypath
```

The `remove` command permits these options following the command name:

• **--help, -?**

Display a help message for the `remove` command and exit.

To see a general help message, use `mysql_config_editor --help`.

• **--host, -h**

Remove the host name from the login path.

• **--login-path=name, -G name**

The login path to remove or modify. The default login path name is **client** if this option is not given.

• **--password, -p**
mysql_config_editor — MySQL Configuration Utility

Remove the password from the login path.
• --port, -P

Remove the TCP/IP port number from the login path. This option was added in MySQL 5.6.11.
• --socket, -S

Remove the Unix socket file name from the login path. This option was added in MySQL 5.6.11.
• --user, -u

Remove the user name from the login path.
• --warn, -w

Warn and prompt the user for confirmation if the command attempts to remove the default login path (client) and --login-path=client was not specified. This option is enabled by default; use --skip-warn to disable it.

reset [options]

Empty the contents of the login path file.

The reset command permits these options following the command name:
• --help, -?

Display a help message for the reset command and exit.

To see a general help message, use mysql_config_editor --help.

set [options]

Write a login path to the login path file.

This command writes to the login path only such options as are specified with the --host, --password, --port, --socket, and --user options. If none of those options are given, mysql_config_editor writes the login path as an empty group.

The set command permits these options following the command name:
• --help, -?

Display a help message for the set command and exit.

To see a general help message, use mysql_config_editor --help.
• --host=host_name, -h host_name

The host name to write to the login path.
• --login-path=name, -G name

The login path to create. The default login path name is client if this option is not given.
• --password, -p
Prompt for a password to write to the login path. After `mysql_config_editor` displays the prompt, type the password and press Enter. To prevent other users from seeing the password, `mysql_config_editor` does not echo it.

To specify an empty password, press Enter at the password prompt. The resulting login path written to the login path file will include a line like this:

```
password =
```

- `--port=port_num, -P port_num`
  The TCP/IP port number to write to the login path. This option was added in MySQL 5.6.11.

- `--socket=file_name, -S file_name`
  The Unix socket file name to write to the login path. This option was added in MySQL 5.6.11.

- `--user=user_name, -u user_name`
  The user name to write to the login path.

- `--warn, -w`
  Warn and prompt the user for confirmation if the command attempts to overwrite an existing login path. This option is enabled by default; use `--skip-warn` to disable it.

### 4.6.7 `mysqlaccess` — Client for Checking Access Privileges

---

**Note**
This utility is deprecated in MySQL 5.6.17 and removed in MySQL 5.7

`mysqlaccess` is a diagnostic tool that Yves Carlier has provided for the MySQL distribution. It checks the access privileges for a host name, user name, and database combination. `mysqlaccess` checks access using only the `user` and `db` tables. It does not check table, column, or routine privileges specified in the `tables_priv`, `columns_priv`, or `procs_priv` tables.

Invoke `mysqlaccess` like this:

```
shell> mysqlaccess [host_name [user_name [db_name]]] [options]
```

When `mysqlaccess` runs, it loads and executes the contents of its configuration file, `mysqlaccess.conf`. `mysqlaccess` looks for the configuration file in these locations, in order:

- The directory named by the `SYSCONFDIR` option to `CMake` when MySQL was built. By default, this is the `etc` directory located under the compiled-in installation directory.

- The `/etc` directory.

`mysqlaccess` supports the options shown in the following table.

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--brief</code></td>
<td>Generate reports in single-line tabular format</td>
</tr>
</tbody>
</table>
mysqlaccess — Client for Checking Access Privileges

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--commit</td>
<td>Copy the new access privileges from the temporary tables to the original grant tables</td>
</tr>
<tr>
<td>--copy</td>
<td>Reload the temporary grant tables from original ones</td>
</tr>
<tr>
<td>--db</td>
<td>Specify the database name</td>
</tr>
<tr>
<td>--debug</td>
<td>Specify the debug level</td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
</tr>
<tr>
<td>--host</td>
<td>Host on which MySQL server is located</td>
</tr>
<tr>
<td>--howto</td>
<td>Display some examples that show how to use mysqlaccess</td>
</tr>
<tr>
<td>--old_server</td>
<td>Assume that the server is an old MySQL server (prior to MySQL 3.21)</td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
</tr>
<tr>
<td>--plan</td>
<td>Display suggestions and ideas for future releases</td>
</tr>
<tr>
<td>--preview</td>
<td>Show the privilege differences after making changes to the temporary grant tables</td>
</tr>
<tr>
<td>--relnotes</td>
<td>Display release notes</td>
</tr>
<tr>
<td>--rhost</td>
<td>Host on which MySQL server is located</td>
</tr>
<tr>
<td>--rollback</td>
<td>Undo the most recent changes to the temporary grant tables.</td>
</tr>
<tr>
<td>--spassword</td>
<td>Password to use when connecting to server as the superuser</td>
</tr>
<tr>
<td>--superuser</td>
<td>Specify the user name for connecting as the superuser</td>
</tr>
<tr>
<td>--table</td>
<td>Generate reports in table format</td>
</tr>
<tr>
<td>--user</td>
<td>MySQL user name to use when connecting to server</td>
</tr>
<tr>
<td>--version</td>
<td>Display version information and exit</td>
</tr>
</tbody>
</table>

- **--help, -?**
  Display a help message and exit.

- **--brief, -b**
  Generate reports in single-line tabular format.

- **--commit**
  Copy the new access privileges from the temporary tables to the original grant tables. The grant tables must be flushed for the new privileges to take effect. (For example, execute a `mysqladmin reload` command.)

- **--copy**
  Reload the temporary grant tables from original ones.

- **--db=db_name, -d db_name**
  Specify the database name.

- **--debug=N**
  Specify the debug level. \( N \) can be an integer from 0 to 3.
• --host=host_name, -h  host_name
  The host name to use in the access privileges.
• --howto
  Display some examples that show how to use mysqlaccess.
• --old_server
  Assume that the server is an old MySQL server (before MySQL 3.21) that does not yet know how to handle full WHERE clauses.
• --password[=password], -p[password]
  The password to use when connecting to the server. If you omit the password value following the --password or -p option on the command line, mysqlaccess prompts for one.
  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”.
• --plan
  Display suggestions and ideas for future releases.
• --preview
  Show the privilege differences after making changes to the temporary grant tables.
• --relnotes
  Display the release notes.
• --rhost=host_name, -H  host_name
  Connect to the MySQL server on the given host.
• --rollback
  Undo the most recent changes to the temporary grant tables.
• --spassword[=password], -P[password]
  The password to use when connecting to the server as the superuser. If you omit the password value following the --spassword or -p option on the command line, mysqlaccess prompts for one.
  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”.
• --superuser=user_name, -U  user_name
  Specify the user name for connecting as the superuser.
• --table, -t
  Generate reports in table format.
• --user=user_name, -u  user_name
  The user name to use in the access privileges.
mysqlbinlog — Utility for Processing Binary Log Files

- --version, -v

Display version information and exit.

If your MySQL distribution is installed in some nonstandard location, you must change the location where mysqlaccess expects to find the mysql client. Edit the mysqlaccess script at approximately line 18. Search for a line that looks like this:

```
$MYSQL = '/usr/local/bin/mysql';  # path to mysql executable
```

Change the path to reflect the location where mysql actually is stored on your system. If you do not do this, a Broken pipe error will occur when you run mysqlaccess.

4.6.8 mysqlbinlog — Utility for Processing Binary Log Files

The server's binary log consists of files containing "events" that describe modifications to database contents. The server writes these files in binary format. To display their contents in text format, use the mysqlbinlog utility. You can also use mysqlbinlog to display the contents of relay log files written by a slave server in a replication setup because relay logs have the same format as binary logs. The binary log and relay log are discussed further in Section 5.4.4, "The Binary Log", and Section 17.2.2, "Replication Relay and Status Logs".

Invoke mysqlbinlog like this:

```
shell> mysqlbinlog [options] log_file ...
```

For example, to display the contents of the binary log file named binlog.000003, use this command:

```
shell> mysqlbinlog binlog.000003
```

The output includes events contained in binlog.000003. For statement-based logging, event information includes the SQL statement, the ID of the server on which it was executed, the timestamp when the statement was executed, how much time it took, and so forth. For row-based logging, the event indicates a row change rather than an SQL statement. See Section 17.1.2, "Replication Formats", for information about logging modes.

Events are preceded by header comments that provide additional information. For example:

```
# at 141
#100309  9:28:36 server id 123  end_log_pos 245
  Query thread_id=3350  exec_time=11  error_code=0
```

In the first line, the number following at indicates the file offset, or starting position, of the event in the binary log file.

The second line starts with a date and time indicating when the statement started on the server where the event originated. For replication, this timestamp is propagated to slave servers. server_id is the server_id value of the server where the event originated. end_log_pos indicates where the next event starts (that is, it is the end position of the current event + 1). thread_id indicates which thread executed the event. exec_time is the time spent executing the event, on a master server. On a slave, it is the difference of the end execution time on the slave minus the beginning execution time on the master. The difference serves as an indicator of how much replication lags behind the master. error_code indicates the result from executing the event. Zero means that no error occurred.
When using event groups, the file offsets of events may be grouped together and the comments of events may be grouped together. Do not mistake these grouped events for blank file offsets.

The output from `mysqlbinlog` can be re-executed (for example, by using it as input to `mysql`) to redo the statements in the log. This is useful for recovery operations after a server crash. For other usage examples, see the discussion later in this section and in Section 7.5, “Point-in-Time (Incremental) Recovery Using the Binary Log”.

Normally, you use `mysqlbinlog` to read binary log files directly and apply them to the local MySQL server. It is also possible to read binary logs from a remote server by using the `--read-from-remote-server` option. To read remote binary logs, the connection parameter options can be given to indicate how to connect to the server. These options are `--host`, `--password`, `--port`, `--protocol`, `--socket`, and `--user`.

When running `mysqlbinlog` against a large binary log, be careful that the filesystem has enough space for the resulting files. To configure the directory that `mysqlbinlog` uses for temporary files, use the `TMPDIR` environment variable.

In MySQL 5.6.10 and later, `mysqlbinlog` sets the value of `pseudo_slave_mode` to true before executing any SQL statements.

`mysqlbinlog` supports the following options, which can be specified on the command line or in the `[mysqlbinlog]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

### Table 4.20 mysqlbinlog Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--base64-output</td>
<td>Print binary log entries using base-64 encoding</td>
<td></td>
</tr>
<tr>
<td>--bind-address</td>
<td>Use specified network interface to connect to MySQL Server</td>
<td>5.6.1</td>
</tr>
<tr>
<td>--binlog-row-event-max-size</td>
<td>Binary log max event size</td>
<td></td>
</tr>
<tr>
<td>--character-sets-dir</td>
<td>Directory where character sets are installed</td>
<td></td>
</tr>
<tr>
<td>--connection-server-id</td>
<td>Used for testing and debugging. See text for applicable default values and other particulars.</td>
<td>5.6.20</td>
</tr>
<tr>
<td>--database</td>
<td>List entries for just this database</td>
<td></td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging log</td>
<td></td>
</tr>
<tr>
<td>--debug-check</td>
<td>Print debugging information when program exits</td>
<td></td>
</tr>
<tr>
<td>--debug-info</td>
<td>Print debugging information, memory, and CPU statistics when program exits</td>
<td></td>
</tr>
<tr>
<td>--default-auth</td>
<td>Authentication plugin to use</td>
<td>5.6.2</td>
</tr>
<tr>
<td>--defaults-extra-file</td>
<td>Read named option file in addition to usual option files</td>
<td></td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
<td></td>
</tr>
<tr>
<td>--defaults-group-suffix</td>
<td>Option group suffix value</td>
<td></td>
</tr>
<tr>
<td>--disable-log-bin</td>
<td>Disable binary logging</td>
<td></td>
</tr>
<tr>
<td>--exclude-gtids</td>
<td>Do not show any of the groups in the GTID set provided</td>
<td>5.6.5</td>
</tr>
</tbody>
</table>
## mysqlbinlog — Utility for Processing Binary Log Files

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--force-if-open</td>
<td>Read binary log files even if open or not closed properly</td>
<td></td>
</tr>
<tr>
<td>--force-read</td>
<td>If mysqlbinlog reads a binary log event that it does not recognize, it prints a warning</td>
<td></td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
<td></td>
</tr>
<tr>
<td>--hexdump</td>
<td>Display a hex dump of the log in comments</td>
<td></td>
</tr>
<tr>
<td>--host</td>
<td>Host on which MySQL server is located</td>
<td></td>
</tr>
<tr>
<td>--include-gtids</td>
<td>Show only the groups in the GTID set provided</td>
<td>5.6.5</td>
</tr>
<tr>
<td>--local-load</td>
<td>Prepare local temporary files for LOAD DATA in the specified directory</td>
<td></td>
</tr>
<tr>
<td>--login-path</td>
<td>Read login path options from .mylogin.cnf</td>
<td>5.6.6</td>
</tr>
<tr>
<td>--local-load</td>
<td>Prepare local temporary files for LOAD DATA in the specified directory</td>
<td></td>
</tr>
<tr>
<td>--no-defaults</td>
<td>Read no option files</td>
<td></td>
</tr>
<tr>
<td>--offset</td>
<td>Skip the first N entries in the log</td>
<td></td>
</tr>
<tr>
<td><strong>open_files_limit</strong></td>
<td>Specify the number of open file descriptors to reserve</td>
<td></td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
<td></td>
</tr>
<tr>
<td>--plugin-dir</td>
<td>Directory where plugins are installed</td>
<td>5.6.2</td>
</tr>
<tr>
<td>--port</td>
<td>TCP/IP port number for connection</td>
<td></td>
</tr>
<tr>
<td>--print-defaults</td>
<td>Print default options</td>
<td></td>
</tr>
<tr>
<td>--protocol</td>
<td>Connection protocol to use</td>
<td></td>
</tr>
<tr>
<td>--raw</td>
<td>Write events in raw (binary) format to output files</td>
<td></td>
</tr>
<tr>
<td>--read-from-remote-master</td>
<td>Read the binary log from a MySQL master rather than reading a local log file</td>
<td>5.6.5</td>
</tr>
<tr>
<td>--read-from-remote-server</td>
<td>Read binary log from MySQL server rather than local log file</td>
<td></td>
</tr>
<tr>
<td>--result-file</td>
<td>Direct output to named file</td>
<td></td>
</tr>
<tr>
<td>--secure-auth</td>
<td>Do not send passwords to server in old (pre-4.1) format</td>
<td>5.6.17</td>
</tr>
<tr>
<td>--server-id</td>
<td>Extract only those events created by the server having the given server ID</td>
<td></td>
</tr>
<tr>
<td>--server-id-bits</td>
<td>Tell mysqlbinlog how to interpret server IDs in binary log when log was written by a mysql log having its server-id-bits set to less than the maximum; supported only by MySQL Cluster version of mysqlbinlog</td>
<td></td>
</tr>
<tr>
<td>--set-charset</td>
<td>Add a SET NAMES charset_name statement to the output</td>
<td></td>
</tr>
<tr>
<td>--shared-memory-base-name</td>
<td>Name of shared memory to use for shared-memory connections</td>
<td></td>
</tr>
<tr>
<td>--short-form</td>
<td>Display only the statements contained in the log</td>
<td></td>
</tr>
<tr>
<td>--skip-gtids</td>
<td>Do not print any GTIDs; use this when writing a dump file from binary logs containing GTIDs.</td>
<td>5.6.5</td>
</tr>
<tr>
<td>--socket</td>
<td>Unix socket file or Windows named pipe to use</td>
<td></td>
</tr>
<tr>
<td>--ssl-crl</td>
<td>File that contains certificate revocation lists</td>
<td>5.6.3</td>
</tr>
<tr>
<td>--ssl-crlpath</td>
<td>Directory that contains certificate revocation-list files</td>
<td>5.6.3</td>
</tr>
<tr>
<td>--ssl-mode</td>
<td>Desired security state of connection to server</td>
<td>5.6.30</td>
</tr>
</tbody>
</table>
**mysqlbinlog — Utility for Processing Binary Log Files**

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--start-datetime</td>
<td>Read binary log from first event with timestamp equal to or later than datetime argument</td>
<td></td>
</tr>
<tr>
<td>--start-position</td>
<td>Read binary log from first event with position equal to or greater than argument</td>
<td></td>
</tr>
<tr>
<td>--stop-datetime</td>
<td>Stop reading binary log at first event with timestamp equal to or greater than datetime argument</td>
<td></td>
</tr>
<tr>
<td>--stop-never</td>
<td>Stay connected to server after reading last binary log file</td>
<td></td>
</tr>
<tr>
<td>--stop-never-slave-server-id</td>
<td>Slave server ID to report when connecting to server</td>
<td></td>
</tr>
<tr>
<td>--stop-position</td>
<td>Stop reading binary log at first event with position equal to or greater than argument</td>
<td></td>
</tr>
<tr>
<td>--to-last-log</td>
<td>Do not stop at the end of requested binary log from a MySQL server, but rather continue printing to end of last binary log</td>
<td></td>
</tr>
<tr>
<td>--user</td>
<td>MySQL user name to use when connecting to server</td>
<td></td>
</tr>
<tr>
<td>--verbose</td>
<td>Reconstruct row events as SQL statements</td>
<td></td>
</tr>
<tr>
<td>--verify-binlog-checksum</td>
<td>Verify checksums in binary log</td>
<td>5.6.1</td>
</tr>
<tr>
<td>--version</td>
<td>Display version information and exit</td>
<td></td>
</tr>
</tbody>
</table>

- **--help, --?**
  Display a help message and exit.

- **--base64-output=value**
  This option determines when events should be displayed encoded as base-64 strings using BINLOG statements. The option has these permissible values (not case-sensitive):
  
  - AUTO ("automatic") or UNSPEC ("unspecified") displays BINLOG statements automatically when necessary (that is, for format description events and row events). If no --base64-output option is given, the effect is the same as --base64-output=AUTO.
  
  **Note**
  Automatic BINLOG display is the only safe behavior if you intend to use the output of mysqlbinlog to re-execute binary log file contents. The other option values are intended only for debugging or testing purposes because they may produce output that does not include all events in executable form.

  - NEVER causes BINLOG statements not to be displayed. mysqlbinlog exits with an error if a row event is found that must be displayed using BINLOG.
  
  - DECODE-ROWS specifies to mysqlbinlog that you intend for row events to be decoded and displayed as commented SQL statements by also specifying the --verbose option. Like NEVER, DECODE-ROWS suppresses display of BINLOG statements, but unlike NEVER, it does not exit with an error if a row event is found.

  For examples that show the effect of --base64-output and --verbose on row event output, see Section 4.6.8.2, “mysqlbinlog Row Event Display”.

- **--bind-address=ip_address**
On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

- `--binlog-row-event-max-size=N`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--binlog-row-event-max-size=#</code></td>
</tr>
<tr>
<td>Type</td>
<td>Numeric</td>
</tr>
<tr>
<td>Default Value</td>
<td>4294967040</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>256</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>18446744073709547520</td>
</tr>
</tbody>
</table>

Specify the maximum size of a row-based binary log event, in bytes. Rows are grouped into events smaller than this size if possible. The value should be a multiple of 256. The default is 4GB.

- `--character-sets-dir=dir_name`

The directory where character sets are installed. See Section 10.15, “Character Set Configuration”.

- `--connection-server-id=server_id`

This option is used to test a MySQL server for support of the `BINLOG_DUMP_NON_BLOCK` connection flag, which was inadvertently removed in MySQL 5.6.5, and restored in MySQL 5.6.20 (Bug #18000079, Bug #71178). It is not required for normal operation.

The effective default and minimum values for this option depend on whether `mysqlbinlog` is run in blocking mode or non-blocking mode. When `mysqlbinlog` is run in blocking mode, the default (and minimum) value is 1; when run in non-blocking mode, the default (and minimum) value is 0.

This option was added in MySQL 5.6.20.

- `--database=db_name, -d db_name`

This option causes `mysqlbinlog` to output entries from the binary log (local log only) that occur while `db_name` is been selected as the default database by `USE`.

The `--database` option for `mysqlbinlog` is similar to the `--binlog-do-db` option for `mysqld`, but can be used to specify only one database. If `--database` is given multiple times, only the last instance is used.

The effects of this option depend on whether the statement-based or row-based logging format is in use, in the same way that the effects of `--binlog-do-db` depend on whether statement-based or row-based logging is in use.

**Statement-based logging.** The `--database` option works as follows:

- While `db_name` is the default database, statements are output whether they modify tables in `db_name` or a different database.
- Unless `db_name` is selected as the default database, statements are not output, even if they modify tables in `db_name`. 
There is an exception for CREATE DATABASE, ALTER DATABASE, and DROP DATABASE. The database being created, altered, or dropped is considered to be the default database when determining whether to output the statement.

Suppose that the binary log was created by executing these statements using statement-based-logging:

```
INSERT INTO test.t1 (i) VALUES(100);
INSERT INTO db2.t2 (j) VALUES(200);
USE test;
INSERT INTO test.t1 (i) VALUES(101);
INSERT INTO t1 (i) VALUES(102);
INSERT INTO db2.t2 (j) VALUES(201);
USE db2;
INSERT INTO test.t1 (i) VALUES(103);
INSERT INTO db2.t2 (j) VALUES(202);
INSERT INTO t2 (j) VALUES(203);
```

`mysqlbinlog --database=test` does not output the first two INSERT statements because there is no default database. It outputs the three INSERT statements following USE test, but not the three INSERT statements following USE db2.

`mysqlbinlog --database=db2` does not output the first two INSERT statements because there is no default database. It does not output the three INSERT statements following USE test, but does output the three INSERT statements following USE db2.

**Row-based logging.** `mysqlbinlog` outputs only entries that change tables belonging to `db_name`. The default database has no effect on this. Suppose that the binary log just described was created using row-based logging rather than statement-based logging. `mysqlbinlog --database=test` outputs only those entries that modify `t1` in the test database, regardless of whether `USE` was issued or what the default database is.

If a server is running with `binlog_format` set to MIXED and you want it to be possible to use `mysqlbinlog` with the `--database` option, you must ensure that tables that are modified are in the database selected by `USE`. (In particular, no cross-database updates should be used.)

- `--debug[=debug_options],-#` [debug_options]

Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o, /tmp/mysqlbinlog.trace`.

- `--debug-check`

Print some debugging information when the program exits.

- `--debug-info`

Print debugging information and memory and CPU usage statistics when the program exits.

- `--default-auth=plugin`

A hint about which client-side authentication plugin to use. See Section 6.2.11, "Pluggable Authentication".

- `--defaults-extra-file=file_name`
mysqlbinlog — Utility for Processing Binary Log Files

Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. *file_name* is interpreted relative to the current directory if given as a relative path name rather than a full path name.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--defaults-file=file_name**

Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. *file_name* is interpreted relative to the current directory if given as a relative path name rather than a full path name.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

Exception: Even with **--defaults-file**, client programs read `.mylogin.cnf`.

- **--defaults-group-suffix=str**

Read not only the usual option groups, but also groups with the usual names and a suffix of *str*. For example, `mysqlbinlog` normally reads the [client] and [mysqlbinlog] groups. If the **--defaults-group-suffix=_other** option is given, `mysqlbinlog` also reads the [client_other] and [mysqlbinlog_other] groups.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--disable-log-bin, -D**

Disable binary logging. This is useful for avoiding an endless loop if you use the **--to-last-log** option and are sending the output to the same MySQL server. This option also is useful when restoring after a crash to avoid duplication of the statements you have logged.

This option causes `mysqlbinlog` to include a `SET sql_log_bin = 0` statement in its output to disable binary logging of the remaining output. Manipulating the session value of the `sql_log_bin` system variable is a restricted operation, so this option requires that you have privileges sufficient to set restricted session variables. See Section 5.1.8.1, “System Variable Privileges”.

- **--exclude-gtids=gtid_set**

Do not display any of the groups listed in the *gtid_set*.

- **--force-if-open, -F**

Read binary log files even if they are open or were not closed properly.

- **--force-read, -f**

With this option, if `mysqlbinlog` reads a binary log event that it does not recognize, it prints a warning, ignores the event, and continues. Without this option, `mysqlbinlog` stops if it reads such an event.

- **--hexdump, -H**

Display a hex dump of the log in comments, as described in Section 4.6.8.1, “mysqlbinlog Hex Dump Format”. The hex output can be helpful for replication debugging.
• `--host=host_name, -h host_name`

Get the binary log from the MySQL server on the given host.

• `--include-gtids=gtid_set`

Display only the groups listed in the `gtid_set`.

• `--local-load=dir_name, -l dir_name`

Prepare local temporary files for `LOAD DATA` in the specified directory.

**Important**

These temporary files are not automatically removed by `mysqlbinlog` or any other MySQL program.

• `--login-path=name`

Read options from the named login path in the `.mylogin.cnf` login path file. A “login path” is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the `mysql_config_editor` utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• `--no-defaults`

Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read.

The exception is that the `.mylogin.cnf` file, if it exists, is read in all cases. This permits passwords to be specified in a safer way than on the command line even when `--no-defaults` is used. (.mylogin.cnf is created by the `mysql_config_editor` utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.)

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• `--offset=N, -o N`

Skip the first `N` entries in the log.

• `--open-files-limit=N`

Specify the number of open file descriptors to reserve.

• `--password[=password], -p[password]`

The password of the MySQL account used for connecting to the server. The password value is optional. If not given, `mysqlbinlog` prompts for one. If given, there must be no space between `--password=` or `-p` and the password following it. If no password option is specified, the default is to send no password.

Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.
To explicitly specify that there is no password and that `mysqlbinlog` should not prompt for one, use the `--skip-password` option.

• `--plugin-dir=dir_name`

The directory in which to look for plugins. Specify this option if the `--default-auth` option is used to specify an authentication plugin but `mysqlbinlog` does not find it. See Section 6.2.11, “Pluggable Authentication”.

• `--port=port_num, -P port_num`

The TCP/IP port number to use for connecting to a remote server.

• `--print-defaults`

Print the program name and all options that it gets from option files.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

• `--protocol={TCP|SOCKET|PIPE|MEMORY}`

The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally result in use of a protocol other than the one you want. For details on the permissible values, see Section 4.2.4, “Connecting to the MySQL Server Using Command Options”.

• `--raw`

By default, `mysqlbinlog` reads binary log files and writes events in text format. The `--raw` option tells `mysqlbinlog` to write them in their original binary format. Its use requires that `--read-from-remote-server` also be used because the files are requested from a server. `mysqlbinlog` writes one output file for each file read from the server. The `--raw` option can be used to make a backup of a server’s binary log. With the `--stop-never` option, the backup is “live” because `mysqlbinlog` stays connected to the server. By default, output files are written in the current directory with the same names as the original log files. Output file names can be modified using the `--result-file` option. For more information, see Section 4.6.8.3, “Using mysqlbinlog to Back Up Binary Log Files”.

• `--read-from-remote-master=type`

Read binary logs from a MySQL server with the `COM_BINLOG_DUMP` or `COM_BINLOG_DUMP_GTID` commands by setting the option value to either `BINLOG-DUMP-NON-GTIDS` or `BINLOG-DUMP-GTIDS`, respectively. If `--read-from-remote-master=BINLOG-DUMP-GTIDS` is combined with `--exclude-gtids`, transactions can be filtered out on the master, avoiding unnecessary network traffic.

The connection parameter options are used with this option or the `--read-from-remote-server` option. These options are `--host`, `--password`, `--port`, `--protocol`, `--socket`, and `--user`. If neither of the remote options is specified, the connection parameter options are ignored.

The `REPLICATION_SLAVE` privilege is required to use this option.

• `--read-from-remote-server, -R`

Read the binary log from a MySQL server rather than reading a local log file. This option requires that the remote server be running. It works only for binary log files on the remote server, not relay log files.
The connection parameter options are used with this option or the `--read-from-remote-master` option. These options are `--host`, `--password`, `--port`, `--protocol`, `--socket`, and `--user`. If neither of the remote options is specified, the connection parameter options are ignored.

The `REPLICATION_SLAVE` privilege is required to use this option.

This option is like `--read-from-remote-master=_BINLOG-DUMP-NON-GTIDS`.

• `--result-file=name, -r name`

Without the `--raw` option, this option indicates the file to which `mysqlbinlog` writes text output. With `--raw`, `mysqlbinlog` writes one binary output file for each log file transferred from the server, writing them by default in the current directory using the same names as the original log file. In this case, the `--result-file` option value is treated as a prefix that modifies output file names.

• `--secure-auth`

Do not send passwords to the server in old (pre-4.1) format. This prevents connections except for servers that use the newer password format. This option is enabled by default; use `--skip-secure-auth` to disable it. This option was added in MySQL 5.6.17.

Note

Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.

Note

This option is deprecated and will be removed in a future release. As of MySQL 5.7.5, it is always enabled and attempting to disable it produces an error.

• `--server-id=id`

Display only those events created by the server having the given server ID.

• `--server-id-bits=N`

Use only the first \(N\) bits of the `server_id` to identify the server. If the binary log was written by a `mysqld` with server-id-bits set to less than 32 and user data stored in the most significant bit, running `mysqlbinlog` with `--server-id-bits` set to 32 enables this data to be seen.

This option is supported only by the versions of `mysqlbinlog` supplied with the NDB Cluster distribution, or built from the NDB Cluster sources.

• `--set-charset=charset_name`

Add a `SET NAMES charset_name` statement to the output to specify the character set to be used for processing log files.

• `--shared-memory-base-name=name`

On Windows, the shared-memory name to use for connections made using shared memory to a local server. The default value is `MYSQL`. The shared-memory name is case-sensitive.
This option applies only if the server was started with the shared_memory system variable enabled to support shared-memory connections.

- **--short-form, -s**

Display only the statements contained in the log, without any extra information or row-based events. This is for testing only, and should not be used in production systems.

- **--skip-gtids=[true|false]**

Do not display any GTIDs in the output. This is needed when writing to a dump file from one or more binary logs containing GTIDs, as shown in this example:

```shell
shell> mysqlbinlog --skip-gtids binlog.000001 > /tmp/dump.sql
shell> mysqlbinlog --skip-gtids binlog.000002 >> /tmp/dump.sql
shell> mysql -u root -p -e "source /tmp/dump.sql"
```

The use of this option is otherwise not normally recommended in production.

- **--socket=path, -S path**

For connections to localhost, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

On Windows, this option applies only if the server was started with the named_pipe system variable enabled to support named-pipe connections. In addition, the user making the connection must be a member of the Windows group specified by the named_pipe_full_access_group system variable.

- **--ssl**

Options that begin with --ssl specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Command Options for Encrypted Connections.

- **--start-datetime=datatime**

Start reading the binary log at the first event having a timestamp equal to or later than the datatime argument. The datatime value is relative to the local time zone on the machine where you run mysqlbinlog. The value should be in a format accepted for the DATETIME or TIMESTAMP data types. For example:

```shell
shell> mysqlbinlog --start-datetime="2005-12-25 11:25:56" binlog.000003
```

This option is useful for point-in-time recovery. See Section 7.3, “Example Backup and Recovery Strategy”.

- **--start-position=N, -j N**

Start reading the binary log at the first event having a position equal to or greater than N. This option applies to the first log file named on the command line.

This option is useful for point-in-time recovery. See Section 7.3, “Example Backup and Recovery Strategy”.

- **--stop-datetime=datatime**
Stop reading the binary log at the first event having a timestamp equal to or later than the `datetime` argument. This option is useful for point-in-time recovery. See the description of the `--start-datetime` option for information about the `datetime` value.

This option is useful for point-in-time recovery. See Section 7.3, “Example Backup and Recovery Strategy”.

- `--stop-never`

This option is used with `--read-from-remote-server`. It tells `mysqlbinlog` to remain connected to the server. Otherwise `mysqlbinlog` exits when the last log file has been transferred from the server. `--stop-never` implies `--to-last-log`, so only the first log file to transfer need be named on the command line.

`--stop-never` is commonly used with `--raw` to make a live binary log backup, but also can be used without `--raw` to maintain a continuous text display of log events as the server generates them.

- `--stop-never-slave-server-id=id`

With `--stop-never`, `mysqlbinlog` reports a server ID of 65535 when it connects to the server. `--stop-never-slave-server-id` explicitly specifies the server ID to report. It can be used to avoid a conflict with the ID of a slave server or another `mysqlbinlog` process. See Section 4.6.8.4, “Specifying the mysqlbinlog Server ID”.

- `--stop-position=N`

Stop reading the binary log at the first event having a position equal to or greater than N. This option applies to the last log file named on the command line.

This option is useful for point-in-time recovery. See Section 7.3, “Example Backup and Recovery Strategy”.

- `--to-last-log, -t`

Do not stop at the end of the requested binary log from a MySQL server, but rather continue printing until the end of the last binary log. If you send the output to the same MySQL server, this may lead to an endless loop. This option requires `--read-from-remote-server`.

- `--user=user_name, -u user_name`

The user name of the MySQL account to use when connecting to a remote server.

- `--verbose, -v`

Reconstruct row events and display them as commented SQL statements. If this option is given twice (by passing in either "-vv" or "--verbose --verbose"), the output includes comments to indicate column data types and some metadata, and row query log events if so configured.

For examples that show the effect of `--base64-output` and `--verbose` on row event output, see Section 4.6.8.2, “mysqlbinlog Row Event Display”.

- `--verify-binlog-checksum, -c`

Verify checksums in binary log files.

- `--version, -V`
Display version information and exit.

Prior to MySQL 5.6.11, the `mysqlbinlog` version number shown was 3.3. In MySQL 5.6.11 and later, this is 3.4. (Bug #15894381, Bug #67643)

You can pipe the output of `mysqlbinlog` into the `mysql` client to execute the events contained in the binary log. This technique is used to recover from a crash when you have an old backup (see Section 7.5, “Point-in-Time (Incremental) Recovery Using the Binary Log”). For example:

```
shell> mysqlbinlog binlog.000001 | mysql -u root -p
```

Or:

```
shell> mysqlbinlog binlog.[0-9]* | mysql -u root -p
```

If the statements produced by `mysqlbinlog` may contain BLOB values, these may cause problems when `mysql` processes them. In this case, invoke `mysql` with the `--binary-mode` option.

You can also redirect the output of `mysqlbinlog` to a text file instead, if you need to modify the statement log first (for example, to remove statements that you do not want to execute for some reason). After editing the file, execute the statements that it contains by using it as input to the `mysql` program:

```
shell> mysqlbinlog binlog.000001 > tmpfile
shell> ... edit tmpfile ...
shell> mysql -u root -p < tmpfile
```

When `mysqlbinlog` is invoked with the `--start-position` option, it displays only those events with an offset in the binary log greater than or equal to a given position (the given position must match the start of one event). It also has options to stop and start when it sees an event with a given date and time. This enables you to perform point-in-time recovery using the `--stop-datetime` option (to be able to say, for example, “roll forward my databases to how they were today at 10:30 a.m.”).

If you have more than one binary log to execute on the MySQL server, the safe method is to process them all using a single connection to the server. Here is an example that demonstrates what may be unsafe:

```
shell> mysqlbinlog binlog.000001 | mysql -u root -p # DANGER!!
shell> mysqlbinlog binlog.000002 | mysql -u root -p # DANGER!!
```

Processing binary logs this way using multiple connections to the server causes problems if the first log file contains a `CREATE TEMPORARY TABLE` statement and the second log contains a statement that uses the temporary table. When the first `mysql` process terminates, the server drops the temporary table. When the second `mysql` process attempts to use the table, the server reports “unknown table.”

To avoid problems like this, use a `single mysql` process to execute the contents of all binary logs that you want to process. Here is one way to do so:

```
shell> mysqlbinlog binlog.000001 binlog.000002 | mysql -u root -p
```

Another approach is to write all the logs to a single file and then process the file:

```
shell> mysqlbinlog binlog.000001 > /tmp/statements.sql
shell> mysqlbinlog binlog.000002 >> /tmp/statements.sql
shell> mysql -u root -p -e "source /tmp/statements.sql"
```
mysqlbinlog — Utility for Processing Binary Log Files

mysqlbinlog can produce output that reproduces a LOAD DATA operation without the original data file. mysqlbinlog copies the data to a temporary file and writes a LOAD DATA LOCAL statement that refers to the file. The default location of the directory where these files are written is system-specific. To specify a directory explicitly, use the --local-load option.

Because mysqlbinlog converts LOAD DATA statements to LOAD DATA LOCAL statements (that is, it adds LOCAL), both the client and the server that you use to process the statements must be configured with the LOCAL capability enabled. See Section 6.1.6, “Security Issues with LOAD DATA LOCAL”.

Warning

The temporary files created for LOAD DATA LOCAL statements are not automatically deleted because they are needed until you actually execute those statements. You should delete the temporary files yourself after you no longer need the statement log. The files can be found in the temporary file directory and have names like original_file_name-##.

4.6.8.1 mysqlbinlog Hex Dump Format

The --hexdump option causes mysqlbinlog to produce a hex dump of the binary log contents:

```shell
shell> mysqlbinlog --hexdump master-bin.000001
```

The hex output consists of comment lines beginning with #, so the output might look like this for the preceding command:

```sql
/*!40019 SET @@SESSION.max_insert_delayed_threads=0*/;
/*!50003 SET @OLD_COMPLETION_TYPE=@@COMPLETION_TYPE,COMPLETION_TYPE=0*/;
# at 4
#051024 17:24:13 server id 1  end_log_pos 98
# Position  Timestamp   Type   Master ID        Size      Master Pos    Flags
# 00000004 9d fc 5c 43   0f   01 00 00 00   5e 00 00 00   62 00 00 00   00 00
# 00000017 04 00 35 2e 30 2e 31 35  2d 64 65 62 75 67 2d 6c |..5.0.15.debug.l|
# 00000027 6f 67 00 00 00 00 00 00  00 00 00 00 00 00 00 00 |og..............|
# 00000037 00 00 00 00 00 00 00 00  00 00 00 00 00 00 00 00 |................|
# 00000047 00 00 00 00 9d fc 5c 43  13 38 0d 00 12 00 12 00 |.......C.8....|
#          Start: binlog v 4, server v 5.0.15-debug-log created 051024 17:24:13
#          at startup
ROLLBACK;
```

Hex dump output currently contains the elements in the following list. This format is subject to change. For more information about binary log format, see MySQL Internals: The Binary Log.

- **Position**: The byte position within the log file.
- **Timestamp**: The event timestamp. In the example shown, '9d fc 5c 43' is the representation of '051024 17:24:13' in hexadecimal.
- **Type**: The event type code.
- **Master ID**: The server ID of the master that created the event.
- **Size**: The size in bytes of the event.
- **Master Pos**: The position of the next event in the original master log file.
- **Flags**: Event flag values.

4.6.8.2 mysqlbinlog Row Event Display
mysqlbinlog — Utility for Processing Binary Log Files

The following examples illustrate how mysqlbinlog displays row events that specify data modifications. These correspond to events with the WRITE_ROWSEVENT, UPDATE_ROWS_EVENT, and DELETE_ROWS_EVENT type codes. The --base64-output=DECODE-ROWS and --verbose options may be used to affect row event output.

Suppose that the server is using row-based binary logging and that you execute the following sequence of statements:

```
CREATE TABLE t
(
  id   INT NOT NULL,
  name VARCHAR(20) NOT NULL,
  date DATE NULL
) ENGINE = InnoDB;

START TRANSACTION;
INSERT INTO t VALUES(1, 'apple', NULL);
UPDATE t SET name = 'pear', date = '2009-01-01' WHERE id = 1;
DELETE FROM t WHERE id = 1;
COMMIT;
```

By default, mysqlbinlog displays row events encoded as base-64 strings using BINLOG statements. Omitting extraneous lines, the output for the row events produced by the preceding statement sequence looks like this:

```
shell> mysqlbinlog log_file
...  
# at 218
#080828 15:03:08 server id 1  end_log_pos 258   Write_rows: table id 17 flags: STMT_END_F
BINLOG 'fAS3SBMBAAAALAAAANoAAAAAABEAAAAAAAAABHRlc3QAAXQAAwMPCgIUAAQ=
  fAS3SBcBAAAAAAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAIAI
mysqlbinlog — Utility for Processing Binary Log Files

/* */;

453
You can tell `mysqlbinlog` to suppress the `BINLOG` statements for row events by using the `--base64-output=DECODE-ROWS` option. This is similar to `--base64-output=NEVER` but does not exit with an error if a row event is found. The combination of `--base64-output=DECODE-ROWS` and `--verbose` provides a convenient way to see row events only as SQL statements:

```
shell> mysqlbinlog -v --base64-output=DECODE-ROWS log_file
```

The SQL statements produced by `--verbose` for row events are much more readable than the corresponding `BINLOG` statements. However, they do not correspond exactly to the original SQL statements that generated the events. The following limitations apply:

- The original column names are lost and replaced by `@N`, where `N` is a column number.
mysq1binlog — Utility for Processing Binary Log Files

• Character set information is not available in the binary log, which affects string column display:
  - There is no distinction made between corresponding binary and nonbinary string types (BINARY and CHAR, VARBINARY and VARCHAR, BLOB and TEXT). The output uses a data type of STRING for fixed-length strings and VARSTRING for variable-length strings.
  - For multibyte character sets, the maximum number of bytes per character is not present in the binary log, so the length for string types is displayed in bytes rather than in characters. For example, STRING(4) will be used as the data type for values from either of these column types:

```
| CHAR(4) CHARACTER SET latin1 |
| CHAR(2) CHARACTER SET ucs2 |
```

• Due to the storage format for events of type UPDATE_ROWS_EVENT, UPDATE statements are displayed with the WHERE clause preceding the SET clause.

Proper interpretation of row events requires the information from the format description event at the beginning of the binary log. Because mysq1binlog does not know in advance whether the rest of the log contains row events, by default it displays the format description event using a BINLOG statement in the initial part of the output.

If the binary log is known not to contain any events requiring a BINLOG statement (that is, no row events), the --base64-output=NEVER option can be used to prevent this header from being written.

4.6.8.3 Using mysq1binlog to Back Up Binary Log Files

By default, mysq1binlog reads binary log files and displays their contents in text format. This enables you to examine events within the files more easily and to re-execute them (for example, by using the output as input to mysql). mysq1binlog can read log files directly from the local file system, or, with the --read-from-remote-server option, it can connect to a server and request binary log contents from that server. mysq1binlog writes text output to its standard output, or to the file named as the value of the --result-file=file_name option if that option is given.

• mysq1binlog Backup Capabilities
• mysq1binlog Backup Options
• Static and Live Backups
• Output File Naming
• Example: mysqldump + mysq1binlog for Backup and Restore
• mysq1binlog Backup Restrictions

mysq1binlog Backup Capabilities

mysq1binlog can read binary log files and write new files containing the same content—that is, in binary format rather than text format. This capability enables you to easily back up a binary log in its original format. mysq1binlog can make a static backup, backing up a set of log files and stopping when the end of the last file is reached. It can also make a continuous (“live”) backup, staying connected to the server when it reaches the end of the last log file and continuing to copy new events as they are generated. In continuous-backup operation, mysq1binlog runs until the connection ends (for example, when the server exits) or mysq1binlog is forcibly terminated. When the connection ends, mysq1binlog does not wait and retry the connection, unlike a slave replication server. To continue a live backup after the server has been restarted, you must also restart mysq1binlog.
**mysqlbinlog — Utility for Processing Binary Log Files**

**mysqlbinlog Backup Options**

Binary log backup requires that you invoke `mysqlbinlog` with two options at minimum:

- The `--read-from-remote-server` (or `-R`) option tells `mysqlbinlog` to connect to a server and request its binary log. (This is similar to a slave replication server connecting to its master server.)
- The `--raw` option tells `mysqlbinlog` to write raw (binary) output, not text output.

Along with `--read-from-remote-server`, it is common to specify other options: `--host` indicates where the server is running, and you may also need to specify connection options such as `--user` and `--password`.

Several other options are useful in conjunction with `--raw`:

- `--stop-never`: Stay connected to the server after reaching the end of the last log file and continue to read new events.
- `--stop-never-slave-server-id=id`: The server ID that `mysqlbinlog` reports to the server when `--stop-never` is used. The default is 65535. This can be used to avoid a conflict with the ID of a slave server or another `mysqlbinlog` process. See Section 4.6.8.4, “Specifying the mysqlbinlog Server ID”.
- `--result-file`: A prefix for output file names, as described later.

**Static and Live Backups**

To back up a server’s binary log files with `mysqlbinlog`, you must specify file names that actually exist on the server. If you do not know the names, connect to the server and use the `SHOW BINARY LOGS` statement to see the current names. Suppose that the statement produces this output:

```
mysql> SHOW BINARY LOGS;
+---------------+-----------+
| Log_name      | File_size |
+---------------+-----------+
| binlog.000130 |     27459 |
| binlog.000131 |     13719 |
| binlog.000132 |     43268 |
+---------------+-----------+
```

With that information, you can use `mysqlbinlog` to back up the binary log to the current directory as follows (enter each command on a single line):

- To make a static backup of `binlog.000130` through `binlog.000132`, use either of these commands:

  ```
  mysqlbinlog --read-from-remote-server --host=host_name --raw
  binlog.000130 binlog.000131 binlog.000132
  mysqlbinlog --read-from-remote-server --host=host_name --raw
  --to-last-log binlog.000130
  ```

  The first command specifies every file name explicitly. The second names only the first file and uses `--to-last-log` to read through the last. A difference between these commands is that if the server happens to open `binlog.000133` before `mysqlbinlog` reaches the end of `binlog.000132`, the first command will not read it, but the second command will.

- To make a live backup in which `mysqlbinlog` starts with `binlog.000130` to copy existing log files, then stays connected to copy new events as the server generates them:
mysqlbinlog — Utility for Processing Binary Log Files

mysqlbinlog --read-from-remote-server --host=host_name --raw
--stop-never binlog.000130

With --stop-never, it is not necessary to specify --to-last-log to read to the last log file because that option is implied.

Output File Naming

Without --raw, mysqlbinlog produces text output and the --result-file option, if given, specifies the name of the single file to which all output is written. With --raw, mysqlbinlog writes one binary output file for each log file transferred from the server. By default, mysqlbinlog writes the files in the current directory with the same names as the original log files. To modify the output file names, use the --result-file option. In conjunction with --raw, the --result-file option value is treated as a prefix that modifies the output file names.

Suppose that a server currently has binary log files named binlog.000999 and up. If you use mysqlbinlog --raw to back up the files, the --result-file option produces output file names as shown in the following table. You can write the files to a specific directory by beginning the --result-file value with the directory path. If the --result-file value consists only of a directory name, the value must end with the pathname separator character. Output files are overwritten if they exist.

<table>
<thead>
<tr>
<th>--result-file Option</th>
<th>Output File Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>--result-file=x</td>
<td>xbinlog.000999 and up</td>
</tr>
<tr>
<td>--result-file=/tmp/</td>
<td>/tmp/binlog.000999 and up</td>
</tr>
<tr>
<td>--result-file=/tmp/x</td>
<td>/tmp/xbinlog.000999 and up</td>
</tr>
</tbody>
</table>

Example: mysqldump + mysqlbinlog for Backup and Restore

The following example describes a simple scenario that shows how to use mysqldump and mysqlbinlog together to back up a server's data and binary log, and how to use the backup to restore the server if data loss occurs. The example assumes that the server is running on host host_name and its first binary log file is named binlog.000999. Enter each command on a single line.

Use mysqlbinlog to make a continuous backup of the binary log:

mysqlbinlog --read-from-remote-server --host=host_name --raw
--stop-never binlog.000999

Use mysqldump to create a dump file as a snapshot of the server's data. Use --all-databases, --events, and --routines to back up all data, and --master-data=2 to include the current binary log coordinates in the dump file.

mysqldump --host=host_name --all-databases --events --routines --master-data=2> dump_file

Execute the mysqldump command periodically to create newer snapshots as desired.

If data loss occurs (for example, if the server crashes), use the most recent dump file to restore the data:

mysql --host=host_name -u root -p < dump_file

Then use the binary log backup to re-execute events that were written after the coordinates listed in the dump file. Suppose that the coordinates in the file look like this:

-- CHANGE MASTER TO MASTER_LOG_FILE='binlog.001002', MASTER_LOG_POS=27284;
If the most recent backed-up log file is named `binlog.001004`, re-execute the log events like this:

```shell
cat binlog.001004
| mysql --host=host_name -u root -p
```

You might find it easier to copy the backup files (dump file and binary log files) to the server host to make it easier to perform the restore operation, or if MySQL does not allow remote root access.

### mysqlbinlog Backup Restrictions

Binary log backups with `mysqlbinlog` are subject to these restrictions:

- `mysqlbinlog` does not automatically reconnect to the MySQL server if the connection is lost (for example, if a server restart occurs or there is a network outage).

- Prior to MySQL 5.6.37, `mysqlbinlog` does not get all events as they are committed, even if the server is configured with `sync_binlog=1`. This means that some of the most recent events may be missing. To ensure that `mysqlbinlog` sees the most recent events, flush the binary log on the server that you are backing up.

- The delay for a backup is similar to the delay for a replication slave.

### 4.6.8.4 Specifying the mysqlbinlog Server ID

When invoked with the `--read-from-remote-server` option, `mysqlbinlog` connects to a MySQL server, specifies a server ID to identify itself, and requests binary log files from the server. You can use `mysqlbinlog` to request log files from a server in several ways:

- Specify an explicitly named set of files: For each file, `mysqlbinlog` connects and issues a `Binlog dump` command. The server sends the file and disconnects. There is one connection per file.

- Specify the beginning file and `--to-last-log`: `mysqlbinlog` connects and issues a `Binlog dump` command for all files. The server sends all files and disconnects.

- Specify the beginning file and `--stop-never` (which implies `--to-last-log`): `mysqlbinlog` connects and issues a `Binlog dump` command for all files. The server sends all files, but does not disconnect after sending the last one.

With `--read-from-remote-server` only, `mysqlbinlog` connects using a server ID of 0, which tells the server to disconnect after sending the last requested log file.

With `--read-from-remote-server` and `--stop-never`, `mysqlbinlog` connects using a nonzero server ID, so the server does not disconnect after sending the last log file. The server ID is 65535 by default, but this can be changed with `--stop-never-slave-server-id`.

Thus, for the first two ways of requesting files, the server disconnects because `mysqlbinlog` specifies a server ID of 0. It does not disconnect if `--stop-never` is given because `mysqlbinlog` specifies a nonzero server ID.

### 4.6.9 mysqldumpslow — Summarize Slow Query Log Files

The MySQL slow query log contains information about queries that take a long time to execute (see Section 5.4.5, "The Slow Query Log"). `mysqldumpslow` parses MySQL slow query log files and summarizes their contents.

Normally, `mysqldumpslow` groups queries that are similar except for the particular values of number and string data values. It "abstracts" these values to `N` and `S` when displaying summary output. To modify value abstracting behavior, use the `-a` and `-n` options.
Invoke `mysqldumpslow` like this:

```shell
shell> mysqldumpslow [options] [log_file ...]
```

Example of usage:

```shell
shell> mysqldumpslow
Reading mysql slow query log from /usr/local/mysql/data/mysqld56-slow.log
Count: 1  Time=4.32s (4s)  Lock=0.00s (0s)  Rows=0.0 (0), root[root]@localhost
  insert into t2 select * from t1
Count: 3  Time=2.53s (7s)  Lock=0.00s (0s)  Rows=0.0 (0), root[root]@localhost
  insert into t2 select * from t1 limit N
Count: 3  Time=2.13s (6s)  Lock=0.00s (0s)  Rows=0.0 (0), root[root]@localhost
  insert into t1 select * from t1
```

`mysqldumpslow` supports the following options.

**Table 4.21 mysqldumpslow Options**

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-a</td>
<td>Do not abstract all numbers to N and strings to 'S'.</td>
</tr>
<tr>
<td>-n</td>
<td>Abstract numbers with at least the specified digits.</td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging information.</td>
</tr>
<tr>
<td>-g</td>
<td>Only consider statements that match the pattern.</td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit.</td>
</tr>
<tr>
<td>-h</td>
<td>Host name of the server in the log file name.</td>
</tr>
<tr>
<td>-i</td>
<td>Name of the server instance.</td>
</tr>
<tr>
<td>-l</td>
<td>Do not subtract lock time from total time.</td>
</tr>
<tr>
<td>-r</td>
<td>Reverse the sort order.</td>
</tr>
<tr>
<td>-s</td>
<td>How to sort output.</td>
</tr>
<tr>
<td>-t</td>
<td>Display only first num queries.</td>
</tr>
<tr>
<td>--verbose</td>
<td>Verbose mode.</td>
</tr>
</tbody>
</table>

- **--help**
  
  Display a help message and exit.

- **-a**
  
  Do not abstract all numbers to N and strings to 'S'.

- **--debug, -d**
  
  Run in debug mode.

- **-g pattern**
  
  Consider only queries that match the (grep-style) pattern.

- **-h host_name**
Host name of MySQL server for *-slow.log file name. The value can contain a wildcard. The default is *
(match all).

- **-i name**
  Name of server instance (if using mysql.server startup script).

- **-l**
  Do not subtract lock time from total time.

- **-n N**
  Abstract numbers with at least N digits within names.

- **-r**
  Reverse the sort order.

- **-s sort_type**
  How to sort the output. The value of sort_type should be chosen from the following list:
  - **t, at**: Sort by query time or average query time
  - **l, al**: Sort by lock time or average lock time
  - **r, ar**: Sort by rows sent or average rows sent
  - **c**: Sort by count
  By default, mysqldumpslow sorts by average query time (equivalent to -s at).

- **-t N**
  Display only the first N queries in the output.

- **--verbose, -v**
  Verbose mode. Print more information about what the program does.

### 4.6.10 mysqlhotcopy — A Database Backup Program

**Note**

This utility is deprecated in MySQL 5.6.20 and removed in MySQL 5.7

mysqlhotcopy is a Perl script that was originally written and contributed by Tim Bunce. It uses FLUSH TABLES, LOCK TABLES, and cp or scp to make a database backup. It is a fast way to make a backup of the database or single tables, but it can be run only on the same machine where the database directories are located. mysqlhotcopy works only for backing up MyISAM and ARCHIVE tables. It runs on Unix.

To use mysqlhotcopy, you must have read access to the files for the tables that you are backing up, the SELECT privilege for those tables, the RELOAD privilege (to be able to execute FLUSH TABLES), and the LOCK TABLES privilege (to be able to lock the tables).
mysqlhotcopy — A Database Backup Program

[Code]

shell> mysqlhotcopy db_name [/path/to/new_directory]

shell> mysqlhotcopy db_name_1 ... db_name_n /path/to/new_directory

Back up tables in the given database that match a regular expression:

shell> mysqlhotcopy db_name./regex/

The regular expression for the table name can be negated by prefixing it with a tilde (~):

shell> mysqlhotcopy db_name./~regex/

mysqlhotcopy supports the following options, which can be specified on the command line or in the [mysqlhotcopy] and [client] groups of an option file. For information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

Table 4.22 mysqlhotcopy Options

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--addtodest</td>
<td>Do not rename target directory (if it exists); merely add files to it</td>
</tr>
<tr>
<td>--allowold</td>
<td>Do not abort if a target exists; rename it by adding an _old suffix</td>
</tr>
<tr>
<td>--checkpoint</td>
<td>Insert checkpoint entries</td>
</tr>
<tr>
<td>--chroot</td>
<td>Base directory of the chroot jail in which mysqld operates</td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging log</td>
</tr>
<tr>
<td>--dryrun</td>
<td>Report actions without performing them</td>
</tr>
<tr>
<td>--flushlog</td>
<td>Flush logs after all tables are locked</td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
</tr>
<tr>
<td>--host</td>
<td>Host on which MySQL server is located</td>
</tr>
<tr>
<td>--keepold</td>
<td>Do not delete previous (renamed) target when done</td>
</tr>
<tr>
<td>--method</td>
<td>The method for copying files</td>
</tr>
<tr>
<td>--noidices</td>
<td>Do not include full index files in the backup</td>
</tr>
<tr>
<td>--old_server</td>
<td>Connect to server that does not support FLUSH TABLES tbl_list WITH READ LOCK</td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
</tr>
<tr>
<td>--port</td>
<td>TCP/IP port number for connection</td>
</tr>
<tr>
<td>--quiet</td>
<td>Be silent except for errors</td>
</tr>
<tr>
<td>--regexp</td>
<td>Copy all databases with names that match the given regular expression</td>
</tr>
<tr>
<td>--resetmaster</td>
<td>Reset the binary log after locking all the tables</td>
</tr>
<tr>
<td>--resetslave</td>
<td>Reset the master.info file after locking all the tables</td>
</tr>
<tr>
<td>--socket</td>
<td>Unix socket file or Windows named pipe to use</td>
</tr>
<tr>
<td>--tmpdir</td>
<td>The temporary directory</td>
</tr>
<tr>
<td>--user</td>
<td>MySQL user name to use when connecting to server</td>
</tr>
</tbody>
</table>

• --help, --?
Display a help message and exit.

- **--addtodest**
  Do not rename target directory (if it exists); merely add files to it.

- **--allowold**
  Do not abort if a target exists; rename it by adding an _old suffix.

- **--checkpoint=db_name.tbl_name**
  Insert checkpoint entries into the specified database **db_name** and table **tbl_name**.

- **--chroot=dir_name**
  Base directory of the chroot jail in which mysqld operates. The **dir_name** value should match that of the **--chroot** option given to mysqld.

- **--debug**
  Enable debug output.

- **--dryrun, -n**
  Report actions without performing them.

- **--flushlog**
  Flush logs after all tables are locked.

- **--host=host_name, -h host_name**
  The host name of the local host to use for making a TCP/IP connection to the local server. By default, the connection is made to localhost using a Unix socket file.

- **--keepold**
  Do not delete previous (renamed) target when done.

- **--method=command**
  The method for copying files (**cp** or **scp**). The default is **cp**.

- **--noindices**
  Do not include full index files for MyISAM tables in the backup. This makes the backup smaller and faster. The indexes for reloaded tables can be reconstructed later with **myisamchk -rq**.

- **--password=password, -p password**
  The password to use when connecting to the server. The password value is not optional for this option, unlike for other MySQL programs.

  Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

- **--port=port_num, -P port_num**
The TCP/IP port number to use when connecting to the local server.

- **--old_server**

In MySQL 5.6, `mysqlhotcopy` uses `FLUSH TABLES tbl_list WITH READ LOCK` to flush and lock tables. Use the `--old_server` option if the server is older than 5.5.3, which is when that statement was introduced.

- **--quiet, -q**

Be silent except for errors.

- **--record_log_pos=db_name.tbl_name**

Record master and slave status in the specified database `db_name` and table `tbl_name`.

- **--regexp=expr**

Copy all databases with names that match the given regular expression.

- **--resetmaster**

Reset the binary log after locking all the tables.

- **--resetslave**

Reset the master info repository file or table after locking all the tables.

- **--socket=path, -S path**

The Unix socket file to use for connections to `localhost`.

- **--suffix=str**

The suffix to use for names of copied databases.

- **--tmpdir=dir_name**

The temporary directory. The default is `/tmp`.

- **--user=user_name, -u user_name**

The MySQL user name to use when connecting to the server.

Use `perldoc` for additional `mysqlhotcopy` documentation, including information about the structure of the tables needed for the `--checkpoint` and `--record_log_pos` options:

```
shell> perldoc mysqlhotcopy
```

### 4.6.11 mysql_convert_table_format — Convert Tables to Use a Given Storage Engine

**Note**

This utility is deprecated in MySQL 5.6.17 and removed in MySQL 5.7
mysql_convert_table_format converts the tables in a database to use a particular storage engine (MyISAM by default). mysql_convert_table_format is written in Perl and requires that the DBI and DBD::mysql Perl modules be installed (see Section 2.13, “Perl Installation Notes”).

Invoke mysql_convert_table_format like this:

```
shell> mysql_convert_table_format [options] db_name
```

The `db_name` argument indicates the database containing the tables to be converted.

mysql_convert_table_format supports the options described in the following list.

- **--help**
  Display a help message and exit.

- **--force**
  Continue even if errors occur.

- **--host=host_name**
  Connect to the MySQL server on the given host.

- **--password=password**
  The password to use when connecting to the server. The password value is not optional for this option, unlike for other MySQL programs.

  Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

- **--port=port_num**
  The TCP/IP port number to use for the connection.

- **--socket=path**
  For connections to localhost, the Unix socket file to use.

- **--type=engine_name**
  Specify the storage engine that the tables should be converted to use. The default is MyISAM if this option is not given.

- **--user=user_name**
  The MySQL user name to use when connecting to the server.

- **--verbose**
  Verbose mode. Print more information about what the program does.

- **--version**
  Display version information and exit.
**mysql_fix_extensions** — Normalize Table File Name Extensions

**Note**
This utility is deprecated in MySQL 5.6.17 and removed in MySQL 5.7

`mysql_find_rows` reads files containing SQL statements and extracts statements that match a given regular expression or that contain `USE db_name` or `SET` statements. The utility expects statements to be terminated with semicolon (`;`) characters.

Invoke `mysql_find_rows` like this:

```
shell> mysql_find_rows [options] [file_name ...]
```

Each `file_name` argument should be the name of file containing SQL statements. If no file names are given, `mysql_find_rows` reads the standard input.

Examples:

```
mysql_find_rows --regexp=problem_table --rows=20 < update.log
mysql_find_rows --regexp=problem_table update-log.1 update-log.2
```

`mysql_find_rows` supports the following options:

- **--help, --Information**
  Display a help message and exit.

- **--regexp=pattern**
  Display queries that match the pattern.

- **--rows=N**
  Quit after displaying `N` queries.

- **--skip-use-db**
  Do not include `USE db_name` statements in the output.

- **--start_row=N**
  Start output from this row.

---

**mysql_fix_extensions** — Normalize Table File Name Extensions

**Note**
This utility is deprecated in MySQL 5.6.17 and removed in MySQL 5.7

`mysql_fix_extensions` converts the extensions for MyISAM (or ISAM) table files to their canonical forms. It looks for files with extensions matching any lettercase variant of `.frm`, `.myd`, `.myi`, `.isd`, and `.ism` and renames them to have extensions of `.frm`, `.MYD`, `.MYI`, `.ISD`, and `.ISM`, respectively. This can be useful after transferring the files from a system with case-insensitive file names (such as Windows) to a system with case-sensitive file names.

Invoke `mysql_fix_extensions` like this, where `data_dir` is the path name to the MySQL data directory.
mysql_setpermission  — Interactively Set Permissions in Grant Tables

Note
This utility is deprecated in MySQL 5.6.17 and removed in MySQL 5.7

mysql_setpermission is a Perl script that was originally written and contributed by Luuk de Boer. It interactively sets permissions in the MySQL grant tables. mysql_setpermission is written in Perl and requires that the DBI and DBD::mysql Perl modules be installed (see Section 2.13, “Perl Installation Notes”).

Invoke mysql_setpermission like this:

```
shell> mysql_setpermission [options]
```

`options` should be either `--help` to display the help message, or options that indicate how to connect to the MySQL server. The account used when you connect determines which permissions you have when attempting to modify existing permissions in the grant tables.

mysql_setpermissions also reads options from the [client] and [perl] groups in the .my.cnf file in your home directory, if the file exists.

mysql_setpermission supports the following options:

- `--help`
  Display a help message and exit.

- `--host=host_name`
  Connect to the MySQL server on the given host.

- `--password=password`
  The password to use when connecting to the server. The password value is not optional for this option, unlike for other MySQL programs.

  Specifying a password on the command line should be considered insecure. To avoid giving the password on the command line, use an option file. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

- `--port=port_num`
  The TCP/IP port number to use for the connection.

- `--socket=path`
  For connections to localhost, the Unix socket file to use.

- `--user=user_name`
  The MySQL user name to use when connecting to the server.
4.6.15 `mysql_waitpid` — Kill Process and Wait for Its Termination

`mysql_waitpid` signals a process to terminate and waits for the process to exit. It uses the `kill()` system call and Unix signals, so it runs on Unix and Unix-like systems.

This program is deprecated as of MySQL 5.6.19 and is removed in MySQL 5.7.

Invoke `mysql_waitpid` like this:

```
shell> mysql_waitpid [options] pid wait_time
```

`mysql_waitpid` sends signal 0 to the process identified by `pid` and waits up to `wait_time` seconds for the process to terminate. `pid` and `wait_time` must be positive integers.

If process termination occurs within the wait time or the process does not exist, `mysql_waitpid` returns 0. Otherwise, it returns 1.

If the `kill()` system call cannot handle signal 0, `mysql_waitpid()` uses signal 1 instead.

`mysql_waitpid` supports the following options:

- `--help`, `-?`, `-I`
  
  Display a help message and exit.

- `--verbose`, `-v`
  
  Verbos mode. Display a warning if signal 0 could not be used and signal 1 is used instead.

- `--version`, `-V`
  
  Display version information and exit.

4.6.16 `mysql_zap` — Kill Processes That Match a Pattern

`mysql_zap` kills processes that match a pattern. It uses the `ps` command and Unix signals, so it runs on Unix and Unix-like systems.

This program is deprecated as of MySQL 5.6.19 and is removed in MySQL 5.7.

Invoke `mysql_zap` like this:

```
shell> mysql_zap [-signal] [-?If] pattern
```

A process matches if its output line from the `ps` command contains the pattern. By default, `mysql_zap` asks for confirmation for each process. Respond `y` to kill the process, or `q` to exit `mysql_zap`. For any other response, `mysql_zap` does not attempt to kill the process.

If the `-signal` option is given, it specifies the name or number of the signal to send to each process. Otherwise, `mysql_zap` tries first with `TERM` (signal 15) and then with `KILL` (signal 9).

`mysql_zap` supports the following additional options:

- `--help`, `-?`, `-I`
  
  Display a help message and exit.
MySQL Program Development Utilities

• -f
  Force mode. mysql_zap attempts to kill each process without confirmation.

• -t
  Test mode. Display information about each process but do not kill it.

4.7 MySQL Program Development Utilities

This section describes some utilities that you may find useful when developing MySQL programs.

In shell scripts, you can use the `my_print_defaults` program to parse option files and see what options would be used by a given program. The following example shows the output that `my_print_defaults` might produce when asked to show the options found in the `[client]` and `[mysql]` groups:

```shell
shell> my_print_defaults client mysql
  --port=3306
  --socket=/tmp/mysql.sock
  --no-auto-rehash
```

Note

For developers: Option file handling is implemented in the C client library simply by processing all options in the appropriate group or groups before any command-line arguments. This works well for programs that use the last instance of an option that is specified multiple times. If you have a C or C++ program that handles multiply specified options this way but that doesn't read option files, you need add only two lines to give it that capability. Check the source code of any of the standard MySQL clients to see how to do this.

Several other language interfaces to MySQL are based on the C client library, and some of them provide a way to access option file contents. These include Perl and Python. For details, see the documentation for your preferred interface.

4.7.1 msql2mysql — Convert mSQL Programs for Use with MySQL

Note

This utility is deprecated in MySQL 5.6.17 and removed in MySQL 5.7

Initially, the MySQL C API was developed to be very similar to that for the mSQL database system. Because of this, mSQL programs often can be converted relatively easily for use with MySQL by changing the names of the C API functions.

The `msql2mysql` utility performs the conversion of mSQL C API function calls to their MySQL equivalents. `msql2mysql` converts the input file in place, so make a copy of the original before converting it. For example, use `msql2mysql` like this:

```shell
shell> cp client-prog.c client-prog.c.orig
shell> msql2mysql client-prog.c
client-prog.c converted
```

Then examine `client-prog.c` and make any post-conversion revisions that may be necessary.
mysql2mysql uses the replace utility to make the function name substitutions. See Section 4.8.2, "replace — A String-Replacement Utility".

4.7.2 mysql_config — Display Options for Compiling Clients

mysql_config provides you with useful information for compiling your MySQL client and connecting it to MySQL. It is a shell script, so it is available only on Unix and Unix-like systems.

mysql_config supports the following options.

• --cflags
  C Compiler flags to find include files and critical compiler flags and defines used when compiling the libmysqlclient library. The options returned are tied to the specific compiler that was used when the library was created and might clash with the settings for your own compiler. Use --include for more portable options that contain only include paths.

• --cxxflags
  Like --cflags, but for C++ compiler flags. This option was added in MySQL 5.6.4.

• --include
  Compiler options to find MySQL include files.

• --libmysqld-libs, --embedded-libs, --embedded
  Libraries and options required to link with libmysqld, the MySQL embedded server.

• --libs
  Libraries and options required to link with the MySQL client library.

• --libs_r
  Libraries and options required to link with the thread-safe MySQL client library. In MySQL 5.6, all client libraries are thread-safe, so this option need not be used. The --libs option can be used in all cases.

• --plugindir
  The default plugin directory path name, defined when configuring MySQL.

• --port
  The default TCP/IP port number, defined when configuring MySQL.

• --socket
  The default Unix socket file, defined when configuring MySQL.

• --variable=var_name
  Display the value of the named configuration variable. Permitted var_name values are pkgincludedir (the header file directory), pkglibdir (the library directory), and plugindir (the plugin directory).

• --version
  Version number for the MySQL distribution.
If you invoke `mysql_config` with no options, it displays a list of all options that it supports, and their values:

```shell
shell> mysql_config
Usage: /usr/local/mysql/bin/mysql_config [options]
Options:
--cflags         [I/usr/local/mysql/include/mysql -mcpu=pentiumpro]
--cxxflags       [I/usr/local/mysql/include/mysql -mcpu=pentiumpro]
--include        [I/usr/local/mysql/include/mysql]
--libs           [L/usr/local/mysql/lib/mysql -lmysqlclient
                  -lpthread -lssl -lcrypto -ldl]
--libs_r         [L/usr/local/mysql/lib/mysql -lmysqlclient_r
                  -lpthread -lssl -lcrypto -ldl]
--plugindir      [/usr/local/mysql/lib/plugin]
--socket         [/tmp/mysql.sock]
--port           [3306]
--version        [5.6.11]
--libmysqld-libs [L/usr/local/mysql/lib/mysql -lmysqld
                 -lpthread -lssl -lcrypto -ldl -lcrypt]
--variable=VAR   VAR is one of:
                 pkgincludedir [/usr/local/mysql/include]
                 pkglibdir     [/usr/local/mysql/lib]
                 plugindir     [/usr/local/mysql/lib/plugin]
```

You can use `mysql_config` within a command line using backticks to include the output that it produces for particular options. For example, to compile and link a MySQL client program, use `mysql_config` as follows:

```bash
gcc -c `mysql_config --cflags` progname.c
gcc -o progname progname.o `mysql_config --libs`
```

### 4.7.3 my_print_defaults — Display Options from Option Files

`my_print_defaults` displays the options that are present in option groups of option files. The output indicates what options will be used by programs that read the specified option groups. For example, the `mysqlcheck` program reads the `[mysqlcheck]` and `[client]` option groups. To see what options are present in those groups in the standard option files, invoke `my_print_defaults` like this:

```shell
shell> my_print_defaults mysqlcheck client
--user=myusername
--password=
--host=localhost
```

The output consists of options, one per line, in the form that they would be specified on the command line. `my_print_defaults` supports the following options.

- **--help, -?**
  Display a help message and exit.

- **--config-file=file_name, --defaults-file=file_name, -c file_name**
  Read only the given option file.

- **--debug=debug_options, -# debug_options**
  Write a debugging log. A typical `debug_options` string is `d:t:o,file_name`. The default is `d:t:o,/tmp/my_print_defaults.trace`.  

470
resolve_stack_dump — Resolve Numeric Stack Trace Dump to Symbols

- --defaults-extra-file=file_name, --extra-file=file_name, -e file_name
Read this option file after the global option file but (on Unix) before the user option file.
For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- --defaults-group-suffix=suffix, -g suffix
In addition to the groups named on the command line, read groups that have the given suffix.
For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- --login-path=name, -l name
Read options from the named login path in the .mylogin.cnf login path file. A “login path” is an option group containing options that specify which MySQL server to connect to and which account to authenticate as. To create or modify a login path file, use the mysql_config_editor utility. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”. This option was added in MySQL 5.6.6.
For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- --no-defaults, -n
Return an empty string.
For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- --show, -s
As of MySQL 5.6.25, my_print_defaults masks passwords by default. Use this option to display passwords in cleartext.

- --verbose, -v
Verbose mode. Print more information about what the program does.

- --version, -V
Display version information and exit.

4.7.4 resolve_stack_dump — Resolve Numeric Stack Trace Dump to Symbols

resolve_stack_dump resolves a numeric stack dump to symbols.

Invoke resolve_stack_dump like this:

```
shell> resolve_stack_dump [options] symbols_file [numeric_dump_file]
```

The symbols file should include the output from the nm --numeric-sort mysqld command. The numeric dump file should contain a numeric stack track from mysqld. If no numeric dump file is named on the command line, the stack trace is read from the standard input.
resolve_stack_dump supports the following options.

- **--help, -h**
  Display a help message and exit.

- **--numeric-dump-file=file_name, -n file_name**
  Read the stack trace from the given file.

- **--symbols-file=file_name, -s file_name**
  Use the given symbols file.

- **--version, -V**
  Display version information and exit.

For more information, see Section 24.5.1.5, “Using a Stack Trace”.

### 4.8 Miscellaneous Programs

#### 4.8.1 perror — Display MySQL Error Message Information

For most system errors, MySQL displays, in addition to an internal text message, the system error code in one of the following styles:

```plaintext
message ... (errno: #)
message ... (Errcode: #)
```

You can find out what the error code means by examining the documentation for your system or by using the `perror` utility.

`perror` prints a description for a system error code or for a storage engine (table handler) error code.

Invoke `perror` like this:

```
shell> perror [options] errorcode ...
```

Examples:

```
shell> perror 1231
MySQL error code 1231 (ER_WRONG_VALUE_FOR_VAR): Variable '%-.64s' can't be set to the value of '%-.200s'
```

```
shell> perror 13 64
OS error code 13:  Permission denied
OS error code 64:  Machine is not on the network
```

To obtain the error message for an NDB Cluster error code, invoke `perror` with the **--ndb** option:

```
shell> perror --ndb errorcode
```

The meaning of system error messages may be dependent on your operating system. A given error code may mean different things on different operating systems.

`perror` supports the following options.
replace — A String-Replacement Utility

- --help, --info, -I, -?
  Display a help message and exit.
- --ndb
  Print the error message for an NDB Cluster error code.
- --silent, -s
  Silent mode. Print only the error message.
- --verbose, -v
  Verbose mode. Print error code and message. This is the default behavior.
- --version, -V
  Display version information and exit.

4.8.2 replace — A String-Replacement Utility

The replace utility program changes strings in place in files or on the standard input.

Invoke replace in one of the following ways:

```
shell> replace from to [from to] ... -- file_name [file_name] ...
shell> replace from to [from to] ... < file_name
```

from represents a string to look for and to represents its replacement. There can be one or more pairs of strings.

Use the -- option to indicate where the string-replacement list ends and the file names begin. In this case, any file named on the command line is modified in place, so you may want to make a copy of the original before converting it. replace prints a message indicating which of the input files it actually modifies.

If the -- option is not given, replace reads the standard input and writes to the standard output.

replace uses a finite state machine to match longer strings first. It can be used to swap strings. For example, the following command swaps a and b in the given files, file1 and file2:

```
shell> replace a b b a -- file1 file2 ...
```

The replace program is used by msql2mysql. See Section 4.7.1, “msql2mysql — Convert mSQL Programs for Use with MySQL”.

replace supports the following options.

- ?, -I
  Display a help message and exit.
- #debug_options
  Enable debugging.
- -s
resolveip — Resolve Host name to IP Address or Vice Versa

Silent mode. Print less information what the program does.
- v

Verbose mode. Print more information about what the program does.
- V

Display version information and exit.

4.8.3 resolveip — Resolve Host name to IP Address or Vice Versa

The resolveip utility resolves host names to IP addresses and vice versa.

Invoke resolveip like this:

```
shell> resolveip [options] {host_name|ip-addr} ...
```

resolveip supports the following options.

- --help, --info, -, -?
  Display a help message and exit.

- --silent, -s
  Silent mode. Produce less output.

- --version, -V
  Display version information and exit.

4.9 MySQL Environment Variables

This section lists environment variables that are used directly or indirectly by MySQL. Most of these can also be found in other places in this manual.

Options on the command line take precedence over values specified in option files and environment variables, and values in option files take precedence over values in environment variables. In many cases, it is preferable to use an option file instead of environment variables to modify the behavior of MySQL. See Section 4.2.2.2, “Using Option Files”.

<table>
<thead>
<tr>
<th>Variable</th>

<td>The default user name on Windows when connecting to mysql.</td>
</tr>
</tbody>
</table>
For information about the `mysql` history file, see Section 4.5.1.3, “mysql Client Logging”.

`MYSQL_TEST_LOGIN_FILE` is the path name of the login path file (the file created by `mysql_config_editor`). If not set, the default value is `%APPDATA%\MySQL\.mylogin.cnf` directory on Windows and `$HOME/.mylogin.cnf` on non-Windows systems. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.

The default `UMASK` and `UMASK_DIR` values are 0660 and 0700, respectively. MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero. For example, setting `UMASK=0600` is equivalent to `UMASK=384` because 0600 octal is 384 decimal.

The `UMASK` and `UMASK_DIR` variables, despite their names, are used as modes, not masks:

- If `UMASK` is set, `mysqld` uses `($UMASK | 0600)` as the mode for file creation, so that newly created files have a mode in the range from 0600 to 0666 (all values octal).

- If `UMASK_DIR` is set, `mysqld` uses `($UMASK_DIR | 0700)` as the base mode for directory creation, which then is AND-ed with `~($UMASK & 0666)`, so that newly created directories have a mode in the range from 0700 to 0777 (all values octal). The AND operation may remove read and write permissions from the directory mode, but not execute permissions.

See also Section B.4.3.1, “Problems with File Permissions”. 

---

For information about the `mysql` history file, see Section 4.5.1.3, “mysql Client Logging”.

`MYSQL_TEST_LOGIN_FILE` is the path name of the login path file (the file created by `mysql_config_editor`). If not set, the default value is `%APPDATA%\MySQL\.mylogin.cnf` directory on Windows and `$HOME/.mylogin.cnf` on non-Windows systems. See Section 4.6.6, “mysql_config_editor — MySQL Configuration Utility”.

The default `UMASK` and `UMASK_DIR` values are 0660 and 0700, respectively. MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero. For example, setting `UMASK=0600` is equivalent to `UMASK=384` because 0600 octal is 384 decimal.

The `UMASK` and `UMASK_DIR` variables, despite their names, are used as modes, not masks:

- If `UMASK` is set, `mysqld` uses `($UMASK | 0600)` as the mode for file creation, so that newly created files have a mode in the range from 0600 to 0666 (all values octal).

- If `UMASK_DIR` is set, `mysqld` uses `($UMASK_DIR | 0700)` as the base mode for directory creation, which then is AND-ed with `~($UMASK & 0666)`, so that newly created directories have a mode in the range from 0700 to 0777 (all values octal). The AND operation may remove read and write permissions from the directory mode, but not execute permissions.

MySQL Server (mysql) is the main program that does most of the work in a MySQL installation. This chapter provides an overview of MySQL Server and covers general server administration:

- Server configuration
- The data directory, particularly the mysql system database
- The server log files
The MySQL Server

- Management of multiple servers on a single machine

For additional information on administrative topics, see also:

- Chapter 6, Security
- Section 14.8, “InnoDB Configuration”
- Chapter 7, Backup and Recovery
- Chapter 17, Replication
- Chapter 19, Partitioning

5.1 The MySQL Server

`mysqld` is the MySQL server. The following discussion covers these MySQL server configuration topics:

- Startup options that the server supports. You can specify these options on the command line, through configuration files, or both.
- Server system variables. These variables reflect the current state and values of the startup options, some of which can be modified while the server is running.
- Server status variables. These variables contain counters and statistics about runtime operation.
- How to set the server SQL mode. This setting modifies certain aspects of SQL syntax and semantics, for example for compatibility with code from other database systems, or to control the error handling for particular situations.
- Configuring and using IPv6 support.
- Configuring and using time zone support.
- Server-side help capabilities.
- The server shutdown process. There are performance and reliability considerations depending on the type of table (transactional or nontransactional) and whether you use replication.

**Note**

Not all storage engines are supported by all MySQL server binaries and configurations. To find out how to determine which storage engines your MySQL server installation supports, see Section 13.7.5.17, “SHOW ENGINES Syntax”.

5.1.1 Configuring the Server

The MySQL server, `mysqld`, has many command options and system variables that can be set at startup to configure its operation. To determine the default command option and system variable values used by the server, execute this command:

```
shell> mysqld --verbose --help
```

The command produces a list of all `mysqld` options and configurable system variables. Its output includes the default option and variable values and looks something like this:
Configuring the Server

<table>
<thead>
<tr>
<th>Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>abort-slave-event-count</td>
<td>0</td>
</tr>
<tr>
<td>allow-suspicious-udfs</td>
<td>FALSE</td>
</tr>
<tr>

<tr>
<td>updatable-views-with-limit</td>
<td>YES</td>
</tr>
<tr>
<td>verbose</td>
<td>TRUE</td>
</tr>
<tr>
<td>wait-timeout</td>
<td>28800</td>
</tr>
</tbody>
</table>

To see the current system variable values actually used by the server as it runs, connect to it and execute this statement:

```
mysql> SHOW VARIABLES;
```

To see some statistical and status indicators for a running server, execute this statement:

```
mysql> SHOW STATUS;
```

System variable and status information also is available using the `mysqladmin` command:

```
shell> mysqladmin variables
shell> mysqladmin extended-status
```

For a full description of all command options, system variables, and status variables, see these sections:

- Section 5.1.6, “Server Command Options”
- Section 5.1.7, “Server System Variables”
- Section 5.1.9, “Server Status Variables”

More detailed monitoring information is available from the Performance Schema; see Chapter 22, MySQL Performance Schema.

MySQL uses algorithms that are very scalable, so you can usually run with very little memory. However, normally better performance results from giving MySQL more memory.

When tuning a MySQL server, the two most important variables to configure are `key_buffer_size` and `table_open_cache`. You should first feel confident that you have these set appropriately before trying to change any other variables.

The following examples indicate some typical variable values for different runtime configurations.

- If you have at least 1-2GB of memory and many tables and want maximum performance with a moderate number of clients, use something like this:

```
shell> mysqld_safe --key_buffer_size=384M --table_open_cache=4000 \
```
**Server Configuration Defaults**

```bash
--sort_buffer_size=4M --read_buffer_size=1M &
```

- If you have only 256MB of memory and only a few tables, but you still do a lot of sorting, you can use something like this:

  ```bash
  shell> mysqld_safe --key_buffer_size=64M --sort_buffer_size=1M
  ```

  If there are very many simultaneous connections, swapping problems may occur unless `mysqld` has been configured to use very little memory for each connection. `mysqld` performs better if you have enough memory for all connections.

- With little memory and lots of connections, use something like this:

  ```bash
  shell> mysqld_safe --key_buffer_size=512K --sort_buffer_size=100K \n  --read_buffer_size=100K &
  ```

  Or even this:

  ```bash
  shell> mysqld_safe --key_buffer_size=512K --sort_buffer_size=16K \n  --table_open_cache=32 --read_buffer_size=8K \n  --net_buffer_length=1K &
  ```

  If you are performing `GROUP BY` or `ORDER BY` operations on tables that are much larger than your available memory, increase the value of `read_rnd_buffer_size` to speed up the reading of rows following sorting operations.

  You can make use of the example option files included with your MySQL distribution; see [Section 5.1.2, “Server Configuration Defaults”](#).

  If you specify an option on the command line for `mysqld` or `mysqld_safe`, it remains in effect only for that invocation of the server. To use the option every time the server runs, put it in an option file. See [Section 4.2.2.2, “Using Option Files”](#).

### 5.1.2 Server Configuration Defaults

The MySQL server has many operating parameters, which you can change at server startup using command-line options or configuration files (option files). It is also possible to change many parameters at runtime. For general instructions on setting parameters at startup or runtime, see [Section 5.1.6, “Server Command Options”](#), and [Section 5.1.7, “Server System Variables”](#).

### 5.1.2.1 Changes to Server Defaults

Beginning with MySQL 5.6.6, several MySQL Server parameter defaults differ from the defaults in previous releases. The motivation for these changes is to provide better out-of-box performance and to reduce the need for database administrators to change settings manually.

In some cases, a parameter has a different fixed default value. In other cases, the server autosizes a parameter at startup using a formula based on other related parameters or server host configuration, rather than using a fixed value. For example, the setting for `back_log` is its previous default of 50, adjusted up by an amount proportional to the value of `max_connections`. The idea behind autosizing is that when the server has information available to make a decision about a parameter setting likely to be better than a fixed default, it will.

The following table summarizes changes to defaults. The Version column indicates when each default changed. For variables that are autosized, the main variable description provides additional detail about...
the sizing algorithm. See Section 5.1.7, “Server System Variables”, and Section 14.14, “InnoDB Startup Options and System Variables”. Any of these default settings can be overridden by specifying an explicit value at server startup.

<td>0</td>
<td>Autosized using</td>
<td>5.6.8</td>
</tr>
<tr>
<td></td>
<td></td>
<td>max_connections</td>
<td></td>
</tr>
</tbody>
</table>

In MySQL 5.6.6, the default for `innodb_checksum_algorithm` was changed from `INNODB` to `CRC32`. For compatibility reasons, the default was returned in 5.6.7 to `INNODB`.

### 5.1.2.2 Using a Sample Default Server Configuration File

On Unix platforms, `mysql_install_db` creates a default option file named `my.cnf` in the base installation directory. This file is created from a template included in the distribution package named `my-default.cnf`. You can find the template in or under the base installation directory. When started using `mysqld_safe`, the server uses `my.cnf` file by default. If `my.cnf` already exists, `mysql_install_db` assumes it to be in use and writes a new file named `my-new.cnf` instead.

With one exception, the settings in the default option file are commented and have no effect. The exception is that the file changes the `sql_mode` system variable from its default of `NO_ENGINE_SUBSTITUTION` to also include `STRICT_TRANS_TABLES`:

```
sql_mode=NO_ENGINE_SUBSTITUTION,STRICT_TRANS_TABLES
```

This setting produces a server configuration that results in errors rather than warnings for bad data in operations that modify transactional tables. See Section 5.1.10, "Server SQL Modes".

The `my-default.cnf` template replaces the older sample option files formerly supplied with MySQL distributions (`my-small.cnf`, `my-medium.cnf`, `my-large.cnf`, and `my-huge.cnf`).

On Windows, MySQL Installer interacts with the user and creates a file named `my.ini` in the base installation directory as the default option file. If you install on Windows from a Zip archive, you can copy the `my-default.ini` template file in the base installation directory to `my.ini` and use the latter as the default option file.

**Note**

On Windows, the `.ini` or `.cnf` option file extension might not be displayed.

On any platform, after completing the installation process, you can edit the default option file at any time to modify the parameters used by the server. For example, to use a parameter setting in the file that is commented with a `#` character at the beginning of the line, remove the `#`, and modify the parameter value if necessary. To disable a To disable a setting, either add a `#` to the beginning of the line or remove it.

For additional information about option file format and syntax, see Section 4.2.2.2, "Using Option Files".
5.1.3 Server Option, System Variable, and Status Variable Reference

The following table lists all command-line options, system variables, and status variables applicable within `mysqld`.

The table lists command-line options (Cmd-line), options valid in configuration files (Option file), server system variables (System Var), and status variables (Status var) in one unified list, with an indication of where each option or variable is valid. If a server option set on the command line or in an option file differs from the name of the corresponding system variable, the variable name is noted immediately below the corresponding option. For system and status variables, the scope of the variable (Var Scope) is Global, Session, or both. Please see the corresponding item descriptions for details on setting and using the options and variables. Where appropriate, direct links to further information about the items are provided.

For a version of this table that is specific to NDB Cluster, see Section 18.3.2.5, “NDB Cluster mysqld Option and Variable Reference”.

Table 5.2 Command-Line Option, System Variable, and Status Variable Summary

### 5.1.4 Server System Variable Reference

The following table lists all system variables applicable within `mysqld`.

The table lists command-line options (Cmd-line), options valid in configuration files (Option file), server system variables (System Var), and status variables (Status var) in one unified list, with an indication of where each option or variable is valid. If a server option set on the command line or in an option file differs from the name of the corresponding system variable, the variable name is noted immediately below the corresponding option. The scope of the variable (Var Scope) is Global, Session, or both. Please see the corresponding item descriptions for details on setting and using the variables. Where appropriate, direct links to further information about the items are provided.

### Table 5.3 System Variable Summary

<table>
<thead>
<tr>
<th>Name</th>
<th>Cmd-Line</th>
<th>Option File</th>
<th>System Var</th>
<th>Status Var</th>
<th>Var Scope</th>
<th>Dynamic</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_log_buffer_size</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
<td>Global</td>

<td>Global</td>
<td>Yes</td>
</tr>
<tr>
<td>audit_log_current_session</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Both</td>
<td>No</td>
</tr>
</tbody>
</table>

**Notes:**

1. This option is dynamic, but only the server should set this information. You should not set the value of this variable manually.

**Notes:**

1. This option is dynamic, but only the server should set this information. You should not set the value of this variable manually.
## 5.1.5 Server Status Variable Reference

The following table lists all status variables applicable within `mysqld`.

The table lists each variable's data type and scope. The last column indicates whether the scope for each variable is Global, Session, or both. Please see the corresponding item descriptions for details on setting and using the variables. Where appropriate, direct links to further information about the items are provided.

### Table 5.4 Status Variable Summary

### 5.1.6 Server Command Options

When you start the `mysqld` server, you can specify program options using any of the methods described in Section 4.2.2, “Specifying Program Options”. The most common methods are to provide options in an option file or on the command line. However, in most cases it is desirable to make sure that the server uses the same options each time it runs. The best way to ensure this is to list them in an option file. See Section 4.2.2.2, “Using Option Files”. That section also describes option file format and syntax.

An embedded MySQL server usually reads options from the `[server]`, `[embedded]`, and `[xxxxx_SERVER]` groups, where `xxxxx` is the name of the application into which the server is embedded.

`mysqld` accepts many command options. For a brief summary, execute this command:

```
mysqld --help
```

To see the full list, use this command:

```
mysqld --verbose --help
```

Some of the items in the list are actually system variables that can be set at server startup. These can be displayed at runtime using the `SHOW VARIABLES` statement. Some items displayed by the preceding `mysqld` command do not appear in `SHOW VARIABLES` output; this is because they are options only and not system variables.
The following list shows some of the most common server options. Additional options are described in other sections:

- Options that affect security: See Section 6.1.4, “Security-Related mysqld Options and Variables”.
- SSL-related options: See Command Options for Encrypted Connections.
- Binary log control options: See Section 5.4.4, “The Binary Log”.
- Replication-related options: See Section 17.1.4, “Replication and Binary Logging Options and Variables”.
- Options for loading plugins such as pluggable storage engines: See Section 5.5.1, “Installing and Uninstalling Plugins”.
- Options specific to particular storage engines: See Section 14.14, “InnoDB Startup Options and System Variables” and Section 15.2.1, “MyISAM Startup Options”.

Some options control the size of buffers or caches. For a given buffer, the server might need to allocate internal data structures. These structures typically are allocated from the total memory allocated to the buffer, and the amount of space required might be platform dependent. This means that when you assign a value to an option that controls a buffer size, the amount of space actually available might differ from the value assigned. In some cases, the amount might be less than the value assigned. It is also possible that the server will adjust a value upward. For example, if you assign a value of 0 to an option for which the minimal value is 1024, the server will set the value to 1024.

Values for buffer sizes, lengths, and stack sizes are given in bytes unless otherwise specified.

Some options take file name values. Unless otherwise specified, the default file location is the data directory if the value is a relative path name. To specify the location explicitly, use an absolute path name. Suppose that the data directory is /var/mysql/data. If a file-valued option is given as a relative path name, it will be located under /var/mysql/data. If the value is an absolute path name, its location is as given by the path name.

You can also set the values of server system variables at server startup by using variable names as options. To assign a value to a server system variable, use an option of the form --var_name=value. For example, --key_buffer_size=32M sets the key_buffer_size variable to a value of 32MB.

When you assign a value to a variable, MySQL might automatically correct the value to stay within a given range, or adjust the value to the closest permissible value if only certain values are permitted.

To restrict the maximum value to which a system variable can be set at runtime with the SET statement, specify this maximum by using an option of the form --maximum-var_name=value at server startup.

You can change the values of most system variables at runtime with the SET statement. See Section 13.7.4.1, “SET Syntax for Variable Assignment”.

Section 5.1.7, “Server System Variables”, provides a full description for all variables, and additional information for setting them at server startup and runtime. For information on changing system variables, see Section 5.1.1, “Configuring the Server”.

- --help, -?

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--help</td>
</tr>
</tbody>
</table>

Display a short help message and exit. Use both the --verbose and --help options to see the full message.
• **--allow-suspicious-udfs**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--allow-suspicious-udfs={OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

This option controls whether user-defined functions that have only an xxx symbol for the main function can be loaded. By default, the option is off and only UDFs that have at least one auxiliary symbol can be loaded; this prevents attempts at loading functions from shared object files other than those containing legitimate UDFs. See [UDF Security Precautions](#).

• **--ansi**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--ansi</td>
</tr>
</tbody>
</table>

Use standard (ANSI) SQL syntax instead of MySQL syntax. For more precise control over the server SQL mode, use the **--sql-mode** option instead. See [Section 1.7, “MySQL Standards Compliance”](#), and [Section 5.1.10, “Server SQL Modes”](#).

• **--basedir=dir_name, -b dir_name**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--basedir=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>basedir</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
<tr>
<td>Default Value</td>
<td>configuration-dependent default</td>
</tr>
</tbody>
</table>

The path to the MySQL installation directory. This option sets the basedir system variable.

• **--bind-address=addr**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--bind-address=addr</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.1</td>
</tr>
<tr>
<td>System Variable</td>
<td>bind_address</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value (&gt;= 5.6.6)</td>
<td>*</td>
</tr>
<tr>
<td>Default Value (&lt;= 5.6.5)</td>
<td>0.0.0.0</td>
</tr>
</tbody>
</table>

This option was removed in MySQL 5.6.1. Use the bind_address system variable instead.

• **--bootstrap**
This option is used by the `mysql_install_db` program to create the MySQL privilege tables without having to start a full MySQL server.

Replication and global transaction identifiers are automatically disabled whenever this option is used (Bug #13992602). See Section 17.1.3, “Replication with Global Transaction Identifiers”.

When the server operates in bootstrap mode, some functionality is unavailable that limits the statements permitted in any file named by the `init_file` system variable. For more information, see the description of that variable.

- **--character-set-client-handshake**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--character-set-client-handshake[={OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

Do not ignore character set information sent by the client. To ignore client information and use the default server character set, use `--skip-character-set-client-handshake`; this makes MySQL behave like MySQL 4.0.

- **--chroot=dir_name, -r dir_name**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--chroot=dir_name</code></td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
</tbody>
</table>

Put the `mysqld` server in a closed environment during startup by using the `chroot()` system call. This is a recommended security measure.

Note

Use of this option somewhat limits `LOAD DATA` and `SELECT ... INTO OUTFILE`.

- **--console**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--console</code></td>
</tr>
<tr>
<td>Platform Specific</td>
<td>Windows</td>
</tr>
</tbody>
</table>

(Windows only.) Write error log messages to `stderr` and `stdout` (the console). `mysqld` does not close the console window if this option is used.

`--log-error` takes precedence over `--console` if both are given.

- **--core-file**
Server Command Options

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--core-file[={OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Write a core file if `mysqld` dies. The name and location of the core file is system dependent. On Linux, a core file named `core.pid` is written to the current working directory of the process, which for `mysqld` is the data directory. `pid` represents the process ID of the server process. On macOS, a core file named `core.pid` is written to the `/cores` directory. On Solaris, use the `coreadm` command to specify where to write the core file and how to name it.

For some systems, to get a core file you must also specify the `--core-file-size` option to `mysqld_safe`. See Section 4.3.2, “mysqld_safe — MySQL Server Startup Script”. On some systems, such as Solaris, you do not get a core file if you are also using the `--user` option. There might be additional restrictions or limitations. For example, it might be necessary to execute `ulimit -c unlimited` before starting the server. Consult your system documentation.

- `--datadir=dir_name, -h dir_name`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--datadir=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>datadir</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
</tbody>
</table>

The path to the MySQL server data directory. This option sets the `datadir` system variable. See the description of that variable.

- `--debug[=debug_options], -# [debug_options]`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--debug[=debug_options]</td>
</tr>
<tr>
<td>System Variable</td>
<td>debug</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value (Windows)</td>
<td>d:t:i:O,\mysqld.trace</td>
</tr>
<tr>
<td>Default Value (Unix)</td>
<td>d:t:i:o,/tmp/mysqld.trace</td>
</tr>
</tbody>
</table>

If MySQL is configured with the `-DWITH_DEBUG=1` CMake option, you can use this option to get a trace file of what `mysqld` is doing. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:i:o,/tmp/mysqld.trace` on Unix and `d:t:i:o,\mysqld.trace` on Windows.

Using `-DWITH_DEBUG=1` to configure MySQL with debugging support enables you to use the `--debug="d,parser_debug"` option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server's standard error output. Typically, this output is written to the error log.
This option may be given multiple times. Values that begin with + or – are added to or subtracted from the previous value. For example, --debug=T --debug=+P sets the value to P:T.

For more information, see Section 24.5.3, “The DEBUG Package”.

• --debug-sync-timeout[=N]

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--debug-sync-timeout[=#]</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>

Controls whether the Debug Sync facility for testing and debugging is enabled. Use of Debug Sync requires that MySQL be configured with the --DISABLE_DEBUG_SYNC=1 CMake option (see Section 2.9.7, “MySQL Source-Configuration Options”). If Debug Sync is not compiled in, this option is not available. The option value is a timeout in seconds. The default value is 0, which disables Debug Sync. To enable it, specify a value greater than 0; this value also becomes the default timeout for individual synchronization points. If the option is given without a value, the timeout is set to 300 seconds.

For a description of the Debug Sync facility and how to use synchronization points, see MySQL Internals: Test Synchronization.

• --default-authentication-plugin=plugin_name

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--default-authentication-plugin=plugin_name</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.6</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>mysql_native_password</td>
</tr>
<tr>
<td>Valid Values</td>
<td>mysql_native_password, sha256_password</td>
</tr>
</tbody>
</table>

This option sets the default authentication plugin. These values are permitted:

• mysql_native_password: Use MySQL native passwords; see Section 6.4.1.1, “Native Pluggable Authentication”.

• sha256_password: Use SHA-256 passwords; see Section 6.4.1.4, “SHA-256 Pluggable Authentication”.

**Note**

Prior to MySQL 5.6.17, if you use this option to change the default authentication plugin to a value other than mysql_native_password, clients older than MySQL 5.5.7 cannot connect because they do not understand the resulting change to the authentication protocol.

In MySQL 5.6, there is no server system variable that corresponds to the --default-authentication-plugin option; to read the value set for this option, you must check the running MySQL Server process to see what options, if any, were employed when invoking mysqld (on Linux systems, you can do this with ps ax | grep mysqld or similar), and possibly the server options file as well. This is a known issue which is resolved in MySQL 5.7. (Bug #68858, Bug #16595944)
The `--default-authentication-plugin` value affects these aspects of server operation:

- It determines which authentication plugin the server assigns to new accounts created by `CREATE USER` and `GRANT` statements that do not explicitly specify an authentication plugin.

- The `old_passwords` system variable affects password hashing for accounts that use the `mysql_native_password` or `sha256_password` authentication plugin. If the default authentication plugin is one of those plugins, the server sets `old_passwords` at startup to the value required by the plugin password hashing method.

- For an account created with either of the following statements, the server associates the account with the default authentication plugin and assigns the account the given password, hashed as required by that plugin:

  ```
  CREATE USER ... IDENTIFIED BY 'cleartext password';
  GRANT ... IDENTIFIED BY 'cleartext password';
  ```

- For an account created with either of the following statements, the server associates the account with the default authentication plugin and assigns the account the given password hash, if the password hash has the format required by the plugin:

  ```
  CREATE USER ... IDENTIFIED BY PASSWORD 'encrypted password';
  GRANT ... IDENTIFIED BY PASSWORD 'encrypted password';
  ```

  If the password hash is not in the format required by the default authentication plugin, the statement fails.

- `--default-time-zone=timezone`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--default-time-zone=name</code></td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

  Set the default server time zone. This option sets the global `time_zone` system variable. If this option is not given, the default time zone is the same as the system time zone (given by the value of the `system_time_zone` system variable.

- `--defaults-extra-file=file_name`

  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name. This must be the first option on the command line if it is used.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- `--defaults-file=file_name`

  Read only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.
**Note**

This must be the first option on the command line if it is used, except that if the server is started with the `--defaults-file` and `--install` (or `--install-manual`) options, `--install` (or `--install-manual`) must be first.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- `--defaults-group-suffix=str`

  Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysqld` normally reads the `[mysqld]` group. If the `--defaults-group-suffix=_other` option is given, `mysqld` also reads the `[mysqld_other]` group.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- `--des-key-file=file_name`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--des-key-file=file_name</code></td>
</tr>
</tbody>
</table>

  Read the default DES keys from this file. These keys are used by the `DES_ENCRYPT()` and `DES_DECRYPT()` functions.

- `--exit-info[=flags],-T [flags]`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--exit-info[=flags]</code></td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>

  This is a bitmask of different flags that you can use for debugging the `mysqld` server. Do not use this option unless you know *exactly* what it does!

- `--external-locking`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--external-locking[]={OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

  Enable external locking (system locking), which is disabled by default. If you use this option on a system on which `lockd` does not fully work (such as Linux), it is easy for `mysqld` to deadlock.

  To disable external locking explicitly, use `--skip-external-locking`.

  External locking affects only `MyISAM` table access. For more information, including conditions under which it can and cannot be used, see Section 8.11.5, “External Locking”.

- `--flush`
### Server Command Options

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td>`--flush=[{OFF</td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>flush</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Boolean</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>OFF</td>
</tr>
</tbody>
</table>

Flush (synchronize) all changes to disk after each SQL statement. Normally, MySQL does a write of all changes to disk only after each SQL statement and lets the operating system handle the synchronizing to disk. See Section B.4.3.3, “What to Do If MySQL Keeps Crashing”.

**Note**

If `--flush` is specified, the value of `flush_time` does not matter and changes to `flush_time` have no effect on flush behavior.

- `--gdb`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td>`--gdb=[{OFF</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Boolean</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>OFF</td>
</tr>
</tbody>
</table>

Install an interrupt handler for SIGINT (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling. See Section 24.5, “Debugging and Porting MySQL”.

- `--ignore-db-dir=dir_name`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--ignore-db-dir=dir_name</code></td>
</tr>
<tr>
<td><strong>Introduced</strong></td>
<td>5.6.3</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Directory name</td>
</tr>
</tbody>
</table>

This option tells the server to ignore the given directory name for purposes of the `SHOW DATABASES` statement or `INFORMATION_SCHEMA` tables. For example, if a MySQL configuration locates the data directory at the root of a file system on Unix, the system might create a `lost+found` directory there that the server should ignore. Starting the server with `--ignore-db-dir=lost+found` causes that name not to be listed as a database.

To specify more than one name, use this option multiple times, once for each name. Specifying the option with an empty value (that is, as `--ignore-db-dir=`) resets the directory list to the empty list.

Instances of this option given at server startup are used to set the `ignore_db_dirs` system variable.

- `--innodb-xxx`

Set an option for the InnoDB storage engine. The InnoDB options are listed in Section 14.14, “InnoDB Startup Options and System Variables”.

---

555
Server Command Options

- **--install [service_name]**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--install [service_name]</td>
</tr>
<tr>
<td>Platform Specific</td>
<td>Windows</td>
</tr>
</tbody>
</table>

(Windows only) Install the server as a Windows service that starts automatically during Windows startup. The default service name is `MySQL` if no `service_name` value is given. For more information, see Section 2.3.4.7, “Starting MySQL as a Windows Service”.

**Note**

If the server is started with the `--defaults-file` and `--install` options, `--install` must be first.

- **--install-manual [service_name]**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--install-manual [service_name]</td>
</tr>
<tr>
<td>Platform Specific</td>
<td>Windows</td>
</tr>
</tbody>
</table>

(Windows only) Install the server as a Windows service that must be started manually. It does not start automatically during Windows startup. The default service name is `MySQL` if no `service_name` value is given. For more information, see Section 2.3.4.7, “Starting MySQL as a Windows Service”.

**Note**

If the server is started with the `--defaults-file` and `--install-manual` options, `--install-manual` must be first.

- **--language=lang_name, -L lang_name**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--language=name</td>
</tr>
<tr>
<td>Deprecated</td>
<td>5.6.1; use <code>lc-messages-dir</code> instead</td>
</tr>
<tr>
<td>System Variable</td>
<td>language</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>/usr/local/mysql/share/mysql/english/</code></td>
</tr>
</tbody>
</table>

The language to use for error messages. `lang_name` can be given as the language name or as the full path name to the directory where the language files are installed. See Section 10.12, “Setting the Error Message Language”.

`--lc-messages-dir` and `--lc-messages` should be used rather than `--language`, which is deprecated and handled as an alias for `--lc-messages-dir`. The `--language` option will be removed in a future MySQL release.

- **--large-pages**
Some hardware/operating system architectures support memory pages greater than the default (usually 4KB). The actual implementation of this support depends on the underlying hardware and operating system. Applications that perform a lot of memory accesses may obtain performance improvements by using large pages due to reduced Translation Lookaside Buffer (TLB) misses.

MySQL supports the Linux implementation of large page support (which is called HugeTLB in Linux). See Section 8.12.4.2, “Enabling Large Page Support”. For Solaris support of large pages, see the description of the --super-large-pages option.

--large-pages is disabled by default.

- --lc-messages=locale_name

The locale to use for error messages. The default is en_US. The server converts the argument to a language name and combines it with the value of --lc-messages-dir to produce the location for the error message file. See Section 10.12, “Setting the Error Message Language”.

- --lc-messages-dir=dir_name

The directory where error messages are located. The server uses the value together with the value of --lc-messages to produce the location for the error message file. See Section 10.12, “Setting the Error Message Language”.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--large-pages=[{OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td>large_pages</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Platform Specific</td>
<td>Linux</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--lc-messages=name</td>
</tr>
<tr>
<td>System Variable</td>
<td>lc_messages</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td>en_US</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--lc-messages-dir=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>lc_messages_dir</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
</tbody>
</table>
• **--local-service**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--local-service</code></td>
</tr>
</tbody>
</table>

(Windows only) A **--local-service** option following the service name causes the server to run using the `LocalService` Windows account that has limited system privileges. If both **--defaults-file** and **--local-service** are given following the service name, they can be in any order. See Section 2.3.4.7, “Starting MySQL as a Windows Service”.

• **--log[=file_name], -l [file_name]**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--log[=file_name]</code></td>
</tr>
<tr>
<td>Deprecated</td>
<td>Yes (removed in 5.6.1); use <code>general_log</code> instead</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>log</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>

The **--log** option was removed in MySQL 5.6.1 (along with the `log` system variable). Instead, use the `general_log` system variable to enable the general query log and the `general_log_file` system variable to set the general query log file name.

• **--log-error[=file_name]**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--log-error[=file_name]</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>log_error</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>

Write the error log and startup messages to this file. See Section 5.4.2, “The Error Log”.

If the option names no file, the error log file name on Unix and Unix-like systems is `host_name.err` in the data directory. The file name on Windows is the same, unless the **--pid-file** option is specified. In that case, the file name is the PID file base name with a suffix of `.err` in the data directory.

If the option names a file, the error log file has that name (with an `.err` suffix added if the name has no suffix), located under the data directory unless an absolute path name is given to specify a different location.

On Windows, **--log-error** takes precedence over **--console** if both are given.

• **--log-isam[=file_name]**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--log-isam[=file_name]</code></td>
</tr>
<tr>
<td>Property</td>
<td>Value</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>

Log all **MyISAM** changes to this file (used only when debugging **MyISAM**).

- **--log-raw**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--log-raw=[{OFF</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.3</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Passwords in certain statements written to the general query log, slow query log, and binary log are rewritten by the server not to occur literally in plain text. Password rewriting can be suppressed for the general query log by starting the server with the **--log-raw** option. This option may be useful for diagnostic purposes, to see the exact text of statements as received by the server, but for security reasons is not recommended for production use.

- **--log-short-format**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--log-short-format=[{OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Log less information to the slow query log, if it has been activated.

- **--log-slow-admin-statements**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--log-slow-admin-statements=[{OFF</td>
</tr>
<tr>
<td>Removed</td>
<td>5.6.11</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Include slow administrative statements in the statements written to the slow query log. Administrative statements include **ALTER TABLE, ANALYZE TABLE, CHECK TABLE, CREATE INDEX, DROP INDEX, OPTIMIZE TABLE, and REPAIR TABLE**.

This command-line option was removed in MySQL 5.6.11 and replaced by the `log_slow_admin_statements` system variable. The system variable can be set on the command line or in option files the same way as the option, so there is no need for any changes at server startup, but the system variable also makes it possible to examine or set the value at runtime.

- **--log-tc=file_name**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--log-tc=file_name</code></td>
</tr>
</tbody>
</table>

The name of the memory-mapped transaction coordinator log file (for XA transactions that affect multiple storage engines when the binary log is disabled). The default name is `tc.log`. The file is created under the data directory if not given as a full path name. This option is unused.

- `--log-tc-size=size`

The size in bytes of the memory-mapped transaction coordinator log. The default size is 24kB.

- `--log-warnings[=level], -W [level]`

Print out warnings such as Aborted connection... to the error log. This option is enabled (1) by default. To disable it, use `--log-warnings=0`. Specifying the option without a `level` value increments the current value by 1. Enabling this option by setting it greater than 0 is recommended, for example, if you use replication (you get more information about what is happening, such as messages about network failures and reconnections). If the value is greater than 1, aborted connections are written to the error log, and access-denied errors for new connection attempts are written. See Section B.4.2.11, “Communication Errors and Aborted Connections”.

If a slave server was started with `--log-warnings` enabled, the slave prints messages to the error log to provide information about its status, such as the binary log and relay log coordinates where it starts its job, when it is switching to another relay log, when it reconnects after a disconnect, and so forth.
The server logs messages about statements that are unsafe for statement-based logging if `--log-warnings` is greater than 0.

- `--memlock`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--memlock[{OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Lock the `mysql` process in memory. This option might help if you have a problem where the operating system is causing `mysql` to swap to disk.

`--memlock` works on systems that support the `mlockall()` system call; this includes Solaris, most Linux distributions that use a 2.4 or higher kernel, and perhaps other Unix systems. On Linux systems, you can tell whether or not `mlockall()` (and thus this option) is supported by checking to see whether or not it is defined in the system `mman.h` file, like this:

```
shell> grep mlockall /usr/include/sys/mman.h
```

If `mlockall()` is supported, you should see in the output of the previous command something like the following:

```
extern int mlockall (int __flags) __THROW;
```

**Important**

Use of this option may require you to run the server as `root`, which, for reasons of security, is normally not a good idea. See Section 6.1.5, “How to Run MySQL as a Normal User”.

On Linux and perhaps other systems, you can avoid the need to run the server as `root` by changing the `limits.conf` file. See the notes regarding the memlock limit in Section 8.12.4.2, “Enabling Large Page Support”.

You must not try to use this option on a system that does not support the `mlockall()` system call; if you do so, `mysql` will very likely crash as soon as you try to start it.

- `--myisam-block-size=N`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--myisam-block-size=#</code></td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1024</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>16384</td>
</tr>
</tbody>
</table>

The block size to be used for MyISAM index pages.

- `--no-defaults`
Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read. This must be the first option on the command line if it is used.

For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--old-style-user-limits**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--old-style-user-limits[={OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Enable old-style user limits. (Before MySQL 5.0.3, account resource limits were counted separately for each host from which a user connected rather than per account row in the `user` table.) See Section 6.2.13, “Setting Account Resource Limits”.

- **--one-thread**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--one-thread</code></td>
</tr>
<tr>
<td>Removed</td>
<td>5.6.1</td>
</tr>
</tbody>
</table>

This option was removed in MySQL 5.6.1. Use `--thread_handling=no-threads` instead.

- **--partition[=value]**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--partition[={OFF</td>
</tr>
<tr>
<td>Disabled by</td>
<td><code>skip-partition</code></td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

Enables or disables user-defined partitioning support in the MySQL Server.

- **--performance-schema-xxx**

Configure a Performance Schema option. For details, see Section 22.14, “Performance Schema Command Options”.

- **--plugin-load=plugin_list**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--plugin-load=plugin_list</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>plugin_load</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>
Server Command Options

This option tells the server to load the named plugins at startup. If multiple `--plugin-load` options are given, only the last one is used. Additional plugins to load may be specified using `--plugin-load-add` options.

The option value is a semicolon-separated list of `name=plugin_library` and `plugin_library` values. Each `name` is the name of a plugin to load, and `plugin_library` is the name of the library file that contains the plugin code. If a plugin library is named without any preceding plugin name, the server loads all plugins in the library. The server looks for plugin library files in the directory named by the `plugin_dir` system variable.

For example, if plugins named `myplug1` and `myplug2` have library files `myplug1.so` and `myplug2.so`, use this option to perform an early plugin load:

```
shell> mysqld --plugin-load="myplug1=myplug1.so;myplug2=myplug2.so"
```

Quotes are used around the argument value here because otherwise semicolon (;) is interpreted as a special character by some command interpreters. (Unix shells treat it as a command terminator, for example.)

Each named plugin is loaded for a single invocation of `mysqld` only. After a restart, the plugin is not loaded unless `--plugin-load` is used again. This is in contrast to `INSTALL PLUGIN`, which adds an entry to the `mysql.plugins` table to cause the plugin to be loaded for every normal server startup.

Under normal startup, the server determines which plugins to load by reading the `mysql.plugins` system table. If the server is started with the `--skip-grant-tables` option, it does not consult the `mysql.plugins` table and does not load plugins listed there. `--plugin-load` enables plugins to be loaded even when `--skip-grant-tables` is given. `--plugin-load` also enables plugins to be loaded at startup that cannot be loaded at runtime.

For additional information about plugin loading, see Section 5.5.1, “Installing and Uninstalling Plugins”.

- `--plugin-load-add=plugin_list`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--plugin-load-add=plugin_list</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.3</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>plugin_load_add</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

This option complements the `--plugin-load` option. `--plugin-load-add` adds a plugin or plugins to the set of plugins to be loaded at startup. The argument format is the same as for `--plugin-load`. `--plugin-load-add` can be used to avoid specifying a large set of plugins as a single long unwieldy `--plugin-load` argument.

`--plugin-load-add` can be given in the absence of `--plugin-load`, but any instance of `--plugin-load-add` that appears before `--plugin-load` has no effect because `--plugin-load` resets the set of plugins to load. In other words, these options:

```
--plugin-load=x --plugin-load-add=y
```
are equivalent to this option:

```
--plugin-load="x;y"
```

But these options:

```
--plugin-load-add=y --plugin-load=x
```

are equivalent to this option:

```
--plugin-load=x
```

For additional information about plugin loading, see Section 5.5.1, “Installing and Uninstalling Plugins”.

- `--plugin-xxx`

Specifies an option that pertains to a server plugin. For example, many storage engines can be built as plugins, and for such engines, options for them can be specified with a `--plugin` prefix. Thus, the `--innodb-file-per-table` option for InnoDB can be specified as `--plugin-innodb-file-per-table`.

For boolean options that can be enabled or disabled, the `--skip` prefix and other alternative formats are supported as well (see Section 4.2.2.4, “Program Option Modifiers”). For example, `--skip-plugin-innodb-file-per-table` disables `innodb-file-per-table`.

The rationale for the `--plugin` prefix is that it enables plugin options to be specified unambiguously if there is a name conflict with a built-in server option. For example, were a plugin writer to name a plugin “sql” and implement a “mode” option, the option name might be `--sql-mode`, which would conflict with the built-in option of the same name. In such cases, references to the conflicting name are resolved in favor of the built-in option. To avoid the ambiguity, users can specify the plugin option as `--plugin-sql-mode`. Use of the `--plugin` prefix for plugin options is recommended to avoid any question of ambiguity.

- `--port=port_num, -P port_num`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--port=port_num</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>port</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>3306</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>65535</td>
</tr>
</tbody>
</table>

The port number to use when listening for TCP/IP connections. On Unix and Unix-like systems, the port number must be 1024 or higher unless the server is started by the `root` operating system user. Setting this option to 0 causes the default value to be used.

- `--port-open-timeout=num`
Server Command Options

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--port-open-timeout=#</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
</tbody>
</table>

On some systems, when the server is stopped, the TCP/IP port might not become available immediately. If the server is restarted quickly afterward, its attempt to reopen the port can fail. This option indicates how many seconds the server should wait for the TCP/IP port to become free if it cannot be opened. The default is not to wait.

- **--print-defaults**

  Print the program name and all options that it gets from option files. This must be the first option on the command line if it is used, except that it may be used immediately after --defaults-file or --defaults-extra-file.

  For additional information about this and other option-file options, see Section 4.2.2.3, “Command-Line Options that Affect Option-File Handling”.

- **--remove [service_name]**

  (Windows only) Remove a MySQL Windows service. The default service name is MySQL if no service_name value is given. For more information, see Section 2.3.4.7, “Starting MySQL as a Windows Service”.

- **--safe-mode**

  Skip some optimization stages. This option was removed in MySQL 5.6.6.

- **--safe-user-create**

  If this option is enabled, a user cannot create new MySQL users by using the GRANT statement unless the user has the INSERT privilege for the mysql.user system table or any column in the table. If you want a user to have the ability to create new users that have those privileges that the user has the right to grant, you should grant the user the following privilege:

  ```sql
  GRANT INSERT(user) ON mysql.user TO 'user_name'@'host_name';
  ```
This ensures that the user cannot change any privilege columns directly, but has to use the `GRANT` statement to give privileges to other users.

- **--secure-auth**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--secure-auth[={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>secure_auth</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value (&gt;= 5.6.5)</td>
<td>ON</td>
</tr>
<tr>
<td>Default Value (&lt;= 5.6.4)</td>
<td>OFF</td>
</tr>
</tbody>
</table>

This option causes the server to block connections by clients that attempt to use accounts that have passwords stored in the old (pre-4.1) format. Use it to prevent all use of passwords employing the old format (and hence insecure communication over the network). This option is enabled by default; to disable it, use `--skip-secure-auth`.

Server startup fails with an error if this option is enabled and the privilege tables are in pre-4.1 format. See Section B.4.2.4, “Client does not support authentication protocol”.

The `mysql` client also has a `--secure-auth` option, which prevents connections to a server if the server requires a password in old format for the client account.

**Note**

Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. Consequently, disabling secure authentication using `--skip-secure-auth` is also deprecated.

- **--skip-concurrent-insert**

Turn off the ability to select and insert at the same time on `MyISAM` tables. (This is to be used only if you think you have found a bug in this feature.) See Section 8.11.3, “Concurrent Inserts”.

- **--skip-grant-tables**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--skip-grant-tables[={OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

This option causes the server to start without using the privilege system at all, which gives anyone with access to the server **unrestricted access to all databases**. You can cause a running server to start using the grant tables again by executing `mysqladmin flush-privileges` or `mysqladmin reload` command from a system shell, or by issuing a MySQL `FLUSH PRIVILEGES` statement after connecting to the server.
This option also causes the server to suppress during its startup sequence the loading of user-defined functions (UDFs), scheduled events, and plugins that were installed with the `INSTALL PLUGIN` statement. To cause plugins to be loaded anyway, use the `--plugin-load` option.

`FLUSH PRIVILEGES` might be executed implicitly by other actions performed after startup (thus causing the server to start using the grant tables again). For example, `mysql_upgrade` flushes the privileges during the upgrade procedure.

- `--skip-host-cache`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--skip-host-cache</code></td>
</tr>
</tbody>
</table>

Disable use of the internal host cache for faster name-to-IP resolution. With the cache disabled, the server performs a DNS lookup every time a client connects.

Use of `--skip-host-cache` is similar to setting the `host_cache_size` system variable to 0, but `host_cache_size` is more flexible because it can also be used to resize, enable, or disable the host cache at runtime, not just at server startup.

If you start the server with `--skip-host-cache`, that does not prevent changes to the value of `host_cache_size`, but such changes have no effect and the cache is not re-enabled even if `host_cache_size` is set larger than 0.

For more information about how the host cache works, see Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”.

- `--skip-innodb`

Disable the InnoDB storage engine. In this case, because the default storage engine is InnoDB, the server will not start unless you also use `--default-storage-engine` and `--default-tmp-storage-engine` to set the default to some other engine for both permanent and TEMPORARY tables.

As of MySQL 5.6.21, the `--skip-innodb` option is deprecated. Its use results in a warning. This option will be removed in a future MySQL release.

- `--skip-name-resolve`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td>`--skip-name-resolve[{OFF</td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>skip_name_resolve</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Boolean</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>OFF</td>
</tr>
</tbody>
</table>

Do not resolve host names when checking client connections. Use only IP addresses. If you use this option, all Host column values in the grant tables must be IP addresses or `localhost`. See Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”.
Depending on the network configuration of your system and the Host values for your accounts, clients may need to connect using an explicit --host option, such as --host=localhost, --host=127.0.0.1, or --host=:1.

An attempt to connect to the host 127.0.0.1 normally resolves to the localhost account. However, this fails if the server is run with the --skip-name-resolve option, so make sure that an account exists that can accept a connection. For example, to be able to connect as root using --host=127.0.0.1 or --host=:1, create these accounts:

```
CREATE USER 'root'@'127.0.0.1' IDENTIFIED BY 'root-password';
CREATE USER 'root'@'::1' IDENTIFIED BY 'root-password';
```

- **--skip-networking**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--skip-networking</td>
</tr>
<tr>
<td>System Variable</td>
<td>skip_networking</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
</tbody>
</table>

Do not listen for TCP/IP connections at all. All interaction with mysqld must be made using named pipes or shared memory (on Windows) or Unix socket files (on Unix). This option is highly recommended for systems where only local clients are permitted. See Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”.

- **--skip-partition**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--skip-partition</td>
</tr>
<tr>
<td></td>
<td>--disable-partition</td>
</tr>
</tbody>
</table>

Disables user-defined partitioning. Partitioned tables can be seen using SHOW TABLES or by querying the INFORMATION_SCHEMA.TABLES table, but cannot be created or modified, nor can data in such tables be accessed. All partition-specific columns in the INFORMATION_SCHEMA.PARTITIONS table display NULL.

Since DROP TABLE removes table definition (.frm) files, this statement works on partitioned tables even when partitioning is disabled using the option. The statement, however, does not remove .par files associated with partitioned tables in such cases. For this reason, you should avoid dropping partitioned tables with partitioning disabled, or take action to remove the orphaned .par files manually.

- **--ssl**

Options that begin with --ssl specify whether to permit clients to connect using SSL and indicate where to find SSL keys and certificates. See Command Options for Encrypted Connections.

- **--standalone**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--standalone</td>
</tr>
<tr>
<td>Platform Specific</td>
<td>Windows</td>
</tr>
</tbody>
</table>
Server Command Options

Available on Windows only; instructs the MySQL server not to run as a service.

- **--super-large-pages**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--super-large-pages=[{OFF</td>
</tr>
<tr>
<td>Platform Specific</td>
<td>Solaris</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Standard use of large pages in MySQL attempts to use the largest size supported, up to 4MB. Under Solaris, a ‘super large pages’ feature enables uses of pages up to 256MB. This feature is available for recent SPARC platforms. It can be enabled or disabled by using the `--super-large-pages` or `--skip-super-large-pages` option.

- **--symbolic-links, --skip-symbolic-links**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--symbolic-links=[{OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

Enable or disable symbolic link support. This option has different effects on Windows and Unix:

- On Windows, enabling symbolic links enables you to establish a symbolic link to a database directory by creating a `db_name.sym` file that contains the path to the real directory. See Section 8.12.3.3, “Using Symbolic Links for Databases on Windows”.

- On Unix, enabling symbolic links means that you can link a MyISAM index file or data file to another directory with the `INDEX DIRECTORY` or `DATA DIRECTORY` option of the `CREATE TABLE` statement. If you delete or rename the table, the files that its symbolic links point to also are deleted or renamed. See Section 8.12.3.2, “Using Symbolic Links for MyISAM Tables on Unix”.

- **--skip-show-database**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--skip-show-database</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>skip_show_database</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
</tbody>
</table>

This option sets the `skip_show_database` system variable that controls who is permitted to use the `SHOW DATABASES` statement. See Section 5.1.7, “Server System Variables”.

- **--skip-stack-trace**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--skip-stack-trace</code></td>
</tr>
</tbody>
</table>
Do not write stack traces. This option is useful when you are running `mysqld` under a debugger. On some systems, you also must use this option to get a core file. See Section 24.5, “Debugging and Porting MySQL”.

- **--skip-thread-priority**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--skip-thread-priority</code></td>
</tr>
<tr>
<td>Deprecated</td>
<td>Yes (removed in 5.6.1)</td>
</tr>
</tbody>
</table>

Disable using thread priorities for faster response time. This option was unused and was removed in MySQL 5.6.1.

- **--slow-start-timeout=timeout**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--slow-start-timeout=#</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.5</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>15000</td>
</tr>
</tbody>
</table>

This option controls the Windows service control manager’s service start timeout. The value is the maximum number of milliseconds that the service control manager waits before trying to kill the windows service during startup. The default value is 15000 (15 seconds). If the MySQL service takes too long to start, you may need to increase this value. A value of 0 means there is no timeout.

- **--socket=path**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--socket={file_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>socket</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value (Other)</td>
<td>/tmp/mysql.sock</td>
</tr>
<tr>
<td>Default Value (Windows)</td>
<td>MySQL</td>
</tr>
</tbody>
</table>

On Unix, this option specifies the Unix socket file to use when listening for local connections. The default value is `/tmp/mysql.sock`. If this option is given, the server creates the file in the data directory unless an absolute path name is given to specify a different directory. On Windows, the option specifies the pipe name to use when listening for local connections that use a named pipe. The default value is `MySQL` (not case sensitive).

- **--sql-mode=value[,value[,value...]]**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--sql-mode=name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td>sql_mode</td>
</tr>
</tbody>
</table>
### Server Command Options

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Set</td>
</tr>
<tr>
<td>Default Value (&gt;= 5.6.6)</td>
<td>NO_ENGINE_SUBSTITUTION</td>
</tr>
<tr>
<td>Default Value (&lt;= 5.6.5)</td>
<td>''</td>
</tr>
<tr>
<td>Valid Values</td>
<td>ALLOW_INVALIDDATES</td>
</tr>
<tr>
<td></td>
<td>ANSI_QUOTES</td>
</tr>
<tr>
<td></td>
<td>ERROR_FOR_DIVISION_BY_ZERO</td>
</tr>
<tr>
<td></td>
<td>HIGH_NOT_PRECEDENCE</td>
</tr>
<tr>
<td></td>
<td>IGNORE_SPACE</td>
</tr>
<tr>
<td></td>
<td>NO_AUTO_CREATE_USER</td>
</tr>
<tr>
<td></td>
<td>NO_AUTO_VALUE_ON_ZERO</td>
</tr>
<tr>
<td></td>
<td>NO_BACKSLASH_ESCAPES</td>
</tr>
<tr>
<td></td>
<td>NO_DIR_IN_CREATE</td>
</tr>
<tr>
<td></td>
<td>NO_ENGINE_SUBSTITUTION</td>
</tr>
<tr>
<td></td>
<td>NO_FIELD_OPTIONS</td>
</tr>
<tr>
<td></td>
<td>NO_KEY_OPTIONS</td>
</tr>
<tr>
<td></td>
<td>NO_TABLE_OPTIONS</td>
</tr>
<tr>
<td></td>
<td>NO_UNSIGNED_SUBTRACTION</td>
</tr>
<tr>
<td></td>
<td>NO_ZERO_DATE</td>
</tr>
<tr>
<td></td>
<td>NO_ZERO_IN_DATE</td>
</tr>
<tr>
<td></td>
<td>ONLY_FULL_GROUP_BY</td>
</tr>
<tr>
<td></td>
<td>PAD_CHAR_TO_FULL_LENGTH</td>
</tr>
<tr>
<td></td>
<td>PIPES_AS_CONCAT</td>
</tr>
<tr>
<td></td>
<td>REAL_AS_FLOAT</td>
</tr>
<tr>
<td></td>
<td>STRICT_ALL_TABLES</td>
</tr>
<tr>
<td></td>
<td>STRICT_TRANS_TABLES</td>
</tr>
</tbody>
</table>

Set the SQL mode. The default is **NO_ENGINE_SUBSTITUTION**. See Section 5.1.10, “Server SQL Modes”.
Note

MySQL installation programs may configure the SQL mode during the installation process. For example, `mysql_install_db` creates a default option file named `my.cnf` in the base installation directory. This file contains a line that sets the SQL mode; see Section 4.4.3, "mysql_install_db — Initialize MySQL Data Directory".

If the SQL mode differs from the default or from what you expect, check for a setting in an option file that the server reads at startup.

- `--sysdate-is-now`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--sysdate-is-now=[OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

SYSDATE() by default returns the time at which it executes, not the time at which the statement in which it occurs begins executing. This differs from the behavior of NOW(). This option causes SYSDATE() to be an alias for NOW(). For information about the implications for binary logging and replication, see the description for SYSDATE() in Section 12.7, “Date and Time Functions” and for SET TIMESTAMP in Section 5.1.7, “Server System Variables”.

- `--tc-heuristic-recover=(COMMIT|ROLLBACK)`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--tc-heuristic-recover=name</code></td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>COMMIT</td>
</tr>
<tr>
<td>Valid Values</td>
<td>COMMIT, ROLLBACK</td>
</tr>
</tbody>
</table>

The type of decision to use in the heuristic recovery process. To use this option, two or more storage engines that support XA transactions must be installed.

- `--temp-pool`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--temp-pool=[OFF</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value (Other)</td>
<td>OFF</td>
</tr>
<tr>
<td>Default Value (Linux)</td>
<td>ON</td>
</tr>
</tbody>
</table>

This option is ignored except on Linux. On Linux, it causes most temporary files created by the server to use a small set of names, rather than a unique name for each new file. This works around a problem in the Linux kernel dealing with creating many new files with different names. With the old behavior, Linux seems to “leak” memory, because it is being allocated to the directory entry cache rather than to the disk cache.
• **--transaction-isolation=level**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--transaction-isolation-name</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>REPEATABLE-READ</td>
</tr>
<tr>
<td>Valid Values</td>
<td>READ-UNCOMMITTED</td>
</tr>
<tr>
<td></td>
<td>READ-COMMITTED</td>
</tr>
<tr>
<td></td>
<td>REPEATABLE-READ</td>
</tr>
<tr>
<td></td>
<td>SERIALIZABLE</td>
</tr>
</tbody>
</table>

Sets the default transaction isolation level. The `level` value can be `READ-UNCOMMITTED`, `READ-COMMITTED`, `REPEATABLE-READ`, or `SERIALIZABLE`. See Section 13.3.6, “SET TRANSACTION Syntax”.

The default transaction isolation level can also be set at runtime using the `SET TRANSACTION` statement or by setting the `tx_isolation` system variable.

• **--transaction-read-only**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--transaction-read-only={OFF</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.5</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Sets the default transaction access mode. By default, read-only mode is disabled, so the mode is read/write.

To set the default transaction access mode at runtime, use the `SET TRANSACTION` statement or set the `tx_read_only` system variable. See Section 13.3.6, “SET TRANSACTION Syntax”.

• **--tmpdir=dir_name, -t dir_name**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--tmpdir=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>tmpdir</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
</tbody>
</table>

The path of the directory to use for creating temporary files. It might be useful if your default `/tmp` directory resides on a partition that is too small to hold temporary tables. This option accepts several paths that are used in round-robin fashion. Paths should be separated by colon characters (`:`) on Unix and semicolon characters (`;`) on Windows.
--tmpdir can be a non-permanent location, such as a directory on a memory-based file system or a directory that is cleared when the server host restarts. If the MySQL server is acting as a replication slave, and you are using a non-permanent location for --tmpdir, consider setting a different temporary directory for the slave using the --slave-load-tmpdir option. For a replication slave, the temporary files used to replicate LOAD DATA statements are stored in this directory, so with a permanent location they can survive machine restarts, although replication can now continue after a restart if the temporary files have been removed.

For more information about the storage location of temporary files, see Section B.4.3.5, “Where MySQL Stores Temporary Files”.

- --user={user_name|user_id}, -u {user_name|user_id}

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--user=name</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

Run the mysqlld server as the user having the name user_name or the numeric user ID user_id. (“User” in this context refers to a system login account, not a MySQL user listed in the grant tables.)

This option is mandatory when starting mysqlld as root. The server changes its user ID during its startup sequence, causing it to run as that particular user rather than as root. See Section 6.1.1, “Security Guidelines”.

To avoid a possible security hole where a user adds a --user=root option to a my.cnf file (thus causing the server to run as root), mysqlld uses only the first --user option specified and produces a warning if there are multiple --user options. Options in /etc/my.cnf and $MYSQL_HOME/my.cnf are processed before command-line options, so it is recommended that you put a --user option in /etc/my.cnf and specify a value other than root. The option in /etc/my.cnf is found before any other --user options, which ensures that the server runs as a user other than root, and that a warning results if any other --user option is found.

- --verbose, -v

Use this option with the --help option for detailed help.

- --version, -V

Display version information and exit.

5.1.7 Server System Variables

The MySQL server maintains many system variables that configure its operation. Each system variable has a default value. System variables can be set at server startup using options on the command line or in an option file. Most of them can be changed dynamically at runtime using the SET statement, which enables you to modify operation of the server without having to stop and restart it. You can also use system variable values in expressions.

At runtime, setting a global system variable value requires the SUPER privilege. Setting a session system variable value normally requires no special privileges and can be done by any user, although there are exceptions. For more information, see Section 5.1.8.1, “System Variable Privileges”.

There are several ways to see the names and values of system variables:
• To see the values that a server will use based on its compiled-in defaults and any option files that it reads, use this command:

    mysqld --verbose --help

• To see the values that a server will use based only on its compiled-in defaults, ignoring the settings in any option files, use this command:

    mysqld --no-defaults --verbose --help

• To see the current values used by a running server, use the `SHOW VARIABLES` statement.

This section provides a description of each system variable. For a system variable summary table, see Section 5.1.4, “Server System Variable Reference”. For more information about manipulation of system variables, see Section 5.1.8, “Using System Variables”.

For additional system variable information, see these sections:

• Section 5.1.8, “Using System Variables”, discusses the syntax for setting and displaying system variable values.

• Section 5.1.8.2, “Dynamic System Variables”, lists the variables that can be set at runtime.

• Information on tuning system variables can be found in Section 5.1.1, “Configuring the Server”.

• Section 14.14, “InnoDB Startup Options and System Variables”, lists InnoDB system variables.

• NDB Cluster System Variables, lists system variables which are specific to NDB Cluster.

• For information on server system variables specific to replication, see Section 17.1.4, “Replication and Binary Logging Options and Variables”.

Note

Some of the following variable descriptions refer to “enabling” or “disabling” a variable. These variables can be enabled with the `SET` statement by setting them to `ON` or `1`, or disabled by setting them to `OFF` or `0`. Boolean variables can be set at startup to the values `ON`, `TRUE`, `OFF`, and `FALSE` (not case sensitive), as well as `1` and `0`. See Section 4.2.2.4, “Program Option Modifiers”.

Some system variables control the size of buffers or caches. For a given buffer, the server might need to allocate internal data structures. These structures typically are allocated from the total memory allocated to the buffer, and the amount of space required might be platform dependent. This means that when you assign a value to a system variable that controls a buffer size, the amount of space actually available might differ from the value assigned. In some cases, the amount might be less than the value assigned. It is also possible that the server will adjust a value upward. For example, if you assign a value of 0 to a variable for which the minimal value is 1024, the server will set the value to 1024.

Values for buffer sizes, lengths, and stack sizes are given in bytes unless otherwise specified.

Some system variables take file name values. Unless otherwise specified, the default file location is the data directory if the value is a relative path name. To specify the location explicitly, use an absolute path name. Suppose that the data directory is `/var/mysql/data`. If a file-valued variable is given as a relative path name, it will be located under `/var/mysql/data`. If the value is an absolute path name, its location is as given by the path name.

• `authentication_windows_log_level`
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--authentication-windows-log-level=#</code></td>
</tr>
<tr>
<td><strong>Introduced</strong></td>
<td>5.6.10</td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>authentication_windows_log_level</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>2</td>
</tr>
<tr>
<td><strong>Minimum Value</strong></td>
<td>0</td>
</tr>
<tr>
<td><strong>Maximum Value</strong></td>
<td>4</td>
</tr>
</tbody>
</table>

This variable is available only if the `authentication_windows` Windows authentication plugin is enabled and debugging code is enabled. See Section 6.4.1.7, “Windows Pluggable Authentication”.

This variable sets the logging level for the Windows authentication plugin. The following table shows the permitted values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No logging</td>
</tr>
<tr>
<td>1</td>
<td>Log only error messages</td>
</tr>
<tr>
<td>2</td>
<td>Log level 1 messages and warning messages</td>
</tr>
<tr>
<td>3</td>
<td>Log level 2 messages and information notes</td>
</tr>
<tr>
<td>4</td>
<td>Log level 3 messages and debug messages</td>
</tr>
</tbody>
</table>

- `authentication_windows_use_principal_name`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td>`--authentication-windows-use-principal-name=#{OFF</td>
</tr>
<tr>
<td><strong>Introduced</strong></td>
<td>5.6.10</td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>authentication_windows_use_principal_name</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Boolean</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>ON</td>
</tr>
</tbody>
</table>

This variable is available only if the `authentication_windows` Windows authentication plugin is enabled. See Section 6.4.1.7, “Windows Pluggable Authentication”.

A client that authenticates using the `InitSecurityContext()` function should provide a string identifying the service to which it connects (`targetName`). MySQL uses the principal name (UPN) of the account under which the server is running. The UPN has the form `user_id@computer_name` and need not be registered anywhere to be used. This UPN is sent by the server at the beginning of authentication handshake.
Server System Variables

This variable controls whether the server sends the UPN in the initial challenge. By default, the variable is enabled. For security reasons, it can be disabled to avoid sending the server's account name to a client as cleartext. If the variable is disabled, the server always sends a 0x00 byte in the first challenge, the client does not specify `targetName`, and as a result, NTLM authentication is used.

If the server fails to obtain its UPN (which will happen primarily in environments that do not support Kerberos authentication), the UPN is not sent by the server and NTLM authentication is used.

- **autocommit**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--autocommit=[{OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>autocommit</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

  The autocommit mode. If set to 1, all changes to a table take effect immediately. If set to 0, you must use `COMMIT` to accept a transaction or `ROLLBACK` to cancel it. If `autocommit` is 0 and you change it to 1, MySQL performs an automatic `COMMIT` of any open transaction. Another way to begin a transaction is to use a `START TRANSACTION` or `BEGIN` statement. See Section 13.3.1, “START TRANSACTION, COMMIT, and ROLLBACK Syntax”.

  By default, client connections begin with `autocommit` set to 1. To cause clients to begin with a default of 0, set the global `autocommit` value by starting the server with the `--autocommit=0` option. To set the variable using an option file, include these lines:

  ```
  [mysql]
  autocommit=0
  ```

- **automatic_sp_privileges**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--automatic-sp-privileges=[{OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>automatic_sp_privileges</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

  When this variable has a value of 1 (the default), the server automatically grants the `EXECUTE` and `ALTER ROUTINE` privileges to the creator of a stored routine, if the user cannot already execute and alter or drop the routine. (The `ALTER ROUTINE` privilege is required to drop the routine.) The server also automatically drops those privileges from the creator when the routine is dropped. If `automatic_sp_privileges` is 0, the server does not automatically add or drop these privileges.

  The creator of a routine is the account used to execute the `CREATE` statement for it. This might not be the same as the account named as the `DEFINER` in the routine definition.
See also Section 20.2.2, “Stored Routines and MySQL Privileges”.

- **avoid_temporal_upgrade**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
<th>Command-Line Format</th>
<th>Introduced</th>
<th>Deprecated</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td>**--avoid-temporal-upgrade=[{OFF</td>
<td>ON}]**</td>
<td></td>
<td>5.6.24</td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><strong>avoid_temporal_upgrade</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td><strong>Global</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td><strong>Yes</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td><strong>Boolean</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td><strong>OFF</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This variable controls whether `ALTER TABLE` implicitly upgrades temporal columns found to be in pre-5.6.4 format (`TIME`, `DATETIME`, and `TIMESTAMP` columns without support for fractional seconds precision). Upgrading such columns requires a table rebuild, which prevents any use of fast alterations that might otherwise apply to the operation to be performed.

This variable is disabled by default. Enabling it causes `ALTER TABLE` not to rebuild temporal columns and thereby be able to take advantage of possible fast alterations.

This variable was added in MySQL 5.6.24. It is deprecated and will be removed in a future MySQL release.

- **back_log**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
<th>Command-Line Format</th>
<th>Default Value</th>
<th>Minimum Value</th>
<th>Maximum Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><strong>--back-log=#</strong></td>
<td></td>
<td>&gt;= 5.6.6</td>
<td>1</td>
<td>65535</td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><strong>back_log</strong></td>
<td></td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td><strong>Global</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td><strong>No</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td><strong>Integer</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The number of outstanding connection requests MySQL can have. This comes into play when the main MySQL thread gets very many connection requests in a very short time. It then takes some time (although very little) for the main thread to check the connection and start a new thread. The `back_log` value indicates how many requests can be stacked during this short time before MySQL momentarily stops answering new requests. You need to increase this only if you expect a large number of connections in a short period of time.

In other words, this value is the size of the listen queue for incoming TCP/IP connections. Your operating system has its own limit on the size of this queue. The manual page for the Unix `listen()` system
call should have more details. Check your OS documentation for the maximum value for this variable. `back_log` cannot be set higher than your operating system limit.

The default value is based on the following formula, capped to a limit of 900:

\[
50 + \frac{\text{max_connections}}{5}
\]

- **Basedir**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--basedir=dir_name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>basedir</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>configuration-dependent default</code></td>
</tr>
</tbody>
</table>

The path to the MySQL installation base directory.

- **big_tables**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--big-tables=[ON</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>big_tables</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

If enabled, the server stores all temporary tables on disk rather than in memory. This prevents most `The table tbl_name is full` errors for `SELECT` operations that require a large temporary table, but also slows down queries for which in-memory tables would suffice.

The default value for new connection is OFF (use in-memory temporary tables). Normally, it should never be necessary to enable this variable because the server is able to handle large result sets automatically by using memory for small temporary tables and switching to disk-based tables as required.

- **bind_address**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--bind-address=addr</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.1</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>bind_address</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>
The MySQL server listens on a single network socket for TCP/IP connections. This socket is bound to a single address, but it is possible for an address to map onto multiple network interfaces. To specify an address, set `bind_address=addr` at server startup, where `addr` is an IPv4 or IPv6 address or a host name. If `addr` is a host name, the server resolves the name to an IP address and binds to that address. If a host name resolves to multiple IP addresses, the server uses the first IPv4 address if there are any, or the first IPv6 address otherwise.

The server treats different types of addresses as follows:

- If the address is `*`, the server accepts TCP/IP connections on all server host IPv4 interfaces, and, if the server host supports IPv6, on all IPv6 interfaces. Use this address to permit both IPv4 and IPv6 connections on all server interfaces. This value is the default.
- If the address is `0.0.0.0`, the server accepts TCP/IP connections on all server host IPv4 interfaces.
- If the address is `::`, the server accepts TCP/IP connections on all server host IPv4 and IPv6 interfaces.
- If the address is an IPv4-mapped address, the server accepts TCP/IP connections for that address, in either IPv4 or IPv6 format. For example, if the server is bound to `::ffff:127.0.0.1`, clients can connect using `--host=127.0.0.1` or `--host=::ffff:127.0.0.1`.
- If the address is a “regular” IPv4 or IPv6 address (such as `127.0.0.1` or `::1`), the server accepts TCP/IP connections only for that IPv4 or IPv6 address.

If binding to the address fails, the server produces an error and does not start.

If you intend to bind the server to a specific address, be sure that the `mysql.user` system table contains an account with administrative privileges that you can use to connect to that address. Otherwise, you will not be able to shut down the server. For example, if you bind the server to `*`, you can connect to it using all existing accounts. But if you bind the server to `::1`, it accepts connections only on that address. In that case, first make sure that the `"root"@"::1"` account is present in the `mysql.user` table so you can still connect to the server to shut it down.

### block_encryption_mode

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--block-encryption-mode=#</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.17</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>block_encryption_mode</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>aes-128-ecb</code></td>
</tr>
</tbody>
</table>

This variable controls the block encryption mode for block-based algorithms such as AES. It affects encryption for `AES_ENCRYPT()` and `AES_DECRYPT()`.  

---

---
**block_encryption_mode** takes a value in **aes-keylen-mode** format, where **keylen** is the key length in bits and **mode** is the encryption mode. The value is not case-sensitive. Permitted **keylen** values are 128, 192, and 256. Permitted encryption modes depend on whether MySQL was compiled using OpenSSL or yaSSL:

- For OpenSSL, permitted **mode** values are: **ECB**, **CBC**, **CFB1**, **CFB8**, **CFB128**, **OFB**
- For yaSSL, permitted **mode** values are: **ECB**, **CBC**

For example, this statement causes the AES encryption functions to use a key length of 256 bits and the CBC mode:

```sql
SET block_encryption_mode = 'aes-256-cbc';
```

An error occurs for attempts to set **block_encryption_mode** to a value containing an unsupported key length or a mode that the SSL library does not support.

This variable was added in MySQL 5.6.17.

**bulk_insert_buffer_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--bulk-insert-buffer-size=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>bulk_insert_buffer_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>8388608</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

**MyISAM** uses a special tree-like cache to make bulk inserts faster for **INSERT ... SELECT**, **INSERT ... VALUES (...), (...), ...**, and **LOAD DATA** when adding data to nonempty tables. This variable limits the size of the cache tree in bytes per thread. Setting it to 0 disables this optimization. The default value is 8MB.

**character_set_client**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>character_set_client</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td>utf8</td>
</tr>
</tbody>
</table>
The character set for statements that arrive from the client. The session value of this variable is set using the character set requested by the client when the client connects to the server. (Many clients support a `--default-character-set` option to enable this character set to be specified explicitly. See also Section 10.4, “Connection Character Sets and Collations.”) The global value of the variable is used to set the session value in cases when the client-requested value is unknown or not available, or the server is configured to ignore client requests:

- The client requests a character set not known to the server. For example, a Japanese-enabled client requests `sjis` when connecting to a server not configured with `sjis` support.
- The client is from a version of MySQL older than MySQL 4.1, and thus does not request a character set.
- mysqld was started with the `--skip-character-set-client-handshake` option, which causes it to ignore client character set configuration. This reproduces MySQL 4.0 behavior and is useful should you wish to upgrade the server without upgrading all the clients.

Some character sets cannot be used as the client character set. Attempting to use them as the `character_set_client` value produces an error. See Impermissible Client Character Sets.

- `character_set_connection`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>character_set_connection</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>utf8</code></td>
</tr>
</tbody>
</table>

The character set used for literals specified without a character set introducer and for number-to-string conversion. For information about introducers, see Section 10.3.8, “Character Set Introducers.”

- `character_set_database`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>character_set_database</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>latin1</code></td>
</tr>
<tr>
<td>Footnote</td>
<td>This option is dynamic, but only the server should set this information. You should not set the value of this variable manually.</td>
</tr>
</tbody>
</table>

The character set used by the default database. The server sets this variable whenever the default database changes. If there is no default database, the variable has the same value as `character_set_server`.

- `character_set_filesystem`
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--character-set-filesystem=name</code></td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>character_set_filesystem</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global, Session</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td><code>binary</code></td>
</tr>
</tbody>
</table>

The file system character set. This variable is used to interpret string literals that refer to file names, such as in the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements and the `LOAD_FILE()` function. Such file names are converted from `character_set_client` to `character_set_filesystem` before the file opening attempt occurs. The default value is `binary`, which means that no conversion occurs. For systems on which multibyte file names are permitted, a different value may be more appropriate. For example, if the system represents file names using UTF-8, set `character_set_filesystem` to 'utf8mb4'.

- **character_set_results**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Variable</strong></td>
<td><code>character_set_results</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global, Session</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td><code>utf8</code></td>
</tr>
</tbody>
</table>

The character set used for returning query results to the client. This includes result data such as column values, result metadata such as column names, and error messages.

- **character_set_server**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--character-set-server=name</code></td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>character_set_server</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global, Session</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td><code>latin1</code></td>
</tr>
</tbody>
</table>

The servers default character set. See Section 10.15, "Character Set Configuration". If you set this variable, you should also set `collation_server` to specify the collation for the character set.

- **character_set_system**
The character set used by the server for storing identifiers. The value is always utf8.

- **character_sets_dir**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--character-sets-dir=dir_name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td>character_sets_dir</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
</tbody>
</table>

The directory where character sets are installed. See Section 10.15, “Character Set Configuration”.

- **collation_connection**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>collation_connection</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

The collation of the connection character set. `collation_connection` is important for comparisons of literal strings. For comparisons of strings with column values, `collation_connection` does not matter because columns have their own collation, which has a higher collation precedence (see Section 10.8.4, “Collation Coercibility in Expressions”).

- **collation_database**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>collation_database</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td>latin1_swedish_ci</td>
</tr>
<tr>
<td>Footnote</td>
<td>This option is dynamic, but only the server should set this information. You should not set the value of this variable manually.</td>
</tr>
</tbody>
</table>

The collation used by the default database. The server sets this variable whenever the default database changes. If there is no default database, the variable has the same value as `collation_server`.

- **collation_server**
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--collation-server=name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>collation_server</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>latin1_swedish_ci</code></td>
</tr>
</tbody>
</table>

The server’s default collation. See [Section 10.15, “Character Set Configuration”](#).

- **completion_type**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--completion-type=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>completion_type</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>NO_CHAIN</code></td>
</tr>
<tr>
<td>Valid Values</td>
<td><code>NO_CHAIN</code>, <code>CHAIN</code>, <code>RELEASE</code>, <code>0</code>, <code>1</code>, <code>2</code></td>
</tr>
</tbody>
</table>

The transaction completion type. This variable can take the values shown in the following table. The variable can be assigned using either the name values or corresponding integer values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>NO_CHAIN</code></td>
<td><code>COMMIT</code> and <code>ROLLBACK</code> are unaffected. This is the default value.</td>
</tr>
<tr>
<td><code>CHAIN</code></td>
<td><code>COMMIT</code> and <code>ROLLBACK</code> are equivalent to <code>COMMIT AND CHAIN</code> and <code>ROLLBACK AND CHAIN</code>, respectively. (A new transaction starts immediately with the same isolation level as the just-terminated transaction.)</td>
</tr>
<tr>
<td><code>RELEASE</code></td>
<td><code>COMMIT</code> and <code>ROLLBACK</code> are equivalent to <code>COMMIT RELEASE</code> and <code>ROLLBACK RELEASE</code>, respectively. (The server disconnects after terminating the transaction.)</td>
</tr>
</tbody>
</table>

`completion_type` affects transactions that begin with `START TRANSACTION` or `BEGIN` and end with `COMMIT` or `ROLLBACK`. It does not apply to implicit commits resulting from execution of the statements listed in [Section 13.3.3, “Statements That Cause an Implicit Commit”](#). It also does not apply for `XA COMMIT`, `XA ROLLBACK`, or when `autocommit=1`. 
concurrent_insert

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--concurrent-insert[=#]</td>
</tr>
<tr>
<td>System Variable</td>
<td>concurrent_insert</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>AUTO</td>
</tr>
<tr>
<td>Valid Values</td>
<td>NEVER, AUTO, ALWAYS</td>
</tr>
</tbody>
</table>

If AUTO (the default), MySQL permits INSERT and SELECT statements to run concurrently for MyISAM tables that have no free blocks in the middle of the data file. If you start mysqld with --skip-new, this variable is set to NEVER.

This variable can take the values shown in the following table. The variable can be assigned using either the name values or corresponding integer values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEVER</td>
<td>Disables concurrent inserts</td>
</tr>
<tr>
<td>AUTO</td>
<td>(Default) Enables concurrent insert for MyISAM tables that do not have holes</td>
</tr>
<tr>
<td>ALWAYS</td>
<td>Enables concurrent inserts for all MyISAM tables, even those that have holes.</td>
</tr>
</tbody>
</table>

See also Section 8.11.3, “Concurrent Inserts”.

connect_timeout

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--connect-timeout=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>connect_timeout</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>10</td>
</tr>
</tbody>
</table>
The number of seconds that the `mysqld` server waits for a connect packet before responding with Bad handshake. The default value is 10 seconds.

Increasing the `connect_timeout` value might help if clients frequently encounter errors of the form Lost connection to MySQL server at 'XXX', system error: `errno`.

- **core_file**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Introduced</td>
<td>5.6.2</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>core_file</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Whether to write a core file if the server crashes. This variable is set by the `--core-file` option.

- **datadir**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--datadir=dir_name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>datadir</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
</tbody>
</table>

The path to the MySQL server data directory. Relative paths are resolved with respect to the current directory. If the server will be started automatically (that is, in contexts for which you cannot assume what the current directory will be), it is best to specify the `datadir` value as an absolute path.

- **date_format**

This variable is unused. It is deprecated and will be removed in a future MySQL release.

- **datetime_format**

This variable is unused. It is deprecated and will be removed in a future MySQL release.

- **debug**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--debug[=debug_options]</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>debug</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
</tbody>
</table>
## Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Default Value (Windows)</strong></td>
<td><code>d:t:i:O,\mysqld.trace</code></td>
</tr>
<tr>
<td><strong>Default Value (Unix)</strong></td>
<td><code>d:t:i:o,/tmp/mysqld.trace</code></td>
</tr>
</tbody>
</table>

This variable indicates the current debugging settings. It is available only for servers built with debugging support. The initial value comes from the value of instances of the `--debug` option given at server startup. The global and session values may be set at runtime.

Setting the session value of this system variable is a restricted operation. The session user must have privileges sufficient to set restricted session variables. See Section 5.1.8.1, “System Variable Privileges”.

Assigning a value that begins with + or – cause the value to added to or subtracted from the current value:

```sql
mysql> SET debug = 'T';
mysql> SELECT @@debug;
```

| +---------+
| @@debug  |
| +---------+
| T         |
| +---------+

```sql
mysql> SET debug = '+P';
mysql> SELECT @@debug;
```

| +---------+
| @@debug  |
| +---------+
| P:T       |
| +---------+

```sql
mysql> SET debug = '-P';
mysql> SELECT @@debug;
```

| +---------+
| @@debug  |
| +---------+
| T         |
| +---------+

For more information, see Section 24.5.3, “The DBUG Package”.

- **debug_sync**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Variable</strong></td>
<td><strong>debug_sync</strong></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Session</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>String</td>
</tr>
</tbody>
</table>

This variable is the user interface to the Debug Sync facility. Use of Debug Sync requires that MySQL be configured with the `--DENABLE_DEBUG_SYNC=1` CMake option (see Section 2.9.7, “MySQL Source-Configuration Options”). If Debug Sync is not compiled in, this system variable is not available.
The global variable value is read only and indicates whether the facility is enabled. By default, Debug Sync is disabled and the value of `debug_sync` is OFF. If the server is started with `--debug-sync-timeout=N`, where `N` is a timeout value greater than 0, Debug Sync is enabled and the value of `debug_sync` is ON - current signal followed by the signal name. Also, `N` becomes the default timeout for individual synchronization points.

The session value can be read by any user and will have the same value as the global variable. The session value can be set to control synchronization points.

Setting the session value of this system variable is a restricted operation. The session user must have privileges sufficient to set restricted session variables. See Section 5.1.8.1, “System Variable Privileges”.

For a description of the Debug Sync facility and how to use synchronization points, see MySQL Internals: Test Synchronization.

- **default_storage_engine**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--default-storage-engine=name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>default_storage_engine</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>InnoDB</td>
</tr>
</tbody>
</table>

The default storage engine for tables. See Chapter 15, Alternative Storage Engines. This variable sets the storage engine for permanent tables only. To set the storage engine for TEMPORARY tables, set the `default_tmp_storage_engine` system variable.

To see which storage engines are available and enabled, use the `SHOW ENGINES` statement or query the `INFORMATION_SCHEMA ENGINES` table.

`default_storage_engine` should be used in preference to `storage_engine`, which is deprecated.

If you disable the default storage engine at server startup, you must set the default engine for both permanent and TEMPORARY tables to a different engine or the server will not start.

- **default_tmp_storage_engine**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--default-tmp-storage-engine=name</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.3</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>default_tmp_storage_engine</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>InnoDB</td>
</tr>
</tbody>
</table>
The default storage engine for TEMPORARY tables (created with `CREATE TEMPORARY TABLE`). To set the storage engine for permanent tables, set the `default_storage_engine` system variable.

If you disable the default storage engine at server startup, you must set the default engine for both permanent and TEMPORARY tables to a different engine or the server will not start.

- `default_week_format`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--default-week-format=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>default_week_format</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>7</td>
</tr>
</tbody>
</table>

The default mode value to use for the `WEEK()` function. See Section 12.7, “Date and Time Functions”.

- `delay_key_write`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--delay-key-write=[OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>delay_key_write</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
<tr>
<td>Valid Values</td>
<td>ON, OFF, ALL</td>
</tr>
</tbody>
</table>

This variable specifies how to use delayed key writes. It applies only to MyISAM tables. Delayed key writing causes key buffers not to be flushed between writes. See also Section 15.2.1, “MyISAM Startup Options”.

This variable can have one of the following values to affect handling of the `DELAY_KEY_WRITE` table option that can be used in `CREATE TABLE` statements.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td><code>DELAY_KEY_WRITE</code> is ignored.</td>
</tr>
<tr>
<td>ON</td>
<td>MySQL honors any <code>DELAY_KEY_WRITE</code> option specified in <code>CREATE TABLE</code> statements. This is the default value.</td>
</tr>
</tbody>
</table>
**Server System Variables**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>All new opened tables are treated as if they were created with the DELAY_KEY_WRITE option enabled.</td>
</tr>
</tbody>
</table>

**Note**

If you set this variable to ALL, you should not use MyISAM tables from within another program (such as another MySQL server or myisamchk) when the tables are in use. Doing so leads to index corruption.

If DELAY_KEY_WRITE is enabled for a table, the key buffer is not flushed for the table on every index update, but only when the table is closed. This speeds up writes on keys a lot, but if you use this feature, you should add automatic checking of all MyISAM tables by starting the server with the myisam_recover_options system variable set (for example, myisam_recover_options='BACKUP,FORCE'). See Section 5.1.7, “Server System Variables”, and Section 15.2.1, “MyISAM Startup Options”.

**Warning**

If you enable external locking with --external-locking, there is no protection against index corruption for tables that use delayed key writes.

- **delayed_insert_limit**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--delayed-insert-limit=#</td>
</tr>
<tr>
<td>Deprecated</td>
<td>5.6.7</td>
</tr>
<tr>
<td>System Variable</td>
<td>delayed_insert_limit</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>100</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

After inserting delayed_insert_limit delayed rows into a nontransactional table, the INSERT DELAYED handler thread checks whether there are any SELECT statements pending. If so, it permits them to execute before continuing to insert delayed rows.

This system variable is deprecated (because DELAYED inserts are deprecated), and will be removed in a future release.

- **delayed_insert_timeout**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--delayed-insert-timeout=#</td>
</tr>
<tr>
<td>Deprecated</td>
<td>5.6.7</td>
</tr>
</tbody>
</table>
### delayed_insert_timeout

**Property** | **Value**  
---|---
**System Variable** | **delayed_insert_timeout**
**Scope** | Global
**Dynamic** | Yes
**Type** | Integer
**Default Value** | 300

How many seconds an **INSERT DELAYED** handler thread should wait for **INSERT** statements before terminating.

This system variable is deprecated (because **DELAYED** inserts are deprecated), and will be removed in a future release.

### delayed_queue_size

**Property** | **Value**  
---|---
**Command-Line Format** | `--delayed-queue-size=#`
**Deprecated** | 5.6.7
**System Variable** | **delayed_queue_size**
**Scope** | Global
**Dynamic** | Yes
**Type** | Integer
**Default Value** | 1000
**Minimum Value** | 1
**Maximum Value (64-bit platforms)** | 18446744073709551615
**Maximum Value (32-bit platforms)** | 4294967295

This is a per-table limit on the number of rows to queue when handling **INSERT DELAYED** statements for nontransactional tables. If the queue becomes full, any client that issues an **INSERT DELAYED** statement waits until there is room in the queue again.

This system variable is deprecated (because **DELAYED** inserts are deprecated), and will be removed in a future release.

### disconnect_on_expired_password

**Property** | **Value**  
---|---
**Command-Line Format** | `--disconnect-on-expired-password[={OFF|ON}]`
**Introduced** | 5.6.10
**System Variable** | **disconnect_on_expired_password**
**Scope** | Global
**Dynamic** | No
**Type** | Boolean
**Default Value** | ON
This variable controls how the server handles clients with expired passwords:

- If the client indicates that it can handle expires passwords, the value of `disconnect_on_expired_password` is irrelevant. The server permits the client to connect but puts it in sandbox mode.

- If the client does not indicate that it can handle expires passwords, the server handles the client according to the value of `disconnect_on_expired_password`:
  - If `disconnect_on_expired_password` is enabled, the server disconnects the client.
  - If `disconnect_on_expired_password` is disabled, the server permits the client to connect but puts it in sandbox mode.

For more information about the interaction of client and server settings relating to expired-password handling, see Section 6.2.10, “Server Handling of Expired Passwords”.

- `div_precision_increment`  

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--div-precision-increment=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>div_precision_increment</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>4</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>30</td>
</tr>
</tbody>
</table>

This variable indicates the number of digits by which to increase the scale of the result of division operations performed with the `/` operator. The default value is 4. The minimum and maximum values are 0 and 30, respectively. The following example illustrates the effect of increasing the default value.

```
mysql> SELECT 1/7;
+--------+
| 1/7    |
+--------+
| 0.1429 |
+--------+
mysql> SET div_precision_increment = 12;
mysql> SELECT 1/7;
+----------------+
| 1/7            |
+----------------+
| 0.142857142857 |
+----------------+
```

- `engine_condition_pushdown`  

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--engine-condition-pushdown[]={OFF</td>
</tr>
<tr>
<td>Deprecated</td>
<td>Yes (removed in 5.6.1); use <code>optimizer_switch</code> instead</td>
</tr>
</tbody>
</table>
Server System Variables

**Property** | **Value**
---|---
**System Variable** | `engine_condition_pushdown`
**Scope** | Global, Session
**Dynamic** | Yes
**Type** | Boolean
**Default Value** | ON

This variable was removed in MySQL 5.6.1. Use the `engine_condition_pushdown` flag of the `optimizer_switch` variable instead. See Section 8.9.2, “Switchable Optimizations”.

**Property** | **Value**
---|---
**Command-Line Format** | `--end-markers-in-json[=(OFF|ON)]`
**Introduced** | 5.6.5
**System Variable** | `end_markers_in_json`
**Scope** | Global, Session
**Dynamic** | Yes
**Type** | Boolean
**Default Value** | OFF

Whether optimizer JSON output should add end markers. See MySQL Internals: The `end_markers_in_json` System Variable.

**Property** | **Value**
---|---
**Command-Line Format** | `--eq-range-index-dive-limit=#`
**Introduced** | 5.6.5
**System Variable** | `eq_range_index_dive_limit`
**Scope** | Global, Session
**Dynamic** | Yes
**Type** | Integer
**Default Value** | 10
**Minimum Value** | 0
**Maximum Value** | 4294967295

This variable indicates the number of equality ranges in an equality comparison condition when the optimizer should switch from using index dives to index statistics in estimating the number of qualifying rows. It applies to evaluation of expressions that have either of these equivalent forms, where the optimizer uses a nonunique index to look up `col_name` values:

```
col_name IN(val1, ..., valN)
col_name = val1 OR ... OR col_name = valN
```
In both cases, the expression contains $N$ equality ranges. The optimizer can make row estimates using index dives or index statistics. If `eq_range_index_dive_limit` is greater than 0, the optimizer uses existing index statistics instead of index dives if there are `eq_range_index_dive_limit` or more equality ranges. Thus, to permit use of index dives for up to $N$ equality ranges, set `eq_range_index_dive_limit` to $N + 1$. To disable use of index statistics and always use index dives regardless of $N$, set `eq_range_index_dive_limit` to 0.

For more information, see Equality Range Optimization of Many-Valued Comparisons.

To update table index statistics for best estimates, use `ANALYZE TABLE`.

- **error_count**

  The number of errors that resulted from the last statement that generated messages. This variable is read only. See Section 13.7.5.18, “SHOW ERRORS Syntax”.

- **event_scheduler**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--event-scheduler[=value]</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>event_scheduler</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
<tr>
<td>Valid Values</td>
<td>ON, OFF, DISABLED</td>
</tr>
</tbody>
</table>

  This variable enables or disables, and starts or stops, the Event Scheduler. The possible status values are `ON`, `OFF`, and `DISABLED`, with the default being `OFF`. Turning the Event Scheduler `OFF` is not the same as disabling the Event Scheduler, which requires setting the status to `DISABLED`. This variable and its effects on the Event Scheduler’s operation are discussed in greater detail in Section 20.4.2, “Event Scheduler Configuration”

- **explicit_defaults_for_timestamp**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--explicit-defaults-for-timestamp[={OFF</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.6</td>
</tr>
<tr>
<td>Deprecated</td>
<td>5.6.6</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>explicit_defaults_for_timestamp</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>
This system variable determines whether the server enables certain nonstandard behaviors for default values and NULL-value handling in TIMESTAMP columns. By default, explicit_defaults_for_timestamp is disabled, which enables the nonstandard behaviors.

If explicit_defaults_for_timestamp is disabled, the server enables the nonstandard behaviors and handles TIMESTAMP columns as follows:

- TIMESTAMP columns not explicitly declared with the NULL attribute are automatically declared with the NOT NULL attribute. Assigning such a column a value of NULL is permitted and sets the column to the current timestamp.

- The first TIMESTAMP column in a table, if not explicitly declared with the NULL attribute or an explicit DEFAULT or ON UPDATE attribute, is automatically declared with the DEFAULT CURRENT_TIMESTAMP and ON UPDATE CURRENT_TIMESTAMP attributes.

- TIMESTAMP columns following the first one, if not explicitly declared with the NULL attribute or an explicit DEFAULT attribute, are automatically declared as DEFAULT '0000-00-00 00:00:00' (the “zero” timestamp). For inserted rows that specify no explicit value for such a column, the column is assigned '0000-00-00 00:00:00' and no warning occurs.

Depending on whether strict SQL mode or the NO_ZERO_DATE SQL mode is enabled, a default value of '0000-00-00 00:00:00' may be invalid. Be aware that the TRADITIONAL SQL mode includes strict mode and NO_ZERO_DATE. See Section 5.1.10, “Server SQL Modes”.

As of MySQL 5.6.6, the nonstandard behaviors just described are deprecated and will be removed in a future MySQL release.

If explicit_defaults_for_timestamp is enabled, the server disables the nonstandard behaviors and handles TIMESTAMP columns as follows:

- It is not possible to assign a TIMESTAMP column a value of NULL to set it to the current timestamp. To assign the current timestamp, set the column to CURRENT_TIMESTAMP or a synonym such as NOW().

- TIMESTAMP columns not explicitly declared with the NOT NULL attribute are automatically declared with the NULL attribute and permit NULL values. Assigning such a column a value of NULL sets it to NULL, not the current timestamp.

- TIMESTAMP columns declared with the NOT NULL attribute do not permit NULL values. For inserts that specify NULL for such a column, the result is either an error for a single-row insert or if strict SQL mode is enabled, or '0000-00-00 00:00:00' is inserted for multiple-row inserts with strict SQL mode disabled. In no case does assigning the column a value of NULL set it to the current timestamp.

- TIMESTAMP columns explicitly declared with the NOT NULL attribute and without an explicit DEFAULT attribute are treated as having no default value. For inserted rows that specify no explicit value for such a column, the result depends on the SQL mode. If strict SQL mode is enabled, an error occurs. If strict SQL mode is not enabled, the column is declared with the implicit default of '0000-00-00 00:00:00' and a warning occurs. This is similar to how MySQL treats other temporal types such as DATETIME.

- No TIMESTAMP column is automatically declared with the DEFAULT CURRENT_TIMESTAMP or ON UPDATE CURRENT_TIMESTAMP attributes. Those attributes must be explicitly specified.

- The first TIMESTAMP column in a table is not handled differently from TIMESTAMP columns following the first one.
If `explicit_defaults_for_timestamp` is disabled at server startup, this warning appears in the error log:

```
[Warning] TIMESTAMP with implicit DEFAULT value is deprecated.
Please use --explicit_defaults_for_timestamp server option (see documentation for more details).
```

As indicated by the warning, to disable the deprecated nonstandard behaviors, enable the `explicit_defaults_for_timestamp` system variable at server startup.

**Note**

`explicit_defaults_for_timestamp` is itself deprecated because its only purpose is to permit control over deprecated `TIMESTAMP` behaviors that are to be removed in a future MySQL release. When removal of those behaviors occurs, `explicit_defaults_for_timestamp` will have no purpose and will be removed as well.

For additional information, see Section 11.3.5, “Automatic Initialization and Updating for `TIMESTAMP` and `DATETIME`”.

- `external_user`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>external_user</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

The external user name used during the authentication process, as set by the plugin used to authenticate the client. With native (built-in) MySQL authentication, or if the plugin does not set the value, this variable is `NULL`. See Section 6.2.12, “Proxy Users”.

- `flush`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--flush=[OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>flush</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

If `ON`, the server flushes (synchronizes) all changes to disk after each SQL statement. Normally, MySQL does a write of all changes to disk only after each SQL statement and lets the operating system handle the synchronizing to disk. See Section B.4.3.3, “What to Do If MySQL Keeps Crashing”. This variable is set to `ON` if you start `mysqld` with the `--flush` option.
Note

If `flush` is enabled, the value of `flush_time` does not matter and changes to `flush_time` have no effect on flush behavior.

- `flush_time`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--flush-time=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>flush_time</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (Other, &lt;= 5.6.5)</td>
<td>0</td>
</tr>
<tr>
<td>Default Value (Windows, &lt;= 5.6.5)</td>
<td>1800</td>
</tr>
<tr>
<td>Default Value (&gt;= 5.6.6)</td>
<td>0</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
</tbody>
</table>

If this is set to a nonzero value, all tables are closed every `flush_time` seconds to free up resources and synchronize unflushed data to disk. This option is best used only on systems with minimal resources. The default is 0.

Note

If `flush` is enabled, the value of `flush_time` does not matter and changes to `flush_time` have no effect on flush behavior.

- `foreign_key_checks`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>foreign_key_checks</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

If set to 1 (the default), foreign key constraints for InnoDB tables are checked. If set to 0, foreign key constraints are ignored, with a couple of exceptions. When re-creating a table that was dropped, an error is returned if the table definition does not conform to the foreign key constraints referencing the table. Likewise, an `ALTER TABLE` operation returns an error if a foreign key definition is incorrectly formed. For more information, see Section 13.1.17.6, “Using FOREIGN KEY Constraints”.

Beginning with MySQL NDB Cluster 7.3.2, setting this variable has the same effect on NDB tables as it does for InnoDB tables—previously, the setting was ignored and all such checks were enforced (Bug #14095855). Typically you leave this setting enabled during normal operation, to enforce referential integrity.
Disabling foreign key checking can be useful for reloading such tables in an order different from that required by their parent/child relationships. See Section 14.6.1.5, “InnoDB and FOREIGN KEY Constraints”.

Setting `foreign_key_checks` to 0 also affects data definition statements: `DROP_SCHEMA` drops a schema even if it contains tables that have foreign keys that are referred to by tables outside the schema, and `DROP TABLE` drops tables that have foreign keys that are referred to by other tables.

**Note**

Setting `foreign_key_checks` to 1 does not trigger a scan of the existing table data. Therefore, rows added to the table while `foreign_key_checks=0` will not be verified for consistency.

**Warning**

With `foreign_key_checks=0`, dropping an index required by a foreign key constraint places the table in an inconsistent state and causes the foreign key check that occurs at table load to fail. To avoid this problem, remove the foreign key constraint before dropping the index (Bug #70260).

- `ft_boolean_syntax`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--ft-boolean-syntax=name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>ft_boolean_syntax</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td>`+ - &gt; &lt; ( ) ~ * : &quot; &amp;</td>
</tr>
</tbody>
</table>

The list of operators supported by boolean full-text searches performed using `IN BOOLEAN MODE`. See Section 12.9.2, “Boolean Full-Text Searches”.

The default variable value is ` '+ - > < ( ) ~ * : " & |`. The rules for changing the value are as follows:

- Operator function is determined by position within the string.
- The replacement value must be 14 characters.
- Each character must be an ASCII nonalphanumeric character.
- Either the first or second character must be a space.
- No duplicates are permitted except the phrase quoting operators in positions 11 and 12. These two characters are not required to be the same, but they are the only two that may be.
- Positions 10, 13, and 14 (which by default are set to `: `, `&`, and `|`) are reserved for future extensions.

- `ft_max_word_len`
### ft_max_word_len

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--ft-max-word-len=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>ft_max_word_len</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>10</td>
</tr>
</tbody>
</table>

The maximum length of the word to be included in a *MyISAM FULLTEXT* index.

**Note**

*FULLTEXT* indexes on *MyISAM* tables must be rebuilt after changing this variable. Use `REPAIR TABLE tbl_name QUICK`.

### ft_min_word_len

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--ft-min-word-len=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>ft_min_word_len</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>4</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
</tbody>
</table>

The minimum length of the word to be included in a *MyISAM FULLTEXT* index.

**Note**

*FULLTEXT* indexes on *MyISAM* tables must be rebuilt after changing this variable. Use `REPAIR TABLE tbl_name QUICK`.

### ft_query_expansion_limit

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--ft-query-expansion-limit=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>ft_query_expansion_limit</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>20</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1000</td>
</tr>
</tbody>
</table>

The number of top matches to use for full-text searches performed using *WITH QUERY EXPANSION*.
Server System Variables

- **ft_stopword_file**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--ft-stopword-file=file_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>ft_stopword_file</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>

The file from which to read the list of stopwords for full-text searches on MyISAM tables. The server looks for the file in the data directory unless an absolute path name is given to specify a different directory. All the words from the file are used; comments are not honored. By default, a built-in list of stopwords is used (as defined in the storage/myisam/ft_static.c file). Setting this variable to the empty string ('') disables stopword filtering. See also Section 12.9.4, “Full-Text Stopwords”.

Note

FULLTEXT indexes on MyISAM tables must be rebuilt after changing this variable or the contents of the stopword file. Use REPAIR TABLE tbl_name QUICK.

- **general_log**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--general-log[=(OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td>general_log</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Whether the general query log is enabled. The value can be 0 (or OFF) to disable the log or 1 (or ON) to enable the log. The destination for log output is controlled by the log_output system variable; if that value is NONE, no log entries are written even if the log is enabled.

- **general_log_file**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--general-log-file=file_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>general_log_file</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
<tr>
<td>Default Value</td>
<td>host_name.log</td>
</tr>
</tbody>
</table>

The name of the general query log file. The default value is host_name.log, but the initial value can be changed with the --general-log-file option.

- **group_concat_max_len**
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--group-concat-max-len=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>group_concat_max_len</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1024</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>4</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

The maximum permitted result length in bytes for the `GROUP_CONCAT()` function. The default is 1024.

- **have_compress**
  
  *YES* if the `zlib` compression library is available to the server, *NO* if not. If not, the `COMPRESS()` and `UNCOMPRESS()` functions cannot be used.

- **have_crypt**
  
  *YES* if the `crypt()` system call is available to the server, *NO* if not. If not, the `ENCRYPT()` function cannot be used.

- **have_csv**
  
  *YES* if `mysqld` supports CSV tables, *NO* if not.

  This variable was removed in MySQL 5.6.1. Use `SHOW ENGINES` instead.

- **have_dynamic_loading**
  
  *YES* if `mysqld` supports dynamic loading of plugins, *NO* if not. If the value is *NO*, you cannot use options such as `--plugin-load` to load plugins at server startup, or the `INSTALL PLUGIN` statement to load plugins at runtime.

- **have_geometry**
  
  *YES* if the server supports spatial data types, *NO* if not.

- **have_innodb**
  
  *YES* if `mysqld` supports InnoDB tables. *DISABLED* if `--skip-innodb` is used.

  This variable was removed in MySQL 5.6.1. Use `SHOW ENGINES` instead.

- **have_openssl**
  
  This variable is an alias for `have_ssl`.

- **have_partitioning**
YES if mysqld supports partitioning.

This variable was removed in MySQL 5.6.1. Use SHOW PLUGINS instead. For more information, see Chapter 19, Partitioning.

• have_profiling

YES if statement profiling capability is present, NO if not. If present, the profiling system variable controls whether this capability is enabled or disabled. See Section 13.7.5.32, “SHOW PROFILES Syntax”.

This variable is deprecated and will be removed in a future MySQL release.

• have_query_cache

YES if mysqld supports the query cache, NO if not.

• have_rtree_keys

YES if RTREE indexes are available, NO if not. (These are used for spatial indexes in MyISAM tables.)

• have_ssl

YES if mysqld supports SSL connections, NO if not. DISABLED indicates that the server was compiled with SSL support, but was not started with the appropriate --ssl-xxx options. For more information, see Section 2.9.6, “Configuring SSL Library Support”.

• have_symlink

YES if symbolic link support is enabled, NO if not. This is required on Unix for support of the DATA DIRECTORY and INDEX DIRECTORY table options, and on Windows for support of data directory symlinks. If the server is started with the --skip-symbolic-links option, the value is DISABLED.

• host_cache_size

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--host-cache-size=#</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.5</td>
</tr>
<tr>
<td>System Variable</td>
<td>host_cache_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (&gt;= 5.6.8)</td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
</tr>
<tr>
<td>Default Value (&lt;= 5.6.7)</td>
<td>128</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>65536</td>
</tr>
</tbody>
</table>

This variable controls the size of the host cache, as well as the size of the Performance Schema host_cache table that exposes the cache contents. Setting the size to 0 disables the host cache. Changing the cache size at runtime causes an implicit FLUSH HOSTS operation that clears the host cache, truncates the host_cache table, and unblocks any blocked hosts.
The default value is autosized to 128, plus 1 for a value of `max_connections` up to 500, plus 1 for every increment of 20 over 500 in the `max_connections` value, capped to a limit of 2000.

Using the `--skip-host-cache` option is similar to setting the `host_cache_size` system variable to 0, but `host_cache_size` is more flexible because it can also be used to resize, enable, and disable the host cache at runtime, not just at server startup. Starting the server with `--skip-host-cache` does not prevent changes to the value of `host_cache_size`, but such changes have no effect and the cache is not re-enabled even if `host_cache_size` is set larger than 0 at runtime.

For more information about how the host cache works, see Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”.

• **hostname**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>hostname</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

The server sets this variable to the server host name at startup.

• **identity**

This variable is a synonym for the `last_insert_id` variable. It exists for compatibility with other database systems. You can read its value with `SELECT @@identity`, and set it using `SET identity`.

• **ignore_db_dirs**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Introduced</td>
<td>5.6.3</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>ignore_db_dirs</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

A comma-separated list of names that are not considered as database directories in the data directory. The value is set from any instances of `--ignore-db-dir` given at server startup.

• **init_connect**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--init-connect=name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>init_connect</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>
A string to be executed by the server for each client that connects. The string consists of one or more SQL statements, separated by semicolon characters.

For users that have the SUPER privilege, the content of `init_connect` is not executed. This is done so that an erroneous value for `init_connect` does not prevent all clients from connecting. For example, the value might contain a statement that has a syntax error, thus causing client connections to fail. Not executing `init_connect` for users that have the SUPER privilege enables them to open a connection and fix the `init_connect` value.

The server discards any result sets produced by statements in the value of `init_connect`.

- `init_file`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--init-file=file_name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>init_file</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>

If specified, this variable names a file containing SQL statements to be read and executed during the startup process. Each statement must be on a single line and should not include comments.

If the server is started with the `--bootstrap` option, it operates in bootstrap mode and some functionality is unavailable that limits the statements permitted in the file. These include statements that relate to account management (such as `CREATE USER` or `GRANT`), replication, and global transaction identifiers. See Section 17.1.3, “Replication with Global Transaction Identifiers”.

- `innodb_xxx`

InnoDB system variables are listed in Section 14.14, “InnoDB Startup Options and System Variables”. These variables control many aspects of storage, memory use, and I/O patterns for InnoDB tables, and are especially important now that InnoDB is the default storage engine.

- `insert_id`

The value to be used by the following `INSERT` or `ALTER TABLE` statement when inserting an `AUTO_INCREMENT` value. This is mainly used with the binary log.

- `interactive_timeout`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--interactive-timeout=</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>interactive_timeout</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>28800</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
</tbody>
</table>
The number of seconds the server waits for activity on an interactive connection before closing it. An interactive client is defined as a client that uses the `CLIENT_INTERACTIVE` option to `mysql_real_connect()`. See also `wait_timeout`.

- **join_buffer_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--join-buffer-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>join_buffer_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (Other, 64-bit platforms, &gt;= 5.6.6)</td>
<td>262144</td>
</tr>
<tr>
<td>Default Value (Other, 64-bit platforms, &lt;= 5.6.5)</td>
<td>131072</td>
</tr>
<tr>
<td>Default Value (Other, 32-bit platforms, &gt;= 5.6.6)</td>
<td>262144</td>
</tr>
<tr>
<td>Default Value (Other, 32-bit platforms, &lt;= 5.6.5)</td>
<td>131072</td>
</tr>
<tr>
<td>Default Value (Windows, &gt;= 5.6.6)</td>
<td>262144</td>
</tr>
<tr>
<td>Default Value (Windows, &lt;= 5.6.5)</td>
<td>131072</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>128</td>
</tr>
<tr>
<td>Maximum Value (Other, 64-bit platforms)</td>
<td>18446744073709547520</td>
</tr>
<tr>
<td>Maximum Value (Other, 32-bit platforms)</td>
<td>4294967295</td>
</tr>
<tr>
<td>Maximum Value (Windows)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

The minimum size of the buffer that is used for plain index scans, range index scans, and joins that do not use indexes and thus perform full table scans. Normally, the best way to get fast joins is to add indexes. Increase the value of `join_buffer_size` to get a faster full join when adding indexes is not possible. One join buffer is allocated for each full join between two tables. For a complex join between several tables for which indexes are not used, multiple join buffers might be necessary.

Unless a Block Nested-Loop or Batched Key Access algorithm is used, there is no gain from setting the buffer larger than required to hold each matching row, and all joins allocate at least the minimum size, so use caution in setting this variable to a large value globally. It is better to keep the global setting small and change the session setting to a larger value only in sessions that are doing large joins. Memory allocation time can cause substantial performance drops if the global size is larger than needed by most queries that use it.

When Block Nested-Loop is used, a larger join buffer can be beneficial up to the point where all required columns from all rows in the first table are stored in the join buffer. This depends on the query; the optimal size may be smaller than holding all rows from the first tables.
When Batched Key Access is used, the value of `join_buffer_size` defines how large the batch of keys is in each request to the storage engine. The larger the buffer, the more sequential access will be to the right hand table of a join operation, which can significantly improve performance.

The default is 256KB. The maximum permissible setting for `join_buffer_size` is 4GB−1. Larger values are permitted for 64-bit platforms (except 64-bit Windows, for which large values are truncated to 4GB−1 with a warning).

For additional information about join buffering, see Section 8.2.1.6, “Nested-Loop Join Algorithms”. For information about Batched Key Access, see Section 8.2.1.11, “Block Nested-Loop and Batched Key Access Joins”.

- **keep_files_on_create**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--keep-files-on-create=[{OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>keep_files_on_create</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>OFF</code></td>
</tr>
</tbody>
</table>

If a `MyISAM` table is created with no `DATA DIRECTORY` option, the `.MYD` file is created in the database directory. By default, if `MyISAM` finds an existing `.MYD` file in this case, it overwrites it. The same applies to `.MYI` files for tables created with no `INDEX DIRECTORY` option. To suppress this behavior, set the `keep_files_on_create` variable to `ON` (1), in which case `MyISAM` will not overwrite existing files and returns an error instead. The default value is `OFF` (0).

If a `MyISAM` table is created with a `DATA DIRECTORY` or `INDEX DIRECTORY` option and an existing `.MYD` or `.MYI` file is found, `MyISAM` always returns an error. It will not overwrite a file in the specified directory.

- **key_buffer_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--key-buffer-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>key_buffer_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>8</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>8</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td><code>OS_PER_PROCESS_LIMIT</code></td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>
Index blocks for *MyISAM* tables are buffered and are shared by all threads. *key_buffer_size* is the size of the buffer used for index blocks. The key buffer is also known as the key cache.

The maximum permissible setting for *key_buffer_size* is 4GB−1 on 32-bit platforms. Larger values are permitted for 64-bit platforms. The effective maximum size might be less, depending on your available physical RAM and per-process RAM limits imposed by your operating system or hardware platform. The value of this variable indicates the amount of memory requested. Internally, the server allocates as much memory as possible up to this amount, but the actual allocation might be less.

You can increase the value to get better index handling for all reads and multiple writes; on a system whose primary function is to run MySQL using the *MyISAM* storage engine, 25% of the machine's total memory is an acceptable value for this variable. However, you should be aware that, if you make the value too large (for example, more than 50% of the machine's total memory), your system might start to page and become extremely slow. This is because MySQL relies on the operating system to perform file system caching for data reads, so you must leave some room for the file system cache. You should also consider the memory requirements of any other storage engines that you may be using in addition to *MyISAM*.

For even more speed when writing many rows at the same time, use *LOCK TABLES*. See Section 8.2.4.1, “Optimizing INSERT Statements”.

You can check the performance of the key buffer by issuing a *SHOW STATUS* statement and examining the *Key_read_requests*, *Key_reads*, *Key_write_requests*, and *Key_writes* status variables. (See Section 13.7.5, “SHOW Syntax.”) The *Key_reads/Key_read_requests* ratio should normally be less than 0.01. The *Key_writes/Key_write_requests* ratio is usually near 1 if you are using mostly updates and deletes, but might be much smaller if you tend to do updates that affect many rows at the same time or if you are using the *DELAY_KEY_WRITE* table option.

The fraction of the key buffer in use can be determined using *key_buffer_size* in conjunction with the *Key_blocks_unused* status variable and the buffer block size, which is available from the *key_cache_block_size* system variable:

\[
1 - \left(\frac{\text{Key_blocks_unused} \times \text{key_cache_block_size}}{\text{key_buffer_size}}\right)
\]

This value is an approximation because some space in the key buffer is allocated internally for administrative structures. Factors that influence the amount of overhead for these structures include block size and pointer size. As block size increases, the percentage of the key buffer lost to overhead tends to decrease. Larger blocks results in a smaller number of read operations (because more keys are obtained per read), but conversely an increase in reads of keys that are not examined (if not all keys in a block are relevant to a query).

It is possible to create multiple *MyISAM* key caches. The size limit of 4GB applies to each cache individually, not as a group. See Section 8.10.2, “The MyISAM Key Cache”.

- *key_cache_age_threshold*

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--key-cache-age-threshold=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>key_cache_age_threshold</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>300</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>100</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

This value controls the demotion of buffers from the hot sublist of a key cache to the warm sublist. Lower values cause demotion to happen more quickly. The minimum value is 100. The default value is 300. See Section 8.10.2, “The MyISAM Key Cache”.

- **key_cache_block_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--key-cache-block-size=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>key_cache_block_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1024</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>512</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>16384</td>
</tr>
</tbody>
</table>

The size in bytes of blocks in the key cache. The default value is 1024. See Section 8.10.2, “The MyISAM Key Cache”.

- **key_cache_division_limit**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--key-cache-division-limit=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>key_cache_division_limit</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>100</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>100</td>
</tr>
</tbody>
</table>

The division point between the hot and warm sublists of the key cache buffer list. The value is the percentage of the buffer list to use for the warm sublist. Permissible values range from 1 to 100. The default value is 100. See Section 8.10.2, “The MyISAM Key Cache”.

- **large_files_support**
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>large_files_support</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
</tbody>
</table>

Whether `mysqld` was compiled with options for large file support.

- **large_pages**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--large-pages=[{OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td>large_pages</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Platform Specific</td>
<td>Linux</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Whether large page support is enabled (via the `--large-pages` option). See Section 8.12.4.2, “Enabling Large Page Support”.

- **large_page_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>large_page_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
</tbody>
</table>

If large page support is enabled, this shows the size of memory pages. Large memory pages are supported only on Linux; on other platforms, the value of this variable is always 0. See Section 8.12.4.2, “Enabling Large Page Support”.

- **last_insert_id**

The value to be returned from `LAST_INSERT_ID()` is stored in the binary log when you use `LAST_INSERT_ID()` in a statement that updates a table. Setting this variable does not update the value returned by the `mysql_insert_id()` C API function.

- **lc_messages**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--lc-messages=name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td>lc_messages</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td>en_US</td>
</tr>
</tbody>
</table>

The locale to use for error messages. The default is en_US. The server converts the argument to a language name and combines it with the value of `lc_messages_dir` to produce the location for the error message file. See Section 10.12, “Setting the Error Message Language”.

- **lc_messages_dir**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--lc-messages-dir=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>lc_messages_dir</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
</tbody>
</table>

The directory where error messages are located. The server uses the value together with the value of `lc_messages` to produce the location for the error message file. See Section 10.12, “Setting the Error Message Language”.

- **lc_time_names**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--lc-time-names=value</td>
</tr>
<tr>
<td>System Variable</td>
<td>lc_time_names</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

This variable specifies the locale that controls the language used to display day and month names and abbreviations. This variable affects the output from the `DATE_FORMAT()`, `DAYNAME()` and `MONTHNAME()` functions. Locale names are POSIX-style values such as 'ja_JP' or 'pt_BR'. The default value is 'en_US' regardless of your system's locale setting. For further information, see Section 10.16, “MySQL Server Locale Support”.

- **license**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>license</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td>GPL</td>
</tr>
</tbody>
</table>

The type of license the server has.

- **local_infile**
**Server System Variables**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td>`--local-infile=[{OFF</td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>local_infile</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Boolean</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>ON</td>
</tr>
</tbody>
</table>

This variable controls server-side LOCAL capability for LOAD DATA statements. Depending on the `local_infile` setting, the server refuses or permits local data loading by clients that have LOCAL enabled on the client side.

To explicitly cause the server to refuse or permit LOAD DATA LOCAL statements (regardless of how client programs and libraries are configured at build time or runtime), start `mysqld` with `local_infile` disabled or enabled, respectively. `local_infile` can also be set at runtime. For more information, see Section 6.1.6, “Security Issues with LOAD DATA LOCAL”.

• **lock_wait_timeout**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--lock-wait-timeout=#</code></td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>lock_wait_timeout</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global, Session</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>31536000</td>
</tr>
<tr>
<td><strong>Minimum Value</strong></td>
<td>1</td>
</tr>
<tr>
<td><strong>Maximum Value</strong></td>
<td>31536000</td>
</tr>
</tbody>
</table>

This variable specifies the timeout in seconds for attempts to acquire metadata locks. The permissible values range from 1 to 31536000 (1 year). The default is 31536000.

This timeout applies to all statements that use metadata locks. These include DML and DDL operations on tables, views, stored procedures, and stored functions, as well as LOCK TABLES, FLUSH TABLES WITH READ LOCK, and HANDLER statements.

This timeout does not apply to implicit accesses to system tables in the mysql database, such as grant tables modified by GRANT or REVOKE statements or table logging statements. The timeout does apply to system tables accessed directly, such as with SELECT or UPDATE.

The timeout value applies separately for each metadata lock attempt. A given statement can require more than one lock, so it is possible for the statement to block for longer than the lock_wait_timeout value before reporting a timeout error. When lock timeout occurs, ER_LOCK_WAIT_TIMEOUT is reported.

`lock_wait_timeout` does not apply to delayed inserts, which always execute with a timeout of 1 year. This is done to avoid unnecessary timeouts because a session that issues a delayed insert receives no notification of delayed insert timeouts.

• **locked_in_memory**
Whether `mysqld` was locked in memory with `--memlock`.

- **log**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--log[=file_name]</code></td>
</tr>
<tr>
<td>Deprecated</td>
<td>Yes (removed in 5.6.1); use <code>general_log</code> instead</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>log</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>

This variable removed in MySQL 5.6.1. Use `general_log` instead.

- **log_error**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--log-error[=file_name]</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>log_error</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>

The name of the error log file, or empty if the server is writing error messages to the console rather than to a named file. See Section 5.4.2, “The Error Log”.

- **log_output**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--log-output=name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>log_output</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Set</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>FILE</code></td>
</tr>
<tr>
<td>Valid Values</td>
<td><code>TABLE</code></td>
</tr>
<tr>
<td></td>
<td><code>FILE</code></td>
</tr>
<tr>
<td></td>
<td><code>NONE</code></td>
</tr>
</tbody>
</table>
The destination or destinations for general query log and slow query log output. The value is a list one or more comma-separated words chosen from \textit{TABLE}, \textit{FILE}, and \textit{NONE}. \textit{TABLE} selects logging to the \texttt{general_log} and \texttt{slow_log} tables in the \texttt{mysql} system database. \textit{FILE} selects logging to log files. \textit{NONE} disables logging. If \textit{NONE} is present in the value, it takes precedence over any other words that are present. \textit{TABLE} and \textit{FILE} can both be given to select both log output destinations.

This variable selects log output destinations, but does not enable log output. To do that, enable the \texttt{general_log} and \texttt{slow_query_log} system variables. For \textit{FILE} logging, the \texttt{general_log_file} and \texttt{slow_query_log_file} system variables determine the log file locations. For more information, see Section 5.4.1, “Selecting General Query Log and Slow Query Log Output Destinations”.

- \texttt{log_queries_not_using_indexes}

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>\texttt{--log-queries-not-using-indexes=[{OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td>\texttt{log_queries_not_using_indexes}</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>\texttt{OFF}</td>
</tr>
</tbody>
</table>

If you enable this variable with the slow query log enabled, queries that are expected to retrieve all rows are logged. See Section 5.4.5, “The Slow Query Log”. This option does not necessarily mean that no index is used. For example, a query that uses a full index scan uses an index but would be logged because the index would not limit the number of rows.

- \texttt{log_slow_admin_statements}

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>\texttt{--log-slow-admin-statements=[{OFF</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.11</td>
</tr>
<tr>
<td>System Variable</td>
<td>\texttt{log_slow_admin_statements}</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>\texttt{OFF}</td>
</tr>
</tbody>
</table>

Include slow administrative statements in the statements written to the slow query log. Administrative statements include \texttt{ALTER TABLE}, \texttt{ANALYZE TABLE}, \texttt{CHECK TABLE}, \texttt{CREATE INDEX}, \texttt{DROP INDEX}, \texttt{OPTIMIZE TABLE}, and \texttt{REPAIR TABLE}.

This variable was added in MySQL 5.6.11 as a replacement for the \texttt{--log-slow-admin-statements} option. The system variable can be set on the command line or in option files the same way as the option, so there is no need for any changes at server startup, but the system variable also makes it possible to examine or set the value at runtime.

- \texttt{log_slow_queries}
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--log_slow_queries=[OFF</td>
</tr>
<tr>
<td>Deprecated</td>
<td>Yes (removed in 5.6.1); use <code>slow_query_log</code> instead</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>log_slow_queries</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

This variable was removed in MySQL 5.6.1. Instead, use the `slow_query_log` system variable to enable the slow query log and the `slow_query_log_file` system variable to set the slow query log file name.

- **log_throttle_queries_not_using_indexes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--log-throttle-queries-not-using-indexes=#</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.5</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>log_throttle_queries_not_using_indexed</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
</tbody>
</table>

If `log_queries_not_using_indexes` is enabled, the `log_throttle_queries_not_using_indexes` variable limits the number of such queries per minute that can be written to the slow query log. A value of 0 (the default) means “no limit”. For more information, see Section 5.4.5, “The Slow Query Log”.

- **log_warnings**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--log-warnings=[#]</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>log_warnings</code></td>
</tr>
<tr>
<td>Scope (&gt;= 5.6.4)</td>
<td>Global</td>
</tr>
<tr>
<td>Scope (&lt;= 5.6.3)</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>
Whether to produce additional warning messages to the error log. This variable is enabled by default with a value of 1. To disable it, set it to 0. If the value is greater than 0, the server logs messages about statements that are unsafe for statement-based logging. If the value is greater than 1, the server logs aborted connections and access-denied errors for new connection attempts. See Section B.4.2.11, “Communication Errors and Aborted Connections”.

- **long_query_time**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--long-query-time=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>long_query_time</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Numeric</td>
</tr>
<tr>
<td>Default Value</td>
<td>10</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
</tbody>
</table>

If a query takes longer than this many seconds, the server increments the `Slow_queries` status variable. If the slow query log is enabled, the query is logged to the slow query log file. This value is measured in real time, not CPU time, so a query that is under the threshold on a lightly loaded system might be above the threshold on a heavily loaded one. The minimum and default values of `long_query_time` are 0 and 10, respectively. The value can be specified to a resolution of microseconds. For logging to a file, times are written including the microseconds part. For logging to tables, only integer times are written; the microseconds part is ignored. See Section 5.4.5, “The Slow Query Log”.

- **low_priority_updates**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--low-priority-updates=[OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>low_priority_updates</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

If set to 1, all `INSERT`, `UPDATE`, `DELETE`, and `LOCK TABLE WRITE` statements wait until there is no pending `SELECT` or `LOCK TABLE READ` on the affected table. The same effect can be obtained using `{INSERT | REPLACE | DELETE | UPDATE} LOW_PRIORITY ...` to lower the priority of only one query. This variable affects only storage engines that use only table-level locking (such as `MyISAM`, `MEMORY`, and `MERGE`). See Section 8.11.2, “Table Locking Issues”.

- **lower_case_file_system**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>lower_case_file_system</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
</tbody>
</table>
This variable describes the case sensitivity of file names on the file system where the data directory is located. **OFF** means file names are case-sensitive, **ON** means they are not case-sensitive. This variable is read only because it reflects a file system attribute and setting it would have no effect on the file system.

- **lower_case_table_names**

If set to 0, table names are stored as specified and comparisons are case-sensitive. If set to 1, table names are stored in lowercase on disk and comparisons are not case sensitive. If set to 2, table names are stored as given but compared in lowercase. This option also applies to database names and table aliases. For additional information, see Section 9.2.3, “Identifier Case Sensitivity”.

On Windows the default value is 1. On macOS, the default value is 2. On Linux, a value of 2 is not supported; the server forces the value to 0 instead.

You should not set `lower_case_table_names` to 0 if you are running MySQL on a system where the data directory resides on a case-insensitive file system (such as on Windows or macOS). It is an unsupported combination that could result in a hang condition when running an `INSERT INTO ... SELECT ... FROM tbl_name` operation with the wrong `tbl_name` letter case. With MyISAM, accessing table names using different letter cases could cause index corruption.

As of MySQL 5.6.27, an error message is printed and the server exits if you attempt to start the server with `--lower_case_table_names=0` on a case-insensitive file system.

If you are using InnoDB tables, you should set this variable to 1 on all platforms to force names to be converted to lowercase.

The setting of this variable in MySQL 5.6 affects the behavior of replication filtering options with regard to case sensitivity. This is a change from previous versions of MySQL. (Bug #51639) See Section 17.2.3, "How Servers Evaluate Replication Filtering Rules", for more information.

- **max_allowed_packet**

If set to 0, table names are stored as specified and comparisons are case-sensitive. If set to 1, table names are stored in lowercase on disk and comparisons are not case sensitive. If set to 2, table names are stored as given but compared in lowercase. This option also applies to database names and table aliases. For additional information, see Section 9.2.3, “Identifier Case Sensitivity”.

On Windows the default value is 1. On macOS, the default value is 2. On Linux, a value of 2 is not supported; the server forces the value to 0 instead.

You should not set `lower_case_table_names` to 0 if you are running MySQL on a system where the data directory resides on a case-insensitive file system (such as on Windows or macOS). It is an unsupported combination that could result in a hang condition when running an `INSERT INTO ... SELECT ... FROM tbl_name` operation with the wrong `tbl_name` letter case. With MyISAM, accessing table names using different letter cases could cause index corruption.

As of MySQL 5.6.27, an error message is printed and the server exits if you attempt to start the server with `--lower_case_table_names=0` on a case-insensitive file system.

If you are using InnoDB tables, you should set this variable to 1 on all platforms to force names to be converted to lowercase.

The setting of this variable in MySQL 5.6 affects the behavior of replication filtering options with regard to case sensitivity. This is a change from previous versions of MySQL. (Bug #51639) See Section 17.2.3, "How Servers Evaluate Replication Filtering Rules", for more information.
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>&gt;= 5.6.6</td>
</tr>
<tr>
<td></td>
<td>4194304</td>
</tr>
<tr>
<td>Default Value</td>
<td>&lt;= 5.6.5</td>
</tr>
<tr>
<td></td>
<td>1048576</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1073741824</td>
</tr>
</tbody>
</table>

The maximum size of one packet or any generated/intermediate string, or any parameter sent by the `mysql_stmt_send_long_data()` C API function. The default is 4MB.

The packet message buffer is initialized to `net_buffer_length` bytes, but can grow up to `max_allowed_packet` bytes when needed. This value by default is small, to catch large (possibly incorrect) packets.

You must increase this value if you are using large BLOB columns or long strings. It should be as big as the largest BLOB you want to use. The protocol limit for `max_allowed_packet` is 1GB. The value should be a multiple of 1024; nonmultiples are rounded down to the nearest multiple.

When you change the message buffer size by changing the value of the `max_allowed_packet` variable, you should also change the buffer size on the client side if your client program permits it. The default `max_allowed_packet` value built in to the client library is 1GB, but individual client programs might override this. For example, `mysql` and `mysqldump` have defaults of 16MB and 24MB, respectively. They also enable you to change the client-side value by setting `max_allowed_packet` on the command line or in an option file.

The session value of this variable is read only. The client can receive up to as many bytes as the session value. However, the server will not send to the client more bytes than the current global `max_allowed_packet` value. (The global value could be less than the session value if the global value is changed after the client connects.)

- `max_connect_errors`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--max-connect-errors=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>max_connect_errors</code></td>

<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (64-bit platforms, &gt;= 5.6.6)</td>
<td>100</td>
</tr>
<tr>
<td>Default Value (64-bit platforms, &lt;= 5.6.5)</td>
<td>10</td>
</tr>
<tr>
<td>Default Value (32-bit platforms, &gt;= 5.6.6)</td>
<td>100</td>
</tr>
<tr>
<td>Default Value (32-bit platforms, &lt;= 5.6.5)</td>
<td>10</td>
</tr>
</tbody>
</table>
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

After `max_connect_errors` successive connection requests from a host are interrupted without a successful connection, the server blocks that host from further connections. If a connection from a host is established successfully within fewer than `max_connect_errors` attempts after a previous connection was interrupted, the error count for the host is cleared to zero. However, once a host is blocked, flushing the host cache is the only way to unblock it. To flush the host cache, execute a `FLUSH HOSTS` statement, a `TRUNCATE TABLE` statement that truncates the Performance Schema `host_cache` table, or a `mysqladmin flush-hosts` command.

For more information about how the host cache works, see Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”.

- `max_connections`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--max-connections=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>max_connections</code></td>

<td>20</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>16384</td>
</tr>
</tbody>
</table>
Server System Variables

Do not start more than this number of threads to handle INSERT DELAYED statements for nontransactional tables. If you try to insert data into a new table after all INSERT DELAYED threads are in use, the row is inserted as if the DELAYED attribute was not specified. If you set this to 0, MySQL never creates a thread to handle DELAYED rows; in effect, this disables DELAYED entirely.

For the SESSION value of this variable, the only valid values are 0 or the GLOBAL value.

This system variable is deprecated (because DELAYED inserts are deprecated), and will be removed in a future release.

- max_digest_length

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--max-digest-length=#</td>

</tr>
<tr>
<td>Maximum Value</td>
<td>1048576</td>
</tr>
</tbody>
</table>

The maximum number of bytes of memory reserved per session for computation of normalized statement digests. Once that amount of space is used during digest computation, truncation occurs: no further tokens from a parsed statement are collected or figure into its digest value. Statements that differ only after that many bytes of parsed tokens produce the same normalized statement digest and are considered identical if compared or if aggregated for digest statistics.

Decreasing the max_digest_length value reduces memory use but causes the digest value of more statements to become indistinguishable if they differ only at the end. Increasing the value permits longer statements to be distinguished but increases memory use, particularly for workloads that involve large numbers of simultaneous sessions (the server allocates max_digest_length bytes per session).

The parser uses this system variable as a limit on the maximum length of normalized statement digests that it computes. The Performance Schema, if it tracks statement digests, makes a copy of the digest value, using the performance_schema_max_digest_length system variable as a limit on the maximum length of digests that it stores. Consequently, if performance_schema_max_digest_length is less than max_digest_length, digest values stored in the Performance Schema are truncated relative to the original digest values.

In MySQL 5.6.24 and 5.6.25, performance_schema_max_digest_length is not available and max_digest_length applies to all digest computation. Before MySQL 5.6.24, neither max_digest_length nor performance_schema_max_digest_length are available and a fixed maximum of 1024 bytes applies to all digest computation.

For more information about statement digesting, see Section 22.10, “Performance Schema Statement Digests”.

- max_error_count
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--max-error-count=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>max_error_count</code></td>
</tr>
<tr>
<td>Scope</td>

<tr>
<td>Default Value</td>
<td>64</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>65535</td>
</tr>
</tbody>
</table>

The maximum number of error, warning, and information messages to be stored for display by the `SHOW ERRORS` and `SHOW WARNINGS` statements. This is the same as the number of condition areas in the diagnostics area, and thus the number of conditions that can be inspected by `GET DIAGNOSTICS`.

- **max_heap_table_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--max-heap-table-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>max_heap_table_size</code></td>
</tr>
<tr>

<td>16777216</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>16384</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>1844674407370954752</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

This variable sets the maximum size to which user-created `MEMORY` tables are permitted to grow. The value of the variable is used to calculate `MEMORY` table `MAX_ROWS` values. Setting this variable has no effect on any existing `MEMORY` table, unless the table is re-created with a statement such as `CREATE TABLE` or altered with `ALTER TABLE` or `TRUNCATE TABLE`. A server restart also sets the maximum size of existing `MEMORY` tables to the global `max_heap_table_size` value.

This variable is also used in conjunction with `tmp_table_size` to limit the size of internal in-memory tables. See Section 8.4.4, “Internal Temporary Table Use in MySQL”.

`max_heap_table_size` is not replicated. See Section 17.4.1.20, “Replication and MEMORY Tables”, and Section 17.4.1.35, “Replication and Variables”, for more information.

- **max_insert_delayed_threads**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deprecated</td>
<td>5.6.7</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>max_insert_delayed_threads</code></td>
</tr>
</tbody>
</table>
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>

This variable is a synonym for `max_delayed_threads`.

This system variable is deprecated (because `DELAYED` inserts are deprecated), and will be removed in a future release.

- **max_join_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--max-join-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>max_join_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>18446744073709551615</td>
</tr>
</tbody>
</table>

Do not permit statements that probably need to examine more than `max_join_size` rows (for single-table statements) or row combinations (for multiple-table statements) or that are likely to do more than `max_join_size` disk seeks. By setting this value, you can catch statements where keys are not used properly and that would probably take a long time. Set it if your users tend to perform joins that lack a `WHERE` clause, that take a long time, or that return millions of rows. For more information, see Using Safe-Updates Mode (`--safe-updates`).

Setting this variable to a value other than `DEFAULT` resets the value of `sql_big_selects` to 0. If you set the `sql_big_selects` value again, the `max_join_size` variable is ignored.

If a query result is in the query cache, no result size check is performed, because the result has previously been computed and it does not burden the server to send it to the client.

- **max_length_for_sort_data**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--max-length-for-sort-data=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>max_length_for_sort_data</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1024</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>4</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>8388608</td>
</tr>
</tbody>
</table>
The cutoff on the size of index values that determines which `filesort` algorithm to use. See Section 8.2.1.13, “ORDER BY Optimization”.

- **max_prepared_stmt_count**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--max-prepared-stmt-count=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>max_prepared_stmt_count</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>16382</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1048576</td>
</tr>
</tbody>
</table>

This variable limits the total number of prepared statements in the server. (The sum of the number of prepared statements across all sessions.) It can be used in environments where there is the potential for denial-of-service attacks based on running the server out of memory by preparing huge numbers of statements. If the value is set lower than the current number of prepared statements, existing statements are not affected and can be used, but no new statements can be prepared until the current number drops below the limit. Setting the value to 0 disables prepared statements.

- **max_seeks_for_key**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--max-seeks-for-key=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>max_seeks_for_key</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (64-bit platforms)</td>
<td><code>18446744073709551615</code></td>
</tr>
<tr>
<td>Default Value (32-bit platforms)</td>
<td><code>4294967295</code></td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td><code>18446744073709551615</code></td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td><code>4294967295</code></td>
</tr>
</tbody>
</table>

Limit the assumed maximum number of seeks when looking up rows based on a key. The MySQL optimizer assumes that no more than this number of key seeks are required when searching for matching rows in a table by scanning an index, regardless of the actual cardinality of the index (see Section 13.7.5.23, “SHOW INDEX Syntax”). By setting this to a low value (say, 100), you can force MySQL to prefer indexes instead of table scans.

- **max_sort_length**
The number of bytes to use when sorting data values. The server uses only the first `max_sort_length` bytes of each value and ignores the rest. Consequently, values that differ only after the first `max_sort_length` bytes compare as equal for `GROUP BY`, `ORDER BY`, and `DISTINCT` operations.

Increasing the value of `max_sort_length` may require increasing the value of `sort_buffer_size` as well. For details, see Section 8.2.1.13, “ORDER BY Optimization”

- `max_sp_recursion_depth`

The number of times that any given stored procedure may be called recursively. The default value for this option is 0, which completely disables recursion in stored procedures. The maximum value is 255.

Stored procedure recursion increases the demand on thread stack space. If you increase the value of `max_sp_recursion_depth`, it may be necessary to increase thread stack size by increasing the value of `thread_stack` at server startup.

- `max_tmp_tables`

This variable is unused. It is deprecated and will be removed in a future MySQL release.

- `max_user_connections`
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>0</td>
</tr>
<tr>
<td><strong>Minimum Value</strong></td>
<td>0</td>
</tr>
<tr>
<td><strong>Maximum Value</strong></td>
<td>4294967295</td>
</tr>
</tbody>
</table>

The maximum number of simultaneous connections permitted to any given MySQL user account. A value of 0 (the default) means “no limit.”

This variable has a global value that can be set at server startup or runtime. It also has a read-only session value that indicates the effective simultaneous-connection limit that applies to the account associated with the current session. The session value is initialized as follows:

- If the user account has a nonzero `MAX_USER_CONNECTIONS` resource limit, the session `max_user_connections` value is set to that limit.
- Otherwise, the session `max_user_connections` value is set to the global value.

Account resource limits are specified using the `GRANT` statement. See Section 6.2.13, “Setting Account Resource Limits”, and Section 13.7.1.4, “GRANT Syntax”.

### max_write_lock_count

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--max-write-lock-count=#</code></td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>max_write_lock_count</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Default Value</strong> (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td><strong>Default Value</strong> (32-bit platforms)</td>
<td>4294967295</td>
</tr>
<tr>
<td><strong>Minimum Value</strong></td>
<td>1</td>
</tr>
<tr>
<td><strong>Maximum Value</strong> (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td><strong>Maximum Value</strong> (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

After this many write locks, permit some pending read lock requests to be processed in between. Write lock requests have higher priority than read lock requests. However, if `max_write_lock_count` is set to some low value (say, 10), read lock requests may be preferred over pending write lock requests if the read lock requests have already been passed over in favor of 10 write lock requests. Normally this behavior does not occur because `max_write_lock_count` by default has a very large value.

### metadata_locks_cache_size

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--metadata-locks-cache-size=#</code></td>
</tr>
</tbody>
</table>
## Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Introduced</td>
<td>5.6.4</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>metadata_locks_cache_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1024</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1048576</td>
</tr>
</tbody>
</table>

The size of the metadata locks cache. The server uses this cache to avoid creation and destruction of synchronization objects. This is particularly helpful on systems where such operations are expensive, such as Windows XP.

### `metadata_locks_hash_instances`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--metadata-locks-hash-instances=#</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.8</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>metadata_locks_hash_instances</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>8</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1024</td>
</tr>
</tbody>
</table>

The set of metadata locks can be partitioned into separate hashes to permit connections accessing different objects to use different locking hashes and reduce contention. The `metadata_locks_hash_instances` system variable specifies the number of hashes (default 8).

### `min_examined_row_limit`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--min-examined-row-limit=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>min_examined_row_limit</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>18446744073709551615 (64-bit platforms)</td>
</tr>
</tbody>
</table>

626
Queries that examine fewer than this number of rows are not logged to the slow query log.

- **multi_range_count**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--multi-range-count=#</td>
</tr>
<tr>
<td>Deprecated</td>
<td>5.6.7</td>
</tr>
<tr>
<td>System Variable</td>
<td>multi_range_count</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>256</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

This variable has no effect. It is deprecated and will be removed in a future MySQL release.

- **myisam_data_pointer_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--myisam-data-pointer-size=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>myisam_data_pointer_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>6</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>2</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>7</td>
</tr>
</tbody>
</table>

The default pointer size in bytes, to be used by `CREATE TABLE` for MyISAM tables when no `MAX_ROWS` option is specified. This variable cannot be less than 2 or larger than 7. The default value is 6. See Section B.4.2.12, “The table is full”.

- **myisam_max_sort_file_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--myisam-max-sort-file-size=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>myisam_max_sort_file_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>
The maximum size of the temporary file that MySQL is permitted to use while re-creating a MyISAM index (during REPAIR TABLE, ALTER TABLE, or LOAD DATA). If the file size would be larger than this value, the index is created using the key cache instead, which is slower. The value is given in bytes.

If MyISAM index files exceed this size and disk space is available, increasing the value may help performance. The space must be available in the file system containing the directory where the original index file is located.

- **myisam_mmap_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value (64-bit platforms)</td>
<td>9223372036854775807</td>
</tr>
<tr>
<td>Default Value (32-bit platforms)</td>
<td>2147483648</td>
</tr>
</tbody>
</table>

The maximum amount of memory to use for memory mapping compressed MyISAM files. If many compressed MyISAM tables are used, the value can be decreased to reduce the likelihood of memory-swapping problems.

- **myisam_recover_options**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--myisam-recover-options[=list]</td>
</tr>
<tr>
<td>System Variable</td>
<td>myisam_recover_options</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
<tr>
<td>Valid Values</td>
<td>OFF</td>
</tr>
</tbody>
</table>
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>DEFAULT</td>
</tr>
<tr>
<td></td>
<td>BACKUP</td>
</tr>
<tr>
<td></td>
<td>FORCE</td>
</tr>
<tr>
<td></td>
<td>QUICK</td>
</tr>
</tbody>
</table>

Set the MyISAM storage engine recovery mode. The variable value is any combination of the values OFF, DEFAULT, BACKUP, FORCE, or QUICK. If you specify multiple values, separate them by commas. Specifying the variable with no value at server startup is the same as specifying DEFAULT, and specifying with an explicit value of "" disables recovery (same as a value of OFF). If recovery is enabled, each time mysqld opens a MyISAM table, it checks whether the table is marked as crashed or was not closed properly. (The last option works only if you are running with external locking disabled.) If this is the case, mysqld runs a check on the table. If the table was corrupted, mysqld attempts to repair it.

The following options affect how the repair works.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>No recovery.</td>
</tr>
<tr>
<td>DEFAULT</td>
<td>Recovery without backup, forcing, or quick checking.</td>
</tr>
<tr>
<td>BACKUP</td>
<td>If the data file was changed during recovery, save a backup of the tbl_name.MYD file as tbl_name-datetime.BAK.</td>
</tr>
<tr>
<td>FORCE</td>
<td>Run recovery even if we would lose more than one row from the .MYD file.</td>
</tr>
<tr>
<td>QUICK</td>
<td>Do not check the rows in the table if there are not any delete blocks.</td>
</tr>
</tbody>
</table>

Before the server automatically repairs a table, it writes a note about the repair to the error log. If you want to be able to recover from most problems without user intervention, you should use the options BACKUP, FORCE. This forces a repair of a table even if some rows would be deleted, but it keeps the old data file as a backup so that you can later examine what happened.

See Section 15.2.1, “MyISAM Startup Options”.

- myisam_repair_threads

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--myisam-repair-threads=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>myisam_repair_threads</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>18446744073709551615 (64-bit platforms)</td>
</tr>
<tr>
<td>Property</td>
<td>Value</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

If this value is greater than 1, MyISAM table indexes are created in parallel (each index in its own thread) during the repair by sorting process. The default value is 1.

**Note**

Multithreaded repair is still beta-quality code.

- **myisam_sort_buffer_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--myisam-sort-buffer-size=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>myisam_sort_buffer_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>8388608</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>4096</td>
</tr>
<tr>
<td>Maximum Value (Other, 64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (Other, 32-bit platforms)</td>
<td>4294967295</td>
</tr>
<tr>
<td>Maximum Value (Windows, 64-bit platforms, &gt;= 5.6.5)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (Windows, 64-bit platforms, &lt;= 5.6.4)</td>
<td>4294967295</td>
</tr>
<tr>
<td>Maximum Value (Windows, 32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

The size of the buffer that is allocated when sorting MyISAM indexes during a REPAIR TABLE or when creating indexes with CREATE INDEX or ALTER TABLE.

- **myisam_stats_method**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--myisam-stats-method=name</td>
</tr>
<tr>
<td>System Variable</td>
<td>myisam_stats_method</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>nulls_unequal</td>
</tr>
<tr>
<td>Valid Values</td>
<td>nulls_equal</td>
</tr>
</tbody>
</table>
nulls_unequal
nulls_ignored

How the server treats NULL values when collecting statistics about the distribution of index values for MyISAM tables. This variable has three possible values, nulls_equal, nulls_unequal, and nulls_ignored. For nulls_equal, all NULL index values are considered equal and form a single value group that has a size equal to the number of NULL values. For nulls_unequal, NULL values are considered unequal, and each NULL forms a distinct value group of size 1. For nulls_ignored, NULL values are ignored.

The method that is used for generating table statistics influences how the optimizer chooses indexes for query execution, as described in Section 8.3.7, “InnoDB and MyISAM Index Statistics Collection”.

- myisam_use_mmap

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--myisam-use-mmap=[{OFF</td>
</tr>
<tr>
<td>System Variable</td>

</tr>
<tr>
<td>Default Value</td>
<td><em>everyone</em></td>
</tr>
<tr>
<td>Valid Values</td>
<td><em>everyone</em></td>
</tr>
<tr>
<td></td>
<td>empty string</td>
</tr>
</tbody>
</table>

(Windows only.) The access control granted to clients on the named pipe created by the MySQL server is set to the minimum necessary for successful communication when the `named_pipe` system variable is enabled to support named-pipe connections. Newer MySQL client software can open named pipe connections without any additional configuration, however, older client software may still require full access to open a named pipe connection.

This variable sets the name of a Windows local group whose members are granted sufficient access by the MySQL server to use older named-pipe clients. Initially, the value is set to '*everyone*' by default, which permits users of the Everyone group on Windows to continue using older clients until the older clients are upgraded. In contrast, setting the value to an empty string means that no Windows user will be granted full access to the named pipe. The default value '*everyone*' provides a language-independent way of referring to the Everyone group on Windows.

Ideally, a new Windows local group name (for example, `mysql_old_client_users`) should be created in Windows and then used to replace the default value for this variable when access to older client software is absolutely necessary. In this case, limit the membership of the group to as few users as possible, removing users from the group when their client software is upgraded. A non-member of the group who attempts to open a connection to MySQL with the older named-pipe client is denied access until the user is added to the group by a Windows administrator, and then the user logs out and logs in (required by Windows).

- `net_buffer_length`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--net-buffer-length=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>net_buffer_length</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>16384</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1048576</td>
</tr>
</tbody>
</table>

Each client thread is associated with a connection buffer and result buffer. Both begin with a size given by `net_buffer_length` but are dynamically enlarged up to `max_allowed_packet` bytes as needed. The result buffer shrinks to `net_buffer_length` after each SQL statement.

This variable should not normally be changed, but if you have very little memory, you can set it to the expected length of statements sent by clients. If statements exceed this length, the connection buffer is automatically enlarged. The maximum value to which `net_buffer_length` can be set is 1MB.
The session value of this variable is read only.

- **net_read_timeout**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--net-read-timeout=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td>net_read_timeout</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>30</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
</tbody>
</table>

The number of seconds to wait for more data from a connection before aborting the read. When the server is reading from the client, `net_read_timeout` is the timeout value controlling when to abort. When the server is writing to the client, `net_write_timeout` is the timeout value controlling when to abort. See also `slave_net_timeout`.

- **net_retry_count**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--net-retry-count=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td>net_retry_count</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>10</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

If a read or write on a communication port is interrupted, retry this many times before giving up. This value should be set quite high on FreeBSD because internal interrupts are sent to all threads.

- **net_write_timeout**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--net-write-timeout=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td>net_write_timeout</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>60</td>
</tr>
</tbody>
</table>
The number of seconds to wait for a block to be written to a connection before aborting the write. See also `net_read_timeout`.

- **new**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--new[={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>new</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Disabled by</td>
<td><code>skip-new</code></td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>OFF</code></td>
</tr>
</tbody>
</table>

This variable was used in MySQL 4.0 to turn on some 4.1 behaviors, and is retained for backward compatibility. Its value is always `OFF`.

In NDB Cluster, setting this variable to `ON` makes it possible to employ partitioning types other than `KEY` or `LINEAR KEY` with NDB tables. *This feature is experimental only, and not supported in production.* For additional information, see User-defined partitioning and the NDB storage engine (NDB Cluster).

- **old**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--old[={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>old</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>OFF</code></td>
</tr>
</tbody>
</table>

`old` is a compatibility variable. It is disabled by default, but can be enabled at startup to revert the server to behaviors present in older versions.

When `old` is enabled, it changes the default scope of index hints to that used prior to MySQL 5.1.17. That is, index hints with no `FOR` clause apply only to how indexes are used for row retrieval and not to resolution of `ORDER BY` or `GROUP BY` clauses. (See Section 8.9.3, “Index Hints”.) Take care about enabling this in a replication setup. With statement-based binary logging, having different modes for the master and slaves might lead to replication errors.

- **old_alter_table**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--old-alter-table[={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>old_alter_table</code></td>
</tr>
</tbody>
</table>
When this variable is enabled, the server does not use the optimized method of processing an `ALTER TABLE` operation. It reverts to using a temporary table, copying over the data, and then renaming the temporary table to the original, as used by MySQL 5.0 and earlier. For more information on the operation of `ALTER TABLE`, see Section 13.1.7, “ALTER TABLE Syntax”.

**old_passwords**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--old-passwords=value</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>old_passwords</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td><code>&gt;= 5.6.6</code> Enumeration</td>
</tr>
<tr>
<td>Type</td>
<td><code>&lt;= 5.6.5</code> Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Valid Values</td>
<td>0, 1, 2</td>
</tr>
</tbody>
</table>

This variable controls the password hashing method used by the `PASSWORD()` function. It also influences password hashing performed by `CREATE USER` and `GRANT` statements that specify a password using an `IDENTIFIED BY` clause.

The following table shows, for each password hashing method, the permitted value of `old_passwords` and which authentication plugins use the hashing method.

<table>
<thead>
<tr>
<th>Password Hashing Method</th>
<th><code>old_passwords</code> Value</th>
<th>Associated Authentication Plugin</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL 4.1 native hashing</td>
<td>0</td>
<td><code>mysql_native_password</code></td>
</tr>
<tr>
<td>Pre-4.1 (“old”) hashing</td>
<td>1</td>
<td><code>mysql_old_password</code></td>
</tr>
<tr>
<td>SHA-256 hashing</td>
<td>2</td>
<td><code>sha256_password</code></td>
</tr>
</tbody>
</table>

**Note**

Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. Consequently, `old_passwords=1`, which causes `PASSWORD()` to generate pre-4.1 password hashes, is also deprecated. For account upgrade instructions, see Section 6.4.1.3, “Migrating Away from Pre-4.1 Password Hashing and the mysql_old_password Plugin”.

635
Server System Variables

If `old_passwords=1`, `PASSWORD(str)` returns the same value as `OLD_PASSWORD(str)`. The latter function is not affected by the value of `old_passwords`.

If you set `old_passwords=2`, follow the instructions for using the `sha256_password` plugin at Section 6.4.1.4, “SHA-256 Pluggable Authentication”.

The server sets the global `old_passwords` value during startup to be consistent with the password hashing method required by the default authentication plugin. The default plugin is `mysql_native_password` unless the `--default-authentication-plugin` option is set otherwise.

When a client successfully connects to the server, the server sets the session `old_passwords` value appropriately for the account authentication method. For example, if the account uses the `sha256_password` authentication plugin, the server sets `old_passwords=2`.

For additional information about authentication plugins and hashing formats, see Section 6.2.11, “Pluggable Authentication”, and Section 6.1.2.4, “Password Hashing in MySQL”.

- `open_files_limit`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--open-files-limit=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>open_files_limit</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (&gt;= 5.6.8)</td>
<td>5000, with possible adjustment</td>
</tr>
<tr>
<td>Default Value (&lt;= 5.6.7)</td>
<td>0</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>platform dependent</td>
</tr>
</tbody>
</table>

The number of file descriptors available to `mysqld` from the operating system. `mysqld` reserves descriptors with `setrlimit()`, using the value requested at startup by setting this variable or the `--open-files-limit` option to `mysqld_safe`. You should try increasing the value of this variable if `mysqld` gives you the error `Too many open files`. Internally, the maximum value for this variable is the maximum unsigned integer value, but the actual maximum is platform dependent.

The runtime variable value indicates the number of file descriptors actually permitted by the system and might differ from the value requested at startup. If the requested number of file descriptors cannot be allocated, `mysqld` writes a warning to the error log.

The effective `open_files_limit` value is based on the value specified at system startup (if any) and the values of `max_connections` and `table_open_cache`, using these formulas:

1) `10 + max_connections + (table_open_cache * 2)`
2) `max_connections * 5`
3) `operating system limit if positive`
4) `if operating system limit is Infinity:`
   - `open_files_limit value specified at startup, 5000 if none`
The server attempts to obtain the number of file descriptors using the maximum of those three values. If that many descriptors cannot be obtained, the server attempts to obtain as many as the system will permit.

The value is 0 on systems where MySQL cannot change the number of open files.

On Unix, the value cannot be set greater than `ulimit -n`.

- `optimizer_join_cache_level`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--optimizer-join-cache-level=#</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.1</td>
</tr>
<tr>
<td>Removed</td>
<td>5.6.3</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>optimizer_join_cache_level</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>4</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>4</td>
</tr>
</tbody>
</table>

As of MySQL 5.6.3, this variable is removed and the `optimizer_switch` variable is used instead. See Section 8.2.1.11, “Block Nested-Loop and Batched Key Access Joins”.

The following table shows the permissible `optimizer_join_cache_level` values.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No join buffer is used for any join operation. This setting can be useful for assessing baseline join performance in comparison to performance with nonzero values that enable use of join buffering.</td>
</tr>
<tr>
<td>1</td>
<td>This is the default value. Join buffers are employed only for inner joins that are executed by the original Block Nested-Loop (BNL) join algorithm. When this algorithm is applied, rows of the inner table are accessed through a table scan, a plain index scan, or a range index scan.</td>
</tr>
<tr>
<td>2</td>
<td>The server employs an incremental join buffer for a join operation if its first operand is produced by a join operation that uses a join buffer itself.</td>
</tr>
<tr>
<td>3</td>
<td>The BNL algorithm is used for outer join operations with one inner table and for inner joins.</td>
</tr>
<tr>
<td>4</td>
<td>The BNL algorithm uses incremental buffers for inner tables. In this case, the BNL algorithm can be used for nested outer joins (outer joins with several inner tables). Such an operation can be executed only if incremental join buffers are used to join all inner tables but the first one.</td>
</tr>
</tbody>
</table>

- `optimizer_prune_level`
Property | Value
---|---
Command-Line Format | `--optimizer-prune-level=#`
System Variable | `optimizer_prune_level`
Scope | Global, Session
Dynamic | Yes
Type | Integer
Default Value | 1
Minimum Value | 0
Maximum Value | 1

Controls the heuristics applied during query optimization to prune less-promising partial plans from the optimizer search space. A value of 0 disables heuristics so that the optimizer performs an exhaustive search. A value of 1 causes the optimizer to prune plans based on the number of rows retrieved by intermediate plans.

- `optimizer_search_depth`

Property | Value
---|---
Command-Line Format | `--optimizer-search-depth=#`
System Variable | `optimizer_search_depth`
Scope | Global, Session
Dynamic | Yes
Type | Integer
Default Value | 62
Minimum Value | 0
Maximum Value | 62

The maximum depth of search performed by the query optimizer. Values larger than the number of relations in a query result in better query plans, but take longer to generate an execution plan for a query. Values smaller than the number of relations in a query return an execution plan quicker, but the resulting plan may be far from being optimal. If set to 0, the system automatically picks a reasonable value.

- `optimizer_switch`

Property | Value
---|---
Command-Line Format | `--optimizer-switch=value`
System Variable | `optimizer_switch`
Scope | Global, Session
Dynamic | Yes
Type | Set
Valid Values (>= 5.6.9) | `batched_key_access={on|off}`
| | `block_nested_loop={on|off}`
<table>

</tbody>
</table>

The *optimizer_switch* system variable enables control over optimizer behavior. The value of this variable is a set of flags, each of which has a value of *on* or *off* to indicate whether the corresponding optimizer behavior is enabled or disabled. This variable has global and session values and can be changed at runtime. The global default can be set at server startup.

To see the current set of optimizer flags, select the variable value:

```sql
mysql> SELECT @@optimizer_switch\G
```

```
*************************** 1. row ***************************
@@optimizer_switch: index_merge=on,index_merge_union=on,
                   index_merge_sort_union=on,
                   index_merge_intersection=on,
                   engine_condition_pushdown=on,
                   index_condition_pushdown=on,
                   mrr=on,mrr_cost_based=on,
                   block_nested_loop=on,batched_key_access=off,
                   materialization=on,semi_join=on,loosescan=on,
                   firstmatch=on,
                   subquery_materialization_cost_based=on,
                   use_index_extensions=on
```

For more information about the syntax of this variable and the optimizer behaviors that it controls, see [Section 8.9.2, “Switchable Optimizations”](#).

- **optimizer_trace**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>

</tbody>
</table>

The offset of optimizer traces to display. For details, see *MySQL Internals: Tracing the Optimizer*.

- **performance_schema_xxx**

Performance Schema system variables are listed in [Section 22.15, “Performance Schema System Variables”](#). These variables may be used to configure Performance Schema operation.

- **pid_file**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--pid-file=file_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>pid_file</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>

The path name of the file in which the server writes its process ID. The server creates the file in the data directory unless an absolute path name is given to specify a different directory. If you specify this variable, you must specify a value. If you do not specify this variable, MySQL uses a default value of `host_name.pid`, where `host_name` is the name of the host machine.

The process ID file is used by other programs such as `mysqld_safe` to determine the server’s process ID. On Windows, this variable also affects the default error log file name. See [Section 5.4.2, “The Error Log”](#).

- **plugin_dir**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--plugin-dir=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>plugin_dir</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
<tr>
<td>Default Value</td>
<td>BASEDIR/lib/plugin</td>
</tr>
</tbody>
</table>

The path name of the plugin directory.

If the plugin directory is writable by the server, it may be possible for a user to write executable code to a file in the directory using `SELECT ... INTO DUMPFILE`. This can be prevented by making `plugin_dir` read only to the server or by setting `secure_file_priv` to a directory where `SELECT` writes can be made safely.
### Server System Variables

- **port**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--port=port_num</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>port</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>3306</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>65535</td>
</tr>
</tbody>
</table>

The number of the port on which the server listens for TCP/IP connections. This variable can be set with the `--port` option.

- **preload_buffer_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--preload-buffer-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>preload_buffer_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>32768</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1073741824</td>
</tr>
</tbody>
</table>

The size of the buffer that is allocated when preloading indexes.

- **profiling**

If set to 0 or **OFF** (the default), statement profiling is disabled. If set to 1 or **ON**, statement profiling is enabled and the `SHOW PROFILE` and `SHOW PROFILES` statements provide access to profiling information. See Section 13.7.5.32, “SHOW PROFILES Syntax”.

This variable is deprecated and will be removed in a future MySQL release.

- **profiling_history_size**

The number of statements for which to maintain profiling information if **profiling** is enabled. The default value is 15. The maximum value is 100. Setting the value to 0 effectively disables profiling. See Section 13.7.5.32, “SHOW PROFILES Syntax”.

This variable is deprecated and will be removed in a future MySQL release.

- **protocol_version**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>protocol_version</code></td>
</tr>
</tbody>
</table>
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>

The version of the client/server protocol used by the MySQL server.

- **proxy_user**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>proxy_user</td>
</tr>
<tr>
<td>Scope</td>
<td>Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

If the current client is a proxy for another user, this variable is the proxy user account name. Otherwise, this variable is `NULL`. See Section 6.2.12, “Proxy Users”.

- **pseudo_slave_mode**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Introduced</td>
<td>5.6.10</td>
</tr>
<tr>
<td>System Variable</td>
<td>pseudo_slave_mode</td>
</tr>
<tr>
<td>Scope</td>
<td>Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>

This variable is for internal server use.

- **pseudo_thread_id**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>pseudo_thread_id</td>
</tr>
<tr>
<td>Scope</td>
<td>Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>

This variable is for internal server use.

- **query_alloc_block_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--query-alloc-block-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td>query_alloc_block_size</td>
</tr>
<tr>
<td>Scope</td>

</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>8192</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
<tr>
<td>Block Size</td>
<td>1024</td>
</tr>
</tbody>
</table>

The allocation size of memory blocks that are allocated for objects created during statement parsing and execution. If you have problems with memory fragmentation, it might help to increase this parameter.

- **query_cache_limit**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--query-cache-limit=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>query_cache_limit</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>

<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1048576</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

Do not cache results that are larger than this number of bytes. The default value is 1MB.

- **query_cache_min_res_unit**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--query-cache-min-res-unit=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>query_cache_min_res_unit</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>4096</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>512</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>
The minimum size (in bytes) for blocks allocated by the query cache. The default value is 4096 (4KB). Tuning information for this variable is given in Section 8.10.3.3, “Query Cache Configuration”.

- **query_cache_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--query-cache-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>query_cache_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (64-bit platforms, &gt;= 5.6.8)</td>
<td>1048576</td>
</tr>
<tr>
<td>Default Value (64-bit platforms, &lt;= 5.6.7)</td>
<td>0</td>
</tr>
<tr>
<td>Default Value (32-bit platforms, &gt;= 5.6.8)</td>
<td>1048576</td>
</tr>
<tr>
<td>Default Value (32-bit platforms, &lt;= 5.6.7)</td>
<td>0</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

The amount of memory allocated for caching query results. By default, the query cache is disabled. This is achieved using a default value of 1M, with a default for `query_cache_type` of 0.

The permissible values are multiples of 1024; other values are rounded down to the nearest multiple. For nonzero values of `query_cache_size`, that many bytes of memory are allocated even if `query_cache_type=0`. See Section 8.10.3.3, “Query Cache Configuration”, for more information.

The query cache needs a minimum size of about 40KB to allocate its structures. (The exact size depends on system architecture.) If you set the value of `query_cache_size` too small, a warning will occur, as described in Section 8.10.3.3, “Query Cache Configuration”.

- **query_cache_type**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--query-cache-type=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>query_cache_type</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value (&gt;= 5.6.8)</td>
<td>0</td>
</tr>
<tr>
<td>Default Value (&lt;= 5.6.7)</td>
<td>1</td>
</tr>
</tbody>
</table>
Set the query cache type. Setting the `GLOBAL` value sets the type for all clients that connect thereafter. Individual clients can set the `SESSION` value to affect their own use of the query cache. Possible values are shown in the following table.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 or OFF</td>
<td>Do not cache results in or retrieve results from the query cache. Note that this does not deallocate the query cache buffer. To do that, you should set <code>query_cache_size</code> to 0.</td>
</tr>
<tr>
<td>1 or ON</td>
<td>Cache all cacheable query results except for those that begin with <code>SELECT SQL_NO_CACHE</code>.</td>
</tr>
<tr>
<td>2 or DEMAND</td>
<td>Cache results only for cacheable queries that begin with <code>SELECT SQL_CACHE</code>.</td>
</tr>
</tbody>
</table>

This variable defaults to `OFF`.

If the server is started with `query_cache_type` set to 0, it does not acquire the query cache mutex at all, which means that the query cache cannot be enabled at runtime and there is reduced overhead in query execution.

- `query_cache_wlock_invalidate`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--query-cache-wlock-invalidate[={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>query_cache_wlock_invalidate</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Normally, when one client acquires a `WRITE` lock on a `MyISAM` table, other clients are not blocked from issuing statements that read from the table if the query results are present in the query cache. Setting this variable to 1 causes acquisition of a `WRITE` lock for a table to invalidate any queries in the query cache that refer to the table. This forces other clients that attempt to access the table to wait while the lock is in effect.

- `query_prealloc_size`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--query-prealloc-size=</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>query_prealloc_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>8192</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>8192</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
<tr>
<td>Block Size</td>
<td>1024</td>
</tr>
</tbody>
</table>

The size of the persistent buffer used for statement parsing and execution. This buffer is not freed between statements. If you are running complex queries, a larger `query_prealloc_size` value might be helpful in improving performance, because it can reduce the need for the server to perform memory allocation during query execution operations.

- **rand_seed1**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>rand_seed1</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>

The `rand_seed1` and `rand_seed2` variables exist as session variables only, and can be set but not read. The variables—but not their values—are shown in the output of `SHOW VARIABLES`.

The purpose of these variables is to support replication of the `RAND()` function. For statements that invoke `RAND()`, the master passes two values to the slave, where they are used to seed the random number generator. The slave uses these values to set the session variables `rand_seed1` and `rand_seed2` so that `RAND()` on the slave generates the same value as on the master.

- **rand_seed2**

See the description for `rand_seed1`.

- **range_alloc_block_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--range-alloc-block-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>range_alloc_block_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>4096</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>4096</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
</tbody>
</table>
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum Value (32-bit platforms)</td>
<td>4294967295</td>
</tr>
<tr>
<td>Block Size</td>
<td>1024</td>
</tr>
</tbody>
</table>

The size of blocks that are allocated when doing range optimization.

- **read_buffer_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--read-buffer-size=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>read_buffer_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>131072</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>8200</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>2147479552</td>
</tr>
</tbody>
</table>

Each thread that does a sequential scan for a MyISAM table allocates a buffer of this size (in bytes) for each table it scans. If you do many sequential scans, you might want to increase this value, which defaults to 131072. The value of this variable should be a multiple of 4KB. If it is set to a value that is not a multiple of 4KB, its value will be rounded down to the nearest multiple of 4KB.

This option is also used in the following context for all storage engines:

- For caching the indexes in a temporary file (not a temporary table), when sorting rows for ORDER BY.
- For bulk insert into partitions.
- For caching results of nested queries.

read_buffer_size is also used in one other storage engine-specific way: to determine the memory block size for MEMORY tables.

For more information about memory use during different operations, see Section 8.12.4.1, "How MySQL Uses Memory".

- **read_only**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--read-only={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td>read_only</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>
When the `read_only` system variable is enabled, the server permits no client updates except from users who have the `SUPER` privilege. This variable is disabled by default.

Even with `read_only` enabled, the server permits these operations:

- Updates performed by slave threads, if the server is a replication slave. In replication setups, it can be useful to enable `read_only` on slave servers to ensure that slaves accept updates only from the master server and not from clients.

- Use of `ANALYZE TABLE` or `OPTIMIZE TABLE` statements. The purpose of read-only mode is to prevent changes to table structure or contents. Analysis and optimization do not qualify as such changes. This means, for example, that consistency checks on read-only replication slaves can be performed with `mysqlcheck --all-databases --analyze`.

- Operations on `TEMPORARY` tables.

- Inserts into the log tables (`mysql.general_log` and `mysql.slow_log`; see Section 5.4.1, “Selecting General Query Log and Slow Query Log Output Destinations”).

`read_only` exists only as a `GLOBAL` variable, so changes to its value require the `SUPER` privilege. Changes to `read_only` on a master server are not replicated to slave servers. The value can be set on a slave server independent of the setting on the master.

The following conditions apply to attempts to enable `read_only`:

- The attempt fails and an error occurs if you have any explicit locks (acquired with `LOCK TABLES`) or have a pending transaction.

- The attempt blocks while other clients have any ongoing statement, active `LOCK TABLES WRITE`, or ongoing commit, until the locks are released and the statements and transactions end. While the attempt to enable `read_only` is pending, requests by other clients for table locks or to begin transactions also block until `read_only` has been set.

- The attempt blocks if there are active transactions that hold metadata locks, until those transactions end.

- `read_only` can be enabled while you hold a global read lock (acquired with `FLUSH TABLES WITH READ LOCK`) because that does not involve table locks.

- `read_rnd_buffer_size`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--read-rnd-buffer-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>read_rnd_buffer_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>262144</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>2147483647</td>
</tr>
</tbody>
</table>
This variable is used for reads from MyISAM tables, and, for any storage engine, for Multi-Range Read optimization.

When reading rows from a MyISAM table in sorted order following a key-sorting operation, the rows are read through this buffer to avoid disk seeks. See Section 8.2.1.13, “ORDER BY Optimization”. Setting the variable to a large value can improve ORDER BY performance by a lot. However, this is a buffer allocated for each client, so you should not set the global variable to a large value. Instead, change the session variable only from within those clients that need to run large queries.

For more information about memory use during different operations, see Section 8.12.4.1, “How MySQL Uses Memory”. For information about Multi-Range Read optimization, see Section 8.2.1.10, “Multi-Range Read Optimization”.

- **secure_auth**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--secure-auth[={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td>secure_auth</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value (&gt;= 5.6.5)</td>
<td>ON</td>
</tr>
<tr>
<td>Default Value (&lt;= 5.6.4)</td>
<td>OFF</td>
</tr>
</tbody>
</table>

If this variable is enabled, the server blocks connections by clients that attempt to use accounts that have passwords stored in the old (pre-4.1) format.

Enable this variable to prevent all use of passwords employing the old format (and hence insecure communication over the network). This variable is enabled by default.

Server startup fails with an error if this variable is enabled and the privilege tables are in pre-4.1 format. See Section B.4.2.4, “Client does not support authentication protocol”.

**Note**

Passwords that use the pre-4.1 hashing method are less secure than passwords that use the native password hashing method and should be avoided. Pre-4.1 passwords are deprecated and support for them will be removed in a future MySQL release. Consequently, disabling secure_auth is also deprecated.

- **secure_file_priv**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--secure-file-priv=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>secure_file_priv</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value (&gt;= 5.6.34)</td>
<td>platform specific</td>
</tr>
</tbody>
</table>
This variable is used to limit the effect of data import and export operations, such as those performed by the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements and the `LOAD_FILE()` function. These operations are permitted only to users who have the `FILE` privilege.

`secure_file_priv` may be set as follows:

- If empty, the variable has no effect. This is not a secure setting.
- If set to the name of a directory, the server limits import and export operations to work only with files in that directory. The directory must exist; the server will not create it.
- If set to `NULL`, the server disables import and export operations. This value is permitted as of MySQL 5.6.34.

Before MySQL 5.6.34, this variable is empty by default. As of 5.6.34, the default value is platform specific and depends on the value of the `INSTALL_LAYOUT` CMake option, as shown in the following table. To specify the default `secure_file_priv` value explicitly if you are building from source, use the `INSTALL_SECURE_FILE_PRIVDIR` CMake option.

<table>
<thead>
<tr>
<th>INSTALL_LAYOUT Value</th>
<th>Default <code>secure_file_priv</code> Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>STANDALONE, WIN</td>
<td>NULL</td>
</tr>
<tr>
<td>DEB, RPM, SLES, SVR4</td>
<td><code>/var/lib/mysql-files</code></td>
</tr>
<tr>
<td>Otherwise</td>
<td><code>mysql-files</code> under the <code>CMAKE_INSTALL_PREFIX</code> value</td>
</tr>
</tbody>
</table>

To set the default `secure_file_priv` value for the `libmysqld` embedded server, use the `INSTALL_SECURE_FILE_PRIV_EMBEDDEDDIR` CMake option. The default value for this option is `NULL`.

As of MySQL 5.6.34, the server checks the value of `secure_file_priv` at startup and writes a warning to the error log if the value is insecure. A non-`NULL` value is considered insecure if it is empty, or the value is the data directory or a subdirectory of it, or a directory that is accessible by all users. If `secure_file_priv` is set to a nonexistent path, the server writes an error message to the error log and exits.

- `server_id`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--server-id=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>server_id</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

Specifies the server ID. This variable is set by the `--server-id` option.

On a replication master and each replication slave, you must specify the `--server-id` option to establish a unique replication ID in the range from 1 to $2^{32} - 1$. "Unique", means that each ID must be different from every other ID in use by any other replication master or slave. For example, `server-id=3`. For additional information, see Section 17.1.4.2, “Replication Master Options and Variables”, and Section 17.1.4.3, “Replication Slave Options and Variables”.

If you omit `--server-id`, the default server ID is 0. If the server ID is set to 0, binary logging takes place, but a master with a server ID of 0 refuses any connections from slaves, and a slave with a server ID of 0 refuses to connect to a master. Note that although you can change the server ID dynamically to a nonzero value, doing so does not enable replication to start immediately. You must change the server ID and then restart the server to initialize the replication slave.

In MySQL 5.6, whether the server ID is set to 0 explicitly or the default is allowed to be used, the server sets the `server_id` system variable to 1; this is a known issue that is fixed in MySQL 5.7.

For more information, see Section 17.1.1.2, “Setting the Replication Slave Configuration”.

- `sha256_password_private_key_path`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--sha256-password-private-key-path=file_name</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.6</td>
</tr>
<tr>

<td>File name</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>private_key.pem</code></td>
</tr>
</tbody>
</table>

This variable is available if MySQL was compiled using OpenSSL (see Section 6.3.4, “SSL Library-Dependent Capabilities”). Its value is the path name of the RSA private key file for the `sha256_password` authentication plugin. If the file is named as a relative path, it is interpreted relative to the server data directory. The file must be in PEM format.

**Important**

Because this file stores a private key, its access mode should be restricted so that only the MySQL server can read it.

For information about `sha256_password`, see Section 6.4.1.4, “SHA-256 Pluggable Authentication”.

- `sha256_password_public_key_path`
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--sha256-password-public-key-path=file_name</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.6</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>sha256_password_public_key_path</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>public_key.pem</code></td>
</tr>
</tbody>
</table>

This variable is available if MySQL was compiled using OpenSSL (see Section 6.3.4, “SSL Library-Dependent Capabilities”). Its value is the path name of the RSA public key file for the `sha256_password` authentication plugin. If the file is named as a relative path, it is interpreted relative to the server data directory. The file must be in PEM format. Because this file stores a public key, copies can be freely distributed to client users. (Clients that explicitly specify a public key when connecting to the server using RSA password encryption must use the same public key as that used by the server.)

For information about `sha256_password`, including information about how clients specify the RSA public key, see Section 6.4.1.4, “SHA-256 Pluggable Authentication”.

• `shared_memory`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--shared-memory[={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>shared_memory</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Platform Specific</td>
<td>Windows</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>OFF</code></td>
</tr>
</tbody>
</table>

(Windows only.) Whether the server permits shared-memory connections.

• `shared_memory_base_name`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--shared-memory-base-name=name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>shared_memory_base_name</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Platform Specific</td>
<td>Windows</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>MYSQL</code></td>
</tr>
</tbody>
</table>
(Windows only.) The name of shared memory to use for shared-memory connections. This is useful when running multiple MySQL instances on a single physical machine. The default name is MySQL. The name is case-sensitive.

This variable applies only if the server is started with the shared_memory system variable enabled to support shared-memory connections.

- **show_old_temporals**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--show-old-temporals=[{OFF</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.24</td>
</tr>
<tr>
<td>Deprecated</td>
<td>5.6.24</td>
</tr>
<tr>
<td>System Variable</td>
<td>show_old_temporals</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Whether SHOW CREATE TABLE output includes comments to flag temporal columns found to be in pre-5.6.4 format (TIME, DATETIME, and TIMESTAMP columns without support for fractional seconds precision). This variable is disabled by default. If enabled, SHOW CREATE TABLE output looks like this:

```
CREATE TABLE `mytbl` (
  `ts` timestamp /* 5.5 binary format */ NOT NULL DEFAULT CURRENT_TIMESTAMP,
  `dt` datetime /* 5.5 binary format */ DEFAULT NULL,
  `t` time /* 5.5 binary format */ DEFAULT NULL
) DEFAULT CHARSET=latin1
```

This variable was added in MySQL 5.6.24. It is deprecated and will be removed in a future MySQL release.

- **skip_external_locking**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--skip-external-locking=[{OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td>skip_external_locking</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

This is OFF if mysqld uses external locking (system locking), ON if external locking is disabled. This affects only MyISAM table access.
This variable is set by the \texttt{--external-locking} or \texttt{--skip-external-locking} option. External locking is disabled by default.

External locking affects only 	exttt{MyISAM} table access. For more information, including conditions under which it can and cannot be used, see Section 8.11.5, “External Locking”.

- \texttt{skip\_name\_resolve}

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>\texttt{--skip-name-resolve[={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td>\texttt{skip_name_resolve}</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

This variable is set from the value of the \texttt{--skip-name-resolve} option. If it is \texttt{OFF}, \texttt{mysqld} resolves host names when checking client connections. If it is \texttt{ON}, \texttt{mysqld} uses only IP numbers; in this case, all \texttt{Host} column values in the grant tables must be IP addresses or \texttt{localhost}. See Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”.

- \texttt{skip\_networking}

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>\texttt{--skip-networking}</td>
</tr>
<tr>
<td>System Variable</td>
<td>\texttt{skip_networking}</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
</tbody>
</table>

This is \texttt{ON} if the server permits only local (non-TCP/IP) connections. On Unix, local connections use a Unix socket file. On Windows, local connections use a named pipe or shared memory. This variable can be set to \texttt{ON} with the \texttt{--skip-networking} option.

- \texttt{skip\_show\_database}

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>\texttt{--skip-show-database}</td>
</tr>
<tr>
<td>System Variable</td>
<td>\texttt{skip_show_database}</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
</tbody>
</table>

This prevents people from using the \texttt{SHOW DATABASES} statement if they do not have the \texttt{SHOW DATABASES} privilege. This can improve security if you have concerns about users being able to see databases belonging to other users. Its effect depends on the \texttt{SHOW DATABASES} privilege: If the variable value is \texttt{ON}, the \texttt{SHOW DATABASES} statement is permitted only to users who have the \texttt{SHOW DATABASES} privilege, and the statement displays all database names. If the value is \texttt{OFF}, \texttt{SHOW DATABASES} is permitted to all users, but displays the names of only those databases for which the user has the \texttt{SHOW DATABASES} or other privilege.
Because a global privilege is considered a privilege for all databases, any global privilege enables a user to see all database names with `SHOW DATABASES` or by examining the `INFORMATION_SCHEMA SCHEMATA` table.

- **slow_launch_time**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--slow-launch-time=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>slow_launch_time</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>2</td>
</tr>
</tbody>
</table>

If creating a thread takes longer than this many seconds, the server increments the `Slow_launch_threads` status variable.

- **slow_query_log**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--slow-query-log[={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>slow_query_log</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Whether the slow query log is enabled. The value can be 0 (or OFF) to disable the log or 1 (or ON) to enable the log. The destination for log output is controlled by the `log_output` system variable; if that value is NONE, no log entries are written even if the log is enabled.

“Slow” is determined by the value of the `long_query_time` variable. See Section 5.4.5, “The Slow Query Log”.

- **slow_query_log_file**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--slow-query-log-file=file_name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>slow_query_log_file</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>host_name-slow.log</code></td>
</tr>
</tbody>
</table>
The name of the slow query log file. The default value is `host_name-slow.log`, but the initial value can be changed with the `--slow_query_log_file` option.

- **socket**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--socket={file_name</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>socket</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Default Value (Other)</td>
<td><code>/tmp/mysql.sock</code></td>
</tr>
<tr>
<td>Default Value (Windows)</td>
<td><code>MySQL</code></td>
</tr>
</tbody>
</table>

On Unix platforms, this variable is the name of the socket file that is used for local client connections. The default is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On Windows, this variable is the name of the named pipe that is used for local client connections. The default value is `MySQL` (not case-sensitive).

- **sort_buffer_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--sort-buffer-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>sort_buffer_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (Other, 64-bit platforms, &gt;= 5.6.4)</td>
<td>262144</td>
</tr>
<tr>
<td>Default Value (Other, 64-bit platforms, &lt;= 5.6.3)</td>
<td>2097144</td>
</tr>
<tr>
<td>Default Value (Other, 32-bit platforms, &gt;= 5.6.4)</td>
<td>262144</td>
</tr>
<tr>
<td>Default Value (Other, 32-bit platforms, &lt;= 5.6.3)</td>
<td>2097144</td>
</tr>
<tr>
<td>Default Value (Windows, &gt;= 5.6.4)</td>
<td>262144</td>
</tr>
<tr>
<td>Default Value (Windows, &lt;= 5.6.3)</td>
<td>2097144</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>32768</td>
</tr>
<tr>
<td>Maximum Value (Other, 64-bit platforms)</td>
<td>18446744073709551615</td>
</tr>
</tbody>
</table>
Each session that must perform a sort allocates a buffer of this size. sort_buffer_size is not specific to any storage engine and applies in a general manner for optimization. At minimum the sort_buffer_size value must be large enough to accommodate fifteen tuples in the sort buffer. Also, increasing the value of max_sort_length may require increasing the value of sort_buffer_size. For more information, see Section 8.2.1.13, “ORDER BY Optimization”

If you see many Sort_merge_passes per second in SHOW GLOBAL STATUS output, you can consider increasing the sort_buffer_size value to speed up ORDER BY or GROUP BY operations that cannot be improved with query optimization or improved indexing.

The optimizer tries to work out how much space is needed but can allocate more, up to the limit. Setting it larger than required globally will slow down most queries that sort. It is best to increase it as a session setting, and only for the sessions that need a larger size. On Linux, there are thresholds of 256KB and 2MB where larger values may significantly slow down memory allocation, so you should consider staying below one of those values. Experiment to find the best value for your workload. See Section B.4.3.5, “Where MySQL Stores Temporary Files”.

The maximum permissible setting for sort_buffer_size is 4GB–1. Larger values are permitted for 64-bit platforms (except 64-bit Windows, for which large values are truncated to 4GB–1 with a warning).

**sql_auto_is_null**

If this variable is enabled, then after a statement that successfully inserts an automatically generated AUTO_INCREMENT value, you can find that value by issuing a statement of the following form:

```sql
SELECT * FROM tbl_name WHERE auto_col IS NULL
```

If the statement returns a row, the value returned is the same as if you invoked the LAST_INSERT_ID() function. For details, including the return value after a multiple-row insert, see Section 12.15, “Information Functions”. If no AUTO_INCREMENT value was successfully inserted, the SELECT statement returns no row.

The behavior of retrieving an AUTO_INCREMENT value by using an IS NULL comparison is used by some ODBC programs, such as Access. See Obtaining Auto-Increment Values. This behavior can be disabled by setting sql_auto_is_null to OFF.

The default value of sql_auto_is_null is OFF.

**sql_big_selects**
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>sql_big_selects</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

If set to **OFF**, MySQL aborts `SELECT` statements that are likely to take a very long time to execute (that is, statements for which the optimizer estimates that the number of examined rows exceeds the value of `max_join_size`). This is useful when an inadvisable `WHERE` statement has been issued. The default value for a new connection is **ON**, which permits all `SELECT` statements.

If you set the `max_join_size` system variable to a value other than **DEFAULT**, `sql_big_selects` is set to **OFF**.

• **sql_buffer_result**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>sql_buffer_result</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

If enabled, `sql_buffer_result` forces results from `SELECT` statements to be put into temporary tables. This helps MySQL free the table locks early and can be beneficial in cases where it takes a long time to send results to the client. The default value is **OFF**.

• **sql_log_off**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>sql_log_off</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
<tr>
<td>Valid Values</td>
<td><strong>OFF</strong> (enable logging)</td>
</tr>
<tr>
<td></td>
<td><strong>ON</strong> (disable logging)</td>
</tr>
</tbody>
</table>

This variable controls whether logging to the general query log is disabled for the current session (assuming that the general query log itself is enabled). The default value is **OFF** (that is, enable logging). To disable or enable general query logging for the current session, set the session `sql_log_off` variable to **ON** or **OFF**.

Setting the session value of this system variable is a restricted operation. The session user must have privileges sufficient to set restricted session variables. See Section 5.1.8.1, “System Variable Privileges”.
- **sql_mode**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--sql-mode=name</code></td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>sql_mode</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global, Session</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Set</td>
</tr>
<tr>
<td><strong>Default Value (&gt;= 5.6.6)</strong></td>
<td>NO_ENGINE_SUBSTITUTION</td>
</tr>
<tr>
<td><strong>Default Value (&lt;= 5.6.5)</strong></td>
<td><code>''</code></td>
</tr>
<tr>
<td><strong>Valid Values</strong></td>
<td>ALLOW_INVALID_DATES</td>
</tr>
<tr>
<td></td>
<td>ANSI_QUOTES</td>
</tr>
<tr>
<td></td>
<td>ERROR_FOR_DIVISION_BY_ZERO</td>
</tr>
<tr>
<td></td>
<td>HIGH_NOT_PRECEDENCE</td>
</tr>
<tr>
<td></td>
<td>IGNORE_SPACE</td>
</tr>
<tr>
<td></td>
<td>NO_AUTO_CREATE_USER</td>
</tr>
<tr>
<td></td>
<td>NO_AUTO_VALUE_ON_ZERO</td>
</tr>
<tr>
<td></td>
<td>NO_BACKSLASH_ESCAPES</td>
</tr>
<tr>
<td></td>
<td>NO_DIR_IN_CREATE</td>
</tr>
<tr>
<td></td>
<td>NO_ENGINE_SUBSTITUTION</td>
</tr>
<tr>
<td></td>
<td>NO_FIELD_OPTIONS</td>
</tr>
<tr>
<td></td>
<td>NO_KEY_OPTIONS</td>
</tr>
<tr>
<td></td>
<td>NO_TABLE_OPTIONS</td>
</tr>
<tr>
<td></td>
<td>NO_UNSIGNED_SUBTRACTION</td>
</tr>
<tr>
<td></td>
<td>NO_ZERO_DATE</td>
</tr>
<tr>
<td></td>
<td>NO_ZERO_IN_DATE</td>
</tr>
<tr>
<td></td>
<td>ONLY_FULL_GROUP_BY</td>
</tr>
<tr>
<td></td>
<td>PAD_CHAR_TO_FULL_LENGTH</td>
</tr>
<tr>
<td></td>
<td>PIPES_AS_CONCAT</td>
</tr>
<tr>
<td></td>
<td>REAL_AS_FLOAT</td>
</tr>
<tr>
<td></td>
<td>STRICT_ALL_TABLES</td>
</tr>
<tr>
<td></td>
<td>STRICT_TRANS_TABLES</td>
</tr>
</tbody>
</table>
The current server SQL mode, which can be set dynamically. The default is `NO_ENGINE_SUBSTITUTION`. For details, see Section 5.1.10, “Server SQL Modes”.

**Note**
MySQL installation programs may configure the SQL mode during the installation process. For example, `mysql_install_db` creates a default option file named `my.cnf` in the base installation directory. This file contains a line that sets the SQL mode; see Section 4.4.3, “mysql_install_db — Initialize MySQL Data Directory”.

If the SQL mode differs from the default or from what you expect, check for a setting in an option file that the server reads at startup.

- **sql_notes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>sql_notes</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

If enabled (the default), diagnostics of `Note` level increment `warning_count` and the server records them. If disabled, `Note` diagnostics do not increment `warning_count` and the server does not record them. `mysqldump` includes output to disable this variable so that reloading the dump file does not produce warnings for events that do not affect the integrity of the reload operation.

- **sql_quote_show_create**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>sql_quote_show_create</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

If enabled (the default), the server quotes identifiers for `SHOW CREATE TABLE` and `SHOW CREATE DATABASE` statements. If disabled, quoting is disabled. This option is enabled by default so that replication works for identifiers that require quoting. See Section 13.7.5.12, “SHOW CREATE TABLE Syntax”, and Section 13.7.5.8, “SHOW CREATE DATABASE Syntax”.

- **sql_safe_updates**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>sql_safe_updates</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
</tbody>
</table>
If this variable is enabled, UPDATE and DELETE statements that do not use a key in the WHERE clause or a LIMIT clause produce an error. This makes it possible to catch UPDATE and DELETE statements where keys are not used properly and that would probably change or delete a large number of rows. The default value is OFF.

For the mysql client, sql_safe_updates can be enabled by using the --safe-updates option. For more information, see Using Safe-Updates Mode (--safe-updates).

### sql_select_limit

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>sql_select_limit</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>

The maximum number of rows to return from SELECT statements. For more information, see Using Safe-Updates Mode (--safe-updates).

The default value for a new connection is the maximum number of rows that the server permits per table. Typical default values are \((2^{32}) - 1\) or \((2^{64}) - 1\). If you have changed the limit, the default value can be restored by assigning a value of DEFAULT.

If a SELECT has a LIMIT clause, the LIMIT takes precedence over the value of sql_select_limit.

### sql_warnings

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>sql_warnings</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

This variable controls whether single-row INSERT statements produce an information string if warnings occur. The default is OFF. Set the value to ON to produce an information string.

### ssl_ca

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--ssl-ca=file_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>ssl_ca</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>
The path to a file with a list of trusted SSL Certificate Authorities.

- **ssl_capath**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--ssl-capath=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>ssl_capath</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
</tbody>
</table>

The path to a directory that contains trusted SSL CA certificates in PEM format. Support for this capability depends on the SSL library used to compile MySQL. See Section 6.3.4, "SSL Library-Dependent Capabilities".

- **ssl_cert**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--ssl-cert=file_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>ssl_cert</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>

The name of the SSL certificate file to use for establishing secure connections.

- **ssl_cipher**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--ssl-cipher=name</td>
</tr>
<tr>
<td>System Variable</td>
<td>ssl_cipher</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

The list of permissible ciphers for SSL encryption.

- **ssl_crl**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--ssl-crl=file_name</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.3</td>
</tr>
<tr>
<td>System Variable</td>
<td>ssl_crl</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>
The path to a file containing certificate revocation lists in PEM format. Support for revocation-list capability depends on the SSL library used to compile MySQL. See Section 6.3.4, “SSL Library-Dependent Capabilities”.

- **ssl_crlpath**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--ssl-crlpath=dir_name</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.3</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>ssl_crlpath</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
</tbody>
</table>

The path to a directory that contains files containing certificate revocation lists in PEM format. Support for revocation-list capability depends on the SSL library used to compile MySQL. See Section 6.3.4, “SSL Library-Dependent Capabilities”.

- **ssl_key**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--ssl-key=file_name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>ssl_key</code></td>
</tr>
<tr>

<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
</tbody>
</table>

The name of the SSL key file to use for establishing secure connections.

- **storage_engine**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>storage_engine</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>InnoDB</code></td>
</tr>
</tbody>
</table>

The default storage engine (table type). See Chapter 15, Alternative Storage Engines.

This variable is deprecated. Use `default_storage_engine` instead.

- **stored_program_cache**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--stored-program-cache=#</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.5</td>
</tr>
</tbody>
</table>
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>stored_program_cache</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>256</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>256</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>524288</td>
</tr>
</tbody>
</table>

Sets a soft upper limit for the number of cached stored routines per connection. The value of this variable is specified in terms of the number of stored routines held in each of the two caches maintained by the MySQL Server for, respectively, stored procedures and stored functions.

Whenever a stored routine is executed this cache size is checked before the first or top-level statement in the routine is parsed; if the number of routines of the same type (stored procedures or stored functions according to which is being executed) exceeds the limit specified by this variable, the corresponding cache is flushed and memory previously allocated for cached objects is freed. This allows the cache to be flushed safely, even when there are dependencies between stored routines.

• **sync_frm**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--sync-frm[={OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td>sync_frm</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

If this variable is set to 1, when any nontemporary table is created its .frm file is synchronized to disk (using `fdatasync()`). This is slower but safer in case of a crash. The default is 1.

• **system_time_zone**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>system_time_zone</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

The server system time zone. When the server begins executing, it inherits a time zone setting from the machine defaults, possibly modified by the environment of the account used for running the server or the startup script. The value is used to set `system_time_zone`. Typically the time zone is specified by the `TZ` environment variable. It also can be specified using the `--timezone` option of the `mysqld_safe` script.
The `system_time_zone` variable differs from `time_zone`. Although they might have the same value, the latter variable is used to initialize the time zone for each client that connects. See Section 5.1.12, "MySQL Server Time Zone Support".

- `table_definition_cache`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--table-definition-cache=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>table_definition_cache</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>&gt;= 5.6.8</code></td>
</tr>
<tr>
<td></td>
<td><code>-1</code> (signifies autosizing; do not assign this literal value)</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>&lt;= 5.6.7</code></td>
</tr>
<tr>
<td>Minimum Value</td>
<td>400</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>524288</td>
</tr>
</tbody>
</table>

The number of table definitions (from `.frm` files) that can be stored in the definition cache. If you use a large number of tables, you can create a large table definition cache to speed up opening of tables. The table definition cache takes less space and does not use file descriptors, unlike the normal table cache. The minimum value is 400. The default value is based on the following formula, capped to a limit of 2000:

\[
400 + \frac{(table
definition\ncache)}{2}
\]

For InnoDB, `table_definition_cache` acts as a soft limit for the number of open table instances in the InnoDB data dictionary cache. If the number of open table instances exceeds the `table_definition_cache` setting, the LRU mechanism begins to mark table instances for eviction and eventually removes them from the data dictionary cache. The limit helps address situations in which significant amounts of memory would be used to cache rarely used table instances until the next server restart. The number of table instances with cached metadata could be higher than the limit defined by `table_definition_cache`, because InnoDB system table instances and parent and child table instances with foreign key relationships are not placed on the LRU list and are not subject to eviction from memory.

Additionally, `table_definition_cache` defines a soft limit for the number of InnoDB file-per-table tablespaces that can be open at one time, which is also controlled by `innodb_open_files`. If both `table_definition_cache` and `innodb_open_files` are set, the highest setting is used. If neither variable is set, `table_definition_cache`, which has a higher default value, is used. If the number of open tablespace file handles exceeds the limit defined by `table_definition_cache` or `innodb_open_files`, the LRU mechanism searches the tablespace file LRU list for files that are fully flushed and are not currently being extended. This process is performed each time a new tablespace is opened. If there are no “inactive” tablespaces, no tablespace files are closed.

- `table_open_cache`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--table-open-cache=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>table_open_cache</code></td>
</tr>
</tbody>
</table>
The number of open tables for all threads. Increasing this value increases the number of file descriptors that `mysqld` requires. You can check whether you need to increase the table cache by checking the `Opened_tables` status variable. See Section 5.1.9, “Server Status Variables”. If the value of `Opened_tables` is large and you do not use `FLUSH TABLES` often (which just forces all tables to be closed and reopened), then you should increase the value of the `table_open_cache` variable. For more information about the table cache, see Section 8.4.3.1, “How MySQL Opens and Closes Tables”.

- **table_open_cache_instances**

  The number of open tables cache instances (default 1). To improve scalability by reducing contention among sessions, the open tables cache can be partitioned into several smaller cache instances of size `table_open_cache / table_open_cache_instances`. A session needs to lock only one instance to access it for DML statements. This segments cache access among instances, permitting higher performance for operations that use the cache when there are many sessions accessing tables. (DDL statements still require a lock on the entire cache, but such statements are much less frequent than DML statements.)

  A value of 8 or 16 is recommended on systems that routinely use 16 or more cores.

- **thread_cache_size**
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (&gt;= 5.6.8)</td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
</tr>
<tr>
<td>Default Value (&lt;= 5.6.7)</td>
<td>0</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>16384</td>
</tr>
</tbody>
</table>

How many threads the server should cache for reuse. When a client disconnects, the client’s threads are put in the cache if there are fewer than `thread_cache_size` threads there. Requests for threads are satisfied by reusing threads taken from the cache if possible, and only when the cache is empty is a new thread created. This variable can be increased to improve performance if you have a lot of new connections. Normally, this does not provide a notable performance improvement if you have a good thread implementation. However, if your server sees hundreds of connections per second you should normally set `thread_cache_size` high enough so that most new connections use cached threads. By examining the difference between the `Connections` and `Threads_created` status variables, you can see how efficient the thread cache is. For details, see Section 5.1.9, “Server Status Variables”.

The default value is based on the following formula, capped to a limit of 100:

`8 + (max_connections / 100)`

- `thread_concurrency`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--thread-concurrency=#</code></td>
</tr>
<tr>
<td>Deprecated</td>
<td>5.6.1</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>thread_concurrency</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>10</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>512</td>
</tr>
</tbody>
</table>

This variable is specific to Solaris 8 and earlier systems, for which `mysql` invokes the `thr_setconcurrency()` function with the variable value. This function enables applications to give the threads system a hint about the desired number of threads that should be run at the same time. Current Solaris versions document this as having no effect.

This variable is deprecated and is removed in MySQL 5.7. You should remove this from MySQL configuration files whenever you see it unless they are for Solaris 8 or earlier.

- `thread_handling`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--thread-handling=name</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>thread_handling</code></td>
</tr>
<tr>
<td>Property</td>
<td>Value</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Enumeration</td>
</tr>
<tr>
<td>Default Value</td>
<td>one-thread-per-connection</td>
</tr>
<tr>
<td>Valid Values</td>
<td>no-threads</td>
</tr>
<tr>
<td></td>
<td>one-thread-per-connection</td>
</tr>
<tr>
<td></td>
<td>loaded-dynamically</td>
</tr>
</tbody>
</table>

The thread-handling model used by the server for connection threads. The permissible values are no-threads (the server uses a single thread to handle one connection) and one-thread-per-connection (the server uses one thread to handle each client connection). no-threads is useful for debugging under Linux; see Section 24.5, “Debugging and Porting MySQL”.

If the thread pool plugin is enabled, the server sets the thread_handling value to loaded-dynamically. See Section 5.5.3.2, “Thread Pool Installation”.

- **thread_pool_algorithm**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--thread-pool-algorithm=#</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.10</td>
</tr>
<tr>
<td>System Variable</td>
<td>thread_pool_algorithm</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1</td>
</tr>
</tbody>
</table>

This variable controls which algorithm the thread pool plugin uses:

- A value of 0 (the default) uses a conservative low-concurrency algorithm which is most well tested and is known to produce very good results.

- A value of 1 increases the concurrency and uses a more aggressive algorithm which at times has been known to perform 5–10% better on optimal thread counts, but has degrading performance as the number of connections increases. Its use should be considered as experimental and not supported.

This variable is available only if the thread pool plugin is enabled. See Section 5.5.3, “MySQL Enterprise Thread Pool”

- **thread_pool_high_priority_connection**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--thread-pool-high-priority-connection=#</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.10</td>
</tr>
<tr>
<td>Property</td>
<td>Value</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td>System Variable</td>
<td>thread_pool_high_priority_connection</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1</td>
</tr>
</tbody>
</table>

This variable affects queuing of new statements prior to execution. If the value is 0 (false, the default), statement queuing uses both the low-priority and high-priority queues. If the value is 1 (true), queued statements always go to the high-priority queue.

This variable is available only if the thread pool plugin is enabled. See Section 5.5.3, "MySQL Enterprise Thread Pool"

- thread_pool_max_unused_threads

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--thread-pool-max-unused-threads=#</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.10</td>
</tr>
<tr>
<td>System Variable</td>
<td>thread_pool_max_unused_threads</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>4096</td>
</tr>
</tbody>
</table>

The maximum permitted number of unused threads in the thread pool. This variable makes it possible to limit the amount of memory used by sleeping threads.

A value of 0 (the default) means no limit on the number of sleeping threads. A value of $N$ where $N$ is greater than 0 means 1 consumer thread and $N$−1 reserve threads. In this case, if a thread is ready to sleep but the number of sleeping threads is already at the maximum, the thread exits rather than going to sleep.

A sleeping thread is either sleeping as a consumer thread or a reserve thread. The thread pool permits one thread to be the consumer thread when sleeping. If a thread goes to sleep and there is no existing consumer thread, it will sleep as a consumer thread. When a thread must be woken up, a consumer thread is selected if there is one. A reserve thread is selected only when there is no consumer thread to wake up.

This variable is available only if the thread pool plugin is enabled. See Section 5.5.3, "MySQL Enterprise Thread Pool"

- thread_pool_prio_kickup_timer
### Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--thread-pool-prio-kickup-timer=#</code></td>
</tr>
<tr>
<td><strong>Introduced</strong></td>
<td>5.6.10</td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>thread_pool_prio_kickup_timer</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global, Session</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>1000</td>
</tr>
<tr>
<td><strong>Minimum Value</strong></td>
<td>0</td>
</tr>
<tr>
<td><strong>Maximum Value</strong></td>
<td>4294967294</td>
</tr>
</tbody>
</table>

This variable affects statements waiting for execution in the low-priority queue. The value is the number of milliseconds before a waiting statement is moved to the high-priority queue. The default is 1000 (1 second). The range of values is 0 to $2^{32} - 2$.

This variable is available only if the thread pool plugin is enabled. See Section 5.5.3, "MySQL Enterprise Thread Pool"

• **thread_pool_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--thread-pool-size=#</code></td>
</tr>
<tr>
<td><strong>Introduced</strong></td>
<td>5.6.10</td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>thread_pool_size</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>16</td>
</tr>
<tr>
<td><strong>Minimum Value</strong></td>
<td>1</td>
</tr>
<tr>
<td><strong>Maximum Value</strong></td>
<td>64</td>
</tr>
</tbody>
</table>

The number of thread groups in the thread pool. This is the most important parameter controlling thread pool performance. It affects how many statements can execute simultaneously. The default value is 16, with a range from 1 to 64 of permissible values. If a value outside this range is specified, the thread pool plugin does not load and the server writes a message to the error log.

This variable is available only if the thread pool plugin is enabled. See Section 5.5.3, "MySQL Enterprise Thread Pool"

• **thread_pool_stall_limit**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--thread-pool-stall-limit=#</code></td>
</tr>
<tr>
<td><strong>Introduced</strong></td>
<td>5.6.10</td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>thread_pool_stall_limit</code></td>
</tr>
</tbody>
</table>
This variable affects executing statements. The value is the amount of time a statement has to finish after starting to execute before it becomes defined as stalled, at which point the thread pool permits the thread group to begin executing another statement. The value is measured in 10 millisecond units, so a value of 6 (the default) means 60ms. The range of values is 4 to 600 (40ms to 6s). Short wait values permit threads to start more quickly. Short values are also better for avoiding deadlock situations. Long wait values are useful for workloads that include long-running statements, to avoid starting too many new statements while the current ones execute.

This variable is available only if the thread pool plugin is enabled. See Section 5.5.3, “MySQL Enterprise Thread Pool”

- thread_stack

The stack size for each thread. Many of the limits detected by the crash-me test are dependent on this value. See Section 8.13.2, “The MySQL Benchmark Suite”. The default is large enough for normal operation. If the thread stack size is too small, it limits the complexity of the SQL statements that the server can handle, the recursion depth of stored procedures, and other memory-consuming actions.

- time_format

This variable is unused. It is deprecated and will be removed in a future MySQL release.

- time_zone
**Server System Variables**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>time_zone</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

The current time zone. This variable is used to initialize the time zone for each client that connects. By default, the initial value of this is 'SYSTEM' (which means, "use the value of system_time_zone"). The value can be specified explicitly at server startup with the **--default-time-zone** option. See Section 5.1.12, "MySQL Server Time Zone Support".

**Note**

If set to SYSTEM, every MySQL function call that requires a time zone calculation makes a system library call to determine the current system time zone. This call may be protected by a global mutex, resulting in contention.

- timed_mutexes

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--timed-mutexes[={OFF</td>
</tr>
<tr>
<td>Deprecated</td>
<td>5.6.20</td>
</tr>
<tr>
<td>System Variable</td>
<td>timed_mutexes</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

This variable is deprecated; it has no use. It will be removed in a future MySQL release.

- timestamp

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>timestamp</td>
</tr>
<tr>
<td>Scope</td>
<td>Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Numeric</td>
</tr>
</tbody>
</table>

Set the time for this client. This is used to get the original timestamp if you use the binary log to restore rows. timestamp_value should be a Unix epoch timestamp (a value like that returned by UNIX_TIMESTAMP(), not a value in 'YYYY-MM-DD hh:mm:ss' format) or **DEFAULT**.

Setting timestamp to a constant value causes it to retain that value until it is changed again. Setting timestamp to **DEFAULT** causes its value to be the current date and time as of the time it is accessed.

As of MySQL 5.6.4, timestamp is a **DOUBLE** rather than **BIGINT** because its value includes a microseconds part.
Server System Variables

**SET timestamp** affects the value returned by NOW() but not by SYSDATE(). This means that timestamp settings in the binary log have no effect on invocations of SYSDATE(). The server can be started with the **--sysdate-is-now** option to cause SYSDATE() to be an alias for NOW(), in which case **SET timestamp** affects both functions.

- **tmp_table_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--tmp-table-size=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>tmp_table_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>16777216</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>18446744073709551615</td>
</tr>
</tbody>
</table>

The property of internal in-memory temporary tables. This variable does not apply to user-created MEMORY tables.

The actual limit is determined from whichever of the values of tmp_table_size and max_heap_table_size is smaller. If an in-memory temporary table exceeds the limit, MySQL automatically converts it to an on-disk MyISAM table. Increase the value of tmp_table_size (and max_heap_table_size if necessary) if you do many advanced GROUP BY queries and you have lots of memory.

You can compare the number of internal on-disk temporary tables created to the total number of internal temporary tables created by comparing the values of the Created_tmp_disk_tables and Created_tmp_tables variables.

See also Section 8.4.4, “Internal Temporary Table Use in MySQL”.

- **tmpdir**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--tmpdir=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>tmpdir</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Directory name</td>
</tr>
</tbody>
</table>

The path of the directory to use for creating temporary files. It might be useful if your default /tmp directory resides on a partition that is too small to hold temporary tables. This variable can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (:) on Unix and semicolon characters (;) on Windows.

**tmpdir** can be a non-permanent location, such as a directory on a memory-based file system or a directory that is cleared when the server host restarts. If the MySQL server is acting as a replication slave, and you are using a non-permanent location for tmpdir, consider setting a different temporary
directory for the slave using the `slave_load_tmpdir` variable. For a replication slave, the temporary files used to replicate `LOAD DATA` statements are stored in this directory, so with a permanent location they can survive machine restarts, although replication can now continue after a restart if the temporary files have been removed.

For more information about the storage location of temporary files, see Section B.4.3.5, “Where MySQL Stores Temporary Files”.

- **transaction_alloc_block_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--transaction-alloc-block-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>transaction_alloc_block_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>8192</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms, &lt;= 5.6.23)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms, &lt;= 5.6.23)</td>
<td>4294967295</td>
</tr>
<tr>
<td>Maximum Value (&gt;= 5.6.24)</td>
<td>131072</td>
</tr>
<tr>
<td>Block Size</td>
<td>1024</td>
</tr>
</tbody>
</table>

The amount in bytes by which to increase a per-transaction memory pool which needs memory. See the description of `transaction_prealloc_size`.

- **transaction_prealloc_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--transaction-prealloc-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>transaction_prealloc_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>4096</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value (64-bit platforms, &lt;= 5.6.23)</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>Maximum Value (32-bit platforms, &lt;= 5.6.23)</td>
<td>4294967295</td>
</tr>
<tr>
<td>Maximum Value (&gt;= 5.6.24)</td>
<td>131072</td>
</tr>
<tr>
<td>Block Size</td>
<td>1024</td>
</tr>
</tbody>
</table>
There is a per-transaction memory pool from which various transaction-related allocations take memory. The initial size of the pool in bytes is \texttt{transaction\_prealloc\_size}. For every allocation that cannot be satisfied from the pool because it has insufficient memory available, the pool is increased by \texttt{transaction\_alloc\_block\_size} bytes. When the transaction ends, the pool is truncated to \texttt{transaction\_prealloc\_size} bytes.

By making \texttt{transaction\_prealloc\_size} sufficiently large to contain all statements within a single transaction, you can avoid many \texttt{malloc()} calls.

- \texttt{tx\_isolation}

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>

<td>\texttt{REPEATABLE-READ}</td>
</tr>
<tr>
<td></td>
<td>\texttt{SERIALIZABLE}</td>
</tr>
</tbody>
</table>

The transaction isolation level. The default is \texttt{REPEATABLE-READ}.

The transaction isolation level has three scopes: global, session, and next transaction. This three-scope implementation leads to some nonstandard isolation-level assignment semantics, as described later.

To set the global transaction isolation level at startup, use the \texttt{--transaction-isolation} server option.

At runtime, the isolation level can be set directly using the \texttt{SET} statement to assign a value to the \texttt{tx\_isolation} system variable, or indirectly using the \texttt{SET TRANSACTION} statement. If you set \texttt{tx\_isolation} directly to an isolation level name that contains a space, the name should be enclosed within quotation marks, with the space replaced by a dash. For example, use this \texttt{SET} statement to set the global value:

```
SET GLOBAL tx_isolation = 'READ-COMMITTED';
```

Setting the global \texttt{tx\_isolation} value sets the isolation level for all subsequent sessions. Existing sessions are unaffected.

To set the session or next-level \texttt{tx\_isolation} value, use the \texttt{SET} statement. For most session system variables, these statements are equivalent ways to set the value:

```
SET @@SESSION.var_name = value;
SET SESSION var_name = value;
SET var_name = value;
SET @@var_name = value;
```
As mentioned previously, the transaction isolation level has a next-transaction scope, in addition to the global and session scopes. To enable the next-transaction scope to be set, `SET` syntax for assigning session system variable values has nonstandard semantics for `tx_isolation`:

- To set the session isolation level, use any of these syntaxes:

  ```
  SET @@SESSION.tx_isolation = value;
  SET SESSION tx_isolation = value;
  SET tx_isolation = value;
  ```

  For each of those syntaxes, these semantics apply:

  - Sets the isolation level for all subsequent transactions performed within the session.
  - Permitted within transactions, but does not affect the current ongoing transaction.
  - If executed between transactions, overrides any preceding statement that sets the next-transaction isolation level.
  - Corresponds to `SET SESSION TRANSACTION ISOLATION LEVEL` (with the `SESSION` keyword).

- To set the next-transaction isolation level, use this syntax:

  ```
  SET @@tx_isolation = value;
  ```

  For that syntax, these semantics apply:

  - Sets the isolation level only for the next single transaction performed within the session.
  - Subsequent transactions revert to the session isolation level.
  - Not permitted within transactions.
  - Corresponds to `SET TRANSACTION ISOLATION LEVEL` (without the `SESSION` keyword).

  For more information about `SET TRANSACTION` and its relationship to the `tx_isolation` system variable, see Section 13.3.6, “SET TRANSACTION Syntax”.

- `tx_read_only`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Introduced</td>
<td>5.6.5</td>
</tr>
<tr>
<td>System Variable</td>

<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

The transaction access mode. The value can be `OFF` (read/write; the default) or `ON` (read only).

The transaction access mode has three scopes: global, session, and next transaction. This three-scope implementation leads to some nonstandard access-mode assignment semantics, as described later.
To set the global transaction access mode at startup, use the `--transaction-read-only` server option.

At runtime, the access mode can be set directly using the `SET` statement to assign a value to the `tx_read_only` system variable, or indirectly using the `SET TRANSACTION` statement. For example, use this `SET` statement to set the global value:

```sql
SET GLOBAL tx_read_only = ON;
```

Setting the global `tx_read_only` value sets the access mode for all subsequent sessions. Existing sessions are unaffected.

To set the session or next-level `tx_read_only` value, use the `SET` statement. For most session system variables, these statements are equivalent ways to set the value:

```sql
SET @@SESSION.var_name = value;
SET SESSION var_name = value;
SET var_name = value;
SET @@var_name = value;
```

As mentioned previously, the transaction access mode has a next-transaction scope, in addition to the global and session scopes. To enable the next-transaction scope to be set, `SET` syntax for assigning session system variable values has nonstandard semantics for `tx_read_only`:

• To set the session access mode, use any of these syntaxes:

```sql
SET @@SESSION.tx_read_only = value;
SET SESSION tx_read_only = value;
SET tx_read_only = value;
```

For each of those syntaxes, these semantics apply:

• Sets the access mode for all subsequent transactions performed within the session.

• Permitted within transactions, but does not affect the current ongoing transaction.

• If executed between transactions, overrides any preceding statement that sets the next-transaction access mode.

• Corresponds to `SET SESSION TRANSACTION {READ WRITE | READ ONLY}` (with the `SESSION` keyword).

• To set the next-transaction access mode, use this syntax:

```sql
SET @@tx_read_only = value;
```

For that syntax, these semantics apply:

• Sets the access mode only for the next single transaction performed within the session.

• Subsequent transactions revert to the session access mode.

• Not permitted within transactions.
• Corresponds to `SET TRANSACTION {READ WRITE | READ ONLY}` (without the `SESSION` keyword).

For more information about `SET TRANSACTION` and its relationship to the `tx_read_only` system variable, see Section 13.3.6, “SET TRANSACTION Syntax”.

• `unique_checks`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>unique_checks</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>ON</code></td>
</tr>
</tbody>
</table>

If set to 1 (the default), uniqueness checks for secondary indexes in InnoDB tables are performed. If set to 0, storage engines are permitted to assume that duplicate keys are not present in input data. If you know for certain that your data does not contain uniqueness violations, you can set this to 0 to speed up large table imports to InnoDB.

Setting this variable to 0 does not require storage engines to ignore duplicate keys. An engine is still permitted to check for them and issue duplicate-key errors if it detects them.

• `updatable_views_with_limit`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--updatable-views-with-limit=[{OFF</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>updatable_views_with_limit</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>1</code></td>
</tr>
</tbody>
</table>

This variable controls whether updates to a view can be made when the view does not contain all columns of the primary key defined in the underlying table, if the update statement contains a `LIMIT` clause. (Such updates often are generated by GUI tools.) An update is an `UPDATE` or `DELETE` statement. Primary key here means a `PRIMARY KEY`, or a `UNIQUE` index in which no column can contain `NULL`.

The variable can have two values:

• 1 or `YES`: Issue a warning only (not an error message). This is the default value.

• 0 or `NO`: Prohibit the update.

• `validate_password_xxx`

The `validate_password` plugin implements a set of system variables having names of the form `validate_password_xxx`. These variables affect password testing by that plugin; see Section 6.4.3.2, “Password Validation Plugin Options and Variables”.

• `validate_userplugins`
Server System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>`--validate-user-plugins=[{OFF</td>
</tr>
<tr>
<td>Introduced</td>
<td>5.6.11</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>validate_user_plugins</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

If this variable is enabled (the default), the server checks each user account and produces a warning if conditions are found that would make the account unusable:

- The account requires an authentication plugin that is not loaded.
- The account requires the `sha256_password` authentication plugin but the server was started with neither SSL nor RSA enabled as required by this plugin.

Enabling `validate_user_plugins` slows down server initialization and `FLUSH PRIVILEGES`. If you do not require the additional checking, you can disable this variable at startup to avoid the performance decrement.

This variable was added in MySQL 5.6.11.

- `version`

  The version number for the server. The value might also include a suffix indicating server build or configuration information. `--log` indicates that one or more of the general log, slow query log, or binary log are enabled. `--debug` indicates that the server was built with debugging support enabled.

- `version_comment`

  The `CMake` configuration program has a `COMPILATION_COMMENT` option that permits a comment to be specified when building MySQL. This variable contains the value of that comment. See Section 2.9.7, “MySQL Source-Configuration Options”.

- `version_compile_machine`

  The `CMake` configuration program has a `COMPILATION_COMMENT` option that permits a comment to be specified when building MySQL. This variable contains the value of that comment. See Section 2.9.7, “MySQL Source-Configuration Options”.

---

682
The type of the server binary.

- **version_compile_os**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>version_compile_os</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
</tbody>
</table>

The type of operating system on which MySQL was built.

- **wait_timeout**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--wait-timeout=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>wait_timeout</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>28800</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum Value (Other)</td>
<td>31536000</td>
</tr>
<tr>
<td>Maximum Value (Windows)</td>
<td>2147483</td>
</tr>
</tbody>
</table>

The number of seconds the server waits for activity on a noninteractive connection before closing it.

On thread startup, the session `wait_timeout` value is initialized from the global `wait_timeout` value or from the global `interactive_timeout` value, depending on the type of client (as defined by the `CLIENT_INTERACTIVE` connect option to `mysql_real_connect()`). See also `interactive_timeout`.

- **warning_count**

  The number of errors, warnings, and notes that resulted from the last statement that generated messages. This variable is read only. See Section 13.7.5.41, “SHOW WARNINGS Syntax”.

### 5.1.8 Using System Variables

The MySQL server maintains many system variables that configure its operation. Section 5.1.7, “Server System Variables”, describes the meaning of these variables. Each system variable has a default value. System variables can be set at server startup using options on the command line or in an option file. Most of them can be changed dynamically while the server is running by means of the `SET` statement, which enables you to modify operation of the server without having to stop and restart it. You can also use system variable values in expressions.

Many system variables are built in. System variables implemented by a server plugin are exposed when the plugin is installed and have names that begin with the plugin name. For example, the `audit_log` plugin implements a system variable named `audit_log_policy`.
There are two scopes in which system variables exist. Global variables affect the overall operation of the server. Session variables affect its operation for individual client connections. A given system variable can have both a global and a session value. Global and session system variables are related as follows:

- When the server starts, it initializes each global variable to its default value. These defaults can be changed by options specified on the command line or in an option file. (See Section 4.2.2, “Specifying Program Options”.)

- The server also maintains a set of session variables for each client that connects. The client's session variables are initialized at connect time using the current values of the corresponding global variables. For example, a client's SQL mode is controlled by the session `sql_mode` value, which is initialized when the client connects to the value of the global `sql_mode` value.

For some system variables, the session value is not initialized from the corresponding global value; if so, that is indicated in the variable description.

System variable values can be set globally at server startup by using options on the command line or in an option file. At startup, the syntax for system variables is the same as for command options, so within variable names, dashes and underscores may be used interchangeably. For example, `--general_log=ON` and `--general-log=ON` are equivalent.

When you use a startup option to set a variable that takes a numeric value, the value can be given with a suffix of `K`, `M`, or `G` (either uppercase or lowercase) to indicate a multiplier of 1024, 1024^2 or 1024^3; that is, units of kilobytes, megabytes, or gigabytes, respectively. Thus, the following command starts the server with an InnoDB log file size of 16 megabytes and a maximum packet size of one gigabyte:

```
mysqld --innodb-log-file-size=16M --max-allowed-packet=1G
```

Within an option file, those variables are set like this:

```
[mysqld]
innoadb_log_file_size=16M
max_allowed_packet=1G
```

The lettercase of suffix letters does not matter; `16M` and `16m` are equivalent, as are `1G` and `1g`.

To restrict the maximum value to which a system variable can be set at runtime with the `SET` statement, specify this maximum by using an option of the form `--maximum-var_name=value` at server startup. For example, to prevent the value of `innodb_log_file_size` from being increased to more than 32MB at runtime, use the option `--maximum-innodb-log-file-size=32M`.

Many system variables are dynamic and can be changed at runtime by using the `SET` statement. For a list, see Section 5.1.8.2, “Dynamic System Variables”. To change a system variable with `SET`, refer to it by name, optionally preceded by a modifier. At runtime, system variable names must be written using underscores, not dashes. The following examples briefly illustrate this syntax:

- Set a global system variable:

  ```
  SET GLOBAL max_connections = 1000;
  SET @@GLOBAL.max_connections = 1000;
  ```

- Set a session system variable:

  ```
  SET SESSION sql_mode = 'TRADITIONAL';
  SET @@SESSION.sql_mode = 'TRADITIONAL';
  ```
Using System Variables

For complete details about SET syntax, see Section 13.7.4.1, “SET Syntax for Variable Assignment”. For a description of the privilege requirements for setting system variables, see Section 5.1.8.1, “System Variable Privileges”

Suffixes for specifying a value multiplier can be used when setting a variable at server startup, but not to set the value with SET at runtime. On the other hand, with SET you can assign a variable’s value using an expression, which is not true when you set a variable at server startup. For example, the first of the following lines is legal at server startup, but the second is not:

```
shell> mysql --max_allowed_packet=16M
shell> mysql --max_allowed_packet=16*1024*1024
```

Conversely, the second of the following lines is legal at runtime, but the first is not:

```
mysql> SET GLOBAL max_allowed_packet=16M;
mysql> SET GLOBAL max_allowed_packet=16*1024*1024;
```

Note

Some system variables can be enabled with the SET statement by setting them to ON or 1, or disabled by setting them to OFF or 0. However, to set such a variable on the command line or in an option file, you must set it to 1 or 0; setting it to ON or OFF will not work. For example, on the command line, --delay_key_write=1 works but --delay_key_write=ON does not.

To display system variable names and values, use the SHOW VARIABLES statement:

```
mysql> SHOW VARIABLES;
```

<table>
<thead>
<tr>
<th>Variable_name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto_increment_increment</td>
<td>1</td>
</tr>

</tr>
</tbody>
</table>

685
With a `LIKE` clause, the statement displays only those variables that match the pattern. To obtain a specific variable name, use a `LIKE` clause as shown:

```
SHOW VARIABLES LIKE 'max_join_size';
SHOW SESSION VARIABLES LIKE 'max_join_size';
```

To get a list of variables whose name match a pattern, use the `%` wildcard character in a `LIKE` clause:

```
SHOW VARIABLES LIKE '%size%';
SHOW GLOBAL VARIABLES LIKE '%size%';
```

Wildcard characters can be used in any position within the pattern to be matched. Strictly speaking, because `_` is a wildcard that matches any single character, you should escape it as `\_` to match it literally. In practice, this is rarely necessary.

For `SHOW VARIABLES`, if you specify neither `GLOBAL` nor `SESSION`, MySQL returns `SESSION` values.

The reason for requiring the `GLOBAL` keyword when setting `GLOBAL`-only variables but not when retrieving them is to prevent problems in the future:

- Were a `SESSION` variable to be removed that has the same name as a `GLOBAL` variable, a client with privileges sufficient to modify global variables might accidentally change the `GLOBAL` variable rather than just the `SESSION` variable for its own session.

- Were a `SESSION` variable to be added with the same name as a `GLOBAL` variable, a client that intends to change the `GLOBAL` variable might find only its own `SESSION` variable changed.

### 5.1.8.1 System Variable Privileges

A system variable can have a global value that affects server operation as a whole, a session value that affects only the current session, or both. To modify system variable runtime values, use the `SET` statement. See Section 13.7.4.1, “SET Syntax for Variable Assignment”. This section describes the privileges required to assign values to system variables at runtime.

Setting a global system variable runtime value requires the `SUPER` privilege.

To set a session system variable runtime value, use the `SET SESSION` statement. In contrast to setting global runtime values, setting session runtime values normally requires no special privileges and can be done by any user to affect the current session. For some system variables, setting the session value may have effects outside the current session and thus is a restricted operation that can be done only by users who have the `SUPER` privilege. If a session system variable is restricted in this way, the variable description indicates that restriction. Examples include `binlog_format` and `sql_log_bin`. Setting the session value of these variables affects binary logging for the current session, but may also have wider implications for the integrity of server replication and backups.

### 5.1.8.2 Dynamic System Variables

Many server system variables are dynamic and can be set at runtime. See Section 13.7.4.1, “SET Syntax for Variable Assignment”. For a description of the privilege requirements for setting system variables, see Section 5.1.8.1, “System Variable Privileges”

The following table lists all dynamic system variables applicable within `mysqld`. 
The table lists each variable's data type and scope. The last column indicates whether the scope for each variable is Global, Session, or both. Please see the corresponding item descriptions for details on setting and using the variables. Where appropriate, direct links to further information about the items are provided.

Variables that have a type of "string" take a string value. Variables that have a type of "numeric" take a numeric value. Variables that have a type of "boolean" can be set to 0, 1, **ON** or **OFF**. Variables that are marked as "enumeration" normally should be set to one of the available values for the variable, but can also be set to the number that corresponds to the desired enumeration value. For enumerated system variables, the first enumeration value corresponds to 0. This differs from the **ENUM** data type used for table columns, for which the first enumeration value corresponds to 1.

### 5.1.8.3 Structured System Variables

A structured variable differs from a regular system variable in two respects:
Using System Variables

- Its value is a structure with components that specify server parameters considered to be closely related.
- There might be several instances of a given type of structured variable. Each one has a different name and refers to a different resource maintained by the server.

MySQL supports one structured variable type, which specifies parameters governing the operation of key caches. A key cache structured variable has these components:

- `key_buffer_size`
- `key_cache_block_size`
- `key_cache_division_limit`
- `key_cache_age_threshold`

This section describes the syntax for referring to structured variables. Key cache variables are used for syntax examples, but specific details about how key caches operate are found elsewhere, in Section 8.10.2, “The MyISAM Key Cache”.

To refer to a component of a structured variable instance, you can use a compound name in `instance_name.component_name` format. Examples:

```
hot_cache.key_buffer_size
hot_cache.key_cache_block_size
cold_cache.key_cache_block_size
```

For each structured system variable, an instance with the name of `default` is always predefined. If you refer to a component of a structured variable without any instance name, the `default` instance is used. Thus, `default.key_buffer_size` and `key_buffer_size` both refer to the same system variable.

Structured variable instances and components follow these naming rules:

- For a given type of structured variable, each instance must have a name that is unique within variables of that type. However, instance names need not be unique across structured variable types. For example, each structured variable has an instance named `default`, so `default` is not unique across variable types.

- The names of the components of each structured variable type must be unique across all system variable names. If this were not true (that is, if two different types of structured variables could share component member names), it would not be clear which default structured variable to use for references to member names that are not qualified by an instance name.

- If a structured variable instance name is not legal as an unquoted identifier, refer to it as a quoted identifier using backticks. For example, `hot-cache` is not legal, but `'hot-cache'` is.

- `global`, `session`, and `local` are not legal instance names. This avoids a conflict with notation such as `@@GLOBAL.var_name` for referring to nonstructured system variables.

Currently, the first two rules have no possibility of being violated because the only structured variable type is the one for key caches. These rules will assume greater significance if some other type of structured variable is created in the future.

With one exception, you can refer to structured variable components using compound names in any context where simple variable names can occur. For example, you can assign a value to a structured variable using a command-line option:
Server Status Variables

In an option file, use this syntax:

```
[mysqld]
hot_cache.key_buffer_size=64K
```

If you start the server with this option, it creates a key cache named `hot_cache` with a size of 64KB in addition to the default key cache that has a default size of 8MB.

Suppose that you start the server as follows:

```
shell> mysqld --key_buffer_size=256K \
   --extra_cache.key_buffer_size=128K \
   --extra_cache.key_cache_block_size=2048
```

In this case, the server sets the size of the default key cache to 256KB. (You could also have written `--default.key_buffer_size=256K`.) In addition, the server creates a second key cache named `extra_cache` that has a size of 128KB, with the size of block buffers for caching table index blocks set to 2048 bytes.

The following example starts the server with three different key caches having sizes in a 3:1:1 ratio:

```
shell> mysqld --key_buffer_size=6M \
   --hot_cache.key_buffer_size=2M \
   --cold_cache.key_buffer_size=2M
```

Structured variable values may be set and retrieved at runtime as well. For example, to set a key cache named `hot_cache` to a size of 10MB, use either of these statements:

```
mysql> SET GLOBAL hot_cache.key_buffer_size = 10*1024*1024;
mysql> SET @@GLOBAL.hot_cache.key_buffer_size = 10*1024*1024;
```

To retrieve the cache size, do this:

```
mysql> SELECT @@GLOBAL.hot_cache.key_buffer_size;
```

However, the following statement does not work. The variable is not interpreted as a compound name, but as a simple string for a `LIKE` pattern-matching operation:

```
mysql> SHOW GLOBAL VARIABLES LIKE 'hot_cache.key_buffer_size';
```

This is the exception to being able to use structured variable names anywhere a simple variable name may occur.

### 5.1.9 Server Status Variables

The MySQL server maintains many status variables that provide information about its operation. You can view these variables and their values by using the `SHOW [GLOBAL | SESSION] STATUS` statement (see Section 13.7.5.36, “SHOW STATUS Syntax”). The optional `GLOBAL` keyword aggregates the values over all connections, and `SESSION` shows the values for the current connection.

```
mysql> SHOW GLOBAL STATUS;
+--------------------------+
```
Server Status Variables

</table>

Many status variables are reset to 0 by the `FLUSH STATUS` statement.

This section provides a description of each status variable. For a status variable summary, see Section 5.1.5, “Server Status Variable Reference”.

The status variables have the following meanings. For meanings of status variables specific to NDB Cluster, see NDB Cluster Status Variables.

- **Aborted_clients**

  The number of connections that were aborted because the client died without closing the connection properly. See Section B.4.2.11, “Communication Errors and Aborted Connections”.

- **Aborted_connects**

  The number of failed attempts to connect to the MySQL server. See Section B.4.2.11, “Communication Errors and Aborted Connections”.

  For additional connection-related information, check the `Connection_errors_xxx` status variables and the `host_cache` table.

- **Binlog_cache_disk_use**

  The number of transactions that used the temporary binary log cache but that exceeded the value of `binlog_cache_size` and used a temporary file to store statements from the transaction.

  The number of nontransactional statements that caused the binary log transaction cache to be written to disk is tracked separately in the `Binlog_stmt_cache_disk_use` status variable.

- **Binlog_cache_use**

  The number of transactions that used the binary log cache.

- **Binlog_stmt_cache_disk_use**

  The number of nontransactional statements that used the binary log statement cache but that exceeded the value of `binlog_stmt_cache_size` and used a temporary file to store those statements.

- **Binlog_stmt_cache_use**

  The number of nontransactional statements that used the binary log statement cache.

- **Bytes_received**
Server Status Variables

The number of bytes received from all clients.

- **Bytes_sent**
  The number of bytes sent to all clients.

- **Com_xxx**
  The `Com_xxx` statement counter variables indicate the number of times each `xxx` statement has been executed. There is one status variable for each type of statement. For example, `Com_delete` and `Com_update` count `DELETE` and `UPDATE` statements, respectively. `Com_delete_multi` and `Com_update_multi` are similar but apply to `DELETE` and `UPDATE` statements that use multiple-table syntax.

If a query result is returned from query cache, the server increments the `Qcache_hits` status variable, not `Com_select`. See Section 8.10.3.4, “Query Cache Status and Maintenance”.

All `Com_stmt_xxx` variables are increased even if a prepared statement argument is unknown or an error occurred during execution. In other words, their values correspond to the number of requests issued, not to the number of requests successfully completed.

The `Com_stmt_xxx` status variables are as follows:

- **Com_stmt_prepare**
- **Com_stmt_execute**
- **Com_stmt_fetch**
- **Com_stmt_send_long_data**
- **Com_stmt_reset**
- **Com_stmt_close**

Those variables stand for prepared statement commands. Their names refer to the `COM_xxx` command set used in the network layer. In other words, their values increase whenever prepared statement API calls such as `mysql_stmt_prepare()`, `mysql_stmt_execute()`, and so forth are executed. However, `Com_stmt_prepare`, `Com_stmt_execute` and `Com_stmt_close` also increase for `PREPARE`, `EXECUTE`, or `DEALLOCATE PREPARE`, respectively. Additionally, the values of the older statement counter variables `Com_prepare_sql`, `Com_execute_sql`, and `Com_dealloc_sql` increase for the `PREPARE`, `EXECUTE`, and `DEALLOCATE PREPARE` statements. `Com_stmt_fetch` stands for the total number of network round-trips issued when fetching from cursors.

`Com_stmt_reprepare` indicates the number of times statements were automatically reprepared by the server after metadata changes to tables or views referred to by the statement. A reprepare operation increments `Com_stmt_reprepare`, and also `Com_stmt_prepare`.

- **Compression**
  Whether the client connection uses compression in the client/server protocol.

- **Connection_errors_***
  These variables provide information about errors that occur during the client connection process. They are global only and represent error counts aggregated across connections from all hosts. These variables track errors not accounted for by the host cache (see Section 8.12.5.2, “DNS Lookup”
Server Status Variables

Optimization and the Host Cache), such as errors that are not associated with TCP connections, occur very early in the connection process (even before an IP address is known), or are not specific to any particular IP address (such as out-of-memory conditions).

- **Connection_errors_accept**
  The number of errors that occurred during calls to `accept()` on the listening port.

- **Connection_errors_internal**
  The number of connections refused due to internal errors in the server, such as failure to start a new thread or an out-of-memory condition.

- **Connection_errors_max_connections**
  The number of connections refused because the server `max_connections` limit was reached.

- **Connection_errors_peer_address**
  The number of errors that occurred while searching for connecting client IP addresses.

- **Connection_errors_select**
  The number of errors that occurred during calls to `select()` or `poll()` on the listening port. (Failure of this operation does not necessarily means a client connection was rejected.)

- **Connection_errors_tcpwrap**
  The number of connections refused by the `libwrap` library.

- **Connections**
  The number of connection attempts (successful or not) to the MySQL server.

- **Created_tmp_disk_tables**
  The number of internal on-disk temporary tables created by the server while executing statements. If an internal temporary table is created initially as an in-memory table but becomes too large, MySQL automatically converts it to an on-disk table. The maximum size for in-memory temporary tables is the minimum of the `tmp_table_size` and `max_heap_table_size` values. If `Created_tmp_disk_tables` is large, you may want to increase the `tmp_table_size` or `max_heap_table_size` value to lessen the likelihood that internal temporary tables in memory will be converted to on-disk tables.

  You can compare the number of internal on-disk temporary tables created to the total number of internal temporary tables created by comparing the values of the `Created_tmp_disk_tables` and `Created_tmp_tables` variables.

  See also Section 8.4.4, “Internal Temporary Table Use in MySQL”.

- **Created_tmp_files**
  How many temporary files `mysqld` has created.

- **Created_tmp_tables**
  The number of internal temporary tables created by the server while executing statements.
You can compare the number of internal on-disk temporary tables created to the total number of internal temporary tables created by comparing the values of the `Created_tmp_disk_tables` and `Created_tmp_tables` variables.

See also Section 8.4.4, “Internal Temporary Table Use in MySQL”.

Each invocation of the `SHOW STATUS` statement uses an internal temporary table and increments the global `Created_tmp_tables` value.

- **Delayed_errors**

  The number of rows written with `INSERT DELAYED` for which some error occurred (probably duplicate key).

  This status variable is deprecated (because `DELAYED` inserts are deprecated), and will be removed in a future release.

- **Delayed_insert_threads**

  The number of `INSERT DELAYED` handler threads in use for nontransactional tables.

  This status variable is deprecated (because `DELAYED` inserts are deprecated), and will be removed in a future release.

- **Delayed_writes**

  The number of `INSERT DELAYED` rows written to nontransactional tables.

  This status variable is deprecated (because `DELAYED` inserts are deprecated), and will be removed in a future release.

- **Flush_commands**

  The number of times the server flushes tables, whether because a user executed a `FLUSH TABLES` statement or due to internal server operation. It is also incremented by receipt of a `COM_REFRESH` packet. This is in contrast to `Com_flush`, which indicates how many `FLUSH` statements have been executed, whether `FLUSH TABLES`, `FLUSH LOGS`, and so forth.

- **Handler_commit**

  The number of internal `COMMIT` statements.

- **Handler_delete**

  The number of times that rows have been deleted from tables.

- **Handler_external_lock**

  The server increments this variable for each call to its `external_lock()` function, which generally occurs at the beginning and end of access to a table instance. There might be differences among storage engines. This variable can be used, for example, to discover for a statement that accesses a partitioned table how many partitions were pruned before locking occurred: Check how much the counter increased for the statement, subtract 2 (2 calls for the table itself), then divide by 2 to get the number of partitions locked.

- **Handler_mrr_init**
The number of times the server uses a storage engine's own Multi-Range Read implementation for table access.

- **Handler_prepare**
  A counter for the prepare phase of two-phase commit operations.

- **Handler_read_first**
  The number of times the first entry in an index was read. If this value is high, it suggests that the server is doing a lot of full index scans (for example, `SELECT col1 FROM foo`, assuming that `col1` is indexed).

- **Handler_read_key**
  The number of requests to read a row based on a key. If this value is high, it is a good indication that your tables are properly indexed for your queries.

- **Handler_read_last**
  The number of requests to read the last key in an index. With `ORDER BY`, the server will issue a first-key request followed by several next-key requests, whereas with `ORDER BY DESC`, the server will issue a last-key request followed by several previous-key requests.

- **Handler_read_next**
  The number of requests to read the next row in key order. This value is incremented if you are querying an index column with a range constraint or if you are doing an index scan.

- **Handler_read_prev**
  The number of requests to read the previous row in key order. This read method is mainly used to optimize `ORDER BY ... DESC`.

- **Handler_read_rnd**
  The number of requests to read a row based on a fixed position. This value is high if you are doing a lot of queries that require sorting of the result. You probably have a lot of queries that require MySQL to scan entire tables or you have joins that do not use keys properly.

- **Handler_read_rnd_next**
  The number of requests to read the next row in the data file. This value is high if you are doing a lot of table scans. Generally this suggests that your tables are not properly indexed or that your queries are not written to take advantage of the indexes you have.

- **Handler_rollback**
  The number of requests for a storage engine to perform a rollback operation.

- **Handler_savepoint**
  The number of requests for a storage engine to place a savepoint.

- **Handler_savepoint_rollback**
  The number of requests for a storage engine to roll back to a savepoint.
Server Status Variables

• **Handler_update**
  The number of requests to update a row in a table.

• **Handler_write**
  The number of requests to insert a row in a table.

• **Innodb_available_undo_logs**
  The total number of available InnoDB rollback segments. Supplements the `innodb_rollback_segments` system variable, which defines the number of active rollback segments.

• **Innodb_buffer_pool_dump_status**
  The progress of an operation to record the pages held in the InnoDB buffer pool, triggered by the setting of `innodb_buffer_pool_dump_at_shutdown` or `innodb_buffer_pool_dump_now`.
  For related information and examples, see Section 14.8.3.5, “Saving and Restoring the Buffer Pool State”.

• **Innodb_buffer_pool_load_status**
  The progress of an operation to warm up the InnoDB buffer pool by reading in a set of pages corresponding to an earlier point in time, triggered by the setting of `innodb_buffer_pool_load_at_startup` or `innodb_buffer_pool_load_now`. If the operation introduces too much overhead, you can cancel it by setting `innodb_buffer_pool_load_abort`.
  For related information and examples, see Section 14.8.3.5, “Saving and Restoring the Buffer Pool State”.

• **Innodb_buffer_pool_bytes_data**
  The total number of bytes in the InnoDB buffer pool containing data. The number includes both dirty and clean pages. For more accurate memory usage calculations than with `Innodb_buffer_pool_pages_data`, when compressed tables cause the buffer pool to hold pages of different sizes.

• **Innodb_buffer_pool_pages_data**
  The number of pages in the InnoDB buffer pool containing data. The number includes both dirty and clean pages. When using compressed tables, the reported `Innodb_buffer_pool_pages_data` value may be larger than `Innodb_buffer_pool_pages_total` (Bug #59550).

• **Innodb_buffer_pool_bytes_dirty**
  The total current number of bytes held in dirty pages in the InnoDB buffer pool. For more accurate memory usage calculations than with `Innodb_buffer_pool_pages_dirty`, when compressed tables cause the buffer pool to hold pages of different sizes.

• **Innodb_buffer_pool_pages_dirty**
  The current number of dirty pages in the InnoDB buffer pool.

• **Innodb_buffer_pool_pages_flushed**
  The number of requests to flush pages from the InnoDB buffer pool.

• **Innodb_buffer_pool_pages_free**
Server Status Variables

The number of free pages in the InnoDB buffer pool.

- **Innodb_buffer_pool_pages_latched**
  The number of latched pages in the InnoDB buffer pool. These are pages currently being read or written, or that cannot be flushed or removed for some other reason. Calculation of this variable is expensive, so it is available only when the **UNIV_DEBUG** system is defined at server build time.

- **Innodb_buffer_pool_pages_misc**
  The number of pages in the InnoDB buffer pool that are busy because they have been allocated for administrative overhead, such as row locks or the adaptive hash index. This value can also be calculated as **Innodb_buffer_pool_pages_total** - **Innodb_buffer_pool_pages_free** - **Innodb_buffer_pool_pages_data**. When using compressed tables, **Innodb_buffer_pool_pages_misc** may report an out-of-bounds value (Bug #59550).

- **Innodb_buffer_pool_pages_total**
  The total size of the InnoDB buffer pool, in pages. When using compressed tables, the reported **Innodb_buffer_pool_pages_data** value may be larger than **Innodb_buffer_pool_pages_total** (Bug #59550)

- **Innodb_buffer_pool_read_ahead**
  The number of pages read into the InnoDB buffer pool by the read-ahead background thread.

- **Innodb_buffer_pool_read_ahead_evicted**
  The number of pages read into the InnoDB buffer pool by the read-ahead background thread that were subsequently evicted without having been accessed by queries.

- **Innodb_buffer_pool_read_ahead_rnd**
  The number of “random” read-aheads initiated by InnoDB. This happens when a query scans a large portion of a table but in random order.

- **Innodb_buffer_pool_read_requests**
  The number of logical read requests.

- **Innodb_buffer_pool_reads**
  The number of logical reads that InnoDB could not satisfy from the buffer pool, and had to read directly from disk.

- **Innodb_buffer_pool_wait_free**
  Normally, writes to the InnoDB buffer pool happen in the background. When InnoDB needs to read or create a page and no clean pages are available, InnoDB flushes some dirty pages first and waits for that operation to finish. This counter counts instances of these waits. If **innodb_buffer_pool_size** has been set properly, this value should be small.

- **Innodb_buffer_pool_write_requests**
  The number of writes done to the InnoDB buffer pool.

- **Innodb_data_fsyncs**
The number of `fsync()` operations so far. The frequency of `fsync()` calls is influenced by the setting of the `innodb_flush_method` configuration option.

- **Innodb_data_pending_fsyncs**
  The current number of pending `fsync()` operations. The frequency of `fsync()` calls is influenced by the setting of the `innodb_flush_method` configuration option.

- **Innodb_data_pending_reads**
  The current number of pending reads.

- **Innodb_data_pending_writes**
  The current number of pending writes.

- **Innodb_data_read**
  The amount of data read since the server was started (in bytes).

- **Innodb_data_reads**
  The total number of data reads (OS file reads).

- **Innodb_data_writes**
  The total number of data writes.

- **Innodb_data_written**
  The amount of data written so far, in bytes.

- **Innodb_dblwr_pages_written**
  The number of pages that have been written to the doublewrite buffer. See Section 14.12.1, “InnoDB Disk I/O”.

- **Innodb_dblwr_writes**
  The number of doublewrite operations that have been performed. See Section 14.12.1, “InnoDB Disk I/O”.

- **Innodb_have_atomic_builtins**
  Indicates whether the server was built with atomic instructions.

- **Innodb_log_waits**
  The number of times that the log buffer was too small and a wait was required for it to be flushed before continuing.

- **Innodb_log_write_requests**
  The number of write requests for the InnoDB redo log.

- **Innodb_log_writes**
  The number of physical writes to the InnoDB redo log file.
Server Status Variables

- **Innodb_num_open_files**
  The number of files InnoDB currently holds open.

- **Innodb_os_log_fsyncs**
  The number of `fsync()` writes done to the InnoDB redo log files.

- **Innodb_os_log_pending_fsyncs**
  The number of pending `fsync()` operations for the InnoDB redo log files.

- **Innodb_os_log_pending_writes**
  The number of pending writes to the InnoDB redo log files.

- **Innodb_os_log_written**
  The number of bytes written to the InnoDB redo log files.

- **Innodb_page_size**
  InnoDB page size (default 16KB). Many values are counted in pages; the page size enables them to be easily converted to bytes.

- **Innodb_pages_created**
  The number of pages created by operations on InnoDB tables.

- **Innodb_pages_read**
  The number of pages read from the InnoDB buffer pool by operations on InnoDB tables.

- **Innodb_pages_written**
  The number of pages written by operations on InnoDB tables.

- **Innodb_row_lock_current_waits**
  The number of row locks currently being waited for by operations on InnoDB tables.

- **Innodb_row_lock_time**
  The total time spent in acquiring row locks for InnoDB tables, in milliseconds.

- **Innodb_row_lock_time_avg**
  The average time to acquire a row lock for InnoDB tables, in milliseconds.

- **Innodb_row_lock_time_max**
  The maximum time to acquire a row lock for InnoDB tables, in milliseconds.

- **Innodb_row_lock_waits**
  The number of times operations on InnoDB tables had to wait for a row lock.

- **Innodb_rows_deleted**
  The number of rows deleted from InnoDB tables.
Server Status Variables

- **Innodb_rows_inserted**
  The number of rows inserted into InnoDB tables.

- **Innodb_rows_read**
  The number of rows read from InnoDB tables.

- **Innodb_rows_updated**
  The number of rows updated in InnoDB tables.

- **Innodb_truncated_status_writes**
  The number of times output from the `SHOW ENGINE INNODB STATUS` statement has been truncated.

- **Key_blocks_not_flushed**
  The number of key blocks in the MyISAM key cache that have changed but have not yet been flushed to disk.

- **Key_blocks_unused**
  The number of unused blocks in the MyISAM key cache. You can use this value to determine how much of the key cache is in use; see the discussion of `key_buffer_size` in Section 5.1.7, “Server System Variables”.

- **Key_blocks_used**
  The number of used blocks in the MyISAM key cache. This value is a high-water mark that indicates the maximum number of blocks that have ever been in use at one time.

- **Key_read_requests**
  The number of requests to read a key block from the MyISAM key cache.

- **Key_reads**
  The number of physical reads of a key block from disk into the MyISAM key cache. If `Key_reads` is large, then your `key_buffer_size` value is probably too small. The cache miss rate can be calculated as `Key_reads/Key_read_requests`.

- **Key_write_requests**
  The number of requests to write a key block to the MyISAM key cache.

- **Key_writes**
  The number of physical writes of a key block from the MyISAM key cache to disk.

- **Last_query_cost**
  The total cost of the last compiled query as computed by the query optimizer. This is useful for comparing the cost of different query plans for the same query. The default value of 0 means that no query has been compiled yet. The default value is 0. `Last_query_cost` has session scope.

  `Last_query_cost` can be computed accurately only for simple, “flat” queries, but not for complex queries such as those containing subqueries or `UNION`. For the latter, the value is set to 0.
Server Status Variables

• **Last_query_partial_plans**
  The number of iterations the query optimizer made in execution plan construction for the previous query. **Last_query_cost** has session scope.

• **Max_used_connections**
  The maximum number of connections that have been in use simultaneously since the server started.

• **Not_flushed_delayed_rows**
  The number of rows waiting to be written to nontransactional tables in **INSERT DELAYED** queues.
  This status variable is deprecated (because **DELAYED** inserts are deprecated), and will be removed in a future release.

• **Open_files**
  The number of files that are open. This count includes regular files opened by the server. It does not include other types of files such as sockets or pipes. Also, the count does not include files that storage engines open using their own internal functions rather than asking the server level to do so.

• **Open_streams**
  The number of streams that are open (used mainly for logging).

• **Open_table_definitions**
  The number of cached **.frm** files.

• **Open_tables**
  The number of tables that are open.

• **Opened_files**
  The number of files that have been opened with **my_open()** (a **mysys** library function). Parts of the server that open files without using this function do not increment the count.

• **Opened_table_definitions**
  The number of **.frm** files that have been cached.

• **Opened_tables**
  The number of tables that have been opened. If **Opened_tables** is big, your **table_open_cache** value is probably too small.

• **Performance_schema_xxx**
  Performance Schema status variables are listed in Section 22.16, “Performance Schema Status Variables”. These variables provide information about instrumentation that could not be loaded or created due to memory constraints.

• **Prepared_stmt_count**
  The current number of prepared statements. (The maximum number of statements is given by the **max_prepared_stmt_count** system variable.)

• **Qcache_free_blocks**
The number of free memory blocks in the query cache.

- **Qcache_free_memory**
  The amount of free memory for the query cache.

- **Qcache_hits**
  The number of query cache hits.
  The discussion at the beginning of this section indicates how to relate this statement-counting status variable to other such variables.

- **Qcache_inserts**
  The number of queries added to the query cache.

- **Qcache_lowmem_prunes**
  The number of queries that were deleted from the query cache because of low memory.

- **Qcache_not_cached**
  The number of noncached queries (not cacheable, or not cached due to the `query_cache_type` setting).

- **Qcache_queries_in_cache**
  The number of queries registered in the query cache.

- **Qcache_total_blocks**
  The total number of blocks in the query cache.

- **Queries**
  The number of statements executed by the server. This variable includes statements executed within stored programs, unlike the `Questions` variable. It does not count `COM_PING` or `COM_STATISTICS` commands.
  The discussion at the beginning of this section indicates how to relate this statement-counting status variable to other such variables.

- **Questions**
  The number of statements executed by the server. This includes only statements sent to the server by clients and not statements executed within stored programs, unlike the `Queries` variable. This variable does not count `COM_PING`, `COM_STATISTICS`, `COM_STMT_PREPARE`, `COM_STMT_CLOSE`, or `COM_STMT_RESET` commands.
  The discussion at the beginning of this section indicates how to relate this statement-counting status variable to other such variables.

- **Rpl_semi_sync_master_clients**
  The number of semisynchronous slaves.
  This variable is available only if the master-side semisynchronous replication plugin is installed.
Server Status Variables

- **Rpl_semi_sync_master_net_avg_wait_time**
  The average time in microseconds the master waited for a slave reply.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_net_wait_time**
  The total time in microseconds the master waited for slave replies.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_net_waits**
  The total number of times the master waited for slave replies.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_no_times**
  The number of times the master turned off semisynchronous replication.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_no_tx**
  The number of commits that were not acknowledged successfully by a slave.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_status**
  Whether semisynchronous replication currently is operational on the master. The value is **ON** if the plugin has been enabled and a commit acknowledgment has occurred. It is **OFF** if the plugin is not enabled or the master has fallen back to asynchronous replication due to commit acknowledgment timeout.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_timefunc_failures**
  The number of times the master failed when calling time functions such as `gettimeofday()`.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_tx_avg_wait_time**
  The average time in microseconds the master waited for each transaction.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_tx_wait_time**
  The total time in microseconds the master waited for transactions.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_tx_waits**
  The total number of times the master waited for transactions.
Server Status Variables

This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_wait_pos_backtraverse**
  The total number of times the master waited for an event with binary coordinates lower than events waited for previously. This can occur when the order in which transactions start waiting for a reply is different from the order in which their binary log events are written.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_wait_sessions**
  The number of sessions currently waiting for slave replies.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_master_yes_tx**
  The number of commits that were acknowledged successfully by a slave.
  This variable is available only if the master-side semisynchronous replication plugin is installed.

- **Rpl_semi_sync_slave_status**
  Whether semisynchronous replication currently is operational on the slave. This is ON if the plugin has been enabled and the slave I/O thread is running, OFF otherwise.
  This variable is available only if the slave-side semisynchronous replication plugin is installed.

- **Rsa_public_key**
  This variable is available if MySQL was compiled using OpenSSL (see Section 6.3.4, “SSL Library-Dependent Capabilities”). Its value is the public key used by the sha256_password authentication plugin for RSA key pair-based password exchange. The value is nonempty only if the server successfully initializes the private and public keys in the files named by the sha256_password_private_key_path and sha256_password_public_key_path system variables. The value of Rsa_public_key comes from the latter file.
  For information about sha256_password, see Section 6.4.1.4, “SHA-256 Pluggable Authentication”.

- **Select_full_join**
  The number of joins that perform table scans because they do not use indexes. If this value is not 0, you should carefully check the indexes of your tables.

- **Select_full_range_join**
  The number of joins that used a range search on a reference table.

- **Select_range**
  The number of joins that used ranges on the first table. This is normally not a critical issue even if the value is quite large.

- **Select_range_check**
  The number of joins without keys that check for key usage after each row. If this is not 0, you should carefully check the indexes of your tables.
Server Status Variables

- **Select_scan**
  The number of joins that did a full scan of the first table.

- **Slave_heartbeat_period**
  Shows the replication heartbeat interval (in seconds) on a replication slave.

- **Slave_last_heartbeat**
  Shows when the most recent heartbeat signal was received by a replication slave, as a `TIMESTAMP` value.

- **Slave_open_temp_tables**
  The number of temporary tables that the slave SQL thread currently has open. If the value is greater than zero, it is not safe to shut down the slave; see Section 17.4.1.29, “Replication and Temporary Tables”.

- **Slave_received_heartbeats**
  This counter increments with each replication heartbeat received by a replication slave since the last time that the slave was restarted or reset, or a `CHANGE MASTER TO` statement was issued.

- **Slave_retried_transactions**
  The total number of times since startup that the replication slave SQL thread has retried transactions.

- **Slave_rows_last_search_algorithm_used**
  The search algorithm that was most recently used by this slave to locate rows for row-based replication. The result shows whether the slave used indexes, a table scan, or hashing as the search algorithm for the last transaction executed on any channel.
  
  The method used depends on the setting for the `slave_rows_search_algorithms` system variable, and the keys that are available on the relevant table.
  
  This variable is available only for debug builds of MySQL.

- **Slave_running**
  This is **ON** if this server is a replication slave that is connected to a replication master, and both the I/O and SQL threads are running; otherwise, it is **OFF**.

- **Slow_launch_threads**
  The number of threads that have taken more than `slow_launch_time` seconds to create.

- **Slow_queries**
  The number of queries that have taken more than `long_query_time` seconds. This counter increments regardless of whether the slow query log is enabled. For information about that log, see Section 5.4.5, “The Slow Query Log”.

- **Sort_merge_passes**
  The number of merge passes that the sort algorithm has had to do. If this value is large, you should consider increasing the value of the `sort_buffer_size` system variable.
- **Sort_range**
  The number of sorts that were done using ranges.

- **Sort_rows**
  The number of sorted rows.

- **Sort_scan**
  The number of sorts that were done by scanning the table.

- **Ssl_accept_renegotiates**
  The number of negotiates needed to establish the connection.

- **Ssl_accepts**
  The number of accepted SSL connections.

- **Ssl_callback_cache_hits**
  The number of callback cache hits.

- **Ssl_cipher**
  The current encryption cipher (empty for unencrypted connections).

- **Ssl_cipher_list**
  The list of possible SSL ciphers (empty for non-SSL connections).

- **Ssl_client_connects**
  The number of SSL connection attempts to an SSL-enabled master.

- **Ssl_connect_renegotiates**
  The number of negotiates needed to establish the connection to an SSL-enabled master.

- **Ssl_ctx_verify_depth**
  The SSL context verification depth (how many certificates in the chain are tested).

- **Ssl_ctx_verify_mode**
  The SSL context verification mode.

- **Ssl_default_timeout**
  The default SSL timeout.

- **Ssl_finished_accepts**
  The number of successful SSL connections to the server.

- **Ssl_finished_connects**
  The number of successful slave connections to an SSL-enabled master.
Server Status Variables

- **Ssl_server_not_after**
  The last date for which the SSL certificate is valid.

  To check SSL certificate expiration information, use this statement:

  ```
  mysql> SHOW STATUS LIKE 'Ssl_server_not%';
  +-----------------------+--------------------------+
  | Variable_name         | Value                    |
  +-----------------------+--------------------------+
  | Ssl_server_not_after  | Apr 28 14:16:39 2025 GMT |
  | Ssl_server_not_before | May  1 14:16:39 2015 GMT |
  +-----------------------+--------------------------+
  
  In MySQL 5.6, the value is empty unless the connection uses SSL.

- **Ssl_server_not_before**
  The first date for which the SSL certificate is valid.

  In MySQL 5.6, the value is empty unless the connection uses SSL.

- **Ssl_session_cache_hits**
  The number of SSL session cache hits.

- **Ssl_session_cache_misses**
  The number of SSL session cache misses.

- **Ssl_session_cache_mode**
  The SSL session cache mode.

- **Ssl_session_cache_overflows**
  The number of SSL session cache overflows.

- **Ssl_session_cache_size**
  The SSL session cache size.

- **Ssl_session_cache_timeouts**
  The number of SSL session cache timeouts.

- **Ssl_sessions_reused**
  How many SSL connections were reused from the cache.

- **Ssl_used_session_cache_entries**
  How many SSL session cache entries were used.

- **Ssl_verify_depth**
  The verification depth for replication SSL connections.

- **Ssl_verify_mode**
Server Status Variables

The verification mode used by the server for a connection that uses SSL. The value is a bitmask; bits are defined in the `openssl/ssl.h` header file:

```c
#define SSL_VERIFY_NONE                 0x00
#define SSL_VERIFY_PEER                 0x01
#define SSL_VERIFY_FAIL_IF_NO_PEER_CERT 0x02
#define SSL_VERIFY_CLIENT_ONCE          0x04
```

- **SSL_VERIFY_PEER** indicates that the server asks for a client certificate. If the client supplies one, the server performs verification and proceeds only if verification is successful. **SSL_VERIFY_CLIENT_ONCE** indicates that a request for the client certificate will be done only in the initial handshake.

- **Ssl_version**

  The SSL protocol version of the connection (for example, TLSv1). If the connection is not encrypted, the value is empty.

- **Table_locks_immediate**

  The number of times that a request for a table lock could be granted immediately.

- **Table_locks_waited**

  The number of times that a request for a table lock could not be granted immediately and a wait was needed. If this is high and you have performance problems, you should first optimize your queries, and then either split your table or tables or use replication.

- **Table_open_cache_hits**

  The number of hits for open tables cache lookups.

- **Table_open_cache_misses**

  The number of misses for open tables cache lookups.

- **Table_open_cache_overflows**

  The number of overflows for the open tables cache. This is the number of times, after a table is opened or closed, a cache instance has an unused entry and the size of the instance is larger than `table_open_cache/table_open_cache_instances`.

- **Tc_log_max_pages_used**

  For the memory-mapped implementation of the log that is used by `mysqld` when it acts as the transaction coordinator for recovery of internal XA transactions, this variable indicates the largest number of pages used for the log since the server started. If the product of `Tc_log_max_pages_used` and `Tc_log_page_size` is always significantly less than the log size, the size is larger than necessary and can be reduced. (The size is set by the `--log-tc-size` option. This variable is unused: It is unneeded for binary log-based recovery, and the memory-mapped recovery log method is not used unless the number of storage engines that are capable of two-phase commit and that support XA transactions is greater than one. (InnoDB is the only applicable engine.)

- **Tc_log_page_size**

  The page size used for the memory-mapped implementation of the XA recovery log. The default value is determined using `getpagesize()`. This variable is unused for the same reasons as described for `Tc_log_max_pages_used`. 

---

716
• **Tc_log_page_waits**
  For the memory-mapped implementation of the recovery log, this variable increments each time the server was not able to commit a transaction and had to wait for a free page in the log. If this value is large, you might want to increase the log size (with the `--log-tc-size` option). For binary log-based recovery, this variable increments each time the binary log cannot be closed because there are two-phase commits in progress. (The close operation waits until all such transactions are finished.)

• **Threads_cached**
  The number of threads in the thread cache.

• **Threads_connected**
  The number of currently open connections.

• **Threads_created**
  The number of threads created to handle connections. If `Threads_created` is big, you may want to increase the `thread_cache_size` value. The cache miss rate can be calculated as `Threads_created/Connections`.

• **Threads_running**
  The number of threads that are not sleeping.

• **Uptime**
  The number of seconds that the server has been up.

• **Uptime_since_flush_status**
  The number of seconds since the most recent `FLUSH STATUS` statement.

### 5.1.10 Server SQL Modes

The MySQL server can operate in different SQL modes, and can apply these modes differently for different clients, depending on the value of the `sql_mode` system variable. DBAs can set the global SQL mode to match site server operating requirements, and each application can set its session SQL mode to its own requirements.

Modes affect the SQL syntax MySQL supports and the data validation checks it performs. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers.

- **Setting the SQL Mode**
- **The Most Important SQL Modes**
- **Full List of SQL Modes**
- **Combination SQL Modes**
- **Strict SQL Mode**

For answers to questions often asked about server SQL modes in MySQL, see Section A.3, “MySQL 5.6 FAQ: Server SQL Mode”.

When working with InnoDB tables, consider also the `innodb_strict_mode` system variable. It enables additional error checks for InnoDB tables.
Setting the SQL Mode

The default SQL mode is **NO_ENGINE_SUBSTITUTION**.

To set the SQL mode at server startup, use the `--sql-mode="modes"` option on the command line, or `sql-mode="modes"` in an option file such as `my.cnf` (Unix operating systems) or `my.ini` (Windows). `modes` is a list of different modes separated by commas. To clear the SQL mode explicitly, set it to an empty string using `--sql-mode=""` on the command line, or `sql-mode=""` in an option file.

**Note**

MySQL installation programs may configure the SQL mode during the installation process. For example, `mysql_install_db` creates a default option file named `my.cnf` in the base installation directory. This file contains a line that sets the SQL mode; see Section 4.4.3, "mysql_install_db — Initialize MySQL Data Directory".

If the SQL mode differs from the default or from what you expect, check for a setting in an option file that the server reads at startup.

To change the SQL mode at runtime, set the global or session `sql_mode` system variable using a `SET` statement:

```sql
SET GLOBAL sql_mode = 'modes';
SET SESSION sql_mode = 'modes';
```

Setting the `GLOBAL` variable requires the `SUPER` privilege and affects the operation of all clients that connect from that time on. Setting the `SESSION` variable affects only the current client. Each client can change its session `sql_mode` value at any time.

To determine the current global or session `sql_mode` setting, select its value:

```sql
SELECT @@GLOBAL.sql_mode;
SELECT @@SESSION.sql_mode;
```

**Important**

**SQL mode and user-defined partitioning.** Changing the server SQL mode after creating and inserting data into partitioned tables can cause major changes in the behavior of such tables, and could lead to loss or corruption of data. It is strongly recommended that you never change the SQL mode once you have created tables employing user-defined partitioning.

When replicating partitioned tables, differing SQL modes on the master and slave can also lead to problems. For best results, you should always use the same server SQL mode on the master and slave.

For more information, see Section 19.6, "Restrictions and Limitations on Partitioning".

The Most Important SQL Modes

The most important `sql_mode` values are probably these:

- **ANSI**
This mode changes syntax and behavior to conform more closely to standard SQL. It is one of the special combination modes listed at the end of this section.

- **STRICT_TRANS_TABLES**

  If a value could not be inserted as given into a transactional table, abort the statement. For a nontransactional table, abort the statement if the value occurs in a single-row statement or the first row of a multiple-row statement. More details are given later in this section.

- **TRADITIONAL**

  Make MySQL behave like a “traditional” SQL database system. A simple description of this mode is “give an error instead of a warning” when inserting an incorrect value into a column. It is one of the special combination modes listed at the end of this section.

  **Note**

  With TRADITIONAL mode enabled, an INSERT or UPDATE aborts as soon as an error occurs. If you are using a nontransactional storage engine, this may not be what you want because data changes made prior to the error may not be rolled back, resulting in a “partially done” update.

When this manual refers to “strict mode,” it means a mode with either or both STRICT_TRANS_TABLES or STRICT_ALL_TABLES enabled.

**Full List of SQL Modes**

The following list describes all supported SQL modes:

- **ALLOW_INVALID_DATES**

  Do not perform full checking of dates. Check only that the month is in the range from 1 to 12 and the day is in the range from 1 to 31. This may be useful for Web applications that obtain year, month, and day in three different fields and store exactly what the user inserted, without date validation. This mode applies to DATE and DATETIME columns. It does not apply to TIMESTAMP columns, which always require a valid date.

  With ALLOW_INVALID_DATES disabled, the server requires that month and day values be legal, and not merely in the range 1 to 12 and 1 to 31, respectively. With strict mode disabled, invalid dates such as '2004-04-31' are converted to '0000-00-00' and a warning is generated. With strict mode enabled, invalid dates generate an error. To permit such dates, enable ALLOW_INVALID_DATES.

- **ANSI_QUOTES**

  Treat " as an identifier quote character (like the ` quote character) and not as a string quote character. You can still use ` to quote identifiers with this mode enabled. With ANSI_QUOTES enabled, you cannot use double quotation marks to quote literal strings because they are interpreted as identifiers.

- **ERROR_FOR_DIVISION_BY_ZERO**

  The ERROR_FOR_DIVISION_BY_ZERO mode affects handling of division by zero, which includes MOD(N,0). For data-change operations (INSERT, UPDATE), its effect also depends on whether strict SQL mode is enabled.

  - If this mode is not enabled, division by zero inserts NULL and produces no warning.
• If this mode is enabled, division by zero inserts `NULL` and produces a warning.

• If this mode and strict mode are enabled, division by zero produces an error, unless `IGNORE` is given as well. For `INSERT IGNORE` and `UPDATE IGNORE`, division by zero inserts `NULL` and produces a warning.

For `SELECT`, division by zero returns `NULL`. Enabling `ERROR_FOR_DIVISION_BY_ZERO` causes a warning to be produced as well, regardless of whether strict mode is enabled.

As of MySQL 5.6.17, `ERROR_FOR_DIVISION_BY_ZERO` is deprecated and setting the `sql_mode` value to include it generates a warning.

• `HIGH_NOT_PRECEDENCE`

The precedence of the `NOT` operator is such that expressions such as `NOT a BETWEEN b AND c` are parsed as `NOT (a BETWEEN b AND c)`. In some older versions of MySQL, the expression was parsed as `(NOT a) BETWEEN b AND c`. The old higher-precedence behavior can be obtained by enabling the `HIGH_NOT_PRECEDENCE` SQL mode.

```
mysql> SET sql_mode = '';
mysql> SELECT NOT 1 BETWEEN -5 AND 5;
-> 0
mysql> SET sql_mode = 'HIGH_NOT_PRECEDENCE';
mysql> SELECT NOT 1 BETWEEN -5 AND 5;
-> 1
```

• `IGNORE_SPACE`

Permit spaces between a function name and the `(` character. This causes built-in function names to be treated as reserved words. As a result, identifiers that are the same as function names must be quoted as described in Section 9.2, “Schema Object Names”. For example, because there is a `COUNT()` function, the use of `count` as a table name in the following statement causes an error:

```
mysql> CREATE TABLE count (i INT);
ERROR 1064 (42000): You have an error in your SQL syntax
```

The table name should be quoted:

```
mysql> CREATE TABLE `count` (i INT);
Query OK, 0 rows affected (0.00 sec)
```

The `IGNORE_SPACE` SQL mode applies to built-in functions, not to user-defined functions or stored functions. It is always permissible to have spaces after a UDF or stored function name, regardless of whether `IGNORE_SPACE` is enabled.

For further discussion of `IGNORE_SPACE`, see Section 9.2.5, “Function Name Parsing and Resolution”.

• `NO_AUTO_CREATE_USER`

Prevent the `GRANT` statement from automatically creating new users if it would otherwise do so, unless authentication information is specified. The statement must specify a nonempty password using `IDENTIFIED BY` or an authentication plugin using `IDENTIFIED WITH`.

• `NO_AUTO_VALUE_ON_ZERO`
**NO_AUTO_VALUE_ON_ZERO** affects handling of **AUTO_INCREMENT** columns. Normally, you generate the next sequence number for the column by inserting either **NULL** or **0** into it. **NO_AUTO_VALUE_ON_ZERO** suppresses this behavior for **0** so that only **NULL** generates the next sequence number.

This mode can be useful if **0** has been stored in a table's **AUTO_INCREMENT** column. (Storing **0** is not a recommended practice, by the way.) For example, if you dump the table with `mysqldump` and then reload it, MySQL normally generates new sequence numbers when it encounters the **0** values, resulting in a table with contents different from the one that was dumped. Enabling **NO_AUTO_VALUE_ON_ZERO** before reloading the dump file solves this problem. For this reason, `mysqldump` automatically includes in its output a statement that enables **NO_AUTO_VALUE_ON_ZERO**.

- **NO_BACKSLASH_ESCAPES**
  Disable the use of the backslash character (\) as an escape character within strings and identifiers. With this mode enabled, backslash becomes an ordinary character like any other.

- **NO_DIR_IN_CREATE**
  When creating a table, ignore all **INDEX DIRECTORY** and **DATA DIRECTORY** directives. This option is useful on slave replication servers.

- **NO_ENGINE_SUBSTITUTION**
  Control automatic substitution of the default storage engine when a statement such as **CREATE TABLE** or **ALTER TABLE** specifies a storage engine that is disabled or not compiled in.

Because storage engines can be pluggable at runtime, unavailable engines are treated the same way:

With **NO_ENGINE_SUBSTITUTION** disabled, for **CREATE TABLE** the default engine is used and a warning occurs if the desired engine is unavailable. For **ALTER TABLE**, a warning occurs and the table is not altered.

With **NOENGINE_SUBSTITUTION** enabled, an error occurs and the table is not created or altered if the desired engine is unavailable.

- **NO_FIELD_OPTIONS**
  Do not print MySQL-specific column options in the output of **SHOW CREATE TABLE**. This mode is used by `mysqldump` in portability mode.

- **NO_KEY_OPTIONS**
  Do not print MySQL-specific index options in the output of **SHOW CREATE TABLE**. This mode is used by `mysqldump` in portability mode.

- **NO_TABLE_OPTIONS**
  Do not print MySQL-specific table options (such as **ENGINE**) in the output of **SHOW CREATE TABLE**. This mode is used by `mysqldump` in portability mode.

- **NO_UNSIGNED_SUBTRACTION**
  Subtraction between integer values, where one is of type **UNSIGNED**, produces an unsigned result by default. If the result would otherwise have been negative, an error results:

```sql
mysql> SET sql_mode = '';
Query OK, 0 rows affected (0.00 sec)
```
If the **NO_UNSIGNED_SUBTRACTION** SQL mode is enabled, the result is negative:

```sql
mysql> SET sql_mode = 'NO_UNSIGNED_SUBTRACTION';
mysql> SELECT CAST(0 AS UNSIGNED) - 1;
+-------------------------+
<table>
<thead>
<tr>
<th>CAST(0 AS UNSIGNED) - 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1</td>
</tr>
</tbody>
</table>
+-------------------------+
```

If the result of such an operation is used to update an **UNSIGNED** integer column, the result is clipped to the maximum value for the column type, or clipped to 0 if **NO_UNSIGNED_SUBTRACTION** is enabled. With strict SQL mode enabled, an error occurs and the column remains unchanged.

When **NO_UNSIGNED_SUBTRACTION** is enabled, the subtraction result is signed, **even if any operand is unsigned**. For example, compare the type of column `c2` in table `t1` with that of column `c2` in table `t2`:

```sql
mysql> SET sql_mode='';
mysql> CREATE TABLE test (c1 BIGINT UNSIGNED NOT NULL);
mysql> CREATE TABLE t1 SELECT c1 - 1 AS c2 FROM test;
mysql> DESCRIBE t1;
+-------+---------------------+------+-----+---------+-------+
| Field | Type                | Null | Key | Default | Extra |
|-------+---------------------+------+-----+---------+-------+
| c2    | bigint(21) unsigned | NO   |     | 0       |       |
+-------+---------------------+------+-----+---------+-------+
mysql> SET sql_mode='NO_UNSIGNED_SUBTRACTION';
mysql> CREATE TABLE t2 SELECT c1 - 1 AS c2 FROM test;
mysql> DESCRIBE t2;
+-------+------------+------+-----+---------+-------+
| Field | Type       | Null | Key | Default | Extra |
|-------+------------+------+-----+---------+-------+
| c2    | bigint(21) | NO   |     | 0       |       |
+-------+------------+------+-----+---------+-------+
```

This means that **BIGINT UNSIGNED** is not 100% usable in all contexts. See Section 12.10, "Cast Functions and Operators".

- **NO_ZERO_DATE**

The **NO_ZERO_DATE** mode affects whether the server permits '0000-00-00' as a valid date. Its effect also depends on whether strict SQL mode is enabled.

- If this mode is not enabled, '0000-00-00' is permitted and inserts produce no warning.

- If this mode is enabled, '0000-00-00' is permitted and inserts produce a warning.

- If this mode and strict mode are enabled, '0000-00-00' is not permitted and inserts produce an error, unless **IGNORE** is given as well. For **INSERT IGNORE** and **UPDATE IGNORE**, '0000-00-00' is permitted and inserts produce a warning.

As of MySQL 5.6.17, **NO_ZERO_DATE** is deprecated and setting the `sql_mode` value to include it generates a warning.
• **NO_ZERO_IN_DATE**

The **NO_ZERO_IN_DATE** mode affects whether the server permits dates in which the year part is nonzero but the month or day part is 0. (This mode affects dates such as '2010-00-01' or '2010-01-00', but not '0000-00-00'. To control whether the server permits '0000-00-00', use the **NO_ZERO_DATE** mode.) The effect of **NO_ZERO_IN_DATE** also depends on whether strict SQL mode is enabled.

- If this mode is not enabled, dates with zero parts are permitted and inserts produce no warning.
- If this mode is enabled, dates with zero parts are inserted as '0000-00-00' and produce a warning.
- If this mode and strict mode are enabled, dates with zero parts are not permitted and inserts produce an error, unless **IGNORE** is given as well. For **INSERT IGNORE** and **UPDATE IGNORE**, dates with zero parts are inserted as '0000-00-00' and produce a warning.

As of MySQL 5.6.17, **NO_ZERO_IN_DATE** is deprecated and setting the **sql_mode** value to include it generates a warning.

• **ONLY_FULL_GROUP_BY**

Reject queries for which the select list, **HAVING** condition, or **ORDER BY** list refer to nonaggregated columns that are not named in the **GROUP BY** clause.

A MySQL extension to standard SQL permits references in the **HAVING** clause to aliased expressions in the select list. Enabling **ONLY_FULL_GROUP_BY** disables this extension, thus requiring the **HAVING** clause to be written using unaliased expressions.

For additional discussion and examples, see Section 12.19.3, “MySQL Handling of GROUP BY”.

• **PAD_CHAR_TO_FULL_LENGTH**

By default, trailing spaces are trimmed from **CHAR** column values on retrieval. If **PAD_CHAR_TO_FULL_LENGTH** is enabled, trimming does not occur and retrieved **CHAR** values are padded to their full length. This mode does not apply to **VARCHAR** columns, for which trailing spaces are retained on retrieval.

```bash
mysql> CREATE TABLE t1 (c1 CHAR(10));
Query OK, 0 rows affected (0.37 sec)

mysql> INSERT INTO t1 (c1) VALUES('xy');
Query OK, 1 row affected (0.01 sec)

mysql> SET sql_mode = '';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT c1, CHAR_LENGTH(c1) FROM t1;
+------|-----------------+
| c1   | CHAR_LENGTH(c1) |
| xy   |               2 |
+------|-----------------+
1 row in set (0.00 sec)

mysql> SET sql_mode = 'PAD_CHAR_TO_FULL_LENGTH';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT c1, CHAR_LENGTH(c1) FROM t1;
+------------|-----------------+
| c1         | CHAR_LENGTH(c1) |
| xy         |                2 |

<tr>
<td></td>
<td>1 row in set (0.00 sec)</td>
</tr>
</tbody>
</table>

- **PIPS_AS_CONCAT**
  
  Treat `||` as a string concatenation operator (same as `CONCAT()`) rather than as a synonym for OR.

- **REAL_AS_FLOAT**
  
  Treat `REAL` as a synonym for `FLOAT`. By default, MySQL treats `REAL` as a synonym for `DOUBLE`.

- **STRICT_ALL_TABLES**
  
  Enable strict SQL mode for all storage engines. Invalid data values are rejected. For details, see [Strict SQL Mode](#).

- **STRICT_TRANS_TABLES**
  
  Enable strict SQL mode for transactional storage engines, and when possible for nontransactional storage engines. For details, see [Strict SQL Mode](#).

### Combination SQL Modes

The following special modes are provided as shorthand for combinations of mode values from the preceding list.

- **ANSI**
  
  Equivalent to `REAL_AS_FLOAT`, `PIPS_AS_CONCAT`, `ANSI_QUOTES`, `IGNORE_SPACE`.

  ANSI mode also causes the server to return an error for queries where a set function \( S \) with an outer reference \( S(\text{outer}\_\text{ref}) \) cannot be aggregated in the outer query against which the outer reference has been resolved. This is such a query:

  ```sql
  SELECT * FROM t1 WHERE t1.a IN (SELECT MAX(t1.b) FROM t2 WHERE ...);
  ```

  Here, `\text{MAX}(t1.b)` cannot aggregated in the outer query because it appears in the WHERE clause of that query. Standard SQL requires an error in this situation. If ANSI mode is not enabled, the server treats \( S(\text{outer}\_\text{ref}) \) in such queries the same way that it would interpret \( S(\text{const}) \).

  See [Section 1.7, “MySQL Standards Compliance”](#).

- **DB2**
  
  Equivalent to `PIPS_AS_CONCAT`, `ANSI_QUOTES`, `IGNORE_SPACE`, `NO_KEY_OPTIONS`, `NO_TABLE_OPTIONS`, `NO_FIELD_OPTIONS`.

- **MAXDB**
  
  Equivalent to `PIPS_AS_CONCAT`, `ANSI_QUOTES`, `IGNORE_SPACE`, `NO_KEY_OPTIONS`, `NO_TABLE_OPTIONS`, `NO_FIELD_OPTIONS`, `NO_AUTO_CREATE_USER`.

- **MSSQL**
  
  Equivalent to `PIPS_AS_CONCAT`, `ANSI_QUOTES`, `IGNORE_SPACE`, `NO_KEY_OPTIONS`, `NO_TABLE_OPTIONS`, `NO_FIELD_OPTIONS`. 

Server SQL Modes

- **MYSQL323**
  Equivalent to **MYSQL323, HIGH_NOT_PRECEDENCE**. This means **HIGH_NOT_PRECEDENCE** plus some **SHOW CREATE TABLE** behaviors specific to **MYSQL323**:
  - **TIMESTAMP** column display does not include **DEFAULT** or **ON UPDATE** attributes.
  - String column display does not include character set and collation attributes. For **CHAR** and **VARCHAR** columns, if the collation is binary, **BINARY** is appended to the column type.
  - The **ENGINE=engine_name** table option displays as **TYPE=engine_name**.
  - For **MEMORY** tables, the storage engine is displayed as **HEAP**.

- **MYSQL40**
  Equivalent to **MYSQL40, HIGH_NOT_PRECEDENCE**. This means **HIGH_NOT_PRECEDENCE** plus some behaviors specific to **MYSQL40**. These are the same as for **MYSQL323**, except that **SHOW CREATE TABLE** does not display **HEAP** as the storage engine for **MEMORY** tables.

- **ORACLE**
  Equivalent to **PIPES_AS_CONCAT, ANSI_QUOTES, IGNORE_SPACE, NO_KEY_OPTIONS, NO_TABLE_OPTIONS, NO_FIELD_OPTIONS, NO_AUTO_CREATE_USER**.

- **POSTGRESQL**
  Equivalent to **PIPES_AS_CONCAT, ANSI_QUOTES, IGNORE_SPACE, NO_KEY_OPTIONS, NO_TABLE_OPTIONS, NO_FIELD_OPTIONS**.

- **TRADITIONAL**
  Equivalent to **STRING_SPLIT, STRICT_ALL_TABLES, NO_ZERO_IN_DATE, NO_ZERO_DATE, ERROR_FOR_DIVISION_BY_ZERO, NO_AUTO_CREATE_USER, and NO_ENGINE_SUBSTITUTION**.

**Strict SQL Mode**

Strict mode controls how MySQL handles invalid or missing values in data-change statements such as **INSERT** or **UPDATE**. A value can be invalid for several reasons. For example, it might have the wrong data type for the column, or it might be out of range. A value is missing when a new row to be inserted does not contain a value for a non-**NULL** column that has no explicit **DEFAULT** clause in its definition. (For a **NULL** column, **NULL** is inserted if the value is missing.) Strict mode also affects DDL statements such as **CREATE TABLE**.

If strict mode is not in effect, MySQL inserts adjusted values for invalid or missing values and produces warnings (see **Section 13.7.5.41, “SHOW WARNINGS Syntax”**). In strict mode, you can produce this behavior by using **INSERT IGNORE** or **UPDATE IGNORE**.

For statements such as **SELECT** that do not change data, invalid values generate a warning in strict mode, not an error.

As of MySQL 5.6.11, strict mode produces an error for attempts to create a key that exceeds the maximum key length. Previously, this resulted in a warning and truncation of the key to the maximum key length (the same as when strict mode is not enabled).

Strict mode does not affect whether foreign key constraints are checked. **foreign_key_checks** can be used for that. (See **Section 5.1.7, “Server System Variables”**.)
Strict SQL mode is in effect if either `STRICT_ALL_TABLES` or `STRICT_TRANS_TABLES` is enabled, although the effects of these modes differ somewhat:

- For transactional tables, an error occurs for invalid or missing values in a data-change statement when either `STRICT_ALL_TABLES` or `STRICT_TRANS_TABLES` is enabled. The statement is aborted and rolled back.

- For nontransactional tables, the behavior is the same for either mode if the bad value occurs in the first row to be inserted or updated: The statement is aborted and the table remains unchanged. If the statement inserts or modifies multiple rows and the bad value occurs in the second or later row, the result depends on which strict mode is enabled:
  - For `STRICT_ALL_TABLES`, MySQL returns an error and ignores the rest of the rows. However, because the earlier rows have been inserted or updated, the result is a partial update. To avoid this, use single-row statements, which can be aborted without changing the table.
  - For `STRICT_TRANS_TABLES`, MySQL converts an invalid value to the closest valid value for the column and inserts the adjusted value. If a value is missing, MySQL inserts the implicit default value for the column data type. In either case, MySQL generates a warning rather than an error and continues processing the statement. Implicit defaults are described in Section 11.6, “Data Type Default Values”.

Strict mode also affects handling of division by zero, zero dates, and zeros in dates, in conjunction with the `ERROR_FOR_DIVISION_BY_ZERO`, `NO_ZERO_DATE`, and `NO_ZERO_IN_DATE` modes. For details, see the descriptions of those modes.

5.1.11 IPv6 Support

Support for IPv6 in MySQL includes these capabilities:

- MySQL Server can accept TCP/IP connections from clients connecting over IPv6. For example, this command connects over IPv6 to the MySQL server on the local host:

  ```
sHELL> mysql -h ::1
  ```

  To use this capability, two things must be true:

  - Your system must be configured to support IPv6. See Section 5.1.11.1, “Verifying System Support for IPv6”.
  - The default MySQL server configuration permits IPv6 connections in addition to IPv4 connections. To change the default configuration, start the server with the `bind_address` system variable set to an appropriate value. See Section 5.1.7, “Server System Variables”.

- MySQL account names permit IPv6 addresses to enable DBAs to specify privileges for clients that connect to the server over IPv6. See Section 6.2.4, “Specifying Account Names”. IPv6 addresses can be specified in account names in statements such as `CREATE USER`, `GRANT`, and `REVOKE`. For example:

  ```
  mysql> CREATE USER 'bill'@'::1' IDENTIFIED BY 'secret';
  mysql> GRANT SELECT ON mydb.* TO 'bill'@'::1';
  ```

- IPv6 functions enable conversion between string and internal format IPv6 address formats, and checking whether values represent valid IPv6 addresses. For example, `INET6_ATON()` and `INET6_NTOA()` are similar to `INET_ATON()` and `INET_NTOA()`, but handle IPv6 addresses in addition to IPv4 addresses. See Section 12.20, “Miscellaneous Functions”.

726
The following sections describe how to set up MySQL so that clients can connect to the server over IPv6.

5.1.11.1 Verifying System Support for IPv6

Before MySQL Server can accept IPv6 connections, the operating system on your server host must support IPv6. As a simple test to determine whether that is true, try this command:

```
shell> ping6 ::1
16 bytes from ::1, icmp_seq=0 hlim=64 time=0.171 ms
16 bytes from ::1, icmp_seq=1 hlim=64 time=0.077 ms
... 
```

To produce a description of your system's network interfaces, invoke `ifconfig -a` and look for IPv6 addresses in the output.

If your host does not support IPv6, consult your system documentation for instructions on enabling it. It might be that you need only reconfigure an existing network interface to add an IPv6 address. Or a more extensive change might be needed, such as rebuilding the kernel with IPv6 options enabled.

These links may be helpful in setting up IPv6 on various platforms:

- Windows
- Gentoo Linux
- Ubuntu Linux
- Linux (Generic)
- macOS

5.1.11.2 Configuring the MySQL Server to Permit IPv6 Connections

The MySQL server listens on a single network socket for TCP/IP connections. This socket is bound to a single address, but it is possible for an address to map onto multiple network interfaces. To specify an address, set `bind_address=addr` at server startup, where `addr` is an IPv4 or IPv6 address or a host name. For details, see the `bind_address` description in Section 5.1.7, “Server System Variables”.

5.1.11.3 Connecting Using the IPv6 Local Host Address

The following procedure shows how to configure MySQL to permit IPv6 connections by clients that connect to the local server using the `::1` local host address. The instructions given here assume that your system supports IPv6.

1. Start the MySQL server with an appropriate `bind_address` setting to permit it to accept IPv6 connections. For example, put the following lines in the server option file and restart the server:

```
[mysqld]
bind_address = *    # before 5.6.6, use :: rather than *
```

Alternatively, you can bind the server to `::1`, but that makes the server more restrictive for TCP/IP connections. It accepts only IPv6 connections for that single address and rejects IPv4 connections. For more information, see the `bind_address` description in Section 5.1.7, “Server System Variables”.

2. As an administrator, connect to the server and create an account for a local user who will connect from the `::1` local IPv6 host address:
IPv6 Support

mysql> CREATE USER 'ipv6user'@'::1' IDENTIFIED BY 'ipv6pass';

For the permitted syntax of IPv6 addresses in account names, see Section 6.2.4, “Specifying Account Names”. In addition to the CREATE USER statement, you can issue GRANT statements that give specific privileges to the account, although that is not necessary for the remaining steps in this procedure.

3. Invoke the mysql client to connect to the server using the new account:

shell> mysql -h ::1 -u ipv6user -pipv6pass

4. Try some simple statements that show connection information:

mysql> STATUS
...
Connection: ::1 via TCP/IP
...
mysql> SELECT CURRENT_USER(), @@bind_address;
+
| CURRENT_USER() | @@bind_address |
|----------------+----------------|
| ipv6user@::1   | ::             |
+

5.1.11.4 Connecting Using IPv6 Nonlocal Host Addresses

The following procedure shows how to configure MySQL to permit IPv6 connections by remote clients. It is similar to the preceding procedure for local clients, but the server and client hosts are distinct and each has its own nonlocal IPv6 address. The example uses these addresses:

Server host: 2001:db8:0:f101::1
Client host: 2001:db8:0:f101::2

These addresses are chosen from the nonroutable address range recommended by IANA for documentation purposes and suffice for testing on your local network. To accept IPv6 connections from clients outside the local network, the server host must have a public address. If your network provider assigns you an IPv6 address, you can use that. Otherwise, another way to obtain an address is to use an IPv6 broker; see Section 5.1.11.5, “Obtaining an IPv6 Address from a Broker”.

1. Start the MySQL server with an appropriate bind_address setting to permit it to accept IPv6 connections. For example, put the following lines in the server option file and restart the server:

```
[mysqld]
bind_address = *   # before 5.6.6, use :: rather than *
```

Alternatively, you can bind the server to 2001:db8:0:f101::1, but that makes the server more restrictive for TCP/IP connections. It accepts only IPv6 connections for that single address and rejects IPv4 connections. For more information, see the bind_address description in Section 5.1.7, “Server System Variables”.

2. On the server host (2001:db8:0:f101::1), create an account for a user who will connect from the client host (2001:db8:0:f101::2):

mysql> CREATE USER 'remoteipv6user'@'2001:db8:0:f101::2' IDENTIFIED BY 'remoteipv6pass';
3. On the client host (2001:db8:0:f101::2), invoke the `mysql` client to connect to the server using the new account:

   ```
   shell> mysql -h 2001:db8:0:f101::1 -u remoteipv6user -premoteipv6pass
   ```

4. Try some simple statements that show connection information:

   ```
   mysql> STATUS
   ...
   Connection: 2001:db8:0:f101::1 via TCP/IP
   ...
   mysql> SELECT CURRENT_USER(), @@bind_address;
   +-----------------------------------+----------------+
   | CURRENT_USER()                    | @@bind_address |
   +-----------------------------------+----------------+
   | remoteipv6user@2001:db8:0:f101::2 | ::             |
   +-----------------------------------+----------------+
   ```

5.1.11.5 Obtaining an IPv6 Address from a Broker

If you do not have a public IPv6 address that enables your system to communicate over IPv6 outside your local network, you can obtain one from an IPv6 broker. The Wikipedia IPv6 Tunnel Broker page lists several brokers and their features, such as whether they provide static addresses and the supported routing protocols.

After configuring your server host to use a broker-supplied IPv6 address, start the MySQL server with an appropriate `bind_address` setting to permit the server to accept IPv6 connections. For example, put the following lines in the server option file and restart the server:

```
[mysqld]
bind_address = *   # before 5.6.6, use :: rather than *
```

Alternatively, you can bind the server to the specific IPv6 address provided by the broker, but that makes the server more restrictive for TCP/IP connections. It accepts only IPv6 connections for that single address and rejects IPv4 connections. For more information, see the `bind_address` description in Section 5.1.7, “Server System Variables”. In addition, if the broker allocates dynamic addresses, the address provided for your system might change the next time you connect to the broker. If so, any accounts you create that name the original address become invalid. To bind to a specific address but avoid this change-of-address problem, you may be able to arrange with the broker for a static IPv6 address.

The following example shows how to use Freenet6 as the broker and the `gogoc` IPv6 client package on Gentoo Linux.

1. Create an account at Freenet6 by visiting this URL and signing up:

   ```
   http://gogonet.gogo6.com
   ```

2. After creating the account, go to this URL, sign in, and create a user ID and password for the IPv6 broker:

   ```
   http://gogonet.gogo6.com/page/freenet6-registration
   ```

3. As `root`, install `gogoc`:
4. Edit `/etc/gogoc/gogoc.conf` to set the `userid` and `password` values. For example:

```
userid=gogouser
passwd=gogopass
```

5. Start `gogoc`:

```
shell> /etc/init.d/gogoc start
```

To start `gogoc` each time your system boots, execute this command:

```
shell> rc-update add gogoc default
```

6. Use `ping6` to try to ping a host:

```
shell> ping6 ipv6.google.com
```

7. To see your IPv6 address:

```
shell> ifconfig tun
```

### 5.1.12 MySQL Server Time Zone Support

This section describes the time zone settings maintained by MySQL, how to load the system tables required for named time support, how to stay current with time zone changes, and how to enable leap-second support.

- **Time Zone Variables**
- **Populating the Time Zone Tables**
- **Staying Current with Time Zone Changes**
- **Time Zone Leap Second Support**

For information about time zone settings in replication setups, please see Section 17.4.1, “Replication Features and Issues”.

#### Time Zone Variables

MySQL Server maintains several time zone settings:

- The system time zone. When the server starts, it attempts to determine the time zone of the host machine automatically and uses it to set the `system_time_zone` system variable. The value does not change thereafter.

  To explicitly specify the system time zone for MySQL Server at startup, set the `TZ` environment variable before you start `mysqld`. If you start the server using `mysqld_safe`, its `--timezone` option provides another way to set the system time zone. The permissible values for `TZ` and `--timezone` are system dependent. Consult your operating system documentation to see what values are acceptable.

- The server current time zone. The global `time_zone` system variable indicates the time zone the server currently is operating in. The initial `time_zone` value is 'SYSTEM', which indicates that the server time zone is the same as the system time zone.
MySQL Server Time Zone Support

**Note**

If set to `SYSTEM`, every MySQL function call that requires a time zone calculation makes a system library call to determine the current system time zone. This call may be protected by a global mutex, resulting in contention.

The initial global server time zone value can be specified explicitly at startup with the `--default-time-zone` option on the command line, or you can use the following line in an option file:

```
default-time-zone='timezone'
```

If you have the `SUPER` privilege, you can set the global server time zone value at runtime with this statement:

```
SET GLOBAL time_zone = timezone;
```

- Per-session time zones. Each client that connects has its own session time zone setting, given by the `session time_zone` variable. Initially, the session variable takes its value from the global `time_zone` variable, but the client can change its own time zone with this statement:

```
SET time_zone = timezone;
```

The session time zone setting affects display and storage of time values that are zone-sensitive. This includes the values displayed by functions such as `NOW()` or `CURTIME()`, and values stored in and retrieved from `TIMESTAMP` columns. Values for `TIMESTAMP` columns are converted from the session time zone to UTC for storage, and from UTC to the session time zone for retrieval.

The session time zone setting does not affect values displayed by functions such as `UTC_TIMESTAMP()` or values in `DATE`, `TIME`, or `DATETIME` columns. Nor are values in those data types stored in UTC; the time zone applies for them only when converting from `TIMESTAMP` values. If you want locale-specific arithmetic for `DATE`, `TIME`, or `DATETIME` values, convert them to UTC, perform the arithmetic, and then convert back.

The current global and session time zone values can be retrieved like this:

```
SELECT @@GLOBAL.time_zone, @@SESSION.time_zone;
```

**timezone** values can be given in several formats, none of which are case sensitive:

- As the value `'SYSTEM'`, indicating that the server time zone is the same as the system time zone.
- As a string indicating an offset from UTC, such as `'+10:00'` or `'-6:00'`.
- As a named time zone, such as `'Europe/Helsinki'`, `'US/Eastern'`, or `'MET'`. Named time zones can be used only if the time zone information tables in the `mysql` database have been created and populated.

**Populating the Time Zone Tables**

Several tables in the `mysql` system database exist to store time zone information (see Section 5.3, “The `mysql` System Database”). The MySQL installation procedure creates the time zone tables, but does not load them. To do so manually, use the following instructions.
Note

Loading the time zone information is not necessarily a one-time operation because the information changes occasionally. When such changes occur, applications that use the old rules become out of date and you may find it necessary to reload the time zone tables to keep the information used by your MySQL server current. See Staying Current with Time Zone Changes.

If your system has its own zoneinfo database (the set of files describing time zones), use the mysql_tzinfo_to_sql program to load the time zone tables. Examples of such systems are Linux, macOS, FreeBSD, and Solaris. One likely location for these files is the /usr/share/zoneinfo directory. If your system has no zoneinfo database, you can use a downloadable package, as described later in this section.

To load the time zone tables from the command line, pass the zoneinfo directory path name to mysql_tzinfo_to_sql and send the output into the mysql program. For example:

```
mysql_tzinfo_to_sql /usr/share/zoneinfo | mysql -u root -p mysql
```

The mysql command shown here assumes that you connect to the server using an account such as root that has privileges for modifying tables in the mysql system database. Adjust the connection parameters as required.

mysql_tzinfo_to_sql reads your system's time zone files and generates SQL statements from them. mysql processes those statements to load the time zone tables.

mysql_tzinfo_to_sql also can be used to load a single time zone file or generate leap second information:

- To load a single time zone file `tz_file` that corresponds to a time zone name `tz_name`, invoke mysql_tzinfo_to_sql like this:

```
mysql_tzinfo_to_sql tz_file tz_name | mysql -u root -p mysql
```

With this approach, you must execute a separate command to load the time zone file for each named zone that the server needs to know about.

- If your time zone must account for leap seconds, initialize leap second information like this, where `tz_file` is the name of your time zone file:

```
mysql_tzinfo_to_sql --leap tz_file | mysql -u root -p mysql
```

After running mysql_tzinfo_to_sql, restart the server so that it does not continue to use any previously cached time zone data.

If your system has no zoneinfo database (for example, Windows), you can use a package that is available for download at the MySQL Developer Zone:

https://dev.mysql.com/downloads/timezones.html

Warning

Do not use a downloadable time zone package if your system has a zoneinfo database. Use the mysql_tzinfo_to_sql utility instead. Otherwise, you may
cause a difference in datetime handling between MySQL and other applications on your system.

You can use either a package that contains SQL statements to populate your existing time zone tables, or a package that contains pre-built MyISAM time zone tables to replace your existing tables:

• To use a time zone package that contains SQL statements, download and unpack it, then load the unpacked file contents into your existing time zone tables:

```
    mysql -u root -p mysql < file_name
```

Then restart the server.

• To use a time zone package that contains .frm, .MYD, and .MYI files for the MyISAM time zone tables, download and unpack it. These table files are part of the mysql database, so you should place the files in the mysql subdirectory of your MySQL server's data directory. Stop the server before doing this and restart it afterward.

### Staying Current with Time Zone Changes

When time zone rules change, applications that use the old rules become out of date. To stay current, it is necessary to make sure that your system uses current time zone information is used. For MySQL, there are multiple factors to consider in staying current:

• The operating system time affects the value that the MySQL server uses for times if its time zone is set to SYSTEM. Make sure that your operating system is using the latest time zone information. For most operating systems, the latest update or service pack prepares your system for the time changes. Check the website for your operating system vendor for an update that addresses the time changes.

• If you replace the system's /etc/localtime time zone file with a version that uses rules differing from those in effect at mysql startup, restart mysql so that it uses the updated rules. Otherwise, mysql might not notice when the system changes its time.

• If you use named time zones with MySQL, make sure that the time zone tables in the mysql database are up to date:

  • If your system has its own zoneinfo database, reload the MySQL time zone tables whenever the zoneinfo database is updated.

  • For systems that do not have their own zoneinfo database, check the MySQL Developer Zone for updates. When a new update is available, download it and use it to replace the content of your current time zone tables.

For instructions for both methods, see Populating the Time Zone Tables. mysql caches time zone information that it looks up, so after updating the time zone tables, restart mysql to make sure that it does not continue to serve outdated time zone data.

If you are uncertain whether named time zones are available, for use either as the server's time zone setting or by clients that set their own time zone, check whether your time zone tables are empty. The following query determines whether the table that contains time zone names has any rows:

```
    mysql> SELECT COUNT(*) FROM mysql.time_zone_name;
```

```
<table>
<thead>
<tr>
<th>COUNT(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>
```
MySQL Server Time Zone Support

---

A count of zero indicates that the table is empty. In this case, no applications currently are using named time zones, and you need not update the tables (unless you want to enable named time zone support). A count greater than zero indicates that the table is not empty and that its contents are available to be used for named time zone support. In this case, be sure to reload your time zone tables so that applications that use named time zones will obtain correct query results.

To check whether your MySQL installation is updated properly for a change in Daylight Saving Time rules, use a test like the one following. The example uses values that are appropriate for the 2007 DST 1-hour change that occurs in the United States on March 11 at 2 a.m.

The test uses this query:

```sql
SELECT
    CONVERT_TZ('2007-03-11 2:00:00','US/Eastern','US/Central') AS time1,
    CONVERT_TZ('2007-03-11 3:00:00','US/Eastern','US/Central') AS time2;
```

The two time values indicate the times at which the DST change occurs, and the use of named time zones requires that the time zone tables be used. The desired result is that both queries return the same result (the input time, converted to the equivalent value in the 'US/Central' time zone).

Before updating the time zone tables, you see an incorrect result like this:

```
+---------------------+---------------------+
| time1               | time2               |
+---------------------+---------------------+
| 2007-03-11 01:00:00 | 2007-03-11 02:00:00 |
+---------------------+---------------------+
```

After updating the tables, you should see the correct result:

```
+---------------------+---------------------+
| time1               | time2               |
+---------------------+---------------------+
| 2007-03-11 01:00:00 | 2007-03-11 01:00:00 |
+---------------------+---------------------+
```

### Time Zone Leap Second Support

Leap second values are returned with a time part that ends with :59:59. This means that a function such as `NOW()` can return the same value for two or three consecutive seconds during the leap second. It remains true that literal temporal values having a time part that ends with :59:60 or :59:61 are considered invalid.

If it is necessary to search for `TIMESTAMP` values one second before the leap second, anomalous results may be obtained if you use a comparison with 'YYYY-MM-DD hh:mm:ss' values. The following example demonstrates this. It changes the session time zone to UTC so there is no difference between internal `TIMESTAMP` values (which are in UTC) and displayed values (which have time zone correction applied).

```sql
mysql> CREATE TABLE t1 (    
a INT,    
ts TIMESTAMP DEFAULT CURRENT_TIMESTAMP,    
PRIMARY KEY (ts)    
);
Query OK, 0 rows affected (0.01 sec)
```
Server-Side Help Support

MySQL Server supports a `HELP` statement that returns information from the MySQL Reference Manual (see Section 13.8.3, "HELP Syntax"). This information is stored in several tables in the `mysql` database (see Section 5.3, "The mysql System Database"). Proper operation of the `HELP` statement requires that these help tables be initialized.

For a new installation of MySQL using a binary or source distribution on Unix, help-table content initialization occurs when you initialize the data directory (see Section 2.10.1, "Initializing the Data
Directory”). For an RPM distribution on Linux or binary distribution on Windows, content initialization occurs as part of the MySQL installation process.

For a MySQL upgrade using a binary distribution, help-table content is not upgraded automatically, but you can upgrade it manually. Locate the fill_help_tables.sql file in the share or share/mysql directory. Change location into that directory and process the file with the mysql client as follows (enter the command on one line):

```
mysql -u root -p
   --init-command="SET sql_log_bin=OFF"
mysql < fill_help_tables.sql
```

The command shown here assumes that you connect to the server using an account such as root that has privileges for modifying tables in the mysql database. Adjust the connection parameters as required.

If you are working with Git and a MySQL development source tree, the source tree contains only a “stub” version of fill_help_tables.sql. To obtain a non-stub copy, use one from a source or binary distribution.

**Note**

Each MySQL series has its own series-specific reference manual, so help-table content is series specific as well. This has implications for replication because help-table content should match the MySQL series. If you load MySQL 5.6 help content into a MySQL 5.6 master server, it does not make sense to replicate that content to a slave server from a different MySQL series and for which that content is not appropriate. For this reason, as you upgrade individual servers in a replication scenario, you should upgrade each server’s help tables, using the instructions given earlier.

5.1.14 Server Response to Signals

On Unix, signals can be sent to processes. mysql responds to signals sent to it as follows:

- **SIGTERM** causes the server to shut down.
- **SIGHUP** causes the server to reload the grant tables and to flush tables, logs, the thread cache, and the host cache. These actions are like various forms of the FLUSH statement. The server also writes a status report to the error log that has this format:

```
Status information:
Current dir: /var/mysql/data/
Running threads: 0  Stack size: 196608
Current locks:
Key caches:
default
Buffer_size: 8388600
Block_size: 1024
Division_limit: 100
Age_limit: 300
blocks used: 0
not flushed: 0
w_requests: 0
writes: 0
r_requests: 0
```
The server shutdown process takes place as follows:

1. The shutdown process is initiated.

   This can occur initiated several ways. For example, a user with the `SHUTDOWN` privilege can execute a `mysqladmin shutdown` command. `mysqladmin` can be used on any platform supported by MySQL. Other operating system-specific shutdown initiation methods are possible as well: The server shuts down on Unix when it receives a `SIGTERM` signal. A server running as a service on Windows shuts down when the services manager tells it to.

2. The server creates a shutdown thread if necessary.

   Depending on how shutdown was initiated, the server might create a thread to handle the shutdown process. If shutdown was requested by a client, a shutdown thread is created. If shutdown is the result of receiving a `SIGTERM` signal, the signal thread might handle shutdown itself, or it might create a separate thread to do so. If the server tries to create a shutdown thread and cannot (for example, if memory is exhausted), it issues a diagnostic message that appears in the error log:

   Error: Can't create thread to kill server

3. The server stops accepting new connections.

   To prevent new activity from being initiated during shutdown, the server stops accepting new client connections by closing the handlers for the network interfaces to which it normally listens for connections: the TCP/IP port, the Unix socket file, the Windows named pipe, and shared memory on Windows.

4. The server terminates current activity.

   For each thread associated with a client connection, the server breaks the connection to the client and marks the thread as killed. Threads die when they notice that they are so marked. Threads for idle connections die quickly. Threads that currently are processing statements check their state periodically and take longer to die. For additional information about thread termination, see Section 13.7.6.4, “KILL Syntax”, in particular for the instructions about killed `REPAIR TABLE` or `OPTIMIZE TABLE` operations on MyISAM tables.
For threads that have an open transaction, the transaction is rolled back.

**Note**

If a thread is updating a nontransactional table, an operation such as a multiple-row **UPDATE** or **INSERT** may leave the table partially updated because the operation can terminate before completion.

If the server is a master replication server, it treats threads associated with currently connected slaves like other client threads. That is, each one is marked as killed and exits when it next checks its state.

If the server is a slave replication server, it stops the I/O and SQL threads, if they are active, before marking client threads as killed. The SQL thread is permitted to finish its current statement (to avoid causing replication problems), and then stops. If the SQL thread is in the middle of a transaction at this point, the server waits until the current replication event group (if any) has finished executing, or until the user issues a **KILL QUERY** or **KILL CONNECTION** statement. See also Section 13.4.2.6, “STOP SLAVE Syntax”. Since nontransactional statements cannot be rolled back, in order to guarantee crash-safe replication, only transactional tables should be used.

**Note**

To guarantee crash safety on the slave, you must run the slave with **--relay-log-recovery** enabled.

See also Section 17.2.2, “Replication Relay and Status Logs”).

5. The server shuts down or closes storage engines.

At this stage, the server flushes the table cache and closes all open tables.

Each storage engine performs any actions necessary for tables that it manages. **InnoDB** flushes its buffer pool to disk (unless **innodb_fast_shutdown** is 2), writes the current LSN to the tablespace, and terminates its own internal threads. **MyISAM** flushes any pending index writes for a table.

6. The server exits.

### 5.2 The MySQL Data Directory

Information managed by the MySQL server is stored under a directory known as the data directory. The following list briefly describes the items typically found in the data directory, with cross references for additional information:

- **Data directory subdirectories.** Each subdirectory of the data directory is a database directory and corresponds to a database managed by the server. All MySQL installations have certain standard databases:
  - The **mysql** directory corresponds to the **mysql** system database, which contains information required by the MySQL server as it runs. See Section 5.3, “The mysql System Database”.
  - The **performance_schema** directory corresponds to the Performance Schema, which provides information used to inspect the internal execution of the server at runtime. See Chapter 22, MySQL Performance Schema.
  - The **ndbinfo** directory corresponds to the **ndbinfo** database that stores information specific to NDB Cluster (present only for installations built to include NDB Cluster). See Section 18.5.10, “ndbinfo: The NDB Cluster Information Database”.

---

The MySQL Data Directory
Other subdirectories correspond to databases created by users or applications.

Note

INFORMATION_SCHEMA is a standard database, but its implementation uses no corresponding database directory.

- Log files written by the server. See Section 5.4, “MySQL Server Logs”.
- InnoDB tablespace and log files. See Chapter 14, The InnoDB Storage Engine.
- The server process ID file (while the server is running).

Some items in the preceding list can be relocated elsewhere by reconfiguring the server. In addition, the --datadir option enables the location of the data directory itself to be changed. For a given MySQL installation, check the server configuration to determine whether items have been moved.

5.3 The mysql System Database

The mysql database is the system database. It contains tables that store information required by the MySQL server as it runs.

Tables in the mysql database fall into these categories:

- Grant System Tables
- Object Information System Tables
- Log System Tables
- Server-Side Help System Tables
- Time Zone System Tables
- Replication System Tables
- Optimizer System Tables
- Miscellaneous System Tables

The remainder of this section enumerates the tables in each category, with cross references for additional information. System tables use the MyISAM storage engine unless otherwise indicated.

Grant System Tables

These system tables contain grant information about user accounts and the privileges held by them:

- **user**: User accounts, global privileges, and other nonprivilege columns.
- **db**: Database-level privileges.
- **host**: Obsolete. MySQL install operations do not create this table as of MySQL 5.6.7.
- **tables_priv**: Table-level privileges.
- **columns_priv**: Column-level privileges.
Object Information System Tables

- **procs_priv**: Stored procedure and function privileges.
- **proxies_priv**: Proxy-user privileges.

For more information about the structure, contents, and purpose of the grant tables, see Section 6.2.3, “Grant Tables”.

Log System Tables

The server uses these system tables for logging:
- **general_log**: The general query log table.
- **slow_log**: The slow query log table.

Log tables use the **CSV** storage engine.

For more information, see Section 5.4, “MySQL Server Logs”.

Server-Side Help System Tables

These system tables contain server-side help information:
- **help_category**: Information about help categories.
- **help_keyword**: Keywords associated with help topics.
- **help_relation**: Mappings between help keywords and topics.
- **help_topic**: Help topic contents.

For more information, see Section 5.1.13, “Server-Side Help Support”.

Time Zone System Tables

These system tables contain time zone information:
Replication System Tables

- **time_zone**: Time zone IDs and whether they use leap seconds.
- **time_zone_leap_second**: When leap seconds occur.
- **time_zone_name**: Mappings between time zone IDs and names.
- **time_zone_transition, time_zone_transition_type**: Time zone descriptions.

For more information, see Section 5.1.12, "MySQL Server Time Zone Support".

Replication System Tables

The server uses these system tables to support replication:

- **ndb_binlog_index**: Binary log information for NDB Cluster replication. See Section 18.6.4, “NDB Cluster Replication Schema and Tables”.

- **slave_master_info, slave_relay_log_info, slave_worker_info**: Used to store replication information on slave servers. See Section 17.2.2, “Replication Relay and Status Logs”.

These tables use the InnoDB storage engine as of MySQL 5.6.6, MyISAM before that.

Optimizer System Tables

The **innodb_index_stats** and **innodb_table_stats** system tables are used for InnoDB persistent optimizer statistics. See Section 14.8.11.1, “Configuring Persistent Optimizer Statistics Parameters”.

These tables use the InnoDB storage engine.

Miscellaneous System Tables

Other system tables do not fall into the preceding categories:

- **firewall_users, firewall_whitelist**: If MySQL Enterprise Firewall is installed, these tables provide persistent storage for information used by the firewall. See Section 6.4.5, “MySQL Enterprise Firewall”.

- **servers**: Used by the FEDERATED storage engine. See Section 15.8.2.2, “Creating a FEDERATED Table Using CREATE SERVER”.

5.4 MySQL Server Logs

MySQL Server has several logs that can help you find out what activity is taking place.

<table>
<thead>
<tr>
<th>Log Type</th>
<th>Information Written to Log</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error log</td>
<td>Problems encountered starting, running, or stopping mysqld</td>
</tr>
<tr>
<td>General query log</td>
<td>Established client connections and statements received from clients</td>
</tr>
<tr>
<td>Binary log</td>
<td>Statements that change data (also used for replication)</td>
</tr>
<tr>
<td>Relay log</td>
<td>Data changes received from a replication master server</td>
</tr>
<tr>
<td>Slow query log</td>
<td>Queries that took more than long_query_time seconds to execute</td>
</tr>
<tr>
<td>DDL log (metadata log)</td>
<td>Metadata operations performed by DDL statements</td>
</tr>
</tbody>
</table>
By default, no logs are enabled, except the error log on Windows. (The DDL log is always created when required, and has no user-configurable options; see Section 5.4.6, “The DDL Log”.) The following log-specific sections provide information about the server options that enable logging.

By default, the server writes files for all enabled logs in the data directory. You can force the server to close and reopen the log files (or in some cases switch to a new log file) by flushing the logs. Log flushing occurs when you issue a `FLUSH LOGS` statement; execute `mysqladmin` with a `flush-logs` or `refresh` argument; or execute `mysqldump` with a `--flush-logs` or `--master-data` option. See Section 13.7.6.3, “FLUSH Syntax”, Section 4.5.2, "mysqladmin — Client for Administering a MySQL Server", and Section 4.5.4, "mysqldump — A Database Backup Program". In addition, the binary log is flushed when its size reaches the value of the `max_binlog_size` system variable.

You can control the general query and slow query logs during runtime. You can enable or disable logging, or change the log file name. You can tell the server to write general query and slow query entries to log tables, log files, or both. For details, see Section 5.4.1, “Selecting General Query Log and Slow Query Log Output Destinations”, Section 5.4.3, “The General Query Log”, and Section 5.4.5, “The Slow Query Log”.

The relay log is used only on slave replication servers, to hold data changes from the master server that must also be made on the slave. For discussion of relay log contents and configuration, see Section 17.2.2.1, “The Slave Relay Log”.

For information about log maintenance operations such as expiration of old log files, see Section 5.4.7, “Server Log Maintenance”.

For information about keeping logs secure, see Section 6.1.2.3, “Passwords and Logging”.

### 5.4.1 Selecting General Query Log and Slow Query Log Output Destinations

MySQL Server provides flexible control over the destination of output written to the general query log and the slow query log, if those logs are enabled. Possible destinations for log entries are log files or the `general_log` and `slow_log` tables in the `mysql` system database. File output, table output, or both can be selected.

- **Log Control at Server Startup**
- **Log Control at Runtime**
- **Log Table Benefits and Characteristics**

#### Log Control at Server Startup

The `log_output` system variable specifies the destination for log output. Setting this variable does not in itself enable the logs; they must be enabled separately.

- If `log_output` is not specified at startup, the default logging destination is **FILE**.
- If `log_output` is specified at startup, its value is a list one or more comma-separated words chosen from **TABLE** (log to tables), **FILE** (log to files), or **NONE** (do not log to tables or files). **NONE**, if present, takes precedence over any other specifiers.

The `general_log` system variable controls logging to the general query log for the selected log destinations. If specified at server startup, `general_log` takes an optional argument of 1 or 0 to enable or disable the log. To specify a file name other than the default for file logging, set the `general_log_file` variable. Similarly, the `slow_query_log` variable controls logging to the slow query log for the selected destinations and setting `slow_query_log_file` specifies a file name for file logging. If either log is enabled, the server opens the corresponding log file and writes startup messages to it. However, further logging of queries to the file does not occur unless the **FILE** log destination is selected.
Selecting General Query Log and Slow Query Log Output Destinations

Examples:

- To write general query log entries to the log table and the log file, use `--log_output=TABLE,FILE` to select both log destinations and `--general_log` to enable the general query log.

- To write general and slow query log entries only to the log tables, use `--log_output=TABLE` to select tables as the log destination and `--general_log` and `--slow_query_log` to enable both logs.

- To write slow query log entries only to the log file, use `--log_output=FILE` to select files as the log destination and `--slow_query_log` to enable the slow query log. In this case, because the default log destination is `FILE`, you could omit the `log_output` setting.

Log Control at Runtime

The system variables associated with log tables and files enable runtime control over logging:

- The `log_output` variable indicates the current logging destination. It can be modified at runtime to change the destination.

- The `general_log` and `slow_query_log` variables indicate whether the general query log and slow query log are enabled (ON) or disabled (OFF). You can set these variables at runtime to control whether the logs are enabled.

- The `general_log_file` and `slow_query_log_file` variables indicate the names of the general query log and slow query log files. You can set these variables at server startup or at runtime to change the names of the log files.

- To disable or enable general query logging for the current session, set the session `sql_log_off` variable to ON or OFF. (This assumes that the general query log itself is enabled.)

Log Table Benefits and Characteristics

The use of tables for log output offers the following benefits:

- Log entries have a standard format. To display the current structure of the log tables, use these statements:

  ```
  SHOW CREATE TABLE mysql.general_log;
  SHOW CREATE TABLE mysql.slow_log;
  ```

- Log contents are accessible through SQL statements. This enables the use of queries that select only those log entries that satisfy specific criteria. For example, to select log contents associated with a particular client (which can be useful for identifying problematic queries from that client), it is easier to do this using a log table than a log file.

- Logs are accessible remotely through any client that can connect to the server and issue queries (if the client has the appropriate log table privileges). It is not necessary to log in to the server host and directly access the file system.

The log table implementation has the following characteristics:

- In general, the primary purpose of log tables is to provide an interface for users to observe the runtime execution of the server, not to interfere with its runtime execution.

- `CREATE TABLE`, `ALTER TABLE`, and `DROP TABLE` are valid operations on a log table. For `ALTER TABLE` and `DROP TABLE`, the log table cannot be in use and must be disabled, as described later.
• By default, the log tables use the *CSV* storage engine that writes data in comma-separated values format. For users who have access to the *.CSV* files that contain log table data, the files are easy to import into other programs such as spreadsheets that can process CSV input.

The log tables can be altered to use the *MyISAM* storage engine. You cannot use `ALTER TABLE` to alter a log table that is in use. The log must be disabled first. No engines other than *CSV* or *MyISAM* are legal for the log tables.

• To disable logging so that you can alter (or drop) a log table, you can use the following strategy. The example uses the general query log; the procedure for the slow query log is similar but uses the `slow_log` table and `slow_query_log` system variable.

```
SET @old_log_state = @@GLOBAL.general_log;
SET GLOBAL general_log = 'OFF';
ALTER TABLE mysql.general_log ENGINE = MyISAM;
SET GLOBAL general_log = @old_log_state;
```

• `TRUNCATE TABLE` is a valid operation on a log table. It can be used to expire log entries.

• `RENAME TABLE` is a valid operation on a log table. You can atomically rename a log table (to perform log rotation, for example) using the following strategy:

```
USE mysql;
DROP TABLE IF EXISTS general_log2;
CREATE TABLE general_log2 LIKE general_log;
RENAME TABLE general_log TO general_log_backup, general_log2 TO general_log;
```

• `CHECK TABLE` is a valid operation on a log table.

• `LOCK TABLES` cannot be used on a log table.

• `INSERT`, `DELETE`, and `UPDATE` cannot be used on a log table. These operations are permitted only internally to the server itself.

• `FLUSH TABLES WITH READ LOCK` and the state of the `read_only` system variable have no effect on log tables. The server can always write to the log tables.

• Entries written to the log tables are not written to the binary log and thus are not replicated to slave servers.

• To flush the log tables or log files, use `FLUSH TABLES` or `FLUSH LOGS`, respectively.

• Partitioning of log tables is not permitted.

• A `mysqldump` dump includes statements to recreate those tables so that they are not missing after reloading the dump file. Log table contents are not dumped.

### 5.4.2 The Error Log

This section discusses how to configure the MySQL server for logging of diagnostic messages to the error log. For information about selecting the error message character set or language, see Section 10.6, “Error Message Character Set”, or Section 10.12, “Setting the Error Message Language”.

The error log contains a record of `mysqld` startup and shutdown times. It also contains diagnostic messages such as errors, warnings, and notes that occur during server startup and shutdown, and while the server is running. For example, if `mysqld` notices that a table needs to be automatically checked or repaired, it writes a message to the error log.
On some operating systems, the error log contains a stack trace if `mysqld` exits abnormally. The trace can be used to determine where `mysqld` exited. See Section 24.5, “Debugging and Porting MySQL”.

If used to start `mysqld`, `mysqld_safe` may write messages to the error log. For example, when `mysqld_safe` notices abnormal `mysqld` exits, it restarts `mysqld` and writes a `mysqld restarted` message to the error log.

The following sections discuss aspects of configuring error logging. In the discussion, “console” means `stderr`, the standard error output. This is your terminal or console window unless the standard error output has been redirected to a different destination.

The server interprets options that determine where to write error messages somewhat differently for Windows and Unix systems. Be sure to configure error logging using the information appropriate to your platform.

### 5.4.2.1 Error Logging on Windows

On Windows, `mysqld` uses the `--log-error`, `--pid-file`, and `--console` options to determine whether `mysqld` writes the error log to the console or a file, and, if to a file, the file name:

- If `--console` is given, `mysqld` writes the error log to the console, unless `--log-error` is also given. `--log-error` takes precedence over `--console` if both are given.

- If `--log-error` is not given, or is given without naming a file, `mysqld` writes the error log to a file named `host_name.err` in the data directory, unless the `--pid-file` option is specified. In that case, the file name is the PID file base name with a suffix of `.err` in the data directory.

- If `--log-error` is given to name a file, `mysqld` writes the error log to that file (with an `.err` suffix added if the name has no suffix), located under the data directory unless an absolute path name is given to specify a different location.

If the server writes the error log to a file, the `log_error` system variable indicates the error log file name.

In addition, the server by default writes events and error messages to the Windows Event Log within the Application log:

- Entries marked as `Error`, `Warning`, and `Note` are written to the Event Log, but not messages such as information statements from individual storage engines.

- Event Log entries have a source of `MySQL`.

- You cannot disable writing information to the Windows Event Log.

### 5.4.2.2 Error Logging on Unix and Unix-Like Systems

On Unix and Unix-like systems, `mysqld` uses the `--log-error` option to determine whether `mysqld` writes the error log to the console or a file, and, if to a file, the file name:

- If `--log-error` is not given, `mysqld` writes the error log to the console.

- If `--log-error` is given without naming a file, `mysqld` writes the error log to a file named `host_name.err` in the data directory.

- If `--log-error` is given to name a file, `mysqld` writes the error log to that file (with an `.err` suffix added if the name has no suffix), located under the data directory unless an absolute path name is given to specify a different location.
• If `--log-error` is given in an option file in a [mysqld], [server], or [mysqld_safe] section, `mysqld_safe` finds and uses the option, and passes it to `mysqld`.

Note
It is common for Yum or APT package installations to configure an error log file location under `/var/log` with an option like `log-error=/var/log/mysqld.log` in a server configuration file. Removing the file name from the option causes the `host_name.err` file in the data directory to be used.

If the server writes the error log to a file, the `log_error` system variable indicates the error log file name.

### 5.4.2.3 Error Logging to the System Log
