The maximum number of metadata lock instruments. This value controls the size of the `metadata_locks` table. If this maximum is exceeded such that a metadata lock cannot be instrumented, the Performance Schema increments the `Performance_schema_metadata_lock_lost` status variable.

- `performance_schema_max_mutex_classes`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-mutex-classes=#</code></td>
</tr>
<tr>
<td>System Variable</td>

</tbody>
</table>
### Performance Schema System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value (&gt;= 8.0.12)</td>
<td>300</td>
</tr>
<tr>
<td>Default Value (&gt;= 8.0.3, &lt;= 8.0.11)</td>
<td>250</td>
</tr>
<tr>
<td>Default Value (&gt;= 8.0.1, &lt;= 8.0.2)</td>
<td>220</td>
</tr>
<tr>
<td>Default Value (8.0.0)</td>
<td>200</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value (&gt;= 8.0.12)</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value (&lt;= 8.0.11)</td>
<td>256</td>
</tr>
</tbody>
</table>

The maximum number of mutex instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- `performance_schema_max_mutex_instances`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-mutex-instances=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_mutex_instances</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>-1</code> (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of instrumented mutex objects. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- `performance_schema_max_prepared_statements_instances`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-prepared-statements-instances=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_prepared_statements_instances</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>-1</code> (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of rows in the `prepared_statements_instances` table. If this maximum is exceeded such that a prepared statement cannot be instrumented, the Performance Schema increments the `Performance_schema_prepared_statements_lost` status variable. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.
Performance Schema System Variables

The default value of this variable is autosized based on the value of the `max_prepared_stmt_count` system variable.

- **performance_schema_max_rwlock_classes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max_rwlock-classes=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_rwlock_classes</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>

<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>(&gt;= 8.0.12) 1024</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>(&lt;= 8.0.11) 256</td>
</tr>
</tbody>
</table>

The maximum number of rwlock instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- **performance_schema_max_program_instances**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-program-instances=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_program_instances</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of stored programs for which the Performance Schema maintains statistics. If this maximum is exceeded, the Performance Schema increments the `Performance_schema_program_lost` status variable. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- **performance_schema_max_rwlock_instances**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max_rwlock_instances=#</code></td>
</tr>
<tr>

<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of instrumented socket objects. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- `performance_schema_max_sql_text_length`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-sql-text-length=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_sql_text_length</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td></td>
</tr>
</tbody>
</table>
Performance Schema System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1024</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1048576</td>
</tr>
</tbody>
</table>

The maximum number of bytes used to store SQL statements. The value applies to storage required for these columns:

- The `SQL_TEXT` column of the `events_statements_current`, `events_statements_history`, and `events_statements_history_long` statement event tables.
- The `QUERY_SAMPLE_TEXT` column of the `events_statements_summary_by_digest` summary table.

Any bytes in excess of `performance_schema_max_sql_text_length` are discarded and do not appear in the column. Statements differing only after that many initial bytes are indistinguishable in the column.

Decreasing the `performance_schema_max_sql_text_length` value reduces memory use but causes more statements to become indistinguishable if they differ only at the end. Increasing the value increases memory use but permits longer statements to be distinguished.

- `performance_schema_max_stage_classes`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-stage-classes=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_stage_classes</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>150</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value (&gt;= 8.0.12)</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value (&lt;= 8.0.11)</td>
<td>256</td>
</tr>
</tbody>
</table>

The maximum number of stage instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- `performance_schema_max_statement_classes`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-statement-classes=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_statement_classes</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
</tbody>
</table>
The maximum number of statement instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

The default value is calculated at server build time based on the number of commands in the client/server protocol and the number of SQL statement types supported by the server.

This variable should not be changed, unless to set it to 0 to disable all statement instrumentation and save all memory associated with it. Setting the variable to nonzero values other than the default has no benefit; in particular, values larger than the default cause more memory to be allocated than is needed.

- **performance_schema_max_statement_stack**

The maximum depth of nested stored program calls for which the Performance Schema maintains statistics. When this maximum is exceeded, the Performance Schema increments the **Performance_schema_nested_statement_lost** status variable for each stored program statement executed.

- **performance_schema_max_table_handles**

The maximum number of opened table objects. This value controls the size of the **table_handles** table. If this maximum is exceeded such that a table handle cannot be instrumented, the Performance Schema increments the **Performance_schema_table_handles_lost** status variable. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.
### Performance Schema System Variables

- **performance_schema_max_table_instances**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-table-instances=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_table_instances</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>–1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of instrumented table objects. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- **performance_schema_max_table_lock_stat**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-table-lock-stat=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_table_lock_stat</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>–1 (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of tables for which the Performance Schema maintains lock statistics. If this maximum is exceeded such that table lock statistics are lost, the Performance Schema increments the `performance_schema_table_lock_stat_lost` status variable.

- **performance_schema_max_thread_classes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-thread-classes=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_thread_classes</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>100 (&gt;= 8.0.3)</td>
</tr>
<tr>
<td>Default Value</td>
<td>50  (&lt;= 8.0.2)</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1024 (&gt;= 8.0.12)</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>256  (&lt;= 8.0.11)</td>
</tr>
</tbody>
</table>
The maximum number of thread instruments. For information about how to set and use this variable, see Section 26.7, "Performance Schema Status Monitoring".

- **performance_schema_max_thread_instances**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema-max-thread-instances=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema_max_thread_instances</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of instrumented thread objects. The value controls the size of the threads table. If this maximum is exceeded such that a thread cannot be instrumented, the Performance Schema increments the Performance_schema_thread_instances_lost status variable. For information about how to set and use this variable, see Section 26.7, "Performance Schema Status Monitoring".

The **max_connections** system variable affects how many threads can run in the server. performance_schema_max_thread_instances affects how many of these running threads can be instrumented.

The variables_by_thread and status_by_thread tables contain system and status variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table will miss some rows. In this case, the Performance_schema_thread_instances_lost status variable will be greater than zero.

- **performance_schema_session_connect_attrs_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema-session-connect-attrs-size=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema_session_connect_attrs_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>-1</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1048576</td>
</tr>
</tbody>
</table>

The amount of preallocated memory per thread reserved to hold connection attribute key-value pairs. If the aggregate size of connection attribute data sent by a client is larger than this amount, the Performance Schema truncates the attribute data, increments the Performance_schema_session_connect_attrs_lost status variable, and writes a message to the error log indicating that truncation occurred if the log_error_verbosity system variable is greater than 1. A _truncated attribute is also added to the session attributes with a value indicating how many bytes were lost, if the attribute buffer has sufficient space. This enables the Performance
Schema to expose per-connection truncation information in the connection attribute tables. This information can be examined without having to check the error log.

The default value of `performance_schema_session_connect_attrs_size` is autosized at server startup. This value may be small, so if truncation occurs (`Performance_schema_session_connect_attrs_lost` becomes nonzero), you may wish to set `performance_schema_session_connect_attrs_size` explicitly to a larger value.

Although the maximum permitted `performance_schema_session_connect_attrs_size` value is 1MB, the effective maximum is 64KB because the server imposes a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. For more information, see Section 26.12.9, “Performance Schema Connection Attribute Tables”.

- **performance_schema_setup_actors_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-setup-actors-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_setup_actors_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>-1</code> (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows in the `setup_actors` table.

- **performance_schema_setup_objects_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-setup-objects-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_setup_objects_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>-1</code> (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows in the `setup_objects` table.

- **performance_schema_users_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-users-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_users_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
</tbody>
</table>
Performance Schema Status Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1048576</td>
</tr>
</tbody>
</table>

The number of rows in the users table. If this variable is 0, the Performance Schema does not maintain connection statistics in the users table or status variable information in the status_by_user table.

26.16 Performance Schema Status Variables

The Performance Schema implements several status variables that provide information about instrumentation that could not be loaded or created due to memory constraints:

```
mysql> SHOW STATUS LIKE 'perf%';
+-------------------------------------------+-------+
| Variable_name                             | Value |
+-------------------------------------------+-------+
| Performance_schema_accounts_lost          | 0     |
| Performance_schema_cond_classes_lost      | 0     |
| Performance_schema_cond_instances_lost    | 0     |
| Performance_schema_file_classes_lost      | 0     |
| Performance_schema_file_handles_lost      | 0     |
| Performance_schema_file_instances_lost    | 0     |
| Performance_schema_hosts_lost             | 0     |
| Performance_schema_locker_lost            | 0     |
| Performance_schema_mutex_classes_lost     | 0     |
| Performance_schema_mutex_instances_lost   | 0     |
| Performance_schema_rwlock_classes_lost    | 0     |
| Performance_schema_rwlock_instances_lost  | 0     |
| Performance_schema_socket_classes_lost    | 0     |
| Performance_schema_socket_instances_lost  | 0     |
| Performance_schema_stage_classes_lost     | 0     |
| Performance_schema_statement_classes_lost | 0     |
| Performance_schema_table_handles_lost     | 0     |
| Performance_schema_table_instances_lost   | 0     |
| Performance_schema_thread_classes_lost    | 0     |
| Performance_schema_thread_instances_lost  | 0     |
| Performance_schema_users_lost             | 0     |
+-------------------------------------------+-------+
```

For information on using these variables to check Performance Schema status, see Section 26.7, “Performance Schema Status Monitoring”.

Performance Schema status variables have the following meanings:

- **Performance_schema_accounts_lost**
  The number of times a row could not be added to the accounts table because it was full.

- **Performance_schema_cond_classes_lost**
  How many condition instruments could not be loaded.

- **Performance_schema_cond_instances_lost**
  How many condition instrument instances could not be created.
• **Performance_schema_digest_lost**
  The number of digest instances that could not be instrumented in the `events_statements_summary_by_digest` table. This can be nonzero if the value of `performance_schema_digests_size` is too small.

• **Performance_schema_file_classes_lost**
  How many file instruments could not be loaded.

• **Performance_schema_file_handles_lost**
  How many file instrument instances could not be opened.

• **Performance_schema_file_instances_lost**
  How many file instrument instances could not be created.

• **Performance_schema_hosts_lost**
  The number of times a row could not be added to the `hosts` table because it was full.

• **Performance_schema_index_stat_lost**
  The number of indexes for which statistics were lost. This can be nonzero if the value of `performance_schema_max_index_stat` is too small.

• **Performance_schema_locker_lost**
  How many events are “lost” or not recorded, due to the following conditions:
  • Events are recursive (for example, waiting for A caused a wait on B, which caused a wait on C).
  • The depth of the nested events stack is greater than the limit imposed by the implementation.
  Events recorded by the Performance Schema are not recursive, so this variable should always be 0.

• **Performance_schema_memory_classes_lost**
  The number of times a memory instrument could not be loaded.

• **Performance_schema_metadata_lock_lost**
  The number of metadata locks that could not be instrumented in the `metadata_locks` table. This can be nonzero if the value of `performance_schema_max_metadata_locks` is too small.

• **Performance_schema_mutex_classes_lost**
  How many mutex instruments could not be loaded.

• **Performance_schema_mutex_instances_lost**
  How many mutex instrument instances could not be created.

• **Performance_schema_nested_statement_lost**
  The number of stored program statements for which statistics were lost. This can be nonzero if the value of `performance_schema_max_statement_stack` is too small.

• **Performance_schema_prepared_statements_lost**
The number of prepared statements that could not be instrumented in the `prepared_statements_instances` table. This can be nonzero if the value of `performance_schema_max_prepared_statements_instances` is too small.

- **Performance_schema_program_lost**

  The number of stored programs for which statistics were lost. This can be nonzero if the value of `performance_schema_max_program_instances` is too small.

- **Performance_schema_rwlock_classes_lost**

  How many rwlock instruments could not be loaded.

- **Performance_schema_rwlock_instances_lost**

  How many rwlock instrument instances could not be created.

- **Performance_schema_session_connect_attrs_longest_seen**

  In addition to the connection attribute size-limit check performed by the Performance Schema against the value of the `performance_schema_session_connect_attrs_size` system variable, the server performs a preliminary check, imposing a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. Otherwise, the server considers the attribute buffer valid and tracks the size of the longest such buffer in the `Performance_schema_session_connect_attrs_longest_seen` status variable. If this value is larger than `performance_schema_session_connect_attrs_size`, DBAs may wish to increase the latter value, or, alternatively, investigate which clients are sending large amounts of attribute data.

  For more information about connection attributes, see Section 26.12.9, “Performance Schema Connection Attribute Tables”.

- **Performance_schema_session_connect_attrs_lost**

  The number of connections for which connection attribute truncation has occurred. For a given connection, if the client sends connection attribute key-value pairs for which the aggregate size is larger than the reserved storage permitted by the value of the `performance_schema_session_connect_attrs_size` system variable, the Performance Schema truncates the attribute data and increments `performance_schema_session_connect_attrs_lost`. If this value is nonzero, you may wish to set `performance_schema_session_connect_attrs_size` to a larger value.

  For more information about connection attributes, see Section 26.12.9, “Performance Schema Connection Attribute Tables”.

- **Performance_schema_socket_classes_lost**

  How many socket instruments could not be loaded.

- **Performance_schema_socket_instances_lost**

  How many socket instrument instances could not be created.

- **Performance_schema_stage_classes_lost**

  How many stage instruments could not be loaded.
The Performance Schema uses this memory allocation model:

- May allocate memory at server startup
- May allocate additional memory during server operation
- Never free memory during server operation (although it might be recycled)
- Free all memory used at shutdown

The result is to relax memory constraints so that the Performance Schema can be used with less configuration, and to decrease the memory footprint so that consumption scales with server load. Memory used depends on the load actually seen, not the load estimated or explicitly configured for.

Several Performance Schema sizing parameters are autoscaled and need not be configured explicitly unless you want to establish an explicit limit on memory allocation:

- `performance_schema_accounts_size`
- `performance_schema_hosts_size`
- `performance_schema_max_cond_instances`
- `performance_schema_max_file_instances`
- `performance_schema_max_index_stat`
- `performance_schema_max_metadata_locks`
- `performance_schema_max_mutex_instances`
- `performance_schema_max_prepared_statements_instances`
- `performance_schema_max_program_instances`
For an autoscaled parameter, configuration works like this:

- With the value set to -1 (the default), the parameter is autoscaled:
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer. The buffer size is unbounded, and may grow with the load.

- With the value set to 0:
  - The corresponding internal buffer is empty initially and no memory is allocated.

- With the value set to $N > 0$:
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer, until the buffer size reaches $N$.
  - Once the buffer size reaches $N$, no more memory is allocated. Data collected by the Performance Schema for this buffer is lost, and any corresponding “lost instance” counters are incremented.

To see how much memory the Performance Schema is using, check the instruments designed for that purpose. The Performance Schema allocates memory internally and associates each buffer with a dedicated instrument so that memory consumption can be traced to individual buffers. Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for these internal buffers. The buffers are global to the server, so the instruments are displayed only in the `memory_summary_global_by_event_name` table, and not in other `memory_summary_by_xxx_by_event_name` tables.

This query shows the information associated with the memory instruments:

```sql
SELECT * FROM performance_schema.memory_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'memory/performance_schema/';
```

### 26.18 Performance Schema and Plugins

Removing a plugin with `UNINSTALL PLUGIN` does not affect information already collected for code in that plugin. Time spent executing the code while the plugin was loaded was still spent even if the plugin is unloaded later. The associated event information, including aggregate information, remains readable in the `performance_schema` database tables. For additional information about the effect of plugin installation and removal, see Section 26.7, “Performance Schema Status Monitoring”.

A plugin implementor who instruments plugin code should document its instrumentation characteristics to enable those who load the plugin to account for its requirements. For example, a third-party storage engine should include in its documentation how much memory the engine needs for mutex and other instruments.

### 26.19 Using the Performance Schema to Diagnose Problems
The Performance Schema is a tool to help a DBA do performance tuning by taking real measurements instead of “wild guesses.” This section demonstrates some ways to use the Performance Schema for this purpose. The discussion here relies on the use of event filtering, which is described in Section 26.4.2, “Performance Schema Event Filtering”.

The following example provides one methodology that you can use to analyze a repeatable problem, such as investigating a performance bottleneck. To begin, you should have a repeatable use case where performance is deemed “too slow” and needs optimization, and you should enable all instrumentation (no pre-filtering at all).

1. Run the use case.

2. Using the Performance Schema tables, analyze the root cause of the performance problem. This analysis will rely heavily on post-filtering.

3. For problem areas that are ruled out, disable the corresponding instruments. For example, if analysis shows that the issue is not related to file I/O in a particular storage engine, disable the file I/O instruments for that engine. Then truncate the history and summary tables to remove previously collected events.

4. Repeat the process at step 1.

At each iteration, the Performance Schema output, particularly the `events_waits_history_long` table, will contain less and less “noise” caused by nonsignificant instruments, and given that this table has a fixed size, will contain more and more data relevant to the analysis of the problem at hand.

At each iteration, investigation should lead closer and closer to the root cause of the problem, as the “signal/noise” ratio will improve, making analysis easier.

5. Once a root cause of performance bottleneck is identified, take the appropriate corrective action, such as:
   - Tune the server parameters (cache sizes, memory, and so forth).
   - Tune a query by writing it differently,
   - Tune the database schema (tables, indexes, and so forth).
   - Tune the code (this applies to storage engine or server developers only).

6. Start again at step 1, to see the effects of the changes on performance.

The `mutex_instances.LOCKED_BY_THREAD_ID` and `rwlock_instances.WRITE_LOCKED_BY_THREAD_ID` columns are extremely important for investigating performance bottlenecks or deadlocks. This is made possible by Performance Schema instrumentation as follows:

1. Suppose that thread 1 is stuck waiting for a mutex.

2. You can determine what the thread is waiting for:

   ```sql
   SELECT * FROM performance_schema.events_waits_current
   WHERE THREAD_ID = thread_1;
   
   Say the query result identifies that the thread is waiting for mutex A, found in `events_waits_current.OBJECT_INSTANCE_BEGIN`.
   ```
3. You can determine which thread is holding mutex A:

```sql
SELECT * FROM performance_schema.mutex_instances
WHERE OBJECT_INSTANCE_BEGIN = 'mutex_A';
```

Say the query result identifies that it is thread 2 holding mutex A, as found in
`mutex_instances.LOCKED_BY_THREAD_ID`.

4. You can see what thread 2 is doing:

```sql
SELECT * FROM performance_schema.events_waits_current
WHERE THREAD_ID = 'thread_2';
```

### 26.19.1 Query Profiling Using Performance Schema

The following example demonstrates how to use Performance Schema statement events and stage events to retrieve data comparable to profiling information provided by `SHOW PROFILES` and `SHOW PROFILE` statements.

The `setup_actors` table can be used to limit the collection of historical events by host, user, or account to reduce runtime overhead and the amount of data collected in history tables. The first step of the example shows how to limit collection of historical events to a specific user.

Performance Schema displays event timer information in picoseconds (trillionths of a second) to normalize timing data to a standard unit. In the following example, `TIMER_WAIT` values are divided by 1000000000000 to show data in units of seconds. Values are also truncated to 6 decimal places to display data in the same format as `SHOW PROFILES` and `SHOW PROFILE` statements.

1. Limit the collection of historical events to the user that will run the query. By default, `setup_actors` is configured to allow monitoring and historical event collection for all foreground threads:

```sql
mysql> SELECT * FROM performance_schema.setup_actors;
+------+------+------+---------+---------+
| HOST | USER | ROLE | ENABLED | HISTORY |
+------+------+------+---------+---------+
| %    | %    | %    | YES     | YES     |
+------+------+------+---------+---------+
```

Update the default row in the `setup_actors` table to disable historical event collection and monitoring for all foreground threads, and insert a new row that enables monitoring and historical event collection for the user that will run the query:

```sql
mysql> UPDATE performance_schema.setup_actors
    -> SET ENABLED = 'NO', HISTORY = 'NO'
    -> WHERE HOST = '%' AND USER = '%';

mysql> INSERT INTO performance_schema.setup_actors
    -> (HOST,USER,ROLE,ENABLED,HISTORY)
    -> VALUES('localhost','test_user','%','YES','YES');
```

Data in the `setup_actors` table should now appear similar to the following:

```sql
mysql> SELECT * FROM performance_schema.setup_actors;
+-----------+-----------+------+---------+---------+
| HOST      | USER      | ROLE | ENABLED | HISTORY |
+-----------+-----------+------+---------+---------+
| localhost | test_user | %    | YES     | YES     |
+-----------+-----------+------+---------+---------+
```
2. Ensure that statement and stage instrumentation is enabled by updating the `setup_instruments` table. Some instruments may already be enabled by default.

```sql
UPDATE performance_schema.setup_instruments
    SET ENABLED = 'YES', TIMED = 'YES'
    WHERE NAME LIKE '%statement/%';

UPDATE performance_schema.setup_instruments
    SET ENABLED = 'YES', TIMED = 'YES'
    WHERE NAME LIKE '%stage/%';
```

3. Ensure that `events_statements_*` and `events_stages_*` consumers are enabled. Some consumers may already be enabled by default.

```sql
UPDATE performance_schema.setup_consumers
    SET ENABLED = 'YES'
    WHERE NAME LIKE '%events_statements_%';

UPDATE performance_schema.setup_consumers
    SET ENABLED = 'YES'
    WHERE NAME LIKE '%events_stages_%';
```

4. Under the user account you are monitoring, run the statement that you want to profile. For example:

```sql
SELECT * FROM employees.employees WHERE emp_no = 10001;
```

<table>
<thead>
<tr>
<th>emp_no</th>
<th>birth_date</th>
<th>first_name</th>
<th>last_name</th>
<th>gender</th>
<th>hire_date</th>
</tr>
</thead>
<tbody>
<tr>
<td>10001</td>
<td>1953-09-02</td>
<td>Georgi</td>
<td>Facello</td>
<td>M</td>
<td>1986-06-26</td>
</tr>
</tbody>
</table>

5. Identify the `EVENT_ID` of the statement by querying the `events_statements_history_long` table. This step is similar to running `SHOW PROFILES` to identify the `Query_ID`. The following query produces output similar to `SHOW PROFILES`:

```sql
SELECT EVENT_ID, TRUNCATE(TIMER_WAIT/1000000000000,6) as Duration, SQL_TEXT
    FROM performance_schema.events_statements_history_long
    WHERE SQL_TEXT like '%10001%';
```

6. Query the `events_stages_history_long` table to retrieve the statement's stage events. Stages are linked to statements using event nesting. Each stage event record has a `NESTING_EVENT_ID` column that contains the `EVENT_ID` of the parent statement.

```sql
SELECT event_name AS Stage, TRUNCATE(TIMER_WAIT/1000000000000,6) AS Duration
    FROM performance_schema.events_stages_history_long
    WHERE NESTING_EVENT_ID=31;
```

<table>
<thead>
<tr>
<th>Stage</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>stage/sql/starting</td>
<td>0.000080</td>
</tr>
<tr>
<td>stage/sql/checking permissions</td>
<td>0.000005</td>
</tr>
<tr>
<td>stage/sql/Opening tables</td>
<td>0.027759</td>
</tr>
<tr>
<td>stage/sql/init</td>
<td>0.000052</td>
</tr>
</tbody>
</table>
26.19.2 Obtaining Parent Event Information

The `data_locks` table shows data locks held and requested. Rows of this table have a `THREAD_ID` column indicating the thread ID of the session that owns the lock, and an `EVENT_ID` column indicating the Performance Schema event that caused the lock. Tuples of `(THREAD_ID, EVENT_ID)` values implicitly identify a parent event in other Performance Schema tables:

- The parent wait event in the `events_waits_xxx` tables
- The parent stage event in the `events_stages_xxx` tables
- The parent statement event in the `events_statements_xxx` tables
- The parent transaction event in the `events_transactions_current` table

To obtain details about the parent event, join the `THREAD_ID` and `EVENT_ID` columns with the columns of like name in the appropriate parent event table. The relation is based on a nested set data model, so the join has several clauses. Given parent and child tables represented by `parent` and `child`, respectively, the join looks like this:

```
WHERE
  parent.THREAD_ID = child.THREAD_ID  /* 1 */
  AND parent.EVENT_ID < child.EVENT_ID /* 2 */
  AND (child.EVENT_ID <= parent.END_EVENT_ID /* 3a */
       OR parent.END_EVENT_ID IS NULL    /* 3b */)
```

The conditions for the join are:

1. The parent and child events are in the same thread.
2. The child event begins after the parent event, so its `EVENT_ID` value is greater than that of the parent.
3. The parent event has either completed or is still running.

To find lock information, `data_locks` is the table containing child events.

The `data_locks` table shows only existing locks, so these considerations apply regarding which table contains the parent event:

- For transactions, the only choice is `events_transactions_current`. If a transaction is completed, it may be in the transaction history tables, but the locks are gone already.
- For statements, it all depends on whether the statement that took a lock is a statement in a transaction that has already completed (use `events_statements_history`) or the statement is still running (use `events_statements_current`).

Obtaining Parent Event Information

- For stages, the logic is similar to that for statements; use `events_stages_history` or `events_stages_current`.

- For waits, the logic is similar to that for statements; use `events_waits_history` or `events_waits_current`. However, so many waits are recorded that the wait that caused a lock is most likely gone from the history tables already.

Wait, stage, and statement events disappear quickly from the history. If a statement that executed a long time ago took a lock but is in a still-open transaction, it might not be possible to find the statement, but it is possible to find the transaction.

This is why the nested set data model works better for locating parent events. Following links in a parent/child relationship (data lock -> parent wait -> parent stage -> parent transaction) does not work well when intermediate nodes are already gone from the history tables.

The following scenario illustrates how to find the parent transaction of a statement in which a lock was taken:

**Session A:**

```sql
[1] START TRANSACTION;
[2] SELECT * FROM t1 WHERE pk = 1;
[3] SELECT 'Hello, world';
```

**Session B:**

```sql
SELECT ...  
FROM performance_schema.events_transactions_current AS parent  
INNER JOIN performance_schema.data_locks AS child  
WHERE  
  parent.THREAD_ID = child.THREAD_ID  
AND parent.EVENT_ID < child.EVENT_ID  
AND (  
  child.EVENT_ID <= parent.END_EVENT_ID  
  OR parent.END_EVENT_ID IS NULL  
);  
```

The query for session B should show statement [2] as owning a data lock on the record with `pk=1`.

If session A executes more statements, [2] fades out of the history table.

The query should show the transaction that started in [1], regardless of how many statements, stages, or waits were executed.

To see more data, you can also use the `events_xxx_history_long` tables, except for transactions, assuming no other query runs in the server (so that history is preserved).
Chapter 27 MySQL sys Schema

  27.4.5 sys Schema Stored Functions .......................................................................... 4693

MySQL 8.0 includes the sys schema, a set of objects that helps DBAs and developers interpret data collected by the Performance Schema. sys schema objects can be used for typical tuning and diagnosis use cases. Objects in this schema include:

- Views that summarize Performance Schema data into more easily understandable form.
- Stored procedures that perform operations such as Performance Schema configuration and generating diagnostic reports.
- Stored functions that query Performance Schema configuration and provide formatting services.

For new installations, the sys schema is installed by default during data directory initialization if you use mysqld with the --initialize or --initialize-insecure option. If this is not desired, you can drop the sys schema manually after initialization if it is unneeded.

The MySQL upgrade procedure produces an error if a sys schema exists but has no version view, on the assumption that absence of this view indicates a user-created sys schema. To upgrade in this case, remove or rename the existing sys schema first.

sys schema objects have a DEFINER of 'mysql.sys'@'localhost'. Use of the dedicated mysql.sys account avoids problems that occur if a DBA renames or removes the root account.

27.1 Prerequisites for Using the sys Schema

Before using the sys schema, the prerequisites described in this section must be satisfied.

Because the sys schema provides an alternative means of accessing the Performance Schema, the Performance Schema must be enabled for the sys schema to work. See Section 26.3, “Performance Schema Startup Configuration”.

For full access to the sys schema, a user must have these privileges:

- SELECT on all sys tables and views
- EXECUTE on all sys stored procedures and functions
- INSERT and UPDATE for the sys_config table, if changes are to be made to it
- Additional privileges for certain sys schema stored procedures and functions, as noted in their descriptions (for example, the ps_setup_save() procedure)

It is also necessary to have privileges for the objects underlying the sys schema objects:
Using the sys Schema

- **SELECT** on any Performance Schema tables accessed by *sys* schema objects, and **UPDATE** for any tables to be updated using *sys* schema objects

- **PROCESS** for the **INFORMATION_SCHEMA INNODB_BUFFER_PAGE** table

Certain Performance Schema instruments and consumers must be enabled and (for instruments) timed to take full advantage of *sys* schema capabilities:

- All **wait** instruments
- All **stage** instruments
- All **statement** instruments
- **xxx_current** and **xxx_history_long** consumers for all events

You can use the *sys* schema itself to enable all of the additional instruments and consumers:

```sql
CALL sys.ps_setup_enable_instrument('wait');
CALL sys.ps_setup_enable_instrument('stage');
CALL sys.ps_setup_enable_instrument('statement');
CALL sys.ps_setup_enable_consumer('current');
CALL sys.ps_setup_enable_consumer('history_long');
```

**Note**

For many uses of the *sys* schema, the default Performance Schema is sufficient for data collection. Enabling all the instruments and consumers just mentioned has a performance impact, so it is preferable to enable only the additional configuration you need. Also, remember that if you enable additional configuration, you can easily restore the default configuration like this:

```sql
CALL sys.ps_setup_reset_to_default(TRUE);
```

### 27.2 Using the sys Schema

You can make the *sys* schema the default schema so that references to its objects need not be qualified with the schema name:

```sql
mysql> USE sys;
Database changed
```

```sql
mysql> SELECT * FROM version;
+-------------+---------------+
| sys_version | mysql_version |
| 2.0.0       | 8.0.13-debug  |
+-------------+---------------+
```

(The **version** view shows the *sys* schema and MySQL server versions.)

To access *sys* schema objects while a different schema is the default (or simply to be explicit), qualify object references with the schema name:

```sql
mysql> SELECT * FROM sys.version;
+-------------+---------------+
| sys_version | mysql_version |
| 2.0.0       | 8.0.13-debug  |
+-------------+---------------+
The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units):

```sql
mysql> SELECT * FROM sys.host_summary_by_file_io;
```

+------------+-------+------------+
| host       | ios   | io_latency |
| localhost  | 67570 | 5.38 s     |
| background | 3468  | 4.18 s     |
+------------+-------+------------+

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```sql
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
```

+------------+-------+---------------+
| host       | ios   | io_latency    |
| localhost  | 67574 | 5380678125144 |
| background | 3474  | 4758696829416 |
+------------+-------+---------------+

The view without the `x$` prefix is intended to provide output that is more user friendly and easier for humans to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data. For additional information about the differences between non-`x$` and `x$` views, see Section 27.4.3, "sys Schema Views".

To examine `sys` schema object definitions, use the appropriate `SHOW` statement or `INFORMATION_SCHEMA` query. For example, to examine the definitions of the `session` view and `format_bytes()` function, use these statements:

```sql
mysql> SHOW CREATE VIEW sys.session;
mysql> SHOW CREATE FUNCTION sys.format_bytes;
```

However, those statements display the definitions in relatively unformatted form. To view object definitions with more readable formatting, access the individual `.sql` files available from the `sys` schema development website at https://github.com/mysql/mysql-sys.

Neither `mysqldump` nor `mysqlpump` dump the `sys` schema by default. To generate a dump file, name the `sys` schema explicitly on the command line using either of these commands:

```bash
mysqldump --databases --routines sys > sys_dump.sql
mysqlpump sys > sys_dump.sql
```

To reinstall the schema from the dump file, use this command:

```bash
mysql < sys_dump.sql
```

### 27.3 sys Schema Progress Reporting

The following `sys` schema views provide progress reporting for long-running transactions:

`processlist`  
`session`
Assuming that the required instruments and consumers are enabled, the `progress` column of these views shows the percentage of work completed for stages that support progress reporting.

Stage progress reporting requires that the `events_stages_current` consumer be enabled, as well as the instruments for which progress information is desired. Instruments for these stages currently support progress reporting:

- `stage/sql/Copying to tmp table`
- `stage/innodb/alter table (end)`
- `stage/innodb/alter table (flush)`
- `stage/innodb/alter table (insert)`
- `stage/innodb/alter table (log apply index)`
- `stage/innodb/alter table (log apply table)`
- `stage/innodb/alter table (merge sort)`
- `stage/innodb/alter table (read PK and internal sort)`
- `stage/innodb/buffer pool load`

For stages that do not support estimated and completed work reporting, or if the required instruments or consumers are not enabled, the `progress` column is `NULL`.

### 27.4 sys Schema Object Reference

The `sys` schema includes tables and triggers, views, and stored procedures and functions. The following sections provide details for each of these objects.

#### 27.4.1 sys Schema Object Index

The following tables list `sys` schema objects and provide a short description of each one.

**Table 27.1 sys Schema Tables and Triggers**

<table>
<thead>
<tr>
<th>Table or Trigger Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sys_config</code></td>
<td><code>sys</code> schema configuration options</td>
</tr>
<tr>
<td><code>sys_config_insert_set_user</code></td>
<td><code>sys_config</code> insert trigger</td>
</tr>
<tr>
<td><code>sys_config_update_set_user</code></td>
<td><code>sys_config</code> update trigger</td>
</tr>
</tbody>
</table>

**Table 27.2 sys Schema Views**

<table>
<thead>
<tr>
<th>View Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>host_summary, x$host_summary</code></td>
<td>Statement activity, file I/O, and connections, grouped by host</td>

27.4.2 sys Schema Tables and Triggers

The following sections describe sys schema tables and triggers.

27.4.2.1 The sys_config Table

This table contains sys schema configuration options, one row per option. Configuration changes made by updating this table persist across client sessions and server restarts.

The sys_config table has these columns:

- variable
  
  The configuration option name.

- value
The configuration option value.

- **set_time**
  
The timestamp of the most recent modification to the row.

- **set_by**
  
The account that made the most recent modification to the row. The value is **NULL** if the row has not been changed since the `sys` schema was installed.

As an efficiency measure to minimize the number of direct reads from the `sys_config` table, `sys` schema functions that use a value from this table check for a user-defined variable with a corresponding name, which is the user-defined variable having the same name plus a `@sys.` prefix. (For example, the variable corresponding to the `diagnostics.include_raw` option is `@sys.diagnostics.include_raw`.) If the user-defined variable exists in the current session and is non-**NULL**, the function uses its value in preference to the value in the `sys_config` table. Otherwise, the function reads and uses the value from the table. In the latter case, the calling function conventionally also sets the corresponding user-defined variable to the table value so that further references to the configuration option within the same session use the variable and need not read the table again.

For example, the `statement_truncate_len` option controls the maximum length of statements returned by the `format_statement()` function. The default is 64. To temporarily change the value to 32 for your current session, set the corresponding `@sys.statement_truncate_len` user-defined variable:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
```

```
+----------------------------------------------------------+
<table>
<thead>
<tr>
<th>sys.format_statement(@stmt)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT variable, value, set_time, set_by FROM sys_config</td>
</tr>
</tbody>
</table>
+----------------------------------------------------------+
```

```
mysql> SET @sys.statement_truncate_len = 32;
```

```
mysql> SELECT sys.format_statement(@stmt);
```

```
+-----------------------------------+
<table>
<thead>
<tr>
<th>sys.format_statement(@stmt)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT variable ... ROM sys_config</td>
</tr>
</tbody>
</table>
+-----------------------------------+
```

Subsequent invocations of `format_statement()` within the session continue to use the user-defined variable value (32), rather than the value stored in the table (64).

To stop using the user-defined variable and revert to using the value in the table, set the variable to **NULL** within your session:

```
mysql> SET @sys.statement_truncate_len = NULL;
```

```
mysql> SELECT sys.format_statement(@stmt);
```

```
+----------------------------------------------------------+
<table>
<thead>
<tr>
<th>sys.format_statement(@stmt)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT variable, value, set_time, set_by FROM sys_config</td>
</tr>
</tbody>
</table>
+----------------------------------------------------------+
```

Alternatively, end your current session (causing the user-defined variable to no longer exist) and begin a new session.

The conventional relationship just described between options in the `sys_config` table and user-defined variables can be exploited to make temporary configuration changes that end when your session ends.
However, if you set a user-defined variable and then subsequently change the corresponding table value within the same session, the changed table value will not be used in that session as long as the user-defined variable exists with a non-NULL value. (The changed table value will be used in other sessions that do not have the user-defined variable assigned.)

The following list describes the options in the `sys_config` table and the corresponding user-defined variables:

- **diagnostics.allow_i_s_tables, @sys.diagnostics.allow_i_s_tables**
  
  If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the `INFORMATION_SCHEMA.TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

- **diagnostics.include_raw, @sys.diagnostics.include_raw**
  
  If this option is `ON`, the `diagnostics()` procedure includes the raw output from querying the `metrics` view. The default is `OFF`.

- **ps_thread_trx_info.max_length, @sys.ps_thread_trx_info.max_length**
  
  The maximum length for JSON output produced by the `ps_thread_trx_info()` function. The default is 65535.

- **statement_performance_analyzer.limit, @sys.statement_performance_analyzer.limit**
  
  The maximum number of rows to return for views that have no built-in limit. (For example, the `statements_with_runtimes_in_95th_percentile` view has a built-in limit in the sense that it returns only statements with average execution time in the 95th percentile.) The default is 100.

- **statement_performance_analyzer.view, @sys.statement_performance_analyzer.view**
  
  The custom query or view to be used by the `statement_performance_analyzer()` procedure (which is itself invoked by the `diagnostics()` procedure). If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. The default is NULL (no custom view defined).

- **statement_truncate_len, @sys.statement_truncate_len**
  
  The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

Other options can be added to the `sys_config` table. For example, the `diagnostics()` and `execute_prepared_stmt()` procedures use the `debug` option if it exists, but this option is not part of the `sys_config` table by default because debug output normally is enabled only temporarily, by setting the corresponding `@sys.debug` user-defined variable. To enable debug output without having to set that variable in individual sessions, add the option to the table:

```sql
mysql> INSERT INTO sys.sys_config (variable, value) VALUES('debug', 'ON');
```

To change the debug setting in the table, do two things. First, modify the value in the table itself:

```sql
mysql> UPDATE sys.sys_config
```
Second, to also ensure that procedure invocations within the current session use the changed value from the table, set the corresponding user-defined variable to `NULL`:

```
mysql> SET @sys.debug = NULL;
```

### 27.4.2.2 The sys_config_insert_set_user Trigger

For rows added to the `sys_config` table by `INSERT` statements, the `sys_config_insert_set_user` trigger sets the `set_by` column to the current user.

### 27.4.2.3 The sys_config_update_set_user Trigger

The `sys_config_update_set_user` trigger for the `sys_config` table is similar to the `sys_config_insert_set_user` trigger, but for `UPDATE` statements.

### 27.4.3 sys Schema Views

The following sections describe `sys` schema views.

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units):

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
+------------+-------+------------+
| host       | ios   | io_latency |
| localhost  | 67570 | 5.38 s     |
| background |  3468 | 4.18 s     |
+------------+-------+------------+
```

The `$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.$host_summary_by_file_io;
+------------+-------+---------------+
| host       | ios   | io_latency    |
| localhost  | 67574 | 5380678125144 |
| background |  3474 | 4758696829416 |
+------------+-------+---------------+
```

The view without the `$` prefix is intended to provide output that is more user friendly and easier to read. The view with the `$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data.

Views without the `$` prefix differ from the corresponding `$` views in these ways:

- Byte counts are formatted with size units using `format_bytes()`.
- Time values are formatted with temporal units using `format_time()`.
- SQL statements are truncated to a maximum display width using `format_statement()`.
• Path name are shortened using `format_path()`.

### 27.4.3.1 The `host_summary` and `x$host_summary` Views

These views summarize statement activity, file I/O, and connections, grouped by host.

The `host_summary` and `x$host_summary` views have these columns:

- **host**
  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **statements**
  The total number of statements for the host.

- **statement_latency**
  The total wait time of timed statements for the host.

- **statement_avg_latency**
  The average wait time per timed statement for the host.

- **table_scans**
  The total number of table scans for the host.

- **file_ios**
  The total number of file I/O events for the host.

- **file_io_latency**
  The total wait time of timed file I/O events for the host.

- **current_connections**
  The current number of connections for the host.

- **total_connections**
  The total number of connections for the host.

- **unique_users**
  The number of distinct users for the host.

- **current_memory**
  The current amount of allocated memory for the host.

- **total_memory_allocated**
  The total amount of allocated memory for the host.

### 27.4.3.2 The `host_summary_by_file_io` and `x$host_summary_by_file_io` Views
These views summarize file I/O, grouped by host. By default, rows are sorted by descending total file I/O latency.

The `host_summary_by_file_io` and `x$host_summary_by_file_io` views have these columns:

- **host**
  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **ios**
  The total number of file I/O events for the host.

- **io_latency**
  The total wait time of timed file I/O events for the host.

### 27.4.3.3 The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` Views

These views summarize file I/O, grouped by host and event type. By default, rows are sorted by host and descending total I/O latency.

The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` views have these columns:

- **host**
  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **event_name**
  The file I/O event name.

- **total**
  The total number of occurrences of the file I/O event for the host.

- **total_latency**
  The total wait time of timed occurrences of the file I/O event for the host.

- **max_latency**
  The maximum single wait time of timed occurrences of the file I/O event for the host.

### 27.4.3.4 The `host_summary_by_stages` and `x$host_summary_by_stages` Views

These views summarize statement stages, grouped by host. By default, rows are sorted by host and descending total latency.

The `host_summary_by_stages` and `x$host_summary_by_stages` views have these columns:

- **host**
The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **event_name**
  The stage event name.

- **total**
  The total number of occurrences of the stage event for the host.

- **total_latency**
  The total wait time of timed occurrences of the stage event for the host.

- **avg_latency**
  The average wait time per timed occurrence of the stage event for the host.

### 27.4.3.5 The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` Views

These views summarize overall statement statistics, grouped by host. By default, rows are sorted by descending total latency.

The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` views have these columns:

- **host**
  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **total**
  The total number of statements for the host.

- **total_latency**
  The total wait time of timed statements for the host.

- **max_latency**
  The maximum single wait time of timed statements for the host.

- **lock_latency**
  The total time waiting for locks by timed statements for the host.

- **rows_sent**
  The total number of rows returned by statements for the host.

- **rows_examined**
  The total number of rows read from storage engines by statements for the host.
• **rows_affected**
  The total number of rows affected by statements for the host.

• **full_scans**
  The total number of full table scans by statements for the host.

### 27.4.3.6 The host_summary_by_statement_type and x$host_summary_by_statement_type Views

These views summarize information about statements executed, grouped by host and statement type. By default, rows are sorted by host and descending total latency.

The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` views have these columns:

• **host**
  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

• **statement**
  The final component of the statement event name.

• **total**
  The total number of occurrences of the statement event for the host.

• **total_latency**
  The total wait time of timed occurrences of the statement event for the host.

• **max_latency**
  The maximum single wait time of timed occurrences of the statement event for the host.

• **lock_latency**
  The total time waiting for locks by timed occurrences of the statement event for the host.

• **rows_sent**
  The total number of rows returned by occurrences of the statement event for the host.

• **rows_examined**
  The total number of rows read from storage engines by occurrences of the statement event for the host.

• **rows_affected**
  The total number of rows affected by occurrences of the statement event for the host.

• **full_scans**
  The total number of full table scans by occurrences of the statement event for the host.
27.4.3.7 The innodb_buffer_stats_by_schema and x$innodb_buffer_stats_by_schema Views

These views summarize the information in the INFORMATION_SCHEMA INNODB_BUFFER_PAGE table, grouped by schema. By default, rows are sorted by descending buffer size.

Warning

Querying views that access the INNODB_BUFFER_PAGE table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The innodb_buffer_stats_by_schema and x$innodb_buffer_stats_by_schema views have these columns:

• object_schema
  The schema name for the object, or InnoDB System if the table belongs to the InnoDB storage engine.

• allocated
  The total number of bytes allocated for the schema.

• data
  The total number of data bytes allocated for the schema.

• pages
  The total number of pages allocated for the schema.

• pages_hashed
  The total number of hashed pages allocated for the schema.

• pages_old
  The total number of old pages allocated for the schema.

• rows_cached
  The total number of cached rows for the schema.

27.4.3.8 The innodb_buffer_stats_by_table and x$innodb_buffer_stats_by_table Views

These views summarize the information in the INFORMATION_SCHEMA INNODB_BUFFER_PAGE table, grouped by schema and table. By default, rows are sorted by descending buffer size.

Warning

Querying views that access the INNODB_BUFFER_PAGE table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.
sys Schema Views

The `innodb_buffer_stats_by_table` and `x$innodb_buffer_stats_by_table` views have these columns:

- **object_schema**
  The schema name for the object, or InnoDB System if the table belongs to the InnoDB storage engine.

- **object_name**
  The table name.

- **allocated**
  The total number of bytes allocated for the table.

- **data**
  The number of data bytes allocated for the table.

- **pages**
  The total number of pages allocated for the table.

- **pages_hashed**
  The number of hashed pages allocated for the table.

- **pages_old**
  The number of old pages allocated for the table.

- **rows_cached**
  The number of cached rows for the table.

27.4.3.9 The `innodb_lock_waits` and `x$innodb_lock_waits` Views

These views summarize the InnoDB locks that transactions are waiting for. By default, rows are sorted by descending lock age.

The `innodb_lock_waits` and `x$innodb_lock_waits` views have these columns:

- **wait_started**
  The time at which the lock wait started.

- **wait_age**
  How long the lock has been waited for, as a TIME value.

- **wait_age_secs**
  How long the lock has been waited for, in seconds.

- **locked_table_schema**
  The schema that contains the locked table.

- **locked_table_name**
The name of the locked table.

- **locked_table_partition**
  The name of the locked partition, if any; **NULL** otherwise.

- **locked_table_subpartition**
  The name of the locked subpartition, if any; **NULL** otherwise.

- **locked_index**
  The name of the locked index.

- **locked_type**
  The type of the waiting lock.

- **waiting_trx_id**
  The ID of the waiting transaction.

- **waiting_trx_started**
  The time at which the waiting transaction started.

- **waiting_trx_age**
  How long the waiting transaction has been waiting, as a **TIME** value.

- **waiting_trx_rows_locked**
  The number of rows locked by the waiting transaction.

- **waiting_trx_rows_modified**
  The number of rows modified by the waiting transaction.

- **waiting_pid**
  The processlist ID of the waiting transaction.

- **waiting_query**
  The statement that is waiting for the lock.

- **waiting_lock_id**
  The ID of the waiting lock.

- **waiting_lock_mode**
  The mode of the waiting lock.

- **blocking_trx_id**
  The ID of the transaction that is blocking the waiting lock.

- **blocking_pid**
The processlist ID of the blocking transaction.

- **blocking_query**
  The statement the blocking transaction is executing. This field reports NULL if the session that issued the blocking query becomes idle. For more information, see Identifying a Blocking Query After the Issuing Session Becomes Idle.

- **blocking_lock_id**
  The ID of the lock that is blocking the waiting lock.

- **blocking_lock_mode**
  The mode of the lock that is blocking the waiting lock.

- **blocking_trx_started**
  The time at which the blocking transaction started.

- **blocking_trx_age**
  How long the blocking transaction has been executing, as a `TIME` value.

- **blocking_trx_rows_locked**
  The number of rows locked by the blocking transaction.

- **blocking_trx_rows_modified**
  The number of rows modified by the blocking transaction.

- **sql_kill_blocking_query**
  The `KILL` statement to execute to kill the blocking statement.

- **sql_kill_blocking_connection**
  The `KILL` statement to execute to kill the session running the blocking statement.

### 27.4.3.10 The io_by_thread_by_latency and x$io_by_thread_by_latency Views

These views summarize I/O consumers to display time waiting for I/O, grouped by thread. By default, rows are sorted by descending total I/O latency.

The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` views have these columns:

- **user**
  For foreground threads, the account associated with the thread. For background threads, the thread name.

- **total**
  The total number of I/O events for the thread.

- **total_latency**
  The total wait time of timed I/O events for the thread.
• **min_latency**
  The minimum single wait time of timed I/O events for the thread.

• **avg_latency**
  The average wait time per timed I/O event for the thread.

• **max_latency**
  The maximum single wait time of timed I/O events for the thread.

• **thread_id**
  The thread ID.

• **processlist_id**
  For foreground threads, the processlist ID of the thread. For background threads, **NULL**.

### 27.4.3.11 The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O, grouped by file. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` views have these columns:

• **file**
  The file path name.

• **count_read**
  The total number of read events for the file.

• **total_read**
  The total number of bytes read from the file.

• **avg_read**
  The average number of bytes per read from the file.

• **count_write**
  The total number of write events for the file.

• **total_written**
  The total number of bytes written to the file.

• **avg_write**
  The average number of bytes per write to the file.

• **total**
  The total number of bytes read and written for the file.
• write_pct
  The percentage of total bytes of I/O that were writes.

27.4.3.12 The io_global_by_file_by_latency and x$io_global_by_file_by_latency Views

These views summarize global I/O consumers to display time waiting for I/O, grouped by file. By default, rows are sorted by descending total latency.

The io_global_by_file_by_latency and x$io_global_by_file_by_latency views have these columns:

• file
  The file path name.

• total
  The total number of I/O events for the file.

• total_latency
  The total wait time of timed I/O events for the file.

• count_read
  The total number of read I/O events for the file.

• read_latency
  The total wait time of timed read I/O events for the file.

• count_write
  The total number of write I/O events for the file.

• write_latency
  The total wait time of timed write I/O events for the file.

• count_misc
  The total number of other I/O events for the file.

• misc_latency
  The total wait time of timed other I/O events for the file.

27.4.3.13 The io_global_by_wait_by_bytes and x$io_global_by_wait_by_bytes Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total I/O (bytes read and written).

The io_global_by_wait_by_bytes and x$io_global_by_wait_by_bytes views have these columns:

• event_name
  The I/O event name, with the wait/io/file/ prefix stripped.
The total number of occurrences of the I/O event.

- **total_latency**
  The total wait time of timed occurrences of the I/O event.

- **min_latency**
  The minimum single wait time of timed occurrences of the I/O event.

- **avg_latency**
  The average wait time per timed occurrence of the I/O event.

- **max_latency**
  The maximum single wait time of timed occurrences of the I/O event.

- **count_read**
  The number of read requests for the I/O event.

- **total_read**
  The number of bytes read for the I/O event.

- **avg_read**
  The average number of bytes per read for the I/O event.

- **count_write**
  The number of write requests for the I/O event.

- **total_written**
  The number of bytes written for the I/O event.

- **avg_written**
  The average number of bytes per write for the I/O event.

- **total_requested**
  The total number of bytes read and written for the I/O event.

### 27.4.3.14 The io_global_by_wait_by_latency and x$io_global_by_wait_by_latency Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total latency.

The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` views have these columns:

- **event_name**
  The I/O event name, with the `wait/io/file/` prefix stripped.
• **total**
The total number of occurrences of the I/O event.

• **total_latency**
The total wait time of timed occurrences of the I/O event.

• **avg_latency**
The average wait time per timed occurrence of the I/O event.

• **max_latency**
The maximum single wait time of timed occurrences of the I/O event.

• **read_latency**
The total wait time of timed read occurrences of the I/O event.

• **write_latency**
The total wait time of timed write occurrences of the I/O event.

• **misc_latency**
The total wait time of timed other occurrences of the I/O event.

• **count_read**
The number of read requests for the I/O event.

• **total_read**
The number of bytes read for the I/O event.

• **avg_read**
The average number of bytes per read for the I/O event.

• **count_write**
The number of write requests for the I/O event.

• **total_written**
The number of bytes written for the I/O event.

• **avg_written**
The average number of bytes per write for the I/O event.

### 27.4.3.15 The latest_file_io and x$latest_file_io Views

These views summarize file I/O activity, grouped by file and thread. By default, rows are sorted with most recent I/O first.

The **latest_file_io** and **x$latest_file_io** views have these columns:

• **thread**
For foreground threads, the account associated with the thread (and port number for TCP/IP connections). For background threads, the thread name and thread ID.

- **file**
  The file path name.

- **latency**
  The wait time of the file I/O event.

- **operation**
  The type of operation.

- **requested**
  The number of data bytes requested for the file I/O event.

### 27.4.3.16 The memory_by_host_by_current_bytes and x$memory_by_host_by_current_bytes Views

These views summarize memory use, grouped by host. By default, rows are sorted by descending amount of memory used.

The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` views have these columns:

- **host**
  The host from which the client connected. Rows for which the HOST column in the underlying Performance Schema table is NULL are assumed to be for background threads and are reported with a host name of background.

- **current_count_used**
  The current number of allocated memory blocks that have not been freed yet for the host.

- **current_allocated**
  The current number of allocated bytes that have not been freed yet for the host.

- **current_avg_alloc**
  The current number of allocated bytes per memory block for the host.

- **current_max_alloc**
  The largest single current memory allocation in bytes for the host.

- **total_allocated**
  The total memory allocation in bytes for the host.

### 27.4.3.17 The memory_by_thread_by_current_bytes and x$memory_by_thread_by_current_bytes Views
These views summarize memory use, grouped by thread. By default, rows are sorted by descending amount of memory used.

The `memory_by_thread_by_current_bytes` and `x$memory_by_thread_by_current_bytes` views have these columns:

- **thread_id**
  The thread ID.

- **user**
  The thread user or thread name.

- **current_count_used**
  The current number of allocated memory blocks that have not been freed yet for the thread.

- **current_allocated**
  The current number of allocated bytes that have not been freed yet for the thread.

- **current_avg_alloc**
  The current number of allocated bytes per memory block for the thread.

- **current_max_alloc**
  The largest single current memory allocation in bytes for the thread.

- **total_allocated**
  The total memory allocation in bytes for the thread.

27.4.3.18 The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` Views

These views summarize memory use, grouped by user. By default, rows are sorted by descending amount of memory used.

The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` views have these columns:

- **user**
  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **current_count_used**
  The current number of allocated memory blocks that have not been freed yet for the user.

- **current_allocated**
  The current number of allocated bytes that have not been freed yet for the user.

- **current_avg_alloc**
The current number of allocated bytes per memory block for the user.

- **current_max_alloc**
  The largest single current memory allocation in bytes for the user.

- **total_allocated**
  The total memory allocation in bytes for the user.

### 27.4.3.19 The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` Views

These views summarize memory use, grouped by allocation type (that is, by event). By default, rows are sorted by descending amount of memory used.

The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` views have these columns:

- **event_name**
  The memory event name.

- **current_count**
  The total number of occurrences of the event.

- **current_alloc**
  The current number of allocated bytes that have not been freed yet for the event.

- **current_avg_alloc**
  The current number of allocated bytes per memory block for the event.

- **high_count**
  The high-water mark for number of memory blocks allocated for the event.

- **high_alloc**
  The high-water mark for number of bytes allocated for the event.

- **high_avg_alloc**
  The high-water mark for average number of bytes per memory block allocated for the event.

### 27.4.3.20 The `memory_global_total` and `x$memory_global_total` Views

These views summarize total memory use within the server.

The `memory_global_total` and `x$memory_global_total` views have these columns:

- **total_allocated**
  The total bytes of memory allocated within the server.

### 27.4.3.21 The metrics View
This view summarizes MySQL server metrics to show variable names, values, types, and whether they are enabled. By default, rows are sorted by variable type and name.

The *metrics* view includes this information:

- Global status variables from the Performance Schema `global_status` table
- InnoDB metrics from the `INFORMATION_SCHEMA`.INNODB_METRICS table
- Current and total memory allocation, based on the Performance Schema memory instrumentation
- The current time (human readable and Unix timestamp formats)

There is some duplication of information between the `global_status` and `INNODB_METRICS` tables, which the *metrics* view eliminates.

The *metrics* view has these columns:

- **Variable_name**
  The metric name. The metric type determines the source from which the name is taken:
  - For global status variables: The `VARIABLE_NAME` column of the `global_status` table
  - For InnoDB metrics: The `NAME` column of the `INNODB_METRICS` table
  - For other metrics: A view-provided descriptive string

- **Variable_value**
  The metric value. The metric type determines the source from which the value is taken:
  - For global status variables: The `VARIABLE_VALUE` column of the `global_status` table
  - For InnoDB metrics: The `COUNT` column of the `INNODB_METRICS` table
  - For memory metrics: The relevant column from the Performance Schema `memory_summary_global_by_event_name` table
  - For the current time: The value of `NOW(3)` or `UNIX_TIMESTAMP(NOW(3))`

- **Type**
  The metric type:
  - For global status variables: `Global Status`
  - For InnoDB metrics: `InnoDB Metrics - %`, where `%` is replaced by the value of the `SUBSYSTEM` column of the `INNODB_METRICS` table
  - For memory metrics: `Performance Schema`
  - For the current time: `System Time`

- **Enabled**
  Whether the metric is enabled:
  - For global status variables: `YES`
• For InnoDB metrics: YES if the STATUS column of the INNODB_METRICS table is enabled, NO otherwise

• For memory metrics: NO, YES, or PARTIAL (currently, PARTIAL occurs only for memory metrics and indicates that not all memory/% instruments are enabled; Performance Schema memory instruments are always enabled)

• For the current time: YES

27.4.3.22 The processlist and x$processlist Views

These views summarize processlist information. They provide more complete information than the SHOW PROCESSLIST statement and the INFORMATION_SCHEMA.PROCESSLIST table, and are also nonblocking. By default, rows are sorted by descending process time and descending wait time.

The column descriptions here are brief. For additional information, see the description of the Performance Schema threads table at Section 26.12.17.5, “The threads Table”.

The processlist and x$processlist views have these columns:

• thd_id
  The thread ID.

• conn_id
  The connection ID.

• user
  The thread user or thread name.

• db
  The default database for the thread, or NULL if there is none.

• command
  For foreground threads, the type of command the thread is executing on behalf of the client, or Sleep if the session is idle.

• state
  An action, event, or state that indicates what the thread is doing.

• time
  The time in seconds that the thread has been in its current state.

• current_statement
  The statement the thread is executing, or NULL if it is not executing any statement.

• statement_latency
  How long the statement has been executing.

• progress
The percentage of work completed for stages that support progress reporting. See Section 27.3, “sys Schema Progress Reporting”.

- **lock_latency**
  The time spent waiting for locks by the current statement.

- **rows_examined**
  The number of rows read from storage engines by the current statement.

- **rows_sent**
  The number of rows returned by the current statement.

- **rows_affected**
  The number of rows affected by the current statement.

- **tmp_tables**
  The number of internal in-memory temporary tables created by the current statement.

- **tmp_disk_tables**
  The number of internal on-disk temporary tables created by the current statement.

- **full_scan**
  The number of full table scans performed by the current statement.

- **last_statement**
  The last statement executed by the thread, if there is no currently executing statement or wait.

- **last_statement_latency**
  How long the last statement executed.

- **current_memory**
  The number of bytes allocated by the thread.

- **last_wait**
  The name of the most recent wait event for the thread.

- **last_wait_latency**
  The wait time of the most recent wait event for the thread.

- **source**
  The source file and line number containing the instrumented code that produced the event.

- **trx_latency**
  The wait time of the current transaction for the thread.
sys Schema Views

- **trx_state**
  The state for the current transaction for the thread.

- **trx_autocommit**
  Whether autocommit mode was enabled when the current transaction started.

- **pid**
  The client process ID.

- **program_name**
  The client program name.

### 27.4.3.23 The `ps_check_lost_instrumentation` View

This view returns information about lost Performance Schema instruments, to indicate whether the Performance Schema is unable to monitor all runtime data.

The `ps_check_lost_instrumentation` view has these columns:

- **variable_name**
  The Performance Schema status variable name indicating which type of instrument was lost.

- **variable_value**
  The number of instruments lost.

### 27.4.3.24 The `schema_auto_increment_columns` View

This view indicates which tables have `AUTO_INCREMENT` columns and provides information about those columns, such as the current and maximum column values and the usage ratio (ratio of used to possible values). By default, rows are sorted by descending usage ratio and maximum column value.

Tables in these schemas are excluded from view output: `mysql`, `sys`, `INFORMATION_SCHEMA`, `performance_schema`.

The `schema_auto_increment_columns` view has these columns:

- **table_schema**
  The schema that contains the table.

- **table_name**
  The table that contains the `AUTO_INCREMENT` column.

- **column_name**
  The name of the `AUTO_INCREMENT` column.

- **data_type**
  The data type of the column.

- **column_type**
The column type of the column, which is the data type plus possibly other information. For example, for a column with a `bigint(20) unsigned` column type, the data type is just `bigint`.

- `is_signed`
  Whether the column type is signed.

- `is_unsigned`
  Whether the column type is unsigned.

- `max_value`
  The maximum permitted value for the column.

- `auto_increment`
  The current `AUTO_INCREMENT` value for the column.

- `auto_increment_ratio`
  The ratio of used to permitted values for the column. This indicates how much of the sequence of values is “used up.”

### 27.4.3.25 The `schema_index_statistics` and `x$schema_index_statistics` Views

These views provide index statistics. By default, rows are sorted by descending total index latency.

The `schema_index_statistics` and `x$schema_index_statistics` views have these columns:

- `table_schema`
  The schema that contains the table.

- `table_name`
  The table that contains the index.

- `index_name`
  The name of the index.

- `rows_selected`
  The total number of rows read using the index.

- `select_latency`
  The total wait time of timed reads using the index.

- `rows_inserted`
  The total number of rows inserted into the index.

- `insert_latency`
  The total wait time of timed inserts into the index.

- `rows_updated`
The total number of rows updated in the index.
- **update_latency**
  
The total wait time of timed updates in the index.
- **rows_deleted**
  
The total number of rows deleted from the index.
- **delete_latency**
  
The total wait time of timed deletes from the index.

### 27.4.3.26 The `schema_object_overview` View

This view summarizes the types of objects within each schema. By default, rows are sorted by schema and object type.

**Note**

For MySQL instances with a large number of objects, this view might take a long time to execute.

The `schema_object_overview` view has these columns:
- **db**
  
The schema name.
- **object_type**
  
The object type: `BASE TABLE, INDEX (index_type), EVENT, FUNCTION, PROCEDURE, TRIGGER, VIEW`.
- **count**
  
The number of objects in the schema of the given type.

### 27.4.3.27 The `schema_redundant_indexes` and `x$schema_flattened_keys` Views

The `schema_redundant_indexes` view displays indexes that duplicate other indexes or are made redundant by them. The `x$schema_flattened_keys` view is a helper view for `schema_redundant_indexes`.

In the following column descriptions, the dominant index is the one that makes the redundant index redundant.

The `schema_redundant_indexes` view has these columns:
- **table_schema**
  
The schema that contains the table.
- **table_name**
  
The table that contains the index.
• **redundant_index_name**
The name of the redundant index.

• **redundant_index_columns**
The names of the columns in the redundant index.

• **redundant_index_non_unique**
The number of nonunique columns in the redundant index.

• **dominant_index_name**
The name of the dominant index.

• **dominant_index_columns**
The names of the columns in the dominant index.

• **dominant_index_non_unique**
The number of nonunique columns in the dominant index.

• **subpart_exists**
Whether the index indexes only part of a column.

• **sql_drop_index**
The statement to execute to drop the redundant index.

The *x$schema_flattened_keys* view has these columns:

• **table_schema**
The schema that contains the table.

• **table_name**
The table that contains the index.

• **index_name**
An index name.

• **non_unique**
The number of nonunique columns in the index.

• **subpart_exists**
Whether the index indexes only part of a column.

• **index_columns**
The name of the columns in the index.

### 27.4.3.28 The schema_table_lock_waits and x$schema_table_lock_waits Views
These views display which sessions are blocked waiting on metadata locks, and what is blocking them. The column descriptions here are brief. For additional information, see the description of the Performance Schema `metadata_locks` table at Section 26.12.12.3, “The metadata_locks Table”.

The `schema_table_lock_waits` and `x$schema_table_lock_waits` views have these columns:

- **object_schema**
  The schema containing the object to be locked.

- **object_name**
  The name of the instrumented object.

- **waiting_thread_id**
  The thread ID of the thread that is waiting for the lock.

- **waiting_pid**
  The processlist ID of the thread that is waiting for the lock.

- **waiting_account**
  The account associated with the session that is waiting for the lock.

- **waiting_lock_type**
  The type of the waiting lock.

- **waiting_lock_duration**
  How long the waiting lock has been waiting.

- **waiting_query**
  The statement that is waiting for the lock.

- **waiting_query_secs**
  How long the statement has been waiting, in seconds.

- **waiting_query_rows_affected**
  The number of rows affected by the statement.

- **waiting_query_rows_examined**
  The number of rows read from storage engines by the statement.

- **blocking_thread_id**
  The thread ID of the thread that is blocking the waiting lock.

- **blocking_pid**
  The processlist ID of the thread that is blocking the waiting lock.

- **blocking_account**
The account associated with the thread that is blocking the waiting lock.

- **blocking_lock_type**
  The type of lock that is blocking the waiting lock.

- **blocking_lock_duration**
  How long the blocking lock has been held.

- **sql_kill_blocking_query**
  The KILL statement to execute to kill the blocking statement.

- **sql_kill_blocking_connection**
  The KILL statement to execute to kill the session running the blocking statement.

### 27.4.3.29 The schema_table_statistics and x$schema_table_statistics Views

These views summarize table statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views use a helper view, **x$ps_schema_table_statistics_io**.

The **schema_table_statistics** and **x$schema_table_statistics** views have these columns:

- **table_schema**
  The schema that contains the table.

- **table_name**
  The table name.

- **total_latency**
  The total wait time of timed I/O events for the table.

- **rows_fetched**
  The total number of rows read from the table.

- **fetch_latency**
  The total wait time of timed read I/O events for the table.

- **rows_inserted**
  The total number of rows inserted into the table.

- **insert_latency**
  The total wait time of timed insert I/O events for the table.

- **rows_updated**
  The total number of rows updated in the table.
• **update_latency**
The total wait time of timed update I/O events for the table.

• **rows_deleted**
The total number of rows deleted from the table.

• **delete_latency**
The total wait time of timed delete I/O events for the table.

• **io_read_requests**
The total number of read requests for the table.

• **io_read**
The total number of bytes read from the table.

• **io_read_latency**
The total wait time of reads from the table.

• **io_write_requests**
The total number of write requests for the table.

• **io_write**
The total number of bytes written to the table.

• **io_write_latency**
The total wait time of writes to the table.

• **io_misc_requests**
The total number of miscellaneous I/O requests for the table.

• **io_misc_latency**
The total wait time of miscellaneous I/O requests for the table.

### 27.4.3.30 The schema_table_statistics_with_buffer and x\$
\$schema_table_statistics_with_buffer Views

These views summarize table statistics, including InnoDB buffer pool statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views user a helper view, \$ps_schema_table_statistics_io.

The schema_table_statistics_with_buffer and x\$schema_table_statistics_with_buffer views have these columns:

• **table_schema**
The schema that contains the table.
• **table_name**
The table name.

• **rows_fetched**
The total number of rows read from the table.

• **fetch_latency**
The total wait time of timed read I/O events for the table.

• **rows_inserted**
The total number of rows inserted into the table.

• **insert_latency**
The total wait time of timed insert I/O events for the table.

• **rows_updated**
The total number of rows updated in the table.

• **update_latency**
The total wait time of timed update I/O events for the table.

• **rows_deleted**
The total number of rows deleted from the table.

• **delete_latency**
The total wait time of timed delete I/O events for the table.

• **io_read_requests**
The total number of read requests for the table.

• **io_read**
The total number of bytes read from the table.

• **io_read_latency**
The total wait time of reads from the table.

• **io_write_requests**
The total number of write requests for the table.

• **io_write**
The total number of bytes written to the table.

• **io_write_latency**
The total wait time of writes to the table.
• **io_misc_requests**
The total number of miscellaneous I/O requests for the table.

• **io_misc_latency**
The total wait time of miscellaneous I/O requests for the table.

• **innodb_buffer_allocated**
The total number of InnoDB buffer bytes allocated for the table.

• **innodb_buffer_data**
The total number of InnoDB data bytes allocated for the table.

• **innodb_buffer_free**
The total number of InnoDB nondata bytes allocated for the table \( (\text{innodb_buffer_allocated} - \text{innodb_buffer_data}) \).

• **innodb_buffer_pages**
The total number of InnoDB pages allocated for the table.

• **innodb_buffer_pages_hashed**
The total number of InnoDB hashed pages allocated for the table.

• **innodb_buffer_pages_old**
The total number of InnoDB old pages allocated for the table.

• **innodb_buffer_rows_cached**
The total number of InnoDB cached rows for the table.

### 27.4.3.31 The schema_tables_with_full_table_scans and x $schema_tables_with_full_table_scans Views

These views display which tables are being accessed with full table scans. By default, rows are sorted by descending rows scanned.

The **schema_tables_with_full_table_scans** and **x $schema_tables_with_full_table_scans** views have these columns:

• **object_schema**
The schema name.

• **object_name**
The table name.

• **rows_full_scanned**
The total number of rows scanned by full scans of the table.

• **latency**
The total wait time of full scans of the table.

27.4.3.32 The schema_unused_indexes View

These views display indexes for which there are no events, which indicates that they are not being used. By default, rows are sorted by schema and table.

This view is most useful when the server has been up and processing long enough that its workload is representative. Otherwise, presence of an index in this view may not be meaningful.

The schema_unused_indexes view has these columns:

- object_schema
  The schema name.
- object_name
  The table name.
- index_name
  The unused index name.

27.4.3.33 The session and x$session Views

These views are similar to processlist and x$processlist, but they filter out background processes to display only user sessions. For descriptions of the columns, see Section 27.4.3.22, “The processlist and x$processlist Views”.

27.4.3.34 The session_ssl_status View

For each connection, this view displays the SSL version, cipher, and count of reused SSL sessions.

The session_ssl_status view has these columns:

- thread_id
  The thread ID for the connection.
- ssl_version
  The version of SSL used for the connection.
- ssl_cipher
  The SSL cipher used for the connection.
- ssl_sessions_reused
  The number of reused SSL sessions for the connection.

27.4.3.35 The statement_analysis and x$statement_analysis Views

These views list normalized statements with aggregated statistics. The content mimics the MySQL Enterprise Monitor Query Analysis view. By default, rows are sorted by descending total latency.
The *statement_analysis* and *$statement_analysis* views have these columns:

- **query**
  The normalized statement string.

- **db**
  The default database for the statement, or **NULL** if there is none.

- **full_scan**
  The total number of full table scans performed by occurrences of the statement.

- **exec_count**
  The total number of times the statement has executed.

- **err_count**
  The total number of errors produced by occurrences of the statement.

- **warn_count**
  The total number of warnings produced by occurrences of the statement.

- **total_latency**
  The total wait time of timed occurrences of the statement.

- **max_latency**
  The maximum single wait time of timed occurrences of the statement.

- **avg_latency**
  The average wait time per timed occurrence of the statement.

- **lock_latency**
  The total time waiting for locks by timed occurrences of the statement.

- **rows_sent**
  The total number of rows returned by occurrences of the statement.

- **rows_sent_avg**
  The average number of rows returned per occurrence of the statement.

- **rows_examined**
  The total number of rows read from storage engines by occurrences of the statement.

- **rows_examined_avg**
  The average number of rows read from storage engines per occurrence of the statement.

- **rows_affected**
The total number of rows affected by occurrences of the statement.

- **rows_affected_avg**
  The average number of rows affected per occurrence of the statement.

- **tmp_tables**
  The total number of internal in-memory temporary tables created by occurrences of the statement.

- **tmp_disk_tables**
  The total number of internal on-disk temporary tables created by occurrences of the statement.

- **rows_sorted**
  The total number of rows sorted by occurrences of the statement.

- **sort_merge_passes**
  The total number of sort merge passes by occurrences of the statement.

- **digest**
  The statement digest.

- **first_seen**
  The time at which the statement was first seen.

- **last_seen**
  The time at which the statement was most recently seen.

### 27.4.3.36 The statements_with_errors_or_warnings and x$statements_with_errors_or_warnings Views

These views display normalized statements that have produced errors or warnings. By default, rows are sorted by descending error and warning counts.

The **statements_with_errors_or_warnings** and **x$statements_with_errors_or_warnings** views have these columns:

- **query**
  The normalized statement string.

- **db**
  The default database for the statement, or **NULL** if there is none.

- **exec_count**
  The total number of times the statement has executed.

- **errors**
  The total number of errors produced by occurrences of the statement.
• error_pct
  The percentage of statement occurrences that produced errors.

• warnings
  The total number of warnings produced by occurrences of the statement.

• warning_pct
  The percentage of statement occurrences that produced warnings.

• first_seen
  The time at which the statement was first seen.

• last_seen
  The time at which the statement was most recently seen.

• digest
  The statement digest.

27.4.3.37 The statements_with_full_table_scans and x$statements_with_full_table_scans Views

These views display normalized statements that have done full table scans. By default, rows are sorted by descending percentage of time a full scan was done and descending total latency.

The statements_with_full_table_scans and x$statements_with_full_table_scans views have these columns:

• query
  The normalized statement string.

• db
  The default database for the statement, or NULL if there is none.

• exec_count
  The total number of times the statement has executed.

• total_latency
  The total wait time of timed statement events for the statement.

• no_index_used_count
  The total number of times no index was used to scan the table.

• no_good_index_used_count
  The total number of times no good index was used to scan the table.

• no_index_used_pct
  The total number of times no index was used to scan the table.
The percentage of the time no index was used to scan the table.

- **rows_sent**
  The total number of rows returned from the table.

- **rows_examined**
  The total number of rows read from the storage engine for the table.

- **rows_sent_avg**
  The average number of rows returned from the table.

- **rows_examined_avg**
  The average number of rows read from the storage engine for the table.

- **first_seen**
  The time at which the statement was first seen.

- **last_seen**
  The time at which the statement was most recently seen.

- **digest**
  The statement digest.

### 27.4.3.38 The statements_with_runtimes_in_95th_percentile and $statements_with_runtimes_in_95th_percentile Views

These views list statements with runtimes in the 95th percentile. By default, rows are sorted by descending average latency.

Both views use two helper views, $ps_digest_avg_latency_distribution and $ps_digest_95th_percentile_by_avg_us.

The **statements_with_runtimes_in_95th_percentile** and $**statements_with_runtimes_in_95th_percentile** views have these columns:

- **query**
  The normalized statement string.

- **db**
  The default database for the statement, or **NULL** if there is none.

- **full_scan**
  The total number of full table scans performed by occurrences of the statement.

- **exec_count**
  The total number of times the statement has executed.
• **err_count**
  The total number of errors produced by occurrences of the statement.

• **warn_count**
  The total number of warnings produced by occurrences of the statement.

• **total_latency**
  The total wait time of timed occurrences of the statement.

• **max_latency**
  The maximum single wait time of timed occurrences of the statement.

• **avg_latency**
  The average wait time per timed occurrence of the statement.

• **rows_sent**
  The total number of rows returned by occurrences of the statement.

• **rows_sent_avg**
  The average number of rows returned per occurrence of the statement.

• **rows_examined**
  The total number of rows read from storage engines by occurrences of the statement.

• **rows_examined_avg**
  The average number of rows read from storage engines per occurrence of the statement.

• **first_seen**
  The time at which the statement was first seen.

• **last_seen**
  The time at which the statement was most recently seen.

• **digest**
  The statement digest.

### 27.4.3.39 The `statements_with_sorting` and `x$statements_with_sorting` Views

These views list normalized statements that have performed sorts. By default, rows are sorted by descending total latency.

The `statements_with_sorting` and `x$statements_with_sorting` views have these columns:

• **query**
  The normalized statement string.

• **db**
The default database for the statement, or NULL if there is none.

- **exec_count**
The total number of times the statement has executed.

- **total_latency**
The total wait time of timed occurrences of the statement.

- **sort_merge_passes**
The total number of sort merge passes by occurrences of the statement.

- **avg_sort_merges**
The average number of sort merge passes per occurrence of the statement.

- **sorts_using_scans**
The total number of sorts using table scans by occurrences of the statement.

- **sort_using_range**
The total number of sorts using range accesses by occurrences of the statement.

- **rows_sorted**
The total number of rows sorted by occurrences of the statement.

- **avg_rows_sorted**
The average number of rows sorted per occurrence of the statement.

- **first_seen**
The time at which the statement was first seen.

- **last_seen**
The time at which the statement was most recently seen.

- **digest**
The statement digest.

### 27.4.3.40 The `statements_with_temp_tables` and `x$statements_with_temp_tables` Views

These views list normalized statements that have used temporary tables. By default, rows are sorted by descending number of on-disk temporary tables used and descending number of in-memory temporary tables used.

The `statements_with_temp_tables` and `x$statements_with_temp_tables` views have these columns:

- **query**
The normalized statement string.
sys Schema Views

- **db**
  The default database for the statement, or `NULL` if there is none.

- **exec_count**
  The total number of times the statement has executed.

- **total_latency**
  The total wait time of timed occurrences of the statement.

- **memory_tmp_tables**
  The total number of internal in-memory temporary tables created by occurrences of the statement.

- **disk_tmp_tables**
  The total number of internal on-disk temporary tables created by occurrences of the statement.

- **avg_tmp_tables_per_query**
  The average number of internal temporary tables created per occurrence of the statement.

- **tmp_tables_to_disk_pct**
  The percentage of internal in-memory temporary tables that were converted to on-disk tables.

- **first_seen**
  The time at which the statement was first seen.

- **last_seen**
  The time at which the statement was most recently seen.

- **digest**
  The statement digest.

**27.4.3.41 The user_summary and x$user_summary Views**

These views summarize statement activity, file I/O, and connections, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary` and `x$user_summary` views have these columns:

- **user**
  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **statements**
  The total number of statements for the user.

- **statement_latency**
  The total wait time of timed statements for the user.
• **statement_avg_latency**
  The average wait time per timed statement for the user.

• **table_scans**
  The total number of table scans for the user.

• **file_ios**
  The total number of file I/O events for the user.

• **file_io_latency**
  The total wait time of timed file I/O events for the user.

• **current_connections**
  The current number of connections for the user.

• **total_connections**
  The total number of connections for the user.

• **unique_hosts**
  The number of distinct hosts from which connections for the user have originated.

• **current_memory**
  The current amount of allocated memory for the user.

• **total_memory_allocated**
  The total amount of allocated memory for the user.

### 27.4.3.42 The user_summary_by_file_io and x$user_summary_by_file_io Views

These views summarize file I/O, grouped by user. By default, rows are sorted by descending total file I/O latency.

The `user_summary_by_file_io` and `x$user_summary_by_file_io` views have these columns:

• **user**
  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

• **ios**
  The total number of file I/O events for the user.

• **io_latency**
  The total wait time of timed file I/O events for the user.

### 27.4.3.43 The user_summary_by_file_io_type and x$user_summary_by_file_io_type Views

These views summarize file I/O, grouped by user and event type. By default, rows are sorted by user and descending total latency.
The `user_summary_by_file_io_type` and `x$user_summary_by_file_io_type` views have these columns:

- **user**
  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **event_name**
  The file I/O event name.

- **total**
  The total number of occurrences of the file I/O event for the user.

- **latency**
  The total wait time of timed occurrences of the file I/O event for the user.

- **max_latency**
  The maximum single wait time of timed occurrences of the file I/O event for the user.

27.4.3.44 The `user_summary_by_stages` and `x$user_summary_by_stages` Views

These views summarize stages, grouped by user. By default, rows are sorted by user and descending total stage latency.

The `user_summary_by_stages` and `x$user_summary_by_stages` views have these columns:

- **user**
  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **event_name**
  The stage event name.

- **total**
  The total number of occurrences of the stage event for the user.

- **total_latency**
  The total wait time of timed occurrences of the stage event for the user.

- **avg_latency**
  The average wait time per timed occurrence of the stage event for the user.

27.4.3.45 The `user_summary_by_statement_latency` and `x$user_summary_by_statement_latency` Views

These views summarize overall statement statistics, grouped by user. By default, rows are sorted by descending total latency.
The user_summary_by_statement_latency and \texttt{x$user_summary_by_statement_latency} views have these columns:

- \texttt{user}
  
  The client user name. Rows for which the \texttt{USER} column in the underlying Performance Schema table is \texttt{NULL} are assumed to be for background threads and are reported with a host name of \texttt{background}.

- \texttt{total}
  
  The total number of statements for the user.

- \texttt{total_latency}
  
  The total wait time of timed statements for the user.

- \texttt{max_latency}
  
  The maximum single wait time of timed statements for the user.

- \texttt{lock_latency}
  
  The total time waiting for locks by timed statements for the user.

- \texttt{rows_sent}
  
  The total number of rows returned by statements for the user.

- \texttt{rows_examined}
  
  The total number of rows read from storage engines by statements for the user.

- \texttt{rows_affected}
  
  The total number of rows affected by statements for the user.

- \texttt{full_scans}
  
  The total number of full table scans by statements for the user.

27.4.3.46 The user_summary_by_statement_type and \texttt{x$user_summary_by_statement_type} Views

These views summarize information about statements executed, grouped by user and statement type. By default, rows are sorted by user and descending total latency.

The user_summary_by_statement_type and \texttt{x$user_summary_by_statement_type} views have these columns:

- \texttt{user}
  
  The client user name. Rows for which the \texttt{USER} column in the underlying Performance Schema table is \texttt{NULL} are assumed to be for background threads and are reported with a host name of \texttt{background}.

- \texttt{statement}
  
  The final component of the statement event name.

- \texttt{total}
The total number of occurrences of the statement event for the user.

- **total_latency**
  The total wait time of timed occurrences of the statement event for the user.

- **max_latency**
  The maximum single wait time of timed occurrences of the statement event for the user.

- **lock_latency**
  The total time waiting for locks by timed occurrences of the statement event for the user.

- **rows_sent**
  The total number of rows returned by occurrences of the statement event for the user.

- **rows_examined**
  The total number of rows read from storage engines by occurrences of the statement event for the user.

- **rows_affected**
  The total number of rows affected by occurrences of the statement event for the user.

- **full_scans**
  The total number of full table scans by occurrences of the statement event for the user.

### 27.4.3.47 The version View

This view provides the current sys schema and MySQL server versions.

The **version** view has these columns:

- **sys_version**
  The sys schema version.

- **mysql_version**
  The MySQL server version.

### 27.4.3.48 The wait_classes_global_by_avg_latency and x$wait_classes_global_by_avg_latency Views

These views summarize wait class average latencies, grouped by event class. By default, rows are sorted by descending average latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The **wait_classes_global_by_avg_latency** and `x$wait_classes_global_by_avg_latency` views have these columns:

- **event_class**
The event class.

- **total**
  The total number of occurrences of events in the class.

- **total_latency**
  The total wait time of timed occurrences of events in the class.

- **min_latency**
  The minimum single wait time of timed occurrences of events in the class.

- **avg_latency**
  The average wait time per timed occurrence of events in the class.

- **max_latency**
  The maximum single wait time of timed occurrences of events in the class.

### 27.4.3.49 The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` Views

These views summarize wait class total latencies, grouped by event class. By default, rows are sorted by descending total latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` views have these columns:

- **event_class**
  The event class.

- **total**
  The total number of occurrences of events in the class.

- **total_latency**
  The total wait time of timed occurrences of events in the class.

- **min_latency**
  The minimum single wait time of timed occurrences of events in the class.

- **avg_latency**
  The average wait time per timed occurrence of events in the class.

- **max_latency**
  The maximum single wait time of timed occurrences of events in the class.
27.4.3.50 The waits_by_host_by_latency and x$waits_by_host_by_latency Views

These views summarize wait events, grouped by host and event. By default, rows are sorted by host and descending total latency. Idle events are ignored.

The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` views have these columns:

- **host**
  The host from which the connection originated.
- **event**
  The event name.
- **total**
  The total number of occurrences of the event for the host.
- **total_latency**
  The total wait time of timed occurrences of the event for the host.
- **avg_latency**
  The average wait time per timed occurrence of the event for the host.
- **max_latency**
  The maximum single wait time of timed occurrences of the event for the host.

27.4.3.51 The waits_by_user_by_latency and x$waits_by_user_by_latency Views

These views summarize wait events, grouped by user and event. By default, rows are sorted by user and descending total latency. Idle events are ignored.

The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` views have these columns:

- **user**
  The user associated with the connection.
- **event**
  The event name.
- **total**
  The total number of occurrences of the event for the user.
- **total_latency**
  The total wait time of timed occurrences of the event for the user.
- **avg_latency**
  The average wait time per timed occurrence of the event for the user.
- **max_latency**
The maximum single wait time of timed occurrences of the event for the user.

### 27.4.3.52 The waits_global_by_latency and x$waits_global_by_latency Views

These views summarize wait events, grouped by event. By default, rows are sorted by descending total latency. Idle events are ignored.

The `waits_global_by_latency` and `x$waits_global_by_latency` views have these columns:

- **events**
  The event name.

- **total**
  The total number of occurrences of the event.

- **total_latency**
  The total wait time of timed occurrences of the event.

- **avg_latency**
  The average wait time per timed occurrence of the event.

- **max_latency**
  The maximum single wait time of timed occurrences of the event.

### 27.4.4 sys Schema Stored Procedures

The following sections describe `sys` schema stored procedures.

#### 27.4.4.1 The create_synonym_db() Procedure

Given a schema name, this procedure creates a synonym schema containing views that refer to all the tables and views in the original schema. This can be used, for example, to create a shorter name by which to refer to a schema with a long name (such as `info` rather than `INFORMATION_SCHEMA`).

**Parameters**

- **in_db_name VARCHAR(64)**: The name of the schema for which to create the synonym.

- **in_synonym VARCHAR(64)**: The name to use for the synonym schema. This schema must not already exist.

**Example**

```
mysql> SHOW DATABASES;
+-------------------+
| Database          |
+-------------------+
| information_schema | mysql
| mysql             |
| performance_schema |
| sys               |
| world             |
+-------------------+
```
### 27.4.4.2 The diagnostics() Procedure

Creates a report of the current server status for diagnostic purposes.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

Data collected for `diagnostics()` includes this information:

- Information from the `metrics` view (see Section 27.4.3.21, “The metrics View”)
- Information from other relevant `sys` schema views, such as the one that determines queries in the 95th percentile
- Information from the `ndbinfo` schema, if the MySQL server is part of NDB Cluster
- Replication status (both master and slave)

Some of the `sys` schema views are calculated as initial (optional), overall, and delta values:

- The initial view is the content of the view at the start of the `diagnostics()` procedure. This output is the same as the start values used for the delta view. The initial view is included if the `diagnostics.include_raw` configuration option is ON.
- The overall view is the content of the view at the end of the `diagnostics()` procedure. This output is the same as the end values used for the delta view. The overall view is always included.
- The delta view is the difference from the beginning to the end of procedure execution. The minimum and maximum values are the minimum and maximum values from the end view, respectively. They do not necessarily reflect the minimum and maximum values in the monitored period. Except for the `metrics` view, the delta is calculated only between the first and last outputs.
Parameters

• **in_max_runtime** INT UNSIGNED: The maximum data collection time in seconds. Use NULL to collect data for the default of 60 seconds. Otherwise, use a value greater than 0.

• **in_interval** INT UNSIGNED: The sleep time between data collections in seconds. Use NULL to sleep for the default of 30 seconds. Otherwise, use a value greater than 0.

• **in_auto_config** ENUM('current', 'medium', 'full'): The Performance Schema configuration to use. Permitted values are:
  - **current**: Use the current instrument and consumer settings.
  - **medium**: Enable some instruments and consumers.
  - **full**: Enable all instruments and consumers.

  **Note**
  The more instruments and consumers enabled, the more impact on MySQL server performance. Be careful with the **medium** setting and especially the **full** setting, which has a large performance impact.

Use of the **medium** or **full** setting requires the **SUPER** privilege.

If a setting other than **current** is chosen, the current settings are restored at the end of the procedure.

Configuration Options

diagnostics() operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 27.4.2.1, “The sys_config Table“):

• **debug**, @sys.debug

  If this option is ON, produce debugging output. The default is OFF.

• **diagnostics.allow_i_s_tables**, @sys.diagnostics.allow_i_s_tables

  If this option is ON, the diagnostics() procedure is permitted to perform table scans on the INFORMATION_SCHEMA.TABLES table. This can be expensive if there are many tables. The default is OFF.

• **diagnostics.include_raw**, @sys.diagnostics.include_raw

  If this option is ON, the diagnostics() procedure output includes the raw output from querying the metrics view. The default is OFF.

• **statement_truncate_len**, @sys.statement_truncate_len

  The maximum length of statements returned by the format_statement() function. Longer statements are truncated to this length. The default is 64.

Example

Create a diagnostics report that starts an iteration every 30 seconds and runs for at most 120 seconds using the current Performance Schema settings:
mysql> CALL sys.diagnostics(120, 30, 'current');

To capture the output from the `diagnostics()` procedure in a file as it runs, use the `mysql` client `tee` `filename` and `notee` commands (see Section 4.5.1.2, “mysql Client Commands”):

mysql> tee diag.out;
mysql> CALL sys.diagnostics(120, 30, 'current');
mysql> notee;

27.4.4.3 The `execute_prepared_stmt()` Procedure

Given an SQL statement as a string, executes it as a prepared statement. The prepared statement is deallocated after execution, so it is not subject to reuse. Thus, this procedure is useful primarily for executing dynamic statements on a one-time basis.

This procedure uses `sys_execute_prepared_stmt` as the prepared statement name. If that statement name exists when the procedure is called, its previous content is destroyed.

Parameters

- `in_query` LONGTEXT CHARACTER SET utf8: The statement string to execute.

Configuration Options

The `execute_prepared_stmt()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 27.4.2.1, “The `sys_config` Table”):

- `debug`, `@sys.debug` If this option is `ON`, produce debugging output. The default is `OFF`.

Example

```
mysql> CALL sys.execute_prepared_stmt('SELECT COUNT(*) FROM mysql.user');
+----------+
| COUNT(*) |
+----------+
|       15 |
+----------+
```

27.4.4.4 The `ps_setup_disable_background_threads()` Procedure

Disables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were disabled. Already disabled threads do not count.

Parameters

None.

Example

```
mysql> CALL sys.ps_setup_disable_background_threads();
+--------------------------------+
<table>
<thead>
<tr>
<th>summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disabled 24 background threads</td>
</tr>
</tbody>
</table>
+--------------------------------+
```
27.4.4.5 The ps_setup_disable_consumer() Procedure

Disables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were disabled. Already disabled consumers do not count.

Parameters

- consumer VARCHAR(128): The value used to match consumer names, which are identified by using %consumer% as an operand for a LIKE pattern match.

A value of '' matches all consumers.

Example

Disable all statement consumers:

```sql
mysql> CALL sys.ps_setup_disable_consumer('statement');
+----------------------+
| summary              |
| Disabled 4 consumers |
+----------------------+
```

27.4.4.6 The ps_setup_disable_instrument() Procedure

Disables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were disabled. Already disabled instruments do not count.

Parameters

- in_pattern VARCHAR(128): The value used to match instrument names, which are identified by using %in_pattern% as an operand for a LIKE pattern match.

A value of '' matches all instruments.

Example

Disable a specific instrument:

```sql
mysql> CALL sys.ps_setup_disable_instrument('wait/lock/metadata/sql/md1');
+-----------------------+
| summary               |
| Disabled 1 instrument |
+-----------------------+
```

Disable all mutex instruments:

```sql
mysql> CALL sys.ps_setup_disable_instrument('mutex');
+--------------------------+
| summary                  |
| Disabled 177 instruments |
+--------------------------+
```

27.4.4.7 The ps_setup_disable_thread() Procedure
Given a connection ID, disables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were disabled. Already disabled threads do not count.

**Parameters**

- **in_connection_id BIGINT**: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

**Example**

Disable a specific connection by its connection ID:

```
mysql> CALL sys.ps_setup_disable_thread(225);
+-------------------+
| summary           |
+-------------------+
| Disabled 1 thread |
+-------------------+
```

Disable the current connection:

```
mysql> CALL sys.ps_setup_disable_thread(CONNECTION_ID());
+-------------------+
| summary           |
+-------------------+
| Disabled 1 thread |
+-------------------+
```

### 27.4.4.8 The `ps_setup_enable_background_threads()` Procedure

Enables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were enabled. Already enabled threads do not count.

**Parameters**

None.

**Example**

```
mysql> CALL sys.ps_setup_enable_background_threads();
+-------------------------------+
| summary                       |
+-------------------------------+
| Enabled 24 background threads |
+-------------------------------+
```

### 27.4.4.9 The `ps_setup_enable_consumer()` Procedure

Enables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were enabled. Already enabled consumers do not count.

**Parameters**

- **consumer VARCHAR(128)**: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

  A value of `' ' matches all consumers.
Example

Enable all statement consumers:

```sql
mysql> CALL sys.ps_setup_enable_consumer('statement');
+---------------------+
| summary             |
+---------------------+
| Enabled 4 consumers |
+---------------------+
```

27.4.4.10 The `ps_setup_enable_instrument()` Procedure

Enables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were enabled. Already enabled instruments do not count.

Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

  A value of `''` matches all instruments.

Example

Enable a specific instrument:

```sql
mysql> CALL sys.ps_setup_enable_instrument('wait/lock/metadata/sql/mdl');
+----------------------+
| summary              |
+----------------------+
| Enabled 1 instrument |
+----------------------+

Enable all mutex instruments:

```sql
mysql> CALL sys.ps_setup_enable_instrument('mutex');
+-------------------------+
| summary                 |
+-------------------------+
| Enabled 177 instruments |
+-------------------------+
```

27.4.4.11 The `ps_setup_enable_thread()` Procedure

Given a connection ID, enables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were enabled. Already enabled threads do not count.

Parameters

- `in_connection_id BIGINT`: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

Example

Enable a specific connection by its connection ID:
27.4.4.12 The `ps_setup_reload_saved()` Procedure

Reloads a Performance Schema configuration saved earlier within the same session using `ps_setup_save()`. For more information, see the description of `ps_setup_save()`.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

Parameters

None.

27.4.4.13 The `ps_setup_reset_to_default()` Procedure

Resets the Performance Schema configuration to its default settings.

Parameters

- `in_verbose BOOLEAN`: Whether to display information about each setup stage during procedure execution. This includes the SQL statements executed.

Example

```
mysql> CALL sys.ps_setup_reset_to_default(TRUE)\G
*************************** 1. row ***************************
status: Resetting: setup_actors
DELETE
FROM performance_schema.setup_actors
WHERE NOT (HOST = '%' AND USER = '%' AND ROLE = '%')

*************************** 1. row ***************************
status: Resetting: setup_actors
INSERT IGNORE INTO performance_schema.setup_actors
VALUES ('%', '%', '%')
...```

27.4.4.14 The `ps_setup_save()` Procedure

Saves the current Performance Schema configuration. This enables you to alter the configuration temporarily for debugging or other purposes, then restore it to the previous state by invoking the `ps_setup_reload_saved()` procedure.
To prevent other simultaneous calls to save the configuration, ps_setup_save() acquires an advisory lock named sys.ps_setup_save by calling the GET_LOCK() function. ps_setup_save() takes a timeout parameter to indicate how many seconds to wait if the lock already exists (which indicates that some other session has a saved configuration outstanding). If the timeout expires without obtaining the lock, ps_setup_save() fails.

It is intended you call ps_setup_reload_saved() later within the same session as ps_setup_save() because the configuration is saved in TEMPORARY tables. ps_setup_save() drops the temporary tables and releases the lock. If you end your session without invoking ps_setup_save(), the tables and lock disappear automatically.

This procedure disables binary logging during its execution by manipulating the session value of the sql_log_bin system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

Parameters

- **in_timeout INT**: How many seconds to wait to obtain the sys.ps_setup_save lock. A negative timeout value means infinite timeout.

Example

```sql
mysql> CALL sys.ps_setup_save(10);
...
make Performance Schema configuration changes ...
mysql> CALL sys.ps_setup_reload_saved();
```

### 27.4.15 The `ps_setup_show_disabled()` Procedure

Displays all currently disabled Performance Schema configuration.

Parameters

- **in_show_instruments BOOLEAN**: Whether to display disabled instruments. This might be a long list.
- **in_show_threads BOOLEAN**: Whether to display disabled threads.

Example

```sql
mysql> CALL sys.ps_setup_show_disabled(TRUE, TRUE);
```

| performance_schema_enabled | 1 |
|---------------------------+---|
| enabled_users             | '%'@'%' |
| object_type               | enabled | timed |
| EVENT mysql.%             | NO      | NO    |
| EVENT performance_schema.%| NO      | NO    |
| EVENT information_schema.%| NO      | NO    |
### 27.4.4.16 The `ps_setup_show_disabled_consumers()` Procedure

Displays all currently disabled Performance Schema consumers.

**Parameters**

None.

**Example**

```sql
mysql> CALL sys.ps_setup_show_disabled_consumers();
+----------------------------------+
| disabled_consumers               |
| events_stages_current            |
| events_stages_history            |
| events_stages_history_long       |
| events_statements_history        |
| events_statements_history_long   |
| events_transactions_history      |
| events_transactions_history_long |
| events_waits_current             |
| events_waits_history             |
| events_waits_history_long        |
+----------------------------------+
```

### 27.4.4.17 The `ps_setup_show_disabled_instruments()` Procedure

Displays all currently disabled Performance Schema instruments. This might be a long list.

**Parameters**

None.

**Example**

```sql
mysql> CALL sys.ps_setup_show_disabled_instruments();
*************************** 1. row ***************************
disabled_instruments: wait/synch/mutex/sql/TC_LOG_MMAP::LOCK_tc
 timed: NO
*************************** 2. row ***************************
disabled_instruments: wait/synch/mutex/sql/THD::LOCK_query_plan
 timed: NO
*************************** 3. row ***************************
disabled_instruments: wait/synch/mutex/sql/MYSQL_BIN_LOG::LOCK_commit
 timed: NO
```
27.4.4.18 The ps_setup_show_enabled() Procedure

Displays all currently enabled Performance Schema configuration.

Parameters

- `in_show_instruments BOOLEAN`: Whether to display enabled instruments. This might be a long list.
- `in_show_threads BOOLEAN`: Whether to display enabled threads.

Example

```sql
mysql> CALL sys.ps_setup_show_enabled(FALSE, FALSE);
+----------------------------+
<table>
<thead>
<tr>
<th>performance_schema_enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
</tbody>
</table>
+----------------------------+
1 row in set (0.01 sec)

+---------------+
<table>
<thead>
<tr>
<th>enabled_users</th>
</tr>
</thead>
<tbody>
<tr>
<td>'%@'</td>
</tr>
</tbody>
</table>
+---------------+
1 row in set (0.01 sec)

+-------------+---------+---------+-------+
<table>
<thead>
<tr>
<th>object_type</th>
<th>objects</th>
<th>enabled</th>
<th>timed</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT</td>
<td>%.%</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>FUNCTION</td>
<td>%.%</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>PROCEDURE</td>
<td>%.%</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>TABLE</td>
<td>%.%</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>TRIGGER</td>
<td>%.%</td>
<td>YES</td>
<td>YES</td>
</tr>
</tbody>
</table>
+-------------+---------+---------+-------+
5 rows in set (0.02 sec)
```

27.4.4.19 The ps_setup_show_enabled_consumers() Procedure

Displays all currently enabled Performance Schema consumers.

Parameters

None.

Example

```sql
mysql> CALL sys.ps_setup_show_enabled_consumers();
+-----------------------------+
<table>
<thead>
<tr>
<th>enabled_consumers</th>
</tr>
</thead>
<tbody>
<tr>
<td>events_statements_current</td>
</tr>
<tr>
<td>events_statements_history</td>
</tr>
<tr>
<td>events_transactions_current</td>
</tr>
<tr>
<td>events_transactions_history</td>
</tr>
<tr>
<td>global_instrumentation</td>
</tr>
<tr>
<td>statements_digest</td>
</tr>
<tr>
<td>thread_instrumentation</td>
</tr>
</tbody>
</table>
+-----------------------------+
```
27.4.4.20 The `ps_setup_show_enabled_instruments()` Procedure

Displays all currently enabled Performance Schema instruments. This might be a long list.

**Parameters**

None.

**Example**

```sql
mysql> CALL sys.ps_setup_show_enabled_instruments();
+-----------------------------+
| enabled_instruments           |
+-----------------------------+
| events_statements_current   |
| events_statements_history   |
| events_transactions_current |
| events_transactions_history |
| global_instrumentation      |
| statements_digest           |
| thread_instrumentation      |
+-----------------------------+
```

27.4.4.21 The `ps_statement_avg_latency_histogram()` Procedure

Displays a textual histogram graph of the average latency values across all normalized statements tracked within the Performance Schema `events_statements_summary_by_digest` table.

This procedure can be used to display a very high-level picture of the latency distribution of statements running within this MySQL instance.

**Parameters**

None.

**Example**

The histogram output in statement units. For example, * = 2 units in the histogram legend means that each * character represents 2 statements.

```sql
mysql> CALL sys.ps_statement_avg_latency_histogram();
```

```text
Performance Schema Statement Digest Average Latency Histogram:
.
* = 2 units
† = 3 units
```
27.4.4.22 The ps_trace_statement_digest() Procedure

Traces all Performance Schema instrumentation for a specific statement digest.

If you find a statement of interest within the Performance Schema `events_statements_summary_by_digest` table, specify its `DIGEST` column MD5 value to this procedure and indicate the polling duration and interval. The result is a report of all statistics tracked within Performance Schema for that digest for the interval.

The procedure also attempts to execute `EXPLAIN` for the longest running example of the digest during the interval. This attempt might fail because the Performance Schema truncates long `SQL_TEXT` values. Consequently, `EXPLAIN` will fail due to parse errors.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

Parameters

- **in_digest VARCHAR(32)**: The statement digest identifier to analyze.
- **in_runtime INT**: How long to run the analysis in seconds.
- **in_interval DECIMAL(2,2)**: The analysis interval in seconds (which can be fractional) at which to try to take snapshots.
- **in_start_fresh BOOLEAN**: Whether to truncate the Performance Schema `events_statements_history_long` and `events_stages_history_long` tables before starting.
- **in_auto_enable BOOLEAN**: Whether to automatically enable required consumers.

Example

```sql
mysql> CALL sys.ps_trace_statement_digest('891ec6860f98ba46d89dd20b0c03652c', 10, 0.1, TRUE, TRUE);
+-----------------+
| SUMMARY STATISTICS |
+-----------------+
| SUMMARY STATISTICS |
+-----------------+ 1 row in set (9.11 sec)
```
27.4.4.23 The `ps_trace_thread()` Procedure

Dumps all Performance Schema data for an instrumented thread to a `.dot` formatted graph file (for the DOT graph description language). Each result set returned from the procedure should be used for a complete graph.
This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

**Parameters**

- **in_thread_id INT**: The thread to trace.
- **in_outfile VARCHAR(255)**: The name to use for the `.dot` output file.
- **in_max_runtime DECIMAL(20,2)**: The maximum number of seconds (which can be fractional) to collect data. Use `NULL` to collect data for the default of 60 seconds.
- **in_interval DECIMAL(20,2)**: The number of seconds (which can be fractional) to sleep between data collections. Use `NULL` to sleep for the default of 1 second.
- **in_start_fresh BOOLEAN**: Whether to reset all Performance Schema data before tracing.
- **in_auto_setup BOOLEAN**: Whether to disable all other threads and enable all instruments and consumers. This also resets the settings at the end of the run.
- **in_debug BOOLEAN**: Whether to include `file:lineno` information in the graph.

**Example**

```
mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, TRUE, TRUE, TRUE);
+-------------------+
| summary           |
| Disabled 1 thread |
+-------------------+
1 row in set (0.00 sec)
```

```
mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, TRUE, TRUE, TRUE);
+-----------------------------------------------------------+
| Info                                                      |
| Data collection starting for THREAD_ID = 25               |
+-----------------------------------------------------------+
1 row in set (0.03 sec)
```

```
mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, TRUE, TRUE, TRUE);
+-----------------------------------------------------------+
| Info                                                      |
| Stack trace written to /tmp/stack-2014-02-16-21:18:41.dot |
+-----------------------------------------------------------+
1 row in set (60.07 sec)
```

```
mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, TRUE, TRUE, TRUE);
+-----------------------------------------------------------+
| Convert to PDF                                           |
+-----------------------------------------------------------+
1 row in set (60.07 sec)
```

```
mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, TRUE, TRUE, TRUE);
+-----------------------------------------------------------+
| Convert to PNG                                           |
+-----------------------------------------------------------+
1 row in set (60.07 sec)
```

```
mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, TRUE, TRUE, TRUE);
+-------------------+
| summary           |
+-------------------+
1 row in set (60.07 sec)
```
27.4.4.24 The `ps_truncate_all_tables()` Procedure

Truncates all Performance Schema summary tables, resetting all aggregated instrumentation as a snapshot. Produces a result set indicating how many tables were truncated.

**Parameters**

- `in.verbose` BOOLEAN: Whether to display each `TRUNCATE TABLE` statement before executing it.

**Example**

```sql
mysql> CALL sys.ps_truncate_all_tables(FALSE);
```

```
+---------------------+
| summary              |
+---------------------+
| Truncated 49 tables |
+---------------------+
```

27.4.4.25 The `statement_performance_analyzer()` Procedure

Creates a report of the statements running on the server. The views are calculated based on the overall and/or delta activity.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

**Parameters**

- `in.action` ENUM('snapshot', 'overall', 'delta', 'create_tmp', 'create_table', 'save', 'cleanup'): The action to take. These values are permitted:
  - `snapshot`: Store a snapshot. The default is to make a snapshot of the current content of the Performance Schema `events_statements_summary_by_digest` table. By setting `in.table`, this can be overwritten to copy the content of the specified table. The snapshot is stored in the `sys` schema `tmp_digests` temporary table.
  - `overall`: Generate an analysis based on the content of the table specified by `in.table`. For the overall analysis, `in.table` can be `NOW()` to use a fresh snapshot. This overwrites an existing snapshot. Use `NULL` for `in.table` to use the existing snapshot. If `in.table` is `NULL` and no snapshot exists, a new snapshot is created. The `in.views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.
  - `delta`: Generate a delta analysis. The delta is calculated between the reference table specified by `in.table` and the snapshot, which must exist. This action uses the `sys` schema `tmp_digests_delta` temporary table. The `in.views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.
  - `create_table`: Create a regular table suitable for storing the snapshot for later use (for example, for calculating deltas).
sys Schema Stored Procedures

- **create_tmp**: Create a temporary table suitable for storing the snapshot for later use (for example, for calculating deltas).

- **save**: Save the snapshot in the table specified by `in_table`. The table must exist and have the correct structure. If no snapshot exists, a new snapshot is created.

- **cleanup**: Remove the temporary tables used for the snapshot and delta.

- **in_table VARCHAR(129)**: The table parameter used for some of the actions specified by the `in_action` parameter. Use the format `db_name.tbl_name` or `tbl_name` without using any backtick (``) identifier-quoting characters. Periods (.) are not supported in database and table names.

  The meaning of the `in_table` value for each `in_action` value is detailed in the individual `in_action` value descriptions.

- **in_views SET ('with_runtimes_in_95th_percentile', 'analysis', 'with_errors_or_warnings', 'with_full_table_scans', 'with_sorting', 'with_temp_tables', 'custom')**: Which views to include. This parameter is a SET value, so it can contain multiple view names, separated by commas. The default is to include all views except custom. The following values are permitted:

  - **with_runtimes_in_95th_percentile**: Use the `statements_with_runtimes_in_95th_percentile` view.
  
  - **analysis**: Use the `statement_analysis` view.
  
  - **with_errors_or_warnings**: Use the `statements_with_errors_or_warnings` view.
  
  - **with_full_table_scans**: Use the `statements_with_full_table_scans` view.
  
  - **with_sorting**: Use the `statements_with_sorting` view.
  
  - **with_temp_tables**: Use the `statements_with_temp_tables` view.
  
  - **custom**: Use a custom view. This view must be specified using the `statement_performance_analyzer.view` configuration option to name a query or an existing view.

**Configuration Options**

The `statement_performance_analyzer()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 27.4.2.1, “The sys_config Table”):

- **debug**, `@sys.debug`

  If this option is **ON**, produce debugging output. The default is **OFF**.

- **statement_performance_analyzer.limit**, `@sys.statement_performance_analyzer.limit`

  The maximum number of rows to return for views that have no built-in limit. The default is 100.

- **statement_performance_analyzer.view**, `@sys.statement_performance_analyzer.view`

  The custom query or view to be used. If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query.
or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. If specifying a view, use the same format as for the `in_table` parameter. The default is `NULL` (no custom view defined).

**Example**

To create a report with the queries in the 95th percentile since the last truncation of `events_statements_summary_by_digest` and with a one-minute delta period:

1. Create a temporary table to store the initial snapshot.
2. Create the initial snapshot.
3. Save the initial snapshot in the temporary table.
4. Wait one minute.
5. Create a new snapshot.
6. Perform analysis based on the new snapshot.
7. Perform analysis based on the delta between the initial and new snapshots.

```
mysql> CALL sys.statement_performance_analyzer('create_tmp', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.08 sec)
mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)
mysql> CALL sys.statement_performance_analyzer('save', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.00 sec)
mysql> DO SLEEP(60);
Query OK, 0 rows affected (1 min 0.00 sec)
mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)
mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile');
+-----------------------------------------+
| Next Output                             |
+-----------------------------------------+
| Queries with Runtime in 95th Percentile |
+-----------------------------------------+
1 row in set (0.05 sec)
...
mysql> CALL sys.statement_performance_analyzer('delta', 'mydb.tmp_digests_ini', 'with_runtimes_in_95th_percentile');
+-----------------------------------------+
| Next Output                             |
+-----------------------------------------+
| Queries with Runtime in 95th Percentile |
+-----------------------------------------+
1 row in set (0.03 sec)
...
```

Create an overall report of the 95th percentile queries and the top 10 queries with full table scans:

```
mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
```
Use a custom view showing the top 10 queries sorted by total execution time, refreshing the view every minute using the `watch` command in Linux:

```sql
mysql> CREATE OR REPLACE VIEW mydb.my_statements AS
    -> SELECT sys.format_statement(DIGEST_TEXT) AS query,
    ->       SCHEMA_NAME AS db,
    ->       COUNT_STAR AS exec_count,
    ->       sys.format_time(SUM_TIMER_WAIT) AS total_latency,
    ->       sys.format_time(AVG_TIMER_WAIT) AS avg_latency,
    ->       ROUND(IFNULL(SUM_ROWS_SENT / NULLIF(COUNT_STAR, 0), 0)) AS rows_sent_avg,
    ->       ROUND(IFNULL(SUM_ROWS_EXAMINED / NULLIF(COUNT_STAR, 0), 0)) AS rows_examined_avg,
    ->       ROUND(IFNULL(SUM_ROWS_AFFECTED / NULLIF(COUNT_STAR, 0), 0)) AS rows_affected_avg,
    ->       DIGEST AS digest
    -> FROM performance_schema.events_statements_summary_by_digest
    -> ORDER BY SUM_TIMER_WAIT DESC;
Query OK, 0 rows affected (0.10 sec)

mysql> CALL sys.statement_performance_analyzer('create_table', 'mydb.digests_prev', NULL);
Query OK, 0 rows affected (0.10 sec)

shell> watch -n 60 "mysql sys --table -e "
> SET @sys.statement_performance_analyzer.view = 'mydb.my_statements';
> SET @sys.statement_performance_analyzer.limit = 10;
> CALL statement_performance_analyzer('snapshot', NULL, NULL);
> CALL statement_performance_analyzer('delta', 'mydb.digests_prev', 'custom');
> CALL statement_performance_analyzer('save', 'mydb.digests_prev', NULL);
> ""
```

27.4.26 The `table_exists()` Procedure
Tests whether a given table exists as a regular table, a TEMPORARY table, or a view. The procedure returns the table type in an OUT parameter. If both a temporary and a permanent table exist with the given name, TEMPORARY is returned.

Parameters

- **in_db VARCHAR(64)**: The name of the database in which to check for table existence.

- **in_table VARCHAR(64)**: The name of the table to check the existence of.

- **out_exists ENUM('', 'BASE TABLE', 'VIEW', 'TEMPORARY')**: The return value. This is an OUT parameter, so it must be a variable into which the table type can be stored. When the procedure returns, the variable has one of the following values to indicate whether the table exists:

  - **'':** The table name does not exist as a base table, TEMPORARY table, or view.

  - **BASE TABLE**: The table name exists as a base (permanent) table.

  - **VIEW**: The table name exists as a view.

  - **TEMPORARY**: The table name exists as a TEMPORARY table.

Example

```
mysql> CREATE DATABASE db1;
Query OK, 1 row affected (0.01 sec)

mysql> USE db1;
Database changed

mysql> CREATE TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.03 sec)

mysql> CREATE TABLE t2 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.20 sec)

mysql> CREATE view v_t1 AS SELECT * FROM t1;
Query OK, 0 rows affected (0.02 sec)

mysql> CREATE TEMPORARY TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.table_exists('db1', 't1', @exists); SELECT @exists;
Query OK, 0 rows affected (0.01 sec)

+-----------+
| @exists   |
+-----------+

```
27.4.5 sys Schema Stored Functions

The following sections describe `sys` schema stored functions.

27.4.5.1 The `extract_schema_from_file_name()` Function

Given a file path name, returns the path component that represents the schema name. This function assumes that the file name lies within the schema directory. For this reason, it will not work with partitions or tables defined using their own `DATA_DIRECTORY` table option.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display schema names, which can be more easily understood than full path names, and can be used in joins against object schema names.

Parameters

- `path VARCHAR(512)`: The full path to a data file from which to extract the schema name.

Return Value

A `VARCHAR(64)` value.

Example

```
mysql> SELECT sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd');
+----------------------------------------------------------+
| sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd') |
| world                                                     |
+----------------------------------------------------------+
```

27.4.5.2 The `extract_table_from_file_name()` Function

Given a file path name, returns the path component that represents the table name.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display table names, which can be more easily understood than full path names, and can be used in joins against object table names.
Parameters

- **path VARCHAR(512)**: The full path to a data file from which to extract the table name.

Return Value

A **VARCHAR(64)** value.

Example

```sql
mysql> SELECT sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd');
+--------------------------------------------------------------------------+
| sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd') |
| City                                                                     |
+--------------------------------------------------------------------------+
```

27.4.5.3 The format_bytes() Function

**Note**

As of MySQL 8.0.16, **format_bytes()** is deprecated and will be removed in a future MySQL version. Applications that use it should be migrated to use the built-in **FORMAT_BYTES()** function instead. See **Section 12.22, “Performance Schema Functions”**.

Given a byte count, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is **bytes, KiB** (kibibytes), **MiB** (mebibytes), **GiB** (gibibytes), **TiB** (tebibytes), or **PiB** (pebibytes).

Parameters

- **bytes TEXT**: The byte count to format.

Return Value

A **TEXT** value.

Example

```sql
mysql> SELECT sys.format_bytes(512), sys.format_bytes(18446644073709551615);
+-----------------------+----------------------------------------+
| sys.format_bytes(512) | sys.format_bytes(18446644073709551615) |
| 512 bytes             | 16383.91 PiB                           |
+-----------------------+----------------------------------------+
```

27.4.5.4 The format_path() Function

Given a path name, returns the modified path name after replacing subpaths that match the values of the following system variables, in order:

- `datadir`
- `tmpdir`
- `slave_load_tmpdir`
- `innodb_data_home_dir`
- `innodb_log_group_home_dir`
innodb_undo_directory
basedir

A value that matches the value of system variable sysvar is replaced with the string @@GLOBAL.sysvar.

Parameters

- **path VARCHAR(512)**: The path name to format.

Return Value

A VARCHAR(512) CHARACTER SET utf8 value.

Example

```sql
mysql> SELECT sys.format_path('/usr/local/mysql/data/world/City.ibd');
+---------------------------------------------------------+
| sys.format_path('/usr/local/mysql/data/world/City.ibd') |
+---------------------------------------------------------+
| /usr/local/mysql/data/world/City.ibd                    |
+---------------------------------------------------------+
```

27.4.5.5 The format_statement() Function

Given a string (normally representing an SQL statement), reduces it to the length given by the statement_truncate_len configuration option, and returns the result. No truncation occurs if the string is shorter than statement_truncate_len. Otherwise, the middle part of the string is replaced by an ellipsis (...).

This function is useful for formatting possibly lengthy statements retrieved from Performance Schema tables to a known fixed maximum length.

Parameters

- **statement LONGTEXT**: The statement to format.

Configuration Options

format_statement() operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 27.4.2.1, “The sys_config Table”):

- **statement_truncate_len, @sys.statement_truncate_len**

  The maximum length of statements returned by the format_statement() function. Longer statements are truncated to this length. The default is 64.

Return Value

A LONGTEXT value.

Example

By default, format_statement() truncates statements to be no more than 64 characters. Setting @sys.statement_truncate_len changes the truncation length for the current session:

```sql
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
```
<table>
<thead>
<tr>
<th>sys.format_statement(@stmt)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT variable, value, set_time, set_by FROM sys_config</td>
</tr>
</tbody>
</table>

mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);

27.4.5.6 The format_time() Function

**Note**
As of MySQL 8.0.16, `format_time()` is deprecated and will be removed in a future MySQL version. Applications that use it should be migrated to use the built-in `FORMAT_PICO_TIME()` function instead. See Section 12.22, “Performance Schema Functions”

Given a Performance Schema latency or wait time in picoseconds, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `ps` (nanoseconds), `ns` (nanoseconds), `us` (microseconds), `ms` (milliseconds), `s` (seconds), `m` (minutes), `h` (hours), `d` (days), or `w` (weeks).

**Parameters**

- **picoseconds TEXT**: The picoseconds value to format.

**Return Value**
A TEXT value.

**Example**

```sql
mysql> SELECT sys.format_time(3501), sys.format_time(188732396662000);
```

<table>
<thead>
<tr>
<th>sys.format_time(3501)</th>
<th>sys.format_time(188732396662000)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.50 ns</td>
<td>3.15 m</td>
</tr>
</tbody>
</table>

27.4.5.7 The list_add() Function

Adds a value to a comma-separated list of values and returns the result.

This function and `list_drop()` can be useful for manipulating the value of system variables such as `sql_mode` and `optimizer_switch` that take a comma-separated list of values.

**Parameters**

- **in_list TEXT**: The list to be modified.
- **in_add_value TEXT**: The value to add to the list.

**Return Value**
A TEXT value.
Example

mysql> SELECT @@sql_mode;
+----------------------------------------+
| @@sql_mode                             |
+----------------------------------------+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES |
+----------------------------------------+
mysql>
mysql> SET @@sql_mode = sys.list_add(@@sql_mode, 'NO_ENGINE_SUBSTITUTION');
mysql>
mysql> SELECT @@sql_mode;
+---------------------------------------------------------------+
| @@sql_mode                                                    |
+---------------------------------------------------------------+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+---------------------------------------------------------------+
mysql>
mysql> SET @@sql_mode = sys.list_drop(@@sql_mode, 'ONLY_FULL_GROUP_BY');
mysql>
mysql> SELECT @@sql_mode;
+--------------------------------------------+
| @@sql_mode                                 |
+--------------------------------------------+
| STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+--------------------------------------------+

27.4.5.8 The list_drop() Function

Removes a value from a comma-separated list of values and returns the result. For more information, see the description of list_add()

Parameters

- **in_list TEXT**: The list to be modified.
- **in_drop_value TEXT**: The value to drop from the list.

Return Value

A TEXT value.

27.4.5.9 The ps_is_account_enabled() Function

Returns YES or NO to indicate whether Performance Schema instrumentation for a given account is enabled.

Parameters

- **in_host VARCHAR(60)**: The host name of the account to check.
- **in_user VARCHAR(32)**: The user name of the account to check.

Return Value

An ENUM('YES', 'NO') value.

Example

mysql> SELECT sys.ps_is_account_enabled('localhost', 'root');
27.4.5.10 The `ps_is_consumer_enabled()` Function

Returns \texttt{YES} or \texttt{NO} to indicate whether a given Performance Schema consumer is enabled, or \texttt{NULL} if the argument is not a valid consumer name.

This function accounts for the consumer hierarchy, so a consumer is not considered enabled unless all consumers on which depends are also enabled. For information about the consumer hierarchy, see Section 26.4.7, “Pre-Filtering by Consumer”.

Parameters

- \texttt{in\_consumer VARCHAR(64)}: The name of the consumer to check.

Return Value

An \texttt{ENUM('YES','NO')} value.

Example

```
mysql> SELECT sys.ps_is_consumer_enabled('thread\_instrumentation');
+------------------------------------------------------+
| sys.ps_is_consumer_enabled('thread\_instrumentation') |
+------------------------------------------------------+
| YES                                                  |
+------------------------------------------------------+
```

27.4.5.11 The `ps_is_instrument_default_enabled()` Function

Returns \texttt{YES} or \texttt{NO} to indicate whether a given Performance Schema instrument is enabled by default.

Parameters

- \texttt{in\_instrument VARCHAR(128)}: The name of the instrument to check.

Return Value

An \texttt{ENUM('YES','NO')} value.

Example

```
mysql> SELECT sys.ps_is_instrument_default_enabled('memory/innodb/row\_log\_buf');
+-------------------------------------------------------------------+
| sys.ps_is_instrument_default_enabled('memory/innodb/row\_log\_buf') |
+-------------------------------------------------------------------+
| NO                                                                |
+-------------------------------------------------------------------+
```

```
mysql> SELECT sys.ps_is_instrument_default_enabled('statement/sql/alter\_user');
+------------------------------------------------------------------+
| sys.ps_is_instrument_default_enabled('statement/sql/alter\_user') |
+------------------------------------------------------------------+
| YES                                                              |
+------------------------------------------------------------------+
```

27.4.5.12 The `ps_is_instrument_default_timed()` Function
Returns **YES** or **NO** to indicate whether a given Performance Schema instrument is timed by default.

**Parameters**

- **in_instrument VARCHAR(128)**: The name of the instrument to check.

**Return Value**

An **ENUM('YES','NO')** value.

**Example**

```sql
mysql> SELECT sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf');
+-----------------------------------------------------------------+
| sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf') |
+-----------------------------------------------------------------+
| NO                                                              |
+-----------------------------------------------------------------+
mysql>
```

---

27.4.5.13 The **sys.ps_is_thread_instrumented()** Function

Returns **YES** or **NO** to indicate whether Performance Schema instrumentation for a given connection ID is enabled, **UNKNOWN** if the ID is unknown, or **NULL** if the ID is **NULL**.

**Parameters**

- **in_connection_id BIGINT UNSIGNED**: The connection ID. This is a value of the type given in the **PROCESSLIST_ID** column of the Performance Schema **threads** table or the **Id** column of **SHOW PROCESSLIST** output.

**Return Value**

An **ENUM('YES','NO','UNKNOWN')** value.

**Example**

```sql
mysql> SELECT sys.ps_is_thread_instrumented(43);
+-----------------------------------+
| sys.ps_is_thread_instrumented(43) |
+-----------------------------------+
| UNKNOWN                           |
+-----------------------------------+
mysql>
```

---

27.4.5.14 The **sys.ps_thread_account()** Function

Given a Performance Schema thread ID, returns the **user_name@host_name** account associated with the thread.
Parameters

- **in_thread_id** BIGINT UNSIGNED: The thread ID for which to return the account. The value should match the THREAD_ID column from some Performance Schema `threads` table row.

Return Value

A `TEXT` value.

Example

```sql
mysql> SELECT sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID()));
+----------------------------------------------------------+
| sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID())) |
+----------------------------------------------------------+
| root@localhost                                           |
+----------------------------------------------------------+
```

27.4.5.15 The `ps_thread_id()` Function

**Note**

As of MySQL 8.0.16, `ps_thread_id()` is deprecated and will be removed in a future MySQL version. Applications that use it should be migrated to use the built-in `PS_THREAD_ID()` and `PS_CURRENT_THREAD_ID()` functions instead. See Section 12.22, “Performance Schema Functions”.

Returns the Performance Schema thread ID assigned to a given connection ID, or the thread ID for the current connection if the connection ID is `NULL`.

Parameters

- **in_connection_id** BIGINT UNSIGNED: The ID of the connection for which to return the thread ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

Return Value

A `BIGINT UNSIGNED` value.

Example

```sql
mysql> SELECT sys.ps_thread_id(260);
+-----------------------+
| sys.ps_thread_id(260) |
+-----------------------+
|                   285 |
+-----------------------+
```

27.4.5.16 The `ps_thread_stack()` Function

Returns a JSON formatted stack of all statements, stages, and events within the Performance Schema for a given thread ID.

Parameters

- **in_thread_id** BIGINT: The ID of the thread to trace. The value should match the THREAD_ID column from some Performance Schema `threads` table row.
**sys Schema Stored Functions**

- **in_verbose BOOLEAN**: Whether to include `file:lineno` information in the events.

**Return Value**

A **LONGTEXT CHARACTER SET latin1** value.

**Example**

```sql
mysql> SELECT sys.ps_thread_stack(37, FALSE) AS thread_stack\G
*************************** 1. row ***************************
thread_stack: "{rankdir": "LR","nodesep": "0.10",
"stack_created": "2014-02-19 13:39:03", "mysql_version": "8.0.2-dmr-debug-log",
"mysql_user": "root@localhost","events": [{"nesting_event_id": "0",
"event_id": "10", "timer_wait": 256.35, "event_info": "sql/select",
"wait_info": "select @@version_comment limit 1\nerrors: 0\nwarnings: 0\nlock time: ...
```

### 27.4.5.17 The `ps_thread_trx_info()` Function

Retrieves a JSON object containing information about a given thread. The information includes the current transaction, and the statements it has already executed, derived from the Performance Schema `events_transactions_current` and `events_statements_history` tables. (The consumers for those tables must be enabled to obtain full data in the JSON object.)

If the output exceeds the truncation length (65535 by default), a JSON error object is returned, such as:

```json
{ "error": "Trx info truncated: Row 6 was cut by GROUP_CONCAT()" }
```

Similar error objects are returned for other warnings and exceptions raised during function execution.

**Parameters**

- **in_thread_id BIGINT UNSIGNED**: The thread ID for which to return transaction information. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

**Configuration Options**

The `ps_thread_trx_info()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 27.4.2.1, “The sys_config Table”):

- **ps_thread_trx_info.max_length, @sys.ps_thread_trx_info.max_length**

  The maximum length of the output. The default is 65535.

**Return Value**

A **LONGTEXT** value.

**Example**

```sql
mysql> SELECT sys.ps_thread_trx_info(48)\G
*************************** 1. row ***************************
sys.ps_thread_trx_info(48): 

{ "time": "790.70 us",
  "state": "COMMITTED",
  "mode": "READ WRITE",
..."}
```
"autocommitted": "NO",
"gtid": "AUTOMATIC",
"isolation": "REPEATABLE READ",
"statements_executed": [
{
  "sql_text": "INSERT INTO info VALUES (1, 'foo')",
  "time": "471.02 us",
  "schema": "trx",
  "rows_examined": 0,
  "rows_affected": 1,
  "rows_sent": 0,
  "tmp_tables": 0,
  "tmp_disk_tables": 0,
  "sort_rows": 0,
  "sort_merge_passes": 0,
},
{
  "sql_text": "COMMIT",
  "time": "254.42 us",
  "schema": "trx",
  "rows_examined": 0,
  "rows_affected": 0,
  "rows_sent": 0,
  "tmp_tables": 0,
  "tmp_disk_tables": 0,
  "sort_rows": 0,
  "sort_merge_passes": 0,
}
]
],

"time": "426.20 us",
"state": "COMMITTED",
"mode": "READ WRITE",
"autocommitted": "NO",
"gtid": "AUTOMATIC",
"isolation": "REPEATABLE READ",
"statements_executed": [
{
  "sql_text": "INSERT INTO info VALUES (2, 'bar')",
  "time": "107.33 us",
  "schema": "trx",
  "rows_examined": 0,
  "rows_affected": 1,
  "rows_sent": 0,
  "tmp_tables": 0,
  "tmp_disk_tables": 0,
  "sort_rows": 0,
  "sort_merge_passes": 0
},
{
  "sql_text": "COMMIT",
  "time": "213.23 us",
  "schema": "trx",
  "rows_examined": 0,
  "rows_affected": 0,
  "rows_sent": 0,
  "tmp_tables": 0,
  "tmp_disk_tables": 0,
  "sort_rows": 0,
  "sort_merge_passes": 0
}
]
]

27.4.5.18 The quote_identifier() Function
Given a string argument, this function produces a quoted identifier suitable for inclusion in SQL statements. This is useful when a value to be used as an identifier is a reserved word or contains backtick (``) characters.

Parameters

\textbf{in_identifier TEXT}: The identifier to quote.

Return Value

A \textbf{TEXT} value.

Example

```
mysql> SELECT sys.quote_identifier('plain');
+-------------------------------+
| sys.quote_identifier('plain') |
| 'plain'                       |
+-------------------------------+
mysql> SELECT sys.quote_identifier('trick`ier');
+-----------------------------------+
| sys.quote_identifier('trick`ier') |
| 'trick``ier'                      |
+-----------------------------------+
mysql> SELECT sys.quote_identifier('integer');
+---------------------------------+
| sys.quote_identifier('integer') |
| `integer`                       |
+---------------------------------+
```

27.4.19 The \texttt{sys_get_config()} Function

Given a configuration option name, returns the option value from the \texttt{sys_config} table, or the provided default value (which may be \texttt{NULL}) if the option does not exist in the table.

If \texttt{sys_get_config()} returns the default value and that value is \texttt{NULL}, it is expected that the caller is able to handle \texttt{NULL} for the given configuration option.

By convention, routines that call \texttt{sys_get_config()} first check whether the corresponding user-defined variable exists and is non-\texttt{NULL}. If so, the routine uses the variable value without reading the \texttt{sys_config} table. If the variable does not exist or is \texttt{NULL}, the routine reads the option value from the table and sets the user-defined variable to that value. For more information about the relationship between configuration options and their corresponding user-defined variables, see Section 27.4.2.1, “The \texttt{sys_config} Table”.

If you want to check whether the configuration option has already been set and, if not, use the return value of \texttt{sys_get_config()}, you can use \texttt{IFNULL(...)} (see example later). However, this should not be done inside a loop (for example, for each row in a result set) because for repeated calls where the assignment is needed only in the first iteration, using \texttt{IFNULL(...)} is expected to be significantly slower than using an \texttt{IF (...) THEN ... END IF;} block (see example later).

Parameters

- \textbf{in_variable_name VARCHAR(128)}: The name of the configuration option for which to return the value.
• `in_default_value` VARCHAR(128): The default value to return if the configuration option is not found in the `sys_config` table.

Return Value

A VARCHAR(128) value.

Example

Get a configuration value from the `sys_config` table, falling back to 128 as the default if the option is not present in the table:

```sql
mysql> SELECT sys.sys_get_config('statement_truncate_len', 128) AS Value;
+-------+
<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>64</td>
</tr>
</tbody>
</table>
+-------+
```

One-liner example: Check whether the option is already set; if not, assign the `IFNULL(...)` result (using the value from the `sys_config` table):

```sql
mysql> SET @sys.statement_truncate_len = IFNULL(@sys.statement_truncate_len, sys.sys_get_config('statement_truncate_len', 64));
```

Block example: Check whether the option is already set; if not, assign the value from the `sys_config` table:

```sql
IF (@sys.statement_truncate_len IS NULL) THEN
  SET @sys.statement_truncate_len = sys.sys_get_config('statement_truncate_len', 64);
END IF;
```

27.4.5.20 The version_major() Function

This function returns the major version of the MySQL server.

Parameters

None.

Return Value

A TINYINT UNSIGNED value.

Example

```sql
mysql> SELECT VERSION(), sys.version_major();
+--------------+---------------------+
| VERSION()    | sys.version_major() |
+--------------+---------------------+
| 8.0.13-debug |                   8 |
+--------------+---------------------+
```

27.4.5.21 The version_minor() Function

This function returns the minor version of the MySQL server.
Parameters

None.

Return Value

A TINYINT UNSIGNED value.

Example

```
mysql> SELECT VERSION(), sys.version_minor();
+--------------+---------------------+
<table>
<thead>
<tr>
<th>VERSION()</th>
<th>sys.version_minor()</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0.13-debug</td>
<td>0</td>
</tr>
</tbody>
</table>
+--------------+---------------------+
```

27.4.5.22 The version_patch() Function

This function returns the patch release version of the MySQL server.

Parameters

None.

Return Value

A TINYINT UNSIGNED value.

Example

```
mysql> SELECT VERSION(), sys.version_patch();
+--------------+---------------------+
<table>
<thead>
<tr>
<th>VERSION()</th>
<th>sys.version_patch()</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0.13-debug</td>
<td>13</td>
</tr>
</tbody>
</table>
+--------------+---------------------+
```

MySQL Connectors provide connectivity to the MySQL server for client programs. APIs provide low-level access to the MySQL protocol and MySQL resources. Both Connectors and the APIs enable you to
MySQL Connectors

MySQL Connectors

Oracle develops a number of connectors:

- **Connector/C** is a standalone replacement for the MySQL Client Library (libmysqlclient), to be used for C applications.

- **Connector/C++** enables C++ applications to connect to MySQL.

- **Connector/J** provides driver support for connecting to MySQL from Java applications using the standard Java Database Connectivity (JDBC) API.

- **Connector.NET** enables developers to create .NET applications that connect to MySQL. Connector.NET implements a fully functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that use Connector.NET can be written in any supported .NET language.

**MySQL for Visual Studio** works with Connector.NET and Microsoft Visual Studio 2012, 2013, 2015, and 2017. MySQL for Visual Studio provides access to MySQL objects and data from Visual Studio. As a Visual Studio package, it integrates directly into Server Explorer providing the ability to create new connections and work with MySQL database objects.

- **Connector/ODBC** provides driver support for connecting to MySQL using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix, and OS X platforms.

- **Connector/Python** provides driver support for connecting to MySQL from Python applications using an API that is compliant with the Python DB API version 2.0. No additional Python modules or MySQL client libraries are required.

The MySQL C API

For direct access to using MySQL natively within a C application, the C API provides low-level access to the MySQL client/server protocol through the libmysqlclient client library. This is the primary method used to connect to an instance of the MySQL server, and is used both by MySQL command-line clients and many of the MySQL Connectors and third-party APIs detailed here.

libmysqlclient is included in MySQL distributions and in Connector/C distributions.

See also Section 28.7.1, “MySQL C API Implementations”.

To access MySQL from a C application, or to build an interface to MySQL for a language not supported by the Connectors or APIs in this chapter, the C API is where to start. A number of programmer’s utilities are available to help with the process; see Section 4.7, “MySQL Program Development Utilities”.

Third-Party MySQL APIs

The remaining APIs described in this chapter provide an interface to MySQL from specific application languages. These third-party solutions are not developed or supported by Oracle. Basic information on their usage and abilities is provided here for reference purposes only.

All the third-party language APIs are developed using one of two methods, using libmysqlclient or by implementing a native driver. The two solutions offer different benefits:
Third-Party MySQL APIs

- Using \texttt{libmysqlclient} offers complete compatibility with MySQL because it uses the same libraries as the MySQL client applications. However, the feature set is limited to the implementation and interfaces exposed through \texttt{libmysqlclient} and the performance may be lower as data is copied between the native language, and the MySQL API components.

- \textit{Native drivers} are an implementation of the MySQL network protocol entirely within the host language or environment. Native drivers are fast, as there is less copying of data between components, and they can offer advanced functionality not available through the standard MySQL API. Native drivers are also easier for end users to build and deploy because no copy of the MySQL client libraries is needed to build the native driver components.

Table 28.1, “MySQL APIs and Interfaces” lists many of the libraries and interfaces available for MySQL.

28.1 MySQL Connector/C

The MySQL Connector/C manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/C Developer Guide
- Release notes: MySQL Connector/C Release Notes

28.2 MySQL Connector/C++

The MySQL Connector/C++ manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/C++ 8.0 Developer Guide
- Release notes: MySQL Connector/C++ Release Notes

28.3 MySQL Connector/J

The MySQL Connector/J manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/J Developer Guide
- Release notes: MySQL Connector/J Release Notes

28.4 MySQL Connector/NET
The MySQL Connector/NET manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/NET Developer Guide
- Release notes: MySQL Connector/NET Release Notes

### 28.5 MySQL Connector/ODBC

The MySQL Connector/ODBC manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/ODBC Developer Guide
- Release notes: MySQL Connector/ODBC Release Notes

### 28.6 MySQL Connector/Python

The MySQL Connector/Python manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/Python Developer Guide
- Release notes: MySQL Connector/Python Release Notes

### 28.7 MySQL C API

The C API provides low-level access to the MySQL client/server protocol and enables C programs to access database contents. The C API code is distributed with MySQL and implemented in the `libmysqlclient` library. See Section 28.7.1, “MySQL C API Implementations”.

Most other client APIs use the `libmysqlclient` library to communicate with the MySQL server. (Exceptions are Connector/J and Connector/NET.) This means that, for example, you can take advantage of many of the same environment variables that are used by other client programs because they are referenced from the library. For a list of these variables, see Section 4.1, “Overview of MySQL Programs”.

For instructions on building client programs using the C API, see Section 28.7.4.1, “Building C API Client Programs”. For programming with threads, see Section 28.7.4.3, “Writing C API Threaded Client Programs”.

**Note**

If, after an upgrade, you experience problems with compiled client programs, such as `Commands out of sync` or unexpected core dumps, the programs were probably compiled using old header or library files. In this case, check the date of the `mysql.h` file and `libmysqlclient.a` library used for compilation to verify that they are from the new MySQL distribution. If not, recompile the programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example, from `libmysqlclient.so.17` to `libmysqlclient.so.18`). For additional compatibility information, see Section 28.7.4.4, “Running C API Client Programs”.

Clients have a maximum communication buffer size. The size of the buffer that is allocated initially (16KB) is automatically increased up to the maximum size (16MB by default). Because buffer sizes are increased only as demand warrants, simply increasing the maximum limit does not in itself cause more resources to be used. This size check is mostly a precaution against erroneous statements and communication packets.
The communication buffer must be large enough to contain a single SQL statement (for client-to-server traffic) and one row of returned data (for server-to-client traffic). Each session's communication buffer is dynamically enlarged to handle any query or row up to the maximum limit. For example, if you have BLOB values that contain up to 16MB of data, you must have a communication buffer limit of at least 16MB (in both server and client). The default maximum built into the client library is 1GB, but the default maximum in the server is 1MB. You can increase this by changing the value of the `max_allowed_packet` parameter at server startup. See Section 5.1.1, “Configuring the Server”.

The MySQL server shrinks each communication buffer to `net_buffer_length` bytes after each query. For clients, the size of the buffer associated with a connection is not decreased until the connection is closed, at which time client memory is reclaimed.

### 28.7.1 MySQL C API Implementations

The MySQL C API is a C-based API that client applications written in C can use to communicate with MySQL Server. Client programs refer to C API header files at compile time and link to a C API library file, `libmysqlclient`, at link time.

There are two ways to obtain the C API header and library files required to build C API client programs:

- Install a MySQL Server distribution.
- Install a Connector/C distribution.

For both MySQL Server and Connector/C, you can install a binary distribution that contains the C API files pre-built, or you can use a source distribution and build the C API files yourself.

Normally, you install either a MySQL Server distribution or a Connector/C distribution, but not both. For information about issues involved with simultaneous MySQL Server and Connector/C installations, see Section 28.7.2, “Simultaneous MySQL Server and Connector/C Installations”.

The names of the library files to use when linking C API client applications depend on the library type and platform for which a distribution is built:

- On Unix (and Unix-like) systems, the static library is `libmysqlclient.a`. The dynamic library is `libmysqlclient.so` on most Unix systems and `libmysqlclient.dylib` on OS X.

- On Windows, the static library is `mysqlclient.lib` and the dynamic library is `libmysql.dll`. Windows distributions also include `libmysql.lib`, a static import library needed for using the dynamic library.

Windows distributions also include a set of debug libraries. These have the same names as the non-debug libraries, but are located in the `lib/debug` library. You must use the debug libraries when compiling clients built using the debug C runtime.

On Unix, you may also see libraries that include `_r` in the names. Before MySQL 5.5, these were built as thread-safe (re-entrant) libraries separately from the non-`_r` libraries. As of 5.5, both libraries are the same and the `_r` names are symbolic links to the corresponding non-`_r` names. There is no need to use the `_r` libraries. For example, if you use `mysql_config` to obtain linker flags, you can use `mysql_config --libs` in all cases, even for threaded clients. There is no need to use `mysql_config --libs_r`.

### 28.7.2 Simultaneous MySQL Server and Connector/C Installations

MySQL Server and Connector/C installation packages both provide the files needed to build and run MySQL C API client programs. This section discusses when it is possible to install both products on the
same system. For some packaging formats, this is possible without conflict. For others, both products cannot be installed at the same time.

This discussion assumes the use of similar package types for both products (for example, RPM packages for both products). It does not try to describe coexistence between packaging types (for example, use of RPM packages for one product and a tar file package for the other). Nor does it describe coexistence of packages provided by Oracle and those provided by third-party vendors.

If you install both products, it may be necessary to adjust your development tools or runtime environment to choose one set of header files and libraries over the other. See Section 28.7.4.1, "Building C API Client Programs", and Section 28.7.4.4, "Running C API Client Programs".

tar and Zip file packages install under the directory into which you unpack them. For example, you can unpack MySQL Server and Connector/C tar packages under /usr/local and they will unpack into distinct directory names without conflict.

Windows MSI installers use their own installation directory, so MySQL Server and Connector/C installers do not conflict.

OS X DMG packages install under the same parent directory but in a different subdirectory, so there is no conflict. For example:

```
/usr/local/mysql-5.6.11-osx10.7-x86_64/
/usr/local/mysql-connector-c-6.1.0-osx10.7-x86/
```

Solaris PKG packages install under the same parent directory but in a different subdirectory, so there is no conflict. For example:

```
/opt/mysql/mysql
/opt/mysql/connector-c
```

The Solaris Connector/C installer does not create any symlinks from system directories such as /usr/bin or /usr/lib into the installation directory. That must be done manually if desired after installation.

For RPM installations, there are several types of RPM packages. MySQL Server shared and devel RPM packages are similar to the corresponding Connector/C RPM packages. These RPM package types cannot coexist because the MySQL Server and Connector/C RPM packages use the same installation locations for the client library-related files. This means the following conditions hold:

- If MySQL Server shared and devel RPM packages are installed, they provide the C API headers and libraries, and there is no need to install the Connector/C RPM packages. To install the Connector/C packages anyway, you must first remove the corresponding MySQL Server packages.

- To install MySQL Server RPM packages if you already have Connector/C RPM packages installed, you must first remove the Connector/C RPM packages.

MySQL Server RPM packages other than shared and devel do not conflict with Connector/C packages and can be installed if Connector/C is installed. This includes the main server RPM that includes the mysqld server itself.

### 28.7.3 Example C API Client Programs

Many of the clients in MySQL source distributions are written in C, such as mysql, mysqladmin, and mysqlshow. If you are looking for examples that demonstrate how to use the C API, take a look at these
Building and Running C API Client Programs

The following sections provide information on building client programs that use the C API. Topics include compiling and linking clients, writing threaded clients, and troubleshooting runtime problems.

28.7.4 Building and Running C API Client Programs

This section provides guidelines for compiling C programs that use the MySQL C API.

Compiling MySQL Clients on Unix

The examples here use gcc as the compiler. A different compiler might be appropriate on some systems (for example, clang on OS X or FreeBSD, or Sun Studio on Solaris). Adjust the examples as necessary.

You may need to specify an -I option when you compile client programs that use MySQL header files, so that the compiler can find them. For example, if the header files are installed in /usr/local/mysql/include, use this option in the compile command:

```
-I/usr/local/mysql/include
```

MySQL clients must be linked using the -lmysqlclient option in the link command. You may also need to specify a -L option to tell the linker where to find the library. For example, if the library is installed in /usr/local/mysql/lib, use these options in the link command:

```
-L/usr/local/mysql/lib -lmysqlclient
```

The path names may differ on your system. Adjust the -I and -L options as necessary.

To make it simpler to compile MySQL programs on Unix, use the mysql_config script. See Section 4.7.1, "mysql_config — Display Options for Compiling Clients".

mysql_config displays the options needed for compiling or linking:

```
shell> mysql_config --cflags
shell> mysql_config --libs
```

You can run those commands to get the proper options and add them manually to compilation or link commands. Alternatively, include the output from mysql_config directly within command lines using backticks:

```
shell> gcc -c `mysql_config --cflags` proiname.c
shell> gcc -o proiname proiname.o `mysql_config --libs`
```

On Unix, linking uses dynamic libraries by default. To link to the static client library instead, add its path name to the link command. For example, if the library is located in /usr/local/mysql/lib, link like this:

```
shell> gcc -o proiname proiname.o /usr/local/mysql/lib/libmysqlclient.a
```

Or use mysql_config to provide the library name:
Building and Running C API Client Programs

shell> gcc --o programname programname.o `mysql_config --variable=pkglibdir`/libmysqlclient.a

`mysql_config` does not currently provide a way to list all libraries needed for static linking, so it might be necessary to name additional libraries on the link command (for example, `-lnsl -lsocket` on Solaris). To get an idea which libraries to add, use `mysql_config --libs` and `ldd libmysqlclient.so` (or `otool -L libmysqlclient.dylib` on OS X).

`pkg-config` can be used as an alternative to `mysql_config` for obtaining information such as compiler flags or link libraries required to compile MySQL applications. For example, the following pairs of commands are equivalent:

- `mysql_config --cflags`
- `pkg-config --cflags mysqlclient`

- `mysql_config --libs`
- `pkg-config --libs mysqlclient`

To produce flags for static linking, use this command:

```
pkg-config --static --libs mysqlclient
```

For more information, see Section 28.7.4.2, “Building C API Client Programs Using pkg-config”.

Compiling MySQL Clients on Microsoft Windows

To specify header and library file locations, use the facilities provided by your development environment.

To build C API clients on Windows, you must link in the C client library, as well as the Windows ws2_32 sockets library and Secur32 security library.

You link your code with either the dynamic or static C client library. On Windows, the static library is named `mysqlclient.lib` and the dynamic library is named `libmysql.dll`. In addition, the `libmysql.lib` static import library is needed for using the dynamic library. If the static C client library is used, the client application must be compiled with the same version of Visual Studio used to compile the C client library (which is Visual Studio 2015 for the static C client library built by Oracle).

Note

The MySQL Connector/C is a standalone, drop-in replacement of the MySQL C client libraries that come with the MySQL server distribution. The Oracle-built MySQL Connector/C contains currently two versions of the static client library, one built with Visual Studio 2013 and the other one with Visual Studio 2015; use the one that matches the Visual Studio version you use to compile your application.

When using the Oracle-built MySQL C client library (or MySQL Connector/C), following these rules when it comes to linking the C runtime for your client application:

- For the Community version of the MySQL C client library (or the Community version of MySQL Connector/C):
  - For version 8.0.0 (or MySQL Connector/C Community 6.1.9 and before):
    - If linking to the static C client library, link statically to the C runtime (use the `/MT` compiler option).
    - If linking to the dynamic C client library, link either statically or dynamically to the C runtime (use either `/MT` or `/MD` compiler option).
• For version 8.0.1 and later (or MySQL Connector/C Community 6.1.10 and later): Always link dynamically to the C runtime (use the /MD compiler option), whether you are linking to the static or dynamic C client library. Also, target hosts running the client application need to have the Visual C++ Redistributable for Visual Studio 2015 installed.

• For the Commercial version of the MySQL C client library (or the Commercial version of MySQL Connector/C):
  
  • If linking to the static C client library, link statically to the C runtime (use the /MT compiler option).
  
  • If linking to the dynamic C client library, link either statically or dynamically to the C runtime (use either /MT or /MD compiler option).

In general, when linking to a static MySQL C client library, the client library and the client application must use the same compiler option when it comes to linking the C runtime—that is, if your C client library is compiled with the /MT option, your client application should also be compiled with the /MT option, and so on (see the MSDN page describing the C library linking options for more details). Follow this rule when you are building your own static MySQL C client library (or MySQL Connector/C) from source and linking you client application to it.

**Note**

Debug Mode: Because of the above-mentioned rule, you cannot build your application in debug mode (with the /MTd or /MDd compiler option) and link it to the static C client library built by Oracle, which is **not** built with the debug options; instead, you will have to build the static client library from source with the debug options.

Troubleshooting Problems Linking to the MySQL Client Library

The MySQL client library includes SSL support built in. It is unnecessary to specify either -lssl or -lcrypto at link time. Doing so may in fact result in problems at runtime.

If the linker cannot find the MySQL client library, you might get undefined-reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0x3b): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding -Ldir_path -lmysqlclient at the end of your link command, where `dir_path` represents the path name of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well. You can include `mysql_config` output directly in your compile or link command using backticks. For example:

```
shell> gcc -o proname proname.o `mysql_config --libs`
```
if an error occurs at link time that the floor symbol is undefined, link to the math library by adding -lm to the end of the compile/link line. similarly, if you get undefined-reference errors for other functions that should exist on your system, such as connect(), check the manual page for the function in question to determine which libraries you should add to the link command.

if you get undefined-reference errors such as the following for functions that do not exist on your system, it usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours:

```
mf_format.o(.text+0x201): undefined reference to '__lxstat'
```

in this case, you should download the latest MySQL or Connector/C source distribution and compile the MySQL client library yourself. see Section 2.9, “Installing MySQL from Source”, and MySQL Connector/C Developer Guide.

### 28.7.4.2 Building C API Client Programs Using pkg-config

MySQL distributions contain a mysqlclient.pc file that provides information about MySQL configuration for use by the pkg-config command. This enables pkg-config to be used as an alternative to mysql_config for obtaining information such as compiler flags or link libraries required to compile MySQL applications. For example, the following pairs of commands are equivalent:

```
mysql_config --cflags
pkg-config --cflags mysqlclient

mysql_config --libs
pkg-config --libs mysqlclient
```

The last pkg-config command produces flags for dynamic linking. To produce flags for static linking, use this command:

```
pkg-config --static --libs mysqlclient
```

On some platforms, the output with and without --static might be the same.

**Note**

If pkg-config does not find MySQL information, it might be necessary to set the PKG_CONFIG_PATH environment variable to the directory in which the mysqlclient.pc file is located, which by default is usually the pkgconfig directory under the MySQL library directory. For example (adjust the location appropriately):

```
export PKG_CONFIG_PATH=/usr/local/mysql/lib/pkgconfig # sh, bash, ...
setenv PKG_CONFIG_PATH /usr/local/mysql/lib/pkgconfig # csh, tcsh, ...
```

The mysqlconfig.pc installation location can be controlled using the INSTALL_PKGCONFIGDIR CMake option. See Section 2.9.4, “MySQL Source-Configuration Options”.

The --variable option takes a configuration variable name and displays the variable value:

```
pkg-config --variable=prefix mysqlclient   # installation prefix directory
pkg-config --variable=includedir mysqlclient # header file directory
pkg-config --variable=libdir mysqlclient   # library directory
```
To see which variable values `pkg-config` can display using the `--variable` option, use this command:

```
pkg-config --print-variables mysqlclient
```

You can use `pkg-config` within a command line using backticks to include the output that it produces for particular options. For example, to compile and link a MySQL client program, use `pkg-config` as follows:

```
gcc -c `pkg-config --cflags mysqlclient` progname.c
```
```
gcc -o progname progname.o `pkg-config --libs mysqlclient`
```

### 28.7.4.3 Writing C API Threaded Client Programs

The client library is almost thread-safe. The biggest problem is that the subroutines in `sql/net_serv.cc` that read from sockets are not interrupt-safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, socket handling should be thread-safe.

To avoid aborting the program when a connection terminates, MySQL blocks `SIGPIPE` on the first call to `mysql_library_init()`, `mysql_init()`, or `mysql_connect()`. To use your own `SIGPIPE` handler, first call `mysql_library_init()`, then install your handler.

If “undefined symbol” errors occur when linking against the `libmysqlclient` client library, in most cases this is because you have not included the thread libraries on the link/compile command.

The client library is thread-safe per connection. You can let two threads share the same connection with the following caveats:

- Multiple threads cannot send a query to the MySQL server at the same time on the same connection. In particular, you must ensure that between calls to `mysql_query()` and `mysql_store_result()` in one thread, no other thread uses the same connection. You must have a mutex lock around your pair of `mysql_query()` and `mysql_store_result()` calls. After `mysql_store_result()` returns, the lock can be released and other threads may query the same connection.

  If you use POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

- Many threads can access different result sets that are retrieved with `mysql_store_result()`.

- To use `mysql_use_result()`, you must ensure that no other thread is using the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.

You need to know the following if you have a thread that did not create the connection to the MySQL database but is calling MySQL functions:

When you call `mysql_init()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things). If you call a MySQL function before the thread has called `mysql_init()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later. To avoid problems, you must do the following:

1. Call `mysql_library_init()` before any other MySQL functions. It is not thread-safe, so call it before threads are created, or protect the call with a mutex.

2. Arrange for `mysql_thread_init()` to be called early in the thread handler before calling any MySQL function. If you call `mysql_init()`, it will call `mysql_thread_init()` for you.
3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

The preceding notes regarding `mysql_init()` also apply to `mysql_connect()`, which calls `mysql_init()`.

### 28.7.4.4 Running C API Client Programs

If, after an upgrade, you experience problems with compiled client programs, such as Commands out of sync or unexpected core dumps, the programs were probably compiled using old header or library files. In this case, check the date of the `mysql.h` file and `libmysqlclient.a` library used for compilation to verify that they are from the new MySQL distribution. If not, recompile the programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example, from `libmysqlclient.so.17` to `libmysqlclient.so.18`).

The major client library version determines compatibility. (For example, for `libmysqlclient.so.18.1.0`, the major version is 18.) For this reason, the libraries shipped with newer versions of MySQL are drop-in replacements for older versions that have the same major number. As long as the major library version is the same, you can upgrade the library and old applications should continue to work with it.

Undefined-reference errors might occur at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `libmysqlclient` library cannot be found, it means that your system cannot find the shared `libmysqlclient.so` library. The solution to this problem is to tell your system to search for shared libraries in the directory where that library is located. Use whichever of the following methods is appropriate for your system:

- Add the path of the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` or `LD_LIBRARY` environment variable.
- On OS X, add the path of the directory where `libmysqlclient.dylib` is located to the `DYLD_LIBRARY_PATH` environment variable.
- Copy the shared-library files (such as `libmysqlclient.so`) to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`. Be sure to copy all related files. A shared library might exist under several names, using symlinks to provide the alternate names.

### 28.7.4.5 C API Server and Client Library Versions

The string and numeric forms of the MySQL server version are available at compile time as the values of the `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` macros, and at runtime as the values of the `mysql_get_server_info()` and `mysql_get_server_version()` functions.

The MySQL client library version depends on the type of distribution that provides the library:

- For MySQL distributions, the client library version is the MySQL version. The string and numeric forms of this version are available at compile time as the values of the `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` macros, and at runtime as the values of the `mysql_get_client_info()` and `mysql_get_client_version()` functions.

The `LIBMYSQL_VERSION` and `LIBMYSQL_VERSION_ID` macros have the same values as `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` and the two sets of macros can be used interchangeably.
• For Connector/C distributions, the client library version is the Connector/C version. The
string and numeric forms of this version are available at compile time as the values of the
\texttt{LIBMYSQL\_VERSION} and \texttt{LIBMYSQL\_VERSION\_ID} macros, and at runtime as the values of the
\texttt{mysql\_get\_client\_info()} and \texttt{mysql\_get\_client\_version()} functions.

The \texttt{MYSQL\_SERVER\_VERSION} and \texttt{MYSQL\_VERSION\_ID} macros indicate the string and numeric forms
of the MySQL version on which the Connector/C distribution is based.

### 28.7.5 C API Data Structures

This section describes C API data structures other than those used for prepared statements, the
asynchronous interface, or the replication stream interface. For information about those, see Section 28.7.9,
“C API Prepared Statement Data Structures”, Section 28.7.13, “C API Asynchronous Interface Data
Structures”, and Section 28.7.19, “C API Binary Log Data Structures”.

• \texttt{MYSQL}

This structure represents handler for one database connection. It is used for almost all MySQL functions.
Do not try to make a copy of a \texttt{MYSQL} structure. There is no guarantee that such a copy will be usable.

• \texttt{MYSQL\_RES}

This structure represents the result of a query that returns rows (\texttt{SELECT}, \texttt{SHOW}, \texttt{DESCRIBE}, \texttt{EXPLAIN}).
The information returned from a query is called the \textit{result set} in the remainder of this section.

• \texttt{MYSQL\_ROW}

This is a type-safe representation of one row of data. It is currently implemented as an array of
counted byte strings. (You cannot treat these as null-terminated strings if field values may contain
binary data, because such values may contain null bytes internally.) Rows are obtained by calling
\texttt{mysql\_fetch\_row()}.

• \texttt{MYSQL\_FIELD}

This structure contains metadata: information about a field, such as the field’s name, type, and size. Its
members are described in more detail later in this section. You may obtain the \texttt{MYSQL\_FIELD} structures
for each field by calling \texttt{mysql\_fetch\_field()} repeatedly. Field values are not part of this structure;
they are contained in a \texttt{MYSQL\_ROW} structure.

• \texttt{MYSQL\_FIELD\_OFFSET}

This is a type-safe representation of an offset into a MySQL field list. (Used by \texttt{mysql\_field\_seek()}.)
Offsets are field numbers within a row, beginning at zero.

• \texttt{my\_ulonglong}

The type used for the number of rows and for \texttt{mysql\_affected\_rows()}, \texttt{mysql\_num\_rows()}, and
\texttt{mysql\_insert\_id()}. This type provides a range of 0 to 1.84e19.

Some functions that return a row count using this type return -1 as an unsigned value to indicate an error
or exceptional condition. You can check for -1 by comparing the return value to \texttt{(my\_ulonglong)\_\_1} (or
to \texttt{(my\_ulonglong)\_~0}, which is equivalent).

On some systems, attempting to print a value of type \texttt{my\_ulonglong} does not work. To print such a
value, convert it to \texttt{unsigned long} and use a \texttt{%lu} print format. Example:
printf ("Number of rows: %lu\n",
(unsigned long) mysql_num_rows(result));

• `my_bool`

A boolean type, for values that are true (nonzero) or false (zero). The `my_bool` type was used before MySQL 8.0. As of MySQL 8.0, use the `bool` or `int` C type instead.

Note

The change from `my_bool` to `bool` means that the `mysql.h` header file requires a C++ or C99 compiler to compile.

The `MYSQL_FIELD` structure contains the members described in the following list. The definitions apply primarily for columns of result sets such as those produced by `SELECT` statements. `MYSQL_FIELD` structures are also used to provide metadata for `OUT` and `INOUT` parameters returned from stored procedures executed using prepared `CALL` statements. For such parameters, some of the structure members have a meaning different from the meaning for column values.

• `char * name`

The name of the field, as a null-terminated string. If the field was given an alias with an `AS` clause, the value of `name` is the alias. For a procedure parameter, the parameter name.

• `char * org_name`

The name of the field, as a null-terminated string. Aliases are ignored. For expressions, the value is an empty string. For a procedure parameter, the parameter name.

• `char * table`

The name of the table containing this field, if it is not a calculated field. For calculated fields, the `table` value is an empty string. If the column is selected from a view, `table` names the view. If the table or view was given an alias with an `AS` clause, the value of `table` is the alias. For a `UNION`, the value is the empty string. For a procedure parameter, the procedure name.

• `char * org_table`

The name of the table, as a null-terminated string. Aliases are ignored. If the column is selected from a view, `org_table` names the view. If the column is selected from a derived table, `org_table` names the base table. If a derived table wraps a view, `org_table` still names the base table. If the column is an expression, `org_table` is the empty string. For a `UNION`, the value is the empty string. For a procedure parameter, the value is the procedure name.

• `char * db`

The name of the database that the field comes from, as a null-terminated string. If the field is a calculated field, `db` is an empty string. For a `UNION`, the value is the empty string. For a procedure parameter, the name of the database containing the procedure.

• `char * catalog`

The catalog name. This value is always "def".

• `char * def`

The default value of this field, as a null-terminated string. This is set only if you use `mysql_list_fields()`.
• unsigned long length

The width of the field. This corresponds to the display length, in bytes.

The server determines the length value before it generates the result set, so this is the minimum length required for a data type capable of holding the largest possible value from the result column, without knowing in advance the actual values that will be produced by the query for the result set.

• unsigned long max_length

The maximum width of the field for the result set (the length in bytes of the longest field value for the rows actually in the result set). If you use mysql_store_result() or mysql_list_fields(), this contains the maximum length for the field. If you use mysql_use_result(), the value of this variable is zero.

The value of max_length is the length of the string representation of the values in the result set. For example, if you retrieve a FLOAT column and the “widest” value is -12.345, max_length is 7 (the length of '-12.345').

If you are using prepared statements, max_length is not set by default because for the binary protocol the lengths of the values depend on the types of the values in the result set. (See Section 28.7.9, “C API Prepared Statement Data Structures”.) If you want the max_length values anyway, enable the STMT_ATTR_UPDATE_MAX_LENGTH option with mysql_stmt_attr_set() and the lengths will be set when you call mysql_stmt_store_result(). (See Section 28.7.11.3, “mysql_stmt_attr_set()”, and Section 28.7.11.28, “mysql_stmt_store_result()”.)

• unsigned int name_length

The length of name.

• unsigned int org_name_length

The length of org_name.

• unsigned int table_length

The length of table.

• unsigned int org_table_length

The length of org_table.

• unsigned int db_length

The length of db.

• unsigned int catalog_length

The length of catalog.

• unsigned int def_length

The length of def.

• unsigned int flags

Bit-flags that describe the field. The flags value may have zero or more of the bits set that are shown in the following table.
### C API Data Structures

<table>
<thead>
<tr>
<th>Flag Value</th>
<th>Flag Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT_NULL_FLAG</td>
<td>Field cannot be NULL</td>
</tr>
<tr>
<td>PRI_KEY_FLAG</td>
<td>Field is part of a primary key</td>
</tr>
<tr>
<td>UNIQUE_KEY_FLAG</td>
<td>Field is part of a unique key</td>
</tr>
<tr>
<td>MULTIPLE_KEY_FLAG</td>
<td>Field is part of a nonunique key</td>
</tr>
<tr>
<td>UNSIGNED_FLAG</td>
<td>Field has the UNIGNED attribute</td>
</tr>
<tr>
<td>ZEROFILL_FLAG</td>
<td>Field has the ZEROFILL attribute</td>
</tr>
<tr>
<td>BINARY_FLAG</td>
<td>Field has the BINARY attribute</td>
</tr>
<tr>
<td>AUTO_INCREMENT_FLAG</td>
<td>Field has the AUTO_INCREMENT attribute</td>
</tr>
<tr>
<td>ENUM_FLAG</td>
<td>Field is an ENUM</td>
</tr>
<tr>
<td>SET_FLAG</td>
<td>Field is a SET</td>
</tr>
<tr>
<td>BLOB_FLAG</td>
<td>Field is a BLOB or TEXT (deprecated)</td>
</tr>
<tr>
<td>TIMESTAMP_FLAG</td>
<td>Field is a TIMESTAMP (deprecated)</td>
</tr>
<tr>
<td>NUM_FLAG</td>
<td>Field is numeric; see additional notes following table</td>
</tr>
<tr>
<td>NO_DEFAULT_VALUE_FLAG</td>
<td>Field has no default value; see additional notes following table</td>
</tr>
</tbody>
</table>

Some of these flags indicate data type information and are superseded by or used in conjunction with the `MYSQL_TYPE_`xxx value in the `field->type` member described later:

- To check for BLOB or TIMESTAMP values, check whether `type` is `MYSQL_TYPE_BLOB` or `MYSQL_TYPE_TIMESTAMP`. (The BLOB_FLAG and TIMESTAMP_FLAG flags are unneeded.)
- ENUM and SET values are returned as strings. For these, check that the `type` value is `MYSQL_TYPE_STRING` and that the ENUM_FLAG or SET_FLAG flag is set in the `flags` value.

NUM_FLAG indicates that a column is numeric. This includes columns with a type of `MYSQL_TYPE_DECIMAL`, `MYSQL_TYPE_NEWDECIMAL`, `MYSQL_TYPE_TINY`, `MYSQL_TYPE_SHORT`, `MYSQL_TYPE_LONG`, `MYSQL_TYPE_FLOAT`, `MYSQL_TYPE_DOUBLE`, `MYSQL_TYPE_NULL`, `MYSQL_TYPE_LONGLONG`, `MYSQL_TYPE_INT24`, and `MYSQL_TYPE_YEAR`.

NO_DEFAULT_VALUE_FLAG indicates that a column has no DEFAULT clause in its definition. This does not apply to NULL columns (because such columns have a default of NULL), or to AUTO_INCREMENT columns (which have an implied default value).

The following example illustrates a typical use of the `flags` value:

```c
if (field->flags & NOT_NULL_FLAG)    
  printf("Field cannot be null\n");
```

You may use the convenience macros shown in the following table to determine the boolean status of the `flags` value.

<table>
<thead>
<tr>
<th>Flag Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_NOT_NULL(flags)</td>
<td>True if this field is defined as NOT NULL</td>
</tr>
<tr>
<td>IS_PRI_KEY(flags)</td>
<td>True if this field is a primary key</td>
</tr>
<tr>
<td>Flag Status</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>IS_BLOB(flags)</td>
<td>True if this field is a BLOB or TEXT (deprecated; test field-&gt;type instead)</td>
</tr>
</tbody>
</table>

- **unsigned int decimals**

  The number of decimals for numeric fields, and the fractional seconds precision for temporal fields.

- **unsigned int charsetnr**

  An ID number that indicates the character set/collation pair for the field.

  Normally, character values in result sets are converted to the character set indicated by the `character_set_results` system variable. In this case, `charsetnr` corresponds to the character set indicated by that variable. Character set conversion can be suppressed by setting `character_set_results` to NULL. In this case, `charsetnr` corresponds to the character set of the original table column or expression. See also Section 10.4, “Connection Character Sets and Collations”.

  To distinguish between binary and nonbinary data for string data types, check whether the `charsetnr` value is 63. If so, the character set is binary, which indicates binary rather than nonbinary data. This enables you to distinguish BINARY from CHAR, VARBINARY from VARCHAR, and the BLOB types from the TEXT types.

  `charsetnr` values are the same as those displayed in the Id column of the SHOW COLLATION statement or the ID column of the INFORMATION_SCHEMA COLLATIONS table. You can use those information sources to see which character set and collation specific `charsetnr` values indicate:

  ```
  mysql> SHOW COLLATION WHERE Id = 63;
  +----------+-------+----+---------+----------+---------+
  | Collation | Charset | Id | Default | Compiled | Sortlen |
  +----------+-------+----+---------+----------+---------+
  | binary   | binary | 63 | Yes     | Yes      | 1       |
  +----------+-------+----+---------+----------+---------+
  mysql> SELECT COLLATION_NAME, CHARACTER_SET_NAME
  FROM INFORMATION_SCHEMA.COLLATIONS WHERE ID = 33;
  +-----------------+--------------------+
  | COLLATION_NAME  | CHARACTER_SET_NAME |
  +-----------------+--------------------+
  | utf8_general_ci | utf8               |
  +-----------------+--------------------+
  ```

- **enum enum_field_types type**

  The type of the field. The `type` value may be one of the `MYSQL_TYPE_` symbols shown in the following table.

<table>
<thead>
<tr>
<th>Type Value</th>
<th>Type Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MYSQL_TYPE_TINY</td>
<td>TINYINT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_SHORT</td>
<td>SMALLINT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_LONG</td>
<td>INTEGER field</td>
</tr>
<tr>
<td>MYSQL_TYPE_INT24</td>
<td>MEDIUMINT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_LONGLONG</td>
<td>BIGINT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_DECIMAL</td>
<td>DECIMAL or NUMERIC field</td>
</tr>
</tbody>
</table>
### Type Value

<table>
<thead>
<tr>
<th><strong>Type</strong> Value</th>
<th><strong>Type Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>MYSQL_TYPE_NEWDECIMAL</td>
<td>Precision math DECIMAL or NUMERIC</td>
</tr>
<tr>
<td>MYSQL_TYPE_FLOAT</td>
<td>FLOAT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_DOUBLE</td>
<td>DOUBLE or REAL field</td>
</tr>
<tr>
<td>MYSQL_TYPE_BIT</td>
<td>BIT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_TIMESTAMP</td>
<td>TIMESTAMP field</td>
</tr>
<tr>
<td>MYSQL_TYPE_DATE</td>
<td>DATE field</td>
</tr>
<tr>
<td>MYSQL_TYPE_TIME</td>
<td>TIME field</td>
</tr>
<tr>
<td>MYSQL_TYPE_DATETIME</td>
<td>DATETIME field</td>
</tr>
<tr>
<td>MYSQL_TYPE_YEAR</td>
<td>YEAR field</td>
</tr>
<tr>
<td>MYSQL_TYPE_STRING</td>
<td>CHAR or BINARY field</td>
</tr>
<tr>
<td>MYSQL_TYPE_VAR_STRING</td>
<td>VARCHAR or VARBINARY field</td>
</tr>
<tr>
<td>MYSQL_TYPE_BLOB</td>
<td>BLOB or TEXT field (use max_length to determine the maximum length)</td>
</tr>
<tr>
<td>MYSQL_TYPE_SET</td>
<td>SET field</td>
</tr>
<tr>
<td>MYSQL_TYPE_ENUM</td>
<td>ENUM field</td>
</tr>
<tr>
<td>MYSQL_TYPE_GEOMETRY</td>
<td>Spatial field</td>
</tr>
<tr>
<td>MYSQL_TYPE_NULL</td>
<td>NULL-type field</td>
</tr>
</tbody>
</table>

The MYSQL_TYPE_TIME2, MYSQL_TYPE_DATEETIME2, and MYSQL_TYPE_TIMESTAMP2 type codes are used only on the server side. Clients see the MYSQL_TYPE_TIME, MYSQL_TYPE_DATEETIME, and MYSQL_TYPE_TIMESTAMP codes.

You can use the IS_NUM() macro to test whether a field has a numeric type. Pass the type value to IS_NUM() and it evaluates to TRUE if the field is numeric:

```c
if (IS_NUM(field->type))
    printf("Field is numeric\n");
```

ENUM and SET values are returned as strings. For these, check that the type value is MYSQL_TYPE_STRING and that the ENUM_Flag or SET_Flag flag is set in the flags value.

### 28.7.6 C API Function Overview

The following list summarizes the functions available in the C API. For greater detail, see the descriptions in Section 28.7.7, “C API Function Descriptions”.

- **my_init()**: Initializes global variables and the thread handler in thread-safe programs.
- **mysql_affected_rows()**: Returns the number of rows changed/deleted/inserted by the last UPDATE, DELETE, or INSERT query.
- **mysql_autocommit()**: Toggles autocommit mode on/off.
- **mysql_change_user()**: Changes the user and database on an open connection.
- **mysql_character_set_name()**: Returns the default character set name for the current connection.
- **mysql_client_find_plugin()**: Returns a pointer to a plugin.
• `mysql_client_register_plugin()`: Registers a plugin.
• `mysql_close()`: Closes a server connection.
• `mysql_commit()`: Commits the transaction.
• `mysql_connect()`: Connects to a MySQL server. This function is deprecated; use `mysql_real_connect()` instead.
• `mysql_create_db()`: Creates a database. This function is deprecated; use the SQL statement `CREATE DATABASE` instead.
• `mysql_data_seek()`: Seeks to an arbitrary row number in a query result set.
• `mysql_debug()`: Does a `DEBUG_PUSH` with the given string.
• `mysql_drop_db()`: Drops a database. This function is deprecated; use the SQL statement `DROP DATABASE` instead.
• `mysql_dump_debug_info()`: Causes the server to write debug information to the log.
• `mysql_eof()`: Determines whether the last row of a result set has been read. This function is deprecated; use `mysql_errno()` or `mysql_error()` instead.
• `mysql_errno()`: Returns the error number for the most recently invoked MySQL function.
• `mysql_error()`: Returns the error message for the most recently invoked MySQL function.
• `mysql_escape_string()`: Escapes special characters in a string for use in an SQL statement.
• `mysql_fetch_field()`: Returns the type of the next table field.
• `mysql_fetch_field_direct()`: Returns the type of a table field, given a field number.
• `mysql_fetch_fields()`: Returns an array of all field structures.
• `mysql_fetch_lengths()`: Returns the lengths of all columns in the current row.
• `mysql_fetch_row()`: Fetches the next row from the result set.
• `mysql_field_count()`: Returns the number of result columns for the most recent statement.
• `mysql_field_seek()` : Puts the column cursor on a specified column.
• `mysql_field_tell()`: Returns the position of the field cursor used for the last `mysql_fetch_field()`.
• `mysql_free_result()`: Frees memory used by a result set.
• `mysql_get_character_set_info()`: Returns information about default character set.
• `mysql_get_client_info()`: Returns client version information as a string.
• `mysql_get_client_version()`: Returns client version information as an integer.
• `mysql_get_host_info()`: Returns a string describing the connection.
• `mysql_get_option()` : Returns the value of a `mysql_options()` option.
• `mysql_get_proto_info()`: Returns the protocol version used by the connection.
• **mysql_get_server_info()**: Returns the server version number.
• **mysql_get_server_version()**: Returns the server version number as an integer.
• **mysql_get_ssl_cipher()**: Returns the current SSL cipher.
• **mysql_hex_string()**: Encodes a string in hexadecimal format.
• **mysql_info()**: Returns information about the most recently executed query.
• **mysql_init()**: Gets or initializes a MYSQL structure.
• **mysql_insert_id()**: Returns the ID generated for an AUTO_INCREMENT column by the previous query.
• **mysql_kill()**: Kills a given thread.
• **mysql_library_end()**: Finalizes the MySQL C API library.
• **mysql_library_init()**: Initializes the MySQL C API library.
• **mysql_list_dbs()**: Returns database names matching a simple regular expression.
• **mysql_list_fields()**: Returns field names matching a simple regular expression.
• **mysql_list_processes()**: Returns a list of the current server threads.
• **mysql_list_tables()**: Returns table names matching a simple regular expression.
• **mysql_load_plugin()**: Loads a plugin.
• **mysql_load_plugin_v()**: Loads a plugin.
• **mysql_more_results()**: Checks whether any more results exist.
• **mysql_next_result()**: Returns/initiates the next result in multiple-result executions.
• **mysql_num_fields()**: Returns the number of columns in a result set.
• **mysql_num_rows()**: Returns the number of rows in a result set.
• **mysql_options()**: Sets connect options for mysql_real_connect().
• **mysql_options4()**: Sets connect options for mysql_real_connect().
• **mysql_ping()**: Checks whether the connection to the server is working, reconnecting as necessary.
• **mysql_plugin_options()**: Sets a plugin option.
• **mysql_query()**: Executes an SQL query specified as a null-terminated string.
• **mysql_real_connect()**: Connects to a MySQL server.
• **mysql_real_escape_string()**: Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection.
• **mysql_real_escape_string_quote()**: Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection and the quoting context.
• **mysql_real_query()**: Executes an SQL query specified as a counted string.
• `mysql_refresh()`: Flushes or resets tables and caches.
• `mysql_reload()`: Tells the server to reload the grant tables.
• `mysql_reset_connection()`: Resets the connection to clear session state.
• `mysql_reset_server_public_key()`: Clears a cached RSA public key from the client library.
• `mysql_result_metadata()`: Whether a result set has metadata.
• `mysql_rollback()`: Rolls back the transaction.
• `mysql_row_seek()`: Seeks to a row offset in a result set, using value returned from `mysql_row_tell()`.
• `mysql_row_tell()`: Returns the row cursor position.
• `mysql_select_db()`: Selects a database.
• `mysql_server_end()`: Finalizes the MySQL C API library.
• `mysql_server_init()`: Initializes the MySQL C API library.
• `mysql_session_track_get_first()`: Gets the first part of session state-change information.
• `mysql_session_track_get_next()`: Gets the next part of session state-change information.
• `mysql_set_character_set()`: Sets the default character set for the current connection.
• `mysql_set_local_infile_default()`: Sets the `LOAD DATA LOCAL` handler callbacks to their default values.
• `mysql_set_local_infile_handler()`: Installs application-specific `LOAD DATA LOCAL` handler callbacks.
• `mysql_set_server_option()`: Sets an option for the connection (like `multi-statements`).
• `mysql_sqlstate()`: Returns the SQLSTATE error code for the last error.
• `mysql_shutdown()`: Shuts down the database server.
• `mysql_ssl_set()`: Prepares to establish an SSL connection to the server.
• `mysql_stat()`: Returns the server status as a string.
• `mysql_store_result()`: Retrieves a complete result set to the client.
• `mysql_thread_end()`: Finalizes a thread handler.
• `mysql_thread_id()`: Returns the current thread ID.
• `mysql_thread_init()`: Initializes a thread handler.
• `mysql_thread_safe()`: Returns 1 if the clients are compiled as thread-safe.
• `mysql_use_result()`: Initiates a row-by-row result set retrieval.
• `mysql_warning_count()`: Returns the warning count for the previous SQL statement.

Application programs should use this general outline for interacting with MySQL:
1. Initialize the MySQL client library by calling `mysql_library_init()`.

2. Initialize a connection handler by calling `mysql_init()` and connect to the server by calling `mysql_real_connect()`.

3. Issue SQL statements and process their results. (The following discussion provides more information about how to do this.)

4. Close the connection to the MySQL server by calling `mysql_close()`.

5. End use of the MySQL client library by calling `mysql_library_end()`.

The purpose of calling `mysql_library_init()` and `mysql_library_end()` is to provide proper initialization and finalization of the MySQL client library. For applications that are linked with the client library, they provide improved memory management. If you do not call `mysql_library_end()`, a block of memory remains allocated. (This does not increase the amount of memory used by the application, but some memory leak detectors will complain about it.)

In a nonmultithreaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multithreaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly through `mysql_init()`. This should be done prior to any other client library call.

To connect to the server, call `mysql_init()` to initialize a connection handler, then call `mysql_real_connect()` with that handler (along with other information such as the host name, user name, and password). Upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of 1 in versions of the API older than 5.0.3, or 0 in newer versions. A value of 1 for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior. When you are done with the connection, call `mysql_close()` to terminate it. Do not use the handler after it has been closed.

While a connection is active, the client may send SQL statements to the server using `mysql_query()` or `mysql_real_query()`. The difference between the two is that `mysql_query()` expects the query to be specified as a null-terminated string whereas `mysql_real_query()` expects a counted string. If the string contains binary data (which may include null bytes), you must use `mysql_real_query()`.

For each non-`SELECT` query (for example, `INSERT`, `UPDATE`, `DELETE`), you can find out how many rows were changed (affected) by calling `mysql_affected_rows()`.

For `SELECT` queries, you retrieve the selected rows as a result set. (Note that some statements are `SELECT`-like in that they return rows. These include `SHOW`, `DESCRIBE`, and `EXPLAIN`. Treat these statements the same way as `SELECT` statements.)

There are two ways for a client to process result sets. One way is to retrieve the entire result set all at once by calling `mysql_store_result()`. This function acquires from the server all the rows returned by the query and stores them in the client. The second way is for the client to initiate a row-by-row result set retrieval by calling `mysql_use_result()`. This function initializes the retrieval, but does not actually get any rows from the server.

In both cases, you access rows by calling `mysql_fetch_row()`. With `mysql_store_result()`, `mysql_fetch_row()` accesses rows that have previously been fetched from the server. With `mysql_use_result()`, `mysql_fetch_row()` actually retrieves the row from the server. Information about the size of the data in each row is available by calling `mysql_fetch_lengths()`.
After you are done with a result set, call `mysql_free_result()` to free the memory used for it. The two retrieval mechanisms are complementary. Choose the approach that is most appropriate for each client application. In practice, clients tend to use `mysql_store_result()` more commonly.

An advantage of `mysql_store_result()` is that because the rows have all been fetched to the client, you not only can access rows sequentially, you can move back and forth in the result set using `mysql_data_seek()` or `mysql_row_seek()` to change the current row position within the result set. You can also find out how many rows there are by calling `mysql_num_rows()`. On the other hand, the memory requirements for `mysql_store_result()` may be very high for large result sets and you are more likely to encounter out-of-memory conditions.

An advantage of `mysql_use_result()` is that the client requires less memory for the result set because it maintains only one row at a time (and because there is less allocation overhead, `mysql_use_result()` can be faster). Disadvantages are that you must process each row quickly to avoid tying up the server, you do not have random access to rows within the result set (you can only access rows sequentially), and the number of rows in the result set is unknown until you have retrieved them all. Furthermore, you must retrieve all the rows even if you determine in mid-retrieval that you've found the information you were looking for.

The API makes it possible for clients to respond appropriately to statements (retrieving rows only as necessary) without knowing whether the statement is a `SELECT`. You can do this by calling `mysql_store_result()` after each `mysql_query()` (or `mysql_real_query()`). If the result set call succeeds, the statement was a `SELECT` and you can read the rows. If the result set call fails, call `mysql_field_count()` to determine whether a result was actually to be expected. If `mysql_field_count()` returns zero, the statement returned no data (indicating that it was an `INSERT`, `UPDATE`, `DELETE`, and so forth), and was not expected to return rows. If `mysql_field_count()` is nonzero, the statement should have returned rows, but did not. This indicates that the statement was a `SELECT` that failed. See the description for `mysql_field_count()` for an example of how this can be done.

Both `mysql_store_result()` and `mysql_use_result()` enable you to obtain information about the fields that make up the result set (the number of fields, their names and types, and so forth). You can access field information sequentially within the row by calling `mysql_fetch_field()` repeatedly, or by field number within the row by calling `mysql_fetch_field_direct()`. The current field cursor position may be changed by calling `mysql_field_seek()`. Setting the field cursor affects subsequent calls to `mysql_fetch_field()`. You can also get information for fields all at once by calling `mysql_fetch_fields()`.

For detecting and reporting errors, MySQL provides access to error information by means of the `mysql_errno()` and `mysql_error()` functions. These return the error code or error message for the most recently invoked function that can succeed or fail, enabling you to determine when an error occurred and what it was.

### 28.7.7 C API Function Descriptions

This section describes C API functions other than those used for prepared statements, the asynchronous interface, or the replication stream interface. For information about those, see Section 28.7.11, “C API Prepared Statement Function Descriptions”, Section 28.7.15, “C API Asynchronous Function Descriptions”, and Section 28.7.21, “C API Binary Log Function Descriptions”.

In the descriptions here, a parameter or return value of `NULL` means `NULL` in the sense of the C programming language, not a MySQL `NULL` value.

Functions that return a value generally return a pointer or an integer. Unless specified otherwise, functions returning a pointer return a non-`NULL` value to indicate success or a `NULL` value to indicate an error, and
functions returning an integer return zero to indicate success or nonzero to indicate an error. Note that “nonzero” means just that. Unless the function description says otherwise, do not test against a value other than zero:

```c
if (result)                   /* correct */
    ... error ...
if (result < 0)               /* incorrect */
    ... error ...
if (result == -1)             /* incorrect */
    ... error ...
```

When a function returns an error, the **Errors** subsection of the function description lists the possible types of errors. You can find out which of these occurred by calling `mysql_errno()`. A string representation of the error may be obtained by calling `mysql_error()`.

### 28.7.7.1 mysql_affected_rows()

```c
my_ulonglong mysql_affected_rows(MYSQL *mysql)
```

#### Description

`mysql_affected_rows()` may be called immediately after executing a statement with `mysql_query()` or `mysql_real_query()`. It returns the number of rows changed, deleted, or inserted by the last statement if it was an UPDATE, DELETE, or INSERT. For SELECT statements, `mysql_affected_rows()` works like `mysql_num_rows()`.

For UPDATE statements, the affected-rows value by default is the number of rows actually changed. If you specify the CLIENT_FOUND_ROWS flag to `mysql_real_connect()` when connecting to mysqld, the affected-rows value is the number of rows “found”; that is, matched by the WHERE clause.

For REPLACE statements, the affected-rows value is 2 if the new row replaced an old row, because in this case, one row was inserted after the duplicate was deleted.

For INSERT ... ON DUPLICATE KEY UPDATE statements, the affected-rows value per row is 1 if the row is inserted as a new row, 2 if an existing row is updated, and 0 if an existing row is set to its current values. If you specify the CLIENT_FOUND_ROWS flag, the affected-rows value is 1 (not 0) if an existing row is set to its current values.

Following a CALL statement for a stored procedure, `mysql_affected_rows()` returns the value that it would return for the last statement executed within the procedure, or 0 if that statement would return -1. Within the procedure, you can use `ROW_COUNT()` at the SQL level to obtain the affected-rows value for individual statements.

`mysql_affected_rows()` returns a meaningful value for a wide range of statements. For details, see the description for `ROW_COUNT()` in Section 12.15, “Information Functions”.

#### Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an UPDATE statement, no rows matched the WHERE clause in the query or that no query has yet been executed. -1 indicates that the query returned an error or that, for a SELECT query, `mysql_affected_rows()` was called prior to calling `mysql_store_result()`.

Because `mysql_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).
Errors

None.

Example

```c
char *stmt = "UPDATE products SET cost=cost*1.25
    WHERE group=10";
mysql_query(&mysql, stmt);
printf("%ld products updated",
    (long) mysql_affected_rows(&mysql));
```

28.7.7.2 mysql_autocommit()

```c
bool mysql_autocommit(MYSQL *mysql, bool mode)
```

Description

Sets autocommit mode on if `mode` is 1, off if `mode` is 0.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

28.7.7.3 mysql_change_user()

```c
bool mysql_change_user(MYSQL *mysql, const char *user, const char *password,
    const char *db)
```

Description

Changes the user and causes the database specified by `db` to become the default (current) database on
the connection specified by `mysql`. In subsequent queries, this database is the default for table references
that include no explicit database specifier.

`mysql_change_user()` fails if the connected user cannot be authenticated or does not have permission
to use the database. In this case, the user and database are not changed.

Pass a `db` parameter of `NULL` if you do not want to have a default database.

This function resets the session state as if one had done a new connect and reauthenticated. (See
Section 28.7.28, “C API Automatic Reconnection Control”.) It always performs a `ROLLBACK` of any active
transactions, closes and drops all temporary tables, and unlocks all locked tables. Session system
variables are reset to the values of the corresponding global system variables. Prepared statements are
released and `HANDLER` variables are closed. Locks acquired with `GET_LOCK()` are released. These
effects occur even if the user did not change.

To reset the connection state in a more lightweight manner without changing the user, use
`mysql_reset_connection()`.

Return Values

Zero for success. Nonzero if an error occurred.
Errors

The same that you can get from `mysql_real_connect()`, plus:

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

- **ER_UNKNOWN_COM_ERROR**
  The MySQL server does not implement this command (probably an old server).

- **ER_ACCESS_DENIED_ERROR**
  The user or password was wrong.

- **ER_BAD_DB_ERROR**
  The database did not exist.

- **ER_DBACCESS_DENIED_ERROR**
  The user did not have access rights to the database.

- **ER_WRONG_DB_NAME**
  The database name was too long.

Example

```c
if (mysql_change_user(&mysql, "user", "password", "new_database")) {
    fprintf(stderr, "Failed to change user. Error: %s\n",
            mysql_error(&mysql));
}
```

28.7.7.4 `mysql_character_set_name()`

```c
const char *mysql_character_set_name(MYSQL *mysql)
```

Description

Returns the default character set name for the current connection.

Return Values

The default character set name
Errors
None.

28.7.7.5 mysql_close()

    void mysql_close(MYSQL *mysql)

Description
Closes a previously opened connection. mysql_close() also deallocates the connection handler pointed to by mysql if the handler was allocated automatically by mysql_init() or mysql_connect(). Do not use the handler after it has been closed.

Return Values
None.

Errors
None.

28.7.7.6 mysql_commit()

    bool mysql_commit(MYSQL *mysql)

Description
Commits the current transaction.

The action of this function is subject to the value of the completion_type system variable. In particular, if the value of completion_type is RELEASE (or 2), the server performs a release after terminating a transaction and closes the client connection. Call mysql_close() from the client program to close the connection from the client side.

Return Values
Zero for success. Nonzero if an error occurred.

Errors
None.

28.7.7.7 mysql_connect()

    MYSQL *mysql_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd)

Description
This function is deprecated. Use mysql_real_connect() instead.

mysql_connect() attempts to establish a connection to a MySQL database engine running on host. mysql_connect() must complete successfully before you can execute any of the other API functions, with the exception of mysql_get_client_info().

The meanings of the parameters are the same as for the corresponding parameters for mysql_real_connect() with the difference that the connection parameter may be NULL. In this...
case, the C API allocates memory for the connection structure automatically and frees it when you call mysql_close(). The disadvantage of this approach is that you cannot retrieve an error message if the connection fails. (To get error information from mysql_errno() or mysql_error(), you must provide a valid MYSQL pointer.)

Return Values

Same as for mysql_real_connect().

Errors

Same as for mysql_real_connect().

28.7.7.8 mysql_create_db()

int mysql_create_db(MYSQL *mysql, const char *db)

Description

Creates the database named by the db parameter.

This function is deprecated. Use mysql_query() to issue an SQL CREATE DATABASE statement instead.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- CR_COMMANDS_OUT_OF_SYNC
  Commands were executed in an improper order.

- CR_SERVER_GONE_ERROR
  The MySQL server has gone away.

- CR_SERVER_LOST
  The connection to the server was lost during the query.

- CR_UNKNOWN_ERROR
  An unknown error occurred.

Example

if(mysql_create_db(&mysql, "my_database"))
{
    fprintf(stderr, "Failed to create new database. Error: %s\n", mysql_error(&mysql));
}

28.7.7.9 mysql_data_seek()

void mysql_data_seek(MYSQL_RES *result, my_ulonglong offset)
Description

Seeks to an arbitrary row in a query result set. The offset value is a row number. Specify a value in the range from 0 to mysql_num_rows(result) - 1.

This function requires that the result set structure contains the entire result of the query, so mysql_data_seek() may be used only in conjunction with mysql_store_result(), not with mysql_use_result().

Return Values

None.

Errors

None.

28.7.7.10 mysql_debug()

void mysql_debug(const char *debug)

Description

Does a DBUG_PUSH with the given string. mysql_debug() uses the Fred Fish debug library. To use this function, you must compile the client library to support debugging. See Section 29.5.4, “The DBUG Package”.

Return Values

None.

Errors

None.

Example

The call shown here causes the client library to generate a trace file in /tmp/client.trace on the client machine:

mysql_debug("d:t:O,/tmp/client.trace");

28.7.7.11 mysql_drop_db()

int mysql_drop_db(MYSQL *mysql, const char *db)

Description

Drops the database named by the db parameter.

This function is deprecated. Use mysql_query() to issue an SQL DROP DATABASE statement instead.

Return Values

Zero for success. Nonzero if an error occurred.
Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

Example

```c
if(mysql_drop_db(&mysql, "my_database"))
  fprintf(stderr, "Failed to drop the database: Error: %s\n",
          mysql_error(&mysql));
```

### 28.7.7.12 mysql_dump_debug_info()

```c
int mysql_dump_debug_info(MYSQL *mysql)
```

**Description**

Instructs the server to write debugging information to the error log. The connected user must have the **SUPER** privilege.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

### 28.7.7.13 mysql_eof()

```c
bool mysql_eof(MYSQL_RES *result)
```
Description

This function is deprecated. `mysql_errno()` or `mysql_error()` may be used instead.

`mysql_eof()` determines whether the last row of a result set has been read.

If you acquire a result set from a successful call to `mysql_store_result()`, the client receives the entire set in one operation. In this case, a NULL return from `mysql_fetch_row()` always means the end of the result set has been reached and it is unnecessary to call `mysql_eof()`. When used with `mysql_store_result()`, `mysql_eof()` always returns true.

On the other hand, if you use `mysql_use_result()` to initiate a result set retrieval, the rows of the set are obtained from the server one by one as you call `mysql_fetch_row()` repeatedly. Because an error may occur on the connection during this process, a NULL return value from `mysql_fetch_row()` does not necessarily mean the end of the result set was reached normally. In this case, you can use `mysql_eof()` to determine what happened. `mysql_eof()` returns a nonzero value if the end of the result set was reached and zero if an error occurred.

Historically, `mysql_eof()` predates the standard MySQL error functions `mysql_errno()` and `mysql_error()`. Because those error functions provide the same information, their use is preferred over `mysql_eof()`, which is deprecated. (In fact, they provide more information, because `mysql_eof()` returns only a boolean value whereas the error functions indicate a reason for the error when one occurs.)

Return Values

Zero for success. Nonzero if the end of the result set has been reached.

Errors

None.

Example

The following example shows how you might use `mysql_eof()`:

```c
mysql_query(&mysql,"SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(!mysql_eof(result))  // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

However, you can achieve the same effect with the standard MySQL error functions:

```c
mysql_query(&mysql,"SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(mysql_errno(&mysql))  // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```
28.7.14 mysql_errno()

```c
unsigned int mysql_errno(MYSQL *mysql)
```

**Description**

For the connection specified by `mysql`, `mysql_errno()` returns the error code for the most recently invoked API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at Appendix B, Errors, Error Codes, and Common Problems.

**Note**

Some functions such as `mysql_fetch_row()` do not set `mysql_errno()` if they succeed. A rule of thumb is that all functions that have to ask the server for information reset `mysql_errno()` if they succeed.

MySQL-specific error numbers returned by `mysql_errno()` differ from SQLSTATE values returned by `mysql_sqlstate()`. For example, the `mysql` client program displays errors using the following format, where 1146 is the `mysql_errno()` value and '42S02' is the corresponding `mysql_sqlstate()` value:

```shell
> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

**Return Values**

An error code value for the last `mysql_xxx()` call, if it failed. zero means no error occurred.

**Errors**

None.

28.7.15 mysql_error()

```c
const char *mysql_error(MYSQL *mysql)
```

**Description**

For the connection specified by `mysql`, `mysql_error()` returns a null-terminated string containing the error message for the most recently invoked API function that failed. If a function did not fail, the return value of `mysql_error()` may be the previous error or an empty string to indicate no error.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_error()` if they succeed.

For functions that reset `mysql_error()`, either of these two tests can be used to check for an error:

```c
if(*mysql_error(&mysql))
{
    // an error occurred
}
if(mysql_error(&mysql)[0])
{
    // an error occurred
}
```
The language of the client error messages may be changed by recompiling the MySQL client library. You can choose error messages in several different languages. See Section 10.11, "Setting the Error Message Language".

Return Values

A null-terminated character string that describes the error. An empty string if no error occurred.

Errors

None.

28.7.7.16 mysql_escape_string()

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not use this function. mysql_escape_string() does not have arguments that enable it to respect the current character set or the quoting context. Use mysql_real_escape_string_quote() instead.</td>
</tr>
</tbody>
</table>

28.7.7.17 mysql_fetch_field()

```
MYSQL_FIELD *mysql_fetch_field(MYSQL_RES *result)
```

Description

Returns the definition of one column of a result set as a MYSQL_FIELD structure. Call this function repeatedly to retrieve information about all columns in the result set. mysql_fetch_field() returns NULL when no more fields are left.

For metadata-optional connections, this function returns NULL when the resultset_metadata system variable is set to NONE. To check whether a result set has metadata, use the mysql_result_metadata() function. For details about managing result set metadata transfer, see Section 28.7.27, "C API Optional Result Set Metadata".

mysql_fetch_field() is reset to return information about the first field each time you execute a new SELECT query. The field returned by mysql_fetch_field() is also affected by calls to mysql_field_seek().

If you've called mysql_query() to perform a SELECT on a table but have not called mysql_store_result(), MySQL returns the default blob length (8KB) if you call mysql_fetch_field() to ask for the length of a BLOB field. (The 8KB size is chosen because MySQL does not know the maximum length for the BLOB. This should be made configurable sometime.) Once you've retrieved the result set, field->max_length contains the length of the largest value for this column in the specific query.

Return Values

The MYSQL_FIELD structure for the current column. NULL if no columns are left or the result set has no metadata.

Errors

None.
Example

```c
MYSQL_FIELD *field;
while((field = mysql_fetch_field(result)))
{
    printf("field name %s\n", field->name);
}
```

28.7.7.18 mysql_fetch_field_direct()

```c
MYSQL_FIELD *mysql_fetch_field_direct(MYSQL_RES *result, unsigned int fieldnr)
```

**Description**

Given a field number `fieldnr` for a column within a result set, returns that column's field definition as a `MYSQL_FIELD` structure. Use this function to retrieve the definition for an arbitrary column. Specify a value for `fieldnr` in the range from 0 to `mysql_num_fields(result)-1`.

For metadata-optional connections, this function returns `NULL` when the `resultset_metadata` system variable is set to `NONE`. To check whether a result set has metadata, use the `mysql_result_metadata()` function. For details about managing result set metadata transfer, see Section 28.7.27, "C API Optional Result Set Metadata".

**Return Values**

The `MYSQL_FIELD` structure for the specified column. `NULL` if the result set has no metadata.

**Errors**

None.

**Example**

```c
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *field;
num_fields = mysql_num_fields(result);
for(i = 0; i < num_fields; i++)
{
    field = mysql_fetch_field_direct(result, i);
    printf("Field %u is %s\n", i, field->name);
}
```

28.7.7.19 mysql_fetch_fields()

```c
MYSQL_FIELD *mysql_fetch_fields(MYSQL_RES *result)
```  

**Description**

Returns an array of all `MYSQL_FIELD` structures for a result set. Each structure provides the field definition for one column of the result set.

For metadata-optional connections, this function returns `NULL` when the `resultset_metadata` system variable is set to `NONE`. To check whether a result set has metadata, use the `mysql_result_metadata()` function. For details about managing result set metadata transfer, see Section 28.7.27, "C API Optional Result Set Metadata".
Return Values

An array of `MYSQL_FIELD` structures for all columns of a result set. `NULL` if the result set has no metadata.

Errors

None.

Example

```c
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *fields;

num_fields = mysql_num_fields(result);
fields = mysql_fetch_fields(result);
for(i = 0; i < num_fields; i++)
{
    printf("Field %u is %s\n", i, fields[i].name);
}
```

28.7.7.20 `mysql_fetch_lengths()`

```c
unsigned long *mysql_fetch_lengths(MYSQL_RES *result)
```

Description

Returns the lengths of the columns of the current row within a result set. If you plan to copy field values, this length information is also useful for optimization, because you can avoid calling `strlen()`. In addition, if the result set contains binary data, you must use this function to determine the size of the data, because `strlen()` returns incorrect results for any field containing null characters.

The length for empty columns and for columns containing `NULL` values is zero. To see how to distinguish these two cases, see the description for `mysql_fetch_row()`.

Return Values

An array of unsigned long integers representing the size of each column (not including any terminating null bytes). `NULL` if an error occurred.

Errors

`mysql_fetch_lengths()` is valid only for the current row of the result set. It returns `NULL` if you call it before calling `mysql_fetch_row()` or after retrieving all rows in the result.

Example

```c
MYSQL_ROW row;
unsigned long *lengths;
unsigned int num_fields;
unsigned int i;

row = mysql_fetch_row(result);
if (row)
{
    num_fields = mysql_num_fields(result);
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
```
28.7.21 mysql_fetch_row()

MYSQL_ROW mysql_fetch_row(MYSQL_RES *result)

Description

mysql_fetch_row() retrieves the next row of a result set:

• When used after mysql_store_result() or mysql_store_result_nonblocking(),
  mysql_fetch_row() returns NULL if there are no more rows to retrieve.

• When used after mysql_use_result(), mysql_fetch_row() returns NULL if there are no more
  rows to retrieve or an error occurred.

The number of values in the row is given by mysql_num_fields(result). If row holds
the return value from a call to mysql_fetch_row(), pointers to the values are accessed as
row[0] to row[mysql_num_fields(result)-1]. NULL values in the row are indicated by NULL
pointers.

The lengths of the field values in the row may be obtained by calling mysql_fetch_lengths(). Empty
fields and fields containing NULL both have length 0; you can distinguish these by checking the pointer for
the field value. If the pointer is NULL, the field is NULL; otherwise, the field is empty.

Return Values

A MYSQL_ROW structure for the next row, or NULL. The meaning of a NULL return depends on which
function was called preceding mysql_fetch_row():

• When used after mysql_store_result() or mysql_store_result_nonblocking(),
  mysql_fetch_row() returns NULL if there are no more rows to retrieve.

• When used after mysql_use_result(), mysql_fetch_row() returns NULL if there are no more
  rows to retrieve or an error occurred. To determine whether an error occurred, check whether
  mysql_error() returns a nonempty string or mysql_errno() returns nonzero.

Errors

Errors are not reset between calls to mysql_fetch_row()

• CR_SERVER_LOST
  The connection to the server was lost during the query.

• CR_UNKNOWN_ERROR
An unknown error occurred.

Example

```c
MYSQL_ROW row;
unsigned int num_fields;
unsigned int i;

num_fields = mysql_num_fields(result);
while ((row = mysql_fetch_row(result)))
{
    unsigned long *lengths;
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("[%.s] ", (int) lengths[i],
                row[i] ? row[i] : "NULL");
    }
    printf("\n");
}
```

28.7.7.22 mysql_field_count()

```c
unsigned int mysql_field_count(MYSQL *mysql)
```

Description

Returns the number of columns for the most recent query on the connection.

The normal use of this function is when `mysql_store_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See Section 28.7.29.1, “Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success”.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```c
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql,query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
```
if (result)  // there are rows
{
    num_fields = mysql_num_fields(result);
    // retrieve rows, then call mysql_free_result(result)
} else  // mysql_store_result() returned nothing; should it have?
{
    if(mysql_field_count(&mysql) == 0)
    {
        // query does not return data
        // (it was not a SELECT)
        num_rows = mysql_affected_rows(&mysql);
    } else // mysql_store_result() should have returned data
    {
        fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
    }
}

An alternative is to replace the mysql_field_count(&mysql) call with mysql_errno(&mysql). In this case, you are checking directly for an error from mysql_store_result() rather than inferring from the value of mysql_field_count() whether the statement was a SELECT.

28.7.7.23 mysql_field_seek()

MYSQL_FIELD_OFFSET mysql_field_seek(MYSQL_RES *result, MYSQL_FIELD_OFFSET offset)

Description

Sets the field cursor to the given offset. The next call to mysql_fetch_field() retrieves the field definition of the column associated with that offset.

To seek to the beginning of a row, pass an offset value of zero.

Return Values

The previous value of the field cursor.

Errors

None.

28.7.7.24 mysql_field_tell()

MYSQL_FIELD_OFFSET mysql_field_tell(MYSQL_RES *result)

Description

Returns the position of the field cursor used for the last mysql_fetch_field(). This value can be used as an argument to mysql_field_seek().

Return Values

The current offset of the field cursor.

Errors

None.
28.7.25 mysql_free_result()

    void mysql_free_result(MYSQL_RES *result)

Description

Note

mysql_free_result() is a synchronous function. Its asynchronous counterpart is mysql_free_result_nonblocking(), for use by applications that require asynchronous communication with the server. See Section 28.7.12, "C API Asynchronous Interface".

mysql_free_result() frees the memory allocated for a result set by mysql_store_result(), mysql_use_result(), mysql_list_dbs(), and so forth. When you are done with a result set, you must free the memory it uses by calling mysql_free_result().

Do not attempt to access a result set after freeing it.

Return Values

None.

Errors

None.

28.7.26 mysql_get_character_set_info()

    void mysql_get_character_set_info(MYSQL *mysql, MY_CHARSET_INFO *cs)

Description

This function provides information about the default client character set. The default character set may be changed with the mysql_set_character_set() function.

Example

This example shows the fields that are available in the MY_CHARSET_INFO structure:

```c
if (!mysql_set_character_set(&mysql, "utf8"))
{
    MY_CHARSET_INFO cs;
    mysql_get_character_set_info(&mysql, &cs);
    printf("character set information:\n");
    printf("character set+collation number: \%d\n", cs.number);
    printf("character set name: \%s\n", cs.name);
    printf("collation name: \%s\n", cs.csname);
    printf("comment: \%s\n", cs.comment);
    printf("directory: \%s\n", cs.dir);
    printf("multi byte character min. length: \%d\n", cs.mbcminlen);
    printf("multi byte character max. length: \%d\n", cs.mbcmaxlen);
}
```

28.7.27 mysql_get_client_info()

    const char *mysql_get_client_info(void)
Description

Returns a string that represents the MySQL client library version (for example, "8.0.18").

The function value is the version of MySQL or Connector/C that provides the client library. For more information, see Section 28.7.4.5, “C API Server and Client Library Versions”.

Return Values

A character string that represents the MySQL client library version.

Errors

None.

28.7.28 mysql_get_client_version()

unsigned long mysql_get_client_version(void)

Description

Returns an integer that represents the MySQL client library version. The value has the format XXXYYZ where X is the major version, YY is the release level (or minor version), and ZZ is the sub-version within the release level:

```
major_version*10000 + release_level*100 + sub_version
```

For example, "8.0.18" is returned as 80018.

The function value is the version of MySQL or Connector/C that provides the client library. For more information, see Section 28.7.4.5, “C API Server and Client Library Versions”.

Return Values

An integer that represents the MySQL client library version.

Errors

None.

28.7.29 mysql_get_host_info()

const char *mysql_get_host_info(MYSQL *mysql)

Description

Returns a string describing the type of connection in use, including the server host name.

Return Values

A character string representing the server host name and the connection type.

Errors

None.

28.7.30 mysql_get_option()
int mysql_get_option(MYSQL *mysql, enum mysql_option option, const void *arg)

Description

Returns the current value of an option settable using `mysql_options()`. The value should be treated as read only.

The `option` argument is the option for which you want its value. The `arg` argument is a pointer to a variable in which to store the option value. `arg` must be a pointer to a variable of the type appropriate for the `option` argument. The following table shows which variable type to use for each `option` value.

<table>
<thead>
<tr>
<th>arg Type</th>
<th>Applicable option Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsigned int</td>
<td>MYSQL_OPT_CONNECT_TIMEOUT, MYSQL_OPT_PROTOCOL,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_READ_TIMEOUT, MYSQL_OPT_RETRY_COUNT,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_SSL_FIPS_MODE, MYSQL_OPT_SSL_MODE,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_WRITE_TIMEOUT, MYSQL_OPT_ZSTD_COMPRESSION_LEVEL</td>
</tr>
<tr>
<td>unsigned long</td>
<td>MYSQL_OPT_MAX_ALLOWED_PACKET, MYSQL_OPT_NET_BUFFER_LENGTH</td>
</tr>
<tr>
<td>bool</td>
<td>MYSQL_ENABLE_CLEARTEXT_PLUGIN,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_CAN_HANDLE_EXPIRED_PASSWORDS,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_GET_SERVER_PUBLIC_KEY, MYSQL_OPT_LOCAL_INFILE,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_OPTIONAL_RESULTSET_METADATA, MYSQL_OPT_RECONNECT,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_REPORT_DATA_TRUNCATION</td>
</tr>
<tr>
<td>const char *</td>
<td>MYSQL_DEFAULT_AUTH, MYSQL_OPT_BIND,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_COMPRESSION_ALGORITHMS, MYSQL_OPT_SSL_CA,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_SSL_CAPATH, MYSQL_OPT_SSL_CERT, MYSQL_OPT_SSL_CIPHER,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_SSL_CRL, MYSQL_OPT_SSL_CRLPATH, MYSQL_OPT_SSL_KEY,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_TLS_CIPHERSUITE, MYSQL_OPT_TLS_VERSION,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_PLUGIN_DIR, MYSQL_READ_DEFAULT_FILE,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_READ_DEFAULT_GROUP, MYSQL_SERVER_PUBLIC_KEY,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_SET_CHARSET_DIR, MYSQL_SET_CHARSET_NAME,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_SHARED_MEMORY_BASE_NAME</td>
</tr>
<tr>
<td>argument not used</td>
<td>MYSQL_OPT_COMPRESS</td>
</tr>
<tr>
<td>cannot be queried (error is returned)</td>
<td>MYSQL_INIT_COMMAND, MYSQL_OPT_CONNECT_ATTR_DELETE, MYSQL_OPT_CONNECT_ATTR_RESET, MYSQL_OPT_NAMED_PIPE</td>
</tr>
</tbody>
</table>

Return Values

Zero for success. Nonzero if an error occurred; this occurs for `option` values that cannot be queried.

Example

The following call tests the `MYSQL_OPT_RECONNECT` option. After the call returns successfully, the value of `reconnect` is true or false to indicate whether automatic reconnection is enabled.

```c
bool reconnect;
if (mysql_get_option(mysql, MYSQL_OPT_RECONNECT, &reconnect))
    fprintf(stderr, "mysql_get_options() failed\n");
```

28.7.31 mysql_get_proto_info()

```c
unsigned int mysql_get_proto_info(MYSQL *mysql)
```
Description
Returns the protocol version used by current connection.

Return Values
An unsigned integer representing the protocol version used by the current connection.

Errors
None.

28.7.7.32 mysql_get_server_info()

    const char *mysql_get_server_info(MYSQL *mysql)

Description
Returns a string that represents the MySQL server version (for example, "8.0.18").

Return Values
A character string that represents the MySQL server version.

Errors
None.

28.7.7.33 mysql_get_server_version()

    unsigned long mysql_get_server_version(MYSQL *mysql)

Description
Returns an integer that represents the MySQL server version. The value has the format XYZZZ where X is the major version, YY is the release level (or minor version), and ZZ is the sub-version within the release level:

    major_version*10000 + release_level*100 + sub_version

For example, "8.0.18" is returned as 80018.

This function is useful in client programs for determining whether some version-specific server capability exists.

Return Values
An integer that represents the MySQL server version.

Errors
None.

28.7.7.34 mysql_get_ssl_cipher()

    const char *mysql_get_ssl_cipher(MYSQL *mysql)
Description

`mysql_get_ssl_cipher()` returns the encryption cipher used for the given connection to the server. `mysql` is the connection handler returned from `mysql_init()`.

Return Values

A string naming the encryption cipher used for the connection, or `NULL` if the connection is not encrypted.

28.7.7.35 `mysql_hex_string()`

```c
unsigned long mysql_hex_string(char *to, const char *from, unsigned long length)
```

Description

This function creates a legal SQL string for use in an SQL statement. See Section 9.1.1, “String Literals”.

The string in the `from` argument is encoded in hexadecimal format, with each character encoded as two hexadecimal digits. The result is placed in the `to` argument, followed by a terminating null byte.

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. When `mysql_hex_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

The return value can be placed into an SQL statement using either `X'value'` or `0xvalue` format. However, the return value does not include the `X'...` or `0x`. The caller must supply whichever of those is desired.

Example

```c
char query[1000], *end;
end = strmov(query, "INSERT INTO test_table values(");
end = strmov(end, "X'");
end += mysql_hex_string(end, "What is this", 12);
end = strmov(end, ",X'");
end += mysql_hex_string(end, "binary data: \0\r\n", 16);
end = strmov(end, ")");
if (mysql_real_query(&mysql, query, (unsigned int) (end - query)))
    { fprintf(stderr, "Failed to insert row, Error: %s\n", mysql_error(&mysql)); }
```

The `strmov()` function used in the example is included in the `libmysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the encoded string that is placed into `to`, not including the terminating null character.

Errors

None.

28.7.7.36 `mysql_info()`
const char *mysql_info(MYSQL *mysql)

Description

Retrieves a string providing information about the most recently executed statement, but only for the statements listed here. For other statements, mysql_info() returns NULL. The format of the string varies depending on the type of statement, as described here. The numbers are illustrative only; the string contains values appropriate for the statement.

- **INSERT INTO ... SELECT ...**
  
  String format: Records: 100 Duplicates: 0 Warnings: 0

- **INSERT INTO ... VALUES (...),(...),(...)**
  
  String format: Records: 3 Duplicates: 0 Warnings: 0

- **LOAD DATA**
  
  String format: Records: 1 Deleted: 0 Skipped: 0 Warnings: 0

- **ALTER TABLE**
  
  String format: Records: 3 Duplicates: 0 Warnings: 0

- **UPDATE**
  
  String format: Rows matched: 40 Changed: 40 Warnings: 0

mysql_info() returns a non-NULL value for INSERT ... VALUES only for the multiple-row form of the statement (that is, only if multiple value lists are specified).

Return Values

A character string representing additional information about the most recently executed statement. NULL if no information is available for the statement.

Errors

None.

28.7.7.37 mysql_init()

MYSQL *mysql_init(MYSQL *mysql)

Description

Allocates or initializes a MYSQL object suitable for mysql_real_connect(). If mysql is a NULL pointer, the function allocates, initializes, and returns a new object. Otherwise, the object is initialized and the address of the object is returned. If mysql_init() allocates a new object, it is freed when mysql_close() is called to close the connection.

In a nonmultithreaded environment, mysql_init() invokes mysql_library_init() automatically as necessary. However, mysql_library_init() is not thread-safe in a multithreaded environment, and thus neither is mysql_init(). Before calling mysql_init(), either call mysql_library_init() prior to spawning any threads, or use a mutex to protect the mysql_library_init() call. This should be done prior to any other client library call.
C API Function Descriptions

Return Values

An initialized MYSQL* handler. NULL if there was insufficient memory to allocate a new object.

Errors

In case of insufficient memory, NULL is returned.

28.7.7.38 mysql_insert_id()

\texttt{my_ulonglong mysql_insert_id(MYSQL *mysql)}

Description

Returns the value generated for an AUTO_INCREMENT column by the previous INSERT or UPDATE statement. Use this function after you have performed an INSERT statement into a table that contains an AUTO_INCREMENT field, or have used INSERT or UPDATE to set a column value with \texttt{LAST_INSERT_ID(expr)}.

The return value of \texttt{mysql_insert_id()} is always zero unless explicitly updated under one of the following conditions:

- INSERT statements that store a value into an AUTO_INCREMENT column. This is true whether the value is automatically generated by storing the special values NULL or 0 into the column, or is an explicit nonspecial value.

- In the case of a multiple-row INSERT statement, \texttt{mysql_insert_id()} returns the first automatically generated AUTO_INCREMENT value that was successfully inserted.

If no rows are successfully inserted, \texttt{mysql_insert_id()} returns 0.

- If an \texttt{INSERT \ldots SELECT} statement is executed, and no automatically generated value is successfully inserted, \texttt{mysql_insert_id()} returns the ID of the last inserted row.

- If an \texttt{INSERT \ldots SELECT} statement uses \texttt{LAST_INSERT_ID(expr)}, \texttt{mysql_insert_id()} returns \texttt{expr}.

- INSERT statements that generate an AUTO_INCREMENT value by inserting \texttt{LAST_INSERT_ID(expr)} into any column or by updating any column to \texttt{LAST_INSERT_ID(expr)}.

- If the previous statement returned an error, the value of \texttt{mysql_insert_id()} is undefined.

The return value of \texttt{mysql_insert_id()} can be simplified to the following sequence:

1. If there is an AUTO_INCREMENT column, and an automatically generated value was successfully inserted, return the first such value.

2. If \texttt{LAST_INSERT_ID(expr)} occurred in the statement, return \texttt{expr}, even if there was an AUTO_INCREMENT column in the affected table.

3. The return value varies depending on the statement used. When called after an INSERT statement:

   - If there is an AUTO_INCREMENT column in the table, and there were some explicit values for this column that were successfully inserted into the table, return the last of the explicit values.

When called after an INSERT \ldots ON DUPLICATE KEY UPDATE statement:

   - If there is an AUTO_INCREMENT column in the table and there were some explicit successfully inserted values or some updated values, return the last of the inserted or updated values.
mysql_insert_id() returns 0 if the previous statement does not use an AUTO_INCREMENT value. If you need to save the value for later, be sure to call mysql_insert_id() immediately after the statement that generates the value.

The value of mysql_insert_id() is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

The LAST_INSERT_ID() SQL function will contain the value of the first automatically generated value that was successfully inserted. LAST_INSERT_ID() is not reset between statements because the value of that function is maintained in the server. Another difference from mysql_insert_id() is that LAST_INSERT_ID() is not updated if you set an AUTO_INCREMENT column to a specific nonspecial value. See Section 12.15, “Information Functions”.

mysql_insert_id() returns 0 following a CALL statement for a stored procedure that generates an AUTO_INCREMENT value because in this case mysql_insert_id() applies to CALL and not the statement within the procedure. Within the procedure, you can use LAST_INSERT_ID() at the SQL level to obtain the AUTO_INCREMENT value.

The reason for the differences between LAST_INSERT_ID() and mysql_insert_id() is that LAST_INSERT_ID() is made easy to use in scripts while mysql_insert_id() tries to provide more exact information about what happens to the AUTO_INCREMENT column.

### Note

The OK packet used in the client/server protocol holds information such as is used for session state tracking. When clients read the OK packet to know whether there is a session state change, this resets values such as the last insert ID and the number of affected rows. Such changes cause mysql_insert_id() to return 0 after execution of commands including but not necessarily limited to COM_PING, COM_REFRESH, and COM_INIT_DB.

### Return Values

Described in the preceding discussion.

### Errors

- **ER_AUTO_INCREMENT_CONFLICT**

  A user-specified AUTO_INCREMENT value in a multi INSERT statement falls within the range between the current AUTO_INCREMENT value and the sum of the current and number of rows affected values.

#### 28.7.7.39 mysql_kill()

```c
int mysql_kill(MYSQL *mysql, unsigned long pid)
```

### Description

**Note**

mysql_kill() is deprecated and will be removed in a future version of MySQL. Instead, use mysql_query() to execute a KILL statement.

Asks the server to kill the thread specified by pid.

This function is deprecated. Use mysql_query() to issue an SQL KILL statement instead.
mysql_kill() cannot handle values larger than 32 bits, but to guard against killing the wrong thread returns an error in these cases:

- If given an ID larger than 32 bits, mysql_kill() returns a CR_INVALID_CONN_HANDLE error.
- After the server's internal thread ID counter reaches a value larger than 32 bits, it returns an ER_DATA_OUT_OF_RANGE error for any mysql_kill() invocation and mysql_kill() fails.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_INVALID_CONN_HANDLE**
  The pid was larger than 32 bits.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

- **ER_DATA_OUT_OF_RANGE**
  The server's internal thread ID counter has reached a value larger than 32 bits, at which point it rejects all mysql_kill() invocations.

28.7.7.40 mysql_library_end()

```c
void mysql_library_end(void)
```

Description

This function finalizes the MySQL client library. Call it when you are done using the library (for example, after disconnecting from the server).

**Note**

To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call mysql_library_end() explicitly. This enables memory management to be performed to clean up and free resources used by the library.

For usage information, see Section 28.7.6, “C API Function Overview”, and Section 28.7.7.41, “mysql_library_init()”.

4754
28.7.41 mysql_library_init()

    int mysql_library_init(int argc, char **argv, char **groups)

Description

Call this function to initialize the MySQL client library before you call any other MySQL function.

Note

To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call mysql_library_end() explicitly. This enables memory management to be performed to clean up and free resources used by the library. See Section 28.7.7.40, “mysql_library_end()”.

In a nonmultithreaded environment, the call to mysql_library_init() may be omitted, because mysql_init() will invoke it automatically as necessary. However, mysql_library_init() is not thread-safe in a multithreaded environment, and thus neither is mysql_init(), which calls mysql_library_init(). You must either call mysql_library_init() prior to spawning any threads, or else use a mutex to protect the call, whether you invoke mysql_library_init() or indirectly through mysql_init(). Do this prior to any other client library call.

The argc, argv, and groups arguments are unused. In older MySQL versions, they were used for applications linked against the embedded server, which is no longer supported. The call now should be written as mysql_library_init(0, NULL, NULL).

```c
#include <mysql.h>
#include <stdlib.h>

int main(void) {
    if (mysql_library_init(0, NULL, NULL)) {
        fprintf(stderr, "could not initialize MySQL client library\n");
        exit(1);
    }

    /* Use any MySQL API functions here */

    mysql_library_end();
    return EXIT_SUCCESS;
}
```

Return Values

Zero for success. Nonzero if an error occurred.

28.7.42 mysql_list_dbs()

    MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)

Description

Returns a result set consisting of database names on the server that match the simple regular expression specified by the wild parameter. wild may contain the wildcard characters % or _, or may be a NULL pointer to match all databases. Calling mysql_list_dbs() is similar to executing the query SHOW DATABASES [LIKE wild].

You must free the result set with mysql_free_result().
Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.
- **CR_OUT_OF_MEMORY**
  Out of memory.
- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.
- **CR_SERVER_LOST**
  The connection to the server was lost during the query.
- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

### 28.7.7.43 `mysql_list_fields()`

```c
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char *wild)
```

Description

Returns an empty result set for which the metadata provides information about the columns in the given table that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters `%` or `_`, or may be a `NULL` pointer to match all fields. Calling `mysql_list_fields()` is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild].`

It is preferable to use `SHOW COLUMNS FROM tbl_name` instead of `mysql_list_fields()`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.
- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.
• **CR_SERVER_LOST**
  The connection to the server was lost during the query.

• **CR_UNKNOWN_ERROR**
  An unknown error occurred.

**Example**

```c
int i;
MYSQL_RES *tbl_cols = mysql_list_fields(mysql, "mytbl", "f%");  
unsigned int field_cnt = mysql_num_fields(tbl_cols);
printf("Number of columns: %d\n", field_cnt);
for (i=0; i < field_cnt; ++i)
{
  /* col describes i-th column of the table */
  MYSQL_FIELD *col = mysql_fetch_field_direct(tbl_cols, i);
  printf("Column %d: %s\n", i, col->name);
}
mysql_free_result(tbl_cols);
```

**28.7.7.44 mysql_list_processes()**

```c
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

**Description**

**Note**

`mysql_list_processes()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a SHOW PROCESSLIST statement.

Returns a result set describing the current server threads. This is the same kind of information as that reported by `mysqladmin processlist` or a SHOW PROCESSLIST query.

You must free the result set with `mysql_free_result()`.

**Return Values**

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

**Errors**

• **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

• **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

• **CR_SERVER_LOST**
  The connection to the server was lost during the query.

• **CR_UNKNOWN_ERROR**
An unknown error occurred.

28.7.7.45 mysql_list_tables()

MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)

Description

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the wild parameter. wild may contain the wildcard characters % or _, or may be a NULL pointer to match all tables. Calling mysql_list_tables() is similar to executing the query SHOW TABLES [LIKE wild].

You must free the result set with mysql_free_result().

Return Values

A MYSQL_RES result set for success. NULL if an error occurred.

Errors

• CR_COMMANDS_OUT_OF_SYNC
  Commands were executed in an improper order.
• CR_SERVER_GONE_ERROR
  The MySQL server has gone away.
• CR_SERVER_LOST
  The connection to the server was lost during the query.
• CR_UNKNOWN_ERROR
  An unknown error occurred.

28.7.7.46 mysql_more_results()

bool mysql_more_results(MYSQL *mysql)

Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute CALL statements, which can return multiple result sets.

mysql_more_results() true if more results exist from the currently executed statement, in which case the application must call mysql_next_result() to fetch the results.

Return Values

TRUE (1) if more results exist. FALSE (0) if no more results exist.

In most cases, you can call mysql_next_result() instead to test whether more results exist and initiate retrieval if so.

See Section 28.7.23, “C API Multiple Statement Execution Support”, and Section 28.7.7.47, “mysql_next_result()”.
Errors

None.

28.7.7.47 mysql_next_result()

```c
int mysql_next_result(MYSQL *mysql)
```

Description

**Note**

```
mysql_next_result() is a synchronous function. Its asynchronous counterpart
is mysql_next_result_nonblocking(), for use by applications that require
asynchronous communication with the server. See Section 28.7.12, “C API
Asynchronous Interface”.
```

`mysql_next_result()` is used when you execute multiple statements specified as a single statement string, or when you use `CALL` statements to execute stored procedures, which can return multiple result sets.

`mysql_next_result()` reads the next statement result and returns a status to indicate whether more results exist. If `mysql_next_result()` returns an error, there are no more results.

Before each call to `mysql_next_result()`, you must call `mysql_free_result()` for the current statement if it is a statement that returned a result set (rather than just a result status).

After calling `mysql_next_result()` the state of the connection is as if you had called `mysql_real_query()` or `mysql_query()` for the next statement. This means that you can call `mysql_store_result()`, `mysql_warning_count()`, `mysql_affected_rows()`, and so forth.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`). `CLIENT_MULTI_RESULTS` is enabled by default.

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_next_result()` to advance to the next result.

For an example that shows how to use `mysql_next_result()`, see Section 28.7.23, “C API Multiple Statement Execution Support”.

**Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Successful and there are more results</td>
</tr>
<tr>
<td>-1</td>
<td>Successful and there are no more results</td>
</tr>
<tr>
<td>&gt;0</td>
<td>An error occurred</td>
</tr>
</tbody>
</table>
Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order. For example, if you did not call `mysql_use_result()` for a previous result set.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

### 28.7.7.48 mysql_num_fields()

```c
unsigned int mysql_num_fields(MYSQL_RES *result)
```

To pass a `MYSQL*` argument instead, use `unsigned int mysql_field_count(MYSQL *mysql)`.

**Description**

Returns the number of columns in a result set.

You can get the number of columns either from a pointer to a result set or to a connection handler. You would use the connection handler if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See Section 28.7.29.1, “Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success”.

**Return Values**

An unsigned integer representing the number of columns in a result set.

**Errors**

None.

**Example**

```c
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql,query_string))
{
    // error
}
else // query succeeded, process any data returned by it
```
An alternative (if you know that your query should have returned a result set) is to replace the
mysql_errno(&mysql) call with a check whether mysql_field_count(&mysql) returns 0. This
happens only if something went wrong.

28.7.7.49 mysql_num_rows()

my_ulonglong mysql_num_rows(MYSQL_RES *result)

Description

Returns the number of rows in the result set.

The use of mysql_num_rows() depends on whether you use mysql_store_result() or
mysql_use_result() to return the result set. If you use mysql_store_result(),
mysql_num_rows() may be called immediately. If you use mysql_use_result(),
mysql_num_rows() does not return the correct value until all the rows in the result set have been
retrieved.

mysql_num_rows() is intended for use with statements that return a result set, such as SELECT. For
statements such as INSERT, UPDATE, or DELETE, the number of affected rows can be obtained with
mysql_affected_rows().

Return Values

The number of rows in the result set.

Errors

None.

28.7.7.50 mysql_options()

int mysql_options(MYSQL *mysql, enum mysql_option option, const void *arg)

Description

Can be used to set extra connect options and affect behavior for a connection. This function may be called
multiple times to set several options. To retrieve option values, use mysql_get_option().
Call `mysql_options()` after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, specify a pointer to the value of the integer as the `arg` argument.

Options for information such as SSL certificate and key files are used to establish an encrypted connection if such connections are available, but do not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the technique described in Section 28.7.22, “C API Encrypted Connection Support”.

The following list describes the possible options, their effect, and how `arg` is used for each option. For option descriptions that indicate `arg` is unused, its value is irrelevant; it is conventional to pass 0.

- **MYSQL_DEFAULT_AUTH** (argument type: `char *`)
  The name of the authentication plugin to use.

- **MYSQL_ENABLE_CLEARTEXT_PLUGIN** (argument type: `bool *`)
  Enable the `mysql_clear_password` cleartext authentication plugin. See Section 6.4.1.4, “Client-Side Cleartext Pluggable Authentication”.

- **MYSQL_INIT_COMMAND** (argument type: `char *`)
  SQL statement to execute when connecting to the MySQL server. Automatically re-executed if reconnection occurs.

- **MYSQL_OPT_BIND** (argument: `char *`)
  The network interface from which to connect to the server. This is used when the client host has multiple network interfaces. The argument is a host name or IP address (specified as a string).

- **MYSQL_OPT_CAN_HANDLE_EXPIRED_PASSWORDS** (argument type: `bool *`)
  Indicate whether the client can handle expired passwords. See Section 6.2.16, “Server Handling of Expired Passwords”.

- **MYSQL_OPT_COMPRESS** (argument: not used)
  Compress all information sent between the client and the server if possible. See Section 4.2.6, “Connection Compression Control”.

As of MySQL 8.0.18, `MYSQL_OPT_COMPRESS` becomes a legacy option, due to the introduction of the `MYSQL_OPT_COMPRESSION_ALGORITHMS` option for more control over connection compression (see Connection Compression Configuration). The meaning of `MYSQL_OPT_COMPRESS` depends on whether `MYSQL_OPT_COMPRESSION_ALGORITHMS` is specified:

- When `MYSQL_OPT_COMPRESSION_ALGORITHMS` is not specified, enabling `MYSQL_OPT_COMPRESS` is equivalent to specifying a client-side algorithm set of `zlib`, uncompressed.

- When `MYSQL_OPT_COMPRESSION_ALGORITHMS` is specified, enabling `MYSQL_OPT_COMPRESS` is equivalent to specifying an algorithm set of `zlib` and the full client-side algorithm set is the union of `zlib` plus the algorithms specified by `MYSQL_OPT_COMPRESSION_ALGORITHMS`. For example, with `MYSQL_OPT_COMPRESS` enabled and `MYSQL_OPT_COMPRESSION_ALGORITHMS` set to `zlib,zstd`, the permitted-algorithm set is `zlib` plus `zlib,zstd`; that is, `zlib,zstd`. With `MYSQL_OPT_COMPRESS` enabled and `MYSQL_OPT_COMPRESSION_ALGORITHMS` set to
zstd, uncompressed, the permitted-algorithm set is zlib plus zstd, uncompressed; that is, zlib, zstd, uncompressed.

As of MySQL 8.0.18, MYSQL_OPT_COMPRESS is deprecated. It will be removed in a future MySQL version. See Legacy Connection Compression Configuration.

• MYSQL_OPT_COMPRESSION_ALGORITHMS (argument type: const char *)

The permitted compression algorithms for connections to the server. The available algorithms are the same as for the protocol_compression_algorithms system variable. If this option is not specified, the default value is uncompressed.

For more information, see Section 4.2.6, “Connection Compression Control”.

This option was added in MySQL 8.0.18.

• MYSQL_OPT_CONNECT_ATTR_DELETE (argument type: char *)

Given a key name, this option deletes a key-value pair from the current set of connection attributes to pass to the server at connect time. The argument is a pointer to a null-terminated string naming the key. Comparison of the key name with existing keys is case-sensitive.

See also the description for the MYSQL_OPT_CONNECT_ATTR_RESET option, as well as the description for the MYSQL_OPT_CONNECT_ATTR_ADD option in the description of the mysql_options4() function. That function description also includes a usage example.

The Performance Schema exposes connection attributes through the session_connect_attrs and session_account_connect_attrs tables. See Section 26.12.9, “Performance Schema Connection Attribute Tables”.

• MYSQL_OPT_CONNECT_ATTR_RESET (argument not used)

This option resets (clears) the current set of connection attributes to pass to the server at connect time.

See also the description for the MYSQL_OPT_CONNECT_ATTR_DELETE option, as well as the description for the MYSQL_OPT_CONNECT_ATTR_ADD option in the description of the mysql_options4() function. That function description also includes a usage example.

The Performance Schema exposes connection attributes through the session_connect_attrs and session_account_connect_attrs tables. See Section 26.12.9, “Performance Schema Connection Attribute Tables”.

• MYSQL_OPT_CONNECT_TIMEOUT (argument type: unsigned int *)

The connect timeout in seconds.

• MYSQL_OPT_GET_SERVER_PUBLIC_KEY (argument type: bool *)

Enables the client to request from the server the public key required for RSA key pair-based password exchange. This option applies to clients that authenticate with the caching_sha2_password authentication plugin. For that plugin, the server does not send the public key unless requested. This option is ignored for accounts that do not authenticate with that plugin. It is also ignored if RSA-based password exchange is not used, as is the case when the client connects to the server using a secure connection.

If MYSQL_SERVER_PUBLIC_KEY is given and specifies a valid public key file, it takes precedence over MYSQL_OPT_GET_SERVER_PUBLIC_KEY.
For information about the `caching_sha2_password` plugin, see Section 6.4.1.3, “Caching SHA-2 Pluggable Authentication”.

- **MYSQL_OPT_LOCAL_INFILE** (argument type: optional pointer to `unsigned int`)

  This option affects client-side `LOCAL` capability for `LOAD DATA` operations. By default, `LOCAL` capability is determined by the default compiled into the MySQL client library (see Section 13.2.7, “LOAD DATA Syntax”). To control this capability explicitly, invoke `mysql_options()` to set the `MYSQL_OPT_LOCAL_INFILE` option:

  - `LOCAL` is disabled if the pointer points to an `unsigned int` that has a zero value.
  - `LOCAL` is enabled if no pointer is given or if the pointer points to an `unsigned int` that has a nonzero value.

  Successful use of a `LOCAL` load operation by a client also requires that the server permits it.

- **MYSQL_OPT_MAX_ALLOWED_PACKET** (argument: `unsigned long *`)

  This option sets the `max_allowed_packet` system variable. If the `mysql` argument is non-`NULL`, the call sets the session system variable value for that session. If `mysql` is `NULL`, the call sets the global system variable value.

- **MYSQL_OPT_NAMEDPIPE** (argument: not used)

  Use a named pipe to connect to the MySQL server on Windows, if the server permits named-pipe connections.

- **MYSQL_OPT_NET_BUFFER_LENGTH** (argument: `unsigned long *`)

  This option sets the `net_buffer_length` system variable. If the `mysql` argument is non-`NULL`, the call sets the session system variable value for that session. If `mysql` is `NULL`, the call sets the global system variable value.

- **MYSQL_OPT_OPTIONAL_RESULTSET_METADATA** (argument type: `bool *`)

  This flag makes result set metadata optional. It is an alternative way of setting the `CLIENT_OPTIONAL_RESULTSET_METADATA` connection flag for the `mysql_real_connect()` function. For details about managing result set metadata transfer, see Section 28.7.27, “C API Optional Result Set Metadata”.

- **MYSQL_OPT_PROTOCOL** (argument type: `unsigned int *`)

  Type of protocol to use. Specify one of the enum values of `mysql_protocol_type` defined in `mysql.h`.

- **MYSQL_OPT_READ_TIMEOUT** (argument type: `unsigned int *`)

  The timeout in seconds for each attempt to read from the server. There are retries if necessary, so the total effective timeout value is three times the option value. You can set the value so that a lost connection can be detected earlier than the TCP/IP `Close_Wait_Timeout` value of 10 minutes.

- **MYSQL_OPT_RECONNECT** (argument type: `bool *`)

  Enable or disable automatic reconnection to the server if the connection is found to have been lost. Reconnect is off by default; this option provides a way to set reconnection behavior explicitly. See Section 28.7.28, “C API Automatic Reconnection Control”.
C API Function Descriptions

- **MYSQL_OPT_RETRY_COUNT** (argument type: `unsigned int *`)
  
The retry count for I/O-related system calls that are interrupted while connecting to the server or communicating with it. If this option is not specified, the default value is 1 (1 retry if the initial call is interrupted for 2 tries total).

  This option can be used only by clients that link against a C client library compiled with NDB Cluster support.

- **MYSQL_OPT_SSL_CA** (argument type: `char *`)
  
The path name of the Certificate Authority (CA) certificate file. This option, if used, must specify the same certificate used by the server.

- **MYSQL_OPT_SSL_CAPATH** (argument type: `char *`)
  
The path name of the directory that contains trusted SSL CA certificate files.

- **MYSQL_OPT_SSL_CERT** (argument type: `char *`)
  
The path name of the client public key certificate file.

- **MYSQL_OPT_SSL_CIPHER** (argument type: `char *`)
  
The list of permissible ciphers for SSL encryption.

- **MYSQL_OPT_SSL_CRL** (argument type: `char *`)
  
The path name of the file containing certificate revocation lists.

- **MYSQL_OPT_SSL_CRLPATH** (argument type: `char *`)
  
The path name of the directory that contains files containing certificate revocation lists.

- **MYSQL_OPT_SSL_FIPS_MODE** (argument type: `unsigned int *`)
  
Controls whether to enable FIPS mode on the client side. The `MYSQL_OPT_SSL_FIPS_MODE` option differs from other `MYSQL_OPT_SSL_xxx` options in that it is not used to establish encrypted connections, but rather to affect which cryptographic operations are permitted. See Section 6.5, “FIPS Support”.

  Permitted option values are `SSL_FIPS_MODE_OFF`, `SSL_FIPS_MODE_ON`, and `SSL_FIPS_MODE_STRICT`.

  **Note**
  
If the OpenSSL FIPS Object Module is not available, the only permitted value for `MYSQL_OPT_SSL_FIPS_MODE` is `SSL_FIPS_MODE_OFF`. In this case, setting `MYSQL_OPT_SSL_FIPS_MODE` to `SSL_FIPS_MODE_ON` or `SSL_FIPS_MODE_STRICT` causes the client to produce a warning at startup and to operate in non-FIPS mode.

- **MYSQL_OPT_SSL_KEY** (argument type: `char *`)
  
The path name of the client private key file.

- **MYSQL_OPT_SSL_MODE** (argument type: `unsigned int *`)
  
The security state to use for the connection to the server: `SSL_MODE_DISABLED`, `SSL_MODE_PREFERRED`, `SSL_MODE_REQUIRED`, `SSL_MODE_VERIFY_CA`, `SSL_MODE_ENCRYPT_ALL`, `SSL_MODE_SYS_DEFAULT`, and `SSL_MODE_VERIFY_NONE`. The default value is `SSL_MODE_SYS_DEFAULT` or `SSL_MODE_ENCRYPT_ALL` depending on whether the `--default-ssl-priority` option is enabled.

---

4765
SSL_MODE_VERIFY_IDENTITY. If this option is not specified, the default is SSL_MODE_PREFERRED. These modes are the permitted values of the mysql_ssl_mode enumeration defined in mysql.h. For more information about the security states, see the description of --ssl-mode in Command Options for Encrypted Connections.

- **MYSQL_OPT_TLS_CIPHERSUITES** (argument type: `char *`)
  Which TLSv1.3 ciphersuites the client permits for encrypted connections. The value is a list of one or more colon-separated ciphersuite names. The ciphersuites that can be named for this option depend on the SSL library used to compile MySQL. For details, see Section 6.3.5, “Encrypted Connection Protocols and Ciphers”.

  This option was added in MySQL 8.0.16.

- **MYSQL_OPT_TLS_VERSION** (argument type: `char *`)
  Which protocols the client permits for encrypted connections. The value is a list of one or more comma-separated protocol names. The protocols that can be named for this option depend on the SSL library used to compile MySQL. For details, see Section 6.3.5, “Encrypted Connection Protocols and Ciphers”.

- **MYSQL_OPT_USE_RESULT** (argument: not used)
  This option is unused.

- **MYSQL_OPT_WRITE_TIMEOUT** (argument type: `unsigned int *`)
  The timeout in seconds for each attempt to write to the server. There is a retry if necessary, so the total effective timeout value is two times the option value.

- **MYSQL_OPT_ZSTD_COMPRESSION_LEVEL** (argument type: `unsigned int *`)
  The compression level to use for connections to the server that use the zstd compression algorithm. The permitted levels are from 1 to 22, with larger values indicating increasing levels of compression. If this option is not specified, the default zstd compression level is 3. The compression level setting has no effect on connections that do not use zstd compression.

  For more information, see Section 4.2.6, “Connection Compression Control”.

  This option was added in MySQL 8.0.18.

- **MYSQL_PLUGIN_DIR** (argument type: `char *`)
  The directory in which to look for client plugins.

- **MYSQL_READ_DEFAULT_FILE** (argument type: `char *`)
  Read options from the named option file instead of from my.cnf.

- **MYSQL_READ_DEFAULT_GROUP** (argument type: `char *`)
  Read options from the named group from my.cnf or the file specified with MYSQL_READ_DEFAULT_FILE.

- **MYSQL_REPORT_DATA_TRUNCATION** (argument type: `bool *`)
  Enable or disable reporting of data truncation errors for prepared statements using the error member of MYSQL_BIND structures. (Default: enabled.)

- **MYSQL_SERVER_PUBLIC_KEY** (argument type: `char *`
The path name of the file containing a client-side copy of the public key required by the server for RSA key pair-based password exchange. The file must be in PEM format. This option applies to clients that authenticate with the sha256_password or caching_sha2_password authentication plugin. This option is ignored for accounts that do not authenticate with one of those plugins. It is also ignored if RSA-based password exchange is not used, as is the case when the client connects to the server using a secure connection.

If MYSQL_SERVER_PUBLIC_KEY is given and specifies a valid public key file, it takes precedence over MYSQL_OPT_GET_SERVER_PUBLIC_KEY.

For information about the sha256_password and caching_sha2_password plugins, see Section 6.4.1.2, “SHA-256 Pluggable Authentication”, and Section 6.4.1.3, “Caching SHA-2 Pluggable Authentication”.

- **MYSQL_SET_CHARSET_DIR** (argument type: char *)
  
  The path name of the directory that contains character set definition files.

- **MYSQL_SET_CHARSET_NAME** (argument type: char *)
  
  The name of the character set to use as the default character set. The argument can be MYSQL_AUTODETECT_CHARSET_NAME to cause the character set to be autodetected based on the operating system setting (see Section 10.4, “Connection Character Sets and Collations”).

- **MYSQL_SHARED_MEMORY_BASE_NAME** (argument type: char *)
  
  The name of the shared-memory object for communication to the server on Windows, if the server supports shared-memory connections. Specify the same value as used for the shared_memory_base_name system variable of the mysql server you want to connect to.

The **client** group is always read if you use MYSQL_READ_DEFAULT_FILE or MYSQL_READ_DEFAULT_GROUP.

The specified group in the option file may contain the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>character-sets-dir=dir_name</td>
<td>The directory where character sets are installed.</td>
</tr>
<tr>
<td>compress</td>
<td>Use the compressed client/server protocol.</td>
</tr>
<tr>
<td>connect-timeout=seconds</td>
<td>The connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.</td>
</tr>
<tr>
<td>database=db_name</td>
<td>Connect to this database if no database was specified in the connect command.</td>

<td>Key file.</td>
</tr>
<tr>
<td>timeout=seconds</td>
<td>Like connect-timeout.</td>
</tr>
<tr>
<td>user</td>
<td>Default user.</td>
</tr>
</tbody>
</table>

`timeout` has been replaced by `connect-timeout`, but `timeout` is still supported for backward compatibility.

For more information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

**Return Values**

Zero for success. Nonzero if you specify an unknown option.

**Example**

The following `mysql_options()` calls request the use of compression in the client/server protocol, cause options to be read from the [odbc] group in option files, and disable transaction autocommit mode:

```c
MYSQL mysql;
mysql_init(&mysql);
mysql_options(&mysql, MYSQL_OPT_COMPRESS, 0);
```
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"odbc");
mysql_options(&mysql,MYSQL_INIT_COMMAND,"SET autocommit=0");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}

28.7.7.51 mysql_options4()

int mysql_options4(MYSQL *mysql, enum mysql_option option, const void *arg1,
                 const void *arg2)

Description

mysql_options4() is similar to mysql_options() but has an extra fourth argument so that two values
 can be passed for the option specified in the second argument.

The following list describes the permitted options, their effect, and how arg1 and arg2 are used.

• MYSQL_OPT_CONNECT_ATTR_ADD (argument types: char *, char *)

    This option adds an attribute key-value pair to the current set of connection attributes to pass to the
    server at connect time. Both arguments are pointers to null-terminated strings. The first and second
    strings indicate the key and value, respectively. If the key is empty or already exists in the current set of
    connection attributes, an error occurs. Comparison of the key name with existing keys is case-sensitive.

    Key names that begin with an underscore (_) are reserved for internal use and should not be created
by application programs. This convention permits new attributes to be introduced by MySQL without
colliding with application attributes.

    mysql_options4() imposes a limit of 64KB on the aggregate size of connection attribute data
it will accept. For calls that cause this limit to be exceeded, a CR_INVALID_PARAMETER_NO
error occurs. Attribute size-limit checks also occur on the server side. For details, see
Section 26.12.9, “Performance Schema Connection Attribute Tables”, which also describes how the
Performance Schema exposes connection attributes through the session_connect_attrs and
session_account_connect_attrs tables.

    See also the descriptions for the MYSQL_OPT_CONNECT_ATTR_RESET and
MYSQL_OPT_CONNECT_ATTR_DELETE options in the description of the mysql_options() function.

Return Values

Zero for success. Nonzero if you specify an unknown option.

Errors

• CR_DUPLICATE_CONNECTION_ATTR

    A duplicate attribute name was specified.

• CR_INVALID_PARAMETER_NO

    A key name was empty or the amount of key-value connection attribute data exceeds 64KB limit.

• CR_OUT_OF_MEMORY

    Out of memory.
Example

This example demonstrates the calls that specify connection attributes:

```c
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql, MYSQL_OPT_CONNECT_ATTR_RESET, 0);
mysql_options4(&mysql, MYSQL_OPT_CONNECT_ATTR_ADD, "key1", "value1");
mysql_options4(&mysql, MYSQL_OPT_CONNECT_ATTR_ADD, "key2", "value2");
mysql_options4(&mysql, MYSQL_OPT_CONNECT_ATTR_ADD, "key3", "value3");
mysql_options(&mysql, MYSQL_OPT_CONNECT_ATTR_DELETE, "key1");
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

28.7.7.52 mysql_ping()

```c
int mysql_ping(MYSQL *mysql)
```

Description

Checks whether the connection to the server is working. If the connection has gone down and auto-reconnect is enabled, an attempt to reconnect is made. If the connection is down and auto-reconnect is disabled, mysql_ping() returns an error.

Auto-reconnect is disabled by default. To enable it, call mysql_options() with the MYSQL_OPT_RECONNECT option. For details, see Section 28.7.7.50, "mysql_options()".

mysql_ping() can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

If mysql_ping() does cause a reconnect, there is no explicit indication of it. To determine whether a reconnect occurs, call mysql_thread_id() to get the original connection identifier before calling mysql_ping(), then call mysql_thread_id() again to see whether the identifier has changed.

If reconnect occurs, some characteristics of the connection will have been reset. For details about these characteristics, see Section 28.7.28, "C API Automatic Reconnection Control".

Return Values

Zero if the connection to the server is active. Nonzero if an error occurred. A nonzero return does not indicate whether the MySQL server itself is down; the connection might be broken for other reasons such as network problems.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.
28.7.53 mysql_query()

```c
int mysql_query(MYSQL *mysql, const char *stmt_str)
```

**Description**

Executes the SQL statement pointed to by the null-terminated string `stmt_str`. Normally, the string must consist of a single SQL statement without a terminating semicolon (`;`) or `\g`. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See Section 28.7.23, “C API Multiple Statement Execution Support”.

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the `\0` character, which `mysql_query()` interprets as the end of the statement string.)

If you want to know whether the statement returns a result set, you can use `mysql_field_count()` to check for this. See Section 28.7.22, “mysql_field_count()”.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

28.7.54 mysql_real_connect()

```c
MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long client_flag)
```

**Description**

mysql_real_connect() is a synchronous function. Its asynchronous counterpart is `mysql_real_connect_nonblocking()`, for use by applications that require asynchronous communication with the server. See Section 28.7.12, “C API Asynchronous Interface”.

`mysql_real_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_real_connect()` must complete successfully before you can execute any other API functions that require a valid `MYSQL` connection handler structure.
The parameters are specified as follows:

- For the first parameter, specify the address of an existing `MYSQL` structure. Before calling `mysql_real_connect()`, call `mysql_init()` to initialize the `MYSQL` structure. You can change a lot of connect options with the `mysql_options()` call. See Section 28.7.7.50, “mysql_options()”.

- The value of `host` may be either a host name or an IP address. The client attempts to connect as follows:
  
  - If `host` is `NULL` or the string "localhost", a connection to the local host is assumed:
    
    - On Windows, the client connects using a shared-memory connection, if the server has shared-memory connections enabled.
    
    - On Unix, the client connects using a Unix socket file. The `unix_socket` parameter or the `MYSQL_UNIX_PORT` environment variable may be used to specify the socket name.
    
    - On Windows, if `host` is ".", or TCP/IP is not enabled and no `unix_socket` is specified or the host is empty, the client connects using a named pipe, if the server has named-pipe connections enabled. If named-pipe connections are not enabled, an error occurs.
    
  - Otherwise, TCP/IP is used.

You can also influence the type of connection to use with the `MYSQL_OPT_PROTOCOL` or `MYSQL_OPT_NAMED_PIPE` options to `mysql_options()`. The type of connection must be supported by the server.

- The `user` parameter contains the user’s MySQL login ID. If `user` is `NULL` or the empty string "", the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current user name must be specified explicitly. See the Connector/ODBC section of Chapter 28, Connectors and APIs.

- The `passwd` parameter contains the password for `user`. If `passwd` is `NULL`, only entries in the `user` table for the user that have a blank (empty) password field are checked for a match. This enables the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

  **Note**

  Do not attempt to encrypt the password before calling `mysql_real_connect()`; password encryption is handled automatically by the client API.

- The `user` and `passwd` parameters use whatever character set has been configured for the `MYSQL` object. By default, this is utf8mb4, but can be changed by calling `mysql_options(mysql, MYSQL_SET_CHARSET_NAME, "charset_name")` prior to connecting.

- `db` is the database name. If `db` is not `NULL`, the connection sets the default database to this value.

- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.

- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe to use. Note that the `host` parameter determines the type of the connection.

- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features:
• **CAN_HANDLE_EXPIRED_PASSWORDS**: The client can handle expired passwords. For more information, see Section 6.2.16, “Server Handling of Expired Passwords”.

• **CLIENT_COMPRESS**: Use compression in the client/server protocol.

• **CLIENT_FOUND_ROWS**: Return the number of found (matched) rows, not the number of changed rows.

• **CLIENT_IGNORE_SIGPIPE**: Prevents the client library from installing a SIGPIPE signal handler. This can be used to avoid conflicts with a handler that the application has already installed.

• **CLIENT_IGNORE_SPACE**: Permit spaces after function names. Makes all functions names reserved words.

• **CLIENT_INTERACTIVE**: Permit interactive_timeout seconds of inactivity (rather than wait_timeout seconds) before closing the connection. The client's session wait_timeout variable is set to the value of the session interactive_timeout variable.

• **CLIENT_LOCAL_FILES**: Enable LOAD DATA LOCAL handling.

• **CLIENT_MULTI_RESULTS**: Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This flag is automatically enabled if CLIENT_MULTI_STATEMENTS is enabled. See the note following this table for more information about this flag.

• **CLIENT_MULTI_STATEMENTS**: Tell the server that the client may send multiple statements in a single string (separated by ; characters). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag.

• **CLIENT_NO_SCHEMA** Do not permit `db_name.tbl_name.col_name` syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.

• **CLIENT_ODBC**: Unused.

• **CLIENT_OPTIONAL_RESULTSET_METADATA**: This flag makes result set metadata optional. Suppression of metadata transfer can improve performance, particularly for sessions that execute many queries that return few rows each. For details about managing result set metadata transfer, see Section 28.7.27, “C API Optional Result Set Metadata”.

• **CLIENT_SSL**: Use SSL (encrypted protocol). Do not set this option within an application program; it is set internally in the client library. Instead, use `mysql_options()` or `mysql_ssl_set()` before calling `mysql_real_connect()`.

• **CLIENT_REMEMBER_OPTIONS**: Remember options specified by calls to `mysql_options()`. Without this option, if `mysql_real_connect()` fails, you must repeat the `mysql_options()` calls before trying to connect again. With this option, the `mysql_options()` calls need not be repeated.

If your program uses CALL statements to execute stored procedures, the CLIENT_MULTI_RESULTS flag must be enabled. This is because each CALL returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because CALL can return multiple results, process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

CLIENT_MULTI_RESULTS can be enabled when you call `mysql_real_connect()`, either explicitly by passing the CLIENT_MULTI_RESULTS flag itself, or implicitly by passing CLIENT_MULTI_STATEMENTS (which also enables CLIENT_MULTI_RESULTS). CLIENT_MULTI_RESULTS is enabled by default.
If you enable `CLIENT_MULTI_STATEMENTS` or `CLIENT_MULTI_RESULTS`, process the result for every call to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see Section 28.7.23, "C API Multiple Statement Execution Support".

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the `mysql_real_connect()` call. To do this, call `mysql_options()` with the `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP` option before calling `mysql_real_connect()`. Then, in the `mysql_real_connect()` call, specify the "no-value" value for each parameter to be read from an option file:

- For `host`, specify a value of `NULL` or the empty string ("").
- For `user`, specify a value of `NULL` or the empty string.
- For `passwd`, specify a value of `NULL`. (For the password, a value of the empty string in the `mysql_real_connect()` call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For `db`, specify a value of `NULL` or the empty string.
- For `port`, specify a value of 0.
- For `unix_socket`, specify a value of `NULL`.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

Return Values

A `MYSQL*` connection handler if the connection was successful, `NULL` if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

Errors

- **CR_CONN_HOST_ERROR**
  Failed to connect to the MySQL server.
- **CR_CONNECTION_ERROR**
  Failed to connect to the local MySQL server.
- **CR_IPSOCK_ERROR**
  Failed to create an IP socket.
- **CR_OUT_OF_MEMORY**
  Out of memory.
- **CR_SOCKET_CREATE_ERROR**
  Failed to create a Unix socket.
- **CR_UNKNOWN_HOST**
  Failed to find the IP address for the host name.
- **CR_VERSION_ERROR**
A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version.

- **CR_NAMEDPIPEOPEN_ERROR**
  Failed to create a named pipe on Windows.

- **CR_NAMEDPIPEWAIT_ERROR**
  Failed to wait for a named pipe on Windows.

- **CR_NAMEDPIPESETSTATE_ERROR**
  Failed to get a pipe handler on Windows.

- **CR_SERVER_LOST**
  If `connect_timeout` > 0 and it took longer than `connect_timeout` seconds to connect to the server or if the server died while executing the `init-command`.

- **CR_ALREADY_CONNECTED**
  The `MYSQL` connection handler is already connected.

Example

```c
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"your_prog_name");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n", mysql_error(&mysql));
}
```

By using `mysql_options()` the MySQL client library reads the `[client]` and `[your_prog_name]` sections in the `my.cnf` file which ensures that your program works, even if someone has set up MySQL in some nonstandard way.

Upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of 1 in versions of the API older than 5.0.3, or 0 in newer versions. A value of 1 for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior.

### 28.7.55 mysql_real_escape_string()

```c
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const char *from, unsigned long length)
```

**Description**

This function creates a legal SQL string for use in an SQL statement. See Section 9.1.1, “String Literals”.

**Note**

`mysql_real_escape_string()` fails and produces an `CR_INSECURE_API_ERR` error if the `NO_BACKSLASH_ESCAPES` SQL mode is enabled. In this case, the
function cannot escape quote characters except by doubling them, and to do this properly, it must know more information about the quoting context than is available. Instead, use \texttt{mysql\_real\_escape\_string\_quote()}, which takes an extra argument for specifying the quoting context.

The \texttt{mysql} argument must be a valid, open connection because character escaping depends on the character set in use by the server.

The string in the \texttt{from} argument is encoded to produce an escaped SQL string, taking into account the current character set of the connection. The result is placed in the \texttt{to} argument, followed by a terminating null byte.

Characters encoded are \texttt{\}, \texttt{,} , '', \texttt{\texttt{\n}}, \texttt{\texttt{\r}}, and Control-Z. Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. \texttt{mysql\_real\_escape\_string()} quotes the other characters to make them easier to read in log files. For comparison, see the quoting rules for literal strings and the \texttt{QUOTE()} SQL function in Section 9.1.1, “String Literals”, and Section 12.5, “String Functions and Operators”.

The string pointed to by \texttt{from} must be \texttt{length} bytes long. You must allocate the \texttt{to} buffer to be at least \texttt{length*2+1} bytes long. (In the worst case, each character may need to be encoded as using two bytes, and there must be room for the terminating null byte.) When \texttt{mysql\_real\_escape\_string()} returns, the contents of \texttt{to} is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

If you must change the character set of the connection, use the \texttt{mysql\_set\_character\_set()} function rather than executing a \texttt{SET NAMES} (or \texttt{SET CHARACTER SET}) statement. \texttt{mysql\_set\_character\_set()} works like \texttt{SET NAMES} but also affects the character set used by \texttt{mysql\_real\_escape\_string()}, which SET NAMES does not.

**Example**

The following example inserts two escaped strings into an \texttt{INSERT} statement, each within single quote characters:

```c
char query[1000],*end;
end = my_stpcpy(query,"INSERT INTO test_table VALUES(''");
end += mysql_real_escape_string(&mysql,end,"What is this",12);
end += mysql_real_escape_string(&mysql,end,"binary data: \\0\\r\n",16);
end = my_stpcpy(end,"'");

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
    { printf(stderr, "Failed to insert row, Error: %s\n", mysql_error(&mysql));
         mysql_close(&mysql);
    }
```

The \texttt{my\_stpcpy()} function used in the example is included in the \texttt{libmysqlclient} library and works like \texttt{strcpy()} but returns a pointer to the terminating null of the first parameter.

**Return Values**

The length of the encoded string that is placed into the \texttt{to} argument, not including the terminating null byte, or -1 if an error occurs.

Because \texttt{mysql\_real\_escape\_string()} returns an unsigned value, you can check for -1 by comparing the return value to \texttt{(unsigned long)\-1} (or to \texttt{(unsigned long)\~0}, which is equivalent).
Errors

- **CR_INSECURE_API_ERR**

  This error occurs if the `NO_BACKSLASH_ESCAPES` SQL mode is enabled because, in that case, `mysql_real_escape_string()` cannot be guaranteed to produce a properly encoded result. To avoid this error, use `mysql_real_escape_string_quote()` instead.

### 28.7.7.56 mysql_real_escape_string_quote()

```c
unsigned long mysql_real_escape_string_quote(MYSQL *mysql, char *to, const char *from, unsigned long length, char quote)
```

**Description**

This function creates a legal SQL string for use in an SQL statement. See [Section 9.1.1, “String Literals”](#).

The `mysql` argument must be a valid, open connection because character escaping depends on the character set in use by the server.

The string in the `from` argument is encoded to produce an escaped SQL string, taking into account the current character set of the connection. The result is placed in the `to` argument, followed by a terminating null byte.

Characters encoded are `\`, `'`, `"`, NUL (ASCII 0), `\n`, `\r`, Control+Z, and `.`. Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. `mysql_real_escape_string_quote()` quotes the other characters to make them easier to read in log files. For comparison, see the quoting rules for literal strings and the `QUOTE()` SQL function in [Section 9.1.1, “String Literals”](#), and [Section 12.5, “String Functions and Operators”](#).

**Note**

If the `ANSI_QUOTES` SQL mode is enabled,

`mysql_real_escape_string_quote()` cannot be used to escape double quote characters for use within double-quoted identifiers. (The function cannot tell whether the mode is enabled to determine the proper escaping character.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and there must be room for the terminating null byte.) When `mysql_real_escape_string_quote()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

The `quote` argument indicates the context in which the escaped string is to be placed. Suppose that you intend to escape the `from` argument and insert the escaped string (designated here by `str`) into one of the following statements:

1) `SELECT * FROM table WHERE name = 'str'
2) `SELECT * FROM table WHERE name = "str"
3) `SELECT * FROM `str` WHERE id = 103`

To perform escaping properly for each statement, call `mysql_real_escape_string_quote()` as follows, where the final argument indicates the quoting context:

```c
1) len = mysql_real_escape_string_quote(&mysql, to, from, from_len, '\''');
```
If you must change the character set of the connection, use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string_quote()`, which `SET NAMES` does not.

**Example**

The following example inserts two escaped strings into an `INSERT` statement, each within single quote characters:

```c
char query[1000], *end;
end = my_stpcpy(query, "INSERT INTO test_table VALUES('");
end += mysql_real_escape_string_quote(&mysql, end, "What is this", 12, '\'');
end = my_stpcpy(end, ', ');
end += mysql_real_escape_string_quote(&mysql, end, "binary data: \0\r\n", 16, '\'');
end = my_stpcpy(end, '")
if (mysql_real_query(&mysql, query, (unsigned int)(end - query)))
    {fprintf(stderr, "Failed to insert row, Error: %s\n", mysql_error(&mysql));}
```

The `my_stpcpy()` function used in the example is included in the `libmysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

**Return Values**

The length of the encoded string that is placed into the `to` argument, not including the terminating null byte.

**Errors**

None.

### 28.7.57 mysql_real_query()

```c
int mysql_real_query(MYSQL *mysql, const char *stmt_str, unsigned long length)
```

**Description**

`mysql_real_query()` is a synchronous function. Its asynchronous counterpart is `mysql_real_query_nonblocking()`, for use by applications that require asynchronous communication with the server. See Section 28.7.12, “C API Asynchronous Interface”.

`mysql_real_query()` executes the SQL statement pointed to by `stmt_str`, a string `length` bytes long. Normally, the string must consist of a single SQL statement without a terminating semicolon (`;`) or `\g`. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See Section 28.7.23, “C API Multiple Statement Execution Support”.

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the `\0` character, which `mysql_query()`
interprets as the end of the statement string.) In addition, \texttt{mysql\_real\_query()} is faster than \texttt{mysql\_query()} because it does not call \texttt{strlen()} on the statement string.

If you want to know whether the statement returns a result set, you can use \texttt{mysql\_field\_count()} to check for this. See \texttt{Section 28.7.7.22, “mysql\_field\_count()”}.

\section*{Return Values}

Zero for success. Nonzero if an error occurred.

\section*{Errors}

\begin{itemize}
  \item \texttt{CR\_COMMANDS\_OUT\_OF\_SYNC}
    \begin{flushleft}
    Commands were executed in an improper order.
    \end{flushleft}
  \item \texttt{CR\_SERVER\_GONE\_ERROR}
    \begin{flushleft}
    The MySQL server has gone away.
    \end{flushleft}
  \item \texttt{CR\_SERVER\_LOST}
    \begin{flushleft}
    The connection to the server was lost during the query.
    \end{flushleft}
  \item \texttt{CR\_UNKNOWN\_ERROR}
    \begin{flushleft}
    An unknown error occurred.
    \end{flushleft}
\end{itemize}

\section*{28.7.7.58 \texttt{mysql\_refresh()}}

\begin{verbatim}
int mysql_refresh(MYSQL *mysql, unsigned int options)
\end{verbatim}

\section*{Description}

\begin{itemize}
  \item \texttt{Note}
    \begin{flushleft}
    \texttt{mysql\_refresh()} is deprecated and will be removed in a future version of MySQL. Instead, use \texttt{mysql\_query()} to execute a FLUSH statement.
    \end{flushleft}
  \item This function flushes tables or caches, or resets replication server information. The connected user must have the \texttt{RELOAD} privilege.
  \item The \texttt{options} argument is a bitmask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.
  \begin{itemize}
    \item \texttt{REFRESH\_GRANT}
      \begin{flushleft}
      Refresh the grant tables, like \texttt{FLUSH PRIVILEGES}.
      \end{flushleft}
    \item \texttt{REFRESH\_LOG}
      \begin{flushleft}
      Flush the logs, like \texttt{FLUSH LOGS}.
      \end{flushleft}
    \item \texttt{REFRESH\_TABLES}
      \begin{flushleft}
      Flush the table cache, like \texttt{FLUSH TABLES}.
      \end{flushleft}
    \item \texttt{REFRESH\_HOSTS}
  \end{itemize}
\end{itemize}
Flush the host cache, like `FLUSH HOSTS`.

* `REFRESH_STATUS`
  Reset status variables, like `FLUSH STATUS`.

* `REFRESH_THREADS`
  Flush the thread cache.

* `REFRESH_SLAVE`
  On a slave replication server, reset the master server information and restart the slave, like `RESET SLAVE`.

* `REFRESH_MASTER`
  On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like `RESET MASTER`.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

* `CR_COMMANDS_OUT_OF_SYNC`
  Commands were executed in an improper order.

* `CR_SERVER_GONE_ERROR`
  The MySQL server has gone away.

* `CR_SERVER_LOST`
  The connection to the server was lost during the query.

* `CR_UNKNOWN_ERROR`
  An unknown error occurred.

### 28.7.7.59 mysql_reload()

```c
int mysql_reload(MYSQL *mysql)
```

**Description**

Asks the MySQL server to reload the grant tables. The connected user must have the `RELOAD` privilege.

This function is deprecated. Use `mysql_query()` to issue an SQL `FLUSH PRIVILEGES` statement instead.

**Return Values**

Zero for success. Nonzero if an error occurred.
Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

### 28.7.7.60 mysql_reset_connection()

```c
int mysql_reset_connection(MYSQL *mysql)
```

**Description**

Resets the connection to clear the session state.

`mysql_reset_connection()` has effects similar to `mysql_change_user()` or an auto-reconnect except that the connection is not closed and reopened, and reauthentication is not done. The write set session history is reset. See Section 28.7.7.3, “mysql_change_user()” and see Section 28.7.28, “C API Automatic Reconnection Control”.

The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session system variables are reinitialized to the values of the corresponding global system variables, including system variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.

**Return Values**

Zero for success. Nonzero if an error occurred.

### 28.7.7.61 mysql_reset_server_public_key()
void mysql_reset_server_public_key(void)

Description

Cleans from the client library any cached copy of the public key required by the server for RSA key pair-based password exchange. This might be necessary when the server has been restarted with a different RSA key pair after the client program had called mysql_options() with the MYSQL_SERVER_PUBLIC_KEY option to specify the RSA public key. In such cases, connection failure can occur due to key mismatch. To fix this problem, the client can use either of the following approaches:

- The client can call mysql_reset_server_public_key() to clear the cached key and try again, after the public key file on the client side has been replaced with a file containing the new public key.
- The client can call mysql_reset_server_public_key() to clear the cached key, then call mysql_options() with the MYSQL_OPT_GET_SERVER_PUBLIC_KEY option (instead of MYSQL_SERVER_PUBLIC_KEY) to request the required public key from the server. Do not use both MYSQL_OPT_GET_SERVER_PUBLIC_KEY and MYSQL_SERVER_PUBLIC_KEY because in that case, MYSQL_SERVER_PUBLIC_KEY takes precedence.

Return Values

None.

Errors

None.

28.7.7.62 mysql_result_metadata()

enum enum_resultset_metadata mysql_result_metadata(MYSQL_RES *result)

Description

mysql_result_metadata() returns a value that indicates whether a result set has metadata. It can be useful for metadata-optional connections when the client does not know in advance whether particular result sets have metadata. For example, if a client executes a stored procedure that returns multiple result sets and might change the resultset_metadata system variable, the client can invoke mysql_result_metadata() for each result set to determine whether it has metadata.

For details about managing result set metadata transfer, see Section 28.7.27, “C API Optional Result Set Metadata”.

Return Values

mysql_result_metadata() returns one of these values:

enum enum_resultset_metadata {
  RESULTSET_METADATA_NONE= 0,
  RESULTSET_METADATA_FULL= 1
};

28.7.7.63 mysql_rollback()

bool mysql_rollback(MYSQL *mysql)
Description

Rolls back the current transaction.

The action of this function is subject to the value of the completion_type system variable. In particular, if the value of completion_type is RELEASE (or 2), the server performs a release after terminating a transaction and closes the client connection. Call mysql_close() from the client program to close the connection from the client side.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

28.7.7.64 mysql_row_seek()

MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET offset)

Description

Sets the row cursor to an arbitrary row in a query result set. The offset value is a row offset, typically a value returned from mysql_row_tell() or from mysql_row_seek(). This value is not a row number; to seek to a row within a result set by number, use mysql_data_seek() instead.

This function requires that the result set structure contains the entire result of the query, so mysql_row_seek() may be used only in conjunction with mysql_store_result(), not with mysql_use_result().

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to mysql_row_seek().

Errors

None.

28.7.7.65 mysql_row_tell()

MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)

Description

Returns the current position of the row cursor for the last mysql_fetch_row(). This value can be used as an argument to mysql_row_seek().

Use mysql_row_tell() only after mysql_store_result(), not after mysql_use_result().

Return Values

The current offset of the row cursor.
Errors
None.

28.7.7.66 mysql_select_db()

```c
int mysql_select_db(MYSQL *mysql, const char *db)
```

Description
Causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that include no explicit database specifier.

`mysql_select_db()` fails unless the connected user can be authenticated as having permission to use the database or some object within it.

Return Values
Zero for success. Nonzero if an error occurred.

Errors
- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.
- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.
- **CR_SERVER_LOST**
  The connection to the server was lost during the query.
- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

28.7.7.67 mysql_server_end()

```c
void mysql_server_end(void)
```

Description
This function finalizes the MySQL client library, which should be done when you are done using the library. However, `mysql_server_end()` is deprecated and `mysql_library_end()` should be used instead. See Section 28.7.7.40, “mysql_library_end()”.

Note
To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call `mysql_server_end()` (or `mysql_library_end()`) explicitly. This enables memory management to be performed to clean up and free resources used by the library.

Return Values
None.
28.7.68 mysql_server_init()

    int mysql_server_init(int argc, char **argv, char **groups)

Description

This function initializes the MySQL client library, which must be done before you call any other MySQL function. However, `mysql_server_init()` is deprecated and you should call `mysql_library_init()` instead. See Section 28.7.7.41, "mysql_library_init()".

Note

To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call `mysql_server_end()` (or `mysql_library_end()`) explicitly. This enables memory management to be performed to clean up and free resources used by the library. See Section 28.7.7.40, "mysql_library_end()".

Return Values

Zero for success. Nonzero if an error occurred.

28.7.69 mysql_session_track_get_first()

    int mysql_session_track_get_first(MYSQL *mysql, enum enum_session_state_type type, const char **data, size_t *length)

Description

MySQL implements a session tracker mechanism whereby the server returns information about session state changes to clients. To control which notifications the server provides about state changes, client applications set system variables having names of the form `session_track_xxx`, such as `session_track_state_change`, `session_track_schema`, and `session_track_system_variables`. See Section 5.1.15, “Server Tracking of Client Session State Changes”.

Change notification occurs in the MySQL client/server protocol, which includes tracker information in OK packets so that session state changes can be detected. To enable client applications to extract state-change information from OK packets, the MySQL C API provides a pair of functions:

- `mysql_session_track_get_first()` fetches the first part of the state-change information received from the server.
- `mysql_session_track_get_next()` fetches any remaining state-change information received from the server. Following a successful call to `mysql_session_track_get_first()`, call this function repeatedly as long as it returns success.

The `mysql_session_track_get_first()` parameters are used as follows. These descriptions also apply to `mysql_session_track_get_next()`, which takes the same parameters.

- `mysql`: The connection handler.
- `type`: The tracker type indicating what kind of information to retrieve. Permitted tracker values are the members of the `enum_session_state_type` enumeration defined in `mysql_com.h`:
The members of that enumeration may change over time as MySQL implements additional session-information trackers. To make it easy for applications to loop over all possible tracker types regardless of the number of members, the `SESSION_TRACK_BEGIN` and `SESSION_TRACK_END` symbols are defined to be equal to the first and last members of the `enum_session_state_type` enumeration. The example code shown later in this section demonstrates this technique. (Of course, if the enumeration members change, you must recompile your application to enable it to take account of new trackers.)

- **data**: The address of a `const char *` variable. Following a successful call, this variable points to the returned data, which should be considered read only.

- **length**: The address of a `size_t` variable. Following a successful call, this variable contains the length of the data pointed to by the `data` parameter.

The following discussion describes how to interpret the `data` and `length` values according to the `type` value. It also indicates which system variable enables notifications for each tracker type.

- **SESSION_TRACK_SCHEMA**: This tracker type indicates that the default schema has been set. `data` is a string containing the new default schema name. `length` is the string length.

To enable notifications for this tracker type, enable the `session_track_schema` system variable.

- **SESSION_TRACK_SYSTEM_VARIABLES**: This tracker type indicates that one or more tracked session system variables have been assigned a value. When a session system variable is assigned, two values per variable are returned (in separate calls). For the first call, `data` is a string containing the variable name and `length` is the string length. For the second call, `data` is a string containing the variable value and `length` is the string length.

By default, notification is enabled for `time_zone`, `autocommit`, `character_set_client`, `character_set_results`, and `character_set_connection`. To change the default notification for this tracker type, set the `session_track_schema` system variable to a list of comma-separated variables for which to track changes, or `*` to track changes for all variables. To disable notification of session variable assignments, set `session_track_system_variables` to the empty string.

- **SESSION_TRACK_STATE_CHANGE**: This tracker type indicates a change to some tracked attribute of session state. `data` is a byte containing a boolean flag that indicates whether session state changes occurred. `length` should be 1. The flag is represented as an ASCII value, not a binary (for example, `'1'`, not `0x01`).

To enable notifications for this tracker type, enable the `session_track_state_change` system variable.

This tracker reports changes for these attributes of session state:

- The default schema (database).

- Session-specific values for system variables.

- User-defined variables.
• Temporary tables.
• Prepared statements.

• **SESSION_TRACK_GTIDS**: This tracker type indicates that GTIDS are available. `data` contains encoded GTID data, `length` indicates the data length. Once the `data` value has been extracted, it must be further interpreted into three parts: Encoding specification, length of GTIDs string, GTIDs string. Currently, there is only one encoding specification, so this should always be 0. The GTIDs string is in the standard format for specifying a set of GTID values; see **GTID Sets**.

To enable notifications for this tracker type, set the `session_track_gtids` system variable.

• **SESSION_TRACK_TRANSACTION_CHARACTERISTICS**: This tracker type indicates that transaction characteristics are available. `data` is a string containing the characteristics data. `length` is the string length. The characteristics tracker data string may be empty, or it may contain one or more SQL statements, each terminated by a semicolon:

  • If no characteristics apply, the string is empty. The session defaults apply. (For isolation level and access mode, these defaults are given by the session values of the `transaction_isolation` and `transaction_read_only` system variables.)

  • If a transaction was explicitly started, the string contains the statement or statements required to restart the transaction with the same characteristics. As a general rule, this is a **START TRANSACTION** statement (possibly with one or more of **READ ONLY**, **READ WRITE**, and **WITH CONSISTENT SNAPSHOT**). If any characteristics apply that cannot be passed to **START TRANSACTION**, such as **ISOLATION LEVEL**, a suitable **SET TRANSACTION** statement is prepended (for example, **SET TRANSACTION ISOLATION LEVEL SERIALIZABLE; START TRANSACTION READ WRITE;**).

  • If a transaction was not explicitly started, but one-shot characteristics that apply only to the next transaction were set up, a **SET TRANSACTION** statement suitable for replicating that setup is generated (for example, **SET TRANSACTION READ ONLY;**).

Next-transaction characteristics can be set using **SET TRANSACTION** without any **GLOBAL** or **SESSION** keyword, or by setting the `transaction_isolation` and `transaction_read_only` system variables using the syntax that applies only to the next transaction:

```
SET @@transaction_isolation = value;
SET @@transaction_read_only = value;
```

For more information about transaction characteristic scope levels and how they are set, see **Transaction Characteristic Scope**.

To enable notifications for this tracker type, set the `session_track_transaction_info` system variable to **CHARACTERISTICS** (which also enables the **SESSION_TRACK_TRANSACTION_STATE** tracker type).

Transaction characteristics tracking enables the client to determine how to restart a transaction in another session so it has the same characteristics as in the original session.

Because characteristics may be set using **SET TRANSACTION** before a transaction is started, it is not safe for the client to assume that there are no transaction characteristics if no transaction is active. It is therefore unsafe not to track transaction characteristics and just switch the connection when no transaction is active (whether this is detected by the transaction state tracker or the traditional **SERVER_STATUS_IN_TRANS** flag). A client **must** subscribe to the transaction characteristics tracker if it may wish to switch its session to another connection at some point and transactions may be used.
The characteristics tracker tracks changes to the one-shot characteristics that apply only to the next transaction. It does not track changes to the session variables. Therefore, the client additionally must track the `transaction_isolation` and `transaction_read_only` system variables to correctly determine the session defaults that apply when next-transaction characteristic values are empty. (To track these variables, list them in the value of the `session_track_system_variables` system variable.)

- **SESSION.Track.Transaction.State**: This tracker type indicates that transaction state information is available. `data` is a string containing ASCII characters, each of which indicates some aspect of the transaction state. `length` is the string length (always 8).

To enable notifications for this tracker type, set the `session_track_transaction_info` system variable to `STATE`.

Transaction state tracking enables the client to determine whether a transaction is in progress and whether it could be moved to a different session without being rolled back.

The scope of the tracker item is the transaction. All state-indicating flags persist until the transaction is committed or rolled back. As statements are added to the transaction, additional flags may be set in successive tracker data values. However, no flags are cleared until the transaction ends.

Transaction state is reported as a string containing a sequence of ASCII characters. Each active state has a unique character assigned to it as well as a fixed position in the sequence. The following list describes the permitted values for positions 1 through 8 of the sequence:

- **Position 1**: Whether an active transaction is ongoing.
  - `T`: An explicitly started transaction is ongoing.
  - `I`: An implicitly started transaction (`autocommit=0`) is ongoing.
  - `_`: There is no active transaction.

- **Position 2**: Whether nontransactional tables were read in the context of the current transaction.
  - `r`: One or more nontransactional tables were read.
  - `_`: No nontransactional tables were read so far.

- **Position 3**: Whether transactional tables were read in the context of the current transaction.
  - `R`: One or more transactional tables were read.
  - `_`: No transactional tables were read so far.

- **Position 4**: Whether unsafe writes (writes to nontransactional tables) were performed in the context of the current transaction.
  - `w`: One or more nontransactional tables were written.
  - `_`: No nontransactional tables were written so far.

- **Position 5**: Whether any transactional tables were written in the context of the current transaction.
  - `w`: One or more transactional tables were written.
• __: No transactional tables were written so far.

• Position 6: Whether any unsafe statements were executed in the context of the current transaction. Statements containing nondeterministic constructs such as \texttt{RAND()} or \texttt{UUID()} are unsafe for statement-based replication.

• s: One or more unsafe statements were executed.

• __: No unsafe statements were executed so far.

• Position 7: Whether a result set was sent to the client during the current transaction.

• S: A result set was sent.

• __: No result sets were sent so far.

• Position 8: Whether a \texttt{LOCK TABLES} statement is in effect.

• L: Tables are explicitly locked with \texttt{LOCK TABLES}.

• __: \texttt{LOCK TABLES} is not active in the session.

Consider a session consisting of the following statements, including one to enable the transaction state tracker:

\begin{verbatim}
1. SET @@SESSION.session_track_transaction_info='STATE';
2. START TRANSACTION;
3. SELECT 1;
4. INSERT INTO t1 () VALUES();
5. INSERT INTO t1 () VALUES(1, RAND());
6. COMMIT;
\end{verbatim}

With transaction state tracking enabled, the following data values result from those statements:

\begin{verbatim}
1. ________
2. T_______
3. T_____S_
4. T___W_S_
5. T___WsS_
6. ________
\end{verbatim}

Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

Example

The following example shows how to call \texttt{mysql_session_track_get_first()} and \texttt{mysql_session_track_get_next()} to retrieve and display all available session state-change information following successful execution of an SQL statement string (represented by \texttt{stmt_str}). It is assumed that the application has set the \texttt{session_track_xxx} system variables that enable the notifications it wishes to receive.
printf("Execute: %s\n", stmt_str);

if (mysql_query(mysql, stmt_str) != 0)
{
    fprintf(stderr, "Error %u: %s\n",
            mysql_errno(mysql), mysql_error(mysql));
    return;
}

MYSQL_RES *result = mysql_store_result(mysql);
if (result) /* there is a result set to fetch */
{
    /* ... process rows here ... */
    printf("Number of rows returned: %lu\n",
            (unsigned long) mysql_num_rows(result));
    mysql_free_result(result);
}
else        /* there is no result set */
{
    if (mysql_field_count(mysql) == 0)
    {
        printf("Number of rows affected: %lu\n",
                (unsigned long) mysql_affected_rows(mysql));
    }
    else      /* an error occurred */
    {
        fprintf(stderr, "Error %u: %s\n",
                    mysql_errno(mysql), mysql_error(mysql));
    }
}

/* extract any available session state-change information */
enum enum_session_state_type type;
for (type = SESSION_TRACK_BEGIN; type <= SESSION_TRACK_END; type++)
{
    const char *data;
    size_t length;

    if (mysql_session_track_get_first(mysql, type, &data, &length) == 0)
    {
        /* print info type and initial data */
        printf("Type=%d:\n", type);
        printf("mysql_session_track_get_first(): length=%d; data=%*.*s\n",
                (int) length, (int) length, (int) length, data);

        /* check for more data */
        while (mysql_session_track_get_next(mysql, type, &data, &length) == 0)
        {
            printf("mysql_session_track_get_next(): length=%d; data=%*.*s\n",
                    (int) length, (int) length, (int) length, data);
        }
    }
}

### 28.7.7.70 mysql_session_track_get_next()

```c
int mysql_session_track_get_next(MYSQL *mysql, enum enum_session_state_type
                                 type, const char **data, size_t *length)
```

**Description**

This function fetches additional session state-change information received from the server, following that retrieved by `mysql_session_track_get_first()`. The parameters for `mysql_session_track_get_next()` are the same as for `mysql_session_track_get_first()`.
Following a successful call to `mysql_session_track_get_first()`, call `mysql_session_track_get_next()` repeatedly until it returns nonzero to indicate no more information is available. The calling sequence for `mysql_session_track_get_next()` is similar to that for `mysql_session_track_get_first()`. For more information and an example that demonstrates both functions, see Section 28.7.7.69, "mysql_session_track_get_first()".

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

None.

**28.7.7.71 mysql_set_character_set()**

```c
int mysql_set_character_set(MYSQL *mysql, const char *csname)
```

**Description**

This function is used to set the default character set for the current connection. The string `csname` specifies a valid character set name. The connection collation becomes the default collation of the character set. This function works like the `SET NAMES` statement, but also sets the value of `mysql->charset`, and thus affects the character set used by `mysql_real_escape_string()`.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Example**

```c
MYSQL mysql;
mysql_init(&mysql);
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
if (!mysql_set_character_set(&mysql, "utf8"))
{
    printf("New client character set: %s\n",
            mysql_character_set_name(&mysql));
}
```

**28.7.7.72 mysql_set_local_infile_default()**

```c
void mysql_set_local_infile_default(MYSQL *mysql);
```

**Description**

Sets the `LOAD DATA LOCAL` callback functions to the defaults used internally by the C client library. The library calls this function automatically if `mysql_set_local_infile_handler()` has not been called or does not supply valid functions for each of its callbacks.

**Return Values**

None.
Errors

None.

28.7.7.73 mysql_set_local_infile_handler()

```c
void mysql_set_local_infile_handler(MYSQL *mysql, int (*local_infile_init)(void **, const char *, void *), int (*local_infile_read)(void *, char *, unsigned int), void (*local_infile_end)(void *), int (*local_infile_error)(void *, char*, unsigned int), void *userdata);
```

Description

This function installs callbacks to be used during the execution of `LOAD DATA LOCAL` statements. It enables application programs to exert control over local (client-side) data file reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```c
int
local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the data file, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argument is the same value that is passed to `mysql_set_local_infile_handler()`.

Make the initialization function return zero for success, nonzero for an error.

```c
int
local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data is stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```c
void
local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. Within this function, deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initialization function returns an error.

```c
int
local_infile_error(void *ptr,  
                   char *error_msg,  
                   unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message is written,
and `error_msg_len` is the length of the buffer. Write the message as a null-terminated string, at most `error_msg_len−1` bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The file name specified in `LOAD DATA LOCAL` will be passed as the second parameter to the `local_infile_init()` callback.

**Return Values**

None.

**Errors**

None.

**28.7.7.74 mysql_set_server_option()**

```c
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

**Description**

Enables or disables an option for the connection. `option` can have one of the following values.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL_OPTION_MULTI_STATEMENTS_ON</td>
<td>Enable multiple-statement support</td>
</tr>
<tr>
<td>MySQL_OPTION_MULTI_STATEMENTS_OFF</td>
<td>Disable multiple-statement support</td>
</tr>
</tbody>
</table>

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see Section 28.7.23, “C API Multiple Statement Execution Support”.

Enabling multiple-statement support with `MYSQL_OPTION_MULTI_STATEMENTS_ON` does not have quite the same effect as enabling it by passing the `CLIENT_MULTI_STATEMENTS` flag to `mysql_real_connect()`. `CLIENT_MULTI_STATEMENTS` also enables `CLIENT_MULTI_RESULTS`. If you are using the `CALL SQL` statement in your programs, multiple-result support must be enabled; this means that `MYSQL_OPTION_MULTI_STATEMENTS_ON` by itself is insufficient to permit the use of `CALL`.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`
  
  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`
  
  The MySQL server has gone away.
• CR_SERVER_LOST
  The connection to the server was lost during the query.

• ER_UNKNOWN_COM_ERROR
  The server did not support `mysql_set_server_option()` (which is the case that the server is older than 4.1.1) or the server did not support the option one tried to set.

### 28.7.7.75 mysql_shutdown()

```c
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level shutdown_level)
```

**Description**

**Note**

`.mysql_shutdown()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a `SHUTDOWN` statement.

Asks the database server to shut down. The connected user must have the `SHUTDOWN` privilege. MySQL servers support only one type of shutdown; `shutdown_level` must be equal to `SHUTDOWN_DEFAULT`. Dynamically linked executables which have been compiled with older versions of the `libmysqlclient` headers and call `mysql_shutdown()` need to be used with the old `libmysqlclient` dynamic library.

An alternative to `mysql_shutdown()` is to use the `SHUTDOWN` SQL statement.

The shutdown process is described in Section 5.1.17, “The Server Shutdown Process”.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

• CR_COMMANDS_OUT_OF_SYNC
  Commands were executed in an improper order.

• CR_SERVER_GONE_ERROR
  The MySQL server has gone away.

• CR_SERVER_LOST
  The connection to the server was lost during the query.

• CR_UNKNOWN_ERROR
  An unknown error occurred.

### 28.7.7.76 mysql_sqlstate()

```c
const char *mysql_sqlstate(MYSQL *mysql)
```

**Description**

Returns a null-terminated string containing the SQLSTATE error code for the most recently executed SQL statement. The error code consists of five characters. ‘00000’ means “no error.” The values are specified
by ANSI SQL and ODBC. For a list of possible values, see Appendix B, Errors, Error Codes, and Common Problems.

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where 1146 is the `mysql_errno()` value and '42S02' is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value 'HY000' (general error) is used for unmapped error numbers.

If you call `mysql_sqlstate()` after `mysql_real_connect()` fails, `mysql_sqlstate()` might not return a useful value. For example, this happens if a host is blocked by the server and the connection is closed without any SQLSTATE value being sent to the client.

**Return Values**

A null-terminated character string containing the SQLSTATE error code.

**See Also**

See Section 28.7.7.14, “mysql_errno()”, Section 28.7.7.15, “mysql_error()”, and Section 28.7.11.27, “mysql_stmt_sqlstate()”.

### 28.7.7.77 mysql_ssl_set()

```c
bool mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert, const char *ca, const char *capath, const char *cipher)
```

**Description**

`mysql_ssl_set()` is used for establishing encrypted connections using SSL. The `mysql` argument must be a valid connection handler. Any unused SSL arguments may be given as NULL.

If used, `mysql_ssl_set()` must be called before `mysql_real_connect()`. `mysql_ssl_set()` does nothing unless SSL support is enabled in the client library.

It is optional to call `mysql_ssl_set()` to obtain an encrypted connection because by default, MySQL programs attempt to connect using encryption if the server supports encrypted connections, falling back to an unencrypted connection if an encrypted connection cannot be established (see Section 6.3.1, “Configuring MySQL to Use Encrypted Connections”). `mysql_ssl_set()` may be useful to applications that must specify particular certificate and key files, encryption ciphers, and so forth.

`mysql_ssl_set()` specifies SSL information such as certificate and key files for establishing an encrypted connection if such connections are available, but does not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the technique described in Section 28.7.22, “C API Encrypted Connection Support”.

For additional security relative to that provided by the default encryption, clients can supply a CA certificate matching the one used by the server and enable host name identity verification. In this way, the server and client place their trust in the same CA certificate and the client verifies that the host to which it connected is the one intended. For details, see Section 28.7.22, “C API Encrypted Connection Support”.

`mysql_ssl_set()` is a convenience function that is essentially equivalent to this set of `mysql_options()` calls:
Because of that equivalence, applications can, instead of calling `mysql_ssl_set()`, call `mysql_options()` directly, omitting calls for those options for which the option value is `NULL`. Moreover, `mysql_options()` offers encrypted-connection options not available using `mysql_ssl_set()`, such as `MYSQL_OPT_SSL_MODE` to specify the security state of the connection, and `MYSQL_OPT_TLS_VERSION` to specify the protocols the client permits for encrypted connections.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`.
- `key`: The path name of the client private key file.
- `cert`: The path name of the client public key certificate file.
- `ca`: The path name of the Certificate Authority (CA) certificate file. This option, if used, must specify the same certificate used by the server.
- `capath`: The path name of the directory that contains trusted SSL CA certificate files.
- `cipher`: The list of permissible ciphers for SSL encryption.

Return Values

This function always returns `0`. If SSL setup is incorrect, a subsequent `mysql_real_connect()` call returns an error when you attempt to connect.

28.7.7.78 `mysql_stat()`

```c
const char *mysql_stat(MYSQL *mysql)
```

Description

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Return Values

A character string describing the server status. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
  
  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`
  
  The MySQL server has gone away.

- `CR_SERVER_LOST`
  
  The connection to the server was lost during the query.
C API Function Descriptions

• CR_UNKNOWN_ERROR
  An unknown error occurred.

28.7.7.79 mysql_store_result()

MYSQL_RES *mysql_store_result (MYSQL *mysql)

Description

Note

mysql_store_result() is a synchronous function. Its asynchronous counterpart is mysql_store_result_nonblocking(), for use by applications that require asynchronous communication with the server. See Section 28.7.12, “C API Asynchronous Interface”.

After invoking mysql_query() or mysql_real_query(), you must call mysql_store_result() or mysql_use_result() for every statement that successfully produces a result set (SELECT, SHOW, DESCRIBE, EXPLAIN, CHECK TABLE, and so forth). You must also call mysql_free_result() after you are done with the result set.

You need not call mysql_store_result() or mysql_use_result() for other statements, but it does not do any harm or cause any notable performance degradation if you call mysql_store_result() in all cases. You can detect whether the statement has a result set by checking whether mysql_store_result() returns a nonzero value (more about this later).

If you enable multiple-statement support, you should retrieve results from calls to mysql_query() or mysql_real_query() by using a loop that calls mysql_next_result() to determine whether there are more results. For an example, see Section 28.7.23, “C API Multiple Statement Execution Support”.

If you want to know whether a statement should return a result set, you can use mysql_field_count() to check for this. See Section 28.7.22, “mysql_field_count()”.

mysql_store_result() reads the entire result of a query to the client, allocates a MYSQL_RES structure, and places the result into this structure.

mysql_store_result() returns NULL if the statement did not return a result set (for example, if it was an INSERT statement), or an error occurred and reading of the result set failed.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

After you have called mysql_store_result() and gotten back a result that is not a null pointer, you can call mysql_num_rows() to find out how many rows are in the result set.

You can call mysql_fetch_row() to fetch rows from the result set, or mysql_row_seek() and mysql_row_tell() to obtain or set the current row position within the result set.

See Section 28.7.29.1, “Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success”.

Return Values

A pointer to a MYSQL_RES result structure with the results. NULL if the statement did not return a result set or an error occurred. To determine whether an error occurred, check whether mysql_error() returns a nonempty string, mysql_errno() returns nonzero, or mysql_field_count() returns zero.
C API Function Descriptions

Errors

mysql_store_result() resets mysql_error() and mysql_errno() if it succeeds.

- CR_COMMANDS_OUT_OF_SYNC
  Commands were executed in an improper order.

- CR_OUT_OF_MEMORY
  Out of memory.

- CR_SERVER_GONE_ERROR
  The MySQL server has gone away.

- CR_SERVER_LOST
  The connection to the server was lost during the query.

- CR_UNKNOWN_ERROR
  An unknown error occurred.

28.7.7.80 mysql_thread_id()

unsigned long mysql_thread_id(MYSQL *mysql)

Description

Returns the thread ID of the current connection. This value can be used as an argument to mysql_kill() to kill the thread.

If the connection is lost and you reconnect with mysql_ping(), the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

Note

This function does not work correctly if thread IDs become larger than 32 bits, which can occur on some systems. To avoid problems with mysql_thread_id(), do not use it. To get the connection ID, execute a SELECT CONNECTION_ID() query and retrieve the result.

Return Values

The thread ID of the current connection.

Errors

None.

28.7.7.81 mysql_use_result()

MYSQL_RES *mysql_use_result(MYSQL *mysql)

Description

After invoking mysql_query() or mysql_real_query(), you must call mysql_store_result() or mysql_use_result() for every statement that successfully produces a result set (SELECT, SHOW,
mysql_use_result() initiates a result set retrieval but does not actually read the result set into the client like mysql_store_result() does. Instead, each row must be retrieved individually by making calls to mysql_fetch_row(). This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than mysql_store_result(). The client allocates memory only for the current row and a communication buffer that may grow up to max_allowed_packet bytes.

On the other hand, you should not use mysql_use_result() for locking reads if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a ^S (stop scroll). This ties up the server and prevents other threads from updating any tables from which the data is being fetched.

When using mysql_use_result(), you must execute mysql_fetch_row() until a NULL value is returned, otherwise, the unfetched rows are returned as part of the result set for your next query. The C API gives the error Commands out of sync; you can't run this command now if you forget to do this!

You may not use mysql_data_seek(), mysql_row_seek(), mysql_row_tell(), mysql_num_rows(), or mysql_affected_rows() with a result returned from mysql_use_result(), nor may you issue other queries until mysql_use_result() has finished. (However, after you have fetched all the rows, mysql_num_rows() accurately returns the number of rows fetched.)

You must call mysql_free_result() once you are done with the result set.

Return Values

A MYSQL_RES result structure. NULL if an error occurred.

Errors

mysql_use_result() resets mysql_error() and mysql_errno() if it succeeds.

• CR_COMMANDS_OUT_OF_SYNC

  Commands were executed in an improper order.

• CR_OUT_OF_MEMORY

  Out of memory.

• CR_SERVER_GONE_ERROR

  The MySQL server has gone away.

• CR_SERVER_LOST

  The connection to the server was lost during the query.

• CR_UNKNOWN_ERROR

  An unknown error occurred.

28.7.7.82 mysql_warning_count()
unsigned int mysql_warning_count(MYSQL *mysql)

Description

Returns the number of errors, warnings, and notes generated during execution of the previous SQL statement.

Return Values

The warning count.

Errors

None.

28.7.8 C API Prepared Statements

The MySQL client/server protocol provides for the use of prepared statements. This capability uses the MYSQL_STMT statement handler data structure returned by the mysql_stmt_init() initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handler returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and nonprepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

For a list of SQL statements that can be used as prepared statements, see Section 13.5, “Prepared SQL Statement Syntax”.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

28.7.9 C API Prepared Statement Data Structures

Prepared statements use several data structures:

- To obtain a statement handler, pass a MYSQL connection handler to mysql_stmt_init(), which returns a pointer to a MYSQL_STMT data structure. This structure is used for further operations with the statement. To specify the statement to prepare, pass the MYSQL_STMT pointer and the statement string to mysql_stmt_prepare().

- To provide input parameters for a prepared statement, set up MYSQL_BIND structures and pass them to mysql_stmt_bind_param(). To receive output column values, set up MYSQL_BIND structures and pass them to mysql_stmt_bind_result().
The `MYSQL_TIME` structure is used to transfer temporal data in both directions.

The following discussion describes the prepared statement data types in detail. For examples that show how to use them, see Section 28.7.11.10, “mysql_stmt_execute()”, and Section 28.7.11.11, “mysql_stmt_fetch()”.

**MYSQL_STMT**

This structure is a handler for a prepared statement. A handler is created by calling `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT`. The handler is used for all subsequent operations with the statement until you close it with `mysql_stmt_close()`, at which point the handler becomes invalid and should no longer be used.

The `MYSQL_STMT` structure has no members intended for application use. Applications should not try to copy a `MYSQL_STMT` structure. There is no guarantee that such a copy will be usable.

Multiple statement handlers can be associated with a single connection. The limit on the number of handlers depends on the available system resources.

**MYSQL_BIND**

This structure is used both for statement input (data values sent to the server) and output (result values returned from the server):

- For input, use `MYSQL_BIND` structures with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`.
- For output, use `MYSQL_BIND` structures with `mysql_stmt_bind_result()` to bind buffers to result set columns, for use in fetching rows with `mysql_stmt_fetch()`.

To use a `MYSQL_BIND` structure, zero its contents to initialize it, then set its members appropriately. For example, to declare and initialize an array of three `MYSQL_BIND` structures, use this code:

```c
MYSQL_BIND bind[3];
memset(bind, 0, sizeof(bind));
```

The `MYSQL_BIND` structure contains the following members for use by application programs. For several of the members, the manner of use depends on whether the structure is used for input or output.

- `enum enum_field_types buffer_type`

  The type of the buffer. This member indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored. For permissible `buffer_type` values, see Section 28.7.9.1, “C API Prepared Statement Type Codes”.

- `void *buffer`

  A pointer to the buffer to be used for data transfer. This is the address of a C language variable.

For input, `buffer` is a pointer to the variable in which you store the data value for a statement parameter. When you call `mysql_stmt_execute()`, MySQL use the value stored in the variable in place of the corresponding parameter marker in the statement (specified with `?` in the statement string).
For output, `buffer` is a pointer to the variable in which to return a result set column value. When you call `mysql_stmt_fetch()`, MySQL stores a column value from the current row of the result set in this variable. You can access the value when the call returns.

To minimize the need for MySQL to perform type conversions between C language values on the client side and SQL values on the server side, use C variables that have types similar to those of the corresponding SQL values:

- For numeric data types, `buffer` should point to a variable of the proper numeric C type. For integer variables (which can be `char` for single-byte values or an integer type for larger values), you should also indicate whether the variable has the `unsigned` attribute by setting the `is_unsigned` member, described later.

- For character (nonbinary) and binary string data types, `buffer` should point to a character buffer.

- For date and time data types, `buffer` should point to a `MYSQL_TIME` structure.

For guidelines about mapping between C types and SQL types and notes about type conversions, see Section 28.7.9.1, “C API Prepared Statement Type Codes”, and Section 28.7.9.2, “C API Prepared Statement Type Conversions”.

- `unsigned long buffer_length`

  The actual size of `*buffer` in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the `buffer_length` value specifies the length of `*buffer` when used with `mysql_stmt_bind_param()` to specify input values, or the maximum number of output data bytes that can be fetched into the buffer when used with `mysql_stmt_bind_result()`.

- `unsigned long *length`

  A pointer to an `unsigned long` variable that indicates the actual number of bytes of data stored in `*buffer`. length is used for character or binary C data.

  For input parameter data binding, set `*length` to indicate the actual length of the parameter value stored in `*buffer`. This is used by `mysql_stmt_execute()`.

  For output value binding, MySQL sets `*length` when you call `mysql_stmt_fetch()`. The `mysql_stmt_fetch()` return value determines how to interpret the length:

  - If the return value is 0, `*length` indicates the actual length of the parameter value.

  - If the return value is `MYSQL_DATA_TRUNCATED`, `*length` indicates the nontruncated length of the parameter value. In this case, the minimum of `*length` and `buffer_length` indicates the actual length of the value.

  `length` is ignored for numeric and temporal data types because the `buffer_type` value determines the length of the data value.

  If you must determine the length of a returned value before fetching it, see Section 28.7.11.11, “mysql_stmt_fetch()”, for some strategies.

- `bool *is_null`

  This member points to a `bool` variable that is true if a value is `NULL`, false if it is not `NULL`. For input, set `*is_null` to true to indicate that you are passing a `NULL` value as a statement parameter.
is_null is a pointer to a boolean scalar, not a boolean scalar, to provide flexibility in how you specify NULL values:

- If your data values are always NULL, use MYSQL_TYPE_NULL as the buffer_type value when you bind the column. The other MYSQL_BIND members, including is_null, do not matter.

- If your data values are always NOT NULL, set is_null = (bool*) 0, and set the other members appropriately for the variable you are binding.

- In all other cases, set the other members appropriately and set is_null to the address of a bool variable. Set that variable's value to true or false appropriately between executions to indicate whether the corresponding data value is NULL or NOT NULL, respectively.

For output, when you fetch a row, MySQL sets the value pointed to by is_null to true or false according to whether the result set column value returned from the statement is or is not NULL.

- bool is_unsigned

This member applies for C variables with data types that can be unsigned (char, short int, int, long long int). Set is_unsigned to true if the variable pointed to by buffer is unsigned and false otherwise. For example, if you bind a signed char variable to buffer, specify a type code of MYSQL_TYPE_TINY and set is_unsigned to false. If you bind an unsigned char instead, the type code is the same but is_unsigned should be true. (For char, it is not defined whether it is signed or unsigned, so it is best to be explicit about signedness by using signed char or unsigned char.)

is_unsigned applies only to the C language variable on the client side. It indicates nothing about the signedness of the corresponding SQL value on the server side. For example, if you use an int variable to supply a value for a BIGINT UNSIGNED column, is_unsigned should be false because int is a signed type. If you use an unsigned int variable to supply a value for a BIGINT column, is_unsigned should be true because unsigned int is an unsigned type. MySQL performs the proper conversion between signed and unsigned values in both directions, although a warning occurs if truncation results.

- bool *error

For output, set this member to point to a bool variable to have truncation information for the parameter stored there after a row fetching operation. When truncation reporting is enabled, mysql_stmt_fetch() returns MYSQL_DATA_TRUNCATED and *error is true in the MYSQL_BIND structures for parameters in which truncation occurred. Truncation indicates loss of sign or significant digits, or that a string was too long to fit in a column. Truncation reporting is enabled by default, but can be controlled by calling mysql_options() with the MYSQL_REPORT_DATA_TRUNCATION option.

- MYSQL_TIME

This structure is used to send and receive DATE, TIME, DATETIME, and TIMESTAMP data directly to and from the server. Set the buffer member to point to a MYSQL_TIME structure, and set the buffer_type member of a MYSQL_BIND structure to one of the temporal types (MYSQL_TYPE_TIME, MYSQL_TYPE_DATE, MYSQL_TYPE_DATETIME, MYSQL_TYPE_TIMESTAMP).

The MYSQL_TIME structure contains the members listed in the following table.

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsigned int year</td>
<td>The year</td>
</tr>
</tbody>
</table>
### C API Prepared Statement Data Structures

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsigned int month</td>
<td>The month of the year</td>
</tr>
<tr>
<td>unsigned int day</td>
<td>The day of the month</td>
</tr>
<tr>
<td>unsigned int hour</td>
<td>The hour of the day</td>
</tr>
<tr>
<td>unsigned int minute</td>
<td>The minute of the hour</td>
</tr>
<tr>
<td>unsigned int second</td>
<td>The second of the minute</td>
</tr>
<tr>
<td>bool neg</td>
<td>A boolean flag indicating whether the time is negative</td>
</tr>
<tr>
<td>unsigned long second_part</td>
<td>The fractional part of the second in microseconds</td>
</tr>
</tbody>
</table>

Only those parts of a `MYSQL_TIME` structure that apply to a given type of temporal value are used. The `year`, `month`, and `day` elements are used for `DATE`, `DATETIME`, and `TIMESTAMP` values. The `hour`, `minute`, and `second` elements are used for `TIME`, `DATETIME`, and `TIMESTAMP` values. See Section 28.7.24, “C API Prepared Statement Handling of Date and Time Values”.

### 28.7.9.1 C API Prepared Statement Type Codes

The `buffer_type` member of `MYSQL_BIND` structures indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored.

The following table shows the permissible values for the `buffer_type` member of `MYSQL_BIND` structures for input values sent to the server. The table shows the C variable types that you can use, the corresponding type codes, and the SQL data types for which the supplied value can be used without conversion. Choose the `buffer_type` value according to the data type of the variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

<table>
<thead>
<tr>
<th>Input Variable C Type</th>
<th>buffer_type Value</th>
<th>SQL Type of Destination Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>signed char</td>
<td>MYSQL_TYPE_TINY</td>
<td>TINYINT</td>
</tr>
<tr>
<td>short int</td>
<td>MYSQL_TYPE_SHORT</td>
<td>SMALLINT</td>
</tr>
<tr>
<td>int</td>
<td>MYSQL_TYPE_LONG</td>
<td>INT</td>
</tr>
<tr>
<td>long long int</td>
<td>MYSQL_TYPEONGLONG</td>
<td>BIGINT</td>
</tr>
<tr>
<td>float</td>
<td>MYSQL_TYPE_FLOAT</td>
<td>FLOAT</td>
</tr>
<tr>
<td>double</td>
<td>MYSQL_TYPE_DOUBLE</td>
<td>DOUBLE</td>
</tr>
<tr>
<td><code>MYSQL_TIME</code></td>
<td>MYSQL_TYPE_TIME</td>
<td>TIME</td>
</tr>
<tr>
<td><code>MYSQL_TIME</code></td>
<td>MYSQL_TYPE_DATE</td>
<td>DATE</td>
</tr>
<tr>
<td><code>MYSQL_TIME</code></td>
<td>MYSQL_TYPE_DATETIME</td>
<td>DATETIME</td>
</tr>
<tr>
<td><code>MYSQL_TIME</code></td>
<td>MYSQL_TYPE_TIMESTAMP</td>
<td>TIMESTAMP</td>
</tr>
<tr>
<td>char[]</td>
<td>MYSQL_TYPE_STRING</td>
<td>TEXT, CHAR, VARCHAR</td>
</tr>
<tr>
<td>char[]</td>
<td>MYSQL_TYPE_BLOB</td>
<td>BLOB, BINARY, VARBINARY</td>
</tr>
<tr>
<td></td>
<td>MYSQL_TYPE_NULL</td>
<td>NULL</td>
</tr>
</tbody>
</table>

Use `MYSQL_TYPE_NULL` as indicated in the description for the `is_null` member in Section 28.7.9, “C API Prepared Statement Data Structures”.
For input string data, use `MYSQL_TYPE_STRING` or `MYSQL_TYPE_BLOB` depending on whether the value is a character (nonbinary) or binary string:

- `MYSQL_TYPE_STRING` indicates character input string data. The value is assumed to be in the character set indicated by the `character_set_client` system variable. If the server stores the value into a column with a different character set, it converts the value to that character set.

- `MYSQL_TYPE_BLOB` indicates binary input string data. The value is treated as having the binary character set. That is, it is treated as a byte string and no conversion occurs.

The following table shows the permissible values for the `buffer_type` member of `MYSQL_BIND` structures for output values received from the server. The table shows the SQL types of received values, the corresponding type codes that such values have in result set metadata, and the recommended C language data types to bind to the `MYSQL_BIND` structure to receive the SQL values without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

<table>
<thead>
<tr>
<th>SQL Type of Received Value</th>
<th><code>buffer_type</code> Value</th>
<th>Output Variable C Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>TINYINT</td>
<td><code>MYSQL_TYPE_TINY</code></td>
<td><code>signed char</code></td>
</tr>
<tr>
<td>SMALLINT</td>
<td><code>MYSQL_TYPE_SHORT</code></td>
<td><code>short int</code></td>
</tr>
<tr>
<td>MEDIUMINT</td>
<td><code>MYSQL_TYPE_INT24</code></td>
<td><code>int</code></td>
</tr>
<tr>
<td>INT</td>
<td><code>MYSQL_TYPE_LONG</code></td>
<td><code>int</code></td>
</tr>
<tr>
<td>BIGINT</td>
<td><code>MYSQL_TYPE_LONGLONG</code></td>
<td><code>long long int</code></td>

</tr>
<tr>
<td>BIT</td>
<td><code>MYSQL_TYPE_BIT</code></td>
<td><code>char[]</code></td>
</tr>
</tbody>
</table>

### 28.7.9.2 C API Prepared Statement Type Conversions

Prepared statements transmit data between the client and server using C language variables on the client side that correspond to SQL values on the server side. If there is a mismatch between the C variable type on the client side and the corresponding SQL value type on the server side, MySQL performs implicit type conversions in both directions.
MySQL knows the type code for the SQL value on the server side. The `buffer_type` value in the `MYSQL_BIND` structure indicates the type code of the C variable that holds the value on the client side. The two codes together tell MySQL what conversion must be performed, if any. Here are some examples:

- If you use `MYSQL_TYPE_LONG` with an `int` variable to pass an integer value to the server that is to be stored into a `FLOAT` column, MySQL converts the value to floating-point format before storing it.

- If you fetch an SQL `MEDIUMINT` column value, but specify a `buffer_type` value of `MYSQL_TYPE_LONGLONG` and use a C variable of type `long long int` as the destination buffer, MySQL converts the `MEDIUMINT` value (which requires less than 8 bytes) for storage into the `long long int` (an 8-byte variable).

- If you fetch a numeric column with a value of 255 into a `char[4]` character array and specify a `buffer_type` value of `MYSQL_TYPE_STRING`, the resulting value in the array is a 4-byte string '255\0'.

- MySQL returns `DECIMAL` values as the string representation of the original server-side value, which is why the corresponding C type is `char[]`. For example, 12.345 is returned to the client as '12.345'. If you specify `MYSQL_TYPE_NEWDECIMAL` and bind a string buffer to the `MYSQL_BIND` structure, `mysql_stmt_fetch()` stores the value in the buffer as a string without conversion. If instead you specify a numeric variable and type code, `mysql_stmt_fetch()` converts the string-format `DECIMAL` value to numeric form.

- For the `MYSQL_TYPE_BIT` type code, `BIT` values are returned into a string buffer, which is why the corresponding C type is `char[]`. The value represents a bit string that requires interpretation on the client side. To return the value as a type that is easier to deal with, you can cause the value to be cast to integer using either of the following types of expressions:

  ```
  SELECT bit_col + 0 FROM t
  SELECT CAST(bit_col AS UNSIGNED) FROM t
  ```

  To retrieve the value, bind an integer variable large enough to hold the value and specify the appropriate corresponding integer type code.

Before binding variables to the `MYSQL_BIND` structures that are to be used for fetching column values, you can check the type codes for each column of the result set. This might be desirable if you want to determine which variable types would be best to use to avoid type conversions. To get the type codes, call `mysql_stmt_result_metadata()` after executing the prepared statement with `mysql_stmt_execute()`. The metadata provides access to the type codes for the result set as described in Section 28.7.11.23, "mysql_stmt_result_metadata()", and Section 28.7.5, "C API Data Structures".

To determine whether output string values in a result set returned from the server contain binary or nonbinary data, check whether the `charsetnr` value of the result set metadata is 63 (see Section 28.7.5, "C API Data Structures"). If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

If you cause the `max_length` member of the `MYSQL_FIELD` column metadata structures to be set (by calling `mysql_stmt_attr_set()`), be aware that the `max_length` values for the result set indicate the lengths of the longest string representation of the result values, not the lengths of the binary representation. That is, `max_length` does not necessarily correspond to the size of the buffers needed to fetch the values with the binary protocol used for prepared statements. Choose the size of the buffers according to the types of the variables into which you fetch the values. For example, a `TINYINT` column containing the value -128 might have a `max_length` value of 4. But the binary representation of any
TINYINT value requires only 1 byte for storage, so you can supply a signed char variable in which to store the value and set is_unsigned to indicate that values are signed.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

28.7.10 C API Prepared Statement Function Overview

The following list summarizes the functions available for prepared statement processing. For greater detail, see the descriptions in Section 28.7.11, “C API Prepared Statement Function Descriptions”.

- `mysql_stmt_affected_rows()`: Returns the number of rows changed, deleted, or inserted by prepared UPDATE, DELETE, or INSERT statement.
- `mysql_stmt_attr_get()`: Gets the value of an attribute for a prepared statement.
- `mysql_stmt_attr_set()`: Sets an attribute for a prepared statement.
- `mysql_stmt_bind_param()`: Associates application data buffers with the parameter markers in a prepared SQL statement.
- `mysql_stmt_bind_result()`: Associates application data buffers with columns in a result set.
- `mysql_stmt_close()`: Frees memory used by a prepared statement.
- `mysql_stmt_data_seek()`: Seeks to an arbitrary row number in a statement result set.
- `mysql_stmt_errno()`: Returns the error number for the last statement execution.
- `mysql_stmt_error()`: Returns the error message for the last statement execution.
- `mysql_stmt_execute()`: Executes a prepared statement.
- `mysql_stmt_fetch()`: Fetches the next row of data from a result set and returns data for all bound columns.
- `mysql_stmt_fetch_column()`: Fetches data for one column of the current row of a result set.
- `mysql_stmt_field_count()`: Returns the number of result columns for the most recent statement.
- `mysql_stmt_free_result()`: Frees the resources allocated to a statement handler.
- `mysql_stmt_init()`: Allocates memory for a MYSQL_STMT structure and initializes it.
- `mysql_stmt_insert_id()`: Returns the ID generated for an AUTO_INCREMENT column by a prepared statement.
- `mysql_stmt_next_result()`: Returns/initiates the next result in a multiple-result execution.
- `mysql_stmt_num_rows()`: Returns the row count from a buffered statement result set.
- `mysql_stmt_param_count()`: Returns the number of parameters in a prepared statement.
- `mysql_stmt_param_metadata()`: Returns parameter metadata in the form of a result set. (This function actually does nothing.)
- `mysql_stmt_prepare()`: Prepares an SQL statement string for execution.
- `mysql_stmt_reset()`: Resets the statement buffers in the server.
- `mysql_stmt_result_metadata()`: Returns prepared statement metadata in the form of a result set.
• `mysql_stmt_row_seek()`: Seeks to a row offset in a statement result set, using value returned from `mysql_stmt_row_tell()`.

• `mysql_stmt_row_tell()`: Returns the statement row cursor position.

• `mysql_stmt_send_long_data()`: Sends long data in chunks to server.

• `mysql_stmt_sqlstate()`: Returns the SQLSTATE error code for the last statement execution.

• `mysql_stmt_store_result()`: Retrieves a complete result set to the client.

Call `mysql_stmt_init()` to create a statement handler, then `mysql_stmt_prepare()` to prepare the statement string, `mysql_stmt_bind_param()` to supply the parameter data, and `mysql_stmt_execute()` to execute the statement. You can repeat the `mysql_stmt_execute()` by changing parameter values in the respective buffers supplied through `mysql_stmt_bind_param()`.

You can send text or binary data in chunks to server using `mysql_stmt_send_long_data()`. See Section 28.7.11.26, “mysql_stmt_send_long_data()”.

If the statement is a `SELECT` or any other statement that produces a result set, `mysql_stmt_prepare()` also returns the result set metadata information in the form of a `MYSQL_RES` result set through `mysql_stmt_result_metadata()`.

You can supply the result buffers using `mysql_stmt_bind_result()`, so that the `mysql_stmt_fetch()` automatically returns data to these buffers. This is row-by-row fetching.

When statement execution has been completed, close the statement handler using `mysql_stmt_close()` so that all resources associated with it can be freed. At that point the handler becomes invalid and should no longer be used.

If you obtained a `SELECT` statement’s result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

**Execution Steps**

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handler with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.

2. If the statement will produce a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.

3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.

4. Call `mysql_stmt_execute()` to execute the statement.

5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.

6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.

7. Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:
• The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.

• The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When \texttt{mysql\_stmt\_execute()} is called, the MySQL client/server protocol performs these actions:

• The client uses the statement handler and sends the parameter data to the server.

• The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an okay status and the number of rows changed, deleted, or inserted.

When \texttt{mysql\_stmt\_fetch()} is called, the MySQL client/server protocol performs these actions:

• The client reads the data from the current row of the result set and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error number, error message, and SQLSTATE code using \texttt{mysql\_stmt\_errno()}, \texttt{mysql\_stmt\_error()}, and \texttt{mysql\_stmt\_sqlstate()}, respectively.

\textbf{Prepared Statement Logging}

For prepared statements that are executed with the \texttt{mysql\_stmt\_prepare()} and \texttt{mysql\_stmt\_execute()} C API functions, the server writes \texttt{Prepare} and \texttt{Execute} lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

1. Call \texttt{mysql\_stmt\_prepare()} to prepare the statement string "SELECT ?".
2. Call \texttt{mysql\_stmt\_bind\_param()} to bind the value 3 to the parameter in the prepared statement.
3. Call \texttt{mysql\_stmt\_execute()} to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

\begin{verbatim}
Prepare  [1] SELECT ?
Execute  [1] SELECT 3
\end{verbatim}

Each \texttt{Prepare} and \texttt{Execute} line in the log is tagged with a \texttt{[N]} statement identifier so that you can keep track of which prepared statement is being logged. \texttt{N} is a positive integer. If there are multiple prepared statements active simultaneously for the client, \texttt{N} may be greater than 1. Each \texttt{Execute} lines shows a prepared statement after substitution of data values for ? parameters.

\textbf{28.7.11 C API Prepared Statement Function Descriptions}

To prepare and execute queries, use the functions described in detail in the following sections.

All functions that operate with a \texttt{MYSQL\_STMT} structure begin with the prefix \texttt{mysql\_stmt\_}.

To create a \texttt{MYSQL\_STMT} handler, use the \texttt{mysql\_stmt\_init()} function.

\textbf{28.7.11.1 mysql\_stmt\_affected\_rows()}

\begin{verbatim}
my_ulonglong mysql\_stmt\_affected\_rows(MYSQL\_STMT *stmt)
\end{verbatim}
Description

`mysql_stmt_affected_rows()` may be called immediately after executing a statement with `mysql_stmt_execute()`. It is like `mysql_affected_rows()` but for prepared statements. For a description of what the affected-rows value returned by this function means, See Section 28.7.7.1, “mysql_affected_rows()”.

Errors

None.

Example

See the Example in Section 28.7.11.10, “mysql_stmt_execute()”.

28.7.11.2 mysql_stmt_attr_get()

```c
bool mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, void *arg)
```

Description

Can be used to get the current value for a statement attribute.

The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, `arg` should point to the value of the integer.

See Section 28.7.11.3, “mysql_stmt_attr_set()”, for a list of options and option types.

Return Values

Zero for success. Nonzero if `option` is unknown.

Errors

None.

28.7.11.3 mysql_stmt_attr_set()

```c
bool mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, const void *arg)
```

Description

Can be used to affect behavior for a prepared statement. This function may be called multiple times to set several options.

The `option` argument is the option that you want to set. The `arg` argument is the value for the option. `arg` should point to a variable that is set to the desired attribute value. The variable type is as indicated in the following table.

The following table shows the possible `option` values.

<table>
<thead>
<tr>
<th>Option</th>
<th>Argument Type</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>STMT_ATTR_UPDATE_MAX_LENGTH</td>
<td>bool *</td>
<td>If set to 1, causes <code>mysql_stmt_store_result()</code> to update the metadata <code>MYSQL_FIELD-&gt;max_length</code> value.</td>
</tr>
<tr>
<td>Option</td>
<td>Argument Type</td>
<td>Function</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>STMT_ATTR_CURSOR_TYPE</td>
<td>unsigned long *</td>
<td>Type of cursor to open for statement when <code>mysql_stmt_execute()</code> is invoked. *arg can be CURSOR_TYPE_NO_CURSOR (the default) or CURSOR_TYPE_READ_ONLY.</td>
</tr>
<tr>
<td>STMT_ATTR_PREFETCH_ROWS</td>
<td>unsigned long *</td>
<td>Number of rows to fetch from server at a time when using a cursor. *arg can be in the range from 1 to the maximum value of unsigned long. The default is 1.</td>
</tr>
</tbody>
</table>

If you use the STMT_ATTR_CURSOR_TYPE option with CURSOR_TYPE_READ_ONLY, a cursor is opened for the statement when you invoke `mysql_stmt_execute()`. If there is already an open cursor from a previous `mysql_stmt_execute()` call, it closes the cursor before opening a new one. `mysql_stmt_reset()` also closes any open cursor before preparing the statement for re-execution. `mysql_stmt_free_result()` closes any open cursor.

If you open a cursor for a prepared statement, `mysql_stmt_store_result()` is unnecessary, because that function causes the result set to be buffered on the client side.

**Return Values**

Zero for success. Nonzero if option is unknown.

**Errors**

None.

**Example**

The following example opens a cursor for a prepared statement and sets the number of rows to fetch at a time to 5:

```c
MYSQL_STMT *stmt;
int rc;
unsigned long type;
unsigned long prefetch_rows = 5;

stmt = mysql_stmt_init(mysql);
type = (unsigned long) CURSOR_TYPE_READ_ONLY;
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_CURSOR_TYPE, (void*) &type);
/* ... check return value ... */
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_PREFETCH_ROWS, 
                        (void*) &prefetch_rows);
/* ... check return value ... */
```

### 28.7.11.4 `mysql_stmt_bind_param()`

**Description**

`mysql_stmt_bind_param()` is used to bind input data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each ? parameter marker that is present in the query.
Suppose that you prepare the following statement:

```sql
INSERT INTO mytbl VALUES(?,?,?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```c
MYSQL_BIND bind[3];
```

Section 28.7.9, “C API Prepared Statement Data Structures”, describes the members of each `MYSQL_BIND` element and how they should be set to provide input values.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_UNSUPPORTED_PARAM_TYPE**
  
  The conversion is not supported. Possibly the `buffer_type` value is invalid or is not one of the supported types.

- **CR_OUT_OF_MEMORY**
  
  Out of memory.

- **CR UNKNOWN_ERROR**
  
  An unknown error occurred.

**Example**

See the Example in Section 28.7.10, “mysql_stmt_execute()”.

### 28.7.11.5 mysql_stmt_bind_result()

```c
bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

**Description**

`mysql_stmt_bind_result()` is used to associate (that is, bind) output columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the data values, because the protocol does not return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol places data into the newly bound buffers when the next call to `mysql_stmt_fetch()` occurs.
To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and length of the output buffer into which the value should be stored. Section 28.7.9, "C API Prepared Statement Data Structures", describes the members of each `MYSQL_BIND` element and how they should be set to receive output values.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_UNSUPPORTED_PARAM_TYPE**
  
  The conversion is not supported. Possibly the `buffer_type` value is invalid or is not one of the supported types.

- **CR_OUT_OF_MEMORY**
  
  Out of memory.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

**Example**

See the Example in Section 28.7.11.11, "mysql_stmt_fetch()".

### 28.7.11.6 mysql_stmt_close()

`bool mysql_stmt_close(MYSQL_STMT *stmt)`

**Description**

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handler pointed to by `stmt`, which at that point becomes invalid and should no longer be used. For a failed `mysql_stmt_close()` call, do not call `mysql_stmt_error()`, or `mysql_stmt_errno()`, or `mysql_stmt_sqlstate()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_error()`, `mysql_errno()`, or `mysql_sqlstate()` instead.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

**Example**

See the Example in Section 28.7.11.10, "mysql_stmt_execute()".
28.7.11.7 mysql_stmt_data_seek()

void mysql_stmt_data_seek(MYSQL_STMT *stmt, my_ulonglong offset)

Description

Seeks to an arbitrary row in a statement result set. The offset value is a row number and should be in the range from 0 to mysql_stmt_num_rows(stmt)-1.

This function requires that the statement result set structure contains the entire result of the last executed query, so mysql_stmt_data_seek() may be used only in conjunction with mysql_stmt_store_result().

Return Values

None.

Errors

None.

28.7.11.8 mysql_stmt_errno()

unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)

Description

For the statement specified by stmt, mysql_stmt_errno() returns the error code for the most recently invoked statement API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL errmsg.h header file. Server error message numbers are listed in mysql_error.h. Errors also are listed at Appendix B, Errors, Error Codes, and Common Problems.

If the failed statement API function was mysql_stmt_close(), do not call or mysql_stmt_errno() to obtain error information because mysql_stmt_close() makes the statement handler invalid. Call mysql_errno() instead.

Return Values

An error code value. Zero if no error occurred.

Errors

None.

28.7.11.9 mysql_stmt_error()

const char *mysql_stmt_error(MYSQL_STMT *stmt)

Description

For the statement specified by stmt, mysql_stmt_error() returns a null-terminated string containing the error message for the most recently invoked statement API function that can succeed or fail. An empty string ("") is returned if no error occurred. Either of these two tests can be used to check for an error:

```c
if(*mysql_stmt_errno(stmt))
{
  // an error occurred
}
```
if (mysql_stmt_error(stmt)[0])
  // an error occurred

If the failed statement API function was `mysql_stmt_close()`, do not call `mysql_stmt_error()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_error()` instead.

The language of the client error messages may be changed by recompiling the MySQL client library. You can choose error messages in several different languages.

**Return Values**

A character string that describes the error. An empty string if no error occurred.

**Errors**

None.

### 28.7.11.10 `mysql_stmt_execute()`

```c
int mysql_stmt_execute(MYSQL_STMT *stmt)
```

**Description**

`mysql_stmt_execute()` executes the prepared query associated with the statement handler. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

Statement processing following `mysql_stmt_execute()` depends on the type of statement:

- For an `UPDATE`, `DELETE`, or `INSERT`, the number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`.

- For a statement such as `SELECT` that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to Section 28.7.11.11, “`mysql_stmt_fetch()`”.

Do not following invocation of `mysql_stmt_execute()` with a call to `mysql_store_result()` or `mysql_use_result()`. Those functions are not intended for processing results from prepared statements.

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`

  Commands were executed in an improper order.
• **CR_OUT_OF_MEMORY**
  Out of memory.

• **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

• **CR_SERVER_LOST**
  The connection to the server was lost during the query.

• **CR_UNKNOWN_ERROR**
  An unknown error occurred.

**Example**

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to be a valid connection handler. For an example that shows how to retrieve data, see Section 28.7.11.11, “mysql_stmt_fetch()”.

```c
#define STRING_SIZE 50
#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT,\
  col2 VARCHAR(40),\n  col3 SMALLINT,\n  col4 TIMESTAMP)"
#define INSERT_SAMPLE "INSERT INTO \n  test_table(col1,col2,col3) \n  VALUES(?,?,?)"

MYSQL_STMT    *stmt;
MYSQL_BIND    bind[3];
my_ulonglong  affected_rows;
int           param_count;
short         small_data;
int           int_data;
char          str_data[STRING_SIZE];
unsigned long str_length;
bool          is_null;

if (mysql_query(mysql, DROP_SAMPLE_TABLE))
{
  fprintf(stderr, " DROP TABLE failed\n");
  fprintf(stderr, "%s\n", mysql_error(mysql));
  exit(0);
}

if (mysql_query(mysql, CREATE_SAMPLE_TABLE))
{
  fprintf(stderr, " CREATE TABLE failed\n");
  fprintf(stderr, "%s\n", mysql_error(mysql));
  exit(0);
}

/* Prepare an INSERT query with 3 parameters */
/* (the TIMESTAMP column is not named; the server */
/* sets it to the current date and time) */
stmt = mysql_stmt_init(mysql);
```
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_SAMPLE, strlen(INSERT_SAMPLE)))
{
    fprintf(stderr, " mysql_stmt_prepare(), INSERT failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}
fprintf(stdout, " prepare, INSERT successful\n");
 /* Get the parameter count from the statement */
param_count= mysql_stmt_param_count(stmt);
fprintf(stdout, " total parameters in INSERT: %d\n", param_count);
if (param_count != 3) /* validate parameter count */
{
    fprintf(stderr, " invalid parameter count returned by MySQL\n");
    exit(0);
}
 /* Bind the data for all 3 parameters */
memset(bind, 0, sizeof(bind));
/* INTEGER PARAM */
/* This is a number type, so there is no need to specify buffer_length */
bind[0].buffer_type= MYSQL_TYPE_LONG;
bind[0].buffer= (char *)&int_data;
bind[0].is_null= 0;
bind[0].length= 0;
/* STRING PARAM */
bind[1].buffer_type= MYSQL_TYPE_STRING;
bind[1].buffer= (char *)str_data;
bind[1].buffer_length= STRING_SIZE;
bind[1].is_null= 0;
bind[1].length= &str_length;
/* SMALLINT PARAM */
bind[2].buffer_type= MYSQL_TYPE_SHORT;
bind[2].buffer= (char *)&small_data;
bind[2].is_null= &is_null;
bind[2].length= 0;
/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
    fprintf(stderr, " mysql_stmt_bind_param() failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}
/* Specify the data values for the first row */
int_data= 10; /* integer */
strncpy(str_data, "MySQL", STRING_SIZE); /* string */
str_length= strlen(str_data);
/* INSERT SMALLINT data as NULL */
is_null= 1;
/* Execute the INSERT statement */
if (mysql_stmt_execute(stmt))
fprintf(stderr, " mysql_stmt_execute(), 1 failed\n");
fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
exit(0);
}
/* Get the number of affected rows */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 1): %lu\n",
(unsigned long) affected_rows);
if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}
/* Specify data values for second row, 
then re-execute the statement */
int_data= 1000;
strncpy(str_data, 
"The most popular Open Source database",
STRING_SIZE);
str_length= strlen(str_data);
small_data= 1000;  /* smallint */
is_null= 0;  /* reset */
/* Execute the INSERT statement - 2*/
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, " mysql_stmt_execute, 2 failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}
/* Get the total rows affected */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 2): %lu\n",
(unsigned long) affected_rows);
if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}
/* Close the statement */
if (mysql_stmt_close(stmt))
{
    /* mysql_stmt_close() invalidates stmt, so call */
    /* mysql_error(mysql) rather than mysql_stmt_error(stmt) */
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_error(mysql));
    exit(0);
}

Note
For complete examples on the use of prepared statement functions, refer to the file
tests/mysql_client_test.c. This file can be obtained from a MySQL source
distribution or from the source repository (see Section 2.9, “Installing MySQL from
Source”).

28.7.11.11 mysql_stmt_fetch()

int mysql_stmt_fetch(MYSQL_STMT *stmt)
Description

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set exists; that is, after a call to `mysql_stmt_execute()` for a statement such as `SELECT` that produces a result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It returns the data in those buffers for all the columns in the current row set and the lengths are returned to the `length` pointer. All columns must be bound by the application before it calls `mysql_stmt_fetch()`.

`mysql_stmt_fetch()` typically occurs within a loop, to ensure that all result set rows are fetched. For example:

```c
int status;
while (1) {
    status = mysql_stmt_fetch(stmt);
    if (status == 1 || status == MYSQL_NO_DATA) break;
    /* handle current row here */
}
/* if desired, handle status == 1 case and display error here */
```

By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before calling `mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains TRUE (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>MYSQL_TYPE_TINY</td>
<td>1</td>
</tr>
<tr>
<td>MYSQL_TYPE_SHORT</td>
<td>2</td>
</tr>
<tr>
<td>MYSQL_TYPE_LONG</td>
<td>4</td>
</tr>
<tr>
<td>MYSQL_TYPE_LONGLONG</td>
<td>8</td>
</tr>
<tr>
<td>MYSQL_TYPE_FLOAT</td>
<td>4</td>
</tr>
<tr>
<td>MYSQL_TYPE_DOUBLE</td>
<td>8</td>
</tr>
<tr>
<td>MYSQL_TYPE_TIME</td>
<td><code>sizeof(MYSQL_TIME)</code></td>
</tr>
<tr>
<td>MYSQL_TYPE_DATE</td>
<td><code>sizeof(MYSQL_TIME)</code></td>
</tr>
<tr>
<td>MYSQL_TYPE_DATETIME</td>
<td><code>sizeof(MYSQL_TIME)</code></td>
</tr>
<tr>
<td>MYSQL_TYPE_STRING</td>
<td><code>data_length</code></td>
</tr>
<tr>
<td>MYSQL_TYPE_BLOB</td>
<td><code>data_length</code></td>
</tr>
</tbody>
</table>

In some cases, you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or `BLOB` value for which you want to know how much space must be allocated. To accomplish this, use one of these strategies:
Before invoking mysql_stmt_fetch() to retrieve individual rows, pass STM_T_ATTR_UPDATE_MAX_LENGTH to mysql_stmt_attr_set(), then invoke mysql_stmt_store_result() to buffer the entire result on the client side. Setting the STM_T_ATTR_UPDATE_MAX_LENGTH attribute causes the maximal length of column values to be indicated by the max_length member of the result set metadata returned by mysql_stmt_result_metadata().

Invoke mysql_stmt_fetch() with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with mysql_stmt_fetch_column().

```
real_length= 0;
bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length
mysql_stmt_bind_result(stmt, bind);

mysql_stmt_fetch(stmt);
if (real_length > 0)
{
    data= malloc(real_length);
    bind[0].buffer= data;
    bind[0].buffer_length= real_length;
    mysql_stmt_fetch_column(stmt, bind, 0, 0);
}
```

### Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success, the data has been fetched to application data buffers.</td>
</tr>
<tr>
<td>1</td>
<td>Error occurred. Error code and message can be obtained by calling mysql_stmt_errno() and mysql_stmt_error().</td>
</tr>
<tr>
<td>MYSQL_NO_DATA</td>
<td>Success, no more data exists</td>
</tr>
<tr>
<td>MYSQL_DATA_TRUNCATED</td>
<td>Data truncation occurred</td>
</tr>
</tbody>
</table>

MYSQL_DATA_TRUNCATED is returned when truncation reporting is enabled. To determine which column values were truncated when this value is returned, check the error members of the MYSQL_BIND structures used for fetching values. Truncation reporting is enabled by default, but can be controlled by calling mysql_options() with the MYSQL_REPORT_DATA_TRUNCATION option.

### Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

  Although mysql_stmt_fetch() can produce this error, it is more likely to occur for the following C API call if mysql_stmt_fetch() is not called enough times to read the entire result set (that is, enough times to return MYSQL_NO_DATA).

- **CR_OUT_OF_MEMORY**
  Out of memory.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.
• **CR_SERVER_LOST**
  The connection to the server was lost during the query.

• **CR_UNKNOWN_ERROR**
  An unknown error occurred.

• **CR_UNSUPPORTED_PARAM_TYPE**
  The buffer type is `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, but the data type is not `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP`.

• All other unsupported conversion errors are returned from `mysql_stmt_bind_result()`.

**Example**

The following example demonstrates how to fetch data from a table using `mysql_stmt_result_metadata()`, `mysql_stmt_bind_result()`, and `mysql_stmt_fetch()`.

(This example expects to retrieve the two rows inserted by the example shown in Section 28.7.11.10, "mysql_stmt_execute()".) The `mysql` variable is assumed to be a valid connection handler.

```c
#define STRING_SIZE 50
#define SELECT_SAMPLE "SELECT col1, col2, col3, col4 FROM test_table"

MYSQL_STMT    *stmt;
MYSQL_BIND    bind[4];
MYSQL_RES     *prepare_meta_result;
MYSQL_TIME    ts;
unsigned long length[4];
int           param_count, column_count, row_count;
short         small_data;
int           int_data;
char          str_data[STRING_SIZE];
bool          is_null[4];
bool          error[4];

/* Prepare a SELECT query to fetch data from test_table */
stmt = mysql_stmt_init(mysql);
if (!stmt)
    { fprintf(stderr, " mysql_stmt_init(), out of memory\n");
      exit(0);
    }
if (mysql_stmt_prepare(stmt, SELECT_SAMPLE, strlen(SELECT_SAMPLE)))
    { fprintf(stderr, " mysql_stmt_prepare(), SELECT failed\n");
      fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
      exit(0);
    }
fprintf(stdout, " prepare, SELECT successful\n");
/* Get the parameter count from the statement */
param_count= mysql_stmt_param_count(stmt);
if (param_count != 0) /* validate parameter count */
    { fprintf(stderr, " invalid parameter count returned by MySQL\n");
      exit(0);
    }
```
/* Fetch result set meta information */
prepare_meta_result = mysql_stmt_result_metadata(stmt);
if (!prepare_meta_result)
{
    fprintf(stderr,
        " mysql_stmt_result_metadata(), \n        returned no meta information\n"");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get total columns in the query */
column_count= mysql_num_fields(prepare_meta_result);
fprintf(stdout,
    " total columns in SELECT statement: %d\n",
    column_count);
if (column_count != 4) /* validate column count */
{
    fprintf(stderr, " invalid column count returned by MySQL\n");
    exit(0);
}

/* Execute the SELECT query */
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, " mysql_stmt_execute(), failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Bind the result buffers for all 4 columns before fetching them */
memset(bind, 0, sizeof(bind));

/* INTEGER COLUMN */
bind[0].buffer_type= MYSQL_TYPE_LONG;
bind[0].buffer= (char *)&int_data;
bind[0].is_null= &is_null[0];
bind[0].length= &length[0];
bind[0].error= &error[0];

/* STRING COLUMN */
bind[1].buffer_type= MYSQL_TYPE_STRING;
bind[1].buffer= (char *)str_data;
bind[1].buffer_length= STRING_SIZE;
bind[1].is_null= &is_null[1];
bind[1].length= &length[1];
bind[1].error= &error[1];

/* SMALLINT COLUMN */
bind[2].buffer_type= MYSQL_TYPE_SHORT;
bind[2].buffer= (char *)&small_data;
bind[2].is_null= &is_null[2];
bind[2].length= &length[2];
bind[2].error= &error[2];

/* TIMESTAMP COLUMN */
bind[3].buffer_type= MYSQL_TYPE_TIMESTAMP;
bind[3].buffer= (char *)&ts;
bind[3].is_null= &is_null[3];
bind[3].length= &length[3];
bind[3].error= &error[3];

/* Bind the result buffers */
if (mysql_stmt_bind_result(stmt, bind))
{
fprintf(stderr, " mysql_stmt_bind_result() failed
");
fprintf(stderr, " %s
", mysql_stmt_error(stmt));
exit(0);
}

/* Now buffer all results to client (optional step) */
if (mysql_stmt_store_result(stmt))
{
fprintf(stderr, " mysql_stmt_store_result() failed
");
fprintf(stderr, " %s
", mysql_stmt_error(stmt));
exit(0);
}

/* Fetch all rows */
row_count= 0;
fprintf(stdout, "Fetching results ...
"),
while (!mysql_stmt_fetch(stmt))
{
row_count++;
fprintf(stdout, " row %d
", row_count);

/* column 1 */
fprintf(stdout, " column1 (integer) : ");
if (is_null[0])
fprintf(stdout, " NULL
");
else
fprintf(stdout, " %d(%ld)
", int_data, length[0]);

/* column 2 */
fprintf(stdout, " column2 (string)   : ");
if (is_null[1])
fprintf(stdout, " NULL
");
else
fprintf(stdout, " %s(%ld)
", str_data, length[1]);

/* column 3 */
fprintf(stdout, " column3 (smallint) : ");
if (is_null[2])
fprintf(stdout, " NULL
");
else
fprintf(stdout, " %d(%ld)
", small_data, length[2]);

/* column 4 */
fprintf(stdout, " column4 (timestamp): ");
if (is_null[3])
fprintf(stdout, " NULL
");
else
fprintf(stdout, " %04d-%02d-%02d %02d:%02d:%02d (%ld)
",
   ts.year, ts.month, ts.day,
   ts.hour, ts.minute, ts.second,
   length[3]);
fprintf(stdout, "
");
}

/* Validate rows fetched */
fprintf(stdout, " total rows fetched: %d
", row_count);
if (row_count != 2)
{
fprintf(stderr, " MySQL failed to return all rows
");
exit(0);
}

/* Free the prepared result metadata */
mysql_free_result(prepare_meta_result);

/* Close the statement */
28.7.11.12 mysql_stmt_fetch_column()

```c
int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int column, unsigned long offset)
```

**Description**

Fetches one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0. `offset` is the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_INVALID_PARAMETER_NO**
  
  Invalid column number.

- **CR_NO_DATA**

  The end of the result set has already been reached.

28.7.11.13 mysql_stmt_field_count()

```c
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

**Description**

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

**Return Values**

An unsigned integer representing the number of columns in a result set.

**Errors**

None.

28.7.11.14 mysql_stmt_free_result()
bool mysql_stmt_free_result(MYSQL_STMT *stmt)

Description

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, mysql_stmt_free_result() closes it.

Return Values

Zero for success. Nonzero if an error occurred.

28.7.11.15 mysql_stmt_init()

MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)

Description

Creates and returns a MYSQL_STMT handler. The handler should be freed with mysql_stmt_close(), at which point the handler becomes invalid and should no longer be used.

See also Section 28.7.9, "C API Prepared Statement Data Structures", for more information.

Return Values

A pointer to a MYSQL_STMT structure in case of success. NULL if out of memory.

Errors

• CR_OUT_OF_MEMORY

Out of memory.

28.7.11.16 mysql_stmt_insert_id()

my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)

Description

Returns the value generated for an AUTO_INCREMENT column by the prepared INSERT or UPDATE statement. Use this function after you have executed a prepared INSERT statement on a table which contains an AUTO_INCREMENT field.

See Section 28.7.38, "mysql_insert_id()", for more information.

Return Values

Value for AUTO_INCREMENT column which was automatically generated or explicitly set during execution of prepared statement, or value generated by LAST_INSERT_ID(expr) function. Return value is undefined if statement does not set AUTO_INCREMENT value.

Errors

None.

28.7.11.17 mysql_stmt_next_result()
int mysql_stmt_next_result(MYSQL_STMT *mysql)

Description

This function is used when you use prepared CALL statements to execute stored procedures, which can return multiple result sets. Use a loop that calls `mysql_stmt_next_result()` to determine whether there are more results. If a procedure has OUT or INOUT parameters, their values will be returned as a single-row result set following any other result sets. The values will appear in the order in which they are declared in the procedure parameter list.

For information about the effect of unhandled conditions on procedure parameters, see Section 13.6.7.8, “Condition Handling and OUT or INOUT Parameters”.

`mysql_stmt_next_result()` returns a status to indicate whether more results exist. If `mysql_stmt_next_result()` returns an error, there are no more results.

Before each call to `mysql_stmt_next_result()`, you must call `mysql_stmt_free_result()` for the current result if it produced a result set (rather than just a result status).

After calling `mysql_stmt_next_result()` the state of the connection is as if you had called `mysql_stmt_execute()`. This means that you can call `mysql_stmt_bind_result()`, `mysql_stmt_affected_rows()`, and so forth.

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_stmt_next_result()` to advance to the next result.

For an example that shows how to use `mysql_stmt_next_result()`, see Section 28.7.25, “C API Prepared CALL Statement Support”.

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Successful and there are more results</td>
</tr>
<tr>
<td>-1</td>
<td>Successful and there are no more results</td>
</tr>
<tr>
<td>&gt;0</td>
<td>An error occurred</td>
</tr>
</tbody>
</table>

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.
28.7.11.18 mysql_stmt_num_rows()

my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)

Description

Returns the number of rows in the result set.

The use of mysql_stmt_num_rows() depends on whether you used mysql_stmt_store_result() to buffer the entire result set in the statement handler. If you use mysql_stmt_store_result(), mysql_stmt_num_rows() may be called immediately. Otherwise, the row count is unavailable unless you count the rows as you fetch them.

mysql_stmt_num_rows() is intended for use with statements that return a result set, such as SELECT. For statements such as INSERT, UPDATE, or DELETE, the number of affected rows can be obtained with mysql_stmt_affected_rows().

Return Values

The number of rows in the result set.

Errors

None.

28.7.11.19 mysql_stmt_param_count()

unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)

Description

Returns the number of parameter markers present in the prepared statement.

Return Values

An unsigned long integer representing the number of parameters in a statement.

Errors

None.

Example

See the Example in Section 28.7.11.10, "mysql_stmt_execute()".

28.7.11.20 mysql_stmt_param_metadata()

MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)

This function currently does nothing.

28.7.11.21 mysql_stmt_prepare()

int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long length)
Description

Given the statement handler returned by `mysql_stmt_init()`, prepares the SQL statement pointed to by the string `stmt_str` and returns a status value. The string length should be given by the `length` argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (`;`) or `\g` to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (`?`) characters into the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are permitted in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value. However, they are not permitted for identifiers (such as table or column names), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using `mysql_stmt_bind_param()` before executing the statement.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_OUT_OF_MEMORY**
  
  Out of memory.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns nonzero), the error message can be obtained by calling `mysql_stmt_error()`.

Example

See the Example in Section 28.7.11.10, “mysql_stmt_execute()”. 

4828
28.7.11.22 mysql_stmt_reset()

    bool mysql_stmt_reset (MYSQL_STMT *stmt)

Description

Resets a prepared statement on client and server to state after prepare. It resets the statement on the server, data sent using mysql_stmt_send_long_data(), unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To re-prepare the statement with another query, use mysql_stmt_prepare().

Return Values

Zero for success. Nonzero if an error occurred.

Errors

• CR_COMMANDS_OUT_OF_SYNC

  Commands were executed in an improper order.

• CR_SERVER_GONE_ERROR

  The MySQL server has gone away.

• CR_SERVER_LOST

  The connection to the server was lost during the query

• CR_UNKNOWN_ERROR

  An unknown error occurred.

28.7.11.23 mysql_stmt_result_metadata()

    MYSQL_RES *mysql_stmt_result_metadata (MYSQL_STMT *stmt)

Description

If a statement passed to mysql_stmt_prepare() is one that produces a result set, mysql_stmt_result_metadata() returns the result set metadata in the form of a pointer to a MYSQL_RES structure that can be used to process the meta information such as number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

• mysql_num_fields()

• mysql_fetch_field()

• mysql_fetch_field_direct()

• mysql_fetch_fields()

• mysql_field_count()
The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handler with `mysql_stmt_fetch()`.

**Return Values**

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

**Errors**

- **CR_OUT_OF_MEMORY**
  
  Out of memory.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

**Example**

See the Example in Section 28.7.11.11, "mysql_stmt_fetch()".

### 28.7.11.24 mysql_stmt_row_seek()

```c
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)
```

**Description**

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

**Return Values**

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

**Errors**

None.

### 28.7.11.25 mysql_stmt_row_tell()

```c
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```
MySQL Row Offset

mysql_stmt_row_tell(MYSQL_STMT *stmt)

Description

Returns the current position of the row cursor for the last mysql_stmt_fetch(). This value can be used as an argument to mysql_stmt_row_seek().

You should use mysql_stmt_row_tell() only after mysql_stmt_store_result().

Return Values

The current offset of the row cursor.

Errors

None.

mysql_stmt_send_long_data()

bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int parameter_number, const char *data, unsigned long length)

Description

Enables an application to send parameter data to the server in pieces (or “chunks”). Call this function after mysql_stmt_bind_param() and before mysql_stmt_execute(). It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the TEXT or BLOB data types.

parameter_number indicates which parameter to associate the data with. Parameters are numbered beginning with 0. data is a pointer to a buffer containing data to be sent, and length indicates the number of bytes in the buffer.

Note

The next mysql_stmt_execute() call ignores the bind buffer for all parameters that have been used with mysql_stmt_send_long_data() since last mysql_stmt_execute() or mysql_stmt_reset().

If you want to reset/forget the sent data, you can do it with mysql_stmt_reset(). See Section 28.7.11.22, “mysql_stmt_reset()”.

The max_allowed_packet system variable controls the maximum size of parameter values that can be sent with mysql_stmt_send_long_data().

Return Values

Zero for success. Nonzero if an error occurred.

Errors

• CR_INVALID_BUFFER_USE

  The parameter does not have a string or binary type.

• CR_INVALID_PARAMETER_NO
Invalid parameter number.

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_OUT_OF_MEMORY**
  Out of memory.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

Example

The following example demonstrates how to send the data for a TEXT column in chunks. It inserts the data value 'MySQL - The most popular Open Source database' into the text_column column. The mysql variable is assumed to be a valid connection handler.

```c
#define INSERT_QUERY "INSERT INTO \\
    test_long_data(text_column) VALUES(?)"

MYSQL_BIND bind[1];
long length;

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0); }
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))
{
    fprintf(stderr, " mysql_stmt_prepare(), INSERT failed\"

    fprintf(stderr, " %s", mysql_stmt_error(stmt));
    exit(0);
}
memset(bind, 0, sizeof(bind));
bind[0].buffer_type= MYSQL_TYPE_STRING;
bind[0].length= &length;
bind[0].is_null= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
    fprintf(stderr, "\n param bind failed\"

    fprintf(stderr, " %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply data in chunks to server */
if (mysql_stmt_send_long_data(stmt,0,"MySQL",5))
{
    fprintf(stderr, "\n send_long_data failed\"

    fprintf(stderr, " %s", mysql_stmt_error(stmt));
    exit(0);
}
```
/* Supply the next piece of data */
if (mysql_stmt_send_long_data(stmt,0,  
    " - The most popular Open Source database",40))
{
    fprintf(stderr, "send_long_data failed\n");
    fprintf(stderr, "%s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Now, execute the query */
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, "mysql_stmt_execute failed\n");
    fprintf(stderr, "%s\n", mysql_stmt_error(stmt));
    exit(0);
}

28.7.11.27 mysql_stmt_sqlstate()

const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)

Description

For the statement specified by stmt, mysql_stmt_sqlstate() returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. "00000" means "no error." The values are specified by ANSI SQL and ODBC. For a list of possible values, see Appendix B, Errors, Error Codes, and Common Problems.

Not all MySQL errors are mapped to SQLSTATE codes. The value "HY000" (general error) is used for unmapped errors.

If the failed statement API function was mysql_stmt_close(), do not call mysql_stmt_sqlstate() to obtain error information because mysql_stmt_close() makes the statement handler invalid. Call mysql_sqlstate() instead.

Return Values

A null-terminated character string containing the SQLSTATE error code.

28.7.11.28 mysql_stmt_store_result()

int mysql_stmt_store_result(MYSQL_STMT *stmt)

Description

Result sets are produced by calling mysql_stmt_execute() to executed prepared statements for SQL statements such as SELECT, SHOW, DESCRIBE, and EXPLAIN. By default, result sets for successfully executed prepared statements are not buffered on the client and mysql_stmt_fetch() fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call mysql_stmt_store_result() after binding data buffers with mysql_stmt_bind_result() and before calling mysql_stmt_fetch() to fetch rows. (For an example, see Section 28.7.11.11, "mysql_stmt_fetch()".)

mysql_stmt_store_result() is optional for result set processing, unless you will call mysql_stmt_data_seek(), mysql_stmt_row_seek(), or mysql_stmt_row_tell(). Those functions require a seekable result set.
It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to Section 28.7.11.23, "mysql_stmt_result_metadata()".

Note
MySQL does not by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications do not need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See Section 28.7.11.3, "mysql_stmt_attr_set()".

Return Values
Zero for success. Nonzero if an error occurred.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_OUT_OF_MEMORY**
  
  Out of memory.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

28.7.12 C API Asynchronous Interface

As of MySQL 8.0.16, the C API includes asynchronous functions that enable nonblocking communication with the MySQL server. Asynchronous functions enable development of applications that differ from the query processing model based on synchronous functions that block if reads from or writes to the server connection must wait. Using the asynchronous functions, an application can check whether work on the server connection is ready to proceed. If not, the application can perform other work before checking again later.

For example, an application might open multiple connections to the server and use them to submit multiple statements for execution. The application then can poll the connections to see which of them have results to be fetched, while doing other work.

The asynchronous C API functions cover operations that might otherwise block when reading to or writing from the server connection: The initial connection operation, sending a query, reading the result, and so forth. Each asynchronous function has the same name as its synchronous counterpart, plus a `_nonblocking` suffix:
• **mysql_fetch_row_nonblocking()**: Asynchronously fetches the next row from the result set.

• **mysql_free_result_nonblocking()**: Asynchronously frees memory used by a result set.

• **mysql_next_result_nonblocking()**: Asynchronously returns/initiates the next result in multiple-result executions.

• **mysql_real_connect_nonblocking()**: Asynchronously connects to a MySQL server.

• **mysql_real_query_nonblocking()**: Asynchronously executes an SQL query specified as a counted string.

• **mysql_store_result_nonblocking()**: Asynchronously retrieves a complete result set to the client.

Applications can mix asynchronous and synchronous functions if there are operations that need not be done asynchronously or for which the asynchronous functions do not apply.

The following discussion describes in more detail how to use asynchronous C API functions.

• **Asynchronous Function Calling Conventions**

• **Example Program**

• **Asynchronous Function Restrictions**

### Asynchronous Function Calling Conventions

All asynchronous C API functions return an `enum net_async_status` value. The return value can be one of the following values to indicate operation status:

• **NET_ASYNC_NOT_READY**: The operation is still in progress and not yet complete.

• **NET_ASYNC_COMPLETE**: The operation completed successfully.

• **NET_ASYNC_ERROR**: The operation terminated in error.

• **NET_ASYNC_COMPLETE_NO_MORE_RESULTS**: The operation completed successfully and no more results are available. This status applies only to **mysql_next_result_nonblocking()**.

In general, to use an asynchronous function, do this:

• Call the function repeatedly until it no longer returns a status of **NET_ASYNC_NOT_READY**.

• Check whether the final status indicates successful completion (**NET_ASYNC_COMPLETE**) or an error (**NET_ASYNC_ERROR**).

The following examples illustrate some typical calling patterns. **function(args)** represents an asynchronous function and its argument list.

• If it is desirable to perform other processing while the operation is in progress:

```c
enum net_async_status status;
status = function(args);
while (status == NET_ASYNC_NOT_READY) {
  /* perform other processing */
  other_processing();
  /* invoke same function and arguments again */
```

```c```
status = function(args);
}
if (status == NET_ASYNC_ERROR) {
  /* call failed; handle error */
} else {
  /* call successful; handle result */
}

• If there is no need to perform other processing while the operation is in progress:

enum net_async_status status;
while ((status == function(args)) == NET_ASYNC_NOT_READY) {
  /* empty loop */
  if (status == NET_ASYNC_ERROR) {
    /* call failed; handle error */
  } else {
    /* call successful; handle result */
  }
}

• If the function success/failure result does not matter and you want to ensure only that the operation has completed:

while (function(args) != NET_ASYNC_COMPLETE) {
  /* empty loop */
}

For mysql_next_result_nonblocking(), it is also necessary to account for the NET_ASYNC_COMPLETE_NO_MORE_RESULTS status, which indicates that the operation completed successfully and no more results are available. Use it like this:

while ((status = mysql_next_result_nonblocking()) != NET_ASYNC_COMPLETE) {
  if (status == NET_ASYNC_COMPLETE_NO_MORE_RESULTS) {
    /* no more results */
  } else if (status == NET_ASYNC_ERROR) {
    /* handle error by calling mysql_error(); */
    break;
  }
}

In most cases, arguments for the asynchronous functions are the same as for the corresponding synchronous functions. Exceptions are mysql_fetch_row_nonblocking() and mysql_store_result_nonblocking(), each of which takes an extra argument compared to its synchronous counterpart. For details, see Section 28.7.15.1, “mysql_fetch_row_nonblocking()”, and Section 28.7.15.6, “mysql_store_result_nonblocking()”.

Example Program

This section shows an example C++ program that illustrates use of asynchronous C API functions.

To set up the SQL objects used by the program, execute the following statements. Substitute a different database or user as desired; in this case, you will need to make some adjustments to the program as well.

```sql
CREATE DATABASE db;
USE db;
CREATE TABLE test_table (id INT NOT NULL);
INSERT INTO test_table VALUES (10), (20), (30);
CREATE USER 'testuser'@'localhost' IDENTIFIED BY 'testpass';
```
Create a file named `async_app.cc` containing the following program. Adjust the connection parameters as necessary.

```c
#include <stdio.h>
#include <string.h>
#include <iostream>
#include <mysql.h>
#include <mysqld_error.h>
using namespace std;

/* change following connection parameters as necessary */
static const char * c_host = "localhost";
static const char * c_user = "testuser";
static const char * c_auth = "testpass";
static int          c_port = 3306;
static const char * c_sock = "/usr/local/mysql/mysql.sock";
static const char * c_dbnm = "db";

void perform_arithmetic() {  
    cout<<"dummy function invoked\n";  
    for (int i = 0; i < 1000; i++)  
        i=1;  
}

int main(int argc, char ** argv) {  
    MYSQL *mysql_local;
    MYSQL_RES *result;
    MYSQL_ROW row;
    net_async_status status;
    const char *stmt_text;
    if (!(mysql_local = mysql_init(NULL))) {  
        cout<<"mysql_init() failed\n";  
        exit(1);
    }
    while ((status = mysql_real_connect_nonblocking(mysql_local, c_host, c_user,
                                                       c_auth, c_dbnm, c_port,
                                                       c_sock, 0))
        == NET_ASYNC_NOT_READY) /* empty loop */
        if (status == NET_ASYNC_ERROR) {  
            cout<<"mysql_real_connect_nonblocking() failed\n";  
            exit(1);
        }
    stmt_text = "SELECT * FROM test_table ORDER BY id";
    status = mysql_real_query_nonblocking(mysql_local, stmt_text,
                                           (unsigned long)strlen(stmt_text));
    /* do some other task before checking function result */
    perform_arithmetic();
    while (status == NET_ASYNC_NOT_READY) {
        status = mysql_real_query_nonblocking(mysql_local, stmt_text,
                                               (unsigned long)strlen(stmt_text));
        perform_arithmetic();
    }
    if (status == NET_ASYNC_ERROR) {  
        cout<<"mysql_real_query_nonblocking() failed\n";  
        exit(1);
    }
    /* retrieve query result asynchronously */

*/
```
status = mysql_store_result_nonblocking(mysql_local, &result);
/* do some other task before checking function result */
perform_arithmetic();
while (status == NET_ASYNC_NOT_READY) {
    status = mysql_store_result_nonblocking(mysql_local, &result);
    perform_arithmetic();
}
if (status == NET_ASYNC_ERROR) {
    cout<<"mysql_store_result_nonblocking() failed\n";
    exit(1);
}
if (result == NULL) {
    cout<<"mysql_store_result_nonblocking() found 0 records\n";
    exit(1);
}

/* fetch a row synchronously */
row = mysql_fetch_row(result);
if (row != NULL && strcmp(row[0], "10") == 0)
    cout<<"ROW: " << row[0] << "\n";
else
    cout<<"incorrect result fetched\n";

/* fetch a row asynchronously, but without doing other work */
while (mysql_fetch_row_nonblocking(result, &row) != NET_ASYNC_COMPLETE)
    /* empty loop */
/* 2nd row fetched */
if (row != NULL && strcmp(row[0], "20") == 0)
    cout<<"ROW: " << row[0] << "\n";
else
    cout<<"incorrect result fetched\n";

/* fetch a row asynchronously, doing other work while waiting */
status = mysql_fetch_row_nonblocking(result, &row);
/* do some other task before checking function result */
perform_arithmetic();
while (status != NET_ASYNC_COMPLETE) {
    status = mysql_fetch_row_nonblocking(result, &row);
    perform_arithmetic();
}
/* 3rd row fetched */
if (row != NULL && strcmp(row[0], "30") == 0)
    cout<<"ROW: " << row[0] << "\n";
else
    cout<<"incorrect result fetched\n";

/* fetch a row asynchronously (no more rows expected) */
while ((status = mysql_fetch_row_nonblocking(result, &row)) != NET_ASYNC_COMPLETE)
    /* empty loop */
if (row == NULL)
    cout <<"No more rows to process.\n";
else
    cout <<"More rows found than expected.\n";
/* free result set memory asynchronously */
while (mysql_free_result_nonblocking(result) != NET_ASYNC_COMPLETE)
    /* empty loop */
mysql_close(mysql_local);

Compile the program using a command similar to this; adjust the compiler and options as necessary:

gcc -g async_app.cc -std=c++11 \
-I/usr/local/mysql/include \

Run the program. The results should be similar to what you see here, although you might see a varying number of dummy function invoked instances.

To experiment with the program, add and remove rows from test_table, running the program again after each change.

Asynchronous Function Restrictions

These restrictions apply to the use of asynchronous C API functions:

- `mysql_real_connect_nonblocking()` can be used only for accounts that authenticate with one of these authentication plugins: `mysql_native_password`, `sha256_password`, or `caching_sha2_password`.

- `mysql_real_connect_nonblocking()` can be used only to establish TCP/IP or Unix socket file connections.

- These statements are not supported and must be processed using synchronous C API functions: `LOAD DATA`, `LOAD XML`.

- Protocol compression is not supported for asynchronous C API functions.

28.7.13 C API Asynchronous Interface Data Structures

This section describes data structures specific to asynchronous C API functions. For information about general-purpose C API data structures, see Section 28.7.5, “C API Data Structures”.

- `enum net_async_status`

  The enumeration type used to express the return status of asynchronous C API functions. The following table shows the permitted status values.

<table>
<thead>
<tr>
<th>Enumeration Status Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NET_ASYNC_COMPLETE</td>
<td>Asynchronous operation is complete</td>
</tr>
<tr>
<td>NET_ASYNC_NOT_READY</td>
<td>Asynchronous operation is still in progress</td>
</tr>
<tr>
<td>NET_ASYNC_ERROR</td>
<td>Asynchronous operation terminated in error</td>
</tr>
<tr>
<td>NET_ASYNC_COMPLETE_NO_MORE_RESULTS</td>
<td>For <code>mysql_next_result_nonblocking()</code>: indicates no more results available</td>
</tr>
</tbody>
</table>

  For more information, see Section 28.7.12, “C API Asynchronous Interface”.

28.7.14 C API Asynchronous Function Overview

The following list summarizes the functions available for asynchronous interaction with the MySQL server. For greater detail, see the descriptions in Section 28.7.15, “C API Asynchronous Function Descriptions”.
28.7.15 C API Asynchronous Function Descriptions

To interact asynchronously with the MySQL server, use the functions described in the following sections. For descriptions of their synchronous counterparts, see Section 28.7.7, “C API Function Descriptions”.

28.7.15.1 mysql_fetch_row_nonblocking()

enum net_async_status mysql_fetch_row_nonblocking(MYSQL_RES *result, MYSQL_ROW *row)

Description

mysql_fetch_row_nonblocking() is used similarly to mysql_fetch_row(). For details about the latter, see Section 28.7.7.21, “mysql_fetch_row()”. The two functions differ as follows:

• mysql_fetch_row() returns a MYSQL_ROW value containing the next row, or NULL. The meaning of a NULL return depends on which function was called preceding mysql_fetch_row():

  • When used after mysql_store_result() or mysql_store_result_nonblocking(), mysql_fetch_row() returns NULL if there are no more rows to retrieve.

  • When used after mysql_use_result(), mysql_fetch_row() returns NULL if there are no more rows to retrieve or an error occurred.

• mysql_fetch_row_nonblocking() returns an enum net_async_status status indicator and takes a second row argument that provides a pointer to a MYSQL_ROW value. When the return status is NET_ASYNC_COMPLETE, the row argument is a pointer to a MYSQL_ROW value containing the next row, or NULL. The meaning of NULL depends on which function was called preceding mysql_fetch_row_nonblocking():

  • When used after mysql_store_result() or mysql_store_result_nonblocking(), the row argument is NULL if there are no more rows to retrieve.
When used after `mysql_use_result()`, the `row` argument is `NULL` if there are no more rows to retrieve or an error occurred.

`mysql_fetch_row_nonblocking()` was added in MySQL 8.0.16.

Return Values

Example

See Section 28.7.12, “C API Asynchronous Interface”.

28.7.15.2 `mysql_free_result_nonblocking()`

```c
enum net_async_status mysql_free_result_nonblocking(MYSQL_RES *result)
```

Description

```
Note

`mysql_free_result_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_free_result()` synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see Section 28.7.12, “C API Asynchronous Interface”.
```

`mysql_free_result_nonblocking()` is used similarly to `mysql_free_result()`. For details about the latter, see Section 28.7.25, “mysql_free_result()”. The two functions differ as follows:

- `mysql_free_result()` does not return a value.
- `mysql_free_result_nonblocking()` returns an `enum net_async_status` status indicator.

`mysql_free_result_nonblocking()` was added in MySQL 8.0.16.

Return Values

Example

See Section 28.7.12, “C API Asynchronous Interface”.

28.7.15.3 `mysql_next_result_nonblocking()`

```c
enum net_async_status mysql_next_result_nonblocking(MYSQL *mysql)
```

Description

```
Note

`mysql_next_result_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_next_result()` synchronous function, for use by applications that require asynchronous communication with the server. For general
information about writing asynchronous C API applications, see Section 28.7.12, “C API Asynchronous Interface”.

mysql_next_result_nonblocking() is used similarly to mysql_next_result(). For details about the latter, see Section 28.7.47, “mysql_next_result()”. The two functions differ as follows:

- mysql_next_result() returns an integer status indicator.
- mysql_next_result_nonblocking() returns an enum net_async_status status indicator.

mysql_next_result_nonblocking() was added in MySQL 8.0.16.

Return Values

Returns an enum net_async_status value. See the description in Section 28.7.13, “C API Asynchronous Interface Data Structures”. A NET_ASYNC_COMPLETE_NO_MORE_RESULTS return status indicates there are no more results available. A NET_ASYNC_ERROR return status indicates an error.

Example

See Section 28.7.12, “C API Asynchronous Interface”.

28.7.15.4 mysql_real_connect_nonblocking()

enum net_async_status mysql_real_connect_nonblocking(MYSQL *mysql, const char *host, const char *user, const char *passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long client_flag)

Description

Note

mysql_real_connect_nonblocking() is an asynchronous function. It is the counterpart of the mysql_real_connect() synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see Section 28.7.12, “C API Asynchronous Interface”.

mysql_real_connect_nonblocking() is used similarly to mysql_real_connect(). For details about the latter, see Section 28.7.54, “mysql_real_connect()”. The two functions differ as follows:

- mysql_real_connect() returns a connection handler or NULL.
- mysql_real_connect_nonblocking() returns an enum net_async_status status indicator.

mysql_real_connect_nonblocking() was added in MySQL 8.0.16.

Return Values

Example

See Section 28.7.12, “C API Asynchronous Interface”.

28.7.15.5 mysql_real_query_nonblocking()
enum net_async_status mysql_real_query_nonblocking(MYSQL *mysql, const char *stmt_str, unsigned long length)

Description

Note

mysql_real_query_nonblocking() is an asynchronous function. It is the counterpart of the mysql_real_query() synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see Section 28.7.12, "C API Asynchronous Interface".

mysql_real_query_nonblocking() is used similarly to mysql_real_query(). For details about the latter, see Section 28.7.57, "mysql_real_query()". The two functions differ as follows:

• mysql_real_query() returns an integer status indicator.

• mysql_real_query_nonblocking() returns an enum net_async_status status indicator.

mysql_real_query_nonblocking() was added in MySQL 8.0.16.

Return Values

Returns an enum net_async_status value. See the description in Section 28.7.13, "C API Asynchronous Interface Data Structures". A NET_ASYNC_ERROR return status indicates an error.

Example

See Section 28.7.12, "C API Asynchronous Interface".

28.7.15.6 mysql_store_result_nonblocking() 

enum net_async_status mysql_store_result_nonblocking(MYSQL *mysql, MYSQL_RES **result )

Description

Note

mysql_store_result_nonblocking() is an asynchronous function. It is the counterpart of the mysql_store_result() synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see Section 28.7.12, "C API Asynchronous Interface".

mysql_store_result_nonblocking() is used similarly to mysql_store_result(). For details about the latter, see Section 28.7.79, "mysql_store_result()". The two functions differ as follows:

• mysql_store_result() returns a pointer to a MYSQL_RESULT value that contains the result set, or NULL if there is no result set or an error occurred.

• mysql_store_result_nonblocking() returns an enum net_async_status status indicator and takes a second result argument that is the address of a pointer to a MYSQL_RESULT into which to store the result set. When the return status is NET_ASYNC_COMPLETE, the result argument is NULL if there is no result set or an error occurred.
mysql_store_result_nonblocking() was added in MySQL 8.0.16.

Return Values

When the return status is NET_ASYNC_COMPLETE, the result argument is NULL if there is no result set or an error occurred. To determine whether an error occurred, check whether mysql_error() returns a nonempty string, mysql_errno() returns nonzero, or mysql_field_count() returns zero.

Example

See Section 28.7.12, “C API Asynchronous Interface”.

28.7.16 C API Threaded Function Descriptions

To create a threaded client, use the functions described in the following sections. See also Section 28.7.4.3, “Writing C API Threaded Client Programs”.

28.7.16.1 mysql_thread_end()

    void mysql_thread_end(void)

Description

Call this function before calling pthread_exit() to free memory allocated by mysql_thread_init().

mysql_thread_end() is not invoked automatically by the client library.

- For release/production builds without debugging support enabled, mysql_thread_end() need not be called.
- For debug builds, mysql_thread_init() allocates debugging information for the DBUG package (see Section 29.5.4, “The DBUG Package”). mysql_thread_end() must be called for each mysql_thread_init() call to avoid a memory leak.

Return Values

None.

28.7.16.2 mysql_thread_init()

    bool mysql_thread_init(void)

Description

This function must be called early within each created thread to initialize thread-specific variables. However, you may not necessarily need to invoke it explicitly: calling mysql_thread_init() is automatically handled by mysql_init(), mysql_library_init(), mysql_server_init(), and mysql_connect(). If you invoke any of those functions, mysql_thread_init() is called for you.

Return Values

Zero for success. Nonzero if an error occurred.
28.7.16.3 mysql_thread_safe()

    unsigned int mysql_thread_safe(void)

Description

This function indicates whether the client library is compiled as thread-safe.

Return Values

1 if the client library is thread-safe, 0 otherwise.

28.7.17 C API Client Plugin Functions

This section describes functions used for the client-side plugin API. They enable management of client plugins. For a description of the st_mysql_client_plugin structure used by these functions, see Client Plugin Descriptors.

It is unlikely that a client program needs to call the functions in this section. For example, a client that supports the use of authentication plugins normally causes a plugin to be loaded by calling mysql_options() to set the MYSQL_DEFAULT_AUTH and MYSQL_PLUGIN_DIR options:

    char *plugin_dir = "path_to_plugin_dir";
    char *default_auth = "plugin_name";
    /* ... process command-line options ... */
    mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
    mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);

Typically, the program will also accept --plugin-dir and --default-auth options that enable users to override the default values.

28.7.17.1 mysql_client_find_plugin()

    struct st_mysql_client_plugin *mysql_client_find_plugin(MYSQL *mysql, const char *name, int type)

Description

Returns a pointer to a loaded plugin, loading the plugin first if necessary. An error occurs if the type is invalid or the plugin cannot be found or loaded.

Specify the parameters as follows:

• mysql: A pointer to a MYSQL structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.

• name: The plugin name.

• type: The plugin type.

Return Values

A pointer to the plugin for success. NULL if an error occurred.
Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See Section 28.7.7.15, "mysql_error()", and Section 28.7.7.14, "mysql_errno()".

Example

```c
MYSQL mysql;
struct st_mysql_client_plugin *p;
if ((p = mysql_client_find_plugin(&mysql, "myplugin",
    MYSQL_CLIENT_AUTHENTICATION_PLUGIN, 0)))
{
    printf("Plugin version: %d.%d.%d\n", p->version[0], p->version[1], p->version[2]);
}
```

28.7.17.2 `mysql_client_register_plugin()`

```c
struct st_mysql_client_plugin *mysql_client_register_plugin(MYSQL *mysql,
    struct st_mysql_client_plugin *plugin)
```

Description

Adds a plugin structure to the list of loaded plugins. An error occurs if the plugin is already loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `plugin`: A pointer to the plugin structure.

Return Values

A pointer to the plugin for success. `NULL` if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See Section 28.7.7.15, "mysql_error()", and Section 28.7.7.14, "mysql_errno()".

28.7.17.3 `mysql_load_plugin()`

```c
struct st_mysql_client_plugin *mysql_load_plugin(MYSQL *mysql, const char *
    name, int type, int argc, ...)
```

Description

Loads a MySQL client plugin, specified by name and type. An error occurs if the type is invalid or the plugin cannot be loaded.

It is not possible to load multiple plugins of the same type. An error occurs if you try to load a plugin of a type already loaded.

Specify the parameters as follows:
• **mysql**: A pointer to a **MYSQL** structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.

• **name**: The name of the plugin to load.

• **type**: The type of plugin to load, or −1 to disable type checking. If type is not −1, only plugins matching the type are considered for loading.

• **argc**: The number of following arguments (0 if there are none). Interpretation of any following arguments depends on the plugin type.

Another way to cause plugins to be loaded is to set the **LIBMYSQL_PLUGINS** environment variable to a list of semicolon-separated plugin names. For example:

```shell> export LIBMYSQL_PLUGINS="myplugin1;myplugin2"
```

Plugins named by **LIBMYSQL_PLUGINS** are loaded when the client program calls `mysql_library_init()`. No error is reported if problems occur loading these plugins.

The **LIBMYSQL_PLUGIN_DIR** environment variable can be set to the path name of the directory in which to look for client plugins. This variable is used in two ways:

• During client plugin preloading, the value of the --plugin-dir option is not available, so client plugin loading fails unless the plugins are located in the hardwired default directory. If the plugins are located elsewhere, **LIBMYSQL_PLUGIN_DIR** environment variable can be set to the proper directory to enable plugin preloading to succeed.

• For explicit client plugin loading, the `mysql_load_plugin()` and `mysql_load_plugin_v()` C API functions use the **LIBMYSQL_PLUGIN_DIR** value if it exists and the --plugin-dir option was not given. If --plugin-dir is given, `mysql_load_plugin()` and `mysql_load_plugin_v()` ignore **LIBMYSQL_PLUGIN_DIR**.

**Return Values**

A pointer to the plugin if it was loaded successfully. **NULL** if an error occurred.

**Errors**

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See Section 28.7.15, “mysql_error()”, and Section 28.7.14, “mysql_errno()”.

**Example**

MySQL mysql;

```c
if(!mysql_load_plugin(&mysql, "myplugin",
        MYSQL_CLIENT_AUTHENTICATION_PLUGIN, 0))
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
    exit(-1);
}
```

**See Also**

See also Section 28.7.17.3, “mysql_load_plugin()”, Section 28.7.15, “mysql_error()”, Section 28.7.14, “mysql_errno()”.
28.7.17.4 mysql_load_plugin_v()

```c
struct st_mysql_client_plugin *mysql_load_plugin_v(MYSQL *mysql, const char *name, int type, int argc, va_list args)
```

**Description**

This function is equivalent to `mysql_load_plugin()`, but it accepts a `va_list` instead of a variable list of parameters.

**See Also**

See also Section 28.7.17.3, “mysql_load_plugin()”.

28.7.17.5 mysql_plugin_options()

```c
int mysql_plugin_options(struct st_mysql_client_plugin *plugin, const char *option, const void *value)
```

**Description**

Passes an option type and value to a plugin. This function can be called multiple times to set several options. If the plugin does not have an option handler, an error occurs.

Specify the parameters as follows:

- **plugin**: A pointer to the plugin structure.
- **option**: The option to be set.
- **value**: A pointer to the option value.

**Return Values**

Zero for success, 1 if an error occurred. If the plugin has an option handler, that handler should also return zero for success and 1 if an error occurred.

28.7.18 C API Binary Log Interface

The MySQL client/server protocol includes a client interface for reading a stream of replication events from a MySQL server binary log. This capability uses the `MYSQL_RPL` data structure and a small set of functions to manage communication between a client program and the server from which the binary log is to be read. The following sections describe aspects of this interface in more detail.

28.7.19 C API Binary Log Data Structures

C API functions for processing a replication event stream from a server require a connection handler (a `MYSQL *` pointer) and a pointer to a `MYSQL_RPL` structure that describes the stream of replication events to read from the server binary log. For example:

```c
MYSQL *mysql = mysql_real_connect(...);
MYSQL_RPL rpl;
# ... initialize MYSQL_RPL members ...
```
int result = mysql_binlog_open(mysql, &rpl);

This section describes the MYSQL_RPL structure members. Connection handlers are described in Section 28.7.5, “C API Data Structures”.

The applicable MYSQL_RPL members depend on the binary log operation to be performed:

- Before calling mysql_binlog_open(), the caller must set the MYSQL_RPL members from file_name_length through flags. In addition, if flags has the MYSQL_RPL_GTID flag set, the caller must set the members from gtid_set_encoded_size through gtid_set_arg.
- After a successful mysql_binlog_fetch() call, the caller examines the size and buffer members.

MYSQL_RPL structure member descriptions:

- **file_name_length**
  The length of the name of the binary log file to read. This member is used in conjunction with file_name; see the file_name description.

- **file_name**
  The name of the binary log file to read:
  - If file_name is NULL, the client library sets it to the empty string and sets file_name_length to 0.
  - If file_name is not NULL, file_name_length must either be the length of the name or 0. If file_name_length is 0, the client library sets it to the length of the name, in which case, file_name must be given as a null-terminated string.

  To read from the beginning of the binary log without having to know the name of the oldest binary log file, set file_name to NULL or the empty string, and start_position to 4.

- **start_position**
  The position at which to start reading the binary log. The position of the first event in any given binary log file is 4.

- **server_id**
  The server ID to use for identifying to the server from which the binary log is read.

- **flags**
  The union of flags that affect binary log reading, or 0 if no flags are set. These flag values are permitted:
  - **MYSQL_RPL_SKIP_HEARTBEAT**
    Set this flag to cause mysql_binlog_fetch() to skip heartbeat events.
  - **MYSQL_RPL_GTID**
    Set this flag to read GTID (global transaction ID) data. If set, you must initialize the MYSQL_RPL structure GTID-related members from gtid_set_encoded_size to gtid_set_arg before calling mysql_binlog_open().

    It is beyond the scope of this documentation to describe in detail how client programs use those GTID-related members. For more information, examine the mysqlbinlog.cc source file. For information about GTID-based replication, see Section 17.1.3, “Replication with Global Transaction Identifiers”.

C API Binary Log Function Overview

- **gtid_set_encoded_size**
  The size of GTID set data, or 0.

- **fix_gtid_set**
  The address of a callback function for `mysql_binlog_open()` to call to fill the command packet GTID set, or NULL if there is no such function. The callback function, if used, should have this calling signature:

  ```c
  void my_callback(MYSQL_RPL *rpl, unsigned char *packet_gtid_set);
  ```

- **gtid_set_arg**
  Either a pointer to GTID set data (if fix_gtid_set is NULL), or a pointer to a value to be made available for use within the callback function (if fix_gtid_set is not NULL). gtid_set_arg is a generic pointer, so it can point to any kind of value (for example, a string, a structure, or a function). Its interpretation within the callback depends on how the callback intends to use it.

- **size**
  After a successful `mysql_binlog_fetch()` call, the size of the returned binary log event. The value is 0 for an EOF event, greater than 0 for a non-EOF event.

- **buffer**
  After a successful `mysql_binlog_fetch()` call, a pointer to the binary log event contents.

### 28.7.20 C API Binary Log Function Overview

The following list summarizes the functions available for reading a replication event stream from a binary log. For greater detail, see the descriptions in Section 28.7.21, “C API Binary Log Function Descriptions”.

- **mysql_binlog_close()**: Closes the replication event stream.
- **mysql_binlog_fetch()**: Reads an event from the replication event stream.
- **mysql_binlog_open()**: Opens the replication event stream.

### 28.7.21 C API Binary Log Function Descriptions

The following sections provide detailed descriptions of the functions that enable reading the stream of replication events from a MySQL server binary log.

The following simple example program demonstrates the binary log C API functions. Program notes:

- **mysql** is assumed to be a valid connection handler.

- The initial `SET` statement sets the `@master_binlog_checksum` user-defined variable that the server takes as an indication that the client is checksum-aware. This client does nothing with checksums, but without this statement, a server that includes checksums in binary log events will return an error for the first attempt to read an event containing a checksum. The value assigned to the variable is immaterial; what matters is that the variable exist. existence.

```c
if (mysql_query(mysql, "SET @master_binlog_checksum='ALL'"))
{
    fprintf(stderr, "mysql_query() failed\n");
    fprintf(stderr, "Error %u: %s\n",
```
For additional examples that show how to use these functions, look in a MySQL source distribution for these source files:

- `mysqlbinlog.cc` in the `client` directory
- `mysql_client_test.c` in the `testclients` directory

### 28.7.21.1 `mysql_binlog_close()`

```c
void mysql_binlog_close(MYSQL *mysql, MYSQL_RPL *rpl)
```

**Description**

Close a replication event stream.

**Arguments:**

- `mysql`: The connection handler returned from `mysql_init()`. The handler remains open after the `mysql_binlog_close()` call.
- `rpl`: The replication stream structure. After calling `mysql_binlog_close()`, this structure should not be used further without reinitializing it and calling `mysql_binlog_open()` again.

**Errors**

None.
Example

See Section 28.7.21, “C API Binary Log Function Descriptions”.

28.7.21.2 mysql_binlog_fetch()

```c
int mysql_binlog_fetch(MYSQL *mysql, MYSQL_RPL *rpl)
```

Description

Fetch one event from the replication event stream.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`.
- `rpl`: The replication stream structure. After a successful call, the `size` member indicates the event size, which is 0 for an EOF event. For a non-EOF event, `size` is greater than 0 and the `buffer` member points to the event contents.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

Example

See Section 28.7.21, “C API Binary Log Function Descriptions”.

28.7.21.3 mysql_binlog_open()

```c
int mysql_binlog_open(MYSQL *mysql, MYSQL_RPL *rpl)
```

Description

Open a new replication event stream, to read a MySQL server binary log.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`.
- `rpl`: A `MYSQL_RPL` structure that has been initialized to indicate the replication event stream source. For a description of the structure members and how to initialize them, see Section 28.7.19, “C API Binary Log Data Structures”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_FILE_NAME_TOO_LONG`
  
  The specified binary log file name was too long.

- `CR_OUT_OF_MEMORY`
C API Encrypted Connection Support

Out of memory.

Example

See Section 28.7.21, “C API Binary Log Function Descriptions”.

28.7.22 C API Encrypted Connection Support

This section describes how C applications use the C API capabilities for encrypted connections. By default, MySQL programs attempt to connect using encryption if the server supports encrypted connections, falling back to an unencrypted connection if an encrypted connection cannot be established (see Section 6.3.1, “Configuring MySQL to Use Encrypted Connections”). For applications that require control beyond the default behavior over how encrypted connections are established, the C API provides these capabilities:

- The `mysql_options()` function enables applications to set the appropriate SSL/TLS options before calling `mysql_real_connect()`. For example, to require the use of an encrypted connection, see Enforcing an Encrypted Connection.

- The `mysql_get_ssl_cipher()` function enables applications to determine, after a connection has been established, whether the connection uses encryption. A `NULL` return value indicates that encryption is not being used. A non-`NULL` return value indicates an encrypted connection and names the encryption cipher. See Section 28.7.7.34, “mysql_get_ssl_cipher()”.

- C API Options for Encrypted Connections
- Enforcing an Encrypted Connection
- Improving Security of Encrypted Connections

C API Options for Encrypted Connections

`mysql_options()` provides the following options for control over use of encrypted connections. For option details, see Section 28.7.50, “mysql_options()”.

- `MYSQL_OPT_SSL_CA`: The path name of the Certificate Authority (CA) certificate file. This option, if used, must specify the same certificate used by the server.

- `MYSQL_OPT_SSL_CAPATH`: The path name of the directory that contains trusted SSL CA certificate files.

- `MYSQL_OPT_SSL_CERT`: The path name of the client public key certificate file.

- `MYSQL_OPT_SSL_CIPHER`: The list of permissible ciphers for SSL encryption.

- `MYSQL_OPT_SSL_CRL`: The path name of the file containing certificate revocation lists.

- `MYSQL_OPT_SSL_CRLPATH`: The path name of the directory that contains certificate revocation list files.

- `MYSQL_OPT_SSL_KEY`: The path name of the client private key file.

- `MYSQL_OPT_SSL_MODE`: The connection security state.

- `MYSQL_OPT_TLS_CIPHERSUITES`: The TLSv1.3 ciphersuites the client permits.

- `MYSQL_OPT_TLS_VERSION`: The encryption protocols the client permits.

`mysql_ssl_set()` can be used as a convenience routine that is equivalent to a set of `mysql_options()` calls that specify certificate and key files, encryption ciphers, and so forth. See Section 28.7.77, “mysql_ssl_set()”. 4853
Enforcing an Encrypted Connection

`mysql_options()` options for information such as SSL certificate and key files are used to establish an encrypted connection if such connections are available, but do not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the following technique:

1. Call `mysql_options()` as necessary supply the appropriate SSL parameters (certificate and key files, encryption ciphers, and so forth).
2. Call `mysql_options()` to pass the `MYSQL_OPT_SSL_MODE` option with a value of `SSL_MODE_REQUIRED` or one of the more-restrictive option values.
3. Call `mysql_real_connect()` to connect to the server. The call fails if an encrypted connection cannot be obtained; exit with an error.

Improving Security of Encrypted Connections

For additional security relative to that provided by the default encryption, clients can supply a CA certificate matching the one used by the server and enable host name identity verification. In this way, the server and client place their trust in the same CA certificate and the client verifies that the host to which it connected is the one intended:

- To specify the CA certificate, call `mysql_options()` to pass the `MYSQL_OPT_SSL_CA` (or `MYSQL_OPT_SSL_CAPATH`) option, and call `mysql_options()` to pass the `MYSQL_OPT_SSL_MODE` option with a value of `SSL_MODE_VERIFY_CA`.
- To enable host name identity verification as well, call `mysql_options()` to pass the `MYSQL_OPT_SSL_MODE` option with a value of `SSL_MODE_VERIFY_IDENTITY` rather than `SSL_MODE_VERIFY_CA`.

Note

Host name identity verification with `SSL_MODE_VERIFY_IDENTITY` does not work with self-signed certificates created automatically by the server, or manually using `mysql_ssl_rsa_setup` (see Section 6.3.2.1, “Creating SSL and RSA Certificates and Keys using MySQL”). Such self-signed certificates do not contain the server name as the Common Name value.

Host name identity verification also does not work with certificates that specify the Common Name using wildcards because that name is compared verbatim to the server name.

28.7.23 C API Multiple Statement Execution Support

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement produces a result set (a set of rows, as for `SELECT`) or an affected-rows count (as for `INSERT`, `UPDATE`, and so forth).

MySQL also supports the execution of a string containing multiple statements separated by semicolon (`;`) characters. This capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling `mysql_set_server_option()`.

Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check whether more results exist and process them in turn.
C API Multiple Statement Execution Support

if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. These functions are used at the end of a loop that iterates as long as more results are available. *Failure to process the result this way may result in a dropped connection to the server.*

Multiple-result processing also is required if you execute `CALL` statements for stored procedures. Results from a stored procedure have these characteristics:

- Statements within the procedure may produce result sets (for example, if it executes `SELECT` statements). These result sets are returned in the order that they are produced as the procedure executes.

  In general, the caller cannot know how many result sets a procedure will return. Procedure execution may depend on loops or conditional statements that cause the execution path to differ from one call to the next. Therefore, you must be prepared to retrieve multiple results.

- The final result from the procedure is a status result that includes no result set. The status indicates whether the procedure succeeded or an error occurred.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handlers are defined to work only with strings that contain a single statement. See Section 28.7.8, "C API Prepared Statements".

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevant:
  - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option *must* be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error *Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context.* `CLIENT_MULTI_RESULTS` is enabled by default.
  - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.

- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of "simple" results for a multiple-statement string where each statement produces a single result, but is *not* sufficient to permit processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.

2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.

4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns nonzero. The code as written distinguishes between no more results and an error, which enables a message to be printed for the latter occurrence.

```c
/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
                      db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{  
    printf("mysql_real_connect() failed\n");
    mysql_close(mysql);
    exit(1);
}

/* execute multiple statements */
status = mysql_query(mysql,
"DROP TABLE IF EXISTS test_table;
CREATE TABLE test_table(id INT);
INSERT INTO test_table VALUES(10);
UPDATE test_table SET id=20 WHERE id=10;
SELECT * FROM test_table;
DROP TABLE test_table");
if (status)
{
    printf("Could not execute statement(s)\n");
    mysql_close(mysql);
    exit(0);
}

/* process each statement result */
do {
    /* did current statement return data? */
    result = mysql_store_result(mysql);
    if (result)
    {
        /* yes; process rows and free the result set */
        process_result_set(mysql, result);
        mysql_free_result(result);
    }
    else          /* no result set or error */
    {
        if (mysql_field_count(mysql) == 0)
        {
            printf("%lld rows affected\n",
                mysql_affected_rows(mysql));
        }
        else /* some error occurred */
        {
            printf("Could not retrieve result set\n");
            break;
        }
    }
    /* more results? -1 = no, >0 = error, 0 = yes (keep looping) */
    if ((status = mysql_next_result(mysql)) > 0)
    {  
        printf("Could not execute statement\n");
        break;
    }
} while (status == 0);
mysql_close(mysql);
```
28.7.24 C API Prepared Statement Handling of Date and Time Values

The binary (prepared statement) protocol enables you to send and receive date and time values (DATE, TIME, DATETIME, and TIMESTAMP), using the MYSQL_TIME structure. The members of this structure are described in Section 28.7.9, "C API Prepared Statement Data Structures".

To send temporal data values, create a prepared statement using mysql_stmt_prepare(). Then, before calling mysql_stmt_execute() to execute the statement, use the following procedure to set up each temporal parameter:

1. In the MYSQL_BIND structure associated with the data value, set the buffer_type member to the type that indicates what kind of temporal value you're sending. For DATE, TIME, DATETIME, or TIMESTAMP values, set buffer_type to MYSQL_TYPE_DATE, MYSQL_TYPE_TIME, MYSQL_TYPE_DATETIME, or MYSQL_TYPE_TIMESTAMP, respectively.

2. Set the buffer member of the MYSQL_BIND structure to the address of the MYSQL_TIME structure in which you pass the temporal value.

3. Fill in the members of the MYSQL_TIME structure that are appropriate for the type of temporal value to pass.

Use mysql_stmt_bind_param() to bind the parameter data to the statement. Then you can call mysql_stmt_execute().

To retrieve temporal values, the procedure is similar, except that you set the buffer_type member to the type of value you expect to receive, and the buffer member to the address of a MYSQL_TIME structure into which the returned value should be placed. Use mysql_stmt_bind_result() to bind the buffers to the statement after calling mysql_stmt_execute() and before fetching the results.

Here is a simple example that inserts DATE, TIME, and TIMESTAMP data. The mysql variable is assumed to be a valid connection handler.

```sql
MYSQL_TIME ts;
MYSQL_BIND bind[3];
MYSQL_STMT *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field, \ 
    timestamp_field) VALUES(?,?,?)");

stmt = mysql_stmt_init(mysql);
if (!stmt)
    {
        fprintf(stderr, " mysql_stmt_init(), out of memory
        exit(0);
    }
if (mysql_stmt_prepare(mysql, query, strlen(query)))
    {
        fprintf(stderr, "mysql_stmt_prepare(), INSERT failed
        %s", mysql_stmt_error(stmt));
        exit(0);
    }
/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...
bind[1]= bind[2]= bind[0];
```
C API Prepared CALL Statement Support

mysql_stmt_bind_param(stmt, bind);
/* supply the data to be sent in the ts structure */
ts.year = 2002;
ts.month = 02;
ts.day = 03;
ts.hour = 10;
ts.minute = 45;
ts.second = 20;
mysql_stmt_execute(stmt);
..

28.7.25 C API Prepared CALL Statement Support

This section describes prepared-statement support in the C API for stored procedures executed using CALL statements:

Stored procedures executed using prepared CALL statements can be used in the following ways:

• A stored procedure can produce any number of result sets. The number of columns and the data types of the columns need not be the same for all result sets.

• The final values of OUT and INOUT parameters are available to the calling application after the procedure returns. These parameters are returned as an extra single-row result set following any result sets produced by the procedure itself. The row contains the values of the OUT and INOUT parameters in the order in which they are declared in the procedure parameter list.

For information about the effect of unhandled conditions on procedure parameters, see Section 13.6.7.8, “Condition Handling and OUT or INOUT Parameters”.

The following discussion shows how to use these capabilities through the C API for prepared statements. To use prepared CALL statements through the PREPARE and EXECUTE statements, see Section 13.2.1, “CALL Syntax”.

An application that executes a prepared CALL statement should use a loop that fetches a result and then invokes mysql_stmt_next_result() to determine whether there are more results. The results consist of any result sets produced by the stored procedure followed by a final status value that indicates whether the procedure terminated successfully.

If the procedure has OUT or INOUT parameters, the result set preceding the final status value contains their values. To determine whether a result set contains parameter values, test whether the SERVER_PS_OUT_PARAMS bit is set in the server_status member of the MYSQL connection handler:

mysql->server_status & SERVER_PS_OUT_PARAMS

The following example uses a prepared CALL statement to execute a stored procedure that produces multiple result sets and that provides parameter values back to the caller by means of OUT and INOUT parameters. The procedure takes parameters of all three types (IN, OUT, INOUT), displays their initial values, assigns new values, displays the updated values, and returns. The expected return information from the procedure therefore consists of multiple result sets and a final status:

• One result set from a SELECT that displays the initial parameter values: 10, NULL, 30. (The OUT parameter is assigned a value by the caller, but this assignment is expected to be ineffective: OUT parameters are seen as NULL within a procedure until assigned a value within the procedure.)

• One result set from a SELECT that displays the modified parameter values: 100, 200, 300.
• One result set containing the final OUT and INOUT parameter values: 200, 300.

• A final status packet.

The code to execute the procedure:

```c
MYSQL_STMT *stmt;
MYSQL_BIND ps_params[3]; /* input parameter buffers */
int int_data[3]; /* input/output values */
bool is_null[3]; /* output value nullability */
int status;

/* set up stored procedure */
status = mysql_query(mysql, "DROP PROCEDURE IF EXISTS p1");
test_error(mysql, status);
status = mysql_query(mysql, "CREATE PROCEDURE p1(
  IN p_in INT,
  OUT p_out INT,
  INOUT p_inout INT)
BEGIN
  SELECT p_in, p_out, p_inout;
  SET p_in = 100, p_out = 200, p_inout = 300;
  SELECT p_in, p_out, p_inout;
END");
test_error(mysql, status);

/* initialize and prepare CALL statement with parameter placeholders */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
  printf("Could not initialize statement\n");
  exit(1);
}
status = mysql_stmt_prepare(stmt, "CALL p1(?, ?, ?)", 16);
test_stmt_error(stmt, status);

/* initialize parameters: p_in, p_out, p_inout (all INT) */
memset(ps_params, 0, sizeof (ps_params));
ps_params[0].buffer_type = MYSQL_TYPE_LONG;
ps_params[0].buffer = (char *) &int_data[0];
ps_params[0].length = 0;
ps_params[0].is_null = 0;
ps_params[1].buffer_type = MYSQL_TYPE_LONG;
ps_params[1].buffer = (char *) &int_data[1];
ps_params[1].length = 0;
ps_params[1].is_null = 0;
ps_params[2].buffer_type = MYSQL_TYPE_LONG;
ps_params[2].buffer = (char *) &int_data[2];
ps_params[2].length = 0;
ps_params[2].is_null = 0;

/* bind parameters */
status = mysql_stmt_bind_param(stmt, ps_params);
test_stmt_error(stmt, status);

/* assign values to parameters and execute statement */
int_data[0]= 10; /* p_in */
int_data[1]= 20; /* p_out */
int_data[2]= 30; /* p_inout */
status = mysql_stmt_execute(stmt);
```
test_stmt_error(stmt, status);
/* process results until there are no more */
do {
    int i;
    int num_fields;       /* number of columns in result */
    MYSQL_FIELD *fields; /* for result set metadata */
    MYSQL_BIND *rs_bind; /* for output buffers */

    /* the column count is > 0 if there is a result set */
    /* 0 if the result is only the final status packet */
    num_fields = mysql_stmt_field_count(stmt);

    if (num_fields > 0)
    {
        /* there is a result set to fetch */
        printf("Number of columns in result: %d\n", num_fields);

        /* what kind of result set is this? */
        printf("Data: ");
        if(mysql->server_status & SERVER_PS_OUT_PARAMS)
            printf("this result set contains OUT/INOUT parameters\n");
        else
            printf("this result set is produced by the procedure\n");

        MYSQL_RES *rs_metadata = mysql_stmt_result_metadata(stmt);
        test_stmt_error(stmt, rs_metadata == NULL);
        fields = mysql_fetch_fields(rs_metadata);
        rs_bind = (MYSQL_BIND *) malloc(sizeof (MYSQL_BIND) * num_fields);
        if (!rs_bind)
        {
            printf("Cannot allocate output buffers\n");
            exit(1);
        }
        memset(rs_bind, 0, sizeof (MYSQL_BIND) * num_fields);

        /* set up and bind result set output buffers */
        for (i = 0; i < num_fields; ++i)
        {
            rs_bind[i].buffer_type = fields[i].type;
            rs_bind[i].is_null = &is_null[i];

            switch (fields[i].type)
            {
            case MYSQL_TYPE_LONG:
                rs_bind[i].buffer = (char *) &int_data[i];
                rs_bind[i].buffer_length = sizeof (int_data);
                break;

            default:
                fprintf(stderr, "ERROR: unexpected type: %d.\n", fields[i].type);
                exit(1); break;
            }
        }

        status = mysql_stmt_bind_result(stmt, rs_bind);
        test_stmt_error(stmt, status);

        /* fetch and display result set rows */
        while (1)
        {
            status = mysql_stmt_fetch(stmt);

            if (status == 1 || status == MYSQL_NO_DATA)
                break;
for (i = 0; i < num_fields; ++i)
{
    switch (rs_bind[i].buffer_type)
    {
        case MYSQL_TYPE_LONG:
            if (*rs_bind[i].is_null)
                printf(" val[%d] = NULL;", i);
            else
                printf(" val[%d] = %ld;", i, (long) *((int *) rs_bind[i].buffer));
                break;
        default:
            printf(" unexpected type (%d)\n", rs_bind[i].buffer_type);
    }
}
printf("\n");
}
mysql_free_result(rs_metadata); /* free metadata */
free(rs_bind); /* free output buffers */
}
else
{
    /* no columns = final status packet */
    printf("End of procedure output\n");
}
/* more results? -1 = no, >0 = error, 0 = yes (keep looking) */
status = mysql_stmt_next_result(stmt);
if (status > 0)
    test_stmt_error(stmt, status);
} while (status == 0);
mysql_stmt_close(stmt);

Execution of the procedure should produce the following output:

Number of columns in result: 3
Data: this result set is produced by the procedure
Number of columns in result: 3
Data: this result set is produced by the procedure
  val[0] = 100; val[1] = 200; val[2] = 300;
Number of columns in result: 2
Data: this result set contains OUT/INOUT parameters
  val[0] = 200; val[1] = 300;
End of procedure output

The code uses two utility routines, `test_error()` and `test_stmt_error()`, to check for errors and terminate after printing diagnostic information if an error occurred:

static void test_error(MYSQL *mysql, int status)
{
    if (status)
    {
        fprintf(stderr, "Error: %s (errno: %d)\n", mysql_error(mysql), mysql_errno(mysql));
        exit(1);
    }
}

static void test_stmt_error(MYSQL_STMT *stmt, int status)
28.7.26 C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- **TIME**, **TIMESTAMP**, and **DATETIME** do not support parts of seconds (for example, from **DATE_FORMAT()**).

- When converting an integer to string, **ZEROFILL** is honored with prepared statements in some cases where the MySQL server does not print the leading zeros. (For example, with **MIN(number-with-zerofill)**).

- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.

- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by **;** characters).

- The capabilities of prepared **CALL** statements are described in Section 28.7.25, “C API Prepared CALL Statement Support”.

28.7.27 C API Optional Result Set Metadata

When a client executes a statement that produces a result set, MySQL by default makes available both the data the result set contains, and result set metadata that provides information about the result set data. Metadata is contained in the **MYSQL_FIELD** structure (see Section 28.7.5, “C API Data Structures”), which is returned by the **mysql_fetch_field()**, **mysql_fetch_field_direct()**, and **mysql_fetch_fields()** functions.

Clients can indicate on a per-connection basis that result set metadata is optional and that the client will indicate to the server whether to return it. Suppression of metadata transfer can improve performance, particularly for sessions that execute many queries that return few rows each.

There are two ways to indicate that result set metadata is optional for a connection. They are equivalent, so either one suffices:

- At connect time, enable the **CLIENT_OPTIONAL_RESULTSET_METADATA** flag for the **client_flag** argument of **mysql_real_connect()**.

- Prior to connect time, enable the **MYSQL_OPT_OPTIONAL_RESULTSET_METADATA** option for **mysql_options()**.

For metadata-optional connections, the client sets the **resultset_metadata** system variable to control whether the server returns result set metadata. Permitted values are **FULL** (return all metadata; this is the default) and **NONE** (return no metadata).

For metadata-optional connections, the **mysql_fetch_field()**, **mysql_fetch_field_direct()**, and **mysql_fetch_fields()** functions return **NULL** when the **resultset_metadata** system variable is set to **NONE**.
To check whether a result set has metadata, use the `mysql_result_metadata()` function. This function returns `RESULTSET_METADATA_FULL` or `RESULTSET_METADATA_NONE` to indicate that the result set has full metadata or no metadata, respectively.

`mysql_result_metadata()` can be useful if the client does not know in advance whether a result set has metadata. For example, if a client executes a stored procedure that returns multiple result sets and might change the `resultset_metadata` system variable, the client can invoke `mysql_result_metadata()` for each result set to determine whether it has metadata.

For connections that are not metadata-optional, setting `resultset_metadata` to `NONE` produces an error.

### 28.7.28 C API Automatic Reconnection Control

The MySQL client library can perform an automatic reconnection to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. If auto-reconnect is enabled, the library tries once to reconnect to the server and send the statement again.

Auto-reconnect is disabled by default.

If it is important for your application to know that the connection has been dropped (so that it can exit or take action to adjust for the loss of state information), be sure that auto-reconnect is disabled. To ensure this, call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option:

```c
bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);
```

If the connection has gone down, the effect of `mysql_ping()` depends on the auto-reconnect state. If auto-reconnect is enabled, `mysql_ping()` performs a reconnect. Otherwise, it returns an error.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

If an automatic reconnection does occur (for example, as a result of calling `mysql_ping()`), there is no explicit indication of it. To check for reconnection, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier changed.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset on the server side and your application will not be notified.

The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session system variables are reinitialized to the values of the corresponding global system variables, including system variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
C API Common Issues

- HANDLER variables are closed.
- The value of LAST_INSERT_ID() is reset to 0.
- Locks acquired with GET_LOCK() are released.
- The association of the client with the Performance Schema threads table row that determines connection thread instrumentation is lost. If the client reconnects after a disconnect, the session is associated with a new row in the threads table and the thread monitoring state may be different. See Section 26.12.17.5, “The threads Table”.

If reconnection occurs, any SQL statement specified by calling mysql_options() with the MYSQL_INIT_COMMAND option is re-executed.

If the connection drops, it is possible that the session associated with the connection on the server side will still be running if the server has not yet detected that the client is no longer connected. In this case, any locks held by the original connection still belong to that session, so you may want to kill it by calling mysql_kill().

28.7.29 C API Common Issues

28.7.29.1 Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success

It is possible for mysql_store_result() to return NULL following a successful call to mysql_query(). When this happens, it means one of the following conditions occurred:

- There was a malloc() failure (for example, if the result set was too large).
- The data could not be read (an error occurred on the connection).
- The query returned no data (for example, it was an INSERT, UPDATE, or DELETE).

You can always check whether the statement should have produced a nonempty result by calling mysql_field_count(). If mysql_field_count() returns zero, the result is empty and the last query was a statement that does not return values (for example, an INSERT or a DELETE). If mysql_field_count() returns a nonzero value, the statement should have produced a nonempty result. See the description of the mysql_field_count() function for an example.

You can test for an error by calling mysql_error() or mysql_errno().

28.7.29.2 What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- mysql_affected_rows() returns the number of rows affected by the last query when doing an INSERT, UPDATE, or DELETE.

  For a fast re-create, use TRUNCATE TABLE.

- mysql_num_rows() returns the number of rows in a result set. With mysql_store_result(), mysql_num_rows() may be called as soon as mysql_store_result() returns. With mysql_use_result(), mysql_num_rows() may be called only after you have fetched all the rows with mysql_fetch_row().

- mysql_insert_id() returns the ID generated by the last query that inserted a row into a table with an AUTO_INCREMENT index. See Section 28.7.38, “mysql_insert_id()”.

4864
• Some queries (LOAD DATA, INSERT INTO ... SELECT, UPDATE) return additional information. The result is returned by mysql_info(). See the description for mysql_info() for the format of the string that it returns. mysql_info() returns a NULL pointer if there is no additional information.

28.7.29.3 How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an AUTO_INCREMENT column, you can obtain the value stored into that column by calling the mysql_insert_id() function.

You can check from your C applications whether a value was stored in an AUTO_INCREMENT column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an INSERT with an AUTO_INCREMENT index:

```c
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

When a new AUTO_INCREMENT value has been generated, you can also obtain it by executing a SELECT LAST_INSERT_ID() statement with mysql_query() and retrieving the value from the result set returned by the statement.

When inserting multiple values, the last automatically incremented value is returned.

For LAST_INSERT_ID(), the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another AUTO_INCREMENT column with a nonmagic value (that is, a value that is not NULL and not 0). Using LAST_INSERT_ID() and AUTO_INCREMENT columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement that client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```sql
INSERT INTO foo (auto,text)
VALUES(NULL,'text');         # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
VALUES(LAST_INSERT_ID(),'text');  # use ID in second table
```

mysql_insert_id() returns the value stored into an AUTO_INCREMENT column, whether that value is automatically generated by storing NULL or 0 or was specified as an explicit value. LAST_INSERT_ID() returns only automatically generated AUTO_INCREMENT values. If you store an explicit value other than NULL or 0, it does not affect the value returned by LAST_INSERT_ID().

For more information on obtaining the last ID in an AUTO_INCREMENT column:

• For information on LAST_INSERT_ID(), which can be used within an SQL statement, see Section 12.15, “Information Functions”.

• For information on mysql_insert_id(), the function you use from within the C API, see Section 28.7.7.38, "mysql_insert_id()”.

• For information on obtaining the auto-incremented value when using Connector/J, see Retrieving AUTO_INCREMENT Column Values through JDBC.

• For information on obtaining the auto-incremented value when using Connector/ODBC, see Obtaining Auto-Increment Values.
28.8 MySQL PHP API

The MySQL PHP API manual is now published in standalone form, not as part of the MySQL Reference Manual. See MySQL and PHP.

28.9 MySQL Perl API

The Perl DBI module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI with MySQL, install the following:

1. The DBI module.
2. The DBD::mysql module. This is the DataBase Driver (DBD) module for Perl.
3. Optionally, the DBD module for any other type of database server you want to access.

Perl DBI is the recommended Perl interface. It replaces an older interface called mysqlperl, which should be considered obsolete.

These sections contain information about using Perl with MySQL and writing MySQL applications in Perl:

• For installation instructions for Perl DBI support, see Section 2.13, “Perl Installation Notes”.
• For an example of reading options from option files, see Section 5.8.4, “Using Client Programs in a Multiple-Server Environment”.
• For secure coding tips, see Section 6.1.1, “Security Guidelines”.
• For debugging tips, see Section 29.5.1.4, “Debugging mysqld under gdb”.
• For some Perl-specific environment variables, see Section 4.9, “MySQL Environment Variables”.
• For considerations for running on OS X, see Section 2.4, “Installing MySQL on macOS”.
• For ways to quote string literals, see Section 9.1.1, “String Literals”.

DBI information is available at the command line, online, or in printed form:

• Once you have the DBI and DBD::mysql modules installed, you can get information about them at the command line with the perldoc command:

  shell> perldoc DBI
  shell> perldoc DBI::FAQ
  shell> perldoc DBD::mysql

  You can also use pod2man, pod2html, and so on to translate this information into other formats.

• For online information about Perl DBI, visit the DBI website, http://dbi.perl.org/. That site hosts a general DBI mailing list.

• For printed information, the official DBI book is Programming the Perl DBI (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI website, http://dbi.perl.org/.

28.10 MySQL Python API
MySQLdb is a third-party driver that provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at http://sourceforge.net/projects/mysql-python/.

The new MySQL Connector/Python component provides an interface to the same Python API, and is built into the MySQL Server and supported by Oracle. See MySQL Connector/Python Developer Guide for details on the Connector, as well as coding guidelines for Python applications and sample Python code.

28.11 MySQL Ruby APIs

Two APIs are available for Ruby programmers developing MySQL applications:

- The MySQL/Ruby API is based on the libmysqlclient API library. For information on installing and using the MySQL/Ruby API, see Section 28.11.1, “The MySQL/Ruby API”.

- The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver). For information on installing and using the Ruby/MySQL API, see Section 28.11.2, “The Ruby/MySQL API”.

For background and syntax information about the Ruby language, see Ruby Programming Language.

28.11.1 The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through libmysqlclient.

For information on installing the module, and the functions exposed, see MySQL/Ruby.

28.11.2 The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see Ruby/MySQL.

28.12 MySQL Tcl API

MySQLtcl is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at http://www.xdobry.de/mysqltcl/.

28.13 MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at http://efsa.sourceforge.net/archive/ravits/mysql.htm.

29.1 MySQL Internals

This chapter describes what you need to know when working on the MySQL code. To track or contribute to MySQL development, follow the instructions in Section 2.9.3, “Installing MySQL Using a Development Source Tree”. If you are interested in MySQL internals, you should also join the MySQL Community Slack. Feel free to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

Note

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at https://dev.mysql.com/doc/index-other.html. It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.9.7, “Generating MySQL Doxygen Documentation Content”.

29.1.1 MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

For information about tuning the parameters that control thread resources, see Section 8.12.4.1, “How MySQL Handles Client Connections”.

On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.

On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.

A signal thread handles all signals. This thread also normally handles alarms and calls process_alarm() to force timeouts on connections that have been idle too long.

If InnoDB is used, there will be additional read and write threads by default. The number of these are controlled by the innodb_read_io_threads and innodb_write_io_threads parameters. See Section 15.13, “InnoDB Startup Options and System Variables”.

If the server is started with the --flush_time=val option, a dedicated thread is created to flush all tables every val seconds.

If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See Section 24.4.1, “Event Scheduler Overview”.

mysqladmin processlist only shows the connection, replication, and event threads.

29.1.2 The MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information, including system requirements, see The MySQL Test Framework in the MySQL Server Doxygen documentation, available at https://dev.mysql.com/doc/index-other.html.

The current set of test cases does not test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (mysqltest), a Perl script to run all tests (mysql-test-run.pl), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type make test from the source root directory, or change location to the mysql-test directory and type ./mysql-test-run.pl. If you have installed a binary distribution, change location to the mysql-test directory under the installation root directory (for example, /usr/local/mysql/mysql-test), and run ./mysql-test-run.pl. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See Section 1.7, “How to Report Bugs or Problems”.

If one test fails, you should run mysql-test-run.pl with the --force option to check whether any other tests fail.
If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports 9306 or 9307. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, and NDB. For example:

```shell
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, join the MySQL Community Slack.

### 29.2 The MySQL Plugin API

MySQL supports a plugin API that enables creation of server components. Plugins can be loaded at server startup, or loaded and unloaded at runtime without restarting the server. The API is generic and does not specify what plugins can do. The components supported by this interface include, but are not limited to, storage engines, full-text parser plugins, and server extensions.

For example, full-text parser plugins can be used to replace or augment the built-in full-text parser. A plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is more general than the older user-defined function (UDF) interface.

The plugin interface uses the `plugin` table in the `mysql` database to record information about plugins that have been installed permanently with the `INSTALL PLUGIN` statement. This table is created as part of the MySQL installation process. Plugins can also be installed for a single server invocation with the `--plugin-load` option. Plugins installed this way are not recorded in the `plugin` table. See Section 5.6.1, “Installing and Uninstalling Plugins”.

MySQL supports an API for client plugins in addition to that for server plugins. This is used, for example, by authentication plugins where a server-side plugin and a client-side plugin cooperate to enable clients to connect to the server through a variety of authentication methods.

---

**Note**

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at [https://dev.mysql.com/doc/index-other.html](https://dev.mysql.com/doc/index-other.html). It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.9.7, “Generating MySQL Doxygen Documentation Content”.

### Additional Resources

The book *MySQL 5.1 Plugin Development* by Sergei Golubchik and Andrew Hutchings provides a wealth of detail about the plugin API. Despite the fact that the book's title refers to MySQL Server 5.1, most of the information in it applies to later versions as well.

### 29.2.1 Types of Plugins

The plugin API enables creation of plugins that implement several capabilities:
Types of Plugins

- Storage engines
- Full-text parsers
- Daemons
- INFORMATION_SCHEMA tables
- Semisynchronous replication
- Auditing
- Authentication
- Password validation and strength checking
- Protocol tracing
- Query rewriting
- Secure keyring storage and retrieval

The following sections provide an overview of these plugin types.

### Storage Engine Plugins

The pluggable storage engine architecture used by MySQL Server enables storage engines to be written as plugins and loaded into and unloaded from a running server. For a description of this architecture, see Section 16.11, "Overview of MySQL Storage Engine Architecture".

For information on how to use the plugin API to write storage engines, see MySQL Internals: Writing a Custom Storage Engine.

### Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). The built-in full-text parser is supported with InnoDB and MyISAM tables.

MySQL also has a character-based ngram full-text parser that supports Chinese, Japanese, and Korean (CJK), and a word-based MeCab parser plugin that supports Japanese, for use with InnoDB and MyISAM tables.

For full-text processing, "parsing" means extracting words (or "tokens", in the case of an n-gram character-based parser) from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in Section 12.9, "Full-Text Search Functions". These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored. For more information, see Section 12.9.4, "Full-Text Stopwords", and Section 12.9.6, "Fine-Tuning MySQL Full-Text Search".

The plugin API enables you to use a full-text parser other than the default built-in full-text parser. For example, if you are working with Japanese, you may choose to use the MeCab full-text parser. The plugin
Types of Plugins

API also enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for token accumulation). The ngram and MeCab parsers operate as replacements for the built-in full-text parser.

  You may choose to provide your own full-text parser if you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. This parsing is affected by the innodb_ft_xxx or ft_xxx system variables and the stopword list.

  One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or .doc files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from noncleartext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a WITH PARSER clause when creating individual FULLTEXT indexes. To create such an index at table-creation time, do this:

```sql
CREATE TABLE t
(
    doc CHAR(255),
    FULLTEXT INDEX (doc) WITH PARSER parser_name
) ENGINE=InnoDB;
```

Or you can add the index after the table has been created:

```sql
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER parser_name;
```

The only SQL change for associating the parser with the index is the WITH PARSER clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a FULLTEXT index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use a table for which a plugin is not available results in an error, although DROP TABLE is still possible.

For more information about full-text plugins, see Section 29.2.4.4, “Writing Full-Text Parser Plugins”. MySQL 8.0 supports full-text plugins with MyISAM and InnoDB.

Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. MySQL distributions include an example daemon plugin that writes periodic heartbeat messages to a file.

For more information about daemon plugins, see Section 29.2.4.5, “Writing Daemon Plugins”.
INFORMATION_SCHEMA Plugins

INFORMATION_SCHEMA plugins enable the creation of tables containing server metadata that are exposed to users through the INFORMATION_SCHEMA database. For example, InnoDB uses INFORMATION_SCHEMA plugins to provide tables that contain information about current transactions and locks.

For more information about INFORMATION_SCHEMA plugins, see Section 29.2.4.6, “Writing INFORMATION_SCHEMA Plugins”.

Semisynchronous Replication Plugins

MySQL replication is asynchronous by default. With semisynchronous replication, a commit performed on the master side blocks before returning to the session that performed the transaction until at least one slave acknowledges that it has received and logged the events for the transaction. Semisynchronous replication is implemented through complementary master and client plugins. See Section 17.3.11, “Semisynchronous Replication”.

For more information about semisynchronous replication plugins, see Section 29.2.4.7, “Writing Semisynchronous Replication Plugins”.

Audit Plugins

The MySQL server provides a pluggable audit interface that enables information about server operations to be reported to interested parties. Audit notification occurs for these operations (although the interface is general and the server could be modified to report others):

- Write a message to the general query log (if the log is enabled)
- Write a message to the error log
- Send a query result to a client

Audit plugins may register with the audit interface to receive notification about server operations. When an auditable event occurs within the server, the server determines whether notification is needed. For each registered audit plugin, the server checks the event against those event classes in which the plugin is interested and passes the event to the plugin if there is a match.

This interface enables audit plugins to receive notifications only about operations in event classes they consider significant and to ignore others. The interface provides for categorization of operations into event classes and further division into event subclasses within each class.

When an audit plugin is notified of an auditable event, it receives a pointer to the current THD structure and a pointer to a structure that contains information about the event. The plugin can examine the event and perform whatever auditing actions are appropriate. For example, the plugin can see what statement produced a result set or was logged, the number of rows in a result, who the current user was for an operation, or the error code for failed operations.

For more information about audit plugins, see Section 29.2.4.8, “Writing Audit Plugins”.

Authentication Plugins

MySQL supports pluggable authentication. Authentication plugins exist on both the server and client sides. Plugins on the server side implement authentication methods for use by clients when they connect to the server. A plugin on the client side communicates with a server-side plugin to provide the authentication information that it requires. A client-side plugin may interact with the user, performing tasks such as soliciting a password or other authentication credentials to be sent to the server. See Section 6.2.17, “Pluggable Authentication”.

4874
Types of Plugins

Pluggable authentication also enables proxy user capability, in which one user takes the identity of another user. A server-side authentication plugin can return to the server the name of the user whose identity the connecting user should have. See Section 6.2.18, “Proxy Users”.

For more information about authentication plugins, see Section 29.2.4.9, “Writing Authentication Plugins”.

Password-Validation Plugins

The MySQL server provides an interface for writing plugins that test passwords. Such a plugin implements two capabilities:

• Rejection of too-weak passwords in statements that assign passwords (such as CREATE USER and ALTER USER statements).

• Assessing the strength of potential passwords for the VALIDATE_PASSWORD_STRENGTH() SQL function.

For information about writing this type of plugin, see Section 29.2.4.10, “Writing Password-Validation Plugins”.

Protocol Trace Plugins

MySQL supports the use of protocol trace plugins: client-side plugins that implement tracing of communication between a client and the server that takes place using the client/server protocol.

For more information about protocol trace plugins, see Section 29.2.4.11, “Writing Protocol Trace Plugins”.

Query Rewrite Plugins

MySQL Server supports query rewrite plugins that can examine and possibly modify statements received by the server before the server executes them. A query rewrite plugin takes statements either before or after the server has parsed them.

A preparse query rewrite plugin has these characteristics:

• The plugin enables rewriting of SQL statements arriving at the server before the server processes them.

• The plugin receives a statement string and may return a different string.

A postparse query rewrite plugin has these characteristics:

• The plugin enables statement rewriting based on parse trees.

• The server parses each statement and passes its parse tree to the plugin, which may traverse the tree. The plugin can return the original tree to the server for further processing, or construct a different tree and return that instead.

• The plugin can use the mysql_parser plugin service for these purposes:

  • To activate statement digest calculation and obtain the normalized version of statements independent of whether the Performance Schema produces digests.

  • To traverse parse trees.

  • To parse statements. This is useful if the plugin constructs a new statement string from the parse tree. The plugin can have the server parse the string to produce a new tree, then return that tree as the representation of the rewritten statement.

For more information about plugin services, see Section 29.3, “MySQL Services for Plugins”.

4875
Preparse and postparse query rewrite plugins share these characteristics:

- If a query rewrite plugin is installed, the --log-raw option affects statement logging as follows:
  - Without --log-raw, the server logs the statement returned by the query rewrite plugin. This may differ from the statement as received.
  - With --log-raw, the server logs the original statement as received.

- If a plugin rewrites a statement, the server decides whether to write it to the binary log (and thus to any replication slaves) based on the rewritten statement, not the original statement. If a plugin rewrites only `SELECT` statements to `SELECT` statements, there is no impact on binary logging because the server does not write `SELECT` statements to the binary log.

- If a plugin rewrites a statement, the server produces a `Note` message that the client can view using `SHOW WARNINGS`. Messages have this format, where `stmt_in` is the original statement and `stmt_out` is the rewritten statement:

```
Query 'stmt_in' rewritten to 'stmt_out' by a query rewrite plugin
```

MySQL distributions include a postparse query rewrite plugin named `Rewriter`. This plugin is rule based. You can add rows to its rules table to cause `SELECT` statement rewriting. For more information, see Section 5.6.4, "The Rewriter Query Rewrite Plugin".

Query rewrite plugins use the same API as audit plugins. For more information about audit plugins, see Section 29.2.4.8, "Writing Audit Plugins".

**Keyring Plugins**

MySQL Server supports keyring plugins that enable internal server components and plugins to securely store sensitive information for later retrieval.

All MySQL distributions include a keyring plugin named `keyring_file`. MySQL Enterprise Edition distributions include additional keyring plugins. See Section 6.4.4, "The MySQL Keyring".

For more information about keyring plugins, see Section 29.2.4.12, "Writing Keyring Plugins".

### 29.2.2 Plugin API Characteristics

The server plugin API has these characteristics:

- All plugins have several things in common.
  - Each plugin has a name that it can be referred to in SQL statements, as well as other metadata such as an author and a description that provide other information. This information can be examined in the `INFORMATION_SCHEMA.PLUGINS` table or using the `SHOW PLUGINS` statement.

- The plugin framework is extendable to accommodate different kinds of plugins.
  - Although some aspects of the plugin API are common to all types of plugins, the API also permits type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Interfaces for several types of plugins exist, such as storage engines, full-text parser, and `INFORMATION_SCHEMA` tables. Others can be added.
• Plugins can expose information to users.

A plugin can implement system and status variables that are available through the `SHOW VARIABLES` and `SHOW STATUS` statements.

• The plugin API includes versioning information.

The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library’s version information to determine whether it supports the plugins in the library.

There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, a library containing a full-text parser plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

• The plugin API implements security restrictions.

A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

• Plugins have access to server services.

The services interface exposes server functionality that plugins can access using ordinary function calls. For details, see Section 29.3, “MySQL Services for Plugins”.

In some respects, the server plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface. For example, UDFs had no versioning information. Also, the newer plugin interface eliminates the security issues of the older UDF interface. The older interface for writing nonplugin UDFs permitted libraries to be loaded from any directory searched by the system’s dynamic linker, and the symbols that identified the UDF library were relatively nonspecific.

The client plugin API has similar architectural characteristics, but client plugins have no direct access to the server the way server plugins do.

### 29.2.3 Plugin API Components

The server plugin implementation comprises several components.

**SQL statements:**

- **INSTALL PLUGIN** registers a plugin in the `mysql.plugin` table and loads the plugin code.
- **UNINSTALL PLUGIN** unregisters a plugin from the `mysql.plugin` table and unloads the plugin code.
- The **WITH PARSER** clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- **SHOW PLUGINS** displays information about server plugins.

**Command-line options and system variables:**

- The **--plugin-load** option enables plugins to be loaded at server startup time.
The `plugin_dir` system variable indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=dir_name` option. `mysql_config --plugindir` displays the default plugin directory path name.

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

Plugin-related tables:

- The `INFORMATION_SCHEMA.PLUGINS` table contains plugin information.
- The `mysql.plugin` table lists each plugin that was installed with `INSTALL PLUGIN` and is required for plugin use. For new MySQL installations, this table is created during the installation process.

The client plugin implementation is simpler:

- For the `mysql_options()` C API function, the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options enable client programs to load authentication plugins.
- There are C API functions that enable management of client plugins.

To examine how MySQL implements plugins, consult the following source files in a MySQL source distribution:

- In the `include/mysql` directory, `plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library. `plugin_xxx.h` files provide additional information that pertains to specific types of plugins. `client_plugin.h` contains information specific to client plugins.
- In the `sql` directory, `sql_plugin.h` and `sql_plugin.cc` comprise the internal plugin implementation. `sql_acl.cc` is where the server uses authentication plugins. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.
- In the `sql-common` directory, `client_plugin.h` implements the C API client plugin functions, and `client.c` implements client authentication support. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.

### 29.2.4 Writing Plugins

To create a plugin library, you must provide the required descriptor information that indicates what plugins the library file contains, and write the interface functions for each plugin.

Every server plugin must have a general descriptor that provides information to the plugin API, and a type-specific descriptor that provides information about the plugin interface for a given type of plugin. The structure of the general descriptor is the same for all plugin types. The structure of the type-specific descriptor varies among plugin types and is determined by the requirements of what the plugin needs to do. The server plugin interface also enables plugins to expose status and system variables. These variables become visible through the `SHOW STATUS` and `SHOW VARIABLES` statements and the corresponding `INFORMATION_SCHEMA` tables.

For client-side plugins, the architecture is a bit different. Each plugin must have a descriptor, but there is no division into separate general and type-specific descriptors. Instead, the descriptor begins with a fixed set of members common to all client plugin types, and the common members are followed by any additional members required to implement the specific plugin type.

A server plugin contains code that becomes part of the running server, so when you write the plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may...
have problems if you attempt to use functions from the\texttt{libstdc++} library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins originally written for older servers. For information about these constraints, see Section 2.9.4, "MySQL Source-Configuration Options", and Section 2.9.5, "Dealing with Problems Compiling MySQL".

Client plugin writers should avoid dependencies on what symbols the calling application has because you cannot be sure what applications will use the plugin.

### 29.2.4.1 Overview of Plugin Writing

These conditions apply to plugin writing:

- MySQL header files used by plugins contain C++ code, so plugins must be compiled as C++ code.
- You must compile plugins with the entire server source code present, not just the libraries and header files.
- Compiled plugins are not compatible across server versions. For a plugin compiled against MySQL 8.0.$x$, there is no guarantee it will work with a MySQL 8.0.$y$ server without recompiling for MySQL 8.0.$y$.
- Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled the calling application dynamically (not statically). For server plugins, this means that\texttt{mysqld} must be linked dynamically.

The following procedure provides an overview of the steps needed to create a plugin library. The next sections provide additional details on setting plugin data structures and writing specific types of plugins.

1. In the plugin source file, include the header files that the plugin library needs. The\texttt{plugin.h} file is required, and the library might require other files as well. For example:

   ```c
   #include <stdlib.h>
   #include <ctype.h>
   #include <mysql/plugin.h>
   ```

2. Set up the descriptor information for the plugin library file. For server plugins, write the library descriptor, which must contain the general plugin descriptor for each server plugin in the file. For more information, see Server Plugin Library and Plugin Descriptors. In addition, set up the type-specific descriptor for each server plugin in the library. Each plugin's general descriptor points to its type-specific descriptor.

   For client plugins, write the client descriptor. For more information, see Client Plugin Descriptors.

3. Write the plugin interface functions for each plugin. For example, each plugin's general plugin descriptor points to the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. The plugin's type-specific description may also point to interface functions.

4. For server plugins, set up the status and system variables, if there are any.

5. Compile the plugin library as a shared library and install it in the plugin directory. For more information, see Section 29.2.4.3, "Compiling and Installing Plugin Libraries".

6. For server plugins, register the plugin with the server. For more information, see Section 5.6.1, "Installing and Uninstalling Plugins".

7. Test the plugin to verify that it works properly.
29.2.4.2 Plugin Data Structures

A plugin library file includes descriptor information to indicate what plugins it contains.

If the plugin library contains any server plugins, it must include the following descriptor information:

• A library descriptor indicates the general server plugin API version number used by the library and contains a general plugin descriptor for each server plugin in the library. To provide the framework for this descriptor, invoke two macros from the `plugin.h` header file:

```c
mysql_declare_plugin(name)
   ... one or more server plugin descriptors here ...
mysql_declare_plugin_end;
```

The macros expand to provide a declaration for the API version automatically. You must provide the plugin descriptors.

• Within the library descriptor, each general server plugin is described by a `st_mysql_plugin` structure. This plugin descriptor structure contains information that is common to every type of server plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin, and pointers to any status or system variables the plugin implements.

• Each general server plugin descriptor within the library descriptor also contains a pointer to a type-specific plugin descriptor. The structure of the type-specific descriptors varies from one plugin type to another because each type of plugin can have its own API. A type-specific plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.

The plugin library also contains the interface functions that are referenced by the general and type-specific descriptors for each plugin in the library.

If the plugin library contains a client plugin, it must include a descriptor for the plugin. The descriptor begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type. To provide the descriptor framework, invoke two macros from the `client_plugin.h` header file:

```c
mysql_declare_client_plugin(plugin_type)
   ... members common to all client plugins ...
   ... type-specific extra members ...
mysql_end_client_plugin;
```

The plugin library also contains any interface functions referenced by the client descriptor.

The `mysql_declare_plugin()` and `mysql_declare_client_plugin()` macros differ somewhat in how they can be invoked, which has implications for the contents of plugin libraries. The following guidelines summarize the rules:

• `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can both be used in the same source file, which means that a plugin library can contain both server and client plugins. However, each of `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can be used at most once.

• `mysql_declare_plugin()` permits multiple server plugin declarations, so a plugin library can contain multiple server plugins.

• `mysql_declare_client_plugin()` permits only a single client plugin declaration. To create multiple client plugins, separate plugin libraries must be used.
When a client program looks for a client plugin that is in a plugin library and not built into
libmysqlclient, it looks for a file with a base name that is the same as the plugin name. For example,
if a program needs to use a client authentication plugin named auth_xxx on a system that uses .so
as the library suffix, it looks in the file named auth_xxx.so. (On OS X, the program looks first for
auth_xxx.dylib, then for auth_xxx.so.) For this reason, if a plugin library contains a client plugin, the
library must have the same base name as that plugin.

The same is not true for a library that contains server plugins. The --plugin-load option and the
INSTALL PLUGIN statement provide the library file name explicitly, so there need be no explicit
relationship between the library name and the name of any server plugins it contains.

Server Plugin Library and Plugin Descriptors

Every plugin library that contains server plugins must include a library descriptor that contains the general
plugin descriptor for each server plugin in the file. This section discusses how to write the library and
general descriptors for server plugins.

The library descriptor must define two symbols:

• _mysql_plugin_interface_version_ specifies the version number of the general plugin
  framework. This is given by the MYSQL_PLUGIN_INTERFACE_VERSION symbol, which is defined in the
  plugin.h file.

• _mysql_plugin_declarations_ defines an array of plugin declarations, terminated by a declaration
  with all members set to 0. Each declaration is an instance of the st_mysql_plugin structure (also
  defined in plugin.h). There must be one of these for each server plugin in the library.

If the server does not find those two symbols in a library, it does not accept it as a legal plugin library and
rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a
plugin library.

The conventional way to define the two required symbols is by using the mysql_declare_plugin() and
mysql_declare_plugin_end macros from the plugin.h file:

mysql_declare_plugin(name)
    ... one or more server plugin descriptors here ...
mysql_declare_plugin_end;

Each server plugin must have a general descriptor that provides information to the server plugin API. The
general descriptor has the same structure for all plugin types. The st_mysql_plugin structure in the
plugin.h file defines this descriptor:

struct st_mysql_plugin
{
    int type;             /* the plugin type (a MYSQL_XXX_PLUGIN value) */
    void *info;           /* pointer to type-specific plugin descriptor */
    const char *name;     /* plugin name */
    const char *author;   /* plugin author (for I_S.PLUGINS) */
    const char *descr;    /* general descriptive text (for I_S.PLUGINS) */
    int license;          /* the plugin license (PLUGIN_LICENSE_XXX) */
    int (*init)(void *);  /* the function to invoke when plugin is loaded */
    int (*deinit)(void *);/* the function to invoke when plugin is unloaded */
    unsigned int version; /* plugin version (for I_S.PLUGINS) */
    struct st_mysql_show_var *status_vars;
    struct st_mysql_sys_var **system_vars;
    void *__reserved1;    /* reserved for dependency checking */
    unsigned long flags;  /* flags for plugin */
}
The `st_mysql_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- **type**: The plugin type. This must be one of the plugin-type values from `plugin.h`:
  ```c
  /* The allowable types of plugins */
  #define MYSQL_UDF_PLUGIN             0  /* User-defined function */
  #define MYSQL_STORAGE_ENGINE_PLUGIN  1  /* Storage Engine */
  #define MYSQL_FTPARSER_PLUGIN        2  /* Full-text parser plugin */
  #define MYSQL_DAEMON_PLUGIN          3  /* The daemon/raw plugin type */
  #define MYSQL_INFORMATION_SCHEMA_PLUGIN  4  /* The I_S plugin type */
  #define MYSQL_AUDIT_PLUGIN           5  /* The Audit plugin type */
  #define MYSQL_REPLICATION_PLUGIN     6  /* The replication plugin type */
  #define MYSQL_AUTHENTICATION_PLUGIN  7  /* The authentication plugin type */
  ...
  ```
  For example, for a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- **info**: A pointer to the type-specific descriptor for the plugin. This descriptor's structure depends on the particular type of plugin, unlike that of the general plugin descriptor structure. For version-control purposes, the first member of the type-specific descriptor for every plugin type is expected to be the interface version for the type. This enables the server to check the type-specific version for every plugin no matter its type. Following the version number, the descriptor includes any other members needed, such as callback functions and other information needed by the server to invoke the plugin properly. Later sections on writing particular types of server plugins describe the structure of their type-specific descriptors.

- **name**: A string that gives the plugin name. This is the name that will be listed in the `mysql.plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`, or with the `--plugin-load` option. The name is also visible in the `INFORMATION_SCHEMA.PLUGINS` table or the output from `SHOW PLUGINS`.

  The plugin name should not begin with the name of any server option. If it does, the server will fail to initialize it. For example, the server has a `--socket` option, so you should not use a plugin name such as `socket`, `socket_plugin`, and so forth.

- **author**: A string naming the plugin author. This can be whatever you like.

- **desc**: A string that provides a general description of the plugin. This can be whatever you like.

- **license**: The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.

- **init**: A once-only initialization function, or `NULL` if there is no such function. The server executes this function when it loads the plugin, which happens for `INSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server startup. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.

- **deinit**: A once-only deinitialization function, or `NULL` if there is no such function. The server executes this function when it unloads the plugin, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server shutdown. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.

- **version**: The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write
the value as a hex constant, the format is 0xMMNN, where MM and NN are the major and minor numbers, respectively. For example, 0x0302 represents version 3.2.

- **status_vars**: A pointer to a structure for status variables associated with the plugin, or NULL if there are no such variables. When the plugin is installed, these variables are displayed in the output of the SHOW STATUS statement.

  The **status_vars** member, if not NULL, points to an array of st_mysql_show_var structures that describe status variables. See Server Plugin Status and System Variables.

- **system_vars**: A pointer to a structure for system variables associated with the plugin, or NULL if there are no such variables. These options and system variables can be used to help initialize variables within the plugin. When the plugin is installed, these variables are displayed in the output of the SHOW VARIABLES statement.

  The **system_vars** member, if not NULL, points to an array of st_mysql_sys_var structures that describe system variables. See Server Plugin Status and System Variables.

- **__reserved1**: A placeholder for the future. It should be set to NULL.

- **flags**: Plugin flags. Individual bits correspond to different flags. The value should be set to the OR of the applicable flags. These flags are available:

  ```c
  #define PLUGIN_OPT_NO_INSTALL   1UL   /* Not dynamically loadable */
  #define PLUGIN_OPT_NO_UNINSTALL 2UL   /* Not dynamically unloadable */
  #define PLUGIN_OPT_ALLOW_EARLY  4UL   /* allow --early-plugin-load */
  ```

  The flags have the following meanings when enabled:

  - **PLUGIN_OPT_NO_INSTALL**: The plugin cannot be loaded at runtime with the INSTALL PLUGIN statement. This is appropriate for plugins that must be loaded at server startup with the --plugin-load, --plugin-load-add, or --early-plugin-load option.

  - **PLUGIN_OPT_NO_UNINSTALL**: The plugin cannot be unloaded at runtime with the UNINSTALL PLUGIN statement.

  - **PLUGIN_OPT_ALLOW_EARLY**: The plugin can be loaded early in the server startup sequence with the --early-plugin-load option. This flag has no effect on whether a plugin can be loaded at server startup with the --plugin-load or --plugin-load-add option, or at runtime with the INSTALL PLUGIN statement.

    This flag was added in MySQL 8.0.17. All plugins compiled using MySQL distributions prior to 8.0.17 do not have this flag set. When loading these into pre-8.0.17 servers this does not matter, but attempts to use --early-plugin-load to load plugin binaries compiled using pre-8.0.17 MySQL distributions into a 8.0.17 or higher server will fail. The plugins must be recompiled against MySQL 8.0.17 or higher.

    The server invokes the **init** and **deinit** functions in the general plugin descriptor only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

    For example, the descriptor information for a library that contains a single full-text parser plugin named simple_parser looks like this:

  ```c
  mysql_declare_plugin(ftexample)
  ```
For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

Plugin.h defines the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros like this:

```c
#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
MYSQL_PLUGIN_EXPORT int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int PSIZE= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin DECLS[]= { \
#ifdef
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
MYSQL_PLUGIN_EXPORT int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int _mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin _mysql_plugin_declarations_[]= { \
#else
#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
 builtin_ ## NAME ## _plugin_interface_version, \
 builtin_ ## NAME ## _sizeof_struct_st_plugin, \
 builtin_ ## NAME ## _plugin)
#endif
#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0,0,0,0,0})
#endif

Note

Those declarations define the `_mysql_plugin_interface_version_` symbol only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that `-DMYSQL_DYNAMIC_PLUGIN` must be provided as part of the compilation command to build the plugin as a shared library.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version_` and `_mysql_plugin_declarations_`):
The preceding example declares a single plugin in the general descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin()` and `mysql_declare_plugin_end`, separated by commas.

MySQL server plugins must be compiled as C++ code. One C++ feature that you should not use is nonconstant variables to initialize global structures. Members of structures such as the `st_mysql_plugin` structure should be initialized only with constant variables. The `simple_parser` descriptor shown earlier is permissible in a C++ plugin because it satisfies that requirement:

```c
mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,      /* type                            */
    &simple_parser_descriptor,  /* descriptor                      */
    "simple_parser",            /* name                            */
    "Oracle Corporation",       /* author                          */
    "Simple Full-Text Parser",  /* description                     */
    PLUGIN_LICENSE_GPL,         /* plugin license                  */
    simple_parser_plugin_init,  /* init function (when loaded)     */
    simple_parser_plugin_deinit,/* deinit function (when unloaded) */
    0x0001,                     /* version                         */
    NULL,
    0
}
mysql_declare_plugin_end;
```

Here is another valid way to write the general descriptor. It uses constant variables to indicate the plugin name, author, and description:

```c
const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "Oracle Corporation";
const char *simple_parser_description = "Simple Full-Text Parser";
mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,      /* type                            */
    &simple_parser_descriptor,  /* descriptor                      */
    simple_parser_name,         /* name                            */
    simple_parser_author,       /* author                          */
    simple_parser_description,  /* description                     */
    PLUGIN_LICENSE_GPL,         /* plugin license                  */
    simple_parser_plugin_init,  /* init function (when loaded)     */
    simple_parser_plugin_deinit,/* deinit function (when unloaded) */
    0x0001,                     /* version                         */
    NULL,
    0
}
mysql_declare_plugin_end;
```
However, the following general descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```c
typedef struct {
    const char *name;
    const char *author;
    const char *description;
} plugin_info;

plugin_info parser_info = {
    "simple_parser",
    "Oracle Corporation",
    "Simple Full-Text Parser"
};

mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,      /* type                            */
    &simple_parser_descriptor,  /* descriptor                      */
    parser_info.name,           /* name                            */
    parser_info.author,         /* author                          */
    parser_info.description,    /* description                     */
    PLUGIN_LICENSE_GPL,         /* plugin license                  */
    simple_parser_plugin_init,  /* init function (when loaded)     */
    simple_parser_plugin_deinit,/* deinit function (when unloaded)   */
    0x0001,                     /* version                         */
    simple_status,              /* status variables                */
    simple_system_variables,    /* system variables                */
    NULL,
    0
}
mysql_declare_plugin_end;
```

**Server Plugin Status and System Variables**

The server plugin interface enables plugins to expose status and system variables using the `status_vars` and `system_vars` members of the general plugin descriptor.

The `status_vars` member of the general plugin descriptor, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```c
struct st_mysql_show_var {
    const char *name;
    char *value;
    enum enum_mysql_show_type type;
};
```

The following table shows the permissible status variable `type` values and what the corresponding variable should be.

**Table 29.1 Server Plugin Status Variable Types**

<table>
<thead>
<tr>
<th>Variable Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHOW_BOOL</td>
<td>Pointer to a boolean variable</td>
</tr>
<tr>
<td>SHOW_INT</td>
<td>Pointer to an integer variable</td>
</tr>
<tr>
<td>SHOW_LONG</td>
<td>Pointer to a long integer variable</td>
</tr>
<tr>
<td>SHOW_LONGLONG</td>
<td>Pointer to a longlong integer variable</td>
</tr>
<tr>
<td>Variable Type</td>
<td>Meaning</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------------------------</td>
</tr>
<tr>
<td>SHOW_CHAR</td>
<td>A string</td>
</tr>
<tr>
<td>SHOW_CHAR_PTR</td>
<td>Pointer to a string</td>
</tr>
<tr>
<td>SHOW_ARRAY</td>
<td>Pointer to another <code>st_mysql_show_var</code> array</td>
</tr>
<tr>
<td>SHOW_FUNC</td>
<td>Pointer to a function</td>
</tr>
<tr>
<td>SHOW_DOUBLE</td>
<td>Pointer to a double</td>
</tr>
</tbody>
</table>

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this signature:

```c
#define SHOW_VAR_FUNC_BUFF_SIZE 1024
typedef int (*mysql_show_var_func) (void *thd,
    struct st_mysql_show_var *out,
    char *buf);
```

The `system_vars` member, if not 0, points to an array of `st_mysql_sys_var` structures, each of which describes one system variable (which can also be set from the command-line or configuration file), followed by a structure with all members set to 0. The `st_mysql_sys_var` structure is defined as follows:

```c
struct st_mysql_sys_var {
    int flags;
    const char *name, *comment;
    int (*check)(THD*, struct st_mysql_sys_var *, void*, st_mysql_value*);
    void (*update)(THD*, struct st_mysql_sys_var *, void*, const void*);
};
```

Additional fields are append as required depending upon the flags.

For convenience, a number of macros are defined that make creating new system variables within a plugin much simpler.

Throughout the macros, the following fields are available:

- **name**: An unquoted identifier for the system variable.
- **varname**: The identifier for the static variable. Where not available, it is the same as the `name` field.
- **opt**: Additional use flags for the system variable. The following table shows the permissible flags.

### Table 29.2 Server Plugin System Variable Flags

<table>
<thead>
<tr>
<th>Flag Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PLUGIN_VAR_READONLY</td>
<td>The system variable is read only</td>
</tr>
<tr>
<td>PLUGIN_VAR_NOSYSVAR</td>
<td>The system variable is not user visible at runtime</td>
</tr>
<tr>
<td>PLUGIN_VAR_NOCMDOPT</td>
<td>The system variable is not configurable from the command line</td>
</tr>
<tr>
<td>PLUGIN_VAR_NOCMDARG</td>
<td>No argument is required at the command line (typically used for boolean variables)</td>
</tr>
<tr>
<td>PLUGIN_VAR_RQCMDARG</td>
<td>An argument is required at the command line (this is the default)</td>
</tr>
<tr>
<td>PLUGIN_VAR_OPCMDARG</td>
<td>An argument is optional at the command line</td>
</tr>
<tr>
<td>PLUGIN_VAR_MEMALLOC</td>
<td>Used for string variables; indicates that memory is to be allocated for storage of the string</td>
</tr>
</tbody>
</table>
• **comment**: A descriptive comment to be displayed in the server help message. **NULL** if this variable is to be hidden.

• **check**: The check function, **NULL** for default.

• **update**: The update function, **NULL** for default.

• **default**: The variable default value.

• **minimum**: The variable minimum value.

• **maximum**: The variable maximum value.

• **blocksize**: The variable block size. When the value is set, it is rounded to the nearest multiple of **blocksize**.

A system variable may be accessed either by using the static variable directly or by using the **SYSVAR()** accessor macro. The **SYSVAR()** macro is provided for completeness. Usually it should be used only when the code cannot directly access the underlying variable.

For example:

```c
static int my_foo;
static MYSQL_SYSVAR_INT(foo_var, my_foo,
    PLUGIN_VAR_RQCMDARG, "foo comment",
    NULL, NULL, 0, 0, INT_MAX, 0);

... SYSVAR(foo_var)= value;
    value= SYSVAR(foo_var);
    my_foo= value;
    value= my_foo;
```

Session variables may be accessed only through the **THDVAR()** accessor macro. For example:

```c
static MYSQL_THDVAR_BOOL(some_flag,
    PLUGIN_VAR_NOCMDARG, "flag comment",
    NULL, NULL, FALSE);

... if (THDVAR(thd, some_flag))
    { do_something();
      THDVAR(thd, some_flag)= FALSE;
    }
```

All global and session system variables must be published to **mysql** before use. This is done by constructing a **NULL**-terminated array of the variables and linking to it in the plugin public interface. For example:

```c
static struct st_mysql_sys_var *my_plugin_vars[] = {
    MYSQL_SYSVAR(foo_var),
    MYSQL_SYSVAR(some_flag),
    NULL
};
mysql_declare_plugin(fooplug)
{ MYSQL)..._PLUGIN,
    &plugin_data,
    "fooplug",
    "foo author",
    "This does foo!",
    PLUGIN_LICENSE_GPL,
}```
Writing Plugins

```c
foo_init,
f虹�fint,
0x0001,
NULL,
my_plugin_vars,
NULL,
0
} mysql_declare_plugin_end;
```

The following convenience macros enable you to declare different types of system variables:

- **Boolean system variables** of type `bool`, which is a 1-byte boolean. (0 = `false`, 1 = `true`)

  ```c
  MYSQL_THDVAR_BOOL(name, opt, comment, check, update, default)
  MYSQL_SYSVAR_BOOL(name, varname, opt, comment, check, update, default)
  ```

- **String system variables** of type `char*`, which is a pointer to a null-terminated string.

  ```c
  MYSQL_THDVAR_STR(name, opt, comment, check, update, default)
  MYSQL_SYSVAR_STR(name, varname, opt, comment, check, update, default)
  ```

- **Integer system variables**, of which there are several varieties.

  - An `int` system variable, which is typically a 4-byte signed word.

    ```c
    MYSQL_THDVAR_INT(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_INT(name, varname, opt, comment, check, update, default,
       minimum, maximum, blocksize)
    ```

  - An `unsigned int` system variable, which is typically a 4-byte unsigned word.

    ```c
    MYSQL_THDVAR_UINT(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_UINT(name, varname, opt, comment, check, update, default,
       minimum, maximum, blocksize)
    ```

  - A `long` system variable, which is typically either a 4- or 8-byte signed word.

    ```c
    MYSQL_THDVAR_LONG(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_LONG(name, varname, opt, comment, check, update, default,
       minimum, maximum, blocksize)
    ```

  - An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word.

    ```c
    MYSQL_THDVAR_ULONG(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_ULONG(name, varname, opt, comment, check, update, default,
       minimum, maximum, blocksize)
    ```

  - A `long long` system variable, which is typically an 8-byte signed word.

    ```c
    MYSQL_THDVAR_LONGLONG(name, opt, comment, check, update,
        default, minimum, maximum, blocksize)
    MYSQL_SYSVAR_LONGLONG(name, varname, opt, comment, check, update,
        default, minimum, maximum, blocksize)
    ```

  - An `unsigned long long` system variable, which is typically an 8-byte unsigned word.

    ```c
    MYSQL_THDVAR_ULONG_LONG(name, opt, comment, check, update,
        default, minimum, maximum, blocksize)
    MYSQL_SYSVAR_ULONG_LONG(name, varname, opt, comment, check, update,
        default, minimum, maximum, blocksize)
    ```
Writing Plugins

• A **double** system variable, which is typically an 8-byte signed word.

• An **unsigned long** system variable, which is typically either a 4- or 8-byte unsigned word. The range of possible values is an ordinal of the number of elements in the typelib, starting from 0.

• An **unsigned long long** system variable, which is typically an 8-byte unsigned word. Each bit represents an element in the typelib.

Internally, all mutable and plugin system variables are stored in a **HASH** structure.

Display of the server command-line help text is handled by compiling a **DYNAMIC_ARRAY** of all variables relevant to command-line options, sorting them, and then iterating through them to display each option.

When a command-line option has been handled, it is then removed from the argv by the handle_option() function (my_getopt.c); in effect, it is consumed.

The server processes command-line options during the plugin installation process, immediately after the plugin has been successfully loaded but before the plugin initialization function has been called.

Plugins loaded at runtime do not benefit from any configuration options and must have usable defaults. Once they are installed, they are loaded at mysqld initialization time and configuration options can be set at the command line or within my.cnf.

Plugins should consider the thd parameter to be read only.

**Client Plugin Descriptors**

Each client plugin must have a descriptor that provides information to the client plugin API. The descriptor structure begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type.

The **st_mysql_client_plugin** structure in the client_plugin.h file defines a “generic” descriptor that contains the common members:

```
struct st_mysql_client_plugin
{
  int type;
  unsigned int interface_version;
  const char *name;
  const char *author;
```
const char *desc;
unsigned int version[3];
const char *license;
void *mysql_api;
int (*init)(char *, size_t, int, va_list);
int (*deinit)();
int (*options)(const char *option, const void *);
};

The common `st_mysql_client_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- **type**: The plugin type. This must be one of the plugin-type values from `client_plugin.h`, such as `MYSQL_CLIENT_AUTHENTICATION_PLUGIN`.
- **interface_version**: The plugin interface version. For example, this is `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION` for an authentication plugin.
- **name**: A string that gives the plugin name. This is the name by which you refer to the plugin when you call `mysql_options()` with the `MYSQL_DEFAULT_AUTH` option or specify the `--default-auth` option to a MySQL client program.
- **author**: A string naming the plugin author. This can be whatever you like.
- **desc**: A string that provides a general description of the plugin. This can be whatever you like.
- **version**: The plugin version as an array of three integers indicating the major, minor, and teeny versions. For example, `{1,2,3}` indicates version 1.2.3.
- **license**: A string that specifies the license type.
- **mysql_api**: For internal use. Specify it as `NULL` in the plugin descriptor.
- **init**: A once-only initialization function, or `NULL` if there is no such function. The client library executes this function when it loads the plugin. The function returns zero for success and nonzero for failure.

The `init` function uses its first two arguments to return an error message if an error occurs. The first argument is a pointer to a `char` buffer, and the second argument indicates the buffer length. Any message returned by the `init` function must be null-terminated, so the maximum message length is the buffer length minus one. The next arguments are passed to `mysql_load_plugin()`. The first indicates how many more arguments there are (0 if none), followed by any remaining arguments.

- **deinit**: A once-only deinitialization function, or `NULL` if there is no such function. The client library executes this function when it unloads the plugin. The function takes no arguments. It returns zero for success and nonzero for failure.
- **options**: A function for handling options passed to the plugin, or `NULL` if there is no such function. The function takes two arguments representing the option name and a pointer to its value. The function returns zero for success and nonzero for failure.

For a given client plugin type, the common descriptor members may be followed by additional members necessary to implement plugins of that type. For example, the `st_mysql_client_plugin_AUTHENTICATION` structure for authentication plugins has a function at the end that the client library calls to perform authentication.

To declare a plugin, use the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros:
Do not specify the `type` or `interface_version` member explicitly. The `mysql_declare_client_plugin()` macro uses the `plugin_type` argument to generate their values automatically. For example, declare an authentication client plugin like this:

```c
mysql_declare_client_plugin(AUTHENTICATION)
    "my_auth_plugin",
    "Author Name",
    "My Client Authentication Plugin",
    {1,0,0},
    "GPL",
    NULL,
    my_auth_init,
    my_auth_deinit,
    my_auth_options,
    my_auth_main
mysql_end_client_plugin;
```

This declaration uses the `AUTHENTICATION` argument to set the `type` and `interface_version` members to `MYSQL_CLIENT_AUTHENTICATION_PLUGIN` and `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION`.

Depending on the plugin type, the descriptor may have other members following the common members. For example, for an authentication plugin, there is a function (`my_auth_main()`) in the descriptor just shown) that handles communication with the server. See Section 29.2.4.9, “Writing Authentication Plugins”.

Normally, a client program that supports the use of authentication plugins causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```c
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";
/* ... process command-line options ... */
mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See Section 28.7.17, “C API Client Plugin Functions”.

### 29.2.4.3 Compiling and Installing Plugin Libraries

After your plugin is written, you must compile it and install it. The procedure for compiling shared objects varies from system to system. If you build your library using CMake, it should be able to generate the correct compilation commands for your system. If the library is named `somepluglib`, you should end up with a shared library file that has a name something like `somepluglib.so`. (The `.so` file name suffix might differ on your system.)

To use CMake, you'll need to set up the configuration files to enable the plugin to be compiled and installed. Use the plugin examples under the `plugin` directory of a MySQL source distribution as a guide.

Create `CMakeLists.txt`, which should look something like this:
Writing Plugins

MYSQL_ADD_PLUGIN(somepluglib somepluglib.c
    MODULE_ONLY MODULE_OUTPUT_NAME "somepluglib")

When CMake generates the Makefile, it should take care of passing to the compilation command the `-DMYSQL_DYNAMIC_PLUGIN` flag, and passing to the linker the `-lmysqlservices` flag, which is needed to link in any functions from services provided through the plugin services interface. See Section 29.3, “MySQL Services for Plugins”.

Run CMake, then run make:

shell> cmake .
shell> make

If you need to specify configuration options to CMake, see Section 2.9.4, “MySQL Source-Configuration Options”, for a list. For example, you might want to specify CMAKE_INSTALL_PREFIX to indicate the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with SHOW VARIABLES:

mysql> SHOW VARIABLES LIKE 'basedir';
+---------------+------------------+
| Variable_name | Value            |
|---------------+------------------+
| base          | /usr/local/mysql |
+---------------+------------------+

The location of the plugin directory where you should install the library is given by the plugin_dir system variable. For example:

mysql> SHOW VARIABLES LIKE 'plugin_dir';
+---------------+-----------------------------------+
| Variable_name | Value                             |
|---------------+-----------------------------------+
| plugin_dir    | /usr/local/mysql/lib/mysql/plugin |
+---------------+-----------------------------------+

To install the plugin library, use make:

shell> make install

Verify that make install installed the plugin library in the proper directory. After installing it, make sure that the library permissions permit it to be executed by the server.

29.2.4.4 Writing Full-Text Parser Plugins

MySQL supports server-side full-text parser plugins with MyISAM and InnoDB. For introductory information about full-text parser plugins, see Full-Text Parser Plugins.

A full-text parser plugin can be used to replace or modify the built-in full-text parser. This section describes how to write a full-text parser plugin named simple_parser. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are nonempty runs of whitespace characters.

The instructions use the source code in the plugin/fulltext directory of MySQL source distributions, so change location into that directory. The following procedure describes how the plugin library is created:

1. To write a full-text parser plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.
Writing Plugins

```c
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_FTPARSER_PLUGIN` server plugin type and the data structures needed to declare the plugin.

2. Set up the library descriptor for the plugin library file.

   This descriptor contains the general plugin descriptor for the server plugin. For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

   For example, the library descriptor for a library that contains a single full-text parser plugin named `simple_parser` looks like this:

   ```c
   mysql_declare_plugin(ftexample)
   {
     MYSQL_FTPARSER_PLUGIN,       /* type                            */
     &simple_parser_descriptor,  /* descriptor                      */
     "simple_parser",            /* name                            */
     "Oracle Corporation",       /* author                          */
     "Simple Full-Text Parser",  /* description                     */
     PLUGIN_LICENSE_GPL,         /* plugin license                  */
     simple_parser_plugin_init,  /* init function (when loaded)     */
     simple_parser_plugin_deinit,/* deinit function (when unloaded)   */
     0x0001,                     /* version                         */
     simple_status,              /* status variables                */
     simple_system_variables,    /* system variables                */
     NULL,
     0
   }
   mysql_declare_plugin_end;
   ```

   The `name` member (`simple_parser`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

   For more information, see [Server Plugin Library and Plugin Descriptors](#).

3. Set up the type-specific plugin descriptor.

   Each general plugin descriptor in the library descriptor points to a type-specific descriptor. For a full-text parser plugin, the type-specific descriptor is an instance of the `st_mysql_ftparser` structure in the `plugin.h` file:

   ```c
   struct st_mysql_ftparser
   {
     int interface_version;
     int (*parse)(MYSQL_FTPARSER_PARAM *param);
     int (*init)(MYSQL_FTPARSER_PARAM *param);
     int (*deinit)(MYSQL_FTPARSER_PARAM *param);
   };
   ```

   As shown by the structure definition, the descriptor has an interface version number and contains pointers to three functions.

   The interface version number is specified using a symbol, which is in the form: `MYSQL_XXX_INTERFACE_VERSION`. For full-text parser plugins, the symbol is
Writing Plugins

MYSQL_FTPARSER_INTERFACE_VERSION. In the source code, you will find the actual interface version number for the full-text parser plugin defined in include/mysql/plugin_ftparser.h. The current interface version number is 0x0101.

The init and deinit members should point to a function or be set to 0 if the function is not needed. The parse member must point to the function that performs the parsing.

In the simple_parser declaration, that descriptor is indicated by &simple_parser_descriptor. The descriptor specifies the version number for the full-text plugin interface (as given by MYSQL_FTPARSER_INTERFACE_VERSION), and the plugin’s parsing, initialization, and deinitialization functions:

```c
static struct st_mysql_ftparser simple_parser_descriptor=
{
    MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version     */
    simple_parser_parse,              /* parsing function     */
    simple_parser_init,               /* parser init function */
    simple_parser_deinit,             /* parser deinit function */
};
```

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.

- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no FULLTEXT index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

The plugin declaration in the general plugin descriptor has init and deinit members that point initialization and deinitialization functions, and so does the type-specific plugin descriptor to which it points. However, these pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the general plugin descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.

- For the type-specific plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a MYSQL_FTPARSER_PARAM structure containing the parsing context. The structure has this definition:

```c
typedef struct st_mysql_ftparser_param
{
    int (*mysql_parse)(struct st_mysql_ftparser_param *,
                      char *doc, int doc_len);
    int (*mysql_add_word)(struct st_mysql_ftparser_param *
                          , char *word, int word_len,
                          MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
    void *ftparser_state;
    void *mysql_ftparam;
};
```
struct charset_info_st *cs;
char *doc;
int length;
int flags;
enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;

The structure members are used as follows:

- **mysql_parse**: A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

  The first parameter for this callback function should be the `param` value itself:

  ```
  param->mysql_parse(param, ...);
  ```

  A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- **mysql_add_word**: A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

  The first parameter for this callback function should be the `param` value itself:

  ```
  param->mysql_add_word(param, ...);
  ```

- **ftparser_state**: This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.

- **mysql_ftparam**: This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

- **cs**: A pointer to information about the character set of the text, or 0 if no information is available.

- **doc**: A pointer to the text to be parsed.

- **length**: The length of the text to be parsed, in bytes.

- **flags**: Parser flags. This is zero if there are no special flags. The only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

  This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- **mode**: The parsing mode. This value will be one of the following constants:

  - **MYSQL_FTPARSER_SIMPLE_MODE**: Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should
Writing Plugins

be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it
should not pass such words to the server.

• **MYSQL_FTPARSER_WITH_STOPWORDS**: Parse in stopword mode. This is used in boolean
searches for phrase matching. The parser should pass all words to the server, even stopwords or
words that are outside any normal length limits.

• **MYSQL_FTPARSER_FULL_BOOLEAN_INFO**: Parse in boolean mode. This is used for parsing
boolean query strings. The parser should recognize not only words but also boolean-
mode operators and pass them to the server as tokens using the `mysql_add_word`
callback. To tell the server what kind of token is being passed, the plugin needs to fill in a
`MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

**Note**

For MyISAM, the stopword list and `ft_min_word_len` and
`ft_max_word_len` are checked inside the tokenizer. For InnoDB,
the stopword list and equivalent word length variable settings
`(innodb_ft_min_token_size` and `innodb_ft_max_token_size`) are
checked outside of the tokenizer. As a result, InnoDB plugin parsers
do not need to check the stopword list, `innodb_ft_min_token_size`, or
`innodb_ft_max_token_size`. Instead, it is recommended that all words be
returned to InnoDB. However, if you want to check stopwords within your plugin
parser, use `MYSQL_FTPARSER_SIMPLE_MODE`, which is for full-text search
index and natural language search. For `MYSQL_FTPARSER_WITH_STOPWORDS`
and `MYSQL_FTPARSER_FULL_BOOLEAN_INFO` modes, it is recommended
that all words be returned to InnoDB including stopwords, in case of phrase
searches.

If the parser is called in boolean mode, the `param->mode` value will be
`MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the
parser uses for passing token information to the server looks like this:

```c
typedef struct st_mysql_ftparser_boolean_info
{
    enum enum_ft_token_type type;
    int yesno;
    int weight_adjust;
    char wasign;
    char trunc;
    int position;
    /* These are parser state and must be removed. */
    char prev;
    char *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

• **type**: The token type. The following table shows the permissible types.

**Table 29.3 Full-Text Parser Token Types**

<table>
<thead>
<tr>
<th>Token Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>FT_TOKEN_EOF</code></td>
<td>End of data</td>
</tr>
<tr>
<td><code>FT_TOKEN_WORD</code></td>
<td>A regular word</td>
</tr>
<tr>
<td><code>FT_TOKEN_LEFT_PAREN</code></td>
<td>The beginning of a group or subexpression</td>
</tr>
</tbody>
</table>
### Writing Plugins

<table>
<thead>
<tr>
<th>Token Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>FT_TOKEN_RIGHT_PAREN</td>
<td>The end of a group or subexpression</td>
</tr>
<tr>
<td>FT_TOKEN_STOPWORD</td>
<td>A stopword</td>
</tr>
</tbody>
</table>

- **yesno**: Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.

- **weight_adjust**: A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at Section 12.9.2, "Boolean Full-Text Searches", that use the < and > operators illustrate how weighting works.

- **wasign**: The sign of the weighting factor. A negative value acts like the ~ boolean-search operator, which causes the word's contribution to the relevance to be negative.

- **trunc**: Whether matching should be done as if the boolean-mode * truncation operator had been given.

- **position**: Start position of the word in the document, in bytes. Used by InnoDB full-text search. For existing plugins that are called in boolean mode, support must be added for the position member.

Plugins should not use the prev and quot members of the MYSQL_FTPARSER_BOOLEAN_INFO structure.

**Note**

The plugin parser framework does not support:

- The @distance boolean operator.
- A leading plus sign (+) or minus sign (−) boolean operator followed by a space and then a word ('+ apple' or '− apple'). The leading plus or minus sign must be directly adjacent to the word, for example: '+apple' or '−apple'.

For information about boolean full-text search operators, see Section 12.9.2, "Boolean Full-Text Searches".

4. Set up the plugin interface functions.

The general plugin descriptor in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For simple_parser, these functions do nothing but return zero to indicate that they succeeded:

```c
static int simple_parser_plugin_init(void *arg __attribute__((unused)))
{
    return(0);
}

static int simple_parser_plugin_deinit(void *arg __attribute__((unused)))
{
    return(0);
}
```
Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```c
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param
    __attribute__((unused)))
{
    return(0);
}
static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param
    __attribute__((unused)))
{
    return(0);
}
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers nonempty runs of whitespace characters to be words, so it identifies words like this:

```c
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
    char *end, *start, *docend= param->doc + param->length;
    for (end= start= param->doc;; end++)
    {
        if (end == docend)
        {
            if (end > start)
                add_word(param, start, end - start);
            break;
        }
        else if (isspace(*end))
        {
            if (end > start)
                add_word(param, start, end - start);
            start= end + 1;
        }
    }
    return(0);
}
```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```c
static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
    MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
        { FT_TOKEN_WORD, 0, 0, 0, 0, ' ', 0 };
For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described earlier in the discussion of the `st_mysql_ftparser_boolean_info` structure.

5. Set up the status variables. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```c
long number_of_calls = 0;

struct st_mysql_show_var simple_status[] =
{
    {"simple_parser_static", (char *)"just a static text", SHOW_CHAR},
    {"simple_parser_called", (char *)&number_of_calls, SHOW_LONG},
    {0,0,0}
};
```

By using status variable names that begin with the plugin name, you can easily display the variables for a plugin with `SHOW STATUS`:

```
mysql> SHOW STATUS LIKE 'simple_parser%';
+----------------------+--------------------+
<table>
<thead>
<tr>
<th>Variable_name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>simple_parser_static</td>
<td>just a static text</td>
</tr>
<tr>
<td>simple_parser_called</td>
<td>0</td>
</tr>
</tbody>
</table>
+----------------------+--------------------+
```

6. To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `simple_parser` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `mypluglib.so` (the `.so` suffix might differ depending on your platform).

7. To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN simple_parser SONAME 'mypluglib.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

8. To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

9. Test the plugin to verify that it works properly.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
    -> FULLTEXT (c) WITH PARSER simple_parser
    -> ) ENGINE=MyISAM;
Query OK, 0 rows affected (0.01 sec)
```
Insert some text into the table and try some searches. These should verify that the parser plugin treats all nonwhitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
  -> ('utf8mb4_0900_as_cs is a case-sensitive collation'),
  -> ('I\'d like a case of oranges'),
  -> ('this is sensitive information'),
  -> ('another row'),
  -> ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0
```
```
mysql> SELECT c FROM t;
+--------------------------------------------------+
| c                                                |
+--------------------------------------------------+
| utf8mb4_0900_as_cs is a case-sensitive collation |
| I\'d like a case of oranges                      |
| this is sensitive information                    |
| another row                                       |
| yet another row                                   |
+--------------------------------------------------+
5 rows in set (0.00 sec)
```
```
mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+--------------------------+
| MATCH(c) AGAINST('case') |
+--------------------------+
|                          0 |
|          1.2968142032623 |
|                          0 |
|                          0 |
|                          0 |
+--------------------------+
5 rows in set (0.00 sec)
```
```
mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-------------------------------+
| MATCH(c) AGAINST('sensitive') |
+-------------------------------+
|                             0 |
|                             0 |
|               1.3253291845322 |
|                             0 |
|                             0 |
+-------------------------------+
5 rows in set (0.01 sec)
```
```
mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+------------------------------------+
| MATCH(c) AGAINST('case-sensitive') |
+------------------------------------+
|                    1.3109166622162 |
|                                  0 |
|                                  0 |
|                                  0 |
|                                  0 |
+------------------------------------+
5 rows in set (0.01 sec)
```
```
mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+--------------------------+
| MATCH(c) AGAINST('I\'d') |
+--------------------------+
|                          0 |
+--------------------------+
```
Neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

### 29.2.4.5 Writing Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. This section describes how to write a daemon server plugin, using the example plugin found in the `plugin/daemon_example` directory of MySQL source distributions. That directory contains the `daemon_example.cc` source file for a daemon plugin named `daemon_example` that writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory.

To write a daemon plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```c
#include <mysql/plugin.h>
```

Plugin `plugin.h` defines the `MYSQL_DAEMON_PLUGIN` server plugin type and the data structures needed to declare the plugin.

The `daemon_example.cc` file sets up the library descriptor as follows. The library descriptor includes a single general server plugin descriptor.

```c
mysql_declare_plugin(daemon_example)
{
  MYSQL_DAEMON_PLUGIN,
  &daemon_example_plugin,
  "daemon_example",
  "Brian Aker",
  "Daemon example, creates a heartbeat beat file in mysql-heartbeat.log",
  PLUGIN_LICENSE_GPL,
  daemon_example_plugin_init, /* Plugin Init */
  daemon_example_plugin_deinit, /* Plugin Deinit */
  0x0100 /* 1.0 */,
  NULL,                       /* status variables                */
  NULL,                       /* system variables                */
  NULL,                       /* config options                  */
  0,                          /* flags                           */
}
mysql_declare_plugin_end;
```

The `name` member (`daemon_example`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The second member of the plugin descriptor, `daemon_example_plugin`, points to the type-specific daemon plugin descriptor. This structure consists only of the type-specific API version number:

```c
struct st_mysql_daemon daemon_example_plugin=
{ MYSQL_DAEMON_INTERFACE_VERSION  };
```

The type-specific structure has no interface functions. There is no communication between the server and the plugin, except that the server calls the initialization and deinitialization functions from the general plugin descriptor to start and stop the plugin:
• `daemon_example_plugin_init()` opens the heartbeat file and spawns a thread that wakes up periodically and writes the next message to the file.

• `daemon_example_plugin_deinit()` closes the file and performs other cleanup.

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling andInstalling Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `daemon_example` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `libdaemon_example.so` (the `.so` suffix might differ depending on your platform).

To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```sql
INSTALL PLUGIN daemon_example SONAME 'libdaemon_example.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

While the plugin is loaded, it writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory. This file grows without limit, so after you have satisfied yourself that the plugin operates correctly, unload it:

```sql
UNINSTALL PLUGIN daemon_example;
```

### 29.2.4.6 Writing INFORMATION_SCHEMA Plugins

This section describes how to write a server-side `INFORMATION_SCHEMA` table plugin. For example code that implements such plugins, see the `sql/sql_show.cc` file of a MySQL source distribution. You can also look at the example plugins found in the InnoDB source. See the `handler/i_s.cc` and `handler/ha_innodb.cc` files within the InnoDB source tree (in the `storage/innobase` directory).

To write an `INFORMATION_SCHEMA` table plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```c
#include <sql_class.h>
#include <table.h>
```

These header files are located in the `sql` directory of MySQL source distributions. They contain C++ structures, so the source file for an `INFORMATION_SCHEMA` plugin must be compiled as C++ code.

The source file for the example plugin developed here is named `simple_i_s_table.cc`. It creates a simple `INFORMATION_SCHEMA` table named `SIMPLE_I_S_TABLE` that has two columns named `NAME` and `VALUE`. The general descriptor for a plugin library that implements the table looks like this:

```c
mysql_declare_plugin(simple_i_s_library)
{
    MYSQL_INFORMATION_SCHEMA_PLUGIN,
    &simple_table_info, /* type-specific descriptor */
    "SIMPLE_I_S_TABLE", /* table name */
    "Author Name", /* author */
```
The name member (SIMPLE_I_S_TABLE) indicates the name to use for references to the plugin in statements such as INSTALL PLUGIN or UNINSTALL PLUGIN. This is also the name displayed by SHOW PLUGINS or INFORMATION_SCHEMA.PLUGINS.

The simple_table_info member of the general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```c
static struct st_mysql_information_schema simple_table_info =
{ MYSQL_INFORMATION_SCHEMA_INTERFACE_VERSION };
```

The general descriptor points to the initialization and deinitialization functions:

- The initialization function provides information about the table structure and a function that populates the table.
- The deinitialization function performs any required cleanup. If no cleanup is needed, this descriptor member can be NULL (as in the example shown).

The initialization function should return 0 for success, 1 if an error occurs. The function receives a generic pointer, which it should interpret as a pointer to the table structure:

```c
static int table_init(void *ptr)
{
    ST_SCHEMA_TABLE *schema_table= (ST_SCHEMA_TABLE*)ptr;

    schema_table->fields_info= simple_table_fields;
    schema_table->fill_table= simple_fill_table;
    return 0;
}
```

The function should set these two members of the table structure:

- **fields_info**: An array of ST_FIELD_INFO structures that contain information about each column.
- **fill_table**: A function that populates the table.

The array pointed to by fields_info should contain one element per column of the INFORMATION_SCHEMA plus a terminating element. The following simple_table_fields array for the example plugin indicates that SIMPLE_I_S_TABLE has two columns. NAME is string-valued with a length of 10 and VALUE is integer-valued with a display width of 20. The last structure marks the end of the array.

```c
static ST_FIELD_INFO simple_table_fields[] =
{
    {"NAME", 10, MYSQL_TYPE_STRING, 0, 0, 0, 0},
    {"VALUE", 6, MYSQL_TYPE_LONG, 0, MY_I_S_UNSIGNED, 0, 0},
    {0, 0, MYSQL_TYPE_NULL, 0, 0, 0, 0}
};
```
For more information about the column information structure, see the definition of ST_FIELD_INFO in the table.h header file. The permissible MYSQL_TYPE_XXX type values are those used in the C API; see Section 28.7.5, “C API Data Structures”.

The fill_table member should be set to a function that populates the table and returns 0 for success, 1 if an error occurs. For the example plugin, the simple_fill_table() function looks like this:

```c
static int simple_fill_table(THD *thd, TABLE_LIST *tables, Item *cond)
{
    TABLE *table = tables->table;

    table->field[0]->store("Name 1", 6, system_charset_info);
    table->field[1]->store(1);
    if (schema_table_store_record(thd, table))
        return 1;
    table->field[0]->store("Name 2", 6, system_charset_info);
    table->field[1]->store(2);
    if (schema_table_store_record(thd, table))
        return 1;
    return 0;
}
```

For each row of the INFORMATION_SCHEMA table, this function initializes each column, then calls schema_table_store_record() to install the row. The store() method arguments depend on the type of value to be stored. For column 0 (NAME, a string), store() takes a pointer to a string, its length, and information about the character set of the string:

```c
store(const char *to, uint length, CHARSET_INFO *cs);
```

For column 1 (VALUE, an integer), store() takes the value and a flag indicating whether it is unsigned:

```c
store(longlong nr, bool unsigned_value);
```

For other examples of how to populate INFORMATION_SCHEMA tables, search for instances of schema_table_store_record() in sql_show.cc.

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the plugin_dir system variable).

To test the plugin, install it:

```sql
mysql> INSTALL PLUGIN SIMPLE_I_S_TABLE SONAME 'simple_i_s_table.so';
```

Verify that the table is present:

```sql
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
    -> WHERE TABLE_NAME = 'SIMPLE_I_S_TABLE';
```

Try to select from it:

```sql
mysql> SELECT * FROM INFORMATION_SCHEMA.SIMPLE_I_S_TABLE;
```
Writing Plugins

<table>
<thead>
<tr>
<th>NAME</th>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name 1</td>
<td>1</td>
</tr>
<tr>
<td>Name 2</td>
<td>2</td>
</tr>
</tbody>
</table>

Uninstall it:

mysql> UNINSTALL PLUGIN SIMPLE_I_S_TABLE;

29.2.4.7 Writing Semisynchronous Replication Plugins

This section describes how to write server-side semisynchronous replication plugins, using the example plugins found in the plugin/semisync directory of MySQL source distributions. That directory contains the source files for master and slave plugins named rpl_semi_sync_master and rpl_semi_sync_slave. The information here covers only how to set up the plugin framework. For details about how the plugins implement replication functions, see the source.

To write a semisynchronous replication plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_REPLICATION_PLUGIN` server plugin type and the data structures needed to declare the plugin.

For the master side, `semisync_master_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_master`:

```
mysql_declare_plugin(semi_sync_master)
{
    MYSQL_REPLICATION_PLUGIN,
    &semi_sync_master_plugin,
    "rpl_semi_sync_master",
    "He Zhenxing",
    "Semi-synchronous replication master",
    PLUGIN_LICENSE_GPL,
    semi_sync_master_plugin_init, /* Plugin Init */
    semi_sync_master_plugin_deinit, /* Plugin Deinit */
    0x0100 /* 1.0 */,
    semi_sync_master_status_vars, /* status variables */
    semi_sync_master_system_vars, /* system variables */
    NULL, /* config options */
    0, /* flags */
}
mysql_declare_plugin_end;
```

For the slave side, `semisync_slave_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_slave`:

```
mysql_declare_plugin(semi_sync_slave)
{
    MYSQL_REPLICATION_PLUGIN,
    &semi_sync_slave_plugin,
    "rpl_semi_sync_slave",
    "He Zhenxing",
    "Semi-synchronous replication slave",
    PLUGIN_LICENSE_GPL,
    semi_sync_slave_plugin_init, /* Plugin Init */
    semi_sync_slave_plugin_deinit, /* Plugin Deinit */
    0x0100 /* 1.0 */,
    semi_sync_slave_status_vars, /* status variables */
    semi_sync_slave_system_vars, /* system variables */
    NULL, /* config options */
    0, /* flags */
}
mysql_declare_plugin_end;
```
For both the master and slave plugins, the general descriptor has pointers to the type-specific descriptor, the initialization and deinitialization functions, and to the status and system variables implemented by the plugin. For information about variable setup, see Server Plugin Status and System Variables. The following remarks discuss the type-specific descriptor and the initialization and deinitialization functions for the master plugin but apply similarly to the slave plugin.

The `semi_sync_master_plugin` member of the master general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```c
struct Mysql_replication semi_sync_master_plugin= {
    MYSQL_REPLICATION_INTERFACE_VERSION
};
```

The initialization and deinitialization function declarations look like this:

```c
static int semi_sync_master_plugin_init(void *p);
static int semi_sync_master_plugin_deinit(void *p);
```

The initialization function uses the pointer to register transaction and binary logging “observers” with the server. After successful initialization, the server takes care of invoking the observers at the appropriate times. (For details on the observers, see the source files.) The deinitialization function cleans up by deregistering the observers. Each function returns 0 for success or 1 if an error occurs.

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `rpl_semi_sync_master` and `rpl_semi_sync_slave` plugins, they are compiled and installed when you build MySQL from source. They are also included in binary distributions. The build process produces shared object libraries with names of `semisync_master.so` and `semisync_slave.so` (the `.so` suffix might differ depending on your platform).

### 29.2.4.8 Writing Audit Plugins

This section describes how to write a server-side audit plugin, using the example plugin found in the `plugin/audit_null` directory of MySQL source distributions. The `audit_null.c` and `audit_null_variables.h` source files in that directory implement an audit plugin named `NULL_AUDIT`.

Note: Other examples of plugins that use the audit plugin API are the query rewrite plugin (see Section 5.6.4, “The Rewriter Query Rewrite Plugin”) and the Version Tokens plugin (see Section 5.6.6, “Version Tokens”).

Within the server, the pluggable audit interface is implemented in the `sql_audit.h` and `sql_audit.cc` files in the `sql` directory of MySQL source distributions. Additionally, several places in the server call the audit interface when an auditable event occurs, so that registered audit plugins can be notified about...
Writing Plugins

the event if necessary. To see where such calls occur, search the server source files for invocations of functions with names of the form `mysql_audit_XXX()`. Audit notification occurs for server operations such as these:

- Client connect and disconnect events
- Writing a message to the general query log (if the log is enabled)
- Writing a message to the error log
- Sending a query result to a client

To write an audit plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```c
#include <mysql/plugin_audit.h>
```

`plugin_audit.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_AUDIT_PLUGIN` server plugin type and the data structures needed to declare the plugin.

`plugin_audit.h` defines data structures specific to audit plugins.

Audit Plugin General Descriptor

An audit plugin, like any MySQL server plugin, has a general plugin descriptor (see Server Plugin Library and Plugin Descriptors) and a type-specific plugin descriptor. In `audit_null.c`, the general descriptor for `audit_null` looks like this:

```c
mysql_declare_plugin(audit_null)
{
    MYSQL_AUDIT_PLUGIN, /* type */
    &audit_null_descriptor, /* descriptor */
    "Oracle Corp", /* author */
    "Simple NULL Audit", /* description */
    PLUGIN_LICENSE_GPL,
    audit_null_plugin_init, /* init function (when loaded) */
    audit_null_plugin_deinit, /* deinit function (when unloaded) */
    0x0003, /* version */
    simple_status, /* status variables */
    system_variables, /* system variables */
    NULL,
    0,
}
mysql_declare_plugin_end;
```

The first member, `MYSQL_AUDIT_PLUGIN`, identifies this plugin as an audit plugin.

`audit_null_descriptor` points to the type-specific plugin descriptor, described later.

The `name` member (`NULL_AUDIT`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The `audit_null_plugin_init` initialization function performs plugin initialization when the plugin is loaded. The `audit_null_plugin_deinit` function performs cleanup when the plugin is unloaded.

The general plugin descriptor also refers to `simple_status` and `system_variables`, structures that expose several status and system variables. When the plugin is enabled, these variables can be inspected
Writing Plugins

using `SHOW` statements (`SHOW STATUS`, `SHOW VARIABLES`) or the appropriate Performance Schema tables.

The `simple_status` structure declares several status variables with names of the form `Audit_null_xxx`. `NULL_AUDIT` increments the `Audit_null_called` status variable for every notification that it receives. The other status variables are more specific and `NULL_AUDIT` increments them only for notifications of specific events.

`system_variables` is an array of system variable elements, each of which is defined using a `MYSQL_THDVAR_xxx` macro. These system variables have names of the form `null_audit_xxx`. These variables can be used to communicate with the plugin at runtime.

Audit Plugin Type-Specific Descriptor

The `audit_null_descriptor` value in the general plugin descriptor points to the type-specific plugin descriptor. For audit plugins, this descriptor has the following structure (defined in `plugin_audit.h`):

```c
struct st_mysql_audit
{
  int interface_version;
  void (*release_thd)(MYSQL_THD);
  int (*event_notify)(MYSQL_THD, mysql_event_class_t, const void *);
  unsigned long class_mask[MYSQL_AUDIT_CLASS_MASK_SIZE];
};
```

The type-specific descriptor for audit plugins has these members:

- **interface_version**: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For audit plugins, the value of the `interface_version` member is `MYSQL_AUDIT_INTERFACE_VERSION` (defined in `plugin_audit.h`).

- **release_thd**: A function that the server calls to inform the plugin that it is being dissociated from its thread context. This should be `NULL` if there is no such function.

- **event_notify**: A function that the server calls to notify the plugin that an auditable event has occurred. This function should not be `NULL`; that would not make sense because no auditing would occur.

- **class_mask**: An array of `MYSQL_AUDIT_CLASS_MASK_SIZE` elements. Each element specifies a bitmask for a given event class to indicate the subclasses for which the plugin wants notification. (This is how the plugin “subscribes” to events of interest.) An element should be 0 to ignore events for the corresponding event class.

The server uses the `event_notify` and `release_thd` functions together. They are called within the context of a specific thread, and a thread might perform an activity that produces several event notifications. The first time the server calls `event_notify` for a thread, it creates a binding of the plugin to the thread. The plugin cannot be uninstalled while this binding exists. When no more events for the thread will occur, the server informs the plugin of this by calling the `release_thd` function, and then destroys the binding. For example, when a client issues a statement, the thread processing the statement might notify audit plugins about the result set produced by the statement and about the statement being logged. After these notifications occur, the server releases the plugin before putting the thread to sleep until the client issues another statement.

This design enables the plugin to allocate resources needed for a given thread in the first call to the `event_notify` function and release them in the `release_thd` function:

```c
event_notify function:
```
if memory is needed to service the thread
allocate memory
... rest of notification processing ...

release_thd function:
if memory was allocated
release memory
... rest of release processing ...

That is more efficient than allocating and releasing memory repeatedly in the notification function.

For the **NULL_AUDIT** audit plugin, the type-specific plugin descriptor looks like this:

```c
static struct st_mysql_audit audit_null_descriptor=
{
  MYSQL_AUDIT_INTERFACE_VERSION, /* interface version */
  NULL,                           /* release_thd function */
  audit_null_notify,              /* notify function */
  { (unsigned long) MYSQL_AUDIT_GENERAL_ALL,
    (unsigned long) MYSQL_AUDIT_CONNECTION_ALL,
    (unsigned long) MYSQL_AUDIT_PARSE_ALL,
    (unsigned long) MYSQL_AUDIT_AUTHORIZATION_ALL,
    (unsigned long) MYSQL_AUDIT_TABLE_ACCESS_ALL,
    (unsigned long) MYSQL_AUDIT_GLOBAL_VARIABLE_ALL,
    (unsigned long) MYSQL_AUDIT_SERVER_STARTUP_ALL,
    (unsigned long) MYSQL_AUDIT_SERVER_SHUTDOWN_ALL,
    (unsigned long) MYSQL_AUDIT_COMMAND_ALL,
    (unsigned long) MYSQL_AUDIT_QUERY_ALL,
    (unsigned long) MYSQL_AUDIT_STORED_PROGRAM_ALL },
};
```

The server calls **audit_null_notify()** to pass audit event information to the plugin. There is no **release_thd** function.

The **class_mask** member is an array that indicates which event classes the plugin subscribes to. As shown, the array contents subscribe to all subclasses of all event classes that are available. To ignore all notifications for a given event class, specify the corresponding **class_mask** element as 0.

The number of **class_mask** elements corresponds to the number of event classes, each of which is listed in the **mysql_event_class_t** enumeration defined in **plugin_audit.h**:

```c
typedef enum
{
  MYSQL_AUDIT_GENERAL_CLASS          = 0,
  MYSQL_AUDIT_CONNECTION_CLASS       = 1,
  MYSQL_AUDIT_PARSE_CLASS            = 2,
  MYSQL_AUDIT_AUTHORIZATION_CLASS    = 3,
  MYSQL_AUDIT_TABLE_ACCESS_CLASS     = 4,
  MYSQL_AUDIT_GLOBAL_VARIABLE_CLASS  = 5,
  MYSQL_AUDIT_SERVER_STARTUP_CLASS   = 6,
  MYSQL_AUDIT_SERVER_SHUTDOWN_CLASS  = 7,
  MYSQL_AUDIT_COMMAND_CLASS          = 8,
  MYSQL_AUDIT_QUERY_CLASS            = 9,
  MYSQL_AUDIT_STORED_PROGRAM_CLASS   = 10,
  /* This item must be last in the list. */
  MYSQL_AUDIT_CLASS_MASK_SIZE
} mysql_event_class_t;
```

For any given event class, **plugin_audit.h** defines bitmask symbols for individual event subclasses, as well as an **xxx_ALL** symbol that is the union of the all subclass bitmasks. For example, for **MYSQL_AUDIT_CONNECTION_CLASS** (the class that covers connect and disconnect events), **plugin_audit.h** defines these symbols:
typedef enum
{
    /** occurs after authentication phase is completed. */
    MYSQL_AUDIT_CONNECTION_CONNECT = 1 << 0,
    /** occurs after connection is terminated. */
    MYSQL_AUDIT_CONNECTION_DISCONNECT = 1 << 1,
    /** occurs after COM_CHANGE_USER RPC is completed. */
    MYSQL_AUDIT_CONNECTION_CHANGE_USER = 1 << 2,
    /** occurs before authentication. */
    MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE = 1 << 3
} mysql_event_connection_subclass_t;

#define MYSQL_AUDIT_CONNECTION_ALL (MYSQL_AUDIT_CONNECTION_CONNECT |
MYSQL_AUDIT_CONNECTION_DISCONNECT |
MYSQL_AUDIT_CONNECTION_CHANGE_USER |
MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE)

To subscribe to all subclasses of the connection event class (as the NULL_AUDIT plugin does), a plugin specifies MYSQL_AUDIT_CONNECTION_ALL in the corresponding class_mask element (class_mask[1] in this case). To subscribe to only some subclasses, the plugin sets the class_mask element to the union of the subclasses of interest. For example, to subscribe only to the connect and change-user subclasses, the plugin sets class_mask[1] to this value:

MYSQL_AUDIT_CONNECTION_CONNECT | MYSQL_AUDIT_CONNECTION_CHANGE_USER

Audit Plugin Notification Function

Most of the work for an audit plugin occurs in the notification function (the event_notify member of the type-specific plugin descriptor). The server calls this function for each auditable event. Audit plugin notification functions have this prototype:

int (*event_notify)(MYSQL_THD, mysql_event_class_t, const void *);

The second and third parameters of the event_notify function prototype represent the event class and a generic pointer to an event structure. (Events in different classes have different structures. The notification function can use the event class value to determine which event structure applies.) The function processes the event and returns a status indicating whether the server should continue processing the event or terminate it.

For NULL_AUDIT, the notification function is audit_null_notify(). This function increments a global event counter (which the plugin exposes as the value of the Audit_null_called status value), and then examines the event class to determine how to process the event structure:

```c
static int audit_null_notify(MYSQL_THD thd __attribute__((unused)),
    mysql_event_class_t event_class,
    const void *event)
{
    ...
    number_of_calls++;

    if (event_class == MYSQL_AUDIT_GENERAL_CLASS)
    {
        const struct mysql_event_general *event_general= (const struct mysql_event_general *)event;
        ...
    }
    else if (event_class == MYSQL_AUDIT_CONNECTION_CLASS)
    {
```
The notification function interprets the `event` argument according to the value of `event_class`. The `event` argument is a generic pointer to the event record, the structure of which differs per event class. (The `plugin_audit.h` file contains the structures that define the contents of each event class.) For each class, `audit_null_notify()` casts the event to the appropriate class-specific structure and then checks its subclass to determine which subclass counter to increment. For example, the code to handle events in the connection-event class looks like this:

```c
else if (event_class == MYSQL_AUDIT_CONNECTION_CLASS)
{
    const struct mysql_event_connection *event_connection =
        (const struct mysql_event_connection *) event;

    switch (event_connection->event_subclass)
    {
    case MYSQL_AUDIT_CONNECTION_CONNECT:
        number_of_calls_connection_connect++;
        break;
    case MYSQL_AUDIT_CONNECTION_DISCONNECT:
        number_of_calls_connection_disconnect++;
        break;
    case MYSQL_AUDIT_CONNECTION_CHANGE_USER:
        number_of_calls_connection_change_user++;
        break;
    case MYSQL_AUDIT_CONNECTION_PRE_AUTHORISE:
        number_of_calls_connection_pre_authenticate++;
        break;
    default:
        break;
    }
}
```

Note

The general event class (MYSQL_AUDIT_GENERAL_CLASS) is deprecated as of MySQL 5.7.9 and will be removed in a future MySQL release. To reduce plugin overhead, it is preferable to subscribe only to the more specific event classes of interest.

For some event classes, the NULL_AUDIT plugin performs other processing in addition to incrementing a counter. In any case, when the notification function finishes processing the event, it should return a status indicating whether the server should continue processing the event or terminate it.

**Audit Plugin Error Handling**

Audit plugin notification functions can report a status value for the current event two ways:

- Use the notification function return value. In this case, the function returns zero if the server should continue processing the event, or nonzero if the server should terminate the event.
• Call the `my_message()` function to set the error state before returning from the notification function. In this case, the notification function return value is ignored and the server terminates event processing with an error. The `my_message()` arguments indicate which error to report, and its message. For example:

```c
my_message(ER_AUDIT_API_ABORT, "This is my error message.", MYF(0));
```

Some events cannot be aborted. A nonzero return value is not taken into consideration and the `my_message()` error call must follow an `is_error()` check. For example:

```c
if (!thd->get_stmt_da()->is_error())
{
    my_message(ER_AUDIT_API_ABORT, "This is my error message.", MYF(0));
}
```

Some events cannot be terminated:

- `MYSQL_AUDIT_CONNECTION_DISCONNECT`: The server cannot prevent a client from disconnecting.
- `MYSQL_AUDIT_COMMAND_END`: This event provides the status of a command that has finished executing, so there is no purpose to terminating it.

If an audit plugin returns nonzero status for a nonterminable event, the server ignores the status and continues processing the event. This is also true if an audit plugin uses the `my_message()` function to terminate a nonterminable event.

### Audit Plugin Usage

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `NULL_AUDIT` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `adt_null.so` (the `.so` suffix might differ depending on your platform).

To register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```c
INSTALL PLUGIN NULL_AUDIT SONAME 'adt_null.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

While the audit plugin is installed, it exposes status variables that indicate the events for which the plugin has been called:

```
mysql> SHOW STATUS LIKE 'Audit_null%';
+-----------------+--------+
| Variable_name   | Value  |
+-----------------+--------+
| Audit_null_authorization_column | 0      |
| Audit_null_authorization_db     | 0      |
| Audit_null_authorization_procedure | 0    |
| Audit_null_authorization_proxy  | 0      |
| Audit_null_authorization_table  | 0      |
+-----------------+--------+
```
Audit_null_called counts all events, and the other variables count instances of specific event subclasses. For example, the preceding `SHOW STATUS` statement causes the server to send a result to the client and to write a message to the general query log if that log is enabled. Thus, a client that issues the statement repeatedly causes `Audit_null_called`, `Audit_null_general_result`, and `Audit_null_general_log` to be incremented each time. Notifications occur whether or not that log is enabled.

The status variables values are aggregated across all sessions. There are no counters for individual sessions.

NULL_AUDIT exposes several system variables that enable communication with the plugin at runtime:

To check the order of audit API calls, set the `null_audit_event_order_check` variable to the expected event order. For example:

```sql
SET null_audit_event_order_check =
    'MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE;;;'
    'MYSQL_AUDIT_GENERAL_LOG;;;'
    'MYSQL_AUDIT_CONNECTION_CONNECT;;;';
```

The statement takes advantage of the SQL syntax that concatenates adjacent strings into a single string.
The format of the value is:

```
'event_name;event_data;command' [';event_name;event_data;command'] ...
```

After the event order is matched, the `null_audit_event_order_check` value is replaced with a value of `EVENT-ORDER-OK`.

Specifying a command value of `ABORT_RET` makes it possible to abort the audit API call on the specified event. The following example aborts `INSERT` statement execution when its `MYSQL_AUDIT_QUERY_STATUS_END` event occurs:

```sql
SET null_audit_event_order_check =
    'MYSQL_AUDIT_COMMAND_START;command_id="3";'
    'MYSQL_AUDIT_GENERAL_LOG;;'
    'MYSQL_AUDIT_QUERY_START;;'
    'MYSQL_AUDIT_AUDIT_QUERY_STATUS_END;;ABORT_RET';
```

After the audit plugin matches the preceding sequence, it aborts event processing and sends an error message to the client:

```
ERROR 3164 (HY000): Aborted by Audit API ('MYSQL_AUDIT_QUERY_STATUS_END';1).
```

Returning a nonzero value from the audit API notification routine is the standard way to abort event execution. It is also possible to specify a custom error code by setting the `null_audit_abort_value` variable to the value that the notification routine should return:

```sql
SET null_audit_abort_value = 123;
```

Aborting a sequence results in a standard message with the custom error code. Suppose that you set audit log system variables like this:

```sql
SET null_audit_abort_value = 123;
SET null_audit_event_order_check =
    'MYSQL_AUDIT_COMMAND_START;command_id="3";'
    'MYSQL_AUDIT_GENERAL_LOG;;'
    'MYSQL_AUDIT_QUERY_START;;ABORT_RET';
```

Then execution of `SELECT 1` results in this error:

```
ERROR 3164 (HY000): Aborted by Audit API ('MYSQL_AUDIT_QUERY_STATUS_END';123).
```

An event can be also aborted with a custom message, specified by setting the `null_audit_abort_message` variable: Suppose that you set audit log system variables like this:

```sql
SET null_audit_abort_message = 'Custom error text.';
SET null_audit_event_order_check =
    'MYSQL_AUDIT_COMMAND_START;command_id="3";'
    'MYSQL_AUDIT_GENERAL_LOG;;'
    'MYSQL_AUDIT_QUERY_START;;ABORT_RET';
```

Then aborting a sequence results in the following error:

```
ERROR 3164 (HY000): Custom error text.
```

For test-creation purposes, it is possible to record events that pass through the plugin. Recording starts by specifying start and end events in the `null_audit_event_record_def` variable:
Statement execution results in storing the events that occur in the `null_audit_event_record` variable. To disable the plugin after testing it, use this statement to unload it:

```
UNINSTALL PLUGIN NULL_AUDIT;
```

# Writing Plugins

## 29.2.4.9 Writing Authentication Plugins

MySQL supports pluggable authentication, in which plugins are invoked to authenticate client connections. Authentication plugins enable the use of authentication methods other than the built-in method of passwords stored in the `mysql.user` system table. For example, plugins can be written to access external authentication methods. Also, authentication plugins can support the proxy user capability, such that the connecting user is a proxy for another user and is treated, for purposes of access control, as having the privileges of a different user. For more information, see Section 6.2.17, “Pluggable Authentication”, and Section 6.2.18, “Proxy Users”.

An authentication plugin can be written for the server side or the client side. Server-side plugins use the same plugin API that is used for the other server plugin types such as full-text parser or audit plugins (although with a different type-specific descriptor). Client-side plugins use the client plugin API.

Several header files contain information relevant to authentication plugins:

- `plugin.h`: Defines the `MYSQL_AUTHENTICATION_PLUGIN` server plugin type.
- `client_plugin.h`: Defines the API for client plugins. This includes the client plugin descriptor and function prototypes for client plugin C API calls (see Section 28.7.17, “C API Client Plugin Functions”).
- `plugin_auth.h`: Defines the part of the server plugin API specific to authentication plugins. This includes the type-specific descriptor for server-side authentication plugins and the `MYSQL_SERVER_AUTH_INFO` structure.
- `plugin_auth_common.h`: Contains common elements of client and server authentication plugins. This includes return value definitions and the `MYSQL_PLUGIN_VIO` structure.

To write an authentication plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

- For a source file that implements a server authentication plugin, include this file:

  ```
  #include <mysql/plugin_auth.h>
  ```

- For a source file that implements a client authentication plugin, or both client and server plugins, include these files:

  ```
  #include <mysql/plugin_auth.h>
  #include <mysql/client_plugin.h>
  #include <mysql.h>
  ```

  `plugin_auth.h` includes `plugin.h` and `plugin_auth_common.h`, so you need not include the latter files explicitly.

  This section describes how to write a pair of simple server and client authentication plugins that work together.
Warning
These plugins accept any non-empty password and the password is sent as cleartext. This is insecure, so the plugins should not be used in production environments.

The server-side and client-side plugins developed here both are named auth_simple. As described in Section 29.2.4.2, “Plugin Data Structures”, the plugin library file must have the same base name as the client plugin, so the source file name is auth_simple.c and produces a library named auth_simple.so (assuming that your system uses .so as the suffix for library files).

In MySQL source distributions, authentication plugin source is located in the plugin/auth directory and can be examined as a guide to writing other authentication plugins. Also, to see how the built-in authentication plugins are implemented, see sql/sql_acl.cc for plugins that are built in to the MySQL server and sql-common/client.c for plugins that are built in to the libmysqlclient client library. (For the built-in client plugins, note that the auth_plugin_t structures used there differ from the structures used with the usual client plugin declaration macros. In particular, the first two members are provided explicitly, not by declaration macros.)

Writing the Server-Side Authentication Plugin

Declare the server-side plugin with the usual general descriptor format that is used for all server plugin types (see Server Plugin Library and Plugin Descriptors). For the auth_simple plugin, the descriptor looks like this:

```c
mysql_declare_plugin(auth_simple)
{
    MYSQL_AUTHENTICATION_PLUGIN,
    &auth_simple_handler,     /* type-specific descriptor */
    "auth_simple",           /* plugin name */
    "Author Name",           /* author */
    "Any-password authentication plugin", /* description */
    PLUGIN_LICENSE_GPL,      /* license type */
    NULL,                    /* no init function */
    NULL,                    /* no deinit function */
    0x0100,                  /* version = 1.0 */
    NULL,                    /* no status variables */
    NULL,                    /* no system variables */
    NULL,                    /* no reserved information */
    0                        /* no flags */
}
mysql_declare_plugin_end;
```

The name member (auth_simple) indicates the name to use for references to the plugin in statements such as INSTALL PLUGIN or UNINSTALL PLUGIN. This is also the name displayed by SHOW PLUGINS or INFORMATION_SCHEMA.PLUGINS.

The auth_simple_handler member of the general descriptor points to the type-specific descriptor. For an authentication plugin, the type-specific descriptor is an instance of the st_mysql_auth structure (defined in plugin_auth.h):

```c
struct st_mysql_auth
{
    int interface_version;
    const char *client_auth_plugin;
    int (*authenticate_user)(MYSQL_PLUGIN_VIO *vio, MYSQL_SERVER_AUTH_INFO *info);
    int (*generate_authentication_string)(char *outbuf, unsigned int *outbuflen, const char *inbuf, unsigned int inbuflen);
    int (*validate_authentication_string)(char* const inbuf, unsigned int buflen);

    unsigned int *outbuflen, const char *inbuf, unsigned int inbuflen);
```
int (*set_salt)(const char *password, unsigned int password_len,
             unsigned char* salt, unsigned char *salt_len);

The st_mysql_auth structure has these members:

- **interface_version**: The type-specific API version number, always MYSQL_AUTHENTICATION_INTERFACE_VERSION
- **client_auth_plugin**: The client plugin name
- **authenticate_user**: A pointer to the main plugin function that communicates with the client
- **generate_authentication_string**: A pointer to a plugin function that generates a password digest from an authentication string
- **validate_authentication_string**: A pointer to a plugin function that validates a password digest
- **set_salt**: A pointer to a plugin function that converts a scrambled password to binary form
- **authentication_flags**: A flags word

The client_auth_plugin member should indicate the name of the client plugin if a specific plugin is required. A value of NULL means “any plugin.” In the latter case, whatever plugin the client uses will do. This is useful if the server plugin does not care about the client plugin or what user name or password it sends. For example, this might be true if the server plugin authenticates only local clients and uses some property of the operating system rather than the information sent by the client plugin.

For auth_simple, the type-specific descriptor looks like this:

```c
static struct st_mysql_auth auth_simple_handler =
{
  MYSQL_AUTHENTICATION_INTERFACE_VERSION,
  "auth_simple",          /* required client-side plugin name */
  auth_simple_server,     /* server-side plugin main function */
  generate_auth_string_hash, /* generate digest from password string */
  validate_auth_string_hash, /* validate password digest */
  set_salt,               /* generate password salt value */
  AUTH_FLAG_PRIVILEGED_USER_FOR_PASSWORD_CHANGE
};
```

The main function, auth_simple_server(), takes two arguments representing an I/O structure and a MYSQL_SERVER_AUTH_INFO structure. The structure definition, found in plugin_auth.h, looks like this:

```c
typedef struct st_mysql_server_auth_info
{
  char *user_name;
  unsigned int user_name_length;
  const char *auth_string;
  unsigned long auth_string_length;
  char authenticated_as[MYSQL_USERNAME_LENGTH+1];
  char external_user[512];
  int password_used;
  const char *host_or_ip;
  unsigned int host_or_ip_length;
} MYSQL_SERVER_AUTH_INFO;
```

The character set for string members is UTF-8. If there is a _length_ member associated with a string, it indicates the string length in bytes. Strings are also null-terminated.
When an authentication plugin is invoked by the server, it should interpret the `MYSQL_SERVER_AUTH_INFO` structure members as follows. Some of these are used to set the value of SQL functions or system variables within the client session, as indicated.

- **user_name**: The user name sent by the client. The value becomes the `USER()` function value.
- **user_name_length**: The length of `user_name` in bytes.
- **auth_string**: The value of the `authentication_string` column of the row in the `mysql.user` system table for the matching account name (that is, the row that matches the client user name and host name and that the server uses to determine how to authenticate the client).

Suppose that you create an account using the following statement:

```sql
CREATE USER 'my_user'@'localhost'
    IDENTIFIED WITH my_plugin AS 'my_auth_string';
```

When `my_user` connects from the local host, the server invokes `my_plugin` and passes `'my_auth_string'` to it as the `auth_string` value.

- **auth_string_length**: The length of `auth_string` in bytes.
- **authenticated_as**: The server sets this to the user name (the value of `user_name`). The plugin can alter it to indicate that the client should have the privileges of a different user. For example, if the plugin supports proxy users, the initial value is the name of the connecting (proxy) user, and the plugin can change this member to the proxied user name. The server then treats the proxy user as having the privileges of the proxied user (assuming that the other conditions for proxy user support are satisfied; see Implementing Proxy User Support in Authentication Plugins). The value is represented as a string at most `MYSQL_USER_NAME_LENGTH` bytes long, plus a terminating null. The value becomes the `CURRENT_USER()` function value.
- **external_user**: The server sets this to the empty string (null terminated). Its value becomes the `external_user` system variable value. If the plugin wants that system variable to have a different value, it should set this member accordingly (for example, to the connecting user name). The value is represented as a string at most 511 bytes long, plus a terminating null.
- **password_used**: This member applies when authentication fails. The plugin can set it or ignore it. The value is used to construct the failure error message of `Authentication fails. Password used: %s`. The value of `password_used` determines how `%s` is handled, as shown in the following table.

<table>
<thead>
<tr>
<th>password_used</th>
<th>%s Handling</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>NO</td>
</tr>
<tr>
<td>1</td>
<td>YES</td>
</tr>
<tr>
<td>2</td>
<td>There will be no %s</td>
</tr>
</tbody>
</table>

- **host_or_ip**: The name of the client host if it can be resolved, or the IP address otherwise.
- **host_or_ip_length**: The length of `host_or_ip` in bytes.

The `auth_simple` main function, `auth_simple_server()`, reads the password (a null-terminated string) from the client and succeeds if the password is nonempty (first byte not null):

```c
static int auth_simple_server (MYSQL_PLUGIN_VIO *vio,
    MYSQL_SERVER_AUTH_INFO *info)
{
```
unsigned char *pkt;
int pkt_len;

/* read the password as null-terminated string, fail on error */
if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
    return CR_ERROR;

/* fail on empty password */
if (!pkt_len || *pkt == '\0')
{
    info->password_used= PASSWORD_USED_NO;
    return CR_ERROR;
}

/* accept any nonempty password */
info->password_used= PASSWORD_USED_YES;
return CR_OK;
}

The main function should return one of the error codes shown in the following table.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CR_OK</td>
<td>Success</td>
</tr>
<tr>
<td>CR_OK_HANDSHAKE_COMPLETE</td>
<td>Do not send a status packet back to client</td>
</tr>
<tr>
<td>CR_ERROR</td>
<td>Error</td>
</tr>
<tr>
<td>CR_AUTH_USER_CREDENTIALS</td>
<td>Authentication failure</td>
</tr>
<tr>
<td>CR_AUTH_HANDSHAKE</td>
<td>Authentication handshake failure</td>
</tr>
<tr>
<td>CR_AUTH_PLUGIN_ERROR</td>
<td>Internal plugin error</td>
</tr>
</tbody>
</table>

For an example of how the handshake works, see the plugin/auth/dialog.c source file.

The server counts plugin errors in the Performance Schema host_cache table.

auth_simple_server() is so basic that it does not use the authentication information structure except to set the member that indicates whether a password was received.

A plugin that supports proxy users must return to the server the name of the proxied user (the MySQL user whose privileges the client user should get). To do this, the plugin must set the info->authenticated_as member to the proxied user name. For information about proxying, see Section 6.2.18, "Proxy Users", and Implementing Proxy User Support in Authentication Plugins.

The generate_authentication_string member of the plugin descriptor takes the password and generates a password hash (digest) from it:

- The first two arguments are pointers to the output buffer and its maximum length in bytes. The function should write the password hash to the output buffer and reset the length to the actual hash length.
- The second two arguments indicate the password input buffer and its length in bytes.
- The function returns 0 for success, 1 if an error occurred.

For the auth_simple plugin, the generate_auth_string_hash() function implements the generate_authentication_string member. It just makes a copy of the password, unless it is too long to fit in the output buffer.

int generate_auth_string_hash(char *outbuf, unsigned int *buflen,
const char *inbuf, unsigned int inbuflen)
{
    /*
    fail if buffer specified by server cannot be copied to output buffer
    */
    if (*buflen < inbuflen)
        return 1;   /* error */
    strncpy(outbuf, inbuf, inbuflen);
    *buflen= strlen(inbuf);
    return 0;     /* success */
}

The validate_authentication_string member of the plugin descriptor validates a password hash:

• The arguments are a pointer to the password hash and its length in bytes.
• The function returns 0 for success, 1 if the password hash cannot be validated.

For the auth_simple plugin, the validate_auth_string_hash() function implements the validate_authentication_string member. It returns success unconditionally:

int validate_auth_string_hash(char* const inbuf  __attribute__((unused)),
                                unsigned int buflen  __attribute__((unused)))
{
    return 0;     /* success */
}

The set_salt member of the plugin descriptor is used only by the mysql_native_password plugin (see Section 6.4.1.1, “Native Pluggable Authentication”). For other authentication plugins, you can use this trivial implementation:

int set_salt(const char* password __attribute__((unused)),
             unsigned int password_len __attribute__((unused)),
             unsigned char* salt __attribute__((unused)),
             unsigned char* salt_len)
{
    *salt_len= 0;
    return 0;     /* success */
}

The authentication_flags member of the plugin descriptor contains flags that affect plugin operation. The permitted flags are:

• AUTH_FLAG_PRIVILEGED_USER_FOR_PASSWORD_CHANGE: Credential changes are a privileged operation. If this flag is set, the server requires that the user has the global CREATE USER privilege or the UPDATE privilege for the mysql database.

• AUTH_FLAG_USES_INTERNAL_STORAGE: Whether the plugin uses internal storage (in the authentication_string column of mysql.user rows). If this flag is not set, attempts to set the password fail and the server produces a warning.

Writing the Client-Side Authentication Plugin

Declare the client-side plugin descriptor with the mysql_declare_client_plugin() and mysql_end_client_plugin macros (see Client Plugin Descriptors). For the auth_simple plugin, the descriptor looks like this:

mysql_declare_client_plugin(AUTHENTICATION)
    "auth_simple",                        /* plugin name */
Writing Plugins

```
/*Author Name",                        /* author */
"Any-password authentication plugin", /* description */
{1,0,0},                              /* version = 1.0.0 */
"GPL",                                /* license type */
NULL,                                 /* for internal use */
NULL,                                 /* no init function */
NULL,                                 /* no deinit function */
NULL,                                 /* no option-handling function */
auth_simple_client                    /* main function */
mysql_end_client_plugin;
```

The descriptor members from the plugin name through the option-handling function are common to all client plugin types. (For descriptions, see Client Plugin Descriptors.) Following the common members, the descriptor has an additional member specific to authentication plugins. This is the "main" function, which handles communication with the server. The function takes two arguments representing an I/O structure and a connection handler. For our simple any-password plugin, the main function does nothing but write to the server the password provided by the user:

```c
static int auth_simple_client (MYSQL_PLUGIN_VIO *vio, MYSQL *mysql)
{
    int res;

    /* send password as null-terminated string as cleartext */
    res= vio->write_packet(vio, (const unsigned char *) mysql->passwd,
                          strlen(mysql->passwd) + 1);

    return res ? CR_ERROR : CR_OK;
}
```

The main function should return one of the error codes shown in the following table.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CR_OK</td>
<td>Success</td>
</tr>
<tr>
<td>CR_OK_HANDSHAKE_COMPLETE</td>
<td>Success, client done</td>
</tr>
<tr>
<td>CR_ERROR</td>
<td>Error</td>
</tr>
</tbody>
</table>

CR_OK_HANDSHAKE_COMPLETE indicates that the client has done its part successfully and has read the last packet. A client plugin may return CR_OK_HANDSHAKE_COMPLETE if the number of round trips in the authentication protocol is not known in advance and the plugin must read another packet to determine whether authentication is finished.

Using the Authentication Plugins

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the plugin_dir system variable).

Register the server-side plugin with the server. For example, to load the plugin at server startup, use a `--plugin-load=auth_simple.so` option (adjust the `.so` suffix for your platform as necessary).

Create a user for whom the server will use the auth_simple plugin for authentication:

```sql
mysql> CREATE USER 'x'@'localhost'
    -> IDENTIFIED WITH auth_simple;
```

Use a client program to connect to the server as user x. The server-side auth_simple plugin communicates with the client program that it should use the client-side auth_simple plugin, and the latter sends the password to the server. The server plugin should reject connections that send an empty
Writing Plugins

password and accept connections that send a nonempty password. Invoke the client program each way to verify this:

```
shell> mysql --user=x --skip-password
ERROR 1045 (28000): Access denied for user 'x'@'localhost' (using password: NO)
shell> mysql --user=x --password
Enter password: abc
mysql>
```

Because the server plugin accepts any nonempty password, it should be considered insecure. After testing the plugin to verify that it works, restart the server without the `--plugin-load` option so as not to inadvertently leave the server running with an insecure authentication plugin loaded. Also, drop the user with `DROP USER 'x'@'localhost'`.

For additional information about loading and using authentication plugins, see Section 5.6.1, “Installing and Uninstalling Plugins”, and Section 6.2.17, “Pluggable Authentication”.

If you are writing a client program that supports the use of authentication plugins, normally such a program causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";
/* ... process command-line options ... */
mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See Section 28.7.17, “C API Client Plugin Functions”.

Implementing Proxy User Support in Authentication Plugins

One of the capabilities that pluggable authentication makes possible is proxy users (see Section 6.2.18, “Proxy Users”). For a server-side authentication plugin to participate in proxy user support, these conditions must be satisfied:

- When a connecting client should be treated as a proxy user, the plugin must return a different name in the `authenticated_as` member of the `MYSQL_SERVER_AUTH_INFO` structure, to indicate the proxied user name. It may also optionally set the `external_user` member, to set the value of the `external_user` system variable.

- Proxy user accounts must be set up to be authenticated by the plugin. Use the `CREATE_USER` or `GRANT` statement to associate accounts with plugins.

- Proxy user accounts must have the `PROXY` privilege for the proxied accounts. Use the `GRANT` statement to grant this privilege.

In other words, the only aspect of proxy user support required of the plugin is that it set `authenticated_as` to the proxied user name. The rest is optional (setting `external_user`) or done by the DBA using SQL statements.

How does an authentication plugin determine which proxied user to return when the proxy user connects? That depends on the plugin. Typically, the plugin maps clients to proxied users based on the authentication
string passed to it by the server. This string comes from the AS part of the IDENTIFIED WITH clause of the CREATE_USER statement that specifies use of the plugin for authentication.

The plugin developer determines the syntax rules for the authentication string and implements the plugin according to those rules. Suppose that a plugin takes a comma-separated list of pairs that map external users to MySQL users. For example:

```
CREATE USER ''@'%.example.com'
   IDENTIFIED WITH my_plugin AS 'extuser1=mysqlusera, extuser2=mysqluserb'
CREATE USER ''@'%.example.org'
   IDENTIFIED WITH my_plugin AS 'extuser1=mysqluserc, extuser2=mysqluserd'
```

When the server invokes a plugin to authenticate a client, it passes the appropriate authentication string to the plugin. The plugin is responsible to:

1. Parse the string into its components to determine the mapping to use
2. Compare the client user name to the mapping
3. Return the proper MySQL user name

For example, if extuser2 connects from an example.com host, the server passes 'extuser1=mysqlusera, extuser2=mysqluserb' to the plugin, and the plugin should copy mysqluserb into authenticated_as, with a terminating null byte. If extuser2 connects from an example.org host, the server passes 'extuser1=mysqluserc, extuser2=mysqluserd', and the plugin should copy mysqluserd instead.

If there is no match in the mapping, the action depends on the plugin. If a match is required, the plugin likely will return an error. Or the plugin might simply return the client name; in this case, it should not change authenticated_as, and the server will not treat the client as a proxy.

The following example demonstrates how to handle proxy users using a plugin named auth_simple_proxy. Like the auth_simple plugin described earlier, auth_simple_proxy accepts any nonempty password as valid (and thus should not be used in production environments). In addition, it examines the auth_string authentication string member and uses these very simple rules for interpreting it:

- If the string is empty, the plugin returns the user name as given and no proxying occurs. That is, the plugin leaves the value of authenticated_as unchanged.
- If the string is nonempty, the plugin treats it as the name of the proxied user and copies it to authenticated_as so that proxying occurs.

For testing, set up one account that is not proxied according to the preceding rules, and one that is. This means that one account has no AS clause, and one includes an AS clause that names the proxied user:

```
CREATE USER 'plugin_user1'@'localhost'
   IDENTIFIED WITH auth_simple_proxy;
CREATE USER 'plugin_user2'@'localhost'
   IDENTIFIED WITH auth_simple_proxy AS 'proxied_user';
```

In addition, create an account for the proxied user and grant plugin_user2 the PROXY privilege for it:

```
CREATE USER 'proxied_user'@'localhost'
   IDENTIFIED BY 'proxied_user_pass';
GRANT PROXY ON 'proxied_user'@'localhost'
   TO 'plugin_user2'@'localhost';
```
Before the server invokes an authentication plugin, it sets `authenticated_as` to the client user name. To indicate that the user is a proxy, the plugin should set `authenticated_as` to the proxied user name. For `auth_simple_proxy`, this means that it must examine the `auth_string` value, and, if the value is nonempty, copy it to the `authenticated_as` member to return it as the name of the proxied user. In addition, when proxying occurs, the plugin sets the `external_user` member to the client user name; this becomes the value of the `external_user` system variable.

```c
static int auth_simple_proxy_server (MYSQL_PLUGIN_VIO *vio,
                                   MYSQL_SERVER_AUTH_INFO *info)
{
    unsigned char *pkt;
    int pkt_len;

    /* read the password as null-terminated string, fail on error */
    if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
        return CR_ERROR;

    /* fail on empty password */
    if (!pkt_len || *pkt == '\0')
    {
        info->password_used= PASSWORD_USED_NO;
        return CR_ERROR;
    }

    /* accept any nonempty password */
    info->password_used= PASSWORD_USED_YES;

    /* if authentication string is nonempty, use as proxied user name */
    /* and use client name as external_user value */
    if (info->auth_string_length > 0)
    {
        strcpy (info->authenticated_as, info->auth_string);
        strcpy (info->external_user, info->user_name);
    }

    return CR_OK;
}
```

After a successful connection, the `USER()` function should indicate the connecting client user and host name, and `CURRENT_USER()` should indicate the account whose privileges apply during the session. The latter value should be the connecting user account if no proxying occurs or the proxied account if proxying does occur.

Compile and install the plugin, then test it. First, connect as `plugin_user1`:

```
shell> mysql --user=plugin_user1 --password
Enter password: x
```

In this case, there should be no proxying:

```
mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
*************************** 1. row ***************************
USER(): plugin_user1@localhost
CURRENT_USER(): plugin_user1@localhost
@@proxy_user: NULL
@@external_user: NULL
```

Then connect as `plugin_user2`:

```
shell> mysql --user=plugin_user2 --password
```
In this case, plugin_user2 should be proxied to proxied_user:

```sql
mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
*************************** 1. row ****************************
USER(): plugin_user2@localhost
CURRENT_USER(): proxied_user@localhost
@@proxy_user: 'plugin_user2'@'localhost'
@@external_user: 'plugin_user2'@'localhost'
```

### 29.2.4.10 Writing Password-Validation Plugins

This section describes how to write a server-side password-validation plugin. The instructions are based on the source code in the plugin/password_validation directory of MySQL source distributions. The `validate_password.cc` source file in that directory implements the plugin named `validate_password`.

**Note**

In MySQL 8.0.4, the `validate_password` plugin was reimplemented as the `validate_password` component. The plugin form of `validate_password` is still available but is now deprecated and will be removed in a future version of MySQL. MySQL installations that use the plugin should make the transition to using the component instead. See Section 6.4.3.3, "Transitioning to the Password Validation Component".

To write a password-validation plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```c
#include <mysql/plugin_validate_password.h>
```

`plugin_validate_password.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_VALIDATE_PASSWORD_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_validate_password.h` defines data structures specific to password-validation plugins.

A password-validation plugin, like any MySQL server plugin, has a general plugin descriptor (see Server Plugin Library and Plugin Descriptors). In `validate_password.cc`, the general descriptor for `validate_password` looks like this:

```c
mysql_declare_plugin(validate_password)
{
    MYSQL_VALIDATE_PASSWORD_PLUGIN, /* type */
    &validate_password_descriptor,     /* descriptor */
    "validate_password",               /* name */
    "Oracle Corporation",              /* author */
    "check password strength",         /* description */
    PLUGIN_LICENSE_GPL,                /* license */
    validate_password_init,            /* init function (when loaded) */
    validate_password_deinit,          /* deinit function (when unloaded) */
    0x0100,                             /* version */
    NULL,                               /* system variables */
    0,
}
mysql_declare_plugin_end;
```
The name member (validate_password) indicates the name to use for references to the plugin in statements such as INSTALL PLUGIN or UNINSTALL PLUGIN. This is also the name displayed by INFORMATION_SCHEMA.PLUGINS or SHOW PLUGINS.

The general descriptor also refers to validate_password_system_variables, a structure that exposes several system variables to the SHOW VARIABLES statement:

```c
static struct st_mysql_sys_var* validate_password_system_variables[] = {
    MYSQL_SYSVAR(length),
    MYSQL_SYSVAR(number_count),
    MYSQL_SYSVAR(mixed_case_count),
    MYSQL_SYSVAR(special_char_count),
    MYSQL_SYSVAR(policy),
    MYSQL_SYSVAR(dictionary_file),
    NULL
};
```

The validate_password_init initialization function reads the dictionary file if one was specified, and the validate_password_deinit function frees data structures associated with the file.

The validate_password_descriptor value in the general descriptor points to the type-specific descriptor. For password-validation plugins, this descriptor has the following structure:

```c
struct st_mysql_validate_password
{
    int interface_version;
    /*
    * This function returns TRUE for passwords which satisfy the password
    * policy (as chosen by plugin variable) and FALSE for all other
    * password
    */
    int (*validate_password)(mysql_string_handle password);
    /*
    * This function returns the password strength (0-100) depending
    * upon the policies
    */
    int (*get_password_strength)(mysql_string_handle password);
};
```

The type-specific descriptor has these members:

- **interface_version**: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks interface_version when it loads the plugin to see whether the plugin is compatible with it. For password-validation plugins, the value of the interface_version member is MYSQL_VALIDATE_PASSWORD_INTERFACE_VERSION (defined in plugin_validate_password.h).

- **validate_password**: A function that the server calls to test whether a password satisfies the current password policy. It returns 1 if the password is okay and 0 otherwise. The argument is the password, passed as a mysql_string_handle value. This data type is implemented by the mysql_string server service. For details, see the string_service.h and string_service.cc source files in the sql directory.

- **get_password_strength**: A function that the server calls to assess the strength of a password. It returns a value from 0 (weak) to 100 (strong). The argument is the password, passed as a mysql_string_handle value.

For the validate_password plugin, the type-specific descriptor looks like this:
To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the plugin_dir system variable). For the validate_password plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of validate_password.so (the .so suffix might differ depending on your platform).

To register the plugin at runtime, use this statement (adjust the .so suffix for your platform as necessary):

```
INSTALL PLUGIN validate_password SONAME 'validate_password.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the INFORMATION_SCHEMA.PLUGINS table or use the SHOW PLUGINS statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

While the validate_password plugin is installed, it exposes system variables that indicate the password-checking parameters:

```
mysql> SHOW VARIABLES LIKE 'validate_password%';
+--------------------------------------+--------+
| Variable_name                        | Value  |
+--------------------------------------+--------+
| validate_password_dictionary_file    |        |
| validate_password_length             | 8      |
| validate_password_mixed_case_count   | 1      |
| validate_password_number_count       | 1      |
| validate_password_policy             | MEDIUM |
| validate_password_special_char_count | 1      |
+--------------------------------------+--------+
```

For descriptions of these variables, see Section 6.4.3.2, “Password Validation Options and Variables”.

To disable the plugin after testing it, use this statement to unload it:

```
UNINSTALL PLUGIN validate_password;
```

### 29.2.4.11 Writing Protocol Trace Plugins

MySQL supports the use of protocol trace plugins: client-side plugins that implement tracing of communication between a client and the server that takes place using the client/server protocol.

#### Using the Test Protocol Trace Plugin

MySQL includes a test protocol trace plugin that serves to illustrate the information available from such plugins, and as a guide to writing other protocol trace plugins. To see how the test plugin works, use a MySQL source distribution; binary distributions are built with the test plugin disabled.

Enable the test protocol trace plugin by configuring MySQL with the `WITH_TEST_TRACE_PLUGIN` CMake option enabled. This causes the test trace plugin to be built and MySQL client programs to load it, but the plugin has no effect by default. Control the plugin using these environment variables:
• **MYSQL_TEST_TRACE_DEBUG**: Set this variable to a value other than 0 to cause the test plugin to produce diagnostic output on stderr.

• **MYSQL_TEST_TRACE_CRASH**: Set this variable to a value other than 0 to cause the test plugin to abort the client program if it detects an invalid trace event.

**Caution**

Diagnostic output from the test protocol trace plugin can disclose passwords and other sensitive information.

Given a MySQL installation built from source with the test plugin enabled, you can see a trace of the communication between the mysql client and the MySQL server as follows:

```
shell> export MYSQL_TEST_TRACE_DEBUG=1
sql> mysql
test_trace: Test trace plugin initialized
test_trace: Starting tracing in stage CONNECTING
test_trace: stage: CONNECTING, event: CONNECTING
test_trace: stage: CONNECTING, event: CONNECTED
test_trace: stage: WAIT_FOR_INIT_PACKET, event: READ_PACKET
test_trace: stage: WAIT_FOR_INIT_PACKET, event: PACKET_RECEIVED
test_trace: packet received: 87 bytes
  0A 35 2E 37 2E 33 2D 6D  31 33 2D 64 65 62 75 67   .5.7.3-m13-debug
  2D 6C 6F 67 00 04 00 00  00 2B 7C 4F 55 3F 79 67   -log.....+|OU?yg
  test_trace: 004: stage: WAIT_FOR_INIT_PACKET, event: INIT_PACKET_RECEIVED
  test_trace: 004: stage: AUTHENTICATE, event: AUTH_PLUGIN
  test_trace: 004: Using authentication plugin: mysql_native_password
  test_trace: 004: stage: AUTHENTICATE, event: SEND_AUTH_RESPONSE
  test_trace: 004: sending packet: 188 bytes
  85 A6 7F 00 00 00 00 01  21 00 00 00 00 00 00 00   .?......!........
  00 00 00 00 00 00 00 00  00 00 00 00 00 00 00 00   ................
  ...
  mysql> quit
test_trace: 008: stage: READY_FOR_COMMAND, event: SEND_COMMAND
  test_trace: 008: QUIT
  test_trace: 008: stage: READY_FOR_COMMAND, event: PACKET_SENT
  test_trace: 008: packet sent: 0 bytes
  test_trace: 008: stage: READY_FOR_COMMAND, event: DISCONNECTED
  test_trace: 008: Connection closed
  test_trace: 008: Tracing connection has ended
  Bye
  test_trace: Test trace plugin de-initialized
```

To disable trace output, do this:

```
shell> MYSQL_TEST_TRACE_DEBUG=
```

### Using Your Own Protocol Trace Plugins

**Note**

To use your own protocol trace plugins, you must configure MySQL with the `WITH_TEST_TRACE_PLUGIN CMake` option *disabled* because only one protocol trace plugin can be loaded at a time and an error occurs for attempts to load a second one. If you have already built MySQL with the test protocol trace plugin enabled to see how it works, you must rebuild MySQL without it before you can use your own plugins.

This section discusses how to write a basic protocol trace plugin named `simple_trace`. This plugin provides a framework showing how to set up the client plugin descriptor and create the trace-related
Writing Plugins

callback functions. In `simple_trace`, these functions are rudimentary and do little other than illustrate the arguments required. To see in detail how a trace plugin can make use of trace event information, check the source file for the test protocol trace plugin (`test_trace_plugin.cc` in the `libmysql` directory of a MySQL source distribution). However, note that the `st_mysql_client_plugin_TRACE` structure used there differs from the structures used with the usual client plugin declaration macros. In particular, the first two members are defined explicitly, not implicitly by declaration macros.

Several header files contain information relevant to protocol trace plugins:

- `client_plugin.h`: Defines the API for client plugins. This includes the client plugin descriptor and function prototypes for client plugin C API calls (see Section 28.7.17, “C API Client Plugin Functions”).
- `plugin_trace.h`: Contains declarations for client-side plugins of type `MYSQL_CLIENT_TRACE_PLUGIN`. It also contains descriptions of the permitted protocol stages, transitions between stages, and the types of events permitted at each stage.

To write a protocol trace plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```c
#include <mysql/plugin_trace.h>
#include <mysql.h>
```

`plugin_trace.h` includes `client_plugin.h`, so you need not include the latter file explicitly.

Declare the client-side plugin descriptor with the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros (see Client Plugin Descriptors). For the `simple_trace` plugin, the descriptor looks like this:

```c
mysql_declare_client_plugin(TRACE)
    "simple_trace", /* plugin name */
    "Author Name", /* author */
    "Simple protocol trace plugin", /* description */
    {1,0,0}, /* version = 1.0.0 */
    "GPL", /* license type */
    NULL, /* for internal use */
    plugin_init, /* initialization function */
    plugin_deinit, /* deinitialization function */
    plugin_options, /* option-handling function */
    trace_start, /* start-trace function */
    trace_stop, /* stop-trace function */
    trace_event /* event-handling function */
mysql_end_client_plugin;
```

The descriptor members from the plugin name through the option-handling function are common to all client plugin types. The members following the common members implement trace event handling.

Function members for which the plugin needs no processing can be declared as `NULL` in the descriptor, in which case you need not write any corresponding function. For illustration purposes and to show the argument syntax, the following discussion implements all functions listed in the descriptor, even though some of them do nothing,

The initialization, deinitialization, and options functions common to all client plugins are declared as follows. For a description of the arguments and return values, see Client Plugin Descriptors.

```c
static int
plugin_init(char *errbuf, size_t errbuf_len, int argc, va_list args)
{
    return 0;
}
```
Writing Plugins

```c
static int
plugin_deinit()
{
    return 0;
}

static int
plugin_options(const char *option, const void *value)
{
    return 0;
}
```

The trace-specific members of the client plugin descriptor are callback functions. The following descriptions provide more detail on how they are used. Each has a first argument that is a pointer to the plugin instance in case your implementation needs to access it.

**trace_start()**: This function is called at the start of each traced connection (each connection that starts after the plugin is loaded). It is passed the connection handler and the protocol stage at which tracing starts. `trace_start()` allocates memory needed by the `trace_event()` function, if any, and returns a pointer to it. If no memory is needed, this function returns `NULL`.

```c
static void *
trace_start(struct st_mysql_client_plugin_TRACE *self,
            MYSQL *conn,
            enum protocol_stage stage)
{
    struct st_trace_data *plugin_data = malloc(sizeof(struct st_trace_data));

    fprintf(stderr, "Initializing trace: stage %d\n", stage);
    if (plugin_data)
    {
        memset(plugin_data, 0, sizeof(struct st_trace_data));
        fprintf(stderr, "Trace initialized\n");
        return plugin_data;
    }
    fprintf(stderr, "Could not initialize trace\n");
    exit(1);
}
```

**trace_stop()**: This function is called when tracing of the connection ends. That usually happens when the connection is closed, but can happen earlier. For example, `trace_event()` can return a nonzero value at any time and that causes tracing of the connection to terminate. `trace_stop()` is then called even though the connection has not ended.

`trace_stop()` is passed the connection handler and a pointer to the memory allocated by `trace_start()` (`NULL` if none). If the pointer is non-`NULL`, `trace_stop()` should deallocate the memory. This function returns no value.

```c
static void
trace_stop(struct st_mysql_client_plugin_TRACE *self,
           MYSQL *conn,
           void *plugin_data)
{
    fprintf(stderr, "Terminating trace\n");
    if (plugin_data)
        free(plugin_data);
}
```

**trace_event()**: This function is called for each event occurrence. It is passed a pointer to the memory allocated by `trace_start()` (`NULL` if none), the connection handler, the current protocol stage and event codes, and event data. This function returns 0 to continue tracing, nonzero if tracing should stop.

```c
trace_event();
```
static int
trace_event(struct st_mysql_client_plugin_TRACE *self, 
void *plugin_data, 
MYSQL *conn, 
enum protocol_stage stage, 
enum trace_event event, 
struct st_trace_event_args args)
{
    fprintf(stderr, "Trace event received: stage %d, event %d\n", stage, event);
    if (event == TRACE_EVENT_DISCONNECTED)
        fprintf(stderr, "Connection closed\n");
    return 0;
}

The tracing framework shuts down tracing of the connection when the connection ends, so
trace_event() should return nonzero only if you want to terminate tracing of the connection early.
Suppose that you want to trace only connections for a certain MySQL account. After authentication,
you can check the user name for the connection and stop tracing if it is not the user in whom you are
interested.

For each call to trace_event(), the st_trace_event_args structure contains the event data. It has
this definition:

struct st_trace_event_args
{
    const char *plugin_name;
    int cmd;
    const unsigned char *hdr;
    size_t hdr_len;
    const unsigned char *pkt;
    size_t pkt_len;
};

For different event types, the st_trace_event_args structure contains the information described
following. All lengths are in bytes. Unused members are set to 0/NULL.

AUTH_PLUGIN event:

plugin_name  The name of the plugin

SEND_COMMAND event:

cmd  The command code
hdr  Pointer to the command packet header
hdr_len  Length of the header
pkt  Pointer to the command arguments
pkt_len  Length of the arguments

Other SEND_xxx and xxx_RECEIVED events:

pkt  Pointer to the data sent or received
pkt_len  Length of the data

PACKET_SENT event:

pkt_len  Number of bytes sent
To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).

After the plugin library file is compiled and installed in the plugin directory, you can test it easily by setting the `LIBMYSQL_PLUGIN` environment variable to the plugin name, which affects any client program that uses that variable. `mysql` is one such program:

```shell
shell> export LIBMYSQL_PLUGIN=simple_trace
shell> mysql
Welcome to the MySQL monitor. Commands end with ; or \
g.
```

To stop the trace plugin from being loaded, do this:

```shell
shell> LIBMYSQL_PLUGIN=
```

It is also possible to write client programs that directly load the plugin. You can tell the client where the plugin directory is located by calling `mysql_options()` to set the `MYSQL_PLUGIN_DIR` option:

```c
cchar *plugin_dir = "path_to_plugin_dir";
/* ... process command-line options ... */
mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
```

Typically, the program will also accept a `--plugin-dir` option that enables users to override the default value.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See Section 28.7.17, “C API Client Plugin Functions”.

### 29.2.4.12 Writing Keyring Plugins
MySQL Server supports a keyring service that enables internal server components and plugins to securely store sensitive information for later retrieval. This section describes how to write a server-side keyring plugin that can be used by service functions to perform key-management operations. For general keyring information, see Section 6.4.4, “The MySQL Keyring”.

The instructions here are based on the source code in the plugin/keyring directory of MySQL source distributions. The source files in that directory implement a plugin named `keyring_file` that uses a file local to the server host for data storage.

To write a keyring plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```c
#include <mysql/plugin_keyring.h>
```

`plugin_keyring.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_KEYRING_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_keyring.h` defines data structures specific to keyring plugins.

A keyring plugin, like any MySQL server plugin, has a general plugin descriptor (see Server Plugin Library and Plugin Descriptors). In `keyring.cc`, the general descriptor for `keyring_file` looks like this:

```c
mysql_declare_plugin(keyring_file)
{
    MYSQL_KEYRING_PLUGIN,     /* type                                     */
    &keyring_descriptor,      /* descriptor                               */
    "keyring_file",           /* name                                     */
    "Oracle Corporation",     /* author                                   */
    "store/fetch authentication data to/from a flat file", /* description */
    PLUGIN_LICENSE_GPL,
    keyring_init,             /* init function (when loaded)              */
    keyring_deinit,           /* deinit function (when unloaded)          */
    0x0100,                   /* version                                  */
    NULL,                     /* status variables                         */
    keyring_system_variables, /* system variables                         */
    NULL,
    0,
}
mysql_declare_plugin_end;
```

The `name` member (`keyring_file`) indicates the plugin name. This is the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The general descriptor also refers to `keyring_system_variables`, a structure that exposes a system variable to the `SHOW VARIABLES` statement:

```c
static struct st_mysql_sys_var *keyring_system_variables[] = {
    MYSQL_SYSVAR(data),
    NULL
};
```

The `keyring_init` initialization function creates the data file if it does not exist, then reads it and initializes the keystore. The `keyring_deinit` function frees data structures associated with the file.

The `keyring_descriptor` value in the general descriptor points to the type-specific descriptor. For keyring plugins, this descriptor has the following structure:

```c
struct st_mysql_keyring
{...}
```
The type-specific descriptor has these members:

- **interface_version**: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For keyring plugins, the value of the `interface_version` member is `MYSQL_KEYRING_INTERFACE_VERSION` (defined in `plugin_keyring.h`).

- **mysql_key_store**: A function that obfuscates and stores a key in the keyring.

- **mysql_key_fetch**: A function that deobfuscates and retrieves a key from the keyring.

- **mysql_key_remove**: A function that removes a key from the keyring.

- **mysql_key_generate**: A function that generates a new random key and stores it in the keyring.

For the `keyring_file` plugin, the type-specific descriptor looks like this:

```c
static struct st_mysql_keyring keyring_descriptor =
{
    MYSQL_KEYRING_INTERFACE_VERSION,
    mysql_key_store,
    mysql_key_fetch,
    mysql_key_remove,
    mysql_key_generate
};
```

The `mysql_key_***` functions implemented by a keyring plugin are analogous to the `my_key_***` functions exposed by the keyring service API. For example, the `mysql_key_store` plugin function is analogous to the `my_key_store` keyring service function. For information about the arguments to keyring service functions and how they are used, see Section 29.3.2, “The Keyring Service”.

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `keyring_file` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `keyring_file.so` (the `.so` suffix might differ depending on your platform).

Keyring plugins typically are loaded early during the server startup process so that they are available to built-in plugins and storage engines that might depend on them. For `keyring_file`, use these lines in the server `my.cnf` file (adjust the `.so` suffix for your platform as necessary):

```
[mysqld]
early-plugin-load=keyring_file.so
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement (see Section 5.6.2, “Obtaining Server Plugin Information”). For example:
While the `keyring_file` plugin is installed, it exposes a system variable that indicates the location of the data file it uses for secure information storage:

```sql
mysql> SHOW VARIABLES LIKE 'keyring_file%';
+-------------------+----------------------------------+
| Variable_name     | Value                            |
| keyring_file_data | /usr/local/mysql/keyring/keyring |
| keyring_file_data | /usr/local/mysql/keyring/keyring |
```

For a description of the `keyring_file_data` variable, see Section 5.1.8, “Server System Variables”.

To disable the plugin after testing it, restart the server without an `--early-plugin-load` option that names the plugin.

### 29.3 MySQL Services for Plugins

MySQL server plugins have access to server “plugin services.” The plugin services interface exposes server functionality that plugins can call. It complements the plugin API and has these characteristics:

- Services enable plugins to access code inside the server using ordinary function calls. Services are also available to user-defined functions (UDFs).
- Services are portable and work on multiple platforms.
- The interface includes a versioning mechanism so that service versions supported by the server can be checked at load time against plugin versions. Versioning protects against incompatibilities between the version of a service that the server provides and the version of the service expected or required by a plugin.
- For information about plugins for testing plugin services, see the Plugins for Testing Plugin Services section of the MySQL Server Doxygen documentation, available at https://dev.mysql.com/doc/index-other.html.

The plugin services interface differs from the plugin API as follows:

- The plugin API enables plugins to be used by the server. The calling initiative lies with the server to invoke plugins. This enables plugins to extend server functionality or register to receive notifications about server processing.
- The plugin services interface enables plugins to call code inside the server. The calling initiative lies with plugins to invoke service functions. This enables functionality already implemented in the server to be used by many plugins; they need not individually implement it themselves.

To determine what services exist and what functions they provide, look in the `include/mysql` directory of a MySQL source distribution. The relevant files are:

- `plugin.h` includes `services.h`, which is the “umbrella” header that includes all available service-specific header files.
Service-specific headers have names of the form `service_xxx.h`. Each service-specific header should contain comments that provide full usage documentation for a given service, including what service functions are available, their calling sequences, and return values.

For developers who wish to modify the server to add a new service, see MySQL Internals: MySQL Services for Plugins.

Available services include the following:

- **get_sysvar_source**: A service that enables plugins to retrieve the source of system variable settings.
- **locking_service**: A service that implements locks with three attributes: Lock namespace, lock name, and lock mode. This locking interface is available at two levels: 1) As a C language interface, callable as a plugin service from server plugins or user-defined functions; 2) At the SQL level, as a set of user-defined functions that map onto calls to the service routines. For more information, see Section 29.3.1, “The Locking Service”.
- **my_plugin_log_service**: A service that enables plugins to report errors and specify error messages. The server writes the messages to its error log.
- **status_variable_registration**: A service for registering status variables.
- **my_thd_scheduler**: A service for plugins to select a thread scheduler.
- **mysql_keyring**: A service for keyring storage. For more information, see Section 29.3.2, “The Keyring Service”.
- **mysql_password_policy**: A service for password validation and strength checking.
- **plugin_registry_service**: MySQL Server includes a component-based infrastructure for improving server extensibility; see Section 5.5, “MySQL Server Components”. However, MySQL plugins use an interface that predates the component interface. The `plugin_registry_service` enables plugins to access the component registry and its services.
- **security_context**: A service that enables plugins to examine or manipulate thread security contexts. This service provides getter and setter routines to access attributes of the server `Security_context` class, which includes attributes such as operating system user and host, authenticated user and host, and client IP address.
- **thd_alloc**: A memory-allocation service.
- **thd_wait**: A service for plugins to report when they are going to sleep or stall.

The remainder of this section describes how a plugin uses server functionality that is available as a service. See also the source for the “daemon” example plugin, which uses the `my_snprintf` service. Within a MySQL source distribution, that plugin is located in the `plugin/daemon_example` directory.

To use a service or services from within a plugin, the plugin source file must include the `plugin.h` header file to access service-related information:

```c
#include <mysql/plugin.h>
```

This does not represent any additional setup cost. A plugin must include that file anyway because it contains definitions and structures that every plugin needs.

To access a service, a plugin calls service functions like any other function.
To report an error that the server will write to its error log, first choose an error level. `mysql/service_my_plugin_log.h` defines these levels:

```c
enum plugin_log_level {
    MY_ERROR_LEVEL,
    MY_WARNING_LEVEL,
    MY_INFORMATION_LEVEL
};
```

Then invoke `my_plugin_log_message()`:

```c
int my_plugin_log_message(MYSQL_PLUGIN *plugin, enum plugin_log_level level, const char *format, ...);
```

For example:

```c
my_plugin_log_message(plugin_ptr, MY_ERROR_LEVEL, "Cannot initialize plugin");
```

Some services for plugins may be provided by plugins and thus are available only if the service-providing plugin is loaded. Any MySQL component that uses such a service should check whether the service is available.

When you build your plugin, use the `-lmysqlservices` flag at link time to link in the `libmysqlservices` library. For example, for CMake, put this in the top-level `CMakeLists.txt` file:

```
FIND_LIBRARY(MYSQLSERVICES_LIB mysqlservices
PATHS "${MYSQL_SRCDIR}/libservices" NO_DEFAULT_PATH)
```

Put this in the `CMakeLists.txt` file in the directory containing the plugin source:

```
# the plugin needs the mysql services library for error logging
TARGET_LINK_LIBRARIES (your_plugin_library_name ${MYSQLSERVICES_LIB})
```

### 29.3.1 The Locking Service

MySQL distributions provide a locking interface that is available at two levels:

- As a C language interface, callable as a plugin service from server plugins or user-defined functions
- At the SQL level, as a set of user-defined functions that map onto calls to the service routines

For general information about plugin services, see Section 29.3, “MySQL Services for Plugins”. For general information about user-defined functions, see Section 29.4.2, “Adding a New User-Defined Function”.

The locking interface has these characteristics:

- Locks have three attributes: Lock namespace, lock name, and lock mode:
  - Locks are identified by the combination of namespace and lock name. The namespace enables different applications to use the same lock names without colliding by creating locks in separate namespaces. For example, if applications A and B use namespaces of `ns1` and `ns2`, respectively, each application can use lock names `lock1` and `lock2` without interfering with the other application.
  - A lock mode is either read or write. Read locks are shared: If a session has a read lock on a given lock identifier, other sessions can acquire a read lock on the same identifier. Write locks are exclusive: If a
session has a write lock on a given lock identifier, other sessions cannot acquire a read or write lock on the same identifier.

- Namespace and lock names must be non-NULL, nonempty, and have a maximum length of 64 characters. A namespace or lock name specified as NULL, the empty string, or a string longer than 64 characters results in an ER_LOCKING_SERVICE_WRONG_NAME error.

- The locking interface treats namespace and lock names as binary strings, so comparisons are case-sensitive.

- The locking interface provides functions to acquire locks and release locks. No special privilege is required to call these functions. Privilege checking is the responsibility of the calling application.

- Locks can be waited for if not immediately available. Lock acquisition calls take an integer timeout value that indicates how many seconds to wait to acquire locks before giving up. If the timeout is reached without successful lock acquisition, an ER_LOCKING_SERVICE_TIMEOUT error occurs. If the timeout is 0, there is no waiting and the call produces an error if locks cannot be acquired immediately.

- The locking interface detects deadlock between lock-acquisition calls in different sessions. In this case, the locking service chooses a caller and terminates its lock-acquisition request with an ER_LOCKING_SERVICE_DEADLOCK error. This error does not cause transactions to roll back. To choose a session in case of deadlock, the locking service prefers sessions that hold read locks over sessions that hold write locks.

- A session can acquire multiple locks with a single lock-acquisition call. For a given call, lock acquisition is atomic: The call succeeds if all locks are acquired. If acquisition of any lock fails, the call acquires no locks and fails, typically with an ER_LOCKING_SERVICE_TIMEOUT or ER_LOCKING_SERVICE_DEADLOCK error.

- A session can acquire multiple locks for the same lock identifier (namespace and lock name combination). These lock instances can be read locks, write locks, or a mix of both.

- Locks acquired within a session are released explicitly by calling a release-locks function, or implicitly when the session terminates (either normally or abnormally). Locks are not released when transactions commit or roll back.

- Within a session, all locks for a given namespace when released are released together.

The interface provided by the locking service is distinct from that provided by GET_LOCK() and related SQL functions (see Section 12.14, “Locking Functions”). For example, GET_LOCK() does not implement namespaces and provides only exclusive locks, not distinct read and write locks.

### 29.3.1.1 The Locking Service C Interface

This section describes how to use the locking service C language interface. To use the UDF interface instead, see Section 29.3.1.2, “The Locking Service UDF Interface”. For general characteristics of the locking service interface, see Section 29.3.1, “The Locking Service”. For general information about plugin services, see Section 29.3, “MySQL Services for Plugins”.

Source files that use the locking service should include this header file:

```c
#include <mysql/service_locking.h>
```

To acquire one or more locks, call this function:

```c
int mysql_acquire_locking_service_locks(MYSQL_THD opaque_thd,
                                      const char* lock_namespace,
```
The arguments have these meanings:

- **opaque_thd**: A thread handle. If specified as NULL, the handle for the current thread is used.
- **lock_namespace**: A null-terminated string that indicates the lock namespace.
- **lock_names**: An array of null-terminated strings that provides the names of the locks to acquire.
- **lock_num**: The number of names in the lock_names array.
- **lock_type**: The lock mode, either LOCKING_SERVICE_READ or LOCKING_SERVICE_WRITE to acquire read locks or write locks, respectively.
- **lock_timeout**: An integer number of seconds to wait to acquire the locks before giving up.

To release locks acquired for a given namespace, call this function:

```c
int mysql_release_locking_service_locks(MYSQL_THD opaque_thd,
                                        const char* lock_namespace);
```

The arguments have these meanings:

- **opaque_thd**: A thread handle. If specified as NULL, the handle for the current thread is used.
- **lock_namespace**: A null-terminated string that indicates the lock namespace.

Locks acquired or waited for by the locking service can be monitored at the SQL level using the Performance Schema. For details, see Locking Service Monitoring.

### 29.3.1.2 The Locking Service UDF Interface

This section describes how to use the locking service user-defined function (UDF) interface. To use the C language interface instead, see Section 29.3.1.1, “The Locking Service C Interface” For general characteristics of the locking service interface, see Section 29.3.1, “The Locking Service”. For general information about user-defined functions, see Section 29.4.2, “Adding a New User-Defined Function”.

#### Installing or Uninstalling the UDF Locking Interface

The locking service routines described in Section 29.3.1.1, “The Locking Service C Interface” need not be installed because they are built into the server. The same is not true of the user-defined functions (UDFs) that map onto calls to the service routines: The UDFs must be installed before use. This section describes how to do that. For general information about UDF installation, see Section 5.7.1, “Installing and Uninstalling User-Defined Functions”.

The locking service UDFs are implemented in a plugin library file located in the directory named by the `plugin_dir` system variable. The file base name is `locking_service`. The file name suffix differs per platform (for example, `.so` for Unix and Unix-like systems, `.dll` for Windows).

To install the locking service UDFs, use the `CREATE FUNCTION` statement (adjust the `.so` suffix for your platform as necessary):

```sql
CREATE FUNCTION service_get_read_locks RETURNS INT
    SONAME 'locking_service.so';
CREATE FUNCTION service_get_write_locks RETURNS INT
```
The Locking Service

SONAME 'locking_service.so';
CREATE FUNCTION service_release_locks RETURNS INT
SONAME 'locking_service.so';

If the UDFs are used on a master replication server, install them on all slave servers as well to avoid replication problems.

Once installed, the UDFs remain installed until uninstalled. To remove them, use the DROP FUNCTION statement:

DROP FUNCTION service_get_read_locks;
DROP FUNCTION service_get_write_locks;
DROP FUNCTION service_release_locks;

Using the UDF Locking Interface

Before using the locking service UDFs, install them according to the instructions provided at Installing or Uninstalling the UDF Locking Interface.

To acquire one or more read locks, call this function:

mysql> SELECT service_get_read_locks('mynamespace', 'rlock1', 'rlock2', 10);
+---------------------------------------------------------------+
| service_get_read_locks('mynamespace', 'rlock1', 'rlock2', 10) |
| +---------------------------------------------------------------+
|                 1                                              |
+---------------------------------------------------------------+

The first argument is the lock namespace. The final argument is an integer timeout indicating how many seconds to wait to acquire the locks before giving up. The arguments in between are the lock names.

For the example just shown, the function acquires locks with lock identifiers (mynamespace, rlock1) and (mynamespace, rlock2).

To acquire write locks rather than read locks, call this function:

mysql> SELECT service_get_write_locks('mynamespace', 'wlock1', 'wlock2', 10);
+----------------------------------------------------------------+
| service_get_write_locks('mynamespace', 'wlock1', 'wlock2', 10) |
| +----------------------------------------------------------------+
|                   1                                            |
+----------------------------------------------------------------+

In this case, the lock identifiers are (mynamespace, wlock1) and (mynamespace, wlock2).

To release all locks for a namespace, use this function:

mysql> SELECT service_release_locks('mynamespace');
+--------------------------------------+
| service_release_locks('mynamespace') |
| +--------------------------------------+
|                    1                  |
+--------------------------------------+

Each locking function returns nonzero for success. If the function fails, an error occurs. For example, the following error occurs because lock names cannot be empty:

mysql> SELECT service_get_read_locks('mynamespace', '', 10);
ERROR 3131 (42000): Incorrect locking service lock name ''. 
A session can acquire multiple locks for the same lock identifier. As long as a different session does not have a write lock for an identifier, the session can acquire any number of read or write locks. Each lock request for the identifier acquires a new lock. The following statements acquire three write locks with the same identifier, then three read locks for the same identifier:

```sql
SELECT service_get_write_locks('ns', 'lock1', 'lock1', 'lock1', 0);
SELECT service_get_read_locks('ns', 'lock1', 'lock1', 'lock1', 0);
```

If you examine the Performance Schema `metadata_locks` table at this point, you will find that the session holds six distinct locks with the same `(ns, lock1)` identifier. (For details, see Locking Service Monitoring.)

Because the session holds at least one write lock on `(ns, lock1)`, no other session can acquire a lock for it, either read or write. If the session held only read locks for the identifier, other sessions could acquire read locks for it, but not write locks.

Locks for a single lock-acquisition call are acquired atomically, but atomicity does not hold across calls. Thus, for a statement such as the following, where `service_get_write_locks()` is called once per row of the result set, atomicity holds for each individual call, but not for the statement as a whole:

```sql
SELECT service_get_write_locks('ns', 'lock1', 'lock2', 0) FROM t1 WHERE ... ;
```

Caution

Because the locking service returns a separate lock for each successful request for a given lock identifier, it is possible for a single statement to acquire a large number of locks. For example:

```sql
INSERT INTO ... SELECT service_get_write_locks('ns', t1.col_name, 0) FROM t1;
```

These types of statements may have certain adverse effects. For example, if the statement fails part way through and rolls back, locks acquired up to the point of failure will still exist. If the intent is for there to be a correspondence between rows inserted and locks acquired, that intent will not be satisfied. Also, if it is important that locks are granted in a certain order, be aware that result set order may differ depending on which execution plan the optimizer chooses. For these reasons, it may be best to limit applications to a single lock-acquisition call per statement.

Locking Service Monitoring

The locking service is implemented using the MySQL Server metadata locks framework, so you monitor locking service locks acquired or waited for by examining the Performance Schema `metadata_locks` table.

First, enable the metadata lock instrument:

```sql
mysql> UPDATE performance_schema.setup_instruments SET ENABLED = 'YES'
->    WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

Then acquire some locks and check the contents of the `metadata_locks` table:

```sql
mysql> SELECT service_get_write_locks('mynamespace', 'lock1', 0);
```

| service_get_write_locks('mynamespace', 'lock1', 0) |
Locking service locks have an `OBJECT_TYPE` value of `LOCKING SERVICE`. This is distinct from, for example, locks acquired with the `GET_LOCK()` function, which have an `OBJECT_TYPE` of `USER LEVEL LOCK`.

The lock namespace, name, and mode appear in the `OBJECT_SCHEMA`, `OBJECT_NAME`, and `LOCK_TYPE` columns. Read and write locks have `LOCK_TYPE` values of `SHARED` and `EXCLUSIVE`, respectively.

The `LOCK_STATUS` value is `GRANTED` for an acquired lock, `PENDING` for a lock that is being waited for. You will see `PENDING` if one session holds a write lock and another session is attempting to acquire a lock having the same identifier.

**Locking Service UDF Interface Reference**

The SQL interface to the locking service implements the user-defined functions described in this section. For usage examples, see Using the UDF Locking Interface.

The functions share these characteristics:

- The return value is nonzero for success. Otherwise, an error occurs.
- Namespace and lock names must be non-`NULL`, nonempty, and have a maximum length of 64 characters.
- Timeout values must be integers indicating how many seconds to wait to acquire locks before giving up with an error. If the timeout is 0, there is no waiting and the function produces an error if locks cannot be acquired immediately.

These locking service UDFs are available:

- `service_get_read_locks(namespace, lock_name[, lock_name] ..., timeout)`
  
  Acquires one or more read (shared) locks in the given namespace using the given lock names, timing out with an error if the locks are not acquired within the given timeout value.

- `service_get_write_locks(namespace, lock_name[, lock_name] ..., timeout)`
  
  Acquires one or more write (exclusive) locks in the given namespace using the given lock names, timing out with an error if the locks are not acquired within the given timeout value.
The Keyring Service

- `service_release_locks(namespace)`

  For the given namespace, releases all locks that were acquired within the current session using `service_get_read_locks()` and `service_get_write_locks()`.

  It is not an error for there to be no locks in the namespace.

29.3.2 The Keyring Service

MySQL Server supports a keyring service that enables internal server components and plugins to securely store sensitive information for later retrieval. This section describes how to use the keyring service functions to store, retrieve, and remove keys in the MySQL keyring keystore. An SQL interface to the keyring service functions is also available as a set of user-defined functions (UDFs); see Section 6.4.4.8, “General-Purpose Keyring Key-Management Functions”. For general keyring information, see Section 6.4.4, “The MySQL Keyring”.

The keyring service uses whatever underlying keyring plugin is enabled, if any. If no keyring plugin is enabled, keyring service calls fail.

A “record” in the keystore consists of data (the key itself) and a unique identifier through which the key is accessed. The identifier has two parts:

- **key_id**: The key ID or name. `key_id` values that begin with `mysql_` are reserved by MySQL Server.
- **user_id**: The session effective user ID. If there is no user context, this value can be `NULL`. The value need not actually be a “user”; the meaning depends on the application.

Functions that implement the keyring UDF interface pass the value of `CURRENT_USER()` as the `user_id` value to keyring service functions.

The keyring service functions have these characteristics in common:

- Each function returns 0 for success, 1 for failure.
- The `key_id` and `user_id` arguments form a unique combination indicating which key in the keyring to use.
- The `key_type` argument provides additional information about the key, such as its encryption method or intended use.
- Keyring service functions treat key IDs, user names, types, and values as binary strings, so comparisons are case sensitive. For example, IDs of `MyKey` and `mykey` refer to different keys.

These keyring service functions are available:

- `my_key_fetch()`

  Deobfuscates and retrieves a key from the keyring, along with its type. The function allocates the memory for the buffers used to store the returned key and key type. The caller should zero or obfuscate the memory when it is no longer needed, then free it.

  Syntax:

  ```c
  bool my_key_fetch(const char *key_id, const char **key_type,
                    const char* user_id, void **key, size_t *key_len)
  ```

  Arguments:
• **key_id, user_id**: Null-terminated strings that as a pair form a unique identifier indicating which key to fetch.

• **key_type**: The address of a buffer pointer. The function stores into it a pointer to a null-terminated string that provides additional information about the key (stored when the key was added).

• **key**: The address of a buffer pointer. The function stores into it a pointer to the buffer containing the fetched key data.

• **key_len**: The address of a variable into which the function stores the size in bytes of the `*key` buffer.

Return value:

Returns 0 for success, 1 for failure.

• **my_key_generate()**

Generates a new random key of a given type and length and stores it in the keyring. The key has a length of `key_len` and is associated with the identifier formed from `key_id` and `user_id`. The type and length values must be consistent with the values supported by the underlying keyring plugin. See Section 6.4.4.7, “Supported Keyring Key Types”.

Syntax:

```c
bool my_key_generate(const char *key_id, const char *key_type, const char *user_id, size_t key_len)
```

Arguments:

• **key_id, user_id**: Null-terminated strings that as a pair form a unique identifier for the key to be generated.

• **key_type**: A null-terminated string that provides additional information about the key.

• **key_len**: The size in bytes of the key to be generated.

Return value:

Returns 0 for success, 1 for failure.

• **my_key_remove()**

Removes a key from the keyring.

Syntax:

```c
bool my_key_remove(const char *key_id, const char *user_id)
```

Arguments:

• **key_id, user_id**: Null-terminated strings that as a pair form a unique identifier for the key to be removed.

Return value:

Returns 0 for success, 1 for failure.
• `my_key_store()`

Obfuscates and stores a key in the keyring.

**Syntax:**

```c
bool my_key_store(const char *key_id, const char *key_type,
                   const char* user_id, void *key, size_t key_len)
```

**Arguments:**

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be stored.
- `key_type`: A null-terminated string that provides additional information about the key.
- `key`: The buffer containing the key data to be stored.
- `key_len`: The size in bytes of the `key` buffer.

**Return value:**

Returns 0 for success, 1 for failure.

### 29.4 Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as library files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See Section 13.7.4.1, “CREATE FUNCTION Syntax for User-Defined Functions”.

- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.

- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See Section 24.2, “Using Stored Routines”.

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you need not do that.

- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.

- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See Section 9.2.4, “Function Name Parsing and Resolution”, for the rules describing how the server interprets references to different kinds of functions.
The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.cc` file that is provided in MySQL source distributions.

**Note**
The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at [https://dev.mysql.com/doc/index-other.html](https://dev.mysql.com/doc/index-other.html). It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.9.7, “Generating MySQL Doxygen Documentation Content”.

### 29.4.1 Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

### 29.4.2 Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. MySQL source distributions include a file `sql/udf_example.cc` that defines five UDF functions. Consult this file to see how UDF calling conventions work. The `include/mysql_com.h` header file defines UDF-related symbols and data structures, although you need not include this header file directly; it is included by `mysql.h`.

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see Section 2.9.4, “MySQL Source-Configuration Options”, and Section 2.9.5, “Dealing with Problems Compiling MySQL”.

To be able to use UDFs, you must link `mysqld` dynamically. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.cc` uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`).

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.
Adding a New User-Defined Function

Note

When using C++ you can encapsulate your C functions within:

```c
extern "C" { ... }
```

This ensures that your C++ function names remain readable in the completed UDF.

The following list describes the C/C++ functions that you write to implement the interface for a function named `xxx()`. The main function, `xxx()`, is required. In addition, a UDF requires at least one of the other functions described here, for reasons discussed in Section 29.4.2.6, “UDF Security Precautions”.

- `xxx()`

  The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.

<table>
<thead>
<tr>
<th>SQL Type</th>
<th>C/C++ Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING</td>
<td>char *</td>
</tr>
<tr>
<td>INTEGER</td>
<td>long long</td>
</tr>
<tr>
<td>REAL</td>
<td>double</td>
</tr>
</tbody>
</table>

It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()`

  The initialization function for `xxx()`. If present, it can be used for the following purposes:

  - To check the number of arguments to `xxx()`.  
  - To verify that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the required types when the main function is called.  
  - To allocate any memory required by the main function.  
  - To specify the maximum length of the result.  
  - To specify (for `REAL` functions) the maximum number of decimal places in the result.  
  - To specify whether the result can be `NULL`.  

- `xxx_deinit()`

  The deinitialization function for `xxx()`. If present, it should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:
Adding a New User-Defined Function

• **xxx_clear()**
  Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

• **xxx_add()**
  Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call **xxx_init()** to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the **GROUP BY** expression.
3. Call **xxx_clear()** for the first row in each new group.
4. Call **xxx_add()** for each row that belongs in the same group.
5. Call **xxx()** to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat steps 3 to 5 until all rows has been processed
7. Call **xxx_deinit()** to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not permitted to allocate any global or static variables that change! If you need memory, you should allocate it in **xxx_init()** and free it in **xxx_deinit()**.

### 29.4.2.1 UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. Section 29.4.2, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

The main **xxx()** function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function **XXX()** to return **STRING**, **INTEGER**, or **REAL** in the **CREATE FUNCTION** statement:

For **STRING** functions:

```c
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For **INTEGER** functions:

```c
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For **REAL** functions:

```c
double xxx(UDF_INIT *initid, UDF_ARGS *args,
           char *is_null, char *error);
```
DECIMAL functions return string values and should be declared the same way as STRING functions. ROW functions are not implemented.

The initialization and deinitialization functions are declared like this:

```c
bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- **bool maybe_null**
  
  `xxx_init()` should set `maybe_null` to 1 if `xxx()` can return NULL. The default value is 1 if any of the arguments are declared `maybe_null`.

- **unsigned int decimals**
  
  The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34, 1.345, and 1.3`, the default would be 3, because `1.345` has 3 decimal digits.

  For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals permitted for the DECIMAL, FLOAT, and DOUBLE data types. This value is available as the constant `NOT_FIXED_DEC` in the `mysql_com.h` header file.

  A `decimals` value of 31 is used for arguments in cases such as a FLOAT or DOUBLE column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10,3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other nonnumber arguments that might be converted within the function to numeric form.

  The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is `NOT FIXED DEC` for even one of the arguments, that is the value used for `decimals`.

- **unsigned int max_length**
  
  The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

  If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- **char *ptr**
  
  A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```c
initid->ptr = allocated_memory;
```
In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- **bool const_item**

  `xxx_init()` should set `const_item` to 1 if `xxx()` always returns the same value and to 0 otherwise.

### 29.4.2.2 UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. Section 29.4.2, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

- **xxx_reset()**

  This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

  ```c
  void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
                 char *is_null, char *error);
  ```

  `xxx_reset()` is not needed or used in MySQL 8.0, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- **xxx_clear()**

  This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

  ```c
  void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
  ```

  `is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

  If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

  `xxx_clear()` is required by MySQL 8.0.

- **xxx_add()**

  This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

  ```c
  void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
               char *is_null, char *error);
  ```

  The `xxx()` function for an aggregate UDF should be declared the same way as for a nonaggregate UDF. See Section 29.4.2.1, “UDF Calling Sequences for Simple Functions”.

  For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.
Return value handling in `xxx()` should be done the same way as for a nonaggregate UDF. See Section 29.4.2.4, “UDF Return Values and Error Handling”.

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for nonaggregate UDFs. See Section 29.4.2.3, “UDF Argument Processing”.

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

### 29.4.2.3 UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- **unsigned int arg_count**
  
  The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

  ```c
  if (args->arg_count != 2)
  {
      strcpy(message,"XXX() requires two arguments");
      return 1;
  }
  ```

  For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count - 1`.

- **enum Item_result *arg_type**

  A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

  To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

  ```c
  if (args->arg_type[0] != STRING_RESULT ||
      args->arg_type[1] != INT_RESULT)
  {
      strcpy(message,"XXX() requires a string and an integer");
      return 1;
  }
  ```

  Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

  As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

  ```c
  args->arg_type[0] = STRING_RESULT;
  ```
Adding a New User-Defined Function

args->arg_type[1] = INT_RESULT;

Exact-value decimal arguments such as 1.3 or DECIMAL column values are passed with a type of DECIMAL_RESULT. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a REAL_RESULT value:

args->arg_type[2] = REAL_RESULT;

- char **args

args->args communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument i, args->args[i] points to the argument value. (See later for instructions on how to access the value properly.) For a nonconstant argument, args->args[i] is 0. A constant argument is an expression that uses only constants, such as 3 or 4*7-2 or SIN(3.14). A nonconstant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with nonconstant arguments.

For each invocation of the main function, args->args contains the actual arguments that are passed for the row currently being processed.

If argument i represents NULL, args->args[i] is a null pointer (0). If the argument is not NULL, functions can refer to it as follows:

- An argument of type STRING_RESULT is given as a string pointer plus a length, to enable handling of binary data or data of arbitrary length. The string contents are available as args->args[i] and the string length is args->lengths[i]. Do not assume that the string is null-terminated.

- For an argument of type INT_RESULT, you must cast args->args[i] to a long long value:

```c
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type REAL_RESULT, you must cast args->args[i] to a double value:

```c
double    real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type DECIMAL_RESULT, the value is passed as a string and should be handled like a STRING_RESULT value.

- ROW_RESULT arguments are not implemented.

- unsigned long *lengths

For the initialization function, the lengths array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, lengths contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types INT_RESULT or REAL_RESULT, lengths still contains the maximum length of the argument (as for the initialization function).

- char *maybe_null

For the initialization function, the maybe_null array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- char **attributes
Adding a New User-Defined Function

args->attributes communicates information about the names of the UDF arguments. For argument i, the attribute name is available as a string in args->attributes[i] and the attribute length is args->attribute_lengths[i]. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional [AS] alias_name clause, in which case the argument name is alias_name. The attributes value for each argument thus depends on whether an alias was given.

Suppose that a UDF my_udf() is invoked as follows:

```sql
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the attributes and attribute_lengths arrays will have these values:

```c
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5
args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6
args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- unsigned long *attribute_lengths

The attribute_lengths array indicates the length of each argument name.

29.4.2.4 UDF Return Values and Error Handling

The initialization function should return 0 if no error occurred and 1 otherwise. If an error occurs, xxx_init() should store a null-terminated error message in the message parameter. The message is returned to the client. The message buffer is MYSQL_ERRMSG_SIZE characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function xxx() is the function value, for long long and double functions. A string function should return a pointer to the result and set *length to the length (in bytes) of the return value. For example:

```c
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the xxx() function using the result parameter. This buffer is sufficiently long to hold 255 characters, which can be multibyte characters. The xxx() function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with malloc() in your xxx_init() function or your xxx() function and free it in your xxx_deinit() function. You can store the allocated memory in the ptr slot in the UDF_INIT structure for reuse by future xxx() calls. See Section 29.4.2.1, “UDF Calling Sequences for Simple Functions”.

To indicate a return value of NULL in the main function, set *is_null to 1:
*is_null = 1;

To indicate an error return in the main function, set *error to 1:

*error = 1;

If xxx() sets *error to 1 for any row, the function value is NULL for the current row and for any subsequent rows processed by the statement in which XXX() was invoked. (xxx() is not even called for subsequent rows.)

### 29.4.2.5 UDF Compiling and Installing

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described here for the example UDF file sql/udf_example.cc that is included in MySQL source distributions. For additional information about UDF installation, see Section 5.7.1, “Installing and Uninstalling User-Defined Functions”.

If a UDF will be referred to in statements that will be replicated to slave servers, you must ensure that every slave also has the function available. Otherwise, replication fails on the slaves when they attempt to invoke the function.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The udf_example.cc file contains the following functions:

- **metaphon()** returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.

- **myfunc_double()** returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.

- **myfunc_int()** returns the sum of the length of its arguments.

- **sequence(const int)** returns a sequence starting from the given number or 1 if no number has been given.

- **lookup()** returns the IP address for a host name.

- **reverse_lookup()** returns the host name for an IP address. The function may be called either with a single string argument of the form 'xxx.xxx.xxx.xxx' or with four numbers.

- **avgcost()** returns an average cost. This is an aggregate function.

A dynamically loadable file should be compiled as a sharable library file, using a command something like this:

```
gcc -shared -o udf_example.so udf_example.cc
```

If you are using gcc with CMake (which is how MySQL itself is configured), you should be able to create udf_example.so with a simpler command:

```
make udf_example
```

After compiling a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from udf_example.cc using gcc directly produces a file named udf_example.so. Copy the shared object to the server's plugin directory and name it udf_example.so. This directory is given by the value of the plugin_dir system variable.
Adding a New User-Defined Function

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, compile user-defined functions using the following procedure:

1. Obtain a MySQL source distribution. See Section 2.1.2, “How to Get MySQL”.
2. Obtain the CMake build utility, if necessary, from http://www.cmake.org. (Version 2.6 or later is required).
3. In the source tree, look in the sql directory for files named `udf_example.def` and `udf_example.cc`. Copy both files from this directory to your working directory.
4. Create a CMake makefile (CMakeLists.txt) with these contents:

```
PROJECT(udf_example)
# Path for MySQL include directory
INCLUDE_DIRECTORIES("c:/mysql/include")
ADD_DEFINITIONS("-DHAVE_DLOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.cc udf_example.def)
TARGET_LINK_LIBRARIES(udf_example wsock32)
```

5. Create the VC project and solution files, substituting an appropriate generator value:

```
cmake -G "generator"
```

Invoking `cmake --help` shows you a list of valid generators.

6. Create `udf_example.dll`:

```
deenv udf_example.sln /build Release
```

On all platforms, after the shared library file has been copied to the plugin_dir directory, notify mysqld about the new functions with the following statements. If library files have a suffix different from `.so` on your system, substitute the correct suffix throughout (for example, `.dll` on Windows).

```
CREATE FUNCTION metaphon RETURNS STRING
  SONAME 'udf_example.so';
CREATE FUNCTION myfunc_double RETURNS REAL
  SONAME 'udf_example.so';
CREATE FUNCTION myfunc_int RETURNS INTEGER
  SONAME 'udf_example.so';
CREATE FUNCTION sequence RETURNS INTEGER
  SONAME 'udf_example.so';
CREATE FUNCTION lookup RETURNS STRING
  SONAME 'udf_example.so';
CREATE FUNCTION reverse_lookup RETURNS STRING
  SONAME 'udf_example.so';
CREATE AGGREGATE FUNCTION avgcost RETURNS REAL
  SONAME 'udf_example.so';
```

Once installed, a function remains installed until it is uninstalled.

To remove functions, use DROP FUNCTION:

```
DROP FUNCTION metaphon;
```
Adding a New Native Function

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` table in the `mysql` system database that serves as a UDF registry. The function's name, type and shared library name are saved in the `mysql.func` table. To create functions, you must have the `INSERT` privilege for the `mysql` database. To drop functions, you must have the `DELETE` privilege for the `mysql` database.

You cannot use `CREATE FUNCTION` to reinstall a function that has previously been installed. To reinstall a function, first remove it with `DROP FUNCTION`, then install it with `CREATE FUNCTION`. You would need to do this, for example, if you upgrade to a new version of MySQL that provides an updated implementation of the function, or you recompile a new version of a function that you have written. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, the server does not load UDFs during startup and UDFs are unavailable.

### 29.4.2.6 UDF Security Precautions

MySQL takes several measures to prevent misuse of user-defined functions.

UDF library files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

To use `CREATE FUNCTION` or `DROP FUNCTION`, you must have the `INSERT` or `DELETE` privilege, respectively, for the `mysql` database. This is necessary because those statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared library files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

### 29.4.3 Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory:

1. Create a subclass for the function in `item_create.cc`:
• If the function takes a fixed number of arguments, create a subclass of Create_func_arg0, Create_func_arg1, Create_func_arg2, or Create_func_arg3, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the Create_func_uuid, Create_func_abs, Create_func_pow, and Create_func_lpad classes.

• If the function takes a variable number of arguments, create a subclass of Create_native_func. For an example, see Create_func_concat.

2. To provide a name by which the function can be referred to in SQL statements, register the name in item_create.cc by adding a line to this array:

```cpp
static Native_func_registry func_array[]
```

You can register several names for the same function. For example, see the lines for "LCASE" and "LOWER", which are aliases for Create_func_lcase.

3. In item_func.h, declare a class inheriting from Item_num_func or Item_str_func, depending on whether your function returns a number or a string.

4. In item_func.cc, add one of the following declarations, depending on whether you are defining a numeric or string function:

```cpp
double   Item_func_newname::val()
longlong Item_func_newname::val_int()
String  *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like Item_num_func), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the Item_str_func class defines a val() function that executes atof() on the value returned by ::str().

5. If the function is nondeterministic, include the following statement in the item constructor to indicate that function results should not be cached:

```cpp
current_thd->lex->safe_to_cache_query=0;
```

A function is nondeterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```cpp
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate max_length based on the given arguments. max_length is the maximum number of characters the function may return. This function should also set maybe_null = 0 if the main function cannot return a NULL value. The function can check whether any of the function arguments can return NULL by checking the arguments' maybe_null variable. Look at Item_func_mod::fix_length_and_dec for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return NULL from ::val(), ::val_int(), or ::str(), you should set null_value to 1 and return 0.
For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

### 29.5 Debugging and Porting MySQL

This section helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See [https://www.mysql.com/support/supportedplatforms/database.html](https://www.mysql.com/support/supportedplatforms/database.html). If you have created a new port of MySQL, please let us know so that we can list it here and on our website ([http://www.mysql.com/](http://www.mysql.com/)), recommending it to other users.

**Note**

If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server.

To build MySQL from source, your system must satisfy the tool requirements listed at Section 2.9, “Installing MySQL from Source”.

If you run into problems with a new port, you may have to do some debugging of MySQL! See Section 29.5.1, “Debugging a MySQL Server”.

**Note**

Before you start debugging `mysqld`, first get the test program `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

**Note**

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at [https://dev.mysql.com/doc/index-other.html](https://dev.mysql.com/doc/index-other.html). It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.9.7, “Generating MySQL Doxygen Documentation Content”.

#### 29.5.1 Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality). See Section B.4.3.3, “What to Do If MySQL Keeps Crashing”.

If `mysqld` does not want to start, verify that you have no `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults` ...

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients cannot connect.
The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you have not compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See Chapter 5, *MySQL Server Administration*. You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See Section 2.1, “General Installation Guidance”.

### 29.5.1.1 Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `-DWITH_DEBUG=1` option. You can check whether MySQL was compiled with debugging by doing: `mysql --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If `mysqld` stops crashing when you configure it with the `-DWITH_DEBUG=1` CMake option, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` using the `CMAKE_C_FLAGS` and `CMAKE_CXX_FLAGS` CMake options and not use `-DWITH_DEBUG=1`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging. If you believe that you have found a bug, please use the instructions at Section 1.7, “How to Report Bugs or Problems”.

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

### 29.5.1.2 Creating Trace Files

If the `mysqld` server does not start or it crashes easily, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `--debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld`.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

The trace file can become very large! To generate a smaller trace file, you can use debugging options something like this:

```
mysql --debug=d,info,error,query,general,where:O,/tmp/mysqld.trace
```
This only prints information with the most interesting tags to the trace file.

If you file a bug, please add only those lines from the trace file to the bug report that indicate where something seems to go wrong. If you cannot locate the wrong place, open a bug report and upload the whole trace file to the report, so that a MySQL developer can take a look at it. For instructions, see Section 1.7, “How to Report Bugs or Problems”.

The trace file is made with the DBUG package by Fred Fish. See Section 29.5.4, “The DBUG Package”.

29.5.1.3 Using WER with PDB to create a Windows crashdump

Program Database files (with suffix .pdb) are included in the ZIP Archive Debug Binaries & Test Suite distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem. This is a separate download from the standard MSI or Zip file.

Note
The PDB files are available in a separate file labeled “ZIP Archive Debug Binaries & Test Suite”.

The PDB file contains more detailed information about mysqld and other tools that enables more detailed trace and dump files to be created. You can use these with WinDbg or Visual Studio to debug mysqld.

For more information on PDB files, see Microsoft Knowledge Base Article 121366. For more information on the debugging options available, see Debugging Tools for Windows.

To use WinDbg, either install the full Windows Driver Kit (WDK) or install the standalone version.

Important
The .exe and .pdb files must be an exact match (both version number and MySQL server edition) or WinDBG will complain while attempting to load the symbols.

1. To generate a minidump mysqld.dmp, enable the core-file option under the [mysqld] section in my.ini. Restart the MySQL server after making these changes.

2. Create a directory to store the generated files, such as c:\symbols

3. Determine the path to your windbg.exe executable using the Find GUI or from the command line, for example: dir /s /b windbg.exe -- a common default is C:\Program Files\Debugging Tools for Windows (x64)\windbg.exe

4. Launch windbg.exe giving it the paths to mysqld.exe, mysqld.pdb, mysqld.dmp, and the source code. Alternatively, pass in each path from the WinDbg GUI. For example:

   windbg.exe -i "C:\mysql-8.0.18-winx64\bin\" -z "C:\mysql-8.0.18-winx64\data\mysqld.dmp" -srcpath "E:\ade\mysql_archives\8.0\8.0.18\mysqld-8.0.18" -y "C:\mysql-8.0.18-winx64\bin;SRV*c:\symbols*http://msdl.microsoft.com/download/symbols" -v -n -c "!analyze -vvvvv"

Note
The ^ character and newline are removed by the Windows command line processor, so be sure the spaces remain intact.

29.5.1.4 Debugging mysqld under gdb
On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. It is best to upgrade to `gdb 5.1` because thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```bash
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

Use the `--gdb` option to `mysqld` to install an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` does not free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections` + 1. In most cases just using `--thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a SIGSEGV signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```bash
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See Section B.4.3.3, "What to Do If MySQL Keeps Crashing".

If you are using `gdb 4.17.x` or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```bash
set print sevenbit off
handle SIGUSR1 nostop nprint
handle SIGUSR2 nostop nprint
handle SIGTSTK nostop nprint
handle SIGINT nostop nprint
handle SIGSTOP nostop nprint
handle SIGTERM nostop nprint
handle SIGALRM nostop nprint
```

If you have problems debugging threads with `gdb`, you should download `gdb 5.x` and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```bash
shell> gdb /usr/local/libexec/mysqld
gdb> run
```
... backtrace full # Do this when mysqld crashes

Include the preceding output in a bug report, which you can file using the instructions in Section 1.7, “How to Report Bugs or Problems”.

If mysqld hangs, you can try to use some system tools like strace or /usr/proc/bin/pstack to examine where mysqld has hung.

strace /tmp/log libexec/mysqld

If you are using the Perl DBI interface, you can turn on debugging information by using the trace method or by setting the DBI_TRACE environment variable.

29.5.1.5 Using a Stack Trace

On some operating systems, the error log contains a stack trace if mysqld dies unexpectedly. You can use this to find out where (and maybe why) mysqld died. See Section 5.4.2, “The Error Log”. To get a stack trace, you must not compile mysqld with the -fommit-frame-pointer option to gcc. See Section 29.5.1.1, “Compiling MySQL for Debugging”.

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information to find out where mysqld died. If you see no messages after this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32) [0x9da402]
        /lib/libpthread.so.0 [0x7f1a5af000f0]
        /lib/libc.so.6 (strcmp+0x2) [0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDpKcS2_pcj+0x7c) [0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0) [0x688354]
mysqld(_Z17sql_set_variablesP3THDP4ListI12set_var_baseE+0x68) [0x688494]
mysqld(_Z11mysql_execute_commandP3THD+0x41a0) [0x67a170]
mysqld(_Z11mysql_parseP3THDpKcjPS2_+0x282) [0x67f0ad]
mysqld(_Z10do_commandP3THD+0xbb7) [0x67fdf8]
mysqld(handle_one_connection+0x11c) [0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information to find out where mysqld died. If you see no messages after this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
        [0x9da402]
        [0x6648e9]
        [0x7f1a5af000f0]
        [0x7f1a5a10f0f2]
        [0x7412cb]
        [0x688354]
        [0x688494]
        [0x67a170]
        [0x67f0ad]
        [0x67fdf8]
        [0x68811b6]`
Newer versions of glibc stack trace functions also print the address as relative to the object. On glibc-based systems (Linux), the trace for a crash within a plugin looks something like:

```
plugin/auth/auth_test_plugin.so(+0x9a6)[0x7ff4d11c29a6]
```

To translate the relative address (+0x9a6) into a file name and line number, use this command:

```
shell> addr2line -fie auth_test_plugin.so 0x9a6
auth_test_plugin
mysql-trunk/plugin/auth/test_plugin.c:65
```
The `addr2line` utility is part of the `binutils` package on Linux.

On Solaris, the procedure is similar. The Solaris `printstack()` already prints relative addresses:

```
plugin/auth/auth_test_plugin.so:0x1510
```

To translate, use this command:

```
shell> gaddr2line -fie auth_test_plugin.so 0x1510
mysql-trunk/plugin/auth/test_plugin.c:88
```

Windows already prints the address, function name and line:

```
O00007FEF07E10A4 auth_test_plugin.dll!auth_test_plugin()[test_plugin.c:72]
```

### 29.5.1.6 Using Server Logs to Find Causes of Errors in mysqld

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See [Chapter 5, MySQL Server Administration](https://dev.mysql.com/doc/refman/8.0/en/server-status-variables.html).

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See [Section 5.4.3, “The General Query Log”](https://dev.mysql.com/doc/refman/8.0/en/server-status-variables.html). When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as `host_name.log`. In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that did not complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 13.8.2, “EXPLAIN Syntax”](https://dev.mysql.com/doc/refman/8.0/en/server-status-variables.html).

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See [Section 5.4.5, “The Slow Query Log”](https://dev.mysql.com/doc/refman/8.0/en/server-status-variables.html).

If you find the text `mysqld restarted` in the error log (normally a file named `host_name.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, MySQL Server Administration](https://dev.mysql.com/doc/refman/8.0/en/server-status-variables.html)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this does not help, report a bug, see [Section 1.7, “How to Report Bugs or Problems”](https://dev.mysql.com/doc/refman/8.0/en/server-status-variables.html).

If you have started `mysqld` with `--myisam-recover-options`, MySQL automatically checks and tries to repair MyISAM tables if they are marked as ‘not closed properly’ or ‘crashed’. If this happens, MySQL writes an entry in the `hostname.err` file ‘Warning: Checking table …’ which is followed by
Warning: Repairing table if the table needs to be repaired. If you get a lot of these errors, without mysqld having died unexpectedly just before, then something is wrong and needs to be investigated further. See Section 5.1.7, “Server Command Options”.

When the server detects MyISAM table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: Got an error from thread_id=1, mi_dynrec.c:368. This is useful information to include in bug reports.

It is not a good sign if mysqld did die unexpectedly, but in this case, you should not investigate the Checking table... messages, but instead try to find out why mysqld died.

### 29.5.1.7 Making a Test Case If You Experience Table Corruption

The following procedure applies to MyISAM tables. For information about steps to take when encountering InnoDB table corruption, see Section 1.7, “How to Report Bugs or Problems”.

If you encounter corrupted MyISAM tables or if mysqld always fails after some update statements, you can test whether the issue is reproducible by doing the following:

1. Stop the MySQL daemon with mysqladmin shutdown.
2. Make a backup of the tables to guard against the very unlikely case that the repair does something bad.
3. Check all tables with myisamchk -s database/*.MYI. Repair any corrupted tables with myisamchk -r database/table.MYI.
4. Make a second backup of the tables.
5. Remove (or move away) any old log files from the MySQL data directory if you need more space.
6. Start mysqld with the binary log enabled. If you want to find a statement that crashes mysqld, you should start the server with the general query log enabled as well. See Section 5.4.3, “The General Query Log”, and Section 5.4.4, “The Binary Log”.
7. When you have gotten a crashed table, stop the mysqld server.
8. Restore the backup.
9. Restart the mysqld server without the binary log enabled.
10. Re-execute the statements with mysqlbinlog binary-log-file | mysql. The binary log is saved in the MySQL database directory with the name hostname-bin.NNNNNN.
11. If the tables are corrupted again or you can get mysqld to die with the above command, you have found a reproducible bug. FTP the tables and the binary log to our bugs database using the instructions given in Section 1.7, “How to Report Bugs or Problems”. If you are a support customer, you can use the MySQL Customer Support Center (https://www.mysql.com/support/) to alert the MySQL team about the problem and have it fixed as soon as possible.

### 29.5.2 Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with -DWITH_DEBUG=1. See Section 2.9.4, “MySQL Source-Configuration Options”.

Before running a client, you should set the MYSQL_DEBUG environment variable:

```shell
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
```
The LOCK_ORDER Tool

shell> export MYSQL_DEBUG

This causes clients to generate a trace file in /tmp/client.trace.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

shell> mysql --debug=d:t:o,/tmp/client.trace

This provides useful information in case you mail a bug report. See Section 1.7, "How to Report Bugs or Problems".

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

29.5.3 The LOCK_ORDER Tool

The MySQL server is a multithreaded application that uses numerous internal locking and lock-related primitives, such as mutexes, rwlocks (including prlocks and sxlocks), conditions, and files. Within the server, the set of lock-related objects changes with implementation of new features and code refactoring for performance improvements. As with any multithreaded application that uses locking primitives, there is always a risk of encountering a deadlock during execution when multiple locks are held at once. For MySQL, the effect of a deadlock is catastrophic, causing a complete loss of service.

As of MySQL 8.0.17, to enable detection of lock-acquisition deadlocks and enforcement that runtime execution is free of them, MySQL supports LOCK_ORDER tooling. This enables a lock-order dependency graph to be defined as part of server design, and server runtime checking to ensure that lock acquisition is acyclic and that execution paths comply with the graph.

This section provides information about using the LOCK_ORDER tool, but only at a basic level. For complete details, see the Lock Order section of the MySQL Server Doxygen documentation, available at https://dev.mysql.com/doc/index-other.html.

The LOCK_ORDER tool is intended for debugging the server, not for production use.

To use the LOCK_ORDER tool, follow this procedure:

1. Build MySQL from source, configuring it with the `-DWITH_LOCK_ORDER=ON` CMake option so that the build includes LOCK_ORDER tooling.

   Note
   With the `WITH_LOCK_ORDER` option enabled, MySQL builds require the `flex` program.

2. To run the server with the LOCK_ORDER tool enabled, enable the `lock_order` system variable at server startup. Several other system variables for LOCK_ORDER configuration are available as well.

3. For MySQL test suite operation, `mysql-test-run.pl` has a `--lock-order` option that controls whether to enable the LOCK_ORDER tool during test case execution.

The system variables described following configure operation of the LOCK_ORDER tool, assuming that MySQL has been built to include LOCK_ORDER tooling. The primary variable is `lock_order`, which indicates whether to enable the LOCK_ORDER tool at runtime:

- If `lock_order` is disabled (the default), no other LOCK_ORDER system variables have any effect.
• If `lock_order` is enabled, the other system variables configure which LOCK_ORDER features to enable.

**Note**

In general, it is intended that the LOCK_ORDER tool be configured by executing `mysql-test-run.pl` with the `--lock-order` option, and for `mysql-test-run.pl` to set LOCK_ORDER system variables to appropriate values.

All LOCK_ORDER system variables must be set at server startup. At runtime, their values are visible but cannot be changed.

Some system variables exist in pairs, such as `lock_order_debug_loop` and `lock_order_trace_loop`. For such pairs, the variables are distinguished as follows when the condition occurs with which they are associated:

- If the `_debug_` variable is enabled, a debug assertion is raised.
- If the `_trace_` variable is enabled, an error is printed to the logs.

**Table 29.4 LOCK_ORDER System Variable Summary**

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Variable Type</th>
<th>Variable Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lock_order</code></td>
<td>Boolean</td>
<td>Global</td>
</tr>
<tr>
<td><code>lock_order_debug_loop</code></td>
<td>Boolean</td>

<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Whether the LOCK_ORDER tool causes a debug assertion failure when it encounters a lock that is destroyed while still held.

- **lock_order_dependencies**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--lock-order-dependencies=file_name</td>
</tr>
<tr>
<td>Introduced</td>
<td>8.0.17</td>
</tr>
<tr>
<td>System Variable</td>
<td>lock_order_dependencies</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
<tr>
<td>Default Value</td>
<td>empty string</td>
</tr>
</tbody>
</table>

The path to the `lock_order_dependencies.txt` file that defines the server lock-order dependency graph.

It is permitted to specify no dependencies. An empty dependency graph is used in this case.

- **lock_order_extra_dependencies**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--lock-order-extra-dependencies=file_name</td>
</tr>
<tr>
<td>Introduced</td>
<td>8.0.17</td>
</tr>
<tr>
<td>System Variable</td>
<td>lock_order_extra_dependencies</td>
</tr>
</tbody>
</table>
The path to a file containing additional dependencies for the lock-order dependency graph. This is useful to amend the primary server dependency graph, defined in the `lock_order_dependencies.txt` file, with additional dependencies describing the behavior of third party code. (The alternative is to modify `lock_order_dependencies.txt` itself, which is not encouraged.)

If this variable is not set, no secondary file is used.

- `lock_order_output_directory`

The directory where the LOCK_ORDER tool writes its logs. If this variable is not set, the default is the current directory.

- `lock_order_print_txt`

Whether the LOCK_ORDER tool performs a lock-order graph analysis and prints a textual report. The report includes any lock-acquisition cycles detected.

- `lock_order_trace_loop`
The LOCK_ORDER Tool

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--lock-order-trace-loop[={OFF</td>
</tr>
<tr>
<td>Introduced</td>
<td>8.0.17</td>
</tr>
<tr>

<td>Boolean</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>ON</td>
</tr>
</tbody>
</table>

Whether the LOCK_ORDER tool prints a trace in the log file when it encounters a lock that is destroyed while still held.

#### 29.5.4 The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is doing. See Section 29.5.1.2, “Creating Trace Files”.

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support.

The DBUG package can be used by invoking a program with the `--debug[=debug_options]` or `--debug_options` option. If you specify the `--debug` or `--debug_options` option without a `debug_options` value, most MySQL programs use a default value. The server default is `d:t:i:o,/tmp/mysqld.trace` on Unix and `d:t:i:O,\mysqld.trace` on Windows. The effect of this default is:

- **d**: Enable output for all debug macros
- **t**: Trace function calls and exits
- **i**: Add PID to output lines
- **o,/tmp/mysqld.trace,\mysqld.trace**: Set the debug output file.

Most client programs use a default `debug_options` value of `d:t:o,/tmp/program_name.trace`, regardless of platform.

Here are some example debug control strings as they might be specified on a shell command line:

```
--debug=d:t
--debug=d:f,main,subr1:F:L:t,20
--debug=d,input,output,files:n
--debug=d:i:O,\mysqld.trace
```

For `mysqld`, it is also possible to change DBUG settings at runtime by setting the `debug` system variable. This variable has global and session values:

```
mysql> SET GLOBAL debug = 'debug_options';
mysql> SET SESSION debug = 'debug_options';
```
Changing the global `debug` value requires privileges sufficient to set global system variables. Changing the session `debug` value requires privileges sufficient to set restricted session system variables. See Section 5.1.9.1, "System Variable Privileges".

The `debug_options` value is a sequence of colon-separated fields:

```
field_1:field_2:...:field_N
```

Each field within the value consists of a mandatory flag character, optionally preceded by a `+` or `-` character, and optionally followed by a comma-delimited list of modifiers:

```
[+|-]flag[,modifier,modifier,...,modifier]
```

The following table describes the permitted flag characters. Unrecognized flag characters are silently ignored.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>d</code></td>
<td>Enable output from <code>DEBUG_XXX</code> macros for the current state. May be followed by a list of keywords, which enables output only for the <code>DEBUG</code> macros with that keyword. An empty list of keywords enables output for all macros. In MySQL, common debug macro keywords to enable are <code>enter</code>, <code>exit</code>, <code>error</code>, <code>warning</code>, <code>info</code>, and <code>loop</code>.</td>
</tr>
<tr>
<td><code>D</code></td>
<td>Delay after each debugger output line. The argument is the delay, in tenths of seconds, subject to machine capabilities. For example, <code>D,20</code> specifies a delay of two seconds.</td>
</tr>
<tr>
<td><code>f</code></td>
<td>Limit debugging, tracing, and profiling to the list of named functions. An empty list enables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.</td>
</tr>
<tr>
<td><code>F</code></td>
<td>Identify the source file name for each line of debug or trace output.</td>
</tr>
<tr>
<td><code>i</code></td>
<td>Identify the process with the PID or thread ID for each line of debug or trace output.</td>
</tr>
<tr>
<td><code>L</code></td>
<td>Identify the source file line number for each line of debug or trace output.</td>
</tr>
<tr>
<td><code>n</code></td>
<td>Print the current function nesting depth for each line of debug or trace output.</td>
</tr>
<tr>
<td><code>N</code></td>
<td>Number each line of debug output.</td>
</tr>
<tr>
<td><code>o</code></td>
<td>Redirect the debugger output stream to the specified file. The default output is <code>stderr</code>.</td>
</tr>
<tr>
<td><code>O</code></td>
<td>Like <code>o</code>, but the file is really flushed between each write. When needed, the file is closed and reopened between each write.</td>
</tr>
<tr>
<td><code>p</code></td>
<td>Limit debugger actions to specified processes. A process must be identified with the <code>DEBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.</td>
</tr>
<tr>
<td><code>P</code></td>
<td>Print the current process name for each line of debug or trace output.</td>
</tr>
<tr>
<td><code>r</code></td>
<td>When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.</td>
</tr>
<tr>
<td><code>S</code></td>
<td>Do function <code>_sanity (_file_, _line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0.</td>
</tr>
<tr>
<td><code>t</code></td>
<td>Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.</td>
</tr>
</tbody>
</table>

The leading `+` or `-` character and trailing list of modifiers are used for flag characters such as `d` or `t` that can enable a debug operation for all applicable modifiers or just some of them.
• With no leading + or −, the flag value is set to exactly the modifier list as given.

• With a leading + or −, the modifiers in the list are added to or subtracted from the current modifier list.

The following examples show how this works for the d flag. An empty d list enabled output for all debug macros. A nonempty list enables output only for the macro keywords in the list.

These statements set the d value to the modifier list as given:

```
mysql> SET debug = 'd';
mysql> SELECT @@debug;
+---------+
| @@debug |
+---------+
| d       |
mysql> SET debug = 'd,error,warning';
mysql> SELECT @@debug;
+-----------------+
| @@debug         |
+-----------------+
| d,error,warning |
+-----------------+
mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+----------------------+
| @@debug              |
+----------------------+
| d,error,warning,loop |
mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
+-----------+
| @@debug   |
+-----------+
| d,warning |
+-----------+
```

A leading + or − adds to or subtracts from the current d value:

```
mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+-----------------------+
| @@debug               |
+-----------------------+
| d,error,warning,loop |
mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
+----------+
| @@debug  |
+----------+
| d,warning |
+----------+
```

Adding to “all macros enabled” results in no change:

```
mysql> SET debug = 'd';
mysql> SELECT @@debug;
+---------+
| @@debug |
+---------+
| d       |
mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+---------+
| @@debug |
+---------+
| d       |
```

Disabling all enabled macros disables the d flag entirely:
The DBUG Package

mysql> SET debug = 'd,error,loop';
mysql> SELECT @@debug;
+---------------+
| @@debug       |
| d,error,loop  |
+---------------+

mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
+---------+
| @@debug |
|         |
+---------+
MySQL Enterprise Edition is a commercial product. Like MySQL Community Edition, MySQL Enterprise Edition includes MySQL Server, a fully integrated transaction-safe, ACID-compliant database with full commit, rollback, crash-recovery, and row-level locking capabilities. In addition, MySQL Enterprise Edition includes the following components designed to provide monitoring and online backup, as well as improved security and scalability:

- MySQL Enterprise Monitor
- MySQL Enterprise Backup
- MySQL Enterprise Security
- MySQL Enterprise Encryption
- MySQL Enterprise Audit
- MySQL Enterprise Firewall
- MySQL Enterprise Thread Pool
- MySQL Enterprise Data Masking and De-Identification

The following sections briefly discuss each of these components and indicate where to find more detailed information. To learn more about commercial products, see https://www.mysql.com/products/.

### 30.1 MySQL Enterprise Monitor Overview

MySQL Enterprise Monitor is an enterprise monitoring system for MySQL that keeps an eye on your MySQL servers, notifies you of potential issues and problems, and advises you how to fix the issues. MySQL Enterprise Monitor can monitor all kinds of configurations, from a single MySQL server that is important to your business, all the way up to a huge farm of MySQL servers powering a busy website.

The following discussion briefly summarizes the basic components that make up the MySQL Enterprise Monitor product. For more information, see the MySQL Enterprise Monitor manual, available at https://dev.mysql.com/doc/mysql-monitor/en/.

MySQL Enterprise Monitor components can be installed in various configurations depending on your database and network topology, to give you the best combination of reliable and responsive monitoring data, with minimal overhead on the database server machines. A typical MySQL Enterprise Monitor installation consists of:
MySQL Enterprise Backup Overview

- One or more MySQL servers to monitor. MySQL Enterprise Monitor can monitor both Community and Enterprise MySQL server releases.

- A MySQL Enterprise Monitor Agent for each monitored host.

- A single MySQL Enterprise Service Manager, which collates information from the agents and provides the user interface to the collected data.

MySQL Enterprise Monitor is designed to monitor one or more MySQL servers. The monitoring information is collected by using an agent, **MySQL Enterprise Monitor Agent**. The agent communicates with the hosts and MySQL servers that it monitors, collecting variables, status and health information, and sending this information to the MySQL Enterprise Service Manager.

The information collected by the agent about each MySQL server and host you are monitoring is sent to the **MySQL Enterprise Service Manager**. This server collates all of the information from the agents. As it collates the information sent by the agents, the MySQL Enterprise Service Manager continually tests the collected data, comparing the status of the server to reasonable values. When thresholds are reached, the server can trigger an event (including an alarm and notification) to highlight a potential issue, such as low memory, high CPU usage, or more complex conditions such insufficient buffer sizes and status information. We call each test, with its associated threshold value, a **rule**.

These rules, and the alarms and notifications, are each known as a **MySQL Enterprise Advisors**. Advisors form a critical part of the MySQL Enterprise Service Manager, as they provide warning information and troubleshooting advice about potential problems.

The MySQL Enterprise Service Manager includes a web server, and you interact with it through any web browser. This interface, the MySQL Enterprise Monitor User Interface, displays all of the information collected by the agents, and lets you view all of your servers and their current status as a group or individually. You control and configure all aspects of the service using the MySQL Enterprise Monitor User Interface.

The information supplied by the MySQL Enterprise Monitor Agent processes also includes statistical and query information, which you can view in the form of graphs. For example, you can view aspects such as server load, query numbers, or index usage information as a graph over time. The graph lets you pinpoint problems or potential issues on your server, and can help diagnose the impact from database or external problems (such as external system or network failure) by examining the data from a specific time interval.

The MySQL Enterprise Monitor Agent can also be configured to collect detailed information about the queries executed on your server, including the row counts and performance times for executing each query. You can correlate the detailed query data with the graphical information to identify which queries were executing when you experienced a particularly high load, index or other issue. The query data is supported by a system called Query Analyzer, and the data can be presented in different ways depending on your needs.

### 30.2 MySQL Enterprise Backup Overview

MySQL Enterprise Backup performs hot backup operations for MySQL databases. The product is architected for efficient and reliable backups of tables created by the InnoDB storage engine. For completeness, it can also back up tables from MyISAM and other storage engines.

Hot backups are performed while the database is running and applications are reading and writing to it. This type of backup does not block normal database operations, and it captures even changes that occur while the backup is happening. For these reasons, hot backups are desirable when your database
“grows up” -- when the data is large enough that the backup takes significant time, and when your data is important enough to your business that you must capture every last change, without taking your application, website, or web service offline.

MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. For efficient backup operations, you can designate InnoDB as the default storage engine for new tables, or convert existing tables to use the InnoDB storage engine.

### 30.3 MySQL Enterprise Security Overview

MySQL Enterprise Edition provides plugins that implement security features using external services:

- MySQL Enterprise Edition includes an authentication plugin that enables MySQL Server to use PAM (Pluggable Authentication Modules) to authenticate MySQL users. PAM enables a system to use a standard interface to access various kinds of authentication methods, such as Unix passwords or an LDAP directory. For more information, see Section 6.4.1.5, “PAM Pluggable Authentication”.

- MySQL Enterprise Edition includes an authentication plugin that performs external authentication on Windows, enabling MySQL Server to use native Windows services to authenticate client connections. Users who have logged in to Windows can connect from MySQL client programs to the server based on the information in their environment without specifying an additional password. For more information, see Section 6.4.1.6, “Windows Pluggable Authentication”.

- MySQL Enterprise Edition includes a keyring plugin that uses Oracle Key Vault as a back end for keyring storage. For more information, see Section 6.4.4, “The MySQL Keyring”.

For other related Enterprise security features, see Section 30.4, “MySQL Enterprise Encryption Overview”.

### 30.4 MySQL Enterprise Encryption Overview

MySQL Enterprise Edition includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable Enterprise applications to perform the following operations:

- Implement added data protection using public-key asymmetric cryptography
- Create public and private keys and digital signatures
- Perform asymmetric encryption and decryption
- Use cryptographic hashing for digital signing and data verification and validation

For more information, see Section 12.19, “MySQL Enterprise Encryption Functions”.

For other related Enterprise security features, see Section 30.3, “MySQL Enterprise Security Overview”.

### 30.5 MySQL Enterprise Audit Overview

MySQL Enterprise Edition includes MySQL Enterprise Audit, implemented using a server plugin. MySQL Enterprise Audit uses the open MySQL Audit API to enable standard, policy-based monitoring and logging of connection and query activity executed on specific MySQL servers. Designed to meet the Oracle audit specification, MySQL Enterprise Audit provides an out of box, easy to use auditing and compliance solution for applications that are governed by both internal and external regulatory guidelines.
When installed, the audit plugin enables MySQL Server to produce a log file containing an audit record of server activity. The log contents include when clients connect and disconnect, and what actions they perform while connected, such as which databases and tables they access.

For more information, see Section 6.4.5, “MySQL Enterprise Audit”.

### 30.6 MySQL Enterprise Firewall Overview

MySQL Enterprise Edition includes MySQL Enterprise Firewall, an application-level firewall that enables database administrators to permit or deny SQL statement execution based on matching against whitelists of accepted statement patterns. This helps harden MySQL Server against attacks such as SQL injection or attempts to exploit applications by using them outside of their legitimate query workload characteristics.

Each MySQL account registered with the firewall has its own statement whitelist, enabling protection to be tailored per account. For a given account, the firewall can operate in recording or protecting mode, for training in the accepted statement patterns or protection against unacceptable statements.

For more information, see Section 6.4.7, “MySQL Enterprise Firewall”.

### 30.7 MySQL Enterprise Thread Pool Overview

MySQL Enterprise Edition includes MySQL Enterprise Thread Pool, implemented using a server plugin. The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. In MySQL Enterprise Edition, a thread pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The plugin implements a thread pool that increases server performance by efficiently managing statement execution threads for large numbers of client connections.

For more information, see Section 5.6.3, “MySQL Enterprise Thread Pool”.

### 30.8 MySQL Enterprise Data Masking and De-Identification Overview

MySQL Enterprise Edition includes MySQL Enterprise Data Masking and De-Identification, implemented as a plugin library containing a plugin and a set of user-defined functions. Data masking hides sensitive information by replacing real values with substitutes. MySQL Enterprise Data Masking and De-Identification functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution.

For more information, see Section 6.4.8, “MySQL Enterprise Data Masking and De-Identification”.
Chapter 31 MySQL Workbench

MySQL Workbench provides a graphical tool for working with MySQL servers and databases. MySQL Workbench fully supports MySQL versions 5.5 and higher.

The following discussion briefly describes MySQL Workbench capabilities. For more information, see the MySQL Workbench manual, available at https://docs.oracle.com/cd/E17952_01/workbench-en/.

MySQL Workbench provides five main areas of functionality:

- **SQL Development**: Enables you to create and manage connections to database servers. As well as enabling you to configure connection parameters, MySQL Workbench provides the capability to execute SQL queries on the database connections using the built-in SQL Editor. This functionality replaces that previously provided by the Query Browser standalone application.

- **Data Modeling**: Enables you to create models of your database schema graphically, reverse and forward engineer between a schema and a live database, and edit all aspects of your database using the comprehensive Table Editor. The Table Editor provides easy-to-use facilities for editing Tables, Columns, Indexes, Triggers, Partitioning, Options, Inserts and Privileges, Routines and Views.

- **Server Administration**: Enables you to create and administer server instances.

- **Data Migration**: Allows you to migrate from Microsoft SQL Server, Sybase ASE, SQLite, SQL Anywhere, PostreSQL, and other RDBMS tables, objects and data to MySQL. Migration also supports migrating from earlier versions of MySQL to the latest releases.

- **MySQL Enterprise Support**: Support for Enterprise products such as MySQL Enterprise Backup and MySQL Audit.

MySQL Workbench is available in two editions, the Community Edition and the Commercial Edition. The Community Edition is available free of charge. The Commercial Edition provides additional Enterprise features, such as database documentation generation, at low cost.
Appendix A MySQL 8.0 Frequently Asked Questions

Table of Contents

A.1 MySQL 8.0 FAQ: General ................................................................. 4983
A.2 MySQL 8.0 FAQ: Storage Engines ............................................... 4984

A.17 MySQL 8.0 FAQ: Virtualization Support ...................................... 5017

A.1 MySQL 8.0 FAQ: General

A.1.1. Which version of MySQL is production-ready (GA)? .................... 4983
A.1.2. Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0? .................... 4984
A.1.3. Can MySQL 8.0 do subqueries? .............................................. 4984
A.1.4. Can MySQL 8.0 perform multiple-table inserts, updates, and deletes? ............................ 4984
A.1.5. Does MySQL 8.0 have Sequences? ........................................... 4984
A.1.6. Does MySQL 8.0 have a NOW() function with fractions of seconds? .................... 4984
A.1.7. Does MySQL 8.0 work with multi-core processors? .................... 4984
A.1.8. Why do I see multiple processes for mysqld? ............................. 4984
A.1.9. Can MySQL 8.0 perform ACID transactions? ............................ 4984

A.1.1. Which version of MySQL is production-ready (GA)?

MySQL 8.0, 5.7, and MySQL 5.6 are supported for production use.

MySQL 8.0 achieved General Availability (GA) status with MySQL 8.0.11, which was released for production use on 19 April 2018.

MySQL 5.7 achieved General Availability (GA) status with MySQL 5.7.9, which was released for production use on 21 October 2015.

MySQL 5.6 achieved General Availability (GA) status with MySQL 5.6.10, which was released for production use on 5 February 2013.

MySQL 5.5 achieved General Availability (GA) status with MySQL 5.5.8, which was released for production use on 3 December 2010. The MySQL 5.5 series is no longer current, but still supported in production.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008. Active development for MySQL 5.1 has ended.
MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005. Active development for MySQL 5.0 has ended.

A.1.2. Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0?

Due to the many new and important features we were introducing in this MySQL version, we decided to start a fresh new series. As the series numbers 6 and 7 had actually been used before by MySQL, we went to 8.0.

A.1.3. Can MySQL 8.0 do subqueries?

Yes. See Section 13.2.11, “Subquery Syntax”.

A.1.4. Can MySQL 8.0 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see Section 13.2.12, “UPDATE Syntax”; for that required to perform multiple-table deletes, see Section 13.2.2, “DELETE Syntax”.

A multiple-table insert can be accomplished using a trigger whose FOR EACH ROW clause contains multiple INSERT statements within a BEGIN ... END block. See Section 24.3, “Using Triggers”.

A.1.5. Does MySQL 8.0 have Sequences?

No. However, MySQL has an AUTO_INCREMENT system, which in MySQL 8.0 can also handle inserts in a multi-master replication setup. With the auto_increment_increment and auto_increment_offset system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The auto_increment_increment value should be greater than the number of servers, and each server should have a unique offset.

A.1.6. Does MySQL 8.0 have a NOW() function with fractions of seconds?

Yes, see Section 11.3.5, “Fractional Seconds in Time Values”.

A.1.7. Does MySQL 8.0 work with multi-core processors?

Yes. MySQL is fully multithreaded, and will make use of multiple CPUs, provided that the operating system supports them.

A.1.8. Why do I see multiple processes for mysqld?

When using LinuxThreads, you should see a minimum of three mysqld processes running. These are in fact threads. There is one thread for the LinuxThreads manager, one thread to handle connections, and one thread to handle alarms and signals.

A.1.9. Can MySQL 8.0 perform ACID transactions?

Yes. All current MySQL versions support transactions. The InnoDB storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The NDB storage engine supports the READ COMMITTED transaction isolation level only.

A.2 MySQL 8.0 FAQ: Storage Engines

A.2.1 Where can I obtain complete documentation for MySQL storage engines? ......................... 4985
A.2.2 Are there any new storage engines in MySQL 8.0? ............................................................. 4985
A.2.3 Have any storage engines been removed in MySQL 8.0? ..................................................... 4985
A.2.4 Can I prevent the use of a particular storage engine? .......................................................... 4985
A.2.5 Is there an advantage to using the InnoDB storage engine exclusively, as opposed to a combination of InnoDB and non-InnoDB storage engines? ................................. 4985

A.2.6 What are the unique benefits of the ARCHIVE storage engine? .................................................. 4985

A.2.1. Where can I obtain complete documentation for MySQL storage engines?

See Chapter 16, Alternative Storage Engines. That chapter contains information about all MySQL storage engines except for the InnoDB storage engine and the NDB storage engine (used for MySQL Cluster). InnoDB is covered in Chapter 15, The InnoDB Storage Engine. NDB is covered in Chapter 22, MySQL NDB Cluster 8.0.

A.2.2. Are there any new storage engines in MySQL 8.0?

No. InnoDB is the default storage engine for new tables. See Section 15.1, "Introduction to InnoDB" for details.

A.2.3. Have any storage engines been removed in MySQL 8.0?

The PARTITION storage engine plugin which provided partitioning support is replaced by a native partitioning handler. As part of this change, the server can no longer be built using -DWITH_PARTITION_STORAGE_ENGINE. partition is also no longer displayed in the output of SHOW PLUGINS, or shown in the INFORMATION_SCHEMA.PLUGINS table.

In order to support partitioning of a given table, the storage engine used for the table must now provide its own ("native") partitioning handler. InnoDB is the only storage engine supported in MySQL 8.0 that includes a native partitioning handler. An attempt to create partitioned tables in MySQL 8.0 using any other storage engine fails. (The NDB storage engine used by MySQL Cluster also provides its own partitioning handler, but is currently not supported by MySQL 8.0.)

A.2.4. Can I prevent the use of a particular storage engine?

Yes. The disabled_storage_engines configuration option defines which storage engines cannot be used to create tables or tablespaces. By default, disabled_storage_engines is empty (no engines disabled), but it can be set to a comma-separated list of one or more engines.

A.2.5. Is there an advantage to using the InnoDB storage engine exclusively, as opposed to a combination of InnoDB and non-InnoDB storage engines?

Yes. Using InnoDB tables exclusively can simplify backup and recovery operations. MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a "warm" backup, where the database continues to run, but those tables cannot be modified while being backed up. See Section 30.2, "MySQL Enterprise Backup Overview".

A.2.6. What are the unique benefits of the ARCHIVE storage engine?

The ARCHIVE storage engine stores large amounts of data without indexes; it has a small footprint, and performs selects using table scans. See Section 16.5, "The ARCHIVE Storage Engine", for details.

A.3 MySQL 8.0 FAQ: Server SQL Mode

A.3.1 What are server SQL modes? ................................................................. 4986
A.3.2 How many server SQL modes are there? .................................................... 4986
A.3.3 How do you determine the server SQL mode? ............................................. 4986
A.3.4 Is the mode dependent on the database or connection? ................................. 4986
A.3.5 Can the rules for strict mode be extended? .................................................. 4986
A.3.6. Does strict mode impact performance? .................................................. 4986
A.3.7. What is the default server SQL mode when MySQL 8.0 is installed? .......... 4986

A.3.1. What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see Section 5.1.11, “Server SQL Modes”.

A.3.2. How many server SQL modes are there?

Each mode can be independently switched on and off. See Section 5.1.11, “Server SQL Modes”, for a complete list of available modes.

A.3.3. How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

A.3.4. Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

A.3.5. Can the rules for strict mode be extended?

When we refer to strict mode, we mean a mode where at least one of the modes TRADITIONAL, STRICT_TRANS_TABLES, or STRICT_ALL_TABLES is enabled. Options can be combined, so you can add restrictions to a mode. See Section 5.1.11, “Server SQL Modes”, for more information.

A.3.6. Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However, if you do require it, strict mode can provide such validation.

A.3.7. What is the default server SQL mode when MySQL 8.0 is installed?

The default SQL mode in MySQL 8.0 includes these modes: ONLY_FULL_GROUP_BY, STRICT_TRANS_TABLES, NO_ZERO_IN_DATE, NO_ZERO_DATE, ERROR_FOR_DIVISION_BY_ZERO, and NO_ENGINE_SUBSTITUTION.

For information about all available modes and default MySQL behavior, see Section 5.1.11, “Server SQL Modes”.

A.4 MySQL 8.0 FAQ: Stored Procedures and Functions

A.4.1. Does MySQL 8.0 support stored procedures and functions? .......................... 4987
A.4.2. Where can I find documentation for MySQL stored procedures and stored functions? .......... 4987
A.4.3. Is there a discussion forum for MySQL stored procedures? ............................... 4987
A.4.4. Where can I find the ANSI SQL 2003 specification for stored procedures? .................. 4987
A.4.5. How do you manage stored routines? ................................................................. 4987
A.4.6. Is there a way to view all stored procedures and stored functions in a given database? .......... 4987
A.4.1. Does MySQL 8.0 support stored procedures and functions?

Yes. MySQL 8.0 supports two types of stored routines, stored procedures and stored functions.

A.4.2. Where can I find documentation for MySQL stored procedures and stored functions?

See Section 24.2, "Using Stored Routines".

A.4.3. Is there a discussion forum for MySQL stored procedures?

A.4.4. Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books, such as SQL-99 Complete, Really by Peter Gulutzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including coverage of stored procedures.

A.4.5. How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with CREATE [FUNCTION|PROCEDURE], ALTER [FUNCTION|PROCEDURE], DROP [FUNCTION|PROCEDURE], and SHOW CREATE [FUNCTION|PROCEDURE]. You can obtain information about existing stored procedures using the ROUTINES table in the INFORMATION_SCHEMA database (see Section 25.23, "The INFORMATION_SCHEMA ROUTINES Table").

A.4.6. Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named dbname, use this query on the INFORMATION_SCHEMA.ROUTINES table:
A.4.7. Where are stored procedures stored?

Stored procedures are stored in the `mysql.routines` and `mysql.parameters` tables, which are part of the data dictionary. You cannot access these tables directly. Instead, query the `INFORMATION_SCHEMA ROUTINES` and `PARAMETERS` tables. See Section 25.23, “The INFORMATION_SCHEMA ROUTINES Table”, and Section 25.16, “The INFORMATION_SCHEMA PARAMETERS Table”.

You can also use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See Section 13.7.6.9, “SHOW CREATE PROCEDURE Syntax”.

A.4.8. Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 8.0.

A.4.9. Can a stored procedure call another stored procedure?

Yes.

A.4.10. Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

A.4.11. Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

A.4.12. Do stored procedures have a statement for raising application errors?

Yes. MySQL 8.0 implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See Section 13.6.7, “Condition Handling”.

A.4.13. Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See Section 13.6.7.2, “DECLARE ... HANDLER Syntax”, for details.

A.4.14. Can MySQL 8.0 stored routines return result sets?

`Stored procedures` can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or higher) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

A.4.15. Is `WITH RECOMPILE` supported for stored procedures?
A.4.16 Is there a MySQL equivalent to using mod_plsql as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 8.0.

A.4.17 Can I pass an array as input to a stored procedure?

Not in MySQL 8.0.

A.4.18 Can I pass a cursor as an IN parameter to a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only.

A.4.19 Can I return a cursor as an OUT parameter from a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only. However, if you do not open a cursor on a SELECT, the result will be sent directly to the client. You can also SELECT INTO variables. See Section 13.2.10, "SELECT Syntax".

A.4.20 Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a stored procedure, but not in a stored function. If you perform an ordinary SELECT inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client/server protocol for this to work. This means that, for example, in PHP, you need to use the mysqli extension rather than the old mysql extension.

A.4.21 Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

A.4.22 Do MySQL 8.0 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in Section 24.7, "Stored Program Binary Logging".

A.4.23 Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. ALTER and DROP statements for stored procedures and functions are also replicated.

A.4.24 How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated. Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

A.4.25 Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:
1. Any user wishing to create stored functions must be granted the SUPER privilege.

2. Alternatively, a DBA can set the log_bin_trust_function_creators system variable to 1, which enables anyone with the standard CREATE ROUTINE privilege to create stored functions.

A.4.26 What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Declaring stored functions to be DETERMINISTIC or setting the log_bin_trust_function_creators system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the IGNORE keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

A.4.27 Do the preceding limitations affect the ability of MySQL to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

A.4.28 What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

Mixed replication is also available (by starting the server with --binlog-format=mixed). This hybrid form of replication "knows" whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see Section 17.2.1, “Replication Formats”.

A.5 MySQL 8.0 FAQ: Triggers

A.5.1 Where can I find the documentation for MySQL 8.0 triggers? ................................................................. 4991
A.5.2 Is there a discussion forum for MySQL Triggers? ......................................................................................... 4991
A.5.3 Does MySQL 8.0 have statement-level or row-level triggers? ................................................................. 4991
A.5.4 Are there any default triggers? ..................................................................................................................... 4991
A.5.5 How are triggers managed in MySQL? ........................................................................................................... 4991
A.5.6 Is there a way to view all triggers in a given database? .................................................................................. 4991
A.5.7 Where are triggers stored? .......................................................................................................................... 4991
A.5.8 Can a trigger call a stored procedure? ........................................................................................................... 4991
A.5.9 Can triggers access tables? .......................................................................................................................... 4991
A.5.10 Can a table have multiple triggers with the same trigger event and action time? .................................. 4991
A.5.11 Can triggers call an external application through a UDF? .......................................................................... 4992
A.5.12 Is it possible for a trigger to update tables on a remote server? ................................................................. 4992
A.5.13 Do triggers work with replication? ................................................................. 4992
A.5.14 How are actions carried out through triggers on a master replicated to a slave? .......... 4992

A.5.1. Where can I find the documentation for MySQL 8.0 triggers?

See Section 24.3, “Using Triggers”.

A.5.2. Is there a discussion forum for MySQL Triggers?

A.5.3. Does MySQL 8.0 have statement-level or row-level triggers?

In MySQL 8.0, all triggers are FOR EACH ROW; that is, the trigger is activated for each row that is
inserted, updated, or deleted. MySQL 8.0 does not support triggers using FOR EACH STATEMENT.

A.5.4. Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some TIMESTAMP columns, as well as
for columns which are defined using AUTO_INCREMENT.

A.5.5. How are triggers managed in MySQL?

In MySQL 8.0, triggers can be created using the CREATE TRIGGER statement, and dropped using
TRIGGER Syntax”, for more about these statements.

Information about triggers can be obtained by querying the INFORMATION_SCHEMA.TRIGGERS
table. See Section 25.34, “The INFORMATION_SCHEMA.TRIGGERS Table”.

A.5.6. Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database dbname using a query on the
INFORMATION_SCHEMA.TRIGGERS table such as the one shown here:

```sql
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see Section 25.34, “The INFORMATION_SCHEMA
TRIGGERS Table”.

You can also use the SHOW TRIGGERS statement, which is specific to MySQL. See
Section 13.7.6.38, “SHOW TRIGGERS Syntax”.

A.5.7. Where are triggers stored?

Triggers are stored in the mysql.triggers system table, which is part of the data dictionary.

A.5.8. Can a trigger call a stored procedure?

Yes.

A.5.9. Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables,
but it is not permitted to modify a table that is already being used (for reading or writing) by the
statement that invoked the function or trigger.

A.5.10 Can a table have multiple triggers with the same trigger event and action time?
In MySQL 8.0, it is possible to define multiple triggers for a given table that have the same trigger event and action time. For example, you can have two `BEFORE UPDATE` triggers for a table. By default, triggers that have the same trigger event and action time activate in the order they were created. To affect trigger order, specify a clause after `FOR EACH ROW` that indicates `FOLLOWS` or `PRECEDES` and the name of an existing trigger that also has the same trigger event and action time. With `FOLLOWS`, the new trigger activates after the existing trigger. With `PRECEDES`, the new trigger activates before the existing trigger.

A.5.11 Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF.

A.5.12 Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See Section 16.8, “The FEDERATED Storage Engine”).

A.5.13 Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL’s “classic” statement-based or row-based replication format.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see Section 17.4.1.35, “Replication and Triggers”.

A.5.14 How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

**Statement-based replication.** First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

**Row-based replication.** When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and, in addition, the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.
In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see Section 17.4.1.35, “Replication and Triggers”.

**A.6 MySQL 8.0 FAQ: Views**

A.6.1 Where can I find documentation covering MySQL Views? .......................... 4993
A.6.2 Is there a discussion forum for MySQL Views? ........................................ 4993
A.6.3 What happens to a view if an underlying table is dropped or renamed? .................. 4993
A.6.4 Does MySQL 8.0 have table snapshots? ............................................. 4993
A.6.5 Does MySQL 8.0 have materialized views? ........................................... 4993
A.6.6 Can you insert into views that are based on joins? .................................. 4993

**A.6.1. Where can I find documentation covering MySQL Views?**

See Section 24.5, “Using Views”.

**A.6.2. Is there a discussion forum for MySQL Views?**

Yes. See https://forums.mysql.com/list.php?100

**A.6.3. What happens to a view if an underlying table is dropped or renamed?**

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See Section 13.7.3.2, “CHECK TABLE Syntax”.)

**A.6.4. Does MySQL 8.0 have table snapshots?**

No.

**A.6.5. Does MySQL 8.0 have materialized views?**

No.

**A.6.6. Can you insert into views that are based on joins?**

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

**A.7 MySQL 8.0 FAQ: INFORMATION_SCHEMA**

A.7.1 Where can I find documentation for the MySQL INFORMATION_SCHEMA database? .......... 4994
A.7.2 Is there a discussion forum for INFORMATION_SCHEMA? .......................... 4994
A.7.3 Where can I find the ANSI SQL 2003 specification for INFORMATION_SCHEMA? .............. 4994
A.7.4 What is the difference between the Oracle Data Dictionary and MySQL INFORMATION_SCHEMA? .......................................................... 4994
A.7.5 Can I add to or otherwise modify the tables found in the INFORMATION_SCHEMA database? .... 4994
A.7.1. Where can I find documentation for the MySQL INFORMATION_SCHEMA database?

See Chapter 25, INFORMATION_SCHEMA Tables

A.7.2. Is there a discussion forum for INFORMATION_SCHEMA?

A.7.3. Where can I find the ANSI SQL 2003 specification for INFORMATION_SCHEMA?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available, such as SQL-99 Complete, Really by Peter Gulutzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including INFORMATION_SCHEMA.

A.7.4. What is the difference between the Oracle Data Dictionary and MySQL INFORMATION_SCHEMA?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. The MySQL implementation is more similar to those found in DB2 and SQL Server, which also support INFORMATION_SCHEMA as defined in the SQL standard.

A.7.5. Can I add to or otherwise modify the tables found in the INFORMATION_SCHEMA database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, we cannot support bugs or other issues which result from modifying INFORMATION_SCHEMA tables or data.

A.8 MySQL 8.0 FAQ: Migration

A.8.1 Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0?

For detailed upgrade information, see Section 2.11, “Upgrading MySQL”. Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will save time and trouble. If you encounter problems during the upgrade, their origin will be easier to identify, either by you or, if you have a MySQL Enterprise subscription, by MySQL support.

A.8.2. How has storage engine (table type) support changed in MySQL 8.0 from previous versions?

Storage engine support has changed as follows:

- Support for ISAM tables was removed in MySQL 5.0 and you should now use the MyISAM storage engine in place of ISAM. To convert a table tblname from ISAM to MyISAM, simply issue a statement such as this one:

  ```sql
  ALTER TABLE tblname ENGINE=MYISAM;
  ```

- Internal RAID for MyISAM tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as MERGE tables and views.

- The VARCHAR column type now retains trailing spaces in all storage engines.

- MEMORY tables (formerly known as HEAP tables) can also contain VARCHAR columns.
A.9 MySQL 8.0 FAQ: Security

A.9.1 Where can I find documentation that addresses security issues for MySQL?

The best place to start is Chapter 6, Security.

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- Section 6.1.1, “Security Guidelines”.
- Section 6.1.3, “Making MySQL Secure Against Attackers”.
- Section B.4.3.2, “How to Reset the Root Password”.
- Section 6.1.5, “How to Run MySQL as a Normal User”.
- Section 29.4.2.6, “UDF Security Precautions”.
- Section 6.1.4, “Security-Related mysqld Options and Variables”.
- Section 6.1.6, “Security Issues with LOAD DATA LOCAL”.
- Section 2.10, “Postinstallation Setup and Testing”.
- Section 6.3, “Using Encrypted Connections”.

A.9.2 What is the default authentication plugin in MySQL 8.0?

The default authentication plugin in MySQL 8.0 is caching_sha2_password. For information about this plugin, see Section 6.4.1.3, “Caching SHA-2 Pluggable Authentication”.

The caching_sha2_password plugin provides more secure password encryption than the mysql_native_password plugin (the default plugin in previous MySQL series). For information about the implications of this change of default plugin for server operation and compatibility of the server with clients and connectors, see caching_sha2_password as the Preferred Authentication Plugin.

For general information about pluggable authentication and other available authentication plugins, see Section 6.2.17, “Pluggable Authentication”, and Section 6.4.1, “Authentication Plugins”.

A.9.3 Does MySQL 8.0 have native support for SSL?

Most 8.0 binaries have support for SSL connections between the client and server. See Section 6.3, “Using Encrypted Connections”.

You can also tunnel a connection using SSH, if (for example) the client application does not support SSL connections. For an example, see Section 6.3.6, “Connecting to MySQL Remotely from Windows with SSH”.

A.9.4 Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?
Most 8.0 binaries have SSL enabled for client/server connections that are secured, authenticated, or both. See Section 6.3, “Using Encrypted Connections”.

A.9.5. Does MySQL 8.0 have built-in authentication against LDAP directories?

The Enterprise edition includes a PAM Authentication Plugin that supports authentication against an LDAP directory.

A.9.6. Does MySQL 8.0 include support for Roles Based Access Control (RBAC)?

Not at this time.

A.10 MySQL 8.0 FAQ: NDB Cluster

In the following section, we answer questions that are frequently asked about MySQL NDB Cluster and the NDB storage engine.

A.10.1 Which versions of the MySQL software support NDB Cluster? Do I have to compile from source?

NDB Cluster is not supported in MySQL Server 8.0 releases; it is released as a separate product. NDB Cluster 8.0 is now available as a Developer Preview release for evaluation and testing of new features in the NDBCLUSTER storage engine; for more information, see Chapter 22, MySQL NDB Cluster 8.0. You are strongly advised to use NDB Cluster 7.6 for any new deployments; if you are using an older version of NDB Cluster, we recommend that you upgrade to this version soon as possible. For an overview of improvements made in NDB Cluster 7.6, see What is New in NDB Cluster 7.6.

NDB Cluster 7.6, based on MySQL Server 5.7 and version 7.6 of the NDB storage engine, is is the most recent General Availability (GA) version of NDB Cluster, based on version 7.6 of the NDB storage engine and MySQL Server 5.7. NDB Cluster 7.6 is available for production use; new deployments intended for production should use the latest GA release in this series, which is currently NDB Cluster 7.6.11. You can obtain the most recent NDB Cluster 7.6 release from https://dev.mysql.com/downloads/cluster/. For information about new features and other important changes in this series, see What is New in NDB Cluster 7.6.

For detailed information about deploying and using NDB Cluster, see Chapter 22, MySQL NDB Cluster 8.0.

A.10.2 What do “NDB” and “NDBCLUSTER” mean?

“NDB” stands for “Network Database”. NDB and NDBCLUSTER are both names for the storage engine that enables clustering support with MySQL. NDB is preferred, but either name is correct.

A.10.3 How many computers do I need to run an NDB Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum recommended number of computers in an NDB Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.
A.11 MySQL 8.0 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

A.11.1 What CJK character sets are available in MySQL? ........................................... 4997
A.11.2 I have inserted CJK characters into my table. Why does SELECT display them as “?” characters? ................................................................. 4998
A.11.3 What problems should I be aware of when working with the Big5 Chinese character set? ........... 5000
A.11.4 Why do Japanese character set conversions fail? .................................................. 5000
A.11.5 What should I do if I want to convert SJIS 81CA to cp932? ................................ 5001
A.11.6 How does MySQL represent the Yen (¥) sign? .................................................... 5001
A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL? ........... 5002
A.11.8 Why do I get incorrect string value error messages? .............................................. 5002
A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API? ......................................................... 5003
A.11.10 I've upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets? ................................................................................................................. 5004
A.11.11 Why do some LIKE and FULLTEXT searches with CJK characters fail? ......................... 5005
A.11.12 How do I know whether character X is available in all character sets? ........................... 5005
A.11.13 Why do CJK strings sort incorrectly in Unicode? (I) ............................................. 5006
A.11.14 Why do CJK strings sort incorrectly in Unicode? (II) .............................................. 5007
A.11.15 Why are my supplementary characters rejected by MySQL? ..................................... 5007
A.11.16 Should “CJK” be “CJKV”? .................................................................................. 5007
A.11.17 Does MySQL permit CJK characters to be used in database and table names? ................ 5007
A.11.18 Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean? ... 5007
A.11.19 Where can I get help with CJK and related issues in MySQL? .................................. 5007

A.11.1 What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the gb18030 character set is not supported prior to MySQL 5.7.4. However, since the name of the applicable language appears in the DESCRIPTION column for every entry in the INFORMATION_SCHEMA.CHARACTER_SETS table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```sql
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
FROM INFORMATION_SCHEMA.CHARACTER_SETS
WHERE DESCRIPTION LIKE '%Chin%'
OR DESCRIPTION LIKE '%Japanese%'
OR DESCRIPTION LIKE '%Korean%'
ORDER BY CHARACTER_SET_NAME;
```

<table>
<thead>
<tr>
<th>CHARACTER_SET_NAME</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>big5</td>
<td>Big5 Traditional Chinese</td>
</tr>
<tr>
<td>cp932</td>
<td>SJIS for Windows Japanese</td>
</tr>
<tr>
<td>eucjpms</td>
<td>UJIS for Windows Japanese</td>
</tr>
<tr>
<td>euckr</td>
<td>EUC-KR Korean</td>
</tr>
<tr>
<td>gb18030</td>
<td>China National Standard GB18030</td>
</tr>
</tbody>
</table>
MySQL supports three variants of the GB (Guojia Biaozhun, or National Standard, or Simplified Chinese) character sets which are official in the People's Republic of China: gb2312, gbk, and (as of MySQL 5.7.4) gb18030.

Sometimes people try to insert gbk characters into gb2312, and it works most of the time because gbk is a superset of gb2312. But eventually they try to insert a rarer Chinese character and it does not work. (For an example, see Bug #16072).

Here, we try to clarify exactly what characters are legitimate in gb2312 or gbk, with reference to the official documents. Please check these references before reporting gb2312 or gbk bugs:

- The MySQL gbk character set is in reality “Microsoft code page 936”. This differs from the official gbk for characters A1A4 (middle dot), A1AA (em dash), A6E0-A6F5, and A8BB-A8C0.
- For a listing of gbk/Unicode mappings, see http://www.unicode.org/Public/MAPPINGS/VENDORS/MICROSOFT/WINDOWS/CP936.TXT.

It is also possible to store CJK characters in Unicode character sets, although the available collations may not sort characters quite as you expect:

- The utf8 and ucs2 character sets support the characters from Unicode Basic Multilingual Plane (BMP). These characters have code point values between U+0000 and U+FFFF.

- The utf8mb4, utf16, utf16le, and utf32 character sets support BMP characters, as well as supplementary characters that lie outside the BMP. Supplementary characters have code point values between U+10000 and U+10FFFF.

The collation used for a Unicode character set determines the ability to sort (that is, distinguish) characters in the set:

- Collations based on Unicode Collation Algorithm (UCA) 4.0.0 distinguish only BMP characters.
- Collations based on UCA 5.2.0 or 9.0.0 distinguish BMP and supplementary characters.
- Non-UCA collations may not distinguish all Unicode characters. For example, the utf8mb4 default collation is utf8mb4_general_ci, which distinguishes only BMP characters.

Moreover, distinguishing characters is not the same as ordering them per the conventions of a given CJK language. Currently, MySQL has only one CJK-specific UCA collation, gb18030_unicode_x201A520_ci (which requires use of the non-Unicode gb18030 character set).

For information about Unicode collations and their differentiating properties, including collation properties for supplementary characters, see Section 10.10.1, “Unicode Character Sets”.

### A.11.2 I have inserted CJK characters into my table. Why does SELECT display them as “?” characters?

This problem is usually due to a setting in MySQL that does not match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:
• Be certain of what MySQL version you are using.

Use the statement `SELECT VERSION();` to determine this.

• Make sure that the database is actually using the desired character set.

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or, better yet, by using this statement:

```
SELECT character_set_name, collation_name 
FROM information_schema.columns 
WHERE table_schema = your_database_name 
AND table_name = your_table_name 
AND column_name = your_column_name;
```

• Determine the hexadecimal value of the character or characters that are not being displayed correctly.

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name) 
FROM table_name;
```

3F is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

• Make sure that a round trip is possible. When you select literal (or _introducer hexadecimal-value), do you obtain literal as a result?

For example, the Japanese Katakana character `Pe (ぺ)` exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ぺ' AS `ぺ`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also `ぺ`, the round trip failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ぺ');`. Then we can determine whether the client encoding is correct.

• Make sure that the problem is not with the browser or other application, rather than with MySQL.

Use the `mysql` client program to accomplish this task. If `mysql` displays characters correctly but your application does not, your problem is probably due to system settings.

To determine your settings, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE `char%`;
+--------------------------+----------------------------------------+
| Name                     | Value       |
+--------------------------+----------------------------------------+
```
These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what setting your underlying computer uses, try changing to a common character set for the country that you're in (`euckr` = Korea; `gb18030`, `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. The `SET NAMES` statement changes all three at once. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5

[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

**A.11.3** What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). The MySQL `big5` character set is in reality Microsoft code page 950, which is very similar to the original `big5` character set.

A feature request for adding HKSCS extensions has been filed. People who need this extension may find the suggested patch for Bug #13577 to be of interest.

**A.11.4** Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpms` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations; that is, the last 4 columns provide the...
hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

</tr>
</tbody>
</table>

Now consider the following portion of the table.

<table>
<thead>
<tr>
<th></th>
<th>ucs2</th>
<th>sjis</th>
<th>cp932</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT SIGN</td>
<td>00AC</td>
<td>81CA</td>
<td>3F</td>
</tr>
<tr>
<td>FULLWIDTH NOT SIGN</td>
<td>FFE2</td>
<td>3F</td>
<td>81CA</td>
</tr>
</tbody>
</table>

This means that MySQL converts the `NOT SIGN` (Unicode U+00AC) to `sjis` code point 0x81CA and to `cp932` code point 3F. (3F is the question mark ("?". This is what is always used when the conversion cannot be performed.)

**A.11.5** What should I do if I want to convert SJIS 81CA to cp932?

Our answer is: "?". There are disadvantages to this, and many people would prefer a “loose” conversion, so that 81CA (NOT SIGN) in sjis becomes 81CA (FULLWIDTH NOT SIGN) in cp932.

**A.11.6** How does MySQL represent the Yen (¥) sign?
A problem arises because some versions of Japanese character sets (both sjis and euc) treat 5C as a reverse solidus (\, also known as a backslash), whereas others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, 5C is always the reverse solidus (\).

A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the euckr (Extended Unix Code Korea) character set, only one problem has been noted. We use the “ASCII” variant of EUC-KR, in which the code point 0x5c is REVERSE SOLIDUS, that is \, instead of the “KS-Roman” variant of EUC-KR, in which the code point 0x5c is WON SIGN (₩). This means that you cannot convert Unicode U+20A9 to euckr:

```
mysql> SELECT CONVERT('₩' USING euckr) AS euckr,
     HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-------+----------+
| euckr | hexeuckr |
| ?     | 3F       |
+-------+----------+
```

A.11.8 Why do I get Incorrect string value error messages?

To see the problem, create a table with one Unicode (ucs2) column and one Chinese (gb2312) column.

```
mysql> CREATE TABLE ch
    (ucs2 CHAR(3) CHARACTER SET ucs2,
     gb2312 CHAR(3) CHARACTER SET gb2312);
```

In nonstrict SQL mode, try to place the rare character 汌 in both columns.

```
mysql> SET sql_mode = '';
m.mysql> INSERT INTO ch VALUES ('Afolios', 'Afolios');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

The INSERT produces a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS\G
*************************** 1. row ***************************
Level: Warning
Code: 1366
Message: Incorrect string value: '\xE6\xB1\x8CB' for column 'gb2312' at row 1
```

So it is a warning about the gb2312 column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-------+--------------+--------+-------------+
| ucs2  | HEX(ucs2)    | gb2312 | HEX(gb2312) |
| Afolios | 00416C4C0042 | Afolios | 413F42      |
+-------+--------------+--------+-------------+
```

Several things need explanation here:
1. The ilit character is not in the gb2312 character set, as described earlier.

2. If you are using an old version of MySQL, you may see a different message.

3. A warning occurs rather than an error because MySQL is not set to use strict SQL mode. In nonstrict mode, MySQL tries to do what it can, to get the best fit, rather than give up. With strict SQL mode, the Incorrect string value message occurs as an error rather than a warning, and the INSERT fails.

**A.11.9  Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API?**

Obtain a direct connection to the server using the `mysql` client, and try the same query there. If `mysql` responds correctly, the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, you are most likely connecting with Connector/ODBC. In this case, you should check Configuring Connector/ODBC. If, for example, you use big5, you would enter SET NAMES 'big5'. (In this case, no ; character is required.) If you are using ASP, you might need to add SET NAMES in the code. Here is an example that has worked in the past:

```sql
<% Session.CodePage=0 Dim strConnection Dim Conn strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" & "pwd=password;database=database;stmt=SET NAMES 'big5';" Set Conn = Server.CreateObject("ADODB.Connection") Conn.Open strConnection %>
```

In much the same way, if you are using any character set other than latin1 with Connector/NET, you must specify the character set in the connection string. See Connecting to MySQL Using Connector/NET, for more information.

If you are using PHP, try this:

```php
$link = new mysqli($host, $usr, $pwd, $db);
if( mysqli_connect_errno() ) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
$link->query("SET NAMES 'utf8'");
?>
```

In this case, we used SET NAMES to change character_set_client, character_set_connection, and character_set_results.

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as UTF-8, include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` section of the HTML page.
If you are using Connector/J, see Using Character Sets and Unicode.

A.11.10 I've upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single "global" character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a "handshake", as described in Section 10.4, "Connection Character Sets and Collations":

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some Asian customers prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use. However, the server ignores this request from the client.

By way of example, suppose that your favorite server character set is `latin1`. Suppose further that the client uses `utf8` because this is what the client's operating system supports. Start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The resulting settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | utf8                                   |
| character_set_connection | utf8                                   |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | utf8                                   |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
```

Now stop the client, and stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```
Start the client with `utf8` once again as the default character set, then display the resulting settings:

```sql
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | latin1                                 |
| character_set_connection | latin1                                 |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | latin1                                 |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/  |
+--------------------------+----------------------------------------+
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client’s initial settings if the `--skip-character-set-client-handshake` option is used.

**A.11.1** Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

For `LIKE` searches, there is a very simple problem with binary string column types such as `BINARY` and `BLOB`: we must know where characters end. With multibyte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `ぁ` requires three bytes, as shown here:

```
<table>
<thead>
<tr>
<th>OCTET_LENGTH(_utf8 'A')</th>
<th>OCTET_LENGTH(_utf8 'ぁ')</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>
```

If we do not know where the first character in a string ends, we do not know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a nonbinary string column type defined to have the proper CJK character set. For example: `mycol TEXT CHARACTER SET sjis`. Alternatively, convert to a CJK character set before comparing.

This is one reason why MySQL cannot permit encodings of nonexistent characters. If it is not strict about rejecting bad input, it has no way of knowing where characters end.

For `FULLTEXT` searches, we must know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary: the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

**A.11.12** How do I know whether character `x` is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese Kana characters appear in all CJK character sets. The following stored procedure accepts a `UCS-2` Unicode character, converts it to other character sets, and displays the results in hexadecimal.

```sql
DELIMITER //
```
CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
(ucs2 CHAR(1) CHARACTER SET ucs2,
 utf8 CHAR(1) CHARACTER SET utf8,
 big5 CHAR(1) CHARACTER SET big5,
 cp932 CHAR(1) CHARACTER SET cp932,
 eucjpms CHAR(1) CHARACTER SET eucjpms,
 euckr CHAR(1) CHARACTER SET euckr,
 gb2312 CHAR(1) CHARACTER SET gb2312,
 gbk CHAR(1) CHARACTER SET gbk,
 sjis CHAR(1) CHARACTER SET sjis,
 ujis CHAR(1) CHARACTER SET ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
 big5=ucs2,
 cp932=ucs2,
 eucjpms=ucs2,
 euckr=ucs2,
 gb2312=ucs2,
 gbk=ucs2,
 sjis=ucs2,
 ujis=ucs2;

/* If there are conversion problems, UPDATE produces warnings. */

SELECT hex(ucs2) AS ucs2,
 hex(utf8) AS utf8,
 hex(big5) AS big5,
 hex(cp932) AS cp932,
 hex(eucjpms) AS eucjpms,
 hex(euckr) AS euckr,
 hex(gb2312) AS gb2312,
 hex(gbk) AS gbk,
 hex(sjis) AS sjis,
 hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;
END;
DELIMITER ;

The input can be any single ucs2 character, or it can be the code value (hexadecimal representation) of that character. For example, from Unicode's list of ucs2 encodings and names (http://www.unicode.org/Public/UNIDATA/UnicodeData.txt), we know that the Katakana character Pe appears in all CJK character sets, and that its code value is \texttt{X'30DA'}. If we use this value as the argument to \texttt{p_convert()}, the result is as shown here:

```
mysql> CALL p_convert(X'30DA');
+--------+--------+--------+--------+--------+--------+--------+--------+--------+--------+
| ucs2   | utf8   | big5   | cp932  | eucjpms| euckr  | gb2312 | gbk    | sjis   | ujis   |
|--------+--------+--------+--------+--------+--------+--------+--------+--------+--------|
| 30DA   | E3839A | C772   | 8379   | A5DA   | ABDA   | A5DA   | A5DA   | 8379   | A5DA   |
+--------+--------+--------+--------+--------+--------+--------+--------+--------+--------+
```

Since none of the column values is \texttt{3F} (that is, the question mark character, ?), we know that every conversion worked.

A.11.13 Why do CJK strings sort incorrectly in Unicode? (I)
CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

**A.11.14.** Why do CJK strings sort incorrectly in Unicode? (II)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

**A.11.15.** Why are my supplementary characters rejected by MySQL?

Supplementary characters lie outside the Unicode Basic Multilingual Plane / Plane 0. BMP characters have code point values between U+0000 and U+FFFF. Supplementary characters have code point values between U+10000 and U+10FFFF.

To store supplementary characters, you must use a character set that permits them:

- The `utf8` and `ucs2` character sets support BMP characters only.
- The `utf8` character set permits only UTF-8 characters that take up to three bytes. This has led to reports such as that found in Bug #12600, which we rejected as "not a bug". With `utf8`, MySQL must truncate an input string when it encounters bytes that it does not understand. Otherwise, it is unknown how long the bad multibyte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the "bad" characters are changed to question marks. However, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters outside the BMP.

**A.11.16.** Should “CJK” be “CJKV”?

No. The term “CJKV” (Chinese Japanese Korean Vietnamese) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL supports the modern Vietnamese script with Western characters, but does not support the old Vietnamese script using Han characters.

As of MySQL 5.6, there are Vietnamese collations for Unicode character sets, as described in Section 10.10.1, “Unicode Character Sets”.

**A.11.17.** Does MySQL permit CJK characters to be used in database and table names?

Yes.

**A.11.18.** Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

The Japanese translation of the MySQL 5.6 manual can be downloaded from https://dev.mysql.com/doc/.

**A.11.19.** Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at https://wikis.oracle.com/display/mysql/List+of+MySQL+User+Groups.
- View feature requests relating to character set issues at http://tinyurl.com/y6xcuf.
A.12 MySQL 8.0 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- Section 28.7.29, “C API Common Issues”
- Common Problems with MySQL and PHP
- Connector/ODBC Notes and Tips
- Connector/NET Programming
- MySQL Connector/J 8.0 Developer Guide

A.13 MySQL 8.0 FAQ: Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication.

A.13.1 Must the slave be connected to the master all the time? ................................................. 5008
A.13.2 Must I enable networking on my master and slave to enable replication? .......................... 5008
A.13.3 How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave? ................................................................. 5009
A.13.4 How do I force the master to block updates until the slave catches up? ................................ 5009
A.13.5 What issues should I be aware of when setting up two-way replication? ............................. 5009
A.13.6 How can I use replication to improve performance of my system? ..................................... 5010
A.13.7 What should I do to prepare client code in my own applications to use performance-enhancing replication? ................................................................................................................ 5010
A.13.8 When and how much can MySQL replication improve the performance of my system? ........ 5010
A.13.9 How can I use replication to provide redundancy or high availability? ............................... 5011
A.13.10 How do I tell whether a master server is using statement-based or row-based binary logging format? .......................................................................................................................... 5011
A.13.11 How do I tell a slave to use row-based replication? ............................................................. 5011
A.13.12 How do I prevent *GRANT* and *REVOKE* statements from replicating to slave machines? .... 5011
A.13.13 Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on OS X and Windows)? ............................................................................. 5012
A.13.14 Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)? ................................................................. 5012

A.13.1 Must the slave be connected to the master all the time?

No, it does not. The slave can go down or stay disconnected for hours or even days, and then reconnect and catch up on updates. For example, you can set up a master/slave relationship over a dial-up link where the link is up only sporadically and for short periods of time. The implication of this is that, at any given time, the slave is not guaranteed to be in synchrony with the master unless you take some special measures.

To ensure that catchup can occur for a slave that has been disconnected, you must not remove binary log files from the master that contain information that has not yet been replicated to the slaves. Asynchronous replication can work only if the slave is able to continue reading the binary log from the point where it last read events.

A.13.2 Must I enable networking on my master and slave to enable replication?
Yes, networking must be enabled on the master and slave. If networking is not enabled, the slave cannot connect to the master and transfer the binary log. Check that the `skip-networking` option has not been enabled in the configuration file for either server.

### A.13.3 How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave?

Check the `Seconds_Behind_Master` column in the output from `SHOW SLAVE STATUS`. See Section 17.1.7.1, "Checking Replication Status".

When the slave SQL thread executes an event read from the master, it modifies its own time to the event timestamp. (This is why `TIMESTAMP` is well replicated.) In the `Time` column in the output of `SHOW PROCESSLIST`, the number of seconds displayed for the slave SQL thread is the number of seconds between the timestamp of the last replicated event and the real time of the slave machine. You can use this to determine the date of the last replicated event. Note that if your slave has been disconnected from the master for one hour, and then reconnects, you may immediately see large `Time` values such as 3600 for the slave SQL thread in `SHOW PROCESSLIST`. This is because the slave is executing statements that are one hour old. See Section 17.2.2, “Replication Implementation Details”.

### A.13.4 How do I force the master to block updates until the slave catches up?

Use the following procedure:

1. On the master, execute these statements:

   ```
   mysql> FLUSH TABLES WITH READ LOCK;
   mysql> SHOW MASTER STATUS;
   ```

   Record the replication coordinates (the current binary log file name and position) from the output of the `SHOW` statement.

2. On the slave, issue the following statement, where the arguments to the `MASTER_POS_WAIT()` function are the replication coordinate values obtained in the previous step:

   ```
   mysql> SELECT MASTER_POS_WAIT('log_name', log_pos);
   ```

   The `SELECT` statement blocks until the slave reaches the specified log file and position. At that point, the slave is in synchrony with the master and the statement returns.

3. On the master, issue the following statement to enable the master to begin processing updates again:

   ```
   mysql> UNLOCK TABLES;
   ```

### A.13.5 What issues should I be aware of when setting up two-way replication?

MySQL replication currently does not support any locking protocol between master and slave to guarantee the atomicity of a distributed (cross-server) update. In other words, it is possible for client A to make an update to co-master 1, and in the meantime, before it propagates to co-master 2, client B could make an update to co-master 2 that makes the update of client A work differently than it did on co-master 1. Thus, when the update of client A makes it to co-master 2, it produces tables that are different from what you have on co-master 1, even after all the updates from co-master 2 have also propagated. This means that you should not chain two servers together in a two-way
replication relationship unless you are sure that your updates can safely happen in any order, or
unless you take care of mis-ordered updates somehow in the client code.

You should also realize that two-way replication actually does not improve performance very much
(if at all) as far as updates are concerned. Each server must do the same number of updates, just
as you would have a single server do. The only difference is that there is a little less lock contention
because the updates originating on another server are serialized in one slave thread. Even this
benefit might be offset by network delays.

**A.13.6 How can I use replication to improve performance of my system?**

Set up one server as the master and direct all writes to it. Then configure as many slaves as you
have the budget and rackspace for, and distribute the reads among the master and the slaves. You
can also start the slaves with the `--skip-innodb` and `--low-priority-updates` options, and
set the `delay_key_write` system variable to `ALL` to get speed improvements on the slave end.
In this case, the slave uses nontransactional MyISAM tables instead of InnoDB tables to get more
speed by eliminating transactional overhead.

**A.13.7 What should I do to prepare client code in my own applications to use performance-enhancing
replication?**

See the guide to using replication as a scale-out solution, Section 17.3.5, “Using Replication for
Scale-Out”.

**A.13.8 When and how much can MySQL replication improve the performance of my system?**

MySQL replication is most beneficial for a system that processes frequent reads and infrequent
writes. In theory, by using a single-master/multiple-slave setup, you can scale the system by adding
more slaves until you either run out of network bandwidth, or your update load grows to the point
that the master cannot handle it.

To determine how many slaves you can use before the added benefits begin to level out, and how
much you can improve performance of your site, you must know your query patterns, and determine
empirically by benchmarking the relationship between the throughput for reads and writes on a
typical master and a typical slave. The example here shows a rather simplified calculation of what
you can get with replication for a hypothetical system. Let `reads` and `writes` denote the number of
reads and writes per second, respectively.

Let's say that system load consists of 10% writes and 90% reads, and we have determined by
benchmarking that `reads` is `1200 - 2 * writes`. In other words, the system can do 1,200 reads per
second with no writes, the average write is twice as slow as the average read, and the relationship
is linear. Suppose that the master and each slave have the same capacity, and that we have one
master and `N` slaves. Then we have for each server (master or slave):

\[
reads = 1200 - 2 \times writes
\]

\[
reads = \frac{9 \times writes}{N + 1} \quad \text{(reads are split, but writes replicated to all slaves)}
\]

\[
9 \times \frac{writes}{N + 1} + 2 \times writes = 1200
\]

\[
writes = \frac{1200}{2 + 9/(N + 1)}
\]

The last equation indicates the maximum number of writes for `N` slaves, given a maximum possible
read rate of 1,200 per second and a ratio of nine reads per write.

This analysis yields the following conclusions:
• If $N = 0$ (which means we have no replication), our system can handle about $1200/11 = 109$ writes per second.

• If $N = 1$, we get up to 184 writes per second.

• If $N = 8$, we get up to 400 writes per second.

• If $N = 17$, we get up to 480 writes per second.

• Eventually, as $N$ approaches infinity (and our budget negative infinity), we can get very close to 600 writes per second, increasing system throughput about 5.5 times. However, with only eight servers, we increase it nearly four times.

These computations assume infinite network bandwidth and neglect several other factors that could be significant on your system. In many cases, you may not be able to perform a computation similar to the one just shown that accurately predicts what will happen on your system if you add $N$ replication slaves. However, answering the following questions should help you decide whether and by how much replication will improve the performance of your system:

• What is the read/write ratio on your system?

• How much more write load can one server handle if you reduce the reads?

• For how many slaves do you have bandwidth available on your network?

A.13.9 How can I use replication to provide redundancy or high availability?

How you implement redundancy is entirely dependent on your application and circumstances. High-availability solutions (with automatic failover) require active monitoring and either custom scripts or third party tools to provide the failover support from the original MySQL server to the slave.

To handle the process manually, you should be able to switch from a failed master to a pre-configured slave by altering your application to talk to the new server or by adjusting the DNS for the MySQL server from the failed server to the new server.

For more information and some example solutions, see Section 17.3.8, “Switching Masters During Failover”.

A.13.10 How do I tell whether a master server is using statement-based or row-based binary logging format?

Check the value of the `binlog_format` system variable:

```
mysql> SHOW VARIABLES LIKE 'binlog_format';
```

The value shown will be one of `STATEMENT`, `ROW`, or `MIXED`. For `MIXED` mode, statement-based logging is used by default but replication switches automatically to row-based logging under certain conditions, such as unsafe statements. For information about when this may occur, see Section 5.4.4.3, “Mixed Binary Logging Format”.

A.13.11 How do I tell a slave to use row-based replication?

Slaves automatically know which format to use.

A.13.12 How do I prevent `GRANT` and `REVOKE` statements from replicating to slave machines?

Start the server with the `--replicate-wild-ignore-table=mysql.%` option to ignore replication for tables in the `mysql` database.
A.13.1 Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on OS X and Windows)?
Yes.

A.13.1 Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)?
Yes.

A.14 MySQL 8.0 FAQ: MySQL Enterprise Thread Pool

A.14.1 What is the Thread Pool and what problem does it solve? ............................................................... 5012
A.14.2 How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput? ............................................................................................................. 5012
A.14.3 How is the Thread Pool different from the client side Connection Pool? .............................................. 5012
A.14.4 When should I use the Thread Pool? ..................................................................................................... 5013
A.14.5 Are there recommended Thread Pool configurations? ............................................................................ 5013

A.14.1 What is the Thread Pool and what problem does it solve?

The MySQL Thread Pool is a MySQL server plugin that extends the default connection-handling capabilities of the MySQL server to limit the number of concurrently executing statements/queries and transactions to ensure that each has sufficient CPU and memory resources to fulfill its task. For MySQL 8.0, the Thread Pool plugin is included in MySQL Enterprise Edition, a commercial product.

The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. The Thread Pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The Thread Pool plugin increases server performance by efficiently managing statement execution threads for large numbers of client connections, especially on modern multi-CPU/Core systems.

For more information, see Section 5.6.3, “MySQL Enterprise Thread Pool”.

A.14.2 How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput?

The Thread Pool uses a “divide and conquer” approach to limiting and balancing concurrency. Unlike the default connection handling of the MySQL Server, the Thread Pool separates connections and threads, so there is no fixed relationship between connections and the threads that execute statements received from those connections. The Thread Pool then manages client connections within configurable thread groups, where they are prioritized and queued based on the nature of the work they were submitted to accomplish.

For more information, see Section 5.6.3.3, “Thread Pool Operation”.

A.14.3 How is the Thread Pool different from the client side Connection Pool?

The MySQL Connection Pool operates on the client side to ensure that a MySQL client does not constantly connect to and disconnect from the MySQL server. It is designed to cache idle connections in the MySQL client for use by other users as they are needed. This minimizes the overhead and expense of establishing and tearing down connections as queries are submitted to the MySQL server. The MySQL Connection Pool has no visibility as to the query handling capabilities or load of the back-end MySQL server. By contrast, the Thread Pool operates on the MySQL server side and is designed to manage the execution of inbound concurrent connections.
and queries as they are received from the client connections accessing the back-end MySQL database. Because of the separation of duties, the MySQL Connection Pool and Thread Pool are orthogonal and can be used independent of each other.

MySQL Connection Pooling via the MySQL Connectors is covered in Chapter 28, Connectors and APIs.

A.14.4 When should I use the Thread Pool?

There are a few rules of thumb to consider for optimal Thread Pool use cases:

The MySQL Threads_running variable keeps track of the number of concurrent statements currently executing in the MySQL Server. If this variable consistently exceeds a region where the server won’t operate optimally (usually going beyond 40 for InnoDB workloads), the Thread Pool will be beneficial, especially in extreme parallel overload situations.

If you are using the innodb_thread_concurrency to limit the number of concurrently executing statements, you will find the Thread Pool solves the same problem, only better, by assigning connections to thread groups, then queuing executions based on transactional content, user defined designations, and so forth.

Lastly, if your workload comprises mainly short queries, the Thread Pool will be beneficial.

To learn more, see Section 5.6.3.4, “Thread Pool Tuning”.

A.14.5 Are there recommended Thread Pool configurations?

The Thread Pool has a number of user case driven configuration parameters that affect its performance. To learn about these and tips on tuning, see Section 5.6.3.4, “Thread Pool Tuning”.

A.15 MySQL 8.0 FAQ: InnoDB Change Buffer

A.15.1 What types of operations modify secondary indexes and result in change buffering? ............... 5013
A.15.2 What is the benefit of the InnoDB change buffer? ............................................................... 5013
A.15.3 Does the change buffer support other types of indexes? .............................................. 5013
A.15.4 How much space does InnoDB use for the change buffer? ........................................... 5014
A.15.5 How do I determine the current size of the change buffer? ............................................. 5014
A.15.6 When does change buffer merging occur? ............................................................... 5014
A.15.7 When is the change buffer flushed? ............................................................... 5014
A.15.8 When should the change buffer be used? ............................................................... 5015
A.15.9 When should the change buffer not be used? ............................................................... 5015
A.15.10 Where can I find additional information about the change buffer? ...................... 5015

A.15.1 What types of operations modify secondary indexes and result in change buffering?

INSERT, UPDATE, and DELETE operations can modify secondary indexes. If an affected index page is not in the buffer pool, the changes can be buffered in the change buffer.

A.15.2 What is the benefit of the InnoDB change buffer?

Buffering secondary index changes when secondary index pages are not in the buffer pool avoids expensive random access I/O operations that would be required to immediately read in affected index pages from disk. Buffered changes can be applied later, in batches, as pages are read into the buffer pool by other read operations.

A.15.3 Does the change buffer support other types of indexes?
No. The change buffer only supports secondary indexes. Clustered indexes, full-text indexes, and spatial indexes are not supported. Full-text indexes have their own caching mechanism.

**A.15.4 How much space does InnoDB use for the change buffer?**

Prior to the introduction of the `innodb_change_buffer_max_size` configuration option in MySQL 5.6, the maximum size of the on-disk change buffer in the system tablespace was 1/3 of the InnoDB buffer pool size.

In MySQL 5.6 and later, the `innodb_change_buffer_max_size` configuration option defines the maximum size of the change buffer as a percentage of the total buffer pool size. By default, `innodb_change_buffer_max_size` is set to 25. The maximum setting is 50.

InnoDB does not buffer an operation if it would cause the on-disk change buffer to exceed the defined limit.

Change buffer pages are not required to persist in the buffer pool and may be evicted by LRU operations.

**A.15.5 How do I determine the current size of the change buffer?**

The current size of the change buffer is reported by `SHOW ENGINE INNODB STATUS \G`, under the INSERT BUFFER AND ADAPTIVE HASH INDEX heading. For example:

```
-------------------------------------
INSERT BUFFER AND ADAPTIVE HASH INDEX
-------------------------------------
Ibuf: size 1, free list len 0, seg size 2, 0 merges
```

Relevant data points include:

- **size**: The number of pages used within the change buffer. Change buffer size is equal to `seg size - (1 + free list len)`. The 1 + value represents the change buffer header page.
- **seg size**: The size of the change buffer, in pages.

For information about monitoring change buffer status, see Section 15.5.2, “Change Buffer”.

**A.15.6 When does change buffer merging occur?**

- When a page is read into the buffer pool, buffered changes are merged upon completion of the read, before the page is made available.
- Change buffer merging is performed as a background task. The `innodb_io_capacity` parameter sets an upper limit on the I/O activity performed by InnoDB background tasks such as merging data from the change buffer.
- A change buffer merge is performed during crash recovery. Changes are applied from the change buffer (in the system tablespace) to leaf pages of secondary indexes as index pages are read into the buffer pool.
- The change buffer is fully durable and will survive a system crash. Upon restart, change buffer merge operations resume as part of normal operations.
- A full merge of the change buffer can be forced as part of a slow server shutdown using `--innodb-fast-shutdown=0`.

**A.15.7 When is the change buffer flushed?**
A.15.8 When should the change buffer be used?

The change buffer is a feature designed to reduce random I/O to secondary indexes as indexes grow larger and no longer fit in the InnoDB buffer pool. Generally, the change buffer should be used when the entire data set does not fit into the buffer pool, when there is substantial DML activity that modifies secondary index pages, or when there are lots of secondary indexes that are regularly changed by DML activity.

A.15.9 When should the change buffer not be used?

You might consider disabling the change buffer if the entire data set fits within the InnoDB buffer pool, if you have relatively few secondary indexes, or if you are using solid-state storage, where random reads are about as fast as sequential reads. Before making configuration changes, it is recommended that you run tests using a representative workload to determine if disabling the change buffer provides any benefit.

A.15.10 Where can I find additional information about the change buffer?

See Section 15.5.2, “Change Buffer”.

A.16 MySQL 8.0 FAQ: InnoDB Data-at-Rest Encryption

A.16.1 Is data decrypted for users who are authorized to see it?

Yes. InnoDB data-at-rest encryption is designed to transparently apply encryption within the database without impacting existing applications. Returning data in encrypted format would break most existing applications. InnoDB data-at-rest encryption provides the benefit of encryption without the overhead associated with traditional database encryption solutions, which would typically require expensive and substantial changes to applications, database triggers, and views.

A.16.2 What is the overhead associated with InnoDB data-at-rest encryption?

There is no additional storage overhead. According to internal benchmarks, performance overhead amounts to a single digit percentage difference.
A.16.3. What are the encryption algorithms used with InnoDB data-at-rest encryption?

InnoDB data-at-rest encryption supports the Advanced Encryption Standard (AES256) block-based encryption algorithm. It uses Electronic Codebook (ECB) block encryption mode for tablespace key encryption and Cipher Block Chaining (CBC) block encryption mode for data encryption.

A.16.4. Is it possible to use 3rd party encryption algorithms in place of the one provided by the InnoDB data-at-rest encryption feature?

No, it is not possible to use other encryption algorithms. The provided encryption algorithm is broadly accepted.

A.16.5. Can indexed columns be encrypted?

InnoDB data-at-rest encryption supports all indexes transparently.

A.16.6. What data types and data lengths does InnoDB data-at-rest encryption support?

InnoDB data-at-rest encryption supports all supported data types. There is no data length limitation.

A.16.7. Does data remain encrypted on the network?

Data encrypted by the InnoDB data-at-rest feature is decrypted when it is read from the tablespace file. Thus, if the data is on the network, it is in cleartext form. However, data on the network can be encrypted using MySQL network encryption, which encrypts data traveling to and from a database using SSL/TLS.

A.16.8. Does database memory contain cleartext or encrypted data?

With InnoDB data-at-rest encryption, in-memory data is decrypted, which provides complete transparency.

A.16.9. How do I know which data to encrypt?

Compliance with the PCI-DSS standard requires that credit card numbers (Primary Account Number, or ‘PAN’) be stored in encrypted form. Breach Notification Laws (for example, CA SB 1386, CA AB 1950, and similar laws in 43+ more US states) require encryption of first name, last name, driver license number, and other PII data. In early 2008, CA AB 1298 added medical and health insurance information to PII data. Additionally, industry specific privacy and security standards may require encryption of certain assets. For example, assets such as pharmaceutical research results, oil field exploration results, financial contracts, or personal data of law enforcement informants may require encryption. In the health care industry, the privacy of patient data, health records and X-ray images is of the highest importance.

A.16.10. How is InnoDB data-at-rest encryption different from encryption functions MySQL already provides?

There are symmetric and asymmetric encryption APIs in MySQL that can be used to manually encrypt data within the database. However, the application must manage encryption keys and perform required encryption and decryption operations by calling API functions. InnoDB data-at-rest encryption requires no application changes, is transparent to end users, and provides automated, built-in key management.

A.16.11. Does the transportable tablespaces feature work with InnoDB data-at-rest encryption?

Yes. It is supported for encrypted file-per-table tablespaces. For more information, see Exporting Encrypted Tablespaces.

A.16.12. Does compression work with InnoDB data-at-rest encryption?
Customers using InnoDB data-at-rest encryption receive the full benefit of compression because compression is applied before data blocks are encrypted.

**A.16.1** Can I use `mysqlpump` or `mysqldump` with encrypted tables?

Yes. Because these utilities create logical backups, the data dumped from encrypted tables is not encrypted.

**A.16.14** How do I change (rotate, re-key) the master encryption key?

InnoDB data-at-rest encryption uses a two tier key mechanism. When data-at-rest encryption is used, individual tablespace keys are stored in the header of the underlying tablespace data file. Tablespace keys are encrypted using the master encryption key. The master encryption key is generated when tablespace encryption is enabled, and is stored outside the database. The master encryption key is rotated using the `ALTER INSTANCE ROTATE INNODB MASTER KEY` statement, which generates a new master encryption key, stores the key, and rotates the key into use.

**A.16.15** How do I migrate data from a cleartext InnoDB tablespace to an encrypted InnoDB tablespace?

Transferring data from one tablespace to another is not required. To encrypt data in an InnoDB file-per-table tablespace, run `ALTER TABLE tbl_name ENCRYPTION = 'Y'`. To encrypt a general tablespace or the `mysql` tablespace, run `ALTER TABLESPACE tablespace_name ENCRYPTION = 'Y'`. Encryption support for general tablespaces was introduced in MySQL 8.0.13. Encryption support for the `mysql` system tablespace is available as of MySQL 8.0.16.

**A.17** MySQL 8.0 FAQ: Virtualization Support

**A.17.1** Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others? ................................................................. 5017

MySQL is supported on virtualized environments, but is certified only for Oracle VM. Contact Oracle Support for more information.

Be aware of potential problems when using virtualization software. The usual ones are related to performance, performance degradations, slowness, or unpredictability of disk, I/O, network, and memory.

This appendix describes the types of error information MySQL provides and how to obtain information about them. It also lists the error messages that the MySQL server and MySQL client programs generate. The final section is for troubleshooting. It describes common problems and errors that may occur and potential resolutions.

Additional Resources

Other sections that discuss error-related topics include:

• Information about configuring where and how the server writes the error log: Section 5.4.2, “The Error Log”

• Information about the character set used for error messages: Section 10.6, “Error Message Character Set”

• Information about the language used for error messages: Section 10.11, “Setting the Error Message Language”

• Information about errors related to InnoDB: Section 15.20.4, “InnoDB Error Handling”

B.1 Error Message Sources and Components

This section discusses how error messages originate within MySQL and the components they contain.

• Error Message Sources

• Error Message Components

• Error Code Ranges

Error Message Sources

Error messages can originate on the server side or the client side:
• On the server side, error messages may occur during the startup and shutdown processes, as a result of issues that occur during SQL statement execution, and so forth.

• The MySQL server writes some error messages to its error log. These indicate issues of interest to database administrators or that require DBA action.

• The server sends other error messages to client programs. These indicate issues pertaining only to a particular client. The MySQL client library takes errors received from the server and makes them available to the host client program.

• Client-side error messages are generated from within the MySQL client library, usually involving problems communicating with the server.

Example server-side error messages written to the error log:

• This message produced during the startup process provides a status or progress indicator:

```
2018-10-28T13:01:32.735983Z 0 [Note] [MY-010303] [Server] Skipping generation of SSL certificates as options related to SSL are specified.
```

• This message indicates an issue that requires DBA action:

```
2018-10-02T03:20:39.410387Z 768 [ERROR] [MY-010045] [Server] Event Scheduler: [evtuser@localhost][myschema.e_daily] Unknown database 'mydb'
```

Example server-side error message sent to client programs, as displayed by the `mysql` client:

```
mysql> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Example client-side error message originating from within the client library, as displayed by the `mysql` client:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

Whether an error originates from within the client library or is received from the server, a MySQL client program may respond in varying ways. As just illustrated, the client may display the error message so the user can take corrective measures. The client may instead internally attempt to resolve or retry a failed operation, or take other action.

**Error Message Components**

When an error occurs, error information includes several components: an error code, SQLSTATE value, and message string. These components have the following characteristics:

• Error code: This value is numeric. It is MySQL-specific and is not portable to other database systems.

  Each error number has a corresponding symbolic value. Examples:

  • The symbol for server error number **1146** is **ER_NO_SUCH_TABLE**.
  
  • The symbol for client error number **2005** is **CR_UNKNOWN_HOST**.

  The set of error codes used in error messages is partitioned into distinct ranges; see Error Code Ranges.
Error codes are stable across General Availability (GA) releases of a given MySQL series. Before a series reaches GA status, new codes may still be under development and are subject to change.

- **SQLSTATE value**: This value is a five-character string (for example, '42S02'). SQLSTATE values are taken from ANSI SQL and ODBC and are more standardized than the numeric error codes. The first two characters of an SQLSTATE value indicate the error class:
  - Class = '00' indicates success.
  - Class = '01' indicates a warning.
  - Class = '02' indicates "not found." This is relevant within the context of cursors and is used to control what happens when a cursor reaches the end of a data set. This condition also occurs for `SELECT ... INTO var_list` statements that retrieve no rows.
  - Class > '02' indicates an exception.

For server-side errors, not all MySQL error numbers have corresponding SQLSTATE values. In these cases, 'HY000' (general error) is used.

For client-side errors, the SQLSTATE value is always 'HY000' (general error), so it is not meaningful for distinguishing one client error from another.

- **Message string**: This string provides a textual description of the error.

**Error Code Ranges**

The set of error codes used in error messages is partitioned into distinct ranges, each with its own purpose:

- 1 to 999: Global error codes. This error code range is called “global” because it is a shared range that is used by the server as well as by clients.

  When an error in this range originates on the server side, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of `MY-`.

  When an error in this range originates on the client side, the client library makes it available to the client program with no zero-padding or prefix.

- 1,000 to 1,999: Server error codes reserved for messages sent to clients.

- 2,000 to 2,999: Client error codes reserved for use by the client library.

- 3,000 to 4,999: Server error codes reserved for messages sent to clients.

- 5,000 to 5,999: Error codes reserved for use by X Plugin for messages sent to clients.

- 10,000 to 49,999: Server error codes reserved for messages to be written to the error log (not sent to clients).

  When an error in this range occurs, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of `MY-`.

- 50,000 to 51,999: Error codes reserved for use by third parties.

The server handles error messages written to the error log differently from error messages sent to clients:
• When the server writes a message to the error log, it pads the error code with leading zeros to six digits and adds a prefix of `MY-` (examples: `MY-000022, MY-010048`).

• When the server sends a message to a client program, it adds no zero-padding or prefix to the error code (examples: 1036, 3013).

**B.2 Error Information Interfaces**

Error messages can originate on the server side or the client side, and each error message includes an error code, SQLSTATE value, and message string, as described in Section B.1, “Error Message Sources and Components”. For lists of server-side, client-side, and global (shared between server and clients) errors, see Section B.3, “Error Message Reference”.

For error checking from within programs, use error code numbers or symbols, not error message strings. Message strings do not change often, but it is possible. Also, if the database administrator changes the language setting, that affects the language of message strings; see Section 10.11, “Setting the Error Message Language”.

Error information in MySQL is available in the server error log, at the SQL level, from within client programs, and at the command line.

• **Error Log**

• **SQL Error Message Interface**

• **Client Error Message Interface**

• **Command-Line Error Message Interface**

**Error Log**

On the server side, some messages are intended for the error log. For information about configuring where and how the server writes the log, see Section 5.4.2, “The Error Log”.

Other server error messages are intended to be sent to client programs and are available as described in Client Error Message Interface.

The range within which a particular error code lies determines whether the server writes an error message to the error log or sends it to clients. For information about these ranges, see Error Code Ranges.

**SQL Error Message Interface**

At the SQL level, there are several sources of error information in MySQL:

• **SQL statement warning and error information** is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The warning_count system variable indicates the number of errors, warnings, and notes (with notes excluded if the sql_notes system variable is disabled). The error_count system variable indicates the number of errors. Its value excludes warnings and notes.

• The `GET DIAGNOSTICS` statement may be used to inspect the diagnostic information in the diagnostics area. See Section 13.6.7.3, “GET DIAGNOSTICS Syntax”.

• **SHOW SLAVE STATUS** statement output includes information about replication errors occurring on replication slave servers.

• **SHOW ENGINE INNODB STATUS** statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an InnoDB table fails.
Client Error Message Interface

Client programs receive errors from two sources:

- Errors that originate on the client side from within the MySQL client library.

- Errors that originate on the server side and are sent to the client by the server. These are received within the client library, which makes them available to the host client program.

The range within which a particular error code lies determines whether it originated from within the client library or was received by the client from the server. For information about these ranges, see Error Code Ranges.

Regardless of whether an error originates from within the client library or is received from the server, a MySQL client program obtains the error code, SQLSTATE value, message string, and other related information by calling C API functions in the client library:

- `mysql_errno()` returns the MySQL error code.

- `mysql_sqlstate()` returns the SQLSTATE value.

- `mysql_error()` returns the message string.

- `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()` are the corresponding error functions for prepared statements.

- `mysql_warning_count()` returns the number of errors, warnings, and notes for the most recent statement.

For descriptions of the client library error functions, see Section 28.7, “MySQL C API”.

A MySQL client program may respond to an error in varying ways. The client may display the error message so the user can take corrective measures, internally attempt to resolve or retry a failed operation, or take other action. For example, (using the `mysql` client), a failure to connect to the server might result in this message:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

Command-Line Error Message Interface

The `perror` program provides information from the command line about error numbers. See Section 4.8.2, “`perror` — Display MySQL Error Message Information”.

```
shell> perror 1231
MySQL error code MY-001231 (ER_WRONG_VALUE_FOR_VAR): Variable '%-.64s' can't be set to the value of '%-.200s'
```

For MySQL NDB Cluster errors, use `ndb_perror`. See Section 22.4.16, “`ndb_perror` — Obtain NDB Error Message Information”.

```
shell> ndb_perror 323
NDB error code 323: Invalid nodegroup id, nodegroup already existing:
Permanent error: Application error
```
B.3 Error Message Reference

This section provides a reference for the various types of error messages in MySQL:

- Error messages produced only by the server: Section B.3.1, “Server Error Message Reference”
- Error messages that originate only from within the MySQL client library: Section B.3.2, “Client Error Message Reference”
- Error messages that are shared between the server and the client library: Section B.3.3, “Global Error Message Reference”

B.3.1 Server Error Message Reference

The MySQL server writes some error messages to its error log, and sends others to client programs.

Example server-side error messages written to the error log:

```
2018-10-28T13:01:32.735983Z 0 [Note] [MY-010303] [Server] Skipping generation of SSL certificates as options related to SSL are specified.
```

Example server-side error message sent to client programs, as displayed by the `mysql` client:

```
mysql> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Each server error message includes an error code, SQLSTATE value, and message string, as described in Section B.1, “Error Message Sources and Components”. These components are available as described in Section B.2, “Error Information Interfaces”.

In addition to the errors in the following list, the server can also produce error messages that have error codes in the range from 1 to 999. See Section B.3.3, “Global Error Message Reference”

- Error number: 1002; Symbol: ER_NO; SQLSTATE: HY000
  Message: NO
  Used in the construction of other messages.

- Error number: 1003; Symbol: ER_YES; SQLSTATE: HY000
  Message: YES
  Used in the construction of other messages.
  Extended EXPLAIN format generates Note messages. ER_YES is used in the Code column for these messages in subsequent SHOW WARNINGS output.

- Error number: 1004; Symbol: ER_CANT_CREATE_FILE; SQLSTATE: HY000
  Message: Can't create file '%s' (errno: %d - %s)
  Occurs for failure to create or copy a file needed for some operation.
  Possible causes: Permissions problem for source file; destination file already exists but is not writeable.
• Error number: 1005; Symbol: ER_CANT_CREATE_TABLE; SQLSTATE: HY000
  Message: Can't create table '%s' (errno: %d - %s)
  InnoDB reports this error when a table cannot be created. If the error message refers to error 150, table creation failed because a foreign key constraint was not correctly formed. If the error message refers to error -1, table creation probably failed because the table includes a column name that matched the name of an internal InnoDB table.

• Error number: 1006; Symbol: ER_CANT_CREATE_DB; SQLSTATE: HY000
  Message: Can't create database '%s' (errno: %d - %s)

• Error number: 1007; Symbol: ER_DB_CREATE_EXISTS; SQLSTATE: HY000
  Message: Can't create database '%s'; database exists
  An attempt to create a database failed because the database already exists.
  Drop the database first if you really want to replace an existing database, or add an IF NOT EXISTS clause to the CREATE DATABASE statement if to retain an existing database without having the statement produce an error.

• Error number: 1008; Symbol: ER_DB_DROP_EXISTS; SQLSTATE: HY000
  Message: Can't drop database '%s'; database doesn't exist

• Error number: 1010; Symbol: ER_DB_DROP_RMDIR; SQLSTATE: HY000
  Message: Error dropping database (can't rmdir '%s', errno: %d - %s)

• Error number: 1012; Symbol: ER_CANT_FIND_SYSTEM_REC; SQLSTATE: HY000
  Message: Can't read record in system table
  Returned by InnoDB for attempts to access InnoDB INFORMATION_SCHEMA tables when InnoDB is unavailable.

• Error number: 1013; Symbol: ER_CANT_GET_STAT; SQLSTATE: HY000
  Message: Can't get status of '%s' (errno: %d - %s)

• Error number: 1015; Symbol: ER_CANT_LOCK; SQLSTATE: HY000
  Message: Can't lock file (errno: %d - %s)

• Error number: 1016; Symbol: ER_CANT_OPEN_FILE; SQLSTATE: HY000
  Message: Can't open file: '%s' (errno: %d - %s)
  InnoDB reports this error when the table from the InnoDB data files cannot be found.

• Error number: 1017; Symbol: ER_FILE_NOT_FOUND; SQLSTATE: HY000
  Message: Can't find file: '%s' (errno: %d - %s)

• Error number: 1018; Symbol: ER_CANT_READ_DIR; SQLSTATE: HY000
  Message: Can't read dir of '%s' (errno: %d - %s)
• Error number: 1020; Symbol: ER_CHECKREAD; SQLSTATE: HY000
  Message: Record has changed since last read in table '%s'
• Error number: 1022; Symbol: ER_DUP_KEY; SQLSTATE: 23000
  Message: Can't write; duplicate key in table '%s'
• Error number: 1024; Symbol: ER_ERROR_ON_READ; SQLSTATE: HY000
  Message: Error reading file '%s' (errno: %d - %s)
• Error number: 1025; Symbol: ER_ERROR_ON_RENAME; SQLSTATE: HY000
  Message: Error on rename of '%s' to '%s' (errno: %d - %s)
• Error number: 1026; Symbol: ER_ERROR_ON_WRITE; SQLSTATE: HY000
  Message: Error writing file '%s' (errno: %d - %s)
• Error number: 1027; Symbol: ER_FILE_USED; SQLSTATE: HY000
  Message: '%s' is locked against change
• Error number: 1028; Symbol: ER_FILSORT_ABORT; SQLSTATE: HY000
  Message: Sort aborted
• Error number: 1030; Symbol: ER_GET_ERRNO; SQLSTATE: HY000
  Message: Got error %d - '%s' from storage engine
  Check the %d value to see what the OS error means. For example, 28 indicates that you have run out of disk space.
• Error number: 1031; Symbol: ER_ILLEGAL_HA; SQLSTATE: HY000
  Message: Table storage engine for '%s' doesn't have this option
• Error number: 1032; Symbol: ER_KEY_NOT_FOUND; SQLSTATE: HY000
  Message: Can't find record in '%s'
• Error number: 1033; Symbol: ER_NOT_FORM_FILE; SQLSTATE: HY000
  Message: Incorrect information in file: '%s'
• Error number: 1034; Symbol: ER_NOT_KEYFILE; SQLSTATE: HY000
  Message: Incorrect key file for table '%s'; try to repair it
• Error number: 1035; Symbol: ER_OLD_KEYFILE; SQLSTATE: HY000
  Message: Old key file for table '%s'; repair it!
• Error number: 1036; Symbol: ER_OPEN_AS_READONLY; SQLSTATE: HY000
  Message: Table '%s' is read only
• Error number: 1037; Symbol: ER_OUTOFMEMORY; SQLSTATE: HY001
Message: Out of memory; restart server and try again (needed %d bytes)

• Error number: 1038; Symbol: ER_OUT_OF_SORTMEMORY; SQLSTATE: HY001
  Message: Out of sort memory, consider increasing server sort buffer size

• Error number: 1040; Symbol: ER_CON_COUNT_ERROR; SQLSTATE: 08004
  Message: Too many connections

• Error number: 1041; Symbol: ER_OUT_OF_RESOURCES; SQLSTATE: HY000
  Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

• Error number: 1042; Symbol: ER_BAD_HOST_ERROR; SQLSTATE: 08S01
  Message: Can't get hostname for your address

• Error number: 1043; Symbol: ER_HANDSHAKE_ERROR; SQLSTATE: 08S01
  Message: Bad handshake

• Error number: 1044; Symbol: ER_DBACCESS_DENIED_ERROR; SQLSTATE: 42000
  Message: Access denied for user '%s'@'%s' to database '%s'

• Error number: 1045; Symbol: ER_ACCESS_DENIED_ERROR; SQLSTATE: 28000
  Message: Access denied for user '%s'@'%s' (using password: %s)

• Error number: 1046; Symbol: ER_NO_DB_ERROR; SQLSTATE: 3D000
  Message: No database selected

• Error number: 1047; Symbol: ER_UNKNOWN_COM_ERROR; SQLSTATE: 08S01
  Message: Unknown command

• Error number: 1048; Symbol: ER_BAD_NULL_ERROR; SQLSTATE: 23000
  Message: Column '%s' cannot be null

• Error number: 1049; Symbol: ER_BAD_DB_ERROR; SQLSTATE: 42000
  Message: Unknown database '%s'

• Error number: 1050; Symbol: ER_TABLE_EXISTS_ERROR; SQLSTATE: 42S01
  Message: Table '%s' already exists

• Error number: 1051; Symbol: ER_BAD_TABLE_ERROR; SQLSTATE: 42S02
  Message: Unknown table '%s'

• Error number: 1052; Symbol: ER_NON_UNIQ_ERROR; SQLSTATE: 23000
  Message: Column '%s' in %s is ambiguous
Likely cause: A column appears in a query without appropriate qualification, such as in a select list or ON clause.

Examples:

```sql
mysql> SELECT i FROM t INNER JOIN t AS t2;
ERROR 1052 (23000): Column 'i' in field list is ambiguous
```

```sql
mysql> SELECT * FROM t LEFT JOIN t AS t2 ON i = i;
ERROR 1052 (23000): Column 'i' in on clause is ambiguous
```

Resolution:

• Qualify the column with the appropriate table name:

```sql
mysql> SELECT t2.i FROM t INNER JOIN t AS t2;
```

• Modify the query to avoid the need for qualification:

```sql
mysql> SELECT * FROM t LEFT JOIN t AS t2 USING (i);
```

• Error number: 1053; Symbol: ER_SERVER_SHUTDOWN; SQLSTATE: 08S01
  Message: Server shutdown in progress

• Error number: 1054; Symbol: ER_BAD_FIELD_ERROR; SQLSTATE: 42S22
  Message: Unknown column '%s' in '%s'

• Error number: 1055; Symbol: ER_WRONG_FIELD_WITH_GROUP; SQLSTATE: 42000
  Message: '%s' isn't in GROUP BY

• Error number: 1056; Symbol: ER_WRONG_GROUP_FIELD; SQLSTATE: 42000
  Message: Can't group on '%s'

• Error number: 1057; Symbol: ER_WRONG_SUM_SELECT; SQLSTATE: 42000
  Message: Statement has sum functions and columns in same statement

• Error number: 1058; Symbol: ER_WRONG_VALUE_COUNT; SQLSTATE: 21S01
  Message: Column count doesn't match value count

• Error number: 1059; Symbol: ER_TOO_LONG_IDENT; SQLSTATE: 42000
  Message: Identifier name '%s' is too long

• Error number: 1060; Symbol: ER_DUP_FIELDNAME; SQLSTATE: 42S21
  Message: Duplicate column name '%s'

• Error number: 1061; Symbol: ER_DUP_KEYNAME; SQLSTATE: 42000
Message: Duplicate key name '%s'

- Error number: 1062; Symbol: ER_DUP_ENTRY; SQLSTATE: 23000
  Message: Duplicate entry '%s' for key %d
  The message returned with this error uses the format string for ER_DUP_ENTRY_WITH_KEY_NAME.

- Error number: 1063; Symbol: ER_WRONG_FIELD_SPEC; SQLSTATE: 42000
  Message: Incorrect column specifier for column '%s'

- Error number: 1064; Symbol: ER_PARSE_ERROR; SQLSTATE: 42000
  Message: %s near '%s' at line %d

- Error number: 1065; Symbol: ER_EMPTY_QUERY; SQLSTATE: 42000
  Message: Query was empty

- Error number: 1066; Symbol: ER_NONUNIQ_TABLE; SQLSTATE: 42000
  Message: Not unique table/alias: '%s'

- Error number: 1067; Symbol: ER_INVALID_DEFAULT; SQLSTATE: 42000
  Message: Invalid default value for '%s'

- Error number: 1068; Symbol: ER_MULTIPLE_PRI_KEY; SQLSTATE: 42000
  Message: Multiple primary key defined

- Error number: 1069; Symbol: ER_TOO_MANY_KEYS; SQLSTATE: 42000
  Message: Too many keys specified; max %d keys allowed

- Error number: 1070; Symbol: ER_TOO_MANY_KEY_PARTS; SQLSTATE: 42000
  Message: Too many key parts specified; max %d parts allowed

- Error number: 1071; Symbol: ER_TOO_LONG_KEY; SQLSTATE: 42000
  Message: Specified key was too long; max key length is %d bytes

- Error number: 1072; Symbol: ER_KEY_COLUMN_DOES_NOT_EXITS; SQLSTATE: 42000
  Message: Key column '%s' doesn't exist in table

- Error number: 1073; Symbol: ER_BLOB_USED_AS_KEY; SQLSTATE: 42000
  Message: BLOB column '%s' can't be used in key specification with the used table type

- Error number: 1074; Symbol: ER_TOO_BIG_FIELDLENGTH; SQLSTATE: 42000
  Message: Column length too big for column '%s' (max = %lu); use BLOB or TEXT instead

- Error number: 1075; Symbol: ER_WRONG_AUTO_KEY; SQLSTATE: 42000
  Message: Incorrect table definition; there can be only one auto column and it must be defined as a key
• Error number: 1076; Symbol: ER_READY; SQLSTATE: HY000
Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d

• Error number: 1077; Symbol: ER_NORMAL_SHUTDOWN; SQLSTATE: HY000
Message: %s: Normal shutdown

   ER_NORMAL_SHUTDOWN was removed after 8.0.4.

• Error number: 1079; Symbol: ER_SHUTDOWN_COMPLETE; SQLSTATE: HY000
Message: %s: Shutdown complete

• Error number: 1080; Symbol: ER_FORCING_CLOSE; SQLSTATE: 08S01
Message: %s: Forcing close of thread %ld user: '%s'

• Error number: 1081; Symbol: ER_IPSOCK_ERROR; SQLSTATE: 08S01
Message: Can't create IP socket

• Error number: 1082; Symbol: ER_NO_SUCH_INDEX; SQLSTATE: 42S12
Message: Table "%s" has no index like the one used in CREATE INDEX; recreate the table

• Error number: 1083; Symbol: ER_WRONG_FIELD_TERMINATORS; SQLSTATE: 42000
Message: Field separator argument is not what is expected; check the manual

• Error number: 1084; Symbol: ER_BLOBS_AND_NO_TERMINATED; SQLSTATE: 42000
Message: You can't use fixed rowlength with BLOBs; please use 'fields terminated by'

• Error number: 1085; Symbol: ER_TEXTFILE_NOT_READABLE; SQLSTATE: HY000
Message: The file "%s" must be in the database directory or be readable by all

• Error number: 1086; Symbol: ER_FILE_EXISTS_ERROR; SQLSTATE: HY000
Message: File "%s" already exists

• Error number: 1087; Symbol: ER_LOAD_INFO; SQLSTATE: HY000
Message: Records: %ld Deleted: %ld Skipped: %ld Warnings: %ld

• Error number: 1088; Symbol: ER_ALTER_INFO; SQLSTATE: HY000
Message: Records: %ld Duplicates: %ld

• Error number: 1089; Symbol: ER_WRONG_SUB_KEY; SQLSTATE: HY000
Message: Incorrect prefix key; the used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique prefix keys

• Error number: 1090; Symbol: ER_CANT_REMOVE_ALL_FIELDS; SQLSTATE: 42000
Message: You can't delete all columns with ALTER TABLE; use DROP TABLE instead

• Error number: 1091; Symbol: ER_CANT_DROP_FIELD_OR_KEY; SQLSTATE: 42000
Message: Can't DROP '%s'; check that column/key exists

- Error number: 1092; Symbol: ER_INSERT_INFO; SQLSTATE: HY000
  Message: Records: %ld Duplicates: %ld Warnings: %ld

- Error number: 1093; Symbol: ER_UPDATE_TABLE_USED; SQLSTATE: HY000
  Message: You can't specify target table '%s' for update in FROM clause

This error occurs for attempts to select from and modify the same table within a single statement. If the select attempt occurs within a derived table, you can avoid this error by setting the `derived_merge` flag of the `optimizer_switch` system variable to force the subquery to be materialized into a temporary table, which effectively causes it to be a different table from the one modified. See Section 8.2.2.4, "Optimizing Derived Tables, View References, and Common Table Expressions with Merging or Materialization".

- Error number: 1094; Symbol: ER_NO_SUCH_THREAD; SQLSTATE: HY000
  Message: Unknown thread id: %lu

- Error number: 1095; Symbol: ER_KILL_DENIED_ERROR; SQLSTATE: HY000
  Message: You are not owner of thread %lu

- Error number: 1096; Symbol: ER_NO_TABLES_USED; SQLSTATE: HY000
  Message: No tables used

- Error number: 1097; Symbol: ER_TOO_BIG_SET; SQLSTATE: HY000
  Message: Too many strings for column '%s' and SET

- Error number: 1098; Symbol: ER_NO_UNIQUE_LOGFILE; SQLSTATE: HY000
  Message: Can't generate a unique log-filename '%s'.(1-999)

- Error number: 1099; Symbol: ER_TABLE_NOT_LOCKED_FOR_WRITE; SQLSTATE: HY000
  Message: Table '%s' was locked with a READ lock and can't be updated

- Error number: 1100; Symbol: ER_TABLE_NOT_LOCKED; SQLSTATE: HY000
  Message: Table '%s' was not locked with LOCK TABLES

- Error number: 1101; Symbol: ER_BLOB_CANT_HAVE_DEFAULT; SQLSTATE: 42000
  Message: BLOB, TEXT, GEOMETRY or JSON column '%s' can't have a default value

- Error number: 1102; Symbol: ER_WRONG_DB_NAME; SQLSTATE: 42000
  Message: Incorrect database name '%s'

- Error number: 1103; Symbol: ER_WRONG_TABLE_NAME; SQLSTATE: 42000
  Message: Incorrect table name '%s'

- Error number: 1104; Symbol: ER_TOO_BIG_SELECT; SQLSTATE: 42000
Message: The SELECT would examine more than MAX_JOIN_SIZE rows; check your WHERE and use SET SQL_BIG_SELECTS=1 or SET MAX_JOIN_SIZE=# if the SELECT is okay

- Error number: 1105; Symbol: ER_UNKNOWN_ERROR; SQLSTATE: HY000
  Message: Unknown error

- Error number: 1106; Symbol: ER_UNKNOWN_PROCEDURE; SQLSTATE: 42000
  Message: Unknown procedure '%s'

- Error number: 1107; Symbol: ER_WRONG_PARAMCOUNT_TO_PROCEDURE; SQLSTATE: 42000
  Message: Incorrect parameter count to procedure '%s'

- Error number: 1108; Symbol: ER_WRONG_PARAMETERS_TO_PROCEDURE; SQLSTATE: HY000
  Message: Incorrect parameters to procedure '%s'

- Error number: 1109; Symbol: ER_UNKNOWN_TABLE; SQLSTATE: 42S02
  Message: Unknown table '%s' in %s

- Error number: 1110; Symbol: ER_FIELD_SPECIFIED_TWICE; SQLSTATE: 42000
  Message: Column '%s' specified twice

- Error number: 1111; Symbol: ER_INVALID_GROUP_FUNC_USE; SQLSTATE: HY000
  Message: Invalid use of group function

- Error number: 1112; Symbol: ER_UNSUPPORTED_EXTENSION; SQLSTATE: 42000
  Message: Table '%s' uses an extension that doesn't exist in this MySQL version

- Error number: 1113; Symbol: ER_TABLE_MUST_HAVE_COLUMNS; SQLSTATE: 42000
  Message: A table must have at least 1 column

- Error number: 1114; Symbol: ER_RECORD_FILE_FULL; SQLSTATE: HY000
  Message: The table '%s' is full

  InnoDB reports this error when the system tablespace runs out of free space. Reconfigure the system tablespace to add a new data file.

- Error number: 1115; Symbol: ER_UNKNOWN_CHARACTER_SET; SQLSTATE: 42000
  Message: Unknown character set: '%s'

- Error number: 1116; Symbol: ER_TOO_MANY_TABLES; SQLSTATE: HY000
  Message: Too many tables; MySQL can only use %d tables in a join

- Error number: 1117; Symbol: ER_TOO_MANY_FIELDS; SQLSTATE: HY000
  Message: Too many columns

- Error number: 1118; Symbol: ER_TOO_BIG_ROWSIZE; SQLSTATE: 42000
Message: Row size too large. The maximum row size for the used table type, not counting BLOBs, is %ld. This includes storage overhead, check the manual. You have to change some columns to TEXT or BLOBs

- Error number: 1119; Symbol: ER_STACK_OVERRUN; SQLSTATE: HY000
  Message: Thread stack overrun: Used: %ld of a %ld stack. Use `mysqld --thread_stack=#` to specify a bigger stack if needed

- Error number: 1120; Symbol: ER_WRONG_OUTER_JOIN; SQLSTATE: 42000
  Message: Cross dependency found in OUTER JOIN; examine your ON conditions
  ER_WRONG_OUTER_JOIN was removed after 8.0.0.

- Error number: 1120; Symbol: ER_WRONG_OUTER_JOIN_UNUSED; SQLSTATE: 42000
  Message: Cross dependency found in OUTER JOIN; examine your ON conditions
  ER_WRONG_OUTER_JOIN_UNUSED was added in 8.0.1.

- Error number: 1121; Symbol: ER_NULL_COLUMN_IN_INDEX; SQLSTATE: 42000
  Message: Table handler doesn't support NULL in given index. Please change column '%s' to be NOT NULL or use another handler

- Error number: 1122; Symbol: ER_CANT_FIND_UDF; SQLSTATE: HY000
  Message: Can't load function '%s'

- Error number: 1123; Symbol: ER_CANT_INITIALIZE_UDF; SQLSTATE: HY000
  Message: Can't initialize function '%s'; %s

- Error number: 1124; Symbol: ER_UDF_NO_PATHS; SQLSTATE: HY000
  Message: No paths allowed for shared library

- Error number: 1125; Symbol: ER_UDF_EXISTS; SQLSTATE: HY000
  Message: Function '%s' already exists

- Error number: 1126; Symbol: ER_CANT_OPEN_LIBRARY; SQLSTATE: HY000
  Message: Can't open shared library '%s' (errno: %d %s)

- Error number: 1127; Symbol: ER_CANT_FIND_DL_ENTRY; SQLSTATE: HY000
  Message: Can't find symbol '%s' in library

- Error number: 1128; Symbol: ER_FUNCTION_NOT_DEFINED; SQLSTATE: HY000
  Message: Function '%s' is not defined

- Error number: 1129; Symbol: ER_HOST_IS_BLOCKED; SQLSTATE: HY000
  Message: Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'
Server Error Message Reference

- **Error number:** 1130; Symbol: `ER_HOST_NOT_PRIVILEGED`; SQLSTATE: HY000
  Message: Host '%s' is not allowed to connect to this MySQL server

- **Error number:** 1131; Symbol: `ER_PASSWORD_ANONYMOUS_USER`; SQLSTATE: 42000
  Message: You are using MySQL as an anonymous user and anonymous users are not allowed to change passwords

- **Error number:** 1132; Symbol: `ER_PASSWORD_NOT_ALLOWED`; SQLSTATE: 42000
  Message: You must have privileges to update tables in the mysql database to be able to change passwords for others

• Error number: 1204; Symbol: ER_SET_CONSTANTS_ONLY; SQLSTATE: HY000

Message: You may only use constant expressions with SET
• Error number: 1205; Symbol: ER_LOCK_WAIT_TIMEOUT; SQLSTATE: HY000

Message: Lock wait timeout exceeded; try restarting transaction

InnoDB reports this error when lock wait timeout expires. The statement that waited too long was rolled back (not the entire transaction). You can increase the value of the innodb_lock_wait_timeout configuration option if SQL statements should wait longer for other transactions to complete, or decrease it if too many long-running transactions are causing locking problems and reducing concurrency on a busy system.
• Error number: 1206; Symbol: ER_LOCK_TABLE_FULL; SQLSTATE: HY000

Message: The total number of locks exceeds the lock table size

InnoDB reports this error when the total number of locks exceeds the amount of memory devoted to managing locks. To avoid this error, increase the value of innodb_buffer_pool_size. Within an individual application, a workaround may be to break a large operation into smaller pieces. For example, if the error occurs for a large INSERT, perform several smaller INSERT operations.
• Error number: 1207; Symbol: ER_READ_ONLY_TRANSACTION; SQLSTATE: 25000

Message: Update locks cannot be acquired during a READ UNCOMMITTED transaction
Server Error Message Reference

- Error number: 1210; Symbol: ER_WRONG_ARGUMENTS; SQLSTATE: HY000

  Message: ‘%s’@’%s’ is not allowed to create new users

- Error number: 1213; Symbol: ER_LOCK_DEADLOCK; SQLSTATE: 40001
  Message: Deadlock found when trying to get lock; try restarting transaction

  InnoDB reports this error when a transaction encounters a deadlock and is automatically rolled back so that your application can take corrective action. To recover from this error, run all the operations in this transaction again. A deadlock occurs when requests for locks arrive in inconsistent order between transactions. The transaction that was rolled back released all its locks, and the other transaction can now get all the locks it requested. Thus, when you re-run the transaction that was rolled back, it might have to wait for other transactions to complete, but typically the deadlock does not recur. If you encounter frequent deadlocks, make the sequence of locking operations (LOCK TABLES, SELECT ... FOR UPDATE, and so on) consistent between the different transactions or applications that experience the issue. See Section 15.7.5, “Deadlocks in InnoDB” for details.

- Error number: 1214; Symbol: ER_TABLE_CANT_HANDLE_FT; SQLSTATE: HY000
  Message: The used table type doesn't support FULLTEXT indexes

- Error number: 1215; Symbol: ER_CANNOT_ADD_FOREIGN; SQLSTATE: HY000
  Message: Cannot add foreign key constraint

- Error number: 1216; Symbol: ER_NO_REFERENCED_ROW; SQLSTATE: 23000
  Message: Cannot add or update a child row: a foreign key constraint fails

  InnoDB reports this error when you try to add a row but there is no parent row, and a foreign key constraint fails. Add the parent row first.

- Error number: 1217; Symbol: ER_ROW_IS_REFERENCED; SQLSTATE: 23000
  Message: Cannot delete or update a parent row: a foreign key constraint fails

  InnoDB reports this error when you try to delete a parent row that has children, and a foreign key constraint fails. Delete the children first.

  Message: Syntax error: %s PARTITIONING requires definition of VALUES %s for each partition

• Error number: 1480; Symbol: ER_PARTITION_WRONG_VALUES_ERROR; SQLSTATE: HY000
  Message: Only %s PARTITIONING can use VALUES %s in partition definition

• Error number: 1481; Symbol: ER_PARTITION_MAXVALUE_ERROR; SQLSTATE: HY000
  Message: MAXVALUE can only be used in last partition definition

• Error number: 1484; Symbol: ER_PARTITION_WRONG_NO_PART_ERROR; SQLSTATE: HY000
  Message: Wrong number of partitions defined, mismatch with previous setting

• Error number: 1485; Symbol: ER_PARTITION_WRONG_NO_SUBPART_ERROR; SQLSTATE: HY000
  Message: Wrong number of subpartitions defined, mismatch with previous setting

• Error number: 1486; Symbol: ER_WRONG_EXPR_IN_PARTITION_FUNC_ERROR; SQLSTATE: HY000
  Message: Constant, random or timezone-dependent expressions in (sub)partitioning function are not allowed

• Error number: 1488; Symbol: ER_FIELD_NOT_FOUND_PART_ERROR; SQLSTATE: HY000
  Message: Field in list of fields for partition function not found in table

• Error number: 1490; Symbol: ER_INCONSISTENT_PARTITION_INFO_ERROR; SQLSTATE: HY000
  Message: The partition info in the frm file is not consistent with what can be written into the frm file

• Error number: 1491; Symbol: ER_PARTITION_FUNC_NOT_ALLOWED_ERROR; SQLSTATE: HY000
  Message: The %s function returns the wrong type

• Error number: 1492; Symbol: ER_PARTITIONS_MUST_BE_DEFINED_ERROR; SQLSTATE: HY000
  Message: For %s partitions each partition must be defined

• Error number: 1493; Symbol: ER_RANGE.NOT.INCREASING_ERROR; SQLSTATE: HY000
  Message: VALUES LESS THAN value must be strictly increasing for each partition

• Error number: 1494; Symbol: ER_INCONSISTENT_TYPE_OF_FUNCTIONS_ERROR; SQLSTATE: HY000
Message: VALUES value must be of same type as partition function

- Error number: 1495; Symbol: ER_MULTIPLE_DEF_CONST_IN_LIST_PART_ERROR; SQLSTATE: HY000
  Message: Multiple definition of same constant in list partitioning

- Error number: 1496; Symbol: ER_PARTITION_ENTRY_ERROR; SQLSTATE: HY000
  Message: Partitioning can not be used stand-alone in query

- Error number: 1497; Symbol: ER_MIX_HANDLER_ERROR; SQLSTATE: HY000
  Message: The mix of handlers in the partitions is not allowed in this version of MySQL

- Error number: 1498; Symbol: ER_PARTITION_NOT_DEFINED_ERROR; SQLSTATE: HY000
  Message: For the partitioned engine it is necessary to define all %s

- Error number: 1499; Symbol: ER_TOO_MANY_PARTITIONS_ERROR; SQLSTATE: HY000
  Message: Too many partitions (including subpartitions) were defined

- Error number: 1500; Symbol: ER_SUBPARTITION_ERROR; SQLSTATE: HY000
  Message: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning

- Error number: 1501; Symbol: ER_CANT_CREATE_HANDLER_FILE; SQLSTATE: HY000
  Message: Failed to create specific handler file

- Error number: 1502; Symbol: ER_BLOB_FIELD_IN_PART_FUNC_ERROR; SQLSTATE: HY000
  Message: A BLOB field is not allowed in partition function

- Error number: 1503; Symbol: ER_UNIQUE_KEY_NEED_ALL_FIELDS_IN_PF; SQLSTATE: HY000
  Message: A %s must include all columns in the table's partitioning function

- Error number: 1504; Symbol: ER_NO_PARTS_ERROR; SQLSTATE: HY000
  Message: Number of %s = 0 is not an allowed value

- Error number: 1505; Symbol: ER_PARTITION_MGMT_ON_NONPARTITIONED; SQLSTATE: HY000
  Message: Partition management on a not partitioned table is not possible

- Error number: 1506; Symbol: ER_FOREIGN_KEY_ON_PARTITIONED; SQLSTATE: HY000
  Message: Foreign keys are not yet supported in conjunction with partitioning

- Error number: 1507; Symbol: ER_DROP_PARTITION_NON_EXISTENT; SQLSTATE: HY000
  Message: Error in list of partitions to %s

- Error number: 1508; Symbol: ER_DROP_LAST_PARTITION; SQLSTATE: HY000
  Message: Cannot remove all partitions, use DROP TABLE instead
Server Error Message Reference

- Error number: 1509; Symbol: ER_COALESCE_ONLY_ON_HASH_PARTITION; SQLSTATE: HY000
  Message: COALESCE PARTITION can only be used on HASH/KEY partitions
- Error number: 1510; Symbol: ER_REORG_HASH_ONLY_ONSAME_NO; SQLSTATE: HY000
  Message: REORGANIZE PARTITION can only be used to reorganize partitions not to change their numbers
- Error number: 1511; Symbol: ER_REORG_NO_PARAM_ERROR; SQLSTATE: HY000
  Message: REORGANIZE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONs
- Error number: 1512; Symbol: ER_ONLY_ON_RANGE_LIST_PARTITION; SQLSTATE: HY000
  Message: %s PARTITION can only be used on RANGE/LIST partitions

  Message: At least one partition must be added
- Error number: 1515; Symbol: ER_COALESCE_PARTITION_NO_PARTITION; SQLSTATE: HY000
  Message: At least one partition must be coalesced
- Error number: 1516; Symbol: ER_REORG_PARTITION_NOT_EXIST; SQLSTATE: HY000
  Message: More partitions to reorganize than there are partitions
- Error number: 1517; Symbol: ERSAME_NAME_PARTITION; SQLSTATE: HY000
  Message: Duplicate partition name %s
- Error number: 1518; Symbol: ER_NO_BINLOG_ERROR; SQLSTATE: HY000
  Message: It is not allowed to shut off binlog on this command
- Error number: 1519; Symbol: ER_CONSECUTIVE_REORG_PARTITIONS; SQLSTATE: HY000
  Message: When reorganizing a set of partitions they must be in consecutive order
- Error number: 1520; Symbol: ER_REORG_OUTSIDE_RANGE; SQLSTATE: HY000
  Message: Reorganize of range partitions cannot change total ranges except for last partition where it can extend the range
- Error number: 1521; Symbol: ER_PARTITION_FUNCTION_FAILURE; SQLSTATE: HY000
  Message: Partition function not supported in this version for this handler
- Error number: 1523; Symbol: ER_LIMI TED_PART_RANGE; SQLSTATE: HY000
  Message: The %s handler only supports 32 bit integers in VALUES
- Error number: 1524; Symbol: ER_PLUGIN_IS_NOT_LOADED; SQLSTATE: HY000
Message: Plugin '%s' is not loaded
•   Error number: 1525; Symbol: ER_WRONG_VALUE; SQLSTATE: HY000
Message: Incorrect %s value: '%s'
•   Error number: 1526; Symbol: ER_NO_PARTITION_FOR_GIVEN_VALUE; SQLSTATE: HY000
Message: Table has no partition for value %s
•   Error number: 1527; Symbol: ER_FILEGROUP_OPTION_ONLY_ONCE; SQLSTATE: HY000
Message: It is not allowed to specify %s more than once
•   Error number: 1528; Symbol: ER_CREATE_FILEGROUP_FAILED; SQLSTATE: HY000
Message: Failed to create %s
•   Error number: 1529; Symbol: ER_DROP_FILEGROUP_FAILED; SQLSTATE: HY000
Message: Failed to drop %s
•   Error number: 1530; Symbol: ER_TABLESPACE_AUTO_EXTEND_ERROR; SQLSTATE: HY000
Message: The handler doesn't support autoextend of tablespaces
•   Error number: 1531; Symbol: ER_WRONG_SIZE_NUMBER; SQLSTATE: HY000
Message: A size parameter was incorrectly specified, either number or on the form 10M
•   Error number: 1532; Symbol: ER_SIZE_OVERFLOW_ERROR; SQLSTATE: HY000
Message: The size number was correct but we don't allow the digit part to be more than 2 billion
•   Error number: 1533; Symbol: ER_ALTER_FILEGROUP_FAILED; SQLSTATE: HY000
Message: Failed to alter: %s
•   Error number: 1534; Symbol: ER_BINLOG_ROW_LOGGING_FAILED; SQLSTATE: HY000
Message: Writing one row to the row-based binary log failed
•   Error number: 1537; Symbol: ER_EVENT_ALREADY_EXISTS; SQLSTATE: HY000
Message: Event '%s' already exists
•   Error number: 1539; Symbol: ER_EVENT_DOES_NOT_EXIST; SQLSTATE: HY000
Message: Unknown event '%s'
•   Error number: 1542; Symbol: ER_EVENT_INTERVAL_NOT_POSITIVE_OR_TOO_BIG; SQLSTATE: HY000
Message: INTERVAL is either not positive or too big
•   Error number: 1543; Symbol: ER_EVENT_ENDS_BEFORE_STARTS; SQLSTATE: HY000
Message: ENDS is either invalid or before STARTS
• Error number: 1544; Symbol: ER_EVENT_EXEC_TIME_IN_THE_PAST; SQLSTATE: HY000
Message: Event execution time is in the past. Event has been disabled

• Error number: 1551; Symbol: ER_EVENT_SAME_NAME; SQLSTATE: HY000
Message: Same old and new event name

• Error number: 1553; Symbol: ER_DROP_INDEX_PK; SQLSTATE: HY000
Message: Cannot drop index '%s': needed in a foreign key constraint

InnoDB reports this error when you attempt to drop the last index that can enforce a particular referential constraint.

For optimal performance with DML statements, InnoDB requires an index to exist on foreign key columns, so that UPDATE and DELETE operations on a parent table can easily check whether corresponding rows exist in the child table. MySQL creates or drops such indexes automatically when needed, as a side-effect of CREATE_TABLE, CREATE_INDEX, and ALTER_TABLE statements.

When you drop an index, InnoDB checks if the index is used for checking a foreign key constraint. It is still OK to drop the index if there is another index that can be used to enforce the same constraint. InnoDB prevents you from dropping the last index that can enforce a particular referential constraint.

• Error number: 1554; Symbol: ER_WARN_DEPRECATED_SYNTAX_WITH_VER; SQLSTATE: HY000
Message: The syntax '%s' is deprecated and will be removed in MySQL %s. Please use %s instead

• Error number: 1556; Symbol: ER_CANT_LOCK_LOG_TABLE; SQLSTATE: HY000
Message: You can't use locks with log tables.

• Error number: 1557; Symbol: ER_FOREIGN_DUPLICATE_KEY_OLD_UNUSED; SQLSTATE: 23000
Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry

• Error number: 1558; Symbol: ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE; SQLSTATE: HY000
Message: The column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please perform the MySQL upgrade procedure.

• Error number: 1559; Symbol: ER_TEMP_TABLE_PREVENTS_SWITCH_OUT_OF_RBR; SQLSTATE: HY000
Message: Cannot switch out of the row-based binary log format when the session has open temporary tables

ER_TEMP_TABLE_PREVENTS_SWITCH_OUT_OF_RBR was removed after 8.0.12.

• Error number: 1560; Symbol: ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_FORMAT; SQLSTATE: HY000
Message: Cannot change the binary logging format inside a stored function or trigger

• Error number: 1562; Symbol: ER_PARTITION_NO_TEMPORARY; SQLSTATE: HY000
Message: Cannot create temporary table with partitions
• Error number: 1563; Symbol: ER_PARTITION_CONST_DOMAIN_ERROR; SQLSTATE: HY000
  Message: Partition constant is out of partition function domain
• Error number: 1564; Symbol: ER_PARTITION_FUNCTION_IS_NOT_ALLOWED; SQLSTATE: HY000
  Message: This partition function is not allowed
• Error number: 1565; Symbol: ER_DDL_LOG_ERROR; SQLSTATE: HY000
  Message: Error in DDL log
  ER_DDL_LOG_ERROR was removed after 8.0.1.
• Error number: 1566; Symbol: ER_NULL_IN_VALUES_LESS_THAN; SQLSTATE: HY000
  Message: Not allowed to use NULL value in VALUES LESS THAN
• Error number: 1567; Symbol: ER_WRONG_PARTITION_NAME; SQLSTATE: HY000
  Message: Incorrect partition name
• Error number: 1568; Symbol: ER_CANT_CHANGE_TX_CHARACTERISTICS; SQLSTATE: 25001
  Message: Transaction characteristics can't be changed while a transaction is in progress
• Error number: 1569; Symbol: ER_DUP_ENTRY_AUTOINCREMENT_CASE; SQLSTATE: HY000
  Message: ALTER TABLE causes auto_increment resequencing, resulting in duplicate entry '%s' for key '%s'
• Error number: 1571; Symbol: ER_EVENT_SET_VAR_ERROR; SQLSTATE: HY000
  Message: Error during starting/stopping of the scheduler. Error code %u
• Error number: 1572; Symbol: ER_PARTITION_MERGE_ERROR; SQLSTATE: HY000
  Message: Engine cannot be used in partitioned tables
• Error number: 1575; Symbol: ER_BASE64_DECODE_ERROR; SQLSTATE: HY000
  Message: Decoding of base64 string failed
• Error number: 1576; Symbol: ER_EVENT_RECURSION_FORBIDDEN; SQLSTATE: HY000
  Message: Recursion of EVENT DDL statements is forbidden when body is present
• Error number: 1578; Symbol: ER_ONLY_INTEGERS_ALLOWED; SQLSTATE: HY000
  Message: Only integers allowed as number here
• Error number: 1579; Symbol: ER_UNSUPORTED_LOG_ENGINE; SQLSTATE: HY000
  Message: This storage engine cannot be used for log tables
• Error number: 1580; Symbol: ER_BAD_LOG_STATEMENT; SQLSTATE: HY000
  Message: You cannot '%s' a log table if logging is enabled
• Error number: 1581; Symbol: ER_CANT_RENAME_LOG_TABLE; SQLSTATE: HY000
Message: Cannot rename '%s'. When logging enabled, rename to/from log table must rename two tables: the log table to an archive table and another table back to '%s'

- Error number: 1582; Symbol: ER_WRONG_PARAMCOUNT_TO_NATIVE_FCT; SQLSTATE: 42000

  Message: Cannot have more than one value for this type of %s partitioning

- Error number: 1658; Symbol: ER_ROW_SINGLE_PARTITION_FIELD_ERROR; SQLSTATE: HY000
  Message: Row expressions in VALUES IN only allowed for multi-field column partitioning

- Error number: 1659; Symbol: ER_FIELD_TYPE_NOT_ALLOWED_AS_PARTITION_FIELD; SQLSTATE: HY000
  Message: Field '%s' is of a not allowed type for this type of partitioning

- Error number: 1660; Symbol: ER_PARTITION_FIELDS_TOO_LONG; SQLSTATE: HY000
  Message: The total length of the partitioning fields is too large

- Error number: 1661; Symbol: ER_BINLOG_ROW_ENGINE_AND_STMT_ENGINE; SQLSTATE: HY000
  Message: Cannot execute statement: impossible to write to binary log since both row-incapable engines and statement-incapable engines are involved.

- Error number: 1662; Symbol: ER_BINLOG_ROW_MODE_AND_STMT_ENGINE; SQLSTATE: HY000
  Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = ROW and at least one table uses a storage engine limited to statement-based logging.
• Error number: 1663; Symbol: ER_BINLOG_UNSAFE_AND_STMT_ENGINE; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since statement is unsafe, storage engine is limited to statement-based logging, and BINLOG_FORMAT = MIXED. %s

• Error number: 1664; Symbol: ER_BINLOG_ROW_INJECTION_AND_STMT_ENGINE; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since statement is in row format and at least one table uses a storage engine limited to statement-based logging.

• Error number: 1665; Symbol: ER_BINLOG_STMT_MODE_AND_ROW_ENGINE; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT and at least one table uses a storage engine limited to row-based logging.%s

• Error number: 1666; Symbol: ER_BINLOG_ROW_INJECTION_AND_STMT_MODE; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since statement is in row format and BINLOG_FORMAT = STATEMENT.

• Error number: 1667; Symbol: ER_BINLOG_MULTIPLE_ENGINES_AND_SELF_LOGGING_ENGINE; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since more than one engine is involved and at least one engine is self-logging.

• Error number: 1668; Symbol: ER_BINLOG_UNSAFE_LIMIT; SQLSTATE: HY000
Message: The statement is unsafe because it uses a LIMIT clause. This is unsafe because the set of rows included cannot be predicted.

• Error number: 1670; Symbol: ER_BINLOG_UNSAFE_SYSTEM_TABLE; SQLSTATE: HY000
Message: The statement is unsafe because it uses the general log, slow query log, or performance_schema table(s). This is unsafe because system tables may differ on slaves.

• Error number: 1671; Symbol: ER_BINLOG_UNSAFE_AUTOINC_COLUMNS; SQLSTATE: HY000
Message: Statement is unsafe because it invokes a trigger or a stored function that inserts into an AUTO_INCREMENT column. Inserted values cannot be logged correctly.

• Error number: 1672; Symbol: ER_BINLOG_UNSAFE_UDF; SQLSTATE: HY000
Message: Statement is unsafe because it uses a UDF which may not return the same value on the slave.

• Error number: 1673; Symbol: ER_BINLOG_UNSAFE_SYSTEM_VARIABLE; SQLSTATE: HY000
Message: Statement is unsafe because it uses a system variable that may have a different value on the slave.

• Error number: 1674; Symbol: ER_BINLOG_UNSAFE_SYSTEM_FUNCTION; SQLSTATE: HY000
Message: Statement is unsafe because it uses a system function that may return a different value on the slave.

• Error number: 1675; Symbol: ER_BINLOG_UNSAFE_NONTRANS_AFTER_TRANS; SQLSTATE: HY000
Message: Statement is unsafe because it accesses a non-transactional table after accessing a transactional table within the same transaction.

• Error number: 1676; Symbol: ER_MESSAGE_AND_STATEMENT; SQLSTATE: HY000
Message: Statement: %s

• Error number: 1677; Symbol: ER_SLAVE_CONVERSION_FAILED; SQLSTATE: HY000
Message: Column %d of table '%s.%s' cannot be converted from type '%s' to type '%s'

ER_SLAVE_CONVERSION_FAILED was removed after 8.0.4.

• Error number: 1678; Symbol: ER_SLAVE_CANT_CREATE_CONVERSION; SQLSTATE: HY000
Message: Can't create conversion table for table '%s.%s'

• Error number: 1679; Symbol: ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_BINLOG_FORMAT; SQLSTATE: HY000
Message: Cannot modify @@session.binlog_format inside a transaction

• Error number: 1680; Symbol: ER_PATH_LENGTH; SQLSTATE: HY000
Message: The path specified for %s is too long.

• Error number: 1681; Symbol: ER_WARN_DEPRECATED_SYNTAX_NO_REPLACEMENT; SQLSTATE: HY000
Message: '%s' is deprecated and will be removed in a future release.

• Error number: 1682; Symbol: ER_WRONG_NATIVE_TABLE_STRUCTURE; SQLSTATE: HY000
Message: Native table '%s.%s' has the wrong structure

• Error number: 1683; Symbol: ER_WRONG_PERFSHEMA_USAGE; SQLSTATE: HY000
Message: Invalid performance_schema usage.

• Error number: 1684; Symbol: ER_WARN_I_S_SKIPPED_TABLE; SQLSTATE: HY000
Message: Table '%s'.%s was skipped since its definition is being modified by concurrent DDL statement

• Error number: 1685; Symbol: ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_BINLOG_DIRECT; SQLSTATE: HY000
Message: Cannot modify @@session.binlog_direct_non_transactional_updates inside a transaction

• Error number: 1686; Symbol: ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_DIRECT; SQLSTATE: HY000
Message: Cannot change the binlog direct flag inside a stored function or trigger

• Error number: 1687; Symbol: ER_SPATIAL_MUST_HAVE_GEOM_COL; SQLSTATE: 42000
Message: A SPATIAL index may only contain a geometrical type column

• Error number: 1688; Symbol: ER_TOO_LONG_INDEX_COMMENT; SQLSTATE: HY000
Message: Comment for index ‘%s’ is too long (max = %lu)
•   Error number: 1689; Symbol: ER_LOCK_ABORTED; SQLSTATE: HY000
Message: Wait on a lock was aborted due to a pending exclusive lock
•   Error number: 1690; Symbol: ER_DATA_OUT_OF_RANGE; SQLSTATE: 22003
Message: %s value is out of range in '%%s'
•   Error number: 1691; Symbol: ER_WRONG_SPVAR_TYPE_IN_LIMIT; SQLSTATE: HY000
Message: A variable of a non-integer based type in LIMIT clause
•   Error number: 1692; Symbol: ER_BINLOG_UNSAFE_MULTIPLE_ENGINES_AND_SELF_LOGGING_ENGINE; SQLSTATE: HY000
Message: Mixing self-logging and non-self-logging engines in a statement is unsafe.
•   Error number: 1693; Symbol: ER_BINLOG_UNSAFE_MIXED_STATEMENT; SQLSTATE: HY000
Message: Statement accesses nontransactional table as well as transactional or temporary table, and
writes to any of them.
•   Error number: 1694; Symbol: ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_SQL_LOG_BIN; SQLSTATE: HY000
Message: Cannot modify @@session.sql_log_bin inside a transaction
•   Error number: 1695; Symbol: ER_STORED_FUNCTION_PREVENTS_SWITCH_SQL_LOG_BIN; SQLSTATE: HY000
Message: Cannot change the sql_log_bin inside a stored function or trigger
•   Error number: 1696; Symbol: ER_FAILED_READ_FROM_PAR_FILE; SQLSTATE: HY000
Message: Failed to read from the .par file
•   Error number: 1697; Symbol: ER_VALUES_IS_NOT_INT_TYPE_ERROR; SQLSTATE: HY000
Message: VALUES value for partition ‘%s’ must have type INT
•   Error number: 1698; Symbol: ER_ACCESS_DENIED_NO_PASSWORD_ERROR; SQLSTATE: 28000
Message: Access denied for user ‘%s’@’%s’
•   Error number: 1699; Symbol: ER_SET_PASSWORD_AUTH_PLUGIN; SQLSTATE: HY000
Message: SET PASSWORD has no significance for users authenticating via plugins
•   Error number: 1701; Symbol: ER_TRUNCATE_ILLEGAL_FK; SQLSTATE: 42000
Message: Cannot truncate a table referenced in a foreign key constraint (%s)
•   Error number: 1702; Symbol: ER_PLUGIN_IS_PERMANENT; SQLSTATE: HY000
Message: Plugin ‘%s’ is force_plus_permanent and can not be unloaded
•   Error number: 1703; Symbol: ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MIN; SQLSTATE: HY000
Message: The requested value for the heartbeat period is less than 1 millisecond. The value is reset to 0, meaning that heartbeating will effectively be disabled.

- Error number: 1704; Symbol: ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MAX; SQLSTATE: HY000

Message: The requested value for the heartbeat period exceeds the value of `slave_net_timeout' seconds. A sensible value for the period should be less than the timeout.

- Error number: 1705; Symbol: ER_STMT_CACHE_FULL; SQLSTATE: HY000

Message: Multi-row statements required more than 'max_binlog_stmt_cache_size' bytes of storage; increase this mysqld variable and try again.

- Error number: 1706; Symbol: ER_MULTI_UPDATE_KEY_CONFLICT; SQLSTATE: HY000

Message: Primary key/partition key update is not allowed since the table is updated both as "%s" and '%s'.

- Error number: 1707; Symbol: ER_TABLE_NEEDS_REBUILD; SQLSTATE: HY000

Message: Table rebuild required. Please do "ALTER TABLE '%s' FORCE" or dump/reload to fix it!

- Error number: 1708; Symbol: WARN_OPTION_BELOW_LIMIT; SQLSTATE: HY000

Message: The value of '%s' should be no less than the value of '%s'

- Error number: 1709; Symbol: ER_INDEX_COLUMN_TOO_LONG; SQLSTATE: HY000

Message: Index column size too large. The maximum column size is %lu bytes.

- Error number: 1710; Symbol: ER_ERROR_IN_TRIGGER_BODY; SQLSTATE: HY000

Message: Trigger '%s' has an error in its body: '%s'

- Error number: 1711; Symbol: ER_ERROR_IN_UNKNOWN_TRIGGER_BODY; SQLSTATE: HY000

Message: Unknown trigger has an error in its body: '%s'

- Error number: 1712; Symbol: ER_INDEX_CORRUPT; SQLSTATE: HY000

Message: Index %s is corrupted

- Error number: 1713; Symbol: ER_UNDO_RECORD_TOO_BIG; SQLSTATE: HY000

Message: Undo log record is too big.

- Error number: 1714; Symbol: ER_BINLOG_UNSAFE_INSERT_IGNORE_SELECT; SQLSTATE: HY000

Message: INSERT IGNORE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error number: 1715; Symbol: ER_BINLOG_UNSAFE_INSERT_SELECT_UPDATE; SQLSTATE: HY000

Message: INSERT... SELECT... ON DUPLICATE KEY UPDATE is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are updated. This order cannot be predicted and may differ on master and the slave.
• Error number: 1716; Symbol: ER_BINLOG_UNSAFE_REPLACE_SELECT; SQLSTATE: HY000
  Message: REPLACE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

• Error number: 1717; Symbol: ER_BINLOG_UNSAFE_CREATE_IGNORE_SELECT; SQLSTATE: HY000
  Message: CREATE... IGNORE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

• Error number: 1718; Symbol: ER_BINLOG_UNSAFE_CREATE_REPLACE_SELECT; SQLSTATE: HY000
  Message: CREATE... REPLACE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

• Error number: 1719; Symbol: ER_BINLOG_UNSAFE_UPDATE_IGNORE; SQLSTATE: HY000
  Message: UPDATE IGNORE is unsafe because the order in which rows are updated determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

• Error number: 1720; Symbol: ER_PLUGIN_NO_UNINSTALL; SQLSTATE: HY000
  Message: Plugin '%s' is marked as not dynamically uninstallable. You have to stop the server to uninstall it.

• Error number: 1721; Symbol: ER_PLUGIN_NO_INSTALL; SQLSTATE: HY000
  Message: Plugin '%s' is marked as not dynamically installable. You have to stop the server to install it.

• Error number: 1722; Symbol: ER_BINLOG_UNSAFE_WRITE_AUTOINC_SELECT; SQLSTATE: HY000
  Message: Statements writing to a table with an auto-increment column after selecting from another table are unsafe because the order in which rows are retrieved determines what (if any) rows will be written. This order cannot be predicted and may differ on master and the slave.

• Error number: 1723; Symbol: ER_BINLOG_UNSAFE_CREATE_SELECT_AUTOINC; SQLSTATE: HY000
  Message: CREATE TABLE... SELECT... on a table with an auto-increment column is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are inserted. This order cannot be predicted and may differ on master and the slave.

• Error number: 1724; Symbol: ER_BINLOG_UNSAFE_INSERT_TWO_KEYS; SQLSTATE: HY000
  Message: INSERT... ON DUPLICATE KEY UPDATE on a table with more than one UNIQUE KEY is unsafe.

• Error number: 1725; Symbol: ER_TABLE_IN_FK_CHECK; SQLSTATE: HY000
  Message: Table is being used in foreign key check.

• Error number: 1726; Symbol: ER_UNSUPPORTED_ENGINE; SQLSTATE: HY000
  Message: Storage engine '%s' does not support system tables. [%s.%s]

• Error number: 1727; Symbol: ER_BINLOG_UNSAFE_AUTOINC_NOT_FIRST; SQLSTATE: HY000
Message: INSERT into autoincrement field which is not the first part in the composed primary key is unsafe.

- Error number: 1728; Symbol: ER_CANNOT_LOAD_FROM_TABLE_V2; SQLSTATE: HY000
  Message: Cannot load from %s.%s. The table is probably corrupted

- Error number: 1729; Symbol: ER_MASTER_DELAY_VALUE_OUT_OF_RANGE; SQLSTATE: HY000
  Message: The requested value %s for the master delay exceeds the maximum %u

- Error number: 1730; Symbol: ER_ONLY_FD_AND_RBR_EVENTS_ALLOWED_IN_BINLOG_STATEMENT; SQLSTATE: HY000
  Message: Only Format_description_log_event and row events are allowed in BINLOG statements (but %s was provided)

- Error number: 1731; Symbol: ER_PARTITION_EXCHANGE_DIFFERENT_OPTION; SQLSTATE: HY000
  Message: Non matching attribute '%s' between partition and table

- Error number: 1732; Symbol: ER_PARTITION_EXCHANGE_PART_TABLE; SQLSTATE: HY000
  Message: Table to exchange with partition is partitioned: '%s'

- Error number: 1733; Symbol: ER_PARTITION_EXCHANGE_TEMP_TABLE; SQLSTATE: HY000
  Message: Table to exchange with partition is temporary: '%s'

- Error number: 1734; Symbol: ER_PARTITION_INSTEAD_OF_SUBPARTITION; SQLSTATE: HY000
  Message: Subpartitioned table, use subpartition instead of partition

- Error number: 1735; Symbol: ER_UNKNOWN_PARTITION; SQLSTATE: HY000
  Message: Unknown partition '%s' in table '%s'

- Error number: 1736; Symbol: ER_TABLES_DIFFERENT_METADATA; SQLSTATE: HY000
  Message: Tables have different definitions

- Error number: 1737; Symbol: ER_ROW_DOES_NOT_MATCH_PARTITION; SQLSTATE: HY000
  Message: Found a row that does not match the partition

- Error number: 1738; Symbol: ER_BINLOG_CACHE_SIZE_GREATER_THAN_MAX; SQLSTATE: HY000
  Message: Option binlog_cache_size (%lu) is greater than max_binlog_cache_size (%lu); setting binlog_cache_size equal to max_binlog_cache_size.

- Error number: 1739; Symbol: ER_WARN_INDEX_NOT_APPLICABLE; SQLSTATE: HY000
  Message: Cannot use %s access on index '%s' due to type or collation conversion on field '%s'

- Error number: 1740; Symbol: ER_PARTITION_EXCHANGE_FOREIGN_KEY; SQLSTATE: HY000
  Message: Table to exchange with partition has foreign key references: '%s'

- Error number: 1742; Symbol: ER_RPL_INFO_DATA_TOO_LONG; SQLSTATE: HY000
Server Error Message Reference

Message: Data for column '%s' too long

• Error number: 1745; Symbol: `ER_BINLOG_STMT_CACHE_SIZE_GREATER_THAN_MAX`; SQLSTATE: HY000
Message: Option binlog_stmt_cache_size (%lu) is greater than max_binlog_stmt_cache_size (%lu); setting binlog_stmt_cache_size equal to max_binlog_stmt_cache_size.

• Error number: 1746; Symbol: `ER_CANT_UPDATE_TABLE_IN_CREATE_TABLE_SELECT`; SQLSTATE: HY000
Message: Can't update table '%s' while '%s' is being created.

• Error number: 1747; Symbol: `ER_PARTITION_CLAUSE_ON_NONPARTITIONED`; SQLSTATE: HY000
Message: PARTITION () clause on non partitioned table

• Error number: 1748; Symbol: `ER_ROW_DOES_NOT_MATCH_GIVEN_PARTITION_SET`; SQLSTATE: HY000
Message: Found a row not matching the given partition set

• Error number: 1750; Symbol: `ER_CHANGE_RPL_INFO_REPOSITORY_FAILURE`; SQLSTATE: HY000
Message: Failure while changing the type of replication repository: %s.

• Error number: 1751; Symbol: `ER_WARNING_NOT_COMPLETE_ROLLBACK_WITH_CREATED_TEMP_TABLE`; SQLSTATE: HY000
Message: The creation of some temporary tables could not be rolled back.

• Error number: 1752; Symbol: `ER_WARNING_NOT_COMPLETE_ROLLBACK_WITH_DROPPED_TEMP_TABLE`; SQLSTATE: HY000
Message: Some temporary tables were dropped, but these operations could not be rolled back.

• Error number: 1753; Symbol: `ER_MTS_FEATURE_IS_NOT_SUPPORTED`; SQLSTATE: HY000
Message: %s is not supported in multi-threaded slave mode. %s

• Error number: 1754; Symbol: `ER_MTS_UPDATED_DBIS_GREATER_MAX`; SQLSTATE: HY000
Message: The number of modified databases exceeds the maximum %d; the database names will not be included in the replication event metadata.

• Error number: 1755; Symbol: `ER_MTS_CANT_PARALLEL`; SQLSTATE: HY000
Message: Cannot execute the current event group in the parallel mode. Encountered event %s, relay-log name %s, position %s which prevents execution of this event group in parallel mode. Reason: %s.

• Error number: 1756; Symbol: `ER_MTS_INCONSISTENT_DATA`; SQLSTATE: HY000
Message: %s

• Error number: 1757; Symbol: `ER_FULLTEXT_NOT_SUPPORTED_WITH_PARTITIONING`; SQLSTATE: HY000
Message: FULLTEXT index is not supported for partitioned tables.
• Error number: 1758; Symbol: ER_DA_INVALID_CONDITION_NUMBER; SQLSTATE: 35000
  Message: Invalid condition number

• Error number: 1759; Symbol: ER_INSECUREPLAIN_TEXT; SQLSTATE: HY000
  Message: Sending passwords in plain text without SSL/TLS is extremely insecure.

• Error number: 1760; Symbol: ER_INSECURECHANGE_MASTER; SQLSTATE: HY000
  Message: Storing MySQL user name or password information in the master info repository is not secure and is therefore not recommended. Please consider using the USER and PASSWORD connection options for START SLAVE; see the 'START SLAVE Syntax' in the MySQL Manual for more information.

• Error number: 1761; Symbol: ER_FOREIGNDUPLICATE_KEY_WITH_CHILD_INFO; SQLSTATE: 23000
  Message: Foreign key constraint for table '%%s', record '%%s' would lead to a duplicate entry in table '%%s', key '%%s'

• Error number: 1762; Symbol: ER_FOREIGNDUPLICATE_KEY_WITHOUT_CHILD_INFO; SQLSTATE: 23000
  Message: Foreign key constraint for table '%%s', record '%%s' would lead to a duplicate entry in a child table

• Error number: 1763; Symbol: ER_SQLTHREAD_WITH_SECURE_SLAVE; SQLSTATE: HY000
  Message: Setting authentication options is not possible when only the Slave SQL Thread is being started.

• Error number: 1764; Symbol: ER_TABLE_HAS_NO_FT; SQLSTATE: HY000
  Message: The table does not have FULLTEXT index to support this query

• Error number: 1765; Symbol: ER_VARIABLENOT_SETTABLE_IN_SF_OR_TRIGGER; SQLSTATE: HY000
  Message: The system variable %s cannot be set in stored functions or triggers.

• Error number: 1766; Symbol: ER_VARIABLENOT_SETTABLE_IN_TRANSACTION; SQLSTATE: HY000
  Message: The system variable %s cannot be set when there is an ongoing transaction.

• Error number: 1769; Symbol: ER_SETSTATEMENT_CANNOT_INVOCES_FUNCTION; SQLSTATE: HY000
  Message: The statement 'SET %s' cannot invoke a stored function.

• Error number: 1770; Symbol: ER_GTID_NEXT_CANT_BE_AUTOMATIC_IF_GTID_NEXT_LIST_IS_NON_NULL; SQLSTATE: HY000
  Message: The system variable @@SESSION.GTID_NEXT cannot be 'AUTOMATIC' when @@SESSION.GTID_NEXT_LIST is non-NULL.

• Error number: 1772; Symbol: ER_MALFORMED_GTID_SET_SPECIFICATION; SQLSTATE: HY000
  Message: Malformed GTID set specification '%%s'.

5074
• Error number: 1773; Symbol: ER_MALFORMED_GTID_SET_ENCODING; SQLSTATE: HY000
  Message: Malformed GTID set encoding.

• Error number: 1774; Symbol: ER_MALFORMED_GTID_SPECIFICATION; SQLSTATE: HY000
  Message: Malformed GTID specification '%s'.

• Error number: 1775; Symbol: ER_GNO_EXHAUSTED; SQLSTATE: HY000
  Message: Impossible to generate Global Transaction Identifier: the integer component reached the maximal value. Restart the server with a new server_uuid.

• Error number: 1776; Symbol: ER_BAD_SLAVE_AUTO_POSITION; SQLSTATE: HY000
  Message: Parameters MASTER_LOG_FILE, MASTER_LOG_POS, RELAY_LOG_FILE and RELAY_LOG_POS cannot be set when MASTER_AUTO_POSITION is active.

• Error number: 1777; Symbol: ER_AUTO_POSITION_REQUIRES_GTID_MODE_NOT_OFF; SQLSTATE: HY000
  Message: CHANGE MASTER TO MASTER_AUTO_POSITION = 1 cannot be executed because @@GLOBAL.GTID_MODE = OFF.

• Error number: 1778; Symbol: ER_CANT_DO_IMPLICIT_COMMIT_IN_TRX_WHEN_GTID_NEXT_IS_SET; SQLSTATE: HY000
  Message: Cannot execute statements with implicit commit inside a transaction when @@SESSION.GTID_NEXT == 'UUID:NUMBER'.

• Error number: 1779; Symbol: ER_GTID_MODE_ON_REQUIRES_ENFORCE_GTID_CONSISTENCY_ON; SQLSTATE: HY000
  Message: GTID_MODE = ON requires ENFORCE_GTID_CONSISTENCY = ON.

• Error number: 1781; Symbol: ER_CANT_SET_GTID_NEXT_TO_GTID_WHEN_GTID_MODE_IS_OFF; SQLSTATE: HY000
  Message: @@SESSION.GTID_NEXT cannot be set to UUID:NUMBER when @@GLOBAL.GTID_MODE = OFF.

• Error number: 1782; Symbol: ER_CANT_SET_GTID_NEXT_TO_ANONYMOUS_WHEN_GTID_MODE_IS_ON; SQLSTATE: HY000
  Message: @@SESSION.GTID_NEXT cannot be set to ANONYMOUS when @@GLOBAL.GTID_MODE = ON.

• Error number: 1783; Symbol: ER_CANT_SET_GTID_NEXT_LIST_TO_NON_NULL_WHEN_GTID_MODE_IS_OFF; SQLSTATE: HY000
  Message: @@SESSION.GTID_NEXT_LIST cannot be set to a non-NULL value when @@GLOBAL.GTID_MODE = OFF.

• Error number: 1785; Symbol: ER_GTIDUnsafe_NON_TRANSACTIONAL_TABLE; SQLSTATE: HY000
  Message: Statement violates GTID consistency: Updates to non-transactional tables can only be done in either autocommitted statements or single-statement transactions, and never in the same statement as updates to transactional tables.
Server Error Message Reference

- **Error number: 1786; Symbol: ER_GTID_UNSAFE_CREATE_SELECT; SQLSTATE: HY000**
  
  Message: Statement violates GTID consistency: CREATE TABLE ... SELECT.

- **Error number: 1787; Symbol: ER_GTID_UNSAFE_CREATE_DROP_TEMPORARY_TABLE_IN_TRANSACTION; SQLSTATE: HY000**
  
  Message: Statement violates GTID consistency: CREATE TEMPORARY TABLE and DROP TEMPORARY TABLE can only be executed outside transactional context. These statements are also not allowed in a function or trigger because functions and triggers are also considered to be multi-statement transactions.

  ER_GTID_UNSAFE_CREATE_DROP_TEMPORARY_TABLE_IN_TRANSACTION was removed after 8.0.12.

- **Error number: 1788; Symbol: ER_GTID_MODE_CAN_ONLY_CHANGE_ONE_STEP_AT_A_TIME; SQLSTATE: HY000**
  
  Message: The value of @@GLOBAL.GTID_MODE can only be changed one step at a time: OFF <-> OFF_PERMISSIVE <-> ON_PERMISSIVE <-> ON. Also note that this value must be stepped up or down simultaneously on all servers. See the Manual for instructions.

- **Error number: 1789; Symbol: ER_MASTER_HAS_PURGED_REQUIRED_GTIDS; SQLSTATE: HY000**
  
  Message: Cannot replicate because the master purged required binary logs. Replicate the missing transactions from elsewhere, or provision a new slave from backup. Consider increasing the master's binary log expiration period. To find the missing transactions, see the master's error log or the manual for GTID_SUBTRACT.

- **Error number: 1790; Symbol: ER_CANT_SET_GTID_NEXT_WHEN_OWNING_GTID; SQLSTATE: HY000**
  
  Message: @@SESSION.GTID_NEXT cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.

- **Error number: 1791; Symbol: ER_UNKNOWN_EXPLAIN_FORMAT; SQLSTATE: HY000**
  
  Message: Unknown EXPLAIN format name: '%s'

- **Error number: 1792; Symbol: ER_CANT_EXECUTE_IN_READ_ONLY_TRANSACTION; SQLSTATE: 25006**
  
  Message: Cannot execute statement in a READ ONLY transaction.

- **Error number: 1793; Symbol: ER_TOO_LONG_TABLE_PARTITION_COMMENT; SQLSTATE: HY000**
  
  Message: Comment for table partition '%s' is too long (max = %lu)

- **Error number: 1794; Symbol: ER_SLAVE_CONFIGURATION; SQLSTATE: HY000**
  
  Message: Slave is not configured or failed to initialize properly. You must at least set --server-id to enable either a master or a slave. Additional error messages can be found in the MySQL error log.

- **Error number: 1795; Symbol: ER_INNODB_FT_LIMIT; SQLSTATE: HY000**
  
  Message: InnoDB presently supports one FULLTEXT index creation at a time

- **Error number: 1796; Symbol: ER_INNODB_NO_FT_TEMP_TABLE; SQLSTATE: HY000**
  
  Message: Cannot create FULLTEXT index on temporary InnoDB table
• Error number: 1797; Symbol: ER_INNODB_FT_WRONG_DOCID_COLUMN; SQLSTATE: HY000
  Message: Column '%s' is of wrong type for an InnoDB FULLTEXT index

• Error number: 1798; Symbol: ER_INNODB_FT_WRONG_DOCID_INDEX; SQLSTATE: HY000
  Message: Index '%s' is of wrong type for an InnoDB FULLTEXT index

• Error number: 1799; Symbol: ER_INNODB_ONLINE_LOG_TOO_BIG; SQLSTATE: HY000
  Message: Creating index '%s' required more than 'innodb_online_alter_log_max_size' bytes of modification log. Please try again.

• Error number: 1800; Symbol: ER_UNKNOWN_ALTER_ALGORITHM; SQLSTATE: HY000
  Message: Unknown ALGORITHM '%s'

• Error number: 1801; Symbol: ER_UNKNOWN_ALTER_LOCK; SQLSTATE: HY000
  Message: Unknown LOCK type '%s'

• Error number: 1802; Symbol: ER_MTS_CHANGE_MASTER_CANT_RUN_WITH_GAPS; SQLSTATE: HY000
  Message: CHANGE MASTER cannot be executed when the slave was stopped with an error or killed in MTS mode. Consider using RESET SLAVE or START SLAVE UNTIL.

• Error number: 1803; Symbol: ER_MTS_RECOVERY_FAILURE; SQLSTATE: HY000
  Message: Cannot recover after SLAVE errored out in parallel execution mode. Additional error messages can be found in the MySQL error log.

• Error number: 1804; Symbol: ER_MTS_RESET_WORKERS; SQLSTATE: HY000
  Message: Cannot clean up worker info tables. Additional error messages can be found in the MySQL error log.

• Error number: 1805; Symbol: ER_COL_COUNT_DOESNT_MATCH_CORRUPTED_V2; SQLSTATE: HY000
  Message: Column count of %s.%s is wrong. Expected %d, found %d. The table is probably corrupted

• Error number: 1806; Symbol: ER_SLAVE_SILENT_RETRY_TRANSACTION; SQLSTATE: HY000
  Message: Slave must silently retry current transaction

• Error number: 1807; Symbol: ER_DISCARD_FK_CHECKS_RUNNING; SQLSTATE: HY000
  Message: There is a foreign key check running on table '%s'. Cannot discard the table.

- **Error number: 3076; Symbol: ER_SLAVE_CHANNEL_NAME_INVALID_OR_TOO_LONG; SQLSTATE: HY000**
  Message: Couldn't create channel: Channel name is either invalid or too long.

- **Error number: 3077; Symbol: ER_SLAVE_CHANNEL_MULTIPLE_CHANNELS_CMD; SQLSTATE: HY000**
  Message: To have multiple channels, repository cannot be of type FILE; Please check the repository configuration and convert them to TABLE.

- **Error number: 3079; Symbol: ER_SLAVE_MULTIPLE_CHANNELS_CMD; SQLSTATE: HY000**
  Message: Multiple channels exist on the slave. Please provide channel name as an argument.

- **Error number: 3080; Symbol: ER_SLAVE_MAX_CHANNELS_EXCEEDED; SQLSTATE: HY000**
  Message: Maximum number of replication channels allowed exceeded.

- **Error number: 3081; Symbol: ER_SLAVE_CHANNEL_MUST_STOP; SQLSTATE: HY000**
  Message: This operation cannot be performed with running replication threads; run STOP SLAVE FOR CHANNEL '%s' first

- **Error number: 3082; Symbol: ER_SLAVE_CHANNEL_NOT_RUNNING; SQLSTATE: HY000**
  Message: This operation requires running replication threads; configure slave and run START SLAVE FOR CHANNEL '%s'

- **Error number: 3083; Symbol: ER_SLAVE_CHANNEL_WAS_RUNNING; SQLSTATE: HY000**
  Message: Replication thread(s) for channel '%s' are already running.

- **Error number: 3084; Symbol: ER_SLAVE_CHANNEL_WAS_NOT_RUNNING; SQLSTATE: HY000**
  Message: Replication thread(s) for channel '%s' are already stopped.
• Error number: 3085; Symbol: ER_SLAVE_CHANNEL_SQL_THREAD_MUST_STOP; SQLSTATE: HY000
   Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL_THREAD FOR CHANNEL '%s' first.

• Error number: 3086; Symbol: ER_SLAVE_CHANNEL_SQL_SKIP_COUNTER; SQLSTATE: HY000
   Message: When sql_slave_skip_counter > 0, it is not allowed to start more than one SQL thread by using 'START SLAVE [SQL_THREAD]'. Value of sql_slave_skip_counter can only be used by one SQL thread at a time. Please use 'START SLAVE [SQL_THREAD] FOR CHANNEL' to start the SQL thread which will use the value of sql_slave_skip_counter.

• Error number: 3087; Symbol: ER_WRONG_FIELD_WITH_GROUP_V2; SQLSTATE: HY000
   Message: Expression #%u of %s is not in GROUP BY clause and contains nonaggregated column '%s' which is not functionally dependent on columns in GROUP BY clause; this is incompatible with sql_mode=only_full_group_by

• Error number: 3088; Symbol: ER_MIX_OF_GROUP_FUNC_AND_FIELDS_V2; SQLSTATE: HY000
   Message: In aggregated query without GROUP BY, expression #%u of %s contains nonaggregated column '%s'; this is incompatible with sql_mode=only_full_group_by

• Error number: 3089; Symbol: ER_WARN_DEPRECATED_SYSVAR_UPDATE; SQLSTATE: HY000
   Message: Updating '%s' is deprecated. It will be made read-only in a future release.

• Error number: 3090; Symbol: ER_WARN_DEPRECATED_SQLMODE; SQLSTATE: HY000
   Message: Changing sql mode '%s' is deprecated. It will be removed in a future release.

• Error number: 3091; Symbol: ER_CANNOT_LOG_PARTIAL_DROP_DATABASE_WITH_GTID; SQLSTATE: HY000
   Message: DROP DATABASE failed; some tables may have been dropped but the database directory remains. The GTID has not been added to GTID_EXECUTED and the statement was not written to the binary log. Fix this as follows: (1) remove all files from the database directory %s; (2) SET GTID_NEXT='%s'; (3) DROP DATABASE `%s`.

• Error number: 3092; Symbol: ER_GROUP_REPLICATION_CONFIGURATION; SQLSTATE: HY000
   Message: The server is not configured properly to be an active member of the group. Please see more details on error log.

• Error number: 3093; Symbol: ER_GROUP_REPLICATION_RUNNING; SQLSTATE: HY000
   Message: The START GROUP_REPLICATION command failed since the group is already running.

• Error number: 3094; Symbol: ER_GROUP_REPLICATION_APPLIER_INIT_ERROR; SQLSTATE: HY000
   Message: The START GROUP_REPLICATION command failed as the applier module failed to start.

• Error number: 3095; Symbol: ER_GROUP_REPLICATION_STOP_APPLIER_THREAD_TIMEOUT; SQLSTATE: HY000
   Message: The STOP GROUP_REPLICATION command execution is incomplete: The applier thread got the stop signal while it was busy. The applier thread will stop once the current task is complete.
Server Error Message Reference

- Error number: **3096**; Symbol: `ER_GROUP_REPLICATION_COMMUNICATION_LAYER_SESSION_ERROR`; SQLSTATE: `HY000`
  Message: The START GROUP_REPLICATION command failed as there was an error when initializing the group communication layer.

- Error number: **3097**; Symbol: `ER_GROUP_REPLICATION_COMMUNICATION_LAYER_JOIN_ERROR`; SQLSTATE: `HY000`
  Message: The START GROUP_REPLICATION command failed as there was an error when joining the communication group.

- Error number: **3098**; Symbol: `ER_BEFORE_DML_VALIDATION_ERROR`; SQLSTATE: `HY000`
  Message: The table does not comply with the requirements by an external plugin.

- Error number: **3099**; Symbol: `ER_PREVENTS_VARIABLE_WITHOUT_RBR`; SQLSTATE: `HY000`
  Message: Cannot change the value of variable `%s` without binary log format as ROW.
  The `transaction_write_set_extraction` option value is set and `binlog_format` is not `ROW`.

- Error number: **3100**; Symbol: `ER_RUN_HOOK_ERROR`; SQLSTATE: `HY000`
  Message: Error on observer while running replication hook '%s'.

- Error number: **3101**; Symbol: `ER_TRANSACTION_ROLLBACK_DURING_COMMIT`; SQLSTATE: `40000`
  Message: Plugin instructed the server to rollback the current transaction.
  When using Group Replication, this means that a transaction failed the group certification process, due to one or more members detecting a potential conflict, and was thus rolled back. See Chapter 18, Group Replication.

- Error number: **3102**; Symbol: `ER_GENERATED_COLUMN_FUNCTION_IS_NOT_ALLOWED`; SQLSTATE: `HY000`
  Message: Expression of generated column '%s' contains a disallowed function.

- Error number: **3103**; Symbol: `ER_UNSUPPORTED_ALTER_INPLACE_ON_VIRTUAL_COLUMN`; SQLSTATE: `HY000`
  Message: INPLACE ADD or DROP of virtual columns cannot be combined with other ALTER TABLE actions

- Error number: **3104**; Symbol: `ER_WRONG_FK_OPTION_FOR_GENERATED_COLUMN`; SQLSTATE: `HY000`
  Message: Cannot define foreign key with %s clause on a generated column.

- Error number: **3105**; Symbol: `ER_NON_DEFAULT_VALUE_FOR_GENERATED_COLUMN`; SQLSTATE: `HY000`
  Message: The value specified for generated column '%s' in table '%s' is not allowed.

- Error number: **3106**; Symbol: `ER_UNSUPPORTED_ACTION_ON_GENERATED_COLUMN`; SQLSTATE: `HY000`
  Message: '%s' is not supported for generated columns.
• Error number: 3107; Symbol: ER_GENERATED_COLUMN_NON_PRIOR; SQLSTATE: HY000
Message: Generated column can refer only to generated columns defined prior to it.
To address this issue, change the table definition to define each generated column later than any generated columns to which it refers.

• Error number: 3108; Symbol: ER_DEPENDENT_BY_GENERATED_COLUMN; SQLSTATE: HY000
Message: Column '%s' has a generated column dependency.
You cannot drop or rename a generated column if another column refers to it. You must either drop those columns as well, or redefine them not to refer to the generated column.

• Error number: 3109; Symbol: ER_GENERATED_COLUMN_REF_AUTO_INC; SQLSTATE: HY000
Message: Generated column '%s' cannot refer to auto-increment column.

• Error number: 3110; Symbol: ER_FEATURE_NOT_AVAILABLE; SQLSTATE: HY000
Message: The '%s' feature is not available; you need to remove '%s' or use MySQL built with '%s'

• Error number: 3111; Symbol: ER_CANT_SET_GTID_MODE; SQLSTATE: HY000
Message: SET @@GLOBAL.GTID_MODE = %s is not allowed because %s.

• Error number: 3112; Symbol: ER_CANT_USE_AUTO_POSITION_WITH_GTID_MODE_OFF; SQLSTATE: HY000
Message: The replication receiver thread%s cannot start in AUTO_POSITION mode: this server uses @@GLOBAL.GTID_MODE = OFF.

• Error number: 3116; Symbol: ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS; SQLSTATE: HY000
Message: Cannot set ENFORCE_GTID_CONSISTENCY = ON because there are ongoing transactions that violate GTID consistency.

ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS was renamed to ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIIONS.

• Error number: 3117; Symbol: ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TX; SQLSTATE: HY000
Message: There are ongoing transactions that violate GTID consistency.

ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIIONS was renamed to ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIIONS.

• Error number: 3118; Symbol: ER_ACCOUNT_HAS_BEEN_LOCKED; SQLSTATE: HY000
Message: Access denied for user '%s'@'%s'. Account is locked.
The account was locked with CREATE USER ... ACCOUNT LOCK or ALTER USER ... ACCOUNT LOCK. An administrator can unlock it with ALTER USER ... ACCOUNT UNLOCK.

• Error number: 3119; Symbol: ER_WRONG_TABLESPACE_NAME; SQLSTATE: 42000
Message: Incorrect tablespace name `\%s`  
- Error number: 3120; Symbol: ER_TABLESPACE_IS_NOT_EMPTY; SQLSTATE: HY000  
Message: Tablespace `\%s` is not empty.

- Error number: 3121; Symbol: ER_WRONG_FILE_NAME; SQLSTATE: HY000  
Message: Incorrect File Name `\%s`.

- Error number: 3122; Symbol: ER_BOOST_GEOMETRY_INCONSISTENT_TURNS_EXCEPTION; SQLSTATE: HY000  
Message: Inconsistent intersection points.

- Error number: 3123; Symbol: ER_WARN_OPTIMIZER_HINT_SYNTAX_ERROR; SQLSTATE: HY000  
Message: Optimizer hint syntax error

- Error number: 3124; Symbol: ER_WARN_BAD_MAX_EXECUTION_TIME; SQLSTATE: HY000  
Message: Unsupported MAX_EXECUTION_TIME

- Error number: 3125; Symbol: ER_WARN_UNSUPPORTED_MAX_EXECUTION_TIME; SQLSTATE: HY000  
Message: MAX_EXECUTION_TIME hint is supported by top-level standalone SELECT statements only
The MAX_EXECUTION_TIME optimizer hint is supported only for SELECT statements.

- Error number: 3126; Symbol: ER_WARN_CONFLICTING_HINT; SQLSTATE: HY000  
Message: Hint `\%s` is ignored as conflicting/duplicated

- Error number: 3127; Symbol: ER_WARN_UNKNOWN_QB_NAME; SQLSTATE: HY000  
Message: Query block name `\%s` is not found for `\%s` hint

- Error number: 3128; Symbol: ER_UNRESOLVED_HINT_NAME; SQLSTATE: HY000  
Message: Unresolved name `\%s` for `\%s` hint

- Error number: 3129; Symbol: ER_WARN_ON_MODIFYING_GTID_EXECUTED_TABLE; SQLSTATE: HY000  
Message: Please do not modify the `\%s` table. This is a mysql internal system table to store GTIDs for committed transactions. Modifying it can lead to an inconsistent GTID state.

- Error number: 3130; Symbol: ER_PLUGGABLE_PROTOCOL_COMMAND_NOT_SUPPORTED; SQLSTATE: HY000  
Message: Command not supported by pluggable protocols

- Error number: 3131; Symbol: ER_LOCKING_SERVICE_WRONG_NAME; SQLSTATE: 42000  
Message: Incorrect locking service lock name `\%s`.

A locking service name was specified as `NULL`, the empty string, or a string longer than 64 characters. Namespace and lock names must be non-`NULL`, nonempty, and no more than 64 characters long.
• Error number: 3132; Symbol: ER_LOCKING_SERVICE_DEADLOCK; SQLSTATE: HY000
Message: Deadlock found when trying to get locking service lock; try releasing locks and restarting lock acquisition.

• Error number: 3133; Symbol: ER_LOCKING_SERVICE_TIMEOUT; SQLSTATE: HY000
Message: Service lock wait timeout exceeded.

• Error number: 3134; Symbol: ER_GIS_MAX_POINTS_IN_GEOMETRY_OVERFLOWED; SQLSTATE: HY000
Message: Parameter %s exceeds the maximum number of points in a geometry (%lu) in function %s.

• Error number: 3135; Symbol: ER_SQL_MODE_MERGED; SQLSTATE: HY000
Message: ‘NO_ZERO_DATE’, ‘NO_ZERO_IN_DATE’ and ‘ERROR_FOR_DIVISION_BY_ZERO’ sql modes should be used with strict mode. They will be merged with strict mode in a future release.

• Error number: 3136; Symbol: ER_VTOKEN_PLUGIN_TOKEN_MISMATCH; SQLSTATE: HY000
Message: Version token mismatch for %.*s. Correct value %.*s
The client has set its version_tokens_session system variable to the list of tokens it requires the server to match, but the server token list has at least one matching token name that has a value different from what the client requires. See Section 5.6.6, “Version Tokens”.

• Error number: 3137; Symbol: ER_VTOKEN_PLUGIN_TOKEN_NOT_FOUND; SQLSTATE: HY000
Message: Version token %.*s not found.
The client has set its version_tokens_session system variable to the list of tokens it requires the server to match, but the server token list is missing at least one of those tokens. See Section 5.6.6, “Version Tokens”.

• Error number: 3138; Symbol: ER_CANT_SET_VARIABLE_WHEN_OWNING_GTID; SQLSTATE: HY000
Message: Variable %s cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.

• Error number: 3139; Symbol: ER_SLAVE_CHANNEL_OPERATION_NOT_ALLOWED; SQLSTATE: HY000
Message: %s cannot be performed on channel '%s'.

• Error number: 3140; Symbol: ER_INVALID_JSON_TEXT; SQLSTATE: 22032
Message: Invalid JSON text: "%s" at position %u in value for column '%s'.

• Error number: 3141; Symbol: ER_INVALID_JSON_TEXT_IN_PARAM; SQLSTATE: 22032
Message: Invalid JSON text in argument %u to function %s: "%s" at position %u.%s

• Error number: 3142; Symbol: ER_INVALID_JSON_BINARY_DATA; SQLSTATE: HY000
Message: The JSON binary value contains invalid data.

• Error number: 3143; Symbol: ER_INVALID_JSON_PATH; SQLSTATE: 42000
Message: Invalid JSON path expression. The error is around character position %u.%s
Server Error Message Reference

- **Error number:** 3144; Symbol: `ER_INVALID_JSON_CHARSET`; SQLSTATE: 22032
  Message: Cannot create a JSON value from a string with CHARACTER SET '%s'.

- **Error number:** 3145; Symbol: `ER_INVALID_JSON_CHARSET_IN_FUNCTION`; SQLSTATE: 22032
  Message: Invalid JSON character data provided to function %s: '%s'; utf8 is required.

- **Error number:** 3146; Symbol: `ER_INVALID_TYPE_FOR_JSON`; SQLSTATE: 22032
  Message: Invalid data type for JSON data in argument %u to function %s; a JSON string or JSON type is required.

- **Error number:** 3147; Symbol: `ER_INVALID_CAST_TO_JSON`; SQLSTATE: 22032
  Message: Cannot CAST value to JSON.

- **Error number:** 3148; Symbol: `ER_INVALID_JSON_PATH_CHARSET`; SQLSTATE: 42000
  Message: A path expression must be encoded in the utf8 character set. The path expression '%s' is encoded in character set '%s'.

- **Error number:** 3149; Symbol: `ER_INVALID_JSON_PATH_WILDCARD`; SQLSTATE: 42000
  Message: In this situation, path expressions may not contain the * and ** tokens or an array range.

- **Error number:** 3150; Symbol: `ER_JSON_VALUE_TOO_BIG`; SQLSTATE: 22032
  Message: The JSON value is too big to be stored in a JSON column.

- **Error number:** 3151; Symbol: `ER_JSON_KEY_TOO_BIG`; SQLSTATE: 22032
  Message: The JSON object contains a key name that is too long.

- **Error number:** 3152; Symbol: `ER_JSON_USED_AS_KEY`; SQLSTATE: 42000
  Message: JSON column '%s' supports indexing only via generated columns on a specified JSON path.

- **Error number:** 3153; Symbol: `ER_JSON_VACUOUS_PATH`; SQLSTATE: 42000
  Message: The path expression '$' is not allowed in this context.

- **Error number:** 3154; Symbol: `ER_JSON_BAD_ONE_OR_ALL_ARG`; SQLSTATE: 42000
  Message: The oneOrAll argument to %s may take these values: 'one' or 'all'.

- **Error number:** 3155; Symbol: `ER_NUMERIC_JSON_VALUE_OUT_OF_RANGE`; SQLSTATE: 22003
  Message: Out of range JSON value for CAST to %s%s from column %s at row %ld

- **Error number:** 3156; Symbol: `ER_INVALID_JSON_VALUE_FOR_CAST`; SQLSTATE: 22018
  Message: Invalid JSON value for CAST to %s%s from column %s at row %ld

- **Error number:** 3157; Symbol: `ER_JSON_DOCUMENT_TOO_DEEP`; SQLSTATE: 22032
  Message: The JSON document exceeds the maximum depth.

- **Error number:** 3158; Symbol: `ER_JSON_DOCUMENT_NULL_KEY`; SQLSTATE: 22032
  Message: JSON documents may not contain NULL member names.
Error number: 3159; Symbol: ER_SECURE_TRANSPORT_REQUIRED; SQLSTATE: HY000
Message: Connections using insecure transport are prohibited while --require_secure_transport=ON.

With the require_secure_transport system variable, clients can connect only using secure transports. Qualifying connections are those using SSL, a Unix socket file, or shared memory.

Error number: 3160; Symbol: ER_NO_SECURE_TRANSPORTS_CONFIGURED; SQLSTATE: HY000
Message: No secure transports (SSL or Shared Memory) are configured, unable to set --require_secure_transport=ON.

The require_secure_transport system variable cannot be enabled if the server does not support at least one secure transport. Configure the server with the required SSL keys/certificates to enable SSL connections, or enable the shared_memory system variable to enable shared-memory connections.

Error number: 3161; Symbol: ER_DISABLED_STORAGE_ENGINE; SQLSTATE: HY000
Message: Storage engine %s is disabled (Table creation is disallowed).

An attempt was made to create a table or tablespace using a storage engine listed in the value of the disabled_storage_engines system variable, or to change an existing table or tablespace to such an engine. Choose a different storage engine.

Error number: 3162; Symbol: ER_USER.Does.Not.Exist; SQLSTATE: HY000
Message: Authorization ID %s does not exist.

Error number: 3163; Symbol: ER_USER_ALREADY_EXISTS; SQLSTATE: HY000
Message: Authorization ID %s already exists.

Error number: 3164; Symbol: ER_AUDIT_API_ABORT; SQLSTATE: HY000
Message: Aborted by Audit API ('%s';%d).

This error indicates that an audit plugin terminated execution of an event. The message typically indicates the event subclass name and a numeric status value.

Error number: 3165; Symbol: ER_INVALID_JSON_PATH_ARRAY_CELL; SQLSTATE: 42000
Message: A path expression is not a path to a cell in an array.

Error number: 3166; Symbol: ER_BUFPOOL_RESIZE_INPROGRESS; SQLSTATE: HY000
Message: Another buffer pool resize is already in progress.

Error number: 3167; Symbol: ER_FEATURE_DISABLED_SEE_DOC; SQLSTATE: HY000
Message: The '%s' feature is disabled; see the documentation for '%s'

Error number: 3168; Symbol: ER_SERVER.ISNT_AVAILABLE; SQLSTATE: HY000
Message: Server isn't available

Error number: 3169; Symbol: ER_SESSION.WAS.KILLED; SQLSTATE: HY000
Message: Session was killed

Error number: 3170; Symbol: ER_CAPACITY.EXCEEDED; SQLSTATE: HY000
Message: Memory capacity of %llu bytes for '%s' exceeded.

- Error number: 3171; Symbol: ER_CAPACITY_EXCEEDED_IN_RANGE_OPTIMIZER; SQLSTATE: HY000
  Message: Range optimization was not done for this query.

- Error number: 3173; Symbol: ER_CANT_WAIT_FOR_EXECUTED_GTID_SET_WHILE_OWNING_A_GTID; SQLSTATE: HY000
  Message: The client holds ownership of the GTID %s. Therefore, WAIT_FOR_EXECUTED_GTID_SET cannot wait for this GTID.

- Error number: 3174; Symbol: ER_CANNOT_ADD_FOREIGN_BASE_COL_VIRTUAL; SQLSTATE: HY000
  Message: Cannot add foreign key on the base column of indexed virtual column.

- Error number: 3175; Symbol: ER_CANNOT_CREATE_VIRTUAL_INDEX_CONSTRAINT; SQLSTATE: HY000
  Message: Cannot create index on virtual column whose base column has foreign constraint.

- Error number: 3176; Symbol: ER_ERROR_ON_MODIFYING_GTID_EXECUTED_TABLE; SQLSTATE: HY000
  Message: Please do not modify the %s table with an XA transaction. This is an internal system table used to store GTIDs for committed transactions. Although modifying it can lead to an inconsistent GTID state, if necessary you can modify it with a non-XA transaction.

- Error number: 3177; Symbol: ER_LOCK_REFUSED_BY_ENGINE; SQLSTATE: HY000
  Message: Lock acquisition refused by storage engine.

- Error number: 3178; Symbol: ER_UNSUPPORTED_ALTER_ONLINE_ON_VIRTUAL_COLUMN; SQLSTATE: HY000
  Message: ADD COLUMN col...VIRTUAL, ADD INDEX(col)

- Error number: 3179; Symbol: ER_MASTER_KEY_ROTATION_NOT_SUPPORTED_BY_SE; SQLSTATE: HY000
  Message: Master key rotation is not supported by storage engine.

- Error number: 3181; Symbol: ER_MASTER_KEY_ROTATION_BINLOG_FAILED; SQLSTATE: HY000
  Message: Write to binlog failed. However, master key rotation has been completed successfully.

- Error number: 3182; Symbol: ER_MASTER_KEY_ROTATION_SE_UNAVAILABLE; SQLSTATE: HY000
  Message: Storage engine is not available.

- Error number: 3183; Symbol: ER_TABLESPACE_CANNOT_ENCRYPT; SQLSTATE: HY000
  Message: This tablespace can't be encrypted.

- Error number: 3184; Symbol: ER_INVALID_ENCRYPTION_OPTION; SQLSTATE: HY000
  Message: Invalid encryption option.
• Error number: 3185; Symbol: ER_CANNOT_FIND_KEY_IN_KEYRING; SQLSTATE: HY000
Message: Can't find master key from keyring, please check in the server log if a keyring plugin is loaded and initialized successfully.

• Error number: 3186; Symbol: ER_CAPACITY_EXCEEDED_IN_PARSER; SQLSTATE: HY000
Message: Parser bailed out for this query.

• Error number: 3187; Symbol: ER_UNSUPPORTED_ALTER_ENCRYPTION_INPLACE; SQLSTATE: HY000
Message: Cannot alter encryption attribute by inplace algorithm.

• Error number: 3188; Symbol: ER_KEYRING_UDF_KEYRING_SERVICE_ERROR; SQLSTATE: HY000
Message: Function '%%s' failed because underlying keyring service returned an error. Please check if a keyring plugin is installed and that provided arguments are valid for the keyring you are using.

• Error number: 3189; Symbol: ER_USER_COLUMN_OLD_LENGTH; SQLSTATE: HY000
Message: It seems that your db schema is old. The %s column is 77 characters long and should be 93 characters long. Please perform the MySQL upgrade procedure.

• Error number: 3190; Symbol: ER_CANT_RESET_MASTER; SQLSTATE: HY000
Message: RESET MASTER is not allowed because %s.

• Error number: 3191; Symbol: ER_GROUP_REPLICATION_MAX_GROUP_SIZE; SQLSTATE: HY000
Message: The START GROUP_REPLICATION command failed since the group already has 9 members.

• Error number: 3192; Symbol: ER_CANNOT_ADD_FOREIGN_BASE_COL_STORED; SQLSTATE: HY000
Message: Cannot add foreign key on the base column of stored column.

• Error number: 3193; Symbol: ER_TABLE_REFERENCED; SQLSTATE: HY000
Message: Cannot complete the operation because table is referenced by another connection.

• Error number: 3197; Symbol: ER_XA_RETRY; SQLSTATE: HY000
Message: The resource manager is not able to commit the transaction branch at this time. Please retry later.

ER_XA_RETRY was added in 8.0.2.

• Error number: 3198; Symbol: ER_KEYRING_AWS_UDF_AWS_KMS_ERROR; SQLSTATE: HY000
Message: Function %s failed due to: %s.

ER_KEYRING_AWS_UDF_AWS_KMS_ERROR was added in 8.0.2.

• Error number: 3199; Symbol: ER_BINLOG_UNSAFE_XA; SQLSTATE: HY000
Message: Statement is unsafe because it is being used inside a XA transaction. Concurrent XA transactions may deadlock on slaves when replicated using statements.

ER_BINLOG_UNSAFE_XA was added in 8.0.2.
• Error number: 3200; Symbol: ER_UDF_ERROR; SQLSTATE: HY000
  Message: %s UDF failed; %s
  ER_UDF_ERROR was added in 8.0.4.

• Error number: 3201; Symbol: ER_KEYRING_MIGRATION_FAILURE; SQLSTATE: HY000
  Message: Can not perform keyring migration : %s
  ER_KEYRING_MIGRATION_FAILURE was added in 8.0.4.

• Error number: 3202; Symbol: ER_KEYRING_ACCESS_DENIED_ERROR; SQLSTATE: 42000
  Message: Access denied; you need %s privileges for this operation
  ER_KEYRING_ACCESS_DENIED_ERROR was added in 8.0.4.

• Error number: 3203; Symbol: ER_KEYRING_MIGRATION_STATUS; SQLSTATE: HY000
  Message: Keyring migration %s.
  ER_KEYRING_MIGRATION_STATUS was added in 8.0.4.

• Error number: 3218; Symbol: ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_VALUE; SQLSTATE: HY000
  Message: Invalid "max_array_length" argument value.
  ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_VALUE was added in 8.0.11.

• Error number: 3500; Symbol: ER_UNSUPPORT_COMPRESSED_TEMPORARY_TABLE; SQLSTATE: HY000
  Message: CREATE TEMPORARY TABLE is not allowed with ROW_FORMAT=COMPRESSED or KEY_BLOCK_SIZE.

• Error number: 3501; Symbol: ER_ACL_OPERATION_FAILED; SQLSTATE: HY000
  Message: The ACL operation failed due to the following error from SE: errcode %d - %s

• Error number: 3502; Symbol: ER_UNSUPPORTED_INDEX_ALGORITHM; SQLSTATE: HY000
  Message: This storage engine does not support the %s index algorithm, storage engine default was used instead.

• Error number: 3503; Symbol: ER_NO_SUCH_DB; SQLSTATE: 42Y07
  Message: Database ‘%s’ doesn’t exist

• Error number: 3504; Symbol: ER_TOO_BIG_ENUM; SQLSTATE: HY000
  Message: Too many enumeration values for column %s.

• Error number: 3505; Symbol: ER_TOO_LONG_SET_ENUM_VALUE; SQLSTATE: HY000
  Message: Too long enumeration/set value for column %s.

• Error number: 3506; Symbol: ER_INVALID_DD_OBJECT; SQLSTATE: HY000
Message: %s dictionary object is invalid. (%s)

- Error number: 3507; Symbol: ER_UPDATING_DD_TABLE; SQLSTATE: HY000
Message: Failed to update %s dictionary object.

- Error number: 3508; Symbol: ER_INVALID_DD_OBJECT_ID; SQLSTATE: HY000
Message: Dictionary object id (%lu) does not exist.

- Error number: 3509; Symbol: ER_INVALID_DD_OBJECT_NAME; SQLSTATE: HY000
Message: Dictionary object name '%s' is invalid. (%s)

- Error number: 3510; Symbol: ER_TABLESPACE_MISSING_WITH_NAME; SQLSTATE: HY000
Message: Tablespace %s doesn't exist.

- Error number: 3511; Symbol: ER_TOO_LONG_ROUTINE_COMMENT; SQLSTATE: HY000
Message: Comment for routine '%s' is too long (max = %lu)

  Message: Window name '%s' is not defined.

  **ER_WINDOW_NO_SUCH_WINDOW** was added in 8.0.2.

- **Error number:** 3580; **Symbol:** ER_WINDOW_CIRCULARITY_IN_WINDOW_GRAPH; **SQLSTATE:** HY000
  
  Message: There is a circularity in the window dependency graph.

  **ER_WINDOW_CIRCULARITY_IN_WINDOW_GRAPH** was added in 8.0.2.

- **Error number:** 3581; **Symbol:** ER_WINDOW_NO_CHILD_PARTITIONING; **SQLSTATE:** HY000
  
  Message: A window which depends on another cannot define partitioning.

  **ER_WINDOW_NO_CHILD_PARTITIONING** was added in 8.0.2.

- **Error number:** 3582; **Symbol:** ER_WINDOW_NO_INHERIT_FRAME; **SQLSTATE:** HY000
  
  Message: Window '%s' has a frame definition, so cannot be referenced by another window.

  **ER_WINDOW_NO_INHERIT_FRAME** was added in 8.0.2.

- **Error number:** 3583; **Symbol:** ER_WINDOW_NO_REDEFINE_ORDER_BY; **SQLSTATE:** HY000
  
  Message: Window '%s' cannot inherit '%s' since both contain an ORDER BY clause.

  **ER_WINDOW_NO_REDEFINE_ORDER_BY** was added in 8.0.2.

- **Error number:** 3584; **Symbol:** ER_WINDOW_FRAME_START_ILLEGAL; **SQLSTATE:** HY000
  
  Message: Window '%s': frame start cannot be UNBOUNDED FOLLOWING.

  **ER_WINDOW_FRAME_START_ILLEGAL** was added in 8.0.2.

- **Error number:** 3585; **Symbol:** ER_WINDOW_FRAME_END_ILLEGAL; **SQLSTATE:** HY000
  
  Message: Window '%s': frame end cannot be UNBOUNDED PRECEDING.

  **ER_WINDOW_FRAME_END_ILLEGAL** was added in 8.0.2.

- **Error number:** 3586; **Symbol:** ER_WINDOW_FRAME_ILLEGAL; **SQLSTATE:** HY000
  
  Message: Window '%s': frame start or end is negative, NULL or of non-integral type

  **ER_WINDOW_FRAME_ILLEGAL** was added in 8.0.2.

- **Error number:** 3587; **Symbol:** ER_WINDOW_RANGE_FRAME_ORDER_TYPE; **SQLSTATE:** HY000
  
  Message: Window '%s' with RANGE N PRECEDING/FOLLOWING frame requires exactly one ORDER BY expression, of numeric or temporal type

  **ER_WINDOW_RANGE_FRAME_ORDER_TYPE** was added in 8.0.2.

- **Error number:** 3588; **Symbol:** ER_WINDOW_RANGE_FRAME_TEMPORAL_TYPE; **SQLSTATE:** HY000
Message: Window '%s' with RANGE frame has ORDER BY expression of datetime type. Only INTERVAL bound value allowed.

ER_WINDOW_RANGE_FRAME_TEMPORAL_TYPE was added in 8.0.2.

- Error number: 3589; Symbol: ER_WINDOW_RANGE_FRAME_NUMERIC_TYPE; SQLSTATE: HY000
  Message: Window '%s' with RANGE frame has ORDER BY expression of numeric type, INTERVAL bound value not allowed.
  ER_WINDOW_RANGE_FRAME_NUMERIC_TYPE was added in 8.0.2.

- Error number: 3590; Symbol: ER_WINDOW_RANGE_BOUND_NOT_CONSTANT; SQLSTATE: HY000
  Message: Window '%s' has a non-constant frame bound.
  ER_WINDOW_RANGE_BOUND_NOT_CONSTANT was added in 8.0.2.

- Error number: 3591; Symbol: ER_WINDOW_DUPLICATE_NAME; SQLSTATE: HY000
  Message: Window '%s' is defined twice.
  ER_WINDOW_DUPLICATE_NAME was added in 8.0.2.

- Error number: 3592; Symbol: ER_WINDOW_ILLEGAL_ORDER_BY; SQLSTATE: HY000
  Message: Window '%s': ORDER BY or PARTITION BY uses legacy position indication which is not supported, use expression.
  ER_WINDOW_ILLEGAL_ORDER_BY was added in 8.0.2.

- Error number: 3593; Symbol: ER_WINDOW_INVALID_WINDOW_FUNC_USE; SQLSTATE: HY000
  Message: You cannot use the window function '%s' in this context.'
  ER_WINDOW_INVALID_WINDOW_FUNC_USE was added in 8.0.2.

- Error number: 3594; Symbol: ER_WINDOW_INVALID_WINDOW_FUNC_ALIAS_USE; SQLSTATE: HY000
  Message: You cannot use the alias '%s' of an expression containing a window function in this context.'
  ER_WINDOW_INVALID_WINDOW_FUNC_ALIAS_USE was added in 8.0.2.

- Error number: 3595; Symbol: ER_WINDOW_NESTED_WINDOW_FUNC_USE_IN_WINDOW_SPEC; SQLSTATE: HY000
  Message: You cannot nest a window function in the specification of window '%s'.
  ER_WINDOW_NESTED_WINDOW_FUNC_USE_IN_WINDOW_SPEC was added in 8.0.2.

- Error number: 3596; Symbol: ER_WINDOW_ROWS_INTERVAL_USE; SQLSTATE: HY000
  Message: Window '%s': INTERVAL can only be used with RANGE frames.
  ER_WINDOW_ROWS_INTERVAL_USE was added in 8.0.2.

- Error number: 3597; Symbol: ER_WINDOW_NO_GROUP_ORDER; SQLSTATE: HY000
Message: ASC or DESC with GROUP BY isn't allowed with window functions; put ASC or DESC in ORDER BY

`ER_WINDOW_NO_GROUP_ORDER` was added in 8.0.2, removed after 8.0.12.

- Error number: 3597; Symbol: `ER_WINDOW_NO_GROUP_ORDER_UNUSED`; SQLSTATE: HY000

Message: ASC or DESC with GROUP BY isn't allowed with window functions; put ASC or DESC in ORDER BY

`ER_WINDOW_NO_GROUP_ORDER_UNUSED` was added in 8.0.13.

- Error number: 3598; Symbol: `ER_WINDOW_EXPLAIN_JSON`; SQLSTATE: HY000

Message: To get information about window functions use `EXPLAIN FORMAT=JSON`

`ER_WINDOW_EXPLAIN_JSON` was added in 8.0.2.

- Error number: 3599; Symbol: `ER_WINDOW_FUNCTION_IGNORES_FRAME`; SQLSTATE: HY000

Message: Window function '%s' ignores the frame clause of window '%s' and aggregates over the whole partition

`ER_WINDOW_FUNCTION_IGNORES_FRAME` was added in 8.0.2.

- Error number: 3600; Symbol: `ER_WINDOW_SE_NOT_ACCEPTABLE`; SQLSTATE: HY000

Message: Windowing requires `@@internal_tmp_mem_storage_engine=TempTable`.

`ER_WINDOW_SE_NOT_ACCEPTABLE` was added in 8.0.2, removed after 8.0.3.

- Error number: 3600; Symbol: `ER_WL9236_NOW_UNUSED`; SQLSTATE: HY000

Message: Windowing requires `@@internal_tmp_mem_storage_engine=TempTable`.

`ER_WL9236_NOW_UNUSED` was added in 8.0.4.

- Error number: 3601; Symbol: `ER_INVALID_NO_OF_ARGS`; SQLSTATE: HY000

Message: Too many arguments for function '%s': %lu; maximum allowed is %s.

`ER_INVALID_NO_OF_ARGS` was added in 8.0.1.

- Error number: 3602; Symbol: `ER_FIELD_IN_GROUPING_NOT_GROUP_BY`; SQLSTATE: HY000

Message: Argument #%u of GROUPING function is not in GROUP BY

`ER_FIELD_IN_GROUPING_NOT_GROUP_BY` was added in 8.0.1.

- Error number: 3603; Symbol: `ER_TOO_LONG_TABLESPACE_COMMENT`; SQLSTATE: HY000

Message: Comment for tablespace '%s' is too long (max = %lu)

`ER_TOO_LONG_TABLESPACE_COMMENT` was added in 8.0.1.

- Error number: 3604; Symbol: `ER_ENGINE_CANT_DROP_TABLE`; SQLSTATE: HY000

Message: Storage engine can't drop table '%s'
**ER_ENGINE_CANT_DROP_TABLE** was added in 8.0.1.

- **Error number:** 3605; Symbol: **ER_ENGINE_CANT_DROP_MISSING_TABLE**; SQLSTATE: HY000
  
  Message: Storage engine can't drop table '%s' because it is missing. Use DROP TABLE IF EXISTS to remove it from data-dictionary.

**ER_ENGINE_CANT_DROP_MISSING_TABLE** was added in 8.0.1.

- **Error number:** 3606; Symbol: **ER_TABLESPACE_DUP_FILENAME**; SQLSTATE: HY000
  
  Message: Duplicate file name for tablespace '%s'

**ER_TABLESPACE_DUP_FILENAME** was added in 8.0.1.

- **Error number:** 3607; Symbol: **ER_DB_DROP_RMDIR2**; SQLSTATE: HY000
  
  Message: Problem while dropping database. Can't remove database directory (%s). Please remove it manually.

**ER_DB_DROP_RMDIR2** was added in 8.0.1.

- **Error number:** 3608; Symbol: **ER_IMP_NO_FILES_MATCHED**; SQLSTATE: HY000
  
  Message: No SDI files matched the pattern '%s'

**ER_IMP_NO_FILES_MATCHED** was added in 8.0.1.

- **Error number:** 3609; Symbol: **ER_IMP_SCHEMA_DOES_NOT_EXIST**; SQLSTATE: HY000
  
  Message: Schema '%s', referenced in SDI, does not exist.

**ER_IMP_SCHEMA_DOES_NOT_EXIST** was added in 8.0.1.

- **Error number:** 3610; Symbol: **ER_IMP_TABLE_ALREADY_EXISTS**; SQLSTATE: HY000
  
  Message: Table '%s.%s', referenced in SDI, already exists.

**ER_IMP_TABLE_ALREADY_EXISTS** was added in 8.0.1.

- **Error number:** 3611; Symbol: **ER_IMP_INCOMPATIBLE_MYSQLD_VERSION**; SQLSTATE: HY000
  
  Message: Imported mysqld_version (%llu) is not compatible with current (%llu)

**ER_IMP_INCOMPATIBLE_MYSQLD_VERSION** was added in 8.0.1.

- **Error number:** 3612; Symbol: **ER_IMP_INCOMPATIBLE_DD_VERSION**; SQLSTATE: HY000
  
  Message: Imported dd version (%u) is not compatible with current (%u)

**ER_IMP_INCOMPATIBLE_DD_VERSION** was added in 8.0.1.

  Message: Unable to remove column statistics for column '%s' in table '%s'.

\texttt{ER\_UNABLE\_TO\_DROP\_COLUMN\_STATISTICS} was added in 8.0.2.

- Error number: 3627; Symbol: \texttt{ER\_UNABLE\_TO\_BUILD\_HISTOGRAM}; SQLSTATE: HY000
  Message: Unable to build histogram statistics for column '%s' in table '%s'.

\texttt{ER\_UNABLE\_TO\_BUILD\_HISTOGRAM} was added in 8.0.2.

- Error number: 3628; Symbol: \texttt{ER\_MANDATORY\_ROLE}; SQLSTATE: HY000
  Message: The role %s is a mandatory role and can't be revoked or dropped. The restriction can be lifted by excluding the role identifier from the global variable \texttt{mandatory\_roles}.

\texttt{ER\_MANDATORY\_ROLE} was added in 8.0.2.

- Error number: 3629; Symbol: \texttt{ER\_MISSING\_TABLESPACE\_FILE}; SQLSTATE: HY000
  Message: Tablespace '%s' does not have a file named '%s'

\texttt{ER\_MISSING\_TABLESPACE\_FILE} was added in 8.0.3.

- Error number: 3630; Symbol: \texttt{ER\_PERSIST\_ONLY\_ACCESS\_DENIED\_ERROR}; SQLSTATE: 42000
  Message: Access denied; you need %s privileges for this operation

\texttt{ER\_PERSIST\_ONLY\_ACCESS\_DENIED\_ERROR} was added in 8.0.3.

- Error number: 3631; Symbol: \texttt{ER\_CMD\_NEED\_SUPER}; SQLSTATE: HY000
  Message: You need the SUPER privilege for command '%s'

\texttt{ER\_CMD\_NEED\_SUPER} was added in 8.0.3.

- Error number: 3632; Symbol: \texttt{ER\_PATH\_IN\_DATADIR}; SQLSTATE: HY000
  Message: Path is within the current data directory '%s'

\texttt{ER\_PATH\_IN\_DATADIR} was added in 8.0.3.

- Error number: 3633; Symbol: \texttt{ER\_DDL\_IN\_PROGRESS}; SQLSTATE: HY000
  Message: Concurrent DDL is performed during the operation. Please try again.

\texttt{ER\_DDL\_IN\_PROGRESS} was added in 8.0.3, removed after 8.0.16.
• Error number: 3633; Symbol: ER_CLONE_DDL_IN_PROGRESS; SQLSTATE: HY000
Message: Concurrent DDL is performed during clone operation. Please try again.

ER_CLONE_DDL_IN_PROGRESS was added in 8.0.17.

• Error number: 3634; Symbol: ER_TOO_MANY_CONCURRENT_CLONES; SQLSTATE: HY000
Message: Too many concurrent clone operations. Maximum allowed - %d.

ER_TOO_MANY_CONCURRENT_CLONES was added in 8.0.3, removed after 8.0.16.

• Error number: 3634; Symbol: ER_CLONE_TOO_MANY_CONCURRENT_CLONES; SQLSTATE: HY000
Message: Too many concurrent clone operations. Maximum allowed - %d.

ER_CLONE_TOO_MANY_CONCURRENT_CLONES was added in 8.0.17.

• Error number: 3635; Symbol: ER_APPLIER_LOG_EVENT_VALIDATION_ERROR; SQLSTATE: HY000
Message: The table in transaction %s does not comply with the requirements by an external plugin.

ER_APPLIER_LOG_EVENT_VALIDATION_ERROR was added in 8.0.3.

• Error number: 3636; Symbol: ER_CTE_MAX_RECURSION_DEPTH; SQLSTATE: HY000
Message: Recursive query aborted after %u iterations. Try increasing @@cte_max_recursion_depth to a larger value.

ER_CTE_MAX_RECURSION_DEPTH was added in 8.0.3.

• Error number: 3637; Symbol: ER_NOT_HINT_UPDATABLE_VARIABLE; SQLSTATE: HY000
Message: Variable %s cannot be set using SET_VAR hint.

ER_NOT_HINT_UPDATABLE_VARIABLE was added in 8.0.3.

• Error number: 3638; Symbol: ER_CREDENTIALS_CONTRADICT_TO_HISTORY; SQLSTATE: HY000
Message: Cannot use these credentials for '%.*s@%.*s' because they contradict the password history policy

ER_CREDENTIALS_CONTRADICT_TO_HISTORY was added in 8.0.3.

• Error number: 3639; Symbol: ER_WARNING_PASSWORD_HISTORY_CLAUSES_VOID; SQLSTATE: HY000
Message: Non-zero password history clauses ignored for user '%s'@'%s' as its authentication plugin %s does not support password history

ER_WARNING_PASSWORD_HISTORY_CLAUSES_VOID was added in 8.0.3.

• Error number: 3640; Symbol: ER_CLIENT DOES NOT SUPPORT; SQLSTATE: HY000
Message: The client doesn't support %s

ER_CLIENT DOES NOT SUPPORT was added in 8.0.3.

• Error number: 3641; Symbol: ER_I S SKIPPED_TABLESPACE; SQLSTATE: HY000
Message: Tablespace '%s' was skipped since its definition is being modified by concurrent DDL statement

ER_I_S_SKIPPED_TABLESPACE was added in 8.0.3.

- Error number: 3642; Symbol: ER_TABLESPACE_ENGINE_MISMATCH; SQLSTATE: HY000
Message: Engine '%s' does not match stored engine '%s' for tablespace '%s'

ER_TABLESPACE_ENGINE_MISMATCH was added in 8.0.3.

- Error number: 3643; Symbol: ER_WRONG_SRID_FOR_COLUMN; SQLSTATE: HY000
Message: The SRID of the geometry does not match the SRID of the column '%s'. The SRID of the geometry is %lu, but the SRID of the column is %lu. Consider changing the SRID of the geometry or the SRID property of the column.

ER_WRONG_SRID_FOR_COLUMN was added in 8.0.3.

- Error number: 3644; Symbol: ER_CANNOT_ALTER_SRID_DUE_TO_INDEX; SQLSTATE: HY000
Message: The SRID specification on the column '%s' cannot be changed because there is a spatial index on the column. Please remove the spatial index before altering the SRID specification.

ER_CANNOT_ALTER_SRID_DUE_TO_INDEX was added in 8.0.3.

- Error number: 3645; Symbol: ER_WARN_BINLOG_PARTITION_UPDATES_DISABLED; SQLSTATE: HY000
Message: When %s, the option binlog_row_value_options=%s will be ignored and updates will be written in full format to binary log.

ER_WARN_BINLOG_PARTITION_UPDATES_DISABLED was added in 8.0.3.

- Error number: 3646; Symbol: ER_WARN_BINLOG_V1_ROW_EVENTS_DISABLED; SQLSTATE: HY000
Message: When %s, the option log_bin_use_v1_row_events=1 will be ignored and row events will be written in new format to binary log.

ER_WARN_BINLOG_V1_ROW_EVENTS_DISABLED was added in 8.0.3.

- Error number: 3647; Symbol: ER_WARN_BINLOG_PARTITION_UPDATES_SUGGESTS_PARTITION_IMAGES; SQLSTATE: HY000
Message: When %s, the option binlog_row_value_options=%s will be used only for the after-image. Full values will be written in the before-image, so the saving in disk space due to binlog_row_value_options is limited to less than 50%.

ER_WARN_BINLOG_PARTITION_UPDATES_SUGGESTS_PARTITION_IMAGES was added in 8.0.3.

- Error number: 3648; Symbol: ER_COULD_NOT_APPLY_JSON_DIFF; SQLSTATE: HY000
Message: Could not apply JSON diff in table %.*s, column %s.

ER_COULD_NOT_APPLY_JSON_DIFF was added in 8.0.3.

- Error number: 3649; Symbol: ER_CORRUPTED_JSON_DIFF; SQLSTATE: HY000
Message: Corrupted JSON diff for table %.*s, column %s.

**ER_CORRUPTED_JSON_DIFF** was added in 8.0.3.

- Error number: 3650; Symbol: **ER_RESOURCE_GROUP_EXISTS**; SQLSTATE: **HY000**
  Message: Resource Group '%s' exists

**ER_RESOURCE_GROUP_EXISTS** was added in 8.0.3.

- Error number: 3651; Symbol: **ER_RESOURCE_GROUP_NOT_EXISTS**; SQLSTATE: **HY000**
  Message: Resource Group '%s' does not exist.

**ER_RESOURCE_GROUP_NOT_EXISTS** was added in 8.0.3.

- Error number: 3652; Symbol: **ER_INVALID_VCPU_ID**; SQLSTATE: **HY000**
  Message: Invalid cpu id %u

**ER_INVALID_VCPU_ID** was added in 8.0.3.

- Error number: 3653; Symbol: **ER_INVALID_VCPU_RANGE**; SQLSTATE: **HY000**
  Message: Invalid VCPU range %u-%u

**ER_INVALID_VCPU_RANGE** was added in 8.0.3.

- Error number: 3654; Symbol: **ER_INVALID_THREAD_PRIORITY**; SQLSTATE: **HY000**
  Message: Invalid thread priority value %d for %s resource group %s. Allowed range is [%d, %d].

**ER_INVALID_THREAD_PRIORITY** was added in 8.0.3.

- Error number: 3655; Symbol: **ER_DISALLOWED_OPERATION**; SQLSTATE: **HY000**
  Message: %s operation is disallowed on %s

**ER_DISALLOWED_OPERATION** was added in 8.0.3.

- Error number: 3656; Symbol: **ER_RESOURCE_GROUP_BUSY**; SQLSTATE: **HY000**
  Message: Resource group %s is busy.

**ER_RESOURCE_GROUP_BUSY** was added in 8.0.3.

- Error number: 3657; Symbol: **ER_RESOURCE_GROUP_DISABLED**; SQLSTATE: **HY000**
  Message: Resource group %s is disabled.

**ER_RESOURCE_GROUP_DISABLED** was added in 8.0.3.

- Error number: 3658; Symbol: **ER_FEATURE_UNSUPPORTED**; SQLSTATE: **HY000**
  Message: Feature %s is unsupported (%s).

**ER_FEATURE_UNSUPPORTED** was added in 8.0.3.

- Error number: 3659; Symbol: **ER_ATTRIBUTE_IGNORED**; SQLSTATE: **HY000**
Server Error Message Reference

Message: Attribute %s is ignored (%s).

ER_ATTRIBUTE_IGNORED was added in 8.0.3.

- Error number: 3660; Symbol: ER_INVALID_THREAD_ID; SQLSTATE: HY000
  Message: Invalid thread id (%llu).
  ER_INVALID_THREAD_ID was added in 8.0.3.

- Error number: 3661; Symbol: ER_RESOURCE_GROUP_BIND_FAILED; SQLSTATE: HY000
  Message: Unable to bind resource group %s with thread id (%llu).(%s).
  ER_RESOURCE_GROUP_BIND_FAILED was added in 8.0.3.

- Error number: 3662; Symbol: ER_INVALID_USE_OF_FORCE_OPTION; SQLSTATE: HY000
  Message: Option FORCE invalid as DISABLE option is not specified.
  ER_INVALID_USE_OF_FORCE_OPTION was added in 8.0.3.

- Error number: 3663; Symbol: ER_GROUP_REPLICATION_COMMAND_FAILURE; SQLSTATE: HY000
  Message: The %s command encountered a failure. %s
  ER_GROUP_REPLICATION_COMMAND_FAILURE was added in 8.0.4.

- Error number: 3664; Symbol: ER_SDI_OPERATION_FAILED; SQLSTATE: HY000
  Message: Failed to %s SDI '%s.%s' in tablespace '%s'.
  ER_SDI_OPERATION_FAILED was added in 8.0.3.

- Error number: 3665; Symbol: ER_MISSING_JSON_TABLE_VALUE; SQLSTATE: 22035
  Message: Missing value for JSON_TABLE column '%s'
  ER_MISSING_JSON_TABLE_VALUE was added in 8.0.4.

- Error number: 3666; Symbol: ER_WRONG_JSON_TABLE_VALUE; SQLSTATE: 2203F
  Message: Can't store an array or an object in the scalar JSON_TABLE column '%s'
  ER_WRONG_JSON_TABLE_VALUE was added in 8.0.4.

- Error number: 3667; Symbol: ER_TF_MUST_HAVE_ALIAS; SQLSTATE: 42000
  Message: Every table function must have an alias
  ER_TF_MUST_HAVE_ALIAS was added in 8.0.4.

- Error number: 3668; Symbol: ER_TF_FORBIDDEN_JOIN_TYPE; SQLSTATE: HY000
  Message: INNER or LEFT JOIN must be used for LATERAL references made by '%s'
  ER_TF_FORBIDDEN_JOIN_TYPE was added in 8.0.4.

- Error number: 3669; Symbol: ER_JT_VALUE_OUT_OF_RANGE; SQLSTATE: 22003
Message: Value is out of range for JSON_TABLE's column '%s'

**ER_JT_VALUE_OUT_OF_RANGE** was added in 8.0.4.

- Error number: 3670; Symbol: **ER_JT_MAX_NESTED_PATH**; SQLSTATE: 42000

Message: More than supported %u NESTED PATHs were found in JSON_TABLE '%s'

**ER_JT_MAX_NESTED_PATH** was added in 8.0.4.

- Error number: 3671; Symbol: **ER_PASSWORD_EXPIRATION_NOT_SUPPORTED_BY_AUTH_METHOD**; SQLSTATE: HY000

Message: The selected authentication method %.*s does not support password expiration

**ER_PASSWORD_EXPIRATION_NOT_SUPPORTED_BY_AUTH_METHOD** was added in 8.0.4.

- Error number: 3672; Symbol: **ER_INVALID_GEOJSON_CRS_NOT_TOP_LEVEL**; SQLSTATE: HY000

Message: Invalid GeoJSON data provided to function %s: Member 'crs' must be specified in the top level object.

**ER_INVALID_GEOJSON_CRS_NOT_TOP_LEVEL** was added in 8.0.4.

- Error number: 3673; Symbol: **ER_BAD_NULL_ERROR_NOT.IGNORED**; SQLSTATE: 23000

Message: Column '%s' cannot be null

**ER_BAD_NULL_ERROR_NOT.IGNORED** was added in 8.0.4.

- Error number: 3674; Symbol: **WARN_USELESS_SPATIAL_INDEX**; SQLSTATE: HY000

Message: The spatial index on column '%s' will not be used by the query optimizer since the column does not have an SRID attribute. Consider adding an SRID attribute to the column.

**WARN_USELESS_SPATIAL_INDEX** was added in 8.0.4.

- Error number: 3675; Symbol: **ER_DISK_FULL_NOWAIT**; SQLSTATE: HY000

Message: Create table/tablespace '%s' failed, as disk is full

**ER_DISK_FULL_NOWAIT** was added in 8.0.4.

- Error number: 3676; Symbol: **ER_PARSE_ERROR_IN_DIGEST_FN**; SQLSTATE: HY000

Message: Could not parse argument to digest function: "%s".

**ER_PARSE_ERROR_IN_DIGEST_FN** was added in 8.0.4.

- Error number: 3677; Symbol: **ER_UNDISCLOSED_PARSE_ERROR_IN_DIGEST_FN**; SQLSTATE: HY000

Message: Could not parse argument to digest function.

**ER_UNDISCLOSED_PARSE_ERROR_IN_DIGEST_FN** was added in 8.0.4.

- Error number: 3678; Symbol: **ER_SCHEMA_DIR_EXISTS**; SQLSTATE: HY000
Message: Schema directory '%s' already exists. This must be resolved manually (e.g. by moving the schema directory to another location).

**ER_SCHEMA_DIR_EXISTS** was added in 8.0.4.

- Error number: 3679; Symbol: **ER_SCHEMA_DIR_MISSING**; SQLSTATE: **HY000**
  
  Message: Schema directory '%s' does not exist

**ER_SCHEMA_DIR_MISSING** was added in 8.0.4.

- Error number: 3680; Symbol: **ER_SCHEMA_DIR_CREATE_FAILED**; SQLSTATE: **HY000**
  
  Message: Failed to create schema directory '%s' (errno: %d - %s)

**ER_SCHEMA_DIR_CREATE_FAILED** was added in 8.0.4.

- Error number: 3681; Symbol: **ER_SCHEMA_DIR_UNKNOWN**; SQLSTATE: **HY000**
  
  Message: Schema '%s' does not exist, but schema directory '%s' was found. This must be resolved manually (e.g. by moving the schema directory to another location).

**ER_SCHEMA_DIR_UNKNOWN** was added in 8.0.4.

- Error number: 3682; Symbol: **ER_ONLY_IMPLEMENTED_FOR_SRID_0_AND_4326**; SQLSTATE: **22S00**
  
  Message: Function %s is only defined for SRID 0 and SRID 4326.

**ER_ONLY_IMPLEMENTED_FOR_SRID_0_AND_4326** was added in 8.0.4.

- Error number: 3683; Symbol: **ER_BINLOG_EXPIRE_LOG_DAYS_AND_SECS_USED_TOGETHER**; SQLSTATE: **HY000**
  
  Message: The option expire_logs_days and binlog_expire_logs_seconds cannot be used together. Please use binlog_expire_logs_seconds to set the expire time (expire_logs_days is deprecated)

**ER_BINLOG_EXPIRE_LOG_DAYS_AND_SECS_USED_TOGETHER** was added in 8.0.11.

- Error number: 3684; Symbol: **ER_REGEXP_STRING_NOT_TERMINATED**; SQLSTATE: **HY000**
  
  Message: An output string could not be zero-terminated because the length exceeds the buffer capacity.

**ER_REGEXP_STRING_NOT_TERMINATED** was added in 8.0.4, removed after 8.0.4.

- Error number: 3684; Symbol: **ER_REGEXP_BUFFER_OVERFLOW**; SQLSTATE: **HY000**
  
  Message: The result string is larger than the result buffer.

**ER_REGEXP_BUFFER_OVERFLOW** was added in 8.0.4.

- Error number: 3685; Symbol: **ER_REGEXP_ILLEGAL_ARGUMENT**; SQLSTATE: **HY000**
  
  Message: Illegal argument to a regular expression.

**ER_REGEXP_ILLEGAL_ARGUMENT** was added in 8.0.4.

- Error number: 3686; Symbol: **ER_REGEXP_INDEX_OUTOFBOUNDS_ERROR**; SQLSTATE: **HY000**
Message: Index out of bounds in regular expression search.

**ER_REGEXP_INDEX_OUTOFBOUNDS_ERROR** was added in 8.0.4.

- Error number: **3687**; Symbol: **ER_REGEXP_INTERNAL_ERROR**; SQLSTATE: **HY000**
  
  Message: Internal error in the regular expression library.

  **ER_REGEXP_INTERNAL_ERROR** was added in 8.0.4.

- Error number: **3688**; Symbol: **ER_REGEXP_RULE_SYNTAX**; SQLSTATE: **HY000**
  
  Message: Syntax error in regular expression on line %u, character %u.

  **ER_REGEXP_RULE_SYNTAX** was added in 8.0.4.

- Error number: **3689**; Symbol: **ER_REGEXP_BAD_ESCAPE_SEQUENCE**; SQLSTATE: **HY000**
  
  Message: Unrecognized escape sequence in regular expression.

  **ER_REGEXP_BAD_ESCAPE_SEQUENCE** was added in 8.0.4.

- Error number: **3690**; Symbol: **ER_REGEXP_UNIMPLEMENTED**; SQLSTATE: **HY000**
  
  Message: The regular expression contains a feature that is not implemented in this library version.

  **ER_REGEXP_UNIMPLEMENTED** was added in 8.0.4.

- Error number: **3691**; Symbol: **ER_REGEXP_MISMATCHED_PAREN**; SQLSTATE: **HY000**
  
  Message: Mismatched parenthesis in regular expression.

  **ER_REGEXP_MISMATCHED_PAREN** was added in 8.0.4.

- Error number: **3692**; Symbol: **ER_REGEXP_BAD_INTERVAL**; SQLSTATE: **HY000**
  
  Message: Incorrect description of a {min,max} interval.

  **ER_REGEXP_BAD_INTERVAL** was added in 8.0.4.

- Error number: **3693**; Symbol: **ER_REGEXP_MAX_LT_MIN**; SQLSTATE: **HY000**
  
  Message: The maximum is less than the minimum in a {min,max} interval.

  **ER_REGEXP_MAX_LT_MIN** was added in 8.0.4.

- Error number: **3694**; Symbol: **ER_REGEXP_INVALID_BACK_REF**; SQLSTATE: **HY000**
  
  Message: Invalid back-reference in regular expression.

  **ER_REGEXP_INVALID_BACK_REF** was added in 8.0.4.

- Error number: **3695**; Symbol: **ER_REGEXP_LOOK_BEHIND_LIMIT**; SQLSTATE: **HY000**
  
  Message: The look-behind assertion exceeds the limit in regular expression.

  **ER_REGEXP_LOOK_BEHIND_LIMIT** was added in 8.0.4.

- Error number: **3696**; Symbol: **ER_REGEXP_MISSING_CLOSE_BRACKET**; SQLSTATE: **HY000**
Message: The regular expression contains an unclosed bracket expression.

ER_REGEXP_MISSING_CLOSE_BRACKET was added in 8.0.4.

- Error number: 3697; Symbol: ER_REGEXP_INVALID_RANGE; SQLSTATE: HY000
Message: The regular expression contains an [x-y] character range where x comes after y.

ER_REGEXP_INVALID_RANGE was added in 8.0.4.

- Error number: 3698; Symbol: ER_REGEXP_STACK_OVERFLOW; SQLSTATE: HY000
Message: Overflow in the regular expression backtrack stack.

ER_REGEXP_STACK_OVERFLOW was added in 8.0.4.

- Error number: 3699; Symbol: ER_REGEXP_TIME_OUT; SQLSTATE: HY000
Message: Timeout exceeded in regular expression match.

ER_REGEXP_TIME_OUT was added in 8.0.4.

- Error number: 3700; Symbol: ER_REGEXP_PATTERN_TOO_BIG; SQLSTATE: HY000
Message: The regular expression pattern exceeds limits on size or complexity.

ER_REGEXP_PATTERN_TOO_BIG was added in 8.0.4.

- Error number: 3701; Symbol: ER_CANT_SET_ERROR_LOG_SERVICE; SQLSTATE: HY000
Message: Value for %s got confusing at or around "%%s". Syntax may be wrong, component may not be INSTALLed, or a component that does not support instances may be listed more than once.

ER_CANT_SET_ERROR_LOG_SERVICE was added in 8.0.4.

- Error number: 3702; Symbol: ER_EMPTY_PIPELINE_FOR_ERROR_LOG_SERVICE; SQLSTATE: HY000
Message: Setting an empty %s pipeline disables error logging!

ER_EMPTY_PIPELINE_FOR_ERROR_LOGSERVICE was added in 8.0.4.

- Error number: 3703; Symbol: ER_COMPONENT_FILTER_DIAGNOSTICS; SQLSTATE: HY000
Message: filter %s: %s

ER_COMPONENT_FILTER_DIAGNOSTICS was added in 8.0.4.

- Error number: 3704; Symbol: ER_INNODB_CANNOT_BE_IGNORED; SQLSTATE: HY000
Message: ignore-builtin-innodb is ignored and will be removed in future releases.

ER_INNODB_CANNOT_BE_IGNORED was added in 8.0.2, removed after 8.0.2.

- Error number: 3704; Symbol: ER_NOT_IMPLEMENTED_FOR_CARTESIAN_SRS; SQLSTATE: 22S00
Message: %s(%s) has not been implemented for Cartesian spatial reference systems.

ER_NOT_IMPLEMENTED_FOR_CARTESIAN_SRS was added in 8.0.4.
• Error number: 3705; Symbol: ER_NOT_IMPLEMENTED_FOR_PROJECTED_SRS; SQLSTATE: 22S00
Message: %s(%) has not been implemented for projected spatial reference systems.
ER_NOT_IMPLEMENTED_FOR_PROJECTED_SRS was added in 8.0.4.

• Error number: 3706; Symbol: ER_NONPOSITIVE_RADIUS; SQLSTATE: 22003
Message: Invalid radius provided to function %s: Radius must be greater than zero.
ER_NONPOSITIVE_RADIUS was added in 8.0.4.

• Error number: 3707; Symbol: ER_RESTART_SERVER_FAILED; SQLSTATE: HY000
Message: Restart server failed (%s).
ER_RESTART_SERVER_FAILED was added in 8.0.4.

• Error number: 3708; Symbol: ER_SRS_MISSING_MANDATORY_ATTRIBUTE; SQLSTATE: SR006
Message: Missing mandatory attribute %s.
ER_SRS_MISSING_MANDATORY_ATTRIBUTE was added in 8.0.4.

• Error number: 3709; Symbol: ER_SRS_MULTIPLE_ATTRIBUTE_DEFINITIONS; SQLSTATE: SR006
Message: Multiple definitions of attribute %s.
ER_SRS_MULTIPLE_ATTRIBUTE_DEFINITIONS was added in 8.0.4.

• Error number: 3710; Symbol: ER_SRS_NAME_CANT_BE_EMPTY_OR_WHITESPACE; SQLSTATE: SR006
Message: The spatial reference system name can't be an empty string or start or end with whitespace.
ER_SRS_NAME_CANT_BE_EMPTY_OR_WHITESPACE was added in 8.0.4.

• Error number: 3711; Symbol: ER_SRS_ORGANIZATION_CANT_BE_EMPTY_OR_WHITESPACE; SQLSTATE: SR006
Message: The organization name can't be an empty string or start or end with whitespace.
ER_SRS_ORGANIZATION_CANT_BE_EMPTY_OR_WHITESPACE was added in 8.0.4.

• Error number: 3712; Symbol: ER_SRS_ID_ALREADY_EXISTS; SQLSTATE: SR004
Message: There is already a spatial reference system with SRID %u.
ER_SRS_ID_ALREADY_EXISTS was added in 8.0.4.

• Error number: 3713; Symbol: ER_WARN_SRS_ID_ALREADY_EXISTS; SQLSTATE: 01S00
Message: There is already a spatial reference system with SRID %u.
ER_WARN_SRS_ID_ALREADY_EXISTS was added in 8.0.4.

• Error number: 3714; Symbol: ER_CANT_MODIFY_SRID_0; SQLSTATE: SR000
Message: SRID 0 is not modifiable.
Server Error Message Reference

- **ER_CANT_MODIFY_SRID_0** was added in 8.0.4.
  - Error number: 3715; Symbol: ER_WARN_RESERVED_SRID_RANGE; SQLSTATE: 01S01
    Message: The SRID range [\%u, \%u] has been reserved for system use. SRSs in this range may be added, modified or removed without warning during upgrade.

- **ER_WARN_RESERVED_SRID_RANGE** was added in 8.0.4.
  - Error number: 3716; Symbol: ER_CANT_MODIFY_SRS_USED_BY_COLUMN; SQLSTATE: SR005
    Message: Can't modify SRID \%u. There is at least one column depending on it.

- **ER_CANT_MODIFY_SRS_USED_BY_COLUMN** was added in 8.0.4.
  - Error number: 3717; Symbol: ER_SRS_INVALID_CHARACTER_IN_ATTRIBUTE; SQLSTATE: SR006
    Message: Invalid character in attribute \%s.

- **ER_SRS_INVALID_CHARACTER_IN_ATTRIBUTE** was added in 8.0.4.
  - Error number: 3718; Symbol: ER_SRS_ATTRIBUTE_STRING_TOO_LONG; SQLSTATE: SR006
    Message: Attribute \%ss is too long. The maximum length is \%u characters.

- **ER_SRS_ATTRIBUTE_STRING_TOO_LONG** was added in 8.0.4.
  - Error number: 3719; Symbol: ER_DEPRECATED_UTF8_ALIAS; SQLSTATE: HY000
    Message: 'utf8' is currently an alias for the character set UTF8MB3, but will be an alias for UTF8MB4 in a future release. Please consider using UTF8MB4 in order to be unambiguous.

- **ER_DEPRECATED_UTF8_ALIAS** was added in 8.0.11.
  - Error number: 3720; Symbol: ER_DEPRECATED_NATIONAL; SQLSTATE: HY000
    Message: NATIONAL/NCHAR/NVARCHAR implies the character set UTF8MB3, which will be replaced by UTF8MB4 in a future release. Please consider using CHAR(x) CHARACTER SET UTF8MB4 in order to be unambiguous.

- **ER_DEPRECATED_NATIONAL** was added in 8.0.11.
  - Error number: 3721; Symbol: ER_INVALID_DEFAULT_UTF8MB4_COLLATION; SQLSTATE: HY000
    Message: Invalid default collation \%ss: utf8mb4_0900_ai_ci or utf8mb4_general_ci expected

- **ER_INVALID_DEFAULT_UTF8MB4_COLLATION** was added in 8.0.11.
  - Error number: 3722; Symbol: ER_UNABLE_TO_COLLECT_LOG_STATUS; SQLSTATE: HY000
    Message: Unable to collect information for column \%ss: \%s.

- **ER_UNABLE_TO_COLLECT_LOG_STATUS** was added in 8.0.11.
  - Error number: 3723; Symbol: ER_RESERVED_TABLESPACE_NAME; SQLSTATE: HY000
    Message: The table \%ss may not be created in the reserved tablespace \%ss.

- **ER_RESERVED_TABLESPACE_NAME** was added in 8.0.11.
- Error number: 3724; Symbol: `ER_UNABLE_TO_SET_OPTION`; SQLSTATE: HY000
  Message: This option cannot be set %s.

  `ER_UNABLE_TO_SET_OPTION` was added in 8.0.11.

- Error number: 3725; Symbol: `ER_SLAVE_POSSIBLY_DIVERGED_AFTER_DDL`; SQLSTATE: HY000
  Message: A commit for an atomic DDL statement was unsuccessful on the master and the slave. The slave supports atomic DDL statements but the master does not, so the action taken by the slave and master might differ. Check that their states have not diverged before proceeding.

  `ER_SLAVE_POSSIBLY_DIVERGED_AFTER_DDL` was added in 8.0.11.

- Error number: 3726; Symbol: `ER_SRS_NOT_GEOGRAPHIC`; SQLSTATE: 22S00
  Message: Function %s is only defined for geographic spatial reference systems, but one of its arguments is in SRID %u, which is not geographic.

  `ER_SRS_NOT_GEOGRAPHIC` was added in 8.0.12.

- Error number: 3727; Symbol: `ER_POLYGON_TOO_LARGE`; SQLSTATE: 22023
  Message: Function %s encountered a polygon that was too large. Polygons must cover less than half the planet.

  `ER_POLYGON_TOO_LARGE` was added in 8.0.12.

- Error number: 3728; Symbol: `ER_SPATIAL_UNIQUE_INDEX`; SQLSTATE: HY000
  Message: Spatial indexes can't be primary or unique indexes.

  `ER_SPATIAL_UNIQUE_INDEX` was added in 8.0.12.

- Error number: 3729; Symbol: `ER_INDEX_TYPE_NOT_SUPPORTED_FOR_SPATIAL_INDEX`; SQLSTATE: HY000
  Message: The index type %s is not supported for spatial indexes.

  `ER_INDEX_TYPE_NOT_SUPPORTED_FOR_SPATIAL_INDEX` was added in 8.0.12.

- Error number: 3730; Symbol: `ER_FK_CANNOT_DROP_PARENT`; SQLSTATE: HY000
  Message: Cannot drop table '%s' referenced by a foreign key constraint '%s' on table '%s'.

  `ER_FK_CANNOT_DROP_PARENT` was added in 8.0.12.

- Error number: 3731; Symbol: `ER_GEOMETRY_PARAM_LONGITUDE_OUT_OF_RANGE`; SQLSTATE: 22S02
  Message: A parameter of function %s contains a geometry with longitude %f, which is out of range. It must be within (%f, %f].

  `ER_GEOMETRY_PARAM_LONGITUDE_OUT_OF_RANGE` was added in 8.0.12.

- Error number: 3732; Symbol: `ER_GEOMETRY_PARAM_LATITUDE_OUT_OF_RANGE`; SQLSTATE: 22S03
Server Error Message Reference

- **Message**: A parameter of function %s contains a geometry with latitude %f, which is out of range. It must be within [%f, %f].
  
  **ER_GEOMETRY_PARAM_LATITUDE_OUT_OF_RANGE** was added in 8.0.12.

- **Error number**: 3733; Symbol: **ER_FK_CANNOT_USE_VIRTUAL_COLUMN**; SQLSTATE: HY000
  
  **Message**: Foreign key '%s' uses virtual column '%s' which is not supported.

  **ER_FK_CANNOT_USE_VIRTUAL_COLUMN** was added in 8.0.12.

- **Error number**: 3734; Symbol: **ER_FK_NO_COLUMN_PARENT**; SQLSTATE: HY000
  
  **Message**: Failed to add the foreign key constraint. Missing column '%s' for constraint '%s' in the referenced table '%s'.

  **ER_FK_NO_COLUMN_PARENT** was added in 8.0.12.

- **Error number**: 3735; Symbol: **ER_CANT_SET_ERROR_SUPPRESSION_LIST**; SQLSTATE: HY000
  
  **Message**: %s: Could not add suppression rule for code "%s". Rule-set may be full, or code may not correspond to an error-log message.

  **ER_CANT_SET_ERROR_SUPPRESSION_LIST** was added in 8.0.13.

- **Error number**: 3736; Symbol: **ER_SRS_GEOGCS_INVALID_AXES**; SQLSTATE: SR002
  
  **Message**: The spatial reference system definition for SRID %u specifies invalid geographic axes '%s' and '%s'. One axis must be NORTH or SOUTH and the other must be EAST or WEST.

  **ER_SRS_GEOGCS_INVALID_AXES** was added in 8.0.13.

- **Error number**: 3737; Symbol: **ER_SRS_INVALID_SEMI_MAJOR_AXIS**; SQLSTATE: SR002
  
  **Message**: The length of the semi-major axis must be a positive number.

  **ER_SRS_INVALID_SEMI_MAJOR_AXIS** was added in 8.0.13.

- **Error number**: 3738; Symbol: **ER_SRS_INVALID_INVERSE_FLATTENING**; SQLSTATE: SR002
  
  **Message**: The inverse flattening must be larger than 1.0, or 0.0 if the ellipsoid is a sphere.

  **ER_SRS_INVALID_INVERSE_FLATTENING** was added in 8.0.13.

- **Error number**: 3739; Symbol: **ER_SRS_INVALID_ANGULAR_UNIT**; SQLSTATE: SR002
  
  **Message**: The angular unit conversion factor must be a positive number.

  **ER_SRS_INVALID_ANGULAR_UNIT** was added in 8.0.13.

- **Error number**: 3740; Symbol: **ER_SRS_INVALID_PRIME_MERIDIAN**; SQLSTATE: SR002
  
  **Message**: The prime meridian must be within (-180, 180] degrees, specified in the SRS angular unit.

  **ER_SRS_INVALID_PRIME_MERIDIAN** was added in 8.0.13.

- **Error number**: 3741; Symbol: **ER_TRANSFORM_SOURCE_SRS_NOT_SUPPORTED**; SQLSTATE: 22S00
  
  **Message**: Transformation from SRID %u is not supported.
ER_TRANSFORM_SOURCE_SRS_NOT_SUPPORTED was added in 8.0.13.

- Error number: 3742; Symbol: ER_TRANSFORM_TARGET_SRS_NOT_SUPPORTED; SQLSTATE: 22S00
  Message: Transformation to SRID %u is not supported.

ER_TRANSFORM_TARGET_SRS_NOT_SUPPORTED was added in 8.0.13.

- Error number: 3743; Symbol: ER_TRANSFORM_SOURCE_SRS_MISSING_TOWGS84; SQLSTATE: 22S00
  Message: Transformation from SRID %u is not supported. The spatial reference system has no TOWGS84 clause.

ER_TRANSFORM_SOURCE_SRS_MISSING_TOWGS84 was added in 8.0.13.

- Error number: 3744; Symbol: ER_TRANSFORM_TARGET_SRS_MISSING_TOWGS84; SQLSTATE: 22S00
  Message: Transformation to SRID %u is not supported. The spatial reference system has no TOWGS84 clause.

ER_TRANSFORM_TARGET_SRS_MISSING_TOWGS84 was added in 8.0.13.

- Error number: 3745; Symbol: ER_TEMP_TABLE_PREVENTS_SWITCH_SESSION_BINLOG_FORMAT; SQLSTATE: HY000
  Message: Changing @@session.binlog_format is disallowed when the session has open temporary table(s). You could wait until these temporary table(s) are dropped and try again.

ER_TEMP_TABLE_PREVENTS_SWITCH_SESSION_BINLOG_FORMAT was added in 8.0.13.

- Error number: 3746; Symbol: ER_TEMP_TABLE_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT; SQLSTATE: HY000
  Message: Changing @@global.binlog_format or @@persist.binlog_format is disallowed when any replication channel has open temporary table(s). You could wait until Slave_open_temp_tables = 0 and try again.

ER_TEMP_TABLE_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT was added in 8.0.13.

- Error number: 3747; Symbol: ER_RUNNING_APPLIER_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT; SQLSTATE: HY000
  Message: Changing @@global.binlog_format or @@persist.binlog_format is disallowed when any replication channel applier thread is running. You could execute STOP SLAVE SQL_THREAD and try again.

ER_RUNNING_APPLIER_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT was added in 8.0.13.

- Error number: 3748; Symbol: ER_CLIENT_GTID_UNSAFE_CREATE_DROP_TEMP_TABLE_IN_TRX_IN_SBR; SQLSTATE: HY000
  Message: Statement violates GTID consistency: CREATE TEMPORARY TABLE and DROP TEMPORARY TABLE are not allowed inside a transaction or inside a procedure in a transactional context when @@session.binlog_format=STATEMENT.
Server Error Message Reference

ER_CLIENT_GTID_UNSafenE_CREATE_DROP_TEMP_TABLE_IN_TRX_IN_SBR was added in 8.0.13.

• Error number: 3750; Symbol: ER_TABLE_WITHOUT_PK; SQLSTATE: HY000
Message: Unable to create or change a table without a primary key, when the system variable "sql_require_primary_key" is set. Add a primary key to the table or unset this variable to avoid this message. Note that tables without a primary key can cause performance problems in row-based replication, so please consult your DBA before changing this setting.

ER_TABLE_WITHOUT_PK was added in 8.0.13.

• Error number: 3751; Symbol: WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX; SQLSTATE: 01000
Message: Data truncated for functional index '%s' at row %ld
WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX was added in 8.0.13, removed after 8.0.16.

• Error number: 3751; Symbol: ER_WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX; SQLSTATE: 01000
Message: Data truncated for functional index '%s' at row %ld
ER_WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX was added in 8.0.17.

• Error number: 3752; Symbol: ER_WARN_DATA_OUT_OF_RANGE_FUNCTIONAL_INDEX; SQLSTATE: 22003
Message: Value is out of range for functional index '%s' at row %ld
ER_WARN_DATA_OUT_OF_RANGE_FUNCTIONAL_INDEX was added in 8.0.13.

• Error number: 3753; Symbol: ER_FUNCTIONAL_INDEX_ON_JSON_OR_GEOMETRY_FUNCTION; SQLSTATE: 42000
Message: Cannot create a functional index on a function that returns a JSON or GEOMETRY value.
ER_FUNCTIONAL_INDEX_ON_JSON_OR_GEOMETRY_FUNCTION was added in 8.0.13.

• Error number: 3754; Symbol: ER_FUNCTIONAL_INDEX_REF_AUTO_INCREMENT; SQLSTATE: HY000
Message: Functional index '%s' cannot refer to an auto-increment column.
ER_FUNCTIONAL_INDEX_REF_AUTO_INCREMENT was added in 8.0.13.

• Error number: 3755; Symbol: ER_CANNOT_DROP_COLUMN_FUNCTIONAL_INDEX; SQLSTATE: HY000
Message: Cannot drop column '%s' because it is used by a functional index. In order to drop the column, you must remove the functional index.
ER_CANNOT_DROP_COLUMN_FUNCTIONAL_INDEX was added in 8.0.13.

• Error number: 3756; Symbol: ER_FUNCTIONAL_INDEX_PRIMARY_KEY; SQLSTATE: HY000
Message: The primary key cannot be a functional index
ER_FUNCTIONAL_INDEX_PRIMARY_KEY was added in 8.0.13.

• Error number: 3757; Symbol: ER_FUNCTIONAL_INDEX_ON_LOB; SQLSTATE: HY000
Message: Cannot create a functional index on an expression that returns a BLOB or TEXT. Please consider using CAST.

**ER_FUNCTIONAL_INDEX_ON_LOB** was added in 8.0.13.

- Error number: 3758; Symbol: **ER_FUNCTIONAL_INDEX_FUNCTION_IS_NOT_ALLOWED**; SQLSTATE: HY000

Message: Expression of functional index '%s' contains a disallowed function.

**ER_FUNCTIONAL_INDEX_FUNCTION_IS_NOT_ALLOWED** was added in 8.0.13.

- Error number: 3759; Symbol: **ERFULLTEXT_FUNCTIONAL_INDEX**; SQLSTATE: HY000

Message: Fulltext functional index is not supported.

**ERFULLTEXT_FUNCTIONAL_INDEX** was added in 8.0.13.

- Error number: 3760; Symbol: **ER_SPATIAL_FUNCTIONAL_INDEX**; SQLSTATE: HY000

Message: Spatial functional index is not supported.

**ER_SPATIAL_FUNCTIONAL_INDEX** was added in 8.0.13.

- Error number: 3761; Symbol: **ER_WRONG_KEY_COLUMN_FUNCTIONAL_INDEX**; SQLSTATE: HY000

Message: The used storage engine cannot index the expression '%s'.

**ER_WRONG_KEY_COLUMN_FUNCTIONAL_INDEX** was added in 8.0.13.

- Error number: 3762; Symbol: **ER_FUNCTIONAL_INDEX_ON_FIELD**; SQLSTATE: HY000

Message: Functional index on a column is not supported. Consider using a regular index instead.

**ER_FUNCTIONAL_INDEX_ON_FIELD** was added in 8.0.13.

- Error number: 3763; Symbol: **ER_GENERATED_COLUMN_NAMED_FUNCTION_IS_NOT_ALLOWED**; SQLSTATE: HY000

Message: Expression of generated column '%s' contains a disallowed function: %s.

**ER_GENERATED_COLUMN_NAMED_FUNCTION_IS_NOT_ALLOWED** was added in 8.0.13.

- Error number: 3764; Symbol: **ER_GENERATED_COLUMN_ROW_VALUE**; SQLSTATE: HY000

Message: Expression of generated column '%s' cannot refer to a row value.

**ER_GENERATED_COLUMN_ROW_VALUE** was added in 8.0.13.

- Error number: 3765; Symbol: **ER_GENERATED_COLUMN_VARIABLES**; SQLSTATE: HY000

Message: Expression of generated column '%s' cannot refer user or system variables.

**ER_GENERATED_COLUMN_VARIABLES** was added in 8.0.13.

- Error number: 3766; Symbol: **ER_DEPENDENT_BY_DEFAULT_GENERATED_VALUE**; SQLSTATE: HY000
Message: Column '%s' of table '%s' has a default value expression dependency and cannot be dropped or renamed.

**ER_DEPENDENT_BY_DEFAULT_GENERATED_VALUE** was added in 8.0.13.

- Error number: **3767**; Symbol: **ER_DEFAULT_VAL_GENERATED_NON_PRIOR**; SQLSTATE: **HY000**
  Message: Default value expression of column '%s' cannot refer to a column defined after it if that column is a generated column or has an expression as default value.

  **ER_DEFAULT_VAL_GENERATED_NON_PRIOR** was added in 8.0.13.

- Error number: **3768**; Symbol: **ER_DEFAULT_VAL_GENERATED_REF_AUTO_INC**; SQLSTATE: **HY000**
  Message: Default value expression of column '%s' cannot refer to an auto-increment column.

  **ER_DEFAULT_VAL_GENERATED_REF_AUTO_INC** was added in 8.0.13.

- Error number: **3769**; Symbol: **ER_DEFAULT_VAL_GENERATED_FUNCTION_IS_NOT_ALLOWED**; SQLSTATE: **HY000**
  Message: Default value expression of column '%s' contains a disallowed function.

  **ER_DEFAULT_VAL_GENERATED_FUNCTION_IS_NOT_ALLOWED** was added in 8.0.13.

- Error number: **3770**; Symbol: **ER_DEFAULT_VAL_GENERATED_NAMED_FUNCTION_IS_NOT_ALLOWED**; SQLSTATE: **HY000**
  Message: Default value expression of column '%s' contains a disallowed function: %s.

  **ER_DEFAULT_VAL_GENERATED_NAMED_FUNCTION_IS_NOT_ALLOWED** was added in 8.0.13.

- Error number: **3771**; Symbol: **ER_DEFAULT_VAL_GENERATED_ROW_VALUE**; SQLSTATE: **HY000**
  Message: Default value expression of column '%s' cannot refer to a row value.

  **ER_DEFAULT_VAL_GENERATED_ROW_VALUE** was added in 8.0.13.

- Error number: **3772**; Symbol: **ER_DEFAULT_VAL_GENERATED_VARIABLES**; SQLSTATE: **HY000**
  Message: Default value expression of column '%s' cannot refer user or system variables.

  **ER_DEFAULT_VAL_GENERATED_VARIABLES** was added in 8.0.13.

- Error number: **3773**; Symbol: **ER_DEFAULT_AS_VAL_GENERATED**; SQLSTATE: **HY000**
  Message: DEFAULT function cannot be used with default value expressions

  **ER_DEFAULT_AS_VAL_GENERATED** was added in 8.0.13.

- Error number: **3774**; Symbol: **ER_UNSUPPORTED_ACTION_ON_DEFAULT_VAL_GENERATED**; SQLSTATE: **HY000**
  Message: '%s' is not supported for default value expressions.

  **ER_UNSUPPORTED_ACTION_ON_DEFAULT_VAL_GENERATED** was added in 8.0.13.

- Error number: **3775**; Symbol: **ER_GTID_UNSAFE_ALTER_ADD_COL_WITH_DEFAULT_EXPRESSION**; SQLSTATE: **HY000**
  Message: '%s' is not supported for default value expressions.

  **ER_GTID_UNSAFE_ALTER_ADD_COL_WITH_DEFAULT_EXPRESSION** was added in 8.0.13.
Message: Statement violates GTID consistency: ALTER TABLE ... ADD COLUMN .. with expression as DEFAULT.

`ER_GTID_UNSAFE_ALTER_ADD_COL_WITH_DEFAULT_EXPRESSION` was added in 8.0.13.

- Error number: 3776; Symbol: `ER_FK_CANNOT_CHANGE_ENGINE`; SQLSTATE: `HY000`
  Message: Cannot change table's storage engine because the table participates in a foreign key constraint.

`ER_FK_CANNOT_CHANGE_ENGINE` was added in 8.0.13.

- Error number: 3777; Symbol: `ER_WARN_DEPRECATED_USER_SET_EXPR`; SQLSTATE: `HY000`
  Message: Setting user variables within expressions is deprecated and will be removed in a future release. Consider alternatives: ‘SET variable=expression, ...’, or ‘SELECT expression(s) INTO variables(s)’.

`ER_WARN_DEPRECATED_USER_SET_EXPR` was added in 8.0.13.

- Error number: 3778; Symbol: `ER_WARN_DEPRECATED_UTF8MB3_COLLATION`; SQLSTATE: `HY000`
  Message: '%s' is a collation of the deprecated character set UTF8MB3. Please consider using UTF8MB4 with an appropriate collation instead.

`ER_WARN_DEPRECATED_UTF8MB3_COLLATION` was added in 8.0.13.

- Error number: 3779; Symbol: `ER_WARN_DEPRECATED_NESTED_COMMENT_SYNTAX`; SQLSTATE: `HY000`
  Message: Nested comment syntax is deprecated and will be removed in a future release.

`ER_WARN_DEPRECATED_NESTED_COMMENT_SYNTAX` was added in 8.0.13.

- Error number: 3780; Symbol: `ER_FK_INCOMPATIBLE_COLUMNS`; SQLSTATE: `HY000`
  Message: Referencing column '%s' and referenced column '%s' in foreign key constraint '%s' are incompatible.

`ER_FK_INCOMPATIBLE_COLUMNS` was added in 8.0.14.

- Error number: 3781; Symbol: `ER_GR_HOLD_WAIT_TIMEOUT`; SQLSTATE: `HY000`
  Message: Timeout exceeded for held statement while new Group Replication primary member is applying backlog.

`ER_GR_HOLD_WAIT_TIMEOUT` was added in 8.0.14.

- Error number: 3782; Symbol: `ER_GR_HOLD_KILLED`; SQLSTATE: `HY000`
  Message: Held statement aborted because Group Replication plugin got shut down or thread was killed while new primary member was applying backlog.

`ER_GR_HOLD_KILLED` was added in 8.0.14.

- Error number: 3783; Symbol: `ER_GR_HOLD_MEMBER_STATUS_ERROR`; SQLSTATE: `HY000`
Message: Held statement was aborted due to member being in error state, while backlog is being applied during Group Replication primary election.

ER_GR_HOLD_MEMBER_STATUS_ERROR was added in 8.0.14.

- Error number: 3784; Symbol: ER_RPL_ENCRYPTION_FAILED_TO_FETCH_KEY; SQLSTATE: HY000
  Message: Failed to fetch key from keyring, please check if keyring plugin is loaded.
  ER_RPL_ENCRYPTION_FAILED_TO_FETCH_KEY was added in 8.0.14.

- Error number: 3785; Symbol: ER_RPL_ENCRYPTION_KEY_NOT_FOUND; SQLSTATE: HY000
  Message: Can't find key from keyring, please check in the server log if a keyring plugin is loaded and initialized successfully.
  ER_RPL_ENCRYPTION_KEY_NOT_FOUND was added in 8.0.14.

- Error number: 3786; Symbol: ER_RPL_ENCRYPTION_KEYRING_INVALID_KEY; SQLSTATE: HY000
  Message: Fetched an invalid key from keyring.
  ER_RPL_ENCRYPTION_KEYRING_INVALID_KEY was added in 8.0.14.

- Error number: 3787; Symbol: ER_RPL_ENCRYPTION_HEADER_ERROR; SQLSTATE: HY000
  Message: Error reading a replication log encryption header: %s.
  ER_RPL_ENCRYPTION_HEADER_ERROR was added in 8.0.14.

- Error number: 3788; Symbol: ER_RPL_ENCRYPTION_FAILED_TO_ROTATE_LOGS; SQLSTATE: HY000
  Message: Failed to rotate some logs after changing binlog encryption settings. Please fix the problem and rotate the logs manually.
  ER_RPL_ENCRYPTION_FAILED_TO_ROTATE_LOGS was added in 8.0.14.

- Error number: 3789; Symbol: ER_RPL_ENCRYPTION_KEY_EXISTS_UNEXPECTED; SQLSTATE: HY000
  Message: Key %s exists unexpected.
  ER_RPL_ENCRYPTION_KEY_EXISTS_UNEXPECTED was added in 8.0.14.

- Error number: 3790; Symbol: ER_RPL_ENCRYPTION_FAILED_TO_GENERATE_KEY; SQLSTATE: HY000
  Message: Failed to generate key, please check if keyring plugin is loaded.
  ER_RPL_ENCRYPTION_FAILED_TO_GENERATE_KEY was added in 8.0.14.

- Error number: 3791; Symbol: ER_RPL_ENCRYPTION_FAILED_TO_STORE_KEY; SQLSTATE: HY000
  Message: Failed to store key, please check if keyring plugin is loaded.
  ER_RPL_ENCRYPTION_FAILED_TO_STORE_KEY was added in 8.0.14.

- Error number: 3792; Symbol: ER_RPL_ENCRYPTION_FAILED_TO_REMOVE_KEY; SQLSTATE: HY000
Message: Failed to remove key, please check if keyring plugin is loaded.

**ER_RPL_ENCRYPTION_FAILED_TO_REMOVE_KEY** was added in 8.0.14.

- **Error number:** 3793; **Symbol:** ER_RPL_ENCRYPTION_UNABLE_TO_CHANGE_OPTION; **SQLSTATE:** HY000

Message: Failed to change binlog_encryption value. %s.

**ER_RPL_ENCRYPTION_UNABLE_TO_CHANGE_OPTION** was added in 8.0.14.

- **Error number:** 3794; **Symbol:** ER_RPL_ENCRYPTION_MASTER_KEY_RECOVERY_FAILED; **SQLSTATE:** HY000

Message: Unable to recover binlog encryption master key, please check if keyring plugin is loaded.

**ER_RPL_ENCRYPTION_MASTER_KEY_RECOVERY_FAILED** was added in 8.0.14.

- **Error number:** 3795; **Symbol:** ER_SLOW_LOG_MODE_IGNORED_WHEN_NOT_LOGGING_TO_FILE; **SQLSTATE:** HY000

Message: slow query log file format changed as requested, but setting will have no effect when not actually logging to a file.

**ER_SLOW_LOG_MODE_IGNORED_WHEN_NOT_LOGGING_TO_FILE** was added in 8.0.14.

- **Error number:** 3796; **Symbol:** ER_GRP_TRX_CONSISTENCY_NOT_ALLOWED; **SQLSTATE:** HY000

Message: The option group_replication_consistency cannot be used on the current member state.

**ER_GRP_TRX_CONSISTENCY_NOT_ALLOWED** was added in 8.0.14.

- **Error number:** 3797; **Symbol:** ER_GRP_TRX_CONSISTENCY_BEFORE; **SQLSTATE:** HY000

Message: Error while waiting for group transactions commit on group_replication_consistency= 'BEFORE'.

**ER_GRP_TRX_CONSISTENCY_BEFORE** was added in 8.0.14.

- **Error number:** 3798; **Symbol:** ER_GRP_TRX_CONSISTENCY_AFTER_ON_TRX_BEGIN; **SQLSTATE:** HY000

Message: Error while waiting for transactions with group_replication_consistency= 'AFTER' to commit.

**ER_GRP_TRX_CONSISTENCY_AFTER_ON_TRX_BEGIN** was added in 8.0.14.

- **Error number:** 3799; **Symbol:** ER_GRP_TRX_CONSISTENCY_BEGIN_NOT_ALLOWED; **SQLSTATE:** HY000

Message: The Group Replication plugin is stopping, therefore new transactions are not allowed to start.

**ER_GRP_TRX_CONSISTENCY_BEGIN_NOT_ALLOWED** was added in 8.0.14.

- **Error number:** 3800; **Symbol:** ER_FUNCTIONAL_INDEX_ROW_VALUE_IS_NOT_ALLOWED; **SQLSTATE:** HY000

Message: Expression of functional index '%s' cannot refer to a row value.
**ER_FUNCTIONAL_INDEX_ROW_VALUE_IS_NOT_ALLOWED** was added in 8.0.14.

- Error number: 3801; Symbol: ER_RPL_ENCRYPTION_FAILED_TO_ENCRYPT; SQLSTATE: HY000
  Message: Failed to encrypt content to write into binlog file: %s.

**ER_RPL_ENCRYPTION_FAILED_TO_ENCRYPT** was added in 8.0.14.

- Error number: 3802; Symbol: ER_PAGE_TRACKING_NOT_STARTED; SQLSTATE: HY000
  Message: Page Tracking is not started yet.

**ER_PAGE_TRACKING_NOT_STARTED** was added in 8.0.16.

- Error number: 3803; Symbol: ER_PAGE_TRACKING_RANGE_NOT_TRACKED; SQLSTATE: HY000
  Message: Tracking was not enabled for the LSN range specified.

**ER_PAGE_TRACKING_RANGE_NOT_TRACKED** was added in 8.0.16.

- Error number: 3804; Symbol: ER_PAGE_TRACKING_CANNOT_PURGE; SQLSTATE: HY000
  Message: Cannot purge data when concurrent clone is in progress. Try later.

**ER_PAGE_TRACKING_CANNOT_PURGE** was added in 8.0.16.

- Error number: 3805; Symbol: ER_RPL_ENCRYPTION_CANNOT_ROTATE_BINLOG_MASTER_KEY; SQLSTATE: HY000
  Message: Cannot rotate binary log master key when 'binlog-encryption' is off.

**ER_RPL_ENCRYPTION_CANNOT_ROTATE_BINLOG_MASTER_KEY** was added in 8.0.16.

- Error number: 3806; Symbol: ER_BINLOG_MASTER_KEY_RECOVERY_OUT_OF_COMBINATION; SQLSTATE: HY000
  Message: Unable to recover binary log master key, the combination of new_master_key_seqno=%u, master_key_seqno=%u and old_master_key_seqno=%u are wrong.

**ER_BINLOG_MASTER_KEY_RECOVERY_OUT_OF_COMBINATION** was added in 8.0.16.

- Error number: 3807; Symbol: ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_OPERATE_KEY; SQLSTATE: HY000
  Message: Failed to operate binary log master key on keyring, please check if keyring plugin is loaded. The statement had no effect: the old binary log master key is still in use, the keyring, binary and relay log files are unchanged, and the server could not start using a new binary log master key for encrypting new binary and relay log files.

**ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_OPERATE_KEY** was added in 8.0.16.

- Error number: 3808; Symbol: ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_ROTATE_LOGS; SQLSTATE: HY000
  Message: Failed to rotate one or more binary or relay log files. A new binary log master key was generated and will be used to encrypt new binary and relay log files. There may still exist binary or relay log files using the previous binary log master key.
ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_ROTATE_LOGS was added in 8.0.16.

- **Error number:** 3809; Symbol: ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_REENCRYPT_LOG; SQLSTATE: HY000
  
  Message: A new binary log master key was generated and will be used to encrypt new binary and relay log files. There may still exist binary or relay log files using the previous binary log master key. 

  ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_REENCRYPT_LOG was added in 8.0.16.

- **Error number:** 3810; Symbol: ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_UNUSED_KEYS; SQLSTATE: HY000
  
  Message: Failed to remove unused binary log encryption keys from the keyring, please check if keyring plugin is loaded. The unused binary log encryption keys may still exist in the keyring, and they will be removed upon server restart or next 'ALTER INSTANCE ROTATE BINLOG MASTER KEY' execution. 

  ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_UNUSED_KEYS was added in 8.0.16.

- **Error number:** 3811; Symbol: ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_AUX_KEY; SQLSTATE: HY000
  
  Message: Failed to remove auxiliary binary log encryption key from keyring, please check if keyring plugin is loaded. The cleanup of the binary log master key rotation process did not finish as expected and the cleanup will take place upon server restart or next 'ALTER INSTANCE ROTATE BINLOG MASTER KEY' execution. 

  ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_AUX_KEY was added in 8.0.16.

- **Error number:** 3812; Symbol: ER_NON_BOOLEAN_EXPR_FOR_CHECK_CONSTRAINT; SQLSTATE: HY000
  
  Message: An expression of non-boolean type specified to a check constraint '%%s'. 

  ER_NON_BOOLEAN_EXPR_FOR_CHECK_CONSTRAINT was added in 8.0.16.

- **Error number:** 3813; Symbol: ER_COLUMN_CHECK_CONSTRAINT_REFERENCES_OTHER_COLUMN; SQLSTATE: HY000
  
  Message: Column check constraint '%%s' references other column. 

  ER_COLUMN_CHECK_CONSTRAINT_REFERENCES_OTHER_COLUMN was added in 8.0.16.

- **Error number:** 3814; Symbol: ER_CHECK_CONSTRAINT_NAMED_FUNCTION_IS_NOT_ALLOWED; SQLSTATE: HY000
  
  Message: An expression of a check constraint '%%s' contains disallowed function: %%s. 

  ER_CHECK_CONSTRAINT_NAMED_FUNCTION_IS_NOT_ALLOWED was added in 8.0.16.

- **Error number:** 3815; Symbol: ER_CHECKCONSTRAINT_FUNCTION_IS_NOT_ALLOWED; SQLSTATE: HY000
  
  Message: An expression of a check constraint '%%s' contains disallowed function. 

  ER_CHECKCONSTRAINT_FUNCTION_IS_NOT_ALLOWED was added in 8.0.16.

- **Error number:** 3816; Symbol: ER_CHECK_CONSTRAINT_VARIABLES; SQLSTATE: HY000
Message: An expression of a check constraint '%s' cannot refer to a user or system variable.

   ER_CHECK_CONSTRAINT_VARIABLES was added in 8.0.16.

• Error number: 3817; Symbol: ER_CHECK_CONSTRAINT_ROW_VALUE; SQLSTATE: HY000
Message: Check constraint '%s' cannot refer to a row value.

   ER_CHECK_CONSTRAINT_ROW_VALUE was added in 8.0.16.

• Error number: 3818; Symbol: ER_CHECK_CONSTRAINT_REFERES_AUTO_INCREMENT_COLUMN; SQLSTATE: HY000
Message: Check constraint '%s' cannot refer to an auto-increment column.

   ER_CHECK_CONSTRAINT_REFERES_AUTO_INCREMENT_COLUMN was added in 8.0.16.

• Error number: 3819; Symbol: ER_CHECK_CONSTRAINT_VIOLATED; SQLSTATE: HY000
Message: Check constraint '%s' is violated.

   ER_CHECK_CONSTRAINT_VIOLATED was added in 8.0.16.

• Error number: 3820; Symbol: ER_CHECK_CONSTRAINT_REFERES_UNKNOWN_COLUMN; SQLSTATE: HY000
Message: Check constraint '%s' refers to non-existing column '%s'.

   ER_CHECK_CONSTRAINT_REFERES_UNKNOWN_COLUMN was added in 8.0.16.

• Error number: 3821; Symbol: ER_CHECK_CONSTRAINT_NOT_FOUND; SQLSTATE: HY000
Message: Check constraint '%s' is not found in the table.

   ER_CHECK_CONSTRAINT_NOT_FOUND was added in 8.0.16.

• Error number: 3822; Symbol: ER_CHECK_CONSTRAINT_DUP_NAME; SQLSTATE: HY000
Message: Duplicate check constraint name '%s'.

   ER_CHECK_CONSTRAINT_DUP_NAME was added in 8.0.16.

• Error number: 3823; Symbol: ER_CHECK_CONSTRAINT_CLAUSE_USING_FK_REFER_ACTION_COLUMN; SQLSTATE: HY000
Message: Column '%s' cannot be used in a check constraint '%s': needed in a foreign key constraint '%s' referential action.

   ER_CHECK_CONSTRAINT_CLAUSE_USING_FK_REFER_ACTION_COLUMN was added in 8.0.16.

• Error number: 3824; Symbol: WARN_UNENCRYPTED_TABLE_IN_ENCRYPTED_DB; SQLSTATE: HY000
Message: Creating an unencrypted table in a database with default encryption enabled.

   WARN_UNENCRYPTED_TABLE_IN_ENCRYPTED_DB was added in 8.0.16.

• Error number: 3825; Symbol: ER_INVALID_ENCRYPTION_REQUEST; SQLSTATE: HY000
Message: Request to create %s table while using an %s tablespace.
**ER_INVALID_ENCRYPTION_REQUEST** was added in 8.0.16.

- **Error number:** 3826; **Symbol:** ER_CANNOT_SET_TABLE_ENCRYPTION; **SQLSTATE:** HY000
  Message: Table encryption differ from its database default encryption, and user doesn't have enough privilege.

**ER_CANNOT_SET_TABLE_ENCRYPTION** was added in 8.0.16.

- **Error number:** 3827; **Symbol:** ER_CANNOT_SET_DATABASE_ENCRYPTION; **SQLSTATE:** HY000
  Message: Database default encryption differ from 'default_table_encryption' setting, and user doesn't have enough privilege.

**ER_CANNOT_SET_DATABASE_ENCRYPTION** was added in 8.0.16.

- **Error number:** 3828; **Symbol:** ER_CANNOT_SET_TABLESPACE_ENCRYPTION; **SQLSTATE:** HY000
  Message: Tablespace encryption differ from 'default_table_encryption' setting, and user doesn't have enough privilege.

**ER_CANNOT_SET_TABLESPACE_ENCRYPTION** was added in 8.0.16.

- **Error number:** 3829; **Symbol:** ER_TABLESPACE_CANNOT_BE_ENCRYPTED; **SQLSTATE:** HY000
  Message: This tablespace can't be encrypted, because one of table's schema has default encryption OFF and user doesn't have enough privilege.

**ER_TABLESPACE_CANNOT_BE_ENCRYPTED** was added in 8.0.16.

- **Error number:** 3830; **Symbol:** ER_TABLESPACE_CANNOT_BE_DECRYPTED; **SQLSTATE:** HY000
  Message: This tablespace can't be decrypted, because one of table's schema has default encryption ON and user doesn't have enough privilege.

**ER_TABLESPACE_CANNOT_BE_DECRYPTED** was added in 8.0.16.

- **Error number:** 3831; **Symbol:** ER_TABLESPACE_TYPE_UNKNOWN; **SQLSTATE:** HY000
  Message: Cannot determine the type of the tablespace named '%s'.

**ER_TABLESPACE_TYPE_UNKNOWN** was added in 8.0.16.

- **Error number:** 3832; **Symbol:** ER_TARGET_TABLESPACE_UNENCRYPTED; **SQLSTATE:** HY000
  Message: Source tablespace is encrypted but target tablespace is not.

**ER_TARGET_TABLESPACE_UNENCRYPTED** was added in 8.0.16.

- **Error number:** 3833; **Symbol:** ER_CANNOT_USE_ENCRYPTION_CLAUSE; **SQLSTATE:** HY000
  Message: ENCRYPTION clause is not valid for %s tablespace.

**ER_CANNOT_USE_ENCRYPTION_CLAUSE** was added in 8.0.16.

- **Error number:** 3834; **Symbol:** ER_INVALID_MULTIPLE_CLAUSES; **SQLSTATE:** HY000
  Message: Multiple %s clauses
**ER_INVALID_MULTIPLE_CLAUSES** was added in 8.0.16.

- **Error number:** 3835; **Symbol:** `ER_UNSUPPORTED_USE_OF Grant AS`; **SQLSTATE:** HY000
  
  Message: GRANT ... AS is currently supported only for global privileges.

**ER_UNSUPPORTED_USE_OF_GRANT_AS** was added in 8.0.16.

- **Error number:** 3836; **Symbol:** `ER_UNKNOWN_AUTH_ID OR ACCESS_DENIED_FOR_GRANT AS`; **SQLSTATE:** HY000
  
  Message: Either some of the authorization IDs in the AS clause are invalid or the current user lacks privileges to execute the statement.

**ER_UNKNOWN_AUTH_ID OR ACCESS_DENIED_FOR_GRANT_AS** was added in 8.0.16.

- **Error number:** 3837; **Symbol:** `ER_DEPENDENT_BY_FUNCTIONAL_INDEX`; **SQLSTATE:** HY000
  
  Message: Column '%s' has a functional index dependency and cannot be dropped or renamed.

**ER_DEPENDENT_BY_FUNCTIONAL_INDEX** was added in 8.0.17.

- **Error number:** 3838; **Symbol:** `ER_PLUGIN_NOT_EARLY`; **SQLSTATE:** HY000
  
  Message: Plugin '%s' is not to be used as an "early" plugin. Don't add it to --early-plugin-load, keyring migration etc.

**ER_PLUGIN_NOT_EARLY** was added in 8.0.17.

- **Error number:** 3839; **Symbol:** `ER_INNODB_REDO_LOG_ARCHIVE_START_SUBDIR_PATH`; **SQLSTATE:** HY000
  
  Message: Redo log archiving start prohibits path name in 'subdir' argument

**ER_INNODB_REDO_LOG_ARCHIVE_START_SUBDIR_PATH** was added in 8.0.17.

- **Error number:** 3840; **Symbol:** `ER_INNODB_REDO_LOG_ARCHIVE_START_TIMEOUT`; **SQLSTATE:** HY000
  
  Message: Redo log archiving start timed out

**ER_INNODB_REDO_LOG_ARCHIVE_START_TIMEOUT** was added in 8.0.17.

- **Error number:** 3841; **Symbol:** `ER_INNODB_REDO_LOG_ARCHIVE_DIRS_INVALID`; **SQLSTATE:** HY000
  
  Message: Server variable 'innodb_redo_log_archive_dirs' is NULL or empty

**ER_INNODB_REDO_LOG_ARCHIVE_DIRS_INVALID** was added in 8.0.17.

- **Error number:** 3842; **Symbol:** `ER_INNODB_REDO_LOG_ARCHIVE_LABEL_NOT_FOUND`; **SQLSTATE:** HY000
  
  Message: Label '%s' not found in server variable 'innodb_redo_log_archive_dirs'

**ER_INNODB_REDO_LOG_ARCHIVE_LABEL_NOT_FOUND** was added in 8.0.17.

- **Error number:** 3843; **Symbol:** `ER_INNODB_REDO_LOG_ARCHIVE_DIR_EMPTY`; **SQLSTATE:** HY000
Message: Directory is empty after label '%s' in server variable 'innodb_redo_log_archive_dirs'

ER_INNODB_REDO_LOG_ARCHIVE_DIR_EMPTY was added in 8.0.17.

•   Error number: 3844; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_NO_SUCH_DIR; SQLSTATE: HY000

Message: Redo log archive directory '%s' does not exist or is not a directory

ER_INNODB_REDO_LOG_ARCHIVE_NO_SUCH_DIR was added in 8.0.17.

•   Error number: 3845; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_DIR_CLASH; SQLSTATE: HY000

Message: Redo log archive directory '%s' is in, under, or over server directory '%s' - '%s'

ER_INNODB_REDO_LOG_ARCHIVE_DIR_CLASH was added in 8.0.17.

•   Error number: 3846; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_DIR_PERMISSIONS; SQLSTATE: HY000

Message: Redo log archive directory '%s' is accessible to all OS users

ER_INNODB_REDO_LOG_ARCHIVE_DIR_PERMISSIONS was added in 8.0.17.

•   Error number: 3847; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_FILE_CREATE; SQLSTATE: HY000

Message: Cannot create redo log archive file '%s' (OS errno: %d - %s)

ER_INNODB_REDO_LOG_ARCHIVE_FILE_CREATE was added in 8.0.17.

•   Error number: 3848; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_ACTIVE; SQLSTATE: HY000

Message: Redo log archiving has been started on '%s' - Call innodb_redo_log_archive_stop() first

ER_INNODB_REDO_LOG_ARCHIVE_ACTIVE was added in 8.0.17.

•   Error number: 3849; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_INACTIVE; SQLSTATE: HY000

Message: Redo log archiving is not active

ER_INNODB_REDO_LOG_ARCHIVE_INACTIVE was added in 8.0.17.

•   Error number: 3850; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_FAILED; SQLSTATE: HY000

Message: Redo log archiving failed: %s

ER_INNODB_REDO_LOG_ARCHIVE_FAILED was added in 8.0.17.

•   Error number: 3851; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_SESSION; SQLSTATE: HY000

Message: Redo log archiving has not been started by this session

ER_INNODB_REDO_LOG_ARCHIVE_SESSION was added in 8.0.17.

•   Error number: 3852; Symbol: ER_STD_REGEX_ERROR; SQLSTATE: HY000

Message: Regex error: %s in function %s.

ER_STD_REGEX_ERROR was added in 8.0.17.
• Error number: 3853; Symbol: ER_INVALID_JSON_TYPE; SQLSTATE: 22032
Message: Invalid JSON type in argument %u to function %s; an %s is required.
  ER_INVALID_JSON_TYPE was added in 8.0.17.

• Error number: 3854; Symbol: ER_CANNOT_CONVERT_STRING; SQLSTATE: HY000
Message: Cannot convert string '%%s' from %s to %s
  ER_CANNOT_CONVERT_STRING was added in 8.0.17.

• Error number: 3855; Symbol: ER_DEPENDENT_BY_PARTITION_FUNC; SQLSTATE: HY000
Message: Column '%s' has a partitioning function dependency and cannot be dropped or renamed.
  ER_DEPENDENT_BY_PARTITION_FUNC was added in 8.0.17.

• Error number: 3856; Symbol: ER_WARN_DEPRECATED_FLOAT_AUTO_INCREMENT; SQLSTATE: HY000
Message: AUTO_INCREMENT support for FLOAT/DOUBLE columns is deprecated and will be removed in a future release. Consider removing AUTO_INCREMENT from column '%s'.
  ER_WARN_DEPRECATED_FLOAT_AUTO_INCREMENT was added in 8.0.17.

• Error number: 3857; Symbol: ER_RPL_CANT_STOP_SLAVE_WHILE_LOCKED_BACKUP; SQLSTATE: HY000
Message: Cannot stop the slave SQL thread while the instance is locked for backup. Try running `UNLOCK INSTANCE` first.
  ER_RPL_CANT_STOP_SLAVE_WHILE_LOCKED_BACKUP was added in 8.0.17.

• Error number: 3858; Symbol: ER_WARN_DEPRECATED_FLOAT_DIGITS; SQLSTATE: HY000
Message: Specifying number of digits for floating point data types is deprecated and will be removed in a future release.
  ER_WARN_DEPRECATED_FLOAT_DIGITS was added in 8.0.17.

• Error number: 3859; Symbol: ER_WARN_DEPRECATED_FLOAT_UNSIGNED; SQLSTATE: HY000
Message: UNSIGNED for decimal and floating point data types is deprecated and support for it will be removed in a future release.
  ER_WARN_DEPRECATED_FLOAT_UNSIGNED was added in 8.0.17.

• Error number: 3860; Symbol: ER_WARN_DEPRECATED_INTEGER_DISPLAY_WIDTH; SQLSTATE: HY000
Message: Integer display width is deprecated and will be removed in a future release.
  ER_WARN_DEPRECATED_INTEGER_DISPLAY_WIDTH was added in 8.0.17.

• Error number: 3861; Symbol: ER_WARN_DEPRECATED_ZEROFILL; SQLSTATE: HY000
Message: The ZEROFILL attribute is deprecated and will be removed in a future release. Use the LPAD function to zero-pad numbers, or store the formatted numbers in a CHAR column.
ER_WARN_DEPRECATED_ZEROFILL was added in 8.0.17.

- Error number: 3862; Symbol: ER_CLONE_DONOR; SQLSTATE: HY000
  Message: Clone Donor Error: %s.
  ER_CLONE_DONOR was added in 8.0.17.

- Error number: 3863; Symbol: ER_CLONE_PROTOCOL; SQLSTATE: HY000
  Message: Clone received unexpected response from Donor: %s.
  ER_CLONE_PROTOCOL was added in 8.0.17.

- Error number: 3864; Symbol: ER_CLONE_DONOR_VERSION; SQLSTATE: HY000
  Message: Clone Donor MySQL version: %s is different from Recipient MySQL version %s.
  ER_CLONE_DONOR_VERSION was added in 8.0.17.

- Error number: 3865; Symbol: ER_CLONE_OS; SQLSTATE: HY000
  Message: Clone Donor OS: %s is different from Recipient OS: %s.
  ER_CLONE_OS was added in 8.0.17.

- Error number: 3866; Symbol: ER_CLONE_PLATFORM; SQLSTATE: HY000
  Message: Clone Donor platform: %s is different from Recipient platform: %s.
  ER_CLONE_PLATFORM was added in 8.0.17.

- Error number: 3867; Symbol: ER_CLONE_CHARSET; SQLSTATE: HY000
  Message: Clone Donor collation: %s is unavailable in Recipient.
  ER_CLONE_CHARSET was added in 8.0.17.

- Error number: 3868; Symbol: ER_CLONE_CONFIG; SQLSTATE: HY000
  Message: Clone Configuration %s: Donor value: %s is different from Recipient value: %s.
  ER_CLONE_CONFIG was added in 8.0.17.

- Error number: 3869; Symbol: ER_CLONE_SYS_CONFIG; SQLSTATE: HY000
  Message: Clone system configuration: %s
  ER_CLONE_SYS_CONFIG was added in 8.0.17.

- Error number: 3870; Symbol: ER_CLONE_PLUGIN_MATCH; SQLSTATE: HY000
  Message: Clone Donor plugin %s is not active in Recipient.
  ER_CLONE_PLUGIN_MATCH was added in 8.0.17.

- Error number: 3871; Symbol: ER_CLONE_LOOPBACK; SQLSTATE: HY000
  Message: Clone cannot use loop back connection while cloning into current data directory.
Server Error Message Reference

**ER_CLONE_LOOPBACK** was added in 8.0.17.

- Error number: 3872; Symbol: **ER_CLONE_ENCRYPTION**; SQLSTATE: **HY000**
  Message: Clone needs SSL connection for encrypted table.
  **ER_CLONE_ENCRYPTION** was added in 8.0.17.

- Error number: 3873; Symbol: **ER_CLONE_DISK_SPACE**; SQLSTATE: **HY000**
  Message: Clone estimated database size is %s. Available space %s is not enough.
  **ER_CLONE_DISK_SPACE** was added in 8.0.17.

- Error number: 3874; Symbol: **ER_CLONE_IN_PROGRESS**; SQLSTATE: **HY000**
  Message: Concurrent clone in progress. Please try after clone is complete.
  **ER_CLONE_IN_PROGRESS** was added in 8.0.17.

- Error number: 3875; Symbol: **ER_CLONE_DISALLOWED**; SQLSTATE: **HY000**
  Message: The clone operation cannot be executed when %s.
  **ER_CLONE_DISALLOWED** was added in 8.0.17.

- Error number: 3876; Symbol: **ER_CANNOT_GRANT_ROLES_TO_ANONYMOUS_USER**; SQLSTATE: **HY000**
  Message: Cannot grant roles to an anonymous user.
  **ER_CANNOT_GRANT_ROLES_TO_ANONYMOUS_USER** was added in 8.0.16.

- Error number: 3877; Symbol: **ER_SECONDARY_ENGINE_PLUGIN**; SQLSTATE: **HY000**
  Message: %s
  **ER_SECONDARY_ENGINE_PLUGIN** was added in 8.0.14.

- Error number: 3878; Symbol: **ER_SECOND_PASSWORD_CANNOT_BE_EMPTY**; SQLSTATE: **HY000**
  Message: Empty password can not be retained as second password for user `%s`@`%s`.
  **ER_SECOND_PASSWORD_CANNOT_BE_EMPTY** was added in 8.0.14.

- Error number: 3879; Symbol: **ER_DB_ACCESS_DENIED**; SQLSTATE: **HY000**
  Message: Access denied for AuthId `%s`@`%s` to database `%s`.
  **ER_DB_ACCESS_DENIED** was added in 8.0.16.

- Error number: 3880; Symbol:
  **ER_DA_AUTH_ID_WITH_SYSTEM_USER_PRIV_IN_MANDATORY_ROLES**; SQLSTATE: **HY000**
  Message: Cannot set mandatory_roles: AuthId `%s`@`%s` has `%s` privilege.
  **ER_DA_AUTH_ID_WITH_SYSTEM_USER_PRIV_IN_MANDATORY_ROLES** was added in 8.0.17.

- Error number: 3881; Symbol:
  **ER_DA_RPL_GTID_TABLE_CANNOT_OPEN**; SQLSTATE: **HY000**
Message: Gtid table is not ready to be used. Table ‘%s.%s’ cannot be opened.

ER_DA_RPL_GTID_TABLE_CANTOPEN was added in 8.0.17.

• Error number: 3882; Symbol: ER_GEOMETRY_IN_UNKNOWN_LENGTH_UNIT; SQLSTATE: SU001
Message: The geometry passed to function '%s' is in SRID 0, which doesn't specify a length unit. Can't convert to '%s'.

ER_GEOMETRY_IN_UNKNOWN_LENGTH_UNIT was added in 8.0.14.

• Error number: 3883; Symbol: ER_DA_PLUGIN_INSTALL_ERROR; SQLSTATE: HY000
Message: Error installing plugin '%s': %s

ER_DA_PLUGIN_INSTALL_ERROR was added in 8.0.17.

• Error number: 3884; Symbol: ER_NO_SESSION_TEMP; SQLSTATE: HY000
Message: Storage engine could not allocate temporary tablespace for this session.

ER_NO_SESSION_TEMP was added in 8.0.13.

• Error number: 3885; Symbol: ER_DA_UNKNOWN_ERROR_NUMBER; SQLSTATE: HY000
Message: Got unknown error: %d

ER_DA_UNKNOWN_ERROR_NUMBER was added in 8.0.17.

• Error number: 3886; Symbol: ER_COLUMN_CHANGE_SIZE; SQLSTATE: HY000
Message: Could not change column ‘%s’ of table ‘%s’. The resulting size of index ‘%s’ would exceed the max key length of %d bytes.

ER_COLUMN_CHANGE_SIZE was added in 8.0.14.

• Error number: 3887; Symbol: ER_REGEXP_INVALID_CAPTURE_GROUP_NAME; SQLSTATE: HY000
Message: A capture group has an invalid name.

ER_REGEXP_INVALID_CAPTURE_GROUP_NAME was added in 8.0.11.

• Error number: 3888; Symbol: ER_DA_SSL_LIBRARY_ERROR; SQLSTATE: HY000
Message: Failed to set up SSL because of the following SSL library error: %s

ER_DA_SSL_LIBRARY_ERROR was added in 8.0.17.

• Error number: 3889; Symbol: ER_SECONDARY_ENGINE; SQLSTATE: HY000
Message: Secondary engine operation failed. %s.

ER_SECONDARY_ENGINE was added in 8.0.13.

• Error number: 3890; Symbol: ER_SECONDARY_ENGINE_DDL; SQLSTATE: HY000
Message: DDLs on a table with a secondary engine defined are not allowed.

ER_SECONDARY_ENGINE_DDL was added in 8.0.13.
• Error number: 3891; Symbol: ER_INCORRECT_CURRENT_PASSWORD; SQLSTATE: HY000
  Message: Incorrect current password. Specify the correct password which has to be replaced.
  ER_INCORRECT_CURRENT_PASSWORD was added in 8.0.13.

• Error number: 3892; Symbol: ER_MISSING_CURRENT_PASSWORD; SQLSTATE: HY000
  Message: Current password needs to be specified in the REPLACE clause in order to change it.
  ER_MISSING_CURRENT_PASSWORD was added in 8.0.13.

• Error number: 3893; Symbol: ER_CURRENT_PASSWORD_NOT_REQUIRED; SQLSTATE: HY000
  Message: Do not specify the current password while changing it for other users.
  ER_CURRENT_PASSWORD_NOT_REQUIRED was added in 8.0.13.

• Error number: 3894; Symbol: ER_PASSWORD_CANNOT_BE RETAINED_ON_PLUGIN_CHANGE; SQLSTATE: HY000
  Message: Current password can not be retained for user '%s'@'%s' because authentication plugin is being changed.
  ER_PASSWORD_CANNOT_BE RETAINED_ON_PLUGIN_CHANGE was added in 8.0.14.

• Error number: 3895; Symbol: ER_CURRENT_PASSWORD_CANNOT_BE RETAINED; SQLSTATE: HY000
  Message: Current password can not be retained for user '%s'@'%s' because new password is empty.
  ER_CURRENT_PASSWORD_CANNOT_BE RETAINED was added in 8.0.14.

• Error number: 3896; Symbol: ER_PARTIAL_REVOKES_EXIST; SQLSTATE: HY000
  Message: At least one partial revoke exists on a database. The system variable '@@partial_revokes' must be set to ON.
  ER_PARTIAL_REVOKES_EXIST was added in 8.0.16.

• Error number: 3897; Symbol: ER_CANNOT_GRANT_SYSTEM_PRIV_TO_MANDATORY_ROLE; SQLSTATE: HY000
  Message: AuthId `%s'@`%s' is set as mandatory Roles. Cannot grant the '%s' privilege.
  ER_CANNOT_GRANT_SYSTEM_PRIV_TO_MANDATORY_ROLE was added in 8.0.16.

• Error number: 3898; Symbol: ER_XA_REPLICATION.Filters; SQLSTATE: HY000
  Message: The use of replication filters with XA transactions is not supported, and can lead to an undefined state in the replication slave.
  ER_XA_REPLICATION.Filters was added in 8.0.12.

• Error number: 3899; Symbol: ER_UNSUPPORTED_SQL_MODE; SQLSTATE: HY000
  Message: sql_mode=0x%08x is not supported.
  ER_UNSUPPORTED_SQL_MODE was added in 8.0.11.

• Error number: 3900; Symbol: ER_REGEXP_INVALID_FLAG; SQLSTATE: HY000
Message: Invalid match mode flag in regular expression.

**ER_REGEXP_INVALID_FLAG** was added in 8.0.12.

- Error number: 3901; Symbol: **ER_PARTIAL_REVOKE_AND_DB_GRANT_BOTH_EXISTS**; SQLSTATE: **HY000**
  Message: '%s' privilege for database '%s' exists both as partial revoke and mysql.db simultaneously. It could mean that the 'mysql' schema is corrupted.
  **ER_PARTIAL_REVOKE_AND_DB_GRANT_BOTH_EXISTS** was added in 8.0.16.

- Error number: 3902; Symbol: **ER_UNIT_NOT_FOUND**; SQLSTATE: **SU001**
  Message: There's no unit of measure named '%s'.
  **ER_UNIT_NOT_FOUND** was added in 8.0.14.

- Error number: 3903; Symbol: **ER_INVALID_JSON_VALUE_FOR_FUNC_INDEX**; SQLSTATE: **22018**
  Message: Invalid JSON value for CAST for functional index '%s'.
  **ER_INVALID_JSON_VALUE_FOR_FUNC_INDEX** was added in 8.0.16.

- Error number: 3904; Symbol: **ER_JSON_VALUE_OUT_OF_RANGE_FOR_FUNC_INDEX**; SQLSTATE: **22003**
  Message: Out of range JSON value for CAST for functional index '%s'.
  **ER_JSON_VALUE_OUT_OF_RANGE_FOR_FUNC_INDEX** was added in 8.0.16.

- Error number: 3905; Symbol: **ER_EXCEEDED_MV_KEYS_NUM**; SQLSTATE: **HY000**
  Message: Exceeded max number of values per record for multi-valued index '%s' by %u value(s).
  **ER_EXCEEDED_MV_KEYS_NUM** was added in 8.0.16.

- Error number: 3906; Symbol: **ER_EXCEEDED_MV_KEYS_SPACE**; SQLSTATE: **HY000**
  Message: Exceeded max total length of values per record for multi-valued index '%s' by %u bytes.
  **ER_EXCEEDED_MV_KEYS_SPACE** was added in 8.0.16.

- Error number: 3907; Symbol: **ER_FUNCTIONAL_INDEX_DATA_IS_TOO_LONG**; SQLSTATE: **22001**
  Message: Data too long for functional index '%s'.
  **ER_FUNCTIONAL_INDEX_DATA_IS_TOO_LONG** was added in 8.0.16.

- Error number: 3908; Symbol: **ER_WRONG_MVI_VALUE**; SQLSTATE: **HY000**
  Message: Cannot store an array or an object in a scalar key part of the index '%s'.
  **ER_WRONG_MVI_VALUE** was added in 8.0.16.

- Error number: 3909; Symbol: **ER_WARN_FUNC_INDEX_NOT_APPLICABLE**; SQLSTATE: **HY000**
  Message: Cannot use functional index '%s' due to type or collation conversion.
**ER_WARN_FUNC_INDEX_NOT_APPLICABLE** was added in 8.0.16.

- Error number: 3910; Symbol: **ER_GRP_RPL_UDF_ERROR**; SQLSTATE: HY000
  
  Message: The function '%s' failed. %s

  **ER_GRP_RPL_UDF_ERROR** was added in 8.0.13.

- Error number: 3911; Symbol: **ER_UPDATE_GTID_PURGED_WITH_GR**; SQLSTATE: HY000
  
  Message: Cannot update GTID_PURGED with the Group Replication plugin running

  **ER_UPDATE_GTID_PURGED_WITH_GR** was added in 8.0.12.

- Error number: 3912; Symbol: **ER_GROUPING_ON_TIMESTAMP_IN_DST**; SQLSTATE: HY000
  
  Message: Grouping on temporal is non-deterministic for timezones having DST. Please consider switching to UTC for this query.

  **ER_GROUPING_ON_TIMESTAMP_IN_DST** was added in 8.0.17.

- Error number: 3913; Symbol: **ER_TABLE_NAME_CAUSES_TOO_LONG_PATH**; SQLSTATE: HY000
  
  Message: Long database name and identifier for object resulted in a path length too long for table '%s'. Please check the path limit for your OS.

  **ER_TABLE_NAME_CAUSES_TOO_LONG_PATH** was added in 8.0.4.

- Error number: 3914; Symbol: **ER_AUDIT_LOG_INSUFFICIENT_PRIVILEGE**; SQLSTATE: HY000
  
  Message: Request ignored for '%s'@'%s'. Role needed to perform operation: '%s'

  **ER_AUDIT_LOG_INSUFFICIENT_PRIVILEGE** was added in 8.0.16.

- Error number: 3916; Symbol: **ER_DA_GRP_RPL_STARTED_AUTO_REJOIN**; SQLSTATE: HY000
  
  Message: Started auto-rejoin procedure attempt %lu of %lu

  **ER_DA_GRP_RPL_STARTED_AUTO_REJOIN** was added in 8.0.17.

- Error number: 3917; Symbol: **ER_SYSVAR_CHANGE_DURING_QUERY**; SQLSTATE: HY000
  
  Message: A plugin was loaded or unloaded during a query, a system variable table was changed.

  **ER_SYSVAR_CHANGE_DURING_QUERY** was added in 8.0.18.

- Error number: 3918; Symbol: **ER_GLOBSTAT_CHANGE_DURING_QUERY**; SQLSTATE: HY000
  
  Message: A plugin was loaded or unloaded during a query, a global status variable was changed.

  **ER_GLOBSTAT_CHANGE_DURING_QUERY** was added in 8.0.18.

- Error number: 3919; Symbol: **ER_GRP_RPL_MESSAGE_SERVICE_INIT_FAILURE**; SQLSTATE: HY000
  
  Message: The START GROUP_REPLICATION command failed to start its message service.

  **ER_GRP_RPL_MESSAGE_SERVICE_INIT_FAILURE** was added in 8.0.18.
• Error number: 3920; Symbol: ER_CHANGE_MASTER_WRONG_COMPRESSION_ALGORITHM_CLIENT; SQLSTATE: HY000
  Message: Invalid MASTER_COMPRESSION_ALGORITHMS '%s' for channel '%s'.
  ER_CHANGE_MASTER_WRONG_COMPRESSION_ALGORITHM_CLIENT was added in 8.0.18.

• Error number: 3921; Symbol: ER_CHANGE_MASTER_WRONG_COMPRESSION_LEVEL_CLIENT; SQLSTATE: HY000
  Message: Invalid MASTER_ZSTD_COMPRESSION_LEVEL %u for channel '%s'.
  ER_CHANGE_MASTER_WRONG_COMPRESSION_LEVEL_CLIENT was added in 8.0.18.

• Error number: 3922; Symbol: ER_WRONG_COMPRESSION_ALGORITHM_CLIENT; SQLSTATE: HY000
  Message: Invalid compression algorithm '%s'.
  ER_WRONG_COMPRESSION_ALGORITHM_CLIENT was added in 8.0.18.

• Error number: 3923; Symbol: ER_WRONG_COMPRESSION_LEVEL_CLIENT; SQLSTATE: HY000
  Message: Invalid zstd compression level for algorithm '%s'.
  ER_WRONG_COMPRESSION_LEVEL_CLIENT was added in 8.0.18.

• Error number: 3924; Symbol: ER_CHANGE_MASTER_WRONG_COMPRESSION_ALGORITHM_LIST_CLIENT; SQLSTATE: HY000
  Message: Specified compression algorithm list '%s' exceeds total count of 3 for channel '%s'.
  ER_CHANGE_MASTER_WRONG_COMPRESSION_ALGORITHM_LIST_CLIENT was added in 8.0.18.

• Error number: MY-010000; Symbol: ER_PARSERTRACE; SQLSTATE: XX999
  Message: Parser saw: %s
  ER_PARSERTRACE was added in 8.0.2.

• Error number: MY-010001; Symbol: ER_BOOTSTRAP_CANT_THREAD; SQLSTATE: HY000
  Message: Can't create thread to handle bootstrap (errno: %d)
  ER_BOOTSTRAP_CANT_THREAD was added in 8.0.2.

• Error number: MY-010002; Symbol: ER_TRIGGER_INVALID_VALUE; SQLSTATE: HY000
  Message: Trigger for table '%s'.%'s': invalid %s value (%s).
  ER_TRIGGER_INVALID_VALUE was added in 8.0.2.

• Error number: MY-010003; Symbol: ER_OPT_WRONG_TREE; SQLSTATE: HY000
  Message: Wrong tree: %s
  ER_OPT_WRONG_TREE was added in 8.0.2.

• Error number: MY-010004; Symbol: ER_DD_FAILSAFE; SQLSTATE: HY000
  Message: Error: Invalid %s
**ER_DD_FAILSAFE** was added in 8.0.2.

- Error number: MY-010005; Symbol: **ER_DD_NO_WRITES_NO_REPOPULATION**; SQLSTATE: HY000
  
  Message: Skip re-populating collations and character sets tables in %s%sread-only mode.

**ER_DD_NO_WRITES_NO_REPOPULATION** was added in 8.0.2.

- Error number: MY-010006; Symbol: **ER_DD_VERSION_FOUND**; SQLSTATE: HY000
  
  Message: Using data dictionary with version '%d'.

**ER_DD_VERSION_FOUND** was added in 8.0.2.

- Error number: MY-010007; Symbol: **ER_DD_VERSION_INSTALLED**; SQLSTATE: HY000
  
  Message: Installed data dictionary with version %d

**ER_DD_VERSION_INSTALLED** was added in 8.0.2.

- Error number: MY-010008; Symbol: **ER_DD_VERSION_UNSUPPORTED**; SQLSTATE: HY000
  
  Message: Data Dictionary version '%d' not supported.

**ER_DD_VERSION_UNSUPPORTED** was added in 8.0.2.

- Error number: MY-010009; Symbol: **ER_LOG_SYSLOG_FACILITY_FAIL**; SQLSTATE: HY000
  
  Message: Failed to set syslog facility to "%s", setting to "%s" (%d) instead.

**ER_LOG_SYSLOG_FACILITY_FAIL** was added in 8.0.2, removed after 8.0.12.

- Error number: MY-010010; Symbol: **ER_LOG_SYSLOG_CANNOT_OPEN**; SQLSTATE: HY000
  
  Message: Cannot open %s; check privileges, or remove syseventlog from --log-error-services!

**ER_LOG_SYSLOG_CANNOT_OPEN** was added in 8.0.2.

- Error number: MY-010011; Symbol: **ER_LOG_SLOW_CANNOT_OPEN**; SQLSTATE: HY000
  
  Message: either restart the query logging by using "SET GLOBAL SLOW_QUERY_LOG=ON" or

**ER_LOG_SLOW_CANNOT_OPEN** was added in 8.0.2.

- Error number: MY-010012; Symbol: **ER_LOG_GENERAL_CANNOT_OPEN**; SQLSTATE: HY000
  
  Message: either restart the query logging by using "SET GLOBAL GENERAL_LOG=ON" or

**ER_LOG_GENERAL_CANNOT_OPEN** was added in 8.0.2.

- Error number: MY-010013; Symbol: **ER_LOG_CANNOT_WRITE**; SQLSTATE: HY000
  
  Message: Failed to write to %s: %s

**ER_LOG_CANNOT_WRITE** was added in 8.0.2.

- Error number: MY-010014; Symbol: **ER_RPL_ZOMBIE_ENCOUNTERED**; SQLSTATE: HY000
Message: While initializing dump thread for slave with %s <%%s>, found a zombie dump thread with the same %s. Master is killing the zombie dump thread.\n
ER_RPL_ZOMBIE_ENCOUNTERED was added in 8.0.2.

- Error number: MY-010015; Symbol: ER_RPL_GTID_TABLE_CANNOT_OPEN; SQLSTATE: HY000
  Message: Gtid table is not ready to be used. Table '%s.%s' cannot be opened.
  ER_RPL_GTID_TABLE_CANNOT_OPEN was added in 8.0.2.

- Error number: MY-010016; Symbol: ER_SYSTEM_SCHEMA_NOT_FOUND; SQLSTATE: HY000
  Message: System schema directory does not exist.
  ER_SYSTEM_SCHEMA_NOT_FOUND was added in 8.0.2.

- Error number: MY-010017; Symbol: ER_DD_INIT_UPGRADE_FAILED; SQLSTATE: HY000
  Message: Error in initializing dictionary, upgrade will do a cleanup and exit
  ER_DD_INIT_UPGRADE_FAILED was added in 8.0.2.

- Error number: MY-010018; Symbol: ER_VIEW_UNKNOWN_CHARSET_OR_COLLATION; SQLSTATE: HY000
  Message: View '%s'.%s': unknown charset name and/or collation name (client: '%s'; connection: '%s').
  ER_VIEW_UNKNOWN_CHARSET_OR_COLLATION was added in 8.0.2.

- Error number: MY-010019; Symbol: ER_DD_VIEW_CANT_ALLOC_CHARSET; SQLSTATE: HY000
  Message: Error in allocating memory for character set name for view %s.%s.
  ER_DD_VIEW_CANT_ALLOC_CHARSET was added in 8.0.2.

- Error number: MY-010020; Symbol: ER_DD_INIT_FAILED; SQLSTATE: HY000
  Message: Data Dictionary initialization failed.
  ER_DD_INIT_FAILED was added in 8.0.2.

- Error number: MY-010021; Symbol: ER_DD_UPDATING_PLUGIN_MD_FAILED; SQLSTATE: HY000
  Message: Failed to update plugin metadata in dictionary tables.
  ER_DD_UPDATING_PLUGIN_MD_FAILED was added in 8.0.2.

- Error number: MY-010022; Symbol: ER_DD_POPULATING_TABLES_FAILED; SQLSTATE: HY000
  Message: Failed to Populate DD tables.
  ER_DD_POPULATING_TABLES_FAILED was added in 8.0.2.

- Error number: MY-010023; Symbol: ER_DD_VIEW_CANT_CREATE; SQLSTATE: HY000
  Message: Error in Creating View %s.%s
  ER_DD_VIEW_CANT_CREATE was added in 8.0.2.
• Error number: MY-010024; Symbol: ER_DD_METADATA_NOT_FOUND; SQLSTATE: HY000
  Message: Unable to start server. Cannot find the meta data for data dictionary table '%s'.
  ER_DD_METADATA_NOT_FOUND was added in 8.0.2.

• Error number: MY-010025; Symbol: ER_DD_CACHE_NOT_EMPTY_AT_SHUTDOWN; SQLSTATE: HY000
  Message: Dictionary cache not empty at shutdown.
  ER_DD_CACHE_NOT_EMPTY_AT_SHUTDOWN was added in 8.0.2.

• Error number: MY-010026; Symbol: ER_DD_OBJECT_REMAINS; SQLSTATE: HY000
  Message: Dictionary objects used but not released.
  ER_DD_OBJECT_REMAINS was added in 8.0.2.

• Error number: MY-010027; Symbol: ER_DD_OBJECT_REMAINS_IN_RELEASER; SQLSTATE: HY000
  Message: Dictionary objects left in default releaser.
  ER_DD_OBJECT_REMAINS_IN_RELEASER was added in 8.0.2.

• Error number: MY-010028; Symbol: ER_DD_OBJECT_RELEASER_REMAINS; SQLSTATE: HY000
  Message: Dictionary object auto releaser not deleted.
  ER_DD_OBJECT_RELEASER_REMAINS was added in 8.0.2.

• Error number: MY-010029; Symbol: ER_DD_CANT_GET_OBJECT_KEY; SQLSTATE: HY000
  Message: Error: Unable to create primary object key.
  ER_DD_CANT_GET_OBJECT_KEY was added in 8.0.2.

• Error number: MY-010030; Symbol: ER_DD_CANT_CREATE_OBJECT_KEY; SQLSTATE: HY000
  Message: Error: Unable to create object key.
  ER_DD_CANT_CREATE_OBJECT_KEY was added in 8.0.2.

• Error number: MY-010031; Symbol: ER_CANT_CREATE_HANDLE_MGR_THREAD; SQLSTATE: HY000
  Message: Can't create handle_manager thread (errno= %d)
  ER_CANT_CREATE_HANDLE_MGR_THREAD was added in 8.0.2.

• Error number: MY-010032; Symbol: ER_RPL_REPO_HAS_GAPS; SQLSTATE: HY000
  Message: It is not possible to change the type of the relay log's repository because there are workers' repositories with gaps. Please, fix the gaps first before doing such change.
  ER_RPL_REPO_HAS_GAPS was added in 8.0.2.

• Error number: MY-010033; Symbol: ER_INVALID_VALUE_FOR_ENFORCE_GTID_CONSISTENCY; SQLSTATE: HY000
  Message: option 'enforce-gtid-consistency': value '%s' was not recognized. Setting enforce-gtid-consistency to OFF.
**ER_INVALID_VALUE_FOR_ENFORCE_GTID_CONSISTENCY** was added in 8.0.2.

- Error number: **MY-010034**; Symbol: **ER_CHANGED_ENFORCE_GTID_CONSISTENCY**; SQLSTATE: **HY000**
  
  Message: Changed ENFORCE_GTID_CONSISTENCY from %s to %s.
  
  **ER_CHANGED_ENFORCE_GTID_CONSISTENCY** was added in 8.0.2.

- Error number: **MY-010035**; Symbol: **ER_CHANGED_GTID_MODE**; SQLSTATE: **HY000**
  
  Message: Changed GTID_MODE from %s to %s.
  
  **ER_CHANGED_GTID_MODE** was added in 8.0.2.

- Error number: **MY-010036**; Symbol: **ER_DISABLED_STORAGE_ENGINE_AS_DEFAULT**; SQLSTATE: **HY000**
  
  Message: %s is set to a disabled storage engine %s.
  
  **ER_DISABLED_STORAGE_ENGINE_AS_DEFAULT** was added in 8.0.2.

- Error number: **MY-010037**; Symbol: **ER_DEBUG_SYNC_HIT**; SQLSTATE: **HY000**
  
  Message: Debug sync points hit: %s
  
  **ER_DEBUG_SYNC_HIT** was added in 8.0.2.

- Error number: **MY-010038**; Symbol: **ER_DEBUG_SYNC_EXECUTED**; SQLSTATE: **HY000**
  
  Message: Debug sync points executed: %s
  
  **ER_DEBUG_SYNC_EXECUTED** was added in 8.0.2.

- Error number: **MY-010039**; Symbol: **ER_DEBUG_SYNC_THREAD_MAX**; SQLSTATE: **HY000**
  
  Message: Debug sync points max active per thread: %s
  
  **ER_DEBUG_SYNC_THREAD_MAX** was added in 8.0.2.

- Error number: **MY-010040**; Symbol: **ER_DEBUG_SYNC_OOM**; SQLSTATE: **HY000**
  
  Message: Debug Sync Facility disabled due to lack of memory.
  
  **ER_DEBUG_SYNC_OOM** was added in 8.0.2.

- Error number: **MY-010041**; Symbol: **ER_CANT_INIT_TC_LOG**; SQLSTATE: **HY000**
  
  Message: Can't init tc log
  
  **ER_CANT_INIT_TC_LOG** was added in 8.0.2.

- Error number: **MY-010042**; Symbol: **ER_EVENT_CANT_INIT_QUEUE**; SQLSTATE: **HY000**
  
  Message: Event Scheduler: Can't initialize the execution queue
  
  **ER_EVENT_CANT_INIT_QUEUE** was added in 8.0.2.

- Error number: **MY-010043**; Symbol: **ER_EVENT_PURGING_QUEUE**; SQLSTATE: **HY000**
Message: Event Scheduler: Purging the queue. %u events

ER_EVENT_PURGING_QUEUE was added in 8.0.2.

• Error number: MY-010044; Symbol: ER_EVENT_LAST_EXECUTION; SQLSTATE: HY000
Message: Event Scheduler: Last execution of %s.%s. %s

ER_EVENT_LAST_EXECUTION was added in 8.0.2.

• Error number: MY-010045; Symbol: ER_EVENT_MESSAGE_STACK; SQLSTATE: HY000
Message: %s

ER_EVENT_MESSAGE_STACK was added in 8.0.2.

• Error number: MY-010046; Symbol: ER_EVENT_EXECUTION_FAILED; SQLSTATE: HY000
Message: Event Scheduler: [%s].[%s.%s] event execution failed.

ER_EVENT_EXECUTION_FAILED was added in 8.0.2.

• Error number: MY-010047; Symbol: ER_CANT_INIT_SCHEDULER_THREAD; SQLSTATE: HY000
Message: Event Scheduler: Cannot initialize the scheduler thread

ER_CANT_INIT_SCHEDULER_THREAD was added in 8.0.2.

• Error number: MY-010048; Symbol: ER_SCHEDULER_STOPPED; SQLSTATE: HY000
Message: Event Scheduler: Stopped

ER_SCHEDULER_STOPPED was added in 8.0.2.

• Error number: MY-010049; Symbol: ER_CANT_CREATE_SCHEDULER_THREAD; SQLSTATE: HY000
Message: Event scheduler: Failed to start scheduler, Can not create thread for event scheduler (errno= %d)

ER_CANT_CREATE_SCHEDULER_THREAD was added in 8.0.2.

• Error number: MY-010050; Symbol: ER_SCHEDULER_WAITING; SQLSTATE: HY000
Message: Event Scheduler: Waiting for the scheduler thread to reply

ER_SCHEDULER_WAITING was added in 8.0.2.

• Error number: MY-010051; Symbol: ER_SCHEDULER_STARTED; SQLSTATE: HY000
Message: Event Scheduler: scheduler thread started with id %u

ER_SCHEDULER_STARTED was added in 8.0.2.

• Error number: MY-010052; Symbol: ER_SCHEDULER_STOPPING_FAILED_TO_GET_EVENT; SQLSTATE: HY000
Message: Event Scheduler: Serious error during getting next event to execute. Stopping

ER_SCHEDULER_STOPPING_FAILED_TO_GET_EVENT was added in 8.0.2.
• Error number: MY-010053; Symbol: ER_SCHEDULER_STOPPING_FAILED_TO_CREATE_WORKER; SQLSTATE: HY000
Message: Event_scheduler::execute_top: Can not create event worker thread (errno=%d). Stopping event scheduler

ER_SCHEDULER_STOPPING_FAILED_TO_CREATE_WORKER was added in 8.0.2.

• Error number: MY-010054; Symbol: ER_SCHEDULER_KILLING; SQLSTATE: HY000
Message: Event Scheduler: Killing the scheduler thread, thread id %u

ER_SCHEDULER_KILLING was added in 8.0.2.

• Error number: MY-010055; Symbol: ER_UNABLE_TO_RESOLVE_IP; SQLSTATE: HY000
Message: IP address '%s' could not be resolved: %s

ER_UNABLE_TO_RESOLVE_IP was added in 8.0.2.

• Error number: MY-010056; Symbol: ER_UNABLE_TO_RESOLVE_HOSTNAME; SQLSTATE: HY000
Message: Host name '%s' could not be resolved: %s

ER_UNABLE_TO_RESOLVE_HOSTNAME was added in 8.0.2.

• Error number: MY-010057; Symbol: ER_HOSTNAME_RESEMBLES_IPV4; SQLSTATE: HY000
Message: IP address '%s' has been resolved to the host name '%s', which resembles IPv4-address itself.

ER_HOSTNAME_RESEMBLES_IPV4 was added in 8.0.2.

• Error number: MY-010058; Symbol: ER_HOSTNAME_DOESNT.Resolve_TO; SQLSTATE: HY000
Message: Hostname '%s' does not resolve to '%s'.

ER_HOSTNAME_DOESNT_RESOLVE_TO was added in 8.0.2.

• Error number: MY-010059; Symbol: ER_ADDRESSES_FOR_HOSTNAME_HEADER; SQLSTATE: HY000
Message: Hostname '%s' has the following IP addresses:

ER_ADDRESSES_FOR_HOSTNAME_HEADER was added in 8.0.2.

• Error number: MY-010060; Symbol: ER_ADDRESSES_FOR_HOSTNAME_LIST_ITEM; SQLSTATE: HY000
Message: - %s

ER_ADDRESSES_FOR_HOSTNAME_LIST_ITEM was added in 8.0.2.

• Error number: MY-010061; Symbol: ER_TRGWITHOUTDEFINER; SQLSTATE: HY000
Message: Definer clause is missing in Trigger of Table %s. Rebuild Trigger to fix definer.

ER_TRG WITHOUT DEFINER was added in 8.0.2.

• Error number: MY-010062; Symbol: ER_TRG_NO_CLIENT_CHARSET; SQLSTATE: HY000
Message: Client character set is missing for trigger of table %s. Using default character set.

`ER_TRG_NO_CLIENT_CHARSET` was added in 8.0.2.

- Error number: `MY-010063`; Symbol: `ER_PARSING_VIEW`; SQLSTATE: `HY000`
  Message: Error in parsing view %s.%s
  `ER_PARSING_VIEW` was added in 8.0.2.

- Error number: `MY-010064`; Symbol: `ER_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP`; SQLSTATE: `HY000`
  Message: Failed to bootstrap components infrastructure.
  `ER_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP` was added in 8.0.2.

- Error number: `MY-010065`; Symbol: `ER_COMPONENTS_INFRASTRUCTURE_SHUTDOWN`; SQLSTATE: `HY000`
  Message: Failed to shutdown components infrastructure.
  `ER_COMPONENTS_INFRASTRUCTURE_SHUTDOWN` was added in 8.0.2.

- Error number: `MY-010066`; Symbol: `ER_COMPONENTS_PERSIST_LOADER_BOOTSTRAP`; SQLSTATE: `HY000`
  Message: Failed to bootstrap persistent components loader.
  `ER_COMPONENTS_PERSIST_LOADER_BOOTSTRAP` was added in 8.0.2.

- Error number: `MY-010067`; Symbol: `ER_DEPART_WITH_GRACE`; SQLSTATE: `HY000`
  Message: Giving %d client threads a chance to die gracefully
  `ER_DEPART_WITH_GRACE` was added in 8.0.2.

- Error number: `MY-010068`; Symbol: `ER_CA_SELF_SIGNED`; SQLSTATE: `HY000`
  Message: CA certificate %s is self signed.
  `ER_CA_SELF_SIGNED` was added in 8.0.2.

- Error number: `MY-010069`; Symbol: `ER_SSL_LIBRARY_ERROR`; SQLSTATE: `HY000`
  Message: Failed to set up SSL because of the following SSL library error: %s
  `ER_SSL_LIBRARY_ERROR` was added in 8.0.2.

- Error number: `MY-010070`; Symbol: `ER_NO_THD_NO_UUID`; SQLSTATE: `HY000`
  Message: Failed to generate a server UUID because it is failed to allocate the THD.
  `ER_NO_THD_NO_UUID` was added in 8.0.2.

- Error number: `MY-010071`; Symbol: `ER_UUID_SALT`; SQLSTATE: `HY000`
  Message: Salting uuid generator variables, current_pid: %lu, server_start_time: %lu, bytes_sent: %llu,
ER_UUID_SALT was added in 8.0.2.

- Error number: MY-010072; Symbol: ER_UUID_IS; SQLSTATE: HY000
  Message: Generated uuid: '%s', server_start_time: %lu, bytes_sent: %llu
  ER_UUID_IS was added in 8.0.2.

- Error number: MY-010073; Symbol: ER_UUID_INVALID; SQLSTATE: HY000
  Message: The server_uuid stored in auto.cnf file is not a valid UUID.
  ER_UUID_INVALID was added in 8.0.2.

- Error number: MY-010074; Symbol: ER_UUID_SCRUB; SQLSTATE: HY000
  Message: Garbage characters found at the end of the server_uuid value in auto.cnf file. It should be of length '%d' (UUID_LENGTH). Clear it and restart the server.
  ER_UUID_SCRUB was added in 8.0.2.

- Error number: MY-010075; Symbol: ER_CREATING_NEW_UUID; SQLSTATE: HY000
  Message: No existing UUID has been found, so we assume that this is the first time that this server has been started. Generating a new UUID: %s.
  ER_CREATING_NEW_UUID was added in 8.0.2.

- Error number: MY-010076; Symbol: ER_CANT_CREATE_UUID; SQLSTATE: HY000
  Message: Initialization of the server's UUID failed because it could not be read from the auto.cnf file. If this is a new server, the initialization failed because it was not possible to generate a new UUID.
  ER_CANT_CREATE_UUID was added in 8.0.2.

- Error number: MY-010077; Symbol: ER_UNKNOWN_UNSUPPORTED_STORAGE_ENGINE; SQLSTATE: HY000
  Message: Unknown/unsupported storage engine: %s
  ER_UNKNOWN_UNSUPPORTED_STORAGE_ENGINE was added in 8.0.2.

- Error number: MY-010078; Symbol: ER_SECURE_AUTH_VALUE_UNSUPPORTED; SQLSTATE: HY000
  Message: Unsupported value 0 for secure-auth
  ER_SECURE_AUTH_VALUE_UNSUPPORTED was added in 8.0.2.

- Error number: MY-010079; Symbol: ER_INVALID_INSTRUMENT; SQLSTATE: HY000
  Message: Invalid instrument name or value for performance_schema_instrument '%s'
  ER_INVALID_INSTRUMENT was added in 8.0.2.

- Error number: MY-010080; Symbol: ER_INNODB_MANDATORY; SQLSTATE: HY000
  Message: The use of InnoDB is mandatory since MySQL 5.7. The former options like '--innodb=0/1/OFF/ON' or '--skip-innodb' are ignored.
**ER_INNODB_MANDATORY** was added in 8.0.2.

- **Error number:** MY-010082; **Symbol:** ER_OLD_PASSWORDS_NO_MIDDLE_GROUND; **SQLSTATE:** HY000
  
  *Message:* Invalid old_passwords mode: 1. Valid values are 2 and 0
  
  **ER_OLD_PASSWORDS_NO_MIDDLE_GROUND** was added in 8.0.2, removed after 8.0.15.

- **Error number:** MY-010083; **Symbol:** ER_VERBOSE_REQUIRES_HELP; **SQLSTATE:** HY000
  
  *Message:* --verbose is for use with --help; did you mean --log-error-verbosity?
  
  **ER_VERBOSE_REQUIRES_HELP** was added in 8.0.2.

- **Error number:** MY-010084; **Symbol:** ER_POINTLESS_WITHOUT_SLOWLOG; **SQLSTATE:** HY000
  
  *Message:* options --log-slow-admin-statements, --log-queries-not-using-indexes and --log-slow-slave-statements have no effect if --slow-query-log is not set
  
  **ER_POINTLESS_WITHOUT_SLOWLOG** was added in 8.0.2.

- **Error number:** MY-010085; **Symbol:** ER_WASTEFUL_NET_BUFFER_SIZE; **SQLSTATE:** HY000
  
  *Message:* net_buffer_length (%lu) is set to be larger than max_allowed_packet (%lu). Please rectify.
  
  **ER_WASTEFUL_NET_BUFFER_SIZE** was added in 8.0.2.

- **Error number:** MY-010086; **Symbol:** ER_DEPRECATED_TIMESTAMP_IMPLICIT_DEFAULTS; **SQLSTATE:** HY000
  
  *Message:* TIMESTAMP with implicit DEFAULT value is deprecated. Please use --explicit_defaults_for_timestamp server option (see documentation for more details).
  
  **ER_DEPRECATED_TIMESTAMP_IMPLICIT_DEFAULTS** was added in 8.0.2.

- **Error number:** MY-010087; **Symbol:** ER_FT_BOOL_SYNTAX_INVALID; **SQLSTATE:** HY000
  
  *Message:* Invalid ft-boolean-syntax string: %s
  
  **ER_FT_BOOL_SYNTAX_INVALID** was added in 8.0.2.

- **Error number:** MY-010088; **Symbol:** ER_CREDENTIALLESS_AUTO_USER_BAD; **SQLSTATE:** HY000
  
  *Message:* 'NO_AUTO_CREATE_USER' sql mode was not set.
  
  **ER_CREDENTIALLESS_AUTO_USER_BAD** was added in 8.0.2.

- **Error number:** MY-010089; **Symbol:** ER_CONNECTION_HANDLING_OOM; **SQLSTATE:** HY000
  
  *Message:* Could not allocate memory for connection handling
  
  **ER_CONNECTION_HANDLING_OOM** was added in 8.0.2.

- **Error number:** MY-010090; **Symbol:** ER_THREAD_HANDLING_OOM; **SQLSTATE:** HY000
  
  *Message:* Could not allocate memory for thread handling
  
  **ER_THREAD_HANDLING_OOM** was added in 8.0.2.
Server Error Message Reference

- Error number: MY-010091; Symbol: ER_CANT_CREATE_TEST_FILE; SQLSTATE: HY000
  Message: Can't create test file %s
  ER_CANT_CREATE_TEST_FILE was added in 8.0.2.

- Error number: MY-010092; Symbol: ER_CANT_CREATE_PID_FILE; SQLSTATE: HY000
  Message: Can't start server: can't create PID file: %s
  ER_CANT_CREATE_PID_FILE was added in 8.0.2.

- Error number: MY-010093; Symbol: ER_CANT_REMOVE_PID_FILE; SQLSTATE: HY000
  Message: Unable to delete pid file: %s
  ER_CANT_REMOVE_PID_FILE was added in 8.0.2.

- Error number: MY-010094; Symbol: ER_CANT_CREATE_SHUTDOWN_THREAD; SQLSTATE: HY000
  Message: Can't create thread to handle shutdown requests (errno= %d)
  ER_CANT_CREATE_SHUTDOWN_THREAD was added in 8.0.2.

- Error number: MY-010095; Symbol: ER_SEC_FILE_PRIV_CANT_ACCESS_DIR; SQLSTATE: HY000
  Message: Failed to access directory for --secure-file-priv. Please make sure that directory exists and is accessible by MySQL Server. Supplied value : %s
  ER_SEC_FILE_PRIV_CANT_ACCESS_DIR was added in 8.0.2.

- Error number: MY-010096; Symbol: ER_SEC_FILE_PRIV_IGNORED; SQLSTATE: HY000
  Message: Ignoring --secure-file-priv value as server is running with --initialize(-insecure).
  ER_SEC_FILE_PRIV_IGNORED was added in 8.0.2.

- Error number: MY-010097; Symbol: ER_SEC_FILE_PRIV_EMPTY; SQLSTATE: HY000
  Message: Insecure configuration for --secure-file-priv: Current value does not restrict location of generated files. Consider setting it to a valid, non-empty path.
  ER_SEC_FILE_PRIV_EMPTY was added in 8.0.2.

- Error number: MY-010098; Symbol: ER_SEC_FILE_PRIV_NULL; SQLSTATE: HY000
  Message: --secure-file-priv is set to NULL. Operations related to importing and exporting data are disabled
  ER_SEC_FILE_PRIV_NULL was added in 8.0.2.

- Error number: MY-010099; Symbol: ER_SEC_FILE_PRIV_DIRECTORY_INSECURE; SQLSTATE: HY000
  Message: Insecure configuration for --secure-file-priv: %s is accessible through --secure-file-priv. Consider choosing a different directory.
  ER_SEC_FILE_PRIV_DIRECTORY_INSECURE was added in 8.0.2.

- Error number: MY-010100; Symbol: ER_SEC_FILE_PRIV_CANT_STAT; SQLSTATE: HY000

This completes the reference to server error messages.
Message: Failed to get stat for directory pointed out by --secure-file-priv

**ER_SEC_FILE_PRIV_CANT_STAT** was added in 8.0.2.

- **Error number:** MY-010101; Symbol: **ER_SEC_FILE_PRIV_DIRECTORY_PERMISSIONS**; SQLSTATE: HY000
  
  Message: Insecure configuration for --secure-file-priv: Location is accessible to all OS users. Consider choosing a different directory.

  **ER_SEC_FILE_PRIV_DIRECTORY_PERMISSIONS** was added in 8.0.2.

- **Error number:** MY-010102; Symbol: **ER_SEC_FILE_PRIV_ARGUMENT_TOO_LONG**; SQLSTATE: HY000
  
  Message: Value for --secure-file-priv is longer than maximum limit of %d

  **ER_SEC_FILE_PRIV_ARGUMENT_TOO_LONG** was added in 8.0.2.

- **Error number:** MY-010103; Symbol: **ER_CANT_CREATE_NAMED_PIPES_THREAD**; SQLSTATE: HY000
  
  Message: Can't create thread to handle named pipes (errno= %d)

  **ER_CANT_CREATE_NAMED_PIPES_THREAD** was added in 8.0.2.

- **Error number:** MY-010104; Symbol: **ER_CANT_CREATE_TCPIP_THREAD**; SQLSTATE: HY000
  
  Message: Can't create thread to handle TCP/IP (errno= %d)

  **ER_CANT_CREATE_TCPIP_THREAD** was added in 8.0.2.

- **Error number:** MY-010105; Symbol: **ER_CANT_CREATE_SHM_THREAD**; SQLSTATE: HY000
  
  Message: Can't create thread to handle shared memory (errno= %d)

  **ER_CANT_CREATE_SHM_THREAD** was added in 8.0.2.

- **Error number:** MY-010106; Symbol: **ER_CANT_CREATE_INTERRUPT_THREAD**; SQLSTATE: HY000
  
  Message: Can't create interrupt-thread (error %d, errno: %d)

  **ER_CANT_CREATE_INTERRUPT_THREAD** was added in 8.0.2.

- **Error number:** MY-010107; Symbol: **ER_WRITABLE_CONFIG_REMOVED**; SQLSTATE: HY000
  
  Message: World-writable config file '%s' has been removed.

  **ER_WRITABLE_CONFIG_REMOVED** was added in 8.0.2.

- **Error number:** MY-010108; Symbol: **ER_CORE_VALUES**; SQLSTATE: HY000
  
  Message: setrlimit could not change the size of core files to 'infinity'; We may not be able to generate a core file on signals

  **ER_CORE_VALUES** was added in 8.0.2.

- **Error number:** MY-010109; Symbol: **ER_WRONG_DATETIME_SPEC**; SQLSTATE: HY000
  
  Message: Wrong date/time format specifier: %s
ER_WRONG_DATETIME_SPEC was added in 8.0.2.

- Error number: MY-010110; Symbol: ER_RPL_BINLOG_FILTERS_OOM; SQLSTATE: HY000
  Message: Could not allocate replication and binlog filters: %s
  ER_RPL_BINLOG_FILTERS_OOM was added in 8.0.2.

- Error number: MY-010111; Symbol: ER_KEYCACHE_OOM; SQLSTATE: HY000
  Message: Cannot allocate the keycache
  ER_KEYCACHE_OOM was added in 8.0.2.

- Error number: MY-010112; Symbol: ER_CONFIRMING_THE_FUTURE; SQLSTATE: HY000
  Message: Current time has got past year 2038. Validating current time with %d iterations before initiating the normal server shutdown process.
  ER_CONFIRMING_THE_FUTURE was added in 8.0.2.

- Error number: MY-010113; Symbol: ER_BACK_IN_TIME; SQLSTATE: HY000
  Message: Iteration %d: Obtained valid current time from system
  ER_BACK_IN_TIME was added in 8.0.2.

- Error number: MY-010114; Symbol: ER_FUTURE_DATE; SQLSTATE: HY000
  Message: Iteration %d: Current time obtained from system is greater than 2038
  ER_FUTURE_DATE was added in 8.0.2.

- Error number: MY-010115; Symbol: ER_UNSUPPORTED_DATE; SQLSTATE: HY000
  Message: This MySQL server doesn't support dates later then 2038
  ER_UNSUPPORTED_DATE was added in 8.0.2.

- Error number: MY-010116; Symbol: ER_STARTING_AS; SQLSTATE: HY000
  Message: %s (mysqld %s) starting as process %lu
  ER_STARTING_AS was added in 8.0.2.

- Error number: MY-010117; Symbol: ER_SHUTTING_DOWN_SLAVE_THREADS; SQLSTATE: HY000
  Message: Shutting down slave threads
  ER_SHUTTING_DOWN_SLAVE_THREADS was added in 8.0.2.

- Error number: MY-010118; Symbol: ER_DISCONNECTING_REMAINING_CLIENTS; SQLSTATE: HY000
  Message: Forcefully disconnecting %d remaining clients
  ER_DISCONNECTING_REMAINING_CLIENTS was added in 8.0.2.

- Error number: MY-010119; Symbol: ER_ABORTING; SQLSTATE: HY000
Message: Aborting

**ER_ABORTING** was added in 8.0.2.

- **Error number:** MY-010120; **Symbol:** ER_BINLOG_END; **SQLSTATE:** HY000

Message: Binlog end

**ER_BINLOG_END** was added in 8.0.2.

- **Error number:** MY-010121; **Symbol:** ER_CALL_ME_LOCALHOST; **SQLSTATE:** HY000

Message: gethostname failed, using '%s' as hostname

**ER_CALL_ME_LOCALHOST** was added in 8.0.2.

- **Error number:** MY-010122; **Symbol:** ER_USER_REQUIRES_ROOT; **SQLSTATE:** HY000

Message: One can only use the --user switch if running as root

**ER_USER_REQUIRES_ROOT** was added in 8.0.2.

- **Error number:** MY-010123; **Symbol:** ER_REALLY_RUN_AS_ROOT; **SQLSTATE:** HY000

Message: Fatal error: Please read "Security" section of the manual to find out how to run mysql as root!

**ER_REALLY_RUN_AS_ROOT** was added in 8.0.2.

- **Error number:** MY-010124; **Symbol:** ER_USER_WHAT_USER; **SQLSTATE:** HY000

Message: Fatal error: Can't change to run as user '%s' ; Please check that the user exists!

**ER_USER_WHAT_USER** was added in 8.0.2.

- **Error number:** MY-010125; **Symbol:** ER_TRANSPORTS_WHAT_TRANSPORTS; **SQLSTATE:** HY000

Message: Server is started with --require-secure-transport=ON but no secure transports (SSL or Shared Memory) are configured.

**ER_TRANSPORTS_WHAT_TRANSPORTS** was added in 8.0.2.

- **Error number:** MY-010126; **Symbol:** ER_FAIL_SETGID; **SQLSTATE:** HY000

Message: setgid: %s

**ER_FAIL_SETGID** was added in 8.0.2.

- **Error number:** MY-010127; **Symbol:** ER_FAIL_SETUID; **SQLSTATE:** HY000

Message: setuid: %s

**ER_FAIL_SETUID** was added in 8.0.2.

- **Error number:** MY-010128; **Symbol:** ER_FAIL_SETREGID; **SQLSTATE:** HY000

Message: setregid: %s

**ER_FAIL_SETREGID** was added in 8.0.2.
Server Error Message Reference

- Error number: MY-010129; Symbol: ER_FAIL_SETREUID; SQLSTATE: HY000
  Message: setreuid: %s
  `ER_FAIL_SETREUID` was added in 8.0.2.

- Error number: MY-010130; Symbol: ER_FAIL_CHROOT; SQLSTATE: HY000
  Message: chroot: %s
  `ER_FAIL_CHROOT` was added in 8.0.2.

- Error number: MY-010131; Symbol: ER_WIN_LISTEN_BUT_HOW; SQLSTATE: HY000
  Message: TCP/IP, --shared-memory, or --named-pipe should be configured on NT OS
  `ER_WIN_LISTEN_BUT_HOW` was added in 8.0.2.

- Error number: MY-010132; Symbol: ER_NOT_RIGHT_NOW; SQLSTATE: HY000
  Message: CTRL-C ignored during startup
  `ER_NOT_RIGHT_NOW` was added in 8.0.2.

- Error number: MY-010133; Symbol: ER_FIXING_CLIENT_CHARSET; SQLSTATE: HY000
  Message: '%s' can not be used as client character set. '%s' will be used as default client character set.
  `ER_FIXING_CLIENT_CHARSET` was added in 8.0.2.

- Error number: MY-010134; Symbol: ER_OOM; SQLSTATE: HY000
  Message: Out of memory
  `ER_OOM` was added in 8.0.2.

- Error number: MY-010135; Symbol: ER_FAILED_TO_LOCK_MEM; SQLSTATE: HY000
  Message: Failed to lock memory. Errno: %d
  `ER_FAILED_TO_LOCK_MEM` was added in 8.0.2.

- Error number: MY-010136; Symbol: ER_MYINIT_FAILED; SQLSTATE: HY000
  Message: my_init() failed.
  `ER_MYINIT_FAILED` was added in 8.0.2.

- Error number: MY-010137; Symbol: ER_BEG_INITFILE; SQLSTATE: HY000
  Message: Execution of init_file '%s' started.
  `ER_BEG_INITFILE` was added in 8.0.2.

- Error number: MY-010138; Symbol: ER_END_INITFILE; SQLSTATE: HY000
  Message: Execution of init_file '%s' ended.
  `ER_END_INITFILE` was added in 8.0.2.
Server Error Message Reference

- Error number: **MY-010139**; Symbol: **ER_CHANGED_MAX_OPEN_FILES**; SQLSTATE: **HY000**
  
  Message: Changed limits: max_open_files: %lu (requested %lu)
  
  **ER_CHANGED_MAX_OPEN_FILES** was added in 8.0.2.

- Error number: **MY-010140**; Symbol: **ER_CANT_INCREASE_MAX_OPEN_FILES**; SQLSTATE: **HY000**
  
  Message: Could not increase number of max_open_files to more than %lu (request: %lu)
  
  **ER_CANT_INCREASE_MAX_OPEN_FILES** was added in 8.0.2.

- Error number: **MY-010141**; Symbol: **ER_CHANGED_MAX_CONNECTIONS**; SQLSTATE: **HY000**
  
  Message: Changed limits: max_connections: %lu (requested %lu)
  
  **ER_CHANGED_MAX_CONNECTIONS** was added in 8.0.2.

- Error number: **MY-010142**; Symbol: **ER_CHANGED_TABLE_OPEN_CACHE**; SQLSTATE: **HY000**
  
  Message: Changed limits: table_open_cache: %lu (requested %lu)
  
  **ER_CHANGED_TABLE_OPEN_CACHE** was added in 8.0.2.

- Error number: **MY-010143**; Symbol: **ER_THE_USER_ABIDES**; SQLSTATE: **HY000**
  
  Message: Ignoring user change to '%s' because the user was set to '%s' earlier on the command line
  
  **ER_THE_USER_ABIDES** was added in 8.0.2.

- Error number: **MY-010144**; Symbol: **ER_RPL_CANT_ADD_DO_TABLE**; SQLSTATE: **HY000**
  
  Message: Could not add do table rule '%s'!
  
  **ER_RPL_CANT_ADD_DO_TABLE** was added in 8.0.2.

- Error number: **MY-010145**; Symbol: **ER_RPL_CANT_ADD_IGNORE_TABLE**; SQLSTATE: **HY000**
  
  Message: Could not add ignore table rule '%s'!
  
  **ER_RPL_CANT_ADD_IGNORE_TABLE** was added in 8.0.2.

- Error number: **MY-010146**; Symbol: **ER_TRACK_VARIABLES_BOGUS**; SQLSTATE: **HY000**
  
  Message: The variable session_track_system_variables either has duplicate values or invalid values.
  
  **ER_TRACK_VARIABLES_BOGUS** was added in 8.0.2.

- Error number: **MY-010147**; Symbol: **ER_EXCESS_ARGUMENTS**; SQLSTATE: **HY000**
  
  Message: Too many arguments (first extra is '%s')
  
  **ER_EXCESS_ARGUMENTS** was added in 8.0.2.

- Error number: **MY-010148**; Symbol: **ER_VERBOSE_HINT**; SQLSTATE: **HY000**
  
  Message: Use --verbose --help to get a list of available options!
  
  **ER_VERBOSE_HINT** was added in 8.0.2.
• Error number: MY-010149; Symbol: ER_CANT_READ_ERRMSGS; SQLSTATE: HY000
  Message: Unable to read errmsg.sys file
  ER_CANT_READ_ERRMSGS was added in 8.0.2.

• Error number: MY-010150; Symbol: ER_CANT_INIT_DB; SQLSTATE: HY000
  Message: Can't init databases
  ER_CANT_INIT_DB was added in 8.0.2.

• Error number: MY-010151; Symbol: ER_LOG_OUTPUT_CONTRADICTION; SQLSTATE: HY000
  Message: There were other values specified to log-output besides NONE. Disabling slow and general logs anyway.
  ER_LOG_OUTPUT_CONTRADICTION was added in 8.0.2.

• Error number: MY-010152; Symbol: ER_NO_CSV_NO_LOG_TABLES; SQLSTATE: HY000
  Message: CSV engine is not present, falling back to the log files
  ER_NO_CSV_NO_LOG_TABLES was added in 8.0.2.

• Error number: MY-010153; Symbol: ER_RPL_REWRITEDB_MISSING_ARROW; SQLSTATE: HY000
  Message: Bad syntax in replicate-rewrite-db - missing '->'!
  ER_RPL_REWRITEDB_MISSING_ARROW was added in 8.0.2.

• Error number: MY-010154; Symbol: ER_RPL_REWRITEDB_EMPTY_FROM; SQLSTATE: HY000
  Message: Bad syntax in replicate-rewrite-db - empty FROM db!
  ER_RPL_REWRITEDB_EMPTY_FROM was added in 8.0.2.

• Error number: MY-010155; Symbol: ER_RPL_REWRITEDB_EMPTY_TO; SQLSTATE: HY000
  Message: Bad syntax in replicate-rewrite-db - empty TO db!
  ER_RPL_REWRITEDB_EMPTY_TO was added in 8.0.2.

• Error number: MY-010156; Symbol: ER_LOG_FILES_GIVEN_LOG_OUTPUT_IS_TABLE; SQLSTATE: HY000
  Message: Although a path was specified for the %s, log tables are used. To enable logging to files use the --log-output=file option.
  ER_LOG_FILES_GIVEN_LOG_OUTPUT_IS_TABLE was added in 8.0.2.

• Error number: MY-010157; Symbol: ER_LOG_FILE_INVALID; SQLSTATE: HY000
  Message: Invalid value for %s: %s
  ER_LOG_FILE_INVALID was added in 8.0.2.

• Error number: MY-010158; Symbol: ER_LOWER_CASE_TABLE_NAMES_CS_DD_ON_CI_FS_UNSUPPORTED; SQLSTATE: HY000
Message: The server option 'lower_case_table_names' is configured to use case sensitive table names but the data directory is on a case-insensitive file system which is an unsupported combination. Please consider either using a case sensitive file system for your data directory or switching to a case-insensitive table name mode.

ER_LOWER_CASE_TABLE_NAMES_CS_DD_ON_CI_FS_UNSUPPORTED was added in 8.0.2.

- Error number: MY-010159; Symbol: ER_LOWER_CASE_TABLE_NAMES_USING_2; SQLSTATE: HY000
  Message: Setting lower_case_table_names=2 because file system for %s is case insensitive
  ER_LOWER_CASE_TABLE_NAMES_USING_2 was added in 8.0.2.

- Error number: MY-010160; Symbol: ER_LOWER_CASE_TABLE_NAMES_USING_0; SQLSTATE: HY000
  Message: lower_case_table_names was set to 2, even though your the file system '%s' is case sensitive. Now setting lower_case_table_names to 0 to avoid future problems.
  ER_LOWER_CASE_TABLE_NAMES_USING_0 was added in 8.0.2.

- Error number: MY-010161; Symbol: ER_NEED_LOG_BIN; SQLSTATE: HY000
  Message: You need to use --log-bin to make %s work.
  ER_NEED_LOG_BIN was added in 8.0.2.

- Error number: MY-010162; Symbol: ER_NEED_FILE_INSTEAD_OF_DIR; SQLSTATE: HY000
  Message: Path '%s' is a directory name, please specify a file name for %s option
  ER_NEED_FILE_INSTEAD_OF_DIR was added in 8.0.2.

- Error number: MY-010163; Symbol: ER_LOG_BIN_BETTER_WITH_NAME; SQLSTATE: HY000
  Message: No argument was provided to --log-bin, and --log-bin-index was not used; so replication may break when this MySQL server acts as a master and has his hostname changed!! Please use '--log-bin=%s' to avoid this problem.
  ER_LOG_BIN_BETTER_WITH_NAME was added in 8.0.2.

- Error number: MY-010164; Symbol: ER_BINLOG_NEEDS_SERVERID; SQLSTATE: HY000
  Message: You have enabled the binary log, but you haven't provided the mandatory server-id. Please refer to the proper server start-up parameters documentation
  ER_BINLOG_NEEDS_SERVERID was added in 8.0.2.

- Error number: MY-010165; Symbol: ER_RPL_CANT_MAKE_PATHS; SQLSTATE: HY000
  Message: Unable to create replication path names: out of memory or path names too long (path name exceeds %d or file name exceeds %d).
  ER_RPL_CANT_MAKE_PATHS was added in 8.0.2.

- Error number: MY-010166; Symbol: ER_CANT_INITIALIZE_GTID; SQLSTATE: HY000
  Message: Failed to initialize GTID structures.
ER_CANT_INITIALIZER_GTID was added in 8.0.2.

- Error number: MY-010167; Symbol: ER_CANT_INITIALIZER_EARLY_PLUGINS; SQLSTATE: HY000
  Message: Failed to initialize early plugins.

ER_CANT_INITIALIZER_EARLY_PLUGINS was added in 8.0.2.

- Error number: MY-010168; Symbol: ER_CANT_INITIALIZER_BUILTIN_PLUGINS; SQLSTATE: HY000
  Message: Failed to initialize builtin plugins.

ER_CANT_INITIALIZER_BUILTIN_PLUGINS was added in 8.0.2.

- Error number: MY-010169; Symbol: ER_CANT_INITIALIZER_DYNAMIC_PLUGINS; SQLSTATE: HY000
  Message: Failed to initialize dynamic plugins.

ER_CANT_INITIALIZER_DYNAMIC_PLUGINS was added in 8.0.2.

- Error number: MY-010170; Symbol: ER_PERFSCHEMA_INIT_FAILED; SQLSTATE: HY000

ER_PERFSCHEMA_INIT_FAILED was added in 8.0.2.

- Error number: MY-010171; Symbol: ER_STACKSIZE_UNEXPECTED; SQLSTATE: HY000
  Message: Asked for %lu thread stack, but got %ld

ER_STACKSIZE_UNEXPECTED was added in 8.0.2.

- Error number: MY-010172; Symbol: ER_CANT_SET_DATADIR; SQLSTATE: HY000
  Message: failed to set datadir to %s

ER_CANT_SET_DATADIR was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010173; Symbol: ER_CANT_STAT_DATADIR; SQLSTATE: HY000
  Message: Can't read data directory's stats (%d): %s. Assuming that it's not owned by the same user/group

ER_CANT_STAT_DATADIR was added in 8.0.2.

- Error number: MY-010174; Symbol: ER_CANT_CHOWN_DATADIR; SQLSTATE: HY000
  Message: Can't change data directory owner to %s

ER_CANT_CHOWN_DATADIR was added in 8.0.2.

- Error number: MY-010175; Symbol: ER_CANT_SET_UP_PERSISTED_VALUES; SQLSTATE: HY000
  Message: Setting persistent options failed.

ER_CANT_SET_UP_PERSISTED_VALUES was added in 8.0.2.
• Error number: MY-010176; Symbol: ER_CANT_SAVE_GTIDS; SQLSTATE: HY000
  Message: Failed to save the set of Global Transaction Identifiers of the last binary log into the mysql.gtid_executed table while the server was shutting down. The next server restart will make another attempt to save Global Transaction Identifiers into the table.
  ER_CANT_SAVE_GTIDS was added in 8.0.2.

• Error number: MY-010177; Symbol: ER_AUTH_CANT_SET_DEFAULT_PLUGIN; SQLSTATE: HY000
  Message: Can't start server: Invalid value for --default-authentication-plugin
  ER_AUTH_CANT_SET_DEFAULT_PLUGIN was added in 8.0.2.

• Error number: MY-010178; Symbol: ER_CANT_JOIN_SHUTDOWN_THREAD; SQLSTATE: HY000
  Message: Could not join %sthread. error:%d
  ER_CANT_JOIN_SHUTDOWN_THREAD was added in 8.0.2.

• Error number: MY-010179; Symbol: ER_CANT_HASH_DO_AND_IGNORE_RULES; SQLSTATE: HY000
  Message: An error occurred while building do_table and ignore_table rules to hashes for global replication filter.
  ER_CANT_HASH_DO_AND_IGNORE_RULES was added in 8.0.2.

• Error number: MY-010180; Symbol: ER_CANT_OPEN_CA; SQLSTATE: HY000
  Message: Error opening CA certificate file
  ER_CANT_OPEN_CA was added in 8.0.2.

• Error number: MY-010181; Symbol: ER_CANT_ACCESS_CAPATH; SQLSTATE: HY000
  Message: Error accessing directory pointed by --ssl-capath
  ER_CANT_ACCESS_CAPATH was added in 8.0.2.

• Error number: MY-010182; Symbol: ER_SSL_TRYING_DATADIR_DEFAULTS; SQLSTATE: HY000
  Message: Found %s, %s and %s in data directory. Trying to enable SSL support using them.
  ER_SSL_TRYING_DATADIR_DEFAULTS was added in 8.0.2.

• Error number: MY-010183; Symbol: ER_AUTO_OPTIONS_FAILED; SQLSTATE: HY000
  Message: Failed to create %s(file: '%s', errno %d)
  ER_AUTO_OPTIONS_FAILED was added in 8.0.2.

• Error number: MY-010184; Symbol: ER_CANT_INIT_TIMER; SQLSTATE: HY000
  Message: Failed to initialize timer component (errno %d).
  ER_CANT_INIT_TIMER was added in 8.0.2.

• Error number: MY-010185; Symbol: ER_SERVERID_TOO_LARGE; SQLSTATE: HY000
  Message: server-id configured is too large to represent with server-id-bits configured.
**ER_SERVERID_TOO_LARGE** was added in 8.0.2.

- Error number: **MY-010186**; Symbol: **ER_DEFAULT_SE_UNAVAILABLE**; SQLSTATE: **HY000**
  Message: Default%s storage engine (%s) is not available
  **ER_DEFAULT_SE_UNAVAILABLE** was added in 8.0.2.

- Error number: **MY-010187**; Symbol: **ER_CANT_OPEN_ERROR_LOG**; SQLSTATE: **HY000**
  Message: Could not open file '%s' for error logging%s%s
  **ER_CANT_OPEN_ERROR_LOG** was added in 8.0.2.

- Error number: **MY-010188**; Symbol: **ER_INVALID_ERROR_LOG_NAME**; SQLSTATE: **HY000**
  Message: Invalid log file name after expanding symlinks: '%s'
  **ER_INVALID_ERROR_LOG_NAME** was added in 8.0.2.

- Error number: **MY-010189**; Symbol: **ER_RPL_INFINITY_DENIED**; SQLSTATE: **HY000**
  Message: using --replicate-same-server-id in conjunction with --log-slave-updates is impossible, it would lead to infinite loops in this server.
  **ER_RPL_INFINITY_DENIED** was added in 8.0.2.

- Error number: **MY-010190**; Symbol: **ER_RPL_INFINITY_IGNORED**; SQLSTATE: **HY000**
  Message: using --replicate-same-server-id in conjunction with --log-slave-updates would lead to infinite loops in this server. However this will be ignored as the --log-bin option is not defined or your server is running with global transaction identiers enabled.
  **ER_RPL_INFINITY_IGNORED** was added in 8.0.2.

- Error number: **MY-010191**; Symbol: **ER_NDB_TABLES_NOT_READY**; SQLSTATE: **HY000**
  Message: NDB : Tables not available after %lu seconds. Consider increasing --ndb-wait-setup value
  **ER_NDB_TABLES_NOT_READY** was added in 8.0.2, removed after 8.0.13.

- Error number: **MY-010192**; Symbol: **ER_TABLE_CHECK_INTACT**; SQLSTATE: **HY000**
  Message: %s
  **ER_TABLE_CHECK_INTACT** was added in 8.0.2.

- Error number: **MY-010193**; Symbol: **ER_DD_TABLESPACE_NOT_FOUND**; SQLSTATE: **HY000**
  Message: Unable to start server. The data dictionary tablespace '%s' does not exist.
  **ER_DD_TABLESPACE_NOT_FOUND** was added in 8.0.2.

- Error number: **MY-010194**; Symbol: **ER_DD_TRG_CONNECTION_COLLATION_MISSING**; SQLSTATE: **HY000**
  Message: Connection collation is missing for trigger of table %s. Using default connection collation.
  **ER_DD_TRG_CONNECTION_COLLATION_MISSING** was added in 8.0.2.
• Error number: MY-010195; Symbol: ER_DD_TRG_DB_COLLATION_MISSING; SQLSTATE: HY000
  Message: Database collation is missing for trigger of table %s. Using Default character set.
  ER_DD_TRG_DB_COLLATION_MISSING was added in 8.0.2.

• Error number: MY-010196; Symbol: ER_DD_TRG_DEFINER_OOM; SQLSTATE: HY000
  Message: Error in Memory allocation for Definer %s for Trigger.
  ER_DD_TRG_DEFINER_OOM was added in 8.0.2.

• Error number: MY-010197; Symbol: ER_DD_TRG_FILE_UNREADABLE; SQLSTATE: HY000
  Message: Error in reading %s.TRG file.
  ER_DD_TRG_FILE_UNREADABLE was added in 8.0.2.

• Error number: MY-010198; Symbol: ER_TRG_CANT_PARSE; SQLSTATE: HY000
  Message: Error in parsing Triggers from %s.TRG file.
  ER_TRG_CANT_PARSE was added in 8.0.2.

• Error number: MY-010199; Symbol: ER_DD_TRG_CANT_ADD; SQLSTATE: HY000
  Message: Error in creating DD entry for Trigger %s.%s
  ER_DD_TRG_CANT_ADD was added in 8.0.2.

• Error number: MY-010200; Symbol: ER_DD_CANT_RESOLVE_VIEW; SQLSTATE: HY000
  Message: Resolving dependency for the view '%s.%s' failed. View is no more valid to use
  ER_DD_CANT_RESOLVEVIEW was added in 8.0.2.

• Error number: MY-010201; Symbol: ER_DD_VIEW_WITHOUT_DEFINER; SQLSTATE: HY000
  Message: %s.%s has no definer (as per an old view format). Current user is used as definer. Please recreate the view.
  ER_DD_VIEW_WITHOUT_DEFINER was added in 8.0.2.

• Error number: MY-010202; Symbol: ER_PLUGIN_INIT_FAILED; SQLSTATE: HY000
  Message: Plugin '%s' init function returned error.
  ER_PLUGIN_INIT_FAILED was added in 8.0.2.

• Error number: MY-010203; Symbol: ER_RPL_TRX_DELEGATES_INIT_FAILED; SQLSTATE: HY000
  ER_RPL_TRX_DELEGATES_INIT_FAILED was added in 8.0.2.

   Message: IPv6 is not available.
   
   ER_CONN_TCP_IPV6_UNAVAILABLE was added in 8.0.2.

• Error number: MY-010255; Symbol: ER_CONN_TCP_ERROR_WITH_STRERROR; SQLSTATE: HY000
   Message: Can't create IP socket: %s
   
   ER_CONN_TCP_ERROR_WITH_STRERROR was added in 8.0.2.

• Error number: MY-010256; Symbol: ER_CONN_TCP_CANT_RESOLVE_HOSTNAME; SQLSTATE: HY000
   Message: Can't start server: cannot resolve hostname!
   
   ER_CONN_TCP_CANT_RESOLVE_HOSTNAME was added in 8.0.2.

• Error number: MY-010257; Symbol: ER_CONN_TCP_IS_THERE_ANOTHER_USING_PORT; SQLSTATE: HY000
   Message: Do you already have another mysqld server running on port: %d ?
   
   ER_CONN_TCP_IS_THERE_ANOTHER_USING_PORT was added in 8.0.2.

• Error number: MY-010258; Symbol: ER_CONN_UNIX_IS_THERE_ANOTHER_USING_SOCKET; SQLSTATE: HY000
   Message: Do you already have another mysqld server running on socket: %s ?
   
   ER_CONN_UNIX_IS_THERE_ANOTHER_USING_SOCKET was added in 8.0.2.

• Error number: MY-010259; Symbol: ER_CONN_UNIX_PID_CLAIMED_SOCKET_FILE; SQLSTATE: HY000
   Message: Another process with pid %d is using unix socket file.
   
   ER_CONN_UNIX_PID_CLAIMED_SOCKET_FILE was added in 8.0.2.

• Error number: MY-010260; Symbol: ER_CONN_TCP_CANT_RESET_V6ONLY; SQLSTATE: HY000
   Message: Failed to reset IPV6_V6ONLY flag (error: %d). The server will listen to IPv6 addresses only.
   
   ER_CONN_TCP_CANT_RESET_V6ONLY was added in 8.0.2.

• Error number: MY-010261; Symbol: ER_CONN_TCP_BIND_RETRY; SQLSTATE: HY000
   Message: Retrying bind on TCP/IP port %u
ER_CONN_TCP_BIND_RETRY was added in 8.0.2.

- Error number: MY-010262; Symbol: ER_CONN_TCP_BIND_FAIL; SQLSTATE: HY000
  Message: Can't start server: Bind on TCP/IP port: %s
  ER_CONN_TCP_BIND_FAIL was added in 8.0.2, removed after 8.0.11.

- Error number: MY-010262; Symbol: ER_CONN_TCP_BIND_FAIL; SQLSTATE: HY000
  Message: Can't start server: Bind on TCP/IP port: %s
  ER_CONN_TCP_BIND_FAIL was added in 8.0.12.

- Error number: MY-010263; Symbol: ER_CONN_TCP_IP_NOT_LOGGED; SQLSTATE: HY000
  Message: Fails to print out IP-address.
  ER_CONN_TCP_IP_NOT_LOGGED was added in 8.0.2.

- Error number: MY-010264; Symbol: ER_CONN_TCP_RESOLVE_INFO; SQLSTATE: HY000
  Message: - '%s' resolves to '%s';
  ER_CONN_TCP_RESOLVE_INFO was added in 8.0.2.

- Error number: MY-010265; Symbol: ER_CONN_TCP_START_FAIL; SQLSTATE: HY000
  Message: Can't start server: listen() on TCP/IP port: %s
  ER_CONN_TCP_START_FAIL was added in 8.0.2.

- Error number: MY-010266; Symbol: ER_CONN_TCP_LISTEN_FAIL; SQLSTATE: HY000
  Message: listen() on TCP/IP failed with error %d
  ER_CONN_TCP_LISTEN_FAIL was added in 8.0.2.

- Error number: MY-010267; Symbol: ER_CONN_UNIX_PATH_TOO_LONG; SQLSTATE: HY000
  Message: The socket file path is too long (> %u): %s
  ER_CONN_UNIX_PATH_TOO_LONG was added in 8.0.2.

- Error number: MY-010268; Symbol: ER_CONN_UNIX_LOCK_FILE_FAIL; SQLSTATE: HY000
  Message: Unable to setup unix socket lock file.
  ER_CONN_UNIX_LOCK_FILE_FAIL was added in 8.0.2.

- Error number: MY-010269; Symbol: ER_CONN_UNIX_NO_FD; SQLSTATE: HY000
  Message: Can't start server: UNIX Socket : %s
  ER_CONN_UNIX_NO_FD was added in 8.0.2.

- Error number: MY-010270; Symbol: ER_CONN_UNIX_NO_BIND_NO_START; SQLSTATE: HY000
  Message: Can't start server: Bind on unix socket: %s
**ER_CONN_UNIX_NO_BIND_NO_START** was added in 8.0.2.

- Error number: **MY-010271**; Symbol: **ER_CONN_UNIX_LISTEN_FAILED**; SQLSTATE: **HY000**
  
  Message: listen() on Unix socket failed with error %d

  **ER_CONN_UNIX_LISTEN_FAILED** was added in 8.0.2.

- Error number: **MY-010272**; Symbol: **ER_CONN_UNIX_LOCK_FILE_GIVING_UP**; SQLSTATE: **HY000**
  
  Message: Unable to create unix socket lock file %s after retries.

  **ER_CONN_UNIX_LOCK_FILE_GIVING_UP** was added in 8.0.2.

- Error number: **MY-010273**; Symbol: **ER_CONN_UNIX_LOCK_FILE_CANT_CREATE**; SQLSTATE: **HY000**
  
  Message: Could not create unix socket lock file %s.

  **ER_CONN_UNIX_LOCK_FILE_CANT_CREATE** was added in 8.0.2.

- Error number: **MY-010274**; Symbol: **ER_CONN_UNIX_LOCK_FILE_CANT_OPEN**; SQLSTATE: **HY000**
  
  Message: Could not open unix socket lock file %s.

  **ER_CONN_UNIX_LOCK_FILE_CANT_OPEN** was added in 8.0.2.

- Error number: **MY-010275**; Symbol: **ER_CONN_UNIX_LOCK_FILE_CANT_READ**; SQLSTATE: **HY000**
  
  Message: Could not read unix socket lock file %s.

  **ER_CONN_UNIX_LOCK_FILE_CANT_READ** was added in 8.0.2.

- Error number: **MY-010276**; Symbol: **ER_CONN_UNIX_LOCK_FILE_EMPTY**; SQLSTATE: **HY000**
  
  Message: Unix socket lock file is empty %s.

  **ER_CONN_UNIX_LOCK_FILE_EMPTY** was added in 8.0.2.

- Error number: **MY-010277**; Symbol: **ER_CONN_UNIX_LOCK_FILE_PIDLESS**; SQLSTATE: **HY000**
  
  Message: Invalid pid in unix socket lock file %s.

  **ER_CONN_UNIX_LOCK_FILE_PIDLESS** was added in 8.0.2.

- Error number: **MY-010278**; Symbol: **ER_CONN_UNIX_LOCK_FILE_CANT_WRITE**; SQLSTATE: **HY000**
  
  Message: Could not write unix socket lock file %s errno %d.

  **ER_CONN_UNIX_LOCK_FILE_CANT_WRITE** was added in 8.0.2.

- Error number: **MY-010279**; Symbol: **ER_CONN_UNIX_LOCK_FILE_CANT_DELETE**; SQLSTATE: **HY000**
  
  Message: Could not remove unix socket lock file %s errno %d.

  **ER_CONN_UNIX_LOCK_FILE_CANT_DELETE** was added in 8.0.2.

- Error number: **MY-010280**; Symbol: **ER_CONN_UNIX_LOCK_FILE_CANT_SYNC**; SQLSTATE: **HY000**
Server Error Message Reference

Message: Could not sync unix socket lock file %s errno %d.

**ER_CONN_UNIX_LOCK_FILE_CANT_SYNC** was added in 8.0.2.

Message: RSA key files not found. Some authentication plugins will not work.

**ER_AUTH_RSA_FILES_NOT_FOUND** was added in 8.0.2.

- Error number: **MY-010288**; Symbol: **ER_CONN_ATTR_TRUNCATED**; SQLSTATE: **HY000**
  
Message: Connection attributes of length %lu were truncated (%d bytes lost) for connection %llu, user %s@%s (as %s), auth: %s

**ER_CONN_ATTR_TRUNCATED** was added in 8.0.2.

- Error number: **MY-010289**; Symbol: **ER_X509_CIPHERS_MISMATCH**; SQLSTATE: **HY000**
  
Message: X.509 ciphers mismatch: should be '%s' but is '%s'

**ER_X509_CIPHERS_MISMATCH** was added in 8.0.2.
• Error number: MY-010290; Symbol: ER_X509_ISSUER_MISMATCH; SQLSTATE: HY000
  Message: X.509 issuer mismatch: should be '%s' but is '%s'
  `ER_X509_ISSUER_MISMATCH` was added in 8.0.2.

• Error number: MY-010291; Symbol: ER_X509_SUBJECT_MISMATCH; SQLSTATE: HY000
  Message: X.509 subject mismatch: should be '%s' but is '%s'
  `ER_X509_SUBJECT_MISMATCH` was added in 8.0.2.

• Error number: MY-010292; Symbol: ER_AUTH_CANT_ACTIVATE_ROLE; SQLSTATE: HY000
  Message: Failed to activate default role %s for %s
  `ER_AUTH_CANT_ACTIVATE_ROLE` was added in 8.0.2.

• Error number: MY-010293; Symbol: ER_X509_NEEDS_RSA_PRIVKEY; SQLSTATE: HY000
  Message: Could not generate RSA private key required for X.509 certificate.
  `ER_X509_NEEDS_RSA_PRIVKEY` was added in 8.0.2.

• Error number: MY-010294; Symbol: ER_X509_CANT_WRITE_KEY; SQLSTATE: HY000
  Message: Could not write key file: %s
  `ER_X509_CANT_WRITE_KEY` was added in 8.0.2.

• Error number: MY-010295; Symbol: ER_X509_CANT_CHMOD_KEY; SQLSTATE: HY000
  Message: Could not set file permission for %s
  `ER_X509_CANT_CHMOD_KEY` was added in 8.0.2.

• Error number: MY-010296; Symbol: ER_X509_CANT_READ_CA_KEY; SQLSTATE: HY000
  Message: Could not read CA key file: %s
  `ER_X509_CANT_READ_CA_KEY` was added in 8.0.2.

• Error number: MY-010297; Symbol: ER_X509_CANT_READ_CA_CERT; SQLSTATE: HY000
  Message: Could not read CA certificate file: %s
  `ER_X509_CANT_READ_CA_CERT` was added in 8.0.2.

• Error number: MY-010298; Symbol: ER_X509_CANT_CREATE_CERT; SQLSTATE: HY000
  Message: Could not generate X.509 certificate.
  `ER_X509_CANT_CREATE_CERT` was added in 8.0.2.

• Error number: MY-010299; Symbol: ER_X509_CANT_WRITE_CERT; SQLSTATE: HY000
  Message: Could not write certificate file: %s
  `ER_X509_CANT_WRITE_CERT` was added in 8.0.2.
• Error number: MY-010300; Symbol: ER_AUTH_CANT_CREATE_RSA_PAIR; SQLSTATE: HY000

Message: Could not generate RSA Private/Public key pair

ER_AUTH_CANT_CREATE_RSA_PAIR was added in 8.0.2.

• Error number: MY-010301; Symbol: ER_AUTH_CANT_WRITE_PRIVKEY; SQLSTATE: HY000

Message: Could not write private key file: %s

ER_AUTH_CANT_WRITE_PRIVKEY was added in 8.0.2.

• Error number: MY-010302; Symbol: ER_AUTH_CANT_WRITE_PUBKEY; SQLSTATE: HY000

Message: Could not write public key file: %s

ER_AUTH_CANT_WRITE_PUBKEY was added in 8.0.2.

• Error number: MY-010303; Symbol: ER_AUTH_SSL_CONF_PREVENTS_CERT_GENERATION; SQLSTATE: HY000

Message: Skipping generation of SSL certificates as options related to SSL are specified.

ER_AUTH_SSL_CONF_PREVENTS_CERT_GENERATION was added in 8.0.2.

• Error number: MY-010304; Symbol: ER_AUTH_USING_EXISTING_CERTS; SQLSTATE: HY000

Message: Skipping generation of SSL certificates as certificate files are present in data directory.

ER_AUTH_USING_EXISTING_CERTS was added in 8.0.2.

• Error number: MY-010305; Symbol: ER_AUTH_CERTS_SAVED_TO_DATADIR; SQLSTATE: HY000

Message: Auto generated SSL certificates are placed in data directory.

ER_AUTH_CERTS_SAVED_TO_DATADIR was added in 8.0.2.

• Error number: MY-010306; Symbol: ER_AUTH_CERT_GENERATION_DISABLED; SQLSTATE: HY000

Message: Skipping generation of SSL certificates as --auto_generate_certs is set to OFF.

ER_AUTH_CERT_GENERATION_DISABLED was added in 8.0.2.

• Error number: MY-010307; Symbol: ER_AUTH_RSA_CONF_PREVENTS_KEY_GENERATION; SQLSTATE: HY000

Message: Skipping generation of RSA key pair through %s as options related to RSA keys are specified.

ER_AUTH_RSA_CONF_PREVENTS_KEY_GENERATION was added in 8.0.2.

• Error number: MY-010308; Symbol: ER_AUTH_KEY_GENERATION_SKIPPED_PAIR_PRESENT; SQLSTATE: HY000

Message: Skipping generation of RSA key pair through %s as key files are present in data directory.

ER_AUTH_KEY_GENERATION_SKIPPED_PAIR_PRESENT was added in 8.0.2.

• Error number: MY-010309; Symbol: ER_AUTH_KEYS_SAVED_TO_DATADIR; SQLSTATE: HY000

Message: Auto generated RSA key files through %s are placed in data directory.
**ER_AUTH_KEYS_SAVED_TO_DATADIR** was added in 8.0.2.

- Error number: **MY-010310**; Symbol: **ER_AUTH_KEY_GENERATION_DISABLED**; SQLSTATE: **HY000**
  
  Message: Skipping generation of RSA key pair as %s is set to OFF.

**ER_AUTH_KEY_GENERATION_DISABLED** was added in 8.0.2.

- Error number: **MY-010311**; Symbol: **ER_AUTHCACHE_PROXIES_PRIV_SKIPPED_NEEDS_RESOLVE**; SQLSTATE: **HY000**
  
  Message: 'proxies_priv' entry '%s@%s %s@%s' ignored in --skip-name-resolve mode.

**ER_AUTHCACHE_PROXIES_PRIV_SKIPPED_NEEDS_RESOLVE** was added in 8.0.2.

- Error number: **MY-010312**; Symbol: **ER_AUTHCACHE_PLUGIN_MISSING**; SQLSTATE: **HY000**
  
  Message: The plugin '%.*s' used to authenticate user '%s'@'%.*s' is not loaded. Nobody can currently login using this account.

**ER_AUTHCACHE_PLUGIN_MISSING** was added in 8.0.2.

- Error number: **MY-010313**; Symbol: **ER_AUTHCACHE_PLUGIN_CONFIG**; SQLSTATE: **HY000**
  
  Message: The plugin '%s' is used to authenticate user '%s'@'%.*s', %s configured. Nobody can currently login using this account.

**ER_AUTHCACHE_PLUGIN_CONFIG** was added in 8.0.2.

- Error number: **MY-010314**; Symbol: **ER_AUTHCACHE_ROLE_TABLES_DODGY**; SQLSTATE: **HY000**
  
  Message: Could not load mysql.role_edges and mysql.default_roles tables. ACL DDLs will not work unless mysql_upgrade is executed.

**ER_AUTHCACHE_ROLE_TABLES_DODGY** was added in 8.0.2, removed after 8.0.4.

- Error number: **MY-010315**; Symbol: **ER_AUTHCACHE_USER_SKIPPED_NEEDS_RESOLVE**; SQLSTATE: **HY000**
  
  Message: 'user' entry '%s@%s' ignored in --skip-name-resolve mode.

**ER_AUTHCACHE_USER_SKIPPED_NEEDS_RESOLVE** was added in 8.0.2.

- Error number: **MY-010316**; Symbol: **ER_AUTHCACHE_USER_TABLE_DODGY**; SQLSTATE: **HY000**
  
  Message: Fatal error: Could not read the column 'authentication_string' from table 'mysql.user'. Please perform the MySQL upgrade procedure.

**ER_AUTHCACHE_USER_TABLE_DODGY** was added in 8.0.2.

- Error number: **MY-010317**; Symbol: **ER_AUTHCACHE_USER_IGNORED_DEPRECATED_PASSWORD**; SQLSTATE: **HY000**
  
  Message: User entry '%s'@'%s' has a deprecated pre-4.1 password. The user will be ignored and no one can login with this user anymore.

**ER_AUTHCACHE_USER_IGNORED_DEPRECATED_PASSWORD** was added in 8.0.2.
Server Error Message Reference

- **Error number:** MY-010318; Symbol: ER_AUTHCACHE_USER_IGNORED_NEEDS_PLUGIN; SQLSTATE: HY000
  
  Message: User entry '%s'@'%s' has an empty plugin value. The user will be ignored and no one can login with this user anymore.
  
  ER_AUTHCACHE_USER_IGNORED_NEEDS_PLUGIN was added in 8.0.2.

- **Error number:** MY-010319; Symbol: ER_AUTHCACHE_USER_IGNORED_INVALID_PASSWORD; SQLSTATE: HY000
  
  Message: Found invalid password for user: '%s'@'%s'; Ignoring user
  
  ER_AUTHCACHE_USER_IGNORED_INVALID_PASSWORD was added in 8.0.2.

- **Error number:** MY-010320; Symbol: ER_AUTHCACHE_EXPIRED_PASSWORD_UNSUPPORTED; SQLSTATE: HY000
  
  Message: 'user' entry '%s'@'%s' has the password ignore flag raised, but its authentication plugin doesn't support password expiration. The user id will be ignored.
  
  ER_AUTHCACHE_EXPIRED_PASSWORD_UNSUPPORTED was added in 8.0.2.

- **Error number:** MY-010321; Symbol: ER_NO_SUPER_WITHOUT_USER_PLUGIN; SQLSTATE: HY000
  
  Message: Some of the user accounts with SUPER privileges were disabled because of empty mysql.user.plugin value. If you are upgrading from MySQL 5.6 to MySQL 5.7 it means that substitution for the empty plugin column was not possible. Probably because of pre 4.1 password hash. If your account is disabled you will need to perform the MySQL upgrade procedure. For complete instructions on how to upgrade MySQL to a new version please see the ‘Upgrading MySQL’ section from the MySQL manual.
  
  ER_NO_SUPER_WITHOUT_USER_PLUGIN was added in 8.0.2.

- **Error number:** MY-010322; Symbol: ER_AUTHCACHE_DB_IGNORED_EMPTY_NAME; SQLSTATE: HY000
  
  Message: Found an entry in the 'db' table with empty database name; Skipped
  
  ER_AUTHCACHE_DB_IGNORED_EMPTY_NAME was added in 8.0.2.

- **Error number:** MY-010323; Symbol: ER_AUTHCACHE_DB_SKIPPED_NEEDS_RESOLVE; SQLSTATE: HY000
  
  Message: 'db' entry '%s'@'%s' ignored in --skip-name-resolve mode.
  
  ER_AUTHCACHE_DB_SKIPPED_NEEDS_RESOLVE was added in 8.0.2.

- **Error number:** MY-010324; Symbol: ER_AUTHCACHE_DB_ENTRY_LOWERCASED_REVOKE_WILL_FAIL; SQLSTATE: HY000
  
  Message: 'db' entry '%s'@'%s' had database in mixed case that has been forced to lowercase because lower_case_table_names is set. It will not be possible to remove this privilege using REVOKE.
  
  ER_AUTHCACHE_DB_ENTRY_LOWERCASED_REVOKE_WILL_FAIL was added in 8.0.2.

- **Error number:** MY-010325; Symbol: ER_AUTHCACHE_TABLE_PROXIES_PRIV_MISSING; SQLSTATE: HY000
Message: The system table mysql.proxies_priv is missing. Please perform the MySQL upgrade procedure.

**ER_AUTHCACHE_TABLE_PROXIES_PRIV_MISSING** was added in 8.0.2.

- Error number: **MY-010326**; Symbol: **ER_AUTHCACHE_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES**; SQLSTATE: **HY000**
  
Message: Fatal error: Can't open and lock privilege tables: %s

**ER_AUTHCACHE_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES** was added in 8.0.2.

- Error number: **MY-010327**; Symbol: **ER_AUTHCACHE_CANT_INIT_GRANT_SUBSYSTEM**; SQLSTATE: **HY000**
  
Message: Fatal: can't initialize grant subsystem - '%s'

**ER_AUTHCACHE_CANT_INIT_GRANT_SUBSYSTEM** was added in 8.0.2.

- Error number: **MY-010328**; Symbol: **ER_AUTHCACHE_PROCS_PRIV_SKIPPED_NEEDS_RESOLVE**; SQLSTATE: **HY000**
  
Message: 'procs_priv' entry '%s %s@%s' ignored in --skip-name-resolve mode.

**ER_AUTHCACHE_PROCS_PRIV_SKIPPED_NEEDS_RESOLVE** was added in 8.0.2.

- Error number: **MY-010329**; Symbol: **ER_AUTHCACHE_PROCS_PRIV_ENTRY_IGNORED_BAD_ROUTINE_TYPE**; SQLSTATE: **HY000**
  
Message: 'procs_priv' entry '%s' ignored, bad routine type

**ER_AUTHCACHE_PROCS_PRIV_ENTRY_IGNORED_BAD_ROUTINE_TYPE** was added in 8.0.2.

- Error number: **MY-010330**; Symbol: **ER_AUTHCACHE_TABLES_PRIV_SKIPPED_NEEDS_RESOLVE**; SQLSTATE: **HY000**
  
Message: 'tables_priv' entry '%s %s@%s' ignored in --skip-name-resolve mode.

**ER_AUTHCACHE_TABLES_PRIV_SKIPPED_NEEDS_RESOLVE** was added in 8.0.2.

- Error number: **MY-010331**; Symbol: **ER_USER_NOT_IN_EXTRA_USERS_BINLOG_POSSIBLY_INCOMPLETE**; SQLSTATE: **HY000**
  
Message: Failed to add %s in extra_users. Binary log entry may miss some of the users.

**ER_USER_NOT_IN_EXTRA_USERS_BINLOG_POSSIBLY_INCOMPLETE** was added in 8.0.2.

- Error number: **MY-010332**; Symbol: **ER_DD_SCHEMA_NOT_FOUND**; SQLSTATE: **HY000**
  
Message: Unable to start server. The data dictionary schema '%s' does not exist.

**ER_DD_SCHEMA_NOT_FOUND** was added in 8.0.2.

- Error number: **MY-010333**; Symbol: **ER_DD_TABLE_NOT_FOUND**; SQLSTATE: **HY000**
  
Message: Unable to start server. The data dictionary table '%s' does not exist.

**ER_DD_TABLE_NOT_FOUND** was added in 8.0.2.
• Error number: MY-010334; Symbol: ER_DD_SE_INIT_FAILED; SQLSTATE: HY000
Message: Failed to initialize DD Storage Engine
ER_DD_SE_INIT_FAILED was added in 8.0.2.

• Error number: MY-010335; Symbol: ER_DD_ABORTING_PARTIAL_UPGRADE; SQLSTATE: HY000
Message: Found partially upgraded DD. Aborting upgrade and deleting all DD tables. Start the upgrade process again.
ER_DD_ABORTING_PARTIAL_UPGRADE was added in 8.0.2.

• Error number: MY-010336; Symbol: ER_DD_FRM_EXISTS_FOR_TABLE; SQLSTATE: HY000
Message: Found .frm file with same name as one of the Dictionary Tables.
ER_DD_FRM_EXISTS_FOR_TABLE was added in 8.0.2.

• Error number: MY-010337; Symbol: ER_DD_CREATED_FOR_UPGRADE; SQLSTATE: HY000
Message: Created Data Dictionary for upgrade
ER_DD_CREATED_FOR_UPGRADE was added in 8.0.2.

• Error number: MY-010338; Symbol: ER_ERRMSG_CANT_FIND_FILE; SQLSTATE: HY000
Message: Can't find error-message file '%s'. Check error-message file location and 'lc-messages-dir' configuration directive.
ER_ERRMSG_CANT_FIND_FILE was added in 8.0.2.

• Error number: MY-010339; Symbol: ER_ERRMSG_LOADING_55_STYLE; SQLSTATE: HY000
Message: Using pre 5.5 semantics to load error messages from '%s'. If this is not intended, refer to the documentation for valid usage of --lc-messages-dir and --language parameters.
ER_ERRMSG_LOADING_55_STYLE was added in 8.0.2.

• Error number: MY-010340; Symbol: ER_ERRMSG_MISSING_IN_FILE; SQLSTATE: HY000
Message: Error message file '%s' had only %d error messages, but it should contain at least %d error messages. Check that the above file is the right version for this program.
ER_ERRMSG_MISSING_IN_FILE was added in 8.0.2.

• Error number: MY-010341; Symbol: ER_ERRMSG_OOM; SQLSTATE: HY000
Message: Not enough memory for messagefile '%s'
ER_ERRMSG_OOM was added in 8.0.2.

• Error number: MY-010342; Symbol: ER_ERRMSG_CANT_READ; SQLSTATE: HY000
Message: Can't read from messagefile '%s'
ER_ERRMSG_CANT_READ was added in 8.0.2.

• Error number: MY-010343; Symbol: ER_TABLE_INCOMPATIBLE_DECIMAL_FIELD; SQLSTATE: HY000
Message: Found incompatible DECIMAL field '%s' in %s; Please do "ALTER TABLE `%s` FORCE" to fix it!

`ER_TABLE_INCOMPATIBLE_DECIMAL_FIELD` was added in 8.0.2.

- Error number: MY-010344; Symbol: `ER_TABLE_INCOMPATIBLE_DECIMAL_FIELD`; SQLSTATE: HY000

Message: Found incompatible YEAR(x) field '%s' in %s; Please do "ALTER TABLE `%s` FORCE" to fix it!

`ER_TABLE_INCOMPATIBLE_YEAR_FIELD` was added in 8.0.2.

- Error number: MY-010345; Symbol: `ER_INCOMPATIBLE_YEAR_FIELD`; SQLSTATE: HY000

Message: '%s' had no or invalid character set, and default character set is multi-byte, so character column sizes may have changed

`ER_INVALID_CHARSET_AND_DEFAULT_IS_MB` was added in 8.0.2.

- Error number: MY-010346; Symbol: `ER_TABLE_WRONG_KEY_DEFINITION`; SQLSTATE: HY000

Message: Found wrong key definition in %s; Please do "ALTER TABLE `%s` FORCE" to fix it!

`ER_TABLE_WRONG_KEY_DEFINITION` was added in 8.0.2.

- Error number: MY-010347; Symbol: `ER_CANT_OPEN_FRM_FILE`; SQLSTATE: HY000

Message: Unable to open file %s

`ER_CANT_OPEN_FRM_FILE` was added in 8.0.2.

- Error number: MY-010348; Symbol: `ER_CANT_READ_FRM_FILE`; SQLSTATE: HY000

Message: Error in reading file %s

`ER_CANT_READ_FRM_FILE` was added in 8.0.2.

- Error number: MY-010349; Symbol: `ER_TABLE_CREATED_WITH_DIFFERENT_VERSION`; SQLSTATE: HY000

Message: Table '%s' was created with a different version of MySQL and cannot be read

`ER_TABLE_CREATED_WITH_DIFFERENT_VERSION` was added in 8.0.2.

- Error number: MY-010350; Symbol: `ER_VIEW_UNPARSABLE`; SQLSTATE: HY000

Message: Unable to read view %s

`ER_VIEW_UNPARSABLE` was added in 8.0.2.

- Error number: MY-010351; Symbol: `ER_FILE_TYPE_UNKNOWN`; SQLSTATE: HY000

Message: File %s has unknown type in its header.

`ER_FILE_TYPE_UNKNOWN` was added in 8.0.2.

- Error number: MY-010352; Symbol: `ER_INVALID_INFO_IN_FRM`; SQLSTATE: HY000
Message: Incorrect information in file %s

ER_INVALID_INFO_IN_FRM was added in 8.0.2.

- Error number: MY-010353; Symbol: ER_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES; SQLSTATE: HY000

Message: Can't open and lock privilege tables: %s

ER_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES was added in 8.0.2.

- Error number: MY-010354; Symbol: ER_AUDIT_PLUGIN_DOES_NOT_SUPPORT_AUDIT_AUTH_EVENTS; SQLSTATE: HY000

Message: Plugin '%s' cannot subscribe to MYSQL_AUDIT_AUTHORIZATION events. Currently not supported.

ER_AUDIT_PLUGIN_DOES_NOT_SUPPORT_AUDIT_AUTH_EVENTS was added in 8.0.2.

- Error number: MY-010355; Symbol: ER_AUDIT_PLUGIN_HAS_INVALID_DATA; SQLSTATE: HY000

Message: Plugin '%s' has invalid data.

ER_AUDIT_PLUGIN_HAS_INVALID_DATA was added in 8.0.2.

- Error number: MY-010356; Symbol: ER_TZ_OOM_INITIALIZING_TIME_ZONES; SQLSTATE: HY000

Message: Fatal error: OOM while initializing time zones

ER_TZ_OOM_INITIALIZING_TIME_ZONES was added in 8.0.2.

- Error number: MY-010357; Symbol: ER_TZ_CANT_OPEN_AND_LOCK_TIME_ZONE_TABLE; SQLSTATE: HY000

Message: Can't open and lock time zone table: %s trying to live without them

ER_TZ_CANT_OPEN_AND_LOCK_TIME_ZONE_TABLE was added in 8.0.2.

- Error number: MY-010358; Symbol: ER_TZ_OOM_LOADING_LEAP_SECOND_TABLE; SQLSTATE: HY000

Message: Fatal error: Out of memory while loading mysql.time_zone_leap_second table

ER_TZ_OOM_LOADING_LEAP_SECOND_TABLE was added in 8.0.2.

- Error number: MY-010359; Symbol: ER_TZ_TOO_MANY_LEAPS_IN_LEAP_SECOND_TABLE; SQLSTATE: HY000

Message: Fatal error: While loading mysql.time_zone_leap_second table: too much leaps

ER_TZ_TOO_MANY_LEAPS_IN_LEAP_SECOND_TABLE was added in 8.0.2.

- Error number: MY-010360; Symbol: ER_TZ_ERROR_LOADING_LEAP_SECOND_TABLE; SQLSTATE: HY000

Message: Fatal error: Error while loading mysql.time_zone_leap_second table

ER_TZ_ERROR_LOADING_LEAP_SECOND_TABLE was added in 8.0.2.
- Error number: MY-010361; Symbol: ER_TZ_UNKNOWN_OR_ILLEGAL_DEFAULT_TIME_ZONE; SQLSTATE: HY000
  Message: Fatal error: Illegal or unknown default time zone '%s'
  ER_TZ_UNKNOWN_OR_ILLEGAL_DEFAULT_TIME_ZONE was added in 8.0.2.

- Error number: MY-010362; Symbol: ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE; SQLSTATE: HY000
  Message: Can't find description of time zone '%.*s'
  ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE was added in 8.0.2.

- Error number: MY-010363; Symbol: ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE_ID; SQLSTATE: HY000
  Message: Can't find description of time zone '%u'
  ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE_ID was added in 8.0.2.

- Error number: MY-010364; Symbol: ER_TZ_TRANSITION_TYPE_TABLE_TYPE_TOO_LARGE; SQLSTATE: HY000
  Message: Error while loading time zone description from mysql.time_zone_transition_type table: too big transition type id
  ER_TZ_TRANSITION_TYPE_TABLE_TYPE_TOO_LARGE was added in 8.0.2.

- Error number: MY-010365; Symbol: ER_TZ_TRANSITION_TYPE_TABLE_ABBREVIATIONS_EXCEED_SPACE; SQLSTATE: HY000
  Message: Error while loading time zone description from mysql.time_zone_transition_type table: not enough room for abbreviations
  ER_TZ_TRANSITION_TYPE_TABLE_ABBREVIATIONS_EXCEED_SPACE was added in 8.0.2.

- Error number: MY-010366; Symbol: ER_TZ_TRANSITION_TYPE_TABLE_LOAD_ERROR; SQLSTATE: HY000
  Message: Error while loading time zone description from mysql.time_zone_transition_type table
  ER_TZ_TRANSITION_TYPE_TABLE_LOAD_ERROR was added in 8.0.2.

- Error number: MY-010367; Symbol: ER_TZ_TRANSITION_TABLE_TOO_MANY_TRANSITIONS; SQLSTATE: HY000
  Message: Error while loading time zone description from mysql.time_zone_transition table: too much transitions
  ER_TZ_TRANSITION_TABLE_TOO_MANY_TRANSITIONS was added in 8.0.2.

- Error number: MY-010368; Symbol: ER_TZ_TRANSITION_TABLE_BAD_TRANSITION_TYPE; SQLSTATE: HY000
  Message: Error while loading time zone description from mysql.time_zone_transition table: bad transition type id
  ER_TZ_TRANSITION_TABLE_BAD_TRANSITION_TYPE was added in 8.0.2.
• Error number: MY-010369; Symbol: ER_TZ_TRANSITION_TABLE_LOAD_ERROR; SQLSTATE: HY000
Message: Error while loading time zone description from mysql.time_zone_transition table

ER_TZ_TRANSITION_TABLE_LOAD_ERROR was added in 8.0.2.

• Error number: MY-010370; Symbol: ER_TZ_NO_TRANSITION_TYPES_IN_TIME_ZONE; SQLSTATE: HY000
Message: loading time zone without transition types

ER_TZ_NO_TRANSITION_TYPES_IN_TIME_ZONE was added in 8.0.2.

• Error number: MY-010371; Symbol: ER_TZ_OOM_LOADING_TIME_ZONE_DESCRIPTION; SQLSTATE: HY000
Message: Out of memory while loading time zone description

ER_TZ_OOM_LOADING_TIME_ZONE_DESCRIPTION was added in 8.0.2.

• Error number: MY-010372; Symbol: ER_TZ_CANT_BUILD_MKTIME_MAP; SQLSTATE: HY000
Message: Unable to build mktime map for time zone

ER_TZ_CANT_BUILD_MKTIME_MAP was added in 8.0.2.

• Error number: MY-010373; Symbol: ER_TZ_OOM WHILE LOADING TIME_ZONE; SQLSTATE: HY000
Message: Out of memory while loading time zone

ER_TZ_OOM WHILE LOADING TIME_ZONE was added in 8.0.2.

• Error number: MY-010374; Symbol: ER_TZ_OOM WHILE SETTING TIME_ZONE; SQLSTATE: HY000
Message: Fatal error: Out of memory while setting new time zone

ER_TZ_OOM WHILE SETTING TIME_ZONE was added in 8.0.2.

• Error number: MY-010375; Symbol: ER_SLAVE_SQL_THREAD_STOPPED UNTIL CONDITION BAD; SQLSTATE: HY000
Message: Slave SQL thread is stopped because UNTIL condition is bad(%s:%llu).

ER_SLAVE_SQL_THREAD_STOPPED UNTIL CONDITION BAD was added in 8.0.2.

• Error number: MY-010376; Symbol: ER_SLAVE_SQL_THREAD_STOPPED UNTIL POSITION REACHED; SQLSTATE: HY000
Message: Slave SQL thread stopped because it reached its UNTIL position %llu

ER_SLAVE_SQL_THREAD_STOPPED UNTIL POSITION REACHED was added in 8.0.2.

• Error number: MY-010377; Symbol: ER_SLAVE_SQL_THREAD_STOPPED BEFORE GTIDS Already Applied; SQLSTATE: HY000
Message: Slave SQL thread stopped because UNTIL SQL BEFORE GTIDS %s is already applied

ER_SLAVE_SQL_THREAD_STOPPED BEFORE GTIDS Already Applied was added in 8.0.2.
• Error number: MY-010378; Symbol: ER_SLAVE_SQL_THREAD_STOPPED_BEFORE_GTIDS_REACHED; SQLSTATE: HY000
  Message: Slave SQL thread stopped because it reached UNTIL SQL_BEFORE_GTIDS %s
  ER_SLAVE_SQL_THREAD_STOPPED_BEFORE_GTIDS_REACHED was added in 8.0.2.

• Error number: MY-010379; Symbol: ER_SLAVE_SQL_THREAD_STOPPED_AFTER_GTIDS_REACHED; SQLSTATE: HY000
  Message: Slave SQL thread stopped because it reached UNTIL SQL_AFTER_GTIDS %s
  ER_SLAVE_SQL_THREAD_STOPPED_AFTER_GTIDS_REACHED was added in 8.0.2.

• Error number: MY-010380; Symbol: ER_SLAVE_SQL_THREAD_STOPPED_GAP_TRX_PROCESSED; SQLSTATE: HY000
  Message: Slave SQL thread stopped according to UNTIL SQL_AFTER_MTS_GAPS as it has processed all gap transactions left from the previous slave session.
  ER_SLAVE_SQL_THREAD_STOPPED_GAP_TRX_PROCESSED was added in 8.0.2.

• Error number: MY-010381; Symbol: ER_GROUP_REPLICATION_PLUGIN_NOT_INSTALLED; SQLSTATE: HY000
  Message: Group Replication plugin is not installed.
  ER_GROUP_REPLICATION_PLUGIN_NOT_INSTALLED was added in 8.0.2.

• Error number: MY-010382; Symbol: ER_GTID_ALREADY_ADDED_BY_USER; SQLSTATE: HY000
  Message: The transaction owned GTID is already in the %s table, which is caused by an explicit modifying from user client.
  ER_GTID_ALREADY_ADDED_BY_USER was added in 8.0.2.

• Error number: MY-010383; Symbol: ER_FAILED_TO_DELETE_FROM_GTID_EXECUTED_TABLE; SQLSTATE: HY000
  Message: Failed to delete the row: '%s' from the gtid_executed table.
  ER_FAILED_TO_DELETE_FROM_GTID_EXECUTED_TABLE was added in 8.0.2.

• Error number: MY-010384; Symbol: ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE; SQLSTATE: HY000
  Message: Failed to compress the gtid_executed table.
  ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE was added in 8.0.2.

• Error number: MY-010385; Symbol: ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE_OOM; SQLSTATE: HY000
  Message: Failed to compress the gtid_executed table, because it is failed to allocate the THD.
  ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE_OOM was added in 8.0.2.

• Error number: MY-010386; Symbol: ER_FAILED_TO_INIT_THREAD_ATTR_FOR_GTID_TABLE_COMPRESSION; SQLSTATE: HY000
Message: Failed to initialize thread attribute when creating compression thread.

`ER_FAILED_TO_INIT_THREAD_ATTR_FOR_GTID_TABLE_COMPRESSION` was added in 8.0.2.

- Error number: `MY-010387`; Symbol: `ER_FAILED_TO_CREATE_GTID_TABLE_COMPRESSION_THREAD`; SQLSTATE: `HY000`

Message: Can not create thread to compress gtid_executed table (errno= %d)

`ER_FAILED_TO_CREATE_GTID_TABLE_COMPRESSION_THREAD` was added in 8.0.2.

- Error number: `MY-010388`; Symbol: `ER_FAILED_TO_JOIN_GTID_TABLE_COMPRESSION_THREAD`; SQLSTATE: `HY000`

Message: Could not join gtid_executed table compression thread. error:%d

`ER_FAILED_TO_JOIN_GTID_TABLE_COMPRESSION_THREAD` was added in 8.0.2.

- Error number: `MY-010389`; Symbol: `ER_NPIPE_FAILED_TO_INIT_SECURITY_DESCRIPTOR`; SQLSTATE: `HY000`

Message: Can't start server : Initialize security descriptor: %s

`ER_NPIPE_FAILED_TO_INIT_SECURITY_DESCRIPTOR` was added in 8.0.2.

- Error number: `MY-010390`; Symbol: `ER_NPIPE_FAILED_TO_SET_SECURITY_DESCRIPTOR`; SQLSTATE: `HY000`

Message: Can't start server : Set security descriptor: %s

`ER_NPIPE_FAILED_TO_SET_SECURITY_DESCRIPTOR` was added in 8.0.2.

- Error number: `MY-010391`; Symbol: `ER_NPIPE_PIPE_ALREADY_IN_USE`; SQLSTATE: `HY000`

Message: Can't start server : Named Pipe "%s" already in use.

`ER_NPIPE_PIPE_ALREADY_IN_USE` was added in 8.0.2.

- Error number: `MY-010392`; Symbol: `ER_NDB_SLAVE_SAW_EPOCH_LOWER_THAN_PREVIOUS_ON_START`; SQLSTATE: `HY000`

Message: NDB Slave : At SQL thread start applying epoch %llu/%llu (%llu) from Master ServerId %u which is lower than previously applied epoch %llu/%llu (%llu). Group Master Log : %s Group Master Log Pos : %llu. Check slave positioning.

`ER_NDB_SLAVE_SAW_EPOCH_LOWER_THAN_PREVIOUS_ON_START` was added in 8.0.2, removed after 8.0.13.

- Error number: `MY-010393`; Symbol: `ER_NDB_SLAVE_SAW_EPOCH_LOWER_THAN_PREVIOUS`; SQLSTATE: `HY000`

Message: NDB Slave : SQL thread stopped as applying epoch %llu/%llu (%llu) from Master ServerId %u which is lower than previously applied epoch %llu/%llu (%llu). Group Master Log : %s Group Master Log Pos : %llu

`ER_NDB_SLAVE_SAW_EPOCH_LOWER_THAN_PREVIOUS` was added in 8.0.2, removed after 8.0.13.
• Error number: **MY-010394**; Symbol: **ER_NDB_SLAVE_SAW_ALREADY_COMMITTED_EPOCH**; SQLSTATE: **HY000**

Message: NDB Slave: SQL thread stopped as attempted to reapply already committed epoch %llu/%llu (%llu) from server id %u. Group Master Log : %s Group Master Log Pos : %llu.

**ER_NDB_SLAVE_SAW_ALREADY_COMMITTED_EPOCH** was added in 8.0.2, removed after 8.0.13.

• Error number: **MY-010395**; Symbol: **ER_NDB_SLAVE_PREVIOUS_EPOCH_NOT_COMMITTED**; SQLSTATE: **HY000**

Message: NDB Slave: SQL thread stopped as attempting to apply new epoch %llu/%llu (%llu) while lower received epoch %llu/%llu (%llu) has not been committed. Master server id : %u. Group Master Log : %s Group Master Log Pos : %llu.

**ER_NDB_SLAVE_PREVIOUS_EPOCH_NOT_COMMITTED** was added in 8.0.2, removed after 8.0.13.

• Error number: **MY-010396**; Symbol: **ER_NDB_SLAVE_MISSING_DATA_FOR_TIMESTAMP_COLUMN**; SQLSTATE: **HY000**

Message: NDB Slave: missing data for %s timestamp column %u.

**ER_NDB_SLAVE_MISSING_DATA_FOR_TIMESTAMP_COLUMN** was added in 8.0.2, removed after 8.0.13.

• Error number: **MY-010397**; Symbol: **ER_NDB_SLAVE_LOGGING_EXCEPTIONS_TO**; SQLSTATE: **HY000**

Message: NDB Slave: Table %s.%s logging exceptions to %s.%s

**ER_NDB_SLAVE_LOGGING_EXCEPTIONS_TO** was added in 8.0.2, removed after 8.0.13.

• Error number: **MY-010398**; Symbol: **ER_NDB_SLAVE_LOW_EPOCH_RESOLUTION**; SQLSTATE: **HY000**

Message: NDB Slave: Table %s.%s : %s, low epoch resolution

**ER_NDB_SLAVE_LOW_EPOCH_RESOLUTION** was added in 8.0.2, removed after 8.0.13.

• Error number: **MY-010399**; Symbol: **ER_NDB_INFO_FOUND_UNEXPECTED_FIELD_TYPE**; SQLSTATE: **HY000**

Message: Found unexpected field type %u

**ER_NDB_INFO_FOUND_UNEXPECTED_FIELD_TYPE** was added in 8.0.2, removed after 8.0.13.

• Error number: **MY-010400**; Symbol: **ER_NDB_INFO_FAILED_TO_CREATE_NDBINFO**; SQLSTATE: **HY000**

Message: Failed to create NdbInfo

**ER_NDB_INFO_FAILED_TO_CREATE_NDBINFO** was added in 8.0.2, removed after 8.0.13.

• Error number: **MY-010401**; Symbol: **ER_NDB_INFO_FAILED_TO_INIT_NDBINFO**; SQLSTATE: **HY000**

Message: Failed to init NdbInfo

**ER_NDB_INFO_FAILED_TO_INIT_NDBINFO** was added in 8.0.2, removed after 8.0.13.
• Error number: MY-010402; Symbol: \texttt{ER\_NDB\_CLUSTER\_WRONG\_NUMBER\_OF\_FUNCTION\_ARGUMENTS}; SQLSTATE: HY000

Message: ndb\_serialize\_cond: Unexpected mismatch of found and expected number of function arguments %u

\texttt{ER\_NDB\_CLUSTER\_WRONG\_NUMBER\_OF\_FUNCTION\_ARGUMENTS} was added in 8.0.2, removed after 8.0.13.

• Error number: MY-010403; Symbol: \texttt{ER\_NDB\_CLUSTER\_SCHEMA\_INFO}; SQLSTATE: HY000

Message: %s - %s.%s

\texttt{ER\_NDB\_CLUSTER\_SCHEMA\_INFO} was added in 8.0.2, removed after 8.0.13.

• Error number: MY-010404; Symbol: \texttt{ER\_NDB\_CLUSTER\_GENERIC\_MESSAGE}; SQLSTATE: HY000

Message: %s

\texttt{ER\_NDB\_CLUSTER\_GENERIC\_MESSAGE} was added in 8.0.2, removed after 8.0.13.

• Error number: MY-010405; Symbol: \texttt{ER\_RPL\_CANT\_OPEN\_INFO\_TABLE}; SQLSTATE: HY000

Message: Info table is not ready to be used. Table '%s.%s' cannot be opened.

\texttt{ER\_RPL\_CANT\_OPEN\_INFO\_TABLE} was added in 8.0.2.

• Error number: MY-010406; Symbol: \texttt{ER\_RPL\_CANT\_SCAN\_INFO\_TABLE}; SQLSTATE: HY000

Message: Info table is not ready to be used. Table '%s.%s' cannot be scanned.

\texttt{ER\_RPL\_CANT\_SCAN\_INFO\_TABLE} was added in 8.0.2.

• Error number: MY-010407; Symbol: \texttt{ER\_RPL\_CORRUPTED\_INFO\_TABLE}; SQLSTATE: HY000

Message: Corrupted table %s.%s. Check out table definition.

\texttt{ER\_RPL\_CORRUPTED\_INFO\_TABLE} was added in 8.0.2.

• Error number: MY-010408; Symbol: \texttt{ER\_RPL\_CORRUPTED\_KEYS\_IN\_INFO\_TABLE}; SQLSTATE: HY000

Message: Info table has a problem with its key field(s). Table '%s.%s' expected field #\%u to be '%s' but found '%s' instead.

\texttt{ER\_RPL\_CORRUPTED\_KEYS\_IN\_INFO\_TABLE} was added in 8.0.2.

• Error number: MY-010409; Symbol: \texttt{ER\_RPL\_WORKER\_ID\_IS}; SQLSTATE: HY000

Message: Choosing worker id %lu, the following is going to be %lu

\texttt{ER\_RPL\_WORKER\_ID\_IS} was added in 8.0.2.

• Error number: MY-010410; Symbol: \texttt{ER\_RPL\_INCONSISTENT\_TIMESTAMPS\_IN\_TRX}; SQLSTATE: HY000

Message: Transaction is tagged with inconsistent logical timestamps: sequence_number (%lld) <= last_committed (%lld)
**Server Error Message Reference**

**ER_RPL_INCONSISTENT_TIMESTAMPS_IN_TRX** was added in 8.0.2.

- Error number: MY-010411; Symbol: **ER_RPL_INCONSISTENT_SEQUENCE_NO_IN_TRX**; SQLSTATE: HY000
  
  Message: Transaction's sequence number is inconsistent with that of a preceding one: 
  `sequence_number (%lld) <= previous sequence_number (%lld)`

**ER_RPL_INCONSISTENT_SEQUENCE_NO_IN_TRX** was added in 8.0.2.

- Error number: MY-010412; Symbol: **ER_RPL_CHANNELS_REQUIRE_TABLES_AS_INFO_REPOSITORIES**; SQLSTATE: HY000
  
  Message: For the creation of replication channels the master info and relay log info repositories must be set to TABLE

**ER_RPL_CHANNELS_REQUIRE_TABLES_AS_INFO_REPOSITORIES** was added in 8.0.2.

- Error number: MY-010413; Symbol: **ER_RPL_CHANNELS_REQUIRE_NON_ZERO_SERVER_ID**; SQLSTATE: HY000
  
  Message: For the creation of replication channels the server id must be different from 0

**ER_RPL_CHANNELS_REQUIRE_NON_ZERO_SERVER_ID** was added in 8.0.2.

- Error number: MY-010414; Symbol: **ER_RPL_REPO_SHOULD_BE_TABLE**; SQLSTATE: HY000
  
  Message: Slave: Wrong repository. Repository should be TABLE

**ER_RPL_REPO_SHOULD_BE_TABLE** was added in 8.0.2.

- Error number: MY-010415; Symbol: **ER_RPL_ERROR_CREATING_MASTER_INFO**; SQLSTATE: HY000
  
  Message: Error creating master info: %s.

**ER_RPL_ERROR_CREATING_MASTER_INFO** was added in 8.0.2.

- Error number: MY-010416; Symbol: **ER_RPL_ERROR_CHANGING_MASTER_INFO_REPO_TYPE**; SQLSTATE: HY000
  
  Message: Error changing the type of master info's repository: %s.

**ER_RPL_ERROR_CHANGING_MASTER_INFO_REPO_TYPE** was added in 8.0.2.

- Error number: MY-010417; Symbol: **ER_RPL_CHANGING_RELAY_LOG_INFO_REPO_TYPE_FAILED_DUE_TO_GAPS**; SQLSTATE: HY000
  
  Message: It is not possible to change the type of the relay log repository because there are workers repositories with possible execution gaps. The value of --relay_log_info_repository is altered to one of the found Worker repositories. The gaps have to be sorted out before resuming with the type change.

**ER_RPL_CHANGING_RELAY_LOG_INFO_REPO_TYPE_FAILED_DUE_TO_GAPS** was added in 8.0.2.

- Error number: MY-010418; Symbol: **ER_RPL_ERROR_CREATING_RELAY_LOG_INFO**; SQLSTATE: HY000
  
  Message: Error creating relay log info: %s.
ER_RPL_ERROR_CREATING_RELAY_LOG_INFO was added in 8.0.2.

- Error number: MY-010419; Symbol: ER_RPL_ERROR_CHANGING_RELAY_LOG_INFO_REPO_TYPE; SQLSTATE: HY000
  Message: Error changing the type of relay log info’s repository: %s.
  ER_RPL_ERROR_CHANGING_RELAY_LOG_INFO_REPO_TYPE was added in 8.0.2.

- Error number: MY-010420; Symbol: ER_RPL_FAILED_TO_DELETE_FROM_SLAVE_WORKERS_INFO_REPOSITORY; SQLSTATE: HY000
  Message: Could not delete from Slave Workers info repository.
  ER_RPL_FAILED_TO_DELETE_FROM_SLAVE_WORKERS_INFO_REPOSITORY was added in 8.0.2.

- Error number: MY-010421; Symbol: ER_RPL_FAILED_TO_RESET_STATE_IN_SLAVE_INFO_REPOSITORY; SQLSTATE: HY000
  Message: Could not store the reset Slave Worker state into the slave info repository.
  ER_RPL_FAILED_TO_RESET_STATE_IN_SLAVE_INFO_REPOSITORY was added in 8.0.2.

- Error number: MY-010422; Symbol: ER_RPL_ERROR_CHECKING_REPOSITORY; SQLSTATE: HY000
  Message: Error in checking %s repository info type of %s.
  ER_RPL_ERROR_CHECKING_REPOSITORY was added in 8.0.2.

- Error number: MY-010423; Symbol: ER_RPL_SLAVE_GENERIC_MESSAGE; SQLSTATE: HY000
  Message: Slave: %s
  ER_RPL_SLAVE_GENERIC_MESSAGE was added in 8.0.2.

- Error number: MY-010424; Symbol: ER_RPL_SLAVE_COULD_NOT_CREATE_CHANNEL_LIST; SQLSTATE: HY000
  Message: Slave: Could not create channel list
  ER_RPL_SLAVE_COULD_NOT_CREATE_CHANNEL_LIST was added in 8.0.2.

- Error number: MY-010425; Symbol: ER_RPL_MULTISOURCEQUIRES_TABLE_TYPE_REPOSITORIES; SQLSTATE: HY000
  Message: Slave: This slave was a multisourced slave previously which is supported only by both TABLE based master info and relay log info repositories. Found one or both of the info repos to be type FILE. Set both repos to type TABLE.
  ER_RPL_MULTISOURCEQUIRES_TABLE_TYPE_REPOSITORIES was added in 8.0.2.

- Error number: MY-010426; Symbol: ER_RPL_SLAVE_FAILED_TO_INIT_A_MASTER_INFO_STRUCTURE; SQLSTATE: HY000
  Message: Slave: Failed to initialize the master info structure for channel '%s'; its record may still be present in 'mysql.slave_master_info' table, consider deleting it.
  ER_RPL_SLAVE_FAILED_TO_INIT_A_MASTER_INFO_STRUCTURE was added in 8.0.2.
• Error number: MY-010427; Symbol: ER_RPL_SLAVE_FAILED_TO_INIT_MASTER_INFO_STRUCTURE; SQLSTATE: HY000
  Message: Failed to initialize the master info structure%s
  ER_RPL_SLAVE_FAILED_TO_INIT_MASTER_INFO_STRUCTURE was added in 8.0.2.

• Error number: MY-010428; Symbol: ER_RPL_SLAVE_FAILED_TO_CREATE_CHANNEL_FROM_MASTER_INFO; SQLSTATE: HY000
  Message: Slave: Failed to create a channel from master info table repository.
  ER_RPL_SLAVE_FAILED_TO_CREATE_CHANNEL_FROM_MASTER_INFO was added in 8.0.2.

• Error number: MY-010429; Symbol: ER_RPL_FAILED_TO_CREATE_NEW_INFO_FILE; SQLSTATE: HY000
  Message: Failed to create a new info file (file '%%s', errno %d)
  ER_RPL_FAILED_TO_CREATE_NEW_INFO_FILE was added in 8.0.2.

• Error number: MY-010430; Symbol: ER_RPL_FAILED_TO_CREATE_CACHE_FOR_INFO_FILE; SQLSTATE: HY000
  Message: Failed to create a cache on info file (file '%%s')
  ER_RPL_FAILED_TO_CREATE_CACHE_FOR_INFO_FILE was added in 8.0.2.

• Error number: MY-010431; Symbol: ER_RPL_FAILED_TO_OPEN_INFO_FILE; SQLSTATE: HY000
  Message: Failed to open the existing info file (file '%%s', errno %d)
  ER_RPL_FAILED_TO_OPEN_INFO_FILE was added in 8.0.2.

• Error number: MY-010432; Symbol: ER_RPL_GTID_MEMORY_FINALLY_AVAILABLE; SQLSTATE: HY000
  Message: Server overcomes the temporary 'out of memory' in '%d' tries while allocating a new chunk of intervals for storing GTIDs.
  ER_RPL_GTID_MEMORY_FINALLY_AVAILABLE was added in 8.0.2.

• Error number: MY-010433; Symbol: ER_SERVER_COST_UNKNOWN_COST_CONSTANT; SQLSTATE: HY000
  Message: Unknown cost constant "%%s" in mysql.server_cost table
  ER_SERVER_COST_UNKNOWN_COST_CONSTANT was added in 8.0.2.

• Error number: MY-010434; Symbol: ER_SERVER_COST_INVALID_COST_CONSTANT; SQLSTATE: HY000
  Message: Invalid value for cost constant "%%s" in mysql.server_cost table: %.1f
  ER_SERVER_COST_INVALID_COST_CONSTANT was added in 8.0.2.

• Error number: MY-010435; Symbol: ER_ENGINE_COST_UNKNOWN_COST_CONSTANT; SQLSTATE: HY000
Message: Unknown cost constant "%s" in mysql.engine_cost table

ER_ENGINE_COST_UNKNOWN_COST_CONSTANT was added in 8.0.2.

- Error number: MY-010436; Symbol: ER_ENGINE_COST_UNKNOWN_STORAGE_ENGINE; SQLSTATE: HY000

Message: Unknown storage engine "%s" in mysql.engine_cost table

ER_ENGINE_COST_UNKNOWN_STORAGE_ENGINE was added in 8.0.2.

- Error number: MY-010437; Symbol: ER_ENGINE_COST_INVALID_DEVICE_TYPE_FOR_SE; SQLSTATE: HY000

Message: Invalid device type %d for "%s" storage engine for cost constant "%s" in mysql.engine_cost table

ER_ENGINE_COST_INVALID_DEVICE_TYPE_FOR_SE was added in 8.0.2.

- Error number: MY-010438; Symbol: ER_ENGINE_COST_INVALID_CONST_CONSTANT_FOR_SE_AND_DEVICE; SQLSTATE: HY000

Message: Invalid value for cost constant "%s" for "%s" storage engine and device type %d in mysql.engine_cost table: %.1f

ER_ENGINE_COST_INVALID_CONST_CONSTANT_FOR_SE_AND_DEVICE was added in 8.0.2.

- Error number: MY-010439; Symbol: ER_SERVER_COST_FAILED_TO_READ; SQLSTATE: HY000

Message: Error while reading from mysql.server_cost table.

ER_SERVER_COST_FAILED_TO_READ was added in 8.0.2.

- Error number: MY-010440; Symbol: ER_ENGINE_COST_FAILED_TO_READ; SQLSTATE: HY000

Message: Error while reading from mysql.engine_cost table.

ER_ENGINE_COST_FAILED_TO_READ was added in 8.0.2.

- Error number: MY-010441; Symbol: ER_FAILED_TO_OPEN_COST_CONSTANT_TABLES; SQLSTATE: HY000

Message: Failed to open optimizer cost constant tables

ER_FAILED_TO_OPEN_COST_CONSTANT_TABLES was added in 8.0.2.

- Error number: MY-010442; Symbol: ER_RPL_UNSUPPORTED_UNIGNORABLE_EVENT_IN_STREAM; SQLSTATE: HY000

Message: Unsupported non-ignorable event fed into the event stream.

ER_RPL_UNSUPPORTED_UNIGNORABLE_EVENT_IN_STREAM was added in 8.0.2.

- Error number: MY-010443; Symbol: ER_RPL_GTID_LOG_EVENT_IN_STREAM; SQLSTATE: HY000

Message: GTID_LOG_EVENT or ANONYMOUS_GTID_LOG_EVENT is not expected in an event stream %s.

5192
Server Error Message Reference

**ER_RPL_GTID_LOG_EVENT_IN_STREAM** was added in 8.0.2.

- **Error number:** MY-010444; **Symbol:** ER_RPL_UNEXPECTED_BEGIN_IN_STREAM; **SQLSTATE:** HY000
  Message: QUERY(BEGIN) is not expected in an event stream in the middle of a %s.

**ER_RPL_UNEXPECTED_BEGIN_IN_STREAM** was added in 8.0.2.

- **Error number:** MY-010445; **Symbol:** ER_RPL_UNEXPECTED_COMMIT_ROLLBACK_OR_XID_LOG_EVENT_IN_STREAM; **SQLSTATE:** HY000
  Message: QUERY(COMMIT or ROLLBACK) or XID_LOG_EVENT is not expected in an event stream %s.

**ER_RPL_UNEXPECTED_COMMIT_ROLLBACK_OR_XID_LOG_EVENT_IN_STREAM** was added in 8.0.2.

- **Error number:** MY-010542; Symbol: **ER_RPL_MTS_RECOVERYFAILEDSTARTCOORDINATOR**; **SQLSTATE**: HY000
  
  Message: MTS recovery: failed to start the coordinator thread. Check the error log for additional details.
  
  **ER_RPL_MTS_RECOVERYFAILEDSTARTCOORDINATOR** was added in 8.0.2.

- **Error number:** MY-010543; Symbol: **ER_RPL_MTS_AUTOMATICRECOVERYFAILED**; **SQLSTATE**: HY000
  
  Message: MTS recovery: automatic recovery failed. Either the slave server had stopped due to an error during an earlier session or relay logs are corrupted. Fix the cause of the slave side error and restart the slave server or consider using RESET SLAVE.
  
  **ER_RPL_MTS_AUTOMATICRECOVERYFAILED** was added in 8.0.2.

- **Error number:** MY-010544; Symbol: **ER_RPL_MTS_RECOVERYCANTOPENRELAYLOG**; **SQLSTATE**: HY000
  
  Message: Failed to open the relay log '%%' (relay_log_pos %s).
ER_RPL_MTS_RECOVERY_CANT_OPEN_RELAY_LOG was added in 8.0.2.

- Error number: MY-010545; Symbol: ER_RPL_MTS_RECOVERY_SUCCESSFUL; SQLSTATE: HY000
  Message: MTS recovery: completed successfully.

ER_RPL_MTS_RECOVERY_SUCCESSFUL was added in 8.0.2.

- Error number: MY-010546; Symbol: ER_RPL_SERVER_ID_MISSING; SQLSTATE: HY000
  Message: Server id not set, will not start slave%s

ER_RPL_SERVER_ID_MISSING was added in 8.0.2.

- Error number: MY-010547; Symbol: ER_RPL_CANT_CREATE_SLAVE_THREAD; SQLSTATE: HY000
  Message: Can't create slave thread%s.

ER_RPL_CANT_CREATE_SLAVE_THREAD was added in 8.0.2.

- Error number: MY-010548; Symbol: ER_RPL_SLAVE_IO_THREAD_WAS_KILLED; SQLSTATE: HY000
  Message: The slave IO thread%s was killed while executing initialization query '%s'

ER_RPL_SLAVE_IO_THREAD_WAS_KILLED was added in 8.0.2.

- Error number: MY-010549; Symbol: ER_RPL_SLAVE_MASTER_UUID_HAS_CHANGED; SQLSTATE: HY000
  Message: The master's UUID has changed, although this should not happen unless you have changed it manually. The old UUID was %s.

ER_RPL_SLAVE_MASTER_UUID_HAS_CHANGED was added in 8.0.2.

- Error number: MY-010550; Symbol: ER_RPL_SLAVE_USES_CHECKSUM_AND_MASTER_PRE_50; SQLSTATE: HY000
  Message: Found a master with MySQL server version older than 5.0. With checksums enabled on the slave, replication might not work correctly. To ensure correct replication, restart the slave server with --slave_sql_verify_checksum=0.

ER_RPL_SLAVE_USES_CHECKSUM_AND_MASTER_PRE_50 was added in 8.0.2.

- Error number: MY-010551; Symbol: ER_RPL_SLAVE_SECONDS_BEHIND_MASTER_DUBIOUS; SQLSTATE: HY000
  Message: "SELECT UNIX_TIMESTAMP()" failed on master, do not trust column Seconds_Behind_Master of SHOW SLAVE STATUS. Error: %s (%d)

ER_RPL_SLAVE_SECONDS_BEHIND_MASTER_DUBIOUS was added in 8.0.2.

- Error number: MY-010552; Symbol: ER_RPL_SLAVE_CANT_FLUSH_MASTER_INFO_FILE; SQLSTATE: HY000
  Message: Failed to flush master info file.

ER_RPL_SLAVE_CANT_FLUSH_MASTER_INFO_FILE was added in 8.0.2.
• Error number: MY-010553; Symbol: ER_RPL_SLAVE_REPORT_HOST_TOO_LONG; SQLSTATE: HY000
Message: The length of report_host is %zu. It is larger than the max length(%d), so this slave cannot be registered to the master%s.
ER_RPL_SLAVE_REPORT_HOST_TOO_LONG was added in 8.0.2.

• Error number: MY-010554; Symbol: ER_RPL_SLAVE_REPORT_USER_TOO_LONG; SQLSTATE: HY000
Message: The length of report_user is %zu. It is larger than the max length(%d), so this slave cannot be registered to the master%s.
ER_RPL_SLAVE_REPORT_USER_TOO_LONG was added in 8.0.2.

• Error number: MY-010555; Symbol: ER_RPL_SLAVE_REPORT_PASSWORD_TOO_LONG; SQLSTATE: HY000
Message: The length of report_password is %zu. It is larger than the max length(%d), so this slave cannot be registered to the master%s.
ER_RPL_SLAVE_REPORT_PASSWORD_TOO_LONG was added in 8.0.2.

• Error number: MY-010556; Symbol: ER_RPL_SLAVE_ERROR_RETRYING; SQLSTATE: HY000
Message: Error on %s: %d %s, will retry in %d secs
ER_RPL_SLAVE_ERROR_RETRYING was added in 8.0.2.

• Error number: MY-010557; Symbol: ER_RPL_SLAVE_ERROR_READING_FROM_SERVER; SQLSTATE: HY000
Message: Error reading packet from server%s: %s (server_errno=%d)
ER_RPL_SLAVE_ERROR_READING_FROM_SERVER was added in 8.0.2.

• Error number: MY-010558; Symbol: ER_RPL_SLAVE_DUMP_THREAD_KILLED_BY_MASTER; SQLSTATE: HY000
Message: Slave%s: received end packet from server due to dump thread being killed on master. Dump threads are killed for example during master shutdown, explicitly by a user, or when the master receives a binlog send request from a duplicate server UUID <%%s> : Error %s
ER_RPL_SLAVE_DUMP_THREAD_KILLED_BY_MASTER was added in 8.0.2.

• Error number: MY-010559; Symbol: ER_RPL_MTS_STATISTICS; SQLSTATE: HY000
Message: Multi-threaded slave statistics%s: seconds elapsed = %lu; events assigned = %llu; worker queues filled over overrun level = %lu; waited due a Worker queue full = %lu; waited due the total size = %lu; waited at clock conflicts = %llu waited (count) when Workers occupied = %lu waited when Workers occupied = %llu
ER_RPL_MTS_STATISTICS was added in 8.0.2.

• Error number: MY-010560; Symbol: ER_RPL_MTS_RECOVERY_COMPLETE; SQLSTATE: HY000
Message: Slave%s: MTS Recovery has completed at relay log %s, position %llu master log %s, position %llu.
ER_RPL_MTS_RECOVERY_COMPLETE was added in 8.0.2.
Server Error Message Reference

• Error number: MY-010561; Symbol: ER_RPL_SLAVE_CANT_INIT_RELAY_LOG_POSITION; SQLSTATE: HY000
  Message: Error initializing relay log position%s: %s
  ER_RPL_SLAVE_CANT_INIT_RELAY_LOG_POSITION was added in 8.0.2.

• Error number: MY-010562; Symbol: ER_RPL_SLAVE_CONNECTED_TO_MASTER_REPLICATION_STARTED; SQLSTATE: HY000
  Message: Slave I/O thread%s: connected to master '%s@%s:%d', replication started in log '%s' at position %s
  ER_RPL_SLAVE_CONNECTED_TO_MASTER_REPLICATION_STARTED was added in 8.0.2.

• Error number: MY-010563; Symbol: ER_RPL_SLAVE_IO_THREAD_KILLED; SQLSTATE: HY000
  Message: Slave I/O thread%s killed while connecting to master
  ER_RPL_SLAVE_IO_THREAD_KILLED was added in 8.0.2.

• Error number: MY-010564; Symbol: ER_RPL_SLAVE_IO_THREAD_CANT_REGISTER_ON_MASTER; SQLSTATE: HY000
  Message: Slave I/O thread couldn't register on master
  ER_RPL_SLAVE_IO_THREAD_CANT_REGISTER_ON_MASTER was added in 8.0.2.

• Error number: MY-010565; Symbol: ER_RPL_SLAVE_FORCING_TO_RECONNECT_IO_THREAD; SQLSTATE: HY000
  Message: Forcing to reconnect slave I/O thread%s
  ER_RPL_SLAVE_FORCING_TO_RECONNECT_IO_THREAD was added in 8.0.2.

• Error number: MY-010566; Symbol: ER_RPL_SLAVE_ERROR_REQUESTING_BINLOG_DUMP; SQLSTATE: HY000
  Message: Failed on request_dump()%s
  ER_RPL_SLAVE_ERROR_REQUESTING_BINLOG_DUMP was added in 8.0.2.

• Error number: MY-010567; Symbol: ER_RPL_LOG_ENTRY_EXCEEDS_SLAVE_MAX_ALLOWED_PACKET; SQLSTATE: HY000
  Message: Log entry on master is longer than slave_max_allowed_packet (%lu) on slave. If the entry is correct, restart the server with a higher value of slave_max_allowed_packet
  ER_RPL_LOG_ENTRY_EXCEEDS_SLAVE_MAX_ALLOWED_PACKET was added in 8.0.2.

• Error number: MY-010568; Symbol: ER_RPL_SLAVE_STOPPING_AS_MASTER_OOM; SQLSTATE: HY000
  Message: Stopping slave I/O thread due to out-of-memory error from master
  ER_RPL_SLAVE_STOPPING_AS_MASTER_OOM was added in 8.0.2.

• Error number: MY-010569; Symbol: ER_RPL_SLAVE_IO_THREAD_ABORTED_WAITING_FOR_RELAY_LOG_SPACE; SQLSTATE: HY000
Message: Slave I/O thread aborted while waiting for relay log space

ER_RPL_SLAVE_IO_THREAD_ABORTED_WAITING_FOR_RELAY_LOG_SPACE was added in 8.0.2.

- Error number: MY-010570; Symbol: ER_RPL_SLAVE_IO_THREAD_EXITING; SQLSTATE: HY000

Message: Slave I/O thread exiting%, read up to log '%s', position %s

ER_RPL_SLAVE_IO_THREAD_EXITING was added in 8.0.2.

- Error number: MY-010571; Symbol: ER_RPL_SLAVE_CANT_INITIALIZE_SLAVE_WORKER; SQLSTATE: HY000

Message: Failed during slave worker initialization%

ER_RPL_SLAVE_CANT_INITIALIZE_SLAVE_WORKER was added in 8.0.2.

- Error number: MY-010572; Symbol: ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO_FOR_WORKER; SQLSTATE: HY000

Message: Slave: MTS group recovery relay log info based on Worker-id %lu, group_relay_log_name %s, group_relay_log_pos %llu group_master_log_name %s, group_master_log_pos %llu

ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO_FOR_WORKER was added in 8.0.2.

- Error number: MY-010573; Symbol: ER_RPL_ERROR_LOOKING_FOR_LOG; SQLSTATE: HY000

Message: Error looking for %s.

ER_RPL_ERROR_LOOKING_FOR_LOG was added in 8.0.2.

- Error number: MY-010574; Symbol: ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO; SQLSTATE: HY000

Message: Slave: MTS group recovery relay log info group_master_log_name %s, event_master_log_pos %llu.

ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO was added in 8.0.2.

- Error number: MY-010575; Symbol: ER_RPL_CANT_FIND_FOLLOWUP_FILE; SQLSTATE: HY000

Message: Error looking for file after %s.

ER_RPL_CANT_FIND_FOLLOWUP_FILE was added in 8.0.2.

- Error number: MY-010576; Symbol: ER_RPL_MTS_CHECKPOINT_PERIOD_DIFFERS_FROM_CNT; SQLSTATE: HY000

Message: This an error cnt != mts_checkpoint_period

ER_RPL_MTS_CHECKPOINT_PERIOD_DIFFERS_FROM_CNT was added in 8.0.2.

- Error number: MY-010577; Symbol: ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED; SQLSTATE: HY000

Message: Failed during slave worker thread creation%

ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED was added in 8.0.2.
• Error number: **MY-010578**; Symbol: **ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED_WITH_ERRNO**; SQLSTATE: **HY000**

  Message: Failed during slave worker thread creation%s (errno= %d)

  **ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED_WITH_ERRNO** was added in 8.0.2.

• Error number: **MY-010579**; Symbol: **ER_RPL_SLAVE_FAILED_TO_INIT_PARTITIONS_HASH**; SQLSTATE: **HY000**

  Message: Failed to init partitions hash

  **ER_RPL_SLAVE_FAILED_TO_INIT_PARTITIONS_HASH** was added in 8.0.2.

• Error number: **MY-010580**; Symbol: **ER_RPL_SLAVE_NDB_TABLES_NOT_AVAILABLE**; SQLSTATE: **HY000**

  Message: Slave SQL thread : NDB : Tables not available after %lu seconds. Consider increasing --ndb-wait-setup value

  **ER_RPL_SLAVE_NDB_TABLES_NOT_AVAILABLE** was added in 8.0.2, removed after 8.0.13.

• Error number: **MY-010581**; Symbol: **ER_RPL_SLAVE_SQL_THREAD_STARTING**; SQLSTATE: **HY000**

  Message: Slave SQL thread%s initialized, starting replication in log '%s' at position %s, relay log '%s' position: %s

  **ER_RPL_SLAVE_SQL_THREAD_STARTING** was added in 8.0.2.

• Error number: **MY-010582**; Symbol: **ER_RPL_SLAVE_SKIP_COUNTER_EXECUTED**; SQLSTATE: **HY000**

  Message: 'SQL_SLAVE_SKIP_COUNTER=%ld' executed at relay_log_file='%s', relay_log_pos='%ld', master_log_name='%s', master_log_pos='%ld' and new position at relay_log_file='%s', relay_log_pos='%ld', master_log_name='%s', master_log_pos='%ld'

  **ER_RPL_SLAVE_SKIP_COUNTER_EXECUTED** was added in 8.0.2.

• Error number: **MY-010583**; Symbol: **ER_RPL_SLAVE_ADDITIONAL_ERROR_INFO_FROM_DA**; SQLSTATE: **HY000**

  Message: Slave (additional info): %s Error_code: MY-%06d

  **ER_RPL_SLAVE_ADDITIONAL_ERROR_INFO_FROM_DA** was added in 8.0.2.

• Error number: **MY-010584**; Symbol: **ER_RPL_SLAVE_ERROR_INFO_FROM_DA**; SQLSTATE: **HY000**

  Message: Slave: %s Error_code: MY-%06d

  **ER_RPL_SLAVE_ERROR_INFO_FROM_DA** was added in 8.0.2.

• Error number: **MY-010585**; Symbol: **ER_RPL_SLAVE_ERROR_LOADING_USER_DEFINED_LIBRARY**; SQLSTATE: **HY000**

  Message: Error loading user-defined library, slave SQL thread aborted. Install the missing library, and restart the slave SQL thread with "SLAVE START". We stopped at log '%s' position %s

  **ER_RPL_SLAVE_ERROR_LOADING_USER_DEFINED_LIBRARY** was added in 8.0.2.
• Error number: MY-010586; Symbol: ER_RPL_SLAVE_ERROR_RUNNING_QUERY; SQLSTATE: HY000
Message: Error running query, slave SQL thread aborted. Fix the problem, and restart the slave SQL thread with "SLAVE START". We stopped at log "%%s' position %s

ER_RPL_SLAVE_ERROR_RUNNING_QUERY was added in 8.0.2.

• Error number: MY-010587; Symbol: ER_RPL_SLAVE_SQL_THREAD_EXITING; SQLSTATE: HY000
Message: Slave SQL thread%%s exiting, replication stopped in log '%%s' at position %s

ER_RPL_SLAVE_SQL_THREAD_EXITING was added in 8.0.2.

• Error number: MY-010588; Symbol: ER_RPL_SLAVE_READ_INVALID_EVENT_FROM_MASTER; SQLSTATE: HY000
Message: Read invalid event from master: '%%s', master could be corrupt but a more likely cause of this is a bug

ER_RPL_SLAVE_READ_INVALID_EVENT_FROM_MASTER was added in 8.0.2.

• Error number: MY-010589; Symbol: ER_RPL_SLAVE_QUEUE_EVENT_FAILED INVALID_CONFIGURATION; SQLSTATE: HY000
Message: The queue event failed for channel '%%s' as its configuration is invalid.

ER_RPL_SLAVE_QUEUE_EVENT_FAILED INVALID_CONFIGURATION was added in 8.0.2.

• Error number: MY-010590; Symbol: ER_RPL_SLAVE_IO_THREAD DETECTED UNEXPECTED EVENT SEQUENCE; SQLSTATE: HY000
Message: An unexpected event sequence was detected by the IO thread while queuing the event received from master '%%s' binary log file, at position %lu.

ER_RPL_SLAVE_IO_THREAD DETECTED UNEXPECTED EVENT SEQUENCE was added in 8.0.2.

• Error number: MY-010591; Symbol: ER_RPL_SLAVE_CANT_USE_CHARSET; SQLSTATE: HY000
Message: '%%s' cannot be used as client character set. '%%s' will be used as default client character set while connecting to master.

ER_RPL_SLAVE_CANT_USE_CHARSET was added in 8.0.2.

• Error number: MY-010592; Symbol: ER_RPL_SLAVE_CONNECTED TO MASTER REPLICATION RESUMED; SQLSTATE: HY000
Message: Slave%%s: connected to master '%%s@%%s:%d', replication resumed in log '%%s' at position %s

ER_RPL_SLAVE_CONNECTED TO MASTER REPLICATION RESUMED was added in 8.0.2.

• Error number: MY-010593; Symbol: ER_RPL_SLAVE_NEXT_LOG IS ACTIVE; SQLSTATE: HY000
Message: next log '%%s' is active

ER_RPL_SLAVE_NEXT_LOG IS ACTIVE was added in 8.0.2.

• Error number: MY-010594; Symbol: ER_RPL_SLAVE_NEXT_LOG IS INACTIVE; SQLSTATE: HY000
Message: next log '%%s' is not active
Server Error Message Reference

**ER_RPL_SLAVE_NEXT_LOG_IS_INACTIVE** was added in 8.0.2.

- **Error number:** MY-010595; **Symbol:** ER_RPL_SLAVE_SQL_THREAD_IO_ERROR_READING_EVENT; SQLSTATE: HY000
  
  Message: Slave SQL thread%s: I/O error reading event (errno: %d cur_log->error: %d)

**ER_RPL_SLAVE_SQL_THREAD_IO_ERROR_READING_EVENT** was added in 8.0.2.

- **Error number:** MY-010596; **Symbol:** ER_RPL_SLAVE_ERROR_READING_RELAY_LOG_EVENTS; SQLSTATE: HY000
  
  Message: Error reading relay log event%s: %s

**ER_RPL_SLAVE_ERROR_READING_RELAY_LOG_EVENTS** was added in 8.0.2.

Message: NDB Binlog: Server shutdown detected...

`ER_NDB_BINLOG_SHUTDOWN_DETECTED` was added in 8.0.2, removed after 8.0.13.

- Error number: `MY-010699`; Symbol: `ER_NDB_BINLOG_LOST_SCHEMA_CONNECTION_WAITING`; SQLSTATE: `HY000`

Message: NDB Binlog: Just lost schema connection, hanging around

`ER_NDB_BINLOG_LOST_SCHEMA_CONNECTION_WAITING` was added in 8.0.2, removed after 8.0.13.

- Error number: `MY-010700`; Symbol: `ER_NDB_BINLOG_LOST_SCHEMA_CONNECTION_CONTINUING`; SQLSTATE: `HY000`

Message: NDB Binlog: ...and on our way

`ER_NDB_BINLOG_LOST_SCHEMA_CONNECTION_CONTINUING` was added in 8.0.2, removed after 8.0.13.

- Error number: `MY-010701`; Symbol: `ER_NDB_BINLOG_ERROR_HANDLING_SCHEMA_EVENT`; SQLSTATE: `HY000`

Message: NDB: error %lu (%s) on handling binlog schema event

`ER_NDB_BINLOG_ERROR_HANDLING_SCHEMA_EVENT` was added in 8.0.2, removed after 8.0.13.

- Error number: `MY-010702`; Symbol: `ER_NDB_BINLOG_CANT_INJECT_APPLY_STATUS_WRITE_ROW`; SQLSTATE: `HY000`

Message: NDB Binlog: Failed to inject apply status write row

`ER_NDB_BINLOG_CANT_INJECT_APPLY_STATUS_WRITE_ROW` was added in 8.0.2, removed after 8.0.13.

- Error number: `MY-010703`; Symbol: `ER_NDB_BINLOG_ERROR_DURING_GCI_ROLLBACK`; SQLSTATE: `HY000`

Message: NDB Binlog: Error during ROLLBACK of GCI %u/%u. Error: %d

`ER_NDB_BINLOG_ERROR_DURING_GCI_ROLLBACK` was added in 8.0.2, removed after 8.0.13.

- Error number: `MY-010704`; Symbol: `ER_NDB_BINLOG_ERROR_DURING_GCI_COMMIT`; SQLSTATE: `HY000`

Message: NDB Binlog: Error during COMMIT of GCI. Error: %d
ER_NDB_BINLOG_ERROR_DURING_GCI_COMMIT was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010705; Symbol: ER_NDB_BINLOG_LATEST_TRX_IN_EPOCH_NOT_IN_BINLOG; SQLSTATE: HY000
  Message: NDB Binlog: latest transaction in epoch %u/%u not in binlog as latest handled epoch is %u/%u

ER_NDB_BINLOG_LATEST_TRX_IN_EPOCH_NOT_IN_BINLOG was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010706; Symbol: ER_NDB_BINLOG_RELEASING_EXTRA_SHARE_REFERENCES; SQLSTATE: HY000
  Message: NDB Binlog: Release extra share references

ER_NDB_BINLOG_RELEASING_EXTRA_SHARE_REFERENCES was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010707; Symbol: ER_NDB_BINLOG_REMAINING_OPEN_TABLES; SQLSTATE: HY000
  Message: NDB Binlog: remaining open tables:

ER_NDB_BINLOG_REMAINING_OPEN_TABLES was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010708; Symbol: ER_NDB_BINLOG_REMAINING_OPEN_TABLE_INFO; SQLSTATE: HY000
  Message: %s.%s state: %u use_count: %u

ER_NDB_BINLOG_REMAINING_OPEN_TABLE_INFO was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010709; Symbol: ER_TREE_CORRUPT_PARENT_SHOULD_POINT_AT_PARENT; SQLSTATE: HY000
  Message: Wrong tree: Parent doesn't point at parent

ER_TREE_CORRUPT_PARENT_SHOULD_POINT_AT_PARENT was added in 8.0.2.

- Error number: MY-010710; Symbol: ER_TREE_CORRUPT_ROOT_SHOULD_BE_BLACK; SQLSTATE: HY000
  Message: Wrong tree: Root should be black

ER_TREE_CORRUPT_ROOT_SHOULD_BE_BLACK was added in 8.0.2.

- Error number: MY-010711; Symbol: ER_TREE_CORRUPT_2_CONSECUTIVE_REDS; SQLSTATE: HY000
  Message: Wrong tree: Found two red in a row

ER_TREE_CORRUPT_2_CONSECUTIVE_REDS was added in 8.0.2.

- Error number: MY-010712; Symbol: ER_TREE_CORRUPT_RIGHT_IS_LEFT; SQLSTATE: HY000
  Message: Wrong tree: Found right == left

ER_TREE_CORRUPT_RIGHT_IS_LEFT was added in 8.0.2.
• Error number: MY-010713; Symbol: ER_TREE_CORRUPT_INCORRECT_BLACK_COUNT; SQLSTATE: HY000
  
  Message: Wrong tree: Incorrect black-count: %d - %d
  
  ER_TREE_CORRUPT_INCORRECT_BLACK_COUNT was added in 8.0.2.

• Error number: MY-010714; Symbol: ER_WRONG_COUNT_FOR_ORIGIN; SQLSTATE: HY000
  
  Message: Use_count: Wrong count %lu for origin %p
  
  ER_WRONG_COUNT_FOR_ORIGIN was added in 8.0.2.

• Error number: MY-010715; Symbol: ER_WRONG_COUNT_FOR_KEY; SQLSTATE: HY000
  
  Message: Use_count: Wrong count for key at %p, %lu should be %lu
  
  ER_WRONG_COUNT_FOR_KEY was added in 8.0.2.

• Error number: MY-010716; Symbol: ER_WRONG_COUNT_OF_ELEMENTS; SQLSTATE: HY000
  
  Message: Wrong number of elements: %u (should be %u) for tree at %p
  
  ER_WRONG_COUNT_OF_ELEMENTS was added in 8.0.2.

• Error number: MY-010717; Symbol: ER_RPL_ERROR_READING_SLAVE_WORKER_CONFIGURATION; SQLSTATE: HY000
  
  Message: Error reading slave worker configuration
  
  ER_RPL_ERROR_READING_SLAVE_WORKER_CONFIGURATION was added in 8.0.2.

• Error number: MY-010718; Symbol: ER_RPL_ERROR_WRITING_SLAVE_WORKER_CONFIGURATION; SQLSTATE: HY000
  
  Message: Error writing slave worker configuration
  
  ER_RPL_ERROR_WRITING_SLAVE_WORKER_CONFIGURATION was added in 8.0.2.

• Error number: MY-010719; Symbol: ER_RPL_FAILED_TO_OPEN_RELAY_LOG; SQLSTATE: HY000
  
  Message: Failed to open relay log %s, error: %s
  
  ER_RPL_FAILED_TO_OPEN_RELAY_LOG was added in 8.0.2.

• Error number: MY-010720; Symbol: ER_RPL_WORKER_CANT_READ_RELAY_LOG; SQLSTATE: HY000
  
  Message: Error when worker read relay log events,relay log name %s, position %llu
  
  ER_RPL_WORKER_CANT_READ_RELAY_LOG was added in 8.0.2.

• Error number: MY-010721; Symbol: ER_RPL_WORKER_CANT_FIND_NEXT_RELAY_LOG; SQLSTATE: HY000
  
  Message: Failed to find next relay log when retrying the transaction, current relay log is %s
  
  ER_RPL_WORKER_CANT_FIND_NEXT_RELAY_LOG was added in 8.0.2.

• Error number: MY-010722; Symbol: ER_RPL_MTS_SLAVE_COORDINATOR_HAS_WAITED; SQLSTATE: HY000
Server Error Message Reference

Message: Multi-threaded slave: Coordinator has waited %lu times hitting slave_pending_jobs_size_max; current event size = %zu.

ER_RPL_MTS_SLAVE_COORDINATOR_HAS_WAITED was added in 8.0.2.

- Error number: MY-010723; Symbol: ER_BINLOG_FAILED_TO_WRITE_DROP_FOR_TEMP_TABLES; SQLSTATE: HY000
Message: Failed to write the DROP statement for temporary tables to binary log

ER_BINLOG_FAILED_TO_WRITE_DROP_FOR_TEMP_TABLES was added in 8.0.2.

- Error number: MY-010724; Symbol: ER_BINLOG_OOM_WRITING_DELETE_WHILE_OPENING_HEAP_TABLE; SQLSTATE: HY000
Message: When opening HEAP table, could not allocate memory to write 'DELETE FROM `%s`.`%s`' to the binary log

ER_BINLOG_OOM_WRITING_DELETE_WHILE_OPENING_HEAP_TABLE was added in 8.0.2.

- Error number: MY-010725; Symbol: ER_FAILED_TO_REPAIR_TABLE; SQLSTATE: HY000
Message: Couldn’t repair table: %s.%s

ER_FAILED_TO_REPAIR_TABLE was added in 8.0.2.

- Error number: MY-010726; Symbol: ER_FAILED_TO_REMOVE_TEMP_TABLE; SQLSTATE: HY000
Message: Could not remove temporary table: '%s', error: %d

ER_FAILED_TO_REMOVE_TEMP_TABLE was added in 8.0.2.

- Error number: MY-010727; Symbol: ER_SYSTEM_TABLE_NOT_TRANSACTIONAL; SQLSTATE: HY000
Message: System table '%.*s' is expected to be transactional.

ER_SYSTEM_TABLE_NOT_TRANSACTIONAL was added in 8.0.2.

- Error number: MY-010728; Symbol: ER_RPL_ERROR_WRITING_MASTER_CONFIGURATION; SQLSTATE: HY000
Message: Error writing master configuration.

ER_RPL_ERROR_WRITING_MASTER_CONFIGURATION was added in 8.0.2.

- Error number: MY-010729; Symbol: ER_RPL_ERROR_READING_MASTER_CONFIGURATION; SQLSTATE: HY000
Message: Error reading master configuration.

ER_RPL_ERROR_READING_MASTER_CONFIGURATION was added in 8.0.2.

- Error number: MY-010730; Symbol: ER_RPL_SSL_INFO_IN_MASTER_INFO_IGNORED; SQLSTATE: HY000
Message: SSL information in the master info file are ignored because this MySQL slave was compiled without SSL support.
Server Error Message Reference

**ER_RPL_SSL_INFO_IN_MASTER_INFOIGNORED** was added in 8.0.2.

- **Error number:** **MY-010731**; Symbol: **ER_PLUGIN_FAILED_DEINITIALIZATION**; SQLSTATE: **HY000**  
  Message: Plugin '%s' of type %s failed deinitialization

**ER_PLUGIN_FAILED_DEINITIALIZATION** was added in 8.0.2.

- **Error number:** **MY-010732**; Symbol: **ER_PLUGIN_HAS_NONZERO_REFCOUNT_AFTER_DEINITIALIZATION**; SQLSTATE: **HY000**  
  Message: Plugin '%s' has ref_count=%d after deinitialization.

**ER_PLUGIN_HAS_NONZERO_REFCOUNT_AFTER_DEINITIALIZATION** was added in 8.0.2.

- **Error number:** **MY-010733**; Symbol: **ER_PLUGIN_SHUTTING_DOWN_PLUGIN**; SQLSTATE: **HY000**  
  Message: Shutting down plugin '%s'

**ER_PLUGIN_SHUTTING_DOWN_PLUGIN** was added in 8.0.2.

- **Error number:** **MY-010734**; Symbol: **ER_PLUGIN_REGISTRATION_FAILED**; SQLSTATE: **HY000**  
  Message: Plugin '%s' registration as a %s failed.

**ER_PLUGIN_REGISTRATION_FAILED** was added in 8.0.2.

- **Error number:** **MY-010735**; Symbol: **ER_PLUGIN_CANT_OPEN_PLUGIN_TABLE**; SQLSTATE: **HY000**  
  Message: Could not open the mysql.plugin table. Please perform the MySQL upgrade procedure.

**ER_PLUGIN_CANT_OPEN_PLUGIN_TABLE** was added in 8.0.2.

- **Error number:** **MY-010736**; Symbol: **ER_PLUGIN_CANT_LOAD**; SQLSTATE: **HY000**  
  Message: Couldn't load plugin named '%s' with soname '%s'.

**ER_PLUGIN_CANT_LOAD** was added in 8.0.2.

- **Error number:** **MY-010737**; Symbol: **ER_PLUGIN_LOAD_PARAMETER_TOO_LONG**; SQLSTATE: **HY000**  
  Message: plugin-load parameter too long

**ER_PLUGIN_LOAD_PARAMETER_TOO_LONG** was added in 8.0.2.

- **Error number:** **MY-010738**; Symbol: **ER_PLUGIN_FORCING_SHUTDOWN**; SQLSTATE: **HY000**  
  Message: Plugin '%s' will be forced to shutdown

**ER_PLUGIN_FORCING_SHUTDOWN** was added in 8.0.2.

- **Error number:** **MY-010739**; Symbol: **ER_PLUGIN_HAS_NONZERO_REFCOUNT_AFTER_SHUTDOWN**; SQLSTATE: **HY000**  
  Message: Plugin '%s' has ref_count=%d after shutdown.

**ER_PLUGIN_HAS_NONZERO_REFCOUNT_AFTER_SHUTDOWN** was added in 8.0.2.

- **Error number:** **MY-010740**; Symbol: **ER_PLUGIN_UNKNOWN_VARIABLE_TYPE**; SQLSTATE: **HY000**
Message: Unknown variable type code 0x%x in plugin '%s'.

**ER_PLUGIN_UNKNOWN_VARIABLE_TYPE** was added in 8.0.2.

- Error number: **MY-010741**; Symbol: **ER_PLUGIN_VARIABLE_SET_READ_ONLY**; SQLSTATE: **HY000**
  
  Message: Server variable %s of plugin %s was forced to be read-only: string variable without update_func and PLUGIN_VAR_MEMALLOC flag

  **ER_PLUGIN_VARIABLE_SET_READ_ONLY** was added in 8.0.2.

- Error number: **MY-010742**; Symbol: **ER_PLUGIN_VARIABLE_MISSING_NAME**; SQLSTATE: **HY000**
  
  Message: Missing variable name in plugin '%s'.

  **ER_PLUGIN_VARIABLE_MISSING_NAME** was added in 8.0.2.

- Error number: **MY-010743**; Symbol: **ER_PLUGIN_VARIABLE_NOT_ALLOCATED_THREAD_LOCAL**; SQLSTATE: **HY000**
  
  Message: Thread local variable '%s' not allocated in plugin '%s'.

  **ER_PLUGIN_VARIABLE_NOT_ALLOCATED_THREAD_LOCAL** was added in 8.0.2.

- Error number: **MY-010744**; Symbol: **ER_PLUGINOOM**; SQLSTATE: **HY000**
  
  Message: Out of memory for plugin '%s'.

  **ER_PLUGINOOM** was added in 8.0.2.

- Error number: **MY-010745**; Symbol: **ER_PLUGIN_BAD_OPTIONS**; SQLSTATE: **HY000**
  
  Message: Bad options for plugin '%s'.

  **ER_PLUGIN_BAD_OPTIONS** was added in 8.0.2.

- Error number: **MY-010746**; Symbol: **ER_PLUGIN_PARSING_OPTIONS_FAILED**; SQLSTATE: **HY000**
  
  Message: Parsing options for plugin '%s' failed.

  **ER_PLUGIN_PARSING_OPTIONS_FAILED** was added in 8.0.2.

- Error number: **MY-010747**; Symbol: **ER_PLUGIN_DISABLED**; SQLSTATE: **HY000**
  
  Message: Plugin '%s' is disabled.

  **ER_PLUGIN_DISABLED** was added in 8.0.2.

- Error number: **MY-010748**; Symbol: **ER_PLUGIN_HAS_CONFLICTING_SYSTEM_VARIABLES**; SQLSTATE: **HY000**
  
  Message: Plugin '%s' has conflicting system variables

  **ER_PLUGIN_HAS_CONFLICTING_SYSTEM_VARIABLES** was added in 8.0.2.

- Error number: **MY-010749**; Symbol: **ER_PLUGIN_CANT_SET_PERSISTENT_OPTIONS**; SQLSTATE: **HY000**
  
  Message: Setting persistent options for plugin '%s' failed.
**ER_PLUGIN_CANT_SET_PERSISTENT_OPTIONS** was added in 8.0.2.

- **Error number:** MY-010750; **Symbol:** ER_MY_NET_WRITE_FAILED_FALLING_BACK_ON_STDERR; **SQLSTATE:** HY000
  
  **Message:** Failed on my_net_write, writing to stderr instead: %s

**ER_MY_NET_WRITE_FAILED_FALLING_BACK_ON_STDERR** was added in 8.0.2.

- **Error number:** MY-010751; **Symbol:** ER_RETRYING_REPAIRWITHOUT QUICK; **SQLSTATE:** HY000
  
  **Message:** Retrying repair of: '%s' without quick

**ER_RETRYING_REPAIRWITHOUT QUICK** was added in 8.0.2.

- **Error number:** MY-010752; **Symbol:** ER_RETRYING_REPAIRWITH_KEYCACHE; **SQLSTATE:** HY000
  
  **Message:** Retrying repair of: '%s' with keycache

**ER_RETRYING_REPAIRWITH_KEYCACHE** was added in 8.0.2.

- **Error number:** MY-010753; **Symbol:** ER_FOUND_ROWS_WHILE_REPAIRING; **SQLSTATE:** HY000
  
  **Message:** Found %s of %s rows when repairing '%s'

**ER_FOUND_ROWS_WHILE_REPAIRING** was added in 8.0.2.

- **Error number:** MY-010754; **Symbol:** ER_ERROR DURING OPTIMIZE TABLE; **SQLSTATE:** HY000
  
  **Message:** Warning: Optimize table got errno %d on %s.%s, retrying

**ER_ERROR DURING OPTIMIZE TABLE** was added in 8.0.2.

- **Error number:** MY-010755; **Symbol:** ER_ERROR ENABLING KEYS; **SQLSTATE:** HY000
  
  **Message:** Warning: Enabling keys got errno %d on %s.%s, retrying

**ER_ERROR ENABLING KEYS** was added in 8.0.2.

- **Error number:** MY-010756; **Symbol:** ER_CHECKING TABLE; **SQLSTATE:** HY000
  
  **Message:** Checking table: '%s'

**ER_CHECKING TABLE** was added in 8.0.2.

- **Error number:** MY-010757; **Symbol:** ER RECOVERING TABLE; **SQLSTATE:** HY000
  
  **Message:** Recovering table: '%s'

**ER RECOVERING TABLE** was added in 8.0.2.

- **Error number:** MY-010758; **Symbol:** ER CANT CREATE TABLE SHARE FROM FRM; **SQLSTATE:** HY000
  
  **Message:** Error in creating TABLE_SHARE from %s.frm file.

**ER CANT CREATE TABLE SHARE FROM FRM** was added in 8.0.2.

- **Error number:** MY-010759; **Symbol:** ER CANT LOCK TABLE; **SQLSTATE:** HY000
Message: Unable to acquire lock on %s.%s

ER_CANT_LOCK_TABLE was added in 8.0.2.

- Error number: MY-010760; Symbol: ER_CANT_ALLOC_TABLE_OBJECT; SQLSTATE: HY000
  
  Message: Error in allocation memory for TABLE object.

ER_CANT_ALLOC_TABLE_OBJECT was added in 8.0.2.

- Error number: MY-010761; Symbol: ER_CANT_CREATE_HANDLER_OBJECT_FOR_TABLE; SQLSTATE: HY000
  
  Message: Error in creating handler object for table %s.%s

ER_CANT_CREATE_HANDLER_OBJECT_FOR_TABLE was added in 8.0.2.

- Error number: MY-010762; Symbol: ER_CANT_SET_HANDLER_REFERENCE_FOR_TABLE; SQLSTATE: HY000
  
  Message: Error in setting handler reference for table %s.%s

ER_CANT_SET_HANDLER_REFERENCE_FOR_TABLE was added in 8.0.2.

- Error number: MY-010763; Symbol: ER_CANT_LOCK_TABLESPACE; SQLSTATE: HY000
  
  Message: Unable to acquire lock on tablespace name %s

ER_CANT_LOCK_TABLESPACE was added in 8.0.2.

- Error number: MY-010764; Symbol: ER_CANT_UPGRADE_GENERATED_COLUMNS_TO_DD; SQLSTATE: HY000
  
  Message: Error in processing generated columns for table %s.%s

ER_CANT_UPGRADE_GENERATED_COLUMNS_TO_DD was added in 8.0.2.

- Error number: MY-010765; Symbol: ER_DD_ERROR_CREATING_ENTRY; SQLSTATE: HY000
  
  Message: Error in Creating DD entry for %s.%s

ER_DD_ERROR_CREATING_ENTRY was added in 8.0.2.

- Error number: MY-010766; Symbol: ER_DD_CANT_FETCH_TABLE_DATA; SQLSTATE: HY000
  
  Message: Error in fetching %s.%s table data from dictionary

ER_DD_CANT_FETCH_TABLE_DATA was added in 8.0.2.

- Error number: MY-010767; Symbol: ER_DD_CANT_FIX_SE_DATA; SQLSTATE: HY000
  
  Message: Error in fixing SE data for %s.%s

ER_DD_CANT_FIX_SE_DATA was added in 8.0.2.

- Error number: MY-010768; Symbol: ER_DD_CANT_CREATE_SP; SQLSTATE: HY000
  
  Message: Error in creating stored program '%s.%s'
ER_DD_CANT_CREATE_SP was added in 8.0.2.

- Error number: MY-010769; Symbol: ER_CANT_OPEN_DB_OPT_USING_DEFAULT_CHARSET; SQLSTATE: HY000
  Message: Unable to open db.opt file %s. Using default character set.

  ER_CANT_OPEN_DB_OPT_USING_DEFAULT_CHARSET was added in 8.0.2.

- Error number: MY-010770; Symbol: ER_CANT_CREATE_CACHE_FOR_DB_OPT; SQLSTATE: HY000
  Message: Unable to initialize IO cache to open db.opt file %s.

  ER_CANT_CREATE_CACHE_FOR_DB_OPT was added in 8.0.2.

- Error number: MY-010771; Symbol: ER_CANT_IDENTIFY_CHARSET_USING_DEFAULT; SQLSTATE: HY000
  Message: Unable to identify the charset in %s. Using default character set.

  ER_CANT_IDENTIFY_CHARSET_USING_DEFAULT was added in 8.0.2.

- Error number: MY-010772; Symbol: ER_DB_OPT_NOT_FOUND_USING_DEFAULT_CHARSET; SQLSTATE: HY000
  Message: db.opt file not found for %s database. Using default character set.

  ER_DB_OPT_NOT_FOUND_USING_DEFAULT_CHARSET was added in 8.0.2.

- Error number: MY-010773; Symbol: ER_EVENT_CANT_GET_TIMEZONE_FROM_FIELD; SQLSTATE: HY000
  Message: Event '%s'.'%s': invalid value in column mysql.event.time_zone.
  This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the mysql.event system table and migrates its contents to the internal data dictionary.

  ER_EVENT_CANT_GET_TIMEZONE_FROM_FIELD was added in 8.0.2.

- Error number: MY-010774; Symbol: ER_EVENT_CANT_FIND_TIMEZONE; SQLSTATE: HY000
  Message: Event '%s'.'%s': has invalid time zone value
  This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the mysql.event system table and migrates its contents to the internal data dictionary.

  ER_EVENT_CANT_FIND_TIMEZONE was added in 8.0.2.

- Error number: MY-010775; Symbol: ER_EVENT_CANT_GET_CHARSET; SQLSTATE: HY000
  Message: Event '%s'.'%s': invalid value in column mysql.event.character_set_client.
  This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the mysql.event system table and migrates its contents to the internal data dictionary.

  ER_EVENT_CANT_GET_CHARSET was added in 8.0.2.

- Error number: MY-010776; Symbol: ER_EVENT_CANT_GET_COLLATION; SQLSTATE: HY000
Message: Event '%s'.'%s': invalid value in column mysql.event.collation_connection.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.event` system table and migrates its contents to the internal data dictionary.

`ER_EVENT_CANT_GET_COLLATION` was added in 8.0.2.

- Error number: `MY-010777`; Symbol: `ER_EVENT_CANT_OPEN_TABLE_MYSQL_EVENT`; SQLSTATE: `HY000`

Message: Failed to open `mysql.event` Table.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.event` system table and migrates its contents to the internal data dictionary.

`ER_EVENT_CANT_OPEN_TABLE_MYSQL_EVENT` was added in 8.0.2.

- Error number: `MY-010778`; Symbol: `ER_CANT_PARSE_STORED_ROUTINE_BODY`; SQLSTATE: `HY000`

Message: Parsing '%s.%s' routine body failed.%s

`ER_CANT_PARSE_STORED_ROUTINE_BODY` was added in 8.0.2.

- Error number: `MY-010779`; Symbol: `ER_CANT_OPEN_TABLE_MYSQL_PROC`; SQLSTATE: `HY000`

Message: Failed to open `mysql.proc` Table.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.proc` system table and migrates its contents to the internal data dictionary.

`ER_CANT_OPEN_TABLE_MYSQL_PROC` was added in 8.0.2.

- Error number: `MY-010780`; Symbol: `ER_CANT_READ_TABLE_MYSQL_PROC`; SQLSTATE: `HY000`

Message: Failed to read `mysql.proc` table.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.proc` system table and migrates its contents to the internal data dictionary.

`ER_CANT_READ_TABLE_MYSQL_PROC` was added in 8.0.2.

- Error number: `MY-010781`; Symbol: `ER_FILE_EXISTS_DURING_UPGRADE`; SQLSTATE: `HY000`

Message: Found %s file in mysql schema. DD will create .ibd file with same name. Please rename table and start upgrade process again.

`ER_FILE_EXISTS_DURING_UPGRADE` was added in 8.0.2.

- Error number: `MY-010782`; Symbol: `ER_CANT_OPEN_DATADIR_AFTER_UPGRADE_FAILURE`; SQLSTATE: `HY000`

Message: Unable to open the data directory %s during clean up after upgrade failed

`ER_CANT_OPEN_DATADIR_AFTER_UPGRADE_FAILURE` was added in 8.0.2.

- Error number: `MY-010783`; Symbol: `ER_CANT_SET_PATH_FOR`; SQLSTATE: `HY000`

Message: Failed to set path %s
**Server Error Message Reference**

**ER_CANT_SET_PATH_FOR** was added in 8.0.2.

- Error number: MY-010784; Symbol: ER_CANT_OPEN_DIR; SQLSTATE: HY000
  Message: Failed to open dir %s
  **ER_CANT_OPEN_DIR** was added in 8.0.2.

- Error number: MY-010785; Symbol: ER_NDB_EMPTY_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS; SQLSTATE: HY000
  Message: NDB: Found empty nodeid specified in --ndb-cluster-connection-pool-nodeids='%s'.
  **ER_NDB_EMPTY_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS** was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010786; Symbol: ER_NDB_CANT_PARSE_NDB_CLUSTER_CONNECTION_POOL_NODEIDS; SQLSTATE: HY000
  Message: NDB: Could not parse '%s' in --ndb-cluster-connection-pool-nodeids='%s'.
  **ER_NDB_CANT_PARSE_NDB_CLUSTER_CONNECTION_POOL_NODEIDS** was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010787; Symbol: ER_NDB_INVALID_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS; SQLSTATE: HY000
  Message: NDB: Invalid nodeid %d in --ndb-cluster-connection-pool-nodeids='%s'.
  **ER_NDB_INVALID_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS** was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010788; Symbol: ER_NDB_DUPLICATE_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS; SQLSTATE: HY000
  Message: NDB: Found duplicate nodeid %d in --ndb-cluster-connection-pool-nodeids='%s'.

ER_BINLOG_FAILED_TO_CLOSE_INDEX_FILE WHILE REBUILDING was added in 8.0.2.

- Error number: MY-010826; Symbol:
  ER_BINLOG_FAILED_TO_DELETE_INDEX_FILE WHILE REBUILDING; SQLSTATE: HY000
Message: While rebuilding index file %s: Failed to delete the existing index file. It could be that file is being used by some other process.

ER_BINLOG_FAILED_TO_DELETE_INDEX_FILE WHILE REBUILDING was added in 8.0.2.

- Error number: MY-010827; Symbol:
  ER_BINLOG_FAILED_TO_RENAME_INDEX_FILE WHILE REBUILDING; SQLSTATE: HY000
Message: While rebuilding index file %s: Failed to rename the new index file to the existing index file.

ER_BINLOG_FAILED_TO_RENAME_INDEX_FILE WHILE REBUILDING was added in 8.0.2.

- Error number: MY-010828; Symbol:
  ER_BINLOG_FAILED_TO_OPEN_INDEX_FILE AFTER REBUILDING; SQLSTATE: HY000
Message: After rebuilding the index file %s: Failed to open the index file.

ER_BINLOG_FAILED_TO_OPEN_INDEX_FILE AFTER REBUILDING was added in 8.0.2.

- Error number: MY-010829; Symbol: ER_BINLOG_CANT_APPEND_LOG TO TMP_INDEX; SQLSTATE: HY000
Message: MYSQL_BIN_LOG::add_log_to_index failed to append log file name: %s, to crash safe index file.

ER_BINLOG_CANT_APPEND_LOG TO TMP_INDEX was added in 8.0.2.

- Error number: MY-010830; Symbol:
  ER_BINLOG_CANT_LOCATE_OLD BINLOG OR RELAY LOG FILES; SQLSTATE: HY000
Message: Failed to locate old binlog or relay log files

ER_BINLOG_CANT_LOCATE_OLD BINLOG OR RELAY LOG FILES was added in 8.0.2.

- Error number: MY-010831; Symbol: ER_BINLOG_CANT_DELETE_FILE; SQLSTATE: HY000
Message: Failed to delete file '%s'

ER_BINLOG_CANT_DELETE_FILE was added in 8.0.2.

- Error number: MY-010832; Symbol: ER_BINLOG_CANT_SET_TMP_INDEX_NAME; SQLSTATE: HY000
Message: MYSQL_BIN_LOG::set_crash_safe_index_file_name failed to set file name.
ER_BINLOG_CANT_SET_TMP_INDEX_NAME was added in 8.0.2.

- Error number: MY-010833; Symbol: ER_BINLOG_FAILED_TO_OPEN_TEMPORARY_INDEX_FILE; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::open_crash_safe_index_file failed to open temporary index file.
  ER_BINLOG_FAILED_TO_OPEN_TEMPORARY_INDEX_FILE was added in 8.0.2.

- Error number: MY-010834; Symbol: ER_BINLOG_ERROR_GETTING_NEXT_LOG_FROM_INDEX; SQLSTATE: HY000
  Message: next log error: %d offset: %s log: %s included: %d
  ER_BINLOG_ERROR_GETTING_NEXT_LOG_FROM_INDEX was added in 8.0.2, removed after 8.0.12.

- Error number: MY-010835; Symbol: ER_BINLOG_CANT_OPEN_TMP_INDEX; SQLSTATE: HY000
  Message: %s failed to open the crash safe index file.
  ER_BINLOG_CANT_OPEN_TMP_INDEX was added in 8.0.2.

- Error number: MY-010836; Symbol: ER_BINLOG_CANT_COPY_INDEX_TO_TMP; SQLSTATE: HY000
  Message: %s failed to copy index file to crash safe index file.
  ER_BINLOG_CANT_COPY_INDEX_TO_TMP was added in 8.0.2.

- Error number: MY-010837; Symbol: ER_BINLOG_CANT_CLOSE_TMP_INDEX; SQLSTATE: HY000
  Message: %s failed to close the crash safe index file.
  ER_BINLOG_CANT_CLOSE_TMP_INDEX was added in 8.0.2.

- Error number: MY-010838; Symbol: ER_BINLOG_CANT_MOVE_TMP_TO_INDEX; SQLSTATE: HY000
  Message: %s failed to move crash safe index file to index file.
  ER_BINLOG_CANT_MOVE_TMP_TO_INDEX was added in 8.0.2.

- Error number: MY-010839; Symbol: ER_BINLOG_PURGE_LOGS_CALLED_WITH_FILE_NOT_IN_INDEX; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::purge_logs was called with file %s not listed in the index.
  ER_BINLOG_PURGE_LOGS_CALLED_WITH_FILE_NOT_IN_INDEX was added in 8.0.2.

- Error number: MY-010840; Symbol: ER_BINLOG_PURGE_LOGS_CANT_SYNC_INDEX_FILE; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::purge_logs failed to sync the index file.
  ER_BINLOG_PURGE_LOGS_CANT_SYNC_INDEX_FILE was added in 8.0.2.

- Error number: MY-010841; Symbol: ER_BINLOG_PURGE_LOGS_CANT_COPY_TO_REGISTER_FILE; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::purge_logs failed to copy %s to register file.
ER_BINLOG_PURGE_LOGS_CANT_COPY_TO_REGISTER_FILE was added in 8.0.2.

- Error number: MY-010842; Symbol: ER_BINLOG_PURGE_LOGS_CANT_FLUSH_REGISTER_FILE; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::purge_logs failed to flush register file.

ER_BINLOG_PURGE_LOGS_CANT_FLUSH_REGISTER_FILE was added in 8.0.2.

- Error number: MY-010843; Symbol: ER_BINLOG_PURGE_LOGS_CANT_UPDATE_INDEX_FILE; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::purge_logs failed to update the index file

ER_BINLOG_PURGE_LOGS_CANT_UPDATE_INDEX_FILE was added in 8.0.2.

- Error number: MY-010844; Symbol: ER_BINLOG_PURGE_LOGS_FAILED_TO_PURGE_LOG; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::purge_logs failed to process registered files that would be purged.

ER_BINLOG_PURGE_LOGS_FAILED_TO_PURGE_LOG was added in 8.0.2.

- Error number: MY-010845; Symbol: ER_BINLOG_FAILED_TO_SET_PURGE_INDEX_FILE_NAME; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::set_purge_index_file_name failed to set file name.

ER_BINLOG_FAILED_TO_SET_PURGE_INDEX_FILE_NAME was added in 8.0.2.

- Error number: MY-010846; Symbol: ER_BINLOG_FAILED_TO_OPEN_REGISTER_FILE; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::open_purge_index_file failed to open register file.

ER_BINLOG_FAILED_TO_OPEN_REGISTER_FILE was added in 8.0.2.

- Error number: MY-010847; Symbol: ER_BINLOG_FAILED_TO_REINIT_REGISTER_FILE; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::purge_index_entry failed to reinit register file for read

ER_BINLOG_FAILED_TO_REINIT_REGISTER_FILE was added in 8.0.2.

- Error number: MY-010848; Symbol: ER_BINLOG_FAILED_TO_READ_REGISTER_FILE; SQLSTATE: HY000
  Message: MYSQL_BIN_LOG::purge_index_entry error %d reading from register file.

ER_BINLOG_FAILED_TO_READ_REGISTER_FILE was added in 8.0.2.

- Error number: MY-010849; Symbol: ER_CANT_STAT_FILE; SQLSTATE: HY000
  Message: Failed to execute mysql_file_stat on file '%s'

ER_CANT_STAT_FILE was added in 8.0.2.
• Error number: MY-010850; Symbol: ER_BINLOG_CANT_DELETE_LOG_FILE_DOES_INDEX_MATCH_FILES; SQLSTATE: HY000
  Message: Failed to delete log file '%s'; consider examining correspondence of your binlog index file to the actual binlog files
  ER_BINLOG_CANT_DELETE_LOG_FILE_DOES_INDEX_MATCH_FILES was added in 8.0.2.

• Error number: MY-010851; Symbol: ER_BINLOG_CANT_DELETE_FILE_AND_READ_BINLOG_INDEX; SQLSTATE: HY000
  Message: Failed to delete file '%s' and read the binlog index file
  ER_BINLOG_CANT_DELETE_FILE_AND_READ_BINLOG_INDEX was added in 8.0.2.

• Error number: MY-010852; Symbol: ER_BINLOG_FAILED_TO_DELETE_LOG_FILE; SQLSTATE: HY000
  Message: Failed to delete log file '%s'
  ER_BINLOG_FAILED_TO_DELETE_LOG_FILE was added in 8.0.2.

• Error number: MY-010853; Symbol: ER_BINLOG_LOGGING_INCIDENT_TO_STOP_SLAVES; SQLSTATE: HY000
  Message: %s An incident event has been written to the binary log which will stop the slaves.
  ER_BINLOG_LOGGING_INCIDENT_TO_STOP_SLAVES was added in 8.0.2.

• Error number: MY-010854; Symbol: ER_BINLOG_CANT_FIND_LOG_IN_INDEX; SQLSTATE: HY000
  Message: find_log_pos() failed (error: %d)
  ER_BINLOG_CANT_FIND_LOG_IN_INDEX was added in 8.0.2.

• Error number: MY-010855; Symbol: ER_BINLOG_RECOVERING_AFTER_CRASH_USING; SQLSTATE: HY000
  Message: Recovering after a crash using %s
  ER_BINLOG_RECOVERING_AFTER_CRASH_USING was added in 8.0.2.

• Error number: MY-010856; Symbol: ER_BINLOG_CANT_OPEN_CRASHED_BINLOG; SQLSTATE: HY000
  Message: Failed to open the crashed binlog file when master server is recovering it.
  ER_BINLOG_CANT_OPEN_CRASHED_BINLOG was added in 8.0.2.

• Error number: MY-010857; Symbol: ER_BINLOG_CANT_TRIM_CRASHED_BINLOG; SQLSTATE: HY000
  Message: Failed to trim the crashed binlog file when master server is recovering it.
  ER_BINLOG_CANT_TRIM_CRASHED_BINLOG was added in 8.0.2.

• Error number: MY-010858; Symbol: ER_BINLOG_CRASHED_BINLOG_TRIMMED; SQLSTATE: HY000
  Message: Crashed binlog file %s size is %llu, but recovered up to %llu. Binlog trimmed to %llu bytes.
**ER_BINLOG_CRASHED_BINLOG_TRIMMED** was added in 8.0.2.

- **Error number:** MY-010859; Symbol: ER_BINLOG_CANT_CLEAR_IN_USE_FLAG_FOR_CRASHED_BINLOG; SQLSTATE: HY000
  
  **Message:** Failed to clear LOG_EVENT_BINLOG_IN_USE_F for the crashed binlog file when master server is recovering it.

**ER_BINLOG_CANT_CLEAR_IN_USE_FLAG_FOR_CRASHED_BINLOG** was added in 8.0.2.

- **Error number:** MY-010860; Symbol: ER_BINLOG_FAILED_TO_RUN_AFTER_SYNC_HOOK; SQLSTATE: HY000
  
  **Message:** Failed to run 'after_sync' hooks

**ER_BINLOG_FAILED_TO_RUN_AFTER_SYNC_HOOK** was added in 8.0.2.

- **Error number:** MY-010861; Symbol: ER_TURNING_LOGGING_OFF_FOR_THE_DURATION; SQLSTATE: HY000
  
  **Message:** %s Hence turning logging off for the whole duration of the MySQL server process. To turn it on again: fix the cause, shutdown the MySQL server and restart it.

**ER_TURNING_LOGGING_OFF_FOR_THE_DURATION** was added in 8.0.2.

- **Error number:** MY-010862; Symbol: ER_BINLOG_FAILED_TO_RUN_AFTER_FLUSH_HOOK; SQLSTATE: HY000
  
  **Message:** Failed to run 'after_flush' hooks

**ER_BINLOG_FAILED_TO_RUN_AFTER_FLUSH_HOOK** was added in 8.0.2.

- **Error number:** MY-010863; Symbol: ER_BINLOG_CRASH_RECOVERY_FAILED; SQLSTATE: HY000
  
  **Message:** Crash recovery failed. Either correct the problem (if it's, for example, out of memory error) and restart, or delete (or rename) binary log and start mysqld with --tc-heuristic-recover={commit|rollback}

**ER_BINLOG_CRASH_RECOVERY_FAILED** was added in 8.0.2.

- **Error number:** MY-010864; Symbol: ER_BINLOG_WARNING_SUPPRESSED; SQLSTATE: HY000
  
  **Message:** The following warning was suppressed %d times during the last %d seconds in the error log

**ERBINLOG_WARNING_SUPPRESSED** was added in 8.0.2.

- **Error number:** MY-010865; Symbol: ER_NDB_LOG_ENTRY; SQLSTATE: HY000
  
  **Message:** NDB: %s

**ER_NDB_LOG_ENTRY** was added in 8.0.2.

- **Error number:** MY-010866; Symbol: ER_NDB_LOG_ENTRY_WITH_PREFIX; SQLSTATE: HY000
  
  **Message:** NDB %s: %s

**ER_NDB_LOG_ENTRY_WITH_PREFIX** was added in 8.0.2.
Server Error Message Reference

- **Error number:** MY-010867; Symbol: ER_NDB_BINLOG_CANT_CREATE_PURGE_THD; SQLSTATE: HY000
  
  Message: NDB: Unable to purge %s.%s File=%s (failed to setup thd)
  
  ER_NDB_BINLOG_CANT_CREATE_PURGE_THD was added in 8.0.2, removed after 8.0.13.

- **Error number:** MY-010868; Symbol: ER_INNODB_UNKNOWN_COLLATION; SQLSTATE: HY000
  
  Message: Unknown collation #%lu.
  
  ER_INNODB_UNKNOWN_COLLATION was added in 8.0.2.

- **Error number:** MY-010869; Symbol: ER_INNODB_INVALID_LOG_GROUP_HOME_DIR; SQLSTATE: HY000
  
  Message: syntax error in innodb_log_group_home_dir
  
  ER_INNODB_INVALID_LOG_GROUP_HOME_DIR was added in 8.0.2.

- **Error number:** MY-010870; Symbol: ER_INNODB_INVALID_INNODB_UNDO_DIRECTORY; SQLSTATE: HY000
  
  Message: syntax error in innodb_undo_directory
  
  ER_INNODB_INVALID_INNODB_UNDO_DIRECTORY was added in 8.0.2.

- **Error number:** MY-010871; Symbol: ER_INNODB_ILLEGAL_COLON_IN_POOL; SQLSTATE: HY000
  
  Message: InnoDB: innodb_buffer_pool_filename cannot have colon (:) in the file name.
  
  ER_INNODB_ILLEGAL_COLON_IN_POOL was added in 8.0.2.

- **Error number:** MY-010872; Symbol: ER_INNODB_INVALID_PAGE_SIZE; SQLSTATE: HY000
  
  Message: InnoDB: Invalid page size=%lu.
  
  ER_INNODB_INVALID_PAGE_SIZE was added in 8.0.2.

- **Error number:** MY-010873; Symbol: ER_INNODB_DIRTY_WATER_MARK_NOT_LOW; SQLSTATE: HY000
  
  Message: InnoDB: innodb_max_dirty_pages_pct_lwm cannot be set higher than innodb_max_dirty_pages_pct. Setting innodb_max_dirty_pages_pct_lwm to %lf
  
  ER_INNODB_DIRTY_WATER_MARK_NOT_LOW was added in 8.0.2.

- **Error number:** MY-010874; Symbol: ER_INNODB_IO_CAPACITY_EXCEEDS_MAX; SQLSTATE: HY000
  
  Message: InnoDB: innodb_io_capacity cannot be set higher than innodb_io_capacity_max. Setting innodb_io_capacity to %lu
  
  ER_INNODB_IO_CAPACITY_EXCEEDS_MAX was added in 8.0.2.

- **Error number:** MY-010875; Symbol: ER_INNODB_FILES_SAME; SQLSTATE: HY000
  
  Message: %s and %s file names seem to be the same.
  
  ER_INNODB_FILES_SAME was added in 8.0.2.
Server Error Message Reference

• Error number: MY-010876; Symbol: ER_INNODB_UNREGISTERED_TRX_ACTIVE; SQLSTATE: HY000
  Message: Transaction not registered for MySQL 2PC, but transaction is active
  ER_INNODB_UNREGISTERED_TRX_ACTIVE was added in 8.0.2.

• Error number: MY-010877; Symbol: ER_INNODB_CLOSING_CONNECTION_ROLLS_BACK; SQLSTATE: HY000
  Message: MySQL is closing a connection that has an active InnoDB transaction. %s row modifications will roll back.
  ER_INNODB_CLOSING_CONNECTION_ROLLS_BACK was added in 8.0.2.

• Error number: MY-010878; Symbol: ER_INNODB_TRX_XLATION_TABLE_OOM; SQLSTATE: HY000
  Message: InnoDB: fail to allocate memory for index translation table. Number of Index:%lu, array size:%lu
  ER_INNODB_TRX_XLATION_TABLE_OOM was added in 8.0.2.

• Error number: MY-010879; Symbol: ER_INNODB_CANT_FIND_INDEX_IN_INNODB_DD; SQLSTATE: HY000
  Message: Cannot find index %s in InnoDB index dictionary.
  ER_INNODB_CANT_FIND_INDEX_IN_INNODB_DD was added in 8.0.2.

• Error number: MY-010880; Symbol: ER_INNODB_INDEX_COLUMN_INFO_UNLIKE_MYSQLS; SQLSTATE: HY000
  Message: Found index %s whose column info does not match that of MySQL.
  ER_INNODB_INDEX_COLUMN_INFO_UNLIKE_MYSQLS was added in 8.0.2.

• Error number: MY-010881; Symbol: ER_INNODB_CANT_OPEN_TABLE; SQLSTATE: HY000
  Message: Failed to open table %s.
  ER_INNODB_CANT_OPEN_TABLE was added in 8.0.2.

• Error number: MY-010882; Symbol: ER_INNODB_CANT_BUILD_INDEX_XLATION_TABLE_FOR; SQLSTATE: HY000
  Message: Build InnoDB index translation table for Table %s failed.
  ER_INNODB_CANT_BUILD_INDEX_XLATION_TABLE_FOR was added in 8.0.2.

• Error number: MY-010883; Symbol: ER_INNODB_PK_NOT_IN_MYSQL; SQLSTATE: HY000
  Message: Table %s has a primary key in InnoDB data dictionary, but not in MySQL!
  ER_INNODB_PK_NOT_IN_MYSQL was added in 8.0.2.

• Error number: MY-010884; Symbol: ER_INNODB_PK_ONLY_IN_MYSQL; SQLSTATE: HY000
  Message: Table %s has no primary key in InnoDB data dictionary, but has one in MySQL! If you created the table with a MySQL version < 3.23.54 and did not define a primary key, but defined a unique key with
all non-NULL columns, then MySQL internally treats that key as the primary key. You can fix this error by dump + DROP + CREATE + reimport of the table.

`ER_INNODB_PK_ONLY_IN_MYSQL` was added in 8.0.2.

- **Error number**: MY-010885; **Symbol**: ER_INNODB_CLUSTERED_INDEX_PRIVATE; **SQLSTATE**: HY000
  
  Message: Table %s key_used_on_scan is %lu even though there is no primary key inside InnoDB.

`ER_INNODB_CLUSTERED_INDEX_PRIVATE` was added in 8.0.2.

- **Error number**: MY-010886; **Symbol**: ER_INNODB_PARTITION_TABLE_LOWERCASED; **SQLSTATE**: HY000
  
  Message: Partition table %s opened after converting to lower case. The table may have been moved from a case in-sensitive file system. Please recreate table in the current file system

`ER_INNODB_PARTITION_TABLE_LOWERCASED` was added in 8.0.2.

- **Error number**: MY-010887; **Symbol**: ER_ERRMSG_REPLACEMENT_DODGY; **SQLSTATE**: HY000
  
  Message: Cannot replace error message (%s,%s,%s) "%s" with "%s"; wrong number or type of %% substitutions.

`ER_ERRMSG_REPLACEMENT_DODGY` was added in 8.0.2.

- **Error number**: MY-010888; **Symbol**: ER_ERRMSG_REPLACEMENTS_FAILED; **SQLSTATE**: HY000
  
  Message: Table for error message replacements could not be found or read, or one or more replacements could not be applied.

`ER_ERRMSG_REPLACEMENTS_FAILED` was added in 8.0.2.

- **Error number**: MY-010889; **Symbol**: ER_NPIPE_CANT_CREATE; **SQLSTATE**: HY000
  
  Message: %s: %s

`ER_NPIPE_CANT_CREATE` was added in 8.0.2.

- **Error number**: MY-010890; **Symbol**: ER_PARTITION_MOVE_CREATED_DUPLICATE_ROW_PLEASE_FIX; **SQLSTATE**: HY000
  
  Message: Table %s: Delete from part %d failed with error %d. But it was already inserted into part %d, when moving the misplaced row! Please manually fix the duplicate row: %s

`ER_PARTITION_MOVE_CREATED_DUPLICATE_ROW_PLEASE_FIX` was added in 8.0.2.

- **Error number**: MY-010891; **Symbol**: ER_AUDIT_CANT_ABORT_COMMAND; **SQLSTATE**: HY000
  
  Message: Command %s' cannot be aborted. The trigger error was (%d) [%s]: %s

`ER_AUDIT_CANT_ABORT_COMMAND` was added in 8.0.2.

- **Error number**: MY-010892; **Symbol**: ER_AUDIT_CANT_ABORT_EVENT; **SQLSTATE**: HY000
  
  Message: Event %s' cannot be aborted. The trigger error was (%d) [%s]: %s

`ER_AUDIT_CANT_ABORT_EVENT` was added in 8.0.2.
Server Error Message Reference

- Error number: MY-010893; Symbol: ER_AUDIT_WARNING; SQLSTATE: HY000
  Message: %s. The trigger error was (%d) [%s]: %s
  ER_AUDIT_WARNING was added in 8.0.2.

- Error number: MY-010894; Symbol: ER_NDB_NUMBER_OF_CHANNELS; SQLSTATE: HY000
  Message: Slave SQL: Configuration with number of replication masters = %u' is not supported when applying to Ndb
  ER_NDB_NUMBER_OF_CHANNELS was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010895; Symbol: ER_NDB_SLAVE_PARALLEL_WORKERS; SQLSTATE: HY000
  Message: Slave SQL: Configuration 'slave_parallel_workers = %lu' is not supported when applying to Ndb
  ER_NDB_SLAVE_PARALLEL_WORKERS was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010896; Symbol: ER_NDB_DISTRIBUTING_ERR; SQLSTATE: HY000
  Message: NDB %s: distributing %s err: %u
  ER_NDB_DISTRIBUTING_ERR was added in 8.0.2, removed after 8.0.13.

- Error number: MY-010897; Symbol: ER_RPL_SLAVE_INSECURE_CHANGE_MASTER; SQLSTATE: HY000
  Message: Storing MySQL user name or password information in the master info repository is not secure and is therefore not recommended. Please consider using the USER and PASSWORD connection options for START SLAVE; see the 'START SLAVE Syntax' in the MySQL Manual for more information.
  ER_RPL_SLAVE_INSECURE_CHANGE_MASTER was added in 8.0.4.

- Error number: MY-010898; Symbol: ER_RPL_SLAVE_FLUSH_RELAY_LOGS_NOT_ALLOWED; SQLSTATE: HY000
  Message: FLUSH RELAY LOGS cannot be performed on channel '%s'.
  ER_RPL_SLAVE_FLUSH_RELAY_LOGS_NOT_ALLOWED was added in 8.0.4, removed after 8.0.15.

- Error number: MY-010899; Symbol: ER_RPL_SLAVE_INCORRECT_CHANNEL; SQLSTATE: HY000
  Message: Slave channel '%s' does not exist.
  ER_RPL_SLAVE_INCORRECT_CHANNEL was added in 8.0.4.

- Error number: MY-010900; Symbol: ER_FAILED_TO_FIND_DL_ENTRY; SQLSTATE: HY000
  Message: Can't find symbol '%s' in library.
  ER_FAILED_TO_FIND_DL_ENTRY was added in 8.0.4.

- Error number: MY-010901; Symbol: ER_FAILED_TO_OPEN_SHARED_LIBRARY; SQLSTATE: HY000
  Message: Can't open shared library '%s' (errno: %d %s).
  ER_FAILED_TO_OPEN_SHARED_LIBRARY was added in 8.0.4.
• Error number: MY-010902; Symbol: **ER_THREAD_PRIORITY_IGNORED**; SQLSTATE: HY000
Message: Thread priority attribute setting in Resource Group SQL shall be ignored due to unsupported platform or insufficient privilege.
**ER_THREAD_PRIORITY_IGNORED** was added in 8.0.4.

• Error number: MY-010903; Symbol: **ER_BINLOG_CACHE_SIZE_TOO_LARGE**; SQLSTATE: HY000
Message: Option binlog_cache_size (%lu) is greater than max_binlog_cache_size (%lu); setting binlog_cache_size equal to max_binlog_cache_size.
**ER_BINLOG_CACHE_SIZE_TOO_LARGE** was added in 8.0.4.

• Error number: MY-010904; Symbol: **ER_BINLOG_STMT_CACHE_SIZE_TOO_LARGE**; SQLSTATE: HY000
Message: Option binlog_stmt_cache_size (%lu) is greater than max_binlog_stmt_cache_size (%lu); setting binlog_stmt_cache_size equal to max_binlog_stmt_cache_size.
**ER_BINLOG_STMT_CACHE_SIZE_TOO_LARGE** was added in 8.0.4.

• Error number: MY-010905; Symbol: **ER_FAILED_TO_GENERATE_UNIQUE_LOGFILE**; SQLSTATE: HY000
Message: Can't generate a unique log-filename %s.(1-999).
**ER_FAILED_TO_GENERATE_UNIQUE_LOGFILE** was added in 8.0.4.

• Error number: MY-010906; Symbol: **ER_FAILED_TO_READ_FILE**; SQLSTATE: HY000
Message: Error reading file '%s' (errno: %d - %s)
**ER_FAILED_TO_READ_FILE** was added in 8.0.4.

• Error number: MY-010907; Symbol: **ER_FAILED_TO_WRITE_TO_FILE**; SQLSTATE: HY000
Message: Error writing file '%s' (errno: %d - %s)
**ER_FAILED_TO_WRITE_TO_FILE** was added in 8.0.4.

• Error number: MY-010908; Symbol: **ER_BINLOG_UNSAFE_MESSAGE_AND_STATEMENT**; SQLSTATE: HY000
Message: %s Statement: %s
**ER_BINLOG_UNSAFE_MESSAGE_AND_STATEMENT** was added in 8.0.4.

• Error number: MY-010909; Symbol: **ER_FORCE_CLOSE_THREAD**; SQLSTATE: HY000
Message: %s: Forcing close of thread %ld user: '%s'.
**ER_FORCE_CLOSE_THREAD** was added in 8.0.4.

• Error number: MY-010910; Symbol: **ER_SERVER_SHUTDOWN_COMPLETE**; SQLSTATE: HY000
Message: %s: Shutdown complete (mysqld %s) %s.
**ER_SERVER_SHUTDOWN_COMPLETE** was added in 8.0.4.
•   Error number: MY-010911; Symbol: ER_RPL_CANT_HAVESAME_BASENAME; SQLSTATE: HY000
Message: Cannot have same base name '%s' for both binary and relay logs. Please check %s (default '%s' if --log-bin option is not used, default '%s' if --log-bin option is used without argument) and %s (default '%s') options to ensure they do not conflict.

ER_RPL_CANT_HAVESAME_BASENAME was added in 8.0.3.

•   Error number: MY-010912; Symbol: ER_RPL_GTID_MODE_REQUIRES_ENFORCE_GTID_CONSISTENCY_ON; SQLSTATE: HY000
Message: GTID_MODE = ON requires ENFORCE_GTID_CONSISTENCY = ON.

ER_RPL_GTID_MODE_REQUIRES_ENFORCE_GTID_CONSISTENCY_ON was added in 8.0.4.

•   Error number: MY-010913; Symbol: ER_WARN_NO_SERVERID_SPECIFIED; SQLSTATE: HY000
Message: You have not provided a mandatory server-id. Servers in a replication topology must have unique server-ids. Please refer to the proper server start-up parameters documentation.

ER_WARN_NO_SERVERID_SPECIFIED was added in 8.0.3.

•   Error number: MY-010914; Symbol: ER_ABORTING_USER_CONNECTION; SQLSTATE: HY000
Message: Aborted connection %u to db: '%s' user: '%s' host: '%s' (%s).

ER_ABORTING_USER_CONNECTION was added in 8.0.4.

•   Error number: MY-010915; Symbol: ER_SQL_MODE_MERGED_WITH_STRICT_MODE; SQLSTATE: HY000
Message: ‘NO_ZERO_DATE’, ‘NO_ZERO_IN_DATE’ and ‘ERROR_FOR_DIVISION_BY_ZERO’ sql modes should be used with strict mode. They will be merged with strict mode in a future release.

ER_SQL_MODE_MERGED_WITH_STRICT_MODE was added in 8.0.4.

•   Error number: MY-010916; Symbol: ER_GTID_PURGED_WAS_UPDATED; SQLSTATE: HY000
Message: @@GLOBAL.GTID_PURGED was changed from '%s' to '%s'.

ER_GTID_PURGED_WAS_UPDATED was added in 8.0.4.

•   Error number: MY-010917; Symbol: ER_GTID_EXECUTED_WAS_UPDATED; SQLSTATE: HY000
Message: @@GLOBAL.GTID_EXECUTED was changed from '%s' to '%s'.

ER_GTID_EXECUTED_WAS_UPDATED was added in 8.0.4.

•   Error number: MY-010918; Symbol: ER_DEPRECATE_MSG_WITH_REPLACEMENT; SQLSTATE: HY000
Message: '%s' is deprecated and will be removed in a future release. Please use %s instead.

ER_DEPRECATE_MSG_WITH_REPLACEMENT was added in 8.0.4.

•   Error number: MY-010919; Symbol: ER_TRG_CREATION_CTX_NOT_SET; SQLSTATE: HY000
Message: Triggers for table '%s'. '%s' have no creation context

ER_TRG_CREATION_CTX_NOT_SET was added in 8.0.4.
• Error number: **MY-010920**; Symbol: **ER_FILE_HAS_OLD_FORMAT**; SQLSTATE: **HY000**
  Message: '%s' has an old format, you should re-create the '%s' object(s)
  
  **ER_FILE_HAS_OLD_FORMAT** was added in 8.0.4.

• Error number: **MY-010921**; Symbol: **ER_VIEW_CREATION_CTX_NOT_SET**; SQLSTATE: **HY000**
  Message: View `%s`.`%s` has no creation context
  
  **ER_VIEW_CREATION_CTX_NOT_SET** was added in 8.0.4.

• Error number: **MY-010923**; Symbol: **ER_TABLE_UPGRADE_REQUIRED**; SQLSTATE: **HY000**
  Message: Table upgrade required. Please do "REPAIR TABLE `%s`" or dump/reload to fix it!
  
  **ER_TABLE_UPGRADE_REQUIRED** was added in 8.0.4.

• Error number: **MY-010924**; Symbol: **ER_GET_ERRNO_FROM_STORAGE_ENGINE**; SQLSTATE: **HY000**
  Message: Got error %d - '%s' from storage engine.
  
  **ER_GET_ERRNO_FROM_STORAGE_ENGINE** was added in 8.0.4.

• Error number: **MY-010925**; Symbol: **ER_ACCESS_DENIED_ERROR WITHOUT PASSWORD**; SQLSTATE: **HY000**
  Message: Access denied for user '%s'@'%s'
  
  **ER_ACCESS_DENIED_ERROR WITHOUT PASSWORD** was added in 8.0.4.

• Error number: **MY-010926**; Symbol: **ER_ACCESS_DENIED ERROR WITH PASSWORD**; SQLSTATE: **HY000**
  Message: Access denied for user '%s'@'%s' (using password: %s)
  
  **ER_ACCESS_DENIED_ERROR WITH PASSWORD** was added in 8.0.4.

• Error number: **MY-010927**; Symbol: **ER_ACCESS_DENIED FOR USER ACCOUNT LOCKED**; SQLSTATE: **HY000**
  Message: Access denied for user '%s'@'%s'. Account is locked.
  
  **ER_ACCESS_DENIED FOR USER ACCOUNT LOCKED** was added in 8.0.4.

• Error number: **MY-010928**; Symbol: **ER_MUST CHANGE EXPIRED PASSWORD**; SQLSTATE: **HY000**
  Message: Your password has expired. To log in you must change it using a client that supports expired passwords.
  
  **ER_MUST CHANGE EXPIRED PASSWORD** was added in 8.0.4.

• Error number: **MY-010929**; Symbol: **ER_SYSTEM_TABLES NOT SUPPORTED BY STORAGE ENGINE**; SQLSTATE: **HY000**
  Message: Storage engine '%s' does not support system tables. [%s.%s].
  
  **ER_SYSTEM_TABLES NOT SUPPORTED BY STORAGE ENGINE** was added in 8.0.4.

• Error number: **MY-010930**; Symbol: **ER_FILESORT_TERMINATED**; SQLSTATE: **HY000**
Message: Sort aborted

ERFILESORT_TERMINATED was added in 8.0.4.

- Error number: MY-010931; Symbol: ER_SERVER_STARTUP_MSG; SQLSTATE: HY000
  ER_SERVER_STARTUP_MSG was added in 8.0.4.

- Error number: MY-010932; Symbol: ER_FAILED_TO_FIND_LOCALE_NAME; SQLSTATE: HY000
  Message: Unknown locale: '%s'.
  ER_FAILED_TO_FIND_LOCALE_NAME was added in 8.0.4.

- Error number: MY-010933; Symbol: ER_FAILED_TO_FIND_COLLATION_NAME; SQLSTATE: HY000
  Message: Unknown collation: '%s'.
  ER_FAILED_TO_FIND_COLLATION_NAME was added in 8.0.4.

- Error number: MY-010934; Symbol: ER_SERVER_OUT_OF_RESOURCES; SQLSTATE: HY000
  Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space.
  ER_SERVER_OUT_OF_RESOURCES was added in 8.0.4.

- Error number: MY-010935; Symbol: ER_SERVER_OUTOFMEMORY; SQLSTATE: HY000
  Message: Out of memory; restart server and try again (needed %d bytes).
  ER_SERVER_OUTOFMEMORY was added in 8.0.4.

- Error number: MY-010936; Symbol: ER_INVALID_COLLATION_FOR_CHARSET; SQLSTATE: HY000
  Message: COLLATION '%s' is not valid for CHARACTER SET '%s'.
  ER_INVALID_COLLATION_FOR_CHARSET was added in 8.0.4.

- Error number: MY-010937; Symbol: ER_CANT_START_ERROR_LOG_SERVICE; SQLSTATE: HY000
  Message: Failed to set %s at or around "%s" -- service is valid, but can not be initialized; please check its configuration and make sure it can read its input(s) and write to its output(s).
  ER_CANT_START_ERROR_LOG_SERVICE was added in 8.0.4.

- Error number: MY-010938; Symbol: ER_CREATING_NEW_UUID_FIRST_START; SQLSTATE: HY000
  Message: Generating a new UUID: %s.
  ER_CREATING_NEW_UUID_FIRST_START was added in 8.0.4.

- Error number: MY-010939; Symbol: ER_FAILED_TO_GET_ABSOLUTE_PATH; SQLSTATE: HY000
  Message: Failed to get absolute path of program executable %s.
  ER_FAILED_TO_GET_ABSOLUTE_PATH was added in 8.0.4.
• Error number: MY-010940; Symbol: ER_PERFSCHHEMA_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP; SQLSTATE: HY000
Message: Failed to bootstrap performance schema components infrastructure.

ER_PERFSCHHEMA_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP was added in 8.0.4.

• Error number: MY-010941; Symbol: ER_PERFSCHHEMA_COMPONENTS_INFRASTRUCTURE_SHUTDOWN; SQLSTATE: HY000
Message: Failed to deinit performance schema components infrastructure.

ER_PERFSCHHEMA_COMPONENTS_INFRASTRUCTURE_SHUTDOWN was added in 8.0.4.

• Error number: MY-010942; Symbol: ER_DUP_FD_OPEN_FAILED; SQLSTATE: HY000
Message: Could not open duplicate fd for %s: %s.

ER_DUP_FD_OPEN_FAILED was added in 8.0.4.

• Error number: MY-010943; Symbol: ER_SYSTEM_VIEW_INIT_FAILED; SQLSTATE: HY000
Message: System views initialization failed.

ER_SYSTEM_VIEW_INIT_FAILED was added in 8.0.4.

• Error number: MY-010944; Symbol: ER_RESOURCE_GROUP_POST_INIT_FAILED; SQLSTATE: HY000
Message: Resource group post initialization failed.

ER_RESOURCE_GROUP_POST_INIT_FAILED was added in 8.0.4.

• Error number: MY-010945; Symbol: ER_RESOURCE_GROUP_SUBSYSTEM_INIT_FAILED; SQLSTATE: HY000

ER_RESOURCE_GROUP_SUBSYSTEM_INIT_FAILED was added in 8.0.4.

• Error number: MY-010946; Symbol: ER_FAILED_START_MYSQLD_DAEMON; SQLSTATE: HY000
Message: Failed to start mysqld daemon. Check mysqld error log.

ER_FAILED_START_MYSQLD_DAEMON was added in 8.0.4.

• Error number: MY-010947; Symbol: ER_CANNOT_CHANGE_TO_ROOT_DIR; SQLSTATE: HY000
Message: Cannot change to root directory: %s.

ER_CANNOT_CHANGE_TO_ROOT_DIR was added in 8.0.4.

• Error number: MY-010948; Symbol: ER_PERSISTENT_PRIVILEGES_BOOTSTRAP; SQLSTATE: HY000
Message: Failed to bootstrap persistent privileges.

ER_PERSISTENT_PRIVILEGES_BOOTSTRAP was added in 8.0.4.

• Error number: MY-010949; Symbol: ER_BASEDIR_SET_TO; SQLSTATE: HY000
Message: Basedir set to %s.

`ER_BASEDIR_SET_TO` was added in 8.0.4.

- **Error number:** MY-010950; **Symbol:** `ER_RPL_FILTER_ADD_WILD_DO_TABLE_FAILED`; **SQLSTATE:** HY000

Message: Could not add wild do table rule '%s'!

`ER_RPL_FILTER_ADD_WILD_DO_TABLE_FAILED` was added in 8.0.4.

- **Error number:** MY-010951; **Symbol:** `ER_RPL_FILTER_ADD_WILD_IGNORE_TABLE_FAILED`; **SQLSTATE:** HY000

Message: Could not add wild ignore table rule '%s'!

`ER_RPL_FILTER_ADD_WILD_IGNORE_TABLE_FAILED` was added in 8.0.4.

- **Error number:** MY-010952; **Symbol:** `ER_PRIVILEGE_SYSTEM_INIT_FAILED`; **SQLSTATE:** HY000

Message: The privilege system failed to initialize correctly. For complete instructions on how to upgrade MySQL to a new version please see the 'Upgrading MySQL' section from the MySQL manual.

`ER_PRIVILEGE_SYSTEM_INIT_FAILED` was added in 8.0.4.

- **Error number:** MY-010953; **Symbol:** `ER_CANNOT_SET_LOG_ERROR_SERVICES`; **SQLSTATE:** HY000

Message: Cannot set services "%s" requested in --log-error-services, using defaults.

`ER_CANNOT_SET_LOG_ERROR_SERVICES` was added in 8.0.4.

- **Error number:** MY-010954; **Symbol:** `ER_PERFSHEMA_TABLES_INIT_FAILED`; **SQLSTATE:** HY000

Message: Performance schema tables initialization failed.

`ER_PERFSHEMA_TABLES_INIT_FAILED` was added in 8.0.4.

- **Error number:** MY-010955; **Symbol:** `ER_TX_EXTRACTION_ALGORITHM_FOR_BINLOG_TX_DEPEDENCY_TRACKING`; **SQLSTATE:** HY000

Message: The transaction_write_set_extraction must be set to %s when binlog_transaction_dependency_tracking is %s.

`ER_TX_EXTRACTION_ALGORITHM_FOR_BINLOG_TX_DEPEDENCY_TRACKING` was added in 8.0.4.

- **Error number:** MY-010956; **Symbol:** `ER_INVALID_REPLICATION_TIMESTAMPS`; **SQLSTATE:** HY000

Message: Invalid replication timestamps: original commit timestamp is more recent than the immediate commit timestamp. This may be an issue if delayed replication is active. Make sure that servers have their clocks set to the correct time. No further message will be emitted until after timestamps become valid again.

`ER_INVALID_REPLICATION_TIMESTAMPS` was added in 8.0.4.

- **Error number:** MY-010957; **Symbol:** `ER_RPL_TIMESTAMPS_RETURNED_TO_NORMAL`; **SQLSTATE:** HY000

Message: The replication timestamps have returned to normal values.
ER_RPL_TIMESTAMPS_RETURNED_TO_NORMAL was added in 8.0.4.

- Error number: MY-010958; Symbol: ER_BINLOG_FILE_OPEN_FAILED; SQLSTATE: HY000
  Message: %s.
  ER_BINLOG_FILE_OPEN_FAILED was added in 8.0.4.

- Error number: MY-010959; Symbol: ER_BINLOG_EVENT_WRITE_TO_STMT_CACHE_FAILED; SQLSTATE: HY000
  Message: Failed to write an incident event into stmt_cache.
  ER_BINLOG_EVENT_WRITE_TO_STMT_CACHE_FAILED was added in 8.0.4.

- Error number: MY-010960; Symbol: ER_SLAVE_RELAY_LOG_TRUNCATE_INFO; SQLSTATE: HY000
  Message: Relaylog file %s size was %llu, but was truncated at %llu.
  ER_SLAVE_RELAY_LOG_TRUNCATE_INFO was added in 8.0.4.

- Error number: MY-010961; Symbol: ER_SLAVE_RELAY_LOG_PURGE_FAILED; SQLSTATE: HY000
  Message: Unable to purge relay log files. %s:%s.
  ER_SLAVE_RELAY_LOG_PURGE_FAILED was added in 8.0.4.

- Error number: MY-010962; Symbol: ER_RPL_SLAVE_FILTER_CREATE_FAILED; SQLSTATE: HY000
  Message: Slave: failed in creating filter for channel '%s'.
  ER_RPL_SLAVE_FILTER_CREATE_FAILED was added in 8.0.4.

- Error number: MY-010963; Symbol: ER_RPL_SLAVE_GLOBAL_FILTERS_COPY_FAILED; SQLSTATE: HY000
  Message: Slave: failed in copying the global filters to its own per-channel filters on configuration for channel '%s'.
  ER_RPL_SLAVE_GLOBAL_FILTERS_COPY_FAILED was added in 8.0.4.

- Error number: MY-010964; Symbol: ER_RPL_SLAVE_RESET_FILTER_OPTIONS; SQLSTATE: HY000
  Message: There are per-channel replication filter(s) configured for channel '%s' which does not exist. The filter(s) have been discarded.
  ER_RPL_SLAVE_RESET_FILTER_OPTIONS was added in 8.0.4.

- Error number: MY-010965; Symbol: ER_MISSING_GRANT_SYSTEM_TABLE; SQLSTATE: HY000
  Message: The system table mysql.global_grants is missing. Please perform the MySQL upgrade procedure.
  ER_MISSING_GRANT_SYSTEM_TABLE was added in 8.0.4.

- Error number: MY-010966; Symbol: ER_MISSING_ACL_SYSTEM_TABLE; SQLSTATE: HY000
  Message: ACL table mysql.%.*s missing. Some operations may fail.
ER_MISSING_ACL_SYSTEM_TABLE was added in 8.0.4.

- Error number: MY-010967; Symbol:
  ER_ANONYMOUS_AUTH_ID_NOT_ALLOWED_IN_MANDATORY_ROLES; SQLSTATE: HY000
  Message: Can't set mandatory_role %s@%s: Anonymous authorization IDs are not allowed as roles.

ER_ANONYMOUS_AUTH_ID_NOT_ALLOWED_IN_MANDATORY_ROLES was added in 8.0.4.

- Error number: MY-010968; Symbol: ER_UNKNOWN_AUTH_ID_IN_MANDATORY_ROLE; SQLSTATE: HY000
  Message: Can't set mandatory_role: There's no such authorization ID %s@%s.

ER_UNKNOWN_AUTH_ID_IN_MANDATORY_ROLE was added in 8.0.4.

- Error number: MY-010969; Symbol: ER_WRITE_ROW_TO_PARTITION_FAILED; SQLSTATE: HY000
  Message: Table '%s' failed to move/insert a row from part %d into part %d: %s.

ER_WRITE_ROW_TO_PARTITION_FAILED was added in 8.0.4.

- Error number: MY-010970; Symbol: ER_RESOURCE_GROUP_METADATA_UPDATE_SKIPPED; SQLSTATE: HY000
  Message: Skipped updating resource group metadata in InnoDB read only mode.

ER_RESOURCE_GROUP_METADATA_UPDATE_SKIPPED was added in 8.0.4.

- Error number: MY-010971; Symbol: ER_FAILED_TO_PERSIST_RESOURCE_GROUP_METADATA; SQLSTATE: HY000
  Message: Failed to persist resource group %s to Data Dictionary.

ER_FAILED_TO_PERSIST_RESOURCE_GROUP_METADATA was added in 8.0.4.

- Error number: MY-010972; Symbol: ER_FAILED_TO_DESERIALIZE_RESOURCE_GROUP; SQLSTATE: HY000
  Message: Failed to deserialize resource group %s.

ER_FAILED_TO_DESERIALIZE_RESOURCE_GROUP was added in 8.0.4.

- Error number: MY-010973; Symbol: ER_FAILED_TO_UPDATE_RESOURCE_GROUP; SQLSTATE: HY000
  Message: Update of resource group %s failed.

ER_FAILED_TO_UPDATE_RESOURCE_GROUP was added in 8.0.4.

- Error number: MY-010974; Symbol: ER_RESOURCE_GROUP_VALIDATION_FAILED; SQLSTATE: HY000
  Message: Validation of resource group %s failed. Resource group is disabled.

ER_RESOURCE_GROUP_VALIDATION_FAILED was added in 8.0.4.
• Error number: MY-010975; Symbol: ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP; SQLSTATE: HY000
Message: Unable to allocate memory for Resource Group %s.
ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP was added in 8.0.4.

• Error number: MY-010976; Symbol: ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP_HASH; SQLSTATE: HY000
Message: Failed to allocate memory for resource group hash.
ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP_HASH was added in 8.0.4.

• Error number: MY-010977; Symbol: ER_FAILED_TO_ADD_RESOURCE_GROUP_TO_MAP; SQLSTATE: HY000
Message: Failed to add resource group %s to resource group map.
ER_FAILED_TO_ADD_RESOURCE_GROUP_TO_MAP was added in 8.0.4.

• Error number: MY-010978; Symbol: ER_RESOURCE_GROUP_IS_DISABLED; SQLSTATE: HY000
Message: Resource group feature is disabled. (Server is compiled with DISABLE_PSI_THREAD).
ER_RESOURCE_GROUP_IS_DISABLED was added in 8.0.4.

• Error number: MY-010979; Symbol: ER_FAILED_TO_APPLY_RESOURCE_GROUP_CONTROLLER; SQLSTATE: HY000
Message: Unable to apply resource group controller %s.
ER_FAILED_TO_APPLY_RESOURCE_GROUP_CONTROLLER was added in 8.0.4.

• Error number: MY-010980; Symbol: ER_FAILED_TO_ACQUIRE_LOCK_ON_RESOURCE_GROUP; SQLSTATE: HY000
Message: Unable to acquire lock on the resource group %s. Hint to switch resource group shall be ignored.
ER_FAILED_TO_ACQUIRE_LOCK_ON_RESOURCE_GROUP was added in 8.0.4.

• Error number: MY-010981; Symbol: ER_PFS_NOTIFICATION_FUNCTION_REGISTER_FAILED; SQLSTATE: HY000
Message: PFS %s notification function registration failed.
ER_PFS_NOTIFICATION_FUNCTION_REGISTER_FAILED was added in 8.0.4.

• Error number: MY-010982; Symbol: ER_RES_GRP_SET_THR_AFFINITY_FAILED; SQLSTATE: HY000
Message: Unable to bind thread id %llu to cpu id %u (error code %d - %s).
ER_RES_GRP_SET_THR_AFFINITY_FAILED was added in 8.0.4.

• Error number: MY-010983; Symbol: ER_RES_GRP_SET_THR_AFFINITY_TO_CPUS_FAILED; SQLSTATE: HY000
Server Error Message Reference

Message: Unable to bind thread id %llu to cpu ids (error code %d - %s).

ER_RES_GRP_SET_THR_AFFINITY_TO_CPUS_FAILED was added in 8.0.4.

•   Error number: MY-010984; Symbol: ER_RES_GRP_THD_UNBIND_FROM_CPU_FAILED; SQLSTATE: HY000

Message: Unbind thread id %llu failed. (error code %d - %s).

ER_RES_GRP_THD_UNBIND_FROM_CPU_FAILED was added in 8.0.4.

•   Error number: MY-010985; Symbol: ER_RES_GRP_SET_THREAD_PRIORITY_FAILED; SQLSTATE: HY000

Message: Setting thread priority %d to thread id %llu failed. (error code %d - %s).

ER_RES_GRP_SET_THREAD_PRIORITY_FAILED was added in 8.0.4.

•   Error number: MY-010986; Symbol: ER_RES_GRP_FAILED_TO_DETERMINE_NICE_CAPABILITY; SQLSTATE: HY000

Message: Unable to determine CAP_SYS_NICE capability.

ER_RES_GRP_FAILED_TO_DETERMINE_NICE_CAPABILITY was added in 8.0.4.

•   Error number: MY-010987; Symbol: ER_RES_GRP_FAILED_TO_GET_THREAD_HANDLE; SQLSTATE: HY000

Message: Retrieval of thread priority unsupported on %s.

ER_RES_GRP_FAILED_TO_GET_THREAD_HANDLE was added in 8.0.4.

•   Error number: MY-010988; Symbol: ER_RES_GRP_GET_THREAD_PRIO_NOT_SUPPORTED; SQLSTATE: HY000

Message: Unable to determine the number of CPUs.

ER_RES_GRP_FAILED_DETERMINE_CPU_COUNT was added in 8.0.4.

•   Error number: MY-010990; Symbol: ER_RES_GRP_FEATURE_NOT_AVAILABLE; SQLSTATE: HY000

Message: Resource group feature shall not be available. Incompatible thread handling option.

ER_RES_GRP_FEATURE_NOT_AVAILABLE was added in 8.0.4.

•   Error number: MY-010991; Symbol: ER_RES_GRP_INVALID_THREAD_PRIORITY; SQLSTATE: HY000

Message: Invalid thread priority %d for a %s resource group. Allowed range is [%d, %d].

ER_RES_GRP_INVALID_THREAD_PRIORITY was added in 8.0.4.

  Message: Error in creating TABLE statistics entry. Fix statistics data by using ANALYZE command.

**ER_DD_UPGRADE_FAILED_TO_CREATE_TABLE_STATS** was added in 8.0.4.

- **Error number:** MY-011008; Symbol: **ER_DD_UPGRADE_TABLE_STATS_MIGRATE_COMPLETED**; SQLSTATE: HY000

  Message: Finished migrating TABLE statistics data.

**ER_DD_UPGRADE_TABLE_STATS_MIGRATE_COMPLETED** was added in 8.0.4.
• Error number: MY-011009; Symbol: ER_DD_UPGRADE_FAILED_TO_CREATE_INDEX_STATS; SQLSTATE: HY000

Message: Error in creating Index statistics entry. Fix statistics data by using ANALYZE command.

ER_DD_UPGRADE_FAILED_TO_CREATE_INDEX_STATS was added in 8.0.4.

• Error number: MY-011010; Symbol: ER_DD_UPGRADE_INDEX_STATS_MIGRATE_COMPLETED; SQLSTATE: HY000

Message: Finished migrating INDEX statistics data.

ER_DD_UPGRADE_INDEX_STATS_MIGRATE_COMPLETED was added in 8.0.4.

• Error number: MY-011011; Symbol: ER_DD_UPGRADE_FAILED_FIND_VALID_DATA_DIR; SQLSTATE: HY000

Message: Failed to find valid data directory.

ER_DD_UPGRADE_FAILED_FIND_VALID_DATA_DIR was added in 8.0.4.

• Error number: MY-011012; Symbol: ER_DD_UPGRADE_START; SQLSTATE: HY000

Message: Starting upgrade of data directory.

ER_DD_UPGRADE_START was added in 8.0.4.

• Error number: MY-011013; Symbol: ER_DD_UPGRADE_FAILED_INIT_DD_SE; SQLSTATE: HY000

Message: Failed to initialize DD Storage Engine.

ER_DD_UPGRADE_FAILED_INIT_DD_SE was added in 8.0.4.

• Error number: MY-011014; Symbol: ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_ABORT; SQLSTATE: HY000

Message: Found partially upgraded DD. Aborting upgrade and deleting all DD tables. Start the upgrade process again.

ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_ABORT was added in 8.0.4.

• Error number: MY-011015; Symbol: ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_CONTINUE; SQLSTATE: HY000

Message: Found partially upgraded DD. Upgrade will continue and start the server.

ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_CONTINUE was added in 8.0.4.

• Error number: MY-011016; Symbol: ER_DD_UPGRADE_SE_LOGS_FAILED; SQLSTATE: HY000

Message: Error in upgrading engine logs.

ER_DD_UPGRADE_SE_LOGS_FAILED was added in 8.0.4.

• Error number: MY-011017; Symbol: ER_DD_UPGRADE_SDI_INFO_UPDATE_FAILED; SQLSTATE: HY000

Message: Error in updating SDI information.
ER_DD_UPGRADE_SDI_INFO_UPDATE_FAILED was added in 8.0.4.

•   Error number: MY-011018; Symbol: ER_SKIP_UPDATING_METADATA_IN_SE_RO_MODE; SQLSTATE: HY000
Message: Skip updating %s metadata in InnoDB read-only mode.

ER_SKIP_UPDATING_METADATA_IN_SE_RO_MODE was added in 8.0.4.

•   Error number: MY-011019; Symbol: ER_CREATED_SYSTEM_WITH_VERSION; SQLSTATE: HY000
Message: Created system views with I_S version %d.

ER_CREATED_SYSTEM_WITH_VERSION was added in 8.0.4.

•   Error number: MY-011020; Symbol: ER_UNKNOWN_ERROR_DETECTED_IN_SE; SQLSTATE: HY000
Message: Unknown error detected %d in handler.

ER_UNKNOWN_ERROR_DETECTED_IN_SE was added in 8.0.4.

•   Error number: MY-011021; Symbol: ER_READ_LOG_EVENT_FAILED; SQLSTATE: HY000
Message: Error in Log_event::read_log_event(): '%s', data_len: %lu, event_type: %d.

ER_READ_LOG_EVENT_FAILED was added in 8.0.4.

•   Error number: MY-011022; Symbol: ER_ROW_DATA_TOO_BIG_TO_WRITE_IN_BINLOG; SQLSTATE: HY000
Message: The row data is greater than 4GB, which is too big to write to the binary log.

ER_ROW_DATA_TOO_BIG_TO_WRITE_IN_BINLOG was added in 8.0.4.

•   Error number: MY-011023; Symbol: ER_FAILED_TO_CONSTRUCT_DROP_EVENT_QUERY; SQLSTATE: HY000
Message: Unable to construct DROP EVENT SQL query string.

ER_FAILED_TO_CONSTRUCT_DROP_EVENT_QUERY was added in 8.0.4.

•   Error number: MY-011024; Symbol: ER_FAILED_TO_BINLOG_DROP_EVENT; SQLSTATE: HY000
Message: Unable to binlog drop event %s.%s.

ER_FAILED_TO_BINLOG_DROP_EVENT was added in 8.0.4.

•   Error number: MY-011025; Symbol: ER_FAILED_TO_START_SLAVE_THREAD; SQLSTATE: HY000
Message: Failed to start slave threads for channel '%s'.

ER_FAILED_TO_START_SLAVE_THREAD was added in 8.0.4.

•   Error number: MY-011026; Symbol: ER_RPL_IO_THREAD_KILLED; SQLSTATE: HY000
Message: %s%s.

ER_RPL_IO_THREAD_KILLED was added in 8.0.4.
• Error number: MY-011027; Symbol: ER_SLAVE_RECONNECT_FAILED; SQLSTATE: HY000
  Message: Failed registering on master, reconnecting to try again, log ‘%s’ at position %s. %s.
  ER_SLAVE_RECONNECT_FAILED was added in 8.0.4.

• Error number: MY-011028; Symbol: ER_SLAVE_KILLED_AFTER_RECONNECT; SQLSTATE: HY000
  Message: Slave I/O thread killed during or after reconnect.
  ER_SLAVE_KILLED_AFTER_RECONNECT was added in 8.0.4.

• Error number: MY-011029; Symbol: ER_SLAVE_NOT_STARTED_ON_SOME_CHANNELS; SQLSTATE: HY000
  Message: Some of the channels are not created/initialized properly. Check for additional messages above. You will not be able to start replication on those channels until the issue is resolved and the server restarted.
  ER_SLAVE_NOT_STARTED_ON_SOME_CHANNELS was added in 8.0.4.

• Error number: MY-011030; Symbol: ER_FAILED_TO_ADD_RPL_FILTER; SQLSTATE: HY000
  Message: Failed to add a replication filter into filter map for channel ‘%s’.
  ER_FAILED_TO_ADD_RPL_FILTER was added in 8.0.4.

• Error number: MY-011031; Symbol: ER_PER_CHANNEL_RPL_FILTER_CONF_FOR_GRP_RPL; SQLSTATE: HY000
  Message: There are per-channel replication filter(s) configured for group replication channel ‘%s’ which is disallowed. The filter(s) have been discarded.
  ER_PER_CHANNEL_RPL_FILTER_CONF_FOR_GRP_RPL was added in 8.0.4.

• Error number: MY-011032; Symbol: ER_RPL_FILTERS_NOT_ATTACHED_TO_CHANNEL; SQLSTATE: HY000
  Message: There are per-channel replication filter(s) configured for channel ‘%s’ which does not exist. The filter(s) have been discarded.
  ER_RPL_FILTERS_NOT_ATTACHED_TO_CHANNEL was added in 8.0.4.

• Error number: MY-011033; Symbol: ER_FAILED_TO_BUILD_DO_AND_IGNORE_TABLE_HASHES; SQLSTATE: HY000
  Message: An error occurred while building do_table and ignore_table rules to hashes for per-channel filter.
  ER_FAILED_TO_BUILD_DO_AND_IGNORE_TABLE_HASHES was added in 8.0.4.

• Error number: MY-011034; Symbol: ER_CLONE_PLUGIN_NOT_LOADED; SQLSTATE: HY000
  Message: Clone plugin not loaded.
  ER_CLONE_PLUGIN_NOT_LOADED was added in 8.0.4, removed after 8.0.16.

• Error number: MY-011034; Symbol: ER_CLONE_PLUGIN_NOT_LOADED_TRACE; SQLSTATE: HY000
Message: Clone plugin cannot be loaded.

**ER_CLONE_PLUGIN_NOT_LOADED_TRACE** was added in 8.0.17.

- **Error number:** MY-011035; **Symbol:** ER_CLONE_HANDLER_EXISTS; **SQLSTATE:** HY000
  Message: Clone Handler exists.

  Message: Could not create Clone Handler.

**ER_CLONE_CREATE_HANDLER_FAIL_TRACE** was added in 8.0.17.

- **Error number:** MY-011037; **Symbol:** ER_CYCLE_TIMER_IS_NOTAVAILABLE; **SQLSTATE:** HY000
  Message: The CYCLE timer is not available. WAIT events in the performance_schema will not be timed.

**ER_CYCLE_TIMER_IS_NOTAVAILABLE** was added in 8.0.4.

- **Error number:** MY-011038; **Symbol:** ER_NANOSECOND_TIMER_IS_NOTAVAILABLE; **SQLSTATE:** HY000
  Message: The NANOSECOND timer is not available. IDLE/STAGE/STATEMENT/TRANSACTION events in the performance_schema will not be timed.

**ER_NANOSECOND_TIMER_IS_NOTAVAILABLE** was added in 8.0.4.

- **Error number:** MY-011039; **Symbol:** ER_MICROSECOND_TIMER_IS_NOTAVAILABLE; **SQLSTATE:** HY000
  Message: The MICROSECOND timer is not available. IDLE/STAGE/STATEMENT/TRANSACTION events in the performance_schema will not be timed.

**ER_MICROSECOND_TIMER_IS_NOTAVAILABLE** was added in 8.0.4.

- **Error number:** MY-011040; **Symbol:** ER_PFS_MALLOC_ARRAY_OVERFLOW; **SQLSTATE:** HY000
  Message: Failed to allocate memory for %zu chunks each of size %zu for buffer '%s' due to overflow.

**ER_PFS_MALLOC_ARRAY_OVERFLOW** was added in 8.0.4.

- **Error number:** MY-011041; **Symbol:** ER_PFS_MALLOC_ARRAY_OOM; **SQLSTATE:** HY000
Message: Failed to allocate %zu bytes for buffer '%s' due to out-of-memory.

ER_PFS_MALLOC_ARRAY_OOM was added in 8.0.4.

- Error number: MY-011042; Symbol: ER_INNODB_FAILED_TO_FIND_IDX_WITH_KEY_NO; SQLSTATE: HY000

Message: InnoDB could not find index %s key no %u for table %s through its index translation table.

ER_INNODB_FAILED_TO_FIND_IDX_WITH_KEY_NO was added in 8.0.4.

- Error number: MY-011043; Symbol: ER_INNODB_FAILED_TO_FIND_IDX; SQLSTATE: HY000

Message: Cannot find index %s in InnoDB index translation table.

ER_INNODB_FAILED_TO_FIND_IDX was added in 8.0.4.

- Error number: MY-011044; Symbol: ER_INNODB_FAILED_TO_FIND_IDX_FROM_DICT_CACHE; SQLSTATE: HY000

Message: InnoDB could not find key no %u with name %s from dict cache for table %s.

ER_INNODB_FAILED_TO_FIND_IDX_FROM_DICT_CACHE was added in 8.0.4.

- Error number: MY-011045; Symbol: ER_INNODB_ACTIVE_INDEX_CHANGE_FAILED; SQLSTATE: HY000

Message: InnoDB: change_active_index(%u) failed.

ER_INNODB_ACTIVE_INDEX_CHANGE_FAILED was added in 8.0.4.

- Error number: MY-011046; Symbol: ER_INNODB_DIFF_IN_REF_LEN; SQLSTATE: HY000

Message: Stored ref len is %lu, but table ref len is %lu.

ER_INNODB_DIFF_IN_REF_LEN was added in 8.0.4.

- Error number: MY-011047; Symbol: ER_WRONG_TYPE_FOR_COLUMN_PREFIX_IDX_FLD; SQLSTATE: HY000

Message: MySQL is trying to create a column prefix index field, on an inappropriate data type. Table name %s, column name %s.

ER_WRONG_TYPE_FOR_COLUMN_PREFIX_IDX_FLD was added in 8.0.4.

- Error number: MY-011048; Symbol: ER_INNODB_CANNOT_CREATE_TABLE; SQLSTATE: HY000

Message: Cannot create table %s.

ER_INNODB_CANNOT_CREATE_TABLE was added in 8.0.4.

- Error number: MY-011049; Symbol: ER_INNODB_INTERNAL_INDEX; SQLSTATE: HY000

Message: Found index %s in InnoDB index list but not its MySQL index number. It could be an InnoDB internal index.

ER_INNODB_INTERNAL_INDEX was added in 8.0.4.
Server Error Message Reference

- Error number: MY-011050; Symbol: ER_INNODB_IDX_CNT_MORE_THAN_DEFINED_IN_MYSQL; SQLSTATE: HY000
  Message: InnoDB: Table %s contains %lu indexes inside InnoDB, which is different from the number of indexes %u defined in MySQL.
  ER_INNODB_IDX_CNT_MORE_THAN_DEFINED_IN_MYSQL was added in 8.0.4.

- Error number: MY-011051; Symbol: ER_INNODB_IDX_CNT_FEWER_THANDEFINED_IN_MYSQL; SQLSTATE: HY000
  Message: Table %s contains fewer indexes inside InnoDB than are defined in the MySQL. Have you mixed up with data dictionary from different installation?
  ER_INNODB_IDX_CNT_FEWER_THAN_DEFINED_IN_MYSQL was added in 8.0.4.

- Error number: MY-011052; Symbol: ER_INNODB_IDX_COLUMN_CNT_DIFF; SQLSTATE: HY000
  Message: Index %s of %s has %lu columns unique inside InnoDB, but MySQL is asking statistics for %lu columns. Have you mixed data dictionary from different installation?
  ER_INNODB_IDX_COLUMN_CNT_DIFF was added in 8.0.4.

  Message: %s

**ER_DEPRECATED_SYNTAX_WITH_REPLACEMENT** was added in 8.0.4.
Message: The syntax '%s' is deprecated and will be removed in a future release. Please use %s instead.
 ER_DEPRECATED_SYNTAX_WITH_REPLACEMENT was added in 8.0.4.

• Error number: MY-011069; Symbol: ER_DEPRECATED_SYNTAX_NO_REPLACEMENT; SQLSTATE: HY000
  Message: The syntax '%s' is deprecated and will be removed in a future release.
  ER_DEPRECATED_SYNTAX_NO_REPLACEMENT was added in 8.0.4.

• Error number: MY-011070; Symbol: ER_DEPRECATED_MSG_NO_REPLACEMENT; SQLSTATE: HY000
  Message: '%s' is deprecated and will be removed in a future release.
  ER_DEPRECATED_MSG_NO_REPLACEMENT was added in 8.0.4.

• Error number: MY-011071; Symbol: ER_LOG_PRINTF_MSG; SQLSTATE: HY000
  Message: %s
  ER_LOG_PRINTF_MSG was added in 8.0.4.

• Error number: MY-011072; Symbol: ER_BINLOG_LOGGING_NOT_POSSIBLE; SQLSTATE: HY000
  Message: Binary logging not possible. Message: %s.
  ER_BINLOG_LOGGING_NOT_POSSIBLE was added in 8.0.4.

• Error number: MY-011073; Symbol: ER_FAILED_TO_SET_PERSISTED_OPTIONS; SQLSTATE: HY000
  Message: Failed to set persisted options.
  ER_FAILED_TO_SET_PERSISTED_OPTIONS was added in 8.0.4.

• Error number: MY-011074; Symbol:
  ER_COMPONENTS_FAILED_TO_ACQUIRE_SERVICEIMPLEMENTATION; SQLSTATE: HY000
  Message: Cannot acquire specified service implementation: '%s'.
  ER_COMPONENTS_FAILED_TO_ACQUIRE_SERVICEIMPLEMENTATION was added in 8.0.4.

• Error number: MY-011075; Symbol: ER_RES_GRP_INVALID_VCPU_RANGE; SQLSTATE: HY000
  Message: Invalid VCPU range %u-%u.
  ER_RES_GRP_INVALID_VCPU_RANGE was added in 8.0.4.

• Error number: MY-011076; Symbol: ER_RES_GRP_INVALID_VCPU_ID; SQLSTATE: HY000
  Message: Invalid cpu id %u.
  ER_RES_GRP_INVALID_VCPU_ID was added in 8.0.4.

• Error number: MY-011077; Symbol: ER_ERROR_DURING_FLUSH_LOG_COMMIT_PHASE; SQLSTATE: HY000
  Message: Got error %d during FLUSH_LOGS.
ER_ERROR_DURING_FLUSH_LOG_COMMIT_PHASE was added in 8.0.4.

- Error number: MY-011078; Symbol: ER_DROP_DATABASE_FAILED_RMDIR_MANUALLY; SQLSTATE: HY000
  
  Message: Problem while dropping database. Can't remove database directory (%s). Please remove it manually.

ER_DROP_DATABASE_FAILED_RMDIR_MANUALLY was added in 8.0.4.

- Error number: MY-011079; Symbol: ER_BINLOG_EXPIRAY_LOG_DAYS_AND_SECS_USED_TOGETHER; SQLSTATE: HY000
  
  Message: The option expire_logs_days cannot be used together with option binlog_expire_logs_seconds. Therefore, value of expire_logs_days is ignored.

ER_BINLOG_EXPIRAY_LOG_DAYS_AND_SECS_USED_TOGETHER was added in 8.0.4, removed after 8.0.4.

- Error number: MY-011079; Symbol: ER_EXPIRE_LOGS_DAYS_IGNORED; SQLSTATE: HY000
  
  Message: The option expire_logs_days cannot be used together with option binlog_expire_logs_seconds. Therefore, value of expire_logs_days is ignored.

ER_EXPIRE_LOGS_DAYS_IGNORED was added in 8.0.4.

- Error number: MY-011080; Symbol: ER_BINLOG_MALFORMED_OR_OLD_RELAY_LOG; SQLSTATE: HY000
  
  Message: malformed or very old relay log which does not have FormatDescriptor.

ER_BINLOG_MALFORMED_OR_OLD_RELAY_LOG was added in 8.0.4.

- Error number: MY-011081; Symbol: ER_DD_UPGRADE_VIEW_COLUMN_NAME_TOO_LONG; SQLSTATE: HY000
  
  Message: Upgrade of view '%s.%s' failed. Re-create the view with the explicit column name lesser than 64 characters.

ER_DD_UPGRADE_VIEW_COLUMN_NAME_TOO_LONG was added in 8.0.4.

- Error number: MY-011082; Symbol: ER_TABLE_NEEDS_DUMP_UPGRADE; SQLSTATE: HY000
  
  Message: Table upgrade required for `%s`.`%s`. Please dump/reload table to fix it!

ER_TABLE_NEEDS_DUMP_UPGRADE was added in 8.0.4.

- Error number: MY-011083; Symbol: ER_DD_UPGRADE_FAILED_TO_UPDATE_VER_NO_IN_TABLESPACE; SQLSTATE: HY000
  
  Message: Error in updating version number in %s tablespace.

ER_DD_UPGRADE_FAILED_TO_UPDATE_VER_NO_IN_TABLESPACE was added in 8.0.4.

- Error number: MY-011084; Symbol: ER_KEYRING_MIGRATION_FAILED; SQLSTATE: HY000
  
  Message: Keyring migration failed.
**ER_KEYRING_MIGRATION_FAILED** was added in 8.0.4.

- **Error number:** MY-011085; Symbol: **ER_KEYRING_MIGRATION_SUCCESSFUL**; **SQLSTATE:** HY000
  
  Message: Keyring migration successful.

*ER_KEYRING_MIGRATION_SUCCESSFUL* was added in 8.0.4.

- **Error number:** MY-011086; Symbol: **ER_RESTART_RECEIVED_INFO**; **SQLSTATE:** HY000
  
  Message: Received RESTART from user %s. Restarting mysqld (Version: %s).

*ER_RESTART_RECEIVED_INFO* was added in 8.0.4.

- **Error number:** MY-011087; Symbol: **ER_LCTN_CHANGED**; **SQLSTATE:** HY000
  
  Message: Different lower_case_table_names settings for server ('%u') and data dictionary ('%u').

*ER_LCTN_CHANGED* was added in 8.0.4.

- **Error number:** MY-011088; Symbol: **ER_DD_INITIALIZE**; **SQLSTATE:** HY000
  
  Message: Data dictionary initializing version '%u'.

*ER_DD_INITIALIZE* was added in 8.0.4.

- **Error number:** MY-011089; Symbol: **ER_DD_RESTART**; **SQLSTATE:** HY000
  
  Message: Data dictionary restarting version '%u'.

*ER_DD_RESTART* was added in 8.0.4.

- **Error number:** MY-011090; Symbol: **ER_DD_UPGRADE**; **SQLSTATE:** HY000
  
  Message: Data dictionary upgrading from version '%u' to '%u'.

*ER_DD_UPGRADE* was added in 8.0.4.

- **Error number:** MY-011091; Symbol: **ER_DD_UPGRADE_OFF**; **SQLSTATE:** HY000
  
  Message: Data dictionary upgrade prohibited by the command line option '--no_dd_upgrade'.

*ER_DD_UPGRADE_OFF* was added in 8.0.4.

- **Error number:** MY-011092; Symbol: **ER_DD_UPGRADE_VERSION_NOT_SUPPORTED**; **SQLSTATE:** HY000
  
  Message: Upgrading the data dictionary from dictionary version '%u' is not supported.

*ER_DD_UPGRADE_VERSION_NOT_SUPPORTED* was added in 8.0.4.

- **Error number:** MY-011093; Symbol: **ER_DD_UPGRADE_SCHEMA_UNAVAILABLE**; **SQLSTATE:** HY000
  
  Message: Upgrading the data dictionary failed, temporary schema name '%s' not available.

*ER_DD_UPGRADE_SCHEMA_UNAVAILABLE* was added in 8.0.4.

- **Error number:** MY-011094; Symbol: **ER_DD_MINOR_DOWNGRADE**; **SQLSTATE:** HY000
Message: Data dictionary minor downgrade from version '%u' to '%u'.

ER_DD_MINOR_DOWNGRADE was added in 8.0.4.

• Error number: MY-011095; Symbol: ER_DD_MINOR_DOWNGRADE_VERSION_NOT_SUPPORTED; SQLSTATE: HY000

Message: Minor downgrade of the Data dictionary from dictionary version '%u' is not supported.

ER_DD_MINOR_DOWNGRADE_VERSION_NOT_SUPPORTED was added in 8.0.4.

• Error number: MY-011096; Symbol: ER_DD_NO_VERSION_FOUND; SQLSTATE: HY000

Message: No data dictionary version number found.

ER_DD_NO_VERSION_FOUND was added in 8.0.4.

• Error number: MY-011097; Symbol: ER_THREAD_POOL_NOT_SUPPORTED_ON_PLATFORM; SQLSTATE: HY000

Message: Thread pool not supported, requires a minimum of %s.

ER_THREAD_POOL_NOT_SUPPORTED_ON_PLATFORM was added in 8.0.4.

• Error number: MY-011098; Symbol: ER_THREAD_POOL_SIZE_TOO_LOW; SQLSTATE: HY000

Message: thread_pool_size=0 means thread pool disabled, Allowed range of thread_pool_size is %d-%d.

ER_THREAD_POOL_SIZE_TOO_LOW was added in 8.0.4.

• Error number: MY-011099; Symbol: ER_THREAD_POOL_SIZE_TOO_HIGH; SQLSTATE: HY000

Message: thread_pool_size=%lu is too high, %d is maximum, thread pool is disabled. Allowed range of thread_pool_size is %d-%d.

ER_THREAD_POOL_SIZE_TOO_HIGH was added in 8.0.4.

• Error number: MY-011100; Symbol: ER_THREAD_POOL_ALGORITHM_INVALID; SQLSTATE: HY000

Message: thread_pool_algorithm can be set to 0 and 1, 0 indicates the default low concurrency algorithm, 1 means a high concurrency algorithm.

ER_THREAD_POOL_ALGORITHM_INVALID was added in 8.0.4.

• Error number: MY-011101; Symbol: ER_THREAD_POOL_INVALID_STALL_LIMIT; SQLSTATE: HY000

Message: thread_pool_stall_limit can be %d at minimum and %d at maximum, smaller values would render the thread pool fairly useless and higher values could make it possible to have undetected deadlock issues in the MySQL Server.

ER_THREAD_POOL_INVALID_STALL_LIMIT was added in 8.0.4.

• Error number: MY-011102; Symbol: ER_THREAD_POOL_INVALID_PRIO_KICKUP_TIMER; SQLSTATE: HY000
Message: Invalid value of thread_pool_prio_kickup_timer specified. Value of thread_pool_prio_kickup_timer should be in range 0-4294967294.

**ER_THREAD_POOL_INVALID_PRIO_KICKUP_TIMER** was added in 8.0.4.

- **Error number:** MY-011103; Symbol: **ER_THREAD_POOL_MAX_UNUSED_THREADS_INVALID**; SQLSTATE: HY000

Message: thread_pool_max_unused_threads cannot be set higher than %d.

**ER_THREAD_POOL_MAX_UNUSED_THREADS_INVALID** was added in 8.0.4.

- **Error number:** MY-011104; Symbol: **ER_THREAD_POOL_CON_HANDLER_INIT_FAILED**; SQLSTATE: HY000

Message: Failed to instantiate the connection handler object.

**ER_THREAD_POOL_CON_HANDLER_INIT_FAILED** was added in 8.0.4.

- **Error number:** MY-011105; Symbol: **ER_THREAD_POOL_INIT_FAILED**; SQLSTATE: HY000

Message: Failed to initialize thread pool plugin.

**ER_THREAD_POOL_INIT_FAILED** was added in 8.0.4.

- **Error number:** MY-011106; Symbol: **ER_THREAD_POOL_PLUGIN_STARTED**; SQLSTATE: HY000

Message: Thread pool plugin started successfully with parameters: thread_pool_size = %lu, thread_pool_algorithm = %s, thread_pool_stall_limit = %u, thread_pool_prio_kickup_timer = %u, thread_pool_max_unused_threads = %u, thread_pool_high_priority_connection = %d.

**ER_THREAD_POOL_PLUGIN_STARTED** was added in 8.0.4.

- **Error number:** MY-011107; Symbol: **ER_THREAD_POOL_CANNOT_SET_THREAD_SPECIFIC_DATA**; SQLSTATE: HY000

Message: Can't setup connection teardown thread-specific data.

**ER_THREAD_POOL_CANNOT_SET_THREAD_SPECIFIC_DATA** was added in 8.0.4.

- **Error number:** MY-011108; Symbol: **ER_THREAD_POOL_FAILED_TO_CREATE_CONNECT_HANDLER_THD**; SQLSTATE: HY000

Message: Creation of connect handler thread failed.

**ER_THREAD_POOL_FAILED_TO_CREATE_CONNECT_HANDLER_THD** was added in 8.0.4.

- **Error number:** MY-011109; Symbol: **ER_THREAD_POOL_FAILED_TO_CREATE_THD_AND_AUTH_CONN**; SQLSTATE: HY000

Message: Failed to create thd and authenticate connection.

**ER_THREAD_POOL_FAILED_TO_CREATE_THD_AND_AUTH_CONN** was added in 8.0.4.

- **Error number:** MY-011110; Symbol: **ER_THREAD_POOL_FAILED_PROCESS_CONNECT_EVENT**; SQLSTATE: HY000

Message: Failed to process connection event.
ER_THREAD_POOL_FAILED_PROCESS_CONNECT_EVENT was added in 8.0.4.

- Error number: MY-011111; Symbol: ER_THREAD_POOL_FAILED_TO_CREATE_POOL; SQLSTATE: HY000
  Message: Can't create pool thread (error %d, errno: %d).

ER_THREAD_POOL_FAILED_TO_CREATE_POOL was added in 8.0.4.

- Error number: MY-011112; Symbol: ER_THREAD_POOL_RATELIMITED_ERROR_MSGS; SQLSTATE: HY000
  Message: Can't create pool thread (error %d, errno: %d).

ER_THREAD_POOL_RATELIMITED_ERROR_MSGS was added in 8.0.4.

- Error number: MY-011113; Symbol: ER_THREAD_POOL_LOW_LEVEL_INIT_FAILED; SQLSTATE: HY000
  Message: tp_group_low_level_init() failed.

ER_THREAD_POOL_LOW_LEVEL_INIT_FAILED was added in 8.0.4.

- Error number: MY-011114; Symbol: ER_THREAD_POOL_LOW_LEVEL_REARM_FAILED; SQLSTATE: HY000
  Message: Rearm failed even after 30 seconds, can't continue without notify socket.

ER_THREAD_POOL_LOW_LEVEL_REARM_FAILED was added in 8.0.4.

- Error number: MY-011115; Symbol: ER_THREAD_POOL_BUFFER_TOO_SMALL; SQLSTATE: HY000
  Message: %s: %s buffer is too small

ER_THREAD_POOL_BUFFER_TOO_SMALL was added in 8.0.4.

- Error number: MY-011116; Symbol: ER_MECAB_NOT_SUPPORTED; SQLSTATE: HY000
  Message: Mecab v%s is not supported, the lowest version supported is v%s.

ER_MECAB_NOT_SUPPORTED was added in 8.0.4.

- Error number: MY-011117; Symbol: ER_MECAB_NOT_VERIFIED; SQLSTATE: HY000
  Message: Mecab v%s is not verified, the highest version supported is v%s.

ER_MECAB_NOT_VERIFIED was added in 8.0.4.

- Error number: MY-011118; Symbol: ER_MECAB_CREATING_MODEL; SQLSTATE: HY000
  Message: Mecab: Trying createModel(%s).

ER_MECAB_CREATING_MODEL was added in 8.0.4.

- Error number: MY-011119; Symbol: ER_MECAB_FAILED_TO_CREATE_MODEL; SQLSTATE: HY000
  Message: Mecab: createModel() failed: %s.

ER_MECAB_FAILED_TO_CREATE_MODEL was added in 8.0.4.
• Error number: **MY-011120**; Symbol: **ER_MECAB_FAILED_TO_CREATE_TRIGGER**; SQLSTATE: **HY000**
  
  **Message:** Mecab: createTagger() failed: %s.

  `ER_MECAB_FAILED_TO_CREATE_TRIGGER` was added in 8.0.4.

• Error number: **MY-011121**; Symbol: **ER_MECAB_UNSUPPORTED_CHARSET**; SQLSTATE: **HY000**
  
  **Message:** Mecab: Unsupported dictionary charset %s.

  `ER_MECAB_UNSUPPORTED_CHARSET` was added in 8.0.4.

• Error number: **MY-011122**; Symbol: **ER_MECAB_CHARSET_LOADED**; SQLSTATE: **HY000**
  
  **Message:** Mecab: Loaded dictionary charset is %s.

  `ER_MECAB_CHARSET_LOADED` was added in 8.0.4.

• Error number: **MY-011123**; Symbol: **ER_MECAB_PARSE_FAILED**; SQLSTATE: **HY000**
  
  **Message:** Mecab: parse() failed: %s.

  `ER_MECAB_PARSE_FAILED` was added in 8.0.4.

• Error number: **MY-011124**; Symbol: **ER_MECAB_OOM_WHILE_PARSING_TEXT**; SQLSTATE: **HY000**
  
  **Message:** Mecab: parse() failed: out of memory.

  `ER_MECAB_OOM_WHILE_PARSING_TEXT` was added in 8.0.4.

• Error number: **MY-011125**; Symbol: **ER_MECAB_CREATE_LATTICE_FAILED**; SQLSTATE: **HY000**
  
  **Message:** Mecab: createLattice() failed: %s.

  `ER_MECAB_CREATE_LATTICE_FAILED` was added in 8.0.4.

• Error number: **MY-011126**; Symbol: **ER_SEMISYNC_TRACE_ENTER_FUNC**; SQLSTATE: **HY000**
  
  **Message:** ---> %s enter.

  `ER_SEMISYNC_TRACE_ENTER_FUNC` was added in 8.0.4.

• Error number: **MY-011127**; Symbol: **ER_SEMISYNC_TRACE_EXIT_WITH_INT_EXIT_CODE**; SQLSTATE: **HY000**
  
  **Message:** <--- %s exit (%d).

  `ER_SEMISYNC_TRACE_EXIT_WITH_INT_EXIT_CODE` was added in 8.0.4.

• Error number: **MY-011128**; Symbol: **ER_SEMISYNC_TRACE_EXIT_WITH_BOOL_EXIT_CODE**; SQLSTATE: **HY000**
  
  **Message:** <--- %s exit (%s).

  `ER_SEMISYNC_TRACE_EXIT_WITH_BOOL_EXIT_CODE` was added in 8.0.4.

• Error number: **MY-011129**; Symbol: **ER_SEMISYNC_TRACE_EXIT**; SQLSTATE: **HY000**
  
  **Message:** <--- %s exit.
ER_SEMISYNC_TRACE_EXIT was added in 8.0.4.

- Error number: MY-011130; Symbol: ER_SEMISYNC_RPL_INIT_FOR_TRX; SQLSTATE: HY000
  Message: Semi-sync replication initialized for transactions.

ER_SEMISYNC_RPL_INIT_FOR_TRX was added in 8.0.4.

- Error number: MY-011131; Symbol: ER_SEMISYNC_FAILED_TO_ALLOCATE_TRX_NODE; SQLSTATE: HY000
  Message: %s: transaction node allocation failed for: (%s, %lu).

ER_SEMISYNC_FAILED_TO_ALLOCATE_TRX_NODE was added in 8.0.4.

- Error number: MY-011132; Symbol: ER_SEMISYNC_BINLOG_WRITE_OUT_OF_ORDER; SQLSTATE: HY000
  Message: %s: binlog write out-of-order, tail (%s, %lu), new node (%s, %lu).

ER_SEMISYNC_BINLOG_WRITE_OUT_OF_ORDER was added in 8.0.4.

- Error number: MY-011133; Symbol: ER_SEMISYNC_INSERT_LOG_INFO_IN_ENTRY; SQLSTATE: HY000
  Message: %s: insert (%s, %lu) in entry(%u).

ER_SEMISYNC_INSERT_LOG_INFO_IN_ENTRY was added in 8.0.4.

- Error number: MY-011134; Symbol: ER_SEMISYNC_PROBE_LOG_INFO_IN_ENTRY; SQLSTATE: HY000
  Message: %s: probe (%s, %lu) in entry(%u).

ER_SEMISYNC_PROBE_LOG_INFO_IN_ENTRY was added in 8.0.4.

- Error number: MY-011135; Symbol: ER_SEMISYNC_CLEARED_ALL_ACTIVE_TRANSACTION_NODES; SQLSTATE: HY000
  Message: %s: cleared all nodes.

ER_SEMISYNC_CLEARED_ALL_ACTIVE_TRANSACTION_NODES was added in 8.0.4.

- Error number: MY-011136; Symbol: ER_SEMISYNC_CLEARED_ACTIVE_TRANSACTION_TILL_POS; SQLSTATE: HY000
  Message: %s: cleared %d nodes back until pos (%s, %lu).

ER_SEMISYNC_CLEARED_ACTIVE_TRANSACTION_TILL_POS was added in 8.0.4.

- Error number: MY-011137; Symbol: ER_SEMISYNC_REPLY_MAGIC_NO_ERROR; SQLSTATE: HY000
  Message: Read semi-sync reply magic number error.

ER_SEMISYNC_REPLY_MAGIC_NO_ERROR was added in 8.0.4.

- Error number: MY-011138; Symbol: ER_SEMISYNC_REPLY_PKT_LENGTH_TOO_SMALL; SQLSTATE: HY000
Message: Read semi-sync reply length error: packet is too small.

ER_SEMISYNC_REPLY_PKT_LENGTH_TOO_SMALL was added in 8.0.4.

- Error number: MY-011139; Symbol: ER_SEMISYNC_REPLY_BINLOG_FILE_TOO_LARGE; SQLSTATE: HY000

Message: Read semi-sync reply binlog file length too large.

ER_SEMISYNC_REPLY_BINLOG_FILE_TOO_LARGE was added in 8.0.4.

- Error number: MY-011140; Symbol: ER_SEMISYNC_SERVER_REPLY; SQLSTATE: HY000

Message: %s: Got reply(%s, %lu) from server %u.

ER_SEMISYNC_SERVER_REPLY was added in 8.0.4.

- Error number: MY-011141; Symbol: ER_SEMISYNC_FUNCTION_CALLED_TWICE; SQLSTATE: HY000

Message: %s called twice.

ER_SEMISYNC_FUNCTION_CALLED_TWICE was added in 8.0.4.

- Error number: MY-011142; Symbol: ER_SEMISYNC_RPL_ENABLED_ON_MASTER; SQLSTATE: HY000

Message: Semi-sync replication enabled on the master.

ER_SEMISYNC_RPL_ENABLED_ON_MASTER was added in 8.0.4.

- Error number: MY-011143; Symbol: ER_SEMISYNC_MASTER_OOM; SQLSTATE: HY000

Message: Cannot allocate memory to enable semi-sync on the master.

ER_SEMISYNC_MASTER_OOM was added in 8.0.4.

- Error number: MY-011144; Symbol: ER_SEMISYNC_DISABLED_ON_MASTER; SQLSTATE: HY000

Message: Semi-sync replication disabled on the master.

ER_SEMISYNC_DISABLED_ON_MASTER was added in 8.0.4.

- Error number: MY-011145; Symbol: ER_SEMISYNC_FORCED_SHUTDOWN; SQLSTATE: HY000

ER_SEMISYNC_FORCED_SHUTDOWN was added in 8.0.4.

- Error number: MY-011146; Symbol: ER_SEMISYNC_MASTER_GOT_REPLY_AT_POS; SQLSTATE: HY000

Message: %s: Got reply at (%s, %lu).

ER_SEMISYNC_MASTER_GOT_REPLY_AT_POS was added in 8.0.4.

- Error number: MY-011147; Symbol: ER_SEMISYNC_MASTER_SIGNAL_ALL_WAITING_THREADS; SQLSTATE: HY000

Message: %s: signal all waiting threads.
**ER_SEMISYNC_MASTER_SIGNAL_ALL_WAITING_THREADS** was added in 8.0.4.

- Error number: MY-011148; Symbol: ER_SEMISYNC_MASTER_TRX_WAIT_POS; SQLSTATE: HY000
  
  **Message:** %s: wait pos (%s, %lu), repl(%d).

  **ER_SEMISYNC_MASTER_TRX_WAIT_POS** was added in 8.0.4.

- Error number: MY-011149; Symbol: ER_SEMISYNC_BINLOG_REPLY_IS_AHEAD; SQLSTATE: HY000
  
  **Message:** %s: Binlog reply is ahead (%s, %lu).

  **ER_SEMISYNC_BINLOG_REPLY_IS_AHEAD** was added in 8.0.4.

- Error number: MY-011150; Symbol: ER_SEMISYNC_MOVE_BACK_WAIT_POS; SQLSTATE: HY000
  
  **Message:** %s: move back wait position (%s, %lu).

  **ER_SEMISYNC_MOVE_BACK_WAIT_POS** was added in 8.0.4.

- Error number: MY-011151; Symbol: ER_SEMISYNC_INIT_WAIT_POS; SQLSTATE: HY000
  
  **Message:** %s: init wait position (%s, %lu).

  **ER_SEMISYNC_INIT_WAIT_POS** was added in 8.0.4.

- Error number: MY-011152; Symbol: ER_SEMISYNC_WAIT_TIME_FOR_BINLOG_SENT; SQLSTATE: HY000
  
  **Message:** %s: wait %lu ms for binlog sent (%s, %lu).

  **ER_SEMISYNC_WAIT_TIME_FOR_BINLOG_SENT** was added in 8.0.4.

- Error number: MY-011153; Symbol: ER_SEMISYNC_WAIT_FOR_BINLOG_TIMEDOUT; SQLSTATE: HY000
  
  **Message:** Timeout waiting for reply of binlog (file: %s, pos: %lu), semi-sync up to file %s, position %lu.

  **ER_SEMISYNC_WAIT_FOR_BINLOG_TIMEDOUT** was added in 8.0.4.

- Error number: MY-011154; Symbol: ER_SEMISYNC_WAIT_TIME_ASSESSMENT_FOR_COMMIT_TRX_FAILED; SQLSTATE: HY000
  
  **Message:** Assessment of waiting time for commitTrx failed at wait position (%s, %lu).

  **ER_SEMISYNC_WAIT_TIME_ASSESSMENT_FOR_COMMIT_TRX_FAILED** was added in 8.0.4.

- Error number: MY-011155; Symbol: ER_SEMISYNC_RPL_SWITCHED_OFF; SQLSTATE: HY000
  
  **Message:** Semi-sync replication switched OFF.

  **ER_SEMISYNC_RPL_SWITCHED_OFF** was added in 8.0.4.

- Error number: MY-011156; Symbol: ER_SEMISYNC_RPL_SWITCHED_ON; SQLSTATE: HY000
  
  **Message:** Semi-sync replication switched ON at (%s, %lu).

  **ER_SEMISYNC_RPL_SWITCHED_ON** was added in 8.0.4.
• Error number: MY-011157; Symbol: ER_SEMISYNC_NO_SPACE_IN_THE_PKT; SQLSTATE: HY000
Message: No enough space in the packet for semi-sync extra header, semi-sync replication disabled.
ER_SEMISYNC_NO_SPACE_IN_THE_PKT was added in 8.0.4.

• Error number: MY-011158; Symbol: ER_SEMISYNC_SYNC_HEADER_UPDATE_INFO; SQLSTATE: HY000
Message: %s: server(%d), (%s, %lu) sync(%d), repl(%d).
ER_SEMISYNC_SYNC_HEADER_UPDATE_INFO was added in 8.0.4.

• Error number: MY-011159; Symbol: ER_SEMISYNC_FAILED_TO_INSERT_TRX_NODE; SQLSTATE: HY000
Message: Semi-sync failed to insert tranx_node for binlog file: %s, position: %lu.
ER_SEMISYNC_FAILED_TO_INSERT_TRX_NODE was added in 8.0.4.

• Error number: MY-011160; Symbol: ER_SEMISYNC_TRX_SKIPPED_AT_POS; SQLSTATE: HY000
Message: %s: Transaction skipped at (%s, %lu).
ER_SEMISYNC_TRX_SKIPPED_AT_POS was added in 8.0.4.

• Error number: MY-011161; Symbol: ER_SEMISYNC_MASTER_FAILED_ON_NET_FLUSH; SQLSTATE: HY000
Message: Semi-sync master failed on net_flush() before waiting for slave reply.
ER_SEMISYNC_MASTER_FAILED_ON_NET_FLUSH was added in 8.0.4.

• Error number: MY-011162; Symbol: ER_SEMISYNC_RECEIVED_ACK_IS_SMALLER; SQLSTATE: HY000
Message: The received ack is smaller than m_greatest_ack.
ER_SEMISYNC_RECEIVED_ACK_IS_SMALLER was added in 8.0.4.

• Error number: MY-011163; Symbol: ER_SEMISYNC_ADD_ACK_TO_SLOT; SQLSTATE: HY000
Message: Add the ack into slot %u.
ER_SEMISYNC_ADD_ACK_TO_SLOT was added in 8.0.4.

• Error number: MY-011164; Symbol: ER_SEMISYNC_UPDATE_EXISTING_SLAVE_ACK; SQLSTATE: HY000
Message: Update an exsiting ack in slot %u.
ER_SEMISYNC_UPDATE_EXISTING_SLAVE_ACK was added in 8.0.4.

• Error number: MY-011165; Symbol: ER_SEMISYNC_FAILED_TO_START_ACK_RECEIVER_THD; SQLSTATE: HY000
Message: Failed to start semi-sync ACK receiver thread, could not create thread(errno:%d).
ER_SEMISYNC_FAILED_TO_START_ACK_RECEIVER_THD was added in 8.0.4.
Server Error Message Reference

- **Error number:** MY-011166; **Symbol:** ER_SEMISYNC_STARTING_ACK_RECEIVER_THD; **SQLSTATE:** HY000
  
  Message: Starting ack receiver thread.
  
  ER_SEMISYNC_STARTING_ACK_RECEIVER_THD was added in 8.0.4.

- **Error number:** MY-011167; **Symbol:** ER_SEMISYNC_FAILED_TO_WAIT_ON_DUMP_SOCKET; **SQLSTATE:** HY000
  
  Message: Failed to wait on semi-sync dump sockets, error: errno=%d.
  
  ER_SEMISYNC_FAILED_TO_WAIT_ON_DUMP_SOCKET was added in 8.0.4.

- **Error number:** MY-011168; **Symbol:** ER_SEMISYNC_STOPPING_ACK_RECEIVER_THREAD; **SQLSTATE:** HY000
  
  Message: Stopping ack receiver thread.
  
  ER_SEMISYNC_STOPPING_ACK_RECEIVER_THREAD was added in 8.0.4.

- **Error number:** MY-011169; **Symbol:** ER_SEMISYNC_FAILED_REGISTER_SLAVE_TO_RECEIVER; **SQLSTATE:** HY000
  
  Message: Failed to register slave to semi-sync ACK receiver thread.
  
  ER_SEMISYNC_FAILED_REGISTER_SLAVE_TO_RECEIVER was added in 8.0.4.

- **Error number:** MY-011170; **Symbol:** ER_SEMISYNC_START_BINLOG_DUMP_TO_SLAVE; **SQLSTATE:** HY000
  
  Message: Start %s binlog_dump to slave (server_id: %d), pos(%s, %lu).
  
  ER_SEMISYNC_START_BINLOG_DUMP_TO_SLAVE was added in 8.0.4.

- **Error number:** MY-011171; **Symbol:** ER_SEMISYNC_STOP_BINLOG_DUMP_TO_SLAVE; **SQLSTATE:** HY000
  
  Message: Stop %s binlog_dump to slave (server_id: %d).
  
  ER_SEMISYNC_STOP_BINLOG_DUMP_TO_SLAVE was added in 8.0.4.

- **Error number:** MY-011172; **Symbol:** ER_SEMISYNC_UNREGISTER_TRX_OBSERVER_FAILED; **SQLSTATE:** HY000
  
  Message: unregister_trans_observer failed.
  
  ER_SEMISYNC_UNREGISTER_TRX_OBSERVER_FAILED was added in 8.0.4.

- **Error number:** MY-011173; **Symbol:** ER_SEMISYNC_UNREGISTER_BINLOG_STORAGE_OBSERVER_FAILED; **SQLSTATE:** HY000
  
  Message: unregister_binlog_storage_observer failed.
  
  ER_SEMISYNC_UNREGISTER_BINLOG_STORAGE_OBSERVER_FAILED was added in 8.0.4.

- **Error number:** MY-011174; **Symbol:** ER_SEMISYNC_UNREGISTER_BINLOG_TRANSMIT_OBSERVER_FAILED; **SQLSTATE:** HY000
Message: unregister_binlog_transmit_observer failed.

`ER_SEMISYNC_UNREGISTER_BINLOG_TRANSMIT_OBSERVER_FAILED` was added in 8.0.4.

- **Error number:** `MY-011175`; **Symbol:** `ER_SEMISYNC_UNREGISTERED_REPLICATOR`; **SQLSTATE:** `HY000`

Message: unregister_replicator OK.

`ER_SEMISYNC_UNREGISTERED_REPLICATOR` was added in 8.0.4.

- **Error number:** `MY-011176`; **Symbol:** `ER_SEMISYNC_SOCKET_FD_TOO_LARGE`; **SQLSTATE:** `HY000`

Message: Semisync slave socket fd is `%u`. select() cannot handle if the socket fd is bigger than `%u` (FD_SETSIZE).

`ER_SEMISYNC_SOCKET_FD_TOO_LARGE` was added in 8.0.4.

- **Error number:** `MY-011177`; **Symbol:** `ER_SEMISYNC_SLAVE_REPLY`; **SQLSTATE:** `HY000`

Message: `%s`: reply - %d.

`ER_SEMISYNC_SLAVE_REPLY` was added in 8.0.4.

- **Error number:** `MY-011178`; **Symbol:** `ER_SEMISYNC_MISSING_MAGIC_NO_FOR_SEMISYNC_PKT`; **SQLSTATE:** `HY000`

Message: Missing magic number for semi-sync packet, packet len: %lu.

`ER_SEMISYNC_MISSING_MAGIC_NO_FOR_SEMISYNC_PKT` was added in 8.0.4.

- **Error number:** `MY-011179`; **Symbol:** `ER_SEMISYNC_SLAVE_START`; **SQLSTATE:** `HY000`

Message: Slave I/O thread: Start %s replication to master '%s'@'%s' in log '%s' at position %lu.

`ER_SEMISYNC_SLAVE_START` was added in 8.0.4.

- **Error number:** `MY-011180`; **Symbol:** `ER_SEMISYNC_SLAVE_REPLY_WITH_BINLOG_INFO`; **SQLSTATE:** `HY000`

Message: `%s`: reply (%s, %lu).

`ER_SEMISYNC_SLAVE_REPLY_WITH_BINLOG_INFO` was added in 8.0.4.

- **Error number:** `MY-011181`; **Symbol:** `ER_SEMISYNC_SLAVE_NET_FLUSH_REPLY_FAILED`; **SQLSTATE:** `HY000`

Message: Semi-sync slave net_flush() reply failed.

`ER_SEMISYNC_SLAVE_NET_FLUSH_REPLY_FAILED` was added in 8.0.4.

- **Error number:** `MY-011182`; **Symbol:** `ER_SEMISYNC_SLAVE_SEND_REPLY_FAILED`; **SQLSTATE:** `HY000`

Message: Semi-sync slave send reply failed: %s (%d).

`ER_SEMISYNC_SLAVE_SEND_REPLY_FAILED` was added in 8.0.4.
• Error number: **MY-011183**; Symbol: **ER_SEMISYNC_EXECUTION_FAILED_ON_MASTER**; SQLSTATE: **HY000**

Message: Execution failed on master: %s; error %d

*ER_SEMISYNC_EXECUTION_FAILED_ON_MASTER* was added in 8.0.4.

• Error number: **MY-011184**; Symbol: **ER_SEMISYNC_NOT_SUPPORTED_BY_MASTER**; SQLSTATE: **HY000**

Message: Master server does not support semi-sync, fallback to asynchronous replication

*ER_SEMISYNC_NOT_SUPPORTED_BY_MASTER* was added in 8.0.4.

• Error number: **MY-011185**; Symbol: **ER_SEMISYNC_SLAVE_SET_FAILED**; SQLSTATE: **HY000**

Message: Set 'rpl_semi_sync_slave=1' on master failed

*ER_SEMISYNC_SLAVE_SET_FAILED* was added in 8.0.4.

• Error number: **MY-011186**; Symbol: **ER_SEMISYNC_FAILED_TO_STOP_ACK_RECEIVER_THD**; SQLSTATE: **HY000**

Message: Failed to stop ack receiver thread on my_thread_join, errno(%d).

*ER_SEMISYNC_FAILED_TO_STOP_ACK_RECEIVER_THD* was added in 8.0.4.

• Error number: **MY-011187**; Symbol: **ER_FIREWALL_FAILED_TO_READ_FIREWALL_TABLES**; SQLSTATE: **HY000**

Message: Failed to read the firewall tables

*ER_FIREWALL_FAILED_TO_READ_FIREWALL_TABLES* was added in 8.0.4.

• Error number: **MY-011188**; Symbol: **ER_FIREWALL_FAILED_TO_REG_DYNAMIC_PRIVILEGES**; SQLSTATE: **HY000**

Message: Failed to register dynamic privileges

*ER_FIREWALL_FAILED_TO_REG_DYNAMIC_PRIVILEGES* was added in 8.0.4.

• Error number: **MY-011189**; Symbol: **ER_FIREWALL_RECORDING_STMT_WAS_TRUNCATED**; SQLSTATE: **HY000**

Message: Statement was truncated and not recorded: %s

*ER_FIREWALL_RECORDING_STMT_WAS_TRUNCATED* was added in 8.0.4.

• Error number: **MY-011190**; Symbol: **ER_FIREWALL_RECORDING_STMT_WITHOUT_TEXT**; SQLSTATE: **HY000**

Message: Statement with no text was not recorded

*ER_FIREWALL_RECORDING_STMT_WITHOUT_TEXT* was added in 8.0.4.

• Error number: **MY-011191**; Symbol: **ER_FIREWALL_SUSPICIOUS_STMT**; SQLSTATE: **HY000**

Message: SUSPICIOUS STATEMENT from "%s". Reason: %s Statement: %s
**ER_FIREWALL_SUSPICIOUS_STMT** was added in 8.0.4.

- **Error number:** MY-011192; Symbol: **ER_FIREWALL_ACCESS_DENIED**; SQLSTATE: HY000
  
  Message: ACCESS DENIED for '%s'. Reason: %s Statement: %s

**ER_FIREWALL_ACCESS_DENIED** was added in 8.0.4.

- **Error number:** MY-011193; Symbol: **ER_FIREWALL_SKIPPED_UNKNOWN_USER_MODE**; SQLSTATE: HY000
  
  Message: Skipped unknown user mode '%%s'

**ER_FIREWALL_SKIPPED_UNKNOWN_USER_MODE** was added in 8.0.4.

- **Error number:** MY-011194; Symbol: **ER_FIREWALL_RELOADING_CACHE**; SQLSTATE: HY000
  
  Message: Reloading cache from disk

**ER_FIREWALL_RELOADING_CACHE** was added in 8.0.4.

- **Error number:** MY-011195; Symbol: **ER_FIREWALL_RESET_FOR_USER**; SQLSTATE: HY000
  
  Message: FIREWALL RESET for '%s'

**ER_FIREWALL_RESET_FOR_USER** was added in 8.0.4.

- **Error number:** MY-011196; Symbol: **ER_FIREWALL_STATUS_FLUSHED**; SQLSTATE: HY000
  
  Message: Counters are reset to zero

**ER_FIREWALL_STATUS_FLUSHED** was added in 8.0.4.

- **Error number:** MY-011197; Symbol: **ER_KEYRING_LOGGER_ERROR_MSG**; SQLSTATE: HY000
  
  Message: %s

**ER_KEYRING_LOGGER_ERROR_MSG** was added in 8.0.4.

- **Error number:** MY-011198; Symbol: **ER_AUDIT_LOG_FILTER_IS_NOT_INSTALLED**; SQLSTATE: HY000
  
  Message: Audit Log plugin supports a filtering, which has not been installed yet. Audit Log plugin will run in the legacy mode, which will be disabled in the next release.

**ER_AUDIT_LOG_FILTER_IS_NOT_INSTALLED** was added in 8.0.4.

- **Error number:** MY-011199; Symbol: **ER_AUDIT_LOG_SWITCHING_TO_INCLUDE_LIST**; SQLSTATE: HY000
  
  Message: Previously exclude list is used, now we start using include list, exclude list is set to NULL.

**ER_AUDIT_LOG_SWITCHING_TO_INCLUDE_LIST** was added in 8.0.4.

- **Error number:** MY-011200; Symbol: **ER_AUDIT_LOG_CANNOT_SET_LOG_POLICY_WITH_OTHER_POLICIES**; SQLSTATE: HY000
Message: Cannot set audit_log_policy simultaneously with either audit_log_connection_policy or audit_log_statement_policy, setting audit_log_connection_policy and audit_log_statement_policy based on audit_log_policy.

ER_AUDIT_LOG_CANNOT_SET_LOG_POLICY_WITH_OTHER_POLICIES was added in 8.0.4.

- Error number: MY-011201; Symbol: ER_AUDIT_LOG_ONLY_INCLUDE_LIST_USED; SQLSTATE: HY000
  Message: Both include and exclude lists provided, include list is preferred, exclude list is set to NULL.
  ER_AUDIT_LOG_ONLY_INCLUDE_LIST_USED was added in 8.0.4.

- Error number: MY-011202; Symbol: ER_AUDIT_LOG_INDEX_MAP_CANNOT_ACCESS_DIR; SQLSTATE: HY000
  Message: Could not access '%s' directory.
  ER_AUDIT_LOG_INDEX_MAP_CANNOT_ACCESS_DIR was added in 8.0.4.

- Error number: MY-011203; Symbol: ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED; SQLSTATE: HY000
  Message: Could not rename file from '%s' to '%s'.
  ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED was added in 8.0.4.

- Error number: MY-011204; Symbol: ER_AUDIT_LOG_WRITER_DEST_FILE_ALREADY_EXISTS; SQLSTATE: HY000
  Message: File '%s' should not exist. It may be incomplete. The server crashed.
  ER_AUDIT_LOG_WRITER_DEST_FILE_ALREADY_EXISTS was added in 8.0.4.

- Error number: MY-011205; Symbol: ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED_REMOVE_FILE_MANUALLY; SQLSTATE: HY000
  Message: Could not rename file from '%s' to '%s'. Remove the file manually.
  ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED_REMOVE_FILE_MANUALLY was added in 8.0.4.

- Error number: MY-011206; Symbol: ER_AUDIT_LOG_WRITER_INCOMPLETE_FILE_RENAMED; SQLSTATE: HY000
  Message: Incomplete file renamed from '%s' to '%s'.
  ER_AUDIT_LOG_WRITER_INCOMPLETE_FILE_RENAMED was added in 8.0.4.

- Error number: MY-011207; Symbol: ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_ENCRYPTION; SQLSTATE: HY000
  Message: Error writing file '%s' (errno: %d - %s).
  ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_ENCRYPTION was added in 8.0.4.

- Error number: MY-011208; Symbol: ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_ENCRYPTION; SQLSTATE: HY000
Message: Could not initialize audit log file encryption.

ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_ENCRYPTION was added in 8.0.4.

- Error number: MY-011209; Symbol: ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_COMPRESSION; SQLSTATE: HY000

Message: Could not initialize audit log file compression.

ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_COMPRESSION was added in 8.0.4.

- Error number: MY-011210; Symbol: ER_AUDIT_LOG_EC_WRITER_FAILED_TO_CREATE_FILE; SQLSTATE: HY000

Message: Could not create '%s' file for audit logging.

ER_AUDIT_LOG_EC_WRITER_FAILED_TO_CREATE_FILE was added in 8.0.4.

- Error number: MY-011211; Symbol: ER_AUDIT_LOG_RENAME_LOG_FILE_BEFORE_FLUSH; SQLSTATE: HY000

Message: Audit log file (%s) must be manually renamed before audit_log_flush is set to true.

ER_AUDIT_LOG_RENAME_LOG_FILE_BEFORE_FLUSH was added in 8.0.4.

- Error number: MY-011212; Symbol: ER_AUDIT_LOG_FILTER_RESULT_MSG; SQLSTATE: HY000

Message: %s

ER_AUDIT_LOG_FILTER_RESULT_MSG was added in 8.0.4.

- Error number: MY-011213; Symbol: ER_AUDIT_LOG_JSON_READER_FAILED_TO_PARSE; SQLSTATE: HY000

Message: Error parsing JSON event. Event not accessible.

ER_AUDIT_LOG_JSON_READER_FAILED_TO_PARSE was added in 8.0.4.

- Error number: MY-011214; Symbol: ER_AUDIT_LOG_JSON_READER_BUF_TOO_SMALL; SQLSTATE: HY000

Message: Buffer is too small to hold JSON event. Number of events skipped: %zu.

ER_AUDIT_LOG_JSON_READER_BUF_TOO_SMALL was added in 8.0.4.

- Error number: MY-011215; Symbol: ER_AUDIT_LOG_JSON_READER_FAILED_TO_OPEN_FILE; SQLSTATE: HY000

Message: Could not open JSON file for reading. Reading next file if exists.

ER_AUDIT_LOG_JSON_READER_FAILED_TO_OPEN_FILE was added in 8.0.4.

- Error number: MY-011216; Symbol: ER_AUDIT_LOG_JSON_READER_FILE_PARSING_ERROR; SQLSTATE: HY000

Message: JSON file parsing error. Reading next file if exists

ER_AUDIT_LOG_JSON_READER_FILE_PARSING_ERROR was added in 8.0.4.
• Error number: MY-011217; Symbol: ER_AUDIT_LOG_FILTER_INVALID_COLUMN_COUNT; SQLSTATE: HY000
Message: Invalid column count in the '%s.%s' table.

ER_AUDIT_LOG_FILTER_INVALID_COLUMN_COUNT was added in 8.0.4.

• Error number: MY-011218; Symbol: ER_AUDIT_LOG_FILTER_INVALID_COLUMN_DEFINITION; SQLSTATE: HY000
Message: Invalid column definition of the '%s.%s' table.

ER_AUDIT_LOG_FILTER_INVALID_COLUMN_DEFINITION was added in 8.0.4.

• Error number: MY-011219; Symbol: ER_AUDIT_LOG_FILTER_FAILED_TO_STORE_TABLEFlds; SQLSTATE: HY000
Message: Could not store field of the %s table.

ER_AUDIT_LOG_FILTER_FAILED_TO_STORE_TABLEFlds was added in 8.0.4.

• Error number: MY-011220; Symbol: ER_AUDIT_LOG_FILTER_FAILED_TO_UPDATE_TABLE; SQLSTATE: HY000
Message: Could not update %s table.

ER_AUDIT_LOG_FILTER_FAILED_TO_UPDATE_TABLE was added in 8.0.4.

• Error number: MY-011221; Symbol: ER_AUDIT_LOG_FILTER_FAILED_TO_INSERT INTO_TABLE; SQLSTATE: HY000
Message: Could not insert into %s table.

ER_AUDIT_LOG_FILTER_FAILED_TO_INSERT INTO_TABLE was added in 8.0.4.

• Error number: MY-011222; Symbol: ER_AUDIT_LOG_FILTER_FAILED TO_DELETE FROM_TABLE; SQLSTATE: HY000
Message: Could not delete from %s table.

ER_AUDIT_LOG_FILTER_FAILED_TO_DELETE FROM_TABLE was added in 8.0.4.

• Error number: MY-011223; Symbol:
ER_AUDIT_LOG_FILTER FAILED TO_INIT_TABLE For_READ; SQLSTATE: HY000
Message: Could not initialize %s table for reading.

ER_AUDIT_LOG_FILTER_FAILED TO_INIT_TABLE For_READ was added in 8.0.4.

• Error number: MY-011224; Symbol: ER_AUDIT_LOG_FILTER FAILED_TO_READ_TABLE; SQLSTATE: HY000
Message: Could not read %s table.

ER_AUDIT_LOG_FILTER FAILED_TO_READ_TABLE was added in 8.0.4.

• Error number: MY-011225; Symbol:
ER_AUDIT_LOG_FILTER FAILED TO_CLOSE_TABLE AFTER READING; SQLSTATE: HY000
Message: Could not close %s table reading.

ER_AUDIT_LOG_FILTER_FAILED_TO_CLOSE_TABLE_AFTER_READING was added in 8.0.4.

- **Error number:** MY-011226; **Symbol:** ER_AUDIT_LOG_FILTER_USER_AND_HOST_CANT_BE_EMPTY; **SQLSTATE:** HY000

Message: Both user and host columns of %s table cannot be empty.

ER_AUDIT_LOG_FILTER_USER_AND_HOST_CANT_BE_EMPTY was added in 8.0.4.

- **Error number:** MY-011227; **Symbol:** ER_AUDIT_LOG_FILTER_FLD_FILTERNAME_CANT_BE_EMPTY; **SQLSTATE:** HY000

Message: Filtername column of %s table cannot be empty.

ER_AUDIT_LOG_FILTER_FLD_FILTERNAME_CANT_BE_EMPTY was added in 8.0.4.

- **Error number:** MY-011228; **Symbol:** ER_VALIDATE_PWD_DICT_FILE_NOT_SPECIFIED; **SQLSTATE:** HY000

Message: Dictionary file not specified

ER_VALIDATE_PWD_DICT_FILE_NOT_SPECIFIED was added in 8.0.4.

- **Error number:** MY-011229; **Symbol:** ER_VALIDATE_PWD_DICT_FILE_NOT_LOADED; **SQLSTATE:** HY000

Message: Dictionary file not loaded

ER_VALIDATE_PWD_DICT_FILE_NOT_LOADED was added in 8.0.4.

- **Error number:** MY-011230; **Symbol:** ER_VALIDATE_PWD_DICT_FILE_TOO_BIG; **SQLSTATE:** HY000

Message: Dictionary file size exceeded MAX_DICTIONARY_FILE_LENGTH, not loaded

ER_VALIDATE_PWD_DICT_FILE_TOO_BIG was added in 8.0.4.

- **Error number:** MY-011231; **Symbol:** ER_VALIDATE_PWD_FAILED_TO_READ_DICT_FILE; **SQLSTATE:** HY000

Message: Exception while reading the dictionary file

ER_VALIDATE_PWD_FAILED_TO_READ_DICT_FILE was added in 8.0.4.

- **Error number:** MY-011232; **Symbol:** ER_VALIDATE_PWD_FAILED_TO_GET_FLD_FROM_SECURITY_CTX; **SQLSTATE:** HY000

Message: Can't retrieve the %s from the security context

ER_VALIDATE_PWD_FAILED_TO_GET_FLD_FROM_SECURITY_CTX was added in 8.0.4.

- **Error number:** MY-011233; **Symbol:** ER_VALIDATE_PWD_FAILED_TO_GET_SECURITY_CTX; **SQLSTATE:** HY000

Message: Can't retrieve the security context

ER_VALIDATE_PWD_FAILED_TO_GET_SECURITY_CTX was added in 8.0.4.
Server Error Message Reference

- Error number: MY-011234; Symbol: ER_VALIDATE_PWD_LENGTH_CHANGED; SQLSTATE: HY000
  Message: Effective value of validate_password_length is changed. New value is %d
  ER_VALIDATE_PWD_LENGTH_CHANGED was added in 8.0.4.

- Error number: MY-011235; Symbol: ER_REWRITER_QUERY_ERROR_MSG; SQLSTATE: HY000
  Message: %s
  ER_REWRITER_QUERY_ERROR_MSG was added in 8.0.4.

- Error number: MY-011236; Symbol: ER_REWRITER_QUERY_FAILED; SQLSTATE: HY000
  Message: Rewritten query failed to parse:%s
  ER_REWRITER_QUERY_FAILED was added in 8.0.4.

- Error number: MY-011237; Symbol: ER_XPLUGIN_STARTUP_FAILED; SQLSTATE: HY000
  Message: Startup failed with error "%s"
  ER_XPLUGIN_STARTUP_FAILED was added in 8.0.4.

- Error number: MY-011238; Symbol: ER_XPLUGIN_SERVER_EXITING; SQLSTATE: HY000
  Message: Exiting
  ER_XPLUGIN_SERVER_EXITING was added in 8.0.4, removed after 8.0.12.

- Error number: MY-011239; Symbol: ER_XPLUGIN_SERVER_EXITED; SQLSTATE: HY000
  Message: Exit done
  ER_XPLUGIN_SERVER_EXITED was added in 8.0.4, removed after 8.0.12.

- Error number: MY-011240; Symbol: ER_XPLUGIN_USING_SSL_CONF_FROM_SERVER; SQLSTATE: HY000
  Message: Using SSL configuration from MySQL Server
  ER_XPLUGIN_USING_SSL_CONF_FROM_SERVER was added in 8.0.4.

- Error number: MY-011241; Symbol: ER_XPLUGIN_USING_SSL_CONF_FROM_MYSQLX; SQLSTATE: HY000
  Message: Using SSL configuration from Mysqlx Plugin
  ER_XPLUGIN_USING_SSL_CONF_FROM_MYSQLX was added in 8.0.4.

- Error number: MY-011242; Symbol: ER_XPLUGIN_FAILED_TO_USE_SSL_CONF; SQLSTATE: HY000
  Message: Neither MySQL Server nor Mysqlx Plugin has valid SSL configuration
  ER_XPLUGIN_FAILED_TO_USE_SSL_CONF was added in 8.0.4.

- Error number: MY-011243; Symbol: ER_XPLUGIN_USING_SSL_FOR_TLS_CONNECTION; SQLSTATE: HY000
  Message: Using %s for TLS connections
**ER_XPLUGIN_USING_SSL_FOR_TLS_CONNECTION** was added in 8.0.4.

- **Error number:** MY-011244; **Symbol:** ER_XPLUGIN_REFERENCE_TO_SECURE_CONN_WITH_XPLUGIN; **SQLSTATE:** HY000

  Message: For more information, please see the Using Secure Connections with X Plugin section in the MySQL documentation

**ER_XPLUGIN_REFERENCE_TO_SECURE_CONN_WITH_XPLUGIN** was added in 8.0.4.

- **Error number:** MY-011245; **Symbol:** ER_XPLUGIN_ERROR_MSG; **SQLSTATE:** HY000

  Message: %s

**ER_XPLUGIN_ERROR_MSG** was added in 8.0.4.

- **Error number:** MY-011246; **Symbol:** ER_SHA_PWD_FAILED_TO_PARSE_AUTH_STRING; **SQLSTATE:** HY000

  Message: Failed to parse stored authentication string for %s. Please check if mysql.user table not corrupted

**ER_SHA_PWD_FAILED_TO_PARSE_AUTH_STRING** was added in 8.0.4.

- **Error number:** MY-011247; **Symbol:** ER_SHA_PWD_FAILED_TO_GENERATE_MULTI_ROUND_HASH; **SQLSTATE:** HY000

  Message: Error in generating multi-round hash for %s. Plugin can not perform authentication without it. This may be a transient problem

**ER_SHA_PWD_FAILED_TO_GENERATE_MULTI_ROUND_HASH** was added in 8.0.4.

- **Error number:** MY-011248; **Symbol:** ER_SHA_PWD_AUTHQUIRES_RSA_OR_SSL; **SQLSTATE:** HY000

  Message: Authentication requires either RSA keys or SSL encryption

**ER_SHA_PWD_AUTHQUIRES_RSA_OR_SSL** was added in 8.0.4.

- **Error number:** MY-011249; **Symbol:** ER_SHA_PWD_RSA_KEY_TOO_LONG; **SQLSTATE:** HY000

  Message: RSA key cipher length of %u is too long. Max value is %u

**ER_SHA_PWD_RSA_KEY_TOO_LONG** was added in 8.0.4.

- **Error number:** MY-011250; **Symbol:** ER_PLUGIN_COMMON_FAILED_TO_OPEN_FILTER_TABLES; **SQLSTATE:** HY000

  Message: Failed to open the %s filter tables

**ER_PLUGIN_COMMON_FAILED_TO_OPEN_FILTER_TABLES** was added in 8.0.4.

- **Error number:** MY-011251; **Symbol:** ER_PLUGIN_COMMON_FAILED_TO_OPEN_TABLE; **SQLSTATE:** HY000

  Message: Failed to open '%s.%s' %s table

**ER_PLUGIN_COMMON_FAILED_TO_OPEN_TABLE** was added in 8.0.4.
• Error number: MY-011252; Symbol: ER_AUTH_LDAP_ERROR_LOGGER_ERROR_MSG; SQLSTATE: HY000
  Message: %s
  ER_AUTH_LDAP_ERROR_LOGGER_ERROR_MSG was added in 8.0.4.

• Error number: MY-011253; Symbol: ER_CONN_CONTROL_ERROR_MSG; SQLSTATE: HY000
  Message: %s
  ER_CONN_CONTROL_ERROR_MSG was added in 8.0.4.

• Error number: MY-011254; Symbol: ER_GRP_RPL_ERROR_MSG; SQLSTATE: HY000
  Message: %s
  ER_GRP_RPL_ERROR_MSG was added in 8.0.4.

• Error number: MY-011255; Symbol: ER_SHA_PWD_SALT_FOR_USER_CORRUPT; SQLSTATE: HY000
  Message: Password salt for user '%s' is corrupt
  ER_SHA_PWD_SALT_FOR_USER_CORRUPT was added in 8.0.4.

• Error number: MY-011256; Symbol: ER_SYS_VAR_COMPONENT_OOM; SQLSTATE: HY000
  Message: Out of memory for component system variable '%s'.
  ER_SYS_VAR_COMPONENT_OOM was added in 8.0.4.

• Error number: MY-011257; Symbol: ER_SYS_VAR_COMPONENT_VARIABLE_SET_READ_ONLY; SQLSTATE: HY000
  Message: variable %s of component %s was forced to be read-only: string variable without update_func and PLUGIN_VAR_MEMALLOC flag.
  ER_SYS_VAR_COMPONENT_VARIABLE_SET_READ_ONLY was added in 8.0.4.

• Error number: MY-011258; Symbol: ER_SYS_VAR_COMPONENT_UNKNOWN_VARIABLE_TYPE; SQLSTATE: HY000
  Message: Unknown variable type code 0x%x in component '%s'.
  ER_SYS_VAR_COMPONENT_UNKNOWN_VARIABLE_TYPE was added in 8.0.4.

• Error number: MY-011259; Symbol: ER_SYS_VAR_COMPONENT_FAILED_TO_PARSE_VARIABLE_OPTIONS; SQLSTATE: HY000
  Message: Parsing options for variable '%s' failed.
  ER_SYS_VAR_COMPONENT_FAILED_TO_PARSE_VARIABLE_OPTIONS was added in 8.0.4.

• Error number: MY-011260; Symbol: ER_SYS_VAR_COMPONENT_FAILED_TO_MAKE_VARIABLE_PERSISTENT; SQLSTATE: HY000
  Message: Setting persistent options for component variable '%s' failed.
  ER_SYS_VAR_COMPONENT_FAILED_TO_MAKE_VARIABLE_PERSISTENT was added in 8.0.4.
• Error number: MY-011261; Symbol: ER_COMPONENT_FILTER_CONFUSED; SQLSTATE: HY000
Message: The log-filter component "%s" got confused at "%s" (state: %s) ...
ER_COMPONENT_FILTER_CONFUSED was added in 8.0.4.

• Error number: MY-011262; Symbol: ER_STOP_SLAVE_IO_THREAD_DISK_SPACE; SQLSTATE: HY000
Message: Waiting until I/O thread for channel '%s' finish writing to disk before stopping. Free some disk space or use 'KILL' to abort I/O thread operation. Notice that aborting the I/O thread while rotating the relay log might corrupt the relay logs, requiring a server restart to fix it.
ER_STOP_SLAVE_IO_THREAD_DISK_SPACE was added in 8.0.2.

• Error number: MY-011263; Symbol: ER_LOG_FILE_CANNOT_OPEN; SQLSTATE: HY000
Message: Could not use %s for logging (error %d - %s). Turning logging off for the server process. To turn it on again: fix the cause, then%s restart the MySQL server.
ER_LOG_FILE_CANNOT_OPEN was added in 8.0.2.

• Error number: MY-011268; Symbol: ER_PERSIST_OPTION_STATUS; SQLSTATE: HY000
Message: Configuring persisted options failed: "%s".
ER_PERSIST_OPTION_STATUS was added in 8.0.11.

• Error number: MY-011269; Symbol: ER_NOT_IMPLEMENTED_GET_TABLESPACE_STATISTICS; SQLSTATE: HY000
Message: The storage engine '%s' does not provide dynamic table statistics
ER_NOT_IMPLEMENTED_GET_TABLESPACE_STATISTICS was added in 8.0.11.

• Error number: MY-011272; Symbol: ER_SSL_FIPS_MODE_ERROR; SQLSTATE: HY000
Message: SSL fips mode error: %s
ER_SSL_FIPS_MODE_ERROR was added in 8.0.11.

• Error number: MY-011273; Symbol: ER_CONN_INIT_CONNECT_IGNORED; SQLSTATE: HY000
Message: init_connect variable is ignored for user: %s host: %s due to expired password.
ER_CONN_INIT_CONNECT_IGNORED was added in 8.0.11.

• Error number: MY-011275; Symbol: ER_REWRITER_OOM; SQLSTATE: HY000
Message: Out of memory.
ER_REWRITER_OOM was added in 8.0.11.

• Error number: MY-011276; Symbol: ER_REWRITER_TABLE_MALFORMED_ERROR; SQLSTATE: HY000
Message: Wrong column count or names when loading rules.
ER_REWRITER_TABLE_MALFORMED_ERROR was added in 8.0.11.

• Error number: MY-011277; Symbol: ER_REWRITER_LOAD_FAILED; SQLSTATE: HY000
Message: Some rules failed to load.

ER_REWRITER_LOAD_FAILED was added in 8.0.11.

- Error number: MY-011278; Symbol: ER_REWRITER_READ_FAILED; SQLSTATE: HY000
  Message: Got error from storage engine while refreshing rewrite rules.
  ER_REWRITER_READ_FAILED was added in 8.0.11.

- Error number: MY-011279; Symbol: ER_CONN_CONTROL_EVENT_COORDINATOR_INIT_FAILED; SQLSTATE: HY000
  Message: Failed to initialize Connection_event_coordinator
  ER_CONN_CONTROL_EVENT_COORDINATOR_INIT_FAILED was added in 8.0.11.

- Error number: MY-011280; Symbol: ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_UPDATE_FAILED; SQLSTATE: HY000
  Message: Failed to update connection delay triggered stats
  ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_UPDATE_FAILED was added in 8.0.11.

- Error number: MY-011281; Symbol: ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_RESET_FAILED; SQLSTATE: HY000
  Message: Failed to reset connection delay triggered stats
  ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_RESET_FAILED was added in 8.0.11.

- Error number: MY-011282; Symbol: ER_CONN_CONTROL_INVALID_CONN_DELAY_TYPE; SQLSTATE: HY000
  Message: Unexpected option type for connection delay.
  ER_CONN_CONTROL_INVALID_CONN_DELAY_TYPE was added in 8.0.11.

- Error number: MY-011283; Symbol: ER_CONN_CONTROL_DELAY_ACTION_INIT_FAILED; SQLSTATE: HY000
  Message: Failed to initialize Connection_delay_action
  ER_CONN_CONTROL_DELAY_ACTION_INIT_FAILED was added in 8.0.11.

- Error number: MY-011284; Symbol: ER_CONN_CONTROL_FAILED_TO_SET_CONN_DELAY; SQLSTATE: HY000
  Message: Could not set %s delay for connection delay.
  ER_CONN_CONTROL_FAILED_TO_SET_CONN_DELAY was added in 8.0.11.

- Error number: MY-011285; Symbol: ER_CONN_CONTROL_FAILED_TO_UPDATE_CONN_DELAY_HASH; SQLSTATE: HY000
  Message: Failed to update connection delay hash for account : %s
  ER_CONN_CONTROL_FAILED_TO_UPDATE_CONN_DELAY_HASH was added in 8.0.11.
• Error number: MY-011286; Symbol: ER_XPLUGIN_FORCE_STOP_CLIENT; SQLSTATE: HY000
Message: %s: Force stopping client because exception occurred: %s
ER_XPLUGIN_FORCE_STOP_CLIENT was added in 8.0.11.

• Error number: MY-011287; Symbol: ER_XPLUGIN_MAX_AUTH_ATTEMPTS_REACHED; SQLSTATE: HY000
Message: %s.%u: Maximum number of authentication attempts reached, login failed.
ER_XPLUGIN_MAX_AUTH_ATTEMPTS_REACHED was added in 8.0.11.

• Error number: MY-011288; Symbol: ER_XPLUGIN_BUFFER_PAGE_ALLOC_FAILED; SQLSTATE: HY000
Message: Error allocating Buffer_page: %s
ER_XPLUGIN_BUFFER_PAGE_ALLOC_FAILED was added in 8.0.11.

• Error number: MY-011289; Symbol: ER_XPLUGIN_DETECTED_HANGING_CLIENTS; SQLSTATE: HY000
Message: Detected %u hanging client(s)
ER_XPLUGIN_DETECTED_HANGING_CLIENTS was added in 8.0.11.

• Error number: MY-011290; Symbol: ER_XPLUGIN_FAILED_TO_ACCEPT_CLIENT; SQLSTATE: HY000
Message: Error accepting client
ER_XPLUGIN_FAILED_TO_ACCEPT_CLIENT was added in 8.0.11.

• Error number: MY-011291; Symbol: ER_XPLUGIN_FAILED_TO_SCHEDULE_CLIENT; SQLSTATE: HY000
Message: Internal error scheduling client for execution
ER_XPLUGIN_FAILED_TO_SCHEDULE_CLIENT was added in 8.0.11.

• Error number: MY-011292; Symbol: ER_XPLUGIN_FAILED_TO_PREPARE_IO_INTERFACES; SQLSTATE: HY000
Message: Preparation of I/O interfaces failed, X Protocol won't be accessible
ER_XPLUGIN_FAILED_TO_PREPARE_IO_INTERFACES was added in 8.0.11.

• Error number: MY-011293; Symbol: ER_XPLUGIN_SRV_SESSION_INIT_THREAD_FAILED; SQLSTATE: HY000
Message: srv_session_init_thread returned error
ER_XPLUGIN_SRV_SESSION_INIT_THREAD_FAILED was added in 8.0.11.

• Error number: MY-011294; Symbol: ER_XPLUGIN_UNABLE_TO_USE_USER_SESSION_ACCOUNT; SQLSTATE: HY000
Message: Unable to use user mysql.session account when connecting the server for internal plugin requests.

`ER_XPLUGIN_UNABLE_TO_USE_USER_SESSION_ACCOUNT` was added in 8.0.11.

- Error number: `MY-011295`; Symbol: `ER_XPLUGIN_REFERENCE_TO_USER_ACCOUNT_DOC_SECTION`; SQLSTATE: `HY000`

Message: For more information, please see the X Plugin User Account section in the MySQL documentation

`ER_XPLUGIN_REFERENCE_TO_USER_ACCOUNT_DOC_SECTION` was added in 8.0.11.

- Error number: `MY-011296`; Symbol: `ER_XPLUGIN_UNEXPECTED_EXCEPTION_DISPATCHING_CMD`; SQLSTATE: `HY000`

Message: %s: Unexpected exception dispatching command: %s

`ER_XPLUGIN_UNEXPECTED_EXCEPTION_DISPATCHING_CMD` was added in 8.0.11.

- Error number: `MY-011297`; Symbol: `ER_XPLUGIN_EXCEPTION_IN_TASK_SCHEDULER`; SQLSTATE: `HY000`

Message: Exception in post: %s

`ER_XPLUGIN_EXCEPTION_IN_TASK_SCHEDULER` was added in 8.0.11.

- Error number: `MY-011298`; Symbol: `ER_XPLUGIN_TASK_SCHEDULING_FAILED`; SQLSTATE: `HY000`

Message: Internal error scheduling task

`ER_XPLUGIN_TASK_SCHEDULING_FAILED` was added in 8.0.11.

- Error number: `MY-011299`; Symbol: `ER_XPLUGIN_EXCEPTION_IN_EVENT_LOOP`; SQLSTATE: `HY000`

Message: Exception in event loop: "%s": %s

`ER_XPLUGIN_EXCEPTION_IN_EVENT_LOOP` was added in 8.0.11.

- Error number: `MY-011300`; Symbol: `ER_XPLUGIN_LISTENER_SETUP_FAILED`; SQLSTATE: `HY000`

Message: Setup of %s failed, %s

`ER_XPLUGIN_LISTENER_SETUP_FAILED` was added in 8.0.11.

- Error number: `MY-011301`; Symbol: `ERXPLUING_NET_STARTUP_FAILED`; SQLSTATE: `HY000`

Message: %s

`ERXPLUING_NET_STARTUP_FAILED` was added in 8.0.11.

- Error number: `MY-011302`; Symbol: `ER_XPLUGIN_FAILED_AT_SSL_CONF`; SQLSTATE: `HY000`

Message: Failed at SSL configuration: "%s"

`ER_XPLUGIN_FAILED_AT_SSL_CONF` was added in 8.0.11.
• Error number: **MY-011303**; Symbol: `ER_XPLUGIN_CLIENT_SSL_HANDSHAKE_FAILED`; SQLSTATE: `HY000`

Message: Error during SSL handshake for client connection (%i)

`ER_XPLUGIN_CLIENT_SSL_HANDSHAKE_FAILED` was added in 8.0.11, removed after 8.0.12.

• Error number: **MY-011304**; Symbol: `ER_XPLUGIN_SSL_HANDSHAKE_WITH_SERVER_FAILED`; SQLSTATE: `HY000`

Message: %s: Error during SSL handshake

`ER_XPLUGIN_SSL_HANDSHAKE_WITH_SERVER_FAILED` was added in 8.0.11, removed after 8.0.12.

• Error number: **MY-011305**; Symbol: `ER_XPLUGIN_FAILED_TO_CREATE_SESSION_FOR_CONN`; SQLSTATE: `HY000`

Message: %s: Error creating session for connection from %s

`ER_XPLUGIN_FAILED_TO_CREATE_SESSION_FOR_CONN` was added in 8.0.11.

• Error number: **MY-011306**; Symbol: `ER_XPLUGIN_FAILED_TO_INITIALIZE_SESSION`; SQLSTATE: `HY000`

Message: %s: Error initializing session for connection: %s

`ER_XPLUGIN_FAILED_TO_INITIALIZE_SESSION` was added in 8.0.11.

• Error number: **MY-011307**; Symbol: `ER_XPLUGIN_MESSAGE_TOO_LONG`; SQLSTATE: `HY000`

Message: %s: Message of size %u received, exceeding the limit of %i

`ER_XPLUGIN_MESSAGE_TOO_LONG` was added in 8.0.11.

• Error number: **MY-011308**; Symbol: `ER_XPLUGIN_UNINITIALIZED_MESSAGE`; SQLSTATE: `HY000`

Message: Message is not properly initialized: %s

`ER_XPLUGIN_UNINITIALIZED_MESSAGE` was added in 8.0.11.

• Error number: **MY-011309**; Symbol: `ER_XPLUGIN_FAILED_TO_SET_MIN_NUMBER_OF_WORKERS`; SQLSTATE: `HY000`

Message: Unable to set minimal number of workers to %u; actual value is %i

`ER_XPLUGIN_FAILED_TO_SET_MIN_NUMBER_OF_WORKERS` was added in 8.0.11.

• Error number: **MY-011310**; Symbol: `ER_XPLUGIN_UNABLE_TO_ACCEPT_CONNECTION`; SQLSTATE: `HY000`

Message: Unable to accept connection, disconnecting client

`ER_XPLUGIN_UNABLE_TO_ACCEPT_CONNECTION` was added in 8.0.11.

• Error number: **MY-011311**; Symbol: `ER_XPLUGIN_ALL_IO_INTERFACES_DISABLED`; SQLSTATE: `HY000`

Message: All I/O interfaces are disabled; X Protocol won't be accessible
Server Error Message Reference

ER_XPLUGIN_ALL_IO_INTERFACES_DISABLED was added in 8.0.11.

- Error number: MY-011312; Symbol: ER_XPLUGIN_INVALID_MSG_DURING_CLIENT_INIT; SQLSTATE: HY000
  
  Message: %s: Invalid message %i received during client initialization

ER_XPLUGIN_INVALID_MSG_DURING_CLIENT_INIT was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011313; Symbol: ER_XPLUGIN_CLOSING_CLIENTS_ON_SHUTDOWN; SQLSTATE: HY000
  
  Message: %s: closing client because of shutdown (state: %i)

ER_XPLUGIN_CLOSING_CLIENTS_ON_SHUTDOWN was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011314; Symbol: ER_XPLUGIN_ERROR_READING_SOCKET; SQLSTATE: HY000
  
  Message: %s: Error reading from socket %s (%i)

ER_XPLUGIN_ERROR_READING_SOCKET was added in 8.0.11.

- Error number: MY-011315; Symbol: ER_XPLUGIN_PEER_DISCONNECTED_WHILE_READING_MSG_BODY; SQLSTATE: HY000
  
  Message: %s: peer disconnected while reading message body

ER_XPLUGIN_PEER_DISCONNECTED_WHILE_READING_MSG_BODY was added in 8.0.11.

- Error number: MY-011316; Symbol: ER_XPLUGIN_READ_FAILED_CLOSING_CONNECTION; SQLSTATE: HY000
  
  Message: client_id:%s - %s while reading from socket, closing connection

ER_XPLUGIN_READ_FAILED_CLOSING_CONNECTION was added in 8.0.11.

- Error number: MY-011317; Symbol: ER_XPLUGIN_INVALID_AUTH_METHOD; SQLSTATE: HY000
  
  Message: %s.%u: Invalid authentication method %s

ER_XPLUGIN_INVALID_AUTH_METHOD was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011318; Symbol: ER_XPLUGIN_UNEXPECTED_MSG_DURING_AUTHENTICATION; SQLSTATE: HY000
  
  Message: %s: Unexpected message of type %i received during authentication

ER_XPLUGIN_UNEXPECTED_MSG_DURING_AUTHENTICATION was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011319; Symbol: ER_XPLUGIN_ERROR_WRITING_TO_CLIENT; SQLSTATE: HY000
  
  Message: Error writing to client: %s (%i)

ER_XPLUGIN_ERROR_WRITING_TO_CLIENT was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011320; Symbol: ER_XPLUGIN_SCHEDULER_STARTED; SQLSTATE: HY000
Message: Scheduler "%s" started.

**ER_XPLUGIN_SCHEDULER_STARTED** was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011321; Symbol: **ER_XPLUGIN_SCHEDULER_STOPPED**; SQLSTATE: HY000

Message: Scheduler "%s" stopped.

**ER_XPLUGIN_SCHEDULER_STOPPED** was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011322; Symbol: **ER_XPLUGIN_LISTENER_SYS_VARIABLE_ERROR**; SQLSTATE: HY000

Message: Please see the MySQL documentation for '%s' system variables to fix the error

**ER_XPLUGIN_LISTENER_SYS_VARIABLE_ERROR** was added in 8.0.11.

- **Error number:** MY-011323; Symbol: **ER_XPLUGIN_LISTENER_STATUS_MSG**; SQLSTATE: HY000

Message: X Plugin ready for connections. %s

**ER_XPLUGIN_LISTENER_STATUS_MSG** was added in 8.0.11.

- **Error number:** MY-011324; Symbol: **ER_XPLUGIN_RETRYING_BIND_ON_PORT**; SQLSTATE: HY000

Message: Retrying `bind()` on TCP/IP port %i

**ER_XPLUGIN_RETRYING_BIND_ON_PORT** was added in 8.0.11.

- **Error number:** MY-011325; Symbol: **ER_XPLUGIN_SHUTDOWN_TRIGGERED**; SQLSTATE: HY000

Message: Shutdown triggered by mysqld abort flag

**ER_XPLUGIN_SHUTDOWN_TRIGGERED** was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011326; Symbol: **ER_XPLUGIN_USER_ACCOUNT_WITH_ALL_PERMISSIONS**; SQLSTATE: HY000

Message: Using %s account for authentication which has all required permissions

**ER_XPLUGIN_USER_ACCOUNT_WITH_ALL_PERMISSIONS** was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011327; Symbol: **ER_XPLUGIN_EXISTING_USER_ACCOUNT_WITH_INCOMPLETE_GRANTS**; SQLSTATE: HY000

Message: Using existing %s account for authentication. Incomplete grants will be fixed

**ER_XPLUGIN_EXISTING_USER_ACCOUNT_WITH_INCOMPLETE_GRANTS** was added in 8.0.11.

- **Error number:** MY-011328; Symbol: **ER_XPLUGIN_SERVER_STARTS_HANDLING_CONNECTIONS**; SQLSTATE: HY000

Message: Server starts handling incoming connections

**ER_XPLUGIN_SERVER_STARTS_HANDLING_CONNECTIONS** was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011329; Symbol: **ER_XPLUGIN_SERVER_STOPPED_HANDLING_CONNECTIONS**; SQLSTATE: HY000
Message: Stopped handling incoming connections

ER_XPLUGIN_SERVER_STOPPED_HANDLING_CONNECTIONS was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011330; Symbol: ER_XPLUGIN_FAILED_TO_INTERRUPT_SESSION; SQLSTATE: HY000
Message: %s: Could not interrupt client session

ER_XPLUGIN_FAILED_TO_INTERRUPT_SESSION was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011331; Symbol: ER_XPLUGIN_CLIENT_RELEASE_TRIGGERED; SQLSTATE: HY000
Message: %s: release triggered by timeout in state:%i

ER_XPLUGIN_CLIENT_RELEASE_TRIGGERED was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011332; Symbol: ER_XPLUGIN_IPv6_AVAILABLE; SQLSTATE: HY000
Message: IPv6 is available

ER_XPLUGIN_IPv6_AVAILABLE was added in 8.0.11.

- Error number: MY-011333; Symbol: ER_XPLUGIN_UNIX_SOCKET_NOT_CONFIGURED; SQLSTATE: HY000
Message: UNIX socket not configured

ER_XPLUGIN_UNIX_SOCKET_NOT_CONFIGURED was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011334; Symbol: ER_XPLUGIN_CLIENT_KILL_MSG; SQLSTATE: HY000
Message: Kill client: %i %s

ER_XPLUGIN_CLIENT_KILL_MSG was added in 8.0.11.

- Error number: MY-011335; Symbol: ER_XPLUGIN_FAILED_TO_GET_SECURITY_CTX; SQLSTATE: HY000
Message: Could not get security context for session

ER_XPLUGIN_FAILED_TO_GET_SECURITY_CTX was added in 8.0.11.

- Error number: MY-011336; Symbol: ER_XPLUGIN_FAILED_TO_SWITCH_SECURITY_CTX_TO_ROOT; SQLSTATE: HY000
Message: Unable to switch security context to root

ER_XPLUGIN_FAILED_TO_SWITCH_SECURITY_CTX_TO_ROOT was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011337; Symbol: ER_XPLUGIN_FAILED_TO_CLOSE_SQL_SESSION; SQLSTATE: HY000
Message: Error closing SQL session
Server Error Message Reference

ER_XPLUGIN_FAILED_TO_CLOSE_SQL_SESSION was added in 8.0.11.

- **Error number:** MY-011338; Symbol: ER_XPLUGIN_FAILED_TO_EXECUTE_ADMIN_CMD; SQLSTATE: HY000
  
  Message: Error executing admin command %s: %s

ER_XPLUGIN_FAILED_TO_EXECUTE_ADMIN_CMD was added in 8.0.11.

- **Error number:** MY-011339; Symbol: ER_XPLUGIN_EMPTY_ADMIN_CMD; SQLSTATE: HY000
  
  Message: Error executing empty admin command

ER_XPLUGIN_EMPTY_ADMIN_CMD was added in 8.0.11.

- **Error number:** MY-011340; Symbol: ER_XPLUGIN_FAILED_TO_GET_SYS_VAR; SQLSTATE: HY000
  
  Message: Unable to retrieve system variable '\%s\'

ER_XPLUGIN_FAILED_TO_GET_SYS_VAR was added in 8.0.11.

- **Error number:** MY-011341; Symbol: ER_XPLUGIN_FAILED_TO_GET_CREATION_STMT; SQLSTATE: HY000
  
  Message: Unable to get creation stmt for collection '\%s\'; query result size: %lu

ER_XPLUGIN_FAILED_TO_GET_CREATION_STMT was added in 8.0.11.

- **Error number:** MY-011342; Symbol: ER_XPLUGIN_FAILED_TO_GET_ENGINE_INFO; SQLSTATE: HY000
  
  Message: Unable to get engine info for collection '\%s\'; creation stmt: %s

ER_XPLUGIN_FAILED_TO_GET_ENGINE_INFO was added in 8.0.11.

- **Error number:** MY-011343; Symbol: ER_XPLUGIN_FAIL_TO_GET_RESULT_DATA; SQLSTATE: HY000
  
  Message: Error getting result data: %s

ER_XPLUGIN_FAIL_TO_GET_RESULT_DATA was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011344; Symbol: ER_XPLUGIN_CAPABILITY_EXPIRED_PASSWORD; SQLSTATE: HY000
  
  Message: Capability expired password failed with error: %s

ER_XPLUGIN_CAPABILITY_EXPIRED_PASSWORD was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011345; Symbol: ER_XPLUGIN_FAILED_TO_SET_SO_REUSEADDR_FLAG; SQLSTATE: HY000
  
  Message: Failed to set SO_REUSEADDR flag (error: %d).

ER_XPLUGIN_FAILED_TO_SET_SO_REUSEADDR_FLAG was added in 8.0.11.

- **Error number:** MY-011346; Symbol: ER_XPLUGIN_FAILED_TO_OPEN_INTERNAL_SESSION; SQLSTATE: HY000
Message: Could not open internal MySQL session

ER_XPLUGIN_FAILED_TO_OPEN_INTERNAL_SESSION was added in 8.0.11.

•   Error number: MY-011347; Symbol: ER_XPLUGIN_FAILED_TO_SWITCH_CONTEXT; SQLSTATE: HY000

Message: Unable to switch context to user %s

ER_XPLUGIN_FAILED_TO_SWITCH_CONTEXT was added in 8.0.11.

•   Error number: MY-011348; Symbol: ER_XPLUGIN_FAILED_TO_UNREGISTER_UDF; SQLSTATE: HY000

Message: Can\'t unregister \'%s\' user defined function

ER_XPLUGIN_FAILED_TO_UNREGISTER_UDF was added in 8.0.11.

•   Error number: MY-011349; Symbol: ER_XPLUGIN_GET_PEER_ADDRESS_FAILED; SQLSTATE: HY000

Message: %s: get peer address failed, can\'t resolve IP to hostname

ER_XPLUGIN_GET_PEER_ADDRESS_FAILED was added in 8.0.11, removed after 8.0.12.

•   Error number: MY-011350; Symbol: ER_XPLUGIN_CAPABILITY_CLIENT_INTERACTIVE_FAILED; SQLSTATE: HY000

Message: Capability client interactive failed with error: %s

ER_XPLUGIN_CAPABILITY_CLIENT_INTERACTIVE_FAILED was added in 8.0.11, removed after 8.0.12.

•   Error number: MY-011351; Symbol: ER_XPLUGIN_FAILED_TO_RESET_IPV6_V6ONLY_FLAG; SQLSTATE: HY000

Message: Failed to reset IPV6_V6ONLY flag (error: %d). The server will listen to IPv6 addresses only.

ER_XPLUGIN_FAILED_TO_RESET_IPV6_V6ONLY_FLAG was added in 8.0.11.

•   Error number: MY-011352; Symbol: ER_KEYRING_INVALID_KEY_TYPE; SQLSTATE: HY000

Message: Invalid key type

ER_KEYRING_INVALID_KEY_TYPE was added in 8.0.11.

•   Error number: MY-011353; Symbol: ER_KEYRING_INVALID_KEY_LENGTH; SQLSTATE: HY000

Message: Invalid key length for given block cipher

ER_KEYRING_INVALID_KEY_LENGTH was added in 8.0.11.

•   Error number: MY-011354; Symbol: ER_KEYRING_FAILED_TO_CREATE_KEYRING_DIR; SQLSTATE: HY000

Message: Could not create keyring directory. The keyring_file will stay unusable until correct path to the keyring directory gets provided
ER_KEYRING_FAILED_TO_CREATE_KEYRING_DIR was added in 8.0.11.

- Error number: MY-011355; Symbol: ER_KEYRING_FILE_INIT_FAILED; SQLSTATE: HY000

Message: keyring_file initialization failure. Please check if the keyring_file_data points to readable keyring file or keyring file can be created in the specified location. The keyring_file will stay unusable until correct path to the keyring file gets provided.

ER_KEYRING_FILE_INIT_FAILED was added in 8.0.11.

- Error number: MY-011356; Symbol: ER_KEYRING_INTERNAL_EXCEPTION_FAILED_FILE_INIT; SQLSTATE: HY000

Message: keyring_file initialization failure due to internal exception inside the plugin.

ER_KEYRING_INTERNAL_EXCEPTION_FAILED_FILE_INIT was added in 8.0.11.

- Error number: MY-011357; Symbol: ER_KEYRING_FAILED_TO_GENERATE_KEY; SQLSTATE: HY000

Message: Failed to generate a key due to internal exception inside keyring_file plugin.

ER_KEYRING_FAILED_TO_GENERATE_KEY was added in 8.0.11.

- Error number: MY-011358; Symbol: ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_INVALID_KEY; SQLSTATE: HY000

Message: Error while %s key: invalid key_type.

ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_INVALID_KEY was added in 8.0.11.

- Error number: MY-011359; Symbol: ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_EMPTY_KEY_ID; SQLSTATE: HY000

Message: Error while %s key: key_id cannot be empty.

ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_EMPTY_KEY_ID was added in 8.0.11.

- Error number: MY-011360; Symbol: ER_KEYRING_OPERATION_FAILED_DUE_TO_INTERNAL_ERROR; SQLSTATE: HY000

Message: Failed to %s due to internal exception inside %s plugin.

ER_KEYRING_OPERATION_FAILED_DUE_TO_INTERNAL_ERROR was added in 8.0.11.

- Error number: MY-011361; Symbol: ER_KEYRING_INCORRECT_FILE; SQLSTATE: HY000

ER_KEYRING_INCORRECT_FILE was added in 8.0.11.

- Error number: MY-011362; Symbol: ER_KEYRING_FOUND_MALFORMED_BACKUP_FILE; SQLSTATE: HY000

Message: Found malformed keyring backup file - removing it.

ER_KEYRING_FOUND_MALFORMED_BACKUP_FILE was added in 8.0.11.
Server Error Message Reference

- **Error number:** MY-011363; **Symbol:** ER_KEYRING_FAILED_TO_RESTORE_FROM_BACKUP_FILE; **SQLSTATE:** HY000
  
  **Message:** Error while restoring keyring from backup file cannot overwrite keyring with backup
  
  ER_KEYRING_FAILED_TO_RESTORE_FROM_BACKUP_FILE was added in 8.0.11.

- **Error number:** MY-011364; **Symbol:** ER_KEYRING_FAILED_TO_FLUSH_KEYRING_TO_FILE; **SQLSTATE:** HY000
  
  **Message:** Error while flushing in-memory keyring into keyring file
  
  ER_KEYRING_FAILED_TO_FLUSH_KEYRING_TO_FILE was added in 8.0.11.

- **Error number:** MY-011365; **Symbol:** ER_KEYRING_FAILED_TO_GET_FILE_STAT; **SQLSTATE:** HY000
  
  **Message:** Error while reading stat for %s. Please check if file %s was not removed. OS returned this error: %s
  
  ER_KEYRING_FAILED_TO_GET_FILE_STAT was added in 8.0.11.

- **Error number:** MY-011366; **Symbol:** ER_KEYRING_FAILED_TO_REMOVE_FILE; **SQLSTATE:** HY000
  
  **Message:** Could not remove file %s. OS returned this error: %s
  
  ER_KEYRING_FAILED_TO_REMOVE_FILE was added in 8.0.11.

- **Error number:** MY-011367; **Symbol:** ER_KEYRING_FAILED_TO_TRUNCATE_FILE; **SQLSTATE:** HY000
  
  **Message:** Could not truncate file %s. OS returned this error: %s
  
  ER_KEYRING_FAILED_TO_TRUNCATE_FILE was added in 8.0.11.

- **Error number:** MY-011368; **Symbol:** ER_KEYRING_UNKNOWN_ERROR; **SQLSTATE:** HY000
  
  **Message:** Unknown error %d
  
  ER_KEYRING_UNKNOWN_ERROR was added in 8.0.11.

- **Error number:** MY-011369; **Symbol:** ER_KEYRING_FAILED_TO_SET_KEYRING_FILE_DATA; **SQLSTATE:** HY000
  
  **Message:** keyring_file_data cannot be set to new value as the keyring file cannot be created/accessed in the provided path
  
  ER_KEYRING_FAILED_TO_SET_KEYRING_FILE_DATA was added in 8.0.11.

- **Error number:** MY-011370; **Symbol:** ER_KEYRING_FILE_IO_ERROR; **SQLSTATE:** HY000
  
  **Message:** %s
  
  ER_KEYRING_FILE_IO_ERROR was added in 8.0.11.

- **Error number:** MY-011371; **Symbol:** ER_KEYRING_FAILED_TO_LOAD_KEYRING_CONTENT; **SQLSTATE:** HY000
  
  **Message:** Error while loading keyring content. The keyring might be malformed
**ER_KEYRING_FAILED_TO_LOAD_KEYRING_CONTENT** was added in 8.0.11.

- **Error number:** MY-011372; **Symbol:** ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING; **SQLSTATE:** HY000

  Message: Could not flush keys to keyring

**ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING** was added in 8.0.11.

- **Error number:** MY-011373; **Symbol:** ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING_BACKUP; **SQLSTATE:** HY000

  Message: Could not flush keys to keyring's backup

**ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING_BACKUP** was added in 8.0.11.

- **Error number:** MY-011374; **Symbol:** ER_KEYRING_KEY_FETCH_FAILED_DUE_TO_EMPTY_KEY_ID; **SQLSTATE:** HY000

  Message: Error while fetching key: key_id cannot be empty

**ER_KEYRING_KEY_FETCH_FAILED_DUE_TO_EMPTY_KEY_ID** was added in 8.0.11.

- **Error number:** MY-011375; **Symbol:** ER_KEYRING_FAILED_TO_REMOVE_KEY_DUE_TO_EMPTY_ID; **SQLSTATE:** HY000

  Message: Error while removing key: key_id cannot be empty

**ER_KEYRING_FAILED_TO_REMOVE_KEY_DUE_TO_EMPTY_ID** was added in 8.0.11.

- **Error number:** MY-011376; **Symbol:** ER_KEYRING_OKV_INCORRECT_KEY_VAULT_CONFIGURED; **SQLSTATE:** HY000

  Message: For keyring_okv to be initialized, please point keyring_okv_conf_dir variable to a directory with Oracle Key Vault configuration file and ssl materials

**ER_KEYRING_OKV_INCORRECT_KEY_VAULT_CONFIGURED** was added in 8.0.11.

- **Error number:** MY-011377; **Symbol:** ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INCORRECT_CONF; **SQLSTATE:** HY000

  Message: keyring_okv initialization failure. Please check that the keyring_okv_conf_dir points to a readable directory and that the directory contains Oracle Key Vault configuration file and ssl materials. Please also check that Oracle Key Vault is up and running

**ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INCORRECT_CONF** was added in 8.0.11.

- **Error number:** MY-011378; **Symbol:** ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INTERNAL_ERROR; **SQLSTATE:** HY000

  Message: keyring_okv initialization failure due to internal exception inside the plugin

**ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INTERNAL_ERROR** was added in 8.0.11.

- **Error number:** MY-011379; **Symbol:** ER_KEYRING_OKV_INVALID_KEY_TYPE; **SQLSTATE:** HY000

  Message: Invalid key type
**ER_KEYRING_OKV_INVALID_KEY_TYPE** was added in 8.0.11.

- Error number: **MY-011380**; Symbol: **ER_KEYRING_OKV_INVALID_KEY_LENGTH_FOR_CIPHER**; SQLSTATE: **HY000**
  
  Message: Invalid key length for given block cipher

**ER_KEYRING_OKV_INVALID_KEY_LENGTH_FOR_CIPHER** was added in 8.0.11.

- Error number: **MY-011381**; Symbol: 
  
  **ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY_DUE_TO_INTERNAL_ERROR**; SQLSTATE: **HY000**
  
  Message: Failed to generate a key due to internal exception inside keyring_okv plugin

**ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY_DUE_TO_INTERNAL_ERROR** was added in 8.0.11.

- Error number: **MY-011382**; Symbol: 
  
  **ER_KEYRING_OKV_FAILED_TO_FIND_SERVER_ENTRY**; SQLSTATE: **HY000**
  
  Message: Could not find entry for server in configuration file %s

**ER_KEYRING_OKV_FAILED_TO_FIND_SERVER_ENTRY** was added in 8.0.11.

- Error number: **MY-011383**; Symbol: 
  
  **ER_KEYRING_OKV_FAILED_TO_FIND_STANDBY_SERVER_ENTRY**; SQLSTATE: **HY000**
  
  Message: Could not find entry for standby server in configuration file %s

**ER_KEYRING_OKV_FAILED_TO_FIND_STANDBY_SERVER_ENTRY** was added in 8.0.11.

- Error number: **MY-011384**; Symbol: 
  
  **ER_KEYRING_OKV_FAILED_TO_PARSE_CONF_FILE**; SQLSTATE: **HY000**
  
  Message: Could not parse the %s file provided

**ER_KEYRING_OKV_FAILED_TO_PARSE_CONF_FILE** was added in 8.0.11.

- Error number: **MY-011385**; Symbol: 
  
  **ER_KEYRING_OKV_FAILED_TO_LOAD_KEY_UID**; SQLSTATE: **HY000**
  
  Message: Could not load keys' uids from the OKV server

**ER_KEYRING_OKV_FAILED_TO_LOAD_KEY_UID** was added in 8.0.11.

- Error number: **MY-011386**; Symbol: 
  
  **ER_KEYRING_OKV_FAILED_TO_INIT_SSL_LAYER**; SQLSTATE: **HY000**
  
  Message: Could not initialize ssl layer

**ER_KEYRING_OKV_FAILED_TO_INIT_SSL_LAYER** was added in 8.0.11.

- Error number: **MY-011387**; Symbol: 
  
  **ER_KEYRING_OKV_FAILED_TO_INIT_CLIENT**; SQLSTATE: **HY000**
  
  Message: Could not initialize OKV client

**ER_KEYRING_OKV_FAILED_TO_INIT_CLIENT** was added in 8.0.11.
• Error number: MY-011388; Symbol: ER_KEYRING_OKV_CONNECTION_TO_SERVER_FAILED; SQLSTATE: HY000
Message: Could not connect to the OKV server
ER_KEYRING_OKV_CONNECTION_TO_SERVER_FAILED was added in 8.0.11.

• Error number: MY-011389; Symbol: ER_KEYRING_OKV_FAILED_TO_REMOVE_KEY; SQLSTATE: HY000
Message: Could not remove the key
ER_KEYRING_OKV_FAILED_TO_REMOVE_KEY was added in 8.0.11.

• Error number: MY-011390; Symbol: ER_KEYRING_OKV_FAILED_TO_ADD_ATTRIBUTE; SQLSTATE: HY000
Message: Could not add attribute, attribute_name=%s attribute value=%s
ER_KEYRING_OKV_FAILED_TO_ADD_ATTRIBUTE was added in 8.0.11.

• Error number: MY-011391; Symbol: ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY; SQLSTATE: HY000
Message: Could not generate the key.
ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY was added in 8.0.11.

• Error number: MY-011392; Symbol: ER_KEYRING_OKV_FAILED_TO_STORE_KEY; SQLSTATE: HY000
Message: Could not store the key.
ER_KEYRING_OKV_FAILED_TO_STORE_KEY was added in 8.0.11.

• Error number: MY-011393; Symbol: ER_KEYRING_OKV_FAILED_TO_ACTIVATE_KEYS; SQLSTATE: HY000
Message: Could not activate the key.
ER_KEYRING_OKV_FAILED_TO_ACTIVATE_KEYS was added in 8.0.11.

• Error number: MY-011394; Symbol: ER_KEYRING_OKV_FAILED_TO_FETCH_KEY; SQLSTATE: HY000
Message: Could not fetch generated key
ER_KEYRING_OKV_FAILED_TO_FETCH_KEY was added in 8.0.11.

• Error number: MY-011395; Symbol: ER_KEYRING_OKV_FAILED_TO_STORE_OR_GENERATE_KEY; SQLSTATE: HY000
Message: Could not store/generate the key - failed to set key attribute x-key-ready
ER_KEYRING_OKV_FAILED_TO_STORE_OR_GENERATE_KEY was added in 8.0.11.

• Error number: MY-011396; Symbol: ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY_SIGNATURE; SQLSTATE: HY000
Message: Could not retrieve key signature from custom attributes

ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY_SIGNATURE was added in 8.0.11.

- Error number: MY-011397; Symbol: ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY; SQLSTATE: HY000

Message: Could not retrieve key from OKV

ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY was added in 8.0.11.

- Error number: MY-011398; Symbol: ER_KEYRING_OKV_FAILED_TO_LOAD_SSL_TRUST_STORE; SQLSTATE: HY000

Message: Error loading trust store

ER_KEYRING_OKV_FAILED_TO_LOAD_SSL_TRUST_STORE was added in 8.0.11.

- Error number: MY-011399; Symbol: ER_KEYRING_OKV_FAILED_TO_SET_CERTIFICATE_FILE; SQLSTATE: HY000

Message: Error setting the certificate file.

ER_KEYRING_OKV_FAILED_TO_SET_CERTIFICATE_FILE was added in 8.0.11.

- Error number: MY-011400; Symbol: ER_KEYRING_OKV_FAILED_TO_SET_KEY_FILE; SQLSTATE: HY000

Message: Error setting the key file.

ER_KEYRING_OKV_FAILED_TO_SET_KEY_FILE was added in 8.0.11.

- Error number: MY-011401; Symbol: ER_KEYRING_OKV_KEY_MISMATCH; SQLSTATE: HY000

Message: Private key does not match the certificate public key

ER_KEYRING_OKV_KEY_MISMATCH was added in 8.0.11.

- Error number: MY-011402; Symbol: ER_KEYRING_ENCRYPTED_FILE_INCORRECT_KEYRING_FILE; SQLSTATE: HY000

Message: Incorrect Keyring file

ER_KEYRING_ENCRYPTED_FILE_INCORRECT_KEYRING_FILE was added in 8.0.11.

- Error number: MY-011403; Symbol: ER_KEYRING_ENCRYPTED_FILE_DECRYPTION_FAILED; SQLSTATE: HY000

ER_KEYRING_ENCRYPTED_FILE_DECRYPTION_FAILED was added in 8.0.11.

- Error number: MY-011404; Symbol: ER_KEYRING_ENCRYPTED_FILE_FOUND_MALFORMED_BACKUP_FILE; SQLSTATE: HY000

Message: Found malformed keyring backup file - removing it
ER_KEYRING_ENCRYPTED_FILE_FOUND_MALFORMED_BACKUP_FILE was added in 8.0.11.

•   Error number: MY-011405; Symbol: ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_RESTORE_KEYRING; SQLSTATE: HY000
Message: Error while restoring keyring from backup file cannot overwrite keyring with backup

ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_RESTORE_KEYRING was added in 8.0.11.

•   Error number: MY-011406; Symbol: ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_FLUSH_KEYRING; SQLSTATE: HY000
Message: Error while flushing in-memory keyring into keyring file

ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_FLUSH_KEYRING was added in 8.0.11.

•   Error number: MY-011407; Symbol: ER_KEYRING_ENCRYPTED_FILE_ENCRYPTION_FAILED; SQLSTATE: HY000

ER_KEYRING_ENCRYPTED_FILE_ENCRYPTION_FAILED was added in 8.0.11.

•   Error number: MY-011408; Symbol: ER_KEYRING_ENCRYPTED_FILE_INVALID_KEYRING_DIR; SQLSTATE: HY000
Message: keyring_encrypted_file_data cannot be set to new value as the keyring file cannot be created/accessed in the provided path

ER_KEYRING_ENCRYPTED_FILE_INVALID_KEYRING_DIR was added in 8.0.11.

•   Error number: MY-011409; Symbol: ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_CREATE_KEYRING_DIR; SQLSTATE: HY000
Message: Could not create keyring directory The keyring_encrypted_file will stay unusable until correct path to the keyring directory gets provided

ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_CREATE_KEYRING_DIR was added in 8.0.11.

•   Error number: MY-011410; Symbol: ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_INVALID; SQLSTATE: HY000
Message: The keyring_encrypted_file_password must be set to a valid value.

ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_INVALID was added in 8.0.11.

•   Error number: MY-011411; Symbol: ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_TOO_LONG; SQLSTATE: HY000
Message: Too long keyring_encrypted_file_password value.

ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_TOO_LONG was added in 8.0.11.

•   Error number: MY-011412; Symbol: ER_KEYRING_ENCRYPTED_FILE_INIT_FAILURE; SQLSTATE: HY000
Message: keyring_encrypted_file initialization failure. Please check if the keyring_encrypted_file_data points to readable keyring file or keyring file can be created in the specified location or password to decrypt keyring file is correct.

**ER_KEYRING_ENCRYPTED_FILE_INIT_FAILURE** was added in 8.0.11.

- Error number: **MY-011413**; Symbol: **ER_KEYRING_ENCRYPTED_FILE_INIT_FAILED_DUE_TO_INTERNAL_ERROR**; SQLSTATE: **HY000**

Message: keyring_encrypted_file initialization failure due to internal exception inside the plugin

**ER_KEYRING_ENCRYPTED_FILE_INIT_FAILED_DUE_TO_INTERNAL_ERROR** was added in 8.0.11.

- Error number: **MY-011414**; Symbol: **ER_KEYRING_ENCRYPTED_FILE_GEN_KEY_FAILED_DUE_TO_INTERNAL_ERROR**; SQLSTATE: **HY000**

Message: Failed to generate a key due to internal exception inside keyring_encrypted_file plugin

**ER_KEYRING_ENCRYPTED_FILE_GEN_KEY_FAILED_DUE_TO_INTERNAL_ERROR** was added in 8.0.11.

- Error number: **MY-011415**; Symbol: **ER_KEYRING_AWS_FAILED_TO_SET_CMK_ID**; SQLSTATE: **HY000**

Message: keyring_aws_cmk_id cannot be set to the new value as AWS KMS seems to not understand the id provided. Please check that CMK id provided is correct.

**ER_KEYRING_AWS_FAILED_TO_SET_CMK_ID** was added in 8.0.11.

- Error number: **MY-011416**; Symbol: **ER_KEYRING_AWS_FAILED_TO_SET_REGION**; SQLSTATE: **HY000**

Message: keyring_aws_region cannot be set to the new value as AWS KMS seems to not understand the region provided. Please check that region provided is correct.

**ER_KEYRING_AWS_FAILED_TO_SET_REGION** was added in 8.0.11.

- Error number: **MY-011417**; Symbol: **ER_KEYRING_AWS_FAILED_TO_OPEN_CONF_FILE**; SQLSTATE: **HY000**

Message: Could not open keyring_aws configuration file: %s. OS returned this error: %s

**ER_KEYRING_AWS_FAILED_TO_OPEN_CONF_FILE** was added in 8.0.11.

- Error number: **MY-011418**; Symbol: **ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_ID_FROM_CONF_FILE**; SQLSTATE: **HY000**

Message: Could not read AWS access key id from keyring_aws configuration file: %s. OS returned this error: %s

**ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_ID_FROM_CONF_FILE** was added in 8.0.11.

- Error number: **MY-011419**; Symbol: **ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_FROM_CONF_FILE**; SQLSTATE: **HY000**
Message: Could not read AWS access key from keyring_aws configuration file: %s. OS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_FROM_CONF_FILE was added in 8.0.11.

- Error number: MY-011420; Symbol: ER_KEYRING_AWS_INVALID_CONF_FILE_PATH; SQLSTATE: HY000

Message: Path to keyring_aws configuration file cannot be empty

ER_KEYRING_AWS_INVALID_CONF_FILE_PATH was added in 8.0.11.

- Error number: MY-011421; Symbol: ER_KEYRING_AWS_INVALID_DATA_FILE_PATH; SQLSTATE: HY000

Message: Path to keyring_aws storage file cannot be empty.

ER_KEYRING_AWS_INVALID_DATA_FILE_PATH was added in 8.0.11.

- Error number: MY-011422; Symbol: ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DIR; SQLSTATE: HY000

Message: Unable to create/access keyring directory.

ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DIR was added in 8.0.11.

- Error number: MY-011423; Symbol: ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DATA_FILE; SQLSTATE: HY000

Message: Unable to create/access keyring_aws storage file. Please check if keyring_aws_data_file points to location where keyring file can be created/accessed. Please also make sure that MySQL server's user has high enough privileges to access this location.

ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DATA_FILE was added in 8.0.11.

- Error number: MY-011424; Symbol: ER_KEYRING_AWS_FAILED_TO_INIT_DUE_TO_INTERNAL_ERROR; SQLSTATE: HY000

Message: keyring_aws initialization failed due to internal error when initializing synchronization primitive - %s. OS returned this error: %s:

ER_KEYRING_AWS_FAILED_TO_INIT_DUE_TO_INTERNAL_ERROR was added in 8.0.11.

- Error number: MY-011425; Symbol: ER_KEYRING_AWS_FAILED_TO_ACCESS_DATA_FILE; SQLSTATE: HY000

Message: Could not access keyring_aws storage file in the path provided. Please check if the keyring_aws directory can be accessed by MySQL Server

ER_KEYRING_AWS_FAILED_TO_ACCESS_DATA_FILE was added in 8.0.11.

- Error number: MY-011426; Symbol: ER_KEYRING_AWS_CMK_ID_NOT_SET; SQLSTATE: HY000

Message: keyring_aws_cmk_id has to be set

ER_KEYRING_AWS_CMK_ID_NOT_SET was added in 8.0.11.
Error number: MY-011427; Symbol: ER_KEYRING_AWS FAILED TO GET KMS CREDENTIAL FROM CONF_FILE; SQLSTATE: HY000
Message: Could not get AWS KMS credentials from the configuration file

ER_KEYRING_AWS FAILED TO GET KMS CREDENTIAL FROM CONF_FILE was added in 8.0.11.

Error number: MY-011428; Symbol: ER KEYRING_AWS INIT FAILURE; SQLSTATE: HY000
Message: keyring_aws initialization failure.

ER KEYRING_AWS INIT FAILURE was added in 8.0.11.

Error number: MY-011429; Symbol: ER_KEYRING_AWS FAILED TO INIT DUE TO PLUGIN INTERNAL ERROR; SQLSTATE: HY000
Message: keyring_aws initialization failure due to internal exception inside the plugin

ER_KEYRING_AWS FAILED TO INIT DUE TO PLUGIN INTERNAL ERROR was added in 8.0.11.

Error number: MY-011430; Symbol: ER KEYRING_AWS INVALID KEY LENGTH FOR CIPHER; SQLSTATE: HY000
Message: Invalid key length for given block cipher

ER_KEYRING_AWS INVALID KEY LENGTH FOR CIPHER was added in 8.0.11.

Error number: MY-011431; Symbol: ER_KEYRING_AWS FAILED TO GENERATE KEY DUE TO INTERNAL ERROR; SQLSTATE: HY000
Message: Failed to generate a key due to internal exception inside keyring_file plugin

ER_KEYRING_AWS FAILED TO GENERATE KEY DUE TO INTERNAL ERROR was added in 8.0.11.

Error number: MY-011432; Symbol: ER KEYRING_AWS INCORRECT FILE; SQLSTATE: HY000
Message: Incorrect Keyring file

ER_KEYRING_AWS INCORRECT FILE was added in 8.0.11.

Error number: MY-011433; Symbol: ER KEYRING_AWS FOUND MALFORMED BACKUP FILE; SQLSTATE: HY000
Message: Found malformed keyring backup file - removing it

ER_KEYRING_AWS FOUND MALFORMED BACKUP FILE was added in 8.0.11.

Error number: MY-011434; Symbol: ER_KEYRING_AWS FAILED TO RESTORE FROM BACKUP FILE; SQLSTATE: HY000
Message: Error while restoring keyring from backup file cannot overwrite keyring with backup

ER_KEYRING_AWS FAILED TO RESTORE FROM BACKUP FILE was added in 8.0.11.

Error number: MY-011435; Symbol: ER KEYRING_AWS FAILED TO FLUSH KEYRING TO FILE; SQLSTATE: HY000
Message: Error while flushing in-memory keyring into keyring file
ER_KEYRING_AWS_FAILED_TO_FLUSH_KEYRING_TO_FILE was added in 8.0.11.

- Error number: MY-011436; Symbol: ER_KEYRING_AWS_INCORRECT_REGION; SQLSTATE: HY000
  Message: Wrong region

ER_KEYRING_AWS_INCORRECT_REGION was added in 8.0.11.

- Error number: MY-011437; Symbol: ER_KEYRING_AWS_FAILED_TO_CONNECT_KMS; SQLSTATE: HY000
  Message: Could not connect to AWS KMS with the credentials provided. Please make sure they are correct. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_CONNECT_KMS was added in 8.0.11.

- Error number: MY-011438; Symbol: ER_KEYRING_AWS_FAILED_TO_GENERATE_NEW_KEY; SQLSTATE: HY000
  Message: Could not generate a new key. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_GENERATE_NEW_KEY was added in 8.0.11.

- Error number: MY-011439; Symbol: ER_KEYRING_AWS_FAILED_TO_ENCRYPT_KEY; SQLSTATE: HY000
  Message: Could not encrypt key. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_ENCRYPT_KEY was added in 8.0.11.

- Error number: MY-011440; Symbol: ER_KEYRING_AWS_FAILED_TO_RE_ENCRYPT_KEY; SQLSTATE: HY000
  Message: Could not re-encrypt key. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_RE_ENCRYPT_KEY was added in 8.0.11.

- Error number: MY-011441; Symbol: ER_KEYRING_AWS_FAILED_TO_DECRYPT_KEY; SQLSTATE: HY000
  Message: Could not decrypt key. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_DECRYPT_KEY was added in 8.0.11.

- Error number: MY-011442; Symbol: ER_KEYRING_AWS_FAILED_TO_ROTATE_CMK; SQLSTATE: HY000
  Message: Could not rotate the CMK. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_ROTATE_CMK was added in 8.0.11.

- Error number: MY-011443; Symbol: ER_GRP_RPL_GTID_ALREADY_USED; SQLSTATE: HY000
  Message: The requested GTID ‘%s:%lld’ was already used, the transaction will rollback.

ER_GRP_RPL_GTID_ALREADY_USED was added in 8.0.11.

- Error number: MY-011444; Symbol: ER_GRP_RPL_APPLIER_THD_KILLED; SQLSTATE: HY000
Message: The group replication applier thread was killed.

ER_GRP_RPL_APPLIER_THD_KILLED was added in 8.0.11.

•   Error number: MY-011445; Symbol: ER_GRP_RPL_EVENT_HANDLING_ERROR; SQLSTATE: HY000

Message: Error at event handling! Got error: %d.

ER_GRP_RPL_EVENT_HANDLING_ERROR was added in 8.0.11.

•   Error number: MY-011446; Symbol: ER_GRP_RPL_ERROR_GTID_EXECUTION_INFO; SQLSTATE: HY000

Message: Error when extracting group GTID execution information, some recovery operations may face future issues.

ER_GRP_RPL_ERROR_GTID_EXECUTION_INFO was added in 8.0.11.

•   Error number: MY-011447; Symbol: ER_GRP_RPL_CERTIFICATE_SIZE_ERROR; SQLSTATE: HY000

Message: An error occurred when trying to reduce the Certification information size for transmission.

ER_GRP_RPL_CERTIFICATE_SIZE_ERROR was added in 8.0.11.

•   Error number: MY-011448; Symbol: ER_GRP_RPL_CREATE_APPLIER_CACHE_ERROR; SQLSTATE: HY000

Message: Failed to create group replication pipeline applier cache!

ER_GRP_RPL_CREATE_APPLIER_CACHE_ERROR was added in 8.0.11.

•   Error number: MY-011449; Symbol: ER_GRP_RPL_UNBLOCK_WAITING_THD; SQLSTATE: HY000

Message: Unblocking the group replication thread waiting for applier to start, as the start group replication was killed.

ER_GRP_RPL_UNBLOCK_WAITING_THD was added in 8.0.11.

•   Error number: MY-011450; Symbol: ER_GRP_RPL_APPLIER_PIPELINE_NOT_DISPOSED; SQLSTATE: HY000

Message: The group replication applier pipeline was not properly disposed. Check the error log for further info.

ER_GRP_RPL_APPLIER_PIPELINE_NOT_DISPOSED was added in 8.0.11.

•   Error number: MY-011451; Symbol: ER_GRP_RPL_APPLIER_THD_EXECUTION_ABORTED; SQLSTATE: HY000

Message: The applier thread execution was aborted. Unable to process more transactions, this member will now leave the group.

ER_GRP_RPL_APPLIER_THD_EXECUTION_ABORTED was added in 8.0.11.

•   Error number: MY-011452; Symbol: ER_GRP_RPL_APPLIER_EXECUTION_FATAL_ERROR; SQLSTATE: HY000
Server Error Message Reference

Message: Fatal error during execution on the Applier process of Group Replication. The server will now leave the group.

**ER_GRP_RPL_APPLIER_EXECUTION_FATAL_ERROR** was added in 8.0.11.

- **Error number:** MY-011453; **Symbol:** ER_GRP_RPL_ERROR_STOPPING_CHANNELS; **SQLSTATE:** HY000
  
  Message: Error stopping all replication channels while server was leaving the group. %s

**ER_GRP_RPL_ERROR_STOPPING_CHANNELS** was added in 8.0.11.

- **Error number:** MY-011454; **Symbol:** ER_GRP_RPL_ERROR_SENDING_SINGLE_PRIMARY_MSSG; **SQLSTATE:** HY000
  
  Message: Error sending single primary message informing that primary did apply relay logs.

**ER_GRP_RPL_ERROR_SENDING_SINGLE_PRIMARY_MSSG** was added in 8.0.11.

- **Error number:** MY-011455; **Symbol:** ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_VER_ERROR; **SQLSTATE:** HY000
  
  Message: Error updating transaction snapshot version after transaction being positively certified.

**ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_VER_ERROR** was added in 8.0.11.

- **Error number:** MY-011456; **Symbol:** ER_GRP_RPL_SIDNO_FETCH_ERROR; **SQLSTATE:** HY000
  
  Message: Error fetching transaction sidno after transaction being positively certified.

**ER_GRP_RPL_SIDNO_FETCH_ERROR** was added in 8.0.11.

- **Error number:** MY-011457; **Symbol:** ER_GRP_RPL_BROADCAST_COMMIT_TRANS_MSSG_FAILED; **SQLSTATE:** HY000
  
  Message: Broadcast of committed transactions message failed.

**ER_GRP_RPL_BROADCAST_COMMIT_TRANS_MSSG_FAILED** was added in 8.0.11.

- **Error number:** MY-011458; **Symbol:** ER_GRP_RPL_GROUP_NAME_PARSE_ERROR; **SQLSTATE:** HY000
  
  Message: Unable to parse the group name during the Certification module initialization.

**ER_GRP_RPL_GROUP_NAME_PARSE_ERROR** was added in 8.0.11.

- **Error number:** MY-011459; **Symbol:** ER_GRP_RPL_ADD_GRPSID_TO_GRPGTIDSID_MAP_ERROR; **SQLSTATE:** HY000
  
  Message: Unable to add the group_sid in the group_gtid_sid_map during the Certification module initialization.

**ER_GRP_RPL_ADD_GRPSID_TO_GRPGTIDSID_MAP_ERROR** was added in 8.0.11.

- **Error number:** MY-011460; **Symbol:** ER_GRP_RPL_UPDATE_GRPGTID_EXECUTED_ERROR; **SQLSTATE:** HY000
  
  Message: Error updating group_gtid_executed GITD set during the Certification module initialization.
**Server Error Message Reference**

**ER_GRP_RPL_UPDATE_GRP_GTID_EXECUTED_ERROR** was added in 8.0.11.

- **Error number:** MY-011461; **Symbol:** ER_GRP_RPL_DONOR_TRANS_INFO_ERROR; **SQLSTATE:** HY000
  
  Message: Unable to handle the donor's transaction information when initializing the conflict detection component. Possible out of memory error.

**ER_GRP_RPL_DONOR_TRANS_INFO_ERROR** was added in 8.0.11.

- **Error number:** MY-011462; **Symbol:** ER_GRP_RPL_SERVER_CONN_ERROR; **SQLSTATE:** HY000
  
  Message: Error when establishing a server connection during the Certification module initialization.

**ER_GRP_RPL_SERVER_CONN_ERROR** was added in 8.0.11.

- **Error number:** MY-011463; **Symbol:** ER_GRP_RPL_ERROR_FETCHING_GTID_EXECUTED_SET; **SQLSTATE:** HY000
  
  Message: Error when extracting this member GTID executed set. Certification module can't be properly initialized.

**ER_GRP_RPL_ERROR_FETCHING_GTID_EXECUTED_SET** was added in 8.0.11.

- **Error number:** MY-011464; **Symbol:** ER_GRP_RPL_ADD_GTID_TO_GRP_GTID_EXECUTED_ERROR; **SQLSTATE:** HY000
  
  Message: Error while adding the server GTID EXECUTED set to the group_gtid_execute during the Certification module initialization.

**ER_GRP_RPL_ADD_GTID_TO_GRP_GTID_EXECUTED_ERROR** was added in 8.0.11.

- **Error number:** MY-011465; **Symbol:** ER_GRP_RPL_ERROR_FETCHING_GTID_SET; **SQLSTATE:** HY000
  
  Message: Error when extracting this member retrieved set for its applier. Certification module can't be properly initialized.

**ER_GRP_RPL_ERROR_FETCHING_GTID_SET** was added in 8.0.11.

- **Error number:** MY-011466; **Symbol:** ER_GRP_RPL_ADD_RETRIEVED_SET_TO_GRP_GTID_EXECUTED_ERROR; **SQLSTATE:** HY000
  
  Message: Error while adding the member retrieved set to the group_gtid_executed during the Certification module initialization.

**ER_GRP_RPL_ADD_RETRIEVED_SET_TO_GRP_GTID_EXECUTED_ERROR** was added in 8.0.11.

- **Error number:** MY-011467; **Symbol:** ER_GRP_RPL_CERTIFICATION_INITIALIZATION_FAILURE; **SQLSTATE:** HY000
  
  Message: Error during Certification module initialization.

**ER_GRP_RPL_CERTIFICATION_INITIALIZATION_FAILURE** was added in 8.0.11.

- **Error number:** MY-011468; **Symbol:** ER_GRP_RPL_UPDATE_LAST_CONFLICT_FREE_TRANS_ERROR; **SQLSTATE:** HY000

**ER_GRP_RPL_UPDATE_LAST_CONFLICT_FREE_TRANS_ERROR** was added in 8.0.11.
Message: Unable to update last conflict free transaction, this transaction will not be tracked on performance_schema.replication_group_member_stats.last_conflict_free_transaction.

ER_GRP_RPL_UPDATE_LAST_CONFLICT_FREE_TRANS_ERROR was added in 8.0.11.

- Error number: MY-011469; Symbol: ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_REF_VER_ERROR; SQLSTATE: HY000

Message: Error updating transaction snapshot version reference for internal storage.

ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_REF_VER_ERROR was added in 8.0.11.

- Error number: MY-011470; Symbol: ER_GRP_RPL_FETCH_TRANS_SIDNO_ERROR; SQLSTATE: HY000

Message: Error fetching transaction sidno while adding to the group_gtid_executed set.

ER_GRP_RPL_FETCH_TRANS_SIDNO_ERROR was added in 8.0.11.

- Error number: MY-011471; Symbol: ER_GRP_RPL_ERROR_VERIFYING_SIDNO; SQLSTATE: HY000

Message: Error while ensuring the sidno be present in the group_gtid_executed.

ER_GRP_RPL_ERROR_VERIFYING_SIDNO was added in 8.0.11.

- Error number: MY-011472; Symbol: ER_GRP_RPL_CANT_GENERATE_GTID; SQLSTATE: HY000

Message: Impossible to generate Global Transaction Identifier: the integer component reached the maximal value. Restart the group with a new group_replication_group_name.

ER_GRP_RPL_CANT_GENERATE_GTID was added in 8.0.11.

- Error number: MY-011473; Symbol: ER_GRP_RPL_INVALID_GTID_SET; SQLSTATE: HY000

Message: Invalid stable transactions set.

ER_GRP_RPL_INVALID_GTID_SET was added in 8.0.11.

- Error number: MY-011474; Symbol: ER_GRP_RPL_UPDATE_GTID_SET_ERROR; SQLSTATE: HY000

Message: Error updating stable transactions set.

ER_GRP_RPL_UPDATE_GTID_SET_ERROR was added in 8.0.11.

- Error number: MY-011475; Symbol: ER_GRP_RPL_RECEIVED_SET_MISSING_GTIDS; SQLSTATE: HY000

Message: There was an error when filling the missing GTIDs on the applier channel received set. Despite not critical, on the long run this may cause performance issues.

ER_GRP_RPL_RECEIVED_SET_MISSING_GTIDS was added in 8.0.11.

- Error number: MY-011476; Symbol: ER_GRP_RPL_SKIP_COMPUTATION_TRANS_COMMITTED; SQLSTATE: HY000

Message: Skipping the computation of the Transactions_committed_all_members field as an older instance of this computation is still ongoing.
ER_GRP_RPL_SKIP_COMPUTATION_TRANS_COMMITTED was added in 8.0.11.

- Error number: MY-011477; Symbol: ER_GRP_RPL_NULL_PACKET; SQLSTATE: HY000
  Message: Null packet on certifier's queue.
  ER_GRP_RPL_NULL_PACKET was added in 8.0.11.

- Error number: MY-011478; Symbol: ER_GRP_RPL_CANT_READ_GTID; SQLSTATE: HY000
  Message: Error reading GTIDs from the message.
  ER_GRP_RPL_CANT_READ_GTID was added in 8.0.11.

- Error number: MY-011479; Symbol: ER_GRP_RPL_PROCESS_GTID_SET_ERROR; SQLSTATE: HY000
  Message: Error processing stable transactions set.
  ER_GRP_RPL_PROCESS_GTID_SET_ERROR was added in 8.0.11.

- Error number: MY-011480; Symbol: ER_GRP_RPL_PROCESS_INTERSECTION_GTID_SET_ERROR; SQLSTATE: HY000
  Message: Error processing intersection of stable transactions set.
  ER_GRP_RPL_PROCESS_INTERSECTION_GTID_SET_ERROR was added in 8.0.11.

- Error number: MY-011481; Symbol: ER_GRP_RPL_SET_STABLE_TRANS_ERROR; SQLSTATE: HY000
  Message: Error setting stable transactions set.
  ER_GRP_RPL_SET_STABLE_TRANS_ERROR was added in 8.0.11.

- Error number: MY-011482; Symbol: ER_GRP_RPL_CANT_READ_GRP_GTID_EXTRACTED; SQLSTATE: HY000
  Message: Error reading group_gtid_extracted from the View_change_log_event.
  ER_GRP_RPL_CANT_READ_GRP_GTID_EXTRACTED was added in 8.0.11.

- Error number: MY-011483; Symbol: ER_GRP_RPL_CANT_READ_WRITE_SET_ITEM; SQLSTATE: HY000
  Message: Error reading the write set item '%s' from the View_change_log_event.
  ER_GRP_RPL_CANT_READ_WRITE_SET_ITEM was added in 8.0.11.

- Error number: MY-011484; Symbol: ER_GRP_RPL_INIT_CERTIFICATION_INFO_FAILURE; SQLSTATE: HY000
  Message: Error during certification_info initialization.
  ER_GRP_RPL_INIT_CERTIFICATION_INFO_FAILURE was added in 8.0.11.

- Error number: MY-011485; Symbol: ER_GRP_RPL_CONFLICT_DETECTION_DISABLED; SQLSTATE: HY000
  Message: Primary had applied all relay logs, disabled conflict detection.
**ER_GRP_RPL_CONFLICT_DETECTION_DISABLED** was added in 8.0.11.

- **Error number:** MY-011486; **Symbol:** ER_GRP_RPL_MSG_DISCARDED; **SQLSTATE:** HY000
  
  Message: Message received while the plugin is not ready, message discarded.

**ER_GRP_RPL_MSG_DISCARDED** was added in 8.0.11.

- **Error number:** MY-011487; **Symbol:** ER_GRP_RPL_MISSING_GRP_RPL_APPLIER; **SQLSTATE:** HY000
  
  Message: Message received without a proper group replication applier.

**ER_GRP_RPL_MISSING_GRP_RPL_APPLIER** was added in 8.0.11.

- **Error number:** MY-011488; **Symbol:** ER_GRP_RPL_CERTIFIER_MSSG_PROCESS_ERROR; **SQLSTATE:** HY000
  
  Message: Error processing message in Certifier.

**ER_GRP_RPL_CERTIFIER_MSSG_PROCESS_ERROR** was added in 8.0.11.

- **Error number:** MY-011489; **Symbol:** ER_GRP_RPL_SRV_NOT_ONLINE; **SQLSTATE:** HY000
  
  Message: This server was not declared online since it is on status %s.

**ER_GRP_RPL_SRV_NOT_ONLINE** was added in 8.0.11.

- **Error number:** MY-011490; **Symbol:** ER_GRP_RPL_SRV_ONLINE; **SQLSTATE:** HY000
  
  Message: This server was declared online within the replication group.

**ER_GRP_RPL_SRV_ONLINE** was added in 8.0.11.

- **Error number:** MY-011491; **Symbol:** ER_GRP_RPL_DISABLE_SRV_READ_MODE_RESTRICTED; **SQLSTATE:** HY000
  
  Message: When declaring the plugin online it was not possible to disable the server read mode settings. Try to disable it manually.

**ER_GRP_RPL_DISABLE_SRV_READ_MODE_RESTRICTED** was added in 8.0.11.

- **Error number:** MY-011492; **Symbol:** ER_GRP_RPL_MEM_ONLINE; **SQLSTATE:** HY000
  
  Message: The member with address %s:%u was declared online within the replication group.

**ER_GRP_RPL_MEM_ONLINE** was added in 8.0.11.

- **Error number:** MY-011493; **Symbol:** ER_GRP_RPL_MEM_UNREACHABLE; **SQLSTATE:** HY000
  
  Message: Member with address %s:%u has become unreachable.

**ER_GRP_RPL_MEM_UNREACHABLE** was added in 8.0.11.

- **Error number:** MY-011494; **Symbol:** ER_GRP_RPL_MEM_REACHABLE; **SQLSTATE:** HY000
  
  Message: Member with address %s:%u is reachable again.

**ER_GRP_RPL_MEM_REACHABLE** was added in 8.0.11.
Server Error Message Reference

- Error number: **MY-011495**; Symbol: **ER_GRP_RPL_SRV_BLOCKED**; SQLSTATE: **HY000**
  Message: This server is not able to reach a majority of members in the group. This server will now block all updates. The server will remain blocked until contact with the majority is restored. It is possible to use `group_replication_force_members` to force a new group membership.
  
  **ER_GRP_RPL_SRV_BLOCKED** was added in 8.0.11.

- Error number: **MY-011496**; Symbol: **ER_GRP_RPL_SRV_BLOCKED_FOR_SECS**; SQLSTATE: **HY000**
  Message: This server is not able to reach a majority of members in the group. This server will now block all updates. The server will remain blocked for the next %lu seconds. Unless contact with the majority is restored, after this time the member will error out and leave the group. It is possible to use `group_replication_force_members` to force a new group membership.
  
  **ER_GRP_RPL_SRV_BLOCKED_FOR_SECS** was added in 8.0.11.

- Error number: **MY-011497**; Symbol: **ER_GRP_RPL_CHANGE_GRP_MEM_NOT_PROCESSED**; SQLSTATE: **HY000**
  Message: A group membership change was received but the plugin is already leaving due to the configured timeout on `group_replication_unreachable_majority_timeout` option.
  
  **ER_GRP_RPL_CHANGE_GRP_MEM_NOT_PROCESSED** was added in 8.0.11.

- Error number: **MY-011498**; Symbol: **ER_GRP_RPL_MEMBER_CONTACT_RESTORED**; SQLSTATE: **HY000**
  Message: The member has resumed contact with a majority of the members in the group. Regular operation is restored and transactions are unblocked.
  
  **ER_GRP_RPL_MEMBER_CONTACT_RESTORED** was added in 8.0.11.

- Error number: **MY-011499**; Symbol: **ER_GRP_RPL_MEMBER_REMOVED**; SQLSTATE: **HY000**
  Message: Members removed from the group: %s
  
  **ER_GRP_RPL_MEMBER_REMOVED** was added in 8.0.11.

- Error number: **MY-011500**; Symbol: **ER_GRP_RPL_PRIMARY_MEMBER_LEFT_GRP**; SQLSTATE: **HY000**
  Message: Primary server with address %s left the group. Electing new Primary.
  
  **ER_GRP_RPL_PRIMARY_MEMBER_LEFT_GRP** was added in 8.0.11.

- Error number: **MY-011501**; Symbol: **ER_GRP_RPL_MEMBER_ADDED**; SQLSTATE: **HY000**
  Message: Members joined the group: %s
  
  **ER_GRP_RPL_MEMBER_ADDED** was added in 8.0.11.

- Error number: **MY-011502**; Symbol: **ER_GRP_RPL_MEMBER_EXIT_PLUGIN_ERROR**; SQLSTATE: **HY000**
  Message: There was a previous plugin error while the member joined the group. The member will now exit the group.
  
  **ER_GRP_RPL_MEMBER_EXIT_PLUGIN_ERROR** was added in 8.0.11.
• Error number: MY-011503; Symbol: ER_GRP_RPL_MEMBER_CHANGE; SQLSTATE: HY000
Message: Group membership changed to %s on view %s.

ER_GRP_RPL_MEMBER_CHANGE was added in 8.0.11.

• Error number: MY-011504; Symbol: ER_GRP_RPL_MEMBER_LEFT_GRP; SQLSTATE: HY000
Message: Group membership changed: This member has left the group.

ER_GRP_RPL_MEMBER_LEFT_GRP was added in 8.0.11.

• Error number: MY-011505; Symbol: ER_GRP_RPL_MEMBER_EXPELLED; SQLSTATE: HY000
Message: Member was expelled from the group due to network failures, changing member status to ERROR.

ER_GRP_RPL_MEMBER_EXPELLED was added in 8.0.11.

• Error number: MY-011506; Symbol: ER_GRP_RPL_SESSION_OPEN_FAILED; SQLSTATE: HY000
Message: Unable to open session to (re)set read only mode. Skipping.

ER_GRP_RPL_SESSION_OPEN_FAILED was added in 8.0.11.

• Error number: MY-011507; Symbol: ER_GRP_RPL_NEW_PRIMARY_ELECTED; SQLSTATE: HY000
Message: A new primary with address %s:%u was elected. %s

ER_GRP_RPL_NEW_PRIMARY_ELECTED was added in 8.0.11.

• Error number: MY-011508; Symbol: ER_GRP_RPL_DISABLE_READ_ONLY_FAILED; SQLSTATE: HY000
Message: Unable to disable super read only flag. Try to disable it manually

ER_GRP_RPL_DISABLE_READ_ONLY_FAILED was added in 8.0.11.

• Error number: MY-011509; Symbol: ER_GRP_RPL_ENABLE_READ_ONLY_FAILED; SQLSTATE: HY000
Message: Unable to set super read only flag. Try to set it manually.

ER_GRP_RPL_ENABLE_READ_ONLY_FAILED was added in 8.0.11.

• Error number: MY-011510; Symbol: ER_GRP_RPL_SRV_PRIMARY_MEM; SQLSTATE: HY000
Message: This server is working as primary member.

ER_GRP_RPL_SRV_PRIMARY_MEM was added in 8.0.11.

• Error number: MY-011511; Symbol: ER_GRP_RPL_SRV_SECONDARY_MEM; SQLSTATE: HY000
Message: This server is working as secondary member with primary member address %s:%u.

ER_GRP_RPL_SRV_SECONDARY_MEM was added in 8.0.11.

• Error number: MY-011512; Symbol: ER_GRP_RPL_NO_SUITABLE_PRIMARY_MEM; SQLSTATE: HY000
Message: Unable to set any member as primary. No suitable candidate.

ER_GRP_RPL_NO_SUITABLE_PRIMARY_MEM was added in 8.0.11.

- Error number: MY-011113; Symbol: ER_GRP_RPL_SUPER_READ_ONLY_ACTIVATE_ERROR; SQLSTATE: HY000

Message: Error when activating super_read_only mode on start. The member will now exit the group.

ER_GRP_RPL_SUPER_READ_ONLY_ACTIVATE_ERROR was added in 8.0.11.

- Error number: MY-011114; Symbol: ER_GRP_RPL_EXCEEDS_AUTO_INC_VALUE; SQLSTATE: HY000

Message: Group contains %lu members which is greater than auto_increment_increment value of %lu. This can lead to a higher transactional abort rate.

ER_GRP_RPL_EXCEEDS_AUTO_INC_VALUE was added in 8.0.11.

- Error number: MY-011115; Symbol: ER_GRP_RPL_DATA_NOT_PROVIDED_BY_MEM; SQLSTATE: HY000

Message: Member with address '%s:%u' didn't provide any data during the last group change. Group information can be outdated and lead to errors on recovery.

ER_GRP_RPL_DATA_NOT_PROVIDED_BY_MEM was added in 8.0.11.

- Error number: MY-011116; Symbol: ER_GRP_RPL_MEMBER_ALREADY_EXISTS; SQLSTATE: HY000

Message: There is already a member with server_uuid %s. The member will now exit the group.

ER_GRP_RPL_MEMBER_ALREADY_EXISTS was added in 8.0.11.

- Error number: MY-011117; Symbol: ER_GRP_RPL_GRP_CHANGE_INFO_EXTRACT_ERROR; SQLSTATE: HY000

Message: Error when extracting information for group change. Operations and checks made to group joiners may be incomplete.

ER_GRP_RPL_GRP_CHANGE_INFO_EXTRACT_ERROR was added in 8.0.11.

- Error number: MY-011118; Symbol: ER_GRP_RPL_GTID_EXECUTED_EXTRACT_ERROR; SQLSTATE: HY000

Message: Error when extracting this member GTID executed set. Operations and checks made to group joiners may be incomplete.

ER_GRP_RPL_GTID_EXECUTED_EXTRACT_ERROR was added in 8.0.11.

- Error number: MY-011119; Symbol: ER_GRP_RPL_GTID_SET_EXTRACT_ERROR; SQLSTATE: HY000

Message: Error when extracting this member retrieved set for its applier. Operations and checks made to group joiners may be incomplete.

ER_GRP_RPL_GTID_SET_EXTRACT_ERROR was added in 8.0.11.

- Error number: MY-011120; Symbol: ER_GRP_RPL_START_FAILED; SQLSTATE: HY000
Message: The START GROUP_REPLICATION command failed since the group already has 9 members.

ER_GRP_RPL_START_FAILED was added in 8.0.11.

- **Error number:** MY-011521; Symbol: ER_GRP_RPL_MEMBER_VER_INCOMPATIBLE; SQLSTATE: HY000

Message: Member version is incompatible with the group.

ER_GRP_RPL_MEMBER_VER_INCOMPATIBLE was added in 8.0.11.

- **Error number:** MY-011522; Symbol: ER_GRP_RPL_TRANS_NOT_PRESENT_IN_GRP; SQLSTATE: HY000

Message: The member contains transactions not present in the group. The member will now exit the group.

ER_GRP_RPL_TRANS_NOT_PRESENT_IN_GRP was added in 8.0.11.

- **Error number:** MY-011523; Symbol: ER_GRP_RPL_TRANS_GREATER_THAN_GRP; SQLSTATE: HY000

Message: It was not possible to assess if the member has more transactions than the group. The member will now exit the group.

ER_GRP_RPL_TRANS_GREATER_THAN_GRP was added in 8.0.11.

- **Error number:** MY-011524; Symbol: ER_GRP_RPL_MEMBER_VERSION_LOWER_THAN_GRP; SQLSTATE: HY000

Message: Member version is lower than some group member, but since option 'group_replication_allow_local_lower_version_join is enabled, member will be allowed to join.

ER_GRP_RPL_MEMBER_VERSION_LOWER_THAN_GRP was added in 8.0.11.

- **Error number:** MY-011525; Symbol: ER_GRP_RPL_LOCAL_GTID_SETS_PROCESS_ERROR; SQLSTATE: HY000

Message: Error processing local GTID sets when comparing this member transactions against the group.

ER_GRP_RPL_LOCAL_GTID_SETS_PROCESS_ERROR was added in 8.0.11.

- **Error number:** MY-011526; Symbol: ER_GRP_RPL_MEMBER_TRANS_GREATER_THAN_GRP; SQLSTATE: HY000

Message: This member has more executed transactions than those present in the group. Local transactions: %s > Group transactions: %s

ER_GRP_RPL_MEMBER_TRANS_GREATER_THAN_GRP was added in 8.0.11.

- **Error number:** MY-011527; Symbol: ER_GRP_RPL_BLOCK_SIZE_DIFF_FROM_GRP; SQLSTATE: HY000

Message: The member is configured with a group_replication_gtid_assignment_block_size option value '%llu' different from the group '%llu'. The member will now exit the group.

ER_GRP_RPL_BLOCK_SIZE_DIFF_FROM_GRP was added in 8.0.11.
• Error number: MY-011528; Symbol: ER_GRP_RPL_TRANS_WRITE_SET_EXTRACT_DIFF_FROM_GRP; SQLSTATE: HY000
  Message: The member is configured with a transaction-write-set-extraction option value '%s' different from the group '%s'. The member will now exit the group.
  ER_GRP_RPL_TRANS_WRITE_SET_EXTRACT_DIFF_FROM_GRP was added in 8.0.11.

• Error number: MY-011529; Symbol: ER_GRP_RPL_MEMBER_CFG_INCOMPATIBLE_WITH_GRP_CFG; SQLSTATE: HY000
  Message: The member configuration is not compatible with the group configuration. Variables such as single_primary_mode or enforce_update_everywhere_checks must have the same value on every server in the group. (member configuration option: [\%s], group configuration option: [\%s]).
  ER_GRP_RPL_MEMBER_CFG_INCOMPATIBLE_WITH_GRP_CFG was added in 8.0.11.

• Error number: MY-011530; Symbol: ER_GRP_RPL_MEMBER_STOP_RPL_CHANNELS_ERROR; SQLSTATE: HY000
  Message: Error stopping all replication channels while server was leaving the group. %s
  ER_GRP_RPL_MEMBER_STOP_RPL_CHANNELS_ERROR was added in 8.0.11.

• Error number: MY-011531; Symbol: ER_GRP_RPL_PURGE_APPLIER_LOGS; SQLSTATE: HY000
  Message: Detected previous RESET MASTER invocation or an issue exists in the group replication applier relay log. Purging existing applier logs.
  ER_GRP_RPL_PURGE_APPLIER_LOGS was added in 8.0.11.

• Error number: MY-011532; Symbol: ER_GRP_RPL_RESET_APPLIER_MODULE_LOGS_ERROR; SQLSTATE: HY000
  Message: Unknown error occurred while resetting applier's module logs.
  ER_GRP_RPL_RESET_APPLIER_MODULE_LOGS_ERROR was added in 8.0.11.

• Error number: MY-011533; Symbol: ER_GRP_RPL_APPLIER_THD_SETUP_ERROR; SQLSTATE: HY000
  Message: Failed to setup the group replication applier thread.
  ER_GRP_RPL_APPLIER_THD_SETUP_ERROR was added in 8.0.11.

• Error number: MY-011534; Symbol: ER_GRP_RPL_APPLIER_THD_START_ERROR; SQLSTATE: HY000
  Message: Error while starting the group replication applier thread
  ER_GRP_RPL_APPLIER_THD_START_ERROR was added in 8.0.11.

• Error number: MY-011535; Symbol: ER_GRP_RPL_APPLIER_THD_STOP_ERROR; SQLSTATE: HY000
  Message: Failed to stop the group replication applier thread.
  ER_GRP_RPL_APPLIER_THD_STOP_ERROR was added in 8.0.11.
Server Error Message Reference

- **Error number:** MY-011536; **Symbol:** ER_GRP_RPL_FETCH_TRANS_DATA_FAILED; **SQLSTATE:** HY000
  
  Message: Failed to fetch transaction data containing required transaction info for applier

  ER_GRP_RPL_FETCH_TRANS_DATA_FAILED was added in 8.0.11.

- **Error number:** MY-011537; **Symbol:** ER_GRP_RPL_SLAVE_IO_THD_PRIMARY_UNKNOWN; **SQLSTATE:** HY000
  
  Message: Can't start slave IO THREAD of channel '%s' when group replication is running with single-primary mode and the primary member is not known.

  ER_GRP_RPL_SLAVE_IO_THD_PRIMARY_UNKNOWN was added in 8.0.11.

- **Error number:** MY-011538; **Symbol:** ER_GRP_RPL_SLAVE_IO_THD_ON_SECONDARY_MEMBER; **SQLSTATE:** HY000
  
  Message: Can't start slave IO THREAD of channel '%s' when group replication is running with single-primary mode on a secondary member.

  ER_GRP_RPL_SLAVE_IO_THD_ON_SECONDARY_MEMBER was added in 8.0.11.

- **Error number:** MY-011539; **Symbol:** ER_GRP_RPL_SLAVE_SQL_THD_PRIMARY_UNKNOWN; **SQLSTATE:** HY000
  
  Message: Can't start slave SQL THREAD of channel '%s' when group replication is running with single-primary mode and the primary member is not known.

  ER_GRP_RPL_SLAVE_SQL_THD_PRIMARY_UNKNOWN was added in 8.0.11.

- **Error number:** MY-011540; **Symbol:** ER_GRP_RPL_SLAVE_SQL_THD_ON_SECONDARY_MEMBER; **SQLSTATE:** HY000
  
  Message: Can't start slave SQL THREAD of channel '%s' when group replication is running with single-primary mode on a secondary member.

  ER_GRP_RPL_SLAVE_SQL_THD_ON_SECONDARY_MEMBER was added in 8.0.11.

- **Error number:** MY-011541; **Symbol:** ER_GRP_RPL_NEEDS_INNODB_TABLE; **SQLSTATE:** HY000
  
  Message: Table %s does not use the InnoDB storage engine. This is not compatible with Group Replication.

  ER_GRP_RPL_NEEDS_INNODB_TABLE was added in 8.0.11.

- **Error number:** MY-011542; **Symbol:** ER_GRP_RPL_PRIMARY_KEY_NOT_DEFINED; **SQLSTATE:** HY000
  
  Message: Table %s does not have any PRIMARY KEY. This is not compatible with Group Replication.

  ER_GRP_RPL_PRIMARY_KEY_NOT_DEFINED was added in 8.0.11.

- **Error number:** MY-011543; **Symbol:** ER_GRP_RPL_FK_WITH_CASCADE_UNSUPPORTED; **SQLSTATE:** HY000
  
  Message: Table %s has a foreign key with 'CASCADE' clause. This is not compatible with Group Replication.
ER_GRP_RPL_FK_WITH_CASCADE_UNSUPPORTED was added in 8.0.11.

• Error number: MY-011544; Symbol: ER_GRP_RPL_AUTO_INC_RESET; SQLSTATE: HY000
  Message: auto_increment_increment is reset to %lu
  ER_GRP_RPL_AUTO_INC_RESET was added in 8.0.11.

• Error number: MY-011545; Symbol: ER_GRP_RPL_AUTO_INC_OFFSET_RESET; SQLSTATE: HY000
  Message: auto_increment_offset is reset to %lu
  ER_GRP_RPL_AUTO_INC_OFFSET_RESET was added in 8.0.11.

• Error number: MY-011546; Symbol: ER_GRP_RPL_AUTO_INC_SET; SQLSTATE: HY000
  Message: auto_increment_increment is set to %lu
  ER_GRP_RPL_AUTO_INC_SET was added in 8.0.11.

• Error number: MY-011547; Symbol: ER_GRP_RPL_AUTO_INC_OFFSET_SET; SQLSTATE: HY000
  Message: auto_increment_offset is set to %lu
  ER_GRP_RPL_AUTO_INC_OFFSET_SET was added in 8.0.11.

• Error number: MY-011548; Symbol: ER_GRP_RPL_FETCH_TRANS_CONTEXT_FAILED; SQLSTATE: HY000
  Message: Failed to fetch transaction context containing required transaction info for certification
  ER_GRP_RPL_FETCH_TRANS_CONTEXT_FAILED was added in 8.0.11.

• Error number: MY-011549; Symbol: ER_GRP_RPL_FETCH_FORMAT_DESC_LOG_EVENT_FAILED; SQLSTATE: HY000
  Message: Failed to fetch Format_description_log_event containing required server info for applier
  ER_GRP_RPL_FETCH_FORMAT_DESC_LOG_EVENT_FAILED was added in 8.0.11.

• Error number: MY-011550; Symbol: ER_GRP_RPL_FETCH_TRANS_CONTEXT_LOG_EVENT_FAILED; SQLSTATE: HY000
  Message: Failed to fetch Transaction_context_log_event containing required transaction info for certification
  ER_GRP_RPL_FETCH_TRANS_CONTEXT_LOG_EVENT_FAILED was added in 8.0.11.

• Error number: MY-011551; Symbol: ER_GRP_RPL_FETCH_SNAPSHOT_VERSION_FAILED; SQLSTATE: HY000
  Message: Failed to read snapshot version from transaction context event required for certification
  ER_GRP_RPL_FETCH_SNAPSHOT_VERSION_FAILED was added in 8.0.11.

• Error number: MY-011552; Symbol: ER_GRP_RPL_FETCH_GTID_LOG_EVENT_FAILED; SQLSTATE: HY000
  Message: Failed to fetch Gtid_log_event containing required transaction info for certification
**ER_GRP_RPL_FETCH_GTID_LOG_EVENT_FAILED** was added in 8.0.11.

- **Error number:** MY-011553; Symbol: **ER_GRP_RPL_UPDATE_SERV_CERTIFICATE_FAILED**; SQLSTATE: **HY000**

  Message: Unable to update certification result on server side, thread_id: %lu

**ER_GRP_RPL_UPDATE_SERV_CERTIFICATE_FAILED** was added in 8.0.11.

- **Error number:** MY-011554; Symbol: **ER_GRP_RPL_ADD_GTID_INFO_WITH_LOCAL_GTID_FAILED**; SQLSTATE: **HY000**

  Message: Unable to add gtid information to the group_gtid_executed set when gtid was provided for local transactions

**ER_GRP_RPL_ADD_GTID_INFO_WITH_LOCAL_GTID_FAILED** was added in 8.0.11.

- **Error number:** MY-011555; Symbol: **ER_GRP_RPL_ADD_GTID_INFO_WITHOUT_LOCAL_GTID_FAILED**; SQLSTATE: **HY000**

  Message: Unable to add gtid information to the group_gtid_executed set when no gtid was provided for local transactions

**ER_GRP_RPL_ADD_GTID_INFO_WITHOUT_LOCAL_GTID_FAILED** was added in 8.0.11.

- **Error number:** MY-011556; Symbol: **ER_GRP_RPL_NOTIFY_CERTIFICATION_OUTCOME_FAILED**; SQLSTATE: **HY000**

  Message: Failed to notify certification outcome

**ER_GRP_RPL_NOTIFY_CERTIFICATION_OUTCOME_FAILED** was added in 8.0.11.

- **Error number:** MY-011557; Symbol: **ER_GRP_RPL_ADD_GTID_INFO_WITH_REMOTE_GTID_FAILED**; SQLSTATE: **HY000**

  Message: Unable to add gtid information to the group_gtid_executed set when gtid was provided for remote transactions

**ER_GRP_RPL_ADD_GTID_INFO_WITH_REMOTE_GTID_FAILED** was added in 8.0.11.

- **Error number:** MY-011558; Symbol: **ER_GRP_RPL_ADD_GTID_INFO_WITHOUT_REMOTE_GTID_FAILED**; SQLSTATE: **HY000**

  Message: Unable to add gtid information to the group_gtid_executed set when gtid was not provided for remote transactions

**ER_GRP_RPL_ADD_GTID_INFO_WITHOUT_REMOTE_GTID_FAILED** was added in 8.0.11.

- **Error number:** MY-011559; Symbol: **ER_GRP_RPL_FETCH_VIEW_CHANGE_LOG_EVENT_FAILED**; SQLSTATE: **HY000**

  Message: Failed to fetch View_change_log_event containing required info for certification

**ER_GRP_RPL_FETCH_VIEW_CHANGE_LOG_EVENT_FAILED** was added in 8.0.11.

- **Error number:** MY-011560; Symbol: **ER_GRP_RPL_CONTACT_WITH_SRV_FAILED**; SQLSTATE: **HY000**
Server Error Message Reference

Message: Error when contacting the server to ensure the proper logging of a group change in the binlog
ER_GRP_RPL_CONTACT_WITH_SRV_FAILED was added in 8.0.11.

•   Error number: MY-011561; Symbol: ER_GRP_RPL_SRV_WAIT_TIME_OUT; SQLSTATE: HY000
Message: Timeout when waiting for the server to execute local transactions in order assure the group change proper logging
ER_GRP_RPL_SRV_WAIT_TIME_OUT was added in 8.0.11.

•   Error number: MY-011562; Symbol: ER_GRP_RPL_FETCH_LOG_EVENT_FAILED; SQLSTATE: HY000
Message: Failed to fetch Log_event containing required server info for applier
ER_GRP_RPL_FETCH_LOG_EVENT_FAILED was added in 8.0.11.

•   Error number: MY-011563; Symbol: ER_GRP_RPL_START_GRP_RPL_FAILED; SQLSTATE: HY000
Message: Unable to start Group Replication. Replication applier infrastructure is not initialized since the server was started with --initialize, --initialize-insecure or --upgrade=MINIMAL on a server upgrade.
ER_GRP_RPL_START_GRP_RPL_FAILED was added in 8.0.11.

•   Error number: MY-011564; Symbol: ER_GRP_RPL_CONN_INTERNAL_PLUGIN_FAIL; SQLSTATE: HY000
Message: Failed to establish an internal server connection to execute plugin operations
ER_GRP_RPL_CONN_INTERNAL_PLUGIN_FAIL was added in 8.0.11.

•   Error number: MY-011565; Symbol: ER_GRP_RPL_SUPER_READ_ON; SQLSTATE: HY000
Message: Setting super_read_only=ON.
ER_GRP_RPL_SUPER_READ_ON was added in 8.0.11.

•   Error number: MY-011566; Symbol: ER_GRP_RPL_SUPER_READ_OFF; SQLSTATE: HY000
Message: Setting super_read_only=OFF.
ER_GRP_RPL_SUPER_READ_OFF was added in 8.0.11.

•   Error number: MY-011567; Symbol: ER_GRP_RPL_KILLED_SESSION_ID; SQLSTATE: HY000
Message: killed session id: %d status: %d
ER_GRP_RPL_KILLED_SESSION_ID was added in 8.0.11.

•   Error number: MY-011568; Symbol: ER_GRP_RPL_KILLED_FAILED_ID; SQLSTATE: HY000
Message: killed failed id: %d failed: %d
ER_GRP_RPL_KILLED_FAILED_ID was added in 8.0.11.

•   Error number: MY-011569; Symbol: ER_GRP_RPL_INTERNAL_QUERY; SQLSTATE: HY000
Message: Internal query: %s result in error. Error number: %ld
ER_GRP_RPL_INTERNAL_QUERY was added in 8.0.11.

- Error number: MY-011570; Symbol: ER_GRP_RPL_COPY_FROM_EMPTY_STRING; SQLSTATE: HY000
  Message: Error copying from empty string
  ER_GRP_RPL_COPY_FROM_EMPTY_STRING was added in 8.0.11.

- Error number: MY-011571; Symbol: ER_GRP_RPL_QUERY_FAIL; SQLSTATE: HY000
  Message: Query execution resulted in failure. errno: %d
  ER_GRP_RPL_QUERY_FAIL was added in 8.0.11.

- Error number: MY-011572; Symbol: ER_GRP_RPL_CREATE_SESSION_UNABLE; SQLSTATE: HY000
  Message: Unable to create a session for executing the queries on the server
  ER_GRP_RPL_CREATE_SESSION_UNABLE was added in 8.0.11.

- Error number: MY-011573; Symbol: ER_GRP_RPL_MEMBER_NOT_FOUND; SQLSTATE: HY000
  Message: The member with address %s:%u has unexpectedly disappeared, killing the current group replication recovery connection
  ER_GRP_RPL_MEMBER_NOT_FOUND was added in 8.0.11.

- Error number: MY-011574; Symbol: ER_GRP_RPL_MAXIMUM_CONNECTION_RETRIES_REACHED; SQLSTATE: HY000
  Message: Maximum number of retries when trying to connect to a donor reached. Aborting group replication recovery.
  ER_GRP_RPL_MAXIMUM_CONNECTION_RETRIES_REACHED was added in 8.0.11.

- Error number: MY-011575; Symbol: ER_GRP_RPL_ALL_DONORS_LEFT_ABORT_RECOVERY; SQLSTATE: HY000
  Message: All donors left. Aborting group replication recovery.
  ER_GRP_RPL_ALL_DONORS_LEFT_ABORT_RECOVERY was added in 8.0.11.

- Error number: MY-011576; Symbol: ER_GRP_RPL_ESTABLISH_RECOVERY_WITH_DONOR; SQLSTATE: HY000
  Message: Establishing group recovery connection with a possible donor. Attempt %d/%d
  ER_GRP_RPL_ESTABLISH_RECOVERY_WITH_DONOR was added in 8.0.11.

- Error number: MY-011577; Symbol: ER_GRP_RPL_ESTABLISH_RECOVERY_WITH_ANOTHER_DONOR; SQLSTATE: HY000
  Message: Retrying group recovery connection with another donor. Attempt %d/%d
  ER_GRP_RPL_ESTABLISH_RECOVERY_WITH_ANOTHER_DONOR was added in 8.0.11.

- Error number: MY-011578; Symbol: ER_GRP_RPL_NO_VALID_DONOR; SQLSTATE: HY000
  Message: No valid donors exist in the group, retrying
Server Error Message Reference

**ER_GRP_RPL_NO_VALID_DONOR** was added in 8.0.11.

- Error number: **MY-011579**; Symbol: **ER_GRP_RPL_CONFIG_RECOVERY**; SQLSTATE: **HY000**
  
  Message: Error when configuring the group recovery connection to the donor.

**ER_GRP_RPL_CONFIG_RECOVERY** was added in 8.0.11.

- Error number: **MY-011580**; Symbol: **ER_GRP_RPL_ESTABLISHING_CONN_GRP_REC_DONOR**; SQLSTATE: **HY000**
  
  Message: Establishing connection to a group replication recovery donor %s at %s port: %d.

**ER_GRP_RPL_ESTABLISHING_CONN_GRP_REC_DONOR** was added in 8.0.11.

- Error number: **MY-011581**; Symbol: **ER_GRP_RPL_CREATE_GRP_RPL.Rec_CHANNEL**; SQLSTATE: **HY000**
  
  Message: Error while creating the group replication recovery channel with donor %s at %s port: %d.

**ER_GRP_RPL_CREATE_GRP_RPL_REC_CHANNEL** was added in 8.0.11.

- Error number: **MY-011582**; Symbol: **ER_GRP_RPL_DONOR_SERVER_CONN**; SQLSTATE: **HY000**
  
  Message: There was an error when connecting to the donor server. Please check that group_replication_recovery channel credentials and all MEMBER_HOST column values of performance_schema.replication_group_members table are correct and DNS resolvable.

**ER_GRP_RPL_DONOR_SERVER_CONN** was added in 8.0.11.

- Error number: **MY-011583**; Symbol: **ER_GRP_RPL_CHECK_STATUS_TABLE**; SQLSTATE: **HY000**
  
  Message: For details please check performance_schema.replication_connection_status table and error log messages of Slave I/O for channel group_replication_recovery.

**ER_GRP_RPL_CHECK_STATUS_TABLE** was added in 8.0.11.

- Error number: **MY-011584**; Symbol: **ER_GRP_RPL_STARTING_GRP_REC**; SQLSTATE: **HY000**
  
  Message: Error while starting the group replication recovery receiver/applier threads

**ER_GRP_RPL_STARTING_GRP_REC** was added in 8.0.11.

- Error number: **MY-011585**; Symbol: **ER_GRP_RPL_DONOR_CONN_TERMINATION**; SQLSTATE: **HY000**
  
  Message: Terminating existing group replication donor connection and purging the corresponding logs.

**ER_GRP_RPL_DONOR_CONN_TERMINATION** was added in 8.0.11.

- Error number: **MY-011586**; Symbol: **ER_GRP_RPL_STOPPING_GRP_REC**; SQLSTATE: **HY000**
  
  Message: Error when stopping the group replication recovery's donor connection

**ER_GRP_RPL_STOPPING_GRP_REC** was added in 8.0.11.

- Error number: **MY-011587**; Symbol: **ER_GRP_RPL_PURGE_REC**; SQLSTATE: **HY000**
  
  Message: Error when purging the group replication recovery's relay logs
ER_GRP_RPL_PURGE_REC was added in 8.0.11.

- Error number: MY-011588; Symbol: ER_GRP_RPL_UNABLE_TO_KILL_CONN_REC_DONOR_APPLIER; SQLSTATE: HY000
  
  Message: Unable to kill the current group replication recovery donor connection after an applier error. Recovery will shutdown.

ER_GRP_RPL_UNABLE_TO_KILL_CONN_REC_DONOR_APPLIER was added in 8.0.11.

- Error number: MY-011589; Symbol: ER_GRP_RPL_UNABLE_TO_KILL_CONN_REC_DONOR_FAILOVER; SQLSTATE: HY000
  
  Message: Unable to kill the current group replication recovery donor connection during failover. Recovery will shutdown.

ER_GRP_RPL_UNABLE_TO_KILL_CONN_REC_DONOR_FAILOVER was added in 8.0.11.

- Error number: MY-011590; Symbol: ER_GRP_RPL_FAILED_TO_NOTIFY_GRP_MEMBERSHIP_EVENT; SQLSTATE: HY000
  
  Message: Unexpected error when notifying an internal component named %s regarding a group membership event.

ER_GRP_RPL_FAILED_TO_NOTIFY_GRP_MEMBERSHIP_EVENT was added in 8.0.11.

- Error number: MY-011591; Symbol: ER_GRP_RPL_FAILED_TO_BROADCAST_GRP_MEMBERSHIP_NOTIFICATION; SQLSTATE: HY000
  
  Message: An undefined error was found while broadcasting an internal group membership notification. This is likely to happen if your components or plugins are not properly loaded or are malfunctioning!

ER_GRP_RPL_FAILED_TO_BROADCAST_GRP_MEMBERSHIP_NOTIFICATION was added in 8.0.11.

- Error number: MY-011592; Symbol: ER_GRP_RPL_FAILED_TO_BROADCAST_MEMBER_STATUS_NOTIFICATION; SQLSTATE: HY000
  
  Message: An undefined error was found while broadcasting an internal group member status notification. This is likely to happen if your components or plugins are not properly loaded or are malfunctioning!

ER_GRP_RPL_FAILED_TO_BROADCAST_MEMBER_STATUS_NOTIFICATION was added in 8.0.11.

- Error number: MY-011593; Symbol: ER_GRP_RPL_OOM_FAILED_TO_GENERATE_IDENTIFICATION_HASH; SQLSTATE: HY000
  
  Message: No memory to generate write identification hash

ER_GRP_RPL_OOM_FAILED_TO_GENERATE_IDENTIFICATION_HASH was added in 8.0.11.

- Error number: MY-011594; Symbol: ER_GRP_RPL_WRITE_IDENT_HASH_BASE64_ENCODING_FAILED; SQLSTATE: HY000
  
  Message: Base 64 encoding of the write identification hash failed

ER_GRP_RPL_WRITE_IDENT_HASH_BASE64_ENCODING_FAILED was added in 8.0.11.

- Error number: MY-011595; Symbol: ER_GRP_RPL_INVALID_BINLOG_FORMAT; SQLSTATE: HY000
Message: Binlog format should be ROW for Group Replication

`ER_GRP_RPL_INVALID_BINLOG_FORMAT` was added in 8.0.11.

- Error number: MY-011596; Symbol: `ER_GRP_RPL_BINLOG_CHECKSUM_SET`; SQLSTATE: HY000

Message: Binlog_checksum should be NONE for Group Replication

`ER_GRP_RPL_BINLOG_CHECKSUM_SET` was added in 8.0.11.

- Error number: MY-011597; Symbol: `ER_GRP_RPL_TRANS_WRITE_SET_EXTRACTION_NOT_SET`; SQLSTATE: HY000

Message: A transaction_write_set_extraction algorithm should be selected when running Group Replication

`ER_GRP_RPL_TRANS_WRITE_SET_EXTRACTION_NOT_SET` was added in 8.0.11.

- Error number: MY-011598; Symbol: `ER_GRP_RPL_UNSUPPORTED_TRANS_ISOLATION`; SQLSTATE: HY000

Message: Transaction isolation level (tx_isolation) is set to SERIALIZABLE, which is not compatible with Group Replication

`ER_GRP_RPL_UNSUPPORTED_TRANS_ISOLATION` was added in 8.0.11.

- Error number: MY-011599; Symbol: `ER_GRP_RPL_CANNOT_EXECUTE_TRANS_WHILE_STOPPING`; SQLSTATE: HY000

Message: Transaction cannot be executed while Group Replication is stopping.

`ER_GRP_RPL_CANNOT_EXECUTE_TRANS_WHILE_STOPPING` was added in 8.0.11.

- Error number: MY-011600; Symbol: `ER_GRP_RPL_CANNOT_EXECUTE_TRANS_WHILE_RECOVERING`; SQLSTATE: HY000

Message: Transaction cannot be executed while Group Replication is recovering. Try again when the server is ONLINE.

`ER_GRP_RPL_CANNOT_EXECUTE_TRANS_WHILE_RECOVERING` was added in 8.0.11.

- Error number: MY-011601; Symbol: `ER_GRP_RPL_CANNOT_EXECUTE_TRANS_IN_ERROR_STATE`; SQLSTATE: HY000

Message: Transaction cannot be executed while Group Replication is on ERROR state. Check for errors and restart the plugin

`ER_GRP_RPL_CANNOT_EXECUTE_TRANS_IN_ERROR_STATE` was added in 8.0.11.

- Error number: MY-011602; Symbol: `ER_GRP_RPL_CANNOT_EXECUTE_TRANS_IN_OFFLINE_MODE`; SQLSTATE: HY000

Message: Transaction cannot be executed while Group Replication is OFFLINE. Check for errors and restart the plugin

`ER_GRP_RPL_CANNOT_EXECUTE_TRANS_IN_OFFLINE_MODE` was added in 8.0.11.
• Error number: MY-011603; Symbol: ER_GRP_RPL_MULTIPLE_CACHE_TYPE_NOT_SUPPORTED_FOR_SESSION; SQLSTATE: HY000

Message: We can only use one cache type at a time on session %u

ER_GRP_RPL_MULTIPLE_CACHE_TYPE_NOT_SUPPORTED_FOR_SESSION was added in 8.0.11.

• Error number: MY-011604; Symbol: ER_GRP_RPL_FAILED_TO_REINIT_BINLOG_CACHE_FOR_READ; SQLSTATE: HY000

Message: Failed to reinit binlog cache log for read on session %u

ER_GRP_RPL_FAILED_TO_REINIT_BINLOG_CACHE_FOR_READ was added in 8.0.11.

• Error number: MY-011605; Symbol: ER_GRP_RPL_FAILED_TO_CREATE_TRANS_CONTEXT; SQLSTATE: HY000

Message: Failed to create the context of the current transaction on session %u

ER_GRP_RPL_FAILED_TO_CREATE_TRANS_CONTEXT was added in 8.0.11.

• Error number: MY-011606; Symbol: ER_GRP_RPL_FAILED_TO_EXTRACT_TRANS_WRITE_SET; SQLSTATE: HY000

Message: Failed to extract the set of items written during the execution of the current transaction on session %u

ER_GRP_RPL_FAILED_TO_EXTRACT_TRANS_WRITE_SET was added in 8.0.11.

• Error number: MY-011607; Symbol: ER_GRP_RPL_FAILED_TO_GATHER_TRANS_WRITE_SET; SQLSTATE: HY000

Message: Failed to gather the set of items written during the execution of the current transaction on session %u

ER_GRP_RPL_FAILED_TO_GATHER_TRANS_WRITE_SET was added in 8.0.11.

• Error number: MY-011608; Symbol: ER_GRP_RPL_TRANS_SIZE_EXCEEDS_LIMIT; SQLSTATE: HY000

Message: Error on session %u. Transaction of size %llu exceeds specified limit %lu. To increase the limit please adjust group_replication_transaction_size_limit option.

ER_GRP_RPL_TRANS_SIZE_EXCEEDS_LIMIT was added in 8.0.11.

• Error number: MY-011609; Symbol: ER_GRP_RPL_REINIT_OF_INTERNAL_CACHE_FOR_READ_FAILED; SQLSTATE: HY000

Message: Error while re-initializing an internal cache, for read operations, on session %u

ER_GRP_RPL_REINIT_OF_INTERNAL_CACHE_FOR_READ_FAILED was added in 8.0.11, removed after 8.0.12.

• Error number: MY-011610; Symbol: ER_GRP_RPL_APPENDING_DATA_TO_INTERNAL_CACHE_FAILED; SQLSTATE: HY000

Message: Error while appending data to an internal cache on session %u
**ER_GRP_RPL_APPENDING_DATA_TO_INTERNAL_CACHE_FAILED** was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011611; **Symbol:** ER_GRP_RPL_WRITE_TO_BINLOG_CACHE_FAILED; **SQLSTATE:** HY000
  
  **Message:** Error while writing binary log cache on session %u

**ER_GRP_RPL_WRITE_TO_BINLOG_CACHE_FAILED** was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011611; **Symbol:** ER_GRP_RPL_WRITE_TO_TRANSACTION_MESSAGE_FAILED; **SQLSTATE:** HY000
  
  **Message:** Error while writing to transaction message on session %u

**ER_GRP_RPL_WRITE_TO_TRANSACTION_MESSAGE_FAILED** was added in 8.0.13.

- **Error number:** MY-011612; **Symbol:**
  
  ER_GRP_RPL_FAILED_TO_REGISTER_TRANS_OUTCOME_NOTIFICATION; **SQLSTATE:** HY000
  
  **Message:** Unable to register for getting notifications regarding the outcome of the transaction on session %u

**ER_GRP_RPL_FAILED_TO_REGISTER_TRANS_OUTCOME_NOTIFICATION** was added in 8.0.11.

- **Error number:** MY-011613; **Symbol:**
  
  ER_GRP_RPL_MSG_TOO_LONG_BROADCASTING_TRANS_FAILED; **SQLSTATE:** HY000
  
  **Message:** Error broadcasting transaction to the group on session %u. Message is too big.

**ER_GRP_RPL_MSG_TOO_LONG_BROADCASTING_TRANS_FAILED** was added in 8.0.11.

- **Error number:** MY-011614; **Symbol:**
  
  ER_GRP_RPL_BROADCASTING_TRANS_TO_GRP_FAILED; **SQLSTATE:** HY000
  
  **Message:** Error while broadcasting the transaction to the group on session %u

**ER_GRP_RPL_BROADCASTING_TRANS_TO_GRP_FAILED** was added in 8.0.11.

- **Error number:** MY-011615; **Symbol:**
  
  ER_GRP_RPL_ERROR_WHILE_WAITING_FOR_CONFLICT_DETECTION; **SQLSTATE:** HY000
  
  **Message:** Error while waiting for conflict detection procedure to finish on session %u

**ER_GRP_RPL_ERROR_WHILE_WAITING_FOR_CONFLICT_DETECTION** was added in 8.0.11.

- **Error number:** MY-011616; **Symbol:**
  
  ER_GRP_RPL_REINIT_OF_INTERNAL_CACHE_FOR_WRITE_FAILED; **SQLSTATE:** HY000
  
  **Message:** Error while re-initializing an internal cache, for write operations, on session %u

**ER_GRP_RPL_REINIT_OF_INTERNAL_CACHE_FOR_WRITE_FAILED** was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011617; **Symbol:**
  
  ER_GRP_RPL_FAILED_TO_CREATE_COMMIT_CACHE; **SQLSTATE:** HY000
  
  **Message:** Failed to create group replication commit cache on session %u
ER_GRP_RPL_FAILED_TO_CREATE_COMMIT_CACHE was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011618; Symbol: ER_GRP_RPL_REINIT_OF_COMMIT_CACHE_FOR_WRITE_FAILED; SQLSTATE: HY000
  
  Message: Failed to reinit group replication commit cache for write on session %u

ER_GRP_RPL_REINIT_OF_COMMIT_CACHE_FOR_WRITE_FAILED was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011619; Symbol: ER_GRP_RPL_PREV_REC_SESSION_RUNNING; SQLSTATE: HY000
  
  Message: A previous recovery session is still running. Please stop the group replication plugin and wait for it to stop

ER_GRP_RPL_PREV_REC_SESSION_RUNNING was added in 8.0.11.

- Error number: MY-011620; Symbol: ER_GRP_RPL_FATAL_REC_PROCESS; SQLSTATE: HY000
  
  Message: Fatal error during the recovery process of Group Replication. The server will leave the group.

ER_GRP_RPL_FATAL_REC_PROCESS was added in 8.0.11.

- Error number: MY-011621; Symbol: ER_GRP_RPL_WHILE_STOPPING_REP_CHANNEL; SQLSTATE: HY000
  
  Message: Error stopping all replication channels while server was leaving the group. %s

ER_GRP_RPL_WHILE_STOPPING_REP_CHANNEL was added in 8.0.11, removed after 8.0.17.

- Error number: MY-011622; Symbol: ER_GRP_RPL_UNABLE_TO_EVALUATE_APPLIER_STATUS; SQLSTATE: HY000
  
  Message: Unable to evaluate the group replication applier execution status. Group replication recovery will shutdown to avoid data corruption.

ER_GRP_RPL_UNABLE_TO_EVALUATE_APPLIER_STATUS was added in 8.0.11.

- Error number: MY-011623; Symbol: ER_GRP_RPL_ONLY_ONE_SERVER_ALIVE; SQLSTATE: HY000
  
  Message: Only one server alive. Declaring this server as online within the replication group

ER_GRP_RPL_ONLY_ONE_SERVER_ALIVE was added in 8.0.11.

- Error number: MY-011624; Symbol: ER_GRP_RPL_CERTIFICATION_REC_PROCESS; SQLSTATE: HY000
  
  Message: Error when processing certification information in the recovery process

ER_GRP_RPL_CERTIFICATION_REC_PROCESS was added in 8.0.11.

- Error number: MY-011625; Symbol: ER_GRP_RPL_UNABLE_TO_ENSURE_EXECUTION_REC; SQLSTATE: HY000
  
  Message: Unable to ensure the execution of group transactions received during recovery.

ER_GRP_RPL_UNABLE_TO_ENSURE_EXECUTION_REC was added in 8.0.11.
• Error number: **MY-011626**; Symbol: `ER_GRP_RPL_WHILE_SENDING_MSG_REC`; SQLSTATE: **HY000**
Message: Error while sending message for group replication recovery

`ER_GRP_RPL_WHILE_SENDING_MSG_REC` was added in 8.0.11.

• Error number: **MY-011627**; Symbol: `ER_GRP_RPL_READ_UNABLE_FOR_SUPER_READ_ONLY`; SQLSTATE: **HY000**
Message: Unable to read the server value for the `super_read_only` variable.

`ER_GRP_RPL_READ_UNABLE_FOR_SUPER_READ_ONLY` was added in 8.0.11.

• Error number: **MY-011628**; Symbol: `ER_GRP_RPL_READ_UNABLE_FOR_READ_ONLY_SUPER_READ_ONLY`; SQLSTATE: **HY000**
Message: Unable to read the server values for the `read_only` and `super_read_only` variables.

`ER_GRP_RPL_READ_UNABLE_FOR_READ_ONLY_SUPER_READ_ONLY` was added in 8.0.11.

• Error number: **MY-011629**; Symbol: `ER_GRP_RPL_READ_UNABLE_FOR_READ_ONLY_SUPER_READ_ONLY`; SQLSTATE: **HY000**
Message: Unable to read the server values for the `read_only` and `super_read_only` variables.

`ER_GRP_RPL_READ_UNABLE_FOR_READ_ONLY_SUPER_READ_ONLY` was added in 8.0.11.

• Error number: **MY-011630**; Symbol: `ER_GRP_RPL_UNABLE_TO_RESET_SERVER_READ_MODE`; SQLSTATE: **HY000**
Message: Unable to reset the server read mode settings. Try to reset them manually.

`ER_GRP_RPL_UNABLE_TO_RESET_SERVER_READ_MODE` was added in 8.0.11.

• Error number: **MY-011631**; Symbol: `ER_GRP_RPL_UNABLE_TO_CERTIFY_PLUGIN_TRANS`; SQLSTATE: **HY000**
Message: Due to a plugin error, some transactions were unable to be certified and will now rollback.

`ER_GRP_RPL_UNABLE_TO_CERTIFY_PLUGIN_TRANS` was added in 8.0.11.

• Error number: **MY-011632**; Symbol: `ER_GRP_RPL_UNBLOCK_CERTIFIED_TRANS`; SQLSTATE: **HY000**
Message: Error when trying to unblock non certified or consistent transactions. Check for consistency errors when restarting the service

`ER_GRP_RPL_UNBLOCK_CERTIFIED_TRANS` was added in 8.0.11.

• Error number: **MY-011633**; Symbol: `ER_GRP_RPL_SERVER_WORKING_AS_SECONDARY`; SQLSTATE: **HY000**
Message: This server is working as secondary member with primary member address %s:%u.

`ER_GRP_RPL_SERVER_WORKING_AS_SECONDARY` was added in 8.0.11.

• Error number: **MY-011633**; Symbol: `ER_GRP_RPL_FAILED_TO_START_WITH_INVALID_SERVER_ID`; SQLSTATE: **HY000**
Message: Unable to start Group Replication. Replication applier infrastructure is not initialized since the server was started with server_id=0. Please, restart the server with server_id larger than 0.

`ER_GRP_RPL_FAILED_TO_START_WITH_INVALID_SERVER_ID` was added in 8.0.11.

• Error number: **MY-011634**; Symbol: `ER_GRP_RPL_FORCE_MEMBERS_MUST_BE_EMPTY`; SQLSTATE: **HY000**
Message: group_replication_force_members must be empty on group start. Current value: ‘%s’

ER_GRP_RPL_FORCE_MEMBERS_MUST_BE_EMPTY was added in 8.0.11.

- Error number: MY-011635; Symbol:
  ER_GRP_RPL_PLUGIN_STRUCT_INIT_NOT_POSSIBLE_ON_SERVER_START; SQLSTATE: HY000

Message: It was not possible to guarantee the initialization of plugin structures on server start

ER_GRP_RPL_PLUGIN_STRUCT_INIT_NOT_POSSIBLE_ON_SERVER_START was added in 8.0.11.

- Error number: MY-011636; Symbol: ER_GRP_RPL_FAILED_TO_ENABLE_SUPER_READ_ONLY_MODE;
  SQLSTATE: HY000

Message: Could not enable the server read only mode and guarantee a safe recovery execution

ER_GRP_RPL_FAILED_TO_ENABLE_SUPER_READ_ONLY_MODE was added in 8.0.11.

- Error number: MY-011637; Symbol: ER_GRP_RPL_FAILED_TO_INIT_COMMUNICATION_ENGINE;
  SQLSTATE: HY000

Message: Error on group communication engine initialization

ER_GRP_RPL_FAILED_TO_INIT_COMMUNICATION_ENGINE was added in 8.0.11.

- Error number: MY-011638; Symbol:
  ER_GRP_RPL_FAILED_TO_START_ON_SECONDARY_WITH_ASYNC_CHANNELS; SQLSTATE: HY000

Message: Can't start group replication on secondary member with single-primary mode while
asynchronous replication channels are running.

ER_GRP_RPL_FAILED_TO_START_ON_SECONDARY_WITH_ASYNC_CHANNELS was added in 8.0.11.

- Error number: MY-011639; Symbol: ER_GRP_RPL_FAILED_TO_START_COMMUNICATION_ENGINE;
  SQLSTATE: HY000

Message: Error on group communication engine start

ER_GRP_RPL_FAILED_TO_START_COMMUNICATION_ENGINE was added in 8.0.11.

- Error number: MY-011640; Symbol:
  ER_GRP_RPL_TIMEOUT_ON_VIEW_AFTER_JOINING_GRP; SQLSTATE: HY000

Message: Timeout on wait for view after joining group

ER_GRP_RPL_TIMEOUT_ON_VIEW_AFTER_JOINING_GRP was added in 8.0.11.

- Error number: MY-011641; Symbol:
  ER_GRP_RPL_FAILED_TO_CALL_GRP_COMMUNICATION_INTERFACE; SQLSTATE: HY000

Message: Error calling group communication interfaces

ER_GRP_RPL_FAILED_TO_CALL_GRP_COMMUNICATION_INTERFACE was added in 8.0.11.

- Error number: MY-011642; Symbol:
  ER_GRP_RPL_MEMBER_SERVER_UUID_IS_INCOMPATIBLE_WITH_GRP; SQLSTATE: HY000
Server Error Message Reference

Message: Member server_uuid is incompatible with the group. Server_uuid %s matches group_name %s.

ER_GRP_RPL_MEMBER_SERVER_UUID_IS_INCOMPATIBLE_WITH_GRP was added in 8.0.11.

• Error number: MY-011643; Symbol: ER_GRP_RPL_MEMBER_CONF_INFO; SQLSTATE: HY000

Message: Member configuration: member_id: %lu; member_uuid: "%s"; single-primary mode: "%s";
group_replication_auto_increment_increment: %lu;

ER_GRP_RPL_MEMBER_CONF_INFO was added in 8.0.11.

• Error number: MY-011644; Symbol: ER_GRP_RPL_FAILED_TO_CONFIRM_IF_SERVER_LEFT_GRP; SQLSTATE: HY000

Message: Unable to confirm whether the server has left the group or not. Check performance_schema.replication_group_members to check group membership information.

ER_GRP_RPL_FAILED_TO_CONFIRM_IF_SERVER_LEFT_GRP was added in 8.0.11.

• Error number: MY-011645; Symbol: ER_GRP_RPL_SERVER_IS_ALREADY_LEAVING; SQLSTATE: HY000

Message: Skipping leave operation: concurrent attempt to leave the group is on-going.

ER_GRP_RPL_SERVER_IS_ALREADY_LEAVING was added in 8.0.11.

• Error number: MY-011646; Symbol: ER_GRP_RPL_SERVER_ALREADY_LEFT; SQLSTATE: HY000

Message: Skipping leave operation: member already left the group.

ER_GRP_RPL_SERVER_ALREADY_LEFT was added in 8.0.11.

• Error number: MY-011647; Symbol: ER_GRP_RPL_WAITING_FOR_VIEW_UPDATE; SQLSTATE: HY000

Message: Going to wait for view modification

ER_GRP_RPL_WAITING_FOR_VIEW_UPDATE was added in 8.0.11.

• Error number: MY-011648; Symbol:

ER_GRP_RPL_TIMEOUT_RECEIVING_VIEW_CHANGE_ON_SHUTDOWN; SQLSTATE: HY000

Message: While leaving the group due to a stop, shutdown or failure there was a timeout receiving a view change. This can lead to a possible inconsistent state. Check the log for more details

ER_GRP_RPL_TIMEOUT_RECEIVING_VIEW_CHANGE_ON_SHUTDOWN was added in 8.0.11.

• Error number: MY-011649; Symbol: ER_GRP_RPL_REQUESTING_NON_MEMBER_SERVER_TO_LEAVE; SQLSTATE: HY000

Message: Requesting to leave the group despite of not being a member

ER_GRP_RPL_REQUESTING_NON_MEMBER_SERVER_TO_LEAVE was added in 8.0.11.

• Error number: MY-011650; Symbol: ER_GRP_RPL_IS_STOPPING; SQLSTATE: HY000

Message: Plugin 'group_replication' is stopping.
**ER_GRP_RPL_IS_STOPPING** was added in 8.0.11.

- **Error number:** MY-011651; **Symbol:** ER_GRP_RPL_IS_STOPPED; **SQLSTATE:** HY000
  
  Message: Plugin 'group_replication' has been stopped.

**ER_GRP_RPL_IS_STOPPED** was added in 8.0.11.

- **Error number:** MY-011652; **Symbol:** ER_GRP_RPL_FAILED_TO_ENABLE_READ_ONLY_MODE_ON_SHUTDOWN; **SQLSTATE:** HY000
  
  Message: On plugin shutdown it was not possible to enable the server read only mode. Local transactions will be accepted and committed.

**ER_GRP_RPL_FAILED_TO_ENABLE_READ_ONLY_MODE_ON_SHUTDOWN** was added in 8.0.11.

- **Error number:** MY-011653; **Symbol:** ER_GRP_RPL_RECOVERY_MODULE_TERMINATION_TIMED_OUT_ON_SHUTDOWN; **SQLSTATE:** HY000
  
  Message: On shutdown there was a timeout on the Group Replication recovery module termination. Check the log for more details

**ER_GRP_RPL_RECOVERY_MODULE_TERMINATION_TIMED_OUT_ON_SHUTDOWN** was added in 8.0.11.

- **Error number:** MY-011654; **Symbol:** ER_GRP_RPL_APPLIER_TERMINATION_TIMED_OUT_ON_SHUTDOWN; **SQLSTATE:** HY000
  
  Message: On shutdown there was a timeout on the Group Replication applier termination.

**ER_GRP_RPL_APPLIER_TERMINATION_TIMED_OUT_ON_SHUTDOWN** was added in 8.0.11.

- **Error number:** MY-011655; **Symbol:** ER_GRP_RPL_FAILED_TO_SHUTDOWN_REGISTRY_MODULE; **SQLSTATE:** HY000
  
  Message: Unexpected failure while shutting down registry module!

**ER_GRP_RPL_FAILED_TO_SHUTDOWN_REGISTRY_MODULE** was added in 8.0.11.

- **Error number:** MY-011656; **Symbol:** ER_GRP_RPL_FAILED_TO_INIT_HANDLER; **SQLSTATE:** HY000
  
  Message: Failure during Group Replication handler initialization

**ER_GRP_RPL_FAILED_TO_INIT_HANDLER** was added in 8.0.11.

- **Error number:** MY-011657; **Symbol:** ER_GRP_RPL_FAILED_TO_REGISTER_SERVER_STATE_OBSERVER; **SQLSTATE:** HY000
  
  Message: Failure when registering the server state observers

**ER_GRP_RPL_FAILED_TO_REGISTER_SERVER_STATE_OBSERVER** was added in 8.0.11.

- **Error number:** MY-011658; **Symbol:** ER_GRP_RPL_FAILED_TO_REGISTER_TRANS_STATE_OBSERVER; **SQLSTATE:** HY000
  
  Message: Failure when registering the transactions state observers

**ER_GRP_RPL_FAILED_TO_REGISTER_TRANS_STATE_OBSERVER** was added in 8.0.11.
• Error number: MY-011659; Symbol: ER_GRP_RPL_FAILED_TO_REGISTER_BINLOG_STATE_OBSERVER; SQLSTATE: HY000
   Message: Failure when registering the binlog state observers
   ER_GRP_RPL_FAILED_TO_REGISTER_BINLOG_STATE_OBSERVER was added in 8.0.11.

• Error number: MY-011660; Symbol: ER_GRP_RPL_FAILED_TO_START_ON_BOOT; SQLSTATE: HY000
   Message: Unable to start Group Replication on boot
   ER_GRP_RPL_FAILED_TO_START_ON_BOOT was added in 8.0.11.

• Error number: MY-011661; Symbol: ER_GRP_RPL_FAILED_TO_STOP_ON_PLUGIN_UNINSTALL; SQLSTATE: HY000
   Message: Failure when stopping Group Replication on plugin uninstall
   ER_GRP_RPL_FAILED_TO_STOP_ON_PLUGIN_UNINSTALL was added in 8.0.11.

• Error number: MY-011662; Symbol: ER_GRP_RPL_FAILED_TO_UNREGISTER_SERVER_STATE_OBSERVER; SQLSTATE: HY000
   Message: Failure when unregistering the server state observers
   ER_GRP_RPL_FAILED_TO_UNREGISTER_SERVER_STATE_OBSERVER was added in 8.0.11.

• Error number: MY-011663; Symbol: ER_GRP_RPL_FAILED_TO_UNREGISTER_TRANS_STATE_OBSERVER; SQLSTATE: HY000
   Message: Failure when unregistering the transactions state observers
   ER_GRP_RPL_FAILED_TO_UNREGISTER_TRANS_STATE_OBSERVER was added in 8.0.11.

• Error number: MY-011664; Symbol: ER_GRP_RPL_FAILED_TO_UNREGISTER_BINLOG_STATE_OBSERVER; SQLSTATE: HY000
   Message: Failure when unregistering the binlog state observers
   ER_GRP_RPL_FAILED_TO_UNREGISTER_BINLOG_STATE_OBSERVER was added in 8.0.11.

• Error number: MY-011665; Symbol: ER_GRP_RPL_ALL_OBSERVERS_UNREGISTERED; SQLSTATE: HY000
   Message: All Group Replication server observers have been successfully unregistered
   ER_GRP_RPL_ALL_OBSERVERS_UNREGISTERED was added in 8.0.11.

• Error number: MY-011666; Symbol: ER_GRP_RPL_FAILED_TO_PARSE_THE_GRP_NAME; SQLSTATE: HY000
   Message: Unable to parse the group name.
   ER_GRP_RPL_FAILED_TO_PARSE_THE_GRP_NAME was added in 8.0.11.

• Error number: MY-011667; Symbol: ER_GRP_RPL_FAILED_TO_GENERATE_SIDNO_FOR_GRP; SQLSTATE: HY000
Message: Unable to parse the group name.

ER_GRP_RPL_FAILED_TO_GENERATE_SIDNO_FOR_GRP was added in 8.0.11.

- Error number: MY-011668; Symbol: ER_GRP_RPL_APPLIER_NOT_STARTED_DUE_TO_RUNNING_PREV_SHUTDOWN; SQLSTATE: HY000
  Message: Cannot start the Group Replication applier as a previous shutdown is still running: The thread will stop once its task is complete.
  ER_GRP_RPL_APPLIER_NOT_STARTED_DUE_TO_RUNNING_PREV_SHUTDOWN was added in 8.0.11.

- Error number: MY-011669; Symbol: ER_GRP_RPL_FAILED_TO_INIT_APPLIER_MODULE; SQLSTATE: HY000
  Message: Unable to initialize the Group Replication applier module.
  ER_GRP_RPL_FAILED_TO_INIT_APPLIER_MODULE was added in 8.0.11.

- Error number: MY-011670; Symbol: ER_GRP_RPL_APPLIER_INITIALIZED; SQLSTATE: HY000
  Message: Group Replication applier module successfully initialized!
  ER_GRP_RPL_APPLIER_INITIALIZED was added in 8.0.11.

- Error number: MY-011671; Symbol: ER_GRP_RPL_COMMUNICATION_SSL_CONF_INFO; SQLSTATE: HY000
  Message: Group communication SSL configuration: group_replication_ssl_mode: "%s"; server_key_file: "%s"; server_cert_file: "%s"; client_key_file: "%s"; client_cert_file: "%s"; ca_file: "%s"; ca_path: "%s"; cipher: "%s"; tls_version: "%s"; crl_file: "%s"; crl_path: "%s"; ssl_fips_mode: "%s"
  ER_GRP_RPL_COMMUNICATION_SSL_CONF_INFO was added in 8.0.11.

- Error number: MY-011672; Symbol: ER_GRP_RPL_ABORTS_AS_SSL_NOT_SUPPORTED_BY_MYSQLD; SQLSTATE: HY000
  Message: MySQL server does not have SSL support and group_replication_ssl_mode is "%s", START GROUP_REPLICATION will abort
  ER_GRP_RPL_ABORTS_AS_SSL_NOT_SUPPORTED_BY_MYSQLD was added in 8.0.11.

- Error number: MY-011673; Symbol: ER_GRP_RPL_SSL_DISABLED; SQLSTATE: HY000
  Message: Group communication SSL configuration: group_replication_ssl_mode: "%s"
  ER_GRP_RPL_SSL_DISABLED was added in 8.0.11.

- Error number: MY-011674; Symbol: ER_GRP_RPL_UNABLE_TO_INIT_COMMUNICATION_ENGINE; SQLSTATE: HY000
  Message: Unable to initialize the group communication engine
  ER_GRP_RPL_UNABLE_TO_INIT_COMMUNICATION_ENGINE was added in 8.0.11.

- Error number: MY-011675; Symbol: ER_GRP_RPL_BINLOG_DISABLED; SQLSTATE: HY000
  Message: Binlog must be enabled for Group Replication
Server Error Message Reference

**ER_GRP_RPL_BINLOG_DISABLED** was added in 8.0.11.

- Error number: MY-011676; Symbol: **ER_GRP_RPL_GTID_MODE_OFF**; SQLSTATE: HY000
  
  Message: Gtid mode should be ON for Group Replication

**ER_GRP_RPL_GTID_MODE_OFF** was added in 8.0.11.

- Error number: MY-011677; Symbol: **ER_GRP_RPL_LOG_SLAVE_UPDATES_NOT_SET**; SQLSTATE: HY000
  
  Message: LOG_SLAVE_UPDATES should be ON for Group Replication

**ER_GRP_RPL_LOG_SLAVE_UPDATES_NOT_SET** was added in 8.0.11.

- Error number: MY-011678; Symbol: **ER_GRP_RPL_INVALID_TRANS_WRITE_SET_EXTRACTION_VALUE**; SQLSTATE: HY000
  
  Message: Extraction of transaction write sets requires an hash algorithm configuration. Please, double check that the parameter transaction-write-set-extraction is set to a valid algorithm.

**ER_GRP_RPL_INVALID_TRANS_WRITE_SET_EXTRACTION_VALUE** was added in 8.0.11.

- Error number: MY-011679; Symbol: **ER_GRP_RPL_RELAY_LOG_INFO_REPO_MUST_BE_TABLE**; SQLSTATE: HY000
  
  Message: Relay log info repository must be set to TABLE

**ER_GRP_RPL_RELAY_LOG_INFO_REPO_MUST_BE_TABLE** was added in 8.0.11.

- Error number: MY-011680; Symbol: **ER_GRP_RPL_MASTER_INFO_REPO_MUST_BE_TABLE**; SQLSTATE: HY000
  
  Message: Master info repository must be set to TABLE.

**ER_GRP_RPL_MASTER_INFO_REPO_MUST_BE_TABLE** was added in 8.0.11.

- Error number: MY-011681; Symbol: **ER_GRP_RPL_INCORRECT_TYPE_SET_FOR_PARALLEL_APPLIER**; SQLSTATE: HY000
  
  Message: In order to use parallel applier on Group Replication, parameter slave-parallel-type must be set to 'LOGICAL_CLOCK'.

**ER_GRP_RPL_INCORRECT_TYPE_SET_FOR_PARALLEL_APPLIER** was added in 8.0.11.

- Error number: MY-011682; Symbol: **ER_GRP_RPL_SLAVE_PRESERVE_COMMIT_ORDER_NOT_SET**; SQLSTATE: HY000
  
  Message: Group Replication requires slave-preserve-commit-order to be set to ON when using more than 1 applier threads.

**ER_GRP_RPL_SLAVE_PRESERVE_COMMIT_ORDER_NOT_SET** was added in 8.0.11.

- Error number: MY-011683; Symbol: **ER_GRP_RPL_SINGLE_PRIM_MODE_NOT_ALLOWED_WITH_UPDATE_EVERYWHERE**; SQLSTATE: HY000

**ER_GRP_RPL_SINGLE_PRIM_MODE_NOT_ALLOWED_WITH_UPDATE_EVERYWHERE** was added in 8.0.11.
Message: It is not allowed to run single primary mode with 'enforce_update_everywhere_checks' enabled.

ER_GRP_RPL_SINGLE_PRIM_MODE_NOT_ALLOWED_WITH_UPDATE_EVERYWHERE was added in 8.0.11.

• Error number: MY-011684; Symbol: ER_GRP_RPL_MODULE_TERMINATE_ERROR; SQLSTATE: HY000

Message: error_message: %s

ER_GRP_RPL_MODULE_TERMINATE_ERROR was added in 8.0.11.

• Error number: MY-011685; Symbol: ER_GRP_RPL_GRP_NAME_OPTION_MANDATORY; SQLSTATE: HY000

Message: The group name option is mandatory

ER_GRP_RPL_GRP_NAME_OPTION_MANDATORY was added in 8.0.11.

• Error number: MY-011686; Symbol: ER_GRP_RPL_GRP_NAME_IS_TOO_LONG; SQLSTATE: HY000

Message: The group name '%s' is not a valid UUID, its length is too big

ER_GRP_RPL_GRP_NAME_IS_TOO_LONG was added in 8.0.11.

• Error number: MY-011687; Symbol: ER_GRP_RPL_GRP_NAME_IS_NOT_VALID_UUID; SQLSTATE: HY000

Message: The group name '%s' is not a valid UUID

ER_GRP_RPL_GRP_NAME_IS_NOT_VALID_UUID was added in 8.0.11.

• Error number: MY-011688; Symbol: ER_GRP_RPL_FLOW_CTRL_MIN_QUOTA_GREATER_THAN_MAX_QUOTA; SQLSTATE: HY000

Message: group_replication_flow_control_min_quota cannot be larger than

ER_GRP_RPL_FLOW_CTRL_MIN_QUOTA_GREATER_THAN_MAX_QUOTA was added in 8.0.11.

• Error number: MY-011689; Symbol: ER_GRP_RPL_FLOW_CTRL_MIN_RECOVERY_QUOTA_GREATER_THAN_MAX_QUOTA; SQLSTATE: HY000

Message: group_replication_flow_control_min_recovery_quota cannot be larger than

ER_GRP_RPL_FLOW_CTRL_MIN_RECOVERY_QUOTA_GREATER_THAN_MAX_QUOTA was added in 8.0.11.

• Error number: MY-011690; Symbol: ER_GRP_RPL_FLOW_CTRL_MAX_QUOTA_SMALLER_THAN_MIN_QUOTAS; SQLSTATE: HY000

Message: group_replication_flow_control_max_quota cannot be smaller than

ER_GRP_RPL_FLOW_CTRL_MAX_QUOTA_SMALLER_THAN_MIN_QUOTAS was added in 8.0.11.
• Error number: MY-011691; Symbol: ER_GRP_RPL_INVALID_SSL_RECOVERY_STRING; SQLSTATE: HY000
  Message: The given value for recovery ssl option '%s' is invalid as its length is beyond the limit
  ER_GRP_RPL_INVALID_SSL_RECOVERY_STRING was added in 8.0.11.

• Error number: MY-011692; Symbol: ER_GRP_RPL_SUPPORTS_ONLY_ONE_FORCE_MEMBERS_SET; SQLSTATE: HY000
  Message: There is one group_replication_force_members operation already ongoing
  ER_GRP_RPL_SUPPORTS_ONLY_ONE_FORCE_MEMBERS_SET was added in 8.0.11.

• Error number: MY-011693; Symbol: ER_GRP_RPL_FORCE_MEMBERS_SET_UPDATE_NOT_ALLOWED; SQLSTATE: HY000
  Message: group_replication_force_members can only be updated when Group Replication is running and a majority of the members are unreachable
  ER_GRP_RPL_FORCE_MEMBERS_SET_UPDATE_NOT_ALLOWED was added in 8.0.11.

• Error number: MY-011694; Symbol: ER_GRP_RPL_GRP_COMMUNICATION_INIT_WITH_CONF; SQLSTATE: HY000
  Message: Initialized group communication with configuration: group_replication_group_name: '%s';
group_replication_local_address: '%s';
group_replication_group_seeds: '%s';
group_replication_bootstrap_group: '%s';
group_replication_poll_spin_loops: %lu;
group_replication_compression_threshold: %lu;
group_replication_ip_whitelist: '%s';
group_replication_communication_debug_options: '%s';
group_replication_member_expel_timeout: '%lu';
group_replication_communication_max_message_size: %lu;
group_replication_message_cache_size: '%llu'
  ER_GRP_RPL_GRP_COMMUNICATION_INIT_WITH_CONF was added in 8.0.11.

• Error number: MY-011695; Symbol: ER_GRP_RPL_UNKNOWN_GRP_RPL_APPLIER_PIPELINE_REQUESTED; SQLSTATE: HY000
  Message: Unknown group replication applier pipeline requested
  ER_GRP_RPL_UNKNOWN_GRP_RPL_APPLIER_PIPELINE_REQUESTED was added in 8.0.11.

• Error number: MY-011696; Symbol: ER_GRP_RPL_FAILED_TO_BOOTSTRAP_EVENT_HANDLING_INFRASTRUCTURE; SQLSTATE: HY000
  Message: Unable to bootstrap group replication event handling infrastructure. Unknown handler type: %d
  ER_GRP_RPL_FAILED_TO_BOOTSTRAP_EVENT_HANDLING_INFRASTRUCTURE was added in 8.0.11.

• Error number: MY-011697; Symbol: ER_GRP_RPL_APPLIER_HANDLER_NOT_INITIALIZED; SQLSTATE: HY000
  Message: One of the group replication applier handlers is null due to an initialization error
  ER_GRP_RPL_APPLIER_HANDLER_NOT_INITIALIZED was added in 8.0.11.
- Error number: **MY-011698**; Symbol: **ER_GRP_RPL_APPLIER_HANDLER_IS_IN_USE**; SQLSTATE: **HY000**

  Message: A group replication applier handler, marked as unique, is already in use.

  **ER_GRP_RPL_APPLIER_HANDLER_IS_IN_USE** was added in 8.0.11.

- Error number: **MY-011699**; Symbol: **ER_GRP_RPL_APPLIER_HANDLER_ROLE_IS_IN_USE**; SQLSTATE: **HY000**

  Message: A group replication applier handler role, that was marked as unique, is already in use.

  **ER_GRP_RPL_APPLIER_HANDLER_ROLE_IS_IN_USE** was added in 8.0.11.

- Error number: **MY-011700**; Symbol: **ER_GRP_RPL_FAILED_TO_INIT_APPLIER_HANDLER**; SQLSTATE: **HY000**

  Message: Error on group replication applier handler initialization

  **ER_GRP_RPL_FAILED_TO_INIT_APPLIER_HANDLER** was added in 8.0.11.

- Error number: **MY-011701**; Symbol: **ER_GRP_RPL_SQL_SERVICE_FAILED_TO_INIT_SESSION_THREAD**; SQLSTATE: **HY000**

  Message: Error when initializing a session thread for internal server connection.

  **ER_GRP_RPL_SQL_SERVICE_FAILED_TO_INIT_SESSION_THREAD** was added in 8.0.11.

- Error number: **MY-011702**; Symbol: **ER_GRP_RPL_SQL_SERVICE_COMM_SESSION_NOT_INITIALIZED**; SQLSTATE: **HY000**

  Message: Error running internal SQL query: %s. The internal server communication session is not initialized

  **ER_GRP_RPL_SQL_SERVICE_COMM_SESSION_NOT_INITIALIZED** was added in 8.0.11.

- Error number: **MY-011703**; Symbol: **ER_GRP_RPL_SQL_SERVICE_SERVER_SESSION_KILLED**; SQLSTATE: **HY000**

  Message: Error running internal SQL query: %s. The internal server session was killed or server is shutting down.

  **ER_GRP_RPL_SQL_SERVICE_SERVER_SESSION_KILLED** was added in 8.0.11.

- Error number: **MY-011704**; Symbol: **ER_GRP_RPL_SQL_SERVICE_FAILED_TO_RUN_SQL_QUERY**; SQLSTATE: **HY000**

  Message: Error running internal SQL query: %s. Got internal SQL error: %s(%d)

  **ER_GRP_RPL_SQL_SERVICE_FAILED_TO_RUN_SQL_QUERY** was added in 8.0.11.

- Error number: **MY-011705**; Symbol: **ER_GRP_RPL_SQL_SERVICE_SERVER_INTERNAL_FAILURE**; SQLSTATE: **HY000**

  Message: Error running internal SQL query: %s. Internal failure.

  **ER_GRP_RPL_SQL_SERVICE_SERVER_INTERNAL_FAILURE** was added in 8.0.11.
• Error number: MY-011706; Symbol:
  ER_GRP_RPL_SQL_SERVICE_RETRIES_EXCEEDED_ON_SESSION_STATE; SQLSTATE: HY000
  
  Message: Error, maximum number of retries exceeded when waiting for the internal server session state
  to be operating
  
  ER_GRP_RPL_SQL_SERVICE_RETRIES_EXCEEDED_ON_SESSION_STATE was added in 8.0.11.

• Error number: MY-011707; Symbol:
  ER_GRP_RPL_SQL_SERVICE_FAILED_TO_FETCH_SECURITY_CTX; SQLSTATE: HY000
  
  Message: Error when trying to fetch security context when contacting the server for internal plugin
  requests.
  
  ER_GRP_RPL_SQL_SERVICE_FAILED_TO_FETCH_SECURITY_CTX was added in 8.0.11.

• Error number: MY-011708; Symbol:
  ER_GRP_RPL_SQL_SERVICE_SERVER_ACCESS_DENIED_FOR_USER; SQLSTATE: HY000
  
  Message: There was an error when trying to access the server with user: %. Make sure the user is
  present in the server and that the MySQL upgrade procedure was run correctly.
  
  ER_GRP_RPL_SQL_SERVICE_SERVER_ACCESS_DENIED_FOR_USER was added in 8.0.11.

• Error number: MY-011709; Symbol:
  ER_GRP_RPL_SQL_SERVICE_MAX_CONN_ERROR_FROM_SERVER; SQLSTATE: HY000
  
  Message: Failed to establish an internal server connection to execute plugin operations since the server
  does not have available connections, please increase @@GLOBAL.MAX_CONNECTIONS. Server
  error: %i.
  
  ER_GRP_RPL_SQL_SERVICE_MAX_CONN_ERROR_FROM_SERVER was added in 8.0.11.

• Error number: MY-011710; Symbol:
  ER_GRP_RPL_SQL_SERVICE_SERVER_ERROR_ON_CONN; SQLSTATE: HY000
  
  Message: Failed to establish an internal server connection to execute plugin operations. Server error:
  %i. Server error message: %s
  
  ER_GRP_RPL_SQL_SERVICE_SERVER_ERROR_ON_CONN was added in 8.0.11.

• Error number: MY-011711; Symbol:
  ER_GRP_RPL_UNREACHABLE_MAJORITY_TIMEOUT_FOR_MEMBER; SQLSTATE: HY000
  
  Message: This member could not reach a majority of the members for more than %ld seconds. The
  member will now leave the group as instructed by the group_replication_unreachable_majority_timeout
  option.
  
  ER_GRP_RPL_UNREACHABLE_MAJORITY_TIMEOUT_FOR_MEMBER was added in 8.0.11.

• Error number: MY-011712; Symbol:
  ER_GRP_RPL_SERVER_SET_TO_READ_ONLY_DUE_TO_ERRORS; SQLSTATE: HY000
  
  Message: The server was automatically set into read only mode after an error was detected.
  
  ER_GRP_RPL_SERVER_SET_TO_READ_ONLY_DUE_TO_ERRORS was added in 8.0.11.
• Error number: MY-011713; Symbol: ER_GRP_RPL_GMS_LISTENER_FAILED_TO_LOG_NOTIFICATION; SQLSTATE: HY000
Message: Unable to log notification to table (errno: %lu) (res: %d)! Message: %s
ER_GRP_RPL_GMS_LISTENER_FAILED_TO_LOG_NOTIFICATION was added in 8.0.11.

• Error number: MY-011714; Symbol: ER_GRP_RPL_GRP_COMMUNICATION_ENG_INIT_FAILED; SQLSTATE: HY000
Message: Failure in group communication engine '%s' initialization
ER_GRP_RPL_GRP_COMMUNICATION_ENG_INIT_FAILED was added in 8.0.11.

• Error number: MY-011715; Symbol: ER_GRP_RPL_SET_GRP_COMMUNICATION_ENG_LOGGER_FAILED; SQLSTATE: HY000
Message: Unable to set the group communication engine logger
ER_GRP_RPL_SET_GRP_COMMUNICATION_ENG_LOGGER_FAILED was added in 8.0.11.

• Error number: MY-011716; Symbol: ER_GRP_RPL_DEBUG_OPTIONS; SQLSTATE: HY000
Message: Current debug options are: '%s'.
ER_GRP_RPL_DEBUG_OPTIONS was added in 8.0.11.

• Error number: MY-011717; Symbol: ER_GRP_RPL_INVALID_DEBUG_OPTIONS; SQLSTATE: HY000
Message: Some debug options in '%s' are not valid.
ER_GRP_RPL_INVALID_DEBUG_OPTIONS was added in 8.0.11.

• Error number: MY-011718; Symbol: ER_GRP_RPL_EXIT_GRP_GCS_ERROR; SQLSTATE: HY000
Message: Error calling group communication interfaces while trying to leave the group
ER_GRP_RPL_EXIT_GRP_GCS_ERROR was added in 8.0.11.

• Error number: MY-011719; Symbol: ER_GRP_RPL_GRP_MEMBER_OFFLINE; SQLSTATE: HY000
Message: Member is not ONLINE, it is not possible to force a new group membership
ER_GRP_RPL_GRP_MEMBER_OFFLINE was added in 8.0.11.

• Error number: MY-011720; Symbol: ER_GRP_RPL_GCS_INTERFACE_ERROR; SQLSTATE: HY000
Message: Error calling group communication interfaces
ER_GRP_RPL_GCS_INTERFACE_ERROR was added in 8.0.11.

• Error number: MY-011721; Symbol: ER_GRP_RPL_FORCE_MEMBER_VALUE_SET_ERROR; SQLSTATE: HY000
Message: Error setting group_replication_force_members value '%s' on group communication interfaces
ER_GRP_RPL_FORCE_MEMBER_VALUE_SET_ERROR was added in 8.0.11.

• Error number: MY-011722; Symbol: ER_GRP_RPL_FORCE_MEMBER_VALUE_SET; SQLSTATE: HY000
Message: The `group_replication_force_members` value '%s' was set in the group communication interfaces

`ER_GRP_RPL_FORCE_MEMBER_VALUE_SET` was added in 8.0.11.

- **Error number:** `MY-011723`; **Symbol:** `ER_GRP_RPL_FORCE_MEMBER_VALUE_TIME_OUT`; **SQLSTATE:** `HY000`

Message: Timeout on wait for view after setting `group_replication_force_members` value '%s' into group communication interfaces

`ER_GRP_RPL_FORCE_MEMBER_VALUE_TIME_OUT` was added in 8.0.11.

- **Error number:** `MY-011724`; **Symbol:** `ER_GRP_RPL_BROADCAST_COMMIT_MSSG_TOO_BIG`; **SQLSTATE:** `HY000`

Message: Broadcast of committed transactions message failed. Message is too big.

`ER_GRP_RPL_BROADCAST_COMMIT_MSSG_TOO_BIG` was added in 8.0.11.

- **Error number:** `MY-011725`; **Symbol:** `ER_GRP_RPL_SEND_STATS_ERROR`; **SQLSTATE:** `HY000`

Message: Error while sending stats message

`ER_GRP_RPL_SEND_STATS_ERROR` was added in 8.0.11.

- **Error number:** `MY-011726`; **Symbol:** `ER_GRP_RPL_MEMBER_STATS_INFO`; **SQLSTATE:** `HY000`

Message: Flow control - update member stats: %s stats certifier_queue %ld, applier_queue %d certified %ld (%ld), applied %ld (%ld), local %ld (%ld), quota %ld (%ld) mode=%d

`ER_GRP_RPL_MEMBER_STATS_INFO` was added in 8.0.11.

- **Error number:** `MY-011727`; **Symbol:** `ER_GRP_RPL_FLOW_CONTROL_STATS`; **SQLSTATE:** `HY000`

Message: Flow control: throttling to %ld commits per %ld sec, with %d writing and %d non-recovering members, min capacity %lld, lim throttle %lld

`ER_GRP_RPL_FLOW_CONTROL_STATS` was added in 8.0.11.

- **Error number:** `MY-011728`; **Symbol:** `ER_GRP_RPL_UNABLE_TO_CONVERT_PACKET_TO_EVENT`; **SQLSTATE:** `HY000`

Message: Unable to convert a packet into an event on the applier. Error: %s

`ER_GRP_RPL_UNABLE_TO_CONVERT_PACKET_TO_EVENT` was added in 8.0.11.

- **Error number:** `MY-011729`; **Symbol:** `ER_GRP_RPL_PIPELINE_CREATE_FAILED`; **SQLSTATE:** `HY000`

Message: Failed to create group replication pipeline cache.

`ER_GRP_RPL_PIPELINE_CREATE_FAILED` was added in 8.0.11.

- **Error number:** `MY-011730`; **Symbol:** `ER_GRP_RPL_PIPELINE_REINIT_FAILED_WRITE`; **SQLSTATE:** `HY000`

Message: Failed to reinit group replication pipeline cache for write.
**ER_GRP_RPL_PIPELINE_REINIT_FAILED_WRITE** was added in 8.0.11.

- **Error number:** MY-011731; **Symbol:** ER_GRP_RPL_UNABLE_TO_CONVERT_EVENT_TO_PACKET; **SQLSTATE:** HY000

  Message: Unable to convert the event into a packet on the applier. Error: %s

**ER_GRP_RPL_UNABLE_TO_CONVERT_EVENT_TO_PACKET** was added in 8.0.11.

- **Error number:** MY-011732; **Symbol:** ER_GRP_RPL_PIPELINE_FLUSH_FAIL; **SQLSTATE:** HY000

  Message: Failed to flush group replication pipeline cache.

**ER_GRP_RPL_PIPELINE_FLUSH_FAIL** was added in 8.0.11.

- **Error number:** MY-011733; **Symbol:** ER_GRP_RPL_PIPELINE_REINIT_FAILED_READ; **SQLSTATE:** HY000

  Message: Failed to reinit group replication pipeline cache for read.

**ER_GRP_RPL_PIPELINE_REINIT_FAILED_READ** was added in 8.0.11.

- **Error number:** MY-011734; **Symbol:** ER_GRP_RPL_STOP_REP_CHANNEL; **SQLSTATE:** HY000

  Message: Error stopping all replication channels while server was leaving the group. Got error: %d. Please check the error log for more details.

**ER_GRP_RPL_STOP_REP_CHANNEL** was added in 8.0.11, removed after 8.0.17.

- **Error number:** MY-011735; **Symbol:** ER_GRP_RPL_GCS_GR_ERROR_MSG; **SQLSTATE:** HY000

  Message: %s

**ER_GRP_RPL_GCS_GR_ERROR_MSG** was added in 8.0.11.

- **Error number:** MY-011736; **Symbol:** ER_GRP_RPL_SLAVE_IO_THREAD_UNBLOCKED; **SQLSTATE:** HY000

  Message: The slave IO thread of channel '%s' is unblocked as the member is declared ONLINE now.

**ER_GRP_RPL_SLAVE_IO_THREAD_UNBLOCKED** was added in 8.0.11.

- **Error number:** MY-011737; **Symbol:** ER_GRP_RPL_SLAVE_IO_THREAD_ERROR_OUT; **SQLSTATE:** HY000

  Message: The slave IO thread of channel '%s' will error out as the member failed to come ONLINE.

**ER_GRP_RPL_SLAVE_IO_THREAD_ERROR_OUT** was added in 8.0.11.

- **Error number:** MY-011738; **Symbol:** ER_GRP_RPL_SLAVE_APPLIER_THREAD_UNBLOCKED; **SQLSTATE:** HY000

  Message: The slave applier thread of channel '%s' is unblocked as the member is declared ONLINE now.

**ER_GRP_RPL_SLAVE_APPLIER_THREAD_UNBLOCKED** was added in 8.0.11.
Server Error Message Reference

- **Error number:** MY-011739; Symbol: **ER_GRP_RPL_SLAVE_APPLIER_THREAD_ERROR_OUT**; **SQLSTATE:** HY000
  
  Message: The slave applier thread of channel '%s' will error out as the member failed to come ONLINE.
  
  **ER_GRP_RPL_SLAVE_APPLIER_THREAD_ERROR_OUT** was added in 8.0.11.

- **Error number:** MY-011740; Symbol: **ER_LDAP_AUTH_FAILED_TO_CREATE_OR_GET_CONNECTION**; **SQLSTATE:** HY000
  
  Message: LDAP authentication initialize: failed to create/ get connection from the pool.
  
  **ER_LDAP_AUTH_FAILED_TO_CREATE_OR_GET_CONNECTION** was added in 8.0.11.

- **Error number:** MY-011741; Symbol: **ER_LDAP_AUTH_DEINIT_FAILED**; **SQLSTATE:** HY000
  
  Message: LDAP authentication deInitialize Failed
  
  **ER_LDAP_AUTH_DEINIT_FAILED** was added in 8.0.11.

- **Error number:** MY-011742; Symbol: **ER_LDAP_AUTH_SKIPPING_USER_GROUP_SEARCH**; **SQLSTATE:** HY000
  
  Message: Skipping group search, No group attribute mentioned
  
  **ER_LDAP_AUTH_SKIPPING_USER_GROUP_SEARCH** was added in 8.0.11.

- **Error number:** MY-011743; Symbol: **ER_LDAP_AUTH_POOL_DISABLE_MAX_SIZE_ZERO**; **SQLSTATE:** HY000
  
  Message: Pool max size is 0, connection pool is disabled
  
  **ER_LDAP_AUTH_POOL_DISABLE_MAX_SIZE_ZERO** was added in 8.0.11.

- **Error number:** MY-011744; Symbol: **ER_LDAP_AUTH_FAILED_TO_CREATE_LDAP_OBJECT_CREATOR**; **SQLSTATE:** HY000
  
  Message: Connection pool initialization, failed to create LDAP object creator
  
  **ER_LDAP_AUTH_FAILED_TO_CREATE_LDAP_OBJECT_CREATOR** was added in 8.0.11.

- **Error number:** MY-011745; Symbol: **ER_LDAP_AUTH_FAILED_TO_CREATE_LDAP_OBJECT**; **SQLSTATE:** HY000
  
  Message: Connection pool initialization, failed to create LDAP object
  
  **ER_LDAP_AUTH_FAILED_TO_CREATE_LDAP_OBJECT** was added in 8.0.11.

- **Error number:** MY-011746; Symbol: **ER_LDAP_AUTH_TLS_CONF**; **SQLSTATE:** HY000
  
  Message: LDAP TLS configuration
  
  **ER_LDAP_AUTH_TLS_CONF** was added in 8.0.11.

- **Error number:** MY-011747; Symbol: **ER_LDAP_AUTH_TLS_CONNECTION**; **SQLSTATE:** HY000
  
  Message: LDAP TLS connection
  
  **ER_LDAP_AUTH_TLS_CONNECTION** was added in 8.0.11.
• Error number: MY-011748; Symbol: ER_LDAP_AUTH_CONN_POOL_NOT_CREATED; SQLSTATE: HY000
Message: LDAP pool is not created.
ER_LDAP_AUTH_CONN_POOL_NOT_CREATED was added in 8.0.11.

• Error number: MY-011749; Symbol: ER_LDAP_AUTH_CONN_POOL_INITIALIZING; SQLSTATE: HY000
Message: LDAP pool is initializing
ER_LDAP_AUTH_CONN_POOL_INITIALIZING was added in 8.0.11.

• Error number: MY-011750; Symbol: ER_LDAP_AUTH_CONN_POOL_DEINITIALIZING; SQLSTATE: HY000
Message: LDAP pool is de-initializing
ER_LDAP_AUTH_CONN_POOL_DEINITIALIZING was added in 8.0.11.

• Error number: MY-011751; Symbol: ER_LDAP_AUTH_ZERO_MAX_POOL_SIZE_UNCHANGED; SQLSTATE: HY000
Message: Pool max size old and new values are 0
ER_LDAP_AUTH_ZERO_MAX_POOL_SIZE_UNCHANGED was added in 8.0.11.

• Error number: MY-011752; Symbol: ER_LDAP_AUTH_POOL_REINITIALIZING; SQLSTATE: HY000
Message: LDAP pool is re-initializing
ER_LDAP_AUTH_POOL_REINITIALIZING was added in 8.0.11.

• Error number: MY-011753; Symbol: ER_LDAP_AUTH_FAILED_TO_WRITE_PACKET; SQLSTATE: HY000
Message: Plug-in has failed to write the packet.
ER_LDAP_AUTH_FAILED_TO_WRITE_PACKET was added in 8.0.11.

• Error number: MY-011754; Symbol: ER_LDAP_AUTH_SETTING_USERNAME; SQLSTATE: HY000
Message: Setting LDAP user name as: %s
ER_LDAP_AUTH_SETTING_USERNAME was added in 8.0.11.

• Error number: MY-011755; Symbol: ER_LDAP_AUTH_USER_AUTH_DATA; SQLSTATE: HY000
Message: User authentication data: %s size: %lu
ER_LDAP_AUTH_USER_AUTH_DATA was added in 8.0.11.

• Error number: MY-011756; Symbol: ER_LDAP_AUTH_INFO_FOR_USER; SQLSTATE: HY000
Message: User is authenticated as: %s external user: %s
ER_LDAP_AUTH_INFO_FOR_USER was added in 8.0.11.
• Error number: MY-011757; Symbol: ER_LDAP_AUTH_USER_GROUP_SEARCH_INFO; SQLSTATE: HY000

Message: Group search information base DN: %s scope: %d filter: %s attribute: %s

ER_LDAP_AUTH_USER_GROUP_SEARCH_INFO was added in 8.0.11.

• Error number: MY-011758; Symbol: ER_LDAP_AUTH_GRP_SEARCH_SPECIAL_HDL; SQLSTATE: HY000

Message: Special handling for group search, {GA} found

ER_LDAP_AUTH_GRP_SEARCH_SPECIAL_HDL was added in 8.0.11.

• Error number: MY-011759; Symbol: ER_LDAP_AUTH_GRP_IS_FULL_DN; SQLSTATE: HY000

Message: Group search special handling, group full DN found.

ER_LDAP_AUTH_GRP_IS_FULL_DN was added in 8.0.11.

• Error number: MY-011760; Symbol: ER_LDAP_AUTH_USER_NOT_FOUND_IN_ANY_GRP; SQLSTATE: HY000

Message: User %s is not member of any group.

ER_LDAP_AUTH_USER_NOT_FOUND_IN_ANY_GRP was added in 8.0.11.

• Error number: MY-011761; Symbol: ER_LDAP_AUTH_USER_FOUND_IN_MANY_GRPS; SQLSTATE: HY000

Message: User %s is member of more than one group

ER_LDAP_AUTH_USER_FOUND_IN_MANY_GRPS was added in 8.0.11.

• Error number: MY-011762; Symbol: ER_LDAP_AUTH_USER_HAS_MULTIPLE_GRP_NAMES; SQLSTATE: HY000

Message: For user %s has multiple user group names. Please check if group attribute name is correct

ER_LDAP_AUTH_USER_HAS_MULTIPLE_GRP_NAMES was added in 8.0.11.

• Error number: MY-011763; Symbol: ER_LDAP_AUTH_SEARCHED_USER_GRP_NAME; SQLSTATE: HY000

Message: Searched group name: %s

ER_LDAP_AUTH_SEARCHED_USER_GRP_NAME was added in 8.0.11.

• Error number: MY-011764; Symbol: ER_LDAP_AUTH_OBJECT_CREATE_TIMESTAMP; SQLSTATE: HY000

Message: LDAP authentication object creation time_stamp: %s dn: %s

ER_LDAP_AUTH_OBJECT_CREATE_TIMESTAMP was added in 8.0.11.

• Error number: MY-011765; Symbol: ER_LDAP_AUTH_CERTIFICATE_NAME; SQLSTATE: HY000

Message: Certificate name: %s
**Server Error Message Reference**

ER_LDAP_AUTH_CERTIFICATE_NAME was added in 8.0.11.

- **Error number:** MY-011766; **Symbol:** ER_LDAP_AUTH_FAILED_TO_POOL_DEINIT; **SQLSTATE:** HY000
  
  Message: Failed to pool de-initialized: pool is already reconstructing

ER_LDAP_AUTH_FAILED_TO_POOL_DEINIT was added in 8.0.11.

- **Error number:** MY-011767; **Symbol:** ER_LDAP_AUTH_FAILED_TO_INITIALIZE_POOL_IN_RECONSTRUCTING; **SQLSTATE:** HY000
  
  Message: Pool initialization failed: pool is already initialized

ER_LDAP_AUTH_FAILED_TO_INITIALIZE_POOL_IN_RECONSTRUCTING was added in 8.0.11.

- **Error number:** MY-011768; **Symbol:** ER_LDAP_AUTH_FAILED_TO_INITIALIZE_POOL_IN_INIT_STATE; **SQLSTATE:** HY000
  
  Message: Pool initialization failed: pool is initializing

ER_LDAP_AUTH_FAILED_TO_INITIALIZE_POOL_IN_INIT_STATE was added in 8.0.11.

- **Error number:** MY-011769; **Symbol:** ER_LDAP_AUTH_FAILED_TO_INITIALIZE_POOL_IN_DEINIT_STATE; **SQLSTATE:** HY000
  
  Message: Pool initialization failed: pool is de-initializing

ER_LDAP_AUTH_FAILED_TO_INITIALIZE_POOL_IN_DEINIT_STATE was added in 8.0.11.

- **Error number:** MY-011770; **Symbol:** ER_LDAP_AUTH_FAILED_TO_DEINITIALIZE_POOL_IN_RECONSTRUCT_STATE; **SQLSTATE:** HY000
  
  Message: Failed to pool deinitialized: pool is already reconstructing

ER_LDAP_AUTH_FAILED_TO_DEINITIALIZE_POOL_IN_RECONSTRUCT_STATE was added in 8.0.11.

- **Error number:** MY-011771; **Symbol:** ER_LDAP_AUTH_FAILED_TO_DEINITIALIZE_NOT_READY_POOL; **SQLSTATE:** HY000
  
  Message: Failed to pool deinitialized : pool is not ready

ER_LDAP_AUTH_FAILED_TO_DEINITIALIZE_NOT_READY_POOL was added in 8.0.11.

- **Error number:** MY-011772; **Symbol:** ER_LDAP_AUTH_FAILED_TO_GET_CONNECTION_AS_PLUGIN_NOT_READY; **SQLSTATE:** HY000
  
  Message: Ldap_connection_pool::get: Failed to return connection as plug-in is not ready/initializing/de-initializing

ER_LDAP_AUTH_FAILED_TO_GET_CONNECTION_AS_PLUGIN_NOT_READY was added in 8.0.11.

- **Error number:** MY-011773; **Symbol:** ER_LDAP_AUTH_CONNECTION_POOL_INIT_FAILED; **SQLSTATE:** HY000
  
  Message: Connection pool has failed to initialized

ER_LDAP_AUTH_CONNECTION_POOL_INIT_FAILED was added in 8.0.11.
Error number: **MY-011774**; Symbol: **ER_LDAP_AUTH_MAX_ALLOWED_CONNECTION_LIMIT_HIT**; SQLSTATE: **HY000**

Message: Ldap_connetion_pool::get LDAP maximum connection allowed size is reached. Increase the maximum limit.

**ER_LDAP_AUTH_MAX_ALLOWED_CONNECTION_LIMIT_HIT** was added in 8.0.11.

---

Error number: **MY-011775**; Symbol: **ER_LDAP_AUTH_MAX_POOL_SIZE_SET_FAILED**; SQLSTATE: **HY000**

Message: Set max pool size failed.

**ER_LDAP_AUTH_MAX_POOL_SIZE_SET_FAILED** was added in 8.0.11.

---

Error number: **MY-011776**; Symbol: **ER_LDAP_AUTH_PLUGIN_FAILED_TO_READ_PACKET**; SQLSTATE: **HY000**

Message: Plug-in has failed to read the packet from client

**ER_LDAP_AUTH_PLUGIN_FAILED_TO_READ_PACKET** was added in 8.0.11.

---

Error number: **MY-011777**; Symbol: **ER_LDAP_AUTH_CREATING_LDAP_CONNECTION**; SQLSTATE: **HY000**

Message: Ldap_authentication::initialize: creating new LDAP connection.

**ER_LDAP_AUTH_CREATING_LDAP_CONNECTION** was added in 8.0.11.

---

Error number: **MY-011778**; Symbol: **ER_LDAP_AUTH_GETTING_CONNECTION_FROM_POOL**; SQLSTATE: **HY000**

Message: Ldap_authentication::initialize: getting connection from pool.

**ER_LDAP_AUTH_GETTING_CONNECTION_FROM_POOL** was added in 8.0.11.

---

Error number: **MY-011779**; Symbol: **ER_LDAP_AUTH_RETURNING_CONNECTION_TO_POOL**; SQLSTATE: **HY000**

Message: Ldap_authentication::de_initialize putting back connection in the pool

**ER_LDAP_AUTH_RETURNING_CONNECTION_TO_POOL** was added in 8.0.11.

---

Error number: **MY-011780**; Symbol: **ER_LDAP_AUTH_SEARCH_USER_GROUP_ATTR_NOT_FOUND**; SQLSTATE: **HY000**

Message: Ldap_authentication::search_user_group no group attribute found

**ER_LDAP_AUTH_SEARCH_USER_GROUP_ATTR_NOT_FOUND** was added in 8.0.11.

---

Error number: **MY-011781**; Symbol: **ER_LDAP_AUTH_LDAP_INFO_NULL**; SQLSTATE: **HY000**

Message: Ldap_connetion_pool::put ldap info null

**ER_LDAP_AUTH_LDAP_INFO_NULL** was added in 8.0.11.

---

Error number: **MY-011782**; Symbol: **ER_LDAP_AUTH_FREEING_CONNECTION**; SQLSTATE: **HY000**

Message: Ldap_connection_pool::put connection is freeing.
**ER_LDAP_AUTH_FREEING_CONNECTION** was added in 8.0.11.

- Error number: **MY-011783**; Symbol: **ER_LDAP_AUTH_CONNECTION_PUSHED_TO_POOL**; SQLSTATE: **HY000**
  
  Message: Ldap_connection_pool::put connection in pushed in the pool

**ER_LDAP_AUTH_FREEING_CONNECTION** was added in 8.0.11.

- Error number: **MY-011784**; Symbol: **ER_LDAP_AUTH_CONNECTION_CREATOR_ENTER**; SQLSTATE: **HY000**
  
  Message: Ldap_connection_creator::Ldap_connection_creator

**ER_LDAP_AUTH_FREEING_CONNECTION** was added in 8.0.11.

- Error number: **MY-011785**; Symbol: **ER_LDAP_AUTH_STARTING_TLS**; SQLSTATE: **HY000**
  
  Message: starting TLS

**ER_LDAP_AUTH_STARTING_TLS** was added in 8.0.11.

- Error number: **MY-011786**; Symbol: **ER_LDAP_AUTH_CONNECTION_GET_LDAP_INFO_NULL**; SQLSTATE: **HY000**
  
  Message: Ldap_connection_pool::get: (ldap_info == NULL)|| (*ldap_info)

**ER_LDAP_AUTH_CONNECTION_GET_LDAP_INFO_NULL** was added in 8.0.11.

- Error number: **MY-011787**; Symbol: **ER_LDAP_AUTH_DELETING_CONNECTION_KEY**; SQLSTATE: **HY000**
  
  Message: Ldap_connection_pool::deinit: deleting connection key %s

**ER_LDAP_AUTH_DELETING_CONNECTION_KEY** was added in 8.0.11.

- Error number: **MY-011788**; Symbol: **ER_LDAP_AUTH_POOLED_CONNECTION_KEY**; SQLSTATE: **HY000**
  
  Message: Ldap_connection_pool::get pooled connection key: %s

**ER_LDAP_AUTH_POOLED_CONNECTION_KEY** was added in 8.0.11.

- Error number: **MY-011789**; Symbol: **ER_LDAP_AUTH_CREATE_CONNECTION_KEY**; SQLSTATE: **HY000**
  
  Message: Ldap_connection_pool::get create connection key: %s

**ER_LDAP_AUTH_CREATE_CONNECTION_KEY** was added in 8.0.11.

- Error number: **MY-011790**; Symbol: **ER_LDAP_AUTH_COMMUNICATION_HOST_INFO**; SQLSTATE: **HY000**
  
  Message: LDAP communication host %s port %u

**ER_LDAP_AUTH_COMMUNICATION_HOST_INFO** was added in 8.0.11.

- Error number: **MY-011791**; Symbol: **ER_LDAP_AUTH_METHOD_TO_CLIENT**; SQLSTATE: **HY000**
Server Error Message Reference

Message: Sending authentication method to client: %s

**ER_LDAP_AUTH_METHOD_TO_CLIENT** was added in 8.0.11.

- **Error number:** MY-011792; **Symbol:** ER_LDAP_AUTH_SASL_REQUEST_FROM_CLIENT; **SQLSTATE:** HY000

Message: SASL request received from mysql client: %s

**ER_LDAP_AUTH_SASL_REQUEST_FROM_CLIENT** was added in 8.0.11.

- **Error number:** MY-011793; **Symbol:** ER_LDAP_AUTH_SASL_PROCESS_SASL; **SQLSTATE:** HY000

Message: Ldap_sasl_authentication::process_sasl rc: %s

**ER_LDAP_AUTH_SASL_PROCESS_SASL** was added in 8.0.11.

- **Error number:** MY-011794; **Symbol:** ER_LDAP_AUTH_SASL_BIND_SUCCESS_INFO; **SQLSTATE:** HY000

Message: Ldap_sasl_authentication::process_sasl sasl bind succeed. dn: %s method: %s server credential: %s

**ER_LDAP_AUTH_SASL_BIND_SUCCESS_INFO** was added in 8.0.11.

- **Error number:** MY-011795; **Symbol:** ER_LDAP_AUTH_STARTED_FOR_USER; **SQLSTATE:** HY000

Message: LDAP authentication started for user name: %s

**ER_LDAP_AUTH_STARTED_FOR_USER** was added in 8.0.11.

- **Error number:** MY-011796; **Symbol:** ER_LDAP_AUTH_DISTINGUISHED_NAME; **SQLSTATE:** HY000

Message: %s

**ER_LDAP_AUTH_DISTINGUISHED_NAME** was added in 8.0.11.

- **Error number:** MY-011797; **Symbol:** ER_LDAP_AUTH_INIT_FAILED; **SQLSTATE:** HY000

Message: LDAP authentication initialize is failed with: %s

**ER_LDAP_AUTH_INIT_FAILED** was added in 8.0.11.

- **Error number:** MY-011798; **Symbol:** ER_LDAP_AUTH_OR_GROUP_RETRIEVAL_FAILED; **SQLSTATE:** HY000

Message: LDAP authentication failed or group retrieval failed: %s

**ER_LDAP_AUTH_OR_GROUP_RETRIEVAL_FAILED** was added in 8.0.11.

- **Error number:** MY-011799; **Symbol:** ER_LDAP_AUTH_USER_GROUP_SEARCH_FAILED; **SQLSTATE:** HY000

Message: Search user group has failed: %s

**ER_LDAP_AUTH_USER_GROUP_SEARCH_FAILED** was added in 8.0.11.

- **Error number:** MY-011800; **Symbol:** ER_LDAP_AUTH_USER_BIND_FAILED; **SQLSTATE:** HY000
Message: LDAP user bind has failed: %s

ER_LDAP_AUTH_USER_BIND_FAILED was added in 8.0.11.

- Error number: MY-011801; Symbol: ER_LDAP_AUTH_POOL_GET_FAILED_TO_CREATE_CONNECTION; SQLSTATE: HY000

Message: Connection pool get: Failed to create LDAP connection. %s

ER_LDAP_AUTH_POOL_GET_FAILED_TO_CREATE_CONNECTION was added in 8.0.11.

- Error number: MY-011802; Symbol: ER_LDAP_AUTH_FAILED_TO_CREATE_LDAP_CONNECTION; SQLSTATE: HY000

Message: Failed to create new LDAP connection: %s

ER_LDAP_AUTH_FAILED_TO_CREATE_LDAP_CONNECTION was added in 8.0.11.

- Error number: MY-011803; Symbol: ER_LDAP_AUTH_FAILED_TO_ESTABLISH_TLS_CONNECTION; SQLSTATE: HY000

Message: Failed to establish TLS connection: %s

ER_LDAP_AUTH_FAILED_TO_ESTABLISH_TLS_CONNECTION was added in 8.0.11.

- Error number: MY-011804; Symbol: ER_LDAP_AUTH_FAILED_TO_SEARCH_DN; SQLSTATE: HY000

Message: Failed to search user full dn: %s

ER_LDAP_AUTH_FAILED_TO_SEARCH_DN was added in 8.0.11.

- Error number: MY-011805; Symbol: ER_LDAP_AUTH_CONNECTION_POOL_REINIT_ENTER; SQLSTATE: HY000

Message: Ldap_connection_pool::reinit

ER_LDAP_AUTH_CONNECTION_POOL_REINIT_ENTER was added in 8.0.11.

- Error number: MY-011806; Symbol: ER_SYSTEMD_NOTIFY_PATH_TOO_LONG; SQLSTATE: HY000

Message: The path '%s', from the NOTIFY_SOCKET environment variable, is too long. At %u bytes it exceeds the limit of %u bytes for an AF_UNIX socket.

ER_SYSTEMD_NOTIFY_PATH_TOO_LONG was added in 8.0.11.

- Error number: MY-011807; Symbol: ER_SYSTEMD_NOTIFY_CONNECT_FAILED; SQLSTATE: HY000

Message: Failed to connect to systemd notification socket named %s. Error: '%s'

ER_SYSTEMD_NOTIFY_CONNECT_FAILED was added in 8.0.11.

- Error number: MY-011808; Symbol: ER_SYSTEMD_NOTIFY_WRITE_FAILED; SQLSTATE: HY000

Message: Failed to write '%s' to systemd notification. Error: '%s'

ER_SYSTEMD_NOTIFY_WRITE_FAILED was added in 8.0.11.

- Error number: MY-011809; Symbol: ER_FOUND_MISSING_GTIDS; SQLSTATE: HY000
Message: Cannot replicate to server with server_uuid='%s' because the present server has purged required binary logs. The connecting server needs to replicate the missing transactions from elsewhere, or be replaced by a new server created from a more recent backup. To prevent this error in the future, consider increasing the binary log expiration period on the present server. The missing transactions are '%s'.

ER_FOUND_MISSING_GTIDS was added in 8.0.11.

• Error number: MY-011810; Symbol: ER_PID_FILE_PRIV_DIRECTORY_INSECURE; SQLSTATE: HY000
Message: Insecure configuration for --pid-file: Location '%s' in the path is accessible to all OS users. Consider choosing a different directory.

ER_PID_FILE_PRIV_DIRECTORY_INSECURE was added in 8.0.11.

• Error number: MY-011811; Symbol: ER_CANT_CHECK_PID_PATH; SQLSTATE: HY000
Message: Can't start server: can't check PID filepath: %s

ER_CANT_CHECK_PID_PATH was added in 8.0.11.

• Error number: MY-011812; Symbol: ER_VALIDATE_PWD_STATUS_VAR_REGISTRATION_FAILED; SQLSTATE: HY000
Message: validate_password status variables registration failed.

ER_VALIDATE_PWD_STATUS_VAR_REGISTRATION_FAILED was added in 8.0.11.

• Error number: MY-011813; Symbol: ER_VALIDATE_PWD_STATUS_VAR_UNREGISTRATION_FAILED; SQLSTATE: HY000
Message: validate_password status variables unregistration failed.

ER_VALIDATE_PWD_STATUS_VAR_UNREGISTRATION_FAILED was added in 8.0.11.

• Error number: MY-011814; Symbol: ER_VALIDATE_PWD_DICT_FILE_OPEN_FAILED; SQLSTATE: HY000
Message: Dictionary file open failed

ER_VALIDATE_PWD_DICT_FILE_OPEN_FAILED was added in 8.0.11.

• Error number: MY-011815; Symbol: ER_VALIDATE_PWD_COULD_BE_NULL; SQLSTATE: HY000
Message: given password string could be null

ER_VALIDATE_PWD_COULD_BE_NULL was added in 8.0.11.

• Error number: MY-011816; Symbol: ER_VALIDATE_PWD_STRING_CONV_TO_LOWERCASE_FAILED; SQLSTATE: HY000
Message: failed to convert the password string to lower case

ER_VALIDATE_PWD_STRING_CONV_TO_LOWERCASE_FAILED was added in 8.0.11.

• Error number: MY-011817; Symbol: ER_VALIDATE_PWD_STRING_CONV_TO_BUFFER_FAILED; SQLSTATE: HY000
Message: failed to convert the password string into a buffer

ER_VALIDATE_PWD_STRING_CONV_TO_BUFFER_FAILED was added in 8.0.11.

- Error number: MY-011818; Symbol: ER_VALIDATE_PWD_STRING_HANDLER_MEM_ALLOCATION_FAILED; SQLSTATE: HY000

Message: memory allocation failed for string handler

ER_VALIDATE_PWD_STRING_HANDLER_MEM_ALLOCATION_FAILED was added in 8.0.11.

- Error number: MY-011819; Symbol: ER_VALIDATE_PWD_STRONG_POLICY_DICT_FILE_UNSPECIFIED; SQLSTATE: HY000

Message: Since the validate_password_policy is mentioned as Strong, dictionary file must be specified

ER_VALIDATE_PWD_STRONG_POLICY_DICT_FILE_UNSPECIFIED was added in 8.0.11.

- Error number: MY-011820; Symbol: ER_VALIDATE_PWD_CONVERT_TO_BUFFER_FAILED; SQLSTATE: HY000

Message: convert_to_buffer service failed

ER_VALIDATE_PWD_CONVERT_TO_BUFFER_FAILED was added in 8.0.11.

- Error number: MY-011821; Symbol: ER_VALIDATE_PWD_VARIABLE_REGISTRATION_FAILED; SQLSTATE: HY000

Message: %s variable registration failed.

ER_VALIDATE_PWD_VARIABLE_REGISTRATION_FAILED was added in 8.0.11.

- Error number: MY-011822; Symbol: ER_VALIDATE_PWD_VARIABLE_UNREGISTRATION_FAILED; SQLSTATE: HY000

Message: %s variable unregistration failed.

ER_VALIDATE_PWD_VARIABLE_UNREGISTRATION_FAILED was added in 8.0.11.

- Error number: MY-011823; Symbol: ER_KEYRING_MIGRATION_EXTRA_OPTIONS; SQLSTATE: HY000

Message: Please specify options specific to keyring migration. Any additional options can be ignored. NOTE: Although some options are valid, migration tool can still report error example: plugin variables for which plugin is not loaded yet.

ER_KEYRING_MIGRATION_EXTRA_OPTIONS was added in 8.0.11.

**ER_IB_MSG_659** was added in 8.0.11.

- Error number: **MY-012485**; Symbol: **ER_IB_MSG_660**; SQLSTATE: **HY000**

Message: %s

**ER_IB_MSG_660** was added in 8.0.11.

- Error number: **MY-012486**; Symbol: **ER_IB_MSG_661**; SQLSTATE: **HY000**

Message: %s

**ER_IB_MSG_661** was added in 8.0.11.

- Error number: **MY-012487**; Symbol: **ER_IB_MSG_662**; SQLSTATE: **HY000**

Message: %s

**ER_IB_MSG_662** was added in 8.0.11.

- Error number: **MY-012488**; Symbol: **ER_IB_MSG_663**; SQLSTATE: **HY000**

Message: %s

**ER_IB_MSG_663** was added in 8.0.11.

- Error number: **MY-012489**; Symbol: **ER_IB_MSG_664**; SQLSTATE: **HY000**

Message: The transaction log size is too large for innodb_log_buffer_size (%lu >= %lu / 2). Trying to extend it.

**ER_IB_MSG_664** was added in 8.0.11, removed after 8.0.13.

- Error number: **MY-012490**; Symbol: **ER_IB_MSG_665**; SQLSTATE: **HY000**

Message: innodb_log_buffer_size was extended to %lu bytes.

**ER_IB_MSG_665** was added in 8.0.11, removed after 8.0.13.

- Error number: **MY-012491**; Symbol: **ER_IB_MSG_666**; SQLSTATE: **HY000**

Message: The transaction log files are too small for the single transaction log (size=%lu). So, the last checkpoint age might exceed the log group capacity %llu.

**ER_IB_MSG_666** was added in 8.0.11, removed after 8.0.13.

- Error number: **MY-012492**; Symbol: **ER_IB_MSG_667**; SQLSTATE: **HY000**

Message: The age of the last checkpoint is %llu, which exceeds the log group capacity %llu.

**ER_IB_MSG_667** was added in 8.0.11, removed after 8.0.13.

- Error number: **MY-012493**; Symbol: **ER_IB_MSG_668**; SQLSTATE: **HY000**

Message: Cannot continue operation. ib_logfiles are too small for innodb_thread_concurrency %lu. The combined size of ib_logfiles should be bigger than 200 kB * innodb_thread_concurrency. To get
mysql to start up, set innodb_thread_concurrency in my.cnf to a lower value, for example, to 8. After an ERROR-FREE shutdown of mysqld you can adjust the size of ib_logfiles. %s

ER_IB_MSG_668 was added in 8.0.11, removed after 8.0.13.

- Error number: MY-012494; Symbol: ER_IB_MSG_669; SQLSTATE: HY000

  ER_IB_MSG_1045 was added in 8.0.11.
• Error number: MY-012871; Symbol: ER_IB_MSG_1046; SQLSTATE: HY000
  Message: Old log sequence number %llu was greater than the new log sequence number %llu. Please submit a bug report to http://bugs.mysql.com
  ER_IB_MSG_1046 was added in 8.0.11.

• Error number: MY-012872; Symbol: ER_IB_MSG_1047; SQLSTATE: HY000
  Message: Semaphore wait has lasted > %llu seconds. We intentionally crash the server because it appears to be hung.
  ER_IB_MSG_1047 was added in 8.0.11.

• Error number: MY-012873; Symbol: ER_IB_MSG_1048; SQLSTATE: HY000
  Message: Waiting for %llu table(s) to be dropped
  ER_IB_MSG_1048 was added in 8.0.11.

• Error number: MY-012874; Symbol: ER_IB_MSG_1049; SQLSTATE: HY000
  Message: Waiting for change buffer merge to complete number of bytes of change buffer just merged: %llu
  ER_IB_MSG_1049 was added in 8.0.11.

• Error number: MY-012875; Symbol: ER_IB_MSG_1050; SQLSTATE: HY000
  Message: Can't set undo tablespace(s) to be encrypted since --innodb_undo_tablespaces=0.
  ER_IB_MSG_1050 was added in 8.0.11, removed after 8.0.15.

• Error number: MY-012876; Symbol: ER_IB_MSG_1051; SQLSTATE: HY000
  Message: Can't set undo tablespace(s) to be encrypted in read-only-mode.
  ER_IB_MSG_1051 was added in 8.0.11.

• Error number: MY-012877; Symbol: ER_IB_MSG_1052; SQLSTATE: HY000
  Message: Can't set undo tablespace '%s' to be encrypted.
  ER_IB_MSG_1052 was added in 8.0.11.

• Error number: MY-012878; Symbol: ER_IB_MSG_1053; SQLSTATE: HY000
  Message: Can't set undo tablespace '%s' to be encrypted. Failed to write header page.
  ER_IB_MSG_1053 was added in 8.0.11.

• Error number: MY-012879; Symbol: ER_IB_MSG_1054; SQLSTATE: HY000
  Message: Can't set undo tablespace '%s' to be encrypted. Error %d - %s
  ER_IB_MSG_1054 was added in 8.0.11.

• Error number: MY-012880; Symbol: ER_IB_MSG_1055; SQLSTATE: HY000
  Message: Encryption is enabled for undo tablespace '%s'.
ER_IB_MSG_1055 was added in 8.0.11.

- Error number: MY-012881; Symbol: ER_IB_MSG_1056; SQLSTATE: HY000
  Message: Can't rotate encryption on undo tablespace '%s'.

ER_IB_MSG_1056 was added in 8.0.11.

- Error number: MY-012882; Symbol: ER_IB_MSG_1057; SQLSTATE: HY000
  Message: Encryption is enabled for undo tablespace '%s'.

ER_IB_MSG_1057 was added in 8.0.11.

- Error number: MY-012883; Symbol: ER_IB_MSG_1058; SQLSTATE: HY000
  Message: os_file_get_status() failed on '%s'. Can't determine file permissions.

ER_IB_MSG_1058 was added in 8.0.11.

- Error number: MY-012884; Symbol: ER_IB_MSG_1059; SQLSTATE: HY000
  Message: %s can't be opened in %s mode.

ER_IB_MSG_1059 was added in 8.0.11.

- Error number: MY-012885; Symbol: ER_IB_MSG_1060; SQLSTATE: HY000
  Message: '%s' not a regular file.

ER_IB_MSG_1060 was added in 8.0.11.

- Error number: MY-012886; Symbol: ER_IB_MSG_1061; SQLSTATE: HY000
  Message: Cannot create %

ER_IB_MSG_1061 was added in 8.0.11.

- Error number: MY-012887; Symbol: ER_IB_MSG_1062; SQLSTATE: HY000
  Message: Setting log file %s size to %llu MB

ER_IB_MSG_1062 was added in 8.0.11.

- Error number: MY-012888; Symbol: ER_IB_MSG_1063; SQLSTATE: HY000
  Message: Cannot set log file %s to size %llu MB

ER_IB_MSG_1063 was added in 8.0.11.

- Error number: MY-012889; Symbol: ER_IB_MSG_1064; SQLSTATE: HY000
  Message: Cannot create log files in read-only mode

ER_IB_MSG_1064 was added in 8.0.11.

- Error number: MY-012890; Symbol: ER_IB_MSG_1065; SQLSTATE: HY000
  Message: Redo log encryption is enabled, but the keyring plugin is not loaded.
ER_IB_MSG_1065 was added in 8.0.11.

- Error number: MY-012891; Symbol: ER_IB_MSG_1066; SQLSTATE: HY000
  Message: Cannot create file for log file %s.

ER_IB_MSG_1066 was added in 8.0.11.

- Error number: MY-012892; Symbol: ER_IB_MSG_1067; SQLSTATE: HY000
  Message: Renaming log file %s to %s.

ER_IB_MSG_1067 was added in 8.0.11.

- Error number: MY-012893; Symbol: ER_IB_MSG_1068; SQLSTATE: HY000
  Message: New log files created, LSN=%llu.

ER_IB_MSG_1068 was added in 8.0.11.

- Error number: MY-012894; Symbol: ER_IB_MSG_1069; SQLSTATE: HY000
  Message: Unable to open '%s'.

ER_IB_MSG_1069 was added in 8.0.11.

- Error number: MY-012895; Symbol: ER_IB_MSG_1070; SQLSTATE: HY000
  Message: Cannot create construction log file '%s' for undo tablespace '%s'.

ER_IB_MSG_1070 was added in 8.0.11.

- Error number: MY-012896; Symbol: ER_IB_MSG_1071; SQLSTATE: HY000
  Message: Creating UNDO Tablespace %s.

ER_IB_MSG_1071 was added in 8.0.11.

- Error number: MY-012897; Symbol: ER_IB_MSG_1072; SQLSTATE: HY000
  Message: Setting file %s size to %llu MB.

ER_IB_MSG_1072 was added in 8.0.11.

- Error number: MY-012898; Symbol: ER_IB_MSG_1073; SQLSTATE: HY000
  Message: Physically writing the file full.

ER_IB_MSG_1073 was added in 8.0.11.

- Error number: MY-012899; Symbol: ER_IB_MSG_1074; SQLSTATE: HY000
  Message: Error in creating %s: probably out of disk space.

ER_IB_MSG_1074 was added in 8.0.11.

- Error number: MY-012900; Symbol: ER_IB_MSG_1075; SQLSTATE: HY000
  Message: Can't set encryption metadata for space %s.
ER_IB_MSG_1075 was added in 8.0.11.

- Error number: MY-012901; Symbol: ER_IB_MSG_1076; SQLSTATE: HY000
  Message: Cannot read first page of '%s' - %s
  ER_IB_MSG_1076 was added in 8.0.11.

- Error number: MY-012902; Symbol: ER_IB_MSG_1077; SQLSTATE: HY000
  Message: Undo tablespace number %lu was being truncated when mysqld quit.
  ER_IB_MSG_1077 was added in 8.0.11.

- Error number: MY-012903; Symbol: ER_IB_MSG_1078; SQLSTATE: HY000
  Message: Cannot recover a truncated undo tablespace in read-only mode
  ER_IB_MSG_1078 was added in 8.0.11.

- Error number: MY-012904; Symbol: ER_IB_MSG_1079; SQLSTATE: HY000
  Message: Reconstructing undo tablespace number %lu.
  ER_IB_MSG_1079 was added in 8.0.11.

- Error number: MY-012905; Symbol: ER_IB_MSG_1080; SQLSTATE: HY000
  Message: Cannot create %s because %s already uses Space ID=%lu! Did you change innodb_undo_directory?
  ER_IB_MSG_1080 was added in 8.0.11.

- Error number: MY-012906; Symbol: ER_IB_MSG_1081; SQLSTATE: HY000
  Message: UNDO tablespace %s must be %s
  ER_IB_MSG_1081 was added in 8.0.11.

- Error number: MY-012907; Symbol: ER_IB_MSG_1082; SQLSTATE: HY000
  Message: Error creating file for %s
  ER_IB_MSG_1082 was added in 8.0.11.

- Error number: MY-012908; Symbol: ER_IB_MSG_1083; SQLSTATE: HY000
  Message: Error reading encryption for %s
  ER_IB_MSG_1083 was added in 8.0.11.

- Error number: MY-012909; Symbol: ER_IB_MSG_1084; SQLSTATE: HY000
  Message: Unable to open undo tablespace number %lu
  ER_IB_MSG_1084 was added in 8.0.11.

- Error number: MY-012910; Symbol: ER_IB_MSG_1085; SQLSTATE: HY000
Message: Opened %llu existing undo tablespaces.

\texttt{ER\_IB\_MSG\_1085} was added in 8.0.11.

- Error number: \texttt{MY-012911}; Symbol: \texttt{ER\_IB\_MSG\_1086}; SQLSTATE: \texttt{HY000}

Message: Cannot create undo tablespaces since innodb\_%s has been set. Using %llu existing undo tablespaces.

\texttt{ER\_IB\_MSG\_1086} was added in 8.0.11.

- Error number: \texttt{MY-012912}; Symbol: \texttt{ER\_IB\_MSG\_1087}; SQLSTATE: \texttt{HY000}

Message: Cannot continue InnoDB startup in %s mode because there are no existing undo tablespaces found.

\texttt{ER\_IB\_MSG\_1087} was added in 8.0.11.

- Error number: \texttt{MY-012913}; Symbol: \texttt{ER\_IB\_MSG\_1088}; SQLSTATE: \texttt{HY000}

Message: Could not create undo tablespace "%s".

\texttt{ER\_IB\_MSG\_1088} was added in 8.0.11.

- Error number: \texttt{MY-012914}; Symbol: \texttt{ER\_IB\_MSG\_1089}; SQLSTATE: \texttt{HY000}

Message: Error %d - %s - opening newly created undo tablespace "%s".

\texttt{ER\_IB\_MSG\_1089} was added in 8.0.11.

- Error number: \texttt{MY-012915}; Symbol: \texttt{ER\_IB\_MSG\_1090}; SQLSTATE: \texttt{HY000}

Message: Created %llu undo tablespaces.

\texttt{ER\_IB\_MSG\_1090} was added in 8.0.11.

- Error number: \texttt{MY-012916}; Symbol: \texttt{ER\_IB\_MSG\_1091}; SQLSTATE: \texttt{HY000}

Message: Unable to create encrypted undo tablespace number %lu. please check if the keyring plugin is initialized correctly

\texttt{ER\_IB\_MSG\_1091} was added in 8.0.11.

- Error number: \texttt{MY-012917}; Symbol: \texttt{ER\_IB\_MSG\_1092}; SQLSTATE: \texttt{HY000}

Message: Encryption is enabled for undo tablespace number %lu.

\texttt{ER\_IB\_MSG\_1092} was added in 8.0.11.

- Error number: \texttt{MY-012918}; Symbol: \texttt{ER\_IB\_MSG\_1093}; SQLSTATE: \texttt{HY000}

Message: Unable to initialize the header page in undo tablespace number %lu.

\texttt{ER\_IB\_MSG\_1093} was added in 8.0.11.

- Error number: \texttt{MY-012919}; Symbol: \texttt{ER\_IB\_MSG\_1094}; SQLSTATE: \texttt{HY000}

Message: Cannot delete old undo tablespaces because they contain undo logs for XA PREPARED transactions.
**ER_IB_MSG_1094** was added in 8.0.11.

- Error number: MY-012920; Symbol: **ER_IB_MSG_1095**; SQLSTATE: HY000
  
  Message: Upgrading %zu existing undo tablespaces that were tracked in the system tablespace to %lu new independent undo tablespaces.

**ER_IB_MSG_1095** was added in 8.0.11.

- Error number: MY-012921; Symbol: **ER_IB_MSG_1096**; SQLSTATE: HY000
  
  Message: Deleting %llu new independent undo tablespaces that we just created.

**ER_IB_MSG_1096** was added in 8.0.11.

- Error number: MY-012922; Symbol: **ER_IB_MSG_1097**; SQLSTATE: HY000
  
  Message: Waiting for purge to start

**ER_IB_MSG_1097** was added in 8.0.11.

- Error number: MY-012923; Symbol: **ER_IB_MSG_1098**; SQLSTATE: HY000
  
  Message: Creating shared tablespace for temporary tables

**ER_IB_MSG_1098** was added in 8.0.11.

- Error number: MY-012924; Symbol: **ER_IB_MSG_1099**; SQLSTATE: HY000
  
  Message: The %s data file must be writable!

**ER_IB_MSG_1099** was added in 8.0.11.

- Error number: MY-012925; Symbol: **ER_IB_MSG_1100**; SQLSTATE: HY000
  
  Message: Could not create the shared %s.

**ER_IB_MSG_1100** was added in 8.0.11.

- Error number: MY-012926; Symbol: **ER_IB_MSG_1101**; SQLSTATE: HY000
  
  Message: Unable to create the shared %s.

**ER_IB_MSG_1101** was added in 8.0.11.

- Error number: MY-012927; Symbol: **ER_IB_MSG_1102**; SQLSTATE: HY000
  
  Message: The %s data file cannot be re-opened after check_file_spec() succeeded!

**ER_IB_MSG_1102** was added in 8.0.11.

- Error number: MY-012928; Symbol: **ER_IB_MSG_1103**; SQLSTATE: HY000
  
  Message: %d threads created by InnoDB had not exited at shutdown!

**ER_IB_MSG_1103** was added in 8.0.11.

- Error number: MY-012929; Symbol: **ER_IB_MSG_1104**; SQLSTATE: HY000
Message: InnoDB Database creation was aborted %swith error %s. You may need to delete the ibdata1 file before trying to start up again.

ER_IB_MSG_1104 was added in 8.0.11.

- Error number: MY-012930; Symbol: ER_IB_MSG_1105; SQLSTATE: HY000
  Message: Plugin initialization aborted %swith error %s.

ER_IB_MSG_1105 was added in 8.0.11.

- Error number: MY-012931; Symbol: ER_IB_MSG_1106; SQLSTATE: HY000
  Message: Waiting for %llu buffer page I/Os to complete

ER_IB_MSG_1106 was added in 8.0.11.

- Error number: MY-012932; Symbol: ER_IB_MSG_1107; SQLSTATE: HY000
  Message: PUNCH HOLE support available

ER_IB_MSG_1107 was added in 8.0.11.

- Error number: MY-012933; Symbol: ER_IB_MSG_1108; SQLSTATE: HY000
  Message: PUNCH HOLE support not available

ER_IB_MSG_1108 was added in 8.0.11.

- Error number: MY-012934; Symbol: ER_IB_MSG_1109; SQLSTATE: HY000
  Message: Size of InnoDB's ulint is %zu but size of void* is %zu. The sizes should be the same so that on a 64-bit platforms you can allocate more than 4 GB of memory.

ER_IB_MSG_1109 was added in 8.0.11.

- Error number: MY-012935; Symbol: ER_IB_MSG_1110; SQLSTATE: HY000
  Message: Database upgrade cannot be accomplished in read-only mode.

ER_IB_MSG_1110 was added in 8.0.11.

- Error number: MY-012936; Symbol: ER_IB_MSG_1111; SQLSTATE: HY000
  Message: Database upgrade cannot be accomplished with innodb_force_recovery > 0

ER_IB_MSG_1111 was added in 8.0.11.

- Error number: MY-012937; Symbol: ER_IB_MSG_1112; SQLSTATE: HY000
  Message: %s

ER_IB_MSG_1112 was added in 8.0.11.

- Error number: MY-012938; Symbol: ER_IB_MSG_1113; SQLSTATE: HY000
  Message: %s

ER_IB_MSG_1113 was added in 8.0.11.
• Error number: MY-012939; Symbol: ER_IB_MSG_1114; SQLSTATE: HY000
  Message: %s
  ER_IB_MSG_1114 was added in 8.0.11.

• Error number: MY-012940; Symbol: ER_IB_MSG_1115; SQLSTATE: HY000
  Message: %s
  ER_IB_MSG_1115 was added in 8.0.11.

• Error number: MY-012941; Symbol: ER_IB_MSG_1116; SQLSTATE: HY000
  Message: %s
  ER_IB_MSG_1116 was added in 8.0.11.

  ER_IB_MSG_1126 was added in 8.0.11.

• Error number: MY-012952; Symbol: ER_IB_MSG_1127; SQLSTATE: HY000
  Message: Unable to create monitor file %s: %s
  ER_IB_MSG_1127 was added in 8.0.11.

• Error number: MY-012953; Symbol: ER_IB_MSG_1128; SQLSTATE: HY000
  Message: Disabling background log and ibuf IO write threads.
  ER_IB_MSG_1128 was added in 8.0.11.

• Error number: MY-012954; Symbol: ER_IB_MSG_1129; SQLSTATE: HY000
  Message: Cannot initialize AIO sub-system
  ER_IB_MSG_1129 was added in 8.0.11.

• Error number: MY-012955; Symbol: ER_IB_MSG_1130; SQLSTATE: HY000
  Message: Initializing buffer pool, total size = %lf%c, instances = %lu, chunk size =%lf%c
  ER_IB_MSG_1130 was added in 8.0.11.

• Error number: MY-012956; Symbol: ER_IB_MSG_1131; SQLSTATE: HY000
  Message: Cannot allocate memory for the buffer pool
  ER_IB_MSG_1131 was added in 8.0.11.

• Error number: MY-012957; Symbol: ER_IB_MSG_1132; SQLSTATE: HY000
  Message: Completed initialization of buffer pool
  ER_IB_MSG_1132 was added in 8.0.11.

• Error number: MY-012958; Symbol: ER_IB_MSG_1133; SQLSTATE: HY000
  Message: Small buffer pool size (%lluM), the flst_validate() debug function can cause a deadlock if the buffer pool fills up.
Server Error Message Reference

ER_IB_MSG_1133 was added in 8.0.11.

- Error number: MY-012959; Symbol: ER_IB_MSG_1134; SQLSTATE: HY000
  
  Message: Could not open or create the system tablespace. If you tried to add new data files to the system tablespace, and it failed here, you should now edit innodb_data_file_path in my.cnf back to what it was, and remove the new ibdata files InnoDB created in this failed attempt. InnoDB only wrote those files full of zeros, but did not yet use them in any way. But be careful: do not remove old data files which contain your precious data!

ER_IB_MSG_1134 was added in 8.0.11.

- Error number: MY-012960; Symbol: ER_IB_MSG_1135; SQLSTATE: HY000
  
  Message: Cannot create log files because data files are corrupt or the database was not shut down cleanly after creating the data files.

ER_IB_MSG_1135 was added in 8.0.11.

- Error number: MY-012961; Symbol: ER_IB_MSG_1136; SQLSTATE: HY000
  
  Message: Only one log file found

ER_IB_MSG_1136 was added in 8.0.11.

- Error number: MY-012962; Symbol: ER_IB_MSG_1137; SQLSTATE: HY000
  
  Message: Log file %s size %llu is not a multiple of innodb_page_size

ER_IB_MSG_1137 was added in 8.0.11.

- Error number: MY-012963; Symbol: ER_IB_MSG_1138; SQLSTATE: HY000
  
  Message: Log file %s is of different size %llu bytes than other log files %llu bytes!

ER_IB_MSG_1138 was added in 8.0.11.

- Error number: MY-012964; Symbol: ER_IB_MSG_1139; SQLSTATE: HY000
  
  Message: Use --innodb-directories to find the tablespace files. If that fails then use --innodb-force-recovery=1 to ignore this and to permanently lose all changes to the missing tablespace(s)

ER_IB_MSG_1139 was added in 8.0.11.

- Error number: MY-012965; Symbol: ER_IB_MSG_1140; SQLSTATE: HY000
  
  Message: The log file may have been corrupt and it is possible that the log scan or parsing did not proceed far enough in recovery. Please run CHECK TABLE on your InnoDB tables to check that they are ok! It may be safest to recover your InnoDB database from a backup!

ER_IB_MSG_1140 was added in 8.0.11.

- Error number: MY-012966; Symbol: ER_IB_MSG_1141; SQLSTATE: HY000
  
  Message: Cannot resize log files in read-only mode.

ER_IB_MSG_1141 was added in 8.0.11.
• Error number: MY-012967; Symbol: ER_IB_MSG_1142; SQLSTATE: HY000
Message: Cannot open DD tablespace.
ER_IB_MSG_1142 was added in 8.0.11.

• Error number: MY-012968; Symbol: ER_IB_MSG_1143; SQLSTATE: HY000
Message: Starting to delete and rewrite log files.
ER_IB_MSG_1143 was added in 8.0.11.

• Error number: MY-012969; Symbol: ER_IB_MSG_1144; SQLSTATE: HY000
Message: Undo from 5.7 found. It will be purged
ER_IB_MSG_1144 was added in 8.0.11.

• Error number: MY-012970; Symbol: ER_IB_MSG_1145; SQLSTATE: HY000
Message: %s
ER_IB_MSG_1145 was added in 8.0.11.

• Error number: MY-012971; Symbol: ER_IB_MSG_1146; SQLSTATE: HY000
Message: %s
ER_IB_MSG_1146 was added in 8.0.11.

• Error number: MY-012972; Symbol: ER_IB_MSG_1147; SQLSTATE: HY000
Message: Tablespace size stored in header is %lu pages, but the sum of data file sizes is %lu pages
ER_IB_MSG_1147 was added in 8.0.11.

• Error number: MY-012973; Symbol: ER_IB_MSG_1148; SQLSTATE: HY000
Message: Cannot start InnoDB. The tail of the system tablespace is missing. Have you edited
innodb_data_file_path in my.cnf in an inappropriate way, removing ibdata files from there? You can
set innodb_force_recovery=1 in my.cnf to force a startup if you are trying to recover a badly corrupt
database.
ER_IB_MSG_1148 was added in 8.0.11.

• Error number: MY-012974; Symbol: ER_IB_MSG_1149; SQLSTATE: HY000
Message: Tablespace size stored in header is %lu pages, but the sum of data file sizes is only %lu pages
ER_IB_MSG_1149 was added in 8.0.11.

• Error number: MY-012975; Symbol: ER_IB_MSG_1150; SQLSTATE: HY000
Message: Cannot start InnoDB. The tail of the system tablespace is missing. Have you edited
innodb_data_file_path in my.cnf in an InnoDB: inappropriate way, removing ibdata files from there? You
can set innodb_force_recovery=1 in my.cnf to force InnoDB: a startup if you are trying to recover a badly
corrupt database.
ER_IB_MSG_1150 was added in 8.0.11.

- Error number: MY-012976; Symbol: ER_IB_MSG_1151; SQLSTATE: HY000
  Message: %s started; log sequence number %llu

ER_IB_MSG_1151 was added in 8.0.11.

- Error number: MY-012977; Symbol: ER_IB_MSG_1152; SQLSTATE: HY000
  Message: Waiting for purge to complete

ER_IB_MSG_1152 was added in 8.0.11.

- Error number: MY-012978; Symbol: ER_IB_MSG_1153; SQLSTATE: HY000
  Message: Waiting for dict_stats_thread to exit

ER_IB_MSG_1153 was added in 8.0.11.

- Error number: MY-012979; Symbol: ER_IB_MSG_1154; SQLSTATE: HY000
  Message: Query counter shows %llu queries still inside InnoDB at shutdown

ER_IB_MSG_1154 was added in 8.0.11.

- Error number: MY-012980; Symbol: ER_IB_MSG_1155; SQLSTATE: HY000
  Message: Shutdown completed; log sequence number %llu

ER_IB_MSG_1155 was added in 8.0.11.

- Error number: MY-012981; Symbol: ER_IB_MSG_1156; SQLSTATE: HY000
  Message: Cannot continue operation.

ER_IB_MSG_1156 was added in 8.0.11.

- Error number: MY-012982; Symbol: ER_IB_MSG_1157; SQLSTATE: HY000
  Message: %s

ER_IB_MSG_1157 was added in 8.0.11.

- Error number: MY-012983; Symbol: ER_IB_MSG_1158; SQLSTATE: HY000
  Message: %s

ER_IB_MSG_1158 was added in 8.0.11.

Message: Invalid character in the user name.

ER_AUDIT_LOG_USER_NAME_INVALID_CHARACTER was added in 8.0.11.

- Error number: MY-013158; Symbol: ER_AUDIT_LOG_UDF_INSUFFICIENT_PRIVILEGE; SQLSTATE: HY000

Message: Request ignored for '%s'@'%s'. SUPER or AUDIT_ADMIN needed to perform operation

ER_AUDIT_LOG_UDF_INSUFFICIENT_PRIVILEGE was added in 8.0.11.

- Error number: MY-013159; Symbol: ER_AUDIT_LOG_NO_KEYRING_PLUGIN_INSTALLED; SQLSTATE: HY000

Message: No keyring plugin installed.

ER_AUDIT_LOG_NO_KEYRING_PLUGIN_INSTALLED was added in 8.0.11.

- Error number: MY-013160; Symbol: ER_AUDIT_LOG_HOST_NAME_INVALID_CHARACTER; SQLSTATE: HY000

Message: Invalid character in the host name.

ER_AUDIT_LOG_HOST_NAME_INVALID_CHARACTER was added in 8.0.11.
• Error number: MY-013161; Symbol: ER_AUDIT_LOG_ENCRYPTION_PASSWORD_HAS_NOT_BEEN_SET; SQLSTATE: HY000
Message: Audit log encryption password has not been set; it will be generated automatically. Use audit_log_encryption_password_get to obtain the password or audit_log_encryption_password_set to set a new one.

ER_AUDIT_LOG_ENCRYPTION_PASSWORD_HAS_NOT_BEEN_SET was added in 8.0.11.

• Error number: MY-013162; Symbol: ER_AUDIT_LOG_COULD_NOT_CREATE_AES_KEY; SQLSTATE: HY000
Message: Could not create AES key. OpenSSL's EVP_BytesToKey function failed.

ER_AUDIT_LOG_COULD_NOT_CREATE_AES_KEY was added in 8.0.11.

• Error number: MY-013163; Symbol: ER_AUDIT_LOG_ENCRYPTION_PASSWORD_CANNOT_BE_FETCHED; SQLSTATE: HY000
Message: Audit log encryption password cannot be fetched from the keyring. Password used so far is used for encryption.

ER_AUDIT_LOG_ENCRYPTION_PASSWORD_CANNOT_BE_FETCHED was added in 8.0.11.

• Error number: MY-013164; Symbol: ER_COULD_NOT_REINITIALIZE_AUDIT_LOG_FILTERS; SQLSTATE: HY000
Message: Could not reinitialize audit log filters.

ER_COULD_NOT_REINITIALIZE_AUDIT_LOG_FILTERS was added in 8.0.11.

• Error number: MY-013165; Symbol: ER_AUDIT_LOG_JSON_USER_NAME_CANNOT_BE_EMPTY; SQLSTATE: HY000
Message: User cannot be empty.

ER_AUDIT_LOG_JSON_USER_NAME_CANNOT_BE_EMPTY was added in 8.0.11.

• Error number: MY-013166; Symbol: ER_AUDIT_LOG_USER_FIRST_CHARACTER_MUST_BE_ALPHANUMERIC; SQLSTATE: HY000
Message: First character of the user name must be alphanumeric.

ER_AUDIT_LOG_USER_FIRST_CHARACTER_MUST_BE_ALPHANUMERIC was added in 8.0.11.

• Error number: MY-013167; Symbol: ER_AUDIT_LOG_JSON_FILTER_DOES_NOT_EXIST; SQLSTATE: HY000
Message: Specified filter has not been found.

ER_AUDIT_LOG_JSON_FILTER_DOES_NOT_EXIST was added in 8.0.11.

• Error number: MY-013168; Symbol: ER_IB_MSG_1271; SQLSTATE: HY000
Message: Cannot upgrade server earlier than 5.7 to 8.0

ER_IB_MSG_1271 was added in 8.0.11.

• Error number: MY-013169; Symbol: ER_STARTING_INIT; SQLSTATE: HY000
Message: %s (mysqld %s) initializing of server in progress as process %lu

ER_STARTING_INIT was added in 8.0.11.

• Error number: MY-013170; Symbol: ER_ENDING_INIT; SQLSTATE: HY000
Message: %s (mysqld %s) initializing of server has completed

ER_ENDING_INIT was added in 8.0.11.

• Error number: MY-013171; Symbol: ER_IB_MSG_1272; SQLSTATE: HY000
Message: Cannot boot server version %lu on data directory built by version %llu. Downgrade is not supported

ER_IB_MSG_1272 was added in 8.0.11.

• Error number: MY-013172; Symbol: ER_SERVER_SHUTDOWN_INFO; SQLSTATE: HY000
Message: Received SHUTDOWN from user %s. Shutting down mysqld (Version: %s).

ER_SERVER_SHUTDOWN_INFO was added in 8.0.12.

• Error number: MY-013173; Symbol: ER_GRP_RPL_PLUGIN_ABORT; SQLSTATE: HY000
Message: The plugin encountered a critical error and will abort: %s

ER_GRP_RPL_PLUGIN_ABORT was added in 8.0.12.

• Error number: MY-013177; Symbol: ER_AUDIT_LOG_TABLE_DEFINITION_NOT_UPGRADED; SQLSTATE: HY000
Message: '%s.%s' table definition has not been upgraded; Please perform the MySQL upgrade procedure.

ER_AUDIT_LOG_TABLE_DEFINITION_NOT_UPGRADED was added in 8.0.12.

• Error number: MY-013178; Symbol: ER_DD_INITIALIZE_SQL_ERROR; SQLSTATE: HY000
Message: Execution of server-side SQL statement '%s' failed with error code = %d, error message = '%s'.

ER_DD_INITIALIZE_SQL_ERROR was added in 8.0.12.

• Error number: MY-013179; Symbol: ER_NO_PATH_FOR_SHARED_LIBRARY; SQLSTATE: HY000
Message: No paths allowed for shared library.

ER_NO_PATH_FOR_SHARED_LIBRARY was added in 8.0.13.

• Error number: MY-013180; Symbol: ER_UDF_ALREADY_EXISTS; SQLSTATE: HY000
Message: Function '%s' already exists.

ER_UDF_ALREADY_EXISTS was added in 8.0.13.

• Error number: MY-013181; Symbol: ER_SET_EVENT_FAILED; SQLSTATE: HY000
Message: Got Error: %ld from SetEvent.
**ER_SET_EVENT_FAILED** was added in 8.0.13.

- **Error number:** MY-013182; **Symbol:** ER_FAILED_TO_ALLOCATE_SSL_BIO; **SQLSTATE:** HY000
  Message: Error allocating SSL BIO.

  **ER_FAILED_TO_ALLOCATE_SSL_BIO** was added in 8.0.13.

- **Error number:** MY-013183; **Symbol:** ER_IB_MSG_1273; **SQLSTATE:** HY000
  Message: %s

  **ER_IB_MSG_1273** was added in 8.0.13.

- **Error number:** MY-013184; **Symbol:** ER_PID_FILEPATH_LOCATIONS_INACCESSIBLE; **SQLSTATE:** HY000
  Message: One or several locations were inaccessible while checking PID filepath.

  **ER_PID_FILEPATH_LOCATIONS_INACCESSIBLE** was added in 8.0.13.

- **Error number:** MY-013185; **Symbol:** ER_UNKNOWN_VARIABLE_IN_PERSISTED_CONFIG_FILE; **SQLSTATE:** HY000
  Message: Currently unknown variable '%s' was read from the persisted config file.

  **ER_UNKNOWN_VARIABLE_IN_PERSISTED_CONFIG_FILE** was added in 8.0.13.

- **Error number:** MY-013186; **Symbol:** ER_FAILED_TO_HANDLE_DEFAULTS_FILE; **SQLSTATE:** HY000
  Message: Fatal error in defaults handling. Program aborted!

  **ER_FAILED_TO_HANDLE_DEFAULTS_FILE** was added in 8.0.13.

- **Error number:** MY-013187; **Symbol:** ER_DUPLICATE_SYS_VAR; **SQLSTATE:** HY000
  Message: Duplicate variable name '%s'.

  **ER_DUPLICATE_SYS_VAR** was added in 8.0.13.

- **Error number:** MY-013188; **Symbol:** ER_FAILED_TO_INIT_SYS_VAR; **SQLSTATE:** HY000
  Message: Failed to initialize system variables.

  **ER_FAILED_TO_INIT_SYS_VAR** was added in 8.0.13.

- **Error number:** MY-013189; **Symbol:** ER_SYS_VAR_NOT_FOUND; **SQLSTATE:** HY000
  Message: Variable name '%s' not found.

  **ER_SYS_VAR_NOT_FOUND** was added in 8.0.13.

- **Error number:** MY-013190; **Symbol:** ER_IB_MSG_1274; **SQLSTATE:** HY000
  Message: Some (%d) threads are still active

  **ER_IB_MSG_1274** was added in 8.0.13.

- **Error number:** MY-013191; **Symbol:** ER_IB_MSG_1275; **SQLSTATE:** HY000
Message: %s

**ER_IB_MSG_1275** was added in 8.0.13.

- **Error number:** MY-013192; **Symbol:** ER_TARGET_TS_UNENCRYPTED; **SQLSTATE:** HY000
  
  Message: Source tablespace is encrypted but target tablespace is not.

  **ER_TARGET_TS_UNENCRYPTED** was added in 8.0.13, removed after 8.0.15.

- **Error number:** MY-013193; **Symbol:** ER_IB_MSG_1276; **SQLSTATE:** HY000
  
  Message: %s

  **ER_IB_MSG_1276** was added in 8.0.13, removed after 8.0.13.

- **Error number:** MY-013193; **Symbol:** ER_IB_MSG_WAIT_FOR_ENCRYPT_THREAD; **SQLSTATE:** HY000
  
  Message: Waiting for tablespace_alter_encrypt_thread to exit

  **ER_IB_MSG_WAIT_FOR_ENCRYPT_THREAD** was added in 8.0.14.

- **Error number:** MY-013194; **Symbol:** ER_IB_MSG_1277; **SQLSTATE:** HY000
  
  Message: %s

  **ER_IB_MSG_1277** was added in 8.0.13.

- **Error number:** MY-013195; **Symbol:** ER_IB_MSG_1278; **SQLSTATE:** HY000
  
  Message: %s

  **ER_IB_MSG_1278** was added in 8.0.13, removed after 8.0.13.

- **Error number:** MY-013195; **Symbol:** ER_IB_MSG_NO_ENCRYPT_PROGRESS_FOUND; **SQLSTATE:** HY000
  
  Message: %s

  **ER_IB_MSG_NO_ENCRYPT_PROGRESS_FOUND** was added in 8.0.14.

- **Error number:** MY-013196; **Symbol:** ER_IB_MSG_1279; **SQLSTATE:** HY000
  
  Message: %s

  **ER_IB_MSG_1279** was added in 8.0.13, removed after 8.0.13.

- **Error number:** MY-013196; **Symbol:** ER_IB_MSG_RESUME_OP_FOR_SPACE; **SQLSTATE:** HY000
  
  Message: %s

  **ER_IB_MSG_RESUME_OP_FOR_SPACE** was added in 8.0.14.

- **Error number:** MY-013197; **Symbol:** ER_IB_MSG_1280; **SQLSTATE:** HY000
  
  Message: %s

  **ER_IB_MSG_1280** was added in 8.0.13.
Server Error Message Reference

- Error number: MY-013198; Symbol: ER_IB_MSG_1281; SQLSTATE: HY000
  Message: %s
  ER_IB_MSG_1281 was added in 8.0.13.

- Error number: MY-013199; Symbol: ER_IB_MSG_1282; SQLSTATE: HY000
  Message: %s
  ER_IB_MSG_1282 was added in 8.0.13.

- Error number: MY-013200; Symbol: ER_IB_MSG_1283; SQLSTATE: HY000
  Message: %s
  ER_IB_MSG_1283 was added in 8.0.13.

- Error number: MY-013201; Symbol: ER_IB_MSG_1284; SQLSTATE: HY000
  Message: %s
  ER_IB_MSG_1284 was added in 8.0.13.

- Error number: MY-013202; Symbol: ER_CANT_SET_ERROR_SUPPRESSION_LIST_FROM_COMMAND_LINE; SQLSTATE: HY000
  Message: %s: Could not add suppression rule for code "%%s". Rule-set may be full, or code may not correspond to an error-log message.
  ER_CANT_SET_ERROR_SUPPRESSION_LIST_FROM_COMMAND_LINE was added in 8.0.13.

- Error number: MY-013203; Symbol: ER_INVALID_VALUE_OF_BIND_ADDRESSES; SQLSTATE: HY000
  Message: Invalid value for command line option bind-addresses: "%%s"
  ER_INVALID_VALUE_OF_BIND_ADDRESSES was added in 8.0.13.

- Error number: MY-013204; Symbol: ER_RELAY_LOG_SPACE_LIMIT_DISABLED; SQLSTATE: HY000
  Message: Ignoring the @@global.relay_log_space_limit option because @@global.relay_log_purge is disabled.
  ER_RELAY_LOG_SPACE_LIMIT_DISABLED was added in 8.0.13.

- Error number: MY-013205; Symbol: ER_GRP_RPL_ERROR_GTID_SET_EXTRACTION; SQLSTATE: HY000
  Message: Error when extracting GTID execution information: %s
  ER_GRP_RPL_ERROR_GTID_SET_EXTRACTION was added in 8.0.13.

- Error number: MY-013206; Symbol: ER_GRP_RPL_MISSING_GRP_RPL_ACTION_COORDINATOR; SQLSTATE: HY000
  Message: Message received without a proper group coordinator module.
  ER_GRP_RPL_MISSING_GRP_RPL_ACTION_COORDINATOR was added in 8.0.13.
• Error number: MY-013207; Symbol: ER_GRP_RPL_JOIN_WHEN_GROUP_ACTION_RUNNING; SQLSTATE: HY000

Message: A member cannot join the group while a group configuration operation is running.

ER_GRP_RPL_JOIN_WHEN_GROUP_ACTION_RUNNING was added in 8.0.13.

• Error number: MY-013208; Symbol: ER_GRP_RPL_JOINER_EXIT_WHEN_GROUP_ACTION_RUNNING; SQLSTATE: HY000

Message: A member is joining the group while a group configuration operation is occurring. The member will now leave the group.

ER_GRP_RPL_JOINER_EXIT_WHEN_GROUP_ACTION_RUNNING was added in 8.0.13.

• Error number: MY-013209; Symbol: ER_GRP_RPL_CHANNEL_THREAD_WHEN_GROUP_ACTION_RUNNING; SQLSTATE: HY000

Message: Can't start slave %s when group replication is running a group configuration operation.

ER_GRP_RPL_CHANNEL_THREAD_WHEN_GROUP_ACTION_RUNNING was added in 8.0.13.

• Error number: MY-013210; Symbol: ER_GRP_RPL_APPOINTED_PRIMARY_NOT_PRESENT; SQLSTATE: HY000

Message: A primary election was invoked but the requested primary member is not in the group. Request ignored.

ER_GRP_RPL_APPOINTED_PRIMARY_NOT_PRESENT was added in 8.0.13.

• Error number: MY-013211; Symbol: ER_GRP_RPL_ERROR_ON_MESSAGE_SENDING; SQLSTATE: HY000

Message: Error while sending message. Context: %s

ER_GRP_RPL_ERROR_ON_MESSAGE_SENDING was added in 8.0.13.

• Error number: MY-013212; Symbol: ER_GRP_RPL_CONFIGURATION_ACTION_ERROR; SQLSTATE: HY000

Message: Error while executing a group configuration operation: %s

ER_GRP_RPL_CONFIGURATION_ACTION_ERROR was added in 8.0.13.

• Error number: MY-013213; Symbol: ER_GRP_RPL_CONFIGURATION_ACTION_LOCAL_TERMINATION; SQLSTATE: HY000

Message: Configuration operation "%s" terminated. %s

ER_GRP_RPL_CONFIGURATION_ACTION_LOCAL_TERMINATION was added in 8.0.13.

• Error number: MY-013214; Symbol: ER_GRP_RPL_CONFIGURATION_ACTION_START; SQLSTATE: HY000

Message: Starting group operation local execution: %s

ER_GRP_RPL_CONFIGURATION_ACTION_START was added in 8.0.13.
• Error number: MY-013215; Symbol: ER_GRP_RPL_CONFIGURATION_ACTION_END; SQLSTATE: HY000
Message: Termination of group operation local execution: %s
ER_GRP_RPL_CONFIGURATION_ACTION_END was added in 8.0.13.

• Error number: MY-013216; Symbol: ER_GRP_RPL_CONFIGURATION_ACTION_KILLED_ERROR; SQLSTATE: HY000
Message: A configuration change was killed in this member. The member will now leave the group as its configuration may have diverged.
ER_GRP_RPL_CONFIGURATION_ACTION_KILLED_ERROR was added in 8.0.13.

• Error number: MY-013217; Symbol: ER_GRP_RPL_PRIMARY_ELECTION_PROCESS_ERROR; SQLSTATE: HY000
Message: There was an issue on the primary election process: %s The member will now leave the group.
ER_GRP_RPL_PRIMARY_ELECTION_PROCESS_ERROR was added in 8.0.13.

• Error number: MY-013218; Symbol: ER_GRP_RPL_PRIMARY_ELECTION_STOP_ERROR; SQLSTATE: HY000
Message: There was an issue when stopping a previous election process: %s
ER_GRP_RPL_PRIMARY_ELECTION_STOP_ERROR was added in 8.0.13.

• Error number: MY-013219; Symbol: ER_GRP_RPL_NO_STAGE_SERVICE; SQLSTATE: HY000
Message: It was not possible to initialize stage logging for this task. The operation will still run without stage tracking.
ER_GRP_RPL_NO_STAGE_SERVICE was added in 8.0.13.

• Error number: MY-013220; Symbol: ER_GRP_RPL_UDF_REGISTER_ERROR; SQLSTATE: HY000
Message: Could not execute the installation of Group Replication UDF function: %s. Check if the function is already present, if so, try to remove it
ER_GRP_RPL_UDF_REGISTER_ERROR was added in 8.0.13.

• Error number: MY-013221; Symbol: ER_GRP_RPL_UDF_UNREGISTER_ERROR; SQLSTATE: HY000
Message: Could not uninstall Group Replication UDF functions. Try to remove them manually if present.
ER_GRP_RPL_UDF_UNREGISTER_ERROR was added in 8.0.13.

• Error number: MY-013222; Symbol: ER_GRP_RPL_UDF_REGISTER_SERVICE_ERROR; SQLSTATE: HY000
Message: Could not execute the installation of Group Replication UDF functions. Check for other errors in the log and try to reinstall the plugin
ER_GRP_RPL_UDF_REGISTER_SERVICE_ERROR was added in 8.0.13.

• Error number: MY-013223; Symbol: ER_GRP_RPL_SERVER_UDF_ERROR; SQLSTATE: HY000
Message: The function '%s' failed. %s

ER_GRP_RPL_SERVER_UDF_ERROR was added in 8.0.17.

- Error number: MY-013227; Symbol: ER_SERVER_WRONG_VALUE_FOR_VAR; SQLSTATE: HY000
Message: Variable '%s' can't be set to the value of '%s'

ER_SERVER_WRONG_VALUE_FOR_VAR was added in 8.0.13.

- Error number: MY-013228; Symbol: ER_COULD_NOT_CREATE_WINDOWS_REGISTRY_KEY; SQLSTATE: HY000
Message: %s was unable to create a new Windows registry key %s for %s; continuing to use the previous ident.

ER_COULD_NOT_CREATE_WINDOWS_REGISTRY_KEY was added in 8.0.13.

- Error number: MY-013229; Symbol:
ER_SERVER_GTID_UNSAFE_CREATE_DROP_TEMP_TABLE_IN_TRX_IN_SBR; SQLSTATE: HY000
Message: Statement violates GTID consistency: CREATE TEMPORARY TABLE and DROP TEMPORARY TABLE are not allowed inside a transaction or inside a procedure in a transactional context when @@session.binlog_format=STATEMENT.

ER_SERVER_GTID_UNSAFE_CREATE_DROP_TEMP_TABLE_IN_TRX_IN_SBR was added in 8.0.13.

- Error number: MY-013233; Symbol:
ER_XPLUGIN_FAILED_TO_SWITCH_SECURITY_CTX; SQLSTATE: HY000
Message: Unable to switch security context to user: %s

ER_XPLUGIN_FAILED_TO_SWITCH_SECURITY_CTX was added in 8.0.13.

- Error number: MY-013234; Symbol:
ER_RPL_GTID_UNSAFE_ALTER_ADD_COL_WITH_DEFAULT_EXPRESSION; SQLSTATE: HY000
Message: Statement violates GTID consistency: ALTER TABLE ... ADD COLUMN .. with expression as DEFAULT.

ER_RPL_GTID_UNSAFE_ALTER_ADD_COL_WITH_DEFAULT_EXPRESSION was added in 8.0.13.

- Error number: MY-013235; Symbol: ER_UPGRADE_PARSE_ERROR; SQLSTATE: HY000
Message: Error in parsing '%s' '%s'.'%s' during upgrade. %s

ER_UPGRADE_PARSE_ERROR was added in 8.0.13.

- Error number: MY-013236; Symbol: ER_DATA_DIRECTORY_UNUSABLE; SQLSTATE: HY000
Message: The designated data directory %s is unusable. You can remove all files that the server added to it.

ER_DATA_DIRECTORY_UNUSABLE was added in 8.0.13.

- Error number: MY-013237; Symbol: ER_LDAP_AUTH_USER_GROUP_SEARCH_ROOT_BIND; SQLSTATE: HY000
Message: Group search rebinding via root DN: %s

ER_LDAP_AUTH_USER_GROUP_SEARCH_ROOT_BIND was added in 8.0.13.

•   Error number: MY-013238; Symbol: ER_PLUGIN_INSTALL_ERROR; SQLSTATE: HY000
Message: Error installing plugin '%s': %s

ER_PLUGIN_INSTALL_ERROR was added in 8.0.13.

•   Error number: MY-013239; Symbol: ER_PLUGIN_UNINSTALL_ERROR; SQLSTATE: HY000
Message: Error uninstalled plugin '%s': %s

ER_PLUGIN_UNINSTALL_ERROR was added in 8.0.13.

•   Error number: MY-013240; Symbol: ER_SHARED_TABLESPACE_USED_BY_PARTITIONED_TABLE; SQLSTATE: HY000
Message: Partitioned table '%s' is not allowed to use shared tablespace '%s'. Please move all partitions
to file-per-table tablespaces before upgrade.

ER_SHARED_TABLESPACE_USED_BY_PARTITIONED_TABLE was added in 8.0.13.

•   Error number: MY-013241; Symbol: ER_UNKNOWN_TABLESPACE_TYPE; SQLSTATE: HY000
Message: Cannot determine the type of the tablespace named '%s'.

ER_UNKNOWN_TABLESPACE_TYPE was added in 8.0.13.

•   Error number: MY-013242; Symbol: ER_WARN_DEPRECATED_UTF8_ALIAS_OPTION; SQLSTATE: HY000
Message: %s: 'utf8' is currently an alias for the character set UTF8MB3, but will be an alias for
UTF8MB4 in a future release. Please consider using UTF8MB4 in order to be unambiguous.

ER_WARN_DEPRECATED_UTF8_ALIAS_OPTION was added in 8.0.13.

•   Error number: MY-013243; Symbol: ER_WARN_DEPRECATED_UTF8MB3_CHARSET_OPTION; SQLSTATE: HY000
Message: %s: The character set UTF8MB3 is deprecated and will be removed in a future release. Please consider using UTF8MB4 instead.

ER_WARN_DEPRECATED_UTF8MB3_CHARSET_OPTION was added in 8.0.13.

•   Error number: MY-013244; Symbol: ER_WARN_DEPRECATED_UTF8MB3_COLLATION_OPTION; SQLSTATE: HY000
Message: %s: '%s' is a collation of the deprecated character set UTF8MB3. Please consider using
UTF8MB4 with an appropriate collation instead.

ER_WARN_DEPRECATED_UTF8MB3_COLLATION_OPTION was added in 8.0.13.

•   Error number: MY-013245; Symbol: ER_SSL_MEMORY_INSTRUMENTATION_INIT_FAILED; SQLSTATE: HY000
Message: The SSL library function %s failed. This is typically caused by the SSL library already being used. As a result the SSL memory allocation will not be instrumented.

`ER_SSL_MEMORY_INSTRUMENTATION_INIT_FAILED` was added in 8.0.13.

- Error number: MY-013246; Symbol: `ER_IB_MSG_MADV_DONTDUMP_UNSUPPORTED`; SQLSTATE: HY000

Message: Disabling @@core_file because @@innodb_buffer_pool_in_core_file is disabled, yet MADV_DONTDUMP is not supported on this platform

`ER_IB_MSG_MADV_DONTDUMP_UNSUPPORTED` was added in 8.0.14.

- Error number: MY-013247; Symbol: `ER_IB_MSG_MADVISE_FAILED`; SQLSTATE: HY000

Message: Disabling @@core_file because @@innodb_buffer_pool_in_core_file is disabled, yet madvise(%p,%zu,%s) failed with %s

`ER_IB_MSG_MADVISE_FAILED` was added in 8.0.14.

- Error number: MY-013249; Symbol: `ER_WARN_REMOVED_SQL_MODE`; SQLSTATE: HY000

Message: sql_mode=0x%08x has been removed and will be ignored

`ER_WARN_REMOVED_SQL_MODE` was added in 8.0.14.

- Error number: MY-013250; Symbol: `ER_IB_MSG_FAILED_TO_ALLOCATE_WAIT`; SQLSTATE: HY000

Message: Failed to allocate memory for a pool of size %zu bytes. Will wait for %zu seconds for a thread to free a resource.

`ER_IB_MSG_FAILED_TO_ALLOCATE_WAIT` was added in 8.0.14.

- Error number: MY-013251; Symbol: `ER_IB_MSG_NUM_POOLS`; SQLSTATE: HY000

Message: Number of pools: %zu

`ER_IB_MSG_NUM_POOLS` was added in 8.0.14.

- Error number: MY-013252; Symbol: `ER_IB_MSG_USING_UNDO_SPACE`; SQLSTATE: HY000

Message: Using undo tablespace '%%s'.

`ER_IB_MSG_USING_UNDO_SPACE` was added in 8.0.14.

- Error number: MY-013253; Symbol: `ER_IB_MSG_FAIL_TO_SAVE_SPACE_STATE`; SQLSTATE: HY000

Message: %%s Unable to save the current state of tablespace '%%s' to the data dictionary

`ER_IB_MSG_FAIL_TO_SAVE_SPACE_STATE` was added in 8.0.14.

- Error number: MY-013254; Symbol: `ER_IB_MSG_MAX_UNDO_SPACES_REACHED`; SQLSTATE: HY000

Message: Cannot create undo tablespace %s at %s because %d undo tablespaces already exist.

`ER_IB_MSG_MAX_UNDO_SPACES_REACHED` was added in 8.0.14.
• Error number: **MY-013255**; Symbol: `ER_IB_MSG_ERROR_OPENING_NEW_UNDO_SPACE`; SQLSTATE: `HY000`  
  Message: Error %d opening newly created undo tablespace %s.
  `ER_IB_MSG_ERROR_OPENING_NEW_UNDO_SPACE` was added in 8.0.14.

• Error number: **MY-013256**; Symbol: `ER_IB_MSG_FAILED_SDI_Z_BUF_ERROR`; SQLSTATE: `HY000`  
  Message: SDI Compression failed, Z_BUF_ERROR
  `ER_IB_MSG_FAILED_SDI_Z_BUF_ERROR` was added in 8.0.14.

• Error number: **MY-013257**; Symbol: `ER_IB_MSG_FAILED_SDI_Z_MEM_ERROR`; SQLSTATE: `HY000`  
  Message: SDI Compression failed, Z_MEM_ERROR
  `ER_IB_MSG_FAILED_SDI_Z_MEM_ERROR` was added in 8.0.14.

• Error number: **MY-013258**; Symbol: `ER_IB_MSG_SDI_Z_STREAM_ERROR`; SQLSTATE: `HY000`  
  Message: SDI Compression failed, Z_STREAM_ERROR
  `ER_IB_MSG_SDI_Z_STREAM_ERROR` was added in 8.0.14.

• Error number: **MY-013259**; Symbol: `ER_IB_MSG_SDI_Z_UNKNOWN_ERROR`; SQLSTATE: `HY000`  
  Message: %s
  `ER_IB_MSG_SDI_Z_UNKNOWN_ERROR` was added in 8.0.14.

• Error number: **MY-013260**; Symbol: `ER_IB_MSG_FOUND_WRONG_UNDO_SPACE`; SQLSTATE: `HY000`  
  Message: Expected to find undo tablespace '%s' for Space ID=%lu, but found '%s' instead! Did you change innodb_undo_directory?
  `ER_IB_MSG_FOUND_WRONG_UNDO_SPACE` was added in 8.0.14.

• Error number: **MY-013261**; Symbol: `ER_IB_MSG_NOT_END_WITH_IBU`; SQLSTATE: `HY000`  
  Message: Cannot use %s as an undo tablespace because it does not end with '.ibu'.
  `ER_IB_MSG_NOT_END_WITH_IBU` was added in 8.0.14.

• Error number: **MY-013262**; Symbol: `ER_IB_MSG_UNDO_TRUNC_EMPTY_FILE`; SQLSTATE: `HY000`  
  Message: ib_undo_trunc_empty_file
  `ER_IB_MSG_UNDO_TRUNC_EMPTY_FILE` was added in 8.0.14.

• Error number: **MY-013263**; Symbol: `ER_IB_MSG_UNDO_TRUNC_BEFOR_DD_UPDATE`; SQLSTATE: `HY000`  
  Message: ib_undo_trunc_before_dd_update
  `ER_IB_MSG_UNDO_TRUNC_BEFOR_DD_UPDATE` was added in 8.0.14.

• Error number: **MY-013264**; Symbol: `ER_IB_MSG_UNDO_TRUNC_BEFORE_UNDO_LOGGING`; SQLSTATE: `HY000`
Message: ib_undo_trunc_before_done_logging

ER_IB_MSG_UNDO_TRUNC_BEFORE_UNDO_LOGGING was added in 8.0.14.

- Error number: MY-013265; Symbol: ER_IB_MSG_UNDO_TRUNC_BEFORE_LOGGING; SQLSTATE: HY000

Message: ib_undo_trunc_before_rsegs

ER_IB_MSG_UNDO_TRUNC_BEFORE_RSEG was added in 8.0.14.

- Error number: MY-013266; Symbol: ER_IB_MSG_FAILED_TO_FINISH_TRUNCATE; SQLSTATE: HY000

Message: %s Failed to finish truncating Undo Tablespace '%s'

ER_IB_MSG_FAILED_TO_FINISH_TRUNCATE was added in 8.0.14.

- Error number: MY-013267; Symbol: ER_IB_MSG_DEPRECATED_INNODB_UNDO_TABLESPACES; SQLSTATE: HY000

Message: The setting INNODB_UNDO_TABLESPACES is deprecated and is no longer used. InnoDB always creates 2 undo tablespaces to start with. If you need more, please use CREATE UNDO TABLESPACE.

ER_IB_MSG_DEPRECATED_INNODB_UNDO_TABLESPACES was added in 8.0.14.

- Error number: MY-013268; Symbol: ER_IB_MSG_DIR_DOES_NOT_EXIST; SQLSTATE: HY000

Message: The directory '%s' does not exist.

ER_IB_MSG_DIR_DOES_NOT_EXIST was added in 8.0.14.

- Error number: MY-013269; Symbol: ER_IB_MSG_LOCK_FREE_HASH_USAGE_STATS; SQLSTATE: HY000

Message: %s

ER_IB_MSG_LOCK_FREE_HASH_USAGE_STATS was added in 8.0.14.

- Error number: MY-013270; Symbol: ER_CLONE_REMOTE_ERROR; SQLSTATE: HY000

Message: Clone Remote Error: %s.

ER_CLONE_REMOTE_ERROR was added in 8.0.14, removed after 8.0.16.

- Error number: MY-013270; Symbol: ER_CLONE_DONOR_TRACE; SQLSTATE: HY000

Message: Clone donor reported : %s.

ER_CLONE_DONOR_TRACE was added in 8.0.17.

- Error number: MY-013271; Symbol: ER_CLONE_PROTOCOL_ERROR; SQLSTATE: HY000

Message: Clone Protocol Error: %s.

ER_CLONE_PROTOCOL_ERROR was added in 8.0.14, removed after 8.0.16.

- Error number: MY-013271; Symbol: ER_CLONE_PROTOCOL_TRACE; SQLSTATE: HY000
Message: Clone received unexpected response from donor : %s.

ER_CLONE_PROTOCOL_TRACE was added in 8.0.17.

• Error number: MY-013272; Symbol: ER_CLONE_INFO_CLIENT; SQLSTATE: HY000
  Message: Client: %s.
  ER_CLONE_INFO_CLIENT was added in 8.0.14, removed after 8.0.16.

• Error number: MY-013272; Symbol: ER_CLONE_CLIENT_TRACE; SQLSTATE: HY000
  Message: Client: %s.
  ER_CLONE_CLIENT_TRACE was added in 8.0.17.

• Error number: MY-013273; Symbol: ER_CLONE_INFO_SERVER; SQLSTATE: HY000
  Message: Server: %s.
  ER_CLONE_INFO_SERVER was added in 8.0.14, removed after 8.0.16.

• Error number: MY-013273; Symbol: ER_CLONE_SERVER_TRACE; SQLSTATE: HY000
  Message: Server: %s.
  ER_CLONE_SERVER_TRACE was added in 8.0.17.

• Error number: MY-013274; Symbol: ER_THREAD_POOL_PFS_TABLES_INIT_FAILED; SQLSTATE: HY000
  Message: Failed to initialize the performance schema tables service.
  ER_THREAD_POOL_PFS_TABLES_INIT_FAILED was added in 8.0.14.

• Error number: MY-013275; Symbol: ER_THREAD_POOL_PFS_TABLES_ADD_FAILED; SQLSTATE: HY000
  Message: Failed to add thread pool performance schema tables.
  ER_THREAD_POOL_PFS_TABLES_ADD_FAILED was added in 8.0.14.

• Error number: MY-013276; Symbol: ER_CANT_SET_DATA_DIR; SQLSTATE: HY000
  Message: Failed to set datadir to '%s' (OS errno: %d - %s)
  ER_CANT_SET_DATA_DIR was added in 8.0.14.

• Error number: MY-013277; Symbol: ER_INNODB_INVALID_INNODB_UNDO_DIRECTORY_LOCATION; SQLSTATE: HY000
  Message: The innodb_undo_directory is not allowed to be an ancestor of the datadir.
  ER_INNODB_INVALID_INNODB_UNDO_DIRECTORY_LOCATION was added in 8.0.14.

• Error number: MY-013278; Symbol: ER_SERVER_RPL_ENCRYPTION_FAILED_TO_FETCH_KEY; SQLSTATE: HY000
  Message: Failed to fetch key from keyring, please check if keyring plugin is loaded.
Server Error Message Reference

**ER_SERVER_RPL_ENCRYPTION_FAILED_TO_FETCH_KEY** was added in 8.0.14.

- **Error number:** MY-013279; **Symbol:** ER_SERVER_RPL_ENCRYPTION_KEY_NOT_FOUND; **SQLSTATE:** HY000
  
  Message: Can't find key from keyring, please check in the server log if a keyring plugin is loaded and initialized successfully.

**ER_SERVER_RPL_ENCRYPTION_KEY_NOT_FOUND** was added in 8.0.14.

- **Error number:** MY-013280; **Symbol:** ER_SERVER_RPL_ENCRYPTION_KEYRING_INVALID_KEY; **SQLSTATE:** HY000
  
  Message: Fetched an invalid key from keyring.

**ER_SERVER_RPL_ENCRYPTION_KEYRING_INVALID_KEY** was added in 8.0.14.

- **Error number:** MY-013281; **Symbol:** ER_SERVER_RPL_ENCRYPTION_HEADER_ERROR; **SQLSTATE:** HY000
  
  Message: Error reading a replication log encryption header: %s.

**ER_SERVER_RPL_ENCRYPTION_HEADER_ERROR** was added in 8.0.14.

- **Error number:** MY-013282; **Symbol:** ER_SERVER_RPL_ENCRYPTION_FAILED_TO_ROTATE_LOGS; **SQLSTATE:** HY000
  
  Message: Failed to rotate some logs after changing binlog encryption settings. Please fix the problem and rotate the logs manually.

**ER_SERVER_RPL_ENCRYPTION_FAILED_TO_ROTATE_LOGS** was added in 8.0.14.

- **Error number:** MY-013283; **Symbol:** ER_SERVER_RPL_ENCRYPTION_KEY_EXISTS_UNEXPECTED; **SQLSTATE:** HY000
  
  Message: Key %s exists unexpected.

**ER_SERVER_RPL_ENCRYPTION_KEY_EXISTS_UNEXPECTED** was added in 8.0.14.

- **Error number:** MY-013284; **Symbol:** ER_SERVER_RPL_ENCRYPTION_FAILED_TO_GENERATE_KEY; **SQLSTATE:** HY000
  
  Message: Failed to generate key, please check if keyring plugin is loaded.

**ER_SERVER_RPL_ENCRYPTION_FAILED_TO_GENERATE_KEY** was added in 8.0.14.

- **Error number:** MY-013285; **Symbol:** ER_SERVER_RPL_ENCRYPTION_FAILED_TO_STORE_KEY; **SQLSTATE:** HY000
  
  Message: Failed to store key, please check if keyring plugin is loaded.

**ER_SERVER_RPL_ENCRYPTION_FAILED_TO_STORE_KEY** was added in 8.0.14.

- **Error number:** MY-013286; **Symbol:** ER_SERVER_RPL_ENCRYPTION_FAILED_TO_REMOVE_KEY; **SQLSTATE:** HY000
  
  Message: Failed to remove key, please check if keyring plugin is loaded.
ER_SERVER_RPL_ENCRYPTION_FAILED_TO_REMOVE_KEY was added in 8.0.14.

- Error number: MY-013287; Symbol: ER_SERVER_RPL_ENCRYPTION_MASTER_KEY_RECOVERY_FAILED; SQLSTATE: HY000
  Message: Unable to recover binlog encryption master key, please check if keyring plugin is loaded.

ER_SERVER_RPL_ENCRYPTION_MASTER_KEY_RECOVERY_FAILED was added in 8.0.14.

- Error number: MY-013288; Symbol: ER_SERVER_RPL_ENCRYPTION_UNABLE_TO_INITIALIZE; SQLSTATE: HY000
  Message: Failed to initialize binlog encryption, please check if keyring plugin is loaded.

ER_SERVER_RPL_ENCRYPTION_UNABLE_TO_INITIALIZE was added in 8.0.14.

- Error number: MY-013289; Symbol: ER_SERVER_RPL_ENCRYPTION_UNABLE_TO_ROTATE_MASTER_KEY_AT_STARTUP; SQLSTATE: HY000
  Message: Failed to rotate binlog encryption master key at startup, please check if keyring plugin is loaded.

ER_SERVER_RPL_ENCRYPTION_UNABLE_TO_ROTATE_MASTER_KEY_AT_STARTUP was added in 8.0.14.

- Error number: MY-013290; Symbol: ER_SERVER_RPL_ENCRYPTION_IGNORE_ROTATE_MASTER_KEY_AT_STARTUP; SQLSTATE: HY000
  Message: Ignoring binlog_rotate_encryption_master_key_at_startup because binlog_encryption option is disabled.

ER_SERVER_RPL_ENCRYPTION_IGNORE_ROTATE_MASTER_KEY_AT_STARTUP was added in 8.0.14.

- Error number: MY-013291; Symbol: ER_INVALID_ADMIN_ADDRESS; SQLSTATE: HY000
  Message: Invalid value for command line option admin-address: '%s'

ER_INVALID_ADMIN_ADDRESS was added in 8.0.14.

- Error number: MY-013292; Symbol: ER_SERVER_STARTUP_ADMIN_INTERFACE; SQLSTATE: HY000
  Message: Admin interface ready for connections, address: '%s' port: %d

ER_SERVER_STARTUP_ADMIN_INTERFACE was added in 8.0.14.

- Error number: MY-013293; Symbol: ER_CANT_CREATE_ADMIN_THREAD; SQLSTATE: HY000
  Message: Can't create thread to handle admin connections (errno= %d)

ER_CANT_CREATE_ADMIN_THREAD was added in 8.0.14.

- Error number: MY-013294; Symbol: ER_WARNING_RETAIN_CURRENT_PASSWORD_CLAUSE_VOID; SQLSTATE: HY000
  Message: RETAIN CURRENT PASSWORD ignored for user '%s'@'%s' as its authentication plugin %s does not support multiple passwords.
**ER_WARNING_RETAIN_CURRENT_PASSWORD_CLAUSE_VOID** was added in 8.0.14.

- **Error number:** MY-013295; **Symbol:** ER_WARNING_DISCARD_OLD_PASSWORD_CLAUSE_VOID; **SQLSTATE:** HY000
  
  Message: DISCARD OLD PASSWORD ignored for user '%s'@'%s' as its authentication plugin %s does not support multiple passwords.

**ER_WARNING_DISCARD_OLD_PASSWORD_CLAUSE_VOID** was added in 8.0.14.

- **Error number:** MY-013299; **Symbol:** ER_WARNING_AUTHCACHE_INVALID_USER_ATTRIBUTES; **SQLSTATE:** HY000
  
  Message: Can not read and process value of User attributes column from mysql.user table for user: '%s'@'%s'; Ignoring user.

**ER_WARNING_AUTHCACHE_INVALID_USER_ATTRIBUTES** was added in 8.0.14.

- **Error number:** MY-013300; **Symbol:** ER_MYSQL_NATIVE_PASSWORD_SECOND_PASSWORD_USED_INFORMATION; **SQLSTATE:** HY000
  
  Message: Second password was used for login by user: '%s'@'%s'.

**ER_MYSQL_NATIVE_PASSWORD_SECOND_PASSWORD_USED_INFORMATION** was added in 8.0.14.

- **Error number:** MY-013301; **Symbol:** ER_SHA256_PASSWORD_SECOND_PASSWORD_USED_INFORMATION; **SQLSTATE:** HY000
  
  Message: Second password was used for login by user: '%s'@'%s'.

**ER_SHA256_PASSWORD_SECOND_PASSWORD_USED_INFORMATION** was added in 8.0.14.

- **Error number:** MY-013302; **Symbol:** ER_CACHING_SHA2_PASSWORD_SECOND_PASSWORD_USED_INFORMATION; **SQLSTATE:** HY000
  
  Message: Second password was used for login by user: '%s'@'%s'.

**ER_CACHING_SHA2_PASSWORD_SECOND_PASSWORD_USED_INFORMATION** was added in 8.0.14.

- **Error number:** MY-013303; **Symbol:** ER_GRP_RPL_SEND_TRX_PREPARED_MESSAGE_FAILED; **SQLSTATE:** HY000
  
  Message: Error sending transaction '%d:%lld' prepared message from session '%u'.

**ER_GRP_RPL_SEND_TRX_PREPARED_MESSAGE_FAILED** was added in 8.0.14.

- **Error number:** MY-013304; **Symbol:** ER_GRP_RPL_RELEASE_COMMIT_AFTER_GROUP_PREPARE_FAILED; **SQLSTATE:** HY000
  
  Message: Error releasing transaction '%d:%lld' for commit on session '%u' after being prepared on all group members.

**ER_GRP_RPL_RELEASE_COMMIT_AFTER_GROUP_PREPARE_FAILED** was added in 8.0.14.

- **Error number:** MY-013305; **Symbol:** ER_GRP_RPL_TRX_ALREADY_EXISTS_ON_TCM_ON_AFTER_CERTIFICATION; **SQLSTATE:** HY000
Message: Transaction '%d:%lld' already exists on Group Replication consistency manager while being registered after conflict detection.

**ER_GRP_RPL_TRX_ALREADY_EXISTS_ON_TCM_ON_AFTER_CERTIFICATION** was added in 8.0.14.

- Error number: **MY-013306**; Symbol: **ER_GRP_RPL_FAILED_TO_INSERT_TRX_ON_TCM_ON_AFTER_CERTIFICATION**; SQLSTATE: **HY000**
  
  Message: Error registering transaction '%d:%lld' on Group Replication consistency manager after conflict detection.

  **ER_GRP_RPL_FAILED_TO_INSERT_TRX_ON_TCM_ON_AFTER_CERTIFICATION** was added in 8.0.14.

- Error number: **MY-013307**; Symbol: **ER_GRP_RPL_REGISTER_TRX_TO_WAIT_FOR_GROUP_PREPARE_FAILED**; SQLSTATE: **HY000**
  
  Message: Error registering transaction '%d:%lld' from session '%u' to wait for being prepared on all group members.

  **ER_GRP_RPL_REGISTER_TRX_TO_WAIT_FOR_GROUP_PREPARE_FAILED** was added in 8.0.14.

- Error number: **MY-013308**; Symbol: **ER_GRP_RPL_TRX_WAIT_FOR_GROUP_PREPARE_FAILED**; SQLSTATE: **HY000**
  
  Message: Error on transaction '%d:%lld' from session '%u' while waiting for being prepared on all group members.

  **ER_GRP_RPL_TRX_WAIT_FOR_GROUP_PREPARE_FAILED** was added in 8.0.14.

- Error number: **MY-013309**; Symbol: **ER_GRP_RPL_TRX_DOES_NOT_EXIST_ON_TCM_ON_HANDLE_REMOTE_PREPARE**; SQLSTATE: **HY000**
  
  Message: Transaction '%d:%lld' does not exist on Group Replication consistency manager while receiving remote transaction prepare.

  **ER_GRP_RPL_TRX_DOES_NOT_EXIST_ON_TCM_ON_HANDLE_REMOTE_PREPARE** was added in 8.0.14.

- Error number: **MY-013310**; Symbol: **ER_GRP_RPL_RELEASE_BEGIN_TRX_AFTER_DEPENDENCIES_COMMIT_FAILED**; SQLSTATE: **HY000**
  
  Message: Error releasing transaction '%d:%lld' for execution on session '%u' after its dependencies did complete commit.

  **ER_GRP_RPL_RELEASE_BEGIN_TRX_AFTER_DEPENDENCIES_COMMIT_FAILED** was added in 8.0.14.

- Error number: **MY-013311**; Symbol: **ER_GRP_RPL_REGISTER_TRX_TO_WAIT_FOR_DEPENDENCIES_FAILED**; SQLSTATE: **HY000**
  
  Message: Error registering transaction from session '%u' to wait for its dependencies to complete commit.

  **ER_GRP_RPL_REGISTER_TRX_TO_WAIT_FOR_DEPENDENCIES_FAILED** was added in 8.0.14.

- Error number: **MY-013312**; Symbol: **ER_GRP_RPL_WAIT_FOR_DEPENDENCIES_FAILED**; SQLSTATE: **HY000**
  
  Message: Error on session '%u' while waiting for its dependencies to complete commit.
ER_GRP_RPL_WAIT_FOR_DEPENDENCIES_FAILED was added in 8.0.14.

- Error number: MY-013313; Symbol: ER_GRP_RPL_REGISTER_TRX_TO_WAIT_FOR_SYNC_BEFORE_EXECUTION_FAILED; SQLSTATE: HY000
  Message: Error registering transaction from session '%u' to wait for sync before execution.
  ER_GRP_RPL_REGISTER_TRX_TO_WAIT_FOR_SYNC_BEFORE_EXECUTION_FAILED was added in 8.0.14.

- Error number: MY-013314; Symbol: ER_GRP_RPL_SEND_TRX_SYNC_BEFORE_EXECUTION_FAILED; SQLSTATE: HY000
  Message: Error sending sync before execution message from session '%u'.
  ER_GRP_RPL_SEND_TRX_SYNC_BEFORE_EXECUTION_FAILED was added in 8.0.14.

- Error number: MY-013315; Symbol: ER_GRP_RPL_TRX_WAIT_FOR_SYNC_BEFORE_EXECUTION_FAILED; SQLSTATE: HY000
  Message: Error on transaction from session '%u' while waiting for sync before execution.
  ER_GRP_RPL_TRX_WAIT_FOR_SYNC_BEFORE_EXECUTION_FAILED was added in 8.0.14.

- Error number: MY-013316; Symbol: ER_GRP_RPL_RELEASE_BEGIN_TRX_AFTER_WAIT_FOR_SYNC_BEFORE_EXEC; SQLSTATE: HY000
  Message: Error releasing transaction for execution on session '%u' after wait for sync before execution.
  ER_GRP_RPL_RELEASE_BEGIN_TRX_AFTER_WAIT_FOR_SYNC_BEFORE_EXEC was added in 8.0.14.

- Error number: MY-013317; Symbol: ER_GRP_RPL_TRX_WAIT_FOR_GROUP_GTID_EXECUTED; SQLSTATE: HY000
  Message: Error waiting for group executed transactions commit on session '%u'.
  ER_GRP_RPL_TRX_WAIT_FOR_GROUP_GTID_EXECUTED was added in 8.0.14.

- Error number: MY-013320; Symbol: ER_WARN_PROPERTY_STRING_PARSE_FAILED; SQLSTATE: HY000
  Message: Could not parse key-value pairs in property string '%s'
  ER_WARN_PROPERTY_STRING_PARSE_FAILED was added in 8.0.14.

- Error number: MY-013321; Symbol: ER_INVALID_PROPERTY_KEY; SQLSTATE: HY000
  Message: Property key '%s' is invalid.
  ER_INVALID_PROPERTY_KEY was added in 8.0.14.

- Error number: MY-013322; Symbol: ER_GRP_RPL_GTID_SET_EXTRACT_ERROR_DURING_RECOVERY; SQLSTATE: HY000
  Message: Error when extracting the group_replication_applier channel received transactions set. Unable to ensure the execution of group transactions received during recovery.
Server Error Message Reference

**ER_GRP_RPL_GTID_SET_EXTRACT_ERROR_DURING_RECOVERY** was added in 8.0.14.

- Error number: **MY-013323**; Symbol: **ER_SERVER_RPL_ENCRYPTION_FAILED_TO_ENCRYPT**; SQLSTATE: **HY000**
  
  Message: Failed to encrypt content to write into binlog file: %s.

**ER_SERVER_RPL_ENCRYPTION_FAILED_TO_ENCRYPT** was added in 8.0.14.

- Error number: **MY-013324**; Symbol: **ER_CANNOT_GET_SERVER_VERSION_FROM_TABLESPACE_HEADER**; SQLSTATE: **HY000**
  
  Message: Cannot get the server version number from the dictionary tablespace header.

**ER_CANNOT_GET_SERVER_VERSION_FROM_TABLESPACE_HEADER** was added in 8.0.14.

- Error number: **MY-013325**; Symbol: **ER_CANNOT_SET_SERVER_VERSION_IN_TABLESPACE_HEADER**; SQLSTATE: **HY000**
  
  Message: Cannot set the server version number in the dictionary tablespace header.

**ER_CANNOT_SET_SERVER_VERSION_IN_TABLESPACE_HEADER** was added in 8.0.14.

- Error number: **MY-013326**; Symbol: **ER_SERVER_UPGRADE_VERSION_NOT_SUPPORTED**; SQLSTATE: **HY000**
  
  Message: Upgrading the server from server version '%u' is not supported.

**ER_SERVER_UPGRADE_VERSION_NOT_SUPPORTED** was added in 8.0.14.

- Error number: **MY-013327**; Symbol: **ER_SERVER_UPGRADE_FROM_VERSION**; SQLSTATE: **HY000**
  
  Message: MySQL server upgrading from version '%u' to '%u'.

**ER_SERVER_UPGRADE_FROM_VERSION** was added in 8.0.14.

- Error number: **MY-013328**; Symbol: **ER_GRP_RPL_ERROR_ON_CERT_DB_INSTALL**; SQLSTATE: **HY000**
  
  Message: The certification information could not be set in this server: '%s'

**ER_GRP_RPL_ERROR_ON_CERT_DB_INSTALL** was added in 8.0.14.

- Error number: **MY-013329**; Symbol: **ER_GRP_RPL_FORCE_MEMBERS_WHEN_LEAVING**; SQLSTATE: **HY000**
  
  Message: A request to force a new group membership was issued when the member is leaving the group.

**ER_GRP_RPL_FORCE_MEMBERS_WHEN_LEAVING** was added in 8.0.14.

- Error number: **MY-013330**; Symbol: **ER_TRG_WRONG_ORDER**; SQLSTATE: **HY000**
  
  Message: Trigger %s.%s for table %s.%s is listed in wrong order. Please drop and recreate all triggers for the table.

**ER_TRG_WRONG_ORDER** was added in 8.0.14.
• Error number: MY-013332; Symbol: ER_LDAP_AUTH_GRP_SEARCH_NOT_SPECIAL_HDL; SQLSTATE: HY000

Message: Special handling for group search, {GA} not found

ER_LDAP_AUTH_GRP_SEARCH_NOT_SPECIAL_HDL was added in 8.0.14.

• Error number: MY-013333; Symbol: ER_LDAP_AUTH_GRP_USER_OBJECT_HAS_GROUP_INFO; SQLSTATE: HY000

Message: User group retrieval: User object has group information

ER_LDAP_AUTH_GRP_USER_OBJECT_HAS_GROUP_INFO was added in 8.0.14.

• Error number: MY-013334; Symbol: ER_LDAP_AUTH_GRP_INFO_FOUND_IN_MANY_OBJECTS; SQLSTATE: HY000

Message: Group information found in multiple user objects. Search filter configuration is incorrect.

ER_LDAP_AUTH_GRP_INFO_FOUND_IN_MANY_OBJECTS was added in 8.0.14.

• Error number: MY-013335; Symbol: ER_LDAP_AUTH_GRP_INCORRECT_ATTRIBUTE; SQLSTATE: HY000

Message: User group retrieval: no group attribute found. Incorrect group search attribute.

ER_LDAP_AUTH_GRP_INCORRECT_ATTRIBUTE was added in 8.0.14.

• Error number: MY-013336; Symbol: ER_LDAP_AUTH_GRP_NULL_ATTRIBUTE_VALUE; SQLSTATE: HY000

Message: User group retrieval: Group attribute values is NULL.

ER_LDAP_AUTH_GRP_NULL_ATTRIBUTE_VALUE was added in 8.0.14.

• Error number: MY-013337; Symbol: ER_LDAP_AUTH_GRP_DN_PARSING_FAILED; SQLSTATE: HY000

ER_LDAP_AUTH_GRP_DN_PARSING_FAILED was added in 8.0.14.

• Error number: MY-013338; Symbol: ER_LDAP_AUTH_GRP_OBJECT_HAS_USER_INFO; SQLSTATE: HY000

Message: User group retrieval: Group object has user information

ER_LDAP_AUTH_GRP_OBJECT_HAS_USER_INFO was added in 8.0.14.

• Error number: MY-013339; Symbol: ER_LDAP_AUTH_LDAPS; SQLSTATE: HY000

Message: Reserved port for ldaps using ldaps

ER_LDAP_AUTH_LDAPS was added in 8.0.14.

• Error number: MY-013340; Symbol: ER_LDAP_MAPPING_GET_USER_PROXY; SQLSTATE: HY000

Message: Get user proxy
**ER_LDAP_MAPPING_GET_USER_PROXY** was added in 8.0.14.

- **Error number:** MY-013341; **Symbol:** ER_LDAP_MAPPING_USER_DONT_BELONG_GROUP; **SQLSTATE:** HY000
  
  Message: Get user proxy: User doesn't belong to any group, user name will be treated as authenticated user.

**ER_LDAP_MAPPING_USER_DONT_BELONG_GROUP** was added in 8.0.14.

- **Error number:** MY-013342; **Symbol:** ER_LDAP_MAPPING_INFO; **SQLSTATE:** HY000
  
  Message: Get user proxy: configured mapping info: %s

**ER_LDAP_MAPPING_INFO** was added in 8.0.14.

  Message: Processing delimiter, separator = not found, resetting position

**ER_LDAP_MAPPING_PROCESS_DELIMITER_EQUAL_NOT_FOUND** was added in 8.0.14.

- **Error number:** MY-013348; **Symbol:** ER_LDAP_MAPPING_PROCESS_DELIMITER_TRY_COMMA; **SQLSTATE:** HY000
  
  Message: "Processing delimiter, failed to get data for = separator try for separator ,."

**ER_LDAP_MAPPING_PROCESS_DELIMITER_TRY_COMMA** was added in 8.0.14.

- **Error number:** MY-013349; **Symbol:** ER_LDAP_MAPPING_PROCESS_DELIMITER_COMMA_NOT_FOUND; **SQLSTATE:** HY000
Message: Processing delimiter, separator , not found, resetting position

ER_LDAP_MAPPING_PROCESS_DELIMITER_COMMA_NOT_FOUND was added in 8.0.14.

- Error number: MY-013350; Symbol: ER_LDAP_MAPPING_NO_SEPARATOR_END_OF_GROUP;
  SQLSTATE: HY000

Message: Processing delimiter: No mapping separator is found, end of group information

ER_LDAP_MAPPING_NO_SEPARATOR_END_OF_GROUP was added in 8.0.14.

- Error number: MY-013351; Symbol: ER_LDAP_MAPPING_GETTING_NEXT_MAPPING; SQLSTATE: HY000

Message: Getting next mapping information

ER_LDAP_MAPPING_GETTING_NEXT_MAPPING was added in 8.0.14.

- Error number: MY-013352; Symbol: ER_LDAP_MAPPING_PARSING_CURRENT_STATE; SQLSTATE: HY000

Message: Parsing mapping, current state: %d delimiter char: %c

ER_LDAP_MAPPING_PARSING_CURRENT_STATE was added in 8.0.14.

- Error number: MY-013353; Symbol: ER_LDAP_MAPPING_PARSING_MAPPING_INFO; SQLSTATE: HY000

Message: Parsing mapping info, LDAP group: %s MySQL proxy: %s

ER_LDAP_MAPPING_PARSING_MAPPING_INFO was added in 8.0.14.

- Error number: MY-013354; Symbol: ER_LDAP_MAPPING_PARSING_ERROR; SQLSTATE: HY000

Message: Mapping parsing error

ER_LDAP_MAPPING_PARSING_ERROR was added in 8.0.14.

- Error number: MY-013355; Symbol: ER_LDAP_MAPPING_TRIMMING_SPACES; SQLSTATE: HY000

Message: Trimming left spaces

ER_LDAP_MAPPING_TRIMMING_SPACES was added in 8.0.14.

- Error number: MY-013356; Symbol: ER_LDAP_MAPPING_IS_QUOTE; SQLSTATE: HY000

Message: Checking if current characters is quote

ER_LDAP_MAPPING_IS_QUOTE was added in 8.0.14.

- Error number: MY-013357; Symbol: ER_LDAP_MAPPING_NON_DESIRED_STATE; SQLSTATE: HY000

Message: Not desired state or un-defined states

ER_LDAP_MAPPING_NON_DESIRED_STATE was added in 8.0.14.

- Error number: MY-013358; Symbol: ER_INVALID_NAMED_PIPE_FULL_ACCESS_GROUP; SQLSTATE: HY000
Invalid value for named_pipe_full_access_group.

**ER_INVALID_NAMEDPIPE_FULL_ACCESSGROUP** was added in 8.0.14.

- **Error number:** MY-013359; Symbol: **ER_PREPARE_FOR_SECONDARY_ENGINE**; SQLSTATE: HY000
  - Message: Retry the statement using a secondary storage engine.
    **ER_PREPARE_FOR_SECONDARY_ENGINE** was added in 8.0.16.

- **Error number:** MY-013360; Symbol: **ER_SERVER_WARN_DEPRECATED**; SQLSTATE: HY000
  - Message: ‘%s’ is deprecated and will be removed in a future release. Please use %s instead.
    **ER_SERVER_WARN_DEPRECATED** was added in 8.0.16.

- **Error number:** MY-013361; Symbol: **ER_AUTH_ID_WITH_SYSTEM_USER_PRIV_IN_MANDATORY_ROLES**; SQLSTATE: HY000
  - Message: Cannot set mandatory_roles: AuthId ‘%s’@‘%s’ has ‘%s’ privilege.
    **ER_AUTH_ID_WITH_SYSTEM_USER_PRIV_IN_MANDATORY_ROLES** was added in 8.0.16.

- **Error number:** MY-013362; Symbol: **ER_SERVER_BINLOG_MASTER_KEY_RECOVERY_OUT_OF_COMBINATION**; SQLSTATE: HY000
  - Message: Unable to recover binary log master key, the combination of new_master_key_seqno=%u, master_key_seqno=%u and old_master_key_seqno=%u are wrong.
    **ER_SERVER_BINLOG_MASTER_KEY_RECOVERY_OUT_OF_COMBINATION** was added in 8.0.16.

- **Error number:** MY-013363; Symbol: **ER_SERVER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_AUX_KEY**; SQLSTATE: HY000
  - Message: Failed to remove auxiliary binary log encryption key from keyring, please check if keyring plugin is loaded. The cleanup of the binary log master key rotation process did not finish as expected and the cleanup will take place upon server restart or next ‘ALTER INSTANCE ROTATE BINLOG MASTER KEY’ execution.
    **ER_SERVER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_AUX_KEY** was added in 8.0.16.

- **Error number:** MY-013368; Symbol: **ER_TURNING_ON_PARTIAL_REVOKES**; SQLSTATE: HY000
  - Message: At least one partial revoke exists on a database. Turning ON the system variable '@@partial_revokes'.
    **ER_TURNING_ON_PARTIAL_REVOKES** was added in 8.0.16.

- **Error number:** MY-013369; Symbol: **ER_WARN_PARTIAL_REVOKE_AND_DB_GRANT**; SQLSTATE: HY000
  - Message: For user ‘%s’@‘%s’, one or more privileges granted through mysql.db for database ‘%s’, conflict with partial revoke. It could mean ‘mysql’ schema is corrupted.
    **ER_WARN_PARTIAL_REVOKE_AND_DB_GRANT** was added in 8.0.16.

- **Error number:** MY-013370; Symbol: **ER_WARN_INCORRECT_PRIVILEGE_FOR_DB_RESTRICTIONS**; SQLSTATE: HY000
Message: For user `%s`, ignored restrictions for privilege(s) `'%s'` for database `'%s'` as these are not valid database privileges.

`ER_WARN_INCORRECT_PRIVILEGE_FOR_DB_RESTRICTIONS` was added in 8.0.16.

- Error number: `MY-013371`; Symbol: `ER_WARN_INVALID_DB_RESTRICTIONS`; SQLSTATE: `HY000`

Message: For user `%s`, ignored restrictions for privilege(s) `'%s'` for database `'%s'` as corresponding global privilege(s) are not granted.

`ER_WARN_INVALID_DB_RESTRICTIONS` was added in 8.0.16.

- Error number: `MY-013372`; Symbol: `ER_GRP_RPL_INVALID_COMMUNICATION_PROTOCOL`; SQLSTATE: `HY000`

Message: `%s` is an invalid value for `group_replication_communication_protocol_join`, please use a MySQL version between 5.7.14 and this server’s version.

`ER_GRP_RPL_INVALID_COMMUNICATION_PROTOCOL` was added in 8.0.16.

- Error number: `MY-013373`; Symbol: `ER_GRP_RPL_STARTED_AUTO_REJOIN`; SQLSTATE: `HY000`

Message: Started auto-rejoin procedure attempt `%lu` of `%lu`

`ER_GRP_RPL_STARTED_AUTO_REJOIN` was added in 8.0.16.

- Error number: `MY-013374`; Symbol: `ER_GRP_RPL_TIMEOUT_RECEIVED_VC_ON_REJOIN`; SQLSTATE: `HY000`

Message: Timeout while waiting for a view change event during the auto-rejoin procedure

`ER_GRP_RPL_TIMEOUT_RECEIVED_VC_ON_REJOIN` was added in 8.0.16.

- Error number: `MY-013375`; Symbol: `ER_GRP_RPL_FINISHED_AUTO_REJOIN`; SQLSTATE: `HY000`

Message: Auto-rejoin procedure attempt `%lu` of `%lu` finished. Member was `%s` able to join the group.

`ER_GRP_RPL_FINISHED_AUTO_REJOIN` was added in 8.0.16.

- Error number: `MY-013376`; Symbol: `ER_GRP_RPL_DEFAULT_TABLE_ENCRYPTION_DIFF_FROM_GRP`; SQLSTATE: `HY000`

Message: The member is configured with a `default_table_encryption` option value `'%d'` different from the group `'%d'`. The member will now exit the group.

`ER_GRP_RPL_DEFAULT_TABLE_ENCRYPTION_DIFF_FROM_GRP` was added in 8.0.16.

- Error number: `MY-013377`; Symbol: `ER_SERVER_UPGRADE_OFF`; SQLSTATE: `HY000`

Message: Server shutting down because upgrade is required, yet prohibited by the command line option `'-upgrade=NONE'`.

`ER_SERVER_UPGRADE_OFF` was added in 8.0.16.

- Error number: `MY-013378`; Symbol: `ER_SERVER_UPGRADE_SKIP`; SQLSTATE: `HY000`

Message: Server upgrade is required, but skipped by command line option `'-upgrade=MINIMAL'`.

5514
**ER_SERVER_UPGRADE_SKIP** was added in 8.0.16.

- **Error number:** MY-013379; **Symbol:** ER_SERVER_UPGRADE_PENDING; **SQLSTATE:** HY000
  Message: Server upgrade started with version %d, but server upgrade of version %d is still pending.

**ER_SERVER_UPGRADE_PENDING** was added in 8.0.16.

- **Error number:** MY-013380; **Symbol:** ER_SERVER_UPGRADE_FAILED; **SQLSTATE:** HY000
  Message: Failed to upgrade server.

**ER_SERVER_UPGRADE_FAILED** was added in 8.0.16.

- **Error number:** MY-013381; **Symbol:** ER_SERVER_UPGRADE_STATUS; **SQLSTATE:** HY000
  Message: Server upgrade from '%d' to '%d' %s.

**ER_SERVER_UPGRADE_STATUS** was added in 8.0.16.

- **Error number:** MY-013382; **Symbol:** ER_SERVER_UPGRADE_REPAIR_REQUIRED; **SQLSTATE:** HY000
  Message: Table '%s' requires repair.

**ER_SERVER_UPGRADE_REPAIR_REQUIRED** was added in 8.0.16.

- **Error number:** MY-013383; **Symbol:** ER_SERVER_UPGRADE_REPAIR_STATUS; **SQLSTATE:** HY000
  Message: Table '%s' repair %s.

**ER_SERVER_UPGRADE_REPAIR_STATUS** was added in 8.0.16.

- **Error number:** MY-013384; **Symbol:** ER_SERVER_UPGRADE_INFO_FILE; **SQLSTATE:** HY000
  Message: Could not open server upgrade info file '%s' for writing. Please make sure the file is writable.

**ER_SERVER_UPGRADE_INFO_FILE** was added in 8.0.16.

- **Error number:** MY-013385; **Symbol:** ER_SERVER_UPGRADE_SYS_SCHEMA; **SQLSTATE:** HY000
  Message: Upgrading the sys schema.

**ER_SERVER_UPGRADE_SYS_SCHEMA** was added in 8.0.16.

- **Error number:** MY-013386; **Symbol:** ER_SERVER_UPGRADE_MYSQL_TABLES; **SQLSTATE:** HY000
  Message: Running queries to upgrade MySQL server.

**ER_SERVER_UPGRADE_MYSQL_TABLES** was added in 8.0.16.

- **Error number:** MY-013387; **Symbol:** ER_SERVER_UPGRADE_SYSTEM_TABLES; **SQLSTATE:** HY000
  Message: Upgrading system table data.

**ER_SERVER_UPGRADE_SYSTEM_TABLES** was added in 8.0.16.

- **Error number:** MY-013388; **Symbol:** ER_SERVER_UPGRADE_EMPTY_SYS; **SQLSTATE:** HY000
  Message: Found empty sys database. Installing the sys schema.
**ER_SERVER_UPGRADE_EMPTY_SYS** was added in 8.0.16.

- Error number: **MY-013389**; Symbol: **ER_SERVER_UPGRADE_NO_SYS_VERSION**; SQLSTATE: **HY000**
  
  Message: A sys schema exists with no sys.version view. If you have a user created sys schema, this must be renamed for the upgrade to succeed.

**ER_SERVER_UPGRADE_NO_SYS_VERSION** was added in 8.0.16.

- Error number: **MY-013390**; Symbol: **ER_SERVER_UPGRADE_SYS_VERSION_EMPTY**; SQLSTATE: **HY000**
  
  Message: A sys schema exists with a sys.version view, but it returns no results.

**ER_SERVER_UPGRADE_SYS_VERSION_EMPTY** was added in 8.0.16.

- Error number: **MY-013391**; Symbol: **ER_SERVER_UPGRADE_SYS_SCHEMA_OUTDATED**; SQLSTATE: **HY000**
  
  Message: Found outdated sys schema version %s.

**ER_SERVER_UPGRADE_SYS_SCHEMA_OUTDATED** was added in 8.0.16.

- Error number: **MY-013392**; Symbol: **ER_SERVER_UPGRADE_SYS_SCHEMA_UP_TO_DATE**; SQLSTATE: **HY000**
  
  Message: The sys schema is already up to date (version %s).

**ER_SERVER_UPGRADE_SYS_SCHEMA_UP_TO_DATE** was added in 8.0.16.

- Error number: **MY-013393**; Symbol: **ER_SERVER_UPGRADE_SYS_SCHEMA_OBJECT_COUNT**; SQLSTATE: **HY000**
  
  Message: Found %d sys %s, but expected %d. Re-installing the sys schema.

**ER_SERVER_UPGRADE_SYS_SCHEMA_OBJECT_COUNT** was added in 8.0.16.

- Error number: **MY-013394**; Symbol: **ER_SERVER_UPGRADE_CHECKING_DB**; SQLSTATE: **HY000**
  
  Message: Checking %s' schema.

**ER_SERVER_UPGRADE_CHECKING_DB** was added in 8.0.16.

- Error number: **MY-013395**; Symbol: **ER_IB_MSG_DDL_LOG_DELETE_BY_ID_TMCT**; SQLSTATE: **HY000**
  
  Message: Too many concurrent transactions while clearing the DDL Log. Please increase the number of Rollback Segments.

**ER_IB_MSG_DDL_LOG_DELETE_BY_ID_TMCT** was added in 8.0.16.

- Error number: **MY-013396**; Symbol: **ER_IB_MSG_POST_RECOVER_DDL_LOG_RECOVER**; SQLSTATE: **HY000**
  
  Message: Error in DDL Log recovery during Post-Recovery processing.
Server Error Message Reference

- Error number: **MY-013397**; Symbol: **ER_IB_MSG_POST_RECOVER_POST_TS_ENCRYPT**; SQLSTATE: **HY000**
  **ER_IB_MSG_POST_RECOVER_POST_TS_ENCRYPT** was added in 8.0.16.

- Error number: **MY-013398**; Symbol: **ER_IB_MSG_DDL_LOG_FAIL_POST_DDL**; SQLSTATE: **HY000**
  Message: Error in DLL Log cleanup during Post-DDL processing.
  **ER_IB_MSG_DDL_LOG_FAIL_POST_DDL** was added in 8.0.16.

- Error number: **MY-013399**; Symbol: **ER_SERVER_BINLOG_UNSAFE_SYSTEM_FUNCTION**; SQLSTATE: **HY000**
  Message: '%s' statement is unsafe because it uses a system function that may return a different value on the slave.
  **ER_SERVER_BINLOG_UNSAFE_SYSTEM_FUNCTION** was added in 8.0.16.

- Error number: **MY-013400**; Symbol: **ER_SERVER_UPGRADE_HELP_TABLE_STATUS**; SQLSTATE: **HY000**
  Message: Upgrade of help tables %s.
  **ER_SERVER_UPGRADE_HELP_TABLE_STATUS** was added in 8.0.16.

- Error number: **MY-013401**; Symbol: **ER_GRP_RPL_SRV_GTID_WAIT_ERROR**; SQLSTATE: **HY000**
  Message: Error when waiting for the server to execute local transactions in order assure the group change proper logging
  **ER_GRP_RPL_SRV_GTID_WAIT_ERROR** was added in 8.0.16.

- Error number: **MY-013402**; Symbol: **ER_GRP_DELAYED_VCLE_LOGGING**; SQLSTATE: **HY000**
  Message: Unable to log the group change View log event in its exaction position in the log. This will not however affect the group replication recovery process or the overall plugin process.
  **ER_GRP_DELAYED_VCLE_LOGGING** was added in 8.0.16.

- Error number: **MY-013404**; Symbol: **ER_BINLOG_UNABLE_TO_ROTATE_GTID_TABLE_READONLY**; SQLSTATE: **HY000**
  Message: Unable to create a new binlog file: Table `mysql.gtid_executed` couldn't be opened. %s
  **ER_BINLOG_UNABLE_TO_ROTATE_GTID_TABLE_READONLY** was added in 8.0.16.

- Error number: **MY-013405**; Symbol: **ER_NETWORK_NAMESPACES_NOT_SUPPORTED**; SQLSTATE: **HY000**
  Message: Network Namespaces is not supported on this platform
  **ER_NETWORK_NAMESPACES_NOT_SUPPORTED** was added in 8.0.16.

- Error number: **MY-013406**; Symbol: **ER_UNKNOWN_NETWORK_NAMESPACE**; SQLSTATE: **HY000**
  Message: Unknown network namespace '%s'
ER_UNKNOWN_NETWORK_NAMESPACE was added in 8.0.16.

- **Error number:** MY-013407; Symbol: ER_NETWORK_NAMESPACE_NOT_ALLOWED_FOR_WILDCARD_ADDRESS; SQLSTATE: HY000
  
  Message: Network namespace not allowed for wildcard interface address

ER_NETWORK_NAMESPACE_NOT_ALLOWED_FOR_WILDCARD_ADDRESS was added in 8.0.16.

- **Error number:** MY-013408; Symbol: ER_SETNS_FAILED; SQLSTATE: HY000
  
  Message: setns() failed with error '%s'

ER_SETNS_FAILED was added in 8.0.16.

- **Error number:** MY-013409; Symbol: ER_WILDCARD_NOT_ALLOWED_FOR_MULTIADDRESS_BIND; SQLSTATE: HY000
  
  Message: Wildcard address value not allowed for multivalued bind address

ER_WILDCARD_NOT_ALLOWED_FOR_MULTIADDRESS_BIND was added in 8.0.16.

- **Error number:** MY-013410; Symbol: ER_NETWORK_NAMESPACE_FILE_PATH_TOO_LONG; SQLSTATE: HY000
  
  Message: The path to a special network namespace file is too long. (got %u > max %u)

ER_NETWORK_NAMESPACE_FILE_PATH_TOO_LONG was added in 8.0.16.

- **Error number:** MY-013411; Symbol: ER_IB_MSG_TOO_LONG_PATH; SQLSTATE: HY000
  
  Message: Cannot create tablespace ‘%s’. The filepath is too long for this OS.

ER_IB_MSG_TOO_LONG_PATH was added in 8.0.16.

- **Error number:** MY-013412; Symbol: ER_IB_RECV_FIRST_REC_GROUP_INVALID; SQLSTATE: HY000
  
  Message: The last block of redo had corrupted first_rec_group and became fixed (%u -> %u).

ER_IB_RECV_FIRST_REC_GROUP_INVALID was added in 8.0.16.

- **Error number:** MY-013413; Symbol: ER_DD_UPGRADE_COMPLETED; SQLSTATE: HY000
  
  Message: Data dictionary upgrade from version '%u' to '%u' completed.

ER_DD_UPGRADE_COMPLETED was added in 8.0.16.

- **Error number:** MY-013414; Symbol: ER_SSL_SERVER_CERT_VERIFY_FAILED; SQLSTATE: HY000
  
  Message: Server SSL certificate doesn't verify: %s

ER_SSL_SERVER_CERT_VERIFY_FAILED was added in 8.0.16.

- **Error number:** MY-013415; Symbol: ER_PERSIST_OPTION_USER_TRUNCATED; SQLSTATE: HY000
  
  Message: Truncated a user name for %s that was too long while reading the persisted variables file

ER_PERSIST_OPTION_USER_TRUNCATED was added in 8.0.16.
Server Error Message Reference

- **Error number:** MY-013416; **Symbol:** ER_PERSIST_OPTION_HOST_TRUNCATED; **SQLSTATE:** HY000
  Message: Truncated a host name for %s that was too long while reading the persisted variables file.
  ER_PERSIST_OPTION_HOST_TRUNCATED was added in 8.0.16.

- **Error number:** MY-013417; **Symbol:** ER_NET_WAIT_ERROR; **SQLSTATE:** HY000
  Message: The wait_timeout period was exceeded, the idle time since last command was too long.
  ER_NET_WAIT_ERROR was added in 8.0.16.

- **Error number:** MY-013418; **Symbol:** ER_IB_MSG_1285; **SQLSTATE:** HY000
  Message: '%s' found not encrypted while '%s' is ON. Trying to encrypt it now.
  ER_IB_MSG_1285 was added in 8.0.16.

- **Error number:** MY-013419; **Symbol:** ER_IB_MSG_CLOCK_MONOTONIC_UNSUPPORTED; **SQLSTATE:** HY000
  Message: CLOCK_MONOTONIC is unsupported, so do not change the system time when MySQL is running!
  ER_IB_MSG_CLOCK_MONOTONIC_UNSUPPORTED was added in 8.0.16.

- **Error number:** MY-013420; **Symbol:** ER_IB_MSG_CLOCK_GETTIME_FAILED; **SQLSTATE:** HY000
  Message: clock_gettime() failed: %s
  ER_IB_MSG_CLOCK_GETTIME_FAILED was added in 8.0.16.

- **Error number:** MY-013421; **Symbol:** ER_PLUGIN_NOT_EARLY_DUP; **SQLSTATE:** HY000
  Message: Plugin '%s' is not to be used as an "early" plugin. Don't add it to --early-plugin-load, keyring migration etc.
  ER_PLUGIN_NOT_EARLY_DUP was added in 8.0.16.

- **Error number:** MY-013422; **Symbol:** ER_PLUGIN_NO_INSTALL_DUP; **SQLSTATE:** HY000
  Message: Plugin '%s' is marked as not dynamically installable. You have to stop the server to install it.
  ER_PLUGIN_NO_INSTALL_DUP was added in 8.0.16.

- **Error number:** MY-013423; **Symbol:** ER_WARN_DEPRECATED_SQL_CALC_FOUND_ROWS; **SQLSTATE:** HY000
  Message: SQL_CALC_FOUND_ROWS is deprecated and will be removed in a future release. Consider using two separate queries instead.
  ER_WARN_DEPRECATED_SQL_CALC_FOUND_ROWS was added in 8.0.16.

- **Error number:** MY-013424; **Symbol:** ER_WARN_DEPRECATED_FOUND_ROWS; **SQLSTATE:** HY000
  Message: FOUND_ROWS() is deprecated and will be removed in a future release. Consider using COUNT(*) instead.
  ER_WARN_DEPRECATED_FOUND_ROWS was added in 8.0.16.
• Error number: MY-013425; Symbol: ER_BINLOG_UNSAFE_DEFAULT_EXPRESSION_IN_SUBSTATEMENT; SQLSTATE: HY000
Message: The statement is unsafe because it invokes a trigger or a stored function that modifies a table that has a column with a DEFAULT expression that may return a different value on the slave.
ER_BINLOG_UNSAFE_DEFAULT_EXPRESSION_IN_SUBSTATEMENT was added in 8.0.16.

• Error number: MY-013426; Symbol: ER_GRP_RPL_MEMBER_VER_READ_COMPATIBLE; SQLSTATE: HY000
Message: Member version is read compatible with the group.
ER_GRP_RPL_MEMBER_VER_READ_COMPATIBLE was added in 8.0.16.

• Error number: MY-013427; Symbol: ER_LOCK_ORDER_INIT_FAILED; SQLSTATE: HY000
ER_LOCK_ORDER_INIT_FAILED was added in 8.0.16.

• Error number: MY-013428; Symbol: ER_AUDIT_LOG_KEYRING_ID_TIMESTAMP_VALUE_IS_INVALID; SQLSTATE: HY000
Message: Keyring ID timestamp value is invalid: ‘%s’
ER_AUDIT_LOG_KEYRING_ID_TIMESTAMP_VALUE_IS_INVALID was added in 8.0.16.

• Error number: MY-013429; Symbol: ER_AUDIT_LOG_FILE_NAME_TIMESTAMP_VALUE_IS_MISSING_OR_INVALID; SQLSTATE: HY000
Message: Cannot process audit log file. File name timestamp value is missing or invalid: ‘%s’
ER_AUDIT_LOG_FILE_NAME_TIMESTAMP_VALUE_IS_MISSING_OR_INVALID was added in 8.0.16.

• Error number: MY-013430; Symbol: ER_AUDIT_LOG_FILE_NAME_DOES_NOT_HAVE_REQUIRED_FORMAT; SQLSTATE: HY000
Message: Cannot process audit log file. File name does not have required format: ‘%s’
ER_AUDIT_LOG_FILE_NAME_DOES_NOT_HAVE_REQUIRED_FORMAT was added in 8.0.16.

• Error number: MY-013431; Symbol: ER_AUDIT_LOG_FILE_NAME_KEYRING_ID_VALUE_IS_MISSING; SQLSTATE: HY000
Message: Cannot process audit log file. File name keyring ID value is missing: ‘%s’
ER_AUDIT_LOG_FILE_NAME_KEYRING_ID_VALUE_IS_MISSING was added in 8.0.16.

• Error number: MY-013432; Symbol: ER_AUDIT_LOG_FILE_HAS_BEEN_SUCCESSFULLY_PROCESSED; SQLSTATE: HY000
Message: Audit log file has been successfully processed: ‘%s’
ER_AUDIT_LOG_FILE_HAS_BEEN_SUCCESSFULLY_PROCESSED was added in 8.0.16.

• Error number: MY-013433; Symbol: ER_AUDIT_LOG_COULD_NOT_OPEN_FILE_FOR_READING; SQLSTATE: HY000
Message: Could not open audit log file for reading: '%s'

ER_AUDIT_LOG_COULD_NOT_OPEN_FILE_FOR_READING was added in 8.0.16.

- Error number: MY-013434; Symbol: ER_AUDIT_LOG_INVALID_FILE_CONTENT; SQLSTATE: HY000
  Message: Invalid audit log file content: '%s'
  ER_AUDIT_LOG_INVALID_FILE_CONTENT was added in 8.0.16.

- Error number: MY-013435; Symbol: ER_AUDIT_LOG_CANNOT_READ_PASSWORD; SQLSTATE: HY000
  Message: Cannot read password: '%s'
  ER_AUDIT_LOG_CANNOT_READ_PASSWORD was added in 8.0.16.

- Error number: MY-013436; Symbol: ER_AUDIT_LOG_CANNOT_STORE_PASSWORD; SQLSTATE: HY000
  Message: Cannot store password: '%s'
  ER_AUDIT_LOG_CANNOT_STORE_PASSWORD was added in 8.0.16.

- Error number: MY-013437; Symbol: ER_AUDIT_LOG_CANNOT_REMOVE_PASSWORD; SQLSTATE: HY000
  Message: Cannot remove password: '%s'
  ER_AUDIT_LOG_CANNOT_REMOVE_PASSWORD was added in 8.0.16.

- Error number: MY-013438; Symbol: ER_AUDIT_LOG_PASSWORD_HAS_BEEN_COPIED; SQLSTATE: HY000
  Message: 'audit_log' password has been copied into '%s' and will be removed with first purged password.
  ER_AUDIT_LOG_PASSWORD_HAS_BEEN_COPIED was added in 8.0.16.

- Error number: MY-013447; Symbol: ER_LDAP_EMPTY_USERDN_PASSWORD; SQLSTATE: HY000
  Message: Empty user dn or password is not allowed, not attempting LDAP bind.
  ER_LDAP_EMPTY_USERDN_PASSWORD was added in 8.0.16.

- Error number: MY-013449; Symbol: ER_ACL_WRONG_OR_MISSING_ACL_TABLES_LOG; SQLSTATE: HY000
  Message: The current layout of the ACL tables does not conform to the server's expected layout. They're either altered, missing or not upgraded from a previous version. However a best effort attempt to read data from these tables will still be made.
  ER_ACL_WRONG_OR_MISSING_ACL_TABLES_LOG was added in 8.0.17.

- Error number: MY-013450; Symbol: ER_LOCK_ORDER_FAILED_WRITE_FILE; SQLSTATE: HY000
  Message: LOCK_ORDER: Failed to write to file <%s>.
  ER_LOCK_ORDER_FAILED_WRITE_FILE was added in 8.0.17.
• Error number: **MY-013451**; Symbol: **ER_LOCK_ORDER FAILED_READ_FILE**; SQLSTATE: **HY000**
  Message: LOCK_ORDER: Failed to read from file <\%s>.  
  **ER_LOCK_ORDER FAILED_READ_FILE** was added in 8.0.17.

• Error number: **MY-013452**; Symbol: **ER_LOCK_ORDER MESSAGE**; SQLSTATE: **HY000**
  Message: LOCK_ORDER message: %s  
  **ER_LOCK_ORDER_MESSAGE** was added in 8.0.17.

• Error number: **MY-013453**; Symbol: **ER_LOCK_ORDER_DEPENDENCIES_SYNTAX**; SQLSTATE: **HY000**
  Message: Lock order dependencies file <\%s> (%d:%d) - (%d:%d) : %s  
  **ER_LOCK_ORDER_DEPENDENCIES_SYNTAX** was added in 8.0.17.

• Error number: **MY-013454**; Symbol: **ER_LOCK_ORDER_SCANNER_SYNTAX**; SQLSTATE: **HY000**
  Message: Lock order scanner: (%d:%d) - (%d:%d) : %s  
  **ER_LOCK_ORDER_SCANNER_SYNTAX** was added in 8.0.17.

• Error number: **MY-013455**; Symbol: **ER_DATA_DIRECTORY_UNUSABLE_DELETABLE**; SQLSTATE: **HY000**
  Message: The newly created data directory %s by --initialize is unusable. You can remove it.  
  **ER_DATA_DIRECTORY_UNUSABLE_DELETABLE** was added in 8.0.17.

• Error number: **MY-013456**; Symbol: **ER_IB_MSG_BTREE_LEVEL_LIMIT_EXCEEDED**; SQLSTATE: **HY000**
  Message: No. of B-tree level created for index %s has crossed the permissible limit. If debug option innodb_limit_optimistic_insert_debug is being used try tweaking it to include more records in a page.  
  **ER_IB_MSG_BTREE_LEVEL_LIMIT_EXCEEDED** was added in 8.0.17.

• Error number: **MY-013457**; Symbol: **ER_IB_CLONE_START_STOP**; SQLSTATE: **HY000**
  Message: %s  
  **ER_IB_CLONE_START_STOP** was added in 8.0.17.

• Error number: **MY-013458**; Symbol: **ER_IB_CLONE_OPERATION**; SQLSTATE: **HY000**
  Message: %s  
  **ER_IB_CLONE_OPERATION** was added in 8.0.17.

• Error number: **MY-013459**; Symbol: **ER_IB_CLONE_RESTART**; SQLSTATE: **HY000**
  Message: %s  
  **ER_IB_CLONE_RESTART** was added in 8.0.17.

• Error number: **MY-013460**; Symbol: **ER_IB_CLONE_USER_DATA**; SQLSTATE: **HY000**
  Message: Clone removing all user data for provisioning: %s
**Server Error Message Reference**

**ER_IB_CLONE_USER_DATA** was added in 8.0.17.

- **Error number:** MY-013461; **Symbol:** ER_IB_CLONE_NON_INNODB_TABLE; **SQLSTATE:** HY000
  
  Message: Non innodb table: %s.%s is not cloned and is empty.

**ER_IB_CLONE_NON_INNODB_TABLE** was added in 8.0.17.

- **Error number:** MY-013462; **Symbol:** ER_CLONE_SHUTDOWN_TRACE; **SQLSTATE:** HY000
  
  Message: Clone shutting down server as RESTART failed. Please start server to complete clone operation.

**ER_CLONE_SHUTDOWN_TRACE** was added in 8.0.17.

- **Error number:** MY-013463; **Symbol:** ER_GRP_RPL_GTID_PURGED_EXTRACT_ERROR; **SQLSTATE:** HY000
  
  Message: Error when extracting this member GTID purged set. Operations and checks made to group joiners may be incomplete.

**ER_GRP_RPL_GTID_PURGED_EXTRACT_ERROR** was added in 8.0.17.

- **Error number:** MY-013464; **Symbol:** ER_GRP_RPL_CLONE_PROCESS_PREPARE_ERROR; **SQLSTATE:** HY000
  
  Message: There was an issue when configuring the remote cloning process: %s

**ER_GRP_RPL_CLONE_PROCESS_PREPARE_ERROR** was added in 8.0.17.

- **Error number:** MY-013465; **Symbol:** ER_GRP_RPL_CLONE_PROCESS_EXEC_ERROR; **SQLSTATE:** HY000
  
  Message: There was an issue when cloning from another server: %s

**ER_GRP_RPL_CLONE_PROCESS_EXEC_ERROR** was added in 8.0.17.

- **Error number:** MY-013466; **Symbol:** ER_GRP_RPL_RECOVERY_EVAL_ERROR; **SQLSTATE:** HY000
  
  Message: There was an issue when trying to evaluate the recovery strategy while joining.%s

**ER_GRP_RPL_RECOVERY_EVAL_ERROR** was added in 8.0.17.

- **Error number:** MY-013467; **Symbol:** ER_GRP_RPL_NO_POSSIBLE_RECOVERY; **SQLSTATE:** HY000
  
  Message: No valid or ONLINE members exist to get the missing data from the group. For cloning check if donors of the same version and with clone plugin installed exist. For distributed recovery check if you have donors where the required data was not purged from the binary logs.

**ER_GRP_RPL_NO_POSSIBLE_RECOVERY** was added in 8.0.17.

- **Error number:** MY-013468; **Symbol:** ER_GRP_RPL_CANT_KILL_THREAD; **SQLSTATE:** HY000
  
  Message: The group replication plugin could not kill the plugin routine for %s. %s

**ER_GRP_RPL_CANT_KILL_THREAD** was added in 8.0.17.
Server Error Message Reference

- **Error number:** MY-013469; Symbol: `ER_GRP_RPL_RECOVERY_STRAT_CLONE_THRESHOLD`; SQLSTATE: HY000
  
  Message: Due to the number of missing transactions being higher than the configured threshold of %llu, this member will use cloning as its recovery strategy.

  `ER_GRP_RPL_RECOVERY_STRAT_CLONE_THRESHOLD` was added in 8.0.17.

- **Error number:** MY-013470; Symbol: `ER_GRP_RPL_RECOVERY_STRAT_CLONE_PURGED`; SQLSTATE: HY000
  
  Message: As no ONLINE member has the missing data for recovering in its binary logs, this member will use cloning as its recovery strategy.

  `ER_GRP_RPL_RECOVERY_STRAT_CLONE_PURGED` was added in 8.0.17.

- **Error number:** MY-013471; Symbol: `ER_GRP_RPL_RECOVERY_STRAT_CHOICE`; SQLSTATE: HY000
  
  Message: The chosen recovery strategy is: %s

  `ER_GRP_RPL_RECOVERY_STRAT_CHOICE` was added in 8.0.17.

- **Error number:** MY-013472; Symbol: `ER_GRP_RPL_RECOVERY_STRAT_FALLBACK`; SQLSTATE: HY000
  
  Message: Due to some issue the recovery strategy switched to: %s

  `ER_GRP_RPL_RECOVERY_STRAT_FALLBACK` was added in 8.0.17.

- **Error number:** MY-013473; Symbol: `ER_GRP_RPL_RECOVERY_STRAT_NO_FALLBACK`; SQLSTATE: HY000
  
  Message: Due to a critical cloning error or lack of donors, distributed recovery cannot be executed. The member will now leave the group.

  `ER_GRP_RPL_RECOVERY_STRAT_NO_FALLBACK` was added in 8.0.17.

- **Error number:** MY-013474; Symbol: `ER_GRP_RPL_SLAVE_THREAD_ERROR_ON_CLONE`; SQLSTATE: HY000
  
  Message: The '%s' thread of channel '%s' will error out as the server will attempt to clone another server

  `ER_GRP_RPL_SLAVE_THREAD_ERROR_ON_CLONE` was added in 8.0.17.

- **Error number:** MY-013475; Symbol: `ER_UNKNOWN_TABLE_IN_UPGRADE`; SQLSTATE: HY000
  
  Message: Unknown table '%s'

  `ER_UNKNOWN_TABLE_IN_UPGRADE` was added in 8.0.17.

- **Error number:** MY-013476; Symbol: `ER_IDENT_CAUSES_TOO_LONG_PATH_IN_UPGRADE`; SQLSTATE: HY000
  
  Message: Long database name and identifier for object resulted in path length exceeding %d characters. Path: '%s'.

  `ER_IDENT_CAUSES_TOO_LONG_PATH_IN_UPGRADE` was added in 8.0.17.

- **Error number:** MY-013477; Symbol: `ER_XA_CANT_CREATE_MDL_BACKUP`; SQLSTATE: HY000
Server Error Message Reference

Message: XA: Failed to take MDL Lock backup of PREPARED XA transaction during client disconnect.

`ER_XA_CANT_CREATE_MDL_BACKUP` was added in 8.0.13.

- **Error number:** `MY-013478`; **Symbol:** `ER_AUDIT_LOG_SUPER_PRIVILEGE_REQUIRED`; **SQLSTATE:** `HY000`

Message: SUPER privilege or AUDIT_ADMIN role required for '%s'@'%s' user.

`ER_AUDIT_LOG_SUPER_PRIVILEGE_REQUIRED` was added in 8.0.11.

- **Error number:** `MY-013479`; **Symbol:** `ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_TYPE`; **SQLSTATE:** `HY000`

Message: Invalid argument type

`ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_TYPE` was added in 8.0.11.

- **Error number:** `MY-013480`; **Symbol:** `ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_COUNT`; **SQLSTATE:** `HY000`

Message: Invalid argument count

`ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_COUNT` was added in 8.0.11.

- **Error number:** `MY-013481`; **Symbol:** `ER_AUDIT_LOG_HAS_NOT_BEEN_INSTALLED`; **SQLSTATE:** `HY000`

Message: audit_log plugin has not been installed using INSTALL PLUGIN syntax.

`ER_AUDIT_LOG_HAS_NOT_BEEN_INSTALLED` was added in 8.0.11.

- **Error number:** `MY-013482`; **Symbol:** `ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_TYPE`; **SQLSTATE:** `HY000`

Message: Invalid "max_array_length" argument type.

`ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_TYPE` was added in 8.0.11.

- **Error number:** `MY-013483`; **Symbol:** `ER_LOG_CANNOT_WRITE_EXTENDED`; **SQLSTATE:** `HY000`

Message: Failed to write to %s: %s (%s)

`ER_LOG_CANNOT_WRITE_EXTENDED` was added in 8.0.17.

- **Error number:** `MY-013484`; **Symbol:** `ER_UPGRADE_WITH_PARTITIONED_TABLES_REJECTED`; **SQLSTATE:** `HY000`

Message: Upgrading from server version %d with partitioned tables and lower_case_table_names == 1 on a case sensitive file system may cause issues, and is therefore prohibited. To upgrade anyway, restart the new server version with the command line option 'upgrade=FORCE'. When upgrade is completed, please execute 'RENAME TABLE <part_table_name> TO <new_table_name>; RENAME TABLE <new_table_name> TO <part_table_name>;' for each of the partitioned tables. Please see the documentation for further information.

`ER_UPGRADE_WITH_PARTITIONED_TABLES_REJECTED` was added in 8.0.18.

- **Error number:** `MY-013485`; **Symbol:** `ER_KEYRING_AWS_INCORRECT_PROXY`; **SQLSTATE:** `HY000`
Message: Incorrect environment variable %s, invalid port: %s

ER_KEYRING_AWS_INCORRECT_PROXY was added in 8.0.18.

• Error number: MY-013486; Symbol: ER_GRP_RPL_SERVER_SET_TO_OFFLINE_MODE_DUE_TO_ERRORS; SQLSTATE: HY000
  Message: The server was automatically set into offline mode after an error was detected.
  ER_GRP_RPL_SERVER_SET_TO_OFFLINE_MODE_DUE_TO_ERRORS was added in 8.0.18.

• Error number: MY-013487; Symbol: ER_GRP_RPL_MESSAGE_SERVICE_FATAL_ERROR; SQLSTATE: HY000
  Message: Message delivery error on message service of Group Replication. The server will now leave the group.
  ER_GRP_RPL_MESSAGE_SERVICE_FATAL_ERROR was added in 8.0.18.

• Error number: MY-013488; Symbol: ER_WARN_WRONG_COMPRESSION_ALGORITHM_LOG; SQLSTATE: HY000
  Message: Invalid MASTER_COMPRESSION_ALGORITHMS '%%s' found in repository for channel '%%s'. Resetting to 'uncompressed' (no compression).
  ER_WARN_WRONG_COMPRESSION_ALGORITHM_LOG was added in 8.0.18.

• Error number: MY-013489; Symbol: ER_WARN_WRONG_COMPRESSION_LEVEL_LOG; SQLSTATE: HY000
  Message: Invalid MASTER_ZSTD_COMPRESSION_LEVEL found in repository for channel '%%s'. Resetting to %u.
  ER_WARN_WRONG_COMPRESSION_LEVEL_LOG was added in 8.0.18.

• Error number: MY-013490; Symbol: ER_PROTOCOL_COMPRESSION_RESET_LOG; SQLSTATE: HY000
  Message: Option --protocol-compression-algorithms is reset to default value.
  ER_PROTOCOL_COMPRESSION_RESET_LOG was added in 8.0.18.

• Error number: MY-013491; Symbol: ER_XPLUGIN_COMPRESSION_ERROR; SQLSTATE: HY000
  Message: Fatal error while compressing outgoing data - %s
  ER_XPLUGIN_COMPRESSION_ERROR was added in 8.0.18.

B.3.2 Client Error Message Reference

Client error messages originate from within the MySQL client library. Here is an example client error message, as displayed by the mysql client:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

Each client error message includes an error code, SQLSTATE value, and message string, as described in Section B.1, “Error Message Sources and Components”. These components are available as described
in Section B.2, “Error Information Interfaces”. For client errors, the SQLSTATE value is always 'HY000' (general error), so it is not meaningful for distinguishing one client error from another.

The client library also makes available to host client programs any errors that originate on the server side and are received by the client from the server. For a list of server-side errors, see Section B.3.1, “Server Error Message Reference”.

In addition to the errors in the following list, the client library can also produce error messages that have error codes in the range from 1 to 999. See Section B.3.3, “Global Error Message Reference”

- Error number: 2000; Symbol: CR_UNKNOWN_ERROR;
  Message: Unknown MySQL error
- Error number: 2001; Symbol: CR_SOCKET_CREATE_ERROR;
  Message: Can't create UNIX socket (%d)
- Error number: 2002; Symbol: CR_CONNECTION_ERROR;
  Message: Can't connect to local MySQL server through socket '%s' (%d)
- Error number: 2003; Symbol: CR_CONN_HOST_ERROR;
  Message: Can't connect to MySQL server on '%s' (%d)
- Error number: 2004; Symbol: CR_IPSOCK_ERROR;
  Message: Can't create TCP/IP socket (%d)
- Error number: 2005; Symbol: CR_UNKNOWN_HOST;
  Message: Unknown MySQL server host '%s' (%d)
- Error number: 2006; Symbol: CR_SERVER_GONE_ERROR;
  Message: MySQL server has gone away
- Error number: 2007; Symbol: CR_VERSION_ERROR;
  Message: Protocol mismatch; server version = %d, client version = %d
- Error number: 2008; Symbol: CR_OUT_OF_MEMORY;
  Message: MySQL client ran out of memory
- Error number: 2009; Symbol: CR_WRONG_HOST_INFO;
  Message: Wrong host info
- Error number: 2010; Symbol: CR_LOCALHOST_CONNECTION;
  Message: Localhost via UNIX socket
- Error number: 2011; Symbol: CR_TCP_CONNECTION;
  Message: %s via TCP/IP
- Error number: 2012; Symbol: CR_SERVER_HANDSHAKE_ERR;
Message: Error in server handshake

- Error number: 2013; Symbol: CR_SERVER_LOST;

Message: Lost connection to MySQL server during query

- Error number: 2014; Symbol: CR_COMMANDS_OUT_OF_SYNC;

Message: Commands out of sync; you can't run this command now

Commands were executed in an improper order. This error occurs when a function is called that is not appropriate for the current state of the connection. For example, if `mysql_stmt_fetch()` is not called enough times to read an entire result set (that is, enough times to return `MYSQL_NO_DATA`), this error may occur for the following C API call.

- Error number: 2015; Symbol: CR_NAMEDPIPE_CONNECTION;

Message: Named pipe: %s

- Error number: 2016; Symbol: CR_NAMEDPIPEWAIT_ERROR;

Message: Can't wait for named pipe to host: %s pipe: %s (%lu)

- Error number: 2017; Symbol: CR_NAMEDPIPEOPEN_ERROR;

Message: Can't open named pipe to host: %s pipe: %s (%lu)

- Error number: 2018; Symbol: CR_NAMEDPIPESETSTATE_ERROR;

Message: Can't set state of named pipe to host: %s pipe: %s (%lu)

- Error number: 2019; Symbol: CR_CANT_READ_CHARSET;

Message: Can't initialize character set %s (path: %s)

- Error number: 2020; Symbol: CR_NET_PACKET_TOO_LARGE;

Message: Got packet bigger than 'max_allowed_packet' bytes

- Error number: 2021; Symbol: CR_EMBEDDED_CONNECTION;

Message: Embedded server

- Error number: 2022; Symbol: CR_PROBE_SLAVE_STATUS;

Message: Error on SHOW SLAVE STATUS:

- Error number: 2023; Symbol: CR_PROBE_SLAVE_HOSTS;

Message: Error on SHOW SLAVE HOSTS:

- Error number: 2024; Symbol: CR_PROBE_SLAVE_CONNECT;

Message: Error connecting to slave:

- Error number: 2025; Symbol: CR_PROBE_MASTER_CONNECT;

Message: Error connecting to master:
• Error number: 2026; Symbol: CR_SSL_CONNECTION_ERROR;
  Message: SSL connection error: %s

• Error number: 2027; Symbol: CR_MALFORMED_PACKET;
  Message: Malformed packet

• Error number: 2028; Symbol: CR_WRONG_LICENSE;
  Message: This client library is licensed only for use with MySQL servers having '%s' license

• Error number: 2029; Symbol: CR_NULL_POINTER;
  Message: Invalid use of null pointer

• Error number: 2030; Symbol: CR_NO_Prepare_STMT;
  Message: Statement not prepared

• Error number: 2031; Symbol: CR_PARAMS_NOT_BOUND;
  Message: No data supplied for parameters in prepared statement

• Error number: 2032; Symbol: CR_DATA_TRUNCATED;
  Message: Data truncated

• Error number: 2033; Symbol: CR_NO_PARAMETERS_EXISTS;
  Message: No parameters exist in the statement

• Error number: 2034; Symbol: CR_INVALID_PARAMETER_NO;
  Message: Invalid parameter number
  
The column number for mysql_stmt_fetch_column() was invalid.

  The parameter number for mysql_stmt_send_long_data() was invalid.

  A key name was empty or the amount of connection attribute data for mysql_options4() exceeds the 64KB limit.

• Error number: 2035; Symbol: CR_INVALID_BUFFER_USE;
  Message: Can't send long data for non-string/non-binary data types (parameter: %d)

• Error number: 2036; Symbol: CR_UNSUPPORTED_PARAM_TYPE;
  Message: Using unsupported buffer type: %d (parameter: %d)

• Error number: 2037; Symbol: CR_SHARED_MEMORY_CONNECTION;
  Message: Shared memory: %s

• Error number: 2038; Symbol: CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR;
  Message: Can't open shared memory; client could not create request event (%lu)

• Error number: 2039; Symbol: CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR;
Message: Can't open shared memory; no answer event received from server (%lu)
- Error number: 2040; Symbol: CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR;

Message: Can't open shared memory; server could not allocate file mapping (%lu)
- Error number: 2041; Symbol: CR_SHARED_MEMORY_CONNECT_MAP_ERROR;

Message: Can't open shared memory; server could not get pointer to file mapping (%lu)
- Error number: 2042; Symbol: CR_SHARED_MEMORY_FILE_MAP_ERROR;

Message: Can't open shared memory; client could not allocate file mapping (%lu)
- Error number: 2043; Symbol: CR_SHARED_MEMORY_MAP_ERROR;

Message: Can't open shared memory; client could not get pointer to file mapping (%lu)
- Error number: 2044; Symbol: CR_SHARED_MEMORY_EVENT_ERROR;

Message: Can't open shared memory; client could not create %s event (%lu)
- Error number: 2045; Symbol: CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR;

Message: Can't open shared memory; no answer from server (%lu)
- Error number: 2046; Symbol: CR_SHARED_MEMORY_CONNECT_SET_ERROR;

Message: Can't open shared memory; cannot send request event to server (%lu)
- Error number: 2047; Symbol: CR_CONN_UNKNOW_PROTOCOL;

Message: Wrong or unknown protocol
- Error number: 2048; Symbol: CR_INVALID_CONN_HANDLE;

Message: Invalid connection handle
- Error number: 2049; Symbol: CR_UNUSED_1;

Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)
- Error number: 2050; Symbol: CR_FETCH_CANCELED;

Message: Row retrieval was canceled by mysql_stmt_close() call
- Error number: 2051; Symbol: CR_NO_DATA;

Message: Attempt to read column without prior row fetch
- Error number: 2052; Symbol: CR_NO_STMT_METADATA;

Message: Prepared statement contains no metadata
- Error number: 2053; Symbol: CR_NO_RESULT_SET;

Message: Attempt to read a row while there is no result set associated with the statement
- Error number: **2054**; Symbol: `CR_NOT_IMPLEMENTED`;
  Message: This feature is not implemented yet
- Error number: **2055**; Symbol: `CR_SERVER_LOST_EXTENDED`;
  Message: Lost connection to MySQL server at '%s', system error: %d
- Error number: **2056**; Symbol: `CR_STMT_CLOSED`;
  Message: Statement closed indirectly because of a preceding %s() call
- Error number: **2057**; Symbol: `CR_NEW_STMT_METADATA`;
  Message: The number of columns in the result set differs from the number of bound buffers. You must reset the statement, rebind the result set columns, and execute the statement again
- Error number: **2058**; Symbol: `CR_ALREADY_CONNECTED`;
  Message: This handle is already connected. Use a separate handle for each connection.
- Error number: **2059**; Symbol: `CR_AUTH_PLUGIN_CANNOT_LOAD`;
  Message: Authentication plugin '%s' cannot be loaded: %s
- Error number: **2060**; Symbol: `CR_DUPLICATE_CONNECTION_ATTR`;
  Message: There is an attribute with the same name already
  A duplicate connection attribute name was specified for `mysql_options4()`.
- Error number: **2061**; Symbol: `CR_AUTH_PLUGIN_ERR`;
  Message: Authentication plugin '%s' reported error: %s
- Error number: **2062**; Symbol: `CR_INSECURE_API_ERR`;
  Message: Insecure API function call: '%s' Use instead: '%s'
  An insecure function call was detected. Modify the application to use the suggested alternative function instead.
- Error number: **2063**; Symbol: `CR_FILE_NAME_TOO_LONG`;
  Message: File name is too long
  `CR_FILE_NAME_TOO_LONG` was added in 8.0.1.
- Error number: **2064**; Symbol: `CR_SSL_FIPS_MODE_ERR`;
  Message: Set FIPS mode ON/STRICT failed
  `CR_SSL_FIPS_MODE_ERR` was added in 8.0.11.
- Error number: **2065**; Symbol: `CR_COMPRESSION_NOT_SUPPORTED`;
  Message: Compression protocol not supported with asynchronous protocol
  `CR_COMPRESSION_NOT_SUPPORTED` was added in 8.0.16.
B.3.3 Global Error Message Reference

This section lists “global” error messages that are shared in the sense that they can be produced by the MySQL server or by MySQL client programs. These errors have error codes in the range from 1 to 999.

Each global error message includes an error code, SQLSTATE value, and message string, as described in Section B.1, “Error Message Sources and Components”. These components are available as described in Section B.2, “Error Information Interfaces”. For global errors, the SQLSTATE value is always 'HY000' (general error), so it is not meaningful for distinguishing one client error from another.

If the server writes a message to the error log that has a global error code, it pads the error code with leading zeros to six digits and adds a prefix of MY- (example: MY-000022). The following list displays error codes in that format.

If a client returns a message with a global error code, it adds no zero-padding or prefix to the error code.

- Error number: 1; Symbol: EE_CANTCREATEFILE;
  Message: Can't create/write to file '%s' (OS errno %d - %s)

- Error number: 2; Symbol: EE_READ;
  Message: Error reading file '%s' (OS errno %d - %s)

- Error number: 3; Symbol: EE_WRITE;
  Message: Error writing file '%s' (OS errno %d - %s)

- Error number: 4; Symbol: EE_BADCLOSE;
  Message: Error on close of '%s' (OS errno %d - %s)

- Error number: 5; Symbol: EE_OUTOFMEMORY;
  Message: Out of memory (Needed %u bytes)

- Error number: 6; Symbol: EE_DELETE;
  Message: Error on delete of '%s' (OS errno %d - %s)

- Error number: 7; Symbol: EE_LINK;
  Message: Error on rename of '%s' to '%s' (OS errno %d - %s)

- Error number: 9; Symbol: EE_EOFERR;
  Message: Unexpected EOF found when reading file '%s' (OS errno %d - %s)

- Error number: 10; Symbol: EE_CANTLOCK;
  Message: Can't lock file (OS errno %d - %s)

- Error number: 11; Symbol: EE_CANTUNLOCK;
Message: Can't unlock file (OS errno %d - %s)

- Error number: 12; Symbol: EE_DIR;

Message: Can't read dir of '%s' (OS errno %d - %s)

- Error number: 13; Symbol: EE_STAT;

Message: Can't get stat of '%s' (OS errno %d - %s)

- Error number: 14; Symbol: EE_CANT_CHSIZE;

Message: Can't change size of file (OS errno %d - %s)

- Error number: 15; Symbol: EE_CANT_OPEN_STREAM;

Message: Can't open stream from handle (OS errno %d - %s)

- Error number: 16; Symbol: EE_GETWD;

Message: Can't get working directory (OS errno %d - %s)

- Error number: 17; Symbol: EE_SETWD;

Message: Can't change dir to '%s' (OS errno %d - %s)

- Error number: 18; Symbol: EE_LINK_WARNING;

Message: Warning: '%s' had %d links

- Error number: 19; Symbol: EE_OPEN_WARNING;

Message: Warning: %d files and %d streams are left open

- Error number: 20; Symbol: EE_DISK_FULL;

Message: Disk is full writing '%s' (OS errno %d - %s). Waiting for someone to free space...

- Error number: 21; Symbol: EE_CANT_MKDIR;

Message: Can't create directory '%s' (OS errno %d - %s)

- Error number: 22; Symbol: EE_UNKNOWN_CHARSET;

Message: Character set '%s' is not a compiled character set and is not specified in the '%s' file

- Error number: 23; Symbol: EE_OUT_OF_FILERESOURCES;

Message: Out of resources when opening file '%s' (OS errno %d - %s)

- Error number: 24; Symbol: EE_CANT_READLINK;

Message: Can't read value for symlink '%s' (Error %d - %s)

- Error number: 25; Symbol: EE_CANT_SYMLINK;

Message: Can't create symlink '%s' pointing at '%s' (Error %d - %s)

- Error number: 26; Symbol: EE_REALPATH;
Message: Error on realpath() on '%%s' (Error %d - %s)  
• Error number: 27; Symbol: EE_SYNC;  
Message: Can't sync file '%%s' to disk (OS errno %d - %s)  
• Error number: 28; Symbol: EE_UNKNOWN_COLLATION;  
Message: Collation '%%s' is not a compiled collation and is not specified in the '%%s' file  
• Error number: 29; Symbol: EE_FILENOTFOUND;  
Message: File '%%s' not found (OS errno %d - %s)  
• Error number: 30; Symbol: EE_FILE_NOT_CLOSED;  
Message: File '%%s' (fileno: %d) was not closed  
• Error number: 31; Symbol: EE_CHANGE_ownership;  
Message: Cannot change ownership of the file '%%s' (OS errno %d - %s)

  Message: unknown option \texttt{\textasciitilde\%s}'.

\texttt{EE\_UNKNOWN\_OPTION} was added in 8.0.13.
• Error number: 69; Symbol: EE_UNKNOWN_SHORT_OPTION;
  Message: %s: unknown option '-%c'.
  EE_UNKNOWN_SHORT_OPTION was added in 8.0.13.

• Error number: 70; Symbol: EE_OPTION_WITHOUT_ARGUMENT;
  Message: %s: option '--%s' cannot take an argument.
  EE_OPTION_WITHOUT_ARGUMENT was added in 8.0.13.

• Error number: 71; Symbol: EE_OPTION_REQUIRES_ARGUMENT;
  Message: %s: option '--%s' requires an argument.
  EE_OPTION_REQUIRES_ARGUMENT was added in 8.0.13.

• Error number: 72; Symbol: EE_SHORT_OPTION_REQUIRES_ARGUMENT;
  Message: %s: option '-%c' requires an argument.
  EE_SHORT_OPTION_REQUIRES_ARGUMENT was added in 8.0.13.

• Error number: 73; Symbol: EE_OPTION_IGNORED_DUE_TO_INVALID_VALUE;
  Message: %s: ignoring option '--%s' due to invalid value '%s'.
  EE_OPTION_IGNORED_DUE_TO_INVALID_VALUE was added in 8.0.13.

• Error number: 74; Symbol: EE_OPTION_WITH_EMPTY_VALUE;
  Message: %s: Empty value for '%s' specified.
  EE_OPTION_WITH_EMPTY_VALUE was added in 8.0.13.

• Error number: 75; Symbol: EE_FAILED_TO_ASSIGN_MAX_VALUE_TO_OPTION;
  Message: %s: Maximum value of '%s' cannot be set.
  EE_FAILED_TO_ASSIGN_MAX_VALUE_TO_OPTION was added in 8.0.13.

• Error number: 76; Symbol: EE_INCORRECT_BOOLEAN_VALUE_FOR_OPTION;
  Message: option '%s': boolean value '%s' was not recognized. Set to OFF.
  EE_INCORRECT_BOOLEAN_VALUE_FOR_OPTION was added in 8.0.13.

• Error number: 77; Symbol: EE_FAILED_TO_SET_OPTION_VALUE;
  Message: %s: Error while setting value '%s' to '%s'.
  EE_FAILED_TO_SET_OPTION_VALUE was added in 8.0.13.

• Error number: 78; Symbol: EE_INCORRECT_INT_VALUE_FOR_OPTION;
  Message: Incorrect integer value: '%s'.
  EE_INCORRECT_INT_VALUE_FOR_OPTION was added in 8.0.13.
• Error number: 79; Symbol: **EE_INCORRECT_UINT_VALUE_FOR_OPTION**;
Message: Incorrect unsigned integer value: '%s'.

*EE_INCORRECT_UINT_VALUE_FOR_OPTION* was added in 8.0.13.

• Error number: 80; Symbol: **EE_ADJUSTED_SIGNED_VALUE_FOR_OPTION**;
Message: option '%s': signed value %s adjusted to %s.

*EE_ADJUSTED_SIGNED_VALUE_FOR_OPTION* was added in 8.0.13.

• Error number: 81; Symbol: **EE_ADJUSTED_UNSIGNED_VALUE_FOR_OPTION**;
Message: option '%s': unsigned value %s adjusted to %s.

*EE_ADJUSTED_UNSIGNED_VALUE_FOR_OPTION* was added in 8.0.13.

• Error number: 82; Symbol: **EE_ADJUSTED_ULONGLONG_VALUE_FOR_OPTION**;
Message: option '%s': value %s adjusted to %s.

*EE_ADJUSTED_ULONGLONG_VALUE_FOR_OPTION* was added in 8.0.13.

• Error number: 83; Symbol: **EE_ADJUSTED_DOUBLE_VALUE_FOR_OPTION**;
Message: option '%s': value %g adjusted to %g.

*EE_ADJUSTED_DOUBLE_VALUE_FOR_OPTION* was added in 8.0.13.

• Error number: 84; Symbol: **EE_INVALID_DECIMAL_VALUE_FOR_OPTION**;
Message: Invalid decimal value for option '%s'.

*EE_INVALID_DECIMAL_VALUE_FOR_OPTION* was added in 8.0.13.

• Error number: 85; Symbol: **EE_COLLATION_PARSER_ERROR**;
Message: %s.

*EE_COLLATION_PARSER_ERROR* was added in 8.0.13.

• Error number: 86; Symbol: **EE_FAILED_TO_RESET_BEFORE_PRIMARY_IGNORABLE_CHAR**;
Message: Failed to reset before a primary ignorable character %s.

*EE_FAILED_TO_RESET_BEFORE_PRIMARY_IGNORABLE_CHAR* was added in 8.0.13.

• Error number: 87; Symbol: **EE_FAILED_TO_RESET_BEFORE_TERTIARY_IGNORABLE_CHAR**;
Message: Failed to reset before a tertiary ignorable character %s.

*EE_FAILED_TO_RESET_BEFORE_TERTIARY_IGNORABLE_CHAR* was added in 8.0.13.

• Error number: 88; Symbol: **EE_SHIFT_CHAR_OUT_OF_RANGE**;
Message: Shift character out of range: %s.

*EE_SHIFT_CHAR_OUT_OF_RANGE* was added in 8.0.13.
• Error number: 89; Symbol: EE_RESET_CHAR_OUT_OF_RANGE;
Message: Reset character out of range: %s.
EE_RESET_CHAR_OUT_OF_RANGE was added in 8.0.13.

• Error number: 90; Symbol: EE_UNKNOWN_LDML_TAG;
Message: Unknown LDML tag: '%.*s'.
EE_UNKNOWN_LDML_TAG was added in 8.0.13.

• Error number: 91; Symbol: EE_FAILED_TO_RESET_BEFORE_SECONDARY_IGNORABLE_CHAR;
Message: Failed to reset before a secondary ignorable character %s.
EE_FAILED_TO_RESET_BEFORE_SECONDARY_IGNORABLE_CHAR was added in 8.0.16.

B.4 Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to
determine the causes of the problems and what to do to solve them.

B.4.1 How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of
equipment is causing it:

• If you have one of the following symptoms, then it is probably a hardware problems (such as memory,
motherboard, CPU, or hard disk) or kernel problem:

  • The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the
Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should
try to restart your computer and check all cables to the keyboard.)
  
  • The mouse pointer does not move.
  
  • The machine does not answer to a remote machine's pings.
  
  • Other programs that are not related to MySQL do not behave correctly.
  
• Your system restarted unexpectedly. (A faulty user-level program should never be able to take down
your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your
hardware! You should also check whether there are any patches, updates, or service packs for your
operating system that could likely solve your problem. Check also that all your libraries (such as glibc)
are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

• If your keyboard is locked up, you may be able to recover by logging in to your machine from another
machine and executing kbd_mode -a.

• Please examine your system log file (/var/log/messages or similar) for reasons for your problem.
If you think the problem is in MySQL, you should also examine MySQL's log files. See Section 5.4,
"MySQL Server Logs".
Common Errors When Using MySQL Programs

- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.

- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.

- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If you have examined all other possibilities and concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report, see Section 1.7, “How to Report Bugs or Problems”. In the bug report, try to give a complete description of how the system is behaving and what you think is happening. Also state why you think that MySQL is causing the problem. Take into consideration all the situations described in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system does not work.” This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?

- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.

- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?

- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in Section 1.7, “How to Report Bugs or Problems”.

B.4.2 Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

B.4.2.1 Access denied

An Access denied error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See Section 6.2, “Access Control and Account Management”, and Section 6.2.21, “Troubleshooting Problems Connecting to MySQL”.

B.4.2.2 Can’t connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.
If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `named_pipe` system variable enabled, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `. as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See Section 2.10.2, “Starting the Server”.

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin --host='hostname' version variables
shell> mysqladmin --host='hostname' --port=3306 version
shell> mysqladmin --host=host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with the `bind_address` system variable set to `127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or Windows Firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.

- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: Connection to MySQL Server Failing on Windows.
Common Errors When Using MySQL Programs

• Someone has removed the Unix socket file that mysqld uses (/tmp/mysql.sock by default). For example, you might have a cron job that removes old files from the /tmp directory. You can always run mysqladmin version to check whether the Unix socket file that mysqladmin is trying to use really exists. The fix in this case is to change the cron job to not remove mysql.sock or to place the socket file somewhere else. See Section B.4.3.6, “How to Protect or Change the MySQL Unix Socket File”.

• You have started the mysqld server with the --socket=/path/to/socket option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same --socket option when you run client programs. You also need to ensure that clients have permission to access the mysql.sock file. To find out where the socket file is, you can do:

  shell> netstat -ln | grep mysql

See Section B.4.3.6, “How to Protect or Change the MySQL Unix Socket File”.

• You are using Linux and one server thread has died (dumped core). In this case, you must kill the other mysqld threads (for example, with kill) before you can restart the MySQL server. See Section B.4.3.3, “What to Do If MySQL Keeps Crashing”.

• The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart mysqld with a --socket option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message Can't connect to MySQL server on some_host, you can try the following things to find out what the problem is:

• Check whether the server is running on that host by executing telnet some_host 3306 and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as telnet: Unable to connect to remote host: Connection refused, then there is no server running on the given port.

• If the server is running on the local host, try using mysqladmin -h localhost variables to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the port variable.)

• If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the mysqld process.

Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a Can't connect to MySQL server error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of TIME_WAIT is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The TIME_WAIT delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.
It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

Important

The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore it if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: http://support.microsoft.com/kb/256986/EN-US/.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters

3. On the Edit menu, click Add Value, and then add the following registry value:

| Value Name: MaxUserPort  
| Data Type: REG_DWORD  
| Value: 65534 |

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the Edit menu, click Add Value, and then add the following registry value:

| Value Name: TcpTimedWaitDelay  
| Data Type: REG_DWORD  
| Value: 30 |

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 30 and 300 decimal, although you may wish to check with Microsoft for the latest permitted values. The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

**B.4.2.3 Lost connection to MySQL server**

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with BLOB values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometimes you may see an `ER_NET_PACKET_TOO_LARGE` error, and that confirms that you need to increase `max_allowed_packet`.

**B.4.2.4 Password Fails When Entered Interactively**

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

**B.4.2.5 Host 'host_name' is blocked**

If the following error occurs, it means that `mysqld` has received many connection requests from the given host that were interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqldadmin flush-hosts'
```

The value of the `max_connect_errors` system variable determines how many successive interrupted connection requests are permitted. After `max_connect_errors` failed requests without a successful connection, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you flush the host cache by executing a `FLUSH HOSTS`
statement, a **TRUNCATE TABLE** statement that truncates the Performance Schema `host_cache` table, or a `mysqladmin flush-hosts` command.

To adjust the permitted number of successive connection errors, set `max_connect_errors` at server startup. For example, put these lines in the server `my.cnf` file:

```
[mysqld]
max_connect_errors=10000
```

The value can also be set at runtime:

```
SET GLOBAL max_connect_errors=10000;
```

If you get the `Host 'host_name' is blocked` error message for a given host, you should first verify that there is nothing wrong with TCP/IP connections from that host. If you are having network problems, it does no good to increase the value of `max_connect_errors`.

For more information about how the host cache works, see Section 8.12.4.2, “DNS Lookup Optimization and the Host Cache”.

**B.4.2.6 Too many connections**

If clients encounter **Too many connections** errors when attempting to connect to the `mysqld` server, all available connections are in use by other clients. The permitted number of connections is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. To support more connections, set `max_connections` to a larger value.

`mysqld` actually permits `max_connections + 1` client connections. The extra connection is reserved for use by accounts that have the `CONNECTION_ADMIN` or `SUPER` privilege. By granting the privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See Section 13.7.6.29, “SHOW PROCESSLIST Syntax”.

The server also permits administrative connections on a dedicated interface. For more information about how the server handles client connections, see Section 8.12.4.1, “How MySQL Handles Client Connections”.

**B.4.2.7 Out of memory**

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

**B.4.2.8 MySQL server has gone away**

This section also covers the related **Lost connection to server during query** error.
The most common reason for the MySQL server has gone away error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CR_SERVER_GONE_ERROR</td>
<td>The client couldn't send a question to the server.</td>
</tr>
<tr>
<td>CR_SERVER_LOST</td>
<td>The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.</td>
</tr>
</tbody>
</table>

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the wait_timeout variable when you start mysqld. See Section 5.1.8, “Server System Variables”.

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the mysql command-line client).

Some other common reasons for the MySQL server has gone away error are:

- You (or the db administrator) has killed the running thread with a KILL statement or a mysqladmin kill command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...) or mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...). In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the reconnect flag in the MYSQL structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because wait_timeout expired) before the command was issued.

The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a mysql_ping() on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set wait_timeout on the mysqld server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If mysqld receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big BLOB columns), you can increase the query limit by setting the server’s max_allowed_packet variable, which has a default value of 64MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in Section B.4.2.9, “Packet Too Large”.

An INSERT or REPLACE statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows
to be inserted; thus, you can often avoid the error by reducing the number of rows sent per INSERT or REPLACE.

- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the MySQL server has gone away error if MySQL is started with the --skip-networking option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.

- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing mysqladmin version and examining the server's uptime. If the client connection was broken because mysqld crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See Section B.4.3.3, “What to Do If MySQL Keeps Crashing”.

You can obtain more information about lost connections by starting mysqld with the log_error_verbosity system variable set to 3. This logs some of the disconnection messages in the hostname.err file. See Section 5.4.2, “The Error Log”.

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See Section B.4.3.3, “What to Do If MySQL Keeps Crashing”.

- If a specific query kills mysqld and the tables involved were checked with CHECK TABLE before you ran the query, can you provide a reproducible test case? See Section 29.5, “Debugging and Porting MySQL”.

- What is the value of the wait_timeout system variable in the MySQL server? (mysqladmin variables gives you the value of this variable.)

- Have you tried to run mysqld with the general query log enabled to determine whether the problem query appears in the log? (See Section 5.4.3, “The General Query Log”.)

See also Section B.4.2.10, “Communication Errors and Aborted Connections”, and Section 1.7, “How to Report Bugs or Problems”.

### B.4.2.9 Packet Too Large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 8.0 server or client is 1GB.

When a MySQL client or the mysqld server receives a packet bigger than max_allowed_packet bytes, it issues an ER_NET_PACKET_TOO_LARGE error and closes the connection. With some clients, you may
also get a *Lost connection to MySQL server during query* error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 64MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 128MB, start the server like this:

```
shell> mysqld --max_allowed_packet=128M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 128MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=128M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

**B.4.2.10 Communication Errors and Aborted Connections**

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See Section 5.4.2, “The Error Log”.
- The general query log. See Section 5.4.3, “The General Query Log”.
- The `Aborted_`xxx and `Connection_errors_`xxx status variables. See Section 5.1.10, “Server Status Variables”.
- The host cache, which is accessible using the Performance Schema `host_cache` table. See Section 8.12.4.2, “DNS Lookup Optimization and the Host Cache”, and Section 26.12.17.1, “The `host_cache` Table”.

If the `log_error_verbosity` system variable is set to 3, you might find messages like this in your error log:

```
[Note] Aborted connection 854 to db: 'employees' user: 'josh'
```
If a client is unable even to connect, the server increments the Aborted_connects status variable. Unsuccessful connection attempts can occur for the following reasons:

• A client attempts to access a database but has no privileges for it.
• A client uses an incorrect password.
• A connection packet does not contain the right information.
• It takes more than connect_timeout seconds to obtain a connect packet. See Section 5.1.8, “Server System Variables”.

If these kinds of things happen, it might indicate that someone is trying to break into your server! If the general query log is enabled, messages for these types of problems are logged to it.

If a client successfully connects but later disconnects improperly or is terminated, the server increments the Aborted_clients status variable, and logs an Aborted connection message to the error log. The cause can be any of the following:

• The client program did not call mysql_close() before exiting.
• The client had been sleeping more than wait_timeout or interactive_timeout seconds without issuing any requests to the server. See Section 5.1.8, “Server System Variables”.
• The client program ended abruptly in the middle of a data transfer.

Other reasons for problems with aborted connections or aborted clients:

• The max_allowed_packet variable value is too small or queries require more memory than you have allocated for mysqld. See Section B.4.2.9, “Packet Too Large”.
• Use of Ethernet protocol with Linux, both half and full duplex. Some Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
• A problem with the thread library that causes interrupts on reads.
• Badly configured TCP/IP.
• Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also Section B.4.2.8, “MySQL server has gone away”.

B.4.2.11 The table is full

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See Section C.10.3, “Limits on Table Size”.

B.4.2.12 Can’t create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

Can’t create/write to file ’\sqla3fe_0.ism’.
The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See Section 4.2.2.2, “Using Option Files”.

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code  28:  No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Provided that the write error is to a test file, the error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

### B.4.2.13 Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

### B.4.2.14 Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system. To fix this problem, assign a new, valid password to the account.

### B.4.2.15 Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
• Even for file systems that are not case-sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See Section 13.7.6, “SHOW Syntax”.

B.4.2.16 Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

• The character set is a multibyte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `--DEFAULT_CHARSET=charset_name` option. See Section 2.9.4, “MySQL Source-Configuration Options”.

All standard MySQL binaries are compiled with support for all multibyte character sets.

• The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

• Recompile the client with support for the character set. See Section 2.9.4, “MySQL Source-Configuration Options”.

• Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.

• Copy the character definition files to the path where the client expects them to be.

B.4.2.17 File Not Found and Similar Errors

If you get `ERROR 'file_name' not found (errno: 23), Can't open file: file_name (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you have not allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
OS error code 23:  File table overflow
shell> perror 24
OS error code 24:  Too many open files
shell> perror 11
OS error code 11:  Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in Section 8.4.3.1, “How MySQL Opens and Closes Tables”. Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).
To change the number of file descriptors available to mysqld, you can use the \--open-files-limit option to mysqld_safe or set the open_files_limit system variable. See Section 5.1.8, “Server System Variables”. The easiest way to set these values is to add an option to your option file. See Section 4.2.2.2, “Using Option Files”. If you have an old version of mysqld that does not support setting the open files limit, you can edit the mysqld_safe script. There is a commented-out line ulimit -n 256 in the script. You can remove the # character to uncomment this line, and change the number 256 to set the number of file descriptors to be made available to mysqld.

\--open-files-limit and ulimit can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start mysqld_safe or mysqld as root (just remember that you also need to start the server with the --user option in this case so that it does not continue to run as root after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

**Note**

If you run the tcsh shell, ulimit does not work! tcsh also reports incorrect values when you ask for the current limits. In this case, you should start mysqld_safe using sh.

### B.4.2.18 Table-Corruption Issues

If you have started mysqld with \--myisam-recover-options, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the hostname.err file 'Warning: Checking table ...' which is followed by Warning: Repairing table if the table needs to be repaired. If you get a lot of these errors, without mysqld having died unexpectedly just before, then something is wrong and needs to be investigated further.

When the server detects MyISAM table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: Got an error from thread_id=1, mi_dynrec.c:368. This is useful information to include in bug reports.

See also Section 5.1.7, “Server Command Options”, and Section 29.5.1.7, “Making a Test Case If You Experience Table Corruption”.

### B.4.3 Administration-Related Issues

#### B.4.3.1 Problems with File Permissions

If you have problems with file permissions, the UMASK or UMASK_DIR environment variable might be set incorrectly when mysqld starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/file_name'  (Errcode: 13)
```

The default UMASK and UMASK_DIR values are 0640 and 0750, respectively. MySQL assumes that the value for UMASK or UMASK_DIR is in octal if it starts with a zero. For example, setting UMASK=0600 is equivalent to UMASK=384 because 0600 octal is 384 decimal.

To change the default UMASK value, start mysqld_safe as follows:

```
shell> UMASK=384  # = 600 in octal
shell> export UMASK
```
Administration-Related Issues

By default, MySQL creates database directories with an access permission value of 0750. To modify this behavior, set the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, to give group access to all new directories, start `mysqld_safe` as follows:

```
shell> UMASK_DIR=504  # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

For additional details, see Section 4.9, “MySQL Environment Variables”.

B.4.3.2 How to Reset the Root Password

If you have never assigned a root password for MySQL, the server does not require a password at all for connecting as root. However, this is insecure. For instructions on assigning a password, see Section 2.10.4, “Securing the Initial MySQL Account”.

If you know the root password and want to change it, see Section 13.7.1.1, “ALTER USER Syntax”, and Section 13.7.1.10, “SET PASSWORD Syntax”.

If you assigned a root password previously but have forgotten it, you can assign a new password. The following sections provide instructions for Windows and Unix and Unix-like systems, as well as generic instructions that apply to any system.

Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for the MySQL 'root'@'localhost' account. To change the password for a root account with a different host name part, modify the instructions to use that host name.

1. Log on to your system as Administrator.

2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the Start menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list and stop it.

   If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

   ```
   ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
   ```

4. Save the file. This example assumes that you name the file `C:\mysql-init.txt`.

5. Open a console window to get to the command prompt: From the Start menu, select Run, then enter `cmd` as the command to be run.

6. Start the MySQL server with the special `--init-file` option (notice that the backslash in the option value is doubled):

   ```
   C:\> cd "C:\Program Files\MySQL\MySQL Server 8.0\bin"
   C:\> mysqld --init-file=C:\mysql-init.txt
   ```
If you installed MySQL to a different location, adjust the `cd` command accordingly.

The server executes the contents of the file named by the `--init-file` option at startup, changing the 'root'@'localhost' account password.

To have server output to appear in the console window rather than in a log file, add the `--console` option to the `mysqld` command.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option. For example:

```bash
C:\> mysqld
    --defaults-file="C:\\ProgramData\\MySQL\\MySQL Server 8.0\\my.ini"
    --init-file=C:\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the Start menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list, right-click it, and choose the Properties option. The Path to executable field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as root using the new password. Stop the MySQL server and restart it normally. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

**Resetting the Root Password: Unix and Unix-Like Systems**

On Unix, use the following procedure to reset the password for the MySQL 'root'@'localhost' account. To change the password for a root account with a different host name part, modify the instructions to use that host name.

The instructions assume that you will start the MySQL server from the Unix login account that you normally use for running it. For example, if you run the server using the mysql login account, you should log in as mysql before using the instructions. Alternatively, you can log in as root, but in this case you must start mysqld with the `--user=mysql` option. If you start the server as root without using `--user=mysql`, the server may create root-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to mysql or remove them.

1. Log on to your system as the Unix user that the MySQL server runs as (for example, `mysql`).

2. Stop the MySQL server if it is running. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

Stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process. Use the actual path name of the `.pid` file in the following command:

```bash
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.
3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

4. Save the file. This example assumes that you name the file `/home/me/mysql-init`. The file contains the password, so do not save it where it can be read by other users. If you are not logged in as `mysql` (the user the server runs as), make sure that the file has permissions that permit `mysql` to read it.

5. Start the MySQL server with the special `--init-file` option:

```
shell> mysqld --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `--init-file` option at startup, changing the `root`@`localhost` account password.

Other options may be necessary as well, depending on how you normally start your server. For example, `--defaults-file` may be needed before `--init-file`.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

**Resetting the Root Password: Generic Instructions**

The preceding sections provide password-resetting instructions specifically for Windows and Unix and Unix-like systems. Alternatively, on any platform, you can reset the password using the `mysql` client (but this approach is less secure):

1. Stop the MySQL server if necessary, then restart it with the `--skip-grant-tables` option.
   This enables anyone to connect without a password and with all privileges, and disables account-management statements such as `ALTER USER` and `SET PASSWORD`. Because this is insecure, if the server is started with the `--skip-grant-tables` option, it enables `--skip-networking` automatically to prevent remote connections.

2. Connect to the MySQL server using the `mysql` client; no password is necessary because the server was started with `--skip-grant-tables`:

```
shell> mysql
```

3. In the `mysql` client, tell the server to reload the grant tables so that account-management statements work:

```
mysql> FLUSH PRIVILEGES;
```

Then change the `root`@`localhost` account password. Replace the password with the password that you want to use. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

```
mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` and `--skip-networking` options).
Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See Section 5.4.2, "The Error Log".

On some systems, you can find in the error log a stack trace of where `mysqld` died. Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with the `delay_key_write` system variable enabled, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that does not support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See Chapter 5, MySQL Server Administration.

- Start `mysqld` with the general query log enabled (see Section 5.4.3, “The General Query Log”). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See Section 5.4.3, “The General Query Log”. If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have isolated the bug and should submit a bug report for it. See Section 1.7, “How to Report Bugs or Problems".
• Try to make a test case that we can use to repeat the problem. See Section 29.5, “Debugging and Porting MySQL”.

• Try the fork_big.pl script. (It is located in the tests directory of source distributions.)

• Configuring MySQL for debugging makes it much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the -DWITH_DEBUG=1 option to CMake and then recompile. See Section 29.5, “Debugging and Porting MySQL”.

• Make sure that you have applied the latest patches for your operating system.

• Use the --skip-external-locking option to mysqld. On some systems, the lockd lock manager does not work properly; the --skip-external-locking option tells mysqld not to use external locking. (This means that you cannot run two mysqld servers on the same data directory and that you must be careful if you use myisamchk. Nevertheless, it may be instructive to try the option as a test.)
