- For _history_long, when the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

When a thread ends, all its rows are discarded from the _history table but not from the _history_long table.

The following example illustrates the differences in how events are added to and discarded from the two types of history tables. The principles apply equally to all event types. The example is based on these assumptions:

- The Performance Schema is configured to retain 10 rows per thread in the _history table and 10,000 rows total in the _history_long table.
- Thread A generates 1 event per second.
  Thread B generates 100 events per second.
- No other threads are running.

After 5 seconds of execution:

- A and B have generated 5 and 500 events, respectively.
  - _history contains 5 rows for A and 10 rows for B. Because storage per thread is limited to 10 rows, no rows have been discarded for A, whereas 490 rows have been discarded for B.
  - _history_long contains 5 rows for A and 500 rows for B. Because the table has a maximum size of 10,000 rows, no rows have been discarded for either thread.

After 5 minutes (300 seconds) of execution:

- A and B have generated 300 and 30,000 events, respectively.
  - _history contains 10 rows for A and 10 rows for B. Because storage per thread is limited to 10 rows, 290 rows have been discarded for A, whereas 29,990 rows have been discarded for B. Rows for A include data up to 10 seconds old, whereas rows for B include data up to only .1 seconds old.
  - _history_long contains 10,000 rows. Because A and B together generate 101 events per second, the table contains data up to approximately 10,000/101 = 99 seconds old, with a mix of rows approximately 100 to 1 from B as opposed to A.

26.10 Performance Schema Statement Digests and Sampling

The MySQL server is capable of maintaining statement digest information. The digesting process converts each SQL statement to normalized form (the statement digest) and computes a SHA-256 hash value (the digest hash value) from the normalized result. Normalization permits statements that are similar to be
Statement Digest General Concepts

When the parser receives an SQL statement, it computes a statement digest if that digest is needed, which is true if any of the following conditions are true:

• Performance Schema digest instrumentation is enabled
• A Query Rewrite Plugin is enabled

The parser is also used by the `STATEMENT_DIGEST_TEXT()` and `STATEMENT_DIGEST()` functions, which applications can call to compute a normalized statement digest and a digest hash value, respectively, from an SQL statement.

The `max_digest_length` system variable value determines the maximum number of bytes available per session for computation of normalized statement digests. Once that amount of space is used during digest computation, truncation occurs: no further tokens from a parsed statement are collected or figure into its digest value. Statements that differ only after that many bytes of parsed tokens produce the same normalized statement digest and are considered identical if compared or if aggregated for digest statistics.

After the normalized statement has been computed, a SHA-256 hash value is computed from it. In addition:

• If any Query Rewrite Plugin is enabled, it is called and the statement digest and digest value are available to it.

• If the Performance Schema has digest instrumentation enabled, it makes a copy of the normalized statement digest, allocating a maximum of `performance_schema_max_digest_length` bytes for it. Consequently, if `performance_schema_max_digest_length` is less than `max_digest_length`, the copy is truncated relative to the original. The copy of the normalized statement digest is stored in the appropriate Performance Schema tables, along with the SHA-256 hash value computed from the original normalized statement. (If the Performance Schema truncates its copy of the normalized statement digest relative to the original, it does not recompute the SHA-256 hash value.)

Statement normalization transforms the statement text to a more standardized digest string representation that preserves the general statement structure while removing information not essential to the structure:

• Object identifiers such as database and table names are preserved.
• Literal values are converted to parameter markers. A normalized statement does not retain information such as names, passwords, dates, and so forth.
• Comments are removed and whitespace is adjusted.
Consider these statements:

```sql
SELECT * FROM orders WHERE customer_id=10 AND quantity>20
SELECT * FROM orders WHERE customer_id = 20 AND quantity > 100
```

To normalize these statements, the parser replaces data values by `?` and adjusts whitespace. Both statements yield the same normalized form and thus are considered “the same”:

```sql
SELECT * FROM orders WHERE customer_id = ? AND quantity > ?
```

The normalized statement contains less information but is still representative of the original statement. Other similar statements that have different data values have the same normalized form.

Now consider these statements:

```sql
SELECT * FROM customers WHERE customer_id = 1000
SELECT * FROM orders WHERE customer_id = 1000
```

In this case, the normalized statements differ because the object identifiers differ:

```sql
SELECT * FROM customers WHERE customer_id = ?
SELECT * FROM orders WHERE customer_id = ?
```

If normalization produces a statement that exceeds the space available in the digest buffer (as determined by `max_digest_length`), truncation occurs and the text ends with “...”. Long normalized statements that differ only in the part that occurs following the “...” are considered the same. Consider these statements:

```sql
SELECT * FROM mytable WHERE cola = 10 AND colb = 20
SELECT * FROM mytable WHERE cola = 10 AND colc = 20
```

If the cutoff happens to be right after the `AND`, both statements have this normalized form:

```sql
SELECT * FROM mytable WHERE cola = ? AND ...
```

In this case, the difference in the second column name is lost and both statements are considered the same.

### Statement Digests in the Performance Schema

In the Performance Schema, statement digesting involves these components:

- A `statements_digest` consumer in the `setup_consumers` table controls whether the Performance Schema maintains digest information. See Statement Digest Consumer.

- The statement event tables (`events_statements_current`, `events_statements_history`, and `events_statements_history_long`) have columns for storing normalized statement digests and the corresponding digest SHA-256 hash values:
  - `DIGEST_TEXT` is the text of the normalized statement digest. This is a copy of the original normalized statement that was computed to a maximum of `max_digest_length` bytes, further truncated as necessary to `performance_schema_max_digest_length` bytes.
  - `DIGEST` is the digest SHA-256 hash value computed from the original normalized statement.

See Section 26.12.6, “Performance Schema Statement Event Tables”.

- The `events_statements_summary_by_digest` summary table provides aggregated statement digest information. This table aggregates information for statements per `SCHEMA_NAME` and `DIGEST`
Statement Digest Memory Use

The Performance Schema uses SHA-256 hash values for aggregation because they are fast to compute and have a favorable statistical distribution that minimizes collisions. See Section 26.12.17.3, “Statement Summary Tables”.

Some Performance Tables have a column that stores original SQL statements from which digests are computed:

- The `SQL_TEXT` column of the `events_statements_current`, `events_statements_history`, and `events_statements_history_long` statement event tables.

- The `QUERY_SAMPLE_TEXT` column of the `events_statements_summary_by_digest` summary table.

The maximum space available for statement display is 1024 bytes by default. To change this value, set the `performance_schema_max_sql_text_length` system variable at server startup. Changes affect the storage required for all the columns just named.

The `performance_schema_max_digest_length` system variable determines the maximum number of bytes available per statement for digest value storage in the Performance Schema. However, the display length of statement digests may be longer than the available buffer size due to internal encoding of statement components such as keywords and literal values. Consequently, values selected from the `DIGEST_TEXT` column of statement event tables may appear to exceed the `performance_schema_max_digest_length` value.

The `events_statements_summary_by_digest` summary table provides a profile of the statements executed by the server. It shows what kinds of statements an application is executing and how often. An application developer can use this information together with other information in the table to assess the application's performance characteristics. For example, table columns that show wait times, lock times, or index use may highlight types of queries that are inefficient. This gives the developer insight into which parts of the application need attention.

The `events_statements_summary_by_digest` summary table has a fixed size. By default the Performance Schema estimates the size to use at startup. To specify the table size explicitly, set the `performance_schema_digests_size` system variable at server startup. If the table becomes full, the Performance Schema groups statements that have `SCHEMA_NAME` and `DIGEST` values not matching existing values in the table in a special row with `SCHEMA_NAME` and `DIGEST` set to `NULL`. This permits all statements to be counted. However, if the special row accounts for a significant percentage of the statements executed, it might be desirable to increase the summary table size by increasing the `performance_schema_digests_size` variable.

**Statement Digest Memory Use**

For applications that generate very long statements that differ only at the end, increasing `max_digest_length` enables computation of digests that distinguish statements that would otherwise aggregate to the same digest. Conversely, decreasing `max_digest_length` causes the server to devote less memory to digest storage but increases the likelihood of longer statements aggregating to the same digest. Administrators should keep in mind that larger values result in correspondingly increased memory requirements, particularly for workloads that involve large numbers of simultaneous sessions (the server allocates `max_digest_length` bytes per session).

As described previously, normalized statement digests as computed by the parser are constrained to a maximum of `max_digest_length` bytes, whereas normalized statement digests stored in the Performance Schema use `performance_schema_max_digest_length` bytes. The following memory-use considerations apply regarding the relative values of `max_digest_length` and `performance_schema_max_digest_length`:
• If `max_digest_length` is less than `performance_schema_max_digest_length`:
  • Server components other than the Performance Schema use normalized statement digests that take up to `max_digest_length` bytes.
  • The Performance Schema does not further truncate normalized statement digests that it stores, but allocates more memory than `max_digest_length` bytes per digest, which is unnecessary.

• If `max_digest_length` equals `performance_schema_max_digest_length`:
  • Server components other than the Performance Schema use normalized statement digests that take up to `max_digest_length` bytes.
  • The Performance Schema does not further truncate normalized statement digests that it stores, and allocates the same amount of memory as `max_digest_length` bytes per digest.

• If `max_digest_length` is greater than `performance_schema_max_digest_length`:
  • Server components other than the Performance Schema use normalized statement digests that take up to `max_digest_length` bytes.
  • The Performance Schema further truncates normalized statement digests that it stores, and allocates less memory than `max_digest_length` bytes per digest.

Because the Performance Schema statement event tables might store many digests, setting `performance_schema_max_digest_length` smaller than `max_digest_length` enables administrators to balance these factors:

• The need to have long normalized statement digests available for server components outside the Performance Schema
• Many concurrent sessions, each of which allocates digest-computation memory
• The need to limit memory consumption by the Performance Schema statement event tables when storing many statement digests

The `performance_schema_max_digest_length` setting is not per session, it is per statement, and a session can store multiple statements in the `events_statements_history` table. A typical number of statements in this table is 10 per session, so each session will consume 10 times the memory indicated by the `performance_schema_max_digest_length` value, for this table alone.

Also, there are many statements (and digests) collected globally, most notably in the `events_statements_history_long` table. Here, too, `N` statements stored will consume `N` times the memory indicated by the `performance_schema_max_digest_length` value.

To assess the amount of memory used for SQL statement storage and digest computation, use the `SHOW ENGINE PERFORMANCE_SCHEMA STATUS` statement, or monitor these instruments:

```sql
mysql> SELECT NAME
            FROM performance_schema.setup_instruments
            WHERE NAME LIKE '%.sqltext';
+------------------------------------------------------------------+
| NAME                                                             |
+------------------------------------------------------------------+
| memory/performance_schema/events_statements_history.sqltext      |
| memory/performance_schema/events_statements_current.sqltext      |
| memory/performance_schema/events_statements_history_long.sqltext |
+------------------------------------------------------------------+
```
Statement Sampling

The Performance Schema uses statement sampling to collect representative statements that produce each digest value in the `events_statements_summary_by_digest` table. These columns store sample statement information: `QUERY_SAMPLE_TEXT` (the text of the statement), `QUERY_SAMPLE_SEEN` (when the statement was seen), and `QUERY_SAMPLE_TIMER_WAIT` (the statement wait or execution time). The Performance Schema updates all three columns each time it chooses a sample statement.

When a new table row is inserted, the statement that produced the row digest value is stored as the current sample statement associated with the digest. Thereafter, when the server sees other statements with the same digest value, it determines whether to use the new statement to replace the current sample statement (that is, whether to resample). Resampling policy is based on the comparative wait times of the current sample statement and new statement and, optionally, the age of the current sample statement:

- Resampling based on wait times: If the new statement wait time has a wait time greater than that of the current sample statement, it becomes the current sample statement.

- Resampling based on age: If the `performance_schema_max_digest_sample_age` system variable has a value greater than zero and the current sample statement is more than that many seconds old, the current statement is considered “too old” and the new statement replaces it. This occurs even if the new statement wait time is less than that of the current sample statement.

By default, `performance_schema_max_digest_sample_age` is 60 seconds (1 minute). To change how quickly sample statements “expire” due to age, increase or decrease the value. To disable the age-based part of the resampling policy, set `performance_schema_max_digest_sample_age` to 0.

26.11 Performance Schema General Table Characteristics

The name of the `performance_schema` database is lowercase, as are the names of tables within it. Queries should specify the names in lowercase.

Many tables in the `performance_schema` database are read only and cannot be modified:

```
mysql> TRUNCATE TABLE performance_schema.setup_instruments;
ERROR 1683 (HY000): Invalid performance_schema usage.
```

Some of the setup tables have columns that can be modified to affect Performance Schema operation; some also permit rows to be inserted or deleted. Truncation is permitted to clear collected events, so `TRUNCATE TABLE` can be used on tables containing those kinds of information, such as tables named with a prefix of `events_waits_`.

Summary tables can be truncated with `TRUNCATE TABLE`. Generally, the effect is to reset the summary columns to 0 or `NULL`, not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.
Privileges are as for other databases and tables:

• To retrieve from `performance_schema` tables, you must have the `SELECT` privilege.

• To change those columns that can be modified, you must have the `UPDATE` privilege.

• To truncate tables that can be truncated, you must have the `DROP` privilege.

Because only a limited set of privileges apply to Performance Schema tables, attempts to use `GRANT ALL` as shorthand for granting privileges at the database or table level fail with an error:

```
mysql> GRANT ALL ON performance_schema.* TO 'u1'@'localhost';
ERROR 1044 (42000): Access denied for user 'root'@'localhost'
to database 'performance_schema'
```

```
mysql> GRANT ALL ON performance_schema.setup_instruments TO 'u2'@'localhost';
ERROR 1044 (42000): Access denied for user 'root'@'localhost'
to database 'performance_schema'
```

Instead, grant exactly the desired privileges:

```
mysql> GRANT SELECT ON performance_schema.* TO 'u1'@'localhost';
Query OK, 0 rows affected (0.03 sec)
```

```
mysql> GRANT SELECT, UPDATE ON performance_schema.setup_instruments TO 'u2'@'localhost';
Query OK, 0 rows affected (0.02 sec)
```

### 26.12 Performance Schema Table Descriptions

Tables in the `performance_schema` database can be grouped as follows:

• Setup tables. These tables are used to configure and display monitoring characteristics.

• Current events tables. The `events_waits_current` table contains the most recent event for each thread. Other similar tables contain current events at different levels of the event hierarchy: `events_stages_current` for stage events, `events_statements_current` for statement events, and `events_transactions_current` for transaction events.

• History tables. These tables have the same structure as the current events tables, but contain more rows. For example, for wait events, `events_waits_history` table contains the most recent 10 events per thread. `events_waits_history_long` contains the most recent 10,000 events. Other similar tables exist for stage, statement, and transaction histories.

To change the sizes of the history tables, set the appropriate system variables at server startup. For example, to set the sizes of the wait event history tables, set `performance_schema_events_waits_history_size` and `performance_schema_events_waits_history_long_size`.

• Summary tables. These tables contain information aggregated over groups of events, including those that have been discarded from the history tables.

• Instance tables. These tables document what types of objects are instrumented. An instrumented object, when used by the server, produces an event. These tables provide event names and explanatory notes or status information.

• Miscellaneous tables. These do not fall into any of the other table groups.
### 26.12.1 Performance Schema Table Index

The following table lists each Performance Schema table and provides a short description of each one.

### 26.12.2 Performance Schema Setup Tables

The setup tables provide information about the current instrumentation and enable the monitoring configuration to be changed. For this reason, some columns in these tables can be changed if you have the **UPDATE** privilege.

The use of tables rather than individual variables for setup information provides a high degree of flexibility in modifying Performance Schema configuration. For example, you can use a single statement with standard SQL syntax to make multiple simultaneous configuration changes.

These setup tables are available:

- **setup_actors**: How to initialize monitoring for new foreground threads
- **setup_consumers**: The destinations to which event information can be sent and stored
- **setup_instruments**: The classes of instrumented objects for which events can be collected
- **setup_objects**: Which objects should be monitored
- **setup_threads**: Instrumented thread names and attributes

#### 26.12.2.1 The setup_actors Table

The **setup_actors** table contains information that determines whether to enable monitoring and historical event logging for new foreground server threads (threads associated with client connections). This table has a maximum size of 100 rows by default. To change the table size, modify the **performance_schema_setup_actors_size** system variable at server startup.

For each new foreground thread, the Performance Schema matches the user and host for the thread against the rows of the **setup_actors** table. If a row from that table matches, its **ENABLED** and **HISTORY** column values are used to set the **INSTRUMENTED** and **HISTORY** columns, respectively, of the **threads** table row for the thread. This enables instrumenting and historical event logging to be applied selectively per host, user, or account (user and host combination). If there is no match, the **INSTRUMENTED** and **HISTORY** columns for the thread are set to **NO**.

For background threads, there is no associated user. **INSTRUMENTED** and **HISTORY** are **YES** by default and **setup_actors** is not consulted.

The initial contents of the **setup_actors** table match any user and host combination, so monitoring and historical event collection are enabled by default for all foreground threads:

```sql
mysql> SELECT * FROM performance_schema.setup_actors;
+--------+--------+--------+--------+--------+
<table>
<thead>
<tr>
<th>HOST</th>
<th>USER</th>
<th>ROLE</th>
<th>ENABLED</th>
<th>HISTORY</th>
</tr>
</thead>
</table>
```

</tbody>
</table>
For information about how to use the `setup_actors` table to affect event monitoring, see Section 26.4.6, “Pre-Filtering by Thread”.

Modifications to the `setup_actors` table affect only foreground threads created subsequent to the modification, not existing threads. To affect existing threads, modify the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows.

The `setup_actors` table has these columns:

- **HOST**
  The host name. This should be a literal name, or '%', to mean “any host.”

- **USER**
  The user name. This should be a literal name, or '%', to mean “any user.”

- **ROLE**
  Unused.

- **ENABLED**
  Whether to enable instrumentation for foreground threads matched by the row. The value is YES or NO.

- **HISTORY**
  Whether to log historical events for foreground threads matched by the row. The value is YES or NO.

The `setup_actors` table has these indexes:

- Primary key on (HOST, USER, ROLE)

`TRUNCATE TABLE` is permitted for the `setup_actors` table. It removes the rows.

### 26.12.2.2 The `setup_consumers` Table

The `setup_consumers` table lists the types of consumers for which event information can be stored and which are enabled:

```sql
mysql> SELECT * FROM performance_schema.setup_consumers;
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>ENABLED</th>
</tr>
</thead>
<tbody>
<tr>
<td>events_stages_current</td>
<td>NO</td>
</tr>
<tr>
<td>events_stages_history</td>
<td>NO</td>
</tr>
<tr>
<td>events_stages_history_long</td>
<td>NO</td>
</tr>
<tr>
<td>events_statements_current</td>
<td>YES</td>
</tr>
<tr>
<td>events_statements_history</td>
<td>YES</td>
</tr>
<tr>
<td>events_statements_history_long</td>
<td>NO</td>
</tr>
<tr>
<td>events_transactions_current</td>
<td>YES</td>
</tr>
<tr>
<td>events_transactions_history</td>
<td>YES</td>
</tr>
<tr>
<td>events_transactions_history_long</td>
<td>NO</td>
</tr>
<tr>
<td>events_waits_current</td>
<td>NO</td>
</tr>
<tr>
<td>events_waits_history</td>
<td>NO</td>
</tr>
<tr>
<td>events_waits_history_long</td>
<td>NO</td>
</tr>
<tr>
<td>global_instrumentation</td>
<td>YES</td>
</tr>
<tr>
<td>thread_instrumentation</td>
<td>YES</td>
</tr>
<tr>
<td>statements_digest</td>
<td>YES</td>
</tr>
</tbody>
</table>
```
The consumer settings in the `setup_consumers` table form a hierarchy from higher levels to lower. For detailed information about the effect of enabling different consumers, see Section 26.4.7, “Pre-Filtering by Consumer”.

Modifications to the `setup_consumers` table affect monitoring immediately.

The `setup_consumers` table has these columns:

- **NAME**
  - The consumer name.

- **ENABLED**
  - Whether the consumer is enabled. The value is `YES` or `NO`. This column can be modified. If you disable a consumer, the server does not spend time adding event information to it.

The `setup_consumers` table has these indexes:

- Primary key on `(NAME)`

`TRUNCATE TABLE` is not permitted for the `setup_consumers` table.

### 26.12.2.3 The setup_instruments Table

The `setup_instruments` table lists classes of instrumented objects for which events can be collected:

```sql
mysql> SELECT * FROM performance_schema.setup_instruments\G
*************************** 1. row ***************************
NAME: wait/synch/mutex/pfs/LOCK_pfs_share_list
ENABLED: NO
TIMED: NO
PROPERTIES: singleton
VOLATILITY: 1
DOCUMENTATION: Components can provide their own performance_schema tables. This lock protects the list of such tables definitions.
...
*************************** 369. row ***************************
NAME: stage/sql/executing
ENABLED: NO
TIMED: NO
PROPERTIES: 
VOLATILITY: 0
DOCUMENTATION: NULL
...
*************************** 687. row ***************************
NAME: statement/abstract/Query
ENABLED: YES
TIMED: YES
PROPERTIES: mutable
VOLATILITY: 0
DOCUMENTATION: SQL query just received from the network. At this point, the real statement type is unknown, the type will be refined after SQL parsing.
...
*************************** 696. row ***************************
NAME: memory/performance_schema/metadata_locks
ENABLED: YES
TIMED: NULL
PROPERTIES: global_statistics
VOLATILITY: 1
DOCUMENTATION: Memory used for table performance_schema.metadata_locks
...
```
Each instrument added to the source code provides a row for the `setup_instruments` table, even when the instrumented code is not executed. When an instrument is enabled and executed, instrumented instances are created, which are visible in the `xxx_instances` tables, such as `file_instances` or `rwlock_instances`.

Modifications to most `setup_instruments` rows affect monitoring immediately. For some instruments, modifications are effective only at server startup; changing them at runtime has no effect. This affects primarily mutexes, conditions, and rwlocks in the server, although there may be other instruments for which this is true.

For more information about the role of the `setup_instruments` table in event filtering, see Section 26.4.3, “Event Pre-Filtering”.

The `setup_instruments` table has these columns:

- **NAME**
  The instrument name. Instrument names may have multiple parts and form a hierarchy, as discussed in Section 26.6, “Performance Schema Instrument Naming Conventions”. Events produced from execution of an instrument have an `EVENT_NAME` value that is taken from the instrument `NAME` value. (Events do not really have a “name,” but this provides a way to associate events with instruments.)

- **ENABLED**
  Whether the instrument is enabled. The value is `YES` or `NO`. A disabled instrument produces no events. This column can be modified, although setting `ENABLED` has no effect for instruments that have already been created.

- **TIMED**
  Whether the instrument is timed. The value is `YES`, `NO`, or `NULL`. This column can be modified, although setting `TIMED` has no effect for instruments that have already been created.

  A `TIMED` value of `NULL` indicates that the instrument does not support timing. For example, memory operations are not timed, so their `TIMED` column is `NULL`.

  Setting `TIMED` to `NULL` for an instrument that supports timing has no effect, as does setting `TIMED` to non-`NULL` for an instrument that does not support timing.

  If an enabled instrument is not timed, the instrument code is enabled, but the timer is not. Events produced by the instrument have `NULL` for the `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` timer values. This in turn causes those values to be ignored when calculating the sum, minimum, maximum, and average time values in summary tables.

- **PROPERTIES**
  The instrument properties. This column uses the `SET` data type, so multiple flags from the following list can be set per instrument:

  - `global_statistics`: The instrument produces only global summaries. Summaries for finer levels are unavailable, such as per thread, account, user, or host. For example, most memory instruments produce only global summaries.

  - `mutable`: The instrument can “mutate” into a more specific one. This property applies only to statement instruments.

  - `progress`: The instrument is capable of reporting progress data. This property applies only to stage instruments.
• **singleton**: The instrument has a single instance. For example, most global mutex locks in the server are singletons, so the corresponding instruments are as well.

• **user**: The instrument is directly related to user workload (as opposed to system workload). One such instrument is `wait/io/socket/sql/client_connection`.

• **VOLATILITY**

The instrument volatility. Volatility values range from low to high. The values correspond to the `PSI_VOLATILITY_` constants defined in the `mysql/psi/psi_base.h` header file:

```c
define PSI_VOLATILITY_UNKNOWN 0
#define PSI_VOLATILITY_PERMANENT 1
#define PSI_VOLATILITY_PROVISIONING 2
#define PSI_VOLATILITY_DDL 3
#define PSI_VOLATILITY_CACHE 4
#define PSI_VOLATILITY_SESSION 5
#define PSI_VOLATILITY_TRANSACTION 6
#define PSI_VOLATILITY_QUERY 7
#define PSI_VOLATILITY_INTRA_QUERY 8
```

The **VOLATILITY** column is purely informational, to provide users (and the Performance Schema code) some hint about the instrument runtime behavior.

Instruments with a low volatility index (PERMANENT = 1) are created once at server startup, and never destroyed or re-created during normal server operation. They are destroyed only during server shutdown.

For example, the `wait/synch/mutex/pfs/LOCK_pfs_share_list` mutex is defined with a volatility of 1, which means it is created once. Possible overhead from the instrumentation itself (namely, mutex initialization) has no effect for this instrument then. Runtime overhead occurs only when locking or unlocking the mutex.

Instruments with a higher volatility index (for example, SESSION = 5) are created and destroyed for every user session. For example, the `wait/synch/mutex/sql/THD::LOCK_query_plan` mutex is created each time a session connects, and destroyed when the session disconnects.

This mutex is more sensitive to Performance Schema overhead, because overhead comes not only from the lock and unlock instrumentation, but also from mutex create and destroy instrumentation, which is executed more often.

Another aspect of volatility concerns whether and when an update to the **ENABLED** column actually has some effect:

• An update to **ENABLED** affects instrumented objects created subsequently, but has no effect on instruments already created.

• Instruments that are more “volatile” use new settings from the `setup_instruments` table sooner.

For example, this statement does not affect the `LOCK_query_plan` mutex for existing sessions, but does have an effect on new sessions created subsequent to the update:

```sql
UPDATE performance_schema.setup_instruments
SET ENABLED=value
```
WHERE NAME = 'wait/synch/mutex/sql/THD::LOCK_query_plan';

This statement actually has no effect at all:

UPDATE performance_schema.setup_instruments
SET ENABLED=value
WHERE NAME = 'wait/synch/mutex/pfs/LOCK_pfs_share_list';

This mutex is permanent, and was created already before the update is executed. The mutex is never created again, so the ENABLED value in setup_instruments is never used. To enable or disable this mutex, use the mutex_instances table instead.

• DOCUMENTATION

A string describing the instrument purpose. The value is NULL if no description is available.

The setup_instruments table has these indexes:

• Primary key on (NAME)

TRUNCATE TABLE is not permitted for the setup_instruments table.

26.12.2.4 The setup_objects Table

The setup_objects table controls whether the Performance Schema monitors particular objects. This table has a maximum size of 100 rows by default. To change the table size, modify the performance_schema_setup_objects_size system variable at server startup.

The initial setup_objects contents look like this:

```
mysql> SELECT * FROM performance_schema.setup_objects;
+-------------+--------------------+-------------+---------+-------+
| OBJECT_TYPE | OBJECT_SCHEMA      | OBJECT_NAME | ENABLED | TIMED |
+-------------+--------------------+-------------+---------+-------+
| EVENT       | mysql              | %           | NO      | NO    |
| EVENT       | performance_schema | %           | NO      | NO    |
| EVENT       | information_schema | %           | NO      | NO    |
| EVENT       | %                  | %           | YES     | YES   |
| FUNCTION    | mysql              | %           | NO      | NO    |
| FUNCTION    | performance_schema | %           | NO      | NO    |
| FUNCTION    | information_schema | %           | NO      | NO    |
| FUNCTION    | %                  | %           | YES     | YES   |
| PROCEDURE   | mysql              | %           | NO      | NO    |
| PROCEDURE   | performance_schema | %           | NO      | NO    |
| PROCEDURE   | information_schema | %           | NO      | NO    |
| PROCEDURE   | %                  | %           | YES     | YES   |
| TABLE       | mysql              | %           | NO      | NO    |
| TABLE       | performance_schema | %           | NO      | NO    |
| TABLE       | information_schema | %           | NO      | NO    |
| TABLE       | %                  | %           | YES     | YES   |
| TRIGGER     | mysql              | %           | NO      | NO    |
| TRIGGER     | performance_schema | %           | NO      | NO    |
| TRIGGER     | information_schema | %           | NO      | NO    |
| TRIGGER     | %                  | %           | YES     | YES   |
+-------------+--------------------+-------------+---------+-------+
```

Modifications to the setup_objects table affect object monitoring immediately.

For object types listed in setup_objects, the Performance Schema uses the table to how to monitor them. Object matching is based on the OBJECT_SCHEMA and OBJECT_NAME columns. Objects for which there is no match are not monitored.
The effect of the default object configuration is to instrument all tables except those in the mysql, INFORMATION_SCHEMA, and performance_schema databases. (Tables in the INFORMATION_SCHEMA database are not instrumented regardless of the contents of setup_objects; the row for information_schema.% simply makes this default explicit.)

When the Performance Schema checks for a match in setup_objects, it tries to find more specific matches first. For example, with a table db1.t1, it looks for a match for 'db1' and 't1', then for 'db1' and '%', then for '%' and '%'. The order in which matching occurs matters because different matching setup_objects rows can have different ENABLED and TIMED values.

Rows can be inserted into or deleted from setup_objects by users with the INSERT or DELETE privilege on the table. For existing rows, only the ENABLED and TIMED columns can be modified, by users with the UPDATE privilege on the table.

For more information about the role of the setup_objects table in event filtering, see Section 26.4.3, “Event Pre-Filtering”.

The setup_objects table has these columns:

- **OBJECT_TYPE**
  
  The type of object to instrument. The value is one of 'EVENT' (Event Scheduler event), 'FUNCTION' (stored function), 'PROCEDURE' (stored procedure), 'TABLE' (base table), or 'TRIGGER' (trigger).

- **TABLE** filtering affects table I/O events (wait/io/table/sql/handler instrument) and table lock events (wait/lock/table/sql/handler instrument).

- **OBJECT_SCHEMA**
  
  The schema that contains the object. This should be a literal name, or '%' to mean “any schema.”

- **OBJECT_NAME**
  
  The name of the instrumented object. This should be a literal name, or '%' to mean “any object.”

- **ENABLED**
  
  Whether events for the object are instrumented. The value is YES or NO. This column can be modified.

- **TIMED**
  
  Whether events for the object are timed. This column can be modified.

The setup_objects table has these indexes:

- **Index on (OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME)**

TRUNCATE TABLE is permitted for the setup_objects table. It removes the rows.

### 26.12.2.5 The setup_threads Table

The setup_threads table lists instrumented thread classes. It exposes thread class names and attributes:

```
mysql> SELECT * FROM performance_schema.setup_threads
```

<table>
<thead>
<tr>
<th>NAME: thread/performance_schema/setup</th>
<th>ENABLED: YES</th>
<th>HISTORY: YES</th>
<th>PROPERTIES: singleton</th>
<th>VOLATILITY: 0</th>
</tr>
</thead>
</table>
The setup_threads table has these columns:

- **NAME**
  
  The instrument name. Thread instruments begin with `thread` (for example, `thread/sql/parser_service` or `thread/performance_schema/setup`).

- **ENABLED**
  
  Whether the instrument is enabled. The value is **YES** or **NO**. This column can be modified, although setting **ENABLED** has no effect for threads that are already running.

  For background threads, setting the **ENABLED** value controls whether **INSTRUMENTED** is set to **YES** or **NO** for threads that are subsequently created for this instrument and listed in the threads table. For foreground threads, this column has no effect; the setup_actors table takes precedence.

- **HISTORY**
  
  Whether to log historical events for the instrument. The value is **YES** or **NO**. This column can be modified, although setting **HISTORY** has no effect for threads that are already running.

  For background threads, setting the **HISTORY** value controls whether **HISTORY** is set to **YES** or **NO** for threads that are subsequently created for this instrument and listed in the threads table. For foreground threads, this column has no effect; the setup_actors table takes precedence.

- **PROPERTIES**
  
  The instrument properties. This column uses the **SET** data type, so multiple flags from the following list can be set per instrument:

  - **singleton**: The instrument has a single instance. For example, there is only one thread for the `thread/sql/main` instrument.

  - **user**: The instrument is directly related to user workload (as opposed to system workload). For example, threads such as `thread/sql/one_connection` executing a user session have the **user** property to differentiate them from system threads.
Performance Schema Instance Tables

• **VOLATILITY**
  The instrument volatility. This column has the same meaning as in the `setup_instruments` table. See Section 26.12.2.3, “The setup_instruments Table”.

• **DOCUMENTATION**
  A string describing the instrument purpose. The value is `NULL` if no description is available.

The `setup_threads` table has these indexes:

- Primary key on (NAME)

TRUNCATE TABLE is not permitted for the `setup_threads` table.

### 26.12.2.6 The setup_timers Table

This table was removed in MySQL 8.0.4.

### 26.12.3 Performance Schema Instance Tables

Instance tables document what types of objects are instrumented. They provide event names and explanatory notes or status information:

- **cond_instances**: Condition synchronization object instances
- **file_instances**: File instances
- **mutex_instances**: Mutex synchronization object instances
- **rwlock_instances**: Lock synchronization object instances
- **socket_instances**: Active connection instances

These tables list instrumented synchronization objects, files, and connections. There are three types of synchronization objects: `cond, mutex, and rwlock`. Each instance table has an `EVENT_NAME` or `NAME` column to indicate the instrument associated with each row. Instrument names may have multiple parts and form a hierarchy, as discussed in Section 26.6, “Performance Schema Instrument Naming Conventions”.

The `mutex_instances.LOCKED_BY_THREAD_ID` and `rwlock_instances.WRITE_LOCKED_BY_THREAD_ID` columns are extremely important for investigating performance bottlenecks or deadlocks. For examples of how to use them for this purpose, see Section 26.19, “Using the Performance Schema to Diagnose Problems”

### 26.12.3.1 The cond_instances Table

The `cond_instances` table lists all the conditions seen by the Performance Schema while the server executes. A condition is a synchronization mechanism used in the code to signal that a specific event has happened, so that a thread waiting for this condition can resume work.

When a thread is waiting for something to happen, the condition name is an indication of what the thread is waiting for, but there is no immediate way to tell which other thread, or threads, will cause the condition to happen.

The `cond_instances` table has these columns:

- **NAME**
Performance Schema Instance Tables

The instrument name associated with the condition.

- **OBJECT_INSTANCE_BEGIN**
  
  The address in memory of the instrumented condition.

The `cond_instances` table has these indexes:

- Primary key on (**OBJECT_INSTANCE_BEGIN**)
- Index on (**NAME**)

`TRUNCATE TABLE` is not permitted for the `cond_instances` table.

### 26.12.3.2 The `file_instances` Table

The `file_instances` table lists all the files seen by the Performance Schema when executing file I/O instrumentation. If a file on disk has never been opened, it will not be in `file_instances`. When a file is deleted from the disk, it is also removed from the `file_instances` table.

The `file_instances` table has these columns:

- **FILE_NAME**
  
  The file name.

- **EVENT_NAME**
  
  The instrument name associated with the file.

- **OPEN_COUNT**
  
  The count of open handles on the file. If a file was opened and then closed, it was opened 1 time, but `OPEN_COUNT` will be 0. To list all the files currently opened by the server, use `WHERE OPEN_COUNT > 0`.

The `file_instances` table has these indexes:

- Primary key on (**FILE_NAME**)
- Index on (**EVENT_NAME**)

`TRUNCATE TABLE` is not permitted for the `file_instances` table.

### 26.12.3.3 The `mutex_instances` Table

The `mutex_instances` table lists all the mutexes seen by the Performance Schema while the server executes. A mutex is a synchronization mechanism used in the code to enforce that only one thread at a given time can have access to some common resource. The resource is said to be “protected” by the mutex.

When two threads executing in the server (for example, two user sessions executing a query simultaneously) do need to access the same resource (a file, a buffer, or some piece of data), these two threads will compete against each other, so that the first query to obtain a lock on the mutex will cause the other query to wait until the first is done and unlocks the mutex.

The work performed while holding a mutex is said to be in a “critical section,” and multiple queries do execute this critical section in a serialized way (one at a time), which is a potential bottleneck.
The `mutex_instances` table has these columns:

- **NAME**
  
  The instrument name associated with the mutex.

- **OBJECT_INSTANCE_BEGIN**
  
  The address in memory of the instrumented mutex.

- **LOCKED_BY_THREAD_ID**
  
  When a thread currently has a mutex locked, `LOCKED_BY_THREAD_ID` is the `THREAD_ID` of the locking thread, otherwise it is `NULL`.

The `mutex_instances` table has these indexes:

- Primary key on `(OBJECT_INSTANCE_BEGIN)`
- Index on `(NAME)`
- Index on `(LOCKED_BY_THREAD_ID)`

`TRUNCATE TABLE` is not permitted for the `mutex_instances` table.

For every mutex instrumented in the code, the Performance Schema provides the following information.

- The `setup_instruments` table lists the name of the instrumentation point, with the prefix `wait/synch/mutex/`.

- When some code creates a mutex, a row is added to the `mutex_instances` table. The `OBJECT_INSTANCE_BEGIN` column is a property that uniquely identifies the mutex.

- When a thread attempts to lock a mutex, the `events_waits_current` table shows a row for that thread, indicating that it is waiting on a mutex (in the `EVENT_NAME` column), and indicating which mutex is waited on (in the `OBJECT_INSTANCE_BEGIN` column).

- When a thread succeeds in locking a mutex:
  
  - `events_waits_current` shows that the wait on the mutex is completed (in the `TIMER_END` and `TIMER_WAIT` columns)
  
  - The completed wait event is added to the `events_waits_history` and `events_waits_history_long` tables
  
  - `mutex_instances` shows that the mutex is now owned by the thread (in the `THREAD_ID` column).

- When a thread unlocks a mutex, `mutex_instances` shows that the mutex now has no owner (the `THREAD_ID` column is `NULL`).

- When a mutex object is destroyed, the corresponding row is removed from `mutex_instances`.

By performing queries on both of the following tables, a monitoring application or a DBA can detect bottlenecks or deadlocks between threads that involve mutexes:

- `events_waits_current`, to see what mutex a thread is waiting for
- `mutex_instances`, to see which other thread currently owns a mutex
26.12.3.4 The rwlock_instances Table

The rwlock_instances table lists all the rwlock (read write lock) instances seen by the Performance Schema while the server executes. An rwlock is a synchronization mechanism used in the code to enforce that threads at a given time can have access to some common resource following certain rules. The resource is said to be “protected” by the rwlock. The access is either shared (many threads can have a read lock at the same time), exclusive (only one thread can have a write lock at a given time), or shared-exclusive (a thread can have a write lock while permitting inconsistent reads by other threads). Shared-exclusive access is otherwise known as an sxlock and optimizes concurrency and improves scalability for read-write workloads.

Depending on how many threads are requesting a lock, and the nature of the locks requested, access can be either granted in shared mode, exclusive mode, shared-exclusive mode or not granted at all, waiting for other threads to finish first.

The rwlock_instances table has these columns:

- **NAME**
  The instrument name associated with the lock.

- **OBJECT_INSTANCE_BEGIN**
  The address in memory of the instrumented lock.

- **WRITE_LOCKED_BY_THREAD_ID**
  When a thread currently has an rwlock locked in exclusive (write) mode, WRITE_LOCKED_BY_THREAD_ID is the THREAD_ID of the locking thread, otherwise it is NULL.

- **READ_LOCKED_BY_COUNT**
  When a thread currently has an rwlock locked in shared (read) mode, READ_LOCKED_BY_COUNT is incremented by 1. This is a counter only, so it cannot be used directly to find which thread holds a read lock, but it can be used to see whether there is a read contention on an rwlock, and see how many readers are currently active.

The rwlock_instances table has these indexes:

- Primary key on (OBJECT_INSTANCE_BEGIN)
- Index on (NAME)
- Index on (WRITE_LOCKED_BY_THREAD_ID)

TRUNCATE TABLE is not permitted for the rwlock_instances table.

By performing queries on both of the following tables, a monitoring application or a DBA may detect some bottlenecks or deadlocks between threads that involve locks:

- events_waits_current, to see what rwlock a thread is waiting for
- rwlock_instances, to see which other thread currently owns an rwlock

There is a limitation: The rwlock_instances can be used only to identify the thread holding a write lock, but not the threads holding a read lock.

26.12.3.5 The socket_instances Table
The **socket_instances** table provides a real-time snapshot of the active connections to the MySQL server. The table contains one row per TCP/IP or Unix socket file connection. Information available in this table provides a real-time snapshot of the active connections to the server. (Additional information is available in socket summary tables, including network activity such as socket operations and number of bytes transmitted and received; see Section 26.12.17.9, “Socket Summary Tables”).

```sql
mysql> SELECT * FROM performance_schema.socket_instances \G
```

<table>
<thead>
<tr>
<th>EVENT_NAME: wait/io/socket/sql/server_unix_socket</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT_INSTANCE_BEGIN: 4316619408</td>
</tr>
<tr>
<td>THREAD_ID: 1</td>
</tr>
<tr>
<td>SOCKET_ID: 16</td>
</tr>
<tr>
<td>IP:</td>
</tr>
<tr>
<td>PORT: 0</td>
</tr>
<tr>
<td>STATE: ACTIVE</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>EVENT_NAME: wait/io/socket/sql/client_connection</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT_INSTANCE_BEGIN: 4316644608</td>
</tr>
<tr>
<td>THREAD_ID: 21</td>
</tr>
<tr>
<td>SOCKET_ID: 39</td>
</tr>
<tr>
<td>IP: 127.0.0.1</td>
</tr>
<tr>
<td>PORT: 55233</td>
</tr>
<tr>
<td>STATE: ACTIVE</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>EVENT_NAME: wait/io/socket/sql/server_tcpip_socket</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT_INSTANCE_BEGIN: 4316699040</td>
</tr>
<tr>
<td>THREAD_ID: 1</td>
</tr>
<tr>
<td>SOCKET_ID: 14</td>
</tr>
<tr>
<td>IP: 0.0.0.0</td>
</tr>
<tr>
<td>PORT: 50603</td>
</tr>
<tr>
<td>STATE: ACTIVE</td>
</tr>
</tbody>
</table>

Socket instruments have names of the form *wait/io/socket/sql/socket_type* and are used like this:

1. The server has a listening socket for each network protocol that it supports. The instruments associated with listening sockets for TCP/IP or Unix socket file connections have a *socket_type* value of *server_tcpip_socket* or *server_unix_socket*, respectively.

2. When a listening socket detects a connection, the server transfers the connection to a new socket managed by a separate thread. The instrument for the new connection thread has a *socket_type* value of *client_connection*.

3. When a connection terminates, the row in **socket_instances** corresponding to it is deleted.

The **socket_instances** table has these columns:

- **EVENT_NAME**
  The name of the *wait/io/socket/* instrument that produced the event. This is a **NAME** value from the **setup_instruments** table. Instrument names may have multiple parts and form a hierarchy, as discussed in Section 26.6, “Performance Schema Instrument Naming Conventions”.

- **OBJECT_INSTANCE_BEGIN**
  This column uniquely identifies the socket. The value is the address of an object in memory.

- **THREAD_ID**
  The internal thread identifier assigned by the server. Each socket is managed by a single thread, so each socket can be mapped to a thread which can be mapped to a server process.

---

4521
Performance Schema Wait Event Tables

- **SOCKET_ID**
  The internal file handle assigned to the socket.

- **IP**
  The client IP address. The value may be either an IPv4 or IPv6 address, or blank to indicate a Unix socket file connection.

- **PORT**
  The TCP/IP port number, in the range from 0 to 65535.

- **STATE**
  The socket status, either **IDLE** or **ACTIVE**. Wait times for active sockets are tracked using the corresponding socket instrument. Wait times for idle sockets are tracked using the **idle** instrument.

  A socket is idle if it is waiting for a request from the client. When a socket becomes idle, the event row in `socket_instances` that is tracking the socket switches from a status of **ACTIVE** to **IDLE**. The **EVENT_NAME** value remains `wait/io/socket/*`, but timing for the instrument is suspended. Instead, an event is generated in the `events_waits_current` table with an **EVENT_NAME** value of **idle**.

  When the next request is received, the **idle** event terminates, the socket instance switches from **IDLE** to **ACTIVE**, and timing of the socket instrument resumes.

The `socket_instances` table has these indexes:

- Primary key on `(OBJECT_INSTANCE_BEGIN)`
- Index on `(THREAD_ID)`
- Index on `(SOCKET_ID)`
- Index on `(IP, PORT)`

**TRUNCATE TABLE** is not permitted for the `socket_instances` table.

The **IP:PORT** column combination value identifies the connection. This combination value is used in the **OBJECT_NAME** column of the `events_waits_` tables, to identify the connection from which socket events come:

- For the Unix domain listener socket (**server_unix_socket**), the port is 0, and the IP is ''.
- For client connections via the Unix domain listener (**client_connection**), the port is 0, and the IP is ''.
- For the TCP/IP server listener socket (**server_tcpiip_socket**), the port is always the master port (for example, 3306), and the IP is always 0.0.0.0.
- For client connections via the TCP/IP listener (**client_connection**), the port is whatever the server assigns, but never 0. The IP is the IP of the originating host (127.0.0.1 or ::1 for the local host).

### 26.12.4 Performance Schema Wait Event Tables

The Performance Schema instruments waits, which are events that take time. Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.
Performance Schema Wait Event Tables

These tables store wait events:

- **events_waits_current**: The current wait event for each thread.
- **events_waits_history**: The most recent wait events that have ended per thread.
- **events_waits_history_long**: The most recent wait events that have ended globally (across all threads).

The following sections describe the wait event tables. There are also summary tables that aggregate information about wait events; see Section 26.12.17.1, “Wait Event Summary Tables”.

For more information about the relationship between the three wait event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

### Configuring Wait Event Collection

To control whether to collect wait events, set the state of the relevant instruments and consumers:

- The **setup_instruments** table contains instruments with names that begin with `wait`. Use these instruments to enable or disable collection of individual wait event classes.

- The **setup_consumers** table contains consumer values with names corresponding to the current and historical wait event table names. Use these consumers to filter collection of wait events.

Some wait instruments are enabled by default; others are disabled. For example:

```
SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments
WHERE NAME LIKE 'wait/io/file/innodb%';
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>ENABLED</th>
<th>TIMED</th>
</tr>
</thead>
<tbody>
<tr>
<td>wait/io/file/innodb/innodb_tablespace_open_file</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>wait/io/file/innodb/innodb_data_file</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>wait/io/file/innodb/innodb_log_file</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>wait/io/file/innodb/innodb_temp_file</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>wait/io/file/innodb/innodb_arch_file</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>wait/io/file/innodb/innodb_clone_file</td>
<td>YES</td>
<td>YES</td>
</tr>
</tbody>
</table>

```
SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments
WHERE NAME LIKE 'wait/io/socket/%';
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>ENABLED</th>
<th>TIMED</th>
</tr>
</thead>
<tbody>
<tr>
<td>wait/io/socket/sql/server_tcpip_socket</td>
<td>NO</td>
<td>NO</td>
</tr>
<tr>
<td>wait/io/socket/sql/server_unix_socket</td>
<td>NO</td>
<td>NO</td>
</tr>
<tr>
<td>wait/io/socket/sql/client_connection</td>
<td>NO</td>
<td>NO</td>
</tr>
</tbody>
</table>

The wait consumers are disabled by default:

```
SELECT *
FROM performance_schema.setup_consumers
WHERE NAME LIKE 'events_waits%';
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>ENABLED</th>
</tr>
</thead>
<tbody>
<tr>
<td>events_waits_current</td>
<td>NO</td>
</tr>
<tr>
<td>events_waits_history</td>
<td>NO</td>
</tr>
<tr>
<td>events_waits_history_long</td>
<td>NO</td>
</tr>
</tbody>
</table>
To control wait event collection at server startup, use lines like these in your `my.cnf` file:

- **Enable:**

```sql
[mysqld]
performance-schema-instrument='wait/%=ON'
performance-schema-consumer-events-waits-current=ON
performance-schema-consumer-events-waits-history=ON
performance-schema-consumer-events-waits-history-long=ON
```

- **Disable:**

```sql
[mysqld]
performance-schema-instrument='wait/%=OFF'
performance-schema-consumer-events-waits-current=OFF
performance-schema-consumer-events-waits-history=OFF
performance-schema-consumer-events-waits-history-long=OFF
```

To control wait event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

- **Enable:**

```sql
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'wait/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'YES'
WHERE NAME LIKE 'events_waits%';
```

- **Disable:**

```sql
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'wait/%';

UPDATE performance_schema.setup_consumers
SET ENABLED = 'NO'
WHERE NAME LIKE 'events_waits%';
```

To collect only specific wait events, enable only the corresponding wait instruments. To collect wait events only for specific wait event tables, enable the wait instruments but only the wait consumers corresponding to the desired tables.

For additional information about configuring event collection, see Section 26.3, "Performance Schema Startup Configuration", and Section 26.4, "Performance Schema Runtime Configuration".

### 26.12.4.1 The `events_waits_current` Table

The `events_waits_current` table contains current wait events. The table stores one row per thread showing the current status of the thread's most recent monitored wait event, so there is no system variable for configuring the table size.

Of the tables that contain wait event rows, `events_waits_current` is the most fundamental. Other tables that contain wait event rows are logically derived from the current events. For example, the `events_waits_history` and `events_waits_history_long` tables are collections of the most recent wait events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.
For more information about the relationship between the three wait event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect wait events, see Section 26.12.4, “Performance Schema Wait Event Tables”.

The `events_waits_current` table has these columns:

- **THREAD_ID, EVENT_ID**
  The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- **END_EVENT_ID**
  This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- **EVENT_NAME**
  The name of the instrument that produced the event. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in Section 26.6, “Performance Schema Instrument Naming Conventions”.

- **SOURCE**
  The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved. For example, if a mutex or lock is being blocked, you can check the context in which this occurs.

- **TIMER_START, TIMER_END, TIMER_WAIT**
  Timing information for the event. The unit for these values is picoseconds (trillionths of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).

  If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END - TIMER_START`).

  If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START, TIMER_END, and TIMER_WAIT` are all `NULL`.

  For discussion of picoseconds as the unit for event times and factors that affect time values, see Section 26.4.1, “Performance Schema Event Timing”.

- **SPINS**
  For a mutex, the number of spin rounds. If the value is `NULL`, the code does not use spin rounds or spinning is not instrumented.

- **OBJECT_SCHEMA, OBJECT_NAME, OBJECT_TYPE, OBJECT_INSTANCE_BEGIN**
  These columns identify the object “being acted on.” What that means depends on the object type.

  For a synchronization object (`cond, mutex, rwlock`):
  - **OBJECT_SCHEMA, OBJECT_NAME, and OBJECT_TYPE** are `NULL`. 
• **OBJECT_INSTANCE_BEGIN** is the address of the synchronization object in memory.

For a file I/O object:

• **OBJECT_SCHEMA** is **NULL**.

• **OBJECT_NAME** is the file name.

• **OBJECT_TYPE** is **FILE**.

• **OBJECT_INSTANCE_BEGIN** is an address in memory.

For a socket object:

• **OBJECT_NAME** is the **IP:PORT** value for the socket.

• **OBJECT_INSTANCE_BEGIN** is an address in memory.

For a table I/O object:

• **OBJECT_SCHEMA** is the name of the schema that contains the table.

• **OBJECT_NAME** is the table name.

• **OBJECT_TYPE** is **TABLE** for a persistent base table or **TEMPORARY TABLE** for a temporary table.

• **OBJECT_INSTANCE_BEGIN** is an address in memory.

An **OBJECT_INSTANCE_BEGIN** value itself has no meaning, except that different values indicate different objects. **OBJECT_INSTANCE_BEGIN** can be used for debugging. For example, it can be used with GROUP BY **OBJECT_INSTANCE_BEGIN** to see whether the load on 1,000 mutexes (that protect, say, 1,000 pages or blocks of data) is spread evenly or just hitting a few bottlenecks. This can help you correlate with other sources of information if you see the same object address in a log file or another debugging or performance tool.

• **INDEX_NAME**

  The name of the index used. **PRIMARY** indicates the table primary index. **NULL** means that no index was used.

• **NESTING_EVENT_ID**

  The **EVENT_ID** value of the event within which this event is nested.

• **NESTING_EVENT_TYPE**

  The nesting event type. The value is **TRANSACTION**, **STATEMENT**, **STAGE**, or **WAIT**.

• **OPERATION**

  The type of operation performed, such as **lock**, **read**, or **write**.

• **NUMBER_OF_BYTES**

  The number of bytes read or written by the operation. For table I/O waits (events for the **wait/io/table/sql/handler** instrument), **NUMBER_OF_BYTES** indicates the number of rows. If the value is greater than 1, the event is for a batch I/O operation. The following discussion describes the difference between exclusively single-row reporting and reporting that reflects batch I/O.
MySQL executes joins using a nested-loop implementation. The job of the Performance Schema instrumentation is to provide row count and accumulated execution time per table in the join. Assume a join query of the following form that is executed using a table join order of \( t_1, t_2, t_3 \):  
\[
\text{SELECT ... FROM } t_1 \text{ JOIN } t_2 \text{ ON ... JOIN } t_3 \text{ ON ...}
\]

Table “fanout” is the increase or decrease in number of rows from adding a table during join processing. If the fanout for table \( t_3 \) is greater than 1, the majority of row-fetch operations are for that table. Suppose that the join accesses 10 rows from \( t_1 \), 20 rows from \( t_2 \) per row from \( t_1 \), and 30 rows from \( t_3 \) per row of table \( t_2 \). With single-row reporting, the total number of instrumented operations is:  
\[
10 + (10 \times 20) + (10 \times 20 \times 30) = 6210
\]

A significant reduction in the number of instrumented operations is achievable by aggregating them per scan (that is, per unique combination of rows from \( t_1 \) and \( t_2 \)). With batch I/O reporting, the Performance Schema produces an event for each scan of the innermost table \( t_3 \) rather than for each row, and the number of instrumented row operations reduces to:  
\[
10 + (10 \times 20) + (10 \times 20) = 410
\]

That is a reduction of 93%, illustrating how the batch-reporting strategy significantly reduces Performance Schema overhead for table I/O by reducing the number of reporting calls. The tradeoff is lesser accuracy for event timing. Rather than time for an individual row operation as in per-row reporting, timing for batch I/O includes time spent for operations such as join buffering, aggregation, and returning rows to the client.

For batch I/O reporting to occur, these conditions must be true:

- Query execution accesses the innermost table of a query block (for a single-table query, that table counts as innermost)
- Query execution does not request a single row from the table (so, for example, \textit{eq_ref} access prevents use of batch reporting)
- Query execution does not evaluate a subquery containing table access for the table
- **FLAGS**

  Reserved for future use.

The \texttt{events_waits_current} table has these indexes:

- Primary key on \((\text{THREAD_ID}, \text{EVENT_ID})\)

\texttt{TRUNCATE TABLE} is permitted for the \texttt{events_waits_current} table. It removes the rows.

### 26.12.4.2 The events_waits_history Table

The \texttt{events_waits_history} table contains the \( N \) most recent wait events that have ended per thread. Wait events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of \( N \) during server startup. To set the number of rows per thread explicitly, set the \texttt{performance_schema_events_waits_history_size} system variable at server startup.
The `events_waits_history` table has the same columns and indexing as `events_waits_current`. See Section 26.12.4.1, “The events_waits_current Table”.

`TRUNCATE TABLE` is permitted for the `events_waits_history` table. It removes the rows.

For more information about the relationship between the three wait event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect wait events, see Section 26.12.4, “Performance Schema Wait Event Tables”.

### 26.12.4.3 The `events_waits_history_long` Table

The `events_waits_history_long` table contains \( N \) the most recent wait events that have ended globally, across all threads. Wait events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The Performance Schema autosizes the value of \( N \) during server startup. To set the table size explicitly, set the `performance_schema_events_waits_history_long_size` system variable at server startup.

The `events_waits_history_long` table has the same columns as `events_waits_current`. See Section 26.12.4.1, “The events_waits_current Table”. Unlike `events_waits_current`, `events_waits_history_long` has no indexing.

`TRUNCATE TABLE` is permitted for the `events_waits_history_long` table. It removes the rows.

For more information about the relationship between the three wait event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect wait events, see Section 26.12.4, “Performance Schema Wait Event Tables”.

### 26.12.5 Performance Schema Stage Event Tables

The Performance Schema instruments stages, which are steps during the statement-execution process, such as parsing a statement, opening a table, or performing a `filesort` operation. Stages correspond to the thread states displayed by `SHOW PROCESSLIST` or that are visible in the `INFORMATION_SCHEMA.PROCESSLIST` table. Stages begin and end when state values change.

Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store stage events:

- `events_stages_current`: The current stage event for each thread.
- `events_stages_history`: The most recent stage events that have ended per thread.
- `events_stages_history_long`: The most recent stage events that have ended globally (across all threads).

The following sections describe the stage event tables. There are also summary tables that aggregate information about stage events; see Section 26.12.17.2, “Stage Summary Tables”.

For more information about the relationship between the three stage event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.
Configuring Stage Event Collection

To control whether to collect stage events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains instruments with names that begin with `stage`. Use these instruments to enable or disable collection of individual stage event classes.

- The `setup_consumers` table contains consumer values with names corresponding to the current and historical stage event table names. Use these consumers to filter collection of stage events.

Other than those instruments that provide statement progress information, the stage instruments are disabled by default. For example:

```sql
SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments
WHERE NAME RLIKE 'stage/sql/[a-c]';
```

```
+----------------------------------------------------+---------+-------+
| NAME                                               | ENABLED | TIMED |
+----------------------------------------------------+---------+-------+
| stage/sql/After create                             | NO      | NO    |
| stage/sql/allocating local table                   | NO      | NO    |
| stage/sql/altering table                           | NO      | NO    |
| stage/sql/committing alter table to storage engine  | NO      | NO    |
| stage/sql/Changing master                          | NO      | NO    |
| stage/sql/Checking master version                   | NO      | NO    |
| stage/sql/checking permissions                      | NO      | NO    |
| stage/sql/cleaning up                               | NO      | NO    |
| stage/sql/closing tables                            | NO      | NO    |
| stage/sql/Connecting to master                      | NO      | NO    |
| stage/sql/converting HEAP to MyISAM                 | NO      | NO    |
| stage/sql/Copying to group table                    | NO      | NO    |
| stage/sql/Copying to tmp table                      | NO      | NO    |
| stage/sql/copy to tmp table                         | NO      | NO    |
| stage/sql/Copying to tmp table                      | NO      | NO    |
| stage/sql/Copying to tmp table                      | NO      | NO    |
| stage/sql/Copying to tmp table                      | NO      | NO    |
| stage/sql/copy to tmp table                         | NO      | NO    |
```

Stage event instruments that provide statement progress information are enabled and timed by default:

```sql
SELECT NAME, ENABLED, TIMED
FROM performance_schema.setup_instruments
WHERE ENABLED='YES' AND NAME LIKE "stage/%";
```

```
+-------------------------------------------------------+---------+-------+
| NAME                                                   | ENABLED | TIMED |
+-------------------------------------------------------+---------+-------+
| stage/sql/copy to tmp table                           | YES     | YES   |
| stage/sql/Applying batch of row changes (write)        | YES     | YES   |
| stage/sql/Applying batch of row changes (update)       | YES     | YES   |
| stage/sql/Applying batch of row changes (delete)       | YES     | YES   |
| stage/innodb/alter table (end)                        | YES     | YES   |
| stage/innodb/alter table (flush)                       | YES     | YES   |
| stage/innodb/alter table (insert)                      | YES     | YES   |
| stage/innodb/alter table (log apply index)             | YES     | YES   |
| stage/innodb/alter table (log apply table)             | YES     | YES   |
| stage/innodb/alter table (merge sort)                  | YES     | YES   |
| stage/innodb/alter table (read PK and internal sort)   | YES     | YES   |
| stage/innodb/buffer pool load                          | YES     | YES   |
| stage/innodb/clone (file copy)                         | YES     | YES   |
| stage/innodb/clone (undo copy)                         | YES     | YES   |
| stage/innodb/clone (page copy)                         | YES     | YES   |
```

The stage consumers are disabled by default:
Performance Schema Stage Event Tables

mysql> SELECT * FROM performance_schema.setup_consumers WHERE NAME LIKE 'events_stages%';
+----------------------------+---------+
| NAME                      | ENABLED |
+----------------------------+---------+
| events_stages_current     | NO      |
| events_stages_history     | NO      |
| events_stages_history_long| NO      |
+----------------------------+---------+

To control stage event collection at server startup, use lines like these in your `my.cnf` file:

- Enable:

  ```
  [mysqld]
  performance-schema-instrument='stage/%=ON'
  performance-schema-consumer-events-stages-current=ON
  performance-schema-consumer-events-stages-history=ON
  performance-schema-consumer-events-stages-history-long=ON
  ```

- Disable:

  ```
  [mysqld]
  performance-schema-instrument='stage/%=OFF'
  performance-schema-consumer-events-stages-current=OFF
  performance-schema-consumer-events-stages-history=OFF
  performance-schema-consumer-events-stages-history-long=OFF
  ```

To control stage event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

- Enable:

  ```
  UPDATE performance_schema.setup_instruments
  SET ENABLED = 'YES', TIMED = 'YES'
  WHERE NAME = 'stage/%';

  UPDATE performance_schema.setup_consumers
  SET ENABLED = 'YES'
  WHERE NAME LIKE 'events_stages%';
  ```

- Disable:

  ```
  UPDATE performance_schema.setup_instruments
  SET ENABLED = 'NO', TIMED = 'NO'
  WHERE NAME = 'stage/%';

  UPDATE performance_schema.setup_consumers
  SET ENABLED = 'NO'
  WHERE NAME LIKE 'events_stages%';
  ```

To collect only specific stage events, enable only the corresponding stage instruments. To collect stage events only for specific stage event tables, enable the stage instruments but only the stage consumers corresponding to the desired tables.

For additional information about configuring event collection, see Section 26.3, "Performance Schema Startup Configuration", and Section 26.4, "Performance Schema Runtime Configuration".

Stage Event Progress Information

The Performance Schema stage event tables contain two columns that, taken together, provide a stage progress indicator for each row:
Performance Schema Stage Event Tables

- **WORK_COMPLETED**: The number of work units completed for the stage
- **WORK_ESTIMATED**: The number of work units expected for the stage

Each column is **NULL** if no progress information is provided for an instrument. Interpretation of the information, if it is available, depends entirely on the instrument implementation. The Performance Schema tables provide a container to store progress data, but make no assumptions about the semantics of the metric itself:

- A “work unit” is an integer metric that increases over time during execution, such as the number of bytes, rows, files, or tables processed. The definition of “work unit” for a particular instrument is left to the instrumentation code providing the data.

- The **WORK_COMPLETED** value can increase one or many units at a time, depending on the instrumented code.

- The **WORK_ESTIMATED** value can change during the stage, depending on the instrumented code.

Instrumentation for a stage event progress indicator can implement any of the following behaviors:

- No progress instrumentation
  
  This is the most typical case, where no progress data is provided. The **WORK_COMPLETED** and **WORK_ESTIMATED** columns are both **NULL**.

- Unbounded progress instrumentation
  
  Only the **WORK_COMPLETED** column is meaningful. No data is provided for the **WORK_ESTIMATED** column, which displays 0.

  By querying the **events_stages_current** table for the monitored session, a monitoring application can report how much work has been performed so far, but cannot report whether the stage is near completion. Currently, no stages are instrumented like this.

- Bounded progress instrumentation
  
  The **WORK_COMPLETED** and **WORK_ESTIMATED** columns are both meaningful.

  This type of progress indicator is appropriate for an operation with a defined completion criterion, such as the table-copy instrument described later. By querying the **events_stages_current** table for the monitored session, a monitoring application can report how much work has been performed so far, and can report the overall completion percentage for the stage, by computing the **WORK_COMPLETED** / **WORK_ESTIMATED** ratio.

The **stage/sql/copy to tmp table** instrument illustrates how progress indicators work. During execution of an **ALTER TABLE** statement, the **stage/sql/copy to tmp table** stage is used, and this stage can execute potentially for a long time, depending on the size of the data to copy.

The table-copy task has a defined termination (all rows copied), and the **stage/sql/copy to tmp table** stage is instrumented to provide bounded progress information: The work unit used is number of rows copied, **WORK_COMPLETED** and **WORK_ESTIMATED** are both meaningful, and their ratio indicates task percentage complete.

To enable the instrument and the relevant consumers, execute these statements:

```sql
UPDATE performance_schema.setup_instruments
SET ENABLED='YES'
WHERE NAME='stage/sql/copy to tmp table';
```
UPDATE performance_schema.setup_consumers
SET ENABLED='YES'
WHERE NAME LIKE 'events_stages_%';

To see the progress of an ongoing ALTER TABLE statement, select from the `events_stages_current` table.

### 26.12.5.1 The `events_stages_current` Table

The `events_stages_current` table contains current stage events. The table stores one row per thread showing the current status of the thread's most recent monitored stage event, so there is no system variable for configuring the table size.

Of the tables that contain stage event rows, `events_stages_current` is the most fundamental. Other tables that contain stage event rows are logically derived from the current events. For example, the `events_stages_history` and `events_stages_history_long` tables are collections of the most recent stage events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three stage event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect stage events, see Section 26.12.5, “Performance Schema Stage Event Tables”.

The `events_stages_current` table has these columns:

- **THREAD_ID, EVENT_ID**
  
  The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- **END_EVENT_ID**
  
  This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- **EVENT_NAME**
  
  The name of the instrument that produced the event. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in Section 26.6, “Performance Schema Instrument Naming Conventions”.

- **SOURCE**
  
  The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- **TIMER_START, TIMER_END, TIMER_WAIT**

  Timing information for the event. The unit for these values is picoseconds (trillionths of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).

  If an event has not finished, `TIMER_END` is the current timer value and `TIMER_WAIT` is the time elapsed so far (`TIMER_END - TIMER_START`).
If an event is produced from an instrument that has `TIMED = NO`, timing information is not collected, and `TIMER_START`, `TIMER_END`, and `TIMER_WAIT` are all `NULL`.

For discussion of picoseconds as the unit for event times and factors that affect time values, see Section 26.4.1, “Performance Schema Event Timing”.

- **WORK_COMPLETED, WORK_ESTIMATED**

  These columns provide stage progress information, for instruments that have been implemented to produce such information. `WORK_COMPLETED` indicates how many work units have been completed for the stage, and `WORK_ESTIMATED` indicates how many work units are expected for the stage. For more information, see Stage Event Progress Information.

- **NESTING_EVENT_ID**

  The `EVENT_ID` value of the event within which this event is nested. The nesting event for a stage event is usually a statement event.

- **NESTING_EVENT_TYPE**

  The nesting event type. The value is `TRANSACTION`, `STATEMENT`, `STAGE`, or `WAIT`.

The `events_stages_current` table has these indexes:

- **Primary key on (THREAD_ID, EVENT_ID)**

  `TRUNCATE TABLE` is permitted for the `events_stages_current` table. It removes the rows.

### 26.12.5.2 The `events_stages_history` Table

The `events_stages_history` table contains the `N` most recent stage events that have ended per thread. Stage events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of `N` during server startup. To set the number of rows per thread explicitly, set the `performance_schema_events_stages_history_size` system variable at server startup.

The `events_stages_history` table has the same columns and indexing as `events_stages_current`. See Section 26.12.5.1, “The `events_stages_current` Table”.

`TRUNCATE TABLE` is permitted for the `events_stages_history` table. It removes the rows.

For more information about the relationship between the three stage event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect stage events, see Section 26.12.5, “Performance Schema Stage Event Tables”.

### 26.12.5.3 The `events_stages_history_long` Table

The `events_stages_history_long` table contains the `N` most recent stage events that have ended globally, across all threads. Stage events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.
The Performance Schema autosizes the value of \( N \) during server startup. To set the table size explicitly, set the `performance_schema_events_stages_history_long_size` system variable at server startup.

The `events_stages_history_long` table has the same columns as `events_stages_current`. See Section 26.12.1.1, “The `events_stages_current` Table”. Unlike `events_stages_current`, `events_stages_history_long` has no indexing.

TRUNCATE TABLE is permitted for the `events_stages_history_long` table. It removes the rows.

For more information about the relationship between the three stage event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect stage events, see Section 26.12.5, “Performance Schema Stage Event Tables”.

26.12.6 Performance Schema Statement Event Tables

The Performance Schema instruments statement execution. Statement events occur at a high level of the event hierarchy. Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store statement events:

- `events_statements_current`: The current statement event for each thread.
- `events_statements_history`: The most recent statement events that have ended per thread.
- `events_statements_history_long`: The most recent statement events that have ended globally (across all threads).
- `prepared_statements_instances`: Prepared statement instances and statistics

The following sections describe the statement event tables. There are also summary tables that aggregate information about statement events; see Section 26.12.17.3, “Statement Summary Tables”.

For more information about the relationship between the three `events_statements_`xxx event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

Configuring Statement Event Collation

To control whether to collect statement events, set the state of the relevant instruments and consumers:

- The `setup_instruments` table contains instruments with names that begin with `statement`. Use these instruments to enable or disable collection of individual statement event classes.

- The `setup_consumers` table contains consumer values with names corresponding to the current and historical statement event table names, and the statement digest consumer. Use these consumers to filter collection of statement events and statement digesting.

The statement instruments are enabled by default, and the `events_statements_current`, `events_statements_history`, and `statements_digest` statement consumers are enabled by default:

```
mysql> SELECT NAME, ENABLED, TIMED
    FROM performance_schema.setup_instruments
    WHERE NAME LIKE 'statement/%';
+---------------------------------------------+---------+-------+
4534
```
To control statement event collection at server startup, use lines like these in your `my.cnf` file:

**Enable:**

```
[mysqld]
performance-schema-instrument='statement/%=ON'
performance-schema-consumer-events-statements-current=ON
performance-schema-consumer-events-statements-history=ON
performance-schema-consumer-events-statements-history-long=ON
performance-schema-consumer-statements-digest=ON
```

**Disable:**

```
[mysqld]
performance-schema-instrument='statement/%=OFF'
performance-schema-consumer-events-statements-current=OFF
performance-schema-consumer-events-statements-history=OFF
performance-schema-consumer-events-statements-history-long=OFF
performance-schema-consumer-statements-digest=OFF
```

To control statement event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

**Enable:**

```sql
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME LIKE 'statement/%';
```

```sql
UPDATE performance_schema.setup_consumers
SET ENABLED = 'YES'
WHERE NAME LIKE '%statements%';
```

**Disable:**

```sql
UPDATE performance_schema.setup_instruments
SET ENABLED = 'OFF', TIMED = 'OFF'
WHERE NAME LIKE 'statement/%';
```

```sql
UPDATE performance_schema.setup_consumers
SET ENABLED = 'OFF'
WHERE NAME LIKE '%statements%';
```
To collect only specific statement events, enable only the corresponding statement instruments. To collect statement events only for specific statement event tables, enable the statement instruments but only the statement consumers corresponding to the desired tables.

For additional information about configuring event collection, see Section 26.3, “Performance Schema Startup Configuration”, and Section 26.4, “Performance Schema Runtime Configuration”.

Statement Monitoring

Statement monitoring begins from the moment the server sees that activity is requested on a thread, to the moment when all activity has ceased. Typically, this means from the time the server gets the first packet from the client to the time the server has finished sending the response. Statements within stored programs are monitored like other statements.

When the Performance Schema instruments a request (server command or SQL statement), it uses instrument names that proceed in stages from more general (or “abstract”) to more specific until it arrives at a final instrument name.

Final instrument names correspond to server commands and SQL statements:

- Server commands correspond to the COM Xxx codes defined in the mysql_com.h header file and processed in sql/sql_parse.cc. Examples are COM_PING and COM_QUIT. Instruments for commands have names that begin with statement/com, such as statement/com/Ping and statement/com/Quit.

- SQL statements are expressed as text, such as DELETE FROM t1 or SELECT * FROM t2. Instruments for SQL statements have names that begin with statement/sql, such as statement/sql/delete and statement/sql/select.

Some final instrument names are specific to error handling:

- statement/com/Error accounts for messages received by the server that are out of band. It can be used to detect commands sent by clients that the server does not understand. This may be helpful for purposes such as identifying clients that are misconfigured or using a version of MySQL more recent than that of the server, or clients that are attempting to attack the server.

- statement/sql/error accounts for SQL statements that fail to parse. It can be used to detect malformed queries sent by clients. A query that fails to parse differs from a query that parses but fails due to an error during execution. For example, SELECT * FROM is malformed, and the statement/sql/error instrument is used. By contrast, SELECT * parses but fails with a No tables used error. In this case, statement/sql/select is used and the statement event contains information to indicate the nature of the error.

A request can be obtained from any of these sources:

- As a command or statement request from a client, which sends the request as packets
- As a statement string read from the relay log on a replication slave
- As an event from the Event Scheduler
The details for a request are not initially known and the Performance Schema proceeds from abstract to specific instrument names in a sequence that depends on the source of the request.

For a request received from a client:

1. When the server detects a new packet at the socket level, a new statement is started with an abstract instrument name of `statement/abstract/new_packet`.

2. When the server reads the packet number, it knows more about the type of request received, and the Performance Schema refines the instrument name. For example, if the request is a `COM_PING` packet, the instrument name becomes `statement/com/Ping` and that is the final name. If the request is a `COM_QUERY` packet, it is known to correspond to an SQL statement but not the particular type of statement. In this case, the instrument changes from one abstract name to a more specific but still abstract name, `statement/abstract/Query`, and the request requires further classification.

3. If the request is a statement, the statement text is read and given to the parser. After parsing, the exact statement type is known. If the request is, for example, an `INSERT` statement, the Performance Schema refines the instrument name from `statement/abstract/Query` to `statement/sql/insert`, which is the final name.

For a request read as a statement from the relay log on a replication slave:

1. Statements in the relay log are stored as text and are read as such. There is no network protocol, so the `statement/abstract/new_packet` instrument is not used. Instead, the initial instrument is `statement/abstract/relay_log`.

2. When the statement is parsed, the exact statement type is known. If the request is, for example, an `INSERT` statement, the Performance Schema refines the instrument name from `statement/abstract/Query` to `statement/sql/insert`, which is the final name.

The preceding description applies only for statement-based replication. For row-based replication, table I/O done on the slave as it processes row changes can be instrumented, but row events in the relay log do not appear as discrete statements.

For a request received from the Event Scheduler:

The event execution is instrumented using the name `statement/scheduler/event`. This is the final name.

Statements executed within the event body are instrumented using `statement/sql/*` names, without use of any preceding abstract instrument. An event is a stored program, and stored programs are precompiled in memory before execution. Consequently, there is no parsing at runtime and the type of each statement is known by the time it executes.

Statements executed within the event body are child statements. For example, if an event executes an `INSERT` statement, execution of the event itself is the parent, instrumented using `statement/scheduler/event`, and the `INSERT` is the child, instrumented using `statement/sql/insert`. The parent/child relationship holds between separate instrumented operations. This differs from the sequence of refinement that occurs within a single instrumented operation, from abstract to final instrument names.

For statistics to be collected for statements, it is not sufficient to enable only the final `statement/sql/*` instruments used for individual statement types. The abstract `statement/abstract/*` instruments must be enabled as well. This should not normally be an issue because all statement instruments are enabled by default. However, an application that enables or disables statement instruments selectively must take into account that disabling abstract instruments also disables statistics collection for the individual statement instruments. For example, to collect statistics for `INSERT` statements, `statement/sql/insert` must be enabled, but also `statement/abstract/new_packet` and `statement/abstract/abstract/Query`.
Query. Similarly, for replicated statements to be instrumented, `statement/abstract/relay_log` must be enabled.

No statistics are aggregated for abstract instruments such as `statement/abstract/Query` because no statement is ever classified with an abstract instrument as the final statement name.

### 26.12.6.1 The `events_statements_current` Table

The `events_statements_current` table contains current statement events. The table stores one row per thread showing the current status of the thread's most recent monitored statement event, so there is no system variable for configuring the table size.

Of the tables that contain statement event rows, `events_statements_current` is the most fundamental. Other tables that contain statement event rows are logically derived from the current events. For example, the `events_statements_history` and `events_statements_history_long` tables are collections of the most recent statement events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three `events_statements_` event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect statement events, see Section 26.12.6, “Performance Schema Statement Event Tables”.

The `events_statements_current` table has these columns:

- **THREAD_ID, EVENT_ID**
  The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

- **END_EVENT_ID**
  This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

- **EVENT_NAME**
  The name of the instrument from which the event was collected. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in Section 26.6, “Performance Schema Instrument Naming Conventions”.

  For SQL statements, the `EVENT_NAME` value initially is `statement/com/Query` until the statement is parsed, then changes to a more appropriate value, as described in Section 26.12.6, “Performance Schema Statement Event Tables”.

- **SOURCE**
  The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- **TIMER_START, TIMER_END, TIMER_WAIT**
  Timing information for the event. The unit for these values is picoseconds (trillionths of a second). The `TIMER_START` and `TIMER_END` values indicate when event timing started and ended. `TIMER_WAIT` is the event elapsed time (duration).
If an event has not finished, \texttt{TIMER\_END} is the current timer value and \texttt{TIMER\_WAIT} is the time elapsed so far (\texttt{TIMER\_END - TIMER\_START}).

If an event is produced from an instrument that has \texttt{TIMED = NO}, timing information is not collected, and \texttt{TIMER\_START}, \texttt{TIMER\_END}, and \texttt{TIMER\_WAIT} are all \texttt{NULL}.

For discussion of picoseconds as the unit for event times and factors that affect time values, see Section 26.4.1, “Performance Schema Event Timing”.

- **LOCK\_TIME**
  
The time spent waiting for table locks. This value is computed in microseconds but normalized to picoseconds for easier comparison with other Performance Schema timers.

- **SQL\_TEXT**
  
The text of the SQL statement. For a command not associated with an SQL statement, the value is \texttt{NULL}.

  The maximum space available for statement display is 1024 bytes by default. To change this value, set the \texttt{performance\_schema\_max\_sql\_text\_length} system variable at server startup. (Changing this value affects columns in other Performance Schema tables as well. See Section 26.10, “Performance Schema Statement Digests and Sampling”.)

- **DIGEST**
  
The statement digest SHA-256 value as a string of 64 hexadecimal characters, or \texttt{NULL} if the \texttt{statements\_digest} consumer is \texttt{no}. For more information about statement digesting, see Section 26.10, “Performance Schema Statement Digests and Sampling”.

- **DIGEST\_TEXT**
  
The normalized statement digest text, or \texttt{NULL} if the \texttt{statements\_digest} consumer is \texttt{no}. For more information about statement digesting, see Section 26.10, “Performance Schema Statement Digests and Sampling”.

  The \texttt{performance\_schema\_max\_digest\_length} system variable determines the maximum number of bytes available per session for digest value storage. However, the display length of statement digests may be longer than the available buffer size due to encoding of statement components such as keywords and literal values in digest buffer. Consequently, values selected from the \texttt{DIGEST\_TEXT} column of statement event tables may appear to exceed the \texttt{performance\_schema\_max\_digest\_length} value.

- **CURRENT\_SCHEMA**
  
The default database for the statement, \texttt{NULL} if there is none.

- **OBJECT\_SCHEMA, OBJECT\_NAME, OBJECT\_TYPE**
  
  For nested statements (stored programs), these columns contain information about the parent statement. Otherwise they are \texttt{NULL}.

- **OBJECT\_INSTANCE\_BEGIN**
  
  This column identifies the statement. The value is the address of an object in memory.

- **MYSQL\_ERRNO**
The statement error number, from the statement diagnostics area.

- **RETURNED_SQLSTATE**
  The statement SQLSTATE value, from the statement diagnostics area.

- **MESSAGE_TEXT**
  The statement error message, from the statement diagnostics area.

- **ERRORS**
  Whether an error occurred for the statement. The value is 0 if the SQLSTATE value begins with 00 (completion) or 01 (warning). The value is 1 if the SQLSTATE value is anything else.

- **WARNINGS**
  The number of warnings, from the statement diagnostics area.

- **ROWS_AFFECTED**
  The number of rows affected by the statement. For a description of the meaning of “affected,” see Section 28.6.6.1, “mysql_affected_rows()”.

- **ROWS_SENT**
  The number of rows returned by the statement.

- **ROWS_EXAMINED**
  The number of rows examined by the server layer (not counting any processing internal to storage engines).

- **CREATED_TMP_DISK_TABLES**
  Like the Created_tmp_disk_tables status variable, but specific to the statement.

- **CREATED_TMP_TABLES**
  Like the Created_tmp_tables status variable, but specific to the statement.

- **SELECT_FULL_JOIN**
  Like the Select_full_join status variable, but specific to the statement.

- **SELECT_FULL_RANGE_JOIN**
  Like the Select_full_range_join status variable, but specific to the statement.

- **SELECT_RANGE**
  Like the Select_range status variable, but specific to the statement.

- **SELECT_RANGE_CHECK**
  Like the Select_range_check status variable, but specific to the statement.
Like the `Select_scan` status variable, but specific to the statement.

- **SORT_MERGE_PASSES**
  Like the `Sort_merge_passes` status variable, but specific to the statement.

- **SORT_RANGE**
  Like the `Sort_range` status variable, but specific to the statement.

- **SORT_ROWS**
  Like the `Sort_rows` status variable, but specific to the statement.

- **SORT_SCAN**
  Like the `Sort_scan` status variable, but specific to the statement.

- **NO_INDEX_USED**
  1 if the statement performed a table scan without using an index, 0 otherwise.

- **NO_GOOD_INDEX_USED**
  1 if the server found no good index to use for the statement, 0 otherwise. For additional information, see the description of the `Extra` column from `EXPLAIN` output for the `Range checked for each record` value in Section 8.8.2, "EXPLAIN Output Format".

- **NESTING_EVENT_ID, NESTING_EVENT_TYPE, NESTING_EVENT_LEVEL**
  These three columns are used with other columns to provide information as follows for top-level (unnested) statements and nested statements (executed within a stored program).

  **For top level statements:**
  ```
  OBJECT_TYPE = NULL
  OBJECT_SCHEMA = NULL
  OBJECT_NAME = NULL
  NESTING_EVENT_ID = NULL
  NESTING_EVENT_TYPE = NULL
  NESTING_LEVEL = 0
  ```

  **For nested statements:**
  ```
  OBJECT_TYPE = the parent statement object type
  OBJECT_SCHEMA = the parent statement object schema
  OBJECT_NAME = the parent statement object name
  NESTING_EVENT_ID = the parent statement EVENT_ID
  NESTING_EVENT_TYPE = 'STATEMENT'
  NESTING_LEVEL = the parent statement NESTING_LEVEL plus one
  ```

- **STATEMENT_ID**
  The query ID maintained by the server at the SQL level. The value is unique for the server instance because these IDs are generated using a global counter that is incremented atomically. This column was added in MySQL 8.0.14.

The `events_statements_current` table has these indexes:

- Primary key on `(THREAD_ID, EVENT_ID)`
TRUNCATE TABLE is permitted for the events_statements_current table. It removes the rows.

26.12.6.2 The events_statements_history Table

The events_statements_history table contains the $N$ most recent statement events that have ended per thread. Statement events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of $N$ during server startup. To set the number of rows per thread explicitly, set the performance_schema_events_statements_history_size system variable at server startup.

The events_statements_history table has the same columns and indexing as events_statements_current. See Section 26.12.6.1, “The events_statements_current Table”.

TRUNCATE TABLE is permitted for the events_statements_history table. It removes the rows.

For more information about the relationship between the three events_statements_xxx event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect statement events, see Section 26.12.6, “Performance Schema Statement Event Tables”.

26.12.6.3 The events_statements_history_long Table

The events_statements_history_long table contains the $N$ most recent statement events that have ended globally, across all threads. Statement events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The value of $N$ is autosized at server startup. To set the table size explicitly, set the performance_schema_events_statements_history_long_size system variable at server startup.

The events_statements_history_long table has the same columns as events_statements_current. See Section 26.12.6.1, “The events_statements_current Table”. Unlike events_statements_current, events_statements_history_long has no indexing.

TRUNCATE TABLE is permitted for the events_statements_history_long table. It removes the rows.

For more information about the relationship between the three events_statements_xxx event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect statement events, see Section 26.12.6, “Performance Schema Statement Event Tables”.

26.12.6.4 The prepared_statements_instances Table

The Performance Schema provides instrumentation for prepared statements, for which there are two protocols:

- The binary protocol. This is accessed through the MySQL C API and maps onto underlying server commands as shown in the following table.

<table>
<thead>
<tr>
<th>C API Function</th>
<th>Corresponding Server Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>mysql_stmt_prepare()</td>
<td>COM_STMT_PREPARE</td>
</tr>
</tbody>
</table>
The text protocol. This is accessed using SQL statements and maps onto underlying server commands as shown in the following table.

<table>
<thead>
<tr>
<th>SQL Statement</th>
<th>Corresponding Server Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREPARE</td>
<td>SQLCOM_PREPARE</td>
</tr>
<tr>
<td>EXECUTE</td>
<td>SQLCOM_EXECUTE</td>
</tr>
<tr>
<td>DEALLOCATE PREPARE, DROP PREPARE</td>
<td>SQLCOM_DEALLOCATE_PREPARE</td>
</tr>
</tbody>
</table>

Performance Schema prepared statement instrumentation covers both protocols. The following discussion refers to the server commands rather than the C API functions or SQL statements.

Information about prepared statements is available in the `prepared_statements_instances` table. This table enables inspection of prepared statements used in the server and provides aggregated statistics about them. To control the size of this table, set the `performance_schema_max_prepared_statements_instances` system variable at server startup.

Collection of prepared statement information depends on the statement instruments shown in the following table. These instruments are enabled by default. To modify them, update the `setup_instruments` table.

<table>
<thead>
<tr>
<th>Instrument</th>
<th>Server Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>statement/com/Prepare</td>
<td>COM_STMT_PREPARE</td>
</tr>
<tr>
<td>statement/com/Execute</td>
<td>COM_STMT_EXECUTE</td>
</tr>
<tr>
<td>statement/sql/prepare_sql</td>
<td>SQLCOM_PREPARE</td>
</tr>
<tr>
<td>statement/sql/execute_sql</td>
<td>SQLCOM_EXECUTE</td>
</tr>
</tbody>
</table>

The Performance Schema manages the contents of the `prepared_statements_instances` table as follows:

- **Statement preparation**

  A `COM_STMT_PREPARE` or `SQLCOM_PREPARE` command creates a prepared statement in the server. If the statement is successfully instrumented, a new row is added to the `prepared_statements_instances` table. If the statement cannot be instrumented, `Performance_schema_prepared_statements_lost` status variable is incremented.

- **Prepared statement execution**

  Execution of a `COM_STMT_EXECUTE` or `SQLCOM_PREPARE` command for an instrumented prepared statement instance updates the corresponding `prepared_statements_instances` table row.

- **Prepared statement deallocation**

  Execution of a `COM_STMT_CLOSE` or `SQLCOM_DEALLOCATE_PREPARE` command for an instrumented prepared statement instance removes the corresponding `prepared_statements_instances` table row. To avoid resource leaks, removal occurs even if the prepared statement instruments described previously are disabled.

The `prepared_statements_instances` table has these columns:
• OBJECT_INSTANCE_BEGIN
  The address in memory of the instrumented prepared statement.

• STATEMENT_ID
  The internal statement ID assigned by the server. The text and binary protocols both use statement IDs.

• STATEMENT_NAME
  For the binary protocol, this column is NULL. For the text protocol, this column is the external statement name assigned by the user. For example, for the following SQL statement, the name of the prepared statement is `stmt`:
  ```sql
  PREPARE stmt FROM 'SELECT 1';
  ```

• SQL_TEXT
  The prepared statement text, with ? placeholder markers.

• OWNER_THREAD_ID, OWNER_EVENT_ID
  These columns indicate the event that created the prepared statement.

• OWNER_OBJECT_TYPE, OWNER_OBJECT_SCHEMA, OWNER_OBJECT_NAME
  For a prepared statement created by a client session, these columns are NULL. For a prepared statement created by a stored program, these columns point to the stored program. A typical user error is forgetting to deallocate prepared statements. These columns can be used to find stored programs that leak prepared statements:
  ```sql
  SELECT
    OWNER_OBJECT_TYPE, OWNER_OBJECT_SCHEMA, OWNER_OBJECT_NAME,
    STATEMENT_NAME, SQL_TEXT
  FROM performance_schema.prepared_statements_instances
  WHERE OWNER_OBJECT_TYPE IS NOT NULL;
  ```

• TIMER_PREPARE
  The time spent executing the statement preparation itself.

• COUNT_REPREPARE
  The number of times the statement was reprepared internally (see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”). Timing statistics for repreparation are not available because it is counted as part of statement execution, not as a separate operation.

• COUNT_EXECUTE, SUM_TIMER_EXECUTE, MIN_TIMER_EXECUTE, AVG_TIMER_EXECUTE, MAX_TIMER_EXECUTE
  Aggregated statistics for executions of the prepared statement.

• SUMxxx
  The remaining SUMxxx columns are the same as for the statement summary tables (see Section 26.12.17.3, “Statement Summary Tables”).

The `prepared_statements_instances` table has these indexes:

• Primary key on (OBJECT_INSTANCE_BEGIN)
• Index on (STATEMENT_ID)
• Index on (STATEMENT_NAME)
• Index on (OWNER_THREAD_ID, OWNER_EVENT_ID)
• Index on (OWNER_OBJECT_TYPE, OWNER_OBJECT_SCHEMA, OWNER_OBJECT_NAME)

TRUNCATE TABLE resets the statistics columns of the prepared_statements_instances table.

26.12.7 Performance Schema Transaction Tables

The Performance Schema instruments transactions. Within the event hierarchy, wait events nest within stage events, which nest within statement events, which nest within transaction events.

These tables store transaction events:
• events_transactions_current: The current transaction event for each thread.
• events_transactions_history: The most recent transaction events that have ended per thread.
• events_transactions_history_long: The most recent transaction events that have ended globally (across all threads).

The following sections describe the transaction event tables. There are also summary tables that aggregate information about transaction events; see Section 26.12.17.5, “Transaction Summary Tables”.

For more information about the relationship between the three transaction event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

Configuring Transaction Event Collation

To control whether to collect transaction events, set the state of the relevant instruments and consumers:

• The setup_instruments table contains an instrument named transaction. Use this instrument to enable or disable collection of individual transaction event classes.

• The setup_consumers table contains consumer values with names corresponding to the current and historical transaction event table names. Use these consumers to filter collection of transaction events.

The transaction instrument and the events_transactions_current and events_transactions_history transaction consumers are enabled by default:

```sql
mysql> SELECT NAME, ENABLED, TIMED
    -> FROM performance_schema.setup_instruments
    -> WHERE NAME = 'transaction';
+-----------------+---------+-------+
| NAME            | ENABLED | TIMED |
+-----------------+---------+-------+
| transaction     | YES     | YES   |
+-----------------+---------+-------+
mysql>
```

```sql
mysql> SELECT *
    -> FROM performance_schema.setup_consumers
    -> WHERE NAME LIKE 'events_transactions%';
+-----------------+---------+
| NAME             | ENABLED |
+-----------------+---------+
| events_transactions_current | YES     |
| events_transactions_history   | YES     |
| events_transactions_history_long | NO      |
```
To control transaction event collection at server startup, use lines like these in your `my.cnf` file:

- **Enable:**
  ```
  [mysqld]
  performance-schema-instrument='transaction=ON'
  performance-schema-consumer-events-transactions-current=ON
  performance-schema-consumer-events-transactions-history=ON
  performance-schema-consumer-events-transactions-history-long=ON
  ```

- **Disable:**
  ```
  [mysqld]
  performance-schema-instrument='transaction=OFF'
  performance-schema-consumer-events-transactions-current=OFF
  performance-schema-consumer-events-transactions-history=OFF
  performance-schema-consumer-events-transactions-history-long=OFF
  ```

To control transaction event collection at runtime, update the `setup_instruments` and `setup_consumers` tables:

- **Enable:**
  ```
  UPDATE performance_schema.setup_instruments
  SET ENABLED = 'YES', TIMED = 'YES'
  WHERE NAME = 'transaction';
  
  UPDATE performance_schema.setup_consumers
  SET ENABLED = 'YES'
  WHERE NAME LIKE 'events_transactions%';
  ```

- **Disable:**
  ```
  UPDATE performance_schema.setup_instruments
  SET ENABLED = 'NO', TIMED = 'NO'
  WHERE NAME = 'transaction';
  
  UPDATE performance_schema.setup_consumers
  SET ENABLED = 'NO'
  WHERE NAME LIKE 'events_transactions%';
  ```

To collect transaction events only for specific transaction event tables, enable the `transaction` instrument but only the `transaction consumers` corresponding to the desired tables.

For additional information about configuring event collection, see Section 26.3, “Performance Schema Startup Configuration”, and Section 26.4, “Performance Schema Runtime Configuration”.

**Transaction Boundaries**

In MySQL Server, transactions start explicitly with these statements:

```
START TRANSACTION | BEGIN | XA START | XA BEGIN
```

Transactions also start implicitly. For example, when the `autocommit` system variable is enabled, the start of each statement starts a new transaction.

When `autocommit` is disabled, the first statement following a committed transaction marks the start of a new transaction. Subsequent statements are part of the transaction until it is committed.

Transactions explicitly end with these statements:
Transactions also end implicitly, by execution of DDL statements, locking statements, and server administration statements.

In the following discussion, references to START TRANSACTION also apply to BEGIN, XA START, and XA BEGIN. Similarly, references to COMMIT and ROLLBACK apply to XA COMMIT and XA ROLLBACK, respectively.

The Performance Schema defines transaction boundaries similarly to that of the server. The start and end of a transaction event closely match the corresponding state transitions in the server:

- For an explicitly started transaction, the transaction event starts during processing of the START TRANSACTION statement.
- For an implicitly started transaction, the transaction event starts on the first statement that uses a transactional engine after the previous transaction has ended.
- For any transaction, whether explicitly or implicitly ended, the transaction event ends when the server transitions out of the active transaction state during the processing of COMMIT or ROLLBACK.

There are subtle implications to this approach:

- Transaction events in the Performance Schema do not fully include the statement events associated with the corresponding START TRANSACTION, COMMIT, or ROLLBACK statements. There is a trivial amount of timing overlap between the transaction event and these statements.
- Statements that work with nontransactional engines have no effect on the transaction state of the connection. For implicit transactions, the transaction event begins with the first statement that uses a transactional engine. This means that statements operating exclusively on nontransactional tables are ignored, even following START TRANSACTION.

To illustrate, consider the following scenario:

1. SET autocommit = OFF;
2. CREATE TABLE t1 (a INT) ENGINE = InnoDB;
3. START TRANSACTION;                       -- Transaction 1 START
4. INSERT INTO t1 VALUES (1), (2), (3);    -- Transaction 1 COMMIT
5. CREATE TABLE t2 (a INT) ENGINE = MyISAM; -- Transaction 1 COMMIT
   -- (implicit; DDL forces commit)
6. INSERT INTO t2 VALUES (1), (2), (3);     -- Write to nontransactional table
7. UPDATE t2 SET a = a + 1;                -- ... and again
8. INSERT INTO t1 VALUES (4), (5), (6);     -- Write to transactional table
   -- Transaction 2 START (implicit)
9. COMMIT;                                  -- Transaction 2 COMMIT

From the perspective of the server, Transaction 1 ends when table t2 is created. Transaction 2 does not start until a transactional table is accessed, despite the intervening updates to nontransactional tables.

From the perspective of the Performance Schema, Transaction 2 starts when the server transitions into an active transaction state. Statements 6 and 7 are not included within the boundaries of Transaction 2, which is consistent with how the server writes transactions to the binary log.

Transaction Instrumentation

Three attributes define transactions:

- Access mode (read only, read write)
Performance Schema Transaction Tables

• Isolation level (SERIALIZABLE, REPEATABLE READ, and so forth)

• Implicit (autocommit enabled) or explicit (autocommit disabled)

To reduce complexity of the transaction instrumentation and to ensure that the collected transaction data provides complete, meaningful results, all transactions are instrumented independently of access mode, isolation level, or autocommit mode.

To selectively examine transaction history, use the attribute columns in the transaction event tables: ACCESS_MODE, ISOLATION_LEVEL, and AUTOCOMMIT.

The cost of transaction instrumentation can be reduced various ways, such as enabling or disabling transaction instrumentation according to user, account, host, or thread (client connection).

Transactions and Nested Events

The parent of a transaction event is the event that initiated the transaction. For an explicitly started transaction, this includes the START TRANSACTION and COMMIT AND CHAIN statements. For an implicitly started transaction, it is the first statement that uses a transactional engine after the previous transaction ends.

In general, a transaction is the top-level parent to all events initiated during the transaction, including statements that explicitly end the transaction such as COMMIT and ROLLBACK. Exceptions are statements that implicitly end a transaction, such as DDL statements, in which case the current transaction must be committed before the new statement is executed.

Transactions and Stored Programs

Transactions and stored program events are related as follows:

• Stored Procedures

Stored procedures operate independently of transactions. A stored procedure can be started within a transaction, and a transaction can be started or ended from within a stored procedure. If called from within a transaction, a stored procedure can execute statements that force a commit of the parent transaction and then start a new transaction.

If a stored procedure is started within a transaction, that transaction is the parent of the stored procedure event.

If a transaction is started by a stored procedure, the stored procedure is the parent of the transaction event.

• Stored Functions

Stored functions are restricted from causing an explicit or implicit commit or rollback. Stored function events can reside within a parent transaction event.

• Triggers

Triggers activate as part of a statement that accesses the table with which it is associated, so the parent of a trigger event is always the statement that activates it.

Triggers cannot issue statements that cause an explicit or implicit commit or rollback of a transaction.

• Scheduled Events
The execution of the statements in the body of a scheduled event takes place in a new connection. Nesting of a scheduled event within a parent transaction is not applicable.

Transactions and Savepoints

Savepoint statements are recorded as separate statement events. Transaction events include separate counters for `SAVEPOINT`, `ROLLBACK TO SAVEPOINT`, and `RELEASE SAVEPOINT` statements issued during the transaction.

Transactions and Errors

Errors and warnings that occur within a transaction are recorded in statement events, but not in the corresponding transaction event. This includes transaction-specific errors and warnings, such as a rollback on a nontransactional table or GTID consistency errors.

26.12.7.1 The `events_transactions_current` Table

The `events_transactions_current` table contains current transaction events. The table stores one row per thread showing the current status of the thread's most recent monitored transaction event, so there is no system variable for configuring the table size. For example:

```sql
mysql> SELECT * FROM performance_schema.events_transactions_current LIMIT 1\G
```

```
*************************** 1. row ***************************
THREAD_ID: 26
EVENT_ID: 7
END_EVENT_ID: NULL
EVENT_NAME: transaction
STATE: ACTIVE
TRX_ID: NULL
GTID: 3E11FA47-71CA-11E1-9E33-C80AA9429562:56
XID: NULL
XA_STATE: NULL
SOURCE: transaction.cc:150
TIMER_START: 420833537900000
TIMER_END: NULL
TIMER_WAIT: NULL
ACCESS_MODE: READ WRITE
ISOLATION_LEVEL: REPEATABLE READ
AUTOCOMMIT: NO
NUMBER_OF_SAVEPOINTS: 0
NUMBER_OF_ROLLBACK_TO_SAVEPOINT: 0
NUMBER_OF_RELEASE_SAVEPOINT: 0
OBJECT_INSTANCE_BEGIN: NULL
NESTING_EVENT_ID: 6
NESTING_EVENT_TYPE: STATEMENT
```

Of the tables that contain transaction event rows, `events_transactions_current` is the most fundamental. Other tables that contain transaction event rows are logically derived from the current events. For example, the `events_transactions_history` and `events_transactions_history_long` tables are collections of the most recent transaction events that have ended, up to a maximum number of rows per thread and globally across all threads, respectively.

For more information about the relationship between the three transaction event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect transaction events, see Section 26.12.7, “Performance Schema Transaction Tables”.

The `events_transactions_current` table has these columns:
• **THREAD_ID, EVENT_ID**

The thread associated with the event and the thread current event number when the event starts. The `THREAD_ID` and `EVENT_ID` values taken together uniquely identify the row. No two rows have the same pair of values.

• **END_EVENT_ID**

This column is set to `NULL` when the event starts and updated to the thread current event number when the event ends.

• **EVENT_NAME**

The name of the instrument from which the event was collected. This is a `NAME` value from the `setup_instruments` table. Instrument names may have multiple parts and form a hierarchy, as discussed in Section 26.6, “Performance Schema Instrument Naming Conventions”.

• **STATE**

The current transaction state. The value is `ACTIVE` (after `START TRANSACTION` or `BEGIN`), `COMMITTED` (after `COMMIT`), or `ROLLED BACK` (after `ROLLBACK`).

• **TRX_ID**

Unused.

• **GTID**

The GTID column contains the value of `gtid_next`, which can be one of `ANONYMOUS`, `AUTOMATIC`, or a GTID using the format `UUID:NUMBER`. For transactions that use `gtid_next=AUTOMATIC`, which is all normal client transactions, the GTID column changes when the transaction commits and the actual GTID is assigned. If `gtid_mode` is either `ON` or `ON_PERMISSIVE`, the GTID column changes to the transaction's GTID. If `gtid_mode` is either `OFF` or `OFF_PERMISSIVE`, the GTID column changes to `ANONYMOUS`.

• **XID_FORMAT_ID, XID_GTRID, and XID_BQUAL**

The components of the XA transaction identifier. They have the format described in Section 13.3.8.1, “XA Transaction SQL Statements”.

• **XA_STATE**

The state of the XA transaction. The value is `ACTIVE` (after `XA START`), `IDLE` (after `XA END`), `PREPARED` (after `XA PREPARE`), `ROLLED BACK` (after `XA ROLLBACK`), or `COMMITTED` (after `XA COMMIT`).

On a replication slave, the same XA transaction can appear in the `events_transactions_current` table with different states on different threads. This is because immediately after the XA transaction is prepared, it is detached from the slave applier thread, and can be committed or rolled back by any thread on the slave. The `events_transactions_current` table displays the current status of the most recent monitored transaction event on the thread, and does not update this status when the thread is idle. So the XA transaction can still be displayed in the `PREPARED` state for the original applier thread, after it has been processed by another thread. To positively identify XA transactions that are still in the `PREPARED` state and need to be recovered, use the `XA RECOVER` statement rather than the Performance Schema transaction tables.

• **SOURCE**
The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- **TIMER_START, TIMER_END, TIMER_WAIT**

  Timing information for the event. The unit for these values is picoseconds (trillionths of a second). The **TIMER_START** and **TIMER_END** values indicate when event timing started and ended. **TIMER_WAIT** is the event elapsed time (duration).

  If an event has not finished, **TIMER_END** is the current timer value and **TIMER_WAIT** is the time elapsed so far (**TIMER_END - TIMER_START**).

  If an event is produced from an instrument that has **TIMED = NO**, timing information is not collected, and **TIMER_START**, **TIMER_END**, and **TIMER_WAIT** are all **NULL**.

  For discussion of picoseconds as the unit for event times and factors that affect time values, see Section 26.4.1, “Performance Schema Event Timing”.

- **ACCESS_MODE**

  The transaction access mode. The value is **READ WRITE** or **READ ONLY**.

- **ISOLATION_LEVEL**

  The transaction isolation level. The value is **REPEATABLE READ**, **READ COMMITTED**, **READ UNCOMMITTED**, or **SERIALIZABLE**.

- **AUTOCOMMIT**

  Whether autocommit mode was enabled when the transaction started.

- **NUMBER_OF_SAVEPOINTS, NUMBER_OF_ROLLBACK_TO_SAVEPOINT, NUMBER_OF_RELEASE_SAVEPOINT**

  The number of **SAVEPOINT**, **ROLLBACK TO SAVEPOINT**, and **RELEASE SAVEPOINT** statements issued during the transaction.

- **OBJECT_INSTANCE_BEGIN**

  Unused.

- **NESTING_EVENT_ID**

  The **EVENT_ID** value of the event within which this event is nested.

- **NESTING_EVENT_TYPE**

  The nesting event type. The value is **TRANSACTION, STATEMENT, STAGE,** or **WAIT**. (**TRANSACTION** will not appear because transactions cannot be nested.)

The **events_transactions_current** table has these indexes:

- Primary key on **(THREAD_ID, EVENT_ID)**

**TRUNCATE TABLE** is permitted for the **events_transactions_current** table. It removes the rows.

### 26.12.7.2 The events_transactions_history Table
The `events_transactions_history` table contains the $N$ most recent transaction events that have ended per thread. Transaction events are not added to the table until they have ended. When the table contains the maximum number of rows for a given thread, the oldest thread row is discarded when a new row for that thread is added. When a thread ends, all its rows are discarded.

The Performance Schema autosizes the value of $N$ during server startup. To set the number of rows per thread explicitly, set the `performance_schema_events_transactions_history_size` system variable at server startup.

The `events_transactions_history` table has the same columns and indexing as `events_transactions_current`. See Section 26.12.7.1, “The events_transactions_current Table”.

`TRUNCATE TABLE` is permitted for the `events_transactions_history` table. It removes the rows.

For more information about the relationship between the three transaction event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect transaction events, see Section 26.12.7, “Performance Schema Transaction Tables”.

### 26.12.7.3 The `events_transactions_history_long` Table

The `events_transactions_history_long` table contains the $N$ most recent transaction events that have ended globally, across all threads. Transaction events are not added to the table until they have ended. When the table becomes full, the oldest row is discarded when a new row is added, regardless of which thread generated either row.

The Performance Schema autosizes the value of $N$ is autosized at server startup. To set the table size explicitly, set the `performance_schema_events_transactions_history_long_size` system variable at server startup.

The `events_transactions_history_long` table has the same columns as `events_transactions_current`. See Section 26.12.7.1, “The events_transactions_current Table”.

Unlike `events_transactions_current`, `events_transactions_history_long` has no indexing.

`TRUNCATE TABLE` is permitted for the `events_transactions_history_long` table. It removes the rows.

For more information about the relationship between the three transaction event tables, see Section 26.9, “Performance Schema Tables for Current and Historical Events”.

For information about configuring whether to collect transaction events, see Section 26.12.7, “Performance Schema Transaction Tables”.

### 26.12.8 Performance Schema Connection Tables

When a client connects to the MySQL server, it does so under a particular user name and from a particular host. The Performance Schema provides statistics about these connections, tracking them per account (user and host combination) as well as separately per user name and host name, using these tables:

- **accounts**: Connection statistics per client account
- **hosts**: Connection statistics per client host name
- **users**: Connection statistics per client user name
The meaning of “account” in the connection tables is similar to its meaning in the MySQL grant tables in the mysql system database, in the sense that the term refers to a combination of user and host values. They differ in that, for grant tables, the host part of an account can be a pattern, whereas for Performance Schema tables, the host value is always a specific nonpattern host name.

Each connection table has CURRENT_CONNECTIONS and TOTAL_CONNECTIONS columns to track the current and total number of connections per “tracking value” on which its statistics are based. The tables differ in what they use for the tracking value. The accounts table has USER and HOST columns to track connections per user and host combination. The users and hosts tables have a USER and HOST column, respectively, to track connections per user name and host name.

The Performance Schema also counts internal threads and threads for user sessions that failed to authenticate, using rows with USER and HOST column values of NULL.

Suppose that clients named user1 and user2 each connect one time from hosta and hostb. The Performance Schema tracks the connections as follows:

- The accounts table has four rows, for the user1/hosta, user1/hostb, user2/hosta, and user2/hostb account values, each row counting one connection per account.
- The hosts table has two rows, for hosta and hostb, each row counting two connections per host name.
- The users table has two rows, for user1 and user2, each row counting two connections per user name.

When a client connects, the Performance Schema determines which row in each connection table applies, using the tracking value appropriate to each table. If there is no such row, one is added. Then the Performance Schema increments by one the CURRENT_CONNECTIONS and TOTAL_CONNECTIONS columns in that row.

When a client disconnects, the Performance Schema decrements by one the CURRENT_CONNECTIONS column in the row and leaves the TOTAL_CONNECTIONS column unchanged.

TRUNCATE TABLE is permitted for connection tables. It has these effects:

- Rows are removed for accounts, hosts, or users that have no current connections (rows with CURRENT_CONNECTIONS = 0).
- Nonremoved rows are reset to count only current connections: For rows with CURRENT_CONNECTIONS > 0, TOTAL_CONNECTIONS is reset to CURRENT_CONNECTIONS.
- Summary tables that depend on the connection table are implicitly truncated, as described later in this section.

The Performance Schema maintains summary tables that aggregate connection statistics for various event types by account, host, or user. These tables have _summary_by_account, _summary_by_host, or _summary_by_user in the name. To identify them, use this query:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
    WHERE TABLE_SCHEMA = 'performance_schema'
    AND TABLE_NAME REGEXP '_summary_by_(account|host|user)'
    ORDER BY TABLE_NAME;
```

+-----------------------------+
<table>
<thead>
<tr>
<th>TABLE_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>events_errors_summary_by_account_by_error</td>
</tr>
<tr>
<td>events_errors_summary_by_host_by_error</td>
</tr>
<tr>
<td>events_summary_by_user_by_error</td>
</tr>
</tbody>
</table>
+-----------------------------+
For details about individual connection summary tables, consult the section that describes tables for the summarized event type:

- Stage event summaries: Section 26.12.17.2, “Stage Summary Tables”
- Transaction event summaries: Section 26.12.17.5, “Transaction Summary Tables”
- Memory event summaries: Section 26.12.17.10, “Memory Summary Tables”
- Error event summaries: Section 26.12.17.11, “Error Summary Tables”

**TRUNCATE TABLE** is permitted for connection summary tables. It removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows. In addition, each summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends. The following table describes the relationship between connection table truncation and implicitly truncated tables.

### Table 26.2 Implicit Effects of Connection Table Truncation

<table>
<thead>
<tr>
<th>Truncated Connection Table</th>
<th>Implicitly Truncated Summary Tables</th>
</tr>
</thead>
<tbody>
<tr>
<td>accounts</td>
<td>Tables with names containing <code>_summary_by_account, _summary_by_thread</code></td>
</tr>
<tr>
<td>hosts</td>
<td>Tables with names containing <code>_summary_by_account, _summary_by_host, _summary_by_thread</code></td>
</tr>
<tr>
<td>users</td>
<td>Tables with names containing <code>_summary_by_account, _summary_by_user, _summary_by_thread</code></td>
</tr>
</tbody>
</table>

Truncating a `_summary_global` summary table also implicitly truncates its corresponding connection and thread summary tables. For example, truncating `events_waits_summary_global_by_event_name` implicitly truncates the wait event summary tables that are aggregated by account, host, user, or thread.

### 26.12.8.1 The accounts Table

The `accounts` table contains a row for each account that has connected to the MySQL server. For each account, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the `performance_schema_accounts_size` system variable at server startup. To disable account statistics, set this variable to 0.
The `accounts` table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of `TRUNCATE TABLE`, see Section 26.12.8, “Performance Schema Connection Tables”.

- **USER**
  
The client user name for the connection. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- **HOST**
  
The host from which the client connected. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- **CURRENT_CONNECTIONS**
  
The current number of connections for the account.

- **TOTAL_CONNECTIONS**
  
The total number of connections for the account.

The `accounts` table has these indexes:

- Primary key on `(USER, HOST)`

26.12.8.2 The `hosts` Table

The `hosts` table contains a row for each host from which clients have connected to the MySQL server. For each host name, the table counts the current and total number of connections. The table size is autosized at server startup. To set the table size explicitly, set the `performance_schema_hosts_size` system variable at server startup. To disable host statistics, set this variable to 0.

The `hosts` table has the following columns. For a description of how the Performance Schema maintains rows in this table, including the effect of `TRUNCATE TABLE`, see Section 26.12.8, “Performance Schema Connection Tables”.

- **HOST**
  
The host from which the client connected. This is `NULL` for an internal thread, or for a user session that failed to authenticate.

- **CURRENT_CONNECTIONS**
  
The current number of connections for the host.

- **TOTAL_CONNECTIONS**
  
The total number of connections for the host.

The `hosts` table has these indexes:

- Primary key on `(HOST)`

26.12.8.3 The `users` Table

The `users` table contains a row for each user who has connected to the MySQL server. For each user name, the table counts the current and total number of connections. The table size is autosized at server startup.
To set the table size explicitly, set the `performance_schema_users_size` system variable at
server startup. To disable user statistics, set this variable to 0.

The `users` table has the following columns. For a description of how the Performance Schema maintains
rows in this table, including the effect of `TRUNCATE TABLE`, see Section 26.12.8, “Performance Schema
Connection Tables”.

- **USER**
  The client user name for the connection. This is `NULL` for an internal thread, or for a user session that
  failed to authenticate.

- **CURRENT_CONNECTIONS**
  The current number of connections for the user.

- **TOTAL_CONNECTIONS**
  The total number of connections for the user.

The `users` table has these indexes:

- Primary key on (USER)

### 26.12.9 Performance Schema Connection Attribute Tables

Connection attributes are key-value pairs that application programs can pass to the server at connect
time. For applications based on the C API implemented by the `libmysqlclient` client library, the
`mysql_options()` and `mysql_options4()` functions define the connection attribute set. Other MySQL
Connectors may provide their own attribute-definition methods.

These Performance Schema tables expose attribute information:

- **session_account_connect_attrs**: Connection attributes for the current session, and other
  sessions associated with the session account

- **session_connect_attrs**: Connection attributes for all sessions

In addition, connect events written to the audit log may include connection attributes. See Section 6.4.5.4,
“Audit Log File Formats”.

Attribute names that begin with an underscore (`_`) are reserved for internal use and should not be created
by application programs. This convention permits new attributes to be introduced by MySQL without
colliding with application attributes, and enables application programs to define their own attributes that do
not collide with internal attributes.

- **Available Connection Attributes**

- **Connection Attribute Limits**

### Available Connection Attributes

The set of connection attributes visible within a given connection varies depending on factors such as your
platform, MySQL Connector used to establish the connection, or client program.

The `libmysqlclient` client library sets these attributes:
Performance Schema Connection Attribute Tables

• _client_name: The client name (libmysql for the client library).
• _client_version: The client library version.
• _os: The operating system (for example, Linux, Win64).
• _pid: The client process ID.
• _platform: The machine platform (for example, x86_64).
• _thread: The client thread ID (Windows only).

Other MySQL Connectors may define their own connection attributes.

MySQL Connector/C++ 8.0.16 and higher defines these attributes for applications that use X DevAPI or X
DevAPI for C:

• _client_license: The connector license (for example GPL-2.0).
• _client_name: The connector name (mysql-connector-cpp).
• _client_version: The connector version.
• _os: The operating system (for example, Linux, Win64).
• _pid: The client process ID.
• _platform: The machine platform (for example, x86_64).
• _source_host: The host name of the machine on which the client is running.
• _thread: The client thread ID (Windows only).

MySQL Connector/J defines these attributes:

• _client_name: The client name
• _client_version: The client library version
• _os: The operating system (for example, Linux, Win64)
• _client_license: The connector license type
• _platform: The machine platform (for example, x86_64)
• _runtime_vendor: The Java runtime environment (JRE) vendor
• _runtime_version: The Java runtime environment (JRE) version

MySQL Connector/NET defines these attributes:

• _client_version: The client library version.
• _os: The operating system (for example, Linux, Win64).
• _pid: The client process ID.
• _platform: The machine platform (for example, x86_64).
• _program_name: The client name.
Performance Schema Connection Attribute Tables

- **_thread**: The client thread ID (Windows only).

PHP defines attributes that depend on how it was compiled:

- Compiled using **libmysqlclient**: The standard **libmysqlclient** attributes, described previously.
- Compiled using **mysqlnd**: Only the **_client_name** attribute, with a value of **mysqlnd**.

Many MySQL client programs set a **program_name** attribute with a value equal to the client name. For example, **mysqladmin** and **mysqldump** set **program_name** to **mysqladmin** and **mysqldump**, respectively. MySQL Shell sets **program_name** to **mysqlsh**.

Some MySQL client programs define additional attributes:

- **mysql** (as of MySQL 8.0.17):
  - **os_user**: The name of the operating system user running the program. Available on Unix and Unix-like systems and Windows.
  - **os_sudouser**: The value of the **SUDO_USER** environment variable. Available on Unix and Unix-like systems.

  **mysql** connection attributes for which the value is empty are not sent.

- **mysqlbinlog**:
  - **_client_role**: **binary_log_listener**

- Replication slave connections:
  - **program_name**: **mysqlld**
  - **_client_role**: **binary_log_listener**
  - **_client_replication_channel_name**: The channel name.

- **FEDERATED** storage engine connections:
  - **program_name**: **mysqlld**
  - **_client_role**: **federated_storage**

**Connection Attribute Limits**

There are limits on the amount of connection attribute data transmitted from client to server:

- A fixed limit imposed by the client prior to connect time.
- A fixed limit imposed by the server at connect time.
- A configurable limit imposed by the Performance Schema at connect time.

For connections initiated using the C API, the **libmysqlclient** library imposes a limit of 64KB on the aggregate size of connection attribute data on the client side: Calls to **mysql_options()** that cause this limit to be exceeded produce a **CR_INVALID_PARAMETER_NO** error. Other MySQL Connectors may impose their own client-side limits on how much connection attribute data can be transmitted to the server.

On the server side, these size checks on connection attribute data occur:
Performance Schema Connection Attribute Tables

- The server imposes a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. Otherwise, the server considers the attribute buffer valid and tracks the size of the longest such buffer in the `Performance_schema_session_connect_attrs_longest_seen` status variable.

- For accepted connections, the Performance Schema checks aggregate attribute size against the value of the `performance_schema_session_connect_attrs_size` system variable. If attribute size exceeds this value, these actions take place:
  - The Performance Schema truncates the attribute data and increments the `Performance_schema_session_connect_attrs_lost` status variable, which indicates the number of connections for which attribute truncation occurred.
  - The Performance Schema writes a message to the error log if the `log_error_verbosity` system variable is greater than 1:

```
Connection attributes of length N were truncated
(N bytes lost)
for connection N, user user_name@host_name
(as user_name), auth: [yes|no]
```

The information in the warning message is intended to help DBAs identify clients for which attribute truncation occurred.

- A `_truncated` attribute is added to the session attributes with a value indicating how many bytes were lost, if the attribute buffer has sufficient space. This enables the Performance Schema to expose per-connection truncation information in the connection attribute tables. This information can be examined without having to check the error log.

### 26.12.9.1 The `session_account_connect_attrs` Table

Application programs can provide key-value connection attributes to be passed to the server at connect time. For descriptions of common attributes, see Section 26.12.9, "Performance Schema Connection Attribute Tables".

The `session_account_connect_attrs` table contains connection attributes only for the current session, and other sessions associated with the session account. To see connection attributes for all sessions, use the `session_connect_attrs` table.

The `session_account_connect_attrs` table contains these columns:

- **PROCESSLIST_ID**
  The connection identifier for the session.

- **ATTR_NAME**
  The attribute name.

- **ATTR_VALUE**
  The attribute value.

- **ORDINAL_POSITION**
  The order in which the attribute was added to the set of connection attributes.

The `session_account_connect_attrs` table has these indexes:
26.12.9.2 The session_connect_attrs Table

Application programs can provide key-value connection attributes to be passed to the server at connect time. For descriptions of common attributes, see Section 26.12.9, “Performance Schema Connection Attribute Tables”.

The session_connect_attrs table contains connection attributes for all sessions. To see connection attributes only for the current session, and other sessions associated with the session account, use the session_account_connect_attrs table.

The session_connect_attrs table contains these columns:

- **PROCESSLIST_ID**
  The connection identifier for the session.

- **ATTR_NAME**
  The attribute name.

- **ATTR_VALUE**
  The attribute value.

- **ORDINAL_POSITION**
  The order in which the attribute was added to the set of connection attributes.

The session_connect_attrs table has these indexes:

- Primary key on (PROCESSLIST_ID, ATTR_NAME)

TRUNCATE TABLE is not permitted for the session_connect_attrs table.

26.12.10 Performance Schema User-Defined Variable Tables

The Performance Schema provides a user_variables_by_thread table that exposes user-defined variables. These are variables defined within a specific session and include a @ character preceding the name; see Section 9.4, “User-Defined Variables”.

The user_variables_by_thread table contains these columns:

- **THREAD_ID**
  The thread identifier of the session in which the variable is defined.

- **VARIABLE_NAME**
  The variable name, without the leading @ character.

- **VARIABLE_VALUE**
  The variable value.
Performance Schema Replication Tables

The user_variables_by_thread table has these indexes:

- Primary key on (THREAD_ID, VARIABLE_NAME)

TRUNCATE TABLE is not permitted for the user_variables_by_thread table.

26.12.11 Performance Schema Replication Tables

The Performance Schema provides tables that expose replication information. This is similar to the information available from the SHOW SLAVE STATUS statement, but representation in table form is more accessible and has usability benefits:

- SHOW SLAVE STATUS output is useful for visual inspection, but not so much for programmatic use. By contrast, using the Performance Schema tables, information about slave status can be searched using general SELECT queries, including complex WHERE conditions, joins, and so forth.

- Query results can be saved in tables for further analysis, or assigned to variables and thus used in stored procedures.

- The replication tables provide better diagnostic information. For multithreaded slave operation, SHOW SLAVE STATUS reports all coordinator and worker thread errors using the Last_SQL_Errno and Last_SQL_Error fields, so only the most recent of those errors is visible and information can be lost. The replication tables store errors on a per-thread basis without loss of information.

- The last seen transaction is visible in the replication tables on a per-worker basis. This is information not available from SHOW SLAVE STATUS.

- Developers familiar with the Performance Schema interface can extend the replication tables to provide additional information by adding rows to the tables.

Replication Table Descriptions

The Performance Schema provides the following replication-related tables:

- Tables that contain information about the connection of the slave server to the master server:
  - replication_connection_configuration: Configuration parameters for connecting to the master
  - replication_connection_status: Current status of the connection to the master

- Tables that contain general (not thread-specific) information about the transaction applier:
  - replication_applier_configuration: Configuration parameters for the transaction applier on the slave.
  - replication_applier_status: Current status of the transaction applier on the slave.

- Tables that contain information about specific threads responsible for applying transactions received from the master:
  - replication_applier_status_by_coordinator: Status of the coordinator thread (empty unless the slave is multithreaded).
  - replication_applier_status_by_worker: Status of the applier thread or worker threads if the slave is multithreaded.

- Tables that contain information about channel based replication filters:
Performance Schema Replication Tables

• `replication_applier_filters`: Provides information about the replication filters configured on specific replication channels.

• `replication_applier_global_filters`: Provides information about global replication filters, which apply to all replication channels.

• Tables that contain information about Group Replication members:
  • `replication_group_members`: Provides network and status information for group members.
  • `replication_group_member_stats`: Provides statistical information about group members and transactions in which they participate.

For more information see Section 18.3, “Monitoring Group Replication”.

The following Performance Schema replication tables continue to be populated when the Performance Schema is disabled:

• `replication_connection_configuration`

• `replication_connection_status`

• `replication_applier_configuration`

• `replication_applier_status`

• `replication_applier_status_by_coordinator`

• `replication_applier_status_by_worker`

The exception is local timing information (start and end timestamps for transactions) in the replication tables `replication_connection_status`, `replication_applier_status_by_coordinator`, and `replication_applier_status_by_worker`. This information is not collected when the Performance Schema is disabled.

The following sections describe each replication table in more detail, including the correspondence between the columns produced by `SHOW SLAVE STATUS` and the replication table columns in which the same information appears.

The remainder of this introduction to the replication tables describes how the Performance Schema populates them and which fields from `SHOW SLAVE STATUS` are not represented in the tables.

**Replication Table Life Cycle**

The Performance Schema populates the replication tables as follows:

• Prior to execution of `CHANGE MASTER TO`, the tables are empty.

• After `CHANGE MASTER TO`, the configuration parameters can be seen in the tables. At this time, there are no active slave threads, so the `THREAD_ID` columns are `NULL` and the `SERVICE_STATE` columns have a value of `OFF`.

• After `START SLAVE`, non-NULL `THREAD_ID` values can be seen. Threads that are idle or active have a `SERVICE_STATE` value of `ON`. The thread that connects to the master server has a value of `CONNECTING` while it establishes the connection, and `ON` thereafter as long as the connection lasts.

• After `STOP SLAVE`, the `THREAD_ID` columns become `NULL` and the `SERVICE_STATE` columns for threads that no longer exist have a value of `OFF`. 
• The tables are preserved after `STOP SLAVE` or threads dying due to an error.

• The `replication_applier_status_by_worker` table is nonempty only when the slave is operating in multithreaded mode. That is, if the `slave_parallel_workers` system variable is greater than 0, this table is populated when `START SLAVE` is executed, and the number of rows shows the number of workers.

**SHOW SLAVE STATUS Information Not In the Replication Tables**

The information in the Performance Schema replication tables differs somewhat from the information available from `SHOW SLAVE STATUS` because the tables are oriented toward use of global transaction identifiers (GTIDs), not file names and positions, and they represent server UUID values, not server ID values. Due to these differences, several `SHOW SLAVE STATUS` columns are not preserved in the Performance Schema replication tables, or are represented a different way:

• The following fields refer to file names and positions and are not preserved:

  - `Master_Log_File`
  - `Read_Master_Log_Pos`
  - `Relay_Log_File`
  - `Relay_Log_Pos`
  - `Relay_Master_Log_File`
  - `Exec_Master_Log_Pos`
  - `Until_Condition`
  - `Until_Log_File`
  - `Until_Log_Pos`

• The `Master_Info_File` field is not preserved. It refers to the `master.info` file used for the slave's master info repository, which has been superseded by crash-safe slave tables.

• The following fields are based on `server_id`, not `server_uuid`, and are not preserved:

  - `Master_Server_Id`
  - `Replicate_Ignore_Server_Ids`

• The `Skip_Counter` field is based on event counts, not GTIDs, and is not preserved.

• These error fields are aliases for `Last_SQL_Errno` and `Last_SQL_Error`, so they are not preserved:

  - `Last_Errno`
  - `Last_Error`

  In the Performance Schema, this error information is available in the `LAST_ERROR_NUMBER` and `LAST_ERROR_MESSAGE` columns of the `replication_applier_status_by_coordinator` table (and `replication_applier_status_by_worker` if the slave is multithreaded). Those tables provide more specific per-thread error information than is available from `Last_Errno` and `Last_Error`.

• Fields that provide information about command-line filtering options is not preserved:

  - `Replicate_Do_DB`
  - `Replicate_Ignore_DB`
  - `Replicate_Do_Table`
  - `Replicate_Ignore_Table`
  - `Replicate_Wild_Do_Table`
  - `Replicate_Wild_Ignore_Table`

• The `Slave_IO_State` and `Slave_SQL_Running_State` fields are not preserved. If needed, these values can be obtained from the process list by using the `THREAD_ID` column of the appropriate replication table and joining it with the `ID` column in the `INFORMATION_SCHEMA.PROCESSLIST` table to select the `STATE` column of the latter table.
Performance Schema Replication Tables

- The `Executed_Gtid_Set` field can show a large set with a great deal of text. Instead, the Performance Schema tables show GTIDs of transactions that are currently being applied by the slave. Alternatively, the set of executed GTIDs can be obtained from the value of the `gtid_executed` system variable.

- The `Seconds_Behind_Master` and `Relay_Log_Space` fields are in to-be-decided status and are not preserved.

Status Variables Moved to Replication Tables

As of MySQL version 5.7.5, the following status variables (previously monitored using `SHOW STATUS`) were moved to the Performance Schema replication tables:

- `Slave_retried_transactions`
- `Slave_last_heartbeat`
- `Slave_received_heartbeats`
- `Slave_heartbeat_period`
- `Slave_running`

These status variables are now only relevant when a single replication channel is being used because they only report the status of the default replication channel. When multiple replication channels exist, use the Performance Schema replication tables described in this section, which report these variables for each existing replication channel.

Replication Channels

The first column of the replication Performance Schema tables is `CHANNEL_NAME`. This enables the tables to be viewed per replication channel. In a non-multisource replication setup there is a single default replication channel. When you are using multiple replication channels on a slave, you can filter the tables per replication channel to monitor a specific replication channel. See Section 17.2.3, “Replication Channels” and Section 17.1.4.8, “Monitoring Multi-Source Replication” for more information.

26.12.11.1 The `replication_connection_configuration` Table

This table shows the configuration parameters used by the slave server for connecting to the master server. Parameters stored in the table can be changed at runtime with the `CHANGE MASTER TO` statement, as indicated in the column descriptions.

Compared to the `replication_connection_status` table, `replication_connection_configuration` changes less frequently. It contains values that define how the slave connects to the master and that remain constant during the connection, whereas `replication_connection_status` contains values that change during the connection.

The `replication_connection_configuration` table has the following columns. The column descriptions indicate the corresponding `CHANGE MASTER TO` options from which the column values are taken, and the table given later in this section shows the correspondence between `replication_connection_configuration` columns and `SHOW SLAVE STATUS` columns.

- `CHANNEL_NAME`

  The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 17.2.3, “Replication Channels” for more information. (`CHANGE MASTER TO` option: `FOR CHANNEL`)
Performance Schema Replication Tables

- **HOST**
  The master host that the slave is connected to. ([CHANGE MASTER TO option: MASTER_HOST]

- **PORT**
  The port used to connect to the master. ([CHANGE MASTER TO option: MASTER_PORT]

- **USER**
  The user name of the account used to connect to the master. ([CHANGE MASTER TO option: MASTER_USER]

- **NETWORK_INTERFACE**
  The network interface that the slave is bound to, if any. ([CHANGE MASTER TO option: MASTER_BIND]

- **AUTO_POSITION**
  1 if autopositioning is in use; otherwise 0. ([CHANGE MASTER TO option: MASTER_AUTO_POSITION]

- **SSL_ALLOWED, SSL_CA_FILE, SSL_CA_PATH, SSL_CERTIFICATE, SSL_CIPHER, SSL_KEY, SSL_VERIFY_SERVER_CERTIFICATE, SSL_CRL_FILE, SSL_CRL_PATH**
  These columns show the SSL parameters used by the slave to connect to the master, if any.

  **SSL_ALLOWED** has these values:
  - **Yes** if an SSL connection to the master is permitted
  - **No** if an SSL connection to the master is not permitted
  - **Ignored** if an SSL connection is permitted but the slave server does not have SSL support enabled

  **CHANGE MASTER TO** options for the other SSL columns: MASTER_SSL_CA, MASTER_SSL_CAPATH, MASTER_SSL_CERT, MASTER_SSL_CIPHER, MASTER_SSL_CRL, MASTER_SSL_CRLPATH, MASTER_SSL_KEY, MASTER_SSL_VERIFY_SERVER_CERT.

- **CONNECTION_RETRY_INTERVAL**
  The number of seconds between connect retries. ([CHANGE MASTER TO option: MASTER_CONNECT_RETRY]

- **CONNECTION_RETRY_COUNT**
  The number of times the slave can attempt to reconnect to the master in the event of a lost connection. ([CHANGE MASTER TO option: MASTER_RETRY_COUNT]

- **HEARTBEAT_INTERVAL**
  The replication heartbeat interval on a slave, measured in seconds. ([CHANGE MASTER TO option: MASTER_HEARTBEAT_PERIOD]

- **TLS_VERSION**
  The TLS version used on the master. For TLS version information, see [Section 6.3.2, “Encrypted Connection TLS Protocols and Ciphers”]. ([CHANGE MASTER TO option: MASTER_TLS_VERSION]

- **PUBLIC_KEY_PATH**
The path name to a file containing a slave-side copy of the public key required by the master for RSA key pair-based password exchange. The file must be in PEM format. This column applies to slaves that authenticate with the `sha256_password` or `caching_sha2_password` authentication plugin. (CHANGE MASTER TO option: `MASTER_PUBLIC_KEY_PATH`)

If `PUBLIC_KEY_PATH` is given and specifies a valid public key file, it takes precedence over `GET_PUBLIC_KEY`.

- **GET_PUBLIC_KEY**

  Whether to request from the master the public key required for RSA key pair-based password exchange. This column applies to slaves that authenticate with the `caching_sha2_password` authentication plugin. For that plugin, the master does not send the public key unless requested. (CHANGE MASTER TO option: `MASTER_GET_PUBLIC_KEY`)

  If `PUBLIC_KEY_PATH` is given and specifies a valid public key file, it takes precedence over `GET_PUBLIC_KEY`.

- **COMPRESSION_ALGORITHMS**

  The permitted compression algorithms for connections to the master. (CHANGE MASTER TO option: `MASTER_COMPRESSION_ALGORITHMS`)

  For more information, see [Section 4.2.6, “Connection Compression Control”](#).

  This column was added in MySQL 8.0.18.

- **ZSTD_COMPRESSION_LEVEL**

  The compression level to use for connections to the master that use the `zstd` compression algorithm. (CHANGE MASTER TO option: `MASTER_ZSTD_COMPRESSION_LEVEL`)

  For more information, see [Section 4.2.6, “Connection Compression Control”](#).

  This column was added in MySQL 8.0.18.

The `replication_connection_configuration` table has these indexes:

- Primary key on `(CHANNEL_NAME)`

`TRUNCATE TABLE` is not permitted for the `replication_connection_configuration` table.

The following table shows the correspondence between `replication_connection_configuration` columns and `SHOW SLAVE STATUS` columns.

<table>
<thead>
<tr>

</tbody>
</table>

#### 26.12.11.2 The replication_connection_status Table

This table shows the current status of the I/O thread that handles the slave server connection to the master server, information on the last transaction queued in the relay log, and information on the transaction currently being queued in the relay log.

Compared to the replication_connection_configuration table, replication_connection_status changes more frequently. It contains values that change during the connection, whereas replication_connection_configuration contains values which define how the slave connects to the master and that remain constant during the connection.

The replication_connection_status table has these columns:

- **CHANNEL_NAME**
  
The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 17.2.3, “Replication Channels” for more information.

- **GROUP_NAME**
  
  If this server is a member of a group, shows the name of the group the server belongs to.

- **SOURCE_UUID**
  
  The server_uuid value from the master.

- **THREAD_ID**
  
  The I/O thread ID.

- **SERVICE_STATE**
ON (thread exists and is active or idle), OFF (thread no longer exists), or CONNECTING (thread exists and is connecting to the master).

- **RECEIVED_TRANSACTION_SET**
  The set of global transaction IDs (GTIDs) corresponding to all transactions received by this slave. Empty if GTIDs are not in use. See GTID Sets for more information.

- **LAST_ERROR_NUMBER, LAST_ERROR_MESSAGE**
  The error number and error message of the most recent error that caused the I/O thread to stop. An error number of 0 and message of the empty string mean “no error.” If the LAST_ERROR_MESSAGE value is not empty, the error values also appear in the slave’s error log.

  Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.

- **LAST_ERROR_TIMESTAMP**
  A timestamp in `YYYY-MM-DD hh:mm:ss[.fraction]` format that shows when the most recent I/O error took place.

- **LAST_HEARTBEAT_TIMESTAMP**
  A timestamp in `YYYY-MM-DD hh:mm:ss[.fraction]` format that shows when the most recent heartbeat signal was received by a replication slave.

- **COUNT_RECEIVED_HEARTBEATS**
  The total number of heartbeat signals that a replication slave received since the last time it was restarted or reset, or a `CHANGE MASTER TO` statement was issued.

- **LAST_QUEUED_TRANSACTION**
  The global transaction ID (GTID) of the last transaction that was queued to the relay log.

- **LAST_QUEUED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP**
  A timestamp in `YYYY-MM-DD hh:mm:ss[.fraction]` format that shows when the last transaction queued in the relay log was committed on the original master.

- **LAST_QUEUED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP**
  A timestamp in `YYYY-MM-DD hh:mm:ss[.fraction]` format that shows when the last transaction queued in the relay log was committed on the immediate master.

- **LAST_QUEUED_TRANSACTION_START_QUEUE_TIMESTAMP**
  A timestamp in `YYYY-MM-DD hh:mm:ss[.fraction]` format that shows when the last transaction was placed in the relay log queue by this I/O thread.

- **LAST_QUEUED_TRANSACTION_END_QUEUE_TIMESTAMP**
  A timestamp in `YYYY-MM-DD hh:mm:ss[.fraction]` format that shows when the last transaction was queued to the relay log files.

- **QUEUEING_TRANSACTION**
  The global transaction ID (GTID) of the currently queueing transaction in the relay log.
Performance Schema Replication Tables

- **QUEUEING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the currently queueing transaction was committed on the original master.

- **QUEUEING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the currently queueing transaction was committed on the immediate master.

- **QUEUEING_TRANSACTION_START_QUEUE_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the first event of the currently queueing transaction was written to the relay log by this I/O thread.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for queued transactions are zero.

The **replication_connection_status** table has these indexes:

- Primary key on (CHANNEL_NAME)
- Index on (THREAD_ID)

The following table shows the correspondence between **replication_connection_status** columns and **SHOW SLAVE STATUS** columns.

<table>
<thead>
<tr>
<th>replication_connection_status Column</th>

</tr>
</tbody>
</table>

### 26.12.11.3 The replication_applier_configuration Table

This table shows the configuration parameters that affect transactions applied by the slave server. Parameters stored in the table can be changed at runtime with the **CHANGE MASTER TO** statement, as indicated in the column descriptions.

The **replication_applier_configuration** table has these columns:

- **CHANNEL_NAME**
  The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 17.2.3, “Replication Channels” for more information.

- **DESIRED_DELAY**
  The number of seconds that the slave must lag the master. (**CHANGE MASTER TO** option: MASTER_DELAY) See Section 17.4.10, “Delayed Replication” for more information.
• PRIVILEGE_CHECKS_USER

The user account that provides the security context for the channel (CHANGE MASTER TO option: PRIVILEGE_CHECKS_USER). This is escaped so that it can be copied into a SQL statement to execute individual transactions. See Section 17.3.3, “Replication Privilege Checks” for more information.

The replication_applier_configuration table has these indexes:

• Primary key on (CHANNEL_NAME)

TRUNCATE TABLE is not permitted for the replication_applier_configuration table.

The following table shows the correspondence between replication_applier_configuration columns and SHOW SLAVE STATUS columns.

<table>
<thead>
<tr>
<th>replication_applier_configuration Column</th>
<th>SHOW SLAVE STATUS Column</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESIRED_DELAY</td>
<td>SQL_Delay</td>
</tr>
</tbody>
</table>

26.12.11.4 The replication_applier_status Table

This table shows the current general transaction execution status on the slave server. The table provides information about general aspects of transaction applier status that are not specific to any thread involved. Thread-specific status information is available in the replication_applier_status_by_coordinator table (and replication_applier_status_by_worker if the slave is multithreaded).

The replication_applier_status table has these columns:

• CHANNEL_NAME

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 17.2.3, “Replication Channels” for more information.

• SERVICE_STATE

Shows ON when the replication channel's applier threads are active or idle, OFF means that the applier threads are not active.

• REMAINING_DELAY

If the slave is waiting for DESIRED_DELAY seconds to pass since the master applied an transaction, this field contains the number of delay seconds remaining. At other times, this field is NULL. (The DESIRED_DELAY value is stored in the replication_applier_configuration table.) See Section 17.4.10, “Delayed Replication” for more information.

• COUNT_TRANSACTIONS_RETRIES

Shows the number of retries that were made because the slave SQL thread failed to apply a transaction. The maximum number of retries for a given transaction is set by the slave_transaction_retries system variable. The replication_applier_status_by_worker table shows detailed information on transaction retries for a single-threaded or multithreaded slave.

The replication_applier_status table has these indexes:

• Primary key on (CHANNEL_NAME)
TRUNCATE TABLE is not permitted for the replication_applier_status table.

The following table shows the correspondence between replication_applier_status columns and SHOW SLAVE STATUS columns.

<table>
<thead>
<tr>
<th>replication_applier_status Column</th>
<th>SHOW SLAVE STATUS Column</th>
</tr>
</thead>
<tbody>
<tr>
<td>SERVICE_STATE</td>
<td>None</td>
</tr>
<tr>
<td>REMAINING_DELAY</td>
<td>SQL_Remaining_Delay</td>
</tr>
</tbody>
</table>

26.12.11.5 The replication_applier_status_by_coordinator Table

For a multithreaded slave, the slave uses multiple worker threads and a coordinator thread to manage them, and this table shows the status of the coordinator thread. For a single-threaded slave, this table is empty. For a multithreaded slave, the replication_applier_status_by_worker table shows the status of the worker threads. This table provides information about the last transaction which was buffered by the coordinator thread to a worker’s queue, as well as the transaction it is currently buffering. The start timestamp refers to when this thread read the first event of the transaction from the relay log to buffer it to a worker’s queue, while the end timestamp refers to when the last event finished buffering to the worker’s queue.

The replication_applier_status_by_coordinator table has these columns:

• CHANNEL_NAME
  The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 17.2.3, “Replication Channels” for more information.

• THREAD_ID
  The SQL/coordinator thread ID.

• SERVICE_STATE
  ON (thread exists and is active or idle) or OFF (thread no longer exists).

• LAST_ERROR_NUMBER, LAST_ERROR_MESSAGE
  The error number and error message of the most recent error that caused the SQL/coordinator thread to stop. An error number of 0 and message which is an empty string means “no error”. If the LAST_ERROR_MESSAGE value is not empty, the error values also appear in the slave’s error log.

Issuing RESET MASTER or RESET SLAVE resets the values shown in these columns.

All error codes and messages displayed in the LAST_ERROR_NUMBER and LAST_ERROR_MESSAGE columns correspond to error values listed in Section B.3.1, “Server Error Message Reference”.

• LAST_ERROR_TIMESTAMP
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the most recent SQL/coordinator error occurred.

• LAST_PROCESSED_TRANSACTION
  The global transaction ID (GTID) of the last transaction processed by this coordinator.
• **LAST_PROCESSED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP**

  A timestamp in 'YYYY-MM-DD hh:mm:ss [.fraction]' format that shows when the last transaction processed by this coordinator was committed on the original master.

• **LAST_PROCESSED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP**

  A timestamp in 'YYYY-MM-DD hh:mm:ss [.fraction]' format that shows when the last transaction processed by this coordinator was committed on the immediate master.

• **LAST_PROCESSED_TRANSACTION_START_BUFFER_TIMESTAMP**

  A timestamp in 'YYYY-MM-DD hh:mm:ss [.fraction]' format that shows when this coordinator thread started writing the last transaction to the buffer of a worker thread.

• **LAST_PROCESSED_TRANSACTION_END_BUFFER_TIMESTAMP**

  A timestamp in 'YYYY-MM-DD hh:mm:ss [.fraction]' format that shows when the last transaction was written to the buffer of a worker thread by this coordinator thread.

• **PROCESSING_TRANSACTION**

  The global transaction ID (GTID) of the transaction that this coordinator thread is currently processing.

• **PROCESSING_TRANSACTION_INTEGRAL_TRANSACTION_TIMESTAMP**

  A timestamp in 'YYYY-MM-DD hh:mm:ss [.fraction]' format that shows when the currently processing transaction was committed on the original master.

• **PROCESSING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP**

  A timestamp in 'YYYY-MM-DD hh:mm:ss [.fraction]' format that shows when the currently processing transaction was committed on the immediate master.

• **PROCESSING_TRANSACTION_START_BUFFER_TIMESTAMP**

  A timestamp in 'YYYY-MM-DD hh:mm:ss [.fraction]' format that shows when this coordinator thread started writing the currently processing transaction to the buffer of a worker thread.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for buffered transactions are zero.

The `replication_applier_status_by_coordinator` table has these indexes:

• Primary key on ```(CHANNEL_NAME)```

• Index on ```(THREAD_ID)```

The following table shows the correspondence between `replication_applier_status_by_coordinator` columns and SHOW SLAVE STATUS columns.

<table>
<thead>
<tr>
<th><code>replication_applier_status_by_coordinator</code> Column</th>
<th>SHOW SLAVE STATUS Column</th>
</tr>
</thead>
<tbody>
<tr>
<td>THREAD_ID</td>
<td>None</td>
</tr>
<tr>
<td>SERVICE_STATE</td>
<td>Slave_SQL_Running</td>
</tr>
<tr>
<td>LAST_ERROR_NUMBER</td>
<td>Last_SQL_Errno</td>
</tr>
</tbody>
</table>

4572
26.12.11.6 The replication_applier_status_by_worker Table

This table provides details of the transactions handled by applier threads on a replication slave or Group Replication group member. For a single-threaded slave, data is shown for the slave’s single applier thread. For a multithreaded slave, data is shown individually for each applier thread. The applier threads on a multithreaded slave are sometimes called workers. The number of applier threads on a replication slave or Group Replication group member is set by the `slave_parallel_workers` system variable, which is set to zero for a single-threaded slave. A multithreaded slave also has a coordinator thread to manage the applier threads, and the status of this thread is shown in the `replication_applier_status_by_coordinator` table.

All error codes and messages displayed in the columns relating to errors correspond to error values listed in Section B.3.1, “Server Error Message Reference”.

When the Performance Schema is disabled, local timing information is not collected, so the fields showing the start and end timestamps for applied transactions are zero. The start timestamps in this table refer to when the worker started applying the first event, and the end timestamps refer to when the last event of the transaction was applied.

When a replication slave is restarted by a `START SLAVE` statement, the columns beginning `APPLYING_TRANSACTION` are reset. Before MySQL 8.0.13, these columns were not reset on a slave that was operating in single-threaded mode, only on a multithreaded slave.

The `replication_applier_status_by_worker` table has these columns:

- **CHANNEL_NAME**
  The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See Section 17.2.3, “Replication Channels” for more information.

- **WORKER_ID**
  The worker identifier (same value as the `id` column in the `mysql.slave_worker_info` table). After `STOP SLAVE`, the `THREAD_ID` column becomes `NULL`, but the `WORKER_ID` value is preserved.

- **THREAD_ID**
  The worker thread ID.

- **SERVICE_STATE**
  `ON` (thread exists and is active or idle) or `OFF` (thread no longer exists).

- **LAST_ERROR_NUMBER**, **LAST_ERROR_MESSAGE**
  The error number and error message of the most recent error that caused the worker thread to stop. An error number of 0 and message of the empty string mean “no error”. If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the slave’s error log.

Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.
Performance Schema Replication Tables

- **LAST_ERROR_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the most recent worker error occurred.

- **LAST_APPLIED_TRANSACTION**
  The global transaction ID (GTID) of the last transaction applied by this worker.

- **LAST_APPLIED_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the last transaction applied by this worker was committed on the original master.

- **LAST_APPLIED_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the last transaction applied by this worker was committed on the immediate master.

- **LAST_APPLIED_TRANSACTION_START_APPLY_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when this worker started applying the last applied transaction.

- **LAST_APPLIED_TRANSACTION_END_APPLY_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when this worker finished applying the last applied transaction.

- **APPLYING_TRANSACTION**
  The global transaction ID (GTID) of the transaction this worker is currently applying.

- **APPLYING_TRANSACTION_ORIGINAL_COMMIT_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the transaction this worker is currently applying was committed on the original master.

- **APPLYING_TRANSACTION_IMMEDIATE_COMMIT_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the transaction this worker is currently applying was committed on the immediate master.

- **APPLYING_TRANSACTION_START_APPLY_TIMESTAMP**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when this worker started its first attempt to apply the transaction that is currently being applied. Before MySQL 8.0.13, this timestamp was refreshed when a transaction was retried due to a transient error, so it showed the timestamp for the most recent attempt to apply the transaction.

- **LAST_APPLIED_TRANSACTION_RETRIES_COUNT**
  The number of times the last applied transaction was retried by the worker after the first attempt. If the transaction was applied at the first attempt, this number is zero.

- **LAST_APPLIED_TRANSACTION_LAST_TRANSIENT_ERROR_NUMBER**
  The error number of the last transient error that caused the transaction to be retried.
Performance Schema Replication Tables

- **LAST_APPLIED_TRANSACTION_LAST_TRANSIENT_ERROR_MESSAGE**
  The message text for the last transient error that caused the transaction to be retried.

- **LAST_APPLIED_TRANSACTION_LAST_TRANSIENT_ERROR_TIMESTAMP**
  A timestamp in "YYYY-MM-DD hh:mm:ss[.fraction]" format for the last transient error that caused the transaction to be retried.

- **APPLYING_TRANSACTION_RETRIES_COUNT**
  The number of times the transaction that is currently being applied was retried until this moment. If the transaction was applied at the first attempt, this number is zero.

- **APPLYING_TRANSACTION_LAST_TRANSIENT_ERROR_NUMBER**
  The error number of the last transient error that caused the current transaction to be retried.

- **APPLYING_TRANSACTION_LAST_TRANSIENT_ERROR_MESSAGE**
  The message text for the last transient error that caused the current transaction to be retried.

- **APPLYING_TRANSACTION_LAST_TRANSIENT_ERROR_TIMESTAMP**
  A timestamp in "YYYY-MM-DD hh:mm:ss[.fraction]" format for the last transient error that caused the current transaction to be retried.

The `replication_applier_status_by_worker` table has these indexes:

- Primary key on `(CHANNEL_NAME, WORKER_ID)`
- Index on `(THREAD_ID)`

The following table shows the correspondence between `replication_applier_status_by_worker` columns and `SHOW SLAVE STATUS` columns.

<table>
<thead>
<tr>
<th><code>replication_applier_status_by_worker</code> Column</th>
<th>SHOW SLAVE STATUS Column</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORKER_ID</td>
<td>None</td>
</tr>
<tr>
<td>THREAD_ID</td>
<td>None</td>
</tr>
<tr>
<td>SERVICE_STATE</td>
<td>None</td>
</tr>
<tr>
<td>LAST_ERROR_NUMBER</td>
<td>Last_SQL_Errno</td>
</tr>
<tr>
<td>LAST_ERROR_MESSAGE</td>
<td>Last_SQL_Error</td>
</tr>
<tr>
<td>LAST_ERROR_TIMESTAMP</td>
<td>Last_SQL_Error_Timestamp</td>
</tr>
</tbody>
</table>

### 26.12.11.7 The replication_applier_global_filters Table

This table shows the global replication filters configured on this slave. The `replication_applier_global_filters` table has the following columns:

- **FILTER_NAME**
  The type of replication filter that has been configured.

- **FILTER_RULE**
The rules configured for the replication filter type using either \texttt{--replicate-\*} command options or \texttt{CHANGE REPLICATION FILTER}.

\begin{itemize}
  \item \textbf{CONFIGURED\_BY}
  \begin{itemize}
    \item \texttt{CHANGE\_REPLICATION\_FILTER} configured by a global replication filter using a \texttt{CHANGE REPLICATION FILTER} statement.
    \item \texttt{STARTUP\_OPTIONS} configured by a global replication filter using a \texttt{--replicate-\*} option.
  \end{itemize}
\end{itemize}

\textbf{ACTIVE\_SINCE}
Timestamp of when the replication filter was configured.

\subsection{26.12.11.8 The replication\_applier\_filters Table}

This table shows the replication channel specific filters configured on this slave. Each row provides information on a replication channel's configured type of filter. The \texttt{replication\_applier\_filters} table has the following columns:

\begin{itemize}
  \item \textbf{CHANNEL\_NAME}
  The name of replication channel with a replication filter configured.
  \item \textbf{FILTER\_NAME}
  The type of replication filter that has been configured for this replication channel.
  \item \textbf{FILTER\_RULE}
  The rules configured for the replication filter type using either \texttt{--replicate-\*} command options or \texttt{CHANGE REPLICATION FILTER}.
  \item \textbf{CONFIGURED\_BY}
  The method used to configure the replication filter, can be one of:
    \begin{itemize}
      \item \texttt{CHANGE\_REPLICATION\_FILTER} configured by a global replication filter using a \texttt{CHANGE REPLICATION FILTER} statement.
      \item \texttt{STARTUP\_OPTIONS} configured by a global replication filter using a \texttt{--replicate-\*} option.
      \item \texttt{CHANGE\_REPLICATION\_FILTER\_FOR\_CHANNEL} configured by a channel specific replication filter using a \texttt{CHANGE REPLICATION FILTER\_FOR\_CHANNEL} statement.
      \item \texttt{STARTUP\_OPTIONS\_FOR\_CHANNEL} configured by a channel specific replication filter using a \texttt{--replicate-\*} option.
    \end{itemize}
  \item \textbf{ACTIVE\_SINCE}
  Timestamp of when the replication filter was configured.
  \item \textbf{COUNTER}
  The number of times the replication filter has been used since it was configured.
\end{itemize}
26.12.11.9 The replication_group_members Table

This table shows network and status information for replication group members. The network addresses shown are the addresses used to connect clients to the group, and should not be confused with the member's internal group communication address specified by `group_replication_local_address`.

The `replication_group_members` table has the following columns:

- **CHANNEL_NAME**
  Name of the Group Replication channel.

- **MEMBER_ID**
  The member server UUID. This has a different value for each member in the group. This also serves as a key because it is unique to each member.

- **MEMBER_HOST**
  Network address of this member (host name or IP address). Retrieved from the member's `hostname` variable. This is the address which clients connect to, unlike the `group_replication_local_address` which is used for internal group communication.

- **MEMBER_PORT**
  Port on which the server is listening. Retrieved from the member's `port` variable.

- **MEMBER_STATE**
  Current state of this member; can be any one of the following:
  - **ONLINE**: The member is in a fully functioning state.
  - **RECOVERING**: The server has joined a group from which it is retrieving data.
  - **OFFLINE**: The group replication plugin is installed but has not been started.
  - **ERROR**: The member has encountered an error, either during applying transactions or during the recovery phase, and is not participating in the group’s transactions.
  - **UNREACHABLE**: The failure detection process suspects that this member cannot be contacted, because the group messages have timed out.

  See Section 18.3.1, “Group Replication Server States”.

- **MEMBER_ROLE**
  Role of the member in the group, either **PRIMARY** or **SECONDARY**.

- **MEMBER_VERSION**
  MySQL version of the member.

The `replication_group_members` table has these indexes:

- None

**TRUNCATE Table** is not permitted for the `replication_group_members` table.
26.12.11.10 The replication_group_member_stats Table

This table shows statistical information for replication group members. It is populated only when Group Replication is running.

The `replication_group_member_stats` table has the following columns:

- **CHANNEL_NAME**
  Name of the Group Replication channel

- **VIEW_ID**
  Current view identifier for this group.

- **MEMBER_ID**
  The member server UUID. This has a different value for each member in the group. This also serves as a key because it is unique to each member.

- **COUNT_TRANSACTIONS_IN_QUEUE**
  The number of transactions in the queue pending conflict detection checks. Once the transactions have been checked for conflicts, if they pass the check, they are queued to be applied as well.

- **COUNT_TRANSACTIONS_CHECKED**
  The number of transactions that have been checked for conflicts.

- **COUNT_CONFLICTS_DETECTED**
  The number of transactions that have not passed the conflict detection check.

- **COUNT_TRANSACTIONS_ROWS_VALIDATING**
  Number of transaction rows which can be used for certification, but have not been garbage collected. Can be thought of as the current size of the conflict detection database against which each transaction is certified.

- **TRANSACTIONS_COMMITTED_ALL_MEMBERS**
  The transactions that have been successfully committed on all members of the replication group, shown as GTID Sets. This is updated at a fixed time interval.

- **LAST_CONFLICT_FREE_TRANSACTION**
  The transaction identifier of the last conflict free transaction which was checked.

- **COUNT_TRANSACTIONS_REMOTE_IN_APPLIER_QUEUE**
  The number of transactions that this member has received from the replication group which are waiting to be applied.

- **COUNT_TRANSACTIONS_REMOTE_APPLIED**
  Number of transactions this member has received from the group and applied.

- **COUNT_TRANSACTIONS_LOCAL_PROPOSED**
  Number of transactions which originated on this member and were sent to the group.
Performance Schema Lock Tables

- **COUNT_TRANSACTIONS_LOCAL_ROLLBACK**
  Number of transactions which originated on this member and were rolled back by the group.

The `replication_group_member_stats` table has these indexes:

- None

`TRUNCATE TABLE` is not permitted for the `replication_group_member_stats` table.

### 26.12.12 Performance Schema Lock Tables

The Performance Schema exposes lock information through these tables:

- **data_locks**: Data locks held and requested
- **data_lock_waits**: Relationships between data lock owners and data lock requestors blocked by those owners
- **metadata_locks**: Metadata locks held and requested
- **table_handles**: Table locks held and requested

The following sections describe these tables in more detail.

#### 26.12.12.1 The data_locks Table

The `data_locks` table shows data locks held and requested. For information about which lock requests are blocked by which held locks, see Section 26.12.12.2, "The data_lock_waits Table".

Example data lock information:

```
mysql> SELECT * FROM performance_schema.data_locks
```

```
*************************** 1. row ***************************
ENGINE: INNODB
ENGINE_LOCK_ID: 139664434886512:1059:139664350547912
ENGINE_TRANSACTION_ID: 2569
THREAD_ID: 46
EVENT_ID: 12
OBJECT_SCHEMA: test
OBJECT_NAME: t1
PARTITION_NAME: NULL
SUBPARTITION_NAME: NULL
INDEX_NAME: NULL
OBJECT_INSTANCE_BEGIN: 139664350547912
LOCK_TYPE: TABLE
LOCK_MODE: IX
LOCK_STATUS: GRANTED
LOCK_DATA: NULL

*************************** 2. row ***************************
ENGINE: INNODB
ENGINE_LOCK_ID: 139664434886512:2:4:1:139664350544872
ENGINE_TRANSACTION_ID: 2569
THREAD_ID: 46
EVENT_ID: 12
OBJECT_SCHEMA: test
OBJECT_NAME: t1
PARTITION_NAME: NULL
SUBPARTITION_NAME: NULL
INDEX_NAME: GEN_CLUST_INDEX
OBJECT_INSTANCE_BEGIN: 139664350544872
LOCK_TYPE: RECORD
LOCK_MODE: X
LOCK_STATUS: GRANTED
```
Performance Schema Lock Tables

Unlike most Performance Schema data collection, there are no instruments for controlling whether data lock information is collected or system variables for controlling data lock table sizes. The Performance Schema collects information that is already available in the server, so there is no memory or CPU overhead to generate this information or need for parameters that control its collection.

Use the `data_locks` table to help diagnose performance problems that occur during times of heavy concurrent load. For InnoDB, see the discussion of this topic at Section 15.15.2, “InnoDB INFORMATION_SCHEMA Transaction and Locking Information”.

The `data_locks` table has these columns:

- **ENGINE**
  
The storage engine that holds or requested the lock.

- **ENGINE_LOCK_ID**
  
The ID of the lock held or requested by the storage engine. Tuples of `(ENGINE_LOCK_ID, ENGINE)` values are unique.

  Lock ID formats are internal and subject to change at any time. Applications should not rely on lock IDs having a particular format.

- **ENGINE_TRANSACTION_ID**
  
The storage engine internal ID of the transaction that requested the lock. This can be considered the owner of the lock, although the lock might still be pending, not actually granted yet (`LOCK_STATUS='WAITING'`).

  If the transaction has not yet performed any write operation (is still considered read only), the column contains internal data that users should not try to interpret. Otherwise, the column is the transaction ID.

  For InnoDB, to obtain details about the transaction, join this column with the `TRX_ID` column of the INFORMATION_SCHEMA INNODB_TRX table.

- **THREAD_ID**
  
The thread ID of the session that created the lock. To obtain details about the thread, join this column with the THREAD_ID column of the Performance Schema threads table.

  THREAD_ID can be used together with EVENT_ID to determine the event during which the lock data structure was created in memory. (This event might have occurred before this particular lock request occurred, if the data structure is used to store multiple locks.)

- **EVENT_ID**
  
The Performance Schema event that caused the lock. Tuples of `(THREAD_ID, EVENT_ID)` values implicitly identify a parent event in other Performance Schema tables:

  - The parent wait event in the `events_waits_xxx` tables
  - The parent stage event in the `events_stages_xxx` tables
  - The parent statement event in the `events_statements_xxx` tables
  - The parent transaction event in the `events_transactions_current` table
To obtain details about the parent event, join the THREAD_ID and EVENT_ID columns with the columns of like name in the appropriate parent event table. See Section 26.19.2, "Obtaining Parent Event Information".

- **OBJECT_SCHEMA**
  The schema that contains the locked table.

- **OBJECT_NAME**
  The name of the locked table.

- **PARTITION_NAME**
  The name of the locked partition, if any; NULL otherwise.

- **SUBPARTITION_NAME**
  The name of the locked subpartition, if any; NULL otherwise.

- **INDEX_NAME**
  The name of the locked index, if any; NULL otherwise.

  In practice, InnoDB always creates an index (GEN_CLUST_INDEX), so INDEX_NAME is non-NULL for InnoDB tables.

- **OBJECT_INSTANCE_BEGIN**
  The address in memory of the lock.

- **LOCK_TYPE**
  The type of lock.

  The value is storage engine dependent. For InnoDB, permitted values are RECORD for a row-level lock, TABLE for a table-level lock.

- **LOCK_MODE**
  How the lock is requested.

  The value is storage engine dependent. For InnoDB, permitted values are S[, GAP], X[, GAP], IS[, GAP], IX[, GAP], AUTO_INC, and UNKNOWN. Lock modes other than AUTO_INC and UNKNOWN indicate gap locks, if present. For information about S, X, IS, IX, and gap locks, refer to Section 15.7.1, "InnoDB Locking".

- **LOCK_STATUS**
  The status of the lock request.

  The value is storage engine dependent. For InnoDB, permitted values are GRANTED (lock is held) and WAITING (lock is being waited for).

- **LOCK_DATA**
  The data associated with the lock, if any. The value is storage engine dependent. For InnoDB, a value is shown if the LOCK_TYPE is RECORD, otherwise the value is NULL. Primary key values of the locked
record are shown for a lock placed on the primary key index. Secondary index values of the locked record are shown with primary key values appended for a lock placed on a secondary index. If there is no primary key, LOCK_DATA shows either the key values of a selected unique index or the unique InnoDB internal row ID number, according to the rules governing InnoDB clustered index use (see Section 15.6.2.1, "Clustered and Secondary Indexes"). LOCK_DATA reports "supremum pseudo-record" for a lock taken on a supremum pseudo-record. If the page containing the locked record is not in the buffer pool because it was written to disk while the lock was held, InnoDB does not fetch the page from disk. Instead, LOCK_DATA reports NULL.

The data_locks table has these indexes:

- Primary key on (ENGINE_LOCK_ID, ENGINE)
- Index on (ENGINE_TRANSACTION_ID, ENGINE)
- Index on (THREAD_ID, EVENT_ID)
- Index on (OBJECT_SCHEMA, OBJECT_NAME, PARTITION_NAME, SUBPARTITION_NAME)

TRUNCATE_TABLE is not permitted for the data_locks table.

26.12.12.2 The data_lock_waits Table

The data_lock_waits table implements a many-to-many relationship showing which data lock requests in the data_locks table are blocked by which held data locks in the data_locks table. Held locks in data_locks appear in data_lock_waits only if they block some lock request.

This information enables you to understand data lock dependencies between sessions. The table exposes not only which lock a session or transaction is waiting for, but which session or transaction currently holds that lock.

Example data lock wait information:

```
mysql> SELECT * FROM performance_schema.data_lock_waits\G
*************************** 1. row ***************************
ENGINE: INNODB
REQUESTING_ENGINE_LOCK_ID: 140211201964816:2:4:2:140211086465800
REQUESTING_ENGINE_TRANSACTION_ID: 1555
REQUESTING_THREAD_ID: 47
REQUESTING_EVENT_ID: 5
REQUESTING_OBJECT_INSTANCE_BEGIN: 140211086465800
BLOCKING_ENGINE_LOCK_ID: 140211201963880:2:4:2:140211086459880
BLOCKING_ENGINE_TRANSACTION_ID: 1554
BLOCKING_THREAD_ID: 46
BLOCKING_EVENT_ID: 12
BLOCKING_OBJECT_INSTANCE_BEGIN: 140211086459880
```

Unlike most Performance Schema data collection, there are no instruments for controlling whether data lock information is collected or system variables for controlling data lock table sizes. The Performance Schema collects information that is already available in the server, so there is no memory or CPU overhead to generate this information or need for parameters that control its collection.

Use the data_lock_waits table to help diagnose performance problems that occur during times of heavy concurrent load. For InnoDB, see the discussion of this topic at Section 15.15.2, “InnoDB INFORMATION_SCHEMA Transaction and Locking Information”.

Because the columns in the data_lock_waits table are similar to those in the data_locks table, the column descriptions here are abbreviated. For more detailed column descriptions, see Section 26.12.12.1, “The data_locks Table”.

4582
The `data_lock_waits` table has these columns:

- **ENGINE**
  The storage engine that requested the lock.

- **REQUESTING_ENGINE_LOCK_ID**
  The ID of the lock requested by the storage engine. To obtain details about the lock, join this column with the ENGINE_LOCK_ID column of the `data_locks` table.

- **REQUESTING_ENGINE_TRANSACTION_ID**
  The storage engine internal ID of the transaction that requested the lock.

- **REQUESTING_THREAD_ID**
  The thread ID of the session that requested the lock.

- **REQUESTING_EVENT_ID**
  The Performance Schema event that caused the lock request in the session that requested the lock.

- **REQUESTING_OBJECT_INSTANCE_BEGIN**
  The address in memory of the requested lock.

- **BLOCKING_ENGINE_LOCK_ID**
  The ID of the blocking lock. To obtain details about the lock, join this column with the ENGINE_LOCK_ID column of the `data_locks` table.

- **BLOCKING_ENGINE_TRANSACTION_ID**
  The storage engine internal ID of the transaction that holds the blocking lock.

- **BLOCKING_THREAD_ID**
  The thread ID of the session that holds the blocking lock.

- **BLOCKING_EVENT_ID**
  The Performance Schema event that caused the blocking lock in the session that holds it.

- **BLOCKING_OBJECT_INSTANCE_BEGIN**
  The address in memory of the blocking lock.

The `data_lock_waits` table has these indexes:

- Index on (REQUESTING_ENGINE_LOCK_ID, ENGINE)
- Index on (BLOCKING_ENGINE_LOCK_ID, ENGINE)
- Index on (REQUESTING_ENGINE_TRANSACTION_ID, ENGINE)
- Index on (BLOCKING_ENGINE_TRANSACTION_ID, ENGINE)
- Index on (REQUESTING_THREAD_ID, REQUESTING_EVENT_ID)
• Index on \( \text{BLOCKING\_THREAD\_ID, BLOCKING\_EVENT\_ID} \)

\texttt{TRUNCATE TABLE} is not permitted for the \texttt{data\_lock\_waits} table.

26.12.12.3 The \texttt{metadata\_locks} Table

MySQL uses metadata locking to manage concurrent access to database objects and to ensure data consistency; see Section 8.11.4, “Metadata Locking”. Metadata locking applies not just to tables, but also to schemas, stored programs (procedures, functions, triggers, scheduled events), table spaces, user locks acquired with the \texttt{GET\_LOCK()} function (see Section 12.14, “Locking Functions”), and locks acquired with the locking service described in Section 29.3.1, “The Locking Service”.

The Performance Schema exposes metadata lock information through the \texttt{metadata\_locks} table:

• Locks that have been granted (shows which sessions own which current metadata locks).

• Locks that have been requested but not yet granted (shows which sessions are waiting for which metadata locks).

• Lock requests that have been killed by the deadlock detector.

• Lock requests that have timed out and are waiting for the requesting session's lock request to be discarded.

This information enables you to understand metadata lock dependencies between sessions. You can see not only which lock a session is waiting for, but which session currently holds that lock.

The \texttt{metadata\_locks} table is read only and cannot be updated. It is autosized by default; to configure the table size, set the \texttt{performance_schema_max_metadata_locks} system variable at server startup.

Metadata lock instrumentation uses the \texttt{wait/lock/metadata/sql/mdl} instrument, which is enabled by default.

To control metadata lock instrumentation state at server startup, use lines like these in your \texttt{my.cnf} file:

• Enable:

  \[
  \begin{align*}
  \text{[mysqld]} \\
  \text{performance-schema-instrument='wait/lock/metadata/sql/mdl=ON'}
  \end{align*}
  \]

• Disable:

  \[
  \begin{align*}
  \text{[mysqld]} \\
  \text{performance-schema-instrument='wait/lock/metadata/sql/mdl=OFF'}
  \end{align*}
  \]

To control metadata lock instrumentation state at runtime, update the \texttt{setup\_instruments} table:

• Enable:

  \[
  \begin{align*}
  \text{UPDATE performance_schema.setup_instruments} \\
  \text{SET ENABLED = 'YES', TIMED = 'YES'} \\
  \text{WHERE NAME = 'wait/lock/metadata/sql/mdl'};
  \end{align*}
  \]

• Disable:

  \[
  \begin{align*}
  \text{UPDATE performance_schema.setup_instruments} \\
  \text{SET ENABLED = 'NO', TIMED = 'NO'} \\
  \text{WHERE NAME = 'wait/lock/metadata/sql/mdl'};
  \end{align*}
  \]
The Performance Schema maintains the `metadata_locks` table content as follows, using the `LOCK_STATUS` column to indicate the status of each lock:

- When a metadata lock is requested and obtained immediately, a row with a status of `GRANTED` is inserted.
- When a metadata lock is requested and not obtained immediately, a row with a status of `PENDING` is inserted.
- When a metadata lock previously requested is granted, its row status is updated to `GRANTED`.
- When a metadata lock is released, its row is deleted.
- When a pending lock request is canceled by the deadlock detector to break a deadlock (`ER_LOCK_DEADLOCK`), its row status is updated from `PENDING` to `VICTIM`.
- When a pending lock request times out (`ER_LOCK_WAIT_TIMEOUT`), its row status is updated from `PENDING` to `TIMEOUT`.
- When granted lock or pending lock request is killed, its row status is updated from `GRANTED` or `PENDING` to `KILLED`.
- The `VICTIM`, `TIMEOUT`, and `KILLED` status values are brief and signify that the lock row is about to be deleted.
- The `PRE_ACQUIRE_NOTIFY` and `POST_RELEASE_NOTIFY` status values are brief and signify that the metadata locking subsubsystem is notifying interested storage engines while entering lock acquisition operations or leaving lock release operations.

The `metadata_locks` table has these columns:

- **OBJECT_TYPE**
  
The type of lock used in the metadata lock subsystem. The value is one of `GLOBAL`, `SCHEMA`, `TABLE`, `FUNCTION`, `PROCEDURE`, `TRIGGER` (currently unused), `EVENT`, `COMMIT`, `USER LEVEL LOCK`, `TABLESPACE`, or `LOCKING SERVICE`.
  
  A value of `USER LEVEL LOCK` indicates a lock acquired with `GET_LOCK()`. A value of `LOCKING SERVICE` indicates a lock acquired with the locking service described in Section 29.3.1, "The Locking Service".

- **OBJECT_SCHEMA**
  
The schema that contains the object.

- **OBJECT_NAME**
  
The name of the instrumented object.

- **OBJECT_INSTANCE_BEGIN**
  
The address in memory of the instrumented object.

- **LOCK_TYPE**
  
The lock type from the metadata lock subsystem. The value is one of `INTENTION_EXCLUSIVE`, `SHARED`, `SHARED_HIGH_PRIO`, `SHARED_READ`, `SHARED_WRITE`, `SHARED_UPGRADABLE`, `SHARED_NO_WRITE`, `SHARED_NO_READ_WRITE`, or `EXCLUSIVE`. 

Performance Schema Lock Tables

• **LOCK_DURATION**
  
The lock duration from the metadata lock subsystem. The value is one of **STATEMENT**, **TRANSACTION**, or **EXPLICIT**. The **STATEMENT** and **TRANSACTION** values signify locks that are released implicitly at statement or transaction end, respectively. The **EXPLICIT** value signifies locks that survive statement or transaction end and are released by explicit action, such as global locks acquired with **FLUSH TABLES WITH READ LOCK**.

• **LOCK_STATUS**
  
The lock status from the metadata lock subsystem. The value is one of **PENDING**, **GRANTED**, **VICTIM**, **TIMEOUT**, **KILLED**, **PRE_ACQUIRE_NOTIFY**, or **POST_RELEASE_NOTIFY**. The Performance Schema assigns these values as described previously.

• **SOURCE**
  
The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

• **OWNER_THREAD_ID**
  
The thread requesting a metadata lock.

• **OWNER_EVENT_ID**
  
The event requesting a metadata lock.

The **metadata_locks** table has these indexes:

- **Primary key on** (OBJECT_INSTANCE_BEGIN)
- **Index on** (OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME)
- **Index on** (OWNER_THREAD_ID, OWNER_EVENT_ID)

**TRUNCATE TABLE** is not permitted for the **metadata_locks** table.

### 26.12.12.4 The table_handles Table

The Performance Schema exposes table lock information through the **table_handles** table to show the table locks currently in effect for each opened table handle. **table_handles** reports what is recorded by the table lock instrumentation. This information shows which table handles the server has open, how they are locked, and by which sessions.

The **table_handles** table is read only and cannot be updated. It is autosized by default; to configure the table size, set the **performance_schema_max_table_handles** system variable at server startup.

Table lock instrumentation uses the **wait/lock/table/sql/handler** instrument, which is enabled by default.

To control table lock instrumentation state at server startup, use lines like these in your **my.cnf** file:

- **Enable:**

  ```
  [mysqld]
  performance-schema-instrument='wait/lock/table/sql/handler=ON'
  ```

- **Disable:**
To control table lock instrumentation state at runtime, update the `setup_instruments` table:

- **Enable:**
  ```sql
  UPDATE performance_schema.setup_instruments
  SET ENABLED = 'YES', TIMED = 'YES'
  WHERE NAME = 'wait/lock/table/sql/handler';
  ```

- **Disable:**
  ```sql
  UPDATE performance_schema.setup_instruments
  SET ENABLED = 'NO', TIMED = 'NO'
  WHERE NAME = 'wait/lock/table/sql/handler';
  ```

The `table_handles` table has these columns:

- **OBJECT_TYPE**
  The table opened by a table handle.

- **OBJECT_SCHEMA**
  The schema that contains the object.

- **OBJECT_NAME**
  The name of the instrumented object.

- **OBJECT_INSTANCE_BEGIN**
  The table handle address in memory.

- **OWNER_THREAD_ID**
  The thread owning the table handle.

- **OWNER_EVENT_ID**
  The event which caused the table handle to be opened.

- **INTERNAL_LOCK**
  The table lock used at the SQL level. The value is one of `READ`, `READ WITH SHARED LOCKS`, `READ HIGH PRIORITY`, `READ NO INSERT`, `WRITE ALLOW WRITE`, `WRITE CONCURRENT INSERT`, `WRITE LOW PRIORITY`, or `WRITE`. For information about these lock types, see the `include/thr_lock.h` source file.

- **EXTERNAL_LOCK**
  The table lock used at the storage engine level. The value is one of `READ EXTERNAL` or `WRITE EXTERNAL`.

The `table_handles` table has these indexes:

- Primary key on `(OBJECT_INSTANCE_BEGIN)`
- Index on `(OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME)`
The MySQL server maintains many system variables that indicate how it is configured (see Section 5.1.8, “Server System Variables”). System variable information is available in these Performance Schema tables:

- **global_variables**: Global system variables. An application that wants only global values should use this table.
- **session_variables**: System variables for the current session. An application that wants all system variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.
- **variables_by_thread**: Session system variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.
- **persisted_variables**: Provides a SQL interface to the `mysqld-auto.cnf` file that stores persisted global system variable settings. See Section 26.12.13.1, “Performance Schema persisted_variables Table”.
- **variables_info**: Shows, for each system variable, the source from which it was most recently set, and its range of values. See Section 26.12.13.2, “Performance Schema variables_info Table”.

The session variable tables (session_variables, variables_by_thread) contain information only for active sessions, not terminated sessions.

**TRUNCATE TABLE** is not supported for Performance Schema system variable tables.

The global_variables and session_variables tables have these columns:

- **VARIABLE_NAME**: The system variable name.
- **VARIABLE_VALUE**: The system variable value. For global_variables, this column contains the global value. For session_variables, this column contains the variable value in effect for the current session.

The global_variables and session_variables tables have these indexes:

- Primary key on (VARIABLE_NAME)

The variables_by_thread table has these columns:

- **THREAD_ID**: The thread identifier of the session in which the system variable is defined.
- **VARIABLE_NAME**: The system variable name.
- **VARIABLE_VALUE**: The session variable value for the session named by the THREAD_ID column.
The `variables_by_thread` table has these indexes:

- Primary key on `(THREAD_ID, VARIABLE_NAME)`

The `variables_by_thread` table contains system variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table will miss some rows. In this case, the `Performance_schema_thread_instances_lost` status variable will be greater than zero.

### 26.12.13.1 Performance Schema persisted_variables Table

The `persisted_variables` table provides an SQL interface to the `mysqld-auto.cnf` file that stores persisted global system variable settings, enabling the file contents to be inspected at runtime using `SELECT` statements. Variables are persisted using `SET PERSIST` or `PERSIST_ONLY` statements; see Section 13.7.6.1, “SET Syntax for Variable Assignment”. The table contains a row for each persisted system variable in the file. Variables not persisted do not appear in the table.

For information about persisted system variables, see Section 13.7.6.1, “SET Syntax for Variable Assignment”.

Suppose that `mysqld-auto.cnf` looks like this (slightly reformatted):

```json
{
    "Version": 1,
    "mysql_server": {
        "max_connections": {
            "Value": "1000",
            "Metadata": {
                "Timestamp": 1.519921706e+15,
                "User": "root",
                "Host": "localhost"
            }
        },
        "autocommit": {
            "Value": "ON",
            "Metadata": {
                "Timestamp": 1.519921707e+15,
                "User": "root",
                "Host": "localhost"
            }
        }
    }
}
```

Then `persisted_variables` has these contents:

```
mysql> SELECT * FROM performance_schema.persisted_variables;
+-----------------+----------------+
| VARIABLE_NAME   | VARIABLE_VALUE |
+-----------------+----------------+
| autocommit      | ON             |
| max_connections | 1000           |
+-----------------+----------------+
```

`persisted_variables` has these columns:

- **VARIABLE_NAME**
  
  The variable name listed in `mysqld-auto.cnf`.

- **VARIABLE_VALUE**
  
  The value listed for the variable in `mysqld-auto.cnf`.
Performance Schema System Variable Tables

`persisted_variables` has these indexes:
- Primary key on (`VARIABLE_NAME`)

TRUNCATE TABLE is not permitted for the `persisted_variables` table.

26.12.13.2 Performance Schema variables_info Table

The `variables_info` table shows, for each system variable, the source from which it was most recently set, and its range of values.

`variables_info` has these columns:
- **VARIABLE_NAME**
  The variable name.
- **VARIABLE_SOURCE**
  The source from which the variable was most recently set:
  - **COMMAND_LINE**
    The variable was set on the command line.
  - **COMPiled**
    The variable has its compiled-in default value. `COMPiled` is the value used for variables not set any other way.
  - **DYNAMIC**
    The variable was set at runtime. This includes variables set within files specified using the `init_file` system variable.
  - **EXPLICIT**
    The variable was set from an option file named with the `--defaults-file` option.
  - **EXTRA**
    The variable was set from an option file named with the `--defaults-extra-file` option.
  - **GLOBAL**
    The variable was set from a global option file. This includes option files not covered by `EXPLICIT`, `EXTRA`, `LOGIN`, `PERSISTED`, `SERVER`, or `USER`.
  - **LOGIN**
    The variable was set from a user-specific login path file (`~/.mylogin.cnf`).
  - **PERSISTED**
    The variable was set from a server-specific `mysqlld-auto.cnf` option file. No row has this value if the server was started with `persistedGlobalsLoad` disabled.
  - **SERVER**
The variable was set from a server-specific $MYSQL_HOME/my.cnf option file. For details about how $MYSQL_HOME is set, see Section 4.2.2.2, “Using Option Files”.

- **USER**

  The variable was set from a user-specific ~/.my.cnf option file.

- **VARIABLE_PATH**

  If the variable was set from an option file, VARIABLE_PATH is the path name of that file. Otherwise, the value is the empty string.

- **MIN_VALUE, MAX_VALUE**

  The minimum and maximum permitted values for the variable. Both are 0 for variables that have no such values (that is, variables that are not numeric).

- **SET_TIME**

  The time at which the variable was most recently set. The default is the time at which the server initialized global system variables during startup.

- **SET_USER, SET_HOST**

  The user name and host name of the client user that most recently set the variable. If a client connects as user17 from host host34.example.com using the account 'user17'@'%.example.com, SET_USER and SET_HOST will be user17 and host34.example.com, respectively. For proxy user connections, these values correspond to the external (proxy) user, not the proxied user against which privilege checking is performed. The default for each column is the empty string, indicating that the variable has not been set since server startup.

The variables_info table has these indexes:

- None

**TRUNCATE TABLE** is not permitted for the variables_info table.

If a variable with a VARIABLE_SOURCE value other than DYNAMIC is set at runtime, VARIABLE_SOURCE becomes DYNAMIC and VARIABLE_PATH becomes the empty string.

A system variable that has only a session value (such as debug_sync) cannot be set at startup or persisted. For session-only system variables, VARIABLE_SOURCE can be only COMPILED or DYNAMIC.

If a system variable has an unexpected VARIABLE_SOURCE value, consider your server startup method. For example, mysqld_safe reads option files and passes certain options it finds there as part of the command line that it uses to start mysqld. Consequently, some system variables that you set in option files might display in variables_info as COMMAND_LINE, rather than as GLOBAL or SERVER as you might otherwise expect.

Some sample queries that use the variables_info table, with representative output:

- **Display variables set on the command line:**

  ```sql
  mysql> SELECT VARIABLE_NAME
  FROM performance_schema.variables_info
  WHERE VARIABLE_SOURCE = 'COMMAND_LINE'
  ORDER BY VARIABLE_NAME;
  +---------------------+
<table>
<thead>
<tr>
<th>VARIABLE_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>---------------------</td>
</tr>
<tr>
<td>---------------------</td>
</tr>
<tr>
<td>---------------------</td>
</tr>
<tr>
<td>---------------------</td>
</tr>
</tbody>
</table>
  +---------------------+
  ```
### Performance Schema Status Variable Tables

<table>
<thead>
<tr>
<th>VARIABLE_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>basedir</td>
</tr>
<tr>
<td>datadir</td>
</tr>
<tr>
<td>log_error</td>
</tr>
<tr>
<td>pid_file</td>
</tr>
<tr>
<td>plugin_dir</td>
</tr>
<tr>
<td>port</td>
</tr>
</tbody>
</table>

- Display variables set from persistent storage:

```sql
mysql> SELECT VARIABLE_NAME
    > FROM performance_schema.variables_info
    > WHERE VARIABLE_SOURCE = 'PERSISTED'
    > ORDER BY VARIABLE_NAME;
```

- Join `variables_info` with the `global_variables` table to display the current values of persisted variables, together with their range of values:

```sql
mysql> SELECT VI.VARIABLE_NAME, GV.VARIABLE_VALUE, VI.MIN_VALUE, VI.MAX_VALUE
    > FROM performance_schema.variables_info AS VI
    > INNER JOIN performance_schema.global_variables AS GV
    > USING (VARIABLE_NAME)
    > WHERE VI.VARIABLE_SOURCE = 'PERSISTED'
    > ORDER BY VARIABLE_NAME;
```

#### 26.12.14 Performance Schema Status Variable Tables

The MySQL server maintains many status variables that provide information about its operation (see *Section 5.1.10, "Server Status Variables"*). Status variable information is available in these Performance Schema tables:

- **global_status**: Global status variables. An application that wants only global values should use this table.

- **session_status**: Status variables for the current session. An application that wants all status variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.

- **status_by_thread**: Session status variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.

There are also summary tables that provide status variable information aggregated by account, host name, and user name. See *Section 26.12.17.12, "Status Variable Summary Tables"*. 
The session variable tables \((\text{session\_status}, \text{status\_by\_thread})\) contain information only for active sessions, not terminated sessions.

The Performance Schema collects statistics for global status variables only for threads for which the \texttt{INSTRUMENTED} value is \texttt{YES} in the \texttt{threads} table. Statistics for session status variables are always collected, regardless of the \texttt{INSTRUMENTED} value.

The Performance Schema does not collect statistics for \texttt{Com\textunderscore xxx} status variables in the status variable tables. To obtain global and per-session statement execution counts, use the \texttt{events\_statements\_summary\_global\_by\_event\_name} and \texttt{events\_statements\_summary\_by\_thread\_by\_event\_name} tables, respectively. For example:

```sql
SELECT EVENT_NAME, COUNT_STAR
FROM performance_schema.events_statements_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'statement/sql/%';
```

The \texttt{global\_status} and \texttt{session\_status} tables have these columns:

- \texttt{VARIABLE\_NAME}
  
  The status variable name.

- \texttt{VARIABLE\_VALUE}
  
  The status variable value. For \texttt{global\_status}, this column contains the global value. For \texttt{session\_status}, this column contains the variable value for the current session.

The \texttt{global\_status} and \texttt{session\_status} tables have these indexes:

- Primary key on \(\texttt{VARIABLE\_NAME}\)

The \texttt{status\_by\_thread} table contains the status of each active thread. It has these columns:

- \texttt{THREAD\_ID}
  
  The thread identifier of the session in which the status variable is defined.

- \texttt{VARIABLE\_NAME}
  
  The status variable name.

- \texttt{VARIABLE\_VALUE}
  
  The session variable value for the session named by the \texttt{THREAD\_ID} column.

The \texttt{status\_by\_thread} table has these indexes:

- Primary key on \(\texttt{THREAD\_ID}, \texttt{VARIABLE\_NAME}\)

The \texttt{status\_by\_thread} table contains status variable information only about foreground threads. If the \texttt{performance\_schema\_max\_thread\_instances} system variable is not autoscaled (signified by a value of \(-1\)) and the maximum permitted number of instrumented thread objects is not greater than the number of background threads, the table will be empty.

The Performance Schema supports \texttt{TRUNCATE TABLE} for status variable tables as follows:

- \texttt{global\_status}: Resets thread, account, host, and user status. Resets global status variables except those that the server never resets.
- **session_status**: Not supported.

- **status_by_thread**: Aggregates status for all threads to the global status and account status, then resets thread status. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

  Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

  **FLUSH_STATUS** adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

### 26.12.15 Performance Schema Thread Pool Tables

#### Note

The Performance Schema tables described here are available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding `INFORMATION_SCHEMA` tables instead; see Section 25.46, "INFORMATION_SCHEMA Thread Pool Tables".

The following sections describe the Performance Schema tables associated with the thread pool plugin (see Section 5.6.3, "MySQL Enterprise Thread Pool"). They provide information about thread pool operation:

- **tp_thread_group_state**: Information about thread pool thread group states
- **tp_thread_group_stats**: Thread group statistics
- **tp_thread_state**: Information about thread pool thread states

Rows in these tables represent snapshots in time. In the case of `tp_thread_state`, all rows for a thread group comprise a snapshot in time. Thus, the MySQL server holds the mutex of the thread group while producing the snapshot. But it does not hold mutexes on all thread groups at the same time, to prevent a statement against `tp_thread_state` from blocking the entire MySQL server.

The Performance Schema thread pool tables are implemented by the thread pool plugin and are loaded and unloaded when that plugin is loaded and unloaded (see Section 5.6.3.2, "Thread Pool Installation"). No special configuration step for the tables is needed. However, the tables depend on the thread pool plugin being enabled. If the thread pool plugin is loaded but disabled, the tables are not created.

#### 26.12.15.1 The tp_thread_group_state Table

#### Note

The Performance Schema table described here is available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding `INFORMATION_SCHEMA` table instead; see Section 25.46.1, "The INFORMATION_SCHEMA TP_THREAD_GROUP_STATE Table".

The `tp_thread_group_state` table has one row per thread group in the thread pool. Each row provides information about the current state of a group.

The `tp_thread_group_state` table has these columns:

- **TP_GROUP_ID**
The thread group ID. This is a unique key within the table.

- **CONSUMER_THREADS**
  The number of consumer threads. There is at most one thread ready to start executing if the active threads become stalled or blocked.

- **RESERVE_THREADS**
  The number of threads in the reserved state. This means that they will not be started until there is a need to wake a new thread and there is no consumer thread. This is where most threads end up when the thread group has created more threads than needed for normal operation. Often a thread group needs additional threads for a short while and then does not need them again for a while. In this case, they go into the reserved state and remain until needed again. They take up some extra memory resources, but no extra computing resources.

- **CONNECT_THREAD_COUNT**
  The number of threads that are processing or waiting to process connection initialization and authentication. There can be a maximum of four connection threads per thread group; these threads expire after a period of inactivity.

- **CONNECTION_COUNT**
  The number of connections using this thread group.

- **QUEUED QUERIES**
  The number of statements waiting in the high-priority queue.

- **QUEUED_TRANSACTIONS**
  The number of statements waiting in the low-priority queue. These are the initial statements for transactions that have not started, so they also represent queued transactions.

- **STALL_LIMIT**
  The value of the `thread_pool_stall_limit` system variable for the thread group. This is the same value for all thread groups.

- **PRIO_KICKUP_TIMER**
  The value of the `thread_pool_prio_kickup_timer` system variable for the thread group. This is the same value for all thread groups.

- **ALGORITHM**
  The value of the `thread_pool_algorithm` system variable for the thread group. This is the same value for all thread groups.

- **THREAD_COUNT**
  The number of threads started in the thread pool as part of this thread group.

- **ACTIVE_THREAD_COUNT**
  The number of threads active in executing statements.
Performance Schema Thread Pool Tables

- **STALLED_THREAD_COUNT**

  The number of stalled statements in the thread group. A stalled statement could be executing, but from a thread pool perspective it is stalled and making no progress. A long-running statement quickly ends up in this category.

- **WAITING_THREAD_NUMBER**

  If there is a thread handling the polling of statements in the thread group, this specifies the thread number within this thread group. It is possible that this thread could be executing a statement.

- **OLDEST_QUEUED**

  How long in milliseconds the oldest queued statement has been waiting for execution.

- **MAX_THREAD_IDS_IN_GROUP**

  The maximum thread ID of the threads in the group. This is the same as `MAX(TP_THREAD_NUMBER)` for the threads when selected from the `tp_thread_state` table. That is, these two queries are equivalent:

  ```sql
  SELECT TP_GROUP_ID, MAX_THREAD_IDS_IN_GROUP
  FROM tp_thread_group_state;
  
  SELECT TP_GROUP_ID, MAX(TP_THREAD_NUMBER)
  FROM tp_thread_state GROUP BY TP_GROUP_ID;
  ```

  The `tp_thread_group_state` table has these indexes:
  - Unique index on `(TP_GROUP_ID)`

  `TRUNCATE TABLE` is not permitted for the `tp_thread_group_state` table.

### 26.12.15.2 The `tp_thread_group_stats` Table

**Note**

The Performance Schema table described here is available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding `INFORMATION_SCHEMA` table instead; see Section 25.46.2, “The INFORMATION_SCHEMA `TP_THREAD_GROUP_STATS` Table”.

The `tp_thread_group_stats` table reports statistics per thread group. There is one row per group.

The `tp_thread_group_stats` table has these columns:

- **TP_GROUP_ID**

  The thread group ID. This is a unique key within the table.

- **CONNECTIONS_STARTED**

  The number of connections started.

- **CONNECTIONS_CLOSED**

  The number of connections closed.

- **QUERIES_EXECUTED**

  4596
The number of statements executed. This number is incremented when a statement starts executing, not when it finishes.

- **QUERIES_QUEUED**
  The number of statements received that were queued for execution. This does not count statements that the thread group was able to begin executing immediately without queuing, which can happen under the conditions described in Section 5.6.3.3, "Thread Pool Operation".

- **THREADS_STARTED**
  The number of threads started.

- **PRIO_KICKUPS**
  The number of statements that have been moved from low-priority queue to high-priority queue based on the value of the `thread_pool_prio_kickup_timer` system variable. If this number increases quickly, consider increasing the value of that variable. A quickly increasing counter means that the priority system is not keeping transactions from starting too early. For InnoDB, this most likely means deteriorating performance due to too many concurrent transactions.

- **STALLED_QUERIES_EXECUTED**
  The number of statements that have become defined as stalled due to executing for longer than the value of the `thread_pool_stall_limit` system variable.

- **BECOME_CONSUMER_THREAD**
  The number of times thread have been assigned the consumer thread role.

- **BECOME_RESERVE_THREAD**
  The number of times threads have been assigned the reserve thread role.

- **BECOME_WAITING_THREAD**
  The number of times threads have been assigned the waiter thread role. When statements are queued, this happens very often, even in normal operation, so rapid increases in this value are normal in the case of a highly loaded system where statements are queued up.

- **WAKE_THREAD_STALL_CHECKER**
  The number of times the stall check thread decided to wake or create a thread to possibly handle some statements or take care of the waiter thread role.

- **SLEEP_WAITS**
  The number of `THD_WAIT_SLEEP` waits. These occur when threads go to sleep (for example, by calling the `SLEEP()` function).

- **DISK_IO_WAITS**
  The number of `THD_WAIT_DISKIO` waits. These occur when threads perform disk I/O that is likely to not hit the file system cache. Such waits occur when the buffer pool reads and writes data to disk, not for normal reads from and writes to files.

- **ROW_LOCK_WAITS**
The number of `THD_WAIT_ROW_LOCK` waits for release of a row lock by another transaction.

- **GLOBAL_LOCK_WAITS**
  The number of `THD_WAIT_GLOBAL_LOCK` waits for a global lock to be released.

- **META_DATA_LOCK_WAITS**
  The number of `THD_WAIT_META_DATA_LOCK` waits for a metadata lock to be released.

- **TABLE_LOCK_WAITS**
  The number of `THD_WAIT_TABLE_LOCK` waits for a table to be unlocked that the statement needs to access.

- **USER_LOCK_WAITS**
  The number of `THD_WAIT_USER_LOCK` waits for a special lock constructed by the user thread.

- **BINLOG_WAITS**
  The number of `THD_WAIT_BINLOG_WAITS` waits for the binary log to become free.

- **GROUP_COMMIT_WAITS**
  The number of `THD_WAIT_GROUP_COMMIT` waits. These occur when a group commit must wait for the other parties to complete their part of a transaction.

- **FSYNC_WAITS**
  The number of `THD_WAIT_SYNC` waits for a file sync operation.

The `tp_thread_group_stats` table has these indexes:

- Unique index on `(TP_GROUP_ID)`

`TRUNCATE TABLE` is not permitted for the `tp_thread_group_stats` table.

### 26.12.15.3 The `tp_thread_state` Table

**Note**

The Performance Schema table described here is available as of MySQL 8.0.14. Prior to MySQL 8.0.14, use the corresponding `INFORMATION_SCHEMA` table instead; see Section 25.46.3, “The `INFORMATION_SCHEMA TP_THREAD_STATE` Table”.

The `tp_thread_state` table has one row per thread created by the thread pool to handle connections.

The `tp_thread_state` table has these columns:

- **TP_GROUP_ID**
  The thread group ID.

- **TP_THREAD_NUMBER**
  The ID of the thread within its thread group. `TP_GROUP_ID` and `TP_THREAD_NUMBER` together provide a unique key within the table.
Performance Schema Clone Tables

• **PROCESS_COUNT**
  
The 10ms interval in which the statement that uses this thread is currently executing. 0 means no statement is executing, 1 means it is in the first 10ms, and so forth.

• **WAIT_TYPE**
  
The type of wait for the thread. **NULL** means the thread is not blocked. Otherwise, the thread is blocked by a call to **thd_wait_begin()** and the value specifies the type of wait. The **xxx_WAIT** columns of the **tp_thread_group_stats** table accumulate counts for each wait type.

The **WAIT_TYPE** value is a string that describes the type of wait, as shown in the following table.

**Table 26.3 tp_thread_state Table WAIT_TYPE Values**

<table>
<thead>
<tr>
<th>Wait Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>THD_WAIT_SLEEP</td>
<td>Waiting for sleep</td>
</tr>
<tr>
<td>THD_WAIT_DISKIO</td>
<td>Waiting for Disk IO</td>
</tr>
<tr>
<td>THD_WAIT_ROW_LOCK</td>
<td>Waiting for row lock</td>
</tr>
<tr>
<td>THD_WAIT_GLOBAL_LOCK</td>
<td>Waiting for global lock</td>
</tr>
<tr>
<td>THD_WAIT_META_DATA_LOCK</td>
<td>Waiting for metadata lock</td>
</tr>
<tr>
<td>THD_WAIT_TABLE_LOCK</td>
<td>Waiting for table lock</td>
</tr>
<tr>
<td>THD_WAIT_USER_LOCK</td>
<td>Waiting for user lock</td>
</tr>
<tr>
<td>THD_WAIT_BINLOG</td>
<td>Waiting for binlog</td>
</tr>
<tr>
<td>THD_WAIT_GROUP_COMMIT</td>
<td>Waiting for group commit</td>
</tr>
<tr>
<td>THD_WAIT_SYNC</td>
<td>Waiting for fsync</td>
</tr>
</tbody>
</table>

The **tp_thread_state** table has these indexes:

• Unique index on (**TP_GROUP_ID, TP_THREAD_NUMBER**)  

**TRUNCATE TABLE** is not permitted for the **tp_thread_state** table.

26.12.16 Performance Schema Clone Tables

Note

The Performance Schema tables described here are available as of MySQL 8.0.17.

The following sections describe the Performance Schema tables associated with the clone plugin (see **Section 5.6.7, “The Clone Plugin”**). The tables provide information about cloning operations.

• **clone_status**: status information about the current or last executed cloning operation.

• **clone_progress**: progress information about the current or last executed cloning operation.

The Performance Schema clone tables are implemented by the clone plugin and are loaded and unloaded when that plugin is loaded and unloaded (see **Section 5.6.7.1, “Installing the Clone Plugin”**). No special configuration step for the tables is needed. However, the tables depend on the clone plugin being enabled. If the clone plugin is loaded but disabled, the tables are not created.

The Performance Schema clone plugin tables are used only on the recipient MySQL server instance. The data is persisted across server shutdown and restart.
26.12.16.1 The clone_status Table

Note
The Performance Schema table described here is available as of MySQL 8.0.17.

The clone_status table shows the status of the current or last executed cloning operation only. The table only ever contains one row of data, or is empty.

The clone_status table has these columns:

- **ID**
  A unique cloning operation identifier in the current MySQL server instance.

- **PID**
  Process list ID of the session executing the cloning operation.

- **STATE**
  Current state of the cloning operation. Values include Not Started, In Progress, Completed, and Failed.

- **BEGIN_TIME**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the cloning operation started.

- **END_TIME**
  A timestamp in 'YYYY-MM-DD hh:mm:ss[.fraction]' format that shows when the cloning operation finished. Reports NULL if the operation has not ended.

- **SOURCE**
  The donor MySQL server address in 'HOST:PORT' format. The column displays 'LOCAL INSTANCE' for a local cloning operation.

- **DESTINATION**
  The directory being cloned to.

- **ERROR_NO**
  The error number reported for a failed cloning operation.

- **ERROR_MESSAGE**
  The error message string for a failed cloning operation.

- **BINLOG_FILE**
  The name of the binary log file up to which data is cloned.

- **BINLOG_POSITION**
  The binary log file offset up to which data is cloned.
• **GTID_EXECUTED**

The GTID value for the last cloned transaction.

The `clone_status` table is read-only. DDL, including `TRUNCATE TABLE`, is not permitted.

### 26.12.16.2 The `clone_progress` Table

**Note**

The Performance Schema table described here is available as of MySQL 8.0.17.

The `clone_progress` table shows progress information for the current or last executed cloning operation only.

The stages of a cloning operation include `DROP DATA`, `FILE COPY`, `PAGE_COPY`, `REDO_COPY`, `FILE_SYNC`, `RESTART`, and `RECOVERY`. A cloning operation produces a record for each stage. The table therefore only ever contains seven rows of data, or is empty.

The `clone_progress` table has these columns:

- **ID**
  
  A unique cloning operation identifier in the current MySQL server instance.

- **STAGE**
  
  The name of the current cloning stage. Stages include `DROP DATA`, `FILE COPY`, `PAGE_COPY`, `REDO_COPY`, `FILE_SYNC`, `RESTART`, and `RECOVERY`.

- **STATE**
  
  The current state of the cloning stage. States include `Not Started`, `In Progress`, and `Completed`.

- **BEGIN_TIME**
  
  A timestamp in `'YYYY-MM-DD hh:mm:ss[.fraction]'` format that shows when the cloning stage started. Reports NULL if the stage has not started.

- **END_TIME**
  
  A timestamp in `'YYYY-MM-DD hh:mm:ss[.fraction]'` format that shows when the cloning stage finished. Reports NULL if the stage has not ended.

- **THREADS**
  
  The number of concurrent threads used in the stage.

- **ESTIMATE**
  
  The estimated amount of data for the current stage, in bytes.

- **DATA**
  
  The amount of data transferred in current state, in bytes.

- **NETWORK**
  
  The amount of network data transferred in the current state, in bytes.
• **DATA_SPEED**
  The current actual speed of data transfer, in bytes per second. This value may differ from the requested maximum data transfer rate defined by `clone_max_data_bandwidth`.

• **NETWORK_SPEED**
  The current speed of network transfer in bytes per second.

The `clone_progress` table is read-only. DDL, including `TRUNCATE TABLE`, is not permitted.

---

### 26.12.17 Performance Schema Summary Tables

Summary tables provide aggregated information for terminated events over time. The tables in this group summarize event data in different ways.

**Wait Event Summaries**
- `events_waits_summary_by_account_by_event_name`: Wait events per account and event name
- `events_waits_summary_by_host_by_event_name`: Wait events per host name and event name
- `events_waits_summary_by_instance`: Wait events per instance
- `events_waits_summary_by_thread_by_event_name`: Wait events per thread and event name
- `events_waits_summary_by_user_by_event_name`: Wait events per user name and event name
- `events_waits_summary_global_by_event_name`: Wait events per event name

**Stage Summaries**
- `events_stages_summary_by_account_by_event_name`: Stage events per account and event name
- `events_stages_summary_by_host_by_event_name`: Stage events per host name and event name
- `events_stages_summary_by_thread_by_event_name`: Stage waits per thread and event name
- `events_stages_summary_by_user_by_event_name`: Stage events per user name and event name
- `events_stages_summary_global_by_event_name`: Stage waits per event name

**Statement Summaries**
- `events_statements_histogram_by_digest`: Statement histograms per schema and digest value.
- `events_statements_histogram_global`: Statement histogram summarized globally.
- `events_statements_summary_by_account_by_event_name`: Statement events per account and event name
- `events_statements_summary_by_digest`: Statement events per schema and digest value
- `events_statements_summary_by_host_by_event_name`: Statement events per host name and event name
- `events_statements_summary_by_program`: Statement events per stored program (stored procedures and functions, triggers, and events)
Performance Schema Summary Tables

- `events_statements_summary_by_thread_by_event_name`: Statement events per thread and event name
- `events_statements_summary_by_user_by_event_name`: Statement events per user name and event name
- `events_statements_summary_global_by_event_name`: Statement events per event name
- `prepared_statements_instances`: Prepared statement instances and statistics

Transaction Summaries

- `events_transactions_summary_by_account_by_event_name`: Transaction events per account and event name
- `events_transactions_summary_by_host_by_event_name`: Transaction events per host name and event name
- `events_transactions_summary_by_thread_by_event_name`: Transaction events per thread and event name
- `events_transactions_summary_by_user_by_event_name`: Transaction events per user name and event name
- `events_transactions_summary_global_by_event_name`: Transaction events per event name

Object Wait Summaries

- `objects_summary_global_by_type`: Object summaries

File I/O Summaries

- `file_summary_by_event_name`: File events per event name
- `file_summary_by_instance`: File events per file instance

Table I/O and Lock Wait Summaries

- `table_io_waits_summary_by_index_usage`: Table I/O waits per index
- `table_io_waits_summary_by_table`: Table I/O waits per table
- `table_lock_waits_summary_by_table`: Table lock waits per table

Socket Summaries

- `socket_summary_by_instance`: Socket waits and I/O per instance
- `socket_summary_by_event_name`: Socket waits and I/O per event name

Memory Summaries

- `memory_summary_by_account_by_event_name`: Memory operations per account and event name
- `memory_summary_by_host_by_event_name`: Memory operations per host and event name
- `memory_summary_by_thread_by_event_name`: Memory operations per thread and event name
- `memory_summary_by_user_by_event_name`: Memory operations per user and event name
• **memory_summary_global_by_event_name**: Memory operations globally per event name

**Error Summaries**

• **events_errors_summary_by_account_by_error**: Errors per error code and account
• **events_errors_summary_by_host_by_error**: Errors per error code and host
• **events_errors_summary_by_thread_by_error**: Errors per error code and thread
• **events_errors_summary_by_user_by_error**: Errors per error code and user
• **events_errors_summary_global_by_error**: Errors per error code

**Status Variable Summaries**

• **status_by_account**: Status variables per account
• **status_by_host**: Status variables per host name
• **status_by_user**: Status variables per user name

Each summary table has grouping columns that determine how to group the data to be aggregated, and summary columns that contain the aggregated values. Tables that summarize events in similar ways often have similar sets of summary columns and differ only in the grouping columns used to determine how events are aggregated.

Summary tables can be truncated with `TRUNCATE TABLE`. Generally, the effect is to reset the summary columns to 0 or `NULL`, not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.

### 26.12.17.1 Wait Event Summary Tables

The Performance Schema maintains tables for collecting current and recent wait events, and aggregates that information in summary tables. Section 26.12.4, “Performance Schema Wait Event Tables” describes the events on which wait summaries are based. See that discussion for information about the content of wait events, the current and recent wait event tables, and how to control wait event collection, which is disabled by default.

Example wait event summary information:

```sql
mysql> SELECT * FROM performance_schema.events_waits_summary_global_by_event_name\G
... 6. row ***************************
  EVENT_NAME: wait/synch/mutex/sql/BINARY_LOG::LOCK_index
  COUNT_STAR: 8
  SUM_TIMER_WAIT: 2119302
  MIN_TIMER_WAIT: 196092
  AVG_TIMER_WAIT: 264912
  MAX_TIMER_WAIT: 569421
... 9. row ***************************
  EVENT_NAME: wait/synch/mutex/sql/hash_filo::lock
  COUNT_STAR: 69
  SUM_TIMER_WAIT: 16848828
  MIN_TIMER_WAIT: 0
  AVG_TIMER_WAIT: 244185
  MAX_TIMER_WAIT: 735345
...`
Each wait event summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- **events_waits_summary_by_account_by_event_name** has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.

- **events_waits_summary_by_host_by_event_name** has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.

- **events_waits_summary_by_instance** has `EVENT_NAME` and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given event name and object. If an instrument is used to create multiple instances, each instance has a unique `OBJECT_INSTANCE_BEGIN` value and is summarized separately in this table.

- **events_waits_summary_by_thread_by_event_name** has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.

- **events_waits_summary_by_user_by_event_name** has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.

- **events_waits_summary_global_by_event_name** has an `EVENT_NAME` column. Each row summarizes events for a given event name. An instrument might be used to create multiple instances of the instrumented object. For example, if there is an instrument for a mutex that is created for each connection, there are as many instances as there are connections. The summary row for the instrument summarizes over all these instances.

Each wait event summary table has these summary columns containing aggregated values:

- **COUNT_STAR**
  The number of summarized events. This value includes all events, whether timed or nontimed.

- **SUM_TIMER_WAIT**
  The total wait time of the summarized timed events. This value is calculated only for timed events because nontimed events have a wait time of `NULL`. The same is true for the other `xxx_TIMER_WAIT` values.

- **MIN_TIMER_WAIT**
  The minimum wait time of the summarized timed events.

- **AVG_TIMER_WAIT**
  The average wait time of the summarized timed events.

- **MAX_TIMER_WAIT**
  The maximum wait time of the summarized timed events.

The wait event summary tables have these indexes:

- **events_waits_summary_by_account_by_event_name**:
  - Primary key on `(USER, HOST, EVENT_NAME)`

- **events_waits_summary_by_host_by_event_name**:
Performance Schema Summary Tables

- Primary key on (HOST, EVENT_NAME)

  `events_waits_summary_by_instance`:
  - Primary key on (OBJECT_INSTANCE_BEGIN)
  - Index on (EVENT_NAME)

  `events_waits_summary_by_thread_by_event_name`:
  - Primary key on (THREAD_ID, EVENT_NAME)

  `events_waits_summary_by_user_by_event_name`:
  - Primary key on (USER, EVENT_NAME)

  `events_waits_summary_global_by_event_name`:
  - Primary key on (EVENT_NAME)

`TRUNCATE TABLE` is permitted for wait summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.

- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each wait summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_waits_summary_global_by_event_name`. For details, see Section 26.12.8, “Performance Schema Connection Tables”.

26.12.17.2 Stage Summary Tables

The Performance Schema maintains tables for collecting current and recent stage events, and aggregates that information in summary tables. Section 26.12.5, “Performance Schema Stage Event Tables” describes the events on which stage summaries are based. See that discussion for information about the content of stage events, the current and historical stage event tables, and how to control stage event collection, which is disabled by default.

Example stage event summary information:

```sql
mysql> SELECT * FROM performance_schema.events_stages_summary_global_by_event_name\G
...                           5. row                         9. row
EVENT_NAME: stage/sql/checking permissions
COUNT_STAR: 57
SUM_TIMER_WAIT: 2650188880
MIN_TIMER_WAIT: 7317456
AVG_TIMER_WAIT: 464945295
MAX_TIMER_WAIT: 12858936792
...
EVENT_NAME: stage/sql/closing tables
COUNT_STAR: 37
SUM_TIMER_WAIT: 662606568
MIN_TIMER_WAIT: 1593864
AVG_TIMER_WAIT: 17907891
```

4606
Each stage summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_stages_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.

- `events_stages_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.

- `events_stages_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.

- `events_stages_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.

- `events_stages_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each stage summary table has these summary columns containing aggregated values: `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, and `MAX_TIMER_WAIT`. These columns are analogous to the columns of the same names in the wait event summary tables (see Section 26.12.17.1, "Wait Event Summary Tables"), except that the stage summary tables aggregate events from `events_stages_current` rather than `events_waits_current`.

The stage summary tables have these indexes:

- `events_stages_summary_by_account_by_event_name`:
  - Primary key on `(USER, HOST, EVENT_NAME)`

- `events_stages_summary_by_host_by_event_name`:
  - Primary key on `(HOST, EVENT_NAME)`

- `events_stages_summary_by_thread_by_event_name`:
  - Primary key on `(THREAD_ID, EVENT_NAME)`

- `events_stages_summary_by_user_by_event_name`:
  - Primary key on `(USER, EVENT_NAME)`

- `events_stages_summary_global_by_event_name`:
  - Primary key on `(EVENT_NAME)`

`TRUNCATE TABLE` is permitted for stage summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.

- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each stage summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of
Performance Schema Summary Tables

events_stages_summary_global_by_event_name. For details, see Section 26.12.8, “Performance Schema Connection Tables”.

26.12.17.3 Statement Summary Tables

The Performance Schema maintains tables for collecting current and recent statement events, and aggregates that information in summary tables. Section 26.12.6, “Performance Schema Statement Event Tables” describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and historical statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement event summary information:

```
mysql> SELECT * FROM performance_schema.events_statements_summary_global_by_event_name\G
*************************** 1. row ***************************
EVENT_NAME: statement/sql/select
COUNT_STAR: 25
SUM_TIMER_WAIT: 1535983999000
MIN_TIMER_WAIT: 209823000
AVG_TIMER_WAIT: 61439359000
MAX_TIMER_WAIT: 1363397650000
SUM_LOCK_TIME: 2018600000
SUM_ERRORS: 0
SUM_WARNINGS: 0
SUM_ROWS_AFFECTED: 0
SUM_ROWS_SENT: 388
SUM_ROWS_EXAMINED: 370
SUM_CREATED_TMP_DISK_TABLES: 0
SUM_CREATED_TMP_TABLES: 0
SUM_SELECT_FULL_JOIN: 0
SUM_SELECT_FULL_RANGE_JOIN: 0
SUM_SELECT_RANGE: 0
SUM_SELECT_RANGE_CHECK: 0
SUM_SELECT_SCAN: 6
SUM_SORT_MERGE_PASSES: 0
SUM_SORT_RANGE: 0
SUM_SORT_ROWS: 0
SUM_SORT_SCAN: 0
SUM_NO_INDEX_USED: 6
SUM_NO_GOOD_INDEX_USED: 0
...```

Each statement summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the setup_instruments table:

- **events_statements_summary_by_account_by_event_name** has EVENT_NAME, USER, and HOST columns. Each row summarizes events for a given account (user and host combination) and event name.

- **events_statements_summary_by_digest** has SCHEMA_NAME and DIGEST columns. Each row summarizes events per schema and digest value. (The DIGEST_TEXT column contains the corresponding normalized statement digest text, but is neither a grouping nor a summary column. The QUERY_SAMPLE_TEXT, QUERY_SAMPLE_SEEN, and QUERY_SAMPLE_TIMER_WAIT columns also are neither grouping nor summary columns; they support statement sampling.)

The maximum number of rows in the table is autosized at server startup. To set this maximum explicitly, set the performance_schema_digests_size system variable at server startup.

- **events_statements_summary_by_host_by_event_name** has EVENT_NAME and HOST columns. Each row summarizes events for a given host and event name.
Performance Schema Summary Tables

- `events_statements_summary_by_program` has `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME` columns. Each row summarizes events for a given stored program (stored procedure or function, trigger, or event).

- `events_statements_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.

- `events_statements_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.

- `events_statements_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

- `prepared_statements_instances` has an `OBJECT_INSTANCE_BEGIN` column. Each row summarizes events for a given prepared statement.

Each statement summary table has these summary columns containing aggregated values (with exceptions as noted):

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns are analogous to the columns of the same names in the wait event summary tables (see Section 26.12.17.1, “Wait Event Summary Tables”), except that the statement summary tables aggregate events from `events_statements_current` rather than `events_waits_current`.

The `prepared_statements_instances` table does not have these columns.

- `SUM_???`

The aggregate of the corresponding `???` column in the `events_statements_current` table. For example, the `SUM_LOCK_TIME` and `SUM_ERRORS` columns in statement summary tables are the aggregates of the `LOCK_TIME` and `ERRORS` columns in `events_statements_current` table.

The `events_statements_summary_by_digest` table has these additional summary columns:

- `FIRST_SEEN`, `LAST_SEEN`

Timestamps indicating when statements with the given digest value were first seen and most recently seen.

- `QUANTILE_95`: The 95th percentile of the statement latency, in picoseconds. This percentile is a high estimate, computed from the histogram data collected. In other words, for a given digest, 95% of the statements measured have a latency lower than `QUANTILE_95`.

For access to the histogram data, use the tables described in Section 26.12.17.4, “Statement Histogram Summary Tables”.

- `QUANTILE_99`: Similar to `QUANTILE_95`, but for the 99th percentile.

- `QUANTILE_999`: Similar to `QUANTILE_95`, but for the 99.9th percentile.

The `events_statements_summary_by_digest` table contains the following columns. These are neither grouping nor summary columns; they support statement sampling:

- `QUERY_SAMPLE_TEXT`

A sample SQL statement that produces the digest value in the row. This column enables applications to access, for a given digest value, a statement actually seen by the server that produces that digest.
Performance Schema Summary Tables

One use for this might be to run `EXPLAIN` on the statement to examine the execution plan for a representative statement associated with a frequently occurring digest.

When the `QUERY_SAMPLE_TEXT` column is assigned a value, the `QUERY_SAMPLE_SEEN` and `QUERY_SAMPLE_TIMER_WAIT` columns are assigned values as well.

The maximum space available for statement display is 1024 bytes by default. To change this value, set the `performance_schema_max_sql_text_length` system variable at server startup. (Changing this value affects columns in other Performance Schema tables as well. See Section 26.10, “Performance Schema Statement Digests and Sampling”.)

For information about statement sampling, see Section 26.10, “Performance Schema Statement Digests and Sampling”.

• **QUERY_SAMPLE_SEEN**
  A timestamp indicating when the statement in the `QUERY_SAMPLE_TEXT` column was seen.

• **QUERY_SAMPLE_TIMER_WAIT**
  The wait time for the sample statement in the `QUERY_SAMPLE_TEXT` column.

The `events_statements_summary_by_program` table has these additional summary columns:

• **COUNT_STATEMENTS, SUM_STATEMENTS_WAIT, MIN_STATEMENTS_WAIT, AVG_STATEMENTS_WAIT, MAX_STATEMENTS_WAIT**
  Statistics about nested statements invoked during stored program execution.

The `prepared_statements_instances` table has these additional summary columns:

• **COUNT_EXECUTE, SUM_TIMER_EXECUTE, MIN_TIMER_EXECUTE, AVG_TIMER_EXECUTE, MAX_TIMER_EXECUTE**
  Aggregated statistics for executions of the prepared statement.

The statement summary tables have these indexes:

• **events_transactions_summary_by_account_by_event_name**:
  Primary key on `(USER, HOST, EVENT_NAME)`

• **events_statements_summary_by_digest**:
  Primary key on `(SCHEMA_NAME, DIGEST)`

• **events_transactions_summary_by_host_by_event_name**:
  Primary key on `(HOST, EVENT_NAME)`

• **events_statements_summary_by_program**:
  Primary key on `(OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME)`

• **events_statements_summary_by_thread_by_event_name**:
  Primary key on `(THREAD_ID, EVENT_NAME)`

• **events_transactions_summary_by_user_by_event_name**:
• Primary key on (USER, EVENT_NAME)

events_statements_summary_global_by_event_name:
• Primary key on (EVENT_NAME)

TRUNCATE TABLE is permitted for statement summary tables. It has these effects:

• For events_statements_summary_by_digest, it removes the rows.

• For other summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.

• For other summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each statement summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of events_statements_summary_global_by_event_name. For details, see Section 26.12.8, "Performance Schema Connection Tables".

In addition, truncating events_statements_summary_by_digest implicitly truncates events_statements_histogram_by_digest, and truncating events_statements_summary_global_by_event_name implicitly truncates events_statements_histogram_global.

Statement Digest Aggregation Rules

If the statements_digest consumer is enabled, aggregation into events_statements_summary_by_digest occurs as follows when a statement completes. Aggregation is based on the DIGEST value computed for the statement.

• If a events_statements_summary_by_digest row already exists with the digest value for the statement that just completed, statistics for the statement are aggregated to that row. The LAST_SEEN column is updated to the current time.

• If no row has the digest value for the statement that just completed, and the table is not full, a new row is created for the statement. The FIRST_SEEN and LAST_SEEN columns are initialized with the current time.

• If no row has the statement digest value for the statement that just completed, and the table is full, the statistics for the statement that just completed are added to a special “catch-all” row with DIGEST = NULL, which is created if necessary. If the row is created, the FIRST_SEEN and LAST_SEEN columns are initialized with the current time. Otherwise, the LAST_SEEN column is updated with the current time.

The row with DIGEST = NULL is maintained because Performance Schema tables have a maximum size due to memory constraints. The DIGEST = NULL row permits digests that do not match other rows to be counted even if the summary table is full, using a common “other” bucket. This row helps you estimate whether the digest summary is representative:

• A DIGEST = NULL row that has a COUNT_STAR value that represents 5% of all digests shows that the digest summary table is very representative; the other rows cover 95% of the statements seen.

• A DIGEST = NULL row that has a COUNT_STAR value that represents 50% of all digests shows that the digest summary table is not very representative; the other rows cover only half the statements seen. Most likely the DBA should increase the maximum table size so that more of the rows counted
in the \texttt{DIGEST = NULL} row would be counted using more specific rows instead. To do this, set the\texttt{performance_schema_digests_size} system variable to a larger value at server startup. The default size is 200.

 Stored Program Instrumentation Behavior  

For stored program types for which instrumentation is enabled in the \texttt{setup_objects} table,\texttt{events_statements_summary_by_program} maintains statistics for stored programs as follows:

- A row is added for an object when it is first used in the server.
- The row for an object is removed when the object is dropped.
- Statistics are aggregated in the row for an object as it executes.

See also Section 26.4.3, “Event Pre-Filtering”.

26.12.17.4 Statement Histogram Summary Tables  

The Performance Schema maintains statement event summary tables that contain information about minimum, maximum, and average statement latency (see Section 26.12.17.3, “Statement Summary Tables”). Those tables permit high-level assessment of system performance. To permit assessment at a more fine-grained level, the Performance Schema also collects histogram data for statement latencies. These histograms provide additional insight into latency distributions.

Section 26.12.6, “Performance Schema Statement Event Tables” describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and historical statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement histogram information:

```sql
mysql> SELECT * FROM performance_schema.events_statements_histogram_by_digest WHERE SCHEMA_NAME = 'mydb' AND DIGEST = 'bb3f69453119b2d7b3ae40673a9d4c7c' AND COUNT_BUCKET > 0 ORDER BY BUCKET_NUMBER
```

```
*************************** 1. row ***************************
SCHEMA_NAME: mydb
DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
BUCKET_NUMBER: 42
BUCKET_TIMER_LOW: 66069344
BUCKET_TIMER_HIGH: 69183097
COUNT_BUCKET: 1
COUNT_BUCKET_AND_LOWER: 1
BUCKET_QUANTILE: 0.058824

*************************** 2. row ***************************
SCHEMA_NAME: mydb
DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
BUCKET_NUMBER: 43
BUCKET_TIMER_LOW: 69183097
BUCKET_TIMER_HIGH: 72443596
COUNT_BUCKET: 1
COUNT_BUCKET_AND_LOWER: 2
BUCKET_QUANTILE: 0.117647

*************************** 3. row ***************************
SCHEMA_NAME: mydb
DIGEST: bb3f69453119b2d7b3ae40673a9d4c7c
BUCKET_NUMBER: 44
BUCKET_TIMER_LOW: 72443596
BUCKET_TIMER_HIGH: 75857757
COUNT_BUCKET: 2
```
Performance Schema Summary Tables

For example, in row 3, these values indicate that 23.52% of queries run in under 75.86 microseconds:

<table>
<thead>
<tr>
<th>BUCKET_TIMER_HIGH</th>
<th>BUCKET_QUANTILE</th>
</tr>
</thead>
<tbody>
<tr>
<td>75857757</td>
<td>0.235294</td>
</tr>
</tbody>
</table>

In row 4, these values indicate that 62.50% of queries run in under 79.44 microseconds:

<table>
<thead>
<tr>
<th>BUCKET_TIMER_HIGH</th>
<th>BUCKET_QUANTILE</th>
</tr>
</thead>
<tbody>
<tr>
<td>79432823</td>
<td>0.625000</td>
</tr>
</tbody>
</table>

Each statement histogram summary table has one or more grouping columns to indicate how the table aggregates events:

- `events_statements_histogram_by_digest` has `SCHEMA_NAME`, `DIGEST`, and `BUCKET_NUMBER` columns:
  - The `SCHEMA_NAME` and `DIGEST` columns identify a statement digest row in the `events_statements_summary_by_digest` table.
  - The `events_statements_histogram_by_digest` rows with the same `SCHEMA_NAME` and `DIGEST` values comprise the histogram for that schema/digest combination.
  - Within a given histogram, the `BUCKET_NUMBER` column indicates the bucket number.

- `events_statements_histogram_global` has a `BUCKET_NUMBER` column. This table summarizes latencies globally across schema name and digest values, using a single histogram. The `BUCKET_NUMBER` column indicates the bucket number within this global histogram.

A histogram consists of $N$ buckets, where each row represents one bucket, with the bucket number indicated by the `BUCKET_NUMBER` column. Bucket numbers begin with 0.

Each statement histogram summary table has these summary columns containing aggregated values:

- **BUCKET_TIMER_LOW, BUCKET_TIMER_HIGH**
  A bucket counts statements that have a latency, in picoseconds, measured between `BUCKET_TIMER_LOW` and `BUCKET_TIMER_HIGH`:
  - The value of `BUCKET_TIMER_LOW` for the first bucket (`BUCKET_NUMBER = 0`) is 0.
  - The value of `BUCKET_TIMER_LOW` for a bucket (`BUCKET_NUMBER = k`) is the same as `BUCKET_TIMER_HIGH` for the previous bucket (`BUCKET_NUMBER = k-1`)
  - The last bucket is a catchall for statements that have a latency exceeding previous buckets in the histogram.
- **COUNT_BUCKET**
The number of statements measured with a latency in the interval from `BUCKET_TIMER_LOW` up to but not including `BUCKET_TIMER_HIGH`.

- **COUNT_BUCKET_AND_LOWER**
  The number of statements measured with a latency in the interval from 0 up to but not including `BUCKET_TIMER_HIGH`.

- **BUCKET_QUANTILE**
  The proportion of statements that fall into this or a lower bucket. This proportion corresponds by definition to `COUNT_BUCKET_AND_LOWER / SUM(COUNT_BUCKET)` and is displayed as a convenience column.

The statement histogram summary tables have these indexes:

- **events_statements_histogram_by_digest**:
  - Unique index on `(SCHEMA_NAME, DIGEST, BUCKET_NUMBER)`

- **events_statements_histogram_global**:
  - Primary key on `(BUCKET_NUMBER)`

`TRUNCATE TABLE` is permitted for statement histogram summary tables. Truncation sets the `COUNT_BUCKET` and `COUNT_BUCKET_AND_LOWER` columns to 0.

In addition, truncating `events_statements_summary_by_digest` implicitly truncates `events_statements_histogram_by_digest`, and truncating `events_statements_summary_global_by_event_name` implicitly truncates `events_statements_histogram_global`.

### 26.12.17.5 Transaction Summary Tables

The Performance Schema maintains tables for collecting current and recent transaction events, and aggregates that information in summary tables. Section 26.12.7, "Performance Schema Transaction Tables" describes the events on which transaction summaries are based. See that discussion for information about the content of transaction events, the current and historical transaction event tables, and how to control transaction event collection, which is disabled by default.

Example transaction event summary information:

```sql
mysql> SELECT * FROM performance_schema.events_transactions_summary_global_by_event_name LIMIT 1;
```

```
+----------------------------+--------------------------+--------------------------+--------------------------+
| EVENT_NAME: transaction    | COUNT_STAR: 5            | SUM_TIMER_WAIT: 19550092000 |
|                            |                          | MIN_TIMER_WAIT: 2954148000  |
|                            |                          | AVG_TIMER_WAIT: 3910018000  |
|                            |                          | MAX_TIMER_WAIT: 5486275000  |
| COUNT_READ_WRITE: 5        |                          | SUM_TIMER_READ_WRITE: 19550092000 |
|                            |                          | MIN_TIMER_READ_WRITE: 2954148000  |
|                            |                          | AVG_TIMER_READ_WRITE: 3910018000  |
|                            |                          | MAX_TIMER_READ_WRITE: 5486275000  |
```

Each transaction summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_transactions_summary_by_account_by_event_name` has `USER`, `HOST`, and `EVENT_NAME` columns. Each row summarizes events for a given account (user and host combination) and event name.

- `events_transactions_summary_by_host_by_event_name` has `HOST` and `EVENT_NAME` columns. Each row summarizes events for a given host and event name.

- `events_transactions_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.

- `events_transactions_summary_by_user_by_event_name` has `USER` and `EVENT_NAME` columns. Each row summarizes events for a given user and event name.

- `events_transactions_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each transaction summary table has these summary columns containing aggregated values:

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`  
  These columns are analogous to the columns of the same names in the wait event summary tables (see Section 26.12.17.1, “Wait Event Summary Tables”), except that the transaction summary tables aggregate events from `events_transactions_current` rather than `events_waits_current`. These columns summarize read-write and read-only transactions.

- `COUNT_READ_WRITE`, `SUM_TIMER_READ_WRITE`, `MIN_TIMER_READ_WRITE`, `AVG_TIMER_READ_WRITE`, `MAX_TIMER_READ_WRITE`  
  These are similar to the `COUNT_STAR` and `xxx_TIMER_WAIT` columns, but summarize read-write transactions only. The transaction access mode specifies whether transactions operate in read/write or read-only mode.

- `COUNT_READ_ONLY`, `SUM_TIMER_READ_ONLY`, `MIN_TIMER_READ_ONLY`, `AVG_TIMER_READ_ONLY`, `MAX_TIMER_READ_ONLY`  
  These are similar to the `COUNT_STAR` and `xxx_TIMER_WAIT` columns, but summarize read-only transactions only. The transaction access mode specifies whether transactions operate in read/write or read-only mode.

The transaction summary tables have these indexes:

- `events_transactions_summary_by_account_by_event_name`:
  - Primary key on (`USER`, `HOST`, `EVENT_NAME`)

- `events_transactions_summary_by_host_by_event_name`:
  - Primary key on (`HOST`, `EVENT_NAME`)

- `events_transactions_summary_by_thread_by_event_name`:
  - Primary key on (`THREAD_ID`, `EVENT_NAME`)
Performance Schema Summary Tables

- `events_transactions_summary_by_user_by_event_name`:
  - Primary key on `(USER, EVENT_NAME)`

- `events_transactions_summary_global_by_event_name`:
  - Primary key on `(EVENT_NAME)`

**TRUNCATE TABLE** is permitted for transaction summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.

- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each transaction summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_transactions_summary_global_by_event_name`. For details, see Section 26.12.8, “Performance Schema Connection Tables”.

**Transaction Aggregation Rules**

Transaction event collection occurs without regard to isolation level, access mode, or autocommit mode.

Transaction event collection occurs for all non-aborted transactions initiated by the server, including empty transactions.

Read-write transactions are generally more resource intensive than read-only transactions, therefore transaction summary tables include separate aggregate columns for read-write and read-only transactions.

Resource requirements may also vary with transaction isolation level. However, presuming that only one isolation level would be used per server, aggregation by isolation level is not provided.

**26.12.17.6 Object Wait Summary Table**

The Performance Schema maintains the `objects_summary_global_by_type` table for aggregating object wait events.

Example object wait event summary information:

```
mysql> SELECT * FROM performance_schema.objects_summary_global_by_type\G
...  
*************************** 3. row ***************************
OBJECT_TYPE: TABLE
OBJECT_SCHEMA: test
OBJECT_NAME: t
COUNT_STAR: 3
SUM_TIMER_WAIT: 263126976
MIN_TIMER_WAIT: 1522272
AVG_TIMER_WAIT: 87708678
MAX_TIMER_WAIT: 258428280

*************************** 10. row ***************************
OBJECT_TYPE: TABLE
OBJECT_SCHEMA: mysql
OBJECT_NAME: user
COUNT_STAR: 14
SUM_TIMER_WAIT: 365567592
MIN_TIMER_WAIT: 1141704
AVG_TIMER_WAIT: 26111769
MAX_TIMER_WAIT: 334783032
```
The `objects_summary_global_by_type` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. Each row summarizes events for the given object.

`objects_summary_global_by_type` has the same summary columns as the `events_waits_summary_by_` tables. See Section 26.12.17.1, “Wait Event Summary Tables”.

The `objects_summary_global_by_type` table has these indexes:

- Primary key on `(OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME)`

`TRUNCATE TABLE` is permitted for the object summary table. It resets the summary columns to zero rather than removing rows.

### 26.12.17.7 File I/O Summary Tables

The Performance Schema maintains file I/O summary tables that aggregate information about I/O operations.

Example file I/O event summary information:

```
mysql> SELECT * FROM performance_schema.file_summary_by_event_name
... 2. row ****************************************
    EVENT_NAME: wait/io/file/sql/binlog
    COUNT_STAR: 31
    SUM_TIMER_WAIT: 8243784888
    MIN_TIMER_WAIT: 0
    AVG_TIMER_WAIT: 265928484
    MAX_TIMER_WAIT: 6490658832
...
mysql> SELECT * FROM performance_schema.file_summary_by_instance
... 2. row ****************************************
    FILE_NAME: /var/mysql/share/english/errmsg.sys
    EVENT_NAME: wait/io/file/sql/ERRMSG
    OBJECT_INSTANCE_BEGIN: 4686193384
    COUNT_STAR: 5
    SUM_TIMER_WAIT: 13990154448
    MIN_TIMER_WAIT: 26349624
    AVG_TIMER_WAIT: 2798030607
    MAX_TIMER_WAIT: 8150662536
...
```

Each file I/O summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `file_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

- `file_summary_by_instance` has `FILE_NAME`, `EVENT_NAME`, and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given file and event name.

Each file I/O summary table has the following summary columns containing aggregated values. Some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`
These columns aggregate all I/O operations.

- **COUNT_READ, SUM_TIMER_READ, MIN_TIMER_READ, AVG_TIMER_READ, MAX_TIMER_READ, SUM_NUMBER_OF_BYTES_READ**

These columns aggregate all read operations, including **FGETS, FGETC, FREAD, and READ**.

- **COUNT_WRITE, SUM_TIMER_WRITE, MIN_TIMER_WRITE, AVG_TIMER_WRITE, MAX_TIMER_WRITE, SUM_NUMBER_OF_BYTES_WRITE**

These columns aggregate all write operations, including **FPUTS, FPUTC, FPRINTF, VFPRINTF, FWRITE, and PWRITE**.

- **COUNT_MISC, SUM_TIMER_MISC, MIN_TIMER_MISC, AVG_TIMER_MISC, MAX_TIMER_MISC**

These columns aggregate all other I/O operations, including **CREATE, DELETE, OPEN, CLOSE, STREAM_OPEN, STREAM_CLOSE, SEEK, TELL, FLUSH, STAT, FSTAT, CHSIZE, RENAME, and SYNC**. There are no byte counts for these operations.

The file I/O summary tables have these indexes:

- **file_summary_by_event_name**:
  - Primary key on (EVENT_NAME)

- **file_summary_by_instance**:
  - Primary key on (OBJECT_INSTANCE_BEGIN)
  - Index on (FILE_NAME)
  - Index on (EVENT_NAME)

**TRUNCATE TABLE** is permitted for file I/O summary tables. It resets the summary columns to zero rather than removing rows.

The MySQL server uses several techniques to avoid I/O operations by caching information read from files, so it is possible that statements you might expect to result in I/O events will not. You may be able to ensure that I/O does occur by flushing caches or restarting the server to reset its state.

### 26.12.17.8 Table I/O and Lock Wait Summary Tables

The following sections describe the table I/O and lock wait summary tables:

- **table_io_waits_summary_by_index_usage**: Table I/O waits per index
- **table_io_waits_summary_by_table**: Table I/O waits per table
- **table_lock_waits_summary_by_table**: Table lock waits per table

**The table_io_waits_summary_by_table** table aggregates all table I/O wait events, as generated by the wait/io/table/sql/handler instrument. The grouping is by table.

The **table_io_waits_summary_by_table** table has these grouping columns to indicate how the table aggregates events: **OBJECT_TYPE, OBJECT_SCHEMA, and OBJECT_NAME**. These columns have the same meaning as in the **events_waits_current** table. They identify the table to which the row applies.
Performance Schema Summary Tables

table_io_waits_summary_by_table has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all writes hold the sum of the corresponding columns that aggregate inserts, updates, and deletes. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

• **COUNT_STAR, SUM_TIMER_WAIT, MIN_TIMER_WAIT, AVG_TIMER_WAIT, MAX_TIMER_WAIT**

  These columns aggregate all I/O operations. They are the same as the sum of the corresponding xxx_READ and xxx_WRITE columns.

• **COUNT_READ, SUM_TIMER_READ, MIN_TIMER_READ, AVG_TIMER_READ, MAX_TIMER_READ**

  These columns aggregate all read operations. They are the same as the sum of the corresponding xxx_FETCH columns.

• **COUNT_WRITE, SUM_TIMER_WRITE, MIN_TIMER_WRITE, AVG_TIMER_WRITE, MAX_TIMER_WRITE**

  These columns aggregate all write operations. They are the same as the sum of the corresponding xxx_INSERT, xxx_UPDATE, and xxx_DELETE columns.

• **COUNT_FETCH, SUM_TIMER_FETCH, MIN_TIMER_FETCH, AVG_TIMER_FETCH, MAX_TIMER_FETCH**

  These columns aggregate all fetch operations.

• **COUNT_INSERT, SUM_TIMER_INSERT, MIN_TIMER_INSERT, AVG_TIMER_INSERT, MAX_TIMER_INSERT**

  These columns aggregate all insert operations.

• **COUNT_UPDATE, SUM_TIMER_UPDATE, MIN_TIMER_UPDATE, AVG_TIMER_UPDATE, MAX_TIMER_UPDATE**

  These columns aggregate all update operations.

• **COUNT_DELETE, SUM_TIMER_DELETE, MIN_TIMER_DELETE, AVG_TIMER_DELETE, MAX_TIMER_DELETE**

  These columns aggregate all delete operations.

The table_io_waits_summary_by_table table has these indexes:

• Unique index on (OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME)

**TRUNCATE TABLE** is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. Truncating this table also truncates the table_io_waits_summary_by_index_usage table.

The table_io_waits_summary_by_index_usage Table

The table_io_waits_summary_by_index_usage table aggregates all table index I/O wait events, as generated by the wait/io/table/sql/handler instrument. The grouping is by table index.

The columns of table_io_waits_summary_by_index_usage are nearly identical to table_io_waits_summary_by_table. The only difference is the additional group column, INDEX_NAME, which corresponds to the name of the index that was used when the table I/O wait event was recorded.
• A value of **PRIMARY** indicates that table I/O used the primary index.
• A value of **NULL** means that table I/O used no index.
• Inserts are counted against **INDEX_NAME = NULL**.

The **table_io_waits_summary_by_index_usage** table has these indexes:

• Unique index on (**OBJECT_TYPE**, **OBJECT_SCHEMA**, **OBJECT_NAME**, **INDEX_NAME**)  

**TRUNCATE TABLE** is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. This table is also truncated by truncation of the **table_io_waits_summary_by_table** table. A DDL operation that changes the index structure of a table may cause the per-index statistics to be reset.

**The table_lock_waits_summary_by_table Table**

The **table_lock_waits_summary_by_table** table aggregates all table lock wait events, as generated by the **wait/lock/table/sql/handler** instrument. The grouping is by table.

This table contains information about internal and external locks:

• An internal lock corresponds to a lock in the SQL layer. This is currently implemented by a call to **thr_lock()**. In event rows, these locks are distinguished by the **OPERATION** column, which has one of these values:

  - read normal
  - read with shared locks
  - read high priority
  - read no insert
  - write allow write
  - write concurrent insert
  - write delayed
  - write low priority
  - write normal

• An external lock corresponds to a lock in the storage engine layer. This is currently implemented by a call to **handler::external_lock()**. In event rows, these locks are distinguished by the **OPERATION** column, which has one of these values:

  - read external
  - write external

The **table_lock_waits_summary_by_table** table has these grouping columns to indicate how the table aggregates events: **OBJECT_TYPE**, **OBJECT_SCHEMA**, and **OBJECT_NAME**. These columns have the same meaning as in the **events_waits_current** table. They identify the table to which the row applies.

**table_lock_waits_summary_by_table** has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all locks hold the sum of the corresponding columns that aggregate read and write locks. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

• **COUNT_STAR**, **SUM_TIMER_WAIT**, **MIN_TIMER_WAIT**, **AVG_TIMER_WAIT**, **MAX_TIMER_WAIT**

These columns aggregate all lock operations. They are the same as the sum of the corresponding **xxx_READ** and **xxx_WRITE** columns.

• **COUNT_READ**, **SUM_TIMER_READ**, **MIN_TIMER_READ**, **AVG_TIMER_READ**, **MAX_TIMER_READ**
These columns aggregate all read-lock operations. They are the same as the sum of the corresponding
xxx_READ_NORMAL, xxx_READ_WITH_SHARED_LOCKS, xxx_READ_HIGH_PRIORITY, and
xxx_READ_NO_INSERT columns.

- COUNT_WRITE, SUM_TIMER_WRITE, MIN_TIMER_WRITE, AVG_TIMER_WRITE, MAX_TIMER_WRITE
  These columns aggregate all write-lock operations. They are the same as the sum of the corresponding
xxx_WRITE_ALLOW_WRITE, xxx_WRITE_CONCURRENT_INSERT, xxx_WRITE_LOW_PRIORITY, and
xxx_WRITE_NORMAL columns.

- COUNT_READ_NORMAL, SUM_TIMER_READ_NORMAL, MIN_TIMER_READ_NORMAL,
  AVG_TIMER_READ_NORMAL, MAX_TIMER_READ_NORMAL
  These columns aggregate internal read locks.

- COUNT_READ_WITH_SHARED_LOCKS, SUM_TIMER_READ_WITH_SHARED_LOCKS,
  MIN_TIMER_READ_WITH_SHARED_LOCKS, AVG_TIMER_READ_WITH_SHARED_LOCKS,
  MAX_TIMER_READ_WITH_SHARED_LOCKS
  These columns aggregate internal read locks.

- COUNT_READ_HIGH_PRIORITY, SUM_TIMER_READ_HIGH_PRIORITY,
  MIN_TIMER_READ_HIGH_PRIORITY, AVG_TIMER_READ_HIGH_PRIORITY,
  MAX_TIMER_READ_HIGH_PRIORITY
  These columns aggregate internal read locks.

- COUNT_READ_NO_INSERT, SUM_TIMER_READ_NO_INSERT, MIN_TIMER_READ_NO_INSERT,
  AVG_TIMER_READ_NO_INSERT, MAX_TIMER_READ_NO_INSERT
  These columns aggregate internal read locks.

- COUNT_READ_EXTERNAL, SUM_TIMER_READ_EXTERNAL, MIN_TIMER_READ_EXTERNAL,
  AVG_TIMER_READ_EXTERNAL, MAX_TIMER_READ_EXTERNAL
  These columns aggregate external read locks.

- COUNT_WRITE_ALLOW_WRITE, SUM_TIMER_WRITE_ALLOW_WRITE,
  MIN_TIMER_WRITE_ALLOW_WRITE, AVG_TIMER_WRITE_ALLOW_WRITE,
  MAX_TIMER_WRITE_ALLOW_WRITE
  These columns aggregate internal write locks.

- COUNT_WRITE_CONCURRENT_INSERT, SUM_TIMER_WRITE_CONCURRENT_INSERT,
  MIN_TIMER_WRITE_CONCURRENT_INSERT, AVG_TIMER_WRITE_CONCURRENT_INSERT,
  MAX_TIMER_WRITE_CONCURRENT_INSERT
  These columns aggregate internal write locks.

- COUNT_WRITE_LOW_PRIORITY, SUM_TIMER_WRITE_LOW_PRIORITY,
  MIN_TIMER_WRITE_LOW_PRIORITY, AVG_TIMER_WRITE_LOW_PRIORITY,
  MAX_TIMER_WRITE_LOW_PRIORITY
  These columns aggregate internal write locks.

- COUNT_WRITE_NORMAL, SUM_TIMER_WRITE_NORMAL, MIN_TIMER_WRITE_NORMAL,
  AVG_TIMER_WRITE_NORMAL, MAX_TIMER_WRITE_NORMAL
Performance Schema Summary Tables

These columns aggregate internal write locks.

- `COUNT_WRITE_EXTERNAL`, `SUM_TIMER_WRITE_EXTERNAL`, `MIN_TIMER_WRITE_EXTERNAL`, `AVG_TIMER_WRITE_EXTERNAL`, `MAX_TIMER_WRITE_EXTERNAL`

These columns aggregate external write locks.

The `table_lock_waits_summary_by_table` table has these indexes:

- Unique index on `(OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME)`

`TRUNCATE TABLE` is permitted for table lock summary tables. It resets the summary columns to zero rather than removing rows.

26.12.17.9 Socket Summary Tables

These socket summary tables aggregate timer and byte count information for socket operations:

- `socket_summary_by_event_name`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instrument.

- `socket_summary_by_instance`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instance. When a connection terminates, the row in `socket_summary_by_instance` corresponding to it is deleted.

The socket summary tables do not aggregate waits generated by `idle` events while sockets are waiting for the next request from the client. For `idle` event aggregations, use the wait-event summary tables; see Section 26.12.17.1, “Wait Event Summary Tables”.

Each socket summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `socket_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

- `socket_summary_by_instance` has an `OBJECT_INSTANCE_BEGIN` column. Each row summarizes events for a given object.

Each socket summary table has these summary columns containing aggregated values:

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

  These columns aggregate all operations.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`, `SUM_NUMBER_OF_BYTES_READ`

  These columns aggregate all receive operations (`RECV`, `RECVFROM`, and `RECVMSG`).

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`, `SUM_NUMBER_OF_BYTES_WRITE`

  These columns aggregate all send operations (`SEND`, `SENDTO`, and `SENDMSG`).

- `COUNT_MISC`, `SUM_TIMER_MISC`, `MIN_TIMER_MISC`, `AVG_TIMER_MISC`, `MAX_TIMER_MISC`

  These columns aggregate all other socket operations, such as `CONNECT`, `LISTEN`, `ACCEPT`, `CLOSE`, and `SHUTDOWN`. There are no byte counts for these operations.
The `socket_summary_by_instance` table also has an `EVENT_NAME` column that indicates the class of the socket: `client_connection`, `server_tcpip_socket`, `server_unix_socket`. This column can be grouped on to isolate, for example, client activity from that of the server listening sockets.

The socket summary tables have these indexes:

- `socket_summary_by_event_name`:
  - Primary key on `(EVENT_NAME)`

- `socket_summary_by_instance`:
  - Primary key on `(OBJECT_INSTANCE_BEGIN)`
  - Index on `(EVENT_NAME)`

`TRUNCATE TABLE` is permitted for socket summary tables. Except for `events_statements_summary_by_digest`, it resets the summary columns to zero rather than removing rows.

**26.12.17.10 Memory Summary Tables**

The Performance Schema instruments memory usage and aggregates memory usage statistics, detailed by these factors:

- Type of memory used (various caches, internal buffers, and so forth)
- Thread, account, user, host indirectly performing the memory operation

The Performance Schema instruments the following aspects of memory use:

- Memory sizes used
- Operation counts
- Low and high water marks

Memory sizes help to understand or tune the memory consumption of the server.

Operation counts help to understand or tune the overall pressure the server is putting on the memory allocator, which has an impact on performance. Allocating a single byte one million times is not the same as allocating one million bytes a single time; tracking both sizes and counts can expose the difference.

Low and high water marks are critical to detect workload spikes, overall workload stability, and possible memory leaks.

Memory summary tables do not contain timing information because memory events are not timed.

For information about collecting memory usage data, see [Memory Instrumentation Behavior](#).

Example memory event summary information:

```sql
mysql> SELECT *
    FROM performance_schema.memory_summary_global_by_event_name
    WHERE EVENT_NAME = 'memory/sql/TABLE'

+-----------------+-----------------+-----------------+-----------------+-----------------+-----------------
| EVENT_NAME      | COUNT_ALLOC     | COUNT_FREE      | SUM_NUMBER_OF_BYTES_ALLOC | SUM_NUMBER_OF_BYTES_FREE |
|-----------------+-----------------+-----------------+-----------------+-----------------|
| memory/sql/TABLE| 1381            | 924             | 2059873         | 1407432         |
```

4623
Each memory summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `memory_summary_by_account_by_event_name` has `USER`, `HOST`, and `EVENT_NAME` columns. Each row summarizes events for a given account (user and host combination) and event name.

- `memory_summary_by_host_by_event_name` has `HOST` and `EVENT_NAME` columns. Each row summarizes events for a given host and event name.

- `memory_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.

- `memory_summary_by_user_by_event_name` has `USER` and `EVENT_NAME` columns. Each row summarizes events for a given user and event name.

- `memory_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each memory summary table has these summary columns containing aggregated values:

- `COUNT_ALLOC`, `COUNT_FREE` 
  The aggregated numbers of calls to memory-allocation and memory-free functions.

- `SUM_NUMBER_OF_BYTES_ALLOC`, `SUM_NUMBER_OF_BYTES_FREE` 
  The aggregated sizes of allocated and freed memory blocks.

- `CURRENT_COUNT_USED` 
  The aggregated number of currently allocated blocks that have not been freed yet. This is a convenience column, equal to `COUNT_ALLOC - COUNT_FREE`.

- `CURRENT_NUMBER_OF_BYTES_USED` 
  The aggregated size of currently allocated memory blocks that have not been freed yet. This is a convenience column, equal to `SUM_NUMBER_OF_BYTES_ALLOC - SUM_NUMBER_OF_BYTES_FREE`.

- `LOW_COUNT_USED`, `HIGH_COUNT_USED` 
  The low and high water marks corresponding to the `CURRENT_COUNT_USED` column.

- `LOW_NUMBER_OF_BYTES_USED`, `HIGH_NUMBER_OF_BYTES_USED` 
  The low and high water marks corresponding to the `CURRENT_NUMBER_OF_BYTES_USED` column.

The memory summary tables have these indexes:

- `memory_summary_by_account_by_event_name`:
  - Primary key on `(USER, HOST, EVENT_NAME)`

- `memory_summary_by_host_by_event_name`:
Performance Schema Summary Tables

- Primary key on (HOST, EVENT_NAME)
- memory_summary_by_thread_by_event_name:
  - Primary key on (THREAD_ID, EVENT_NAME)
- memory_summary_by_user_by_event_name:
  - Primary key on (USER, EVENT_NAME)
- memory_summary_global_by_event_name:
  - Primary key on (EVENT_NAME)

**TRUNCATE TABLE** is permitted for memory summary tables. It has these effects:

- In general, truncation resets the baseline for statistics, but does not change the server state. That is, truncating a memory table does not free memory.
- **COUNT_ALLOC** and **COUNT_FREE** are reset to a new baseline, by reducing each counter by the same value.
- Likewise, **SUM_NUMBER_OF_BYTES_ALLOC** and **SUM_NUMBER_OF_BYTES_FREE** are reset to a new baseline.
- **LOW_COUNT_USED** and **HIGH_COUNT_USED** are reset to **CURRENT_COUNT_USED**.
- **LOW_NUMBER_OF_BYTES_USED** and **HIGH_NUMBER_OF_BYTES_USED** are reset to **CURRENT_NUMBER_OF_BYTES_USED**.

In addition, each memory summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of **memory_summary_global_by_event_name**. For details, see Section 26.12.8, "Performance Schema Connection Tables".

**Memory Instrumentation Behavior**

Memory instruments are listed in the **setup_instruments** table and have names of the form **memory/code_area/instrument_name**. Memory instrumentation is enabled by default.

Instruments named with the prefix **memory/performance_schema/** expose how much memory is allocated for internal buffers in the Performance Schema itself. The **memory/performance_schema/** instruments are built in, always enabled, and cannot be disabled at startup or runtime. Built-in memory instruments are displayed only in the **memory_summary_global_by_event_name** table.

To control memory instrumentation state at server startup, use lines like these in your **my.cnf** file:

- Enable:
  ```
  [mysqld]
  performance-schema-instrument='memory/%=ON'
  ```

- Disable:
  ```
  [mysqld]
  performance-schema-instrument='memory/%=OFF'
  ```

To control memory instrumentation state at runtime, update the **ENABLED** column of the relevant instruments in the **setup_instruments** table.
• Enable:

```sql
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES'
WHERE NAME LIKE 'memory/%';
```

• Disable:

```sql
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME LIKE 'memory/%';
```

For memory instruments, the TIMED column in `setup_instruments` is ignored because memory operations are not timed.

When a thread in the server executes a memory allocation that has been instrumented, these rules apply:

- If the thread is not instrumented or the memory instrument is not enabled, the memory block allocated is not instrumented.
- Otherwise (that is, both the thread and the instrument are enabled), the memory block allocated is instrumented.

For deallocation, these rules apply:

- If a memory allocation operation was instrumented, the corresponding free operation is instrumented, regardless of the current instrument or thread enabled status.
- If a memory allocation operation was not instrumented, the corresponding free operation is not instrumented, regardless of the current instrument or thread enabled status.

For the per-thread statistics, the following rules apply.

When an instrumented memory block of size $N$ is allocated, the Performance Schema makes these updates to memory summary table columns:

- `COUNT_ALLOC`: Increased by 1
- `CURRENT_COUNT_USED`: Increased by 1
- `HIGH_COUNT_USED`: Increased if `CURRENT_COUNT_USED` is a new maximum
- `SUM_NUMBER_OF_BYTES_ALLOC`: Increased by $N$
- `CURRENT_NUMBER_OF_BYTES_USED`: Increased by $N$
- `HIGH_NUMBER_OF_BYTES_USED`: Increased if `CURRENT_NUMBER_OF_BYTES_USED` is a new maximum

When an instrumented memory block is deallocated, the Performance Schema makes these updates to memory summary table columns:

- `COUNT_FREE`: Increased by 1
- `CURRENT_COUNT_USED`: Decreased by 1
- `LOW_COUNT_USED`: Decreased if `CURRENT_COUNT_USED` is a new minimum
- `SUM_NUMBER_OF_BYTES_FREE`: Increased by $N$
- `CURRENT_NUMBER_OF_BYTES_USED`: Decreased by $N$
Performance Schema Summary Tables

- **LOW_NUMBER_OF_BYTES_USED**: Decreased if **CURRENT_NUMBER_OF_BYTES_USED** is a new minimum. For higher-level aggregates (global, by account, by user, by host), the same rules apply as expected for low and high water marks.

- **LOW_COUNT_USED** and **LOW_NUMBER_OF_BYTES_USED** are lower estimates. The value reported by the Performance Schema is guaranteed to be less than or equal to the lowest count or size of memory effectively used at runtime.

- **HIGH_COUNT_USED** and **HIGH_NUMBER_OF_BYTES_USED** are higher estimates. The value reported by the Performance Schema is guaranteed to be greater than or equal to the highest count or size of memory effectively used at runtime.

For lower estimates in summary tables other than **memory_summary_global_by_event_name**, it is possible for values to go negative if memory ownership is transferred between threads.

Here is an example of estimate computation; but note that estimate implementation is subject to change:

Thread 1 uses memory in the range from 1MB to 2MB during execution, as reported by the **LOW_NUMBER_OF_BYTES_USED** and **HIGH_NUMBER_OF_BYTES_USED** columns of the **memory_summary_by_thread_by_event_name** table.

Thread 2 uses memory in the range from 10MB to 12MB during execution, as reported likewise.

When these two threads belong to the same user account, the per-account summary estimates that this account used memory in the range from 11MB to 14MB. That is, the **LOW_NUMBER_OF_BYTES_USED** for the higher level aggregate is the sum of each **LOW_NUMBER_OF_BYTES_USED** (assuming the worst case). Likewise, the **HIGH_NUMBER_OF_BYTES_USED** for the higher level aggregate is the sum of each **HIGH_NUMBER_OF_BYTES_USED** (assuming the worst case).

11MB is a lower estimate that can occur only if both threads hit the low usage mark at the same time.

14MB is a higher estimate that can occur only if both threads hit the high usage mark at the same time.

The real memory usage for this account could have been in the range from 11.5MB to 13.5MB.

For capacity planning, reporting the worst case is actually the desired behavior, as it shows what can potentially happen when sessions are uncorrelated, which is typically the case.

26.12.17.11 Error Summary Tables

The Performance Schema maintains summary tables for aggregating statistical information about server errors (and warnings). For a list of server errors, see Section B.3.1, “Server Error Message Reference”.

Collection of error information is controlled by the **error** instrument, which is enabled by default. Timing information is not collected.

Each error summary table has three columns that identify the error:

- **ERROR_NUMBER** is the numeric error value. The value is unique.

- **ERROR_NAME** is the symbolic error name corresponding to the **ERROR_NUMBER** value. The value is unique.

- **SQLSTATE** is the SQLSTATE value corresponding to the **ERROR_NUMBER** value. The value is not necessarily unique.

For example, if **ERROR_NUMBER** is 1050, **ERROR_NAME** is **ER_TABLE_EXISTS_ERROR** and **SQLSTATE** is **42S01**.
Example error event summary information:

```
mysql> SELECT * 
    FROM performance_schema.events_errors_summary_global_by_error
    WHERE SUM_ERROR_RAISED <> 0
G
*************************** 1. row ***************************
    ERROR_NUMBER: 1064
    ERROR_NAME: ER_PARSE_ERROR
    SQL_STATE: 42000
    SUM_ERROR_RAISED: 1
    SUM_ERRORHandled: 0
    FIRST_SEEN: 2016-06-28 07:34:02
    LAST_SEEN: 2016-06-28 07:34:02
*************************** 2. row ***************************
    ERROR_NUMBER: 1146
    ERROR_NAME: ER_NO_SUCH_TABLE
    SQL_STATE: 42S02
    SUM_ERROR_RAISED: 2
    SUM_ERRORHandled: 0
    FIRST_SEEN: 2016-06-28 07:34:05
    LAST_SEEN: 2016-06-28 07:36:18
*************************** 3. row ***************************
    ERROR_NUMBER: 1317
    ERROR_NAME: ER_QUERY_INTERRUPTED
    SQL_STATE: 70100
    SUM_ERROR_RAISED: 1
    SUM_ERRORHandled: 0
    FIRST_SEEN: 2016-06-28 11:01:49
    LAST_SEEN: 2016-06-28 11:01:49
```

Each error summary table has one or more grouping columns to indicate how the table aggregates errors:

- `events_errors_summary_by_account_by_error` has `USER`, `HOST`, and `ERROR_NUMBER` columns. Each row summarizes events for a given account (user and host combination) and error.
- `events_errors_summary_by_host_by_error` has `HOST` and `ERROR_NUMBER` columns. Each row summarizes events for a given host and error.
- `events_errors_summary_by_thread_by_error` has `THREAD_ID` and `ERROR_NUMBER` columns. Each row summarizes events for a given thread and error.
- `events_errors_summary_by_user_by_error` has `USER` and `ERROR_NUMBER` columns. Each row summarizes events for a given user and error.
- `events_errors_summary_global_by_error` has an `ERROR_NUMBER` column. Each row summarizes events for a given error.

Each error summary table has these summary columns containing aggregated values:

- **SUM_ERROR_RAISED**
  This column aggregates the number of times the error occurred.
- **SUM_ERROR_HANDLED**
  This column aggregates the number of times the error was handled by an SQL exception handler.
- **FIRST_SEEN, LAST_SEEN**
  Timestamp indicating when the error was first seen and most recently seen.

A `NULL` row in each error summary table is used to aggregate statistics for all errors that lie out of range of the instrumented errors. For example, if MySQL Server errors lie in the range from `M` to `N` and an error is
raised with number \( q \) not in that range, the error is aggregated in the NULL row. The NULL row is the row with ERROR_NUMBER=0, ERROR_NAME=NULL, and SQLSTATE=NULL.

The error summary tables have these indexes:

- \textbf{events_errors_summary_by_account_by_error}:
  - Primary key on (USER, HOST, ERROR_NUMBER)
- \textbf{events_errors_summary_by_host_by_error}:
  - Primary key on (HOST, ERROR_NUMBER)
- \textbf{events_errors_summary_by_thread_by_error}:
  - Primary key on (THREAD_ID, ERROR_NUMBER)
- \textbf{events_errors_summary_by_user_by_error}:
  - Primary key on (USER, ERROR_NUMBER)
- \textbf{events_errors_summary_global_by_error}:
  - Primary key on (ERROR_NUMBER)

\textsc{Truncate Table} is permitted for error summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero or NULL rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero or NULL for the remaining rows.

In addition, each error summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of events_errors_summary_global_by_error. For details, see Section 26.12.8, “Performance Schema Connection Tables”.

### 26.12.17.12 Status Variable Summary Tables

The Performance Schema makes status variable information available in the tables described in Section 26.12.14, “Performance Schema Status Variable Tables”. It also makes aggregated status variable information available in summary tables, described here. Each status variable summary table has one or more grouping columns to indicate how the table aggregates status values:

- \textbf{status_by_account} has USER, HOST, and VARIABLE_NAME columns to summarize status variables by account.
- \textbf{status_by_host} has HOST and VARIABLE_NAME columns to summarize status variables by the host from which clients connected.
- \textbf{status_by_user} has USER and VARIABLE_NAME columns to summarize status variables by client user name.

Each status variable summary table has this summary column containing aggregated values:

- \textbf{VARIABLE_VALUE}

The aggregated status variable value for active and terminated sessions.
The status variable summary tables have these indexes:

- **status_by_account:**
  - Primary key on (`USER, HOST, VARIABLE_NAME`)

- **status_by_host:**
  - Primary key on (`HOST, VARIABLE_NAME`)

- **status_by_user:**
  - Primary key on (`USER, VARIABLE_NAME`)

The meaning of “account” in these tables is similar to its meaning in the MySQL grant tables in the `mysql` system database, in the sense that the term refers to a combination of user and host values. They differ in that, for grant tables, the host part of an account can be a pattern, whereas for Performance Schema tables, the host value is always a specific nonpattern host name.

Account status is collected when sessions terminate. The session status counters are added to the global status counters and the corresponding account status counters. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

The Performance Schema supports `TRUNCATE TABLE` for status variable summary tables as follows; in all cases, status for active sessions is unaffected:

- **status_by_account**: Aggregates account status from terminated sessions to user and host status, then resets account status.
- **status_by_host**: Resets aggregated host status from terminated sessions.
- **status_by_user**: Resets aggregated user status from terminated sessions.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

### 26.12.18 Performance Schema Miscellaneous Tables

The following sections describe tables that do not fall into the table categories discussed in the preceding sections:

- **host_cache**: Information from the internal host cache
- **performance_timers**: Which event timers are available
- **threads**: Information about server threads
- **user_defined_functions**: User-defined functions registered by a server component, plugin, or `CREATE FUNCTION` statement
- **log_status**: Information about server logs for backup purposes

### 26.12.18.1 The host_cache Table
The `host_cache` table provides access to the contents of the host cache, which contains client host name and IP address information and is used to avoid Domain Name System (DNS) lookups. The `host_cache_size` system variable controls the size of the host cache, as well as the size of the `host_cache` table that exposes the cache contents. For operational and configuration information about the host cache, see Section 8.12.4.2, “DNS Lookup Optimization and the Host Cache”.

Because the `host_cache` table exposes the contents of the host cache, it can be examined using `SELECT` statements. This may help you diagnose the causes of connection problems. The Performance Schema must be enabled or this table is empty.

The `host_cache` table has these columns:

- **IP**
  
  The IP address of the client that connected to the server, expressed as a string.

- **HOST**

  The resolved DNS host name for that client IP, or `NULL` if the name is unknown.

- **HOST_VALIDATED**

  Whether the IP-to-host name-to-IP DNS resolution was performed successfully for the client IP. If `HOST_VALIDATED` is `YES`, the `HOST` column is used as the host name corresponding to the IP so that additional calls to DNS can be avoided. While `HOST_VALIDATED` is `NO`, DNS resolution is attempted for each connection attempt, until it eventually completes with either a valid result or a permanent error. This information enables the server to avoid caching bad or missing host names during temporary DNS failures, which would negatively affect clients forever.

- **SUM_CONNECT_ERRORS**

  The number of connection errors that are deemed “blocking” (assessed against the `max_connect_errors` system variable). Only protocol handshake errors are counted, and only for hosts that passed validation (HOST_VALIDATED = YES).

  Once `SUM_CONNECT_ERRORS` for a given host reaches the value of `max_connect_errors`, new connections from that host are blocked. The `SUM_CONNECT_ERRORS` value can exceed the `max_connect_errors` value because multiple connection attempts from a host can occur simultaneously while the host is not blocked. Any or all of them can fail, independently incrementing `SUM_CONNECT_ERRORS`, possibly beyond the value of `max_connect_errors`.

  Suppose that `max_connect_errors` is 200 and `SUM_CONNECT_ERRORS` for a given host is 199. If 10 clients attempt to connect from that host simultaneously, none of them are blocked because `SUM_CONNECT_ERRORS` has not reached 200. If blocking errors occur for five of the clients, `SUM_CONNECT_ERRORS` is increased by one for each client, for a resulting `SUM_CONNECT_ERRORS` value of 204. The other five clients succeed and are not blocked because the value of `SUM_CONNECT_ERRORS` when their connection attempts began had not reached 200. New connections from the host that begin after `SUM_CONNECT_ERRORS` reaches 200 are blocked.

- **COUNT_HOST_BLOCKED_ERRORS**

  The number of connections that were blocked because `SUM_CONNECT_ERRORS` exceeded the value of the `max_connect_errors` system variable.

- **COUNT_NAMEINFO_TRANSIENT_ERRORS**

  The number of transient errors during IP-to-host name DNS resolution.
• **COUNT_NAMEINFO_PERMANENT_ERRORS**
  The number of permanent errors during IP-to-host name DNS resolution.

• **COUNT_FORMAT_ERRORS**
  The number of host name format errors. MySQL does not perform matching of Host column values in the mysql.user system table against host names for which one or more of the initial components of the name are entirely numeric, such as `1.2.example.com`. The client IP address is used instead. For the rationale why this type of matching does not occur, see Section 6.2.4, “Specifying Account Names”.

• **COUNT_ADDRINFO_TRANSIENT_ERRORS**
  The number of transient errors during host name-to-IP reverse DNS resolution.

• **COUNT_ADDRINFO_PERMANENT_ERRORS**
  The number of permanent errors during host name-to-IP reverse DNS resolution.

• **COUNT_FCRDNS_ERRORS**
  The number of forward-confirmed reverse DNS errors. These errors occur when IP-to-host name-to-IP DNS resolution produces an IP address that does not match the client originating IP address.

• **COUNT_HOST_ACL_ERRORS**
  The number of errors that occur because no users are permitted to connect from the client host. In such cases, the server returns `ER_HOST_NOT_PRIVILEGED` and does not even ask for a user name or password.

• **COUNT_NO_AUTH_PLUGIN_ERRORS**
  The number of errors due to requests for an unavailable authentication plugin. A plugin can be unavailable if, for example, it was never loaded or a load attempt failed.

• **COUNT_AUTH_PLUGIN_ERRORS**
  The number of errors reported by authentication plugins.

  An authentication plugin can report different error codes to indicate the root cause of a failure. Depending on the type of error, one of these columns is incremented: `COUNT_AUTHENTICATION_ERRORS, COUNT_AUTH_PLUGIN_ERRORS, COUNT_HANDSHAKE_ERRORS`. New return codes are an optional extension to the existing plugin API. Unknown or unexpected plugin errors are counted in the `COUNT_AUTH_PLUGIN_ERRORS` column.

• **COUNT_HANDSHAKE_ERRORS**
  The number of errors detected at the wire protocol level.

• **COUNT_PROXY_USER_ERRORS**
  The number of errors detected when proxy user A is proxied to another user B who does not exist.

• **COUNT_PROXY_USER_ACL_ERRORS**
  The number of errors detected when proxy user A is proxied to another user B who does exist but for whom A does not have the `PROXY` privilege.

• **COUNT_AUTHENTICATION_ERRORS**
  4632
The number of errors caused by failed authentication.

- **COUNT_SSL_ERRORS**
  The number of errors due to SSL problems.

- **COUNT_MAX_USER_CONNECTIONS_ERRORS**
  The number of errors caused by exceeding per-user connection quotas. See Section 6.2.20, “Setting Account Resource Limits”.

- **COUNT_MAX_USER_CONNECTIONS_PER_HOUR_ERRORS**
  The number of errors caused by exceeding per-user connections-per-hour quotas. See Section 6.2.20, “Setting Account Resource Limits”.

- **COUNT_DEFAULT_DATABASE_ERRORS**
  The number of errors related to the default database. For example, the database does not exist or the user has no privileges to access it.

- **COUNT_INIT_CONNECT_ERRORS**
  The number of errors caused by execution failures of statements in the `init_connect` system variable value.

- **COUNT_LOCAL_ERRORS**
  The number of errors local to the server implementation and not related to the network, authentication, or authorization. For example, out-of-memory conditions fall into this category.

- **COUNT_UNKNOWN_ERRORS**
  The number of other, unknown errors not accounted for by other columns in this table. This column is reserved for future use, in case new error conditions must be reported, and if preserving the backward compatibility and structure of the `host_cache` table is required.

- **FIRST_SEEN**
  The timestamp of the first connection attempt seen from the client in the `IP` column.

- **LAST_SEEN**
  The timestamp of the most recent connection attempt seen from the client in the `IP` column.

- **FIRST_ERROR_SEEN**
  The timestamp of the first error seen from the client in the `IP` column.

- **LAST_ERROR_SEEN**
  The timestamp of the most recent error seen from the client in the `IP` column.

The `host_cache` table has these indexes:

- Primary key on (`IP`)
- Index on (`HOST`)
The `FLUSH HOSTS` statement, `TRUNCATE TABLE host_cache` statement, and `mysqladmin flush-hosts` command have the same effect: They clear the host cache, remove all rows from the `host_cache` table that exposes the cache contents, and unblock any blocked hosts (see Section B.4.2.5, “Host ‘host_name’ is blocked”). `FLUSH HOSTS` and `mysqladmin flush-hosts` require the `RELOAD` privilege. `TRUNCATE TABLE` requires the `DROP` privilege for the `host_cache` table.

### 26.12.18.2 The `keyring_keys` table

MySQL Server supports a keyring that enables internal server components and plugins to securely store sensitive information for later retrieval. See Section 6.4.4, “The MySQL Keyring”.

As of MySQL 8.0.16, the `keyring_keys` table exposes metadata for keys in the keyring. Key metadata includes key IDs, key owners, and backend key IDs. The `keyring_keys` table does not expose any sensitive keyring data such as key contents.

The `keyring_keys` table has these columns:

- **KEY_ID**
  - The key identifier.

- **KEY_OWNER**
  - The owner of the key.

- **BACKEND_KEY_ID**
  - The ID used for the key by the keyring backend.

The `keyring_keys` table has no indexes.

`TRUNCATE TABLE` is not permitted for the `keyring_keys` table.

### 26.12.18.3 The `log_status` Table

The `log_status` table provides information that enables an online backup tool to copy the required log files without locking those resources for the duration of the copy process.

When the `log_status` table is queried, the server blocks logging and related administrative changes for just long enough to populate the table, then releases the resources. The `log_status` table informs the online backup which point it should copy up to in the master's binary log and `gtid_executed` record, and the relay log for each replication channel. It also provides relevant information for individual storage engines, such as the last log sequence number (LSN) and the LSN of the last checkpoint taken for the InnoDB storage engine.

The `log_status` table has these columns:

- **SERVER_UUID**
  - The server UUID for this server instance. This is the generated unique value of the read-only system variable `server_uuid`.

- **LOCAL**
  - The log position state information from the master, provided as a single JSON object with the following keys:
    - `binary_log_file` - The name of the current binary log file.
### Performance Schema Miscellaneous Tables

- **binary_log_position**
  The current binary log position at the time the `log_status` table was accessed.

- **gtid_executed**
  The current value of the global server variable `gtid_executed` at the time the `log_status` table was accessed. This information is consistent with the `binary_log_file` and `binary_log_position` keys.

#### REPLICATION

A JSON array of channels, each with the following information:

- **channel_name**
  The name of the replication channel. The default replication channel's name is the empty string ("").

- **relay_log_file**
  The name of the current relay log file for the replication channel.

- **relay_log_pos**
  The current relay log position at the time the `log_status` table was accessed.

#### STORAGE_ENGINES

Relevant information from individual storage engines, provided as a JSON object with one key for each applicable storage engine.

The `log_status` table has no indexes.

The `BACKUP_ADMIN` privilege, as well as the `SELECT` privilege, is required for access to the `log_status` table.

`TRUNCATE TABLE` is not permitted for the `log_status` table.

### 26.12.18.4 The performance_timers Table

The `performance_timers` table shows which event timers are available:

```sql
mysql> SELECT * FROM performance_schema.performance_timers;
+-------------+-----------------+------------------+----------------+
<table>
<thead>
<tr>
<th>TIMER_NAME</th>
<th>TIMER_FREQUENCY</th>
<th>TIMER_RESOLUTION</th>
<th>TIMER_OVERHEAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>CYCLE</td>
<td>2389029850</td>
<td>1</td>
<td>72</td>
</tr>
<tr>
<td>NANOSECOND</td>
<td>1000000000</td>
<td>1</td>
<td>112</td>
</tr>
<tr>
<td>MICROSECOND</td>
<td>1000000</td>
<td>1</td>
<td>136</td>
</tr>
<tr>
<td>MILLISECOND</td>
<td>1036</td>
<td>1</td>
<td>168</td>
</tr>
</tbody>
</table>
+-------------+-----------------+------------------|----------------|
```

If the values associated with a given timer name are `NULL`, that timer is not supported on your platform. For an explanation of how event timing occurs, see Section 26.4.1, “Performance Schema Event Timing”.

The `performance_timers` table has these columns:

- **TIMER_NAME**
  The timer name.

- **TIMER_FREQUENCY**
  The number of timer units per second. For a cycle timer, the frequency is generally related to the CPU speed. For example, on a system with a 2.4GHz processor, the `CYCLE` may be close to 2400000000.
**Performance Schema Miscellaneous Tables**

- **TIMER_RESOLUTION**

  Indicates the number of timer units by which timer values increase. If a timer has a resolution of 10, its value increases by 10 each time.

- **TIMER_OVERHEAD**

  The minimal number of cycles of overhead to obtain one timing with the given timer. The Performance Schema determines this value by invoking the timer 20 times during initialization and picking the smallest value. The total overhead really is twice this amount because the instrumentation invokes the timer at the start and end of each event. The timer code is called only for timed events, so this overhead does not apply for nontimed events.

The `performance_timers` table has these indexes:

- None

  **TRUNCATE TABLE** is not permitted for the `performance_timers` table.

### 26.12.18.5 The threads Table

The `threads` table contains a row for each server thread. Each row contains information about a thread and indicates whether monitoring and historical event logging are enabled for it:

```sql
mysql> SELECT * FROM performance_schema.threads;
```

```
*************************** 1. row ***************************
THREAD_ID: 1
NAME: thread/sql/main
TYPE: BACKGROUND
PROCESSLIST_ID: NULL
PROCESSLIST_USER: NULL
PROCESSLIST_HOST: NULL
PROCESSLIST_DB: NULL
PROCESSLIST_COMMAND: NULL
PROCESSLIST_TIME: 80284
PROCESSLIST_STATE: NULL
PROCESSLIST_INFO: NULL
PARENT_THREAD_ID: NULL
ROLE: NULL
INSTRUMENTED: YES
HISTORY: YES
CONNECTION_TYPE: NULL
THREAD_OS_ID: 489803
RESOURCE_GROUP: SYS_default
...
*************************** 4. row ***************************
THREAD_ID: 51
NAME: thread/sql/one_connection
TYPE: FOREGROUND
PROCESSLIST_ID: 34
PROCESSLIST_USER: isabella
PROCESSLIST_HOST: localhost
PROCESSLIST_DB: performance_schema
PROCESSLIST_COMMAND: Query
PROCESSLIST_TIME: 0
PROCESSLIST_STATE: Sending data
PROCESSLIST_INFO: SELECT * FROM performance_schema.threads
PARENT_THREAD_ID: 1
ROLE: NULL
INSTRUMENTED: YES
HISTORY: YES
CONNECTION_TYPE: SSL/TLS
THREAD_OS_ID: 755399
```
When the Performance Schema initializes, it populates the `threads` table based on the threads in existence then. Thereafter, a new row is added each time the server creates a thread.

The `INSTRUMENTED` and `HISTORY` column values for new threads are determined by the contents of the `setup_actors` table. For information about how to use the `setup_actors` table to control these columns, see Section 26.4.6, "Pre-Filtering by Thread".

Removal of rows from the `threads` table occurs when threads end. For a thread associated with a client session, removal occurs when the session ends. If a client has auto-reconnect enabled and the session reconnects after a disconnect, the session becomes associated with a new row in the `threads` table that has a different `PROCESSLIST_ID` value. The initial `INSTRUMENTED` and `HISTORY` values for the new thread may be different from those of the original thread: The `setup_actors` table may have changed in the meantime, and if the `INSTRUMENTED` or `HISTORY` value for the original thread was changed after the row was initialized, the change does not carry over to the new thread.

The `threads` table columns with names having a prefix of `PROCESSLIST_` provide information similar to that available from the `INFORMATION_SCHEMA.PROCESSLIST` table or the `SHOW PROCESSLIST` statement. Thus, all three sources provide thread-monitoring information. Use of `threads` differs from use of the other two sources in these ways:

- Access to `threads` does not require a mutex and has minimal impact on server performance. `INFORMATION_SCHEMA.PROCESSLIST` and `SHOW PROCESSLIST` have negative performance consequences because they require a mutex.

- `threads` provides additional information for each thread, such as whether it is a foreground or background thread, and the location within the server associated with the thread.

- `threads` provides information about background threads, so it can be used to monitor activity the other thread information sources cannot.

- You can enable or disable thread monitoring (that is, whether events executed by the thread are instrumented) and historical event logging. To control the initial `INSTRUMENTED` and `HISTORY` values for new foreground threads, use the `setup_actors` table. To control these aspects of existing threads, set the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows. (For more information about the conditions under which thread monitoring and historical event logging occur, see the descriptions of the `INSTRUMENTED` and `HISTORY` columns.)

For these reasons, DBAs who perform server monitoring using `INFORMATION_SCHEMA.PROCESSLIST` or `SHOW PROCESSLIST` may wish to monitor using the `threads` table instead.

### Note

For `INFORMATION_SCHEMA.PROCESSLIST` and `SHOW PROCESSLIST`, information about threads for other users is shown only if the current user has the `PROCESS` privilege. That is not true of the `threads` table; all rows are shown to any user who has the `SELECT` privilege for the table. Users who should not be able to see threads for other users should not be given that privilege.

The `threads` table has these columns:

- **THREAD_ID**

  A unique thread identifier.
Performance Schema Miscellaneous Tables

- **NAME**
  The name associated with the thread instrumentation code in the server. For example, `thread/sql/one_connection` corresponds to the thread function in the code responsible for handling a user connection, and `thread/sql/main` stands for the `main()` function of the server.

- **TYPE**
  The thread type, either **FOREGROUND** or **BACKGROUND**. User connection threads are foreground threads. Threads associated with internal server activity are background threads. Examples are internal InnoDB threads, “binlog dump” threads sending information to slaves, and slave I/O and SQL threads.

- **PROCESSLIST_ID**
  For threads that are displayed in the `INFORMATION_SCHEMA.PROCESSLIST` table, this is the same value displayed in the `ID` column of that table. It is also the value displayed in the `Id` column of `SHOW PROCESSLIST` output, and the value that `CONNECTION_ID()` would return within that thread.

  For background threads (threads not associated with a user connection), `PROCESSLIST_ID` is **NULL**, so the values are not unique.

- **PROCESSLIST_USER**
  The user associated with a foreground thread, **NULL** for a background thread.

- **PROCESSLIST_HOST**
  The host name of the client associated with a foreground thread, **NULL** for a background thread.

  Unlike the `HOST` column of the `INFORMATION_SCHEMA.PROCESSLIST` table or the `Host` column of `SHOW PROCESSLIST` output, the `PROCESSLIST_HOST` column does not include the port number for TCP/IP connections. To obtain this information from the Performance Schema, enable the socket instrumentation (which is not enabled by default) and examine the `socket_instances` table:

```sql
mysql> SELECT NAME, ENABLED, TIMED
                  FROM performance_schema.setup_instruments
               WHERE NAME LIKE 'wait/io/socket%';
+----------------------------------------+---------+-------+
| NAME                                   | ENABLED | TIMED |
+----------------------------------------+---------+-------+
| wait/io/socket/sql/server_tcpip_socket | NO      | NO    |
| wait/io/socket/sql/server_unix_socket  | NO      | NO    |
| wait/io/socket/sql/client_connection   | NO      | NO    |
+----------------------------------------+---------+-------+
3 rows in set (0.01 sec)
```

```sql
mysql> UPDATE performance_schema.setup_instruments
       SET ENABLED='YES'
       WHERE NAME LIKE 'wait/io/socket%';
Query OK, 3 rows affected (0.00 sec)
Rows matched: 3  Changed: 3  Warnings: 0
```

```sql
mysql> SELECT * FROM performance_schema.socket_instances\G
```

```
*************************** 1. row ***************************
EVENT_NAME: wait/io/socket/sql/client_connection
OBJECT_INSTANCE_BEGIN: 140612577298432
THREAD_ID: 31
SOCKET_ID: 53
IP: ::ffff:127.0.0.1
PORT: 55642
STATE: ACTIVE
...
```
Performance Schema Miscellaneous Tables

- **PROCESSLIST_DB**
  
The default database for the thread, or NULL if there is none.

- **PROCESSLIST_COMMAND**
  
  For foreground threads, the type of command the thread is executing on behalf of the client, or Sleep if the session is idle. For descriptions of thread commands, see Section 8.14, “Examining Thread Information”. The value of this column corresponds to the Com_xxx commands of the client/server protocol and Com_xxx status variables. See Section 5.1.10, “Server Status Variables”

  Background threads do not execute commands on behalf of clients, so this column may be NULL.

- **PROCESSLIST_TIME**
  
The time in seconds that the thread has been in its current state.

- **PROCESSLIST_STATE**
  
  An action, event, or state that indicates what the thread is doing. For descriptions of PROCESSLIST_STATE values, see Section 8.14, “Examining Thread Information”. If the value if NULL, the thread may correspond to an idle client session or the work it is doing is not instrumented with stages.

  Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that bears investigation.

- **PROCESSLIST_INFO**
  
The statement the thread is executing, or NULL if it is not executing any statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a CALL statement executes a stored procedure that is executing a SELECT statement, the PROCESSLIST_INFO value shows the SELECT statement.

- **PARENT_THREAD_ID**
  
  If this thread is a subthread (spawned by another thread), this is the THREAD_ID value of the spawning thread.

- **ROLE**
  
  Unused.

- **INSTRUMENTED**
  
  Whether events executed by the thread are instrumented. The value is YES or NO.

  - For foreground threads, the initial INSTRUMENTED value is determined by whether the user account associated with the thread matches any row in the setup_actors table. Matching is based on the values of the PROCESSLIST_USER and PROCESSLIST_HOST columns.

    If the thread spawns a subthread, matching occurs again for the threads table row created for the subthread.

  - For background threads, INSTRUMENTED is YES by default. setup_actors is not consulted because there is no associated user for background threads.

  - For any thread, its INSTRUMENTED value can be changed during the lifetime of the thread.
For monitoring of events executed by the thread to occur, these things must be true:

- The `thread_instrumentation` consumer in the `setup_consumers` table must be `YES`.
- The `threads.INSTRUMENTED` column must be `YES`.
- Monitoring occurs only for those thread events produced from instruments that have the `ENABLED` column set to `YES` in the `setup_instruments` table.

**HISTORY**

Whether to log historical events for the thread. The value is `YES` or `NO`.

- For foreground threads, the initial `HISTORY` value is determined by whether the user account associated with the thread matches any row in the `setup_actors` table. Matching is based on the values of the `PROCESSLIST_USER` and `PROCESSLIST_HOST` columns.

  If the thread spawns a subthread, matching occurs again for the `threads` table row created for the subthread.

- For background threads, `HISTORY` is `YES` by default. `setup_actors` is not consulted because there is no associated user for background threads.

- For any thread, its `HISTORY` value can be changed during the lifetime of the thread.

For historical event logging for the thread to occur, these things must be true:

- The appropriate history-related consumers in the `setup_consumers` table must be enabled. For example, wait event logging in the `events_waits_history` and `events_waits_history_long` tables requires the corresponding `events_waits_history` and `events_waits_history_long` consumers to be `YES`.

- The `threads.HISTORY` column must be `YES`.

- Logging occurs only for those thread events produced from instruments that have the `ENABLED` column set to `YES` in the `setup_instruments` table.

**CONNECTION_TYPE**

The protocol used to establish the connection, or `NULL` for background threads. Permitted values are `TCP/IP` (TCP/IP connection established without encryption), `SSL/TLS` (TCP/IP connection established with encryption), `Socket` (Unix socket file connection), `Named Pipe` (Windows named pipe connection), and `Shared Memory` (Windows shared memory connection).

**THREAD_OS_ID**

The thread or task identifier as defined by the underlying operating system, if there is one:

- When a MySQL thread is associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains the operating system thread ID.

- When a MySQL thread is not associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains `NULL`. This is typical for user sessions when the thread pool plugin is used (see Section 5.6.3, “MySQL Enterprise Thread Pool”).

For Linux, `THREAD_OS_ID` corresponds to the value of the `gettid()` function. This value is exposed, for example, using the `perf` or `ps -L` commands, or in the `proc` file system (`/proc/[pid]/task/[tid]`). For more information, see the `perf-stat(1), ps(1), and proc(5)` man pages.

- **RESOURCE_GROUP**
  - The resource group label. This value is `NULL` if resource groups are not supported on the current platform or server configuration (see Resource Group Restrictions).

The `threads` table has these indexes:

- Primary key on (`THREAD_ID`)
- Index on (`NAME`)
- Index on (`PROCESSLIST_ID`)
- Index on (`PROCESSLIST_USER,PROCESSLIST_HOST`)
- Index on (`PROCESSLIST_HOST`)
- Index on (`THREAD_OS_ID`)
- Index on (`RESOURCE_GROUP`)

`TRUNCATE TABLE` is not permitted for the `threads` table.

### 26.12.18.6 The `user_defined_functions` Table

The `user_defined_functions` table contains a row for each user-defined function (UDF) registered by a server component or plugin, or by a `CREATE FUNCTION` statement.

`user_defined_functions` has these columns:

- **UDF_NAME**
  - The UDF name as referred to in SQL statements. The value is `NULL` if the function was registered by a `CREATE FUNCTION` statement and is in the process of unloading.

- **UDF_RETURN_TYPE**
  - The UDF return value type. The value is one of `int, decimal, real, char, or row`.

- **UDF_TYPE**
  - The UDF type. The value is one of `function` (scalar) or `aggregate`.

- **UDF_LIBRARY**
  - The name of the UDF library file containing the executable UDF code. The file is located in the directory named by the `plugin_dir` system variable. The value is `NULL` if the UDF was registered using a server component service rather than by a `CREATE FUNCTION` statement.

- **UDF_USAGE_COUNT**
  - The current UDF usage count.

The `user_defined_functions` table has these indexes:

- Primary key on (`UDF_NAME`)
TRUNCATE TABLE is not permitted for the user_defined_functions table.

26.14 Performance Schema Command Options

Performance Schema parameters can be specified at server startup on the command line or in option files to configure Performance Schema instruments and consumers. Runtime configuration is also possible in many cases (see Section 26.4, “Performance Schema Runtime Configuration”), but startup configuration must be used when runtime configuration is too late to affect instruments that have already been initialized during the startup process.

Performance Schema consumers and instruments can be configured at startup using the following syntax. For additional details, see Section 26.3, “Performance Schema Startup Configuration”.

- `--performance-schema-consumer-consumer_name=value`
  Configure a Performance Schema consumer. Consumer names in the setup_consumers table use underscores, but for consumers set at startup, dashes and underscores within the name are equivalent. Options for configuring individual consumers are detailed later in this section.

- `--performance-schema-instrument=instrument_name=value`
  Configure a Performance Schema instrument. The name may be given as a pattern to configure instruments that match the pattern.

The following items configure individual consumers:

- `--performance-schema-consumer-events-stages-current=value`
  Configure the `events-stages-current` consumer.

- `--performance-schema-consumer-events-stages-history=value`
  Configure the `events-stages-history` consumer.

- `--performance-schema-consumer-events-stages-history-long=value`
  Configure the `events-stages-history-long` consumer.

- `--performance-schema-consumer-events-statements-current=value`
  Configure the `events-statements-current` consumer.

- `--performance-schema-consumer-events-statements-history=value`
  Configure the `events-statements-history` consumer.

- `--performance-schema-consumer-events-statements-history-long=value`
  Configure the `events-statements-history-long` consumer.

- `--performance-schema-consumer-events-transactions-current=value`
  Configure the Performance Schema `events-transactions-current` consumer.

- `--performance-schema-consumer-events-transactions-history=value`
  Configure the Performance Schema `events-transactions-history` consumer.

- `--performance-schema-consumer-events-transactions-history-long=value`
  Configure the Performance Schema `events-transactions-history-long` consumer.
• `--performance-schema-consumer-events-waits-current=value`
  Configure the `events-waits-current` consumer.

• `--performance-schema-consumer-events-waits-history=value`
  Configure the `events-waits-history` consumer.

• `--performance-schema-consumer-events-waits-history-long=value`
  Configure the `events-waits-history-long` consumer.

• `--performance-schema-consumer-global-instrumentation=value`
  Configure the `global-instrumentation` consumer.

• `--performance-schema-consumer-statements-digest=value`
  Configure the `statements-digest` consumer.

• `--performance-schema-consumer-thread-instrumentation=value`
  Configure the `thread-instrumentation` consumer.

### 26.15 Performance Schema System Variables

The Performance Schema implements several system variables that provide configuration information:

```
mysql> SHOW VARIABLES LIKE 'perf%';
+---------------------------------+-------+
| Variable_name                   | Value |
+---------------------------------+-------+
| performance_schema              | ON    |
| performance_schema_accounts_size| -1    |
| performance_schema_digests_size | 10000 |
| performance_schema_events_stages_history_long_size | 10000 |
| performance_schema_events_stages_history_size | 10 |
| performance_schema_events_statements_history_long_size | 10000 |
| performance_schema_events_statements_history_size | 10 |
| performance_schema_events_transactions_history_long_size | 10000 |
| performance_schema_events_transactions_history_size | 10 |
| performance_schema_events_waits_history_long_size | 10000 |
| performance_schema_events_waits_history_size | 10 |
| performance_schema_hosts_size    | -1    |
| performance_schema_max_cond_classes | 80   |
| performance_schema_max_cond_instances | -1   |
| performance_schema_max_digest_length | 1024 |
| performance_schema_max_file_classes    | 50    |
| performance_schema_max_file_handles | 32768 |
| performance_schema_max_file_instances | -1   |
| performance_schema_max_index_stat  | -1    |
| performance_schema_max_memory_classes | 320  |
| performance_schema_max_metadata_locks | -1   |
| performance_schema_max_mutex_classes | 220  |
| performance_schema_max_mutex_instances | -1   |
| performance_schema_max_prepared_statements_instances | -1   |
| performance_schema_max_program_instances | -1   |
| performance_schema_max_rwlock_classes | 40   |
| performance_schema_max_rwlock_instances | -1   |
| performance_schema_max_socket_classes | 10   |
| performance_schema_max_socket_instances | -1   |
| performance_schema_max_sql_text_length | 1024 |
| performance_schema_max_stage_classes | 150  |
| performance_schema_max_statement_classes | 192  |
+---------------------------------+-------+
```
Performance Schema system variables can be set at server startup on the command line or in option files, and many can be set at runtime. See Section 26.13, “Performance Schema Option and Variable Reference”.

The Performance Schema automatically sizes the values of several of its parameters at server startup if they are not set explicitly. For more information, see Section 26.3, “Performance Schema Startup Configuration”.

Performance Schema system variables have the following meanings:

• performance_schema

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema={OFF|ON}</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

The value of this variable is ON or OFF to indicate whether the Performance Schema is enabled. By default, the value is ON. At server startup, you can specify this variable with no value or a value of ON or 1 to enable it, or with a value of OFF or 0 to disable it.

Even when the Performance Schema is disabled, it continues to populate the global_variables, session_variables, global_status, and session_status tables. This occurs as necessary to permit the results for the SHOW VARIABLES and SHOW STATUS statements to be drawn from those tables, depending on the setting of the show_compatibility_56 system variable. The Performance Schema also populates some of the replication tables when disabled.

• performance_schema_accounts_size

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema-accounts-size=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema_accounts_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
</tbody>
</table>
The number of rows in the `accounts` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `accounts` table or status variable information in the `status_by_account` table.

• `performance_schema_digests_size`

The maximum number of rows in the `events_statements_summary_by_digest` table. If this maximum is exceeded such that a digest cannot be instrumented, the Performance Schema increments the `Performance_schema_digest_lost` status variable.

For more information about statement digesting, see Section 26.10, “Performance Schema Statement Digests and Sampling”.

• `performance_schema_error_size`
The number of instrumented server error codes. The default value is the actual number of server error codes. Although the value can be set anywhere from 0 to its maximum, the intended use is to set it to either its default (to instrument all errors) or 0 (to instrument no errors).

Error information is aggregated in summary tables; see Section 26.12.17.11, “Error Summary Tables”. If an error occurs that is not instrumented, information for the occurrence is aggregated to the NULL row in each summary table; that is, to the row with `ERROR_NUMBER=0`, `ERROR_NAME=NULL`, and `SQLSTATE=NULL`.

- **performance_schema_events_stages_history_long_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--performance-schema-events-stages-history-long-size=#</code></td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>performance_schema_events_stages_history_long_size</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR Hint Applies</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows in the `events_stages_history_long` table.

- **performance_schema_events_stages_history_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--performance-schema-events-stages-history-size=#</code></td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>performance_schema_events_stages_history_size</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR Hint Applies</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows per thread in the `events_stages_history` table.

- **performance_schema_events_statements_history_long_size**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--performance-schema-events-statements-history-long-size=#</code></td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><code>performance_schema_events_statements_history_long_size</code></td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR Hint Applies</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>4649 (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows per thread in the `events_statements_history_long` table.
### Performance Schema System Variables

#### performance_schema_events_statements_history_size

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-events-statements-history-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_events_statements_history_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR Hint Applies</strong></td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>(-1) (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows per thread in the `events_statements_history` table.

#### performance_schema_events_transactions_history_long_size

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-events-transactions-history-long-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_events_transactions_history_long_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR Hint Applies</strong></td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>(-1) (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows in the `events_transactions_history_long` table.

#### performance_schema_events_transactions_history_size

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-events-transactions-history-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_events_transactions_history_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR Hint Applies</strong></td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>(-1) (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows in the `events_transactions_history` table.
The number of rows per thread in the `events_transactions_history` table.

- `performance_schema_events_waits_history_long_size`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-events-waits-history-long-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_events_waits_history_long_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows in the `events_waits_history_long` table.

- `performance_schema_events_waits_history_size`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-events-waits-history-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_events_waits_history_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows per thread in the `events_waits_history` table.

- `performance_schema_hosts_size`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-hosts-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_hosts_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1048576</td>
</tr>
</tbody>
</table>

The number of rows in the `hosts` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `hosts` table or status variable information in the `status_by_host` table.
Performance Schema System Variables

- **performance_schema_max_cond_classes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-cond-classes=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_cond_classes</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>80</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value (&gt;= 8.0.12)</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value (&lt;= 8.0.11)</td>
<td>256</td>
</tr>
</tbody>
</table>

The maximum number of condition instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- **performance_schema_max_cond_instances**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-cond-instances=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_cond_instances</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of instrumented condition objects. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- **performance_schema_max_digest_length**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-digest-length=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_digest_length</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1024</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>4652</td>
</tr>
</tbody>
</table>

The maximum number of bytes of memory reserved per statement for computation of normalized statement digest values in the Performance Schema. This variable is related to `max_digest_length`; see the description of that variable in Section 5.1.8, “Server System Variables”.

For more information about statement digesting, including considerations regarding memory use, see Section 26.10, “Performance Schema Statement Digests and Sampling”.

- **performance_schema_max_digest_sample_age**

This variable affects statement sampling for the `events_statements_summary_by_digest` table. When a new table row is inserted, the statement that produced the row digest value is stored as the current sample statement associated with the digest. Thereafter, when the server sees other statements with the same digest value, it determines whether to use the new statement to replace the current sample statement (that is, whether to resample). Resampling policy is based on the comparative wait times of the current sample statement and new statement and, optionally, the age of the current sample statement:

- Resampling based on wait times: If the new statement wait time has a wait time greater than that of the current sample statement, it becomes the current sample statement.

- Resampling based on age: If the `performance_schema_max_digest_sample_age` system variable has a value greater than zero and the current sample statement is more than that many seconds old, the current statement is considered “too old” and the new statement replaces it. This occurs even if the new statement wait time is less than that of the current sample statement.

For information about statement sampling, see Section 26.10, “Performance Schema Statement Digests and Sampling”.

- **performance_schema_max_file_classes**
### Performance Schema System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>80</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value ( (\geq 8.0.12) )</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value ( (\leq 8.0.11) )</td>
<td>256</td>
</tr>
</tbody>
</table>

The maximum number of file instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- **performance_schema_max_file_handles**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-file-handles=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_file_handles</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>32768</td>
</tr>
</tbody>
</table>

The maximum number of opened file objects. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

The value of `performance_schema_max_file_handles` should be greater than the value of `open_files_limit`. `open_files_limit` affects the maximum number of open file handles the server can support and `performance_schema_max_file_handles` affects how many of these file handles can be instrumented.

- **performance_schema_max_file_instances**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-file-instances=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_file_instances</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>(-1) (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of instrumented file objects. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.  

4654
• **performance_schema_max_index_stat**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema-max-index-stat=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema_max_index_stat</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of indexes for which the Performance Schema maintains statistics. If this maximum is exceeded such that index statistics are lost, the Performance Schema increments the Performance_schema_index_stat_lost status variable. The default value is autosized using the value of performance_schema_max_table_instances.

• **performance_schema_max_memory_classes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema-max-memory-classes=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema_max_memory_classes</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (&gt;= 8.0.1)</td>
<td>450</td>
</tr>
<tr>
<td>Default Value (8.0.0)</td>
<td>350</td>
</tr>
</tbody>
</table>

The maximum number of memory instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

• **performance_schema_max_metadata_locks**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema-max-metadata-locks=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema_max_metadata_locks</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of metadata lock instruments. This value controls the size of the metadata_locks table. If this maximum is exceeded such that a metadata lock cannot be instrumented, the Performance Schema increments the Performance_schema_metadata_lock_lost status variable.
### Performance Schema System Variables

- **performance_schema_max_mutex_classes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-mutex-classes=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_mutex_classes</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR</strong> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (&gt;= 8.0.12)</td>
<td>300</td>
</tr>
<tr>
<td>Default Value (&gt;= 8.0.3, &lt;= 8.0.11)</td>
<td>250</td>
</tr>
<tr>
<td>Default Value (&gt;= 8.0.1, &lt;= 8.0.2)</td>
<td>220</td>
</tr>
<tr>
<td>Default Value (8.0.0)</td>
<td>200</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value (&gt;= 8.0.12)</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value (&lt;= 8.0.11)</td>
<td>256</td>
</tr>
</tbody>
</table>

The maximum number of mutex instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- **performance_schema_max_mutex_instances**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-mutex-instances=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_mutex_instances</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR</strong> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of instrumented mutex objects. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- **performance_schema_max_prepared_statements_instances**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-prepared-statements-instances=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_prepared_statements_instances</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR</strong> Hint Applies</td>
<td>No</td>
</tr>
</tbody>
</table>
The maximum number of rows in the `prepared_statements_instances` table. If this maximum is exceeded such that a prepared statement cannot be instrumented, the Performance Schema increments the `Performance_schema_prepared_statements_lost` status variable. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

The default value of this variable is autosized based on the value of the `max_prepared_stmt_count` system variable.

- **performance_schema_max_rwlock_classes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>

</tr>
</tbody>
</table>

The maximum number of instrumented socket objects. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

4658
• **performance_schema_max_sql_text_length**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema-max-sql-text-length=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema_max_sql_text_length</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR</strong> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>1024</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1048576</td>
</tr>
</tbody>
</table>

The maximum number of bytes used to store SQL statements. The value applies to storage required for these columns:

- The `SQL_TEXT` column of the `events_statements_current`, `events_statements_history`, and `events_statements_history_long` statement event tables.
- The `QUERY_SAMPLE_TEXT` column of the `events_statements_summary_by_digest` summary table.

Any bytes in excess of `performance_schema_max_sql_text_length` are discarded and do not appear in the column. Statements differing only after that many initial bytes are indistinguishable in the column.

Decreasing the `performance_schema_max_sql_text_length` value reduces memory use but causes more statements to become indistinguishable if they differ only at the end. Increasing the value increases memory use but permits longer statements to be distinguished.

• **performance_schema_max_stage_classes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema-max-stage-classes=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema_max_stage_classes</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR</strong> Hint Applies</td>
<td>No</td>

<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>150</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value (&gt;= 8.0.12)</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value (&lt;= 8.0.11)</td>
<td>256</td>
</tr>
</tbody>
</table>

The maximum number of stage instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

• **performance_schema_max_statement_classes**
Performance Schema System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema-max-statement-classes=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema_max_statement_classes</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>(-1) (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of statement instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

The default value is calculated at server build time based on the number of commands in the client/server protocol and the number of SQL statement types supported by the server.

This variable should not be changed, unless to set it to 0 to disable all statement instrumentation and save all memory associated with it. Setting the variable to nonzero values other than the default has no benefit; in particular, values larger than the default cause more memory to be allocated then is needed.

- **performance_schema_max_statement_stack**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--performance-schema-max-statement-stack=#</td>
</tr>
<tr>
<td>System Variable</td>
<td>performance_schema_max_statement_stack</td>

<tr>
<td>Default Value</td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of tables for which the Performance Schema maintains lock statistics. If this maximum is exceeded such that table lock statistics are lost, the Performance Schema increments the `performance_schema_table_lock_stat_lost` status variable.

• **performance_schema_max_thread_classes**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-thread-classes=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_thread_classes</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>SET_VAR Hint Applies</td>
<td>No</td>
</tr>
</tbody>
</table>
### Performance Schema System Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value (&gt;= 8.0.3)</td>
<td>100</td>
</tr>
<tr>
<td>Default Value (&lt;= 8.0.2)</td>
<td>50</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum Value (&gt;= 8.0.12)</td>
<td>1024</td>
</tr>
<tr>
<td>Maximum Value (&lt;= 8.0.11)</td>
<td>256</td>
</tr>
</tbody>
</table>

The maximum number of thread instruments. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

- `performance_schema_max_thread_instances`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-max-thread-instances=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_max_thread_instances</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The maximum number of instrumented thread objects. The value controls the size of the `threads` table. If this maximum is exceeded such that a thread cannot be instrumented, the Performance Schema increments the `Performance_schema_thread_instances_lost` status variable. For information about how to set and use this variable, see Section 26.7, “Performance Schema Status Monitoring”.

The `max_connections` system variable affects how many threads can run in the server. `performance_schema_max_thread_instances` affects how many of these running threads can be instrumented.

The `variables_by_thread` and `status_by_thread` tables contain system and status variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table will miss some rows. In this case, the `Performance_schema_thread_instances_lost` status variable will be greater than zero.

- `performance_schema_session_connect_attrs_size`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-session-connect-attrs-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_session_connect_attrs_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autosizing; do not assign this literal value)</td>
</tr>
</tbody>
</table>
The amount of preallocated memory per thread reserved to hold connection attribute key-value pairs. If the aggregate size of connection attribute data sent by a client is larger than this amount, the Performance Schema truncates the attribute data, increments the `Performance_schema_session_connect_attrs_lost` status variable, and writes a message to the error log indicating that truncation occurred if the `log_error_verbosity` system variable is greater than 1. A _truncated attribute is also added to the session attributes with a value indicating how many bytes were lost, if the attribute buffer has sufficient space. This enables the Performance Schema to expose per-connection truncation information in the connection attribute tables. This information can be examined without having to check the error log.

The default value of `performance_schema_session_connect_attrs_size` is autosized at server startup. This value may be small, so if truncation occurs (`Performance_schema_session_connect_attrs_lost` becomes nonzero), you may wish to set `performance_schema_session_connect_attrs_size` explicitly to a larger value.

Although the maximum permitted `performance_schema_session_connect_attrs_size` value is 1MB, the effective maximum is 64KB because the server imposes a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. For more information, see Section 26.12.9, “Performance Schema Connection Attribute Tables”.

• `performance_schema_setup_actors_size`

The number of rows in the `setup_actors` table.

• `performance_schema_setup_objects_size`
Performance Schema Status Variables

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
</tbody>
</table>

The number of rows in the `setup_objects` table.

- `performance_schema_users_size`

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--performance-schema-users-size=#</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>performance_schema_users_size</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><code>SET_VAR</code> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Default Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
<tr>
<td>Minimum Value</td>
<td>-1 (signifies autoscaling; do not assign this literal value)</td>
</tr>
<tr>
<td>Maximum Value</td>
<td>1048576</td>
</tr>
</tbody>
</table>

The number of rows in the `users` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `users` table or status variable information in the `status_by_user` table.

## 26.16 Performance Schema Status Variables

The Performance Schema implements several status variables that provide information about instrumentation that could not be loaded or created due to memory constraints:

```sql
mysql> SHOW STATUS LIKE 'perf%';
```

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Performance_schema_accounts_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_cond_classes_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_cond_instances_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_file_classes_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_file_handles_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_file_instances_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_hosts_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_locker_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_mutex_classes_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_mutex_instances_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_rwlock_classes_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_rwlock_instances_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_socket_classes_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_socket_instances_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_socket_classes_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_table_handles_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_table_instances_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_thread_classes_lost</td>
<td>0</td>
</tr>
<tr>
<td>Performance_schema_thread_instances_lost</td>
<td>0</td>
</tr>
</tbody>
</table>

For information on using these variables to check Performance Schema status, see Section 26.7, “Performance Schema Status Monitoring”.

4664
Performance Schema status variables have the following meanings:

- `Performance_schema_accounts_lost`
  The number of times a row could not be added to the `accounts` table because it was full.

- `Performance_schema_cond_classes_lost`
  How many condition instruments could not be loaded.

- `Performance_schema_cond_instances_lost`
  How many condition instrument instances could not be created.

- `Performance_schema_digest_lost`
  The number of digest instances that could not be instrumented in the `events_statements_summary_by_digest` table. This can be nonzero if the value of `performance_schema_digests_size` is too small.

- `Performance_schema_file_classes_lost`
  How many file instruments could not be loaded.

- `Performance_schema_file_handles_lost`
  How many file instrument instances could not be opened.

- `Performance_schema_file_instances_lost`
  How many file instrument instances could not be created.

- `Performance_schema_hosts_lost`
  The number of times a row could not be added to the `hosts` table because it was full.

- `Performance_schema_index_stat_lost`
  The number of indexes for which statistics were lost. This can be nonzero if the value of `performance_schema_max_index_stat` is too small.

- `Performance_schema_locker_lost`
  How many events are “lost” or not recorded, due to the following conditions:
  - Events are recursive (for example, waiting for A caused a wait on B, which caused a wait on C).
  - The depth of the nested events stack is greater than the limit imposed by the implementation.
  Events recorded by the Performance Schema are not recursive, so this variable should always be 0.

- `Performance_schema_memory_classes_lost`
  The number of times a memory instrument could not be loaded.

- `Performance_schema_metadata_lock_lost`
  The number of metadata locks that could not be instrumented in the `metadata_locks` table. This can be nonzero if the value of `performance_schema_max_metadata_locks` is too small.
• **Performance_schema_mutex_classes_lost**
  How many mutex instruments could not be loaded.

• **Performance_schema_mutex_instances_lost**
  How many mutex instrument instances could not be created.

• **Performance_schema_nested_statement_lost**
  The number of stored program statements for which statistics were lost. This can be nonzero if the value of `performance_schema_max_statement_stack` is too small.

• **Performance_schema_prepared_statements_lost**
  The number of prepared statements that could not be instrumented in the `prepared_statements_instances` table. This can be nonzero if the value of `performance_schema_max_prepared_statements_instances` is too small.

• **Performance_schema_program_lost**
  The number of stored programs for which statistics were lost. This can be nonzero if the value of `performance_schema_max_program_instances` is too small.

• **Performance_schema_rwlock_classes_lost**
  How many rwlock instruments could not be loaded.

• **Performance_schema_rwlock_instances_lost**
  How many rwlock instrument instances could not be created.

• **Performance_schema_session_connect_attrs_longest_seen**
  In addition to the connection attribute size-limit check performed by the Performance Schema against the value of the `performance_schema_session_connect_attrs_size` system variable, the server performs a preliminary check, imposing a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. Otherwise, the server considers the attribute buffer valid and tracks the size of the longest such buffer in the `Performance_schema_session_connect_attrs_longest_seen` status variable. If this value is larger than `performance_schema_session_connect_attrs_size`, DBAs may wish to increase the latter value, or, alternatively, investigate which clients are sending large amounts of attribute data.

  For more information about connection attributes, see Section 26.12.9, “Performance Schema Connection Attribute Tables”.

• **Performance_schema_session_connect_attrs_lost**
  The number of connections for which connection attribute truncation has occurred. For a given connection, if the client sends connection attribute key-value pairs for which the aggregate size is larger than the reserved storage permitted by the value of the `performance_schema_session_connect_attrs_size` system variable, the Performance Schema truncates the attribute data and increments
The Performance Schema Memory-Allocation Model

Performance_schema_session_connect_attrs_lost. If this value is nonzero, you may wish to set performance_schema_session_connect_attrs_size to a larger value.

For more information about connection attributes, see Section 26.12.9, “Performance Schema Connection Attribute Tables”.

• Performance_schema_socket_classes_lost
   How many socket instruments could not be loaded.

• Performance_schema_socket_instances_lost
   How many socket instrument instances could not be created.

• Performance_schema_stage_classes_lost
   How many stage instruments could not be loaded.

• Performance_schema_statement_classes_lost
   How many statement instruments could not be loaded.

• Performance_schema_table_handles_lost
   How many table instrument instances could not be opened. This can be nonzero if the value of performance_schema_max_table_handles is too small.

• Performance_schema_table_instances_lost
   How many table instrument instances could not be created.

• Performance_schema_table_lock_stat_lost
   The number of tables for which lock statistics were lost. This can be nonzero if the value of performance_schema_max_table_lock_stat is too small.

• Performance_schema_thread_classes_lost
   How many thread instruments could not be loaded.

• Performance_schema_thread_instances_lost
   The number of thread instances that could not be instrumented in the threads table. This can be nonzero if the value of performance_schema_max_thread_instances is too small.

• Performance_schema_users_lost
   The number of times a row could not be added to the users table because it was full.

26.17 The Performance Schema Memory-Allocation Model

The Performance Schema uses this memory allocation model:

• May allocate memory at server startup
• May allocate additional memory during server operation
• Never free memory during server operation (although it might be recycled)
• Free all memory used at shutdown

The result is to relax memory constraints so that the Performance Schema can be used with less configuration, and to decrease the memory footprint so that consumption scales with server load. Memory used depends on the load actually seen, not the load estimated or explicitly configured for.

Several Performance Schema sizing parameters are autoscaled and need not be configured explicitly unless you want to establish an explicit limit on memory allocation:

<table>
<thead>
<tr>
<th>Parameter</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

For an autoscaled parameter, configuration works like this:

• With the value set to -1 (the default), the parameter is autoscaled:
  • The corresponding internal buffer is empty initially and no memory is allocated.
  • As the Performance Schema collects data, memory is allocated in the corresponding buffer. The buffer size is unbounded, and may grow with the load.

• With the value set to 0:
  • The corresponding internal buffer is empty initially and no memory is allocated.

• With the value set to \(N > 0\):
  • The corresponding internal buffer is empty initially and no memory is allocated.
  • As the Performance Schema collects data, memory is allocated in the corresponding buffer, until the buffer size reaches \(N\).
  • Once the buffer size reaches \(N\), no more memory is allocated. Data collected by the Performance Schema for this buffer is lost, and any corresponding “lost instance” counters are incremented.

To see how much memory the Performance Schema is using, check the instruments designed for that purpose. The Performance Schema allocates memory internally and associates each buffer with a dedicated instrument so that memory consumption can be traced to individual buffers. Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for these internal buffers. The buffers are global to the server, so the instruments are displayed only in the `memory_summary_global_by_event_name` table, and not in other `memory_summary_by_xxx_by_event_name` tables.

This query shows the information associated with the memory instruments:

```sql
SELECT * FROM performance_schema.memory_summary_global_by_event_name
```
26.18 Performance Schema and Plugins

Removing a plugin with `UNINSTALL PLUGIN` does not affect information already collected for code in that plugin. Time spent executing the code while the plugin was loaded was still spent even if the plugin is unloaded later. The associated event information, including aggregate information, remains readable in `performance_schema` database tables. For additional information about the effect of plugin installation and removal, see Section 26.7, “Performance Schema Status Monitoring”.

A plugin implementor who instruments plugin code should document its instrumentation characteristics to enable those who load the plugin to account for its requirements. For example, a third-party storage engine should include in its documentation how much memory the engine needs for mutex and other instruments.

26.19 Using the Performance Schema to Diagnose Problems

The Performance Schema is a tool to help a DBA do performance tuning by taking real measurements instead of “wild guesses.” This section demonstrates some ways to use the Performance Schema for this purpose. The discussion here relies on the use of event filtering, which is described in Section 26.4.2, “Performance Schema Event Filtering”.

The following example provides one methodology that you can use to analyze a repeatable problem, such as investigating a performance bottleneck. To begin, you should have a repeatable use case where performance is deemed “too slow” and needs optimization, and you should enable all instrumentation (no pre-filtering at all).

1. Run the use case.

2. Using the Performance Schema tables, analyze the root cause of the performance problem. This analysis will rely heavily on post-filtering.

3. For problem areas that are ruled out, disable the corresponding instruments. For example, if analysis shows that the issue is not related to file I/O in a particular storage engine, disable the file I/O instruments for that engine. Then truncate the history and summary tables to remove previously collected events.

4. Repeat the process at step 1.

   At each iteration, the Performance Schema output, particularly the `events_waits_history_long` table, will contain less and less “noise” caused by nonsignificant instruments, and given that this table has a fixed size, will contain more and more data relevant to the analysis of the problem at hand.

   At each iteration, investigation should lead closer and closer to the root cause of the problem, as the “signal/noise” ratio will improve, making analysis easier.

5. Once a root cause of performance bottleneck is identified, take the appropriate corrective action, such as:
   - Tune the server parameters (cache sizes, memory, and so forth).
   - Tune a query by writing it differently,
   - Tune the database schema (tables, indexes, and so forth).
   - Tune the code (this applies to storage engine or server developers only).

6. Start again at step 1, to see the effects of the changes on performance.
The `mutex_instances.LOCKED_BY_THREAD_ID` and `rwlock_instances.WRITE_LOCKED_BY_THREAD_ID` columns are extremely important for investigating performance bottlenecks or deadlocks. This is made possible by Performance Schema instrumentation as follows:

1. Suppose that thread 1 is stuck waiting for a mutex.
2. You can determine what the thread is waiting for:

   ```sql
   SELECT * FROM performance_schema.events_waits_current
   WHERE THREAD_ID = thread_1;
   ```

   Say the query result identifies that the thread is waiting for mutex A, found in `events_waits_current.OBJECT_INSTANCE_BEGIN`.

3. You can determine which thread is holding mutex A:

   ```sql
   SELECT * FROM performance_schema.mutex_instances
   WHERE OBJECT_INSTANCE_BEGIN = mutex_A;
   ```

   Say the query result identifies that it is thread 2 holding mutex A, as found in `mutex_instances.LOCKED_BY_THREAD_ID`.

4. You can see what thread 2 is doing:

   ```sql
   SELECT * FROM performance_schema.events_waits_current
   WHERE THREAD_ID = thread_2;
   ```

### 26.19.1 Query Profiling Using Performance Schema

The following example demonstrates how to use Performance Schema statement events and stage events to retrieve data comparable to profiling information provided by `SHOW PROFILES` and `SHOW PROFILE` statements.

The `setup_actors` table can be used to limit the collection of historical events by host, user, or account to reduce runtime overhead and the amount of data collected in history tables. The first step of the example shows how to limit collection of historical events to a specific user.

Performance Schema displays event timer information in picoseconds (trillionths of a second) to normalize timing data to a standard unit. In the following example, `TIMER_WAIT` values are divided by 1000000000000 to show data in units of seconds. Values are also truncated to 6 decimal places to display data in the same format as `SHOW PROFILES` and `SHOW PROFILE` statements.

1. Limit the collection of historical events to the user that will run the query. By default, `setup_actors` is configured to allow monitoring and historical event collection for all foreground threads:

   ```sql
   mysql> SELECT * FROM performance_schema.setup_actors;
   +---------+---------+---------+--------+---------+
   | HOST    | USER    | ROLE    | ENABLED | HISTORY |
   +---------+---------+---------+--------+---------+
   | %       | %       | %       | YES    | YES     |
   +---------+---------+---------+--------+---------+
   ```

   Update the default row in the `setup_actors` table to disable historical event collection and monitoring for all foreground threads, and insert a new row that enables monitoring and historical event collection for the user that will run the query:

   ```sql
   mysql> UPDATE performance_schema.setup_actors
   SET ENABLED = 'NO', HISTORY = 'NO'
   ```
WHERE HOST = 'localhost' AND USER = 'test_user';

mysql> INSERT INTO performance_schema.setup_actors
    (HOST,USER,ROLE,ENABLED,HISTORY)
    VALUES('localhost','test_user','%',YES,YES);

Data in the setup_actors table should now appear similar to the following:

mysql> SELECT * FROM performance_schema.setup_actors;

+-----------+-----------+------+---------+---------+
| HOST      | USER      | ROLE | ENABLED | HISTORY |
+-----------+-----------+------+---------+---------+
| %         | %         | %    | NO      | NO      |
| localhost | test_user | %    | YES     | YES     |
+-----------+-----------+------+---------+---------+

2. Ensure that statement and stage instrumentation is enabled by updating the setup_instruments table. Some instruments may already be enabled by default.

mysql> UPDATE performance_schema.setup_instruments
    SET ENABLED = 'YES', TIMED = 'YES'
    WHERE NAME LIKE '%statement/%';

mysql> UPDATE performance_schema.setup_instruments
    SET ENABLED = 'YES', TIMED = 'YES'
    WHERE NAME LIKE '%stage/%';

3. Ensure that events_statements_* and events_stages_* consumers are enabled. Some consumers may already be enabled by default.

mysql> UPDATE performance_schema.setup_consumers
    SET ENABLED = 'YES'
    WHERE NAME LIKE '%events_statements_%';

mysql> UPDATE performance_schema.setup_consumers
    SET ENABLED = 'YES'
    WHERE NAME LIKE '%events_stages_%';

4. Under the user account you are monitoring, run the statement that you want to profile. For example:

mysql> SELECT * FROM employees.employees WHERE emp_no = 10001;

+--------+------------+------------+-----------+--------+------------+
<table>
<thead>
<tr>
<th>emp_no</th>
<th>birth_date</th>
<th>first_name</th>
<th>last_name</th>
<th>gender</th>
<th>hire_date</th>
</tr>
</thead>
<tbody>
<tr>
<td>10001</td>
<td>1953-09-02</td>
<td>Georgi</td>
<td>Facello</td>
<td>M</td>
<td>1986-06-26</td>
</tr>
</tbody>
</table>
+--------+------------+------------+-----------+--------+------------+

5. Identify the EVENT_ID of the statement by querying the events_statements_history_long table. This step is similar to running SHOW PROFILES to identify the Query_ID. The following query produces output similar to SHOW PROFILES:

mysql> SELECT EVENT_ID, TRUNCATE(TIMER_WAIT/1000000000000,6) as Duration, SQL_TEXT
    FROM performance_schema.events_statements_history_long WHERE SQL_TEXT like '%10001%';

+----------+----------+--------------------------------------------------------+
| event_id | duration | sql_text                                               |
|----------|----------|--------------------------------------------------------+
|       31 | 0.028310 | SELECT * FROM employees.employees WHERE emp_no = 10001 |
+----------+----------+--------------------------------------------------------+

6. Query the events_stages_history_long table to retrieve the statement's stage events. Stages are linked to statements using event nesting. Each stage event record has a NESTING_EVENT_ID column that contains the EVENT_ID of the parent statement.

mysql> SELECT event_name AS Stage, TRUNCATE(TIMER_WAIT/1000000000000,6) AS Duration
    FROM performance_schema.events_stages_history_long WHERE SQL_TEXT like '%10001%';
26.19.2 Obtaining Parent Event Information

The `data_locks` table shows data locks held and requested. Rows of this table have a `THREAD_ID` column indicating the thread ID of the session that owns the lock, and an `EVENT_ID` column indicating the Performance Schema event that caused the lock. Tuples of `(THREAD_ID, EVENT_ID)` values implicitly identify a parent event in other Performance Schema tables:

- The parent wait event in the `events_waits_XXX` tables
- The parent stage event in the `events_stages_XXX` tables
- The parent statement event in the `events_statements_XXX` tables
- The parent transaction event in the `events_transactions_current` table

To obtain details about the parent event, join the `THREAD_ID` and `EVENT_ID` columns with the columns of like name in the appropriate parent event table. The relation is based on a nested set data model, so the join has several clauses. Given parent and child tables represented by `parent` and `child`, respectively, the join looks like this:

```
WHERE
  parent.THREAD_ID = child.THREAD_ID  /* 1 */
  AND parent EVENT_ID < child EVENT_ID  /* 2 */
  AND (  
    child EVENT_ID <= parent.END EVENT_ID  /* 3a */
    OR parent.END EVENT_ID IS NULL  /* 3b */
  )
```

The conditions for the join are:

1. The parent and child events are in the same thread.
2. The child event begins after the parent event, so its `EVENT_ID` value is greater than that of the parent.
3. The parent event has either completed or is still running.

To find lock information, `data_locks` is the table containing child events.

The `data_locks` table shows only existing locks, so these considerations apply regarding which table contains the parent event:
• For transactions, the only choice is `events_transactions_current`. If a transaction is completed, it may be in the transaction history tables, but the locks are gone already.

• For statements, it all depends on whether the statement that took a lock is a statement in a transaction that has already completed (use `events_statements_history`) or the statement is still running (use `events_statements_current`).

• For stages, the logic is similar to that for statements; use `events_stages_history` or `events_stages_current`.

• For waits, the logic is similar to that for statements; use `events_waits_history` or `events_waits_current`. However, so many waits are recorded that the wait that caused a lock is most likely gone from the history tables already.

Wait, stage, and statement events disappear quickly from the history. If a statement that executed a long time ago took a lock but is in a still-open transaction, it might not be possible to find the statement, but it is possible to find the transaction.

This is why the nested set data model works better for locating parent events. Following links in a parent/child relationship (data lock -> parent wait -> parent stage -> parent transaction) does not work well when intermediate nodes are already gone from the history tables.

The following scenario illustrates how to find the parent transaction of a statement in which a lock was taken:

Session A:

```sql
[1] START TRANSACTION;
[2] SELECT * FROM t1 WHERE pk = 1;
[3] SELECT 'Hello, world';
```

Session B:

```sql
SELECT ...
FROM performance_schema.events_transactions_current AS parent
INNER JOIN performance_schema.data_locks AS child
WHERE
  parent.THREAD_ID = child.THREAD_ID
  AND parent.EVENT_ID < child.EVENT_ID
  AND (
    child.EVENT_ID <= parent.END_EVENT_ID
    OR parent.END_EVENT_ID IS NULL
  );
```

The query for session B should show statement [2] as owning a data lock on the record with `pk=1`.

If session A executes more statements, [2] fades out of the history table.

The query should show the transaction that started in [1], regardless of how many statements, stages, or waits were executed.

To see more data, you can also use the `events_xxx_history_long` tables, except for transactions, assuming no other query runs in the server (so that history is preserved).

### 26.20 Restrictions on Performance Schema

The Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.
If you save event information in another table, you should not assume that the original events will still be available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `setup_xxx` tables.

Tables in the `performance_schema` database cannot be indexed.

Tables in the `performance_schema` database are not replicated.

The types of timers might vary per platform. The `performance_timers` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

  27.4.5 sys Schema Stored Functions .......................................................................... 4746

MySQL 8.0 includes the sys schema, a set of objects that helps DBAs and developers interpret data collected by the Performance Schema. sys schema objects can be used for typical tuning and diagnosis use cases. Objects in this schema include:

• Views that summarize Performance Schema data into more easily understandable form.

• Stored procedures that perform operations such as Performance Schema configuration and generating diagnostic reports.

• Stored functions that query Performance Schema configuration and provide formatting services.

For new installations, the sys schema is installed by default during data directory initialization if you use mysql with the --initialize or --initialize-insecure option. If this is not desired, you can drop the sys schema manually after initialization if it is unneeded.

The MySQL upgrade procedure produces an error if a sys schema exists but has no version view, on the assumption that absence of this view indicates a user-created sys schema. To upgrade in this case, remove or rename the existing sys schema first.

sys schema objects have a DEFINER of 'mysql.sys'@'localhost'. Use of the dedicated mysql.sys account avoids problems that occur if a DBA renames or removes the root account.

27.1 Prerequisites for Using the sys Schema

Before using the sys schema, the prerequisites described in this section must be satisfied.

Because the sys schema provides an alternative means of accessing the Performance Schema, the Performance Schema must be enabled for the sys schema to work. See Section 26.3, “Performance Schema Startup Configuration”.

For full access to the sys schema, a user must have these privileges:

• SELECT on all sys tables and views

• EXECUTE on all sys stored procedures and functions

• INSERT and UPDATE for the sys_config table, if changes are to be made to it

• Additional privileges for certain sys schema stored procedures and functions, as noted in their descriptions (for example, the ps_setup_save() procedure)
It is also necessary to have privileges for the objects underlying the `sys` schema objects:

- **SELECT** on any Performance Schema tables accessed by `sys` schema objects, and **UPDATE** for any tables to be updated using `sys` schema objects
- **PROCESS** for the `INFORMATION_SCHEMA.INNODB_BUFFER_PAGE` table

Certain Performance Schema instruments and consumers must be enabled and (for instruments) timed to take full advantage of `sys` schema capabilities:

- All `wait` instruments
- All `stage` instruments
- All `statement` instruments
- `xxx_current` and `xxx_history_long` consumers for all events

You can use the `sys` schema itself to enable all of the additional instruments and consumers:

```plaintext
CALL sys.ps_setup_enable_instrument('wait');
CALL sys.ps_setup_enable_instrument('stage');
CALL sys.ps_setup_enable_instrument('statement');
CALL sys.ps_setup_enable_consumer('current');
CALL sys.ps_setup_enable_consumer('history_long');
```

**Note**

For many uses of the `sys` schema, the default Performance Schema is sufficient for data collection. Enabling all the instruments and consumers just mentioned has a performance impact, so it is preferable to enable only the additional configuration you need. Also, remember that if you enable additional configuration, you can easily restore the default configuration like this:

```plaintext
CALL sys.ps_setup_reset_to_default(TRUE);
```

### 27.2 Using the sys Schema

You can make the `sys` schema the default schema so that references to its objects need not be qualified with the schema name:

```plaintext
mysql> USE sys;
Database changed
mysql> SELECT * FROM version;
```

<table>
<thead>
<tr>
<th>sys_version</th>
<th>mysql_version</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.0.0</td>
<td>8.0.13-debug</td>
</tr>
</tbody>
</table>

(The `version` view shows the `sys` schema and MySQL server versions.)

To access `sys` schema objects while a different schema is the default (or simply to be explicit), qualify object references with the schema name:

```plaintext
mysql> SELECT * FROM sys.version;
```

<table>
<thead>
<tr>
<th>sys_version</th>
<th>mysql_version</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.0.0</td>
<td>8.0.13-debug</td>
</tr>
</tbody>
</table>
The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units):

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
+------------+-------+------------+
| host       | ios   | io_latency |
+------------+-------+------------+
| localhost  | 67570 | 5.38 s     |
| background |  3468 | 4.18 s     |
+------------+-------+------------+
```

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
+------------+-------+---------------+
| host       | ios   | io_latency    |
+------------+-------+---------------+
| localhost  | 67574 | 5380678125144 |
| background |  3474 | 4758696829416 |
+------------+-------+---------------+
```

The view without the `x$` prefix is intended to provide output that is more user friendly and easier for humans to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data. For additional information about the differences between non-`x$` and `x$` views, see Section 27.4.3, “sys Schema Views”.

To examine `sys` schema object definitions, use the appropriate `SHOW` statement or `INFORMATION_SCHEMA` query. For example, to examine the definitions of the `session` view and `format_bytes()` function, use these statements:

```
mysql> SHOW CREATE VIEW sys.session;
mysql> SHOW CREATE FUNCTION sys.format_bytes;
```

However, those statements display the definitions in relatively unformatted form. To view object definitions with more readable formatting, access the individual `.sql` files found under the `scripts/sys_schema` in MySQL source distributions. Prior to MySQL 8.0.18, the sources are maintained in a separate distribution available from the `sys` schema development website at https://github.com/mysql/mysql-sys.

Neither `mysqldump` nor `mysqlpump` dump the `sys` schema by default. To generate a dump file, name the `sys` schema explicitly on the command line using either of these commands:

```
mysqldump --databases --routines sys > sys_dump.sql
mysqlpump sys > sys_dump.sql
```

To reinstall the schema from the dump file, use this command:

```
mysql < sys_dump.sql
```

### 27.3 sys Schema Progress Reporting

The following `sys` schema views provide progress reporting for long-running transactions:

```
processlist
session
x$processlist
x$session
```

Assuming that the required instruments and consumers are enabled, the `progress` column of these views shows the percentage of work completed for stages that support progress reporting.
Stage progress reporting requires that the `events_stages_current` consumer be enabled, as well as the instruments for which progress information is desired. Instruments for these stages currently support progress reporting:

- stage/sql/Copying to tmp table
- stage/innodb/alter table (end)
- stage/innodb/alter table (flush)
- stage/innodb/alter table (insert)
- stage/innodb/alter table (log apply index)
- stage/innodb/alter table (log apply table)
- stage/innodb/alter table (merge sort)
- stage/innodb/alter table (read PK and internal sort)
- stage/innodb/buffer pool load

For stages that do not support estimated and completed work reporting, or if the required instruments or consumers are not enabled, the `progress` column is NULL.

### 27.4 sys Schema Object Reference

The `sys` schema includes tables and triggers, views, and stored procedures and functions. The following sections provide details for each of these objects.

#### 27.4.1 sys Schema Object Index

The following tables list `sys` schema objects and provide a short description of each one.

**Table 27.1 sys Schema Tables and Triggers**

<table>
<thead>
<tr>
<th>Table or Trigger Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sys_config</code></td>
<td>sys schema configuration options</td>
</tr>
<tr>
<td><code>sys_config_insert_set_user</code></td>
<td><code>sys_config</code> insert trigger</td>
</tr>
<tr>
<td><code>sys_config_update_set_user</code></td>
<td><code>sys_config</code> update trigger</td>
</tr>
</tbody>
</table>

**Table 27.2 sys Schema Views**

<table>
<thead>
<tr>
<th>View Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>host_summary, x$host_summary</code></td>
<td>Statement activity, file I/O, and connections, grouped by host</td>
</tr>
<tr>
<td><code>host_summary_by_file_io, x$host_summary_by_file_io</code></td>
<td>File I/O, grouped by host</td>
</tr>
<tr>
<td><code>host_summary_by_file_io_type, x$host_summary_by_file_io_type</code></td>
<td>File I/O, grouped by host and event type</td>
</tr>
<tr>
<td><code>host_summary_by_stages, x$host_summary_by_stages</code></td>
<td>Statement stages, grouped by host</td>
</tr>
<tr>

### sys Schema Tables and Triggers

The following sections describe *sys* schema tables and triggers.

#### 27.4.2.1 The *sys_config* Table

This table contains *sys* schema configuration options, one row per option. Configuration changes made by updating this table persist across client sessions and server restarts.

The *sys_config* table has these columns:

- **variable**
  - The configuration option name.
- **value**
  - The configuration option value.
- **set_time**
  - The configuration option value.

<tr>
<td><code>version_patch()</code></td>
<td>MySQL server patch release version number</td>
</tr>
</tbody>
</table>
The timestamp of the most recent modification to the row.

- **set_by**

  The account that made the most recent modification to the row. The value is **NULL** if the row has not been changed since the **sys** schema was installed.

As an efficiency measure to minimize the number of direct reads from the **sys_config** table, **sys** schema functions that use a value from this table check for a user-defined variable with a corresponding name, which is the user-defined variable having the same name plus a **@sys** prefix. (For example, the variable corresponding to the **diagnostics.include_raw** option is **@sys.diagnostics.include_raw**.) If the user-defined variable exists in the current session and is non-**NULL**, the function uses its value in preference to the value in the **sys_config** table. Otherwise, the function reads and uses the value from the table. In the latter case, the calling function conventionally also sets the corresponding user-defined variable to the table value so that further references to the configuration option within the same session use the variable and need not read the table again.

For example, the **statement_truncate_len** option controls the maximum length of statements returned by the **format_statement()** function. The default is 64. To temporarily change the value to 32 for your current session, set the corresponding **@sys.statement_truncate_len** user-defined variable:

```sql
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
+----------------------------------------------------------+
| sys.format_statement(@stmt)                              |
+----------------------------------------------------------+
| SELECT variable, value, set_time, set_by FROM sys_config |
+----------------------------------------------------------+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);
+-----------------------------------+
| sys.format_statement(@stmt)       |
+-----------------------------------+
| SELECT variable, value, set_time, set_by FROM sys_config |
|                                  |
+-----------------------------------+
mysql> SET @sys.statement_truncate_len = NULL;
mysql> SELECT sys.format_statement(@stmt);
+----------------------------------------------------------+
| sys.format_statement(@stmt)      |
|                                  |
| SELECT variable, value, set_time, set_by FROM sys_config |
|                                  |
+----------------------------------------------------------+
```

Subsequent invocations of **format_statement()** within the session continue to use the user-defined variable value (32), rather than the value stored in the table (64).

To stop using the user-defined variable and revert to using the value in the table, set the variable to **NULL** within your session:

```sql
mysql> SET @sys.statement_truncate_len = NULL;
mysql> SELECT sys.format_statement(@stmt);
+----------------------------------------------------------+
| sys.format_statement(@stmt)                              |
|                                  |
| SELECT variable, value, set_time, set_by FROM sys_config |
|                                  |
+----------------------------------------------------------+
```

Alternatively, end your current session (causing the user-defined variable to no longer exist) and begin a new session.

The conventional relationship just described between options in the **sys_config** table and user-defined variables can be exploited to make temporary configuration changes that end when your session ends. However, if you set a user-defined variable and then subsequently change the corresponding table value within the same session, the changed table value will not be used in that session as long as the user-defined variable exists with a non-**NULL** value. (The changed table value **will** be used in other sessions that do not have the user-defined variable assigned.)
The following list describes the options in the `sys_config` table and the corresponding user-defined variables:

- **diagnostics.allow_i_s_tables, @sys.diagnostics.allow_i_s_tables**

  If this option is ON, the `diagnostics()` procedure is permitted to perform table scans on the `INFORMATION_SCHEMA.TABLES` table. This can be expensive if there are many tables. The default is OFF.

- **diagnostics.include_raw, @sys.diagnostics.include_raw**

  If this option is ON, the `diagnostics()` procedure includes the raw output from querying the `metrics` view. The default is OFF.

- **ps_thread_trx_info.max_length, @sys.ps_thread_trx_info.max_length**

  The maximum length for JSON output produced by the `ps_thread_trx_info()` function. The default is 65535.

- **statement_performance_analyzer.limit, @sys.statement_performance_analyzer.limit**

  The maximum number of rows to return for views that have no built-in limit. (For example, the `statements_with_runtimes_in_95th_percentile` view has a built-in limit in the sense that it returns only statements with average execution time in the 95th percentile.) The default is 100.

- **statement_performance_analyzer.view, @sys.statement_performance_analyzer.view**

  The custom query or view to be used by the `statement_performance_analyzer()` procedure (which is itself invoked by the `diagnostics()` procedure). If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any LIMIT clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. The default is NULL (no custom view defined).

- **statement_truncate_len, @sys.statement_truncate_len**

  The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

Other options can be added to the `sys_config` table. For example, the `diagnostics()` and `execute_prepared_stmt()` procedures use the `debug` option if it exists, but this option is not part of the `sys_config` table by default because debug output normally is enabled only temporarily, by setting the corresponding `@sys.debug` user-defined variable. To enable debug output without having to set that variable in individual sessions, add the option to the table:

```sql
mysql> INSERT INTO sys.sys_config (variable, value) VALUES('debug', 'ON');
```

To change the debug setting in the table, do two things. First, modify the value in the table itself:

```sql
mysql> UPDATE sys.sys_config
       SET value = 'OFF'
       WHERE variable = 'debug';
```

Second, to also ensure that procedure invocations within the current session use the changed value from the table, set the corresponding user-defined variable to NULL:

```sql
mysql> SET @sys.debug = NULL;
```
27.4.2.2 The sys_config_insert_set_user Trigger

For rows added to the sys_config table by INSERT statements, the sys_config_insert_set_user trigger sets the set_by column to the current user.

27.4.2.3 The sys_config_update_set_user Trigger

The sys_config_update_set_user trigger for the sys_config table is similar to the sys_config_insert_set_user trigger, but for UPDATE statements.

27.4.3 sys Schema Views

The following sections describe sys schema views.

The sys schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a x$ prefix. For example, the host_summary_by_file_io view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units):

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
+------------+-------+------------+
| host       | ios   | io_latency |
| localhost  | 67570 | 5.38 s     |
| background |  3468 | 4.18 s     |
+------------+-------+------------+
```

The x$host_summary_by_file_io view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
+------------+-------+---------------+
| host       | ios   | io_latency    |
| localhost  | 67574 | 5380678125144 |
| background |  3474 | 4758696829416 |
+------------+-------+---------------+
```

The view without the x$ prefix is intended to provide output that is more user friendly and easier to read. The view with the x$ prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data.

Views without the x$ prefix differ from the corresponding x$ views in these ways:

- Byte counts are formatted with size units using `format_bytes()`.
- Time values are formatted with temporal units using `format_time()`.
- SQL statements are truncated to a maximum display width using `format_statement()`.
- Path names are shortened using `format_path()`.

27.4.3.1 The host_summary and x$host_summary Views

These views summarize statement activity, file I/O, and connections, grouped by host.

The host_summary and x$host_summary views have these columns:
• **host**
  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

• **statements**
  The total number of statements for the host.

• **statement_latency**
  The total wait time of timed statements for the host.

• **statement_avg_latency**
  The average wait time per timed statement for the host.

• **table_scans**
  The total number of table scans for the host.

• **file_ios**
  The total number of file I/O events for the host.

• **file_io_latency**
  The total wait time of timed file I/O events for the host.

• **current_connections**
  The current number of connections for the host.

• **total_connections**
  The total number of connections for the host.

• **unique_users**
  The number of distinct users for the host.

• **current_memory**
  The current amount of allocated memory for the host.

• **total_memory_allocated**
  The total amount of allocated memory for the host.

### 27.4.3.2 The `host_summary_by_file_io` and `x$host_summary_by_file_io` Views

These views summarize file I/O, grouped by host. By default, rows are sorted by descending total file I/O latency.

The `host_summary_by_file_io` and `x$host_summary_by_file_io` views have these columns:

• **host**
sys Schema Views

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **ios**
  The total number of file I/O events for the host.

- **io_latency**
  The total wait time of timed file I/O events for the host.

### 27.4.3.3 The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` Views

These views summarize file I/O, grouped by host and event type. By default, rows are sorted by host and descending total I/O latency.

The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` views have these columns:

- **host**
  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **event_name**
  The file I/O event name.

- **total**
  The total number of occurrences of the file I/O event for the host.

- **total_latency**
  The total wait time of timed occurrences of the file I/O event for the host.

- **max_latency**
  The maximum single wait time of timed occurrences of the file I/O event for the host.

### 27.4.3.4 The `host_summary_by_stages` and `x$host_summary_by_stages` Views

These views summarize statement stages, grouped by host. By default, rows are sorted by host and descending total latency.

The `host_summary_by_stages` and `x$host_summary_by_stages` views have these columns:

- **host**
  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **event_name**
The stage event name.

- **total**
  
The total number of occurrences of the stage event for the host.

- **total_latency**
  
The total wait time of timed occurrences of the stage event for the host.

- **avg_latency**
  
The average wait time per timed occurrence of the stage event for the host.

### 27.4.3.5 The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` Views

These views summarize overall statement statistics, grouped by host. By default, rows are sorted by descending total latency.

The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` views have these columns:

- **host**
  
The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **total**
  
The total number of statements for the host.

- **total_latency**
  
The total wait time of timed statements for the host.

- **max_latency**
  
The maximum single wait time of timed statements for the host.

- **lock_latency**
  
The total time waiting for locks by timed statements for the host.

- **rows_sent**
  
The total number of rows returned by statements for the host.

- **rows_examined**
  
The total number of rows read from storage engines by statements for the host.

- **rows_affected**
  
The total number of rows affected by statements for the host.

- **full_scans**
The total number of full table scans by statements for the host.

27.4.3.6 The host_summary_by_statement_type and x$host_summary_by_statement_type Views

These views summarize information about statements executed, grouped by host and statement type. By default, rows are sorted by host and descending total latency.

The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` views have these columns:

- **host**
  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **statement**
  The final component of the statement event name.

- **total**
  The total number of occurrences of the statement event for the host.

- **total_latency**
  The total wait time of timed occurrences of the statement event for the host.

- **max_latency**
  The maximum single wait time of timed occurrences of the statement event for the host.

- **lock_latency**
  The total time waiting for locks by timed occurrences of the statement event for the host.

- **rows_sent**
  The total number of rows returned by occurrences of the statement event for the host.

- **rows_examined**
  The total number of rows read from storage engines by occurrences of the statement event for the host.

- **rows_affected**
  The total number of rows affected by occurrences of the statement event for the host.

- **full_scans**
  The total number of full table scans by occurrences of the statement event for the host.

27.4.3.7 The innodb_buffer_stats_by_schema and x$innodb_buffer_stats_by_schema Views

These views summarize the information in the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table, grouped by schema. By default, rows are sorted by descending buffer size.
Warning
Querying views that access the INNODB_BUFFER_PAGE table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The innodb_buffer_stats_by_schema and x$innodb_buffer_stats_by_schema views have these columns:

- object_schema
  The schema name for the object, or InnoDB System if the table belongs to the InnoDB storage engine.

- allocated
  The total number of bytes allocated for the schema.

- data
  The total number of data bytes allocated for the schema.

- pages
  The total number of pages allocated for the schema.

- pages_hashed
  The total number of hashed pages allocated for the schema.

- pages_old
  The total number of old pages allocated for the schema.

- rows_cached
  The total number of cached rows for the schema.

27.4.3.8 The innodb_buffer_stats_by_table and x$innodb_buffer_stats_by_table Views
These views summarize the information in the INFORMATION_SCHEMA INNODB_BUFFER_PAGE table, grouped by schema and table. By default, rows are sorted by descending buffer size.

Warning
Querying views that access the INNODB_BUFFER_PAGE table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The innodb_buffer_stats_by_table and x$innodb_buffer_stats_by_table views have these columns:

- object_schema
  The schema name for the object, or InnoDB System if the table belongs to the InnoDB storage engine.
sys Schema Views

- **object_name**
  The table name.

- **allocated**
  The total number of bytes allocated for the table.

- **data**
  The number of data bytes allocated for the table.

- **pages**
  The total number of pages allocated for the table.

- **pages_hashed**
  The number of hashed pages allocated for the table.

- **pages_old**
  The number of old pages allocated for the table.

- **rows_cached**
  The number of cached rows for the table.

### 27.4.3.9 The `innodb_lock_waits` and `x$innodb_lock_waits` Views

These views summarize the InnoDB locks that transactions are waiting for. By default, rows are sorted by descending lock age.

The `innodb_lock_waits` and `x$innodb_lock_waits` views have these columns:

- **wait_started**
  The time at which the lock wait started.

- **wait_age**
  How long the lock has been waited for, as a `TIME` value.

- **wait_age_secs**
  How long the lock has been waited for, in seconds.

- **locked_table_schema**
  The schema that contains the locked table.

- **locked_table_name**
  The name of the locked table.

- **locked_table_partition**
  The name of the locked partition, if any; `NULL` otherwise.

- **locked_table_subpartition**
The name of the locked subpartition, if any; \texttt{NULL} otherwise.

- \texttt{locked_index}
  The name of the locked index.

- \texttt{locked_type}
  The type of the waiting lock.

- \texttt{waiting_trx_id}
  The ID of the waiting transaction.

- \texttt{waiting_trx_started}
  The time at which the waiting transaction started.

- \texttt{waiting_trx_age}
  How long the waiting transaction has been waiting, as a \texttt{TIME} value.

- \texttt{waiting_trx_rows_locked}
  The number of rows locked by the waiting transaction.

- \texttt{waiting_trx_rows_modified}
  The number of rows modified by the waiting transaction.

- \texttt{waiting_pid}
  The processlist ID of the waiting transaction.

- \texttt{waiting_query}
  The statement that is waiting for the lock.

- \texttt{waiting_lock_id}
  The ID of the waiting lock.

- \texttt{waiting_lock_mode}
  The mode of the waiting lock.

- \texttt{blocking_trx_id}
  The ID of the transaction that is blocking the waiting lock.

- \texttt{blocking_pid}
  The processlist ID of the blocking transaction.

- \texttt{blocking_query}
  The statement the blocking transaction is executing. This field reports NULL if the session that issued the blocking query becomes idle. For more information, see Identifying a Blocking Query After the Issuing Session Becomes Idle.
• **blocking_lock_id**  
The ID of the lock that is blocking the waiting lock.

• **blocking_lock_mode**  
The mode of the lock that is blocking the waiting lock.

• **blocking_trx_started**  
The time at which the blocking transaction started.

• **blocking_trx_age**  
How long the blocking transaction has been executing, as a `TIME` value.

• **blocking_trx_rows_locked**  
The number of rows locked by the blocking transaction.

• **blocking_trx_rows_modified**  
The number of rows modified by the blocking transaction.

• **sql_kill_blocking_query**  
The `KILL` statement to execute to kill the blocking statement.

• **sql_kill_blocking_connection**  
The `KILL` statement to execute to kill the session running the blocking statement.

### 27.4.3.10 The io_by_thread_by_latency and x$io_by_thread_by_latency Views

These views summarize I/O consumers to display time waiting for I/O, grouped by thread. By default, rows are sorted by descending total I/O latency.

The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` views have these columns:

• **user**  
For foreground threads, the account associated with the thread. For background threads, the thread name.

• **total**  
The total number of I/O events for the thread.

• **total_latency**  
The total wait time of timed I/O events for the thread.

• **min_latency**  
The minimum single wait time of timed I/O events for the thread.

• **avg_latency**  
The average wait time per timed I/O event for the thread.
sys Schema Views

- **max_latency**
The maximum single wait time of timed I/O events for the thread.

- **thread_id**
The thread ID.

- **processlist_id**
  For foreground threads, the processlist ID of the thread. For background threads, **NULL**.

### 27.4.3.11 The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O, grouped by file. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` views have these columns:

- **file**
The file path name.

- **count_read**
The total number of read events for the file.

- **total_read**
The total number of bytes read from the file.

- **avg_read**
The average number of bytes per read from the file.

- **count_write**
The total number of write events for the file.

- **total_written**
The total number of bytes written to the file.

- **avg_write**
The average number of bytes per write to the file.

- **total**
The total number of bytes read and written for the file.

- **write_pct**
The percentage of total bytes of I/O that were writes.

### 27.4.3.12 The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` Views

These views summarize global I/O consumers to display time waiting for I/O, grouped by file. By default, rows are sorted by descending total latency.
The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` views have these columns:

- **file**
  The file path name.
- **total**
  The total number of I/O events for the file.
- **total_latency**
  The total wait time of timed I/O events for the file.
- **count_read**
  The total number of read I/O events for the file.
- **read_latency**
  The total wait time of timed read I/O events for the file.
- **count_write**
  The total number of write I/O events for the file.
- **write_latency**
  The total wait time of timed write I/O events for the file.
- **count_misc**
  The total number of other I/O events for the file.
- **misc_latency**
  The total wait time of timed other I/O events for the file.

27.4.3.13 The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` views have these columns:

- **event_name**
  The I/O event name, with the `wait/io/file/` prefix stripped.
- **total**
  The total number of occurrences of the I/O event.
- **total_latency**
  The total wait time of timed occurrences of the I/O event.
• **min_latency**
The minimum single wait time of timed occurrences of the I/O event.

• **avg_latency**
The average wait time per timed occurrence of the I/O event.

• **max_latency**
The maximum single wait time of timed occurrences of the I/O event.

• **count_read**
The number of read requests for the I/O event.

• **total_read**
The number of bytes read for the I/O event.

• **avg_read**
The average number of bytes per read for the I/O event.

• **count_write**
The number of write requests for the I/O event.

• **total_written**
The number of bytes written for the I/O event.

• **avg_written**
The average number of bytes per write for the I/O event.

• **total_requested**
The total number of bytes read and written for the I/O event.

### 27.4.3.14 The io_global_by_wait_by_latency and x$io_global_by_wait_by_latency Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total latency.

The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` views have these columns:

• **event_name**
The I/O event name, with the `wait/io/file/` prefix stripped.

• **total**
The total number of occurrences of the I/O event.

• **total_latency**
The total wait time of timed occurrences of the I/O event.
• **avg latency**
The average wait time per timed occurrence of the I/O event.

• **max latency**
The maximum single wait time of timed occurrences of the I/O event.

• **read latency**
The total wait time of timed read occurrences of the I/O event.

• **write latency**
The total wait time of timed write occurrences of the I/O event.

• **misc latency**
The total wait time of timed other occurrences of the I/O event.

• **count read**
The number of read requests for the I/O event.

• **total read**
The number of bytes read for the I/O event.

• **avg read**
The average number of bytes per read for the I/O event.

• **count write**
The number of write requests for the I/O event.

• **total written**
The number of bytes written for the I/O event.

• **avg written**
The average number of bytes per write for the I/O event.

### 27.4.3.15 The latest_file_io and x$latest_file_io Views

These views summarize file I/O activity, grouped by file and thread. By default, rows are sorted with most recent I/O first.

The **latest_file_io** and **x$latest_file_io** views have these columns:

• **thread**
  For foreground threads, the account associated with the thread (and port number for TCP/IP connections). For background threads, the thread name and thread ID

• **file**
The file path name.
sys Schema Views

- **latency**
  The wait time of the file I/O event.

- **operation**
  The type of operation.

- **requested**
  The number of data bytes requested for the file I/O event.

27.4.3.16 The memory_by_host_by_current_bytes and x-memory_by_host_by_current_bytes Views

These views summarize memory use, grouped by host. By default, rows are sorted by descending amount of memory used.

The `memory_by_host_by_current_bytes` and `x-memory_by_host_by_current_bytes` views have these columns:

- **host**
  The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- **current_count_used**
  The current number of allocated memory blocks that have not been freed yet for the host.

- **current_allocated**
  The current number of allocated bytes that have not been freed yet for the host.

- **current_avg_alloc**
  The current number of allocated bytes per memory block for the host.

- **current_max_alloc**
  The largest single current memory allocation in bytes for the host.

- **total_allocated**
  The total memory allocation in bytes for the host.

27.4.3.17 The memory_by_thread_by_current_bytes and x-memory_by_thread_by_current_bytes Views

These views summarize memory use, grouped by thread. By default, rows are sorted by descending amount of memory used.

The `memory_by_thread_by_current_bytes` and `x-memory_by_thread_by_current_bytes` views have these columns:

- **thread_id**
The thread ID.

- **user**
  The thread user or thread name.

- **current_count_used**
  The current number of allocated memory blocks that have not been freed yet for the thread.

- **current_allocated**
  The current number of allocated bytes that have not been freed yet for the thread.

- **current_avg_alloc**
  The current number of allocated bytes per memory block for the thread.

- **current_max_alloc**
  The largest single current memory allocation in bytes for the thread.

- **total_allocated**
  The total memory allocation in bytes for the thread.

### 27.4.3.18 The memory_by_user_by_current_bytes and x$memory_by_user_by_current_bytes Views

These views summarize memory use, grouped by user. By default, rows are sorted by descending amount of memory used.

The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` views have these columns:

- **user**
  The client user name. Rows for which the `USER` column in the underlying Performance Schema table is NULL are assumed to be for background threads and are reported with a host name of `background`.

- **current_count_used**
  The current number of allocated memory blocks that have not been freed yet for the user.

- **current_allocated**
  The current number of allocated bytes that have not been freed yet for the user.

- **current_avg_alloc**
  The current number of allocated bytes per memory block for the user.

- **current_max_alloc**
  The largest single current memory allocation in bytes for the user.

- **total_allocated**
The total memory allocation in bytes for the user.

27.4.3.19 The memory_global_by_current_bytes and x$memory_global_by_current_bytes Views

These views summarize memory use, grouped by allocation type (that is, by event). By default, rows are sorted by descending amount of memory used.

The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` views have these columns:

- `event_name`
The memory event name.

- `current_count`
The total number of occurrences of the event.

- `current_alloc`
The current number of allocated bytes that have not been freed yet for the event.

- `current_avg_alloc`
The current number of allocated bytes per memory block for the event.

- `high_count`
The high-water mark for number of memory blocks allocated for the event.

- `high_alloc`
The high-water mark for number of bytes allocated for the event.

- `high_avg_alloc`
The high-water mark for average number of bytes per memory block allocated for the event.

27.4.3.20 The memory_global_total and x$memory_global_total Views

These views summarize total memory use within the server.

The `memory_global_total` and `x$memory_global_total` views have these columns:

- `total_allocated`
The total bytes of memory allocated within the server.

27.4.3.21 The metrics View

This view summarizes MySQL server metrics to show variable names, values, types, and whether they are enabled. By default, rows are sorted by variable type and name.

The `metrics` view includes this information:

- Global status variables from the Performance Schema `global_status` table
• **InnoDB metrics** from the `INFORMATION_SCHEMA.INNODB_METRICS` table
• Current and total memory allocation, based on the Performance Schema memory instrumentation
• The current time (human readable and Unix timestamp formats)

There is some duplication of information between the `global_status` and `INNODB_METRICS` tables, which the `metrics` view eliminates.

The `metrics` view has these columns:

- **Variable_name**
  The metric name. The metric type determines the source from which the name is taken:
  - For global status variables: The `VARIABLE_NAME` column of the `global_status` table
  - For InnoDB metrics: The `NAME` column of the `INNODB_METRICS` table
  - For other metrics: A view-provided descriptive string

- **Variable_value**
  The metric value. The metric type determines the source from which the value is taken:
  - For global status variables: The `VARIABLE_VALUE` column of the `global_status` table
  - For InnoDB metrics: The `COUNT` column of the `INNODB_METRICS` table
  - For memory metrics: The relevant column from the Performance Schema `memory_summary_global_by_event_name` table
  - For the current time: The value of `NOW(3)` or `UNIX_TIMESTAMP(NOW(3))`

- **Type**
  The metric type:
  - For global status variables: **Global Status**
  - For InnoDB metrics: **InnoDB Metrics - %**, where `%` is replaced by the value of the `SUBSYSTEM` column of the `INNODB_METRICS` table
  - For memory metrics: **Performance Schema**
  - For the current time: **System Time**

- **Enabled**
  Whether the metric is enabled:
  - For global status variables: **YES**
  - For InnoDB metrics: **YES** if the `STATUS` column of the `INNODB_METRICS` table is enabled, **NO** otherwise
  - For memory metrics: **NO, YES, or PARTIAL** (currently, **PARTIAL** occurs only for memory metrics and indicates that not all memory/`%` instruments are enabled; Performance Schema memory instruments are always enabled)
• For the current time: **YES**

### 27.4.3.22 The `processlist` and `$processlist` Views

These views summarize processlist information. They provide more complete information than the `SHOW PROCESSLIST` statement and the `INFORMATION_SCHEMA PROCESSLIST` table, and are also nonblocking. By default, rows are sorted by descending process time and descending wait time.

The column descriptions here are brief. For additional information, see the description of the Performance Schema `threads` table at Section 26.12.18.5, “The threads Table”.

The `processlist` and `$processlist` views have these columns:

- **thd_id**
  The thread ID.

- **conn_id**
  The connection ID.

- **user**
  The thread user or thread name.

- **db**
  The default database for the thread, or `NULL` if there is none.

- **command**
  For foreground threads, the type of command the thread is executing on behalf of the client, or `Sleep` if the session is idle.

- **state**
  An action, event, or state that indicates what the thread is doing.

- **time**
  The time in seconds that the thread has been in its current state.

- **current_statement**
  The statement the thread is executing, or `NULL` if it is not executing any statement.

- **statement_latency**
  How long the statement has been executing.

- **progress**
  The percentage of work completed for stages that support progress reporting. See Section 27.3, “sys Schema Progress Reporting”.

- **lock_latency**
  The time spent waiting for locks by the current statement.
• **rows_examined**
  The number of rows read from storage engines by the current statement.

• **rows_sent**
  The number of rows returned by the current statement.

• **rows_affected**
  The number of rows affected by the current statement.

• **tmp_tables**
  The number of internal in-memory temporary tables created by the current statement.

• **tmp_disk_tables**
  The number of internal on-disk temporary tables created by the current statement.

• **full_scan**
  The number of full table scans performed by the current statement.

• **last_statement**
  The last statement executed by the thread, if there is no currently executing statement or wait.

• **last_statement_latency**
  How long the last statement executed.

• **current_memory**
  The number of bytes allocated by the thread.

• **last_wait**
  The name of the most recent wait event for the thread.

• **last_wait_latency**
  The wait time of the most recent wait event for the thread.

• **source**
  The source file and line number containing the instrumented code that produced the event.

• **trx_latency**
  The wait time of the current transaction for the thread.

• **trx_state**
  The state for the current transaction for the thread.

• **trx_autocommit**
  Whether autocommit mode was enabled when the current transaction started.
sys Schema Views

- **pid**
  The client process ID.

- **program_name**
  The client program name.

### 27.4.3.23 The `ps_check_lost_instrumentation` View

This view returns information about lost Performance Schema instruments, to indicate whether the Performance Schema is unable to monitor all runtime data.

The `ps_check_lost_instrumentation` view has these columns:

- **variable_name**
  The Performance Schema status variable name indicating which type of instrument was lost.

- **variable_value**
  The number of instruments lost.

### 27.4.3.24 The `schema_auto_increment_columns` View

This view indicates which tables have `AUTO_INCREMENT` columns and provides information about those columns, such as the current and maximum column values and the usage ratio (ratio of used to possible values). By default, rows are sorted by descending usage ratio and maximum column value.

Tables in these schemas are excluded from view output: `mysql`, `sys`, `INFORMATION_SCHEMA`, `performance_schema`.

The `schema_auto_increment_columns` view has these columns:

- **table_schema**
  The schema that contains the table.

- **table_name**
  The table that contains the `AUTO_INCREMENT` column.

- **column_name**
  The name of the `AUTO_INCREMENT` column.

- **data_type**
  The data type of the column.

- **column_type**
  The column type of the column, which is the data type plus possibly other information. For example, for a column with a `bigint(20) unsigned` column type, the data type is just `bigint`.

- **is_signed**
  Whether the column type is signed.
sys Schema Views

- **is_unsigned**
  Whether the column type is unsigned.

- **max_value**
  The maximum permitted value for the column.

- **auto_increment**
  The current AUTO_INCREMENT value for the column.

- **auto_increment_ratio**
  The ratio of used to permitted values for the column. This indicates how much of the sequence of values is “used up.”

**27.4.3.25 The schema_index_statistics and x$schema_index_statistics Views**

These views provide index statistics. By default, rows are sorted by descending total index latency.

The **schema_index_statistics** and **x$schema_index_statistics** views have these columns:

- **table_schema**
  The schema that contains the table.

- **table_name**
  The table that contains the index.

- **index_name**
  The name of the index.

- **rows_selected**
  The total number of rows read using the index.

- **select_latency**
  The total wait time of timed reads using the index.

- **rows_inserted**
  The total number of rows inserted into the index.

- **insert_latency**
  The total wait time of timed inserts into the index.

- **rows_updated**
  The total number of rows updated in the index.

- **update_latency**
  The total wait time of timed updates in the index.

- **rows_deleted**
The total number of rows deleted from the index.

- **delete_latency**
  The total wait time of timed deletes from the index.

### 27.4.3.26 The schema_object_overview View

This view summarizes the types of objects within each schema. By default, rows are sorted by schema and object type.

*Note*

For MySQL instances with a large number of objects, this view might take a long time to execute.

The **schema_object_overview** view has these columns:

- **db**
  The schema name.

- **object_type**
  The object type: BASE TABLE, INDEX (index_type), EVENT, FUNCTION, PROCEDURE, TRIGGER, VIEW.

- **count**
  The number of objects in the schema of the given type.

### 27.4.3.27 The schema_redundant_indexes and x$schema_flattened_keys Views

The **schema_redundant_indexes** view displays indexes that duplicate other indexes or are made redundant by them. The **x$schema_flattened_keys** view is a helper view for **schema_redundant_indexes**.

In the following column descriptions, the dominant index is the one that makes the redundant index redundant.

The **schema_redundant_indexes** view has these columns:

- **table_schema**
  The schema that contains the table.

- **table_name**
  The table that contains the index.

- **redundant_index_name**
  The name of the redundant index.

- **redundant_index_columns**
  The names of the columns in the redundant index.
• **redundant_index_non_unique**
  The number of nonunique columns in the redundant index.

• **dominant_index_name**
  The name of the dominant index.

• **dominant_index_columns**
  The names of the columns in the dominant index.

• **dominant_index_non_unique**
  The number of nonunique columns in the dominant index.

• **subpart_exists**
  Whether the index indexes only part of a column.

• **sql_drop_index**
  The statement to execute to drop the redundant index.

The *x$schema_flattened_keys* view has these columns:

• **table_schema**
  The schema that contains the table.

• **table_name**
  The table that contains the index.

• **index_name**
  An index name.

• **non_unique**
  The number of nonunique columns in the index.

• **subpart_exists**
  Whether the index indexes only part of a column.

• **index_columns**
  The name of the columns in the index.

### 27.4.3.28 The schema_table_lock_waits and x$schema_table_lock_waits Views

These views display which sessions are blocked waiting on metadata locks, and what is blocking them.

The column descriptions here are brief. For additional information, see the description of the Performance Schema *metadata_locks* table at Section 26.12.12.3, “The metadata_locks Table”.

The *schema_table_lock_waits* and *x$schema_table_lock_waits* views have these columns:
• object_schema
  The schema containing the object to be locked.

• object_name
  The name of the instrumented object.

• waiting_thread_id
  The thread ID of the thread that is waiting for the lock.

• waiting_pid
  The processlist ID of the thread that is waiting for the lock.

• waiting_account
  The account associated with the session that is waiting for the lock.

• waiting_lock_type
  The type of the waiting lock.

• waiting_lock_duration
  How long the waiting lock has been waiting.

• waiting_query
  The statement that is waiting for the lock.

• waiting_query_secs
  How long the statement has been waiting, in seconds.

• waiting_query_rows_affected
  The number of rows affected by the statement.

• waiting_query_rows_examined
  The number of rows read from storage engines by the statement.

• blocking_thread_id
  The thread ID of the thread that is blocking the waiting lock.

• blocking_pid
  The processlist ID of the thread that is blocking the waiting lock.

• blocking_account
  The account associated with the thread that is blocking the waiting lock.

• blocking_lock_type
  The type of lock that is blocking the waiting lock.
• blocking_lock_duration
  How long the blocking lock has been held.
• sql_kill_blocking_query
  The KILL statement to execute to kill the blocking statement.
• sql_kill_blocking_connection
  The KILL statement to execute to kill the session running the blocking statement.

27.4.3.29 The schema_table_statistics and x$schema_table_statistics Views

These views summarize table statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views use a helper view, x$ps_schema_table_statistics_io.

The schema_table_statistics and x$schema_table_statistics views have these columns:

• table_schema
  The schema that contains the table.
• table_name
  The table name.
• total_latency
  The total wait time of timed I/O events for the table.
• rows_fetched
  The total number of rows read from the table.
• fetch_latency
  The total wait time of timed read I/O events for the table.
• rows_inserted
  The total number of rows inserted into the table.
• insert_latency
  The total wait time of timed insert I/O events for the table.
• rows_updated
  The total number of rows updated in the table.
• update_latency
  The total wait time of timed update I/O events for the table.
• rows_deleted
  The total number of rows deleted from the table.
The total number of rows deleted from the table.

- **delete_latency**
  The total wait time of timed delete I/O events for the table.

- **io_read_requests**
  The total number of read requests for the table.

- **io_read**
  The total number of bytes read from the table.

- **io_read_latency**
  The total wait time of reads from the table.

- **io_write_requests**
  The total number of write requests for the table.

- **io_write**
  The total number of bytes written to the table.

- **io_write_latency**
  The total wait time of writes to the table.

- **io_misc_requests**
  The total number of miscellaneous I/O requests for the table.

- **io_misc_latency**
  The total wait time of miscellaneous I/O requests for the table.

### 27.4.3.30 The schema_table_statistics_with_buffer and x$schema_table_statistics_with_buffer Views

These views summarize table statistics, including InnoDB buffer pool statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views user a helper view, x$ps_schema_table_statistics_io.

The schema_table_statistics_with_buffer and x$schema_table_statistics_with_buffer views have these columns:

- **table_schema**
  The schema that contains the table.

- **table_name**
  The table name.

- **rows_fetched**
sys Schema Views

The total number of rows read from the table.

- fetch_latency
  The total wait time of timed read I/O events for the table.

- rows_inserted
  The total number of rows inserted into the table.

- insert_latency
  The total wait time of timed insert I/O events for the table.

- rows_updated
  The total number of rows updated in the table.

- update_latency
  The total wait time of timed update I/O events for the table.

- rows_deleted
  The total number of rows deleted from the table.

- delete_latency
  The total wait time of timed delete I/O events for the table.

- io_read_requests
  The total number of read requests for the table.

- io_read
  The total number of bytes read from the table.

- io_read_latency
  The total wait time of reads from the table.

- io_write_requests
  The total number of write requests for the table.

- io_write
  The total number of bytes written to the table.

- io_write_latency
  The total wait time of writes to the table.

- io_misc_requests
  The total number of miscellaneous I/O requests for the table.

- io_misc_latency
The total wait time of miscellaneous I/O requests for the table.

- **innodb_buffer_allocated**
  The total number of InnoDB buffer bytes allocated for the table.

- **innodb_buffer_data**
  The total number of InnoDB data bytes allocated for the table.

- **innodb_buffer_free**
  The total number of InnoDB nondata bytes allocated for the table \((\text{innodb_buffer_allocated} - \text{innodb_buffer_data})\).

- **innodb_buffer_pages**
  The total number of InnoDB pages allocated for the table.

- **innodb_buffer_pages_hashed**
  The total number of InnoDB hashed pages allocated for the table.

- **innodb_buffer_pages_old**
  The total number of InnoDB old pages allocated for the table.

- **innodb_buffer_rows_cached**
  The total number of InnoDB cached rows for the table.

### 27.4.3.31 The `schema_tables_with_full_table_scans` and `$schema_tables_with_full_table_scans` Views

These views display which tables are being accessed with full table scans. By default, rows are sorted by descending rows scanned.

The `schema_tables_with_full_table_scans` and `$schema_tables_with_full_table_scans` views have these columns:

- **object_schema**
  The schema name.

- **object_name**
  The table name.

- **rows_full_scanned**
  The total number of rows scanned by full scans of the table.

- **latency**
  The total wait time of full scans of the table.

### 27.4.3.32 The `schema_UNUSED_indexes` View
These views display indexes for which there are no events, which indicates that they are not being used. By default, rows are sorted by schema and table.

This view is most useful when the server has been up and processing long enough that its workload is representative. Otherwise, presence of an index in this view may not be meaningful.

The `schema_unused_indexes` view has these columns:

- `object_schema`
  The schema name.
- `object_name`
  The table name.
- `index_name`
  The unused index name.

### 27.4.3.33 The session and x$session Views

These views are similar to `processlist` and `x$processlist`, but they filter out background processes to display only user sessions. For descriptions of the columns, see Section 27.4.3.22, “The processlist and x$processlist Views”.

### 27.4.3.34 The session_ssl_status View

For each connection, this view displays the SSL version, cipher, and count of reused SSL sessions.

The `session_ssl_status` view has these columns:

- `thread_id`
  The thread ID for the connection.
- `ssl_version`
  The version of SSL used for the connection.
- `ssl_cipher`
  The SSL cipher used for the connection.
- `ssl_sessions_reused`
  The number of reused SSL sessions for the connection.

### 27.4.3.35 The statement_analysis and x$statement_analysis Views

These views list normalized statements with aggregated statistics. The content mimics the MySQL Enterprise Monitor Query Analysis view. By default, rows are sorted by descending total latency.

The `statement_analysis` and `x$statement_analysis` views have these columns:

- `query`
The normalized statement string.

- **db**
  The default database for the statement, or **NULL** if there is none.

- **full_scan**
  The total number of full table scans performed by occurrences of the statement.

- **exec_count**
  The total number of times the statement has executed.

- **err_count**
  The total number of errors produced by occurrences of the statement.

- **warn_count**
  The total number of warnings produced by occurrences of the statement.

- **total_latency**
  The total wait time of timed occurrences of the statement.

- **max_latency**
  The maximum single wait time of timed occurrences of the statement.

- **avg_latency**
  The average wait time per timed occurrence of the statement.

- **lock_latency**
  The total time waiting for locks by timed occurrences of the statement.

- **rows_sent**
  The total number of rows returned by occurrences of the statement.

- **rows_sent_avg**
  The average number of rows returned per occurrence of the statement.

- **rows_examined**
  The total number of rows read from storage engines by occurrences of the statement.

- **rows_examined_avg**
  The average number of rows read from storage engines per occurrence of the statement.

- **rows_affected**
  The total number of rows affected by occurrences of the statement.

- **rows_affected_avg**
sys Schema Views

The average number of rows affected per occurrence of the statement.

- **tmp_tables**
  The total number of internal in-memory temporary tables created by occurrences of the statement.

- **tmp_disk_tables**
  The total number of internal on-disk temporary tables created by occurrences of the statement.

- **rows_sorted**
  The total number of rows sorted by occurrences of the statement.

- **sort_merge_passes**
  The total number of sort merge passes by occurrences of the statement.

- **digest**
  The statement digest.

- **first_seen**
  The time at which the statement was first seen.

- **last_seen**
  The time at which the statement was most recently seen.

27.4.3.36 The statements_with_errors_or_warnings and x$statements_with_errors_or_warnings Views

These views display normalized statements that have produced errors or warnings. By default, rows are sorted by descending error and warning counts.

The `statements_with_errors_or_warnings` and `x$statements_with_errors_or_warnings` views have these columns:

- **query**
  The normalized statement string.

- **db**
  The default database for the statement, or `NULL` if there is none.

- **exec_count**
  The total number of times the statement has executed.

- **errors**
  The total number of errors produced by occurrences of the statement.

- **error_pct**
  The percentage of statement occurrences that produced errors.
- **warnings**
  The total number of warnings produced by occurrences of the statement.

- **warning_pct**
  The percentage of statement occurrences that produced warnings.

- **first_seen**
  The time at which the statement was first seen.

- **last_seen**
  The time at which the statement was most recently seen.

- **digest**
  The statement digest.

### 27.4.3.37 The statements_with_full_table_scans and $x$statements_with_full_table_scans Views

These views display normalized statements that have done full table scans. By default, rows are sorted by descending percentage of time a full scan was done and descending total latency.

The `statements_with_full_table_scans` and `x$statements_with_full_table_scans` views have these columns:

- **query**
  The normalized statement string.

- **db**
  The default database for the statement, or **NULL** if there is none.

- **exec_count**
  The total number of times the statement has executed.

- **total_latency**
  The total wait time of timed statement events for the statement.

- **no_index_used_count**
  The total number of times no index was used to scan the table.

- **no_good_index_used_count**
  The total number of times no good index was used to scan the table.

- **no_index_used_pct**
  The percentage of the time no index was used to scan the table.

- **rows_sent**
The total number of rows returned from the table.

- **rows_examined**
The total number of rows read from the storage engine for the table.

- **rows_sent_avg**
The average number of rows returned from the table.

- **rows_examined_avg**
The average number of rows read from the storage engine for the table.

- **first_seen**
The time at which the statement was first seen.

- **last_seen**
The time at which the statement was most recently seen.

- **digest**
The statement digest.

**27.4.3.38 The statements_with_runtimes_in_95th_percentile and $x$ statements_with_runtimes_in_95th_percentile Views**

These views list statements with runtimes in the 95th percentile. By default, rows are sorted by descending average latency.

Both views use two helper views, $x$ps_digest_avg_latency_distribution and $x$ps_digest_95th_percentile_by_avg_us.

The statements_with_runtimes_in_95th_percentile and $x$ statements_with_runtimes_in_95th_percentile Views have these columns:

- **query**
The normalized statement string.

- **db**
The default database for the statement, or **NULL** if there is none.

- **full_scan**
The total number of full table scans performed by occurrences of the statement.

- **exec_count**
The total number of times the statement has executed.

- **err_count**
The total number of errors produced by occurrences of the statement.
• **warn_count**
  The total number of warnings produced by occurrences of the statement.

• **total_latency**
  The total wait time of timed occurrences of the statement.

• **max_latency**
  The maximum single wait time of timed occurrences of the statement.

• **avg_latency**
  The average wait time per timed occurrence of the statement.

• **rows_sent**
  The total number of rows returned by occurrences of the statement.

• **rows_sent_avg**
  The average number of rows returned per occurrence of the statement.

• **rows_examined**
  The total number of rows read from storage engines by occurrences of the statement.

• **rows_examined_avg**
  The average number of rows read from storage engines per occurrence of the statement.

• **first_seen**
  The time at which the statement was first seen.

• **last_seen**
  The time at which the statement was most recently seen.

• **digest**
  The statement digest.

### 27.4.3.39 The statements_with_sorting and x$statements_with_sorting Views

These views list normalized statements that have performed sorts. By default, rows are sorted by descending total latency.

The `statements_with_sorting` and `x$statements_with_sorting` views have these columns:

• **query**
  The normalized statement string.

• **db**
  The default database for the statement, or `NULL` if there is none.

• **exec_count**
The total number of times the statement has executed.

- **total_latency**
  The total wait time of timed occurrences of the statement.

- **sort_merge_passes**
  The total number of sort merge passes by occurrences of the statement.

- **avg_sort_merges**
  The average number of sort merge passes per occurrence of the statement.

- **sorts_using_scans**
  The total number of sorts using table scans by occurrences of the statement.

- **sort_using_range**
  The total number of sorts using range accesses by occurrences of the statement.

- **rows_sorted**
  The total number of rows sorted by occurrences of the statement.

- **avg_rows_sorted**
  The average number of rows sorted per occurrence of the statement.

- **first_seen**
  The time at which the statement was first seen.

- **last_seen**
  The time at which the statement was most recently seen.

- **digest**
  The statement digest.

### 27.4.3.40 The statements_with_temp_tables and x$statements_with_temp_tables Views

These views list normalized statements that have used temporary tables. By default, rows are sorted by descending number of on-disk temporary tables used and descending number of in-memory temporary tables used.

The `statements_with_temp_tables` and `x$statements_with_temp_tables` views have these columns:

- **query**
  The normalized statement string.

- **db**
  The default database for the statement, or **NULL** if there is none.
• **exec_count**
  The total number of times the statement has executed.

• **total_latency**
  The total wait time of timed occurrences of the statement.

• **memory_tmp_tables**
  The total number of internal in-memory temporary tables created by occurrences of the statement.

• **disk_tmp_tables**
  The total number of internal on-disk temporary tables created by occurrences of the statement.

• **avg_tmp_tables_per_query**
  The average number of internal temporary tables created per occurrence of the statement.

• **tmp_tables_to_disk_pct**
  The percentage of internal in-memory temporary tables that were converted to on-disk tables.

• **first_seen**
  The time at which the statement was first seen.

• **last_seen**
  The time at which the statement was most recently seen.

• **digest**
  The statement digest.

### 27.4.3.41 The user_summary and x$user_summary Views

These views summarize statement activity, file I/O, and connections, grouped by user. By default, rows are sorted by descending total latency.

The *user_summary* and *x$user_summary* views have these columns:

• **user**
  The client user name. Rows for which the USER column in the underlying Performance Schema table is NULL are assumed to be for background threads and are reported with a host name of background.

• **statements**
  The total number of statements for the user.

• **statement_latency**
  The total wait time of timed statements for the user.

• **statement_avg_latency**
  The average wait time per timed statement for the user.
sys Schema Views

- **table_scans**
  The total number of table scans for the user.

- **file_ios**
  The total number of file I/O events for the user.

- **file_io_latency**
  The total wait time of timed file I/O events for the user.

- **current_connections**
  The current number of connections for the user.

- **total_connections**
  The total number of connections for the user.

- **unique_hosts**
  The number of distinct hosts from which connections for the user have originated.

- **current_memory**
  The current amount of allocated memory for the user.

- **total_memory_allocated**
  The total amount of allocated memory for the user.

### 27.4.3.42 The user_summary_by_file_io and $user_summary_by_file_io Views

These views summarize file I/O, grouped by user. By default, rows are sorted by descending total file I/O latency.

The **user_summary_by_file_io** and $user_summary_by_file_io views have these columns:

- **user**
  The client user name. Rows for which the USER column in the underlying Performance Schema table is NULL are assumed to be for background threads and are reported with a host name of background.

- **ios**
  The total number of file I/O events for the user.

- **io_latency**
  The total wait time of timed file I/O events for the user.

### 27.4.3.43 The user_summary_by_file_io_type and $user_summary_by_file_io_type Views

These views summarize file I/O, grouped by user and event type. By default, rows are sorted by user and descending total latency.

The **user_summary_by_file_io_type** and $user_summary_by_file_io_type views have these columns:
• **user**
  The client user name. Rows for which the USER column in the underlying Performance Schema table is NULL are assumed to be for background threads and are reported with a host name of background.

• **event_name**
  The file I/O event name.

• **total**
  The total number of occurrences of the file I/O event for the user.

• **latency**
  The total wait time of timed occurrences of the file I/O event for the user.

• **max_latency**
  The maximum single wait time of timed occurrences of the file I/O event for the user.

27.4.3.44 The **user_summary_by_stages** and **x$user_summary_by_stages** Views

These views summarize stages, grouped by user. By default, rows are sorted by user and descending total stage latency.

The **user_summary_by_stages** and **x$user_summary_by_stages** views have these columns:

• **user**
  The client user name. Rows for which the USER column in the underlying Performance Schema table is NULL are assumed to be for background threads and are reported with a host name of background.

• **event_name**
  The stage event name.

• **total**
  The total number of occurrences of the stage event for the user.

• **total_latency**
  The total wait time of timed occurrences of the stage event for the user.

• **avg_latency**
  The average wait time per timed occurrence of the stage event for the user.

27.4.3.45 The **user_summary_by_statement_latency** and **x$user_summary_by_statement_latency** Views

These views summarize overall statement statistics, grouped by user. By default, rows are sorted by descending total latency.

The **user_summary_by_statement_latency** and **x$user_summary_by_statement_latency** views have these columns:

• **user**
sys Schema Views

The client user name. Rows for which the USER column in the underlying Performance Schema table is NULL are assumed to be for background threads and are reported with a host name of background.

- total
  The total number of statements for the user.
- total_latency
  The total wait time of timed statements for the user.
- max_latency
  The maximum single wait time of timed statements for the user.
- lock_latency
  The total time waiting for locks by timed statements for the user.
- rows_sent
  The total number of rows returned by statements for the user.
- rows_exامined
  The total number of rows read from storage engines by statements for the user.
- rows_affected
  The total number of rows affected by statements for the user.
- full_scans
  The total number of full table scans by statements for the user.

27.4.3.46 The user_summary_by_statement_type and x$user_summary_by_statement_type Views

These views summarize information about statements executed, grouped by user and statement type. By default, rows are sorted by user and descending total latency.

The user_summary_by_statement_type and x$user_summary_by_statement_type views have these columns:

- user
  The client user name. Rows for which the USER column in the underlying Performance Schema table is NULL are assumed to be for background threads and are reported with a host name of background.
- statement
  The final component of the statement event name.
- total
  The total number of occurrences of the statement event for the user.
- total_latency
  The total wait time of timed statements for the user.
The total wait time of timed occurrences of the statement event for the user.

- **max_latency**
  The maximum single wait time of timed occurrences of the statement event for the user.

- **lock_latency**
  The total time waiting for locks by timed occurrences of the statement event for the user.

- **rows_sent**
  The total number of rows returned by occurrences of the statement event for the user.

- **rows_examined**
  The total number of rows read from storage engines by occurrences of the statement event for the user.

- **rows_affected**
  The total number of rows affected by occurrences of the statement event for the user.

- **full_scans**
  The total number of full table scans by occurrences of the statement event for the user.

### 27.4.3.47 The version View

This view provides the current `sys` schema and MySQL server versions.

**Note**

As of MySQL 8.0.18, this view is deprecated and will be removed in a future MySQL version. Affected applications should be adjusted to use an alternative instead. For example, use the `VERSION()` function to retrieve the MySQL server version.

The **version** view has these columns:

- **sys_version**
  The `sys` schema version.

- **mysql_version**
  The MySQL server version.

### 27.4.3.48 The wait_classes_global_by_avg_latency and x$wait_classes_global_by_avg_latency Views

These views summarize wait class average latencies, grouped by event class. By default, rows are sorted by descending average latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The **wait_classes_global_by_avg_latency** and **x$wait_classes_global_by_avg_latency** views have these columns:
sys Schema Views

- **event_class**
  The event class.

- **total**
  The total number of occurrences of events in the class.

- **total_latency**
  The total wait time of timed occurrences of events in the class.

- **min_latency**
  The minimum single wait time of timed occurrences of events in the class.

- **avg_latency**
  The average wait time per timed occurrence of events in the class.

- **max_latency**
  The maximum single wait time of timed occurrences of events in the class.

### 27.4.3.49 The wait_classes_global_by_latency and x$wait_classes_global_by_latency Views

These views summarize wait class total latencies, grouped by event class. By default, rows are sorted by descending total latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` views have these columns:

- **event_class**
  The event class.

- **total**
  The total number of occurrences of events in the class.

- **total_latency**
  The total wait time of timed occurrences of events in the class.

- **min_latency**
  The minimum single wait time of timed occurrences of events in the class.

- **avg_latency**
  The average wait time per timed occurrence of events in the class.

- **max_latency**
  The maximum single wait time of timed occurrences of events in the class.
27.4.3.50 The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` Views

These views summarize wait events, grouped by host and event. By default, rows are sorted by host and descending total latency. Idle events are ignored.

The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` views have these columns:

- **host**
  The host from which the connection originated.

- **event**
  The event name.

- **total**
  The total number of occurrences of the event for the host.

- **total_latency**
  The total wait time of timed occurrences of the event for the host.

- **avg_latency**
  The average wait time per timed occurrence of the event for the host.

- **max_latency**
  The maximum single wait time of timed occurrences of the event for the host.

27.4.3.51 The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` Views

These views summarize wait events, grouped by user and event. By default, rows are sorted by user and descending total latency. Idle events are ignored.

The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` views have these columns:

- **user**
  The user associated with the connection.

- **event**
  The event name.

- **total**
  The total number of occurrences of the event for the user.

- **total_latency**
  The total wait time of timed occurrences of the event for the user.

- **avg_latency**
  The average wait time per timed occurrence of the event for the user.

- **max_latency**
  The maximum single wait time of timed occurrences of the event for the user.
The maximum single wait time of timed occurrences of the event for the user.

### 27.4.3.52 The waits_global_by_latency and x$waits_global_by_latency Views

These views summarize wait events, grouped by event. By default, rows are sorted by descending total latency. Idle events are ignored.

The `waits_global_by_latency` and `x$waits_global_by_latency` views have these columns:

- **events**
  
  The event name.

- **total**
  
  The total number of occurrences of the event.

- **total_latency**
  
  The total wait time of timed occurrences of the event.

- **avg_latency**
  
  The average wait time per timed occurrence of the event.

- **max_latency**
  
  The maximum single wait time of timed occurrences of the event.

### 27.4.4 sys Schema Stored Procedures

The following sections describe `sys` schema stored procedures.

#### 27.4.4.1 The create_synonym_db() Procedure

Given a schema name, this procedure creates a synonym schema containing views that refer to all the tables and views in the original schema. This can be used, for example, to create a shorter name by which to refer to a schema with a long name (such as `info` rather than `INFORMATION_SCHEMA`).

**Parameters**

- **in_db_name VARCHAR(64)**: The name of the schema for which to create the synonym.

- **in_synonym VARCHAR(64)**: The name to use for the synonym schema. This schema must not already exist.

**Example**

```
mysql> SHOW DATABASES;
+-----------------+
| Database        |
+-----------------+
| information_schema |
| mysql           |
| performance_schema |
| sys             |
| world           |
```
### 27.4.4.2 The diagnostics() Procedure

Creates a report of the current server status for diagnostic purposes.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

Data collected for `diagnostics()` includes this information:

- Information from the `metrics` view (see Section 27.4.3.21, “The metrics View”)
- Information from other relevant `sys` schema views, such as the one that determines queries in the 95th percentile
- Information from the `ndbinfo` schema, if the MySQL server is part of NDB Cluster
- Replication status (both master and slave)

Some of the `sys` schema views are calculated as initial (optional), overall, and delta values:

- The initial view is the content of the view at the start of the `diagnostics()` procedure. This output is the same as the start values used for the delta view. The initial view is included if the `diagnostics.include_raw` configuration option is ON.
- The overall view is the content of the view at the end of the `diagnostics()` procedure. This output is the same as the end values used for the delta view. The overall view is always included.
- The delta view is the difference from the beginning to the end of procedure execution. The minimum and maximum values are the minimum and maximum values from the end view, respectively. They do not necessarily reflect the minimum and maximum values in the monitored period. Except for the `metrics` view, the delta is calculated only between the first and last outputs.
Parameters

- **in_max_runtime INT UNSIGNED**: The maximum data collection time in seconds. Use NULL to collect data for the default of 60 seconds. Otherwise, use a value greater than 0.

- **in_interval INT UNSIGNED**: The sleep time between data collections in seconds. Use NULL to sleep for the default of 30 seconds. Otherwise, use a value greater than 0.

- **in_auto_config ENUM('current', 'medium', 'full')**: The Performance Schema configuration to use. Permitted values are:
  - **current**: Use the current instrument and consumer settings.
  - **medium**: Enable some instruments and consumers.
  - **full**: Enable all instruments and consumers.

> **Note**

The more instruments and consumers enabled, the more impact on MySQL server performance. Be careful with the **medium** setting and especially the **full** setting, which has a large performance impact.

Use of the **medium** or **full** setting requires the **SUPER** privilege.

If a setting other than **current** is chosen, the current settings are restored at the end of the procedure.

Configuration Options

The **diagnostics()** operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 27.4.2.1, “The sys_config Table”):

- **debug, @sys.debug**

  If this option is ON, produce debugging output. The default is OFF.

- **diagnostics.allow_i_s_tables, @sys.diagnostics.allow_i_s_tables**

  If this option is ON, the **diagnostics()** procedure is permitted to perform table scans on the INFORMATION_SCHEMA.TABLES table. This can be expensive if there are many tables. The default is OFF.

- **diagnostics.include_raw, @sys.diagnostics.include_raw**

  If this option is ON, the **diagnostics()** procedure output includes the raw output from querying the **metrics** view. The default is OFF.

- **statement_truncate_len, @sys.statement_truncate_len**

  The maximum length of statements returned by the **format_statement()** function. Longer statements are truncated to this length. The default is 64.

Example

Create a diagnostics report that starts an iteration every 30 seconds and runs for at most 120 seconds using the current Performance Schema settings:

```sql
mysql> CALL sys.diagnostics(120, 30, 'current');
```
To capture the output from the `diagnostics()` procedure in a file as it runs, use the `mysql` client `tee` and `notee` commands (see Section 4.5.1.2, "mysql Client Commands"):

```sql
mysql> tee diag.out;
mysql> CALL sys.diagnostics(120, 30, 'current');
mysql> notee;
```

### 27.4.4.3 The `execute_prepared_stmt()` Procedure

Given an SQL statement as a string, executes it as a prepared statement. The prepared statement is deallocated after execution, so it is not subject to reuse. Thus, this procedure is useful primarily for executing dynamic statements on a one-time basis.

This procedure uses `sys_execute_prepared_stmt` as the prepared statement name. If that statement name exists when the procedure is called, its previous content is destroyed.

**Parameters**

- `in_query` `LONGTEXT CHARACTER SET utf8`: The statement string to execute.

**Configuration Options**

`execute_prepared_stmt()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 27.4.2.1, "The `sys_config` Table"):

- `debug`, `@sys.debug`

  If this option is `ON`, produce debugging output. The default is `OFF`.

**Example**

```sql
mysql> CALL sys.execute_prepared_stmt('SELECT COUNT(*) FROM mysql.user');
+----------+
<table>
<thead>
<tr>
<th>COUNT(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
</tr>
</tbody>
</table>
+----------+
```

### 27.4.4.4 The `ps_setup_disable_background_threads()` Procedure

Disables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were disabled. Already disabled threads do not count.

**Parameters**

None.

**Example**

```sql
mysql> CALL sys.ps_setup_disable_background_threads();
```

### 27.4.4.5 The `ps_setup_disable_consumer()` Procedure

Disables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were disabled. Already disabled consumers do not count.

**Parameters**

None.

**Example**

```sql
mysql> CALL sys.ps_setup_disable_consumer();
```

4730
Parameters

- **consumer VARCHAR(128)**: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a LIKE pattern match.

  A value of '' matches all consumers.

Example

Disable all statement consumers:

```sql
mysql> CALL sys.ps_setup_disable_consumer('statement');
+----------------------+
| summary              |
+----------------------+
| Disabled 4 consumers |
+----------------------+
```

27.4.4.6 The ps_setup_disable_instrument() Procedure

Disables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were disabled. Already disabled instruments do not count.

Parameters

- **in_pattern VARCHAR(128)**: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a LIKE pattern match.

  A value of '' matches all instruments.

Example

Disable a specific instrument:

```sql
mysql> CALL sys.ps_setup_disable_instrument('wait/lock/metadata/sql/mdl');
+-----------------------+
| summary               |
+-----------------------+
| Disabled 1 instrument |
+-----------------------+
```

Disable all mutex instruments:

```sql
mysql> CALL sys.ps_setup_disable_instrument('mutex');
+--------------------------+
| summary                  |
+--------------------------+
| Disabled 177 instruments |
+--------------------------+
```

27.4.4.7 The ps_setup_disable_thread() Procedure

Given a connection ID, disables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were disabled. Already disabled threads do not count.

Parameters

- **in_connection_id BIGINT**: The connection ID. This is a value of the type given in the PROCESSLIST_ID column of the Performance Schema threads table or the Id column of SHOW PROCESSLIST output.
Example

Disable a specific connection by its connection ID:

```sql
mysql> CALL sys.ps_setup_disable_thread(225);
+-------------------+
| summary           |
+-------------------+
| Disabled 1 thread |
+-------------------+
```

Disable the current connection:

```sql
mysql> CALL sys.ps_setup_disable_thread(CONNECTION_ID());
+-------------------+
| summary           |
+-------------------+
| Disabled 1 thread |
+-------------------+
```

27.4.4.8 The `ps_setup_enable_background_threads()` Procedure

Enables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were enabled. Already enabled threads do not count.

Parameters

None.

Example

```sql
mysql> CALL sys.ps_setup_enable_background_threads();
+-------------------------------+
| summary                       |
+-------------------------------+
| Enabled 24 background threads |
+-------------------------------+
```

27.4.4.9 The `ps_setup_enable_consumer()` Procedure

Enables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were enabled. Already enabled consumers do not count.

Parameters

- `consumer VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

  A value of `' ' matches all consumers.

Example

Enable all statement consumers:

```sql
mysql> CALL sys.ps_setup_enable_consumer('statement');
+---------------------+
| summary             |
+---------------------+
| Enabled 4 consumers |
+---------------------+
```
27.4.10 The `ps_setup_enable_instrument()` Procedure

Enables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were enabled. Already enabled instruments do not count.

Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a LIKE pattern match.

  A value of '' matches all instruments.

Example

Enable a specific instrument:

```
mysql> CALL sys.ps_setup_enable_instrument('wait/lock/metadata/sql/mdl');
```

```
+----------------------+
<table>
<thead>
<tr>
<th>summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled 1 instrument</td>
</tr>
</tbody>
</table>
+----------------------+
```

Enable all mutex instruments:

```
mysql> CALL sys.ps_setup_enable_instrument('mutex');
```

```
+-------------------------+
<table>
<thead>
<tr>
<th>summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled 177 instruments</td>
</tr>
</tbody>
</table>
+-------------------------+
```

27.4.11 The `ps_setup_enable_thread()` Procedure

Given a connection ID, enables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were enabled. Already enabled threads do not count.

Parameters

- `in_connection_id BIGINT`: The connection ID. This is a value of the type given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

Example

Enable a specific connection by its connection ID:

```
mysql> CALL sys.ps_setup_enable_thread(225);
```

```
+------------------+
<table>
<thead>
<tr>
<th>summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled 1 thread</td>
</tr>
</tbody>
</table>
+------------------+
```

Enable the current connection:

```
mysql> CALL sys.ps_setup_enable_thread(CONNECTION_ID());
```
27.4.12 The `ps_setup_reload_saved()` Procedure

Reloads a Performance Schema configuration saved earlier within the same session using `ps_setup_save()`. For more information, see the description of `ps_setup_save()`.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

Parameters

None.

27.4.13 The `ps_setup_reset_to_default()` Procedure

Resets the Performance Schema configuration to its default settings.

Parameters

- **in_verbose BOOLEAN**: Whether to display information about each setup stage during procedure execution. This includes the SQL statements executed.

Example

```sql
mysql> CALL sys.ps_setup_reset_to_default(TRUE)\G
*************************** 1. row ***************************
status: Resetting: setup_actors
DELETE FROM performance_schema.setup_actors
WHERE NOT (HOST = '%' AND USER = '%' AND ROLE = '%')
*************************** 1. row ***************************
status: Resetting: setup_actors
INSERT IGNORE INTO performance_schema.setup_actors
VALUES ('%', '%', '%')
...```

27.4.14 The `ps_setup_save()` Procedure

Saves the current Performance Schema configuration. This enables you to alter the configuration temporarily for debugging or other purposes, then restore it to the previous state by invoking the `ps_setup_reload_saved()` procedure.

To prevent other simultaneous calls to save the configuration, `ps_setup_save()` acquires an advisory lock named `sys.ps_setup_save` by calling the `GET_LOCK()` function. `ps_setup_save()` takes a timeout parameter to indicate how many seconds to wait if the lock already exists (which indicates that some other session has a saved configuration outstanding). If the timeout expires without obtaining the lock, `ps_setup_save()` fails.

It is intended you call `ps_setup_reload_saved()` later within the same session as `ps_setup_save()` because the configuration is saved in `TEMPORARY` tables. `ps_setup_save()` drops the temporary tables.
and releases the lock. If you end your session without invoking \texttt{ps\_setup\_save()}, the tables and lock disappear automatically.

This procedure disables binary logging during its execution by manipulating the session value of the \texttt{sql\_log\_bin} system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

### Parameters

- \texttt{in\_timeout INT}: How many seconds to wait to obtain the \texttt{sys.ps\_setup\_save} lock. A negative timeout value means infinite timeout.

### Example

```sql
mysql> CALL sys.ps_setup_save(10);
...
make Performance Schema configuration changes ...
mysql> CALL sys.ps_setup_reload_saved();
```

#### 27.4.15 The \texttt{ps\_setup\_show\_disabled()} Procedure

Displays all currently disabled Performance Schema configuration.

### Parameters

- \texttt{in\_show\_instruments BOOLEAN}: Whether to display disabled instruments. This might be a long list.
- \texttt{in\_show\_threads BOOLEAN}: Whether to display disabled threads.

### Example

```sql
mysql> CALL sys.ps_setup_show_disabled(TRUE, TRUE);
```

```
+----------------------------+
<table>
<thead>
<tr>
<th>performance_schema_enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
</tbody>
</table>
+----------------------------+

+---------------+----------------+---------+-------+
<table>
<thead>
<tr>
<th>enabled_users</th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>'%'@'%'</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
+---------------+----------------+---------+-------+

+-------------+----------------+---------+-------+
<table>
<thead>
<tr>
<th>object_type</th>
<th>objects</th>
<th>enabled</th>
<th>timed</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>
```

4735
27.4.4.16 The `sys.ps_setup_show_disabled_consumers()` Procedure

Displays all currently disabled Performance Schema consumers.

**Parameters**

None.

**Example**

```sql
mysql> CALL sys.ps_setup_show_disabled_consumers();
+----------------------------------+
| disabled_consumers               |
+----------------------------------+
| events_stages_current            |
| events_stages_history            |
| events_stages_history_long       |
| events_statements_history        |
| events_statements_history_long   |
| events_transactions_history      |
| events_transactions_history_long |
| events_waits_current             |
| events_waits_history             |
| events_waits_history_long        |
+----------------------------------+
```

27.4.4.17 The `sys.ps_setup_show_disabled_instruments()` Procedure

Displays all currently disabled Performance Schema instruments. This might be a long list.

**Parameters**

None.

**Example**

```sql
mysql> CALL sys.ps_setup_show_disabled_instruments();
*************************** 1. row ***************************
| disabled_instruments: wait/synch/mutex/sql/TC_LOG_MMAP::LOCK_tcm	timed: NO |
| disabled_instruments: wait/synch/mutex/sql/THD::LOCK_query_plan	timed: NO |
| disabled_instruments: wait/synch/mutex/sql/MYSQL_BIN_LOG::LOCK_commit	timed: NO |
```

27.4.4.18 The `sys.ps_setup_show_enabled()` Procedure

Displays all currently enabled Performance Schema configuration.

**Parameters**

- `in_show_instruments BOOLEAN`: Whether to display enabled instruments. This might be a long list.
- `in_show_threads BOOLEAN`: Whether to display enabled threads.
Example

```sql
mysql> CALL sys.ps_setup_show_enabled(FALSE, FALSE);
+----------------------------+
| performance_schema_enabled |
| +------------------+-------+
| 1                +
| +------------------+-------+
1 row in set (0.01 sec)

+------------------+
| enabled_users    |
| +------------------+
| %'@'%            |
| +------------------+
1 row in set (0.01 sec)

+-------------+---------+---------+-------+
| object_type | objects | enabled | timed |
| +-------------+---------+---------+-------+
| EVENT       | %.%     | YES     | YES   |
| FUNCTION    | %.%     | YES     | YES   |
| PROCEDURE   | %.%     | YES     | YES   |
| TABLE       | %.%     | YES     | YES   |
| TRIGGER     | %.%     | YES     | YES   |
+-------------+---------+---------+-------+
5 rows in set (0.02 sec)

+-----------------------------+
| enabled_consumers           |
| +-----------------------------+
| events_statements_current   |
| events_statements_history   |
| events_transactions_current |
| events_transactions_history |
| global_instrumentation      |
| statements_digest           |
| thread_instrumentation      |
+-----------------------------+
```

27.4.19 The `ps_setup_show_enabled_consumers()` Procedure

Displays all currently enabled Performance Schema consumers.

Parameters

None.

Example

```sql
mysql> CALL sys.ps_setup_show_enabled_consumers();
+-----------------------------+
| enabled_consumers           |
| +-----------------------------+
| events_statements_current   |
| events_statements_history   |
| events_transactions_current |
| events_transactions_history |
| global_instrumentation      |
| statements_digest           |
| thread_instrumentation      |
+-----------------------------+
```

27.4.20 The `ps_setup_show_enabled_instruments()` Procedure
sys Schema Stored Procedures

Displays all currently enabled Performance Schema instruments. This might be a long list.

**Parameters**

None.

**Example**

```sql
mysql> CALL sys.ps_setup_show_enabled_instruments()\G
*************************** 1. row ***************************
enabled_instruments: wait/io/file/sql/map
  timed: YES
*************************** 2. row ***************************
enabled_instruments: wait/io/file/sql/binlog
  timed: YES
*************************** 3. row ***************************
enabled_instruments: wait/io/file/sql/binlog_cache
  timed: YES
...```

**27.4.4.21 The ps_statement_avg_latency_histogram() Procedure**

Displays a textual histogram graph of the average latency values across all normalized statements tracked within the Performance Schema `events_statements_summary_by_digest` table.

This procedure can be used to display a very high-level picture of the latency distribution of statements running within this MySQL instance.

**Parameters**

None.

**Example**

The histogram output in statement units. For example, * = 2 units in the histogram legend means that each * character represents 2 statements.

```sql
mysql> CALL sys.ps_statement_avg_latency_histogram()\G
*************************** 1. row ***************************
Performance Schema Statement Digest Average Latency Histogram:
  . = 1 unit
  * = 2 units
  # = 3 units

(0 - 66ms)  88  #
(66 - 133ms)  14  ....
(133 - 199ms)  4  ....
(199 - 265ms)  5  **
(265 - 332ms)  1  .
(332 - 398ms)  0  .
(398 - 464ms)  1  .
(464 - 531ms)  0  .
(531 - 597ms)  0  .
(597 - 663ms)  0  .
(663 - 730ms)  0  .
(730 - 796ms)  0  .
(796 - 863ms)  0  .
(863 - 929ms)  0  .
(929 - 995ms)  0  .
(995 - 1062ms)  0  .

Total Statements: 114; Buckets: 16; Bucket Size: 66 ms;
```
27.4.22 The ps_trace_statement_digest() Procedure

Traces all Performance Schema instrumentation for a specific statement digest.

If you find a statement of interest within the Performance Schema
events_statements_summary_by_digest table, specify its DIGEST column MD5 value to this
procedure and indicate the polling duration and interval. The result is a report of all statistics tracked within
Performance Schema for that digest for the interval.

The procedure also attempts to execute EXPLAIN for the longest running example of the digest during
the interval. This attempt might fail because the Performance Schema truncates long SQL_TEXT values.
Consequently, EXPLAIN will fail due to parse errors.

This procedure disables binary logging during its execution by manipulating the session value of the
sql_log_bin system variable. That is a restricted operation, so the procedure requires privileges
sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

Parameters

- **in_digest VARCHAR(32)**: The statement digest identifier to analyze.
- **in_runtime INT**: How long to run the analysis in seconds.
- **in_interval DECIMAL(2,2)**: The analysis interval in seconds (which can be fractional) at which to
try to take snapshots.
- **in_start_fresh BOOLEAN**: Whether to truncate the Performance Schema
events_statements_history_long and events_stages_history_long tables before starting.
- **in_auto_enable BOOLEAN**: Whether to automatically enable required consumers.

Example

```sql
mysql> CALL sys.ps_trace_statement_digest('891ec6860f98ba46d89dd20b0c03652c', 10, 0.1, TRUE, TRUE);
```

```
+--------------------+
| SUMMARY STATISTICS |
+--------------------+

+---------------------------+--------+-----------+-----------+-------------------+---------+---------+
| event_name                | count  | latency   |           |                   |         |
| stage/sql/statistics      | 16     | 546.92 us |           |                   |         |
| stage/sql/freeing items  | 18     | 520.11 us |           |                   |         |
| stage/sql/init            | 51     | 466.80 us |           |                   |         |
| stage/sql/cleaning up     | 18     | 11.92 us  |           |                   |         |
| stage/sql/executing       | 16     | 6.95 us   |           |                   |         |

17 rows in set (9.12 sec)
```
27.4.4.23 The `ps_trace_thread()` Procedure

Dumps all Performance Schema data for an instrumented thread to a *.dot* formatted graph file (for the DOT graph description language). Each result set returned from the procedure should be used for a complete graph.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, “System Variable Privileges”.

**Parameters**

- **in_thread_id INT**: The thread to trace.
- **in_outfile VARCHAR(255)**: The name to use for the *.dot* output file.
- **in_max_runtime DECIMAL(20,2)**: The maximum number of seconds (which can be fractional) to collect data. Use `NULL` to collect data for the default of 60 seconds.
- **in_interval DECIMAL(20,2)**: The number of seconds (which can be fractional) to sleep between data collections. Use `NULL` to sleep for the default of 1 second.
- **in_start_fresh BOOLEAN**: Whether to reset all Performance Schema data before tracing.
sys Schema Stored Procedures

• **in_auto_setup** BOOLEAN: Whether to disable all other threads and enable all instruments and consumers. This also resets the settings at the end of the run.

• **in_debug** BOOLEAN: Whether to include `file:lineno` information in the graph.

Example

```
mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL, TRUE, TRUE, TRUE);
+-------------------+
| summary           |
+-------------------+ 1 row in set (0.00 sec)
  +-------------------+
  | Disabled 1 thread |
  +-------------------+ 1 row in set (0.03 sec)
  +-------------------+
  | Info              |
  +-------------------+
  | Data collection starting for THREAD_ID = 25 |
  +-------------------+ 1 row in set (0.03 sec)
  +-------------------+
  | Info              |
  +-------------------+
  | Stack trace written to /tmp/stack-2014-02-16-21:18:41.dot |
  +-------------------+ 1 row in set (60.07 sec)
```

27.4.4.24 The ps_truncate_all_tables() Procedure

Truncates all Performance Schema summary tables, resetting all aggregated instrumentation as a snapshot. Produces a result set indicating how many tables were truncated.

Parameters

• **in_verbose** BOOLEAN: Whether to display each TRUNCATE TABLE statement before executing it.

Example

```
mysql> CALL sys.ps_truncate_all_tables(FALSE);
+---------------------+
| summary             |
+---------------------+ 4741 rows in set (60.07 sec)
```

```
27.4.25 The statement_performance_analyzer() Procedure

Creates a report of the statements running on the server. The views are calculated based on the overall and/or delta activity.

This procedure disables binary logging during its execution by manipulating the session value of the sql_log_bin system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See Section 5.1.9.1, "System Variable Privileges".

Parameters

- **in_action ENUM('snapshot', 'overall', 'delta', 'create_tmp', 'create_table', 'save', 'cleanup')**: The action to take. These values are permitted:
  - **snapshot**: Store a snapshot. The default is to make a snapshot of the current content of the Performance Schema events_statements_summary_by_digest table. By setting in_table, this can be overwritten to copy the content of the specified table. The snapshot is stored in the sys schema tmp_digests temporary table.
  - **overall**: Generate an analysis based on the content of the table specified by in_table. For the overall analysis, in_table can be NOW() to use a fresh snapshot. This overwrites an existing snapshot. Use NULL for in_table to use the existing snapshot. If in_table is NULL and no snapshot exists, a new snapshot is created. The in_views parameter and the statement_performance_analyzer.limit configuration option affect the operation of this procedure.
  - **delta**: Generate a delta analysis. The delta is calculated between the reference table specified by in_table and the snapshot, which must exist. This action uses the sys schema tmp_digests_delta temporary table. The in_views parameter and the statement_performance_analyzer.limit configuration option affect the operation of this procedure.
  - **create_table**: Create a regular table suitable for storing the snapshot for later use (for example, for calculating deltas).
  - **create_tmp**: Create a temporary table suitable for storing the snapshot for later use (for example, for calculating deltas).
  - **save**: Save the snapshot in the table specified by in_table. The table must exist and have the correct structure. If no snapshot exists, a new snapshot is created.
  - **cleanup**: Remove the temporary tables used for the snapshot and delta.

- **in_table VARCHAR(129)**: The table parameter used for some of the actions specified by the in_action parameter. Use the format db_name.tbl_name or tbl_name without using any backtick (`) identifier-quoting characters. Periods (.) are not supported in database and table names.

The meaning of the in_table value for each in_action value is detailed in the individual in_action value descriptions.

- **in_views SET ('with_runtimes_in_95th_percentile', 'analysis', 'with_errors_or_warnings', 'with_full_table_scans', 'with_sorting', 'with_temp_tables', 'custom')**: Which views to include. This parameter is a SET value, so it can
contain multiple view names, separated by commas. The default is to include all views except custom. The following values are permitted:

- **with_runtimes_in_95th_percentile**: Use the `statements_with_runtimes_in_95th_percentile` view.
- **analysis**: Use the `statement_analysis` view.
- **with_errors_or_warnings**: Use the `statements_with_errors_or_warnings` view.
- **with_full_table_scans**: Use the `statements_with_full_table_scans` view.
- **with_sorting**: Use the `statements_with_sorting` view.
- **with_temp_tables**: Use the `statements_with_temp_tables` view.
- **custom**: Use a custom view. This view must be specified using the `statement_performance_analyzer.view` configuration option to name a query or an existing view.

**Configuration Options**

The `statement_performance_analyzer()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 27.4.2.1, “The sys_config Table”):

- **debug, @sys.debug**
  
  If this option is **ON**, produce debugging output. The default is **OFF**.

- **statement_performance_analyzer.limit, @sys.statement_performance_analyzer.limit**

  The maximum number of rows to return for views that have no built-in limit. The default is 100.

- **statement_performance_analyzer.view, @sys.statement_performance_analyzer.view**

  The custom query or view to be used. If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any **LIMIT** clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. If specifying a view, use the same format as for the `in_table` parameter. The default is **NULL** (no custom view defined).

**Example**

To create a report with the queries in the 95th percentile since the last truncation of `events_statements_summary_by_digest` and with a one-minute delta period:

1. Create a temporary table to store the initial snapshot.
2. Create the initial snapshot.
3. Save the initial snapshot in the temporary table.
4. Wait one minute.
5. Create a new snapshot.
6. Perform analysis based on the new snapshot.
7. Perform analysis based on the delta between the initial and new snapshots.

```sql
mysql> CALL sys.statement_performance_analyzer('create_tmp', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.08 sec)

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL sys.statement_performance_analyzer('save', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.00 sec)

mysql> DO SLEEP(60);
Query OK, 0 rows affected (1 min 0.00 sec)

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile');
+-----------------------------------------+
| Next Output                             |
| Queries with Runtime in 95th Percentile |
+-----------------------------------------+
1 row in set (0.05 sec)
...

mysql> CALL sys.statement_performance_analyzer('delta', 'mydb.tmp_digests_ini', 'with_runtimes_in_95th_percentile');
+-----------------------------------------+
| Next Output                             |
| Queries with Runtime in 95th Percentile |
+-----------------------------------------+
1 row in set (0.03 sec)
...

Create an overall report of the 95th percentile queries and the top 10 queries with full table scans:

```sql
mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.01 sec)

mysql> SET @sys.statement_performance_analyzer.limit = 10;
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile,with_full_table_scans');
+-----------------------------------------+
| Next Output                             |
| Queries with Runtime in 95th Percentile |
+-----------------------------------------+
1 row in set (0.01 sec)
...

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile,with_full_table_scans');
+-----------------------------------------+
| Top 10 Queries with Full Table Scan     |
+-----------------------------------------+
1 row in set (0.09 sec)
...

Use a custom view showing the top 10 queries sorted by total execution time, refreshing the view every minute using the watch command in Linux:
sys Schema Stored Procedures

mysql> CREATE OR REPLACE VIEW mydb.my_statements AS
    -> SELECT sys.format_statement(DIGEST_TEXT) AS query,
    -> SCHEMA_NAME AS db,
    -> COUNT_STAR AS exec_count,
    -> sys.format_time(SUM_TIMER_WAIT) AS total_latency,
    -> sys.format_time(AVG_TIMER_WAIT) AS avg_latency,
    -> ROUND(IFNULL(SUM_ROWS_SENT / NULLIF(COUNT_STAR, 0), 0)) AS rows_sent_avg,
    -> ROUND(IFNULL(SUM_ROWS_EXAMINED / NULLIF(COUNT_STAR, 0), 0)) AS rows_examined_avg,
    -> ROUND(IFNULL(SUM_ROWS_AFFECTED / NULLIF(COUNT_STAR, 0), 0)) AS rows_affected_avg,
    -> DIGEST AS digest
    -> FROM performance_schema.events_transactions_summary_by_digest
    -> ORDER BY SUM_TIMER_WAIT DESC;
Query OK, 0 rows affected (0.10 sec)

mysql> CALL sys.statement_performance_analyzer('create_table', 'mydb.digests_prev', NULL);
Query OK, 0 rows affected (0.10 sec)

shell> watch -n 60 "mysql sys --table -e "
> SET @sys.statement_performance_analyzer.view = 'mydb.my_statements';
> SET @sys.statement_performance_analyzer.limit = 10;
> CALL statement_performance_analyzer('snapshot', NULL, NULL);
> CALL statement_performance_analyzer('delta', 'mydb.digests_prev', 'custom');
> CALL statement_performance_analyzer('save', 'mydb.digests_prev', NULL);
> ""
Every 60.0s: mysql sys --table -e " " ... Mon Dec 22 10:58:51 2014

27.4.4.26 The table_exists() Procedure

Tests whether a given table exists as a regular table, a TEMPORARY table, or a view. The procedure returns the table type in an OUT parameter. If both a temporary and a permanent table exist with the given name, TEMPORARY is returned.

Parameters

- **in_db VARCHAR(64)**: The name of the database in which to check for table existance.
- **in_table VARCHAR(64)**: The name of the table to check the existance of.
- **out_exists ENUM('', 'BASE TABLE', 'VIEW', 'TEMPORARY')**: The return value. This is an OUT parameter, so it must be a variable into which the table type can be stored. When the procedure returns, the variable has one of the following values to indicate whether the table exists:
  - ''': The table name does not exist as a base table, TEMPORARY table, or view.
  - BASE TABLE: The table name exists as a base (permanent) table.
  - VIEW: The table name exists as a view.
  - TEMPORARY: The table name exists as a TEMPORARY table.

Example

mysql> CREATE DATABASE db1;
27.4.5 sys Schema Stored Functions

The following sections describe sys schema stored functions.

27.4.5.1 The extract_schema_from_file_name() Function

Given a file path name, returns the path component that represents the schema name. This function assumes that the file name lies within the schema directory. For this reason, it will not work with partitions or tables defined using their own DATA_DIRECTORY table option.
This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display schema names, which can be more easily understood than full path names, and can be used in joins against object schema names.

**Parameters**

- **path VARCHAR(512)**: The full path to a data file from which to extract the schema name.

**Return Value**

A VARCHAR(64) value.

**Example**

```sql
mysql> SELECT sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd');
+----------------------------------+
| sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd') |
| world                           |
+----------------------------------+
```

### 27.4.5.2 The `extract_table_from_file_name()` Function

Given a file path name, returns the path component that represents the table name.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display table names, which can be more easily understood than full path names, and can be used in joins against object table names.

**Parameters**

- **path VARCHAR(512)**: The full path to a data file from which to extract the table name.

**Return Value**

A VARCHAR(64) value.

**Example**

```sql
mysql> SELECT sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd');
+----------------------------------+
| sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd') |
| City                            |
+----------------------------------+
```

### 27.4.5.3 The `format_bytes()` Function

**Note**

As of MySQL 8.0.16, `format_bytes()` is deprecated and will be removed in a future MySQL version. Applications that use it should be migrated to use the built-in `FORMAT_BYTES()` function instead. See Section 12.22, “Performance Schema Functions”

Given a byte count, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is bytes, KiB (kibibytes), MiB (mebibytes), GiB (gibibytes), TiB (tebibytes), or PiB (pebibytes).
Parameters

- bytes TEXT: The byte count to format.

Return Value

A TEXT value.

Example

```sql
mysql> SELECT sys.format_bytes(512), sys.format_bytes(18446644073709551615);
+-----------------------+----------------------------------------+
| sys.format_bytes(512) | sys.format_bytes(18446644073709551615) | 16383.91 PiB
+-----------------------+----------------------------------------+
```

27.4.5.4 The format_path() Function

Given a path name, returns the modified path name after replacing subpaths that match the values of the following system variables, in order:

- datadir
- tmpdir
- slave_load_tmpdir
- innodb_data_home_dir
- innodb_log_group_home_dir
- innodb_undo_directory
- basedir

A value that matches the value of system variable `sysvar` is replaced with the string `@@GLOBAL.sysvar`.

Parameters

- path VARCHAR(512): The path name to format.

Return Value

A VARCHAR(512) CHARACTER SET utf8 value.

Example

```sql
mysql> SELECT sys.format_path('/usr/local/mysql/data/world/City.ibd');
+---------------------------------------------------------+
| sys.format_path('/usr/local/mysql/data/world/City.ibd') |
| /usr/local/mysql/data/world/City.ibd                    |
+---------------------------------------------------------+
```

27.4.5.5 The format_statement() Function

Given a string (normally representing an SQL statement), reduces it to the length given by the `statement_truncate_len` configuration option, and returns the result. No truncation occurs if the string is shorter than `statement_truncate_len`. Otherwise, the middle part of the string is replaced by an ellipsis (...).

This function is useful for formatting possibly lengthy statements retrieved from Performance Schema tables to a known fixed maximum length.

Parameters

- statement LONGTEXT: The statement to format.
Configuration Options

`format_statement()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 27.4.2.1, “The `sys_config` Table”):

- `statement_truncate_len`, `@sys.statement_truncate_len`

  The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

Return Value

A `LONGTEXT` value.

Example

By default, `format_statement()` truncates statements to be no more than 64 characters. Setting `@sys.statement_truncate_len` changes the truncation length for the current session:

```sql
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
+----------------------------------------------------------+
| sys.format_statement(@stmt)                              |
+----------------------------------------------------------+
| SELECT variable, value, set_time, set_by FROM sys_config |
+----------------------------------------------------------+
mysql>
```

```sql
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);
+-----------------------------------+
| sys.format_statement(@stmt)       |
+-----------------------------------+
| SELECT variabl ... ROM sys_config |
+-----------------------------------+
```

27.4.5.6 The `format_time()` Function

Note

As of MySQL 8.0.16, `format_time()` is deprecated and will be removed in a future MySQL version. Applications that use it should be migrated to use the built-in `FORMAT_PICO_TIME()` function instead. See Section 12.22, “Performance Schema Functions”

Given a Performance Schema latency or wait time in picoseconds, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `ps` (nanoseconds), `ns` (nanoseconds), `us` (microseconds), `ms` (milliseconds), `s` (seconds), `m` (minutes), `h` (hours), `d` (days), or `w` (weeks).

Parameters

- `picoseconds TEXT`: The picoseconds value to format.

Return Value

A `TEXT` value.

Example

```sql
mysql> SELECT sys.format_time(3501), sys.format_time(188732396662000);
```

2749
27.4.5.7 The list_add() Function

Adds a value to a comma-separated list of values and returns the result.

This function and list_drop() can be useful for manipulating the value of system variables such as sql_mode and optimizer_switch that take a comma-separated list of values.

Parameters

- **in_list** TEXT: The list to be modified.
- **in_add_value** TEXT: The value to add to the list.

Return Value

A TEXT value.

Example

```sql
mysql> SELECT @@sql_mode;
+----------------------------------------+
| @@sql_mode                             |
+----------------------------------------+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES |
+----------------------------------------+

mysql> SET @@sql_mode = sys.list_add(@@sql_mode, 'NO_ENGINE_SUBSTITUTION');

mysql> SELECT @@sql_mode;
+---------------------------------------------------------------+
| @@sql_mode                                                    |
+---------------------------------------------------------------+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+---------------------------------------------------------------+

mysql> SET @@sql_mode = sys.list_drop(@@sql_mode, 'ONLY_FULL_GROUP_BY');

mysql> SELECT @@sql_mode;
+--------------------------------------------+
| @@sql_mode                                 |
+--------------------------------------------+
| STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+--------------------------------------------+
```

27.4.5.8 The list_drop() Function

Removes a value from a comma-separated list of values and returns the result. For more information, see the description of list_add().

Parameters

- **in_list** TEXT: The list to be modified.
- **in_drop_value** TEXT: The value to drop from the list.

Return Value

A TEXT value.
27.4.5.9 The ps_is_account_enabled() Function

Returns YES or NO to indicate whether Performance Schema instrumentation for a given account is enabled.

Parameters

- `in_host VARCHAR(60)`: The host name of the account to check.
- `in_user VARCHAR(32)`: The user name of the account to check.

Return Value

An ENUM('YES', 'NO') value.

Example

```sql
mysql> SELECT sys.ps_is_account_enabled('localhost', 'root');
+------------------------------------------------+
| sys.ps_is_account_enabled('localhost', 'root') |
+------------------------------------------------+
| YES                                             |
+------------------------------------------------+
```

27.4.5.10 The ps_is_consumer_enabled() Function

Returns YES or NO to indicate whether a given Performance Schema consumer is enabled, or NULL if the argument is NULL. If the argument is not a valid consumer name, an error occurs. (Prior to MySQL 8.0.18, the function returns NULL if the argument is not a valid consumer name.)

This function accounts for the consumer hierarchy, so a consumer is not considered enabled unless all consumers on which depends are also enabled. For information about the consumer hierarchy, see Section 26.4.7, "Pre-Filtering by Consumer".

Parameters

- `in_consumer VARCHAR(64)`: The name of the consumer to check.

Return Value

An ENUM('YES', 'NO') value.

Example

```sql
mysql> SELECT sys.ps_is_consumer_enabled('thread_instrumentation');
+------------------------------------------------------+
| sys.ps_is_consumer_enabled('thread_instrumentation') |
+------------------------------------------------------+
| YES                                                  |
+------------------------------------------------------+
```

27.4.5.11 The ps_is_instrument_default_enabled() Function

Returns YES or NO to indicate whether a given Performance Schema instrument is enabled by default.

Parameters

- `in_instrument VARCHAR(128)`: The name of the instrument to check.
Return Value

An ENUM('YES','NO') value.

Example

```
mysql> SELECT sys.ps_is_instrument_default_enabled('memory/innodb/row_log_buf');
+-------------------------------------------------------------------+
| sys.ps_is_instrument_default_enabled('memory/innodb/row_log_buf') |
| NO                                                                |
+-------------------------------------------------------------------+
mysql> SELECT sys.ps_is_instrument_default_enabled('statement/sql/alter_user');
+------------------------------------------------------------------+
| sys.ps_is_instrument_default_enabled('statement/sql/alter_user') |
| YES                                                              |
+------------------------------------------------------------------+
```

27.4.5.12 The ps_is_instrument_default_timed() Function

Returns YES or NO to indicate whether a given Performance Schema instrument is timed by default.

Parameters

- `in_instrument VARCHAR(128)`: The name of the instrument to check.

Return Value

An ENUM('YES','NO') value.

Example

```
mysql> SELECT sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf');
+-----------------------------------------------------------------+
| sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf') |
| NO                                                              |
+-----------------------------------------------------------------+
mysql> SELECT sys.ps_is_instrument_default_timed('statement/sql/alter_user');
+----------------------------------------------------------------+
| sys.ps_is_instrument_default_timed('statement/sql/alter_user') |
| YES                                                            |
+----------------------------------------------------------------+
```

27.4.5.13 The ps_is_thread_instrumented() Function

Returns YES or NO to indicate whether Performance Schema instrumentation for a given connection ID is enabled, UNKNOWN if the ID is unknown, or NULL if the ID is NULL.

Parameters

- `in_connection_id BIGINT UNSIGNED`: The connection ID. This is a value of the type given in the PROCESSLIST_ID column of the Performance Schema threads table or the Id column of SHOW PROCESSLIST output.

Return Value

An ENUM('YES','NO','UNKNOWN') value.
Example

mysql> SELECT sys.ps_is_thread_instrumented(43);
+-----------------------------------+
| sys.ps_is_thread_instrumented(43) |
| UNKNOWN                           |
+-----------------------------------+
mysql>

mysql> SELECT sys.ps_is_thread_instrumented(CONNECTION_ID());
+------------------------------------------------+
| sys.ps_is_thread_instrumented(CONNECTION_ID()) |
| YES                                            |
+------------------------------------------------+

27.4.5.14 The ps_thread_account() Function

Given a Performance Schema thread ID, returns the user_name@host_name account associated with the thread.

Parameters

• **in_thread_id** BIGINT UNSIGNED: The thread ID for which to return the account. The value should match the THREAD_ID column from some Performance Schema threads table row.

Return Value

A TEXT value.

Example

mysql> SELECT sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID()));
+----------------------------------------------------------+
| sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID())) |
| root@localhost                                           |
+----------------------------------------------------------+

27.4.5.15 The ps_thread_id() Function

Note

As of MySQL 8.0.16, ps_thread_id() is deprecated and will be removed in a future MySQL version. Applications that use it should be migrated to use the built-in PS_THREAD_ID() and PS_CURRENT_THREAD_ID() functions instead. See Section 12.22, “Performance Schema Functions”

Returns the Performance Schema thread ID assigned to a given connection ID, or the thread ID for the current connection if the connection ID is NULL.

Parameters

• **in_connection_id** BIGINT UNSIGNED: The ID of the connection for which to return the thread ID. This is a value of the type given in the PROCESSLIST_ID column of the Performance Schema threads table or the Id column of SHOW PROCESSLIST output.

Return Value

A BIGINT UNSIGNED value.
Example

```sql
mysql> SELECT sys.ps_thread_id(260);
+-----------------------+
| sys.ps_thread_id(260) |
+-----------------------+
|                   285 |
+-----------------------+
```

27.4.5.16 The `ps_thread_stack()` Function

Returns a JSON formatted stack of all statements, stages, and events within the Performance Schema for a given thread ID.

Parameters

- `in_thread_id` BIGINT: The ID of the thread to trace. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.
- `in_verbose` BOOLEAN: Whether to include `file:lineno` information in the events.

Return Value

A `LONGTEXT` CHARACTER SET latin1 value.

Example

```sql
mysql> SELECT sys.ps_thread_stack(37, FALSE) AS thread_stack;
```

27.4.5.17 The `ps_thread_trx_info()` Function

Returns a JSON object containing information about a given thread. The information includes the current transaction, and the statements it has already executed, derived from the Performance Schema `events_transactions_current` and `events_statements_history` tables. (The consumers for those tables must be enabled to obtain full data in the JSON object.)

If the output exceeds the truncation length (65535 by default), a JSON error object is returned, such as:

```json
{ "error": "Trx info truncated: Row 6 was cut by GROUP_CONCAT()" }
```

Similar error objects are returned for other warnings and exceptions raised during function execution.

Parameters

- `in_thread_id` BIGINT UNSIGNED: The thread ID for which to return transaction information. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

Configuration Options

`ps_thread_trx_info()` operation can be modified using the following configuration options or their corresponding user-defined variables (see Section 27.4.2.1, “The sys_config Table”):

- `ps_thread_trx_info.max_length`, `@sys.ps_thread_trx_info.max_length`
The maximum length of the output. The default is 65535.

**Return Value**

A **LONGTEXT** value.

**Example**

```sql
mysql> SELECT sys.ps_thread_trx_info(48)\G
*************************** 1. row ***************************
sys.ps_thread_trx_info(48): [
    
    "time": "790.70 us",
    "state": "COMMITTED",
    "mode": "READ WRITE",
    "autocommitted": "NO",
    "gtid": "AUTOMATIC",
    "isolation": "REPEATABLE READ",
    "statements_executed": [
        
        "sql_text": "INSERT INTO info VALUES (1, 'foo')",
        "time": "471.02 us",
        "schema": "trx",
        "rows_examined": 0,
        "rows_affected": 1,
        "rows_sent": 0,
        "tmp_tables": 0,
        "tmp_disk_tables": 0,
        "sort_rows": 0,
        "sort_merge_passes": 0
    ],

    "sql_text": "COMMIT",
    "time": "254.42 us",
    "schema": "trx",
    "rows_examined": 0,
    "rows_affected": 0,
    "rows_sent": 0,
    "tmp_tables": 0,
    "tmp_disk_tables": 0,
    "sort_rows": 0,
    "sort_merge_passes": 0
]

    
    "time": "426.20 us",
    "state": "COMMITTED",
    "mode": "READ WRITE",
    "autocommitted": "NO",
    "gtid": "AUTOMATIC",
    "isolation": "REPEATABLE READ",
    "statements_executed": [
        
        "sql_text": "INSERT INTO info VALUES (2, 'bar')",
        "time": "107.33 us",
        "schema": "trx",
        "rows_examined": 0,
        "rows_affected": 1,
        "rows_sent": 0,
        "tmp_tables": 0,
        "tmp_disk_tables": 0,
        "sort_rows": 0,
        "sort_merge_passes": 0
    ]

],
```

4755
27.4.5.18 The quote_identifier() Function

Given a string argument, this function produces a quoted identifier suitable for inclusion in SQL statements. This is useful when a value to be used as an identifier is a reserved word or contains backtick (`) characters.

**Parameters**

* in_identifier TEXT: The identifier to quote.

**Return Value**

A TEXT value.

**Example**

```sql
mysql> SELECT sys.quote_identifier('plain');
+---------------------------+
| sys.quote_identifier('plain') |
+---------------------------+
| `plain`                   |
+---------------------------+

mysql> SELECT sys.quote_identifier('trick`ier');
+------------------------+
| sys.quote_identifier('trick`ier') |
+------------------------+
| `trick``ier`           |
+------------------------+

mysql> SELECT sys.quote_identifier('integer');
+---------------------------+
| sys.quote_identifier('integer') |
+---------------------------+
| `integer`                 |
+---------------------------+
```

27.4.5.19 The sys_get_config() Function

Given a configuration option name, returns the option value from the sys_config table, or the provided default value (which may be NULL) if the option does not exist in the table.

If sys_get_config() returns the default value and that value is NULL, it is expected that the caller is able to handle NULL for the given configuration option.

By convention, routines that call sys_get_config() first check whether the corresponding user-defined variable exists and is non-NUL. If so, the routine uses the variable value without reading the sys_config table. If the variable does not exist or is NULL, the routine reads the option value from the table and sets
the user-defined variable to that value. For more information about the relationship between configuration options and their corresponding user-defined variables, see Section 27.4.2.1, “The sys_config Table”.

If you want to check whether the configuration option has already been set and, if not, use the return value of `sys_get_config()`, you can use `IFNULL(...)` (see example later). However, this should not be done inside a loop (for example, for each row in a result set) because for repeated calls where the assignment is needed only in the first iteration, using `IFNULL(...)` is expected to be significantly slower than using an `IF (...) THEN ... END IF;` block (see example later).

**Parameters**

- `in_variable_name VARCHAR(128)`: The name of the configuration option for which to return the value.

- `in_default_value VARCHAR(128)`: The default value to return if the configuration option is not found in the `sys_config` table.

**Return Value**

A `VARCHAR(128)` value.

**Example**

Get a configuration value from the `sys_config` table, falling back to 128 as the default if the option is not present in the table:

```sql
mysql> SELECT sys.sys_get_config('statement_truncate_len', 128) AS Value;
+-------+
<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>64</td>
</tr>
</tbody>
</table>
+-------+
```

One-liner example: Check whether the option is already set; if not, assign the `IFNULL(...)` result (using the value from the `sys_config` table):

```sql
mysql> SET @sys.statement_truncate_len = IFNULL(@sys.statement_truncate_len, sys.sys_get_config('statement_truncate_len', 64));
```

`IF (...) THEN ... END IF;` block example: Check whether the option is already set; if not, assign the value from the `sys_config` table:

```sql
IF (@sys.statement_truncate_len IS NULL) THEN
  SET @sys.statement_truncate_len = sys.sys_get_config('statement_truncate_len', 64);
END IF;
```

**27.4.5.20 The version_major() Function**

This function returns the major version of the MySQL server.

**Parameters**

None.

**Return Value**

A `TINYINT UNSIGNED` value.
Example

```sql
mysql> SELECT VERSION(), sys.version_major();
+--------------+---------------------+
<table>
<thead>
<tr>
<th>VERSION()</th>
<th>sys.version_major()</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0.13-debug</td>
<td>8</td>
</tr>
</tbody>
</table>
+--------------+---------------------+
```

27.4.5.21 The version_minor() Function

This function returns the minor version of the MySQL server.

**Parameters**

None.

**Return Value**

A **TINYINT UNSIGNED** value.

Example

```sql
mysql> SELECT VERSION(), sys.version_minor();
+--------------+---------------------+
<table>
<thead>
<tr>
<th>VERSION()</th>
<th>sys.version_minor()</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0.13-debug</td>
<td>0</td>
</tr>
</tbody>
</table>
+--------------+---------------------+
```

27.4.5.22 The version_patch() Function

This function returns the patch release version of the MySQL server.

**Parameters**

None.

**Return Value**

A **TINYINT UNSIGNED** value.

Example

```sql
mysql> SELECT VERSION(), sys.version_patch();
+--------------+---------------------+
<table>
<thead>
<tr>
<th>VERSION()</th>
<th>sys.version_patch()</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0.13-debug</td>
<td>13</td>
</tr>
</tbody>
</table>
+--------------+---------------------+
```

MySQL Connectors provide connectivity to the MySQL server for client programs. APIs provide low-level access to the MySQL protocol and MySQL resources. Both Connectors and the APIs enable you to connect and execute MySQL statements from another language or environment, including ODBC, Java (JDBC), Perl, Python, PHP, Ruby, and native C MySQL instances.
MySQL Connectors

Oracle develops a number of connectors:

- **Connector/C++** enables C++ applications to connect to MySQL.
- **Connector/J** provides driver support for connecting to MySQL from Java applications using the standard Java Database Connectivity (JDBC) API.
- **Connector/NET** enables developers to create .NET applications that connect to MySQL. Connector/NET implements a fully functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that use Connector/NET can be written in any supported .NET language.
- **Connector/ODBC** provides driver support for connecting to MySQL using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix, and macOS platforms.
- **Connector/Python** provides driver support for connecting to MySQL from Python applications using an API that is compliant with the Python DB API version 2.0. No additional Python modules or MySQL client libraries are required.

The MySQL C API

For direct access to using MySQL natively within a C application, the **C API** provides low-level access to the MySQL client/server protocol through the `libmysqlclient` client library. This is the primary method used to connect to an instance of the MySQL server, and is used both by MySQL command-line clients and many of the MySQL Connectors and third-party APIs detailed here.

`libmysqlclient` is included in MySQL distributions.

See also Section 28.6.1, “MySQL C API Implementations”.

To access MySQL from a C application, or to build an interface to MySQL for a language not supported by the Connectors or APIs in this chapter, the C API is where to start. A number of programmer's utilities are available to help with the process; see Section 4.7, “Program Development Utilities”.

Third-Party MySQL APIs

The remaining APIs described in this chapter provide an interface to MySQL from specific application languages. These third-party solutions are not developed or supported by Oracle. Basic information on their usage and abilities is provided here for reference purposes only.

All the third-party language APIs are developed using one of two methods, using `libmysqlclient` or by implementing a **native driver**. The two solutions offer different benefits:

- **Using libmysqlclient** offers complete compatibility with MySQL because it uses the same libraries as the MySQL client applications. However, the feature set is limited to the implementation and interfaces exposed through `libmysqlclient` and the performance may be lower as data is copied between the native language, and the MySQL API components.
- **Native drivers** are an implementation of the MySQL network protocol entirely within the host language or environment. Native drivers are fast, as there is less copying of data between components, and they
Third-Party MySQL APIs

can offer advanced functionality not available through the standard MySQL API. Native drivers are also easier for end users to build and deploy because no copy of the MySQL client libraries is needed to build the native driver components.

Table 28.1, “MySQL APIs and Interfaces” lists many of the libraries and interfaces available for MySQL.

### 28.1 MySQL Connector/C++

The MySQL Connector/C++ manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/C++ 8.0 Developer Guide
- Release notes: MySQL Connector/C++ Release Notes

### 28.2 MySQL Connector/J

The MySQL Connector/J manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/J Developer Guide
- Release notes: MySQL Connector/J Release Notes

### 28.3 MySQL Connector/NET

The MySQL Connector/NET manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/NET Developer Guide
- Release notes: MySQL Connector/NET Release Notes

### 28.4 MySQL Connector/ODBC

The MySQL Connector/ODBC manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: MySQL Connector/ODBC Developer Guide
- Release notes: MySQL Connector/ODBC Release Notes

### 28.5 MySQL Connector/Python

The MySQL Connector/Python manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:
28.6 MySQL C API

The C API provides low-level access to the MySQL client/server protocol and enables C programs to access database contents. The C API code is distributed with MySQL and implemented in the libmysqlclient library. See Section 28.6.1, “MySQL C API Implementations”.

Most other client APIs use the libmysqlclient library to communicate with the MySQL server. (Exceptions are Connector/J and Connector/NET.) This means that, for example, you can take advantage of many of the same environment variables that are used by other client programs because they are referenced from the library. For a list of these variables, see Section 4.1, “Overview of MySQL Programs”.

For instructions on building client programs using the C API, see Section 28.6.3.1, “Building C API Client Programs”. For programming with threads, see Section 28.6.3.3, “Writing C API Threaded Client Programs”.

Note

If, after an upgrade, you experience problems with compiled client programs, such as Commands out of sync or unexpected core dumps, the programs were probably compiled using old header or library files. In this case, check the date of the mysql.h file and libmysqlclient.a library used for compilation to verify that they are from the new MySQL distribution. If not, recompile the programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example, from libmysqlclient.so.17 to libmysqlclient.so.18). For additional compatibility information, see Section 28.6.3.4, “Running C API Client Programs”.

Clients have a maximum communication buffer size. The size of the buffer that is allocated initially (16KB) is automatically increased up to the maximum size (16MB by default). Because buffer sizes are increased only as demand warrants, simply increasing the maximum limit does not in itself cause more resources to be used. This size check is mostly a precaution against erroneous statements and communication packets.

The communication buffer must be large enough to contain a single SQL statement (for client-to-server traffic) and one row of returned data (for server-to-client traffic). Each session’s communication buffer is dynamically enlarged to handle any query or row up to the maximum limit. For example, if you have BLOB values that contain up to 16MB of data, you must have a communication buffer limit of at least 16MB (in both server and client). The default maximum built into the client library is 1GB, but the default maximum in the server is 1MB. You can increase this by changing the value of the max_allowed_packet parameter at server startup. See Section 5.1.1, “Configuring the Server”.

The MySQL server shrinks each communication buffer to net_buffer_length bytes after each query. For clients, the size of the buffer associated with a connection is not decreased until the connection is closed, at which time client memory is reclaimed.

28.6.1 MySQL C API Implementations

The MySQL C API is a C-based API that client applications written in C can use to communicate with MySQL Server. Client programs refer to C API header files at compile time and link to a C API library file, libmysqlclient, at link time.
To obtain the C API header and library files required to build C API client programs, install a MySQL Server distribution.

You can install a binary distribution that contains the C API files pre-built, or you can use a source distribution and build the C API files yourself.

The names of the library files to use when linking C API client applications depend on the library type and platform for which a distribution is built:

- On Unix (and Unix-like) systems, the static library is `libmysqlclient.a`. The dynamic library is `libmysqlclient.so` on most Unix systems and `libmysqlclient.dylib` on macOS.

- On Windows, the static library is `mysqlclient.lib` and the dynamic library is `libmysql.dll`. Windows distributions also include `libmysql.lib`, a static import library needed for using the dynamic library.

Windows distributions also include a set of debug libraries. These have the same names as the nondebug libraries, but are located in the `lib/debug` library. You must use the debug libraries when compiling clients built using the debug C runtime.

On Unix, you may also see libraries that include `_r` in the names. Before MySQL 5.5, these were built as thread-safe (re-entrant) libraries separately from the non-`_r` libraries. As of 5.5, both libraries are the same and the `_r` names are symbolic links to the corresponding non-`_r` names. There is no need to use the `_r` libraries. For example, if you use `mysql_config` to obtain linker flags, you can use `mysql_config --libs` in all cases, even for threaded clients. There is no need to use `mysql_config --libs_r`.

### 28.6.2 Example C API Client Programs

Many of the clients in MySQL source distributions are written in C, such as `mysql`, `mysqladmin`, and `mysqlshow`. If you are looking for examples that demonstrate how to use the C API, take a look at those clients: Obtain a source distribution and look in its `client` directory. See Section 2.1.2, “How to Get MySQL”.

For information about individual C API functions, the sections for most functions include usage examples.

### 28.6.3 Building and Running C API Client Programs

The following sections provide information on building client programs that use the C API. Topics include compiling and linking clients, writing threaded clients, and troubleshooting runtime problems.

#### 28.6.3.1 Building C API Client Programs

This section provides guidelines for compiling C programs that use the MySQL C API.

- **Compiling MySQL Clients on Unix**
- **Compiling MySQL Clients on Microsoft Windows**
- **Troubleshooting Problems Linking to the MySQL Client Library**

**Compiling MySQL Clients on Unix**

The examples here use `gcc` as the compiler. A different compiler might be appropriate on some systems (for example, `clang` on macOS or FreeBSD, or Sun Studio on Solaris). Adjust the examples as necessary.

You may need to specify an `-I` option when you compile client programs that use MySQL header files, so that the compiler can find them. For example, if the header files are installed in `/usr/local/mysql/include`, use this option in the compile command:
You can link your code with either the dynamic or static MySQL C client library. The dynamic library base name is `libmysqlclient` and the suffix differs by platform (for example, `.so` for Linux, `.dylib` for macOS). The static library is named `libmysqlclient.a` on all platforms.

MySQL clients must be linked using the `-lmysqlclient` option in the link command. You may also need to specify a `--L` option to tell the linker where to find the library. For example, if the library is installed in `/usr/local/mysql/lib`, use these options in the link command:

```
-L/usr/local/mysql/lib -lmysqlclient
```

The path names may differ on your system. Adjust the `-I` and `-L` options as necessary.

To make it simpler to compile MySQL programs on Unix, use the `mysql_config` script. See Section 4.7.1, "mysql_config — Display Options for Compiling Clients".

`mysql_config` displays the options needed for compiling or linking:

```
mysql_config --cflags
mysql_config --libs
```

You can invoke those commands at the command line to get the proper options and add them manually to compilation or link commands. Alternatively, include the output from `mysql_config` directly within command lines using backticks:

```
gcc -c `mysql_config --cflags` proname.c
gcc -o proname proname.o `mysql_config --libs`
```

On Unix, linking uses dynamic libraries by default. To link to the static client library instead, add its path name to the link command. For example, if the library is located in `/usr/local/mysql/lib`, link like this:

```
gcc -o proname proname.o /usr/local/mysql/lib/libmysqlclient.a
```

Or use `mysql_config` to provide the path to the library:

```
gcc -o proname proname.o `mysql_config --variable=pkglibdir`/libmysqlclient.a
```

`mysql_config` does not currently provide a way to list all libraries needed for static linking, so it might be necessary to name additional libraries on the link command (for example, `-lnsl -lsocket` on Solaris). To get an idea which libraries to add, use `mysql_config --libs` and `ldd libmysqlclient.so` (or `otool -L libmysqlclient.dylib` on macOS).

`pkg-config` can be used as an alternative to `mysql_config` for obtaining information such as compiler flags or link libraries required to compile MySQL applications. For example, the following pairs of commands are equivalent:

```
mysql_config --cflags
pkg-config --cflags mysqlclient
mysql_config --libs
pkg-config --libs mysqlclient
```

To produce flags for static linking, use this command:

```
pkg-config --static --libs mysqlclient
```

For more information, see Section 28.6.3.2, “Building C API Client Programs Using pkg-config”.
Compiling MySQL Clients on Microsoft Windows

To specify header and library file locations, use the facilities provided by your development environment.

To build C API clients on Windows, you must link in the C client library, as well as the Windows ws2_32 sockets library and Secur32 security library.

You can link your code with either the dynamic or static MySQL C client library:

- The dynamic library is named `libmysql.dll`. In addition, the `libmysql.lib` static import library is needed for using the dynamic library.

- The static library is named `mysqlclient.lib`. To link with the static C client library, the client application must be compiled with the same version of Visual Studio used to compile the C client library (which is Visual Studio 2015 for the static C client library built by Oracle).

When using the Oracle-built MySQL C client library, follow these rules when it comes to linking the C runtime for your client application:

- For the MySQL C client library from a Community distribution of MySQL:
  - Always link dynamically to the C runtime (use the `/MD` compiler option), whether you are linking to the static or dynamic C client library. Also, target hosts running the client application must have the Visual C++ Redistributable for Visual Studio 2015 installed.

- For the MySQL C client library from a Commercial distribution of MySQL:
  - If linking to the static C client library, link statically to the C runtime (use the `/MT` compiler option).
  - If linking to the dynamic C client library, link either statically or dynamically to the C runtime (use either `/MT` or `/MD` compiler option).

In general, when linking to a static MySQL C client library, the client library and the client application must use the same compiler options when it comes to linking the C runtime—that is, if your C client library is compiled with the `/MT` option, your client application should also be compiled with the `/MT` option, and so on (see the MSDN page describing the C library linking options for more details). Follow this rule when you build your own static MySQL C client library from a source distribution of MySQL and link your client application to it.

**Note**

*Debug Mode:* Because of the just-mentioned linking rule, you cannot build your application in debug mode (with the `/MTd` or `/MDd` compiler option) and link it to a static C client library built by Oracle, which is not built with the debug options. Instead, you must build the static client library from source with the debug options.

Troubleshooting Problems Linking to the MySQL Client Library

The MySQL client library includes SSL support built in. It is unnecessary to specify either `-lssl` or `-lcrypto` at link time. Doing so may in fact result in problems at runtime.

If the linker cannot find the MySQL client library, you might get undefined-reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
```
Building and Running C API Client Programs

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the path name of the directory where the client library is located. To determine the correct directory, try this command:

```bash
mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well. You can include `mysql_config` output directly in your compile or link command using backticks. For example:

```bash
gcc -o proname proname.o `mysql_config --libs`
```

If an error occurs at link time that the `floor` symbol is undefined, link to the math library by adding `-lm` to the end of the compile/link line. Similarly, if you get undefined-reference errors for other functions that should exist on your system, such as `connect()`, check the manual page for the function in question to determine which libraries you should add to the link command.

If you get undefined-reference errors such as the following for functions that do not exist on your system, it usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours:

```plaintext
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

In this case, you should download a source distribution for the latest version of MySQL and compile the MySQL client library yourself. See Section 2.9, “Installing MySQL from Source”.

### 28.6.3.2 Building C API Client Programs Using pkg-config

MySQL distributions contain a `mysqlclient.pc` file that provides information about MySQL configuration for use by the `pkg-config` command. This enables `pkg-config` to be used as an alternative to `mysql_config` for obtaining information such as compiler flags or link libraries required to compile MySQL applications. For example, the following pairs of commands are equivalent:

```bash
mysql_config --cflags
pkg-config --cflags mysqlclient
```

```bash
mysql_config --libs
pkg-config --libs mysqlclient
```

The last `pkg-config` command produces flags for dynamic linking. To produce flags for static linking, use this command:

```bash
pkg-config --static --libs mysqlclient
```

On some platforms, the output with and without `--static` might be the same.

**Note**

If `pkg-config` does not find MySQL information, it might be necessary to set the `PKG_CONFIG_PATH` environment variable to the directory in which the `mysqlclient.pc` file is located, which by default is usually the `pkgconfig` directory under the MySQL library directory. For example (adjust the location appropriately):

```bash
# For sh, bash, ...
```
The `--variable` option takes a configuration variable name and displays the variable value:

```bash
# installation prefix directory
pkg-config --variable=prefix mysqlclient
# header file directory
pkg-config --variable=includedir mysqlclient
# library directory
pkg-config --variable=libdir mysqlclient
```

To see which variable values `pkg-config` can display using the `--variable` option, use this command:

```bash
pkg-config --print-variables mysqlclient
```

You can use `pkg-config` within a command line using backticks to include the output that it produces for particular options. For example, to compile and link a MySQL client program, use `pkg-config` as follows:

```bash
gcc -c `pkg-config --cflags mysqlclient` progname.c
gcc -o progname progname.o `pkg-config --libs mysqlclient`
```

### 28.6.3.3 Writing C API Threaded Client Programs

This section provides guidance for writing client programs that use the thread-related functions in the MySQL C API. For further information about these functions, see Section 28.6.15, “C API Threaded Function Descriptions”. For examples of source code that uses them, look in the `client` directory of a MySQL source distribution:

- The source for `mysqlimport` uses threading in the code associated with the `--use-threads` option.
- The source for `mysqlslap` uses threads to set up simultaneous workloads, to test server operation under high load.

As an alternative to thread programming, applications may find the asynchronous (nonblocking) C API functions useful. These functions enable applications to submit multiple outstanding requests to the server and determine when each has finished using polling. For more information, see Section 28.6.11, “C API Asynchronous Interface”.

If undefined-reference errors occur when linking a threaded program against the MySQL client library, the most likely cause is that you did not include the thread libraries on the link/compile command.

The client library is almost thread-safe. The biggest problem is that the subroutines in `sql/net_serv.cc` that read from sockets are not interrupt-safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, socket handling should be thread-safe.

To avoid aborting the program when a connection terminates, MySQL blocks `SIGPIPE` on the first call to `mysql_library_init()`, `mysql_init()`, or `mysql_connect()`. To use your own `SIGPIPE` handler, first call `mysql_library_init()`, then install your handler.

The client library is thread-safe per connection. Two threads can share the same connection with the following caveats:
• Unless you are using the asynchronous C API functions mentioned previously, multiple threads cannot send a query to the MySQL server at the same time on the same connection. In particular, you must ensure that between calls to `mysql_query()` and `mysql_store_result()` in one thread, no other thread uses the same connection. To do this, use a mutex lock around your pair of `mysql_query()` and `mysql_store_result()` calls. After `mysql_store_result()` returns, the lock can be released and other threads may query the same connection.

If you use POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

Note

If you examine programs in a MySQL source distribution, instead of calls to `pthread_mutex_lock()` and `pthread_mutex_unlock()`, you will see calls to `native_mutex_lock()` and `native_mutex_unlock()`. The latter functions are defined in the `thr_mutex.h` header file and map to platform-specific mutex functions.

• Multiple threads can access different result sets that are retrieved with `mysql_store_result()`.

• To use `mysql_use_result()`, you must ensure that no other thread uses the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.

If a thread does not create the connection to the MySQL database but calls MySQL functions, take the following into account:

When you call `mysql_init()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things). If you call a MySQL function before the thread has called `mysql_init()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later. To avoid problems, you must do the following:

1. Call `mysql_library_init()` before any other MySQL functions. It is not thread-safe, so call it before threads are created, or protect the call with a mutex.

2. Arrange for `mysql_thread_init()` to be called early in the thread handler before calling any MySQL function. (If you call `mysql_init()`, it calls `mysql_thread_init()` for you.)

3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

The preceding notes regarding `mysql_init()` also apply to `mysql_connect()`, which calls `mysql_init()`.

### 28.6.3.4 Running C API Client Programs

If, after an upgrade, you experience problems with compiled client programs, such as `Commands out of sync` or unexpected core dumps, the programs were probably compiled using old header or library files. In this case, check the date of the `mysql.h` header file and `libmysqlclient.a` library used for compilation to verify that they are from the new MySQL distribution. If not, recompile the programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example, from `libmysqlclient.so.17` to `libmysqlclient.so.18`).

The major shared client library version determines compatibility. (For example, for `libmysqlclient.so.18.1.0`, the major version is 18.) Libraries shipped with newer versions of MySQL...
are drop-in replacements for older versions that have the same major number. As long as the major library version is the same, you can upgrade the library and old applications should continue to work with it.

Undefined-reference errors might occur at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `libmysqlclient` library cannot be found, it means that your system cannot find the shared `libmysqlclient.so` library. The solution to this problem is to tell your system to search for shared libraries in the directory where that library is located. Use whichever of the following methods is appropriate for your system:

- Add the path of the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` or `LD_LIBRARY` environment variable.
- On macOS, add the path of the directory where `libmysqlclient.dylib` is located to the `DYLD_LIBRARY_PATH` environment variable.
- Copy the shared-library files (such as `libmysqlclient.so`) to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`. Be sure to copy all related files. A shared library might exist under several names, using symlinks to provide the alternate names.

### 28.6.3.5 C API Server Version and Client Library Version

The string and numeric forms of the MySQL server version are available at compile time as the values of the `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` macros, and at runtime as the values of the `mysql_get_server_info()` and `mysql_get_server_version()` functions.

The client library version is the MySQL version. The string and numeric forms of this version are available at compile time as the values of the `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` macros, and at runtime as the values of the `mysql_get_client_info()` and `mysql_get_client_version()` functions.

### 28.6.4 C API Data Structures

This section describes C API data structures other than those used for prepared statements, the asychronous interface, or the replication stream interface. For information about those, see Section 28.6.8, “C API Prepared Statement Data Structures”, Section 28.6.12, “C API Asynchronous Interface Data Structures”, and Section 28.6.18, “C API Binary Log Data Structures”.

- **MYSQL**

  This structure represents handler for one database connection. It is used for almost all MySQL functions. Do not try to make a copy of a `MYSQL` structure. There is no guarantee that such a copy will be usable.

- **MYSQL_RES**

  This structure represents the result of a query that returns rows (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`). The information returned from a query is called the *result set* in the remainder of this section.

- **MYSQL_ROW**

  This is a type-safe representation of one row of data. It is currently implemented as an array of counted byte strings. (You cannot treat these as null-terminated strings if field values may contain binary data, because such values may contain null bytes internally.) Rows are obtained by calling `mysql_fetch_row()`.

- **MYSQL_FIELD**
This structure contains metadata: information about a field, such as the field's name, type, and size. Its members are described in more detail later in this section. You may obtain the `MYSQL_FIELD` structures for each field by calling `mysql_fetch_field()` repeatedly. Field values are not part of this structure; they are contained in a `MYSQL_ROW` structure.

- **MYSQL_FIELD_OFFSET**
  
  This is a type-safe representation of an offset into a MySQL field list. (Used by `mysql_field_seek()`.) Offsets are field numbers within a row, beginning at zero.

- **my_ulonglong**
  
  A type used for 64-bit unsigned integers. The `my_ulonglong` type was used before MySQL 8.0.18. As of MySQL 8.0.18, use the `uint64_t` C type instead.

- **my_bool**
  
  A boolean type, for values that are true (nonzero) or false (zero). The `my_bool` type was used before MySQL 8.0. As of MySQL 8.0, use the `bool` or `int` C type instead.

  **Note**
  
  The change from `my_bool` to `bool` means that the `mysql.h` header file requires a C++ or C99 compiler to compile.

The `MYSQL_FIELD` structure contains the members described in the following list. The definitions apply primarily for columns of result sets such as those produced by `SELECT` statements. `MYSQL_FIELD` structures are also used to provide metadata for `OUT` and `INOUT` parameters returned from stored procedures executed using prepared `CALL` statements. For such parameters, some of the structure members have a meaning different from the meaning for column values.

- **char * name**
  
  The name of the field, as a null-terminated string. If the field was given an alias with an `AS` clause, the value of `name` is the alias. For a procedure parameter, the parameter name.

- **char * org_name**
  
  The name of the field, as a null-terminated string. Aliases are ignored. For expressions, the value is an empty string. For a procedure parameter, the parameter name.

- **char * table**
  
  The name of the table containing this field, if it is not a calculated field. For calculated fields, the `table` value is an empty string. If the column is selected from a view, `table` names the view. If the table or view was given an alias with an `AS` clause, the value of `table` is the alias. For a `UNION`, the value is the empty string. For a procedure parameter, the procedure name.

- **char * org_table**
  
  The name of the table, as a null-terminated string. Aliases are ignored. If the column is selected from a view, `org_table` names the view. If the column is selected from a derived table, `org_table` names the base table. If a derived table wraps a view, `org_table` still names the base table. If the column is an expression, `org_table` is the empty string. For a `UNION`, the value is the empty string. For a procedure parameter, the value is the procedure name.

- **char * db**
The name of the database that the field comes from, as a null-terminated string. If the field is a calculated field, `db` is an empty string. For a `UNION`, the value is the empty string. For a procedure parameter, the name of the database containing the procedure.

- `char * catalog`
  The catalog name. This value is always "def".

- `char * def`
  The default value of this field, as a null-terminated string. This is set only if you use `mysql_list_fields()`.

- `unsigned long length`
  The width of the field. This corresponds to the display length, in bytes.
  The server determines the `length` value before it generates the result set, so this is the minimum length required for a data type capable of holding the largest possible value from the result column, without knowing in advance the actual values that will be produced by the query for the result set.

- `unsigned long max_length`
  The maximum width of the field for the result set (the length in bytes of the longest field value for the rows actually in the result set). If you use `mysql_store_result()` or `mysql_list_fields()`, this contains the maximum length for the field. If you use `mysql_use_result()`, the value of this variable is zero.
  The value of `max_length` is the length of the string representation of the values in the result set. For example, if you retrieve a `FLOAT` column and the "widest" value is -12.345, `max_length` is 7 (the length of '-12.345').
  If you are using prepared statements, `max_length` is not set by default because for the binary protocol the lengths of the values depend on the types of the values in the result set. (See Section 28.6.8, “C API Prepared Statement Data Structures”.) If you want the `max_length` values anyway, enable the `STMT_ATTR_UPDATE_MAX_LENGTH` option with `mysql_stmt_attr_set()` and the lengths will be set when you call `mysql_stmt_store_result()`.(See Section 28.6.10.3, “mysql_stmt_attr_set()”, and Section 28.6.10.28, “mysql_stmt_store_result()”.)

- `unsigned int name_length`
  The length of `name`.

- `unsigned int org_name_length`
  The length of `org_name`.

- `unsigned int table_length`
  The length of `table`.

- `unsigned int org_table_length`
  The length of `org_table`.

- `unsigned int db_length`
  The length of `db`. 
• unsigned int catalog_length
  The length of catalog.

• unsigned int def_length
  The length of def.

• unsigned int flags

  Bit-flags that describe the field. The flags value may have zero or more of the bits set that are shown in the following table.

<table>
<thead>
<tr>
<th>Flag Value</th>
<th>Flag Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT_NULL_FLAG</td>
<td>Field cannot be NULL</td>
</tr>
<tr>
<td>PRI_KEY_FLAG</td>
<td>Field is part of a primary key</td>
</tr>
<tr>
<td>UNIQUE_KEY_FLAG</td>
<td>Field is part of a unique key</td>
</tr>
<tr>
<td>MULTIPLE_KEY_FLAG</td>
<td>Field is part of a nonunique key</td>
</tr>
<tr>
<td>UNSIGNED_FLAG</td>
<td>Field has the UNSIGNED attribute</td>
</tr>
<tr>
<td>ZEROFILL_FLAG</td>
<td>Field has the ZEROFILL attribute</td>
</tr>
<tr>
<td>BINARY_FLAG</td>
<td>Field has the BINARY attribute</td>
</tr>
<tr>
<td>AUTO_INCREMENT_FLAG</td>
<td>Field has the AUTO_INCREMENT attribute</td>
</tr>
<tr>
<td>ENUM_FLAG</td>
<td>Field is an ENUM</td>
</tr>
<tr>
<td>SET_FLAG</td>
<td>Field is a SET</td>
</tr>
<tr>
<td>BLOB_FLAG</td>
<td>Field is a BLOB or TEXT (deprecated)</td>
</tr>
<tr>
<td>TIMESTAMP_FLAG</td>
<td>Field is a TIMESTAMP (deprecated)</td>
</tr>
<tr>
<td>NUM_FLAG</td>
<td>Field is numeric; see additional notes following table</td>
</tr>
<tr>
<td>NO_DEFAULT_VALUE_FLAG</td>
<td>Field has no default value; see additional notes following table</td>
</tr>
</tbody>
</table>

Some of these flags indicate data type information and are superseded by or used in conjunction with the MYSQL_TYPE_xxx value in the field->type member described later:

• To check for BLOB or TIMESTAMP values, check whether type is MYSQL_TYPE_BLOB or MYSQL_TYPE_TIMESTAMP. (The BLOB_FLAG and TIMESTAMP_FLAG flags are unneeded.)

• ENUM and SET values are returned as strings. For these, check that the type value is MYSQL_TYPE_STRING and that the ENUM.Flag or SET_FLAG flag is set in the flags value.

NUM_FLAG indicates that a column is numeric. This includes columns with a type of
  MYSQL_TYPE_DECIMAL, MYSQL_TYPE_NEWDECIMAL, MYSQL_TYPE_TINY, MYSQL_TYPE_SHORT, MYSQL_TYPE_LONG, MYSQL_TYPE_FLOAT, MYSQL_TYPE_DOUBLE, MYSQL_TYPE_NULL, MYSQL_TYPE_LONGLONG, MYSQL_TYPE_INT24, and MYSQL_TYPE_YEAR.

NO_DEFAULT_VALUE_FLAG indicates that a column has no DEFAULT clause in its definition. This does not apply to NULL columns (because such columns have a default of NULL), or to AUTO_INCREMENT columns (which have an implied default value).

The following example illustrates a typical use of the flags value:

```c
if (field->flags & NOT_NULL_FLAG)
```
printf("Field cannot be null
");

You may use the convenience macros shown in the following table to determine the boolean status of the `flags` value.

<table>
<thead>
<tr>
<th>Flag Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>IS_NOT_NULL(flags)</code></td>
<td>True if this field is defined as NOT NULL</td>
</tr>
<tr>
<td><code>IS_PRI_KEY(flags)</code></td>
<td>True if this field is a primary key</td>
</tr>
<tr>
<td><code>IS_BLOB(flags)</code></td>
<td>True if this field is a BLOB or TEXT (deprecated; test field-&gt;type instead)</td>
</tr>
</tbody>
</table>

- `unsigned int decimals`

  The number of decimals for numeric fields, and the fractional seconds precision for temporal fields.

- `unsigned int charsetnr`

  An ID number that indicates the character set/collation pair for the field.

  Normally, character values in result sets are converted to the character set indicated by the `character_set_results` system variable. In this case, `charsetnr` corresponds to the character set indicated by that variable. Character set conversion can be suppressed by setting `character_set_results` to `NULL`. In this case, `charsetnr` corresponds to the character set of the original table column or expression. See also [Section 10.4, “Connection Character Sets and Collations”](#section10.4).

  To distinguish between binary and nonbinary data for string data types, check whether the `charsetnr` value is 63. If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

  `charsetnr` values are the same as those displayed in the `Id` column of the `SHOW COLLATION` statement or the `ID` column of the `INFORMATION_SCHEMA.COLLATIONS` table. You can use those information sources to see which character set and collation specific `charsetnr` values indicate:

```sql
mysql> SHOW COLLATION WHERE Id = 63;
+------------+---------+----+---------+----------+---------+
| Collation  | Charset | Id | Default | Compiled | Sortlen |
+------------+---------+----+---------+----------+---------+
| binary     | binary  | 63 | Yes     | Yes      | 1       |
+------------+---------+----+---------+----------+---------+
```

```sql
mysql> SELECT COLLATION_NAME, CHARACTER_SET_NAME
FROM INFORMATION_SCHEMA.COLLATIONS WHERE ID = 33;
+---------------+-----------------+
| COLLATION_NAME | CHARACTER_SET_NAME |
+---------------+-----------------+
| utf8_general_ci | utf8            |
+---------------+-----------------+
```

- `enum enum_field_types type`

  The type of the field. The `type` value may be one of the `MYSQL_TYPE_` symbols shown in the following table.

<table>
<thead>
<tr>
<th>Type Value</th>
<th>Type Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>MYSQL_TYPE_TINY</code></td>
<td>TINYINT field</td>
</tr>
<tr>
<td>Type Value</td>
<td>Type Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>MYSQL_TYPE_SHORT</td>
<td>SMALLINT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_LONG</td>
<td>INTEGER field</td>
</tr>
<tr>
<td>MYSQL_TYPE_INT24</td>
<td>MEDIUMINT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_LONGLONG</td>
<td>BIGINT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_DECIMAL</td>
<td>DECIMAL or NUMERIC field</td>
</tr>
<tr>
<td>MYSQL_TYPE_NEWDECIMAL</td>
<td>Precision math DECIMAL or NUMERIC</td>
</tr>
<tr>
<td>MYSQL_TYPE_FLOAT</td>
<td>FLOAT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_DOUBLE</td>
<td>DOUBLE or REAL field</td>
</tr>
<tr>
<td>MYSQL_TYPE_BIT</td>
<td>BIT field</td>
</tr>
<tr>
<td>MYSQL_TYPE_TIMESTAMP</td>
<td>TIMESTAMP field</td>
</tr>
<tr>
<td>MYSQL_TYPE_DATE</td>
<td>DATE field</td>
</tr>
<tr>
<td>MYSQL_TYPE_TIME</td>
<td>TIME field</td>
</tr>
<tr>
<td>MYSQL_TYPE_DATETIME</td>
<td>DATETIME field</td>
</tr>
<tr>
<td>MYSQL_TYPE_YEAR</td>
<td>YEAR field</td>
</tr>
<tr>
<td>MYSQL_TYPE_STRING</td>
<td>CHAR or BINARY field</td>
</tr>
<tr>
<td>MYSQL_TYPE_VAR_STRING</td>
<td>VARCHAR or VARBINARY field</td>
</tr>
<tr>
<td>MYSQL_TYPE_BLOB</td>
<td>BLOB or TEXT field (use max_length to determine the maximum length)</td>
</tr>
<tr>
<td>MYSQL_TYPE_SET</td>
<td>SET field</td>
</tr>
<tr>
<td>MYSQL_TYPE_ENUM</td>
<td>ENUM field</td>
</tr>
<tr>
<td>MYSQL_TYPE_GEOMETRY</td>
<td>Spatial field</td>
</tr>
<tr>
<td>MYSQL_TYPE_NULL</td>
<td>NULL-type field</td>
</tr>
</tbody>
</table>

The `MYSQL_TYPE_TIME2`, `MYSQL_TYPE_DATETIME2`, and `MYSQL_TYPE_TIMESTAMP2` type codes are used only on the server side. Clients see the `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, and `MYSQL_TYPE_TIMESTAMP` codes.

You can use the `IS_NUM()` macro to test whether a field has a numeric type. Pass the `type` value to `IS_NUM()` and it evaluates to TRUE if the field is numeric:

```c
if (IS_NUM(field->type))
    printf("Field is numeric\n");
```

`ENUM` and `SET` values are returned as strings. For these, check that the `type` value is `MYSQL_TYPE_STRING` and that the `ENUM_FLAG` or `SET_FLAG` flag is set in the `flags` value.

### 28.6.5 C API Function Overview

The following list summarizes the functions available in the C API. For greater detail, see the descriptions in Section 28.6.6, “C API Function Descriptions”.

- `my_init()` : Initializes global variables and the thread handler in thread-safe programs.
- `mysql_affected_rows()` : Returns the number of rows changed/deleted/inserted by the last UPDATE, DELETE, or INSERT query.
- `mysql_autocommit()` : Toggles autocommit mode on/off.
• `mysql_change_user()`: Changes the user and database on an open connection.
• `mysql_character_set_name()`: Returns the default character set name for the current connection.
• `mysql_client_find_plugin()`: Returns a pointer to a plugin.
• `mysql_client_register_plugin()`: Registers a plugin.
• `mysql_close()`: Closes a server connection.
• `mysql_commit()`: Commits the transaction.
• `mysql_connect()`: Connects to a MySQL server. This function is deprecated; use `mysql_real_connect()` instead.
• `mysql_create_db()`: Creates a database. This function is deprecated; use the SQL statement `CREATE DATABASE` instead.
• `mysql_data_seek()`: Seeks to an arbitrary row number in a query result set.
• `mysql_debug()`: Does a `DBUG_PUSH` with the given string.
• `mysql_drop_db()`: Drops a database. This function is deprecated; use the SQL statement `DROP DATABASE` instead.
• `mysql_dump_debug_info()`: Causes the server to write debug information to the log.
• `mysql_eof()`: Determines whether the last row of a result set has been read. This function is deprecated; use `mysql_errno()` or `mysql_error()` instead.
• `mysql_errno()`: Returns the error number for the most recently invoked MySQL function.
• `mysql_error()`: Returns the error message for the most recently invoked MySQL function.
• `mysql_escape_string()`: Escapes special characters in a string for use in an SQL statement.
• `mysql_fetch_field()`: Returns the type of the next table field.
• `mysql_fetch_field_direct()`: Returns the type of a table field, given a field number.
• `mysql_fetch_fields()`: Returns an array of all field structures.
• `mysql_fetch_lengths()`: Returns the lengths of all columns in the current row.
• `mysql_fetch_row()`: Fetches the next row from the result set.
• `mysql_field_count()`: Returns the number of result columns for the most recent statement.
• `mysql_field_seek()`: Puts the column cursor on a specified column.
• `mysql_field_tell()`: Returns the position of the field cursor used for the last `mysql_fetch_field()`.
• `mysql_free_result()`: Frees memory used by a result set.
• `mysql_get_character_set_info()`: Returns information about default character set.
• `mysql_get_client_info()`: Returns client version information as a string.
• `mysql_get_client_version()`: Returns client version information as an integer.
• **mysql_get_host_info()**: Returns a string describing the connection.
• **mysql_get_option()**: Returns the value of a mysql_options() option.
• **mysql_get_proto_info()**: Returns the protocol version used by the connection.
• **mysql_get_server_info()**: Returns the server version number.
• **mysql_get_server_version()**: Returns the server version number as an integer.
• **mysql_get_ssl_cipher()**: Returns the current SSL cipher.
• **mysql_hex_string()**: Encodes a string in hexadecimal format.
• **mysql_info()**: Returns information about the most recently executed query.
• **mysql_init()**: Gets or initializes a MYSQL structure.
• **mysql_insert_id()**: Returns the ID generated for an AUTO_INCREMENT column by the previous query.
• **mysql_kill()**: Kills a given thread.
• **mysql_library_end()**: Finalizes the MySQL C API library.
• **mysql_library_init()**: Initializes the MySQL C API library.
• **mysql_list_dbs()**: Returns database names matching a simple regular expression.
• **mysql_list_fields()**: Returns field names matching a simple regular expression.
• **mysql_list_processes()**: Returns a list of the current server threads.
• **mysql_list_tables()**: Returns table names matching a simple regular expression.
• **mysql_load_plugin()**: Loads a plugin.
• **mysql_load_plugin_v()**: Loads a plugin.
• **mysql_more_results()**: Checks whether any more results exist.
• **mysql_next_result()**: Returns/initiates the next result in multiple-result executions.
• **mysql_num_fields()**: Returns the number of columns in a result set.
• **mysql_num_rows()**: Returns the number of rows in a result set.
• **mysql_options()**: Sets connect options for mysql_real_connect().
• **mysql_options4()**: Sets connect options for mysql_real_connect().
• **mysql_ping()**: Checks whether the connection to the server is working, reconnecting as necessary.
• **mysql_plugin_options()**: Sets a plugin option.
• **mysql_query()**: Executes an SQL query specified as a null-terminated string.
• **mysql_real_connect()**: Connects to a MySQL server.
• **mysql_real_escape_string()**: Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection.
C API Function Overview

- **mysql_real_escape_string_quote()**: Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection and the quoting context.
- **mysql_real_query()**: Executes an SQL query specified as a counted string.
- **mysql_refresh()**: Flushes or resets tables and caches.
- **mysql_reload()**: Tells the server to reload the grant tables.
- **mysql_reset_connection()**: Resets the connection to clear session state.
- **mysql_reset_server_public_key()**: Clears a cached RSA public key from the client library.
- **mysql_result_metadata()**: Whether a result set has metadata.
- **mysql_rollback()**: Rolls back the transaction.
- **mysql_row_seek()**: Seeks to a row offset in a result set, using value returned from **mysql_row_tell()**.
- **mysql_row_tell()**: Returns the row cursor position.
- **mysql_select_db()**: Selects a database.
- **mysql_server_end()**: Finalizes the MySQL C API library.
- **mysql_server_init()**: Initializes the MySQL C API library.
- **mysql_session_track_get_first()**: Gets the first part of session state-change information.
- **mysql_session_track_get_next()**: Gets the next part of session state-change information.
- **mysql_set_character_set()**: Sets the default character set for the current connection.
- **mysql_set_local_infile_default()**: Sets the LOAD DATA LOCAL handler callbacks to their default values.
- **mysql_set_local_infile_handler()**: Installs application-specific LOAD DATA LOCAL handler callbacks.
- **mysql_set_server_option()**: Sets an option for the connection (like multi-statements).
- **mysql_sqlstate()**: Returns the SQLSTATE error code for the last error.
- **mysql_shutdown()**: Shuts down the database server.
- **mysql_ssl_set()**: Prepares to establish an SSL connection to the server.
- **mysql_stat()**: Returns the server status as a string.
- **mysql_store_result()**: Retrieves a complete result set to the client.
- **mysql_thread_end()**: Finalizes a thread handler.
- **mysql_thread_id()**: Returns the current thread ID.
- **mysql_thread_init()**: Initializes a thread handler.
- **mysql_thread_safe()**: Returns 1 if the clients are compiled as thread-safe.
• **mysql_use_result()**: Initiates a row-by-row result set retrieval.

• **mysql_warning_count()**: Returns the warning count for the previous SQL statement.

Application programs should use this general outline for interacting with MySQL:

1. Initialize the MySQL client library by calling `mysql_library_init()`.

2. Initialize a connection handler by calling `mysql_init()` and connect to the server by calling `mysql_real_connect()`.

3. Issue SQL statements and process their results. (The following discussion provides more information about how to do this.)

4. Close the connection to the MySQL server by calling `mysql_close()`.

5. End use of the MySQL client library by calling `mysql_library_end()`.

The purpose of calling `mysql_library_init()` and `mysql_library_end()` is to provide proper initialization and finalization of the MySQL client library. For applications that are linked with the client library, they provide improved memory management. If you do not call `mysql_library_end()`, a block of memory remains allocated. (This does not increase the amount of memory used by the application, but some memory leak detectors will complain about it.)

In a nonmultithreaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multithreaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly through `mysql_init()`. This should be done prior to any other client library call.

To connect to the server, call `mysql_init()` to initialize a connection handler, then call `mysql_real_connect()` with that handler (along with other information such as the host name, user name, and password). Upon connection, `mysql_real_connect()` sets the reconnect flag (part of the `MYSQL` structure) to a value of 1 in versions of the API older than 5.0.3, or 0 in newer versions. A value of 1 for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior. When you are done with the connection, call `mysql_close()` to terminate it. Do not use the handler after it has been closed.

While a connection is active, the client may send SQL statements to the server using `mysql_query()` or `mysql_real_query()`. The difference between the two is that `mysql_query()` expects the query to be specified as a null-terminated string whereas `mysql_real_query()` expects a counted string. If the string contains binary data (which may include null bytes), you must use `mysql_real_query()`.

For each non-**SELECT** query (for example, **INSERT**, **UPDATE**, **DELETE**), you can find out how many rows were changed (affected) by calling `mysql_affected_rows()`.

For **SELECT** queries, you retrieve the selected rows as a result set. (Note that some statements are **SELECT**-like in that they return rows. These include **SHOW**, **DESCRIBE**, and **EXPLAIN**. Treat these statements the same way as **SELECT** statements.)

There are two ways for a client to process result sets. One way is to retrieve the entire result set all at once by calling `mysql_store_result()`. This function acquires from the server all the rows returned by the query and stores them in the client. The second way is for the client to initiate a row-by-row result set retrieval by calling `mysql_use_result()`. This function initializes the retrieval, but does not actually get any rows from the server.
In both cases, you access rows by calling `mysql_fetch_row()`. With `mysql_store_result()`, `mysql_fetch_row()` accesses rows that have previously been fetched from the server. With `mysql_use_result()` and `mysql_fetch_row()` actually retrieves the row from the server. Information about the size of the data in each row is available by calling `mysql_fetch_lengths()`.

After you are done with a result set, call `mysql_free_result()` to free the memory used for it.

The two retrieval mechanisms are complementary. Choose the approach that is most appropriate for each client application. In practice, clients tend to use `mysql_store_result()` more commonly.

An advantage of `mysql_store_result()` is that because the rows have all been fetched to the client, you not only can access rows sequentially, you can move back and forth in the result set using `mysql_data_seek()` or `mysql_row_seek()` to change the current row position within the result set. You can also find out how many rows are there by calling `mysql_num_rows()`. On the other hand, the memory requirements for `mysql_store_result()` may be very high for large result sets and you are more likely to encounter out-of-memory conditions.

An advantage of `mysql_use_result()` is that the client requires less memory for the result set because it maintains only one row at a time (and because there is less allocation overhead, `mysql_use_result()` can be faster). Disadvantages are that you must process each row quickly to avoid tying up the server, you do not have random access to rows within the result set (you can only access rows sequentially), and the number of rows in the result set is unknown until you have retrieved them all. Furthermore, you must retrieve all the rows even if you determine in mid-retrieval that you've found the information you were looking for.

The API makes it possible for clients to respond appropriately to statements (retrieving rows only as necessary) without knowing whether the statement is a `SELECT`. You can do this by calling `mysql_store_result()` after each `mysql_query()` (or `mysql_real_query()`). If the result set call succeeds, the statement was a `SELECT` and you can read the rows. If the result set call fails, call `mysql_field_count()` to determine whether a result was actually to be expected. If `mysql_field_count()` returns zero, the statement returned no data (indicating that it was an `INSERT`, `UPDATE`, `DELETE`, and so forth), and was not expected to return rows. If `mysql_field_count()` is nonzero, the statement should have returned rows, but did not. This indicates that the statement was a `SELECT` that failed. See the description for `mysql_field_count()` for an example of how this can be done.

Both `mysql_store_result()` and `mysql_use_result()` enable you to obtain information about the fields that make up the result set (the number of fields, their names and types, and so forth). You can access field information sequentially within the row by calling `mysql_fetch_field()` repeatedly, or by field number within the row by calling `mysql_fetch_field_direct()`. The current field cursor position may be changed by calling `mysql_field_seek()`. Setting the field cursor affects subsequent calls to `mysql_fetch_field()`. You can also get information for fields all at once by calling `mysql_fetch_fields()`.

For detecting and reporting errors, MySQL provides access to error information by means of the `mysql_errno()` and `mysql_error()` functions. These return the error code or error message for the most recently invoked function that can succeed or fail, enabling you to determine when an error occurred and what it was.

### 28.6.6 C API Function Descriptions

This section describes C API functions other than those used for prepared statements, the asynchronous interface, or the replication stream interface. For information about those, see Section 28.6.10, “C API Prepared Statement Function Descriptions”, Section 28.6.14, “C API Asynchronous Function Descriptions”, and Section 28.6.20, “C API Binary Log Function Descriptions”.

4780
In the descriptions here, a parameter or return value of NULL means NULL in the sense of the C programming language, not a MySQL NULL value.

Functions that return a value generally return a pointer or an integer. Unless specified otherwise, functions returning a pointer return a non-NULL value to indicate success or a NULL value to indicate an error, and functions returning an integer return zero to indicate success or nonzero to indicate an error. Note that “nonzero” means just that. Unless the function description says otherwise, do not test against a value other than zero:

```c
if (result)                   /* correct */
  ... error ...
if (result < 0)               /* incorrect */
  ... error ...
if (result == -1)             /* incorrect */
  ... error ...
```

When a function returns an error, the Errors subsection of the function description lists the possible types of errors. You can find out which of these occurred by calling mysql_errno(). A string representation of the error may be obtained by calling mysql_error().

### 28.6.6.1 mysql_affected_rows()

```c
uint64_t mysql_affected_rows(MYSQL *mysql)
```

**Description**

mysql_affected_rows() may be called immediately after executing a statement with mysql_query() or mysql_real_query(). It returns the number of rows changed, deleted, or inserted by the last statement if it was an UPDATE, DELETE, or INSERT. For SELECT statements, mysql_affected_rows() works like mysql_num_rows().

For UPDATE statements, the affected-rows value by default is the number of rows actually changed. If you specify the CLIENT_FOUND_ROWS flag to mysql_real_connect() when connecting to mysqld, the affected-rows value is the number of rows “found”; that is, matched by the WHERE clause.

For REPLACE statements, the affected-rows value is 2 if the new row replaced an old row, because in this case, one row was inserted after the duplicate was deleted.

For INSERT ... ON DUPLICATE KEY UPDATE statements, the affected-rows value per row is 1 if the row is inserted as a new row, 2 if an existing row is updated, and 0 if an existing row is set to its current values. If you specify the CLIENT_FOUND_ROWS flag, the affected-rows value is 1 (not 0) if an existing row is set to its current values.

Following a CALL statement for a stored procedure, mysql_affected_rows() returns the value that it would return for the last statement executed within the procedure, or 0 if that statement would return -1. Within the procedure, you can use ROW_COUNT() at the SQL level to obtain the affected-rows value for individual statements.

mysql_affected_rows() returns a meaningful value for a wide range of statements. For details, see the description for ROW_COUNT() in Section 12.15, “Information Functions”.

**Return Values**

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an UPDATE statement, no rows matched the WHERE clause in the query or that
no query has yet been executed. -1 indicates that the query returned an error or that, for a SELECT query, mysql_affected_rows() was called prior to calling mysql_store_result().

Because mysql_affected_rows() returns an unsigned value, you can check for -1 by comparing the return value to (uint64_t)-1 (or to (uint64_t)~0, which is equivalent).

Errors

None.

Example

```c
char *stmt = "UPDATE products SET cost=cost*1.25 WHERE group=10";
mysql_query(&mysql,stmt);
printf("%ld products updated", (long) mysql_affected_rows(&mysql));
```

28.6.6.2 mysql_autocommit()

```c
bool mysql_autocommit(MYSQL *mysql, bool mode)
```

Description

Sets autocommit mode on if mode is 1, off if mode is 0.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

28.6.6.3 mysql_change_user()

```c
bool mysql_change_user(MYSQL *mysql, const char *user, const char *password, const char *db)
```

Description

Changes the user and causes the database specified by db to become the default (current) database on the connection specified by mysql. In subsequent queries, this database is the default for table references that include no explicit database specifier.

mysql_change_user() fails if the connected user cannot be authenticated or does not have permission to use the database. In this case, the user and database are not changed.

Pass a db parameter of NULL if you do not want to have a default database.

This function resets the session state as if one had done a new connect and reauthenticated. (See Section 28.6.27, “C API Automatic Reconnection Control”.) It always performs a ROLLBACK of any active transactions, closes and drops all temporary tables, and unlocks all locked tables. Session system variables are reset to the values of the corresponding global system variables. Prepared statements are released and HANDLER variables are closed. Locks acquired with GET_LOCK() are released. These effects occur even if the user did not change.

To reset the connection state in a more lightweight manner without changing the user, use mysql_reset_connection().
Return Values

Zero for success. Nonzero if an error occurred.

Errors

The same that you can get from `mysql_real_connect()`, plus:

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

- **ER_UNKNOWN_COM_ERROR**
  The MySQL server does not implement this command (probably an old server).

- **ER_ACCESS_DENIED_ERROR**
  The user or password was wrong.

- **ER_BAD_DB_ERROR**
  The database did not exist.

- **ER_DBACCESS_DENIED_ERROR**
  The user did not have access rights to the database.

- **ER_WRONG_DB_NAME**
  The database name was too long.

Example

```c
if (mysql_change_user(&mysql, "user", "password", "new_database"))
{
    fprintf(stderr, "Failed to change user. Error: %s\n",
            mysql_error(&mysql));
}
```

28.6.6.4 `mysql_character_set_name()`

```c
const char *mysql_character_set_name(MYSQL *mysql)
```

Description

Returns the default character set name for the current connection.
**Return Values**

The default character set name

**Errors**

None.

### 28.6.6.5 mysql_close()

```c
void mysql_close(MYSQL *mysql)
```

**Description**

Closes a previously opened connection. `mysql_close()` also deallocates the connection handler pointed to by `mysql` if the handler was allocated automatically by `mysql_init()` or `mysql_connect()`. Do not use the handler after it has been closed.

**Return Values**

None.

**Errors**

None.

### 28.6.6.6 mysql_commit()

```c
bool mysql_commit(MYSQL *mysql)
```

**Description**

Commits the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is `RELEASE` (or 2), the server performs a release after terminating a transaction and closes the client connection. Call `mysql_close()` from the client program to close the connection from the client side.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

None.

### 28.6.6.7 mysql_connect()

```c
MYSQL *mysql_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd)
```

**Description**

This function is deprecated. Use `mysql_real_connect()` instead.
mysql_connect() attempts to establish a connection to a MySQL database engine running on host. mysql_connect() must complete successfully before you can execute any of the other API functions, with the exception of mysql_get_client_info().

The meanings of the parameters are the same as for the corresponding parameters for mysql_real_connect() with the difference that the connection parameter may be NULL. In this case, the C API allocates memory for the connection structure automatically and frees it when you call mysql_close(). The disadvantage of this approach is that you cannot retrieve an error message if the connection fails. (To get error information from mysql_errno() or mysql_error(), you must provide a valid MYSQL pointer.)

**Return Values**

Same as for mysql_real_connect().

**Errors**

Same as for mysql_real_connect().

### 28.6.6.8 mysql_create_db()

```c
int mysql_create_db(MYSQL *mysql, const char *db)
```

**Description**

Creates the database named by the db parameter.

This function is deprecated. Use mysql_query() to issue an SQL CREATE DATABASE statement instead.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**

  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**

  The MySQL server has gone away.

- **CR_SERVER_LOST**

  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**

  An unknown error occurred.

**Example**

```c
if(mysql_create_db(&mysql, "my_database"))
{
    fprintf(stderr, "Failed to create new database. Error: %s\n", 
```
28.6.6.9 mysql_data_seek()

```c
void mysql_data_seek(MYSQL_RES *result, uint64_t offset)
```

**Description**

Seeks to an arbitrary row in a query result set. The `offset` value is a row number. Specify a value in the range from 0 to `mysql_num_rows(result)-1`.

This function requires that the result set structure contains the entire result of the query, so `mysql_data_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

**Return Values**

None.

**Errors**

None.

28.6.6.10 mysql_debug()

```c
void mysql_debug(const char *debug)
```

**Description**

Does a `DBUG_PUSH` with the given string. `mysql_debug()` uses the Fred Fish debug library. To use this function, you must compile the client library to support debugging. See Section 29.5.4, “The DBUG Package”.

**Return Values**

None.

**Errors**

None.

**Example**

The call shown here causes the client library to generate a trace file in `/tmp/client.trace` on the client machine:

```c
mysql_debug("d:t:O,/tmp/client.trace");
```

28.6.6.11 mysql_drop_db()

```c
int mysql_drop_db(MYSQL *mysql, const char *db)
```

**Description**

Drops the database named by the `db` parameter.
This function is deprecated. Use `mysql_query()` to issue an SQL DROP DATABASE statement instead.

### Return Values

Zero for success. Nonzero if an error occurred.

### Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

### Example

```c
if(mysql_drop_db(&mysql, "my_database"))
   fprintf(stderr, "Failed to drop the database: Error: %s\n",
           mysql_error(&mysql));
```

### 28.6.6.12 mysql_dump_debug_info()

#### Description

Instructs the server to write debugging information to the error log. The connected user must have the **SUPER** privilege.

#### Return Values

Zero for success. Nonzero if an error occurred.

#### Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
28.6.6.13 mysql_eof()

bool mysql_eof(MYSQL_RES *result)

Description

This function is deprecated. mysql_errno() or mysql_error() may be used instead.

mysql_eof() determines whether the last row of a result set has been read.

If you acquire a result set from a successful call to mysql_store_result(), the client receives the entire set in one operation. In this case, a NULL return from mysql_fetch_row() always means the end of the result set has been reached and it is unnecessary to call mysql_eof(). When used with mysql_store_result(), mysql_eof() always returns true.

On the other hand, if you use mysql_use_result() to initiate a result set retrieval, the rows of the set are obtained from the server one by one as you call mysql_fetch_row() repeatedly. Because an error may occur on the connection during this process, a NULL return value from mysql_fetch_row() does not necessarily mean the end of the result set was reached normally. In this case, you can use mysql_eof() to determine what happened. mysql_eof() returns a nonzero value if the end of the result set was reached and zero if an error occurred.

Historically, mysql_eof() predates the standard MySQL error functions mysql_errno() and mysql_error(). Because those error functions provide the same information, their use is preferred over mysql_eof(), which is deprecated. (In fact, they provide more information, because mysql_eof() returns only a boolean value whereas the error functions indicate a reason for the error when one occurs.)

Return Values

Zero for success. Nonzero if the end of the result set has been reached.

Errors

None.

Example

The following example shows how you might use mysql_eof():

```c
mysql_query(&mysql,"SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(!mysql_eof(result))  // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

However, you can achieve the same effect with the standard MySQL error functions:

```c
mysql_query(&mysql,"SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
```
// do something with data
if(mysql_errno(&mysql)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}

28.6.6.14 mysql_errno()

unsigned int mysql_errno(MYSQL *mysql)

Description

For the connection specified by mysql, mysql_errno() returns the error code for the most recently invoked API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL errmsg.h header file. Server error message numbers are listed in mysql_error.h. Errors also are listed at Appendix B, Errors, Error Codes, and Common Problems.

Note

Some functions such as mysql_fetch_row() do not set mysql_errno() if they succeed. A rule of thumb is that all functions that have to ask the server for information reset mysql_errno() if they succeed.

MySQL-specific error numbers returned by mysql_errno() differ from SQLSTATE values returned by mysql_sqlstate(). For example, the mysql client program displays errors using the following format, where 1146 is the mysql_errno() value and '42S02' is the corresponding mysql_sqlstate() value:

shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist

Return Values

An error code value for the last mysql_xxx() call, if it failed. zero means no error occurred.

Errors

None.

28.6.6.15 mysql_error()

const char *mysql_error(MYSQL *mysql)

Description

For the connection specified by mysql, mysql_error() returns a null-terminated string containing the error message for the most recently invoked API function that failed. If a function did not fail, the return value of mysql_error() may be the previous error or an empty string to indicate no error.

A rule of thumb is that all functions that have to ask the server for information reset mysql_error() if they succeed.

For functions that reset mysql_error(), either of these two tests can be used to check for an error:

if(*mysql_error(&mysql))
{
    // an error occurred
}
The language of the client error messages may be changed by recompiling the MySQL client library. You can choose error messages in several different languages. See Section 10.12, “Setting the Error Message Language”.

Return Values

A null-terminated character string that describes the error. An empty string if no error occurred.

Errors

None.

28.6.6.16 mysql_escape_string()

Note

Do not use this function. mysql_escape_string() does not have arguments that enable it to respect the current character set or the quoting context. Use mysql_real_escape_string_quote() instead.

28.6.6.17 mysql_fetch_field()

MYSQL_FIELD *mysql_fetch_field(MYSQL_RES *result)

Description

Returns the definition of one column of a result set as a MYSQL_FIELD structure. Call this function repeatedly to retrieve information about all columns in the result set. mysql_fetch_field() returns NULL when no more fields are left.

For metadata-optional connections, this function returns NULL when the resultset_metadata system variable is set to NONE. To check whether a result set has metadata, use the mysql_result_metadata() function. For details about managing result set metadata transfer, see Section 28.6.26, “C API Optional Result Set Metadata”.

mysql_fetch_field() is reset to return information about the first field each time you execute a new SELECT query. The field returned by mysql_fetch_field() is also affected by calls to mysql_field_seek().

If you’ve called mysql_query() to perform a SELECT on a table but have not called mysql_store_result(), MySQL returns the default blob length (8KB) if you call mysql_fetch_field() to ask for the length of a BLOB field. (The 8KB size is chosen because MySQL does not know the maximum length for the BLOB. This should be made configurable sometime.) Once you’ve retrieved the result set, field->max_length contains the length of the largest value for this column in the specific query.

Return Values

The MYSQL_FIELD structure for the current column. NULL if no columns are left or the result set has no metadata.
C API Function Descriptions

Errors

None.

Example

```c
MYSQL_FIELD *field;
while((field = mysql_fetch_field(result)))
{
    printf("field name %s\n", field->name);
}
```

### 28.6.6.18 mysql_fetch_field_direct()

**MYSQL_FIELD *mysql_fetch_field_direct(MYSQL_RES *result, unsigned int fieldnr)**

**Description**

Given a field number `fieldnr` for a column within a result set, returns that column's field definition as a `MYSQL_FIELD` structure. Use this function to retrieve the definition for an arbitrary column. Specify a value for `fieldnr` in the range from 0 to `mysql_num_fields(result)-1`.

For metadata-optional connections, this function returns `NULL` when the `resultset_metadata` system variable is set to `NONE`. To check whether a result set has metadata, use the `mysql_result_metadata()` function. For details about managing result set metadata transfer, see Section 28.6.26, “C API Optional Result Set Metadata”.

**Return Values**

The `MYSQL_FIELD` structure for the specified column. `NULL` if the result set has no metadata.

**Errors**

None.

**Example**

```c
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *field;
num_fields = mysql_num_fields(result);
for(i = 0; i < num_fields; i++)
{
    field = mysql_fetch_field_direct(result, i);
    printf("Field %u is %s\n", i, field->name);
}
```

### 28.6.6.19 mysql_fetch_fields()

**MYSQL_FIELD *mysql_fetch_fields(MYSQL_RES *result)**

**Description**

Returns an array of all `MYSQL_FIELD` structures for a result set. Each structure provides the field definition for one column of the result set.

For metadata-optional connections, this function returns `NULL` when the `resultset_metadata` system variable is set to `NONE`. To check whether a result set has metadata, use the
mysql_result_metadata() function. For details about managing result set metadata transfer, see Section 28.6.26, "C API Optional Result Set Metadata".

Return Values

An array of MYSQL_FIELD structures for all columns of a result set. NULL if the result set has no metadata.

Errors

None.

Example

```c
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *fields;

num_fields = mysql_num_fields(result);
fields = mysql_fetch_fields(result);
for(i = 0; i < num_fields; i++)
{
    printf("Field %u is %s\n", i, fields[i].name);
}
```

28.6.6.20 mysql_fetch_lengths()

unsigned long *mysql_fetch_lengths(MYSQL_RES *result)

Description

Returns the lengths of the columns of the current row within a result set. If you plan to copy field values, this length information is also useful for optimization, because you can avoid calling strlen(). In addition, if the result set contains binary data, you must use this function to determine the size of the data, because strlen() returns incorrect results for any field containing null characters.

The length for empty columns and for columns containing NULL values is zero. To see how to distinguish these two cases, see the description for mysql_fetch_row().

Return Values

An array of unsigned long integers representing the size of each column (not including any terminating null bytes). NULL if an error occurred.

Errors

mysql_fetch_lengths() is valid only for the current row of the result set. It returns NULL if you call it before calling mysql_fetch_row() or after retrieving all rows in the result.

Example

```c
MYSQL_ROW row;
unsigned long *lengths;
unsigned int num_fields;
unsigned int i;

row = mysql_fetch_row(result);
if (row)
{
    num_fields = mysql_num_fields(result);
```
lengths = mysql_fetch_lengths(result);
for(i = 0; i < num_fields; i++)
{
    printf("Column %u is %lu bytes in length.\n",
           i, lengths[i]);
}

## 28.6.6.21 mysql_fetch_row()

MYSQL_ROW mysql_fetch_row(MYSQL_RES *result)

### Description

Note

mysql_fetch_row() is a synchronous function. Its asynchronous counterpart is mysql_fetch_row_nonblocking(), for use by applications that require asynchronous communication with the server. See Section 28.6.11, “C API Asynchronous Interface”.

mysql_fetch_row() retrieves the next row of a result set:

- When used after mysql_store_result() or mysql_store_result_nonblocking(), mysql_fetch_row() returns NULL if there are no more rows to retrieve.
- When used after mysql_use_result(), mysql_fetch_row() returns NULL if there are no more rows to retrieve or an error occurred.

The number of values in the row is given by mysql_num_fields(result). If row holds the return value from a call to mysql_fetch_row(), pointers to the values are accessed as row[0] to row[mysql_num_fields(result)-1]. NULL values in the row are indicated by NULL pointers.

The lengths of the field values in the row may be obtained by calling mysql_fetch_lengths(). Empty fields and fields containing NULL both have length 0; you can distinguish these by checking the pointer for the field value. If the pointer is NULL, the field is NULL; otherwise, the field is empty.

### Return Values

A MYSQL_ROW structure for the next row, or NULL. The meaning of a NULL return depends on which function was called preceding mysql_fetch_row():

- When used after mysql_store_result() or mysql_store_result_nonblocking(), mysql_fetch_row() returns NULL if there are no more rows to retrieve.
- When used after mysql_use_result(), mysql_fetch_row() returns NULL if there are no more rows to retrieve or an error occurred. To determine whether an error occurred, check whether mysql_error() returns a nonempty string or mysql_errno() returns nonzero.

### Errors

Errors are not reset between calls to mysql_fetch_row()

- **CR_SERVER_LOST**
  
The connection to the server was lost during the query.
- **CR_UNKNOWN_ERROR**
An unknown error occurred.

**Example**

```c
MYSQL_ROW row;
unsigned int num_fields;
unsigned int i;

num_fields = mysql_num_fields(result);
while ((row = mysql_fetch_row(result)))
{
    unsigned long *lengths;
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("[%.*s ] ", (int) lengths[i],
                   row[i] ? row[i] : "NULL");
    }
    printf("\n");
}
```

### 28.6.22 mysql_field_count()

**Function**

```c
unsigned int mysql_field_count(MYSQL *mysql)
```

**Description**

Returns the number of columns for the most recent query on the connection.

The normal use of this function is when `mysql_store_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See Section 28.6.28.1, "Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success".

**Return Values**

An unsigned integer representing the number of columns in a result set.

**Errors**

None.

**Example**

```c
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql,query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
```
An alternative is to replace the `mysql_field_count(&mysql)` call with `mysql_errno(&mysql)`. In this case, you are checking directly for an error from `mysql_store_result()` rather than inferring from the value of `mysql_field_count()` whether the statement was a SELECT.

### 28.6.6.23 mysql_field_seek()

```c
MYSQL_FIELD_OFFSET mysql_field_seek(MYSQL_RES *result, MYSQL_FIELD_OFFSET offset)
```

**Description**

Sets the field cursor to the given offset. The next call to `mysql_fetch_field()` retrieves the field definition of the column associated with that offset.

To seek to the beginning of a row, pass an `offset` value of zero.

**Return Values**

The previous value of the field cursor.

**Errors**

None.

### 28.6.6.24 mysql_field_tell()

```c
MYSQL_FIELD_OFFSET mysql_field_tell(MYSQL_RES *result)
```

**Description**

Returns the position of the field cursor used for the last `mysql_fetch_field()`. This value can be used as an argument to `mysql_field_seek()`.

**Return Values**

The current offset of the field cursor.

**Errors**

None.
28.6.25 mysql_free_result()

```c
void mysql_free_result(MYSQL_RES *result)
```

**Description**

This function frees the memory allocated for a result set by `mysql_store_result()`, `mysql_use_result()`, `mysql_list_dbs()`, and so forth. When you are done with a result set, you must free the memory it uses by calling `mysql_free_result()`.

Do not attempt to access a result set after freeing it.

**Return Values**

None.

**Errors**

None.

28.6.26 mysql_get_character_set_info()

```c
void mysql_get_character_set_info(MYSQL *mysql, MY_CHARSET_INFO *cs)
```

**Description**

This function provides information about the default client character set. The default character set may be changed with the `mysql_set_character_set()` function.

**Example**

This example shows the fields that are available in the `MY_CHARSET_INFO` structure:

```c
if (!mysql_set_character_set(&mysql, "utf8"))
{
    MY_CHARSET_INFO cs;
    mysql_get_character_set_info(&mysql, &cs);
    printf("character set information:\n");
    printf("character set name: %s\n", cs.name);
    printf("collation name: %s\n", cs.csname);
    printf("comment: %s\n", cs.comment);
    printf("directory: %s\n", cs.dir);
    printf("multi byte character min. length: %d\n", cs.mbminlen);
    printf("multi byte character max. length: %d\n", cs.mbmaxlen);
}
```

28.6.27 mysql_get_client_info()

```c
const char *mysql_get_client_info(void)
```
C API Function Descriptions

Description

Returns a string that represents the MySQL client library version (for example, "8.0.20").

The function value is the version of MySQL that provides the client library. For more information, see Section 28.6.3.5, “C API Server Version and Client Library Version”.

Return Values

A character string that represents the MySQL client library version.

Errors

None.

28.6.6.28 mysql_get_client_version()

unsigned long mysql_get_client_version(void)

Description

Returns an integer that represents the MySQL client library version. The value has the format XYYZZ where X is the major version, YY is the release level (or minor version), and ZZ is the sub-version within the release level:

major_version*10000 + release_level*100 + sub_version

For example, "8.0.20" is returned as 80020.

The function value is the version of MySQL that provides the client library. For more information, see Section 28.6.3.5, “C API Server Version and Client Library Version”.

Return Values

An integer that represents the MySQL client library version.

Errors

None.

28.6.6.29 mysql_get_host_info()

const char *mysql_get_host_info(MYSQL *mysql)

Description

Returns a string describing the type of connection in use, including the server host name.

Return Values

A character string representing the server host name and the connection type.

Errors

None.
28.6.6.30 mysql_get_option()

```c
int mysql_get_option(MYSQL *mysql, enum mysql_option option, const void *arg)
```

**Description**

Returns the current value of an option settable using `mysql_options()`. The value should be treated as read only.

The `option` argument is the option for which you want its value. The `arg` argument is a pointer to a variable in which to store the option value. `arg` must be a pointer to a variable of the type appropriate for the `option` argument. The following table shows which variable type to use for each `option` value.

<table>
<thead>
<tr>
<th>arg Type</th>
<th>Applicable option Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsigned int</td>
<td>MYSQL_OPT_CONNECT_TIMEOUT, MYSQL_OPT_PROTOCOL,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_READ_TIMEOUT, MYSQL_OPT_RETRY_COUNT,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_SSL_FIPS_MODE, MYSQL_OPT_SSL_MODE,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_WRITE_TIMEOUT, MYSQL_OPT_ZSTD_COMPRESSION_LEVEL</td>
</tr>
<tr>
<td>unsigned long</td>
<td>MYSQL_OPT_MAX_ALLOWED_PACKET, MYSQL_OPT_NET_BUFFER_LENGTH</td>
</tr>
<tr>
<td>bool</td>
<td>MYSQL_ENABLE_CLEARTEXT_PLUGIN, MYSQL_OPT_CAN_HANDLE_EXPIRED_PASSWORDS,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_OPT_GET_SERVER_PUBLIC_KEY, MYSQL_OPT_LOCAL_INFILE,</td>
</tr>
<tr>

<td>MYSQL_PLUGIN_DIR, MYSQL_READ_DEFAULT_FILE, MYSQL_READ_DEFAULT_GROUP, MYSQL_SERVER_PUBLIC_KEY,</td>
</tr>
<tr>
<td></td>
<td>MYSQL_SET_CHARSET_DIR, MYSQL_SET_CHARSET_NAME, MYSQL_SHARED_MEMORY_BASE_NAME</td>
</tr>
<tr>
<td>argument not used</td>
<td>MYSQL_OPT_COMPRESS</td>
</tr>
</tbody>
</table>
| cannot be queried | (error is returned) MYSQL_INIT_COMMAND, MYSQL_OPT_CONNECT_ATTR_DELETE,
| (error is returned) | MYSQL_OPT_CONNECT_ATTR_RESET, MYSQL_OPT_NAMED_PIPE                                       |

**Return Values**

Zero for success. Nonzero if an error occurred; this occurs for `option` values that cannot be queried.

**Example**

The following call tests the `MYSQL_OPT_RECONNECT` option. After the call returns successfully, the value of `reconnect` is true or false to indicate whether automatic reconnection is enabled.

```c
bool reconnect;
if (mysql_get_option(mysql, MYSQL_OPT_RECONNECT, &reconnect))
    fprintf(stderr, "mysql_get_options() failed\n");
```

28.6.6.31 mysql_get_proto_info()

```c
unsigned int mysql_get_proto_info(MYSQL *mysql)
```
Description

Returns the protocol version used by current connection.

Return Values

An unsigned integer representing the protocol version used by the current connection.

Errors

None.

28.6.6.32 mysql_get_server_info()

const char *mysql_get_server_info(MYSQL *mysql)

Description

Returns a string that represents the MySQL server version (for example, "8.0.20").

Return Values

A character string that represents the MySQL server version.

Errors

None.

28.6.6.33 mysql_get_server_version()

unsigned long mysql_get_server_version(MYSQL *mysql)

Description

Returns an integer that represents the MySQL server version. The value has the format XYYZZ where X is the major version, YY is the release level (or minor version), and ZZ is the sub-version within the release level:

\[
\text{major\_version}*10000 + \text{release\_level}*100 + \text{sub\_version}
\]

For example, "8.0.20" is returned as 80020.

This function is useful in client programs for determining whether some version-specific server capability exists.

Return Values

An integer that represents the MySQL server version.

Errors

None.

28.6.6.34 mysql_get_ssl_cipher()

const char *mysql_get_ssl_cipher(MYSQL *mysql)
C API Function Descriptions

Description

mysql_get_ssl_cipher() returns the encryption cipher used for the given connection to the server. mysql is the connection handler returned from mysql_init().

Return Values

A string naming the encryption cipher used for the connection, or NULL if the connection is not encrypted.

28.6.6.35 mysql_hex_string()

unsigned long mysql_hex_string(char *to, const char *from, unsigned long length)

Description

This function creates a legal SQL string for use in an SQL statement. See Section 9.1.1, "String Literals". The string in the from argument is encoded in hexadecimal format, with each character encoded as two hexadecimal digits. The result is placed in the to argument, followed by a terminating null byte.

The string pointed to by from must be length bytes long. You must allocate the to buffer to be at least length*2+1 bytes long. When mysql_hex_string() returns, the contents of to is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

The return value can be placed into an SQL statement using either X'value' or 0xvalue format. However, the return value does not include the X'...' or 0x. The caller must supply whichever of those is desired.

Example

```c
char query[1000],*end;
end = strmov(query,"INSERT INTO test_table values(");
end = strmov(end,"X'\n");  
end += mysql_hex_string(end,"What is this",12);
end = strmov(end,"',X'\n");  
end += mysql_hex_string(end,"binary data: \0\r\n",16);
end = strmov(end,"')\n");
if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
    { fprintf(stderr, "Failed to insert row, Error: %s\n", mysql_error(&mysql));
    }
```

The strmov() function used in the example is included in the libmysqlclient library and works like strcpy() but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the encoded string that is placed into to, not including the terminating null character.

Errors

None.

28.6.6.36 mysql_info()
**const char *mysql_info(MYSQL *mysql)**

**Description**

Retrieves a string providing information about the most recently executed statement, but only for the statements listed here. For other statements, `mysql_info()` returns `NULL`. The format of the string varies depending on the type of statement, as described here. The numbers are illustrative only; the string contains values appropriate for the statement.

- **INSERT INTO ... SELECT ...**
  
  String format: Records: 100 Duplicates: 0 Warnings: 0

- **INSERT INTO ... VALUES (...),(...),(...)...**
  
  String format: Records: 3 Duplicates: 0 Warnings: 0

- **LOAD DATA**
  
  String format: Records: 1 Deleted: 0 Skipped: 0 Warnings: 0

- **ALTER TABLE**
  
  String format: Records: 3 Duplicates: 0 Warnings: 0

- **UPDATE**
  
  String format: Rows matched: 40 Changed: 40 Warnings: 0

`mysql_info()` returns a non-`NULL` value for `INSERT ... VALUES` only for the multiple-row form of the statement (that is, only if multiple value lists are specified).

**Return Values**

A character string representing additional information about the most recently executed statement. `NULL` if no information is available for the statement.

**Errors**

None.

**28.6.6.37 mysql_init()**

```c
MYSQL *mysql_init(MYSQL *mysql)
```

**Description**

Allocates or initializes a `MYSQL` object suitable for `mysql_real_connect()`. If `mysql` is a `NULL` pointer, the function allocates, initializes, and returns a new object. Otherwise, the object is initialized and the address of the object is returned. If `mysql_init()` allocates a new object, it is freed when `mysql_close()` is called to close the connection.

In a nonmultithreaded environment, `mysql_init()` invokes `mysql_library_init()` automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multithreaded environment, and thus neither is `mysql_init()`. Before calling `mysql_init()`, either call `mysql_library_init()` prior to spawning any threads, or use a mutex to protect the `mysql_library_init()` call. This should be done prior to any other client library call.
C API Function Descriptions

Return Values

An initialized MYSQL* handler. NULL if there was insufficient memory to allocate a new object.

Errors

In case of insufficient memory, NULL is returned.

28.6.6.38 mysql_insert_id()

**uint64_t mysql_insert_id(MYSQL *mysql)**

**Description**

Returns the value generated for an AUTO_INCREMENT column by the previous INSERT or UPDATE statement. Use this function after you have performed an INSERT statement into a table that contains an AUTO_INCREMENT field, or have used INSERT or UPDATE to set a column value with LAST_INSERT_ID(expr).

The return value of mysql_insert_id() is always zero unless explicitly updated under one of the following conditions:

- INSERT statements that store a value into an AUTO_INCREMENT column. This is true whether the value is automatically generated by storing the special values NULL or 0 into the column, or is an explicit nonspecial value.

- In the case of a multiple-row INSERT statement, mysql_insert_id() returns the first automatically generated AUTO_INCREMENT value that was successfully inserted.

  If no rows are successfully inserted, mysql_insert_id() returns 0.

- If an INSERT ... SELECT statement is executed, and no automatically generated value is successfully inserted, mysql_insert_id() returns the ID of the last inserted row.

- If an INSERT ... SELECT statement uses LAST_INSERT_ID(expr), mysql_insert_id() returns expr.

- INSERT statements that generate an AUTO_INCREMENT value by inserting LAST_INSERT_ID(expr) into any column or by updating any column to LAST_INSERT_ID(expr).

- If the previous statement returned an error, the value of mysql_insert_id() is undefined.

The return value of mysql_insert_id() can be simplified to the following sequence:

1. If there is an AUTO_INCREMENT column, and an automatically generated value was successfully inserted, return the first such value.

2. If last_INSERT_ID(expr) occurred in the statement, return expr, even if there was an AUTO_INCREMENT column in the affected table.

3. The return value varies depending on the statement used. When called after an INSERT statement:

   - If there is an AUTO_INCREMENT column in the table, and there were some explicit values for this column that were successfully inserted into the table, return the last of the explicit values.

When called after an INSERT ... ON DUPLICATE KEY UPDATE statement:

   - If there is an AUTO_INCREMENT column in the table and there were some explicit successfully inserted values or some updated values, return the last of the inserted or updated values.
mysql_insert_id() returns 0 if the previous statement does not use an AUTO_INCREMENT value. If you must save the value for later, be sure to call mysql_insert_id() immediately after the statement that generates the value.

The value of mysql_insert_id() is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

The LAST_INSERT_ID() SQL function will contain the value of the first automatically generated value that was successfully inserted. LAST_INSERT_ID() is not reset between statements because the value of that function is maintained in the server. Another difference from mysql_insert_id() is that LAST_INSERT_ID() is not updated if you set an AUTO_INCREMENT column to a specific nonspecial value. See Section 12.15, “Information Functions”.

mysql_insert_id() returns 0 following a CALL statement for a stored procedure that generates an AUTO_INCREMENT value because in this case mysql_insert_id() applies to CALL and not the statement within the procedure. Within the procedure, you can use LAST_INSERT_ID() at the SQL level to obtain the AUTO_INCREMENT value.

The reason for the differences between LAST_INSERT_ID() and mysql_insert_id() is that LAST_INSERT_ID() is made easy to use in scripts while mysql_insert_id() tries to provide more exact information about what happens to the AUTO_INCREMENT column.

Note

The OK packet used in the client/server protocol holds information such as is used for session state tracking. When clients read the OK packet to know whether there is a session state change, this resets values such as the last insert ID and the number of affected rows. Such changes cause mysql_insert_id() to return 0 after execution of commands including but not necessarily limited to COM_PING, COM_REFRESH, and COM_INIT_DB.

Return Values

Described in the preceding discussion.

Errors

• ER_AUTO_INCREMENT_CONFLICT

A user-specified AUTO_INCREMENT value in a multi INSERT statement falls within the range between the current AUTO_INCREMENT value and the sum of the current and number of rows affected values.

28.6.6.39 mysql_kill()

int mysql_kill(MYSQL *mysql, unsigned long pid)

Description

Note

mysql_kill() is deprecated and will be removed in a future version of MySQL. Instead, use mysql_query() to execute a KILL statement.

Asks the server to kill the thread specified by pid.

This function is deprecated. Use mysql_query() to issue an SQL KILL statement instead.
mysql_kill() cannot handle values larger than 32 bits, but to guard against killing the wrong thread returns an error in these cases:

- If given an ID larger than 32 bits, mysql_kill() returns a CR_INVALID_CONN_HANDLE error.
- After the server's internal thread ID counter reaches a value larger than 32 bits, it returns an ER_DATA_OUT_OF_RANGE error for any mysql_kill() invocation and mysql_kill() fails.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_INVALID_CONN_HANDLE**
  
  The pid was larger than 32 bits.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

- **ER_DATA_OUT_OF_RANGE**
  
  The server's internal thread ID counter has reached a value larger than 32 bits, at which point it rejects all mysql_kill() invocations.

### 28.6.6.40 mysql_library_end()

```c
void mysql_library_end(void)
```

**Description**

This function finalizes the MySQL client library. Call it when you are done using the library (for example, after disconnecting from the server).

**Note**

To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call mysql_library_end() explicitly. This enables memory management to be performed to clean up and free resources used by the library.

For usage information, see Section 28.6.5, “C API Function Overview”, and Section 28.6.6.41, “mysql_library_init()”.

4804
28.6.41 mysql_library_init()

```c
int mysql_library_init(int argc, char **argv, char **groups)
```

**Description**

Call this function to initialize the MySQL client library before you call any other MySQL function.

**Note**

To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call `mysql_library_end()` explicitly. This enables memory management to be performed to clean up and free resources used by the library. See Section 28.6.6.40, "mysql_library_end()".

In a nonmultithreaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multithreaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly through `mysql_init()`. Do this prior to any other client library call.

The `argc`, `argv`, and `groups` arguments are unused. In older MySQL versions, they were used for applications linked against the embedded server, which is no longer supported. The call now should be written as `mysql_library_init(0, NULL, NULL).

```c
#include <mysql.h>
#include <stdlib.h>

int main(void) {
    if (mysql_library_init(0, NULL, NULL)) {
        fprintf(stderr, "could not initialize MySQL client library\n");
        exit(1);
    }

    /* Use any MySQL API functions here */
    mysql_library_end();
    return EXIT_SUCCESS;
}
```

**Return Values**

Zero for success. Nonzero if an error occurred.

28.6.42 mysql_list_dbs()

```c
MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)
```

**Description**

Returns a result set consisting of database names on the server that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters `%` or `_`, or may be a `NULL` pointer to match all databases. Calling `mysql_list_dbs()` is similar to executing the query `SHOW DATABASES [LIKE wild].`

You must free the result set with `mysql_free_result()`.
Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
  Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`
  Out of memory.

- `CR_SERVER_GONE_ERROR`
  The MySQL server has gone away.

- `CR_SERVER_LOST`
  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`
  An unknown error occurred.

28.6.6.43 `mysql_list_fields()`

```c
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char *wild)
```

Description

```
Note
mysql_list_fields() is deprecated and will be removed in a future version of MySQL. Instead, use mysql_query() to execute a SHOW COLUMNS statement.
```

Returns an empty result set for which the metadata provides information about the columns in the given table that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters % or _, or may be a `NULL` pointer to match all fields. Calling `mysql_list_fields()` is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild].`

It is preferable to use `SHOW COLUMNS FROM tbl_name` instead of `mysql_list_fields()`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`
  The MySQL server has gone away.
• CR_SERVER_LOST

The connection to the server was lost during the query.

• CR_UNKNOWN_ERROR

An unknown error occurred.

Example

```c
int i;
MYSQL_RES *tbl_cols = mysql_list_fields(mysql, "mytbl", "f%");

unsigned int field_cnt = mysql_num_fields(tbl_cols);
printf("Number of columns: %d\n", field_cnt);

for (i=0; i < field_cnt; ++i)
{
    /* col describes i-th column of the table */
    MYSQL_FIELD *col = mysql_fetch_field_direct(tbl_cols, i);
    printf ("Column %d: %s\n", i, col->name);
}
mysql_free_result(tbl_cols);
```

28.6.6.44 mysql_list_processes()

```c
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

Description

Note

mysql_list_processes() is deprecated and will be removed in a future version of MySQL. Instead, use mysql_query() to execute a SHOW PROCESSLIST statement.

Returns a result set describing the current server threads. This is the same kind of information as that reported by mysqladmin processlist or a SHOW PROCESSLIST query.

You must free the result set with mysql_free_result().

Return Values

A MYSQL_RES result set for success. NULL if an error occurred.

Errors

• CR_COMMANDS_OUT_OF_SYNC

Commands were executed in an improper order.

• CR_SERVER_GONE_ERROR

The MySQL server has gone away.

• CR_SERVER_LOST

The connection to the server was lost during the query.

• CR_UNKNOWN_ERROR
An unknown error occurred.

### 28.6.6.45 mysql_list_tables()

```c
MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)
```

**Description**

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters `%` or `_`, or may be a `NULL` pointer to match all tables. Calling `mysql_list_tables()` is similar to executing the query `SHOW TABLES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

**Return Values**

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`
  
  Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`
  
  The MySQL server has gone away.

- `CR_SERVER_LOST`
  
  The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`
  
  An unknown error occurred.

### 28.6.6.46 mysql_more_results()

```c
bool mysql_more_results(MYSQL *mysql)
```

**Description**

This function is used when you execute multiple statements specified as a single statement string, or when you execute `CALL` statements, which can return multiple result sets.

`mysql_more_results()` returns `true` if more results exist from the currently executed statement, in which case the application must call `mysql_next_result()` to fetch the results.

**Return Values**

`TRUE` (1) if more results exist. `FALSE` (0) if no more results exist.

In most cases, you can call `mysql_next_result()` instead to test whether more results exist and initiate retrieval if so.

See Section 28.6.22, “C API Multiple Statement Execution Support”, and Section 28.6.6.47, “mysql_next_result()”. 

4808
Errors

None.

28.6.47 mysql_next_result()

int mysql_next_result(MYSQL *mysql)

Description

Note

mysql_next_result() is a synchronous function. Its asynchronous counterpart is mysql_next_result_nonblocking(), for use by applications that require asynchronous communication with the server. See Section 28.6.11, “C API Asynchronous Interface”.

mysql_next_result() is used when you execute multiple statements specified as a single statement string, or when you use CALL statements to execute stored procedures, which can return multiple result sets.

mysql_next_result() reads the next statement result and returns a status to indicate whether more results exist. If mysql_next_result() returns an error, there are no more results.

Before each call to mysql_next_result(), you must call mysql_free_result() for the current statement if it is a statement that returned a result set (rather than just a result status).

After calling mysql_next_result() the state of the connection is as if you had called mysql_real_query() or mysql_query() for the next statement. This means that you can call mysql_store_result(), mysql_warning_count(), mysql_affected_rows(), and so forth.

If your program uses CALL statements to execute stored procedures, the CLIENT_MULTI_RESULTS flag must be enabled. This is because each CALL returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because CALL can return multiple results, process them using a loop that calls mysql_next_result() to determine whether there are more results.

CLIENT_MULTI_RESULTS can be enabled when you call mysql_real_connect(), either explicitly by passing the CLIENT_MULTI_RESULTS flag itself, or implicitly by passing CLIENT_MULTI_STATEMENTS (which also enables CLIENT_MULTI_RESULTS). CLIENT_MULTI_RESULTS is enabled by default.

It is also possible to test whether there are more results by calling mysql_more_results(). However, this function does not change the connection state, so if it returns true, you must still call mysql_next_result() to advance to the next result.

For an example that shows how to use mysql_next_result(), see Section 28.6.22, “C API Multiple Statement Execution Support”.

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Successful and there are more results</td>
</tr>
<tr>
<td>-1</td>
<td>Successful and there are no more results</td>
</tr>
<tr>
<td>&gt;0</td>
<td>An error occurred</td>
</tr>
</tbody>
</table>
Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order. For example, if you did not call `mysql_use_result()` for a previous result set.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

28.6.6.48 mysql_num_fields()

```c
unsigned int mysql_num_fields(MYSQL_RES *result)
```

To pass a `MYSQL*` argument instead, use `unsigned int mysql_field_count(MYSQL *mysql)`.

Description

Returns the number of columns in a result set.

You can get the number of columns either from a pointer to a result set or to a connection handler. You would use the connection handler if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT-like`) statement. The example shown here illustrates how this may be done.

See Section 28.6.28.1, “Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success”.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```c
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql,query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{   
```
result = mysql_store_result(&mysql);
if (result)  // there are rows
{
    num_fields = mysql_num_fields(result);
    // retrieve rows, then call mysql_free_result(result)
}
else  // mysql_store_result() returned nothing; should it have?
{
    if (mysql_errno(&mysql))
        { fprintf(stderr, "Error: %s\n", mysql_error(&mysql)); }
    else if (mysql_field_count(&mysql) == 0)
        { // query does not return data
            if (it was not a SELECT)
                num_rows = mysql_affected_rows(&mysql);
        }
}

An alternative (if you know that your query should have returned a result set) is to replace the
mysql_errno(&mysql) call with a check whether mysql_field_count(&mysql) returns 0. This
happens only if something went wrong.

28.6.6.49 mysql_num_rows()

uint64_t mysql_num_rows(MYSQL_RES *result)

Description

Returns the number of rows in the result set.

The use of mysql_num_rows() depends on whether you use mysql_store_result() or
mysql_use_result() to return the result set. If you use mysql_store_result(),
mysql_num_rows() may be called immediately. If you use mysql_use_result(),
mysql_num_rows() does not return the correct value until all the rows in the result set have been
retrieved.

mysql_num_rows() is intended for use with statements that return a result set, such as SELECT. For
statements such as INSERT, UPDATE, or DELETE, the number of affected rows can be obtained with
mysql_affected_rows().

Return Values

The number of rows in the result set.

Errors

None.

28.6.6.50 mysql_options()

int mysql_options(MYSQL *mysql, enum mysql_option option, const void *arg)

Description

Can be used to set extra connect options and affect behavior for a connection. This function may be called
multiple times to set several options. To retrieve option values, use mysql_get_option().
Call `mysql_options()` after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, specify a pointer to the value of the integer as the `arg` argument.

Options for information such as SSL certificate and key files are used to establish an encrypted connection if such connections are available, but do not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the technique described in Section 28.6.21, “C API Encrypted Connection Support”.

The following list describes the possible options, their effect, and how `arg` is used for each option. For option descriptions that indicate `arg` is unused, its value is irrelevant; it is conventional to pass 0.

- **MYSQL_DEFAULT_AUTH** (argument type: `char *`)
  The name of the authentication plugin to use.

- **MYSQL_ENABLE_CLEARTEXT_PLUGIN** (argument type: `bool *`)
  Enable the `mysql_clear_password` cleartext authentication plugin. See Section 6.4.1.4, “Client-Side Cleartext Pluggable Authentication”.

- **MYSQL_INIT_COMMAND** (argument type: `char *`)
  SQL statement to execute when connecting to the MySQL server. Automatically re-executed if reconnection occurs.

- **MYSQL_OPT_BIND** (argument: `char *`)
  The network interface from which to connect to the server. This is used when the client host has multiple network interfaces. The argument is a host name or IP address (specified as a string).

- **MYSQL_OPT_CAN_HANDLE_EXPIRED_PASSWORDS** (argument type: `bool *`)
  Indicate whether the client can handle expired passwords. See Section 6.2.16, “Server Handling of Expired Passwords”.

- **MYSQL_OPT_COMPRESS** (argument: not used)
  Compress all information sent between the client and the server if possible. See Section 4.2.6, “Connection Compression Control”.

As of MySQL 8.0.18, `MYSQL_OPT_COMPRESS` becomes a legacy option, due to the introduction of the `MYSQL_OPT_COMPRESSION_ALGORITHMS` option for more control over connection compression (see Connection Compression Configuration). The meaning of `MYSQL_OPT_COMPRESS` depends on whether `MYSQL_OPT_COMPRESSION_ALGORITHMS` is specified:

- When `MYSQL_OPT_COMPRESSION_ALGORITHMS` is not specified, enabling `MYSQL_OPT_COMPRESS` is equivalent to specifying a client-side algorithm set of `zlib,uncompressed`.

- When `MYSQL_OPT_COMPRESSION_ALGORITHMS` is specified, enabling `MYSQL_OPT_COMPRESS` is equivalent to specifying an algorithm set of `zlib` and the full client-side algorithm set is the union of `zlib` plus the algorithms specified by `MYSQL_OPT_COMPRESSION_ALGORITHMS`. For example, with `MYSQL_OPT_COMPRESS` enabled and `MYSQL_OPT_COMPRESSION_ALGORITHMS` set to `zlib,zstd`, the permitted-algorithm set is `zlib` plus `zlib,zstd`; that is, `zlib,zstd`. With `MYSQL_OPT_COMPRESS` enabled and `MYSQL_OPT_COMPRESSION_ALGORITHMS` set to
• **MYSQL_OPT_COMPRESSION_ALGORITHMS** (argument type: `const char *`)

  The permitted compression algorithms for connections to the server. The available algorithms are the same as for the `protocol_compression_algorithms` system variable. If this option is not specified, the default value is `uncompressed`.

  For more information, see Section 4.2.6, “Connection Compression Control”.

  This option was added in MySQL 8.0.18.

• **MYSQL_OPT_CONNECT_ATTR_DELETE** (argument type: `char *`)

  Given a key name, this option deletes a key-value pair from the current set of connection attributes to pass to the server at connect time. The argument is a pointer to a null-terminated string naming the key. Comparison of the key name with existing keys is case-sensitive.

  See also the description for the `MYSQL_OPT_CONNECT_ATTR_RESET` option, as well as the description for the `MYSQL_OPT_CONNECT_ATTR_ADD` option in the description of the `mysql_options4()` function. That function description also includes a usage example.

  The Performance Schema exposes connection attributes through the `session_connect_attrs` and `session_account_connect_attrs` tables. See Section 26.12.9, “Performance Schema Connection Attribute Tables”.

• **MYSQL_OPT_CONNECT_ATTR_RESET** (argument not used)

  This option resets (clears) the current set of connection attributes to pass to the server at connect time.

  See also the description for the `MYSQL_OPT_CONNECT_ATTR_DELETE` option, as well as the description for the `MYSQL_OPT_CONNECT_ATTR_ADD` option in the description of the `mysql_options4()` function. That function description also includes a usage example.

  The Performance Schema exposes connection attributes through the `session_connect_attrs` and `session_account_connect_attrs` tables. See Section 26.12.9, “Performance Schema Connection Attribute Tables”.

• **MYSQL_OPT_CONNECT_TIMEOUT** (argument type: `unsigned int *`)

  The connect timeout in seconds.

• **MYSQL_OPT_GET_SERVER_PUBLIC_KEY** (argument type: `bool *`)

  Enables the client to request from the server the public key required for RSA key pair-based password exchange. This option applies to clients that authenticate with the `caching_sha2_password` authentication plugin. For that plugin, the server does not send the public key unless requested. This option is ignored for accounts that do not authenticate with that plugin. It is also ignored if RSA-based password exchange is not used, as is the case when the client connects to the server using a secure connection.

  If `MYSQL_SERVER_PUBLIC_KEY` is given and specifies a valid public key file, it takes precedence over `MYSQL_OPT_GET_SERVER_PUBLIC_KEY`. 
For information about the `caching_sha2_password` plugin, see Section 6.4.1.2, “Caching SHA-2 Pluggable Authentication”.

- **MYSQL_OPT_LOCAL_INFILE** (argument type: optional pointer to `unsigned int`)
  This option affects client-side LOCAL capability for LOAD DATA operations. By default, LOCAL capability is determined by the default compiled into the MySQL client library (see Section 13.2.7, “LOAD DATA Statement”). To control this capability explicitly, invoke `mysql_options()` to set the `MYSQL_OPT_LOCAL_INFILE` option:

  - LOCAL is disabled if the pointer points to an `unsigned int` that has a zero value.
  - LOCAL is enabled if no pointer is given or if the pointer points to an `unsigned int` that has a nonzero value.

Successful use of a LOCAL load operation by a client also requires that the server permits it.

- **MYSQL_OPT_MAX_ALLOWED_PACKET** (argument: `unsigned long *`)
  This option sets the `max_allowed_packet` system variable. If the `mysql` argument is non-NULL, the call sets the session system variable value for that session. If `mysql` is NULL, the call sets the global system variable value.

- **MYSQL_OPT_NAMED_PIPE** (argument: not used)
  Use a named pipe to connect to the MySQL server on Windows, if the server permits named-pipe connections.

- **MYSQL_OPT_NET_BUFFER_LENGTH** (argument: `unsigned long *`)
  This option sets the `net_buffer_length` system variable. If the `mysql` argument is non-NULL, the call sets the session system variable value for that session. If `mysql` is NULL, the call sets the global system variable value.

- **MYSQL_OPT_OPTIONAL_RESULTSET_METADATA** (argument type: `bool *`)
  This flag makes result set metadata optional. It is an alternative way of setting the `CLIENT_OPTIONAL_RESULTSET_METADATA` connection flag for the `mysql_real_connect()` function. For details about managing result set metadata transfer, see Section 28.6.26, “C API Optional Result Set Metadata”.

- **MYSQL_OPT_PROTOCOL** (argument type: `unsigned int *`)
  Type of protocol to use. Specify one of the enum values of `mysql_protocol_type` defined in `mysql.h`.

- **MYSQL_OPT_READ_TIMEOUT** (argument type: `unsigned int *`)
  The timeout in seconds for each attempt to read from the server. There are retries if necessary, so the total effective timeout value is three times the option value. You can set the value so that a lost connection can be detected earlier than the TCP/IP `Close_Wait_Timeout` value of 10 minutes.

- **MYSQL_OPT_RECONNECT** (argument type: `bool *`)
  Enable or disable automatic reconnection to the server if the connection is found to have been lost. Reconnect is off by default; this option provides a way to set reconnection behavior explicitly. See Section 28.6.27, “C API Automatic Reconnection Control”.

4814
• **MYSQL_OPT_RETRY_COUNT** (argument type: `unsigned int *`)

  The retry count for I/O-related system calls that are interrupted while connecting to the server or communicating with it. If this option is not specified, the default value is 1 (1 retry if the initial call is interrupted for 2 tries total).

  This option can be used only by clients that link against a C client library compiled with NDB Cluster support.

• **MYSQL_OPT_SSL_CA** (argument type: `char *`)

  The path name of the Certificate Authority (CA) certificate file. This option, if used, must specify the same certificate used by the server.

• **MYSQL_OPT_SSL_CAPATH** (argument type: `char *`)

  The path name of the directory that contains trusted SSL CA certificate files.

• **MYSQL_OPT_SSL_CERT** (argument type: `char *`)

  The path name of the client public key certificate file.

• **MYSQL_OPT_SSL_CIPHER** (argument type: `char *`)

  The list of permissible ciphers for SSL encryption.

• **MYSQL_OPT_SSL_CRL** (argument type: `char *`)

  The path name of the file containing certificate revocation lists.

• **MYSQL_OPT_SSL_CRLPATH** (argument type: `char *`)

  The path name of the directory that contains files containing certificate revocation lists.

• **MYSQL_OPT_SSL_FIPS_MODE** (argument type: `unsigned int *`)

  Controls whether to enable FIPS mode on the client side. The `MYSQL_OPT_SSL_FIPS_MODE` option differs from other `MYSQL_OPT_SSL_`xxx options in that it is not used to establish encrypted connections, but rather to affect which cryptographic operations are permitted. See Section 6.5, “FIPS Support”.

  Permitted option values are `SSL_FIPS_MODE_OFF`, `SSL_FIPS_MODE_ON`, and `SSL_FIPS_MODE STRICT`.

  **Note**

  If the OpenSSL FIPS Object Module is not available, the only permitted value for `MYSQL_OPT_SSL_FIPS_MODE` is `SSL_FIPS_MODE OFF`. In this case, setting `MYSQL_OPT_SSL_FIPS_MODE` to `SSL_FIPS_MODE ON` or `SSL_FIPS_MODE STRICT` causes the client to produce a warning at startup and to operate in non-FIPS mode.

• **MYSQL_OPT_SSL_KEY** (argument type: `char *`)

  The path name of the client private key file.

• **MYSQL_OPT_SSL_MODE** (argument type: `unsigned int *`)

  The security state to use for the connection to the server: `SSL_MODE_DISABLED`, `SSL_MODE_PREFERRED`, `SSL_MODE_REQUIRED`, `SSL_MODE_VERIFY_CA`,
SSL_MODE_VERIFY_IDENTITY. If this option is not specified, the default is SSL_MODE_PREFERRED. These modes are the permitted values of the mysql_ssl_mode enumeration defined in mysql.h. For more information about the security states, see the description of --ssl-mode in Command Options for Encrypted Connections.

- MYSQL_OPT_TLS_CIPHERSUITES (argument type: char *)

Which ciphersuites the client permits for encrypted connections that use TLSv1.3. The value is a list of one or more colon-separated ciphersuite names. The ciphersuites that can be named for this option depend on the SSL library used to compile MySQL. For details, see Section 6.3.2, “Encrypted Connection TLS Protocols and Ciphers”.

This option was added in MySQL 8.0.16.

- MYSQL_OPT_TLS_VERSION (argument type: char *)

Which protocols the client permits for encrypted connections. The value is a list of one or more comma-separated protocol versions. The protocols that can be named for this option depend on the SSL library used to compile MySQL. For details, see Section 6.3.2, “Encrypted Connection TLS Protocols and Ciphers”.

- MYSQL_OPT_USE_RESULT (argument: not used)

This option is unused.

- MYSQL_OPT_WRITE_TIMEOUT (argument type: unsigned int *)

The timeout in seconds for each attempt to write to the server. There is a retry if necessary, so the total effective timeout value is two times the option value.

- MYSQL_OPT_ZSTD_COMPRESSION_LEVEL (argument type: unsigned int *)

The compression level to use for connections to the server that use the zstd compression algorithm. The permitted levels are from 1 to 22, with larger values indicating increasing levels of compression. If this option is not specified, the default zstd compression level is 3. The compression level setting has no effect on connections that do not use zstd compression.

For more information, see Section 4.2.6, “Connection Compression Control”.

This option was added in MySQL 8.0.18.

- MYSQL_PLUGIN_DIR (argument type: char *)

The directory in which to look for client plugins.

- MYSQL_READ_DEFAULT_FILE (argument type: char *)

Read options from the named option file instead of from my.cnf.

- MYSQL_READ_DEFAULT_GROUP (argument type: char *)

Read options from the named group from my.cnf or the file specified with MYSQL_READ_DEFAULT_FILE.

- MYSQL_REPORT_DATA_TRUNCATION (argument type: bool *)

Enable or disable reporting of data truncation errors for prepared statements using the error member of MYSQL_BIND structures. (Default: enabled.)
C API Function Descriptions

- **MYSQL_SERVER_PUBLIC_KEY** (argument type: `char *`)

  The path name of the file containing a client-side copy of the public key required by the server for RSA key pair-based password exchange. The file must be in PEM format. This option applies to clients that authenticate with the `sha256_password` or `caching_sha2_password` authentication plugin. This option is ignored for accounts that do not authenticate with one of those plugins. It is also ignored if RSA-based password exchange is not used, as is the case when the client connects to the server using a secure connection.

  If `MYSQL_SERVER_PUBLIC_KEY` is given and specifies a valid public key file, it takes precedence over `MYSQL_OPT_GET_SERVER_PUBLIC_KEY`.

  For information about the `sha256_password` and `caching_sha2_password` plugins, see Section 6.4.1.3, “SHA-256 Pluggable Authentication”, and Section 6.4.1.2, “Caching SHA-2 Pluggable Authentication”.

- **MYSQL_SET_CHARSET_DIR** (argument type: `char *`)

  The path name of the directory that contains character set definition files.

- **MYSQL_SET_CHARSET_NAME** (argument type: `char *`)

  The name of the character set to use as the default character set. The argument can be `MYSQL_AUTODETECT_CHARSET_NAME` to cause the character set to be autodetected based on the operating system setting (see Section 10.4, “Connection Character Sets and Collations”).

- **MYSQL_SHARED_MEMORY_BASE_NAME** (argument type: `char *`)

  The name of the shared-memory object for communication to the server on Windows, if the server supports shared-memory connections. Specify the same value as used for the `shared_memory_base_name` system variable of the `mysqld` server you want to connect to.

  The client group is always read if you use `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP`.

  The specified group in the option file may contain the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>character-sets-dir=dir_name</td>
<td>The directory where character sets are installed.</td>
</tr>
<tr>
<td>compress</td>
<td>Use the compressed client/server protocol.</td>
</tr>
<tr>
<td>connect-timeout=seconds</td>
<td>The connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.</td>
</tr>
<tr>
<td>database=db_name</td>
<td>Connect to this database if no database was specified in the connect command.</td>
</tr>

<tr>
<td>init-command=stmt</td>
<td>Statement to execute when connecting to MySQL server. Automatically re-executed if reconnection occurs.</td>
</tr>
<tr>
<td>interactive-timeout=seconds</td>
<td>Same as specifying CLIENT_INTERACTIVE to mysql_real_connect(). See Section 28.6.6.54, &quot;mysql_real_connect()&quot;.</td>
</tr>
<tr>
<td>local-infile={0</td>
<td>1}</td>
</tr>
<tr>
<td>max_allowed_packet=bytes</td>
<td>Maximum size of packet that client can read from server.</td>
</tr>
<tr>
<td>multi-queries,multi-results</td>
<td>Enable multiple result sets from multiple-statement executions or stored procedures.</td>
</tr>
<tr>
<td>multi-statements</td>
<td>Enable the client to send multiple statements in a single string (separated by ; characters).</td>
</tr>
<tr>
<td>password=password</td>
<td>Default password.</td>
</tr>
<tr>
<td>pipe</td>
<td>Use named pipes to connect to a MySQL server on Windows.</td>
</tr>
<tr>
<td>port=port_num</td>
<td>Default port number.</td>
</tr>
<tr>
<td>protocol={TCP</td>
<td>SOCKET</td>
</tr>
<tr>
<td>return-found-rows</td>
<td>Tell mysql_info() to return found rows instead of updated rows when using UPDATE.</td>
</tr>
<tr>
<td>shared-memory-base-name=name</td>
<td>Shared-memory name to use to connect to server.</td>
</tr>
<tr>
<td>socket={file_name</td>
<td>pipe_name}</td>
</tr>
<tr>
<td>ssl-ca=file_name</td>
<td>Certificate Authority file.</td>
</tr>
<tr>
<td>ssl-capath=dir_name</td>
<td>Certificate Authority directory.</td>
</tr>
<tr>
<td>ssl-cert=file_name</td>
<td>Certificate file.</td>
</tr>
<tr>
<td>ssl-cipher=cipher_list</td>
<td>Permissible SSL ciphers.</td>
</tr>
<tr>
<td>ssl-key=file_name</td>
<td>Key file.</td>
</tr>
<tr>
<td>timeout=seconds</td>
<td>Like connect-timeout.</td>
</tr>
<tr>
<td>user</td>
<td>Default user.</td>
</tr>
</tbody>
</table>

timeout has been replaced by connect-timeout, but timeout is still supported for backward compatibility.

For more information about option files used by MySQL programs, see Section 4.2.2.2, “Using Option Files”.

Return Values

Zero for success. Nonzero if you specify an unknown option.

Example

The following mysql_options() calls request the use of compression in the client/server protocol, cause options to be read from the [odbc] group in option files, and disable transaction autocommit mode:

```c
MYSQL mysql;
```
28.6.6.51 `mysql_options4()`

```c
int mysql_options4(MYSQL *mysql, enum mysql_option option, const void *arg1, const void *arg2)
```

**Description**

`mysql_options4()` is similar to `mysql_options()` but has an extra fourth argument so that two values can be passed for the option specified in the second argument.

The following list describes the permitted options, their effect, and how `arg1` and `arg2` are used.

- **MYSQL_OPT_CONNECT_ATTR_ADD** (argument types: `char *`, `char *`)

  This option adds an attribute key-value pair to the current set of connection attributes to pass to the server at connect time. Both arguments are pointers to null-terminated strings. The first and second strings indicate the key and value, respectively. If the key is empty or already exists in the current set of connection attributes, an error occurs. Comparison of the key name with existing keys is case-sensitive.

  Key names that begin with an underscore (_ _) are reserved for internal use and should not be created by application programs. This convention permits new attributes to be introduced by MySQL without colliding with application attributes.

  `mysql_options4()` imposes a limit of 64KB on the aggregate size of connection attribute data it will accept. For calls that cause this limit to be exceeded, a `CR_INVALID_PARAMETER_NO` error occurs. Attribute size-limit checks also occur on the server side. For details, see Section 26.12.9, “Performance Schema Connection Attribute Tables”, which also describes how the Performance Schema exposes connection attributes through the `session_connect_attrs` and `session_account_connect_attrs` tables.

  See also the descriptions for the `MYSQL_OPT_CONNECT_ATTR_RESET` and `MYSQL_OPT_CONNECT_ATTR_DELETE` options in the description of the `mysql_options()` function.

**Return Values**

Zero for success. Nonzero if you specify an unknown option.

**Errors**

- **CR_DUPLICATE_CONNECTION_ATTR**

  A duplicate attribute name was specified.

- **CR_INVALID_PARAMETER_NO**

  A key name was empty or the amount of key-value connection attribute data exceeds 64KB limit.

- **CR_OUT_OF_MEMORY**

  Out of memory.
Example

This example demonstrates the calls that specify connection attributes:

```c
MYSQL mysql;
mysql_init(&mysql);
mysql_options(&mysql, MYSQL_OPT_CONNECT_ATTR_RESET, 0);
mysql_options4(&mysql, MYSQL_OPT_CONNECT_ATTR_ADD, "key1", "value1");
mysql_options4(&mysql, MYSQL_OPT_CONNECT_ATTR_ADD, "key2", "value2");
mysql_options4(&mysql, MYSQL_OPT_CONNECT_ATTR_ADD, "key3", "value3");
mysql_options(&mysql, MYSQL_OPT_CONNECT_ATTR_DELETE, "key1");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

28.6.6.52 `mysql_ping()`

```c
int mysql_ping(MYSQL *mysql)
```

Description

Checks whether the connection to the server is working. If the connection has gone down and auto-
reconnect is enabled an attempt to reconnect is made. If the connection is down and auto-reconnect is
disabled, `mysql_ping()` returns an error.

Auto-reconnect is disabled by default. To enable it, call `mysql_options()` with the
`MYSQL_OPT_RECONNECT` option. For details, see Section 28.6.6.50, "mysql_options()".

`mysql_ping()` can be used by clients that remain idle for a long while, to check whether the server has
closed the connection and reconnect if necessary.

If `mysql_ping()` does cause a reconnect, there is no explicit indication of it. To determine whether
a reconnect occurs, call `mysql_thread_id()` to get the original connection identifier before calling
`mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier has changed.

If reconnect occurs, some characteristics of the connection will have been reset. For details about these
characteristics, see Section 28.6.27, "C API Automatic Reconnection Control".

Return Values

Zero if the connection to the server is active. Nonzero if an error occurred. A nonzero return does not
indicate whether the MySQL server itself is down; the connection might be broken for other reasons such
as network problems.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.
### 28.6.53 mysql_query()

```c
int mysql_query(MYSQL *mysql, const char *stmt_str)
```

**Description**

Executes the SQL statement pointed to by the null-terminated string `stmt_str`. Normally, the string must consist of a single SQL statement without a terminating semicolon (`;`) or `\g`. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See Section 28.6.22, “C API Multiple Statement Execution Support”.

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the `\0` character, which `mysql_query()` interprets as the end of the statement string.)

If you want to know whether the statement returns a result set, you can use `mysql_field_count()` to check for this. See Section 28.6.6.22, “mysql_field_count()”.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

### 28.6.54 mysql_real_connect()

```c
MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long client_flag)
```

**Description**

`mysql_real_connect()` is a synchronous function. Its asynchronous counterpart is `mysql_real_connect_nonblocking()`, for use by applications that require asynchronous communication with the server. See Section 28.6.11, “C API Asynchronous Interface”.

`mysql_real_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_real_connect()` must complete successfully before you can execute any other API functions that require a valid `MYSQL` connection handler structure.
The parameters are specified as follows:

- For the first parameter, specify the address of an existing `MYSQL` structure. Before calling `mysql_real_connect()`, call `mysql_init()` to initialize the `MYSQL` structure. You can change a lot of connect options with the `mysql_options()` call. See Section 28.6.6.50, “mysql_options()”.

- The value of `host` may be either a host name or an IP address. The client attempts to connect as follows:
  - If `host` is `NULL` or the string "localhost", a connection to the local host is assumed:
    - On Windows, the client connects using a shared-memory connection, if the server has shared-memory connections enabled.
    - On Unix, the client connects using a Unix socket file. The `unix_socket` parameter or the `MYSQL_UNIX_PORT` environment variable may be used to specify the socket name.
  - On Windows, if `host` is ".", or TCP/IP is not enabled and no `unix_socket` is specified or the host is empty, the client connects using a named pipe, if the server has named-pipe connections enabled. If named-pipe connections are not enabled, an error occurs.
  - Otherwise, TCP/IP is used.

You can also influence the type of connection to use with the `MYSQL_OPT_PROTOCOL` or `MYSQL_OPT_NAMED_PIPE` options to `mysql_options()`. The type of connection must be supported by the server.

- The `user` parameter contains the user’s MySQL login ID. If `user` is `NULL` or the empty string "", the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current user name must be specified explicitly. See the Connector/ODBC section of Chapter 28, Connectors and APIs.

- The `passwd` parameter contains the password for `user`. If `passwd` is `NULL`, only entries in the `user` table for the user that have a blank (empty) password field are checked for a match. This enables the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

  **Note**
  Do not attempt to encrypt the password before calling `mysql_real_connect()`; password encryption is handled automatically by the client API.

- The `user` and `passwd` parameters use whatever character set has been configured for the `MYSQL` object. By default, this is `utf8mb4`, but can be changed by calling `mysql_options(mysql, MYSQL_SET_CHARSET_NAME, "charset_name")` prior to connecting.

- `db` is the database name. If `db` is not `NULL`, the connection sets the default database to this value.

- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.

- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe to use. Note that the `host` parameter determines the type of the connection.

- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features:
• **CAN_HANDLE_EXPIRED_PASSWORDS**: The client can handle expired passwords. For more information, see Section 6.2.16, “Server Handling of Expired Passwords”.

• **CLIENT_COMPRESS**: Use compression in the client/server protocol.

• **CLIENT_FOUND_ROWS**: Return the number of found (matched) rows, not the number of changed rows.

• **CLIENT_IGNORE_SIGPIPE**: Prevents the client library from installing a **SIGPIPE** signal handler. This can be used to avoid conflicts with a handler that the application has already installed.

• **CLIENT.Ignore_SPACE**: Permit spaces after function names. Makes all function names reserved words.

• **CLIENT_INTERACTIVE**: Permit **interactive_timeout** seconds of inactivity (rather than **wait_timeout** seconds) before closing the connection. The client’s session **wait_timeout** variable is set to the value of the session **interactive_timeout** variable.

• **CLIENT_LOCAL_FILES**: Enable **LOAD DATA LOCAL** handling.

• **CLIENT_MULTI_RESULTS**: Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This flag is automatically enabled if **CLIENT_MULTI_STATEMENTS** is enabled. See the note following this table for more information about this flag.

• **CLIENT_MULTI_STATEMENTS**: Tell the server that the client may send multiple statements in a single string (separated by ; characters). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag.

• **CLIENT_NO_SCHEMA**: Do not permit **db_name.tbl_name.col_name** syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.

• **CLIENT_ODBC**: Unused.

• **CLIENT_OPTIONAL_RESULTSET_METADATA**: This flag makes result set metadata optional. Suppression of metadata transfer can improve performance, particularly for sessions that execute many queries that return few rows each. For details about managing result set metadata transfer, see Section 28.6.26, “C API Optional Result Set Metadata”.

• **CLIENT_SSL**: Use SSL (encrypted protocol). Do not set this option within an application program; it is set internally in the client library. Instead, use **mysql_options()** or **mysql_ssl_set()** before calling **mysql_real_connect()**.

• **CLIENT_REMEMBER_OPTIONS**: Remember options specified by calls to **mysql_options()**. Without this option, if **mysql_real_connect()** fails, you must repeat the **mysql_options()** calls before trying to connect again. With this option, the **mysql_options()** calls need not be repeated.

If your program uses **CALL** statements to execute stored procedures, the **CLIENT_MULTI_RESULTS** flag must be enabled. This is because each **CALL** returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because **CALL** can return multiple results, process them using a loop that calls **mysql_next_result()** to determine whether there are more results.

**CLIENT_MULTI_RESULTS** can be enabled when you call **mysql_real_connect()**, either explicitly by passing the **CLIENT_MULTI_RESULTS** flag itself, or implicitly by passing **CLIENT_MULTI_STATEMENTS** (which also enables **CLIENT_MULTI_RESULTS**). **CLIENT_MULTI_RESULTS** is enabled by default.
If you enable `CLIENT_MULTI_STATEMENTS` or `CLIENT_MULTI_RESULTS`, process the result for every call to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see Section 28.6.22, “C API Multiple Statement Execution Support”.

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the `mysql_real_connect()` call. To do this, call `mysql_options()` with the `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP` option before calling `mysql_real_connect()`. Then, in the `mysql_real_connect()` call, specify the “no-value” value for each parameter to be read from an option file:

- For `host`, specify a value of `NULL` or the empty string (`""`).
- For `user`, specify a value of `NULL` or the empty string.
- For `passwd`, specify a value of `NULL`. (For the password, a value of the empty string in the `mysql_real_connect()` call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For `db`, specify a value of `NULL` or the empty string.
- For `port`, specify a value of 0.
- For `unix_socket`, specify a value of `NULL`.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

**Return Values**

A `MYSQL*` connection handler if the connection was successful, `NULL` if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

**Errors**

- **CR_CONN_HOST_ERROR**
  Failed to connect to the MySQL server.
- **CR_CONNECTION_ERROR**
  Failed to connect to the local MySQL server.
- **CR_IPSOCK_ERROR**
  Failed to create an IP socket.
- **CR_OUT_OF_MEMORY**
  Out of memory.
- **CR_SOCKET_CREATE_ERROR**
  Failed to create a Unix socket.
- **CR_UNKNOWN_HOST**
  Failed to find the IP address for the host name.
- **CR_VERSION_ERROR**
A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version.

- **CR_NAMEDPIPEOPEN_ERROR**
  Failed to create a named pipe on Windows.

- **CR_NAMEDPIPEWAIT_ERROR**
  Failed to wait for a named pipe on Windows.

- **CR_NAMEDPIPEGESETSTATE_ERROR**
  Failed to get a pipe handler on Windows.

- **CR_SERVER_LOST**
  If \texttt{connect\_timeout} > 0 and it took longer than \texttt{connect\_timeout} seconds to connect to the server or if the server died while executing the \texttt{init-command}.

- **CR_ALREADY_CONNECTED**
  The \texttt{MYSQL} connection handler is already connected.

**Example**

```c
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"your_prog_name");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n", 
            mysql_error(&mysql));
}
```

By using \texttt{mysql\_options()} the MySQL client library reads the \texttt{[client]} and \texttt{[your\_prog\_name]} sections in the \texttt{my.cnf} file which ensures that your program works, even if someone has set up MySQL in some nonstandard way.

Upon connection, \texttt{mysql\_real\_connect()} sets the \texttt{reconnect} flag (part of the \texttt{MYSQL} structure) to a value of 1 in versions of the API older than 5.0.3, or 0 in newer versions. A value of 1 for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the \texttt{MYSQL\_OPT\_RECONNECT} option to \texttt{mysql\_options()} to control reconnection behavior.

**28.6.6.55 mysql\_real\_escape\_string()**

```c
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const char *from, unsigned long length)
```

**Description**

This function creates a legal SQL string for use in an SQL statement. See \texttt{Section 9.1.1, “String Literals”}.

**Note**

mysql_real_escape_string() fails and produces an \texttt{CR\_INSECURE\_API\_ERR} error if the \texttt{NO\_BACKSLASH\_ESCAPES} SQL mode is enabled. In this case, the
function cannot escape quote characters except by doubling them, and to do this properly, it must know more information about the quoting context than is available. Instead, use `mysql_real_escape_string_quote()`, which takes an extra argument for specifying the quoting context.

The `mysql` argument must be a valid, open connection because character escaping depends on the character set in use by the server.

The string in the `from` argument is encoded to produce an escaped SQL string, taking into account the current character set of the connection. The result is placed in the `to` argument, followed by a terminating null byte.

Characters encoded are `, ' " NUL (ASCII 0), \n, \r, and Control+Z. Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. `mysql_real_escape_string()` quotes the other characters to make them easier to read in log files. For comparison, see the quoting rules for literal strings and the `QUOTE()` SQL function in Section 9.1.1, "String Literals", and Section 12.5, "String Functions and Operators".

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and there must be room for the terminating null byte.) When `mysql_real_escape_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

If you must change the character set of the connection, use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string()`, which `SET NAMES` does not.

Example

The following example inserts two escaped strings into an `INSERT` statement, each within single quote characters:

```c
char query[1000],*end;
end = my_stpcpy(query,"INSERT INTO test_table VALUES('");
end += mysql_real_escape_string(&mysql,end,"What is this",12);
end = my_stpcpy(end,"','");
end += mysql_real_escape_string(&mysql,end,"binary data: \0\r\n",16);
end = my_stpcpy(end,"')");
if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
            mysql_error(&mysql));
}
```

The `my_stpcpy()` function used in the example is included in the `libmysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the encoded string that is placed into the `to` argument, not including the terminating null byte, or -1 if an error occurs.

Because `mysql_real_escape_string()` returns an unsigned value, you can check for -1 by comparing the return value to `(unsigned long)-1` (or to `(unsigned long)-0`, which is equivalent).
Errors

- **CR_INSECURE_API_ERR**
  
  This error occurs if the NO_BACKSLASH_ESCAPES SQL mode is enabled because, in that case, `mysql_real_escape_string()` cannot be guaranteed to produce a properly encoded result. To avoid this error, use `mysql_real_escape_string_quote()` instead.

### 28.6.6.56 mysql_real_escape_string_quote()

```c
unsigned long mysql_real_escape_string_quote(MYSQL *mysql, char *to, const char *from, unsigned long length, char quote)
```

**Description**

This function creates a legal SQL string for use in an SQL statement. See Section 9.1.1, “String Literals”.

The `mysql` argument must be a valid, open connection because character escaping depends on the character set in use by the server.

The string in the `from` argument is encoded to produce an escaped SQL string, taking into account the current character set of the connection. The result is placed in the `to` argument, followed by a terminating null byte.

Characters encoded are `\`, `'`, `"`, NUL (ASCII 0), `
`, ``, Control+Z, and `. Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. `mysql_real_escape_string_quote()` quotes the other characters to make them easier to read in log files. For comparison, see the quoting rules for literal strings and the `QUOTE()` SQL function in Section 9.1.1, “String Literals”, and Section 12.5, “String Functions and Operators”.

**Note**

If the ANSI_QUOTES SQL mode is enabled, `mysql_real_escape_string_quote()` cannot be used to escape double quote characters for use within double-quoted identifiers. (The function cannot tell whether the mode is enabled to determine the proper escaping character.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and there must be room for the terminating null byte.) When `mysql_real_escape_string_quote()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

The `quote` argument indicates the context in which the escaped string is to be placed. Suppose that you intend to escape the `from` argument and insert the escaped string (designated here by `str`) into one of the following statements:

1) SELECT * FROM table WHERE name = 'str'
2) SELECT * FROM table WHERE name = "str"
3) SELECT * FROM `str` WHERE id = 103

To perform escaping properly for each statement, call `mysql_real_escape_string_quote()` as follows, where the final argument indicates the quoting context:

1) `len = mysql_real_escape_string_quote(&mysql, to, from, from_len, '\'';`
2) `len = mysql_real_escape_string_quote(&mysql, to, from, from_len, '"');`
3) `len = mysql_real_escape_string_quote(&mysql, to, from, from_len, '\'';');`
If you must change the character set of the connection, use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string_quote()`, which `SET NAMES` does not.

**Example**

The following example inserts two escaped strings into an `INSERT` statement, each within single quote characters:

```c
char query[1000],*end;
end = my_stpcpy(query,"INSERT INTO test_table VALUES('");
end += mysql_real_escape_string_quote(&mysql,end,"What is this",12,'\'');
end = my_stpcpy(end,"'"',"binary data: \0\r\n",16,'\'');
end = my_stpcpy(end,"'");

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
            mysql_error(&mysql));
}
```

The `my_stpcpy()` function used in the example is included in the `libmysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

**Return Values**

The length of the encoded string that is placed into the `to` argument, not including the terminating null byte.

**Errors**

None.

### 28.6.6.57 mysql_real_query()

```c
int mysql_real_query(MYSQL *mysql, const char *stmt_str, unsigned long length)
```

**Description**

- **Note**

  `mysql_real_query()` is a synchronous function. Its asynchronous counterpart is `mysql_real_query_nonblocking()`, for use by applications that require asynchronous communication with the server. See Section 28.6.11, "C API Asynchronous Interface".

`mysql_real_query()` executes the SQL statement pointed to by `stmt_str`, a string `length` bytes long. Normally, the string must consist of a single SQL statement without a terminating semicolon (`;`) or `\g`. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See Section 28.6.22, "C API Multiple Statement Execution Support".

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the `\0` character, which `mysql_query()` interprets as the end of the statement string.) In addition, `mysql_real_query()` is faster than `mysql_query()` because it does not call `strlen()` on the statement string.

If you want to know whether the statement returns a result set, you can use `mysql_field_count()` to check for this. See Section 28.6.6.22, "mysql_field_count()".
Return Values

Zero for success. Nonzero if an error occurred.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

### 28.6.6.58 mysql_refresh()

```c
int mysql_refresh(MYSQL *mysql, unsigned int options)
```

**Description**

This function flushes tables or caches, or resets replication server information. The connected user must have the `RELOAD` privilege.

The `options` argument is a bitmask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.

- **REFRESH_GRANT**
  
  Refresh the grant tables, like `FLUSH PRIVILEGES`.

- **REFRESH_LOG**
  
  Flush the logs, like `FLUSH LOGS`.

- **REFRESH_TABLES**
  
  Flush the table cache, like `FLUSH TABLES`.

- **REFRESH_HOSTS**
  
  Flush the host cache, like `FLUSH HOSTS`.

- **REFRESH_STATUS**
  
  Reset status variables, like `FLUSH STATUS`.

Note

`mysql_refresh()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a `FLUSH` statement.
### C API Function Descriptions

- **REFRESH_THREADS**
  Flush the thread cache.

- **REFRESH_SLAVE**
  On a slave replication server, reset the master server information and restart the slave, like `RESET SLAVE`.

- **REFRESH_MASTER**
  On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like `RESET MASTER`.

#### Return Values
Zero for success. Nonzero if an error occurred.

#### Errors
- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

#### 28.6.6.59 mysql_reload()

```c
int mysql_reload(MYSQL *mysql)
```

#### Description
Asks the MySQL server to reload the grant tables. The connected user must have the `RELOAD` privilege.

This function is deprecated. Use `mysql_query()` to issue an SQL `FLUSH PRIVILEGES` statement instead.

#### Return Values
Zero for success. Nonzero if an error occurred.

#### Errors
- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

### 28.6.6.60 mysql_reset_connection()

```c
int mysql_reset_connection(MYSQL *mysql)
```

**Description**

Resets the connection to clear the session state.

`mysql_reset_connection()` has effects similar to `mysql_change_user()` or an auto-reconnect except that the connection is not closed and reopened, and reauthentication is not done. The write set session history is reset. See Section 28.6.6.3, "mysql_change_user()", and Section 28.6.27, "C API Automatic Reconnection Control".

The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session system variables are reinitialized to the values of the corresponding global system variables, including system variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.

**Return Values**

Zero for success. Nonzero if an error occurred.

### 28.6.6.61 mysql_reset_server_public_key()

```c
void mysql_reset_server_public_key(void)
```

**Description**

Clears from the client library any cached copy of the public key required by the server for RSA key pair-based password exchange. This might be necessary when the server has been restarted.
with a different RSA key pair after the client program had called `mysql_options()` with the `MYSQL_SERVER_PUBLIC_KEY` option to specify the RSA public key. In such cases, connection failure can occur due to key mismatch. To fix this problem, the client can use either of the following approaches:

- The client can call `mysql_reset_server_public_key()` to clear the cached key and try again, after the public key file on the client side has been replaced with a file containing the new public key.
- The client can call `mysql_reset_server_public_key()` to clear the cached key, then call `mysql_options()` with the `MYSQL_OPT_GET_SERVER_PUBLIC_KEY` option (instead of `MYSQL_SERVER_PUBLIC_KEY`) to request the required public key from the server. Do not use both `MYSQL_OPT_GET_SERVER_PUBLIC_KEY` and `MYSQL_SERVER_PUBLIC_KEY` because in that case, `MYSQL_SERVER_PUBLIC_KEY` takes precedence.

Return Values

None.

Errors

None.

28.6.6.62 mysql_result_metadata()

```c
enum enum_resultset_metadata mysql_result_metadata(MYSQL_RES *result)
```

Description

`mysql_result_metadata()` returns a value that indicates whether a result set has metadata. It can be useful for metadata-optional connections when the client does not know in advance whether particular result sets have metadata. For example, if a client executes a stored procedure that returns multiple result sets and might change the `resultset_metadata` system variable, the client can invoke `mysql_result_metadata()` for each result set to determine whether it has metadata.

For details about managing result set metadata transfer, see Section 28.6.26, “C API Optional Result Set Metadata”.

Return Values

`mysql_result_metadata()` returns one of these values:

```c
enum enum_resultset_metadata {
    RESULTSET_METADATA_NONE= 0,
    RESULTSET_METADATA_FULL= 1
};
```

28.6.6.63 mysql_rollback()

```c
bool mysql_rollback(MYSQL *mysql)
```

Description

Rolls back the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is `RELEASE` (or 2), the server performs a release after terminating a transaction and closes the client connection. Call `mysql_close()` from the client program to close the connection from the client side.
Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

28.6.64 mysql_row_seek()

MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET offset)

Description

Sets the row cursor to an arbitrary row in a query result set. The offset value is a row offset, typically a value returned from mysql_row_tell() or from mysql_row_seek(). This value is not a row number; to seek to a row within a result set by number, use mysql_data_seek() instead.

This function requires that the result set structure contains the entire result of the query, so mysql_row_seek() may be used only in conjunction with mysql_store_result(), not with mysql_use_result().

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to mysql_row_seek().

Errors

None.

28.6.65 mysql_row_tell()

MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)

Description

Returns the current position of the row cursor for the last mysql_fetch_row(). This value can be used as an argument to mysql_row_seek().

Use mysql_row_tell() only after mysql_store_result(), not after mysql_use_result().

Return Values

The current offset of the row cursor.

Errors

None.

28.6.66 mysql_select_db()

int mysql_select_db(MYSQL *mysql, const char *db)

Description

Causes the database specified by db to become the default (current) database on the connection specified by mysql. In subsequent queries, this database is the default for table references that include no explicit database specifier.
**mysql_select_db()** fails unless the connected user can be authenticated as having permission to use the database or some object within it.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

---

### 28.6.6.67 mysql_server_end()

```c
void mysql_server_end(void)
```

**Description**

This function finalizes the MySQL client library, which should be done when you are done using the library. However, **mysql_server_end()** is deprecated and **mysql_library_end()** should be used instead. See Section 28.6.6.40, “mysql_library_end()”.

**Note**

To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call **mysql_server_end()** (or **mysql_library_end()**) explicitly. This enables memory management to be performed to clean up and free resources used by the library.

**Return Values**

None.

---

### 28.6.6.68 mysql_server_init()

```c
int mysql_server_init(int argc, char **argv, char **groups)
```

**Description**

This function initializes the MySQL client library, which must be done before you call any other MySQL function. However, **mysql_server_init()** is deprecated and you should call **mysql_library_init()** instead. See Section 28.6.6.41, “mysql_library_init()”.

---

4834
Note
To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call `mysql_server_end()` (or `mysql_library_end()` explicitly. This enables memory management to be performed to clean up and free resources used by the library. See Section 28.6.6.40, "mysql_library_end()".

Return Values
Zero for success. Nonzero if an error occurred.

28.6.6.69 `mysql_session_track_get_first()`

```c
int mysql_session_track_get_first(MYSQL *mysql, enum enum_session_state_type type, const char **data, size_t *length)
```

Description
MySQL implements a session tracker mechanism whereby the server returns information about session state changes to clients. To control which notifications the server provides about state changes, client applications set system variables having names of the form `session_track_xxx`, such as `session_track_state_change`, `session_track_schema`, and `session_track_system_variables`. See Section 5.1.15, “Server Tracking of Client Session State Changes”.

Change notification occurs in the MySQL client/server protocol, which includes tracker information in OK packets so that session state changes can be detected. To enable client applications to extract state-change information from OK packets, the MySQL C API provides a pair of functions:

- `mysql_session_track_get_first()` fetches the first part of the state-change information received from the server.
- `mysql_session_track_get_next()` fetches any remaining state-change information received from the server. Following a successful call to `mysql_session_track_get_first()`, call this function repeatedly as long as it returns success.

The `mysql_session_track_get_first()` parameters are used as follows. These descriptions also apply to `mysql_session_track_get_next()`, which takes the same parameters.

- **mysql**: The connection handler.
- **type**: The tracker type indicating what kind of information to retrieve. Permitted tracker values are the members of the `enum enum_session_state_type` enumeration defined in `mysql_com.h`:

```c
enum enum_session_state_type {
    SESSION_TRACK_SYSTEM_VARIABLES,   /* Session system variables */
    SESSION_TRACK_SCHEMA,             /* Current schema */
    SESSION_TRACK_STATE_CHANGE,       /* Session state changes */
    SESSION_TRACK_GTIDS,              /* GTIDs */
    SESSION_TRACK_TRANSACTION_CHARACTERISTICS, /* Transaction characteristics */
    SESSION_TRACK_TRANSACTION_STATE   /* Transaction state */
};
```

The members of that enumeration may change over time as MySQL implements additional session-information trackers. To make it easy for applications to loop over all possible tracker types regardless of the number of members, the `SESSION_TRACK_BEGIN` and `SESSION_TRACK_END` symbols are
defined to be equal to the first and last members of the `enum_session_state_type` enumeration. The example code shown later in this section demonstrates this technique. (Of course, if the enumeration members change, you must recompile your application to enable it to take account of new trackers.)

- **data**: The address of a `const char *` variable. Following a successful call, this variable points to the returned data, which should be considered read only.

- **length**: The address of a `size_t` variable. Following a successful call, this variable contains the length of the data pointed to by the `data` parameter.

The following discussion describes how to interpret the `data` and `length` values according to the `type` value. It also indicates which system variable enables notifications for each tracker type.

- **SESSION_TRACK_SCHEMA**: This tracker type indicates that the default schema has been set. `data` is a string containing the new default schema name. `length` is the string length.

  To enable notifications for this tracker type, enable the `session_track_schema` system variable.

- **SESSION_TRACK_SYSTEM_VARIABLES**: This tracker type indicates that one or more tracked session system variables have been assigned a value. When a session system variable is assigned, two values per variable are returned (in separate calls). For the first call, `data` is a string containing the variable name and `length` is the string length. For the second call, `data` is a string containing the variable value and `length` is the string length.

  By default, notification is enabled for these session system variables:

  - `autocommit`
  - `character_set_client`
  - `character_set_connection`
  - `character_set_results`
  - `time_zone`

  To change the default notification for this tracker type, set the `session_track_schema` system variable to a list of comma-separated variables for which to track changes, or `*` to track changes for all variables. To disable notification of session variable assignments, set `session_track_system_variables` to the empty string.

- **SESSION_TRACK_STATE_CHANGE**: This tracker type indicates a change to some tracked attribute of session state. `data` is a byte containing a boolean flag that indicates whether session state changes occurred. `length` should be 1. The flag is represented as an ASCII value, not a binary (for example, '1', not 0x01).

  To enable notifications for this tracker type, enable the `session_track_state_change` system variable.

  This tracker reports changes for these attributes of session state:

  - The default schema (database).
  - Session-specific values for system variables.
  - User-defined variables.
  - Temporary tables.
• Prepared statements.

• **SESSION_TRACK_GTIDS**: This tracker type indicates that GTIDs are available. `data` contains the GTID string. `length` is the string length. The GTID string is in the standard format for specifying a set of GTID values; see GTID Sets.

To enable notifications for this tracker type, set the `session_track_gtids` system variable.

• **SESSION_TRACK_TRANSACTION_CHARACTERISTICS**: This tracker type indicates that transaction characteristics are available. `data` is a string containing the characteristics data. `length` is the string length. The characteristics tracker data string may be empty, or it may contain one or more SQL statements, each terminated by a semicolon:

  - If no characteristics apply, the string is empty. The session defaults apply. (For isolation level and access mode, these defaults are given by the session values of the `transaction_isolation` and `transaction_read_only` system variables.)

  - If a transaction was explicitly started, the string contains the statement or statements required to restart the transaction with the same characteristics. As a general rule, this is a `START TRANSACTION` statement (possibly with one or more of `READ ONLY`, `READ WRITE`, and `WITH CONSISTENT SNAPSHOT`). If any characteristics apply that cannot be passed to `START TRANSACTION`, such as `ISOLATION LEVEL`, a suitable `SET TRANSACTION` statement is prepended (for example, `SET TRANSACTION ISOLATION LEVEL SERIALIZABLE; START TRANSACTION READ WRITE;`).

  - If a transaction was not explicitly started, but one-shot characteristics that apply only to the next transaction were set up, a `SET TRANSACTION` statement suitable for replicating that setup is generated (for example, `SET TRANSACTION READ ONLY;`).

  Next-transaction characteristics can be set using `SET TRANSACTION` without any `GLOBAL` or `SESSION` keyword, or by setting the `transaction_isolation` and `transaction_read_only` system variables using the syntax that applies only to the next transaction:

  ```
  SET @@transaction_isolation = `value`;
  SET @@transaction_read_only = `value`;
  ```

  For more information about transaction characteristic scope levels and how they are set, see Transaction Characteristic Scope.

To enable notifications for this tracker type, set the `session_track_transaction_info` system variable to `CHARACTERISTICS` (which also enables the `SESSION_TRACK_TRANSACTION_STATE` tracker type).

Transaction characteristics tracking enables the client to determine how to restart a transaction in another session so it has the same characteristics as in the original session.

Because characteristics may be set using `SET TRANSACTION` before a transaction is started, it is not safe for the client to assume that there are no transaction characteristics if no transaction is active. It is therefore unsafe not to track transaction characteristics and just switch the connection when no transaction is active (whether this is detected by the transaction state tracker or the traditional `SERVER_STATUS_IN_TRANS` flag). A client must subscribe to the transaction characteristics tracker if it may wish to switch its session to another connection at some point and transactions may be used.

The characteristics tracker tracks changes to the one-shot characteristics that apply only to the next transaction. It does not track changes to the session variables. Therefore, the client additionally must track the `transaction_isolation` and `transaction_read_only` system variables to correctly determine the session defaults that apply when next-transaction characteristic values are empty. (To
track these variables, list them in the value of the `session_track_system_variables` system variable.)
SESSION_TRACK_TRANSACTION_STATE: This tracker type indicates that transaction state information is available. data is a string containing ASCII characters, each of which indicates some aspect of the transaction state. length is the string length (always 8).

To enable notifications for this tracker type, set the session_track_transaction_info system variable to STATE.

Transaction state tracking enables the client to determine whether a transaction is in progress and whether it could be moved to a different session without being rolled back.

The scope of the tracker item is the transaction. All state-indicating flags persist until the transaction is committed or rolled back. As statements are added to the transaction, additional flags may be set in successive tracker data values. However, no flags are cleared until the transaction ends.

Transaction state is reported as a string containing a sequence of ASCII characters. Each active state has a unique character assigned to it as well as a fixed position in the sequence. The following list describes the permitted values for positions 1 through 8 of the sequence:

- Position 1: Whether an active transaction is ongoing.
  - T: An explicitly started transaction is ongoing.
  - I: An implicitly started transaction (autocommit=0) is ongoing.
  - _: There is no active transaction.

- Position 2: Whether nontransactional tables were read in the context of the current transaction.
  - r: One or more nontransactional tables were read.
  - _: No nontransactional tables were read so far.

- Position 3: Whether transactional tables were read in the context of the current transaction.
  - R: One or more transactional tables were read.
  - _: No transactional tables were read so far.

- Position 4: Whether unsafe writes (writes to nontransactional tables) were performed in the context of the current transaction.
  - w: One or more nontransactional tables were written.
  - _: No nontransactional tables were written so far.

- Position 5: Whether any transactional tables were written in the context of the current transaction.
  - W: One or more transactional tables were written.
  - _: No transactional tables were written so far.

- Position 6: Whether any unsafe statements were executed in the context of the current transaction. Statements containing nondeterministic constructs such as RAND() or UUID() are unsafe for statement-based replication.
  - s: One or more unsafe statements were executed.
C API Function Descriptions

- _: No unsafe statements were executed so far.
- Position 7: Whether a result set was sent to the client during the current transaction.
  - S: A result set was sent.
  - _: No result sets were sent so far.
- Position 8: Whether a `LOCK TABLES` statement is in effect.
  - L: Tables are explicitly locked with `LOCK TABLES`.
  - _: `LOCK TABLES` is not active in the session.

Consider a session consisting of the following statements, including one to enable the transaction state tracker:

```
1. SET @SESSION.session_track_transaction_info='STATE';
2. START TRANSACTION;
3. SELECT 1;
4. INSERT INTO t1 () VALUES();
5. INSERT INTO t1 () VALUES(1, RAND());
6. COMMIT;
```

With transaction state tracking enabled, the following `data` values result from those statements:

```
1. ___
2. T____
3. T____S_
4. T__W_S_
5. T__WsS_
6. ___
```

Return Values

Zero for success. Nonzero if an error occurred.

Errors

None.

Example

The following example shows how to call `mysql_session_track_get_first()` and `mysql_session_track_get_next()` to retrieve and display all available session state-change information following successful execution of an SQL statement string (represented by `stmt_str`). It is assumed that the application has set the `session_track_xxx` system variables that enable the notifications it wishes to receive.

```
printf("Execute: %s\n", stmt_str);
if (mysql_query(mysql, stmt_str) != 0)
{
    fprintf(stderr, "Error %u: %s\n",
            mysql_errno(mysql), mysql_error(mysql));
    return;
}
MYSQL_RES *result = mysql_store_result(mysql);
if (result) /* there is a result set to fetch */
C API Function Descriptions

```c
/* ... process rows here ... */
printf("Number of rows returned: %lu\n",
(unsigned long) mysql_num_rows(result));
mysql_free_result(result);
}
else        /* there is no result set */
{
if (mysql_field_count(mysql) == 0)
{
printf("Number of rows affected: %lu\n",
(unsigned long) mysql_affected_rows(mysql));
}
else        /* an error occurred */
{
fprintf(stderr, "Error %u: %s\n",
mysql_errno(mysql), mysql_error(mysql));
}
}
/* extract any available session state-change information */
enum enum_session_state_type type;
for (type = SESSION_TRACK_BEGIN; type <= SESSION_TRACK_END; type++)
{
const char *data;
size_t length;

if (mysql_session_track_get_first(mysql, type, &data, &length) == 0)
{
/* print info type and initial data */
printf("Type=%d: \n", type);
printf("mysql_session_track_get_first(): length=%d; data=%*.*s\n",
(int) length, (int) length, (int) length, data);
/* check for more data */
while (mysql_session_track_get_next(mysql, type, &data, &length) == 0)
{
printf("mysql_session_track_get_next(): length=%d; data=%*.*s\n",
(int) length, (int) length, (int) length, data);
}
}
}
```

28.6.6.70 `mysql_session_track_get_next()`

```c
int mysql_session_track_get_next(MYSQL *mysql, enum enum_session_state_type
type, const char **data, size_t *length)
```

**Description**

This function fetches additional session state-change information received from the server, following that retrieved by `mysql_session_track_get_first()`. The parameters for `mysql_session_track_get_next()` are the same as for `mysql_session_track_get_first()`.

Following a successful call to `mysql_session_track_get_first()`, call `mysql_session_track_get_next()` repeatedly until it returns nonzero to indicate no more information is available. The calling sequence for `mysql_session_track_get_next()` is similar to that for `mysql_session_track_get_first()`. For more information and an example that demonstrates both functions, see Section 28.6.6.69, "mysql_session_track_get_first()".

**Return Values**

Zero for success. Nonzero if an error occurred.
Errors

None.

28.6.6.71 mysql_set_character_set()

    int mysql_set_character_set(MYSQL *mysql, const char *csname)

Description

This function is used to set the default character set for the current connection. The string csname specifies a valid character set name. The connection collation becomes the default collation of the character set. This function works like the \texttt{SET NAMES} statement, but also sets the value of \texttt{mysql->charset}, and thus affects the character set used by \texttt{mysql_real_escape_string()}

Return Values

Zero for success. Nonzero if an error occurred.

Example

```c
MYSQL mysql;
mysql_init(&mysql);
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
if (!mysql_set_character_set(&mysql, "utf8"))
{
    printf("New client character set: %s\n",
            mysql_character_set_name(&mysql));
}
```

28.6.6.72 mysql_set_local_infile_default()

    void mysql_set_local_infile_default(MYSQL *mysql);

Description

Sets the \texttt{LOAD DATA LOCAL} callback functions to the defaults used internally by the C client library. The library calls this function automatically if \texttt{mysql_set_local_infile_handler()} has not been called or does not supply valid functions for each of its callbacks.

Return Values

None.

Errors

None.

28.6.6.73 mysql_set_local_infile_handler()

    void mysql_set_local_infile_handler(MYSQL *mysql, int (*local_infile_init)(void **, const char *, void *), int (*local_infile_read)(void *, char *, unsigned int), void (*local_infile_end)(void *), int (*local_infile_error)(void *, char*, unsigned int), void *userdata);
Description

This function installs callbacks to be used during the execution of `LOAD DATA LOCAL` statements. It enables application programs to exert control over local (client-side) data file reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```c
int local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the data file, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argument is the same value that is passed to `mysql_set_local_infile_handler()`.

Make the initialization function return zero for success, nonzero for an error.

```c
int local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data is stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```c
void local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. Within this function, deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initialization function returns an error.

```c
int local_infile_error(void *ptr, char *error_msg, unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message is written, and `error_msg_len` is the length of the buffer. Write the message as a null-terminated string, at most `error_msg_len - 1` bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The file name specified in `LOAD DATA LOCAL` will be passed as the second parameter to the `local_infile_init()` callback.

Return Values

None.
28.6.6.74 mysql_set_server_option()

```c
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

**Description**

Enables or disables an option for the connection. `option` can have one of the following values.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MYSQL_OPTION_MULTI STATEMENTS ON</td>
<td>Enable multiple-statement support</td>
</tr>
<tr>
<td>MYSQL_OPTION_MULTI STATEMENTS OFF</td>
<td>Disable multiple- statement support</td>
</tr>
</tbody>
</table>

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see Section 28.6.22, “C API Multiple Statement Execution Support”.

Enabling multiple-statement support with `MYSQL_OPTION_MULTI_STATEMENTS_ON` does not have quite the same effect as enabling it by passing the `CLIENT_MULTI_STATEMENTS` flag to `mysql_real_connect()`: `CLIENT_MULTI_STATEMENTS` also enables `CLIENT_MULTI_RESULTS`. If you are using the `CALL` SQL statement in your programs, multiple-result support must be enabled; this means that `MYSQL_OPTION_MULTI_STATEMENTS_ON` by itself is insufficient to permit the use of `CALL`.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **ER_UNKNOWN_COM_ERROR**
  
  The server did not support `mysql_set_server_option()` (which is the case that the server is older than 4.1.1) or the server did not support the option one tried to set.

28.6.6.75 mysql_shutdown()

```c
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level shutdown_level)
```

**Description**

Note

`mysql_shutdown()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a `SHUTDOWN` statement.
Asks the database server to shut down. The connected user must have the **SHUTDOWN** privilege. MySQL servers support only one type of shutdown; **shutdown_level** must be equal to **SHUTDOWN_DEFAULT**. Dynamically linked executables that have been compiled with older versions of the `libmysqlclient` headers and call `mysql_shutdown()` must be used with the old `libmysqlclient` dynamic library.

An alternative to `mysql_shutdown()` is to use the **SHUTDOWN** SQL statement.

The shutdown process is described in Section 5.1.16, “The Server Shutdown Process”.

### Return Values

Zero for success. Nonzero if an error occurred.

### Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

### 28.6.6.76 `mysql_sqlstate()`

```c
const char *mysql_sqlstate(MYSQL *mysql)
```

### Description

Returns a null-terminated string containing the SQLSTATE error code for the most recently executed SQL statement. The error code consists of five characters. '00000' means “no error.” The values are specified by ANSI SQL and ODBC. For a list of possible values, see Appendix B, Errors, Error Codes, and Common Problems.

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and '42S02' is the corresponding `mysql_sqlstate()` value:

```bash
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value 'HY000' (general error) is used for unmapped error numbers.

If you call `mysql_sqlstate()` after `mysql_real_connect()` fails, `mysql_sqlstate()` might not return a useful value. For example, this happens if a host is blocked by the server and the connection is closed without any SQLSTATE value being sent to the client.

### Return Values

A null-terminated character string containing the SQLSTATE error code.
See Also

28.6.6.77 mysql_ssl_set()

bool mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert, const char *ca, const char *capath, const char *cipher)

Description

mysql_ssl_set() is used for establishing encrypted connections using SSL. The mysql argument must be a valid connection handler. Any unused SSL arguments may be given as NULL.

If used, mysql_ssl_set() must be called before mysql_real_connect(). mysql_ssl_set() does nothing unless SSL support is enabled in the client library.

It is optional to call mysql_ssl_set() to obtain an encrypted connection because by default, MySQL programs attempt to connect using encryption if the server supports encrypted connections, falling back to an unencrypted connection if an encrypted connection cannot be established (see Section 6.3.1, “Configuring MySQL to Use Encrypted Connections”). mysql_ssl_set() may be useful to applications that must specify particular certificate and key files, encryption ciphers, and so forth.

mysql_ssl_set() specifies SSL information such as certificate and key files for establishing an encrypted connection if such connections are available, but does not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the technique described in Section 28.6.21, “C API Encrypted Connection Support”.

For additional security relative to that provided by the default encryption, clients can supply a CA certificate matching the one used by the server and enable host name identity verification. In this way, the server and client place their trust in the same CA certificate and the client verifies that the host to which it connected is the one intended. For details, see Section 28.6.21, “C API Encrypted Connection Support”.

mysql_ssl_set() is a convenience function that is essentially equivalent to this set of mysql_options() calls:

```c
mysql_options(mysql, MYSQL_OPT_SSL_KEY, key);
mysql_options(mysql, MYSQL_OPT_SSL_CERT, cert);
mysql_options(mysql, MYSQL_OPT_SSL_CA, ca);
mysql_options(mysql, MYSQL_OPT_SSL_CAPATH, capath);
mysql_options(mysql, MYSQL_OPT_SSL_CIPHER, cipher);
```

Because of that equivalence, applications can, instead of calling mysql_ssl_set(), call mysql_options() directly, omitting calls for those options for which the option value is NULL. Moreover, mysql_options() offers encrypted-connection options not available using mysql_ssl_set(), such as MYSQL_OPT_SSL_MODE to specify the security state of the connection, and MYSQL_OPT_TLS_VERSION to specify the protocols the client permits for encrypted connections.

Arguments:

- **mysql**: The connection handler returned from mysql_init().
- **key**: The path name of the client private key file.
- **cert**: The path name of the client public key certificate file.
- **ca**: The path name of the Certificate Authority (CA) certificate file. This option, if used, must specify the same certificate used by the server.
- **capath**: The path name of the directory that contains trusted SSL CA certificate files.
- **cipher**: The list of permissible ciphers for SSL encryption.

**Return Values**

This function always returns 0. If SSL setup is incorrect, a subsequent `mysql_real_connect()` call returns an error when you attempt to connect.

### 28.6.6.78 mysql_stat()

```c
const char *mysql_stat(MYSQL *mysql)
```

**Description**

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

**Return Values**

A character string describing the server status. `NULL` if an error occurred.

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

### 28.6.6.79 mysql_store_result()

```c
MYSQL_RES *mysql_store_result(MYSQL *mysql)
```

**Description**

- **Note**

  `mysql_store_result()` is a synchronous function. Its asynchronous counterpart is `mysql_store_result_nonblocking()`, for use by applications that require asynchronous communication with the server. See Section 28.6.11, "C API Asynchronous Interface".

  After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (SELECT, SHOW, DESCRIBE, EXPLAIN, CHECK TABLE, and so forth). You must also call `mysql_free_result()` after you are done with the result set.
You need not call `mysql_store_result()` or `mysql_use_result()` for other statements, but it does not do any harm or cause any notable performance degradation if you call `mysql_store_result()` in all cases. You can detect whether the statement has a result set by checking whether `mysql_store_result()` returns a nonzero value (more about this later).

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see Section 28.6.22, “C API Multiple Statement Execution Support”.

If you want to know whether a statement should return a result set, you can use `mysql_field_count()` to check for this. See Section 28.6.6.22, “mysql_field_count()”.

`mysql_store_result()` reads the entire result of a query to the client, allocates a `MYSQL_RES` structure, and places the result into this structure.

`mysql_store_result()` returns `NULL` if the statement did not return a result set (for example, if it was an `INSERT` statement), or an error occurred and reading of the result set failed.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

After you have called `mysql_store_result()` and gotten back a result that is not a null pointer, you can call `mysql_num_rows()` to find out how many rows are in the result set.

You can call `mysql_fetch_row()` to fetch rows from the result set, or `mysql_row_seek()` and `mysql_row_tell()` to obtain or set the current row position within the result set.

See Section 28.6.28.1, “Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success”.

**Return Values**

A pointer to a `MYSQL_RES` result structure with the results. `NULL` if the statement did not return a result set or an error occurred. To determine whether an error occurred, check whether `mysql_error()` returns a nonempty string, `mysql_errno()` returns nonzero, or `mysql_field_count()` returns zero.

**Errors**

`mysql_store_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_OUT_OF_MEMORY**
  
  Out of memory.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.
28.6.80 mysql_thread_id()

    unsigned long mysql_thread_id(MYSQL *mysql)

Description

Returns the thread ID of the current connection. This value can be used as an argument to mysql_kill() to kill the thread.

If the connection is lost and you reconnect with mysql_ping(), the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

Note

This function does not work correctly if thread IDs become larger than 32 bits, which can occur on some systems. To avoid problems with mysql_thread_id(), do not use it. To get the connection ID, execute a SELECT CONNECTION_ID() query and retrieve the result.

Return Values

The thread ID of the current connection.

Errors

None.

28.6.81 mysql_use_result()

    MYSQL_RES *mysql_use_result(MYSQL *mysql)

Description

After invoking mysql_query() or mysql_real_query(), you must call mysql_store_result() or mysql_use_result() for every statement that successfully produces a result set (SELECT, SHOW, DESCRIBE, EXPLAIN, CHECK TABLE, and so forth). You must also call mysql_free_result() after you are done with the result set.

mysql_use_result() initiates a result set retrieval but does not actually read the result set into the client like mysql_store_result() does. Instead, each row must be retrieved individually by making calls to mysql_fetch_row(). This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than mysql_store_result(). The client allocates memory only for the current row and a communication buffer that may grow up to max_allowed_packet bytes.

On the other hand, you should not use mysql_use_result() for locking reads if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a ^S (stop scroll). This ties up the server and prevent other threads from updating any tables from which the data is being fetched.

When using mysql_use_result(), you must execute mysql_fetch_row() until a NULL value is returned, otherwise, the unfetched rows are returned as part of the result set for your next query. The C API gives the error Commands out of sync; you can't run this command now if you forget to do this!

You may not use mysql_data_seek(), mysql_row_seek(), mysql_row_tell(), mysql_num_rows(), or mysql_affected_rows() with a result returned from mysql_use_result(), nor may you issue other queries until mysql_use_result() has finished. (However, after you have fetched all the rows, mysql_num_rows() accurately returns the number of rows fetched.)
You must call `mysql_free_result()` once you are done with the result set.

**Return Values**

A `MYSQL_RES` result structure. `NULL` if an error occurred.

**Errors**

`mysql_use_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_OUT_OF_MEMORY**
  Out of memory.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

### 28.6.6.82 `mysql_warning_count()`

```c
unsigned int mysql_warning_count(MYSQL *mysql)
```

**Description**

Returns the number of errors, warnings, and notes generated during execution of the previous SQL statement.

**Return Values**

The warning count.

**Errors**

None.

### 28.6.7 C API Prepared Statements

The MySQL client/server protocol provides for the use of prepared statements. This capability uses the `MYSQL_STMT` statement handler data structure returned by the `mysql_stmt_init()` initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handler returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.
Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and nonprepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

For a list of SQL statements that can be used as prepared statements, see Section 13.5, “Prepared Statements”.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

### 28.6.8 C API Prepared Statement Data Structures

Prepared statements use several data structures:

- To obtain a statement handler, pass a MYSQL connection handler to `mysql_stmt_init()`, which returns a pointer to a MYSQL_STMT data structure. This structure is used for further operations with the statement. To specify the statement to prepare, pass the MYSQL_STMT pointer and the statement string to `mysql_stmt_prepare()`.

- To provide input parameters for a prepared statement, set up MYSQL_BIND structures and pass them to `mysql_stmt_bind_param()`. To receive output column values, set up MYSQL_BIND structures and pass them to `mysql_stmt_bind_result()`.

- The MYSQL_TIME structure is used to transfer temporal data in both directions.

The following discussion describes the prepared statement data types in detail. For examples that show how to use them, see Section 28.6.10.10, “mysql_stmt_execute()”, and Section 28.6.10.11, “mysql_stmt_fetch()”.

- **MYSQL_STMT**

  This structure is a handler for a prepared statement. A handler is created by calling `mysql_stmt_init()`, which returns a pointer to a MYSQL_STMT. The handler is used for all subsequent operations with the statement until you close it with `mysql_stmt_close()`, at which point the handler becomes invalid and should no longer be used.

  The MYSQL_STMT structure has no members intended for application use. Applications should not try to copy a MYSQL_STMT structure. There is no guarantee that such a copy will be usable.

  Multiple statement handlers can be associated with a single connection. The limit on the number of handlers depends on the available system resources.

- **MYSQL_BIND**

  This structure is used both for statement input (data values sent to the server) and output (result values returned from the server):

  - For input, use MYSQL_BIND structures with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`.

  - For output, use MYSQL_BIND structures with `mysql_stmt_bind_result()` to bind buffers to result set columns, for use in fetching rows with `mysql_stmt_fetch()`.
To use a `MYSQL_BIND` structure, zero its contents to initialize it, then set its members appropriately. For example, to declare and initialize an array of three `MYSQL_BIND` structures, use this code:

```c
MYSQL_BIND bind[3];
memset(bind, 0, sizeof(bind));
```

The `MYSQL_BIND` structure contains the following members for use by application programs. For several of the members, the manner of use depends on whether the structure is used for input or output.

- **enum enum_field_types buffer_type**

  The type of the buffer. This member indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored. For permissible `buffer_type` values, see Section 28.6.8.1, “C API Prepared Statement Type Codes”.

- **void *buffer**

  A pointer to the buffer to be used for data transfer. This is the address of a C language variable.

  For input, `buffer` is a pointer to the variable in which you store the data value for a statement parameter. When you call `mysql_stmt_execute()`, MySQL use the value stored in the variable in place of the corresponding parameter marker in the statement (specified with `?` in the statement string).

  For output, `buffer` is a pointer to the variable in which to return a result set column value. When you call `mysql_stmt_fetch()`, MySQL stores a column value from the current row of the result set in this variable. You can access the value when the call returns.

  To minimize the need for MySQL to perform type conversions between C language values on the client side and SQL values on the server side, use C variables that have types similar to those of the corresponding SQL values:

  - For numeric data types, `buffer` should point to a variable of the proper numeric C type. For integer variables (which can be `char` for single-byte values or an integer type for larger values), you should also indicate whether the variable has the `unsigned` attribute by setting the `is_unsigned` member, described later.

  - For character (nonbinary) and binary string data types, `buffer` should point to a character buffer.

  - For date and time data types, `buffer` should point to a `MYSQL_TIME` structure.

  For guidelines about mapping between C types and SQL types and notes about type conversions, see Section 28.6.8.1, “C API Prepared Statement Type Codes”, and Section 28.6.8.2, “C API Prepared Statement Type Conversions”.

- **unsigned long buffer_length**

  The actual size of `*buffer` in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the `buffer_length` value specifies the length of `*buffer` when used with `mysql_stmt_bind_param()` to specify input values, or
the maximum number of output data bytes that can be fetched into the buffer when used with mysql_stmt_bind_result().

* unsigned long *length

A pointer to an unsigned long variable that indicates the actual number of bytes of data stored in *buffer. length is used for character or binary C data.

For input parameter data binding, set *length to indicate the actual length of the parameter value stored in *buffer. This is used by mysql_stmt_execute().

For output value binding, MySQL sets *length when you call mysql_stmt_fetch(). The mysql_stmt_fetch() return value determines how to interpret the length:

• If the return value is 0, *length indicates the actual length of the parameter value.

• If the return value is MYSQL_DATA_TRUNCATED, *length indicates the nontruncated length of the parameter value. In this case, the minimum of *length and buffer_length indicates the actual length of the value.

length is ignored for numeric and temporal data types because the buffer_type value determines the length of the data value.

If you must determine the length of a returned value before fetching it, see Section 28.6.10.11, "mysql_stmt_fetch()", for some strategies.

* bool *is_null

This member points to a bool variable that is true if a value is NULL, false if it is not NULL. For input, set *is_null to true to indicate that you are passing a NULL value as a statement parameter.

is_null is a pointer to a boolean scalar, not a boolean scalar, to provide flexibility in how you specify NULL values:

• If your data values are always NULL, use MYSQL_TYPE_NULL as the buffer_type value when you bind the column. The other MYSQL_BIND members, including is_null, do not matter.

• If your data values are always NOT NULL, set is_null = (bool*) 0, and set the other members appropriately for the variable you are binding.

• In all other cases, set the other members appropriately and set is_null to the address of a bool variable. Set that variable's value to true or false appropriately between executions to indicate whether the corresponding data value is NULL or NOT NULL, respectively.

For output, when you fetch a row, MySQL sets the value pointed to by is_null to true or false according to whether the result set column value returned from the statement is or is not NULL.

* bool is_unsigned

This member applies for C variables with data types that can be unsigned (char, short int, int, long long int). Set is_unsigned to true if the variable pointed to by buffer is unsigned and false otherwise. For example, if you bind a signed char variable to buffer, specify a type code of MYSQL_TYPE_TINY and set is_unsigned to false. If you bind an unsigned char instead, the type
code is the same but _is_unsigned_ should be true. (For _char_, it is not defined whether it is signed or unsigned, so it is best to be explicit about signedness by using _signed char_ or _unsigned char_.)

_is_unsigned_ applies only to the C language variable on the client side. It indicates nothing about the signedness of the corresponding SQL value on the server side. For example, if you use an _int_ variable to supply a value for a _BIGINT UNSIGNED_ column, _is_unsigned_ should be false because _int_ is a signed type. If you use an _unsigned int_ variable to supply a value for a _BIGINT_ column, _is_unsigned_ should be true because _unsigned int_ is an unsigned type. MySQL performs the proper conversion between signed and unsigned values in both directions, although a warning occurs if truncation results.

- _bool _*error_

  For output, set this member to point to a _bool_ variable to have truncation information for the parameter stored there after a row fetching operation. When truncation reporting is enabled, _mysql_stmt_fetch()_ returns _MYSQL_DATA_TRUNCATED_ and _*error_ is true in the _MYSQL_BIND_ structures for parameters in which truncation occurred. Truncation indicates loss of sign or significant digits, or that a string was too long to fit in a column. Truncation reporting is enabled by default, but can be controlled by calling _mysql_options()_ with the _MYSQL_REPORT_DATA_TRUNCATION_ option.

- _MYSQL_TIME_

  This structure is used to send and receive _DATE, TIME, DATETIME, and TIMESTAMP_ data directly to and from the server. Set the _buffer_ member to point to a _MYSQL_TIME_ structure, and set the _buffer_type_ member of a _MYSQL_BIND_ structure to one of the temporal types (_MYSQL_TYPE_TIME, MYSQL_TYPE_DATE, MYSQL_TYPE_DATETIME, MYSQL_TYPE_TIMESTAMP_).

  The _MYSQL_TIME_ structure contains the members listed in the following table.

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsigned int <em>year</em></td>
<td>The year</td>
</tr>
<tr>
<td>unsigned int <em>month</em></td>
<td>The month of the year</td>
</tr>
<tr>
<td>unsigned int <em>day</em></td>
<td>The day of the month</td>
</tr>
<tr>
<td>unsigned int <em>hour</em></td>
<td>The hour of the day</td>
</tr>
<tr>
<td>unsigned int <em>minute</em></td>
<td>The minute of the hour</td>
</tr>
<tr>
<td>unsigned int <em>second</em></td>
<td>The second of the minute</td>
</tr>
<tr>
<td>_bool <em>neg</em></td>
<td>A boolean flag indicating whether the time is negative</td>
</tr>
<tr>
<td>unsigned long <em>second_part</em></td>
<td>The fractional part of the second in microseconds</td>
</tr>
</tbody>
</table>

Only those parts of a _MYSQL_TIME_ structure that apply to a given type of temporal value are used. The _year, month, and day_ elements are used for _DATE, DATETIME, and TIMESTAMP_ values. The _hour, minute, and second_ elements are used for _TIME, DATETIME, and TIMESTAMP_ values. See Section 28.6.23, “C API Prepared Statement Handling of Date and Time Values”.

### 28.6.8.1 C API Prepared Statement Type Codes

The _buffer_type_ member of _MYSQL_BIND_ structures indicates the data type of the C language variable bound to a statement parameter or result set column. For input, _buffer_type_ indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored.
The following table shows the permissible values for the buffer_type member of MYSQL_BIND structures for input values sent to the server. The table shows the C variable types that you can use, the corresponding type codes, and the SQL data types for which the supplied value can be used without conversion. Choose the buffer_type value according to the data type of the C language variable that you are binding. For the integer types, you should also set the is_unsigned member to indicate whether the variable is signed or unsigned.

<table>
<thead>
<tr>
<th>Input Variable C Type</th>
<th>buffer_type Value</th>
<th>SQL Type of Destination Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>signed char</td>
<td>MYSQL_TYPE_TINY</td>
<td>TINYINT</td>
</tr>
<tr>
<td>short int</td>
<td>MYSQL_TYPE_SHORT</td>
<td>SMALLINT</td>
</tr>
<tr>
<td>int</td>
<td>MYSQL_TYPE_LONG</td>
<td>INT</td>
</tr>
<tr>
<td>long long int</td>
<td>MYSQL_TYPE_LONGLONG</td>
<td>BIGINT</td>
</tr>
<tr>
<td>float</td>
<td>MYSQL_TYPE_FLOAT</td>
<td>FLOAT</td>
</tr>
<tr>
<td>double</td>
<td>MYSQL_TYPE_DOUBLE</td>
<td>DOUBLE</td>
</tr>
<tr>
<td>MySQL_TIME</td>
<td>MYSQL_TYPE_TIME</td>
<td>TIME</td>
</tr>
<tr>
<td>MySQL_TIME</td>
<td>MYSQL_TYPE_DATE</td>
<td>DATE</td>
</tr>
<tr>
<td>MySQL_TIME</td>
<td>MYSQL_TYPE_DATETIME</td>
<td>DATETIME</td>
</tr>
<tr>
<td>MySQL_TIME</td>
<td>MYSQL_TYPE_TIMESTAMP</td>
<td>TIMESTAMP</td>
</tr>
<tr>
<td>char[]</td>
<td>MYSQL_TYPE_STRING</td>
<td>TEXT, CHAR, VARCHAR</td>
</tr>
<tr>
<td>char[]</td>
<td>MYSQL_TYPE_BLOB</td>
<td>BLOB, BINARY, VARBINARY</td>
</tr>
<tr>
<td></td>
<td>MYSQL_TYPE_NULL</td>
<td>NULL</td>
</tr>
</tbody>
</table>

Use MYSQL_TYPE_NULL as indicated in the description for the is_null member in Section 28.6.8, “C API Prepared Statement Data Structures”.

For input string data, use MYSQL_TYPE_STRING or MYSQL_TYPE_BLOB depending on whether the value is a character (nonbinary) or binary string:

- MYSQL_TYPE_STRING indicates character input string data. The value is assumed to be in the character set indicated by the character_set_client system variable. If the server stores the value into a column with a different character set, it converts the value to that character set.

- MYSQL_TYPE_BLOB indicates binary input string data. The value is treated as having the binary character set. That is, it is treated as a byte string and no conversion occurs.

The following table shows the permissible values for the buffer_type member of MYSQL_BIND structures for output values received from the server. The table shows the SQL types of received values, the corresponding type codes that such values have in result set metadata, and the recommended C language data types to bind to the MYSQL_BIND structure to receive the SQL values without conversion. Choose the buffer_type value according to the data type of the C language variable that you are binding. For the integer types, you should also set the is_unsigned member to indicate whether the variable is signed or unsigned.

<table>
<thead>
<tr>
<th>SQL Type of Received Value</th>
<th>buffer_type Value</th>
<th>Output Variable C Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>TINYINT</td>
<td>MYSQL_TYPE_TINY</td>
<td>signed char</td>
</tr>
<tr>
<td>SMALLINT</td>
<td>MYSQL_TYPE_SHORT</td>
<td>short int</td>
</tr>
<tr>
<td>MEDIUMINT</td>
<td>MYSQL_TYPE_INT24</td>
<td>int</td>
</tr>
<tr>
<td>INT</td>
<td>MYSQL_TYPE_LONG</td>
<td>int</td>
</tr>
<tr>
<td>BIGINT</td>
<td>MYSQL_TYPE_LONGLONG</td>
<td>long long int</td>
</tr>
</tbody>
</table>
### C API Prepared Statement Data Structures

</tbody>
</table>

### 28.6.8.2 C API Prepared Statement Type Conversions

Prepared statements transmit data between the client and server using C language variables on the client side that correspond to SQL values on the server side. If there is a mismatch between the C variable type on the client side and the corresponding SQL value type on the server side, MySQL performs implicit type conversions in both directions.

MySQL knows the type code for the SQL value on the server side. The buffer type value in the MYSQL_BIND structure indicates the type code of the C variable that holds the value on the client side. The two codes together tell MySQL what conversion must be performed, if any. Here are some examples:

- If you use MYSQL_TYPE_LONG with an int variable to pass an integer value to the server that is to be stored into a FLOAT column, MySQL converts the value to floating-point format before storing it.
- If you fetch an SQL MEDIUMINT column value, but specify a buffer type value of MYSQL_TYPE_LONGLONG and use a C variable of type long long int as the destination buffer, MySQL converts the MEDIUMINT value (which requires less than 8 bytes) for storage into the long long int (an 8-byte variable).
- If you fetch a numeric column with a value of 255 into a char[4] character array and specify a buffer_type value of MYSQL_TYPE_STRING, the resulting value in the array is a 4-byte string '255\0'.
- MySQL returns DECIMAL values as the string representation of the original server-side value, which is why the corresponding C type is char[]. For example, 12.345 is returned to the client as '12.345'. If you specify MYSQL_TYPE_NEWDECIMAL and bind a string buffer to the MYSQL_BIND structure, mysql_stmt_fetch() stores the value in the buffer as a string without conversion. If instead you specify a numeric variable and type code, mysql_stmt_fetch() converts the string-format DECIMAL value to numeric form.
- For the MYSQL_TYPE_BIT type code, BIT values are returned into a string buffer, which is why the corresponding C type is char[]. The value represents a bit string that requires interpretation on the
client side. To return the value as a type that is easier to deal with, you can cause the value to be cast to integer using either of the following types of expressions:

```
SELECT bit_col + 0 FROM t
SELECT CAST(bit_col AS UNSIGNED) FROM t
```

To retrieve the value, bind an integer variable large enough to hold the value and specify the appropriate corresponding integer type code.

Before binding variables to the `MYSQL_BIND` structures that are to be used for fetching column values, you can check the type codes for each column of the result set. This might be desirable if you want to determine which variable types would be best to use to avoid type conversions. To get the type codes, call `mysql_stmt_result_metadata()` after executing the prepared statement with `mysql_stmt_execute()`. The metadata provides access to the type codes for the result set as described in Section 28.6.10.23, "mysql_stmt_result_metadata()", and Section 28.6.4, "C API Data Structures".

To determine whether output string values in a result set returned from the server contain binary or nonbinary data, check whether the `charsetnr` value of the result set metadata is 63 (see Section 28.6.4, "C API Data Structures"). If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

If you cause the `max_length` member of the `MYSQL_FIELD` column metadata structures to be set (by calling `mysql_stmt_attr_set()`), be aware that the `max_length` values for the result set indicate the lengths of the longest string representation of the result values, not the lengths of the binary representation. That is, `max_length` does not necessarily correspond to the size of the buffers needed to fetch the values with the binary protocol used for prepared statements. Choose the size of the buffers according to the types of the variables into which you fetch the values. For example, a `TINYINT` column containing the value -128 might have a `max_length` value of 4. But the binary representation of any `TINYINT` value requires only 1 byte for storage, so you can supply a `signed char` variable in which to store the value and set `is_unsigned` to indicate that values are signed.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, "Caching of Prepared Statements and Stored Programs".

### 28.6.9 C API Prepared Statement Function Overview

The following list summarizes the functions available for prepared statement processing. For greater detail, see the descriptions in Section 28.6.10, "C API Prepared Statement Function Descriptions".

- `mysql_stmt_affected_rows()`: Returns the number of rows changed, deleted, or inserted by prepared `UPDATE`, `DELETE`, or `INSERT` statement.
- `mysql_stmt_attr_get()`: Gets the value of an attribute for a prepared statement.
- `mysql_stmt_attr_set()`: Sets an attribute for a prepared statement.
- `mysql_stmt_bind_param()`: Associates application data buffers with the parameter markers in a prepared SQL statement.
- `mysql_stmt_bind_result()`: Associates application data buffers with columns in a result set.
- `mysql_stmt_close()`: Frees memory used by a prepared statement.
- `mysql_stmt_data_seek()`: Seeks to an arbitrary row number in a statement result set.
C API Prepared Statement Function Overview

- `mysql_stmt_errno()`: Returns the error number for the last statement execution.
- `mysql_stmt_error()`: Returns the error message for the last statement execution.
- `mysql_stmt_execute()`: Executes a prepared statement.
- `mysql_stmt_fetch()`: Fetches the next row of data from a result set and returns data for all bound columns.
- `mysql_stmt_fetch_column()`: Fetches data for one column of the current row of a result set.
- `mysql_stmt_field_count()`: Returns the number of result columns for the most recent statement.
- `mysql_stmt_free_result()`: Frees the resources allocated to a statement handler.
- `mysql_stmt_init()`: Allocates memory for a `MYSQL_STMT` structure and initializes it.
- `mysql_stmt_insert_id()`: Returns the ID generated for an `AUTO_INCREMENT` column by a prepared statement.
- `mysql_stmt_next_result()`: Returns/initiates the next result in a multiple-result execution.
- `mysql_stmt_num_rows()`: Returns the row count from a buffered statement result set.
- `mysql_stmt_param_count()`: Returns the number of parameters in a prepared statement.
- `mysql_stmt_param_metadata()`: Returns parameter metadata in the form of a result set. (This function actually does nothing.)
- `mysql_stmt_prepare()`: Prepares an SQL statement string for execution.
- `mysql_stmt_reset()`: Resets the statement buffers in the server.
- `mysql_stmt_result_metadata()`: Returns prepared statement metadata in the form of a result set.
- `mysql_stmt_row_seek()`: Seeks to a row offset in a statement result set, using value returned from `mysql_stmt_row_tell()`.
- `mysql_stmt_row_tell()`: Returns the statement row cursor position.
- `mysql_stmt_send_long_data()`: Sends long data in chunks to server.
- `mysql_stmt_sqlstate()`: Returns the SQLSTATE error code for the last statement execution.
- `mysql_stmt_store_result()`: Retrieves a complete result set to the client.

Call `mysql_stmt_init()` to create a statement handler, then `mysql_stmt_prepare()` to prepare the statement string, `mysql_stmt_bind_param()` to supply the parameter data, and `mysql_stmt_execute()` to execute the statement. You can repeat the `mysql_stmt_execute()` by changing parameter values in the respective buffers supplied through `mysql_stmt_bind_param()`.

You can send text or binary data in chunks to server using `mysql_stmt_send_long_data()`. See Section 28.6.10.26, “mysql_stmt_send_long_data()”.

If the statement is a SELECT or any other statement that produces a result set, `mysql_stmt_prepare()` also returns the result set metadata information in the form of a `MYSQL_RES` result set through `mysql_stmt_result_metadata()`.

You can supply the result buffers using `mysql_stmt_bind_result()`, so that the `mysql_stmt_fetch()` automatically returns data to these buffers. This is row-by-row fetching.
When statement execution has been completed, close the statement handler using `mysql_stmt_close()` so that all resources associated with it can be freed. At that point the handler becomes invalid and should no longer be used.

If you obtained a SELECT statement's result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

**Execution Steps**

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handler with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.

2. If the statement will produce a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.

3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.

4. Call `mysql_stmt_execute()` to execute the statement.

5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.

6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.

7. Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:

- The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.

- The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When `mysql_stmt_execute()` is called, the MySQL client/server protocol performs these actions:

- The client uses the statement handler and sends the parameter data to the server.

- The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an okay status and the number of rows changed, deleted, or inserted.

When `mysql_stmt_fetch()` is called, the MySQL client/server protocol performs these actions:

- The client reads the data from the current row of the result set and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error number, error message, and SQLSTATE code using `mysql_stmt_errno()`, `mysql_stmt_error()`, and `mysql_stmt_sqlstate()`, respectively.
Prepared Statement Logging

For prepared statements that are executed with the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions, the server writes Prepare and Execute lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

1. Call `mysql_stmt_prepare()` to prepare the statement string "SELECT ?".
2. Call `mysql_stmt_bind_param()` to bind the value 3 to the parameter in the prepared statement.
3. Call `mysql_stmt_execute()` to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

<table>
<thead>
<tr>
<th>Prepare</th>
<th>Execute</th>
</tr>
</thead>
</table>

Each Prepare and Execute line in the log is tagged with a \([N]\) statement identifier so that you can keep track of which prepared statement is being logged. \(N\) is a positive integer. If there are multiple prepared statements active simultaneously for the client, \(N\) may be greater than 1. Each Execute lines shows a prepared statement after substitution of data values for ? parameters.

28.6.10 C API Prepared Statement Function Descriptions

To prepare and execute queries, use the functions described in detail in the following sections.

All functions that operate with a MYSQL_STMT structure begin with the prefix `mysql_stmt_`.

To create a MYSQL_STMT handler, use the `mysql_stmt_init()` function.

28.6.10.1 `mysql_stmt_affected_rows()`

```c
uint64_t mysql_stmt_affected_rows(MYSQL_STMT *stmt)
```

**Description**

`mysql_stmt_affected_rows()` may be called immediately after executing a statement with `mysql_stmt_execute()`. It is like `mysql_affected_rows()` but for prepared statements. For a description of what the affected-rows value returned by this function means, See Section 28.6.6.1, “mysql_affected_rows()”.

**Errors**

None.

**Example**

See the Example in Section 28.6.10.10, “mysql_stmt_execute()”.

28.6.10.2 `mysql_stmt_attr_get()`

```c
bool mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, void *arg)
```

**Description**

Can be used to get the current value for a statement attribute.
The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, `arg` should point to the value of the integer.

See Section 28.6.10.3, "mysql_stmt_attr_set()", for a list of options and option type values.

**Return Values**

Zero for success. Nonzero if `option` is unknown.

**Errors**

None.

### 28.6.10.3 mysql_stmt_attr_set()

```c
bool mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, const void *arg)
```

**Description**

Can be used to affect behavior for a prepared statement. This function may be called multiple times to set several options.

The `option` argument is the option that you want to set. The `arg` argument is the value for the option. `arg` should point to a variable that is set to the desired attribute value. The variable type is as indicated in the following table.

The following table shows the possible `option` values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Argument Type</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>STMT_ATTR_UPDATE_MAX_LENGTH</td>
<td>bool *</td>
<td>If set to 1, causes <code>mysql_stmt_store_result()</code> to update the metadata <code>MYSQL_FIELD-&gt;max_length</code> value.</td>
</tr>
<tr>
<td>STMT_ATTR_CURSOR_TYPE</td>
<td>unsigned long *</td>
<td>Type of cursor to open for statement when <code>mysql_stmt_execute()</code> is invoked. <code>*arg</code> can be CURSOR_TYPE_NO_CURSOR (the default) or CURSOR_TYPE_READ_ONLY.</td>
</tr>
<tr>
<td>STMT_ATTR_PREFETCH_ROWS</td>
<td>unsigned long *</td>
<td>Number of rows to fetch from server at a time when using a cursor. <code>*arg</code> can be in the range from 1 to the maximum value of <code>unsigned long</code>. The default is 1.</td>
</tr>
</tbody>
</table>

If you use the `STMT_ATTR_CURSOR_TYPE` option with CURSOR_TYPE_READ_ONLY, a cursor is opened for the statement when you invoke `mysql_stmt_execute()`. If there is already an open cursor from a previous `mysql_stmt_execute()` call, it closes the cursor before opening a new one. `mysql_stmt_reset()` also closes any open cursor before preparing the statement for re-execution. `mysql_stmt_free_result()` closes any open cursor.

If you open a cursor for a prepared statement, `mysql_stmt_store_result()` is unnecessary, because that function causes the result set to be buffered on the client side.
Return Values

Zero for success. Nonzero if option is unknown.

Errors

None.

Example

The following example opens a cursor for a prepared statement and sets the number of rows to fetch at a time to 5:

```c
MYSQL_STMT *stmt;
int rc;
unsigned long type;
unsigned long prefetch_rows = 5;
stmt = mysql_stmt_init(mysql);
type = (unsigned long) CURSOR_TYPE_READ_ONLY;
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_CURSOR_TYPE, (void*) &type);
/* ... check return value ... */
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_PREFETCH_ROWS,
                      (void*) &prefetch_rows);
/* ... check return value ... */
```

28.6.10.4 mysql_stmt_bind_param()

```c
bool mysql_stmt_bind_param(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_param()` is used to bind input data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each `?` parameter marker that is present in the query.

Suppose that you prepare the following statement:

```sql
INSERT INTO mytbl VALUES(?,?,?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```c
MYSQL_BIND bind[3];
```

Section 28.6.8, “C API Prepared Statement Data Structures”, describes the members of each `MYSQL_BIND` element and how they should be set to provide input values.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`
  
  The conversion is not supported. Possibly the `buffer_type` value is invalid or is not one of the supported types.
• **CR_OUT_OF_MEMORY**
  Out of memory.

• **CR_UNKNOWN_ERROR**
  An unknown error occurred.

**Example**

See the Example in Section 28.6.10.10, “mysql_stmt_execute()”.

### 28.6.10.5 mysql_stmt_bind_result()

```c
bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

**Description**

`mysql_stmt_bind_result()` is used to associate (that is, bind) output columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the data values, because the protocol does not return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol places data into the newly bound buffers when the next call to `mysql_stmt_fetch()` occurs.

To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and length of the output buffer into which the value should be stored. Section 28.6.8, “C API Prepared Statement Data Structures”, describes the members of each `MYSQL_BIND` element and how they should be set to receive output values.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

• **CR_UNSUPPORTED_PARAM_TYPE**
  The conversion is not supported. Possibly the `buffer_type` value is invalid or is not one of the supported types.

• **CR_OUT_OF_MEMORY**
  Out of memory.

• **CR_UNKNOWN_ERROR**
  An unknown error occurred.
Example

See the Example in Section 28.6.10.11, “mysql_stmt_fetch()”.

28.6.10.6 mysql_stmt_close()

`bool mysql_stmt_close(MYSQL_STMT *stmt)`

**Description**

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handler pointed to by `stmt`, which at that point becomes invalid and should no longer be used. For a failed `mysql_stmt_close()` call, do not call `mysql_stmt_error()`, or `mysql_stmt_errno()`, or `mysql_stmt_sqlstate()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_error()`, `mysql_errno()`, or `mysql_sqlstate()` instead.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

Example

See the Example in Section 28.6.10.10, “mysql_stmt_execute()”.

28.6.10.7 mysql_stmt_data_seek()

`void mysql_stmt_data_seek(MYSQL_STMT *stmt, uint64_t offset)`

**Description**

Seeks to an arbitrary row in a statement result set. The `offset` value is a row number and should be in the range from 0 to `mysql_stmt_num_rows(stmt)-1`.

This function requires that the statement result set structure contains the entire result of the last executed query, so `mysql_stmt_data_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

**Return Values**

None.

**Errors**

None.

28.6.10.8 mysql_stmt_errno()
unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)

Description
For the statement specified by stmt, mysql_stmt_errno() returns the error code for the most recently
invoked statement API function that can succeed or fail. A return value of zero means that no error
occurred. Client error message numbers are listed in the MySQL errmsg.h header file. Server error
message numbers are listed in mysql_error.h. Errors also are listed at Appendix B, Errors, Error
Codes, and Common Problems.

If the failed statement API function was mysql_stmt_close(), do not call or mysql_stmt_errno() to obtain error information because mysql_stmt_close() makes the statement handler invalid. Call mysql_errno() instead.

Return Values
An error code value. Zero if no error occurred.

Errors
None.

28.6.10.9 mysql_stmt_error()

const char *mysql_stmt_error(MYSQL_STMT *stmt)

Description
For the statement specified by stmt, mysql_stmt_error() returns a null-terminated string containing
the error message for the most recently invoked statement API function that can succeed or fail. An empty
string ("") is returned if no error occurred. Either of these two tests can be used to check for an error:

```c
if(*mysql_stmt_errno(stmt))
{
    // an error occurred
}
if (mysql_stmt_error(stmt)[0])
{
    // an error occurred
}
```

If the failed statement API function was mysql_stmt_close(), do not call mysql_stmt_error() to obtain error information because mysql_stmt_close() makes the statement handler invalid. Call mysql_error() instead.

The language of the client error messages may be changed by recompiling the MySQL client library. You
can choose error messages in several different languages.

Return Values
A character string that describes the error. An empty string if no error occurred.

Errors
None.

28.6.10.10 mysql_stmt_execute()

int mysql_stmt_execute(MYSQL_STMT *stmt)
Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handler. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

Statement processing following `mysql_stmt_execute()` depends on the type of statement:

- For an UPDATE, DELETE, or INSERT, the number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`.

- For a statement such as SELECT that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to Section 28.6.10.11, “mysql_stmt_fetch()”.

Do not following invocation of `mysql_stmt_execute()` with a call to `mysql_store_result()` or `mysql_use_result()`. Those functions are not intended for processing results from prepared statements.

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_OUT_OF_MEMORY**
  
  Out of memory.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to
be a valid connection handler. For an example that shows how to retrieve data, see Section 28.6.10.11, "mysql_stmt_fetch()".

```c
#define STRING_SIZE 50
#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT, col2 VARCHAR(40), col3 SMALLINT, col4 TIMESTAMP)"
#define INSERT_SAMPLE "INSERT INTO test_table(col1,col2,col3) VALUES(?,?,?)"

MYSQL_STMT *stmt;
MYSQL_BIND bind[3];
uint64_t affected_rows;
int param_count;
short small_data;
int int_data;
char str_data[STRING_SIZE];
unsigned long str_length;
bool is_null;

if (mysql_query(mysql, DROP_SAMPLE_TABLE))
{
    fprintf(stderr, " DROP TABLE failed\n");
    fprintf(stderr, "%s\n", mysql_error(mysql));
    exit(0);
}
if (mysql_query(mysql, CREATE_SAMPLE_TABLE))
{
    fprintf(stderr, " CREATE TABLE failed\n");
    fprintf(stderr, "%s\n", mysql_error(mysql));
    exit(0);
}

/* Prepare an INSERT query with 3 parameters */
/* (the TIMESTAMP column is not named; the server */
/* sets it to the current date and time) */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_SAMPLE, strlen(INSERT_SAMPLE)))
{
    fprintf(stderr, " mysql_stmt_prepare(), INSERT failed\n");
    fprintf(stderr, "%s\n", mysql_stmt_error(stmt));
    exit(0);
}
fprintf(stdout, " prepare, INSERT successful\n");
/* Get the parameter count from the statement */
param_count= mysql_stmt_param_count(stmt);
if (param_count != 3) /* validate parameter count */
{
    fprintf(stderr, " invalid parameter count returned by MySQL\n");
    exit(0);
}
/* Bind the data for all 3 parameters */
```
memset(bind, 0, sizeof(bind));

/* INTEGER PARAM */
/* This is a number type, so there is no need
to specify buffer_length */
bind[0].buffer_type= MYSQL_TYPE_LONG;
bind[0].buffer= (char *)&int_data;
bind[0].is_null= 0;
bind[0].length= 0;

/* STRING PARAM */
bind[1].buffer_type= MYSQL_TYPE_STRING;
bind[1].buffer= (char *)str_data;
bind[1].buffer_length= STRING_SIZE;
bind[1].is_null= 0;
bind[1].length= &str_length;

/* SMALLINT PARAM */
bind[2].buffer_type= MYSQL_TYPE_SHORT;
bind[2].buffer= (char *)&small_data;
bind[2].is_null= &is_null;
bind[2].length= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
    fprintf(stderr, " mysql_stmt_bind_param() failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Specify the data values for the first row */
int_data= 10; /* integer */
strncpy(str_data, "MySQL", STRING_SIZE); /* string */
str_length= strlen(str_data);

/* INSERT SMALLINT data as NULL */
is_null= 1;

/* Execute the INSERT statement - 1*/
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, " mysql_stmt_execute(), 1 failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get the number of affected rows */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 1): %lu\n",
        (unsigned long) affected_rows);
if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}

/* Specify data values for second row,
then re-execute the statement */
int_data= 1000;
strncpy(str_data, "The most popular Open Source database",
        STRING_SIZE);
str_length= strlen(str_data);
small_data= 1000; /* smallint */
is_null= 0; /* reset */
/* Execute the INSERT statement - 2*/
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, " mysql_stmt_execute, 2 failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get the total rows affected */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 2): %lu\n", (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    /* mysql_stmt_close() invalidates stmt, so call
       * mysql_error(mysql) rather than mysql_stmt_error(stmt) */
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_error(mysql));
    exit(0);
}

Note
For complete examples on the use of prepared statement functions, refer to the file
tests/mysql_client_test.c. This file can be obtained from a MySQL source
distribution or from the source repository (see Section 2.9, "Installing MySQL from
Source").

28.6.10.11 mysql_stmt_fetch()

    int mysql_stmt_fetch(MYSQL_STMT *stmt)

Description

mysql_stmt_fetch() returns the next row in the result set. It can be called only while the result set
exists; that is, after a call to mysql_stmt_execute() for a statement such as SELECT that produces a
result set.

mysql_stmt_fetch() returns row data using the buffers bound by mysql_stmt_bind_result(). It
returns the data in those buffers for all the columns in the current row set and the lengths are returned to
the length pointer. All columns must be bound by the application before it calls mysql_stmt_fetch().

mysql_stmt_fetch() typically occurs within a loop, to ensure that all result set rows are fetched. For
example:

    int status;
    while (1)
    {
        status = mysql_stmt_fetch(stmt);
        if (status == 1 || status == MYSQL_NO_DATA)
            break;
By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before calling `mysql_stmt_fetch()`.

If a fetched data value is a NULL value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains TRUE (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>MYSQL_TYPE_TINY</td>
<td>1</td>
</tr>
<tr>
<td>MYSQL_TYPE_SHORT</td>
<td>2</td>
</tr>
<tr>
<td>MYSQL_TYPE_LONG</td>
<td>4</td>
</tr>
<tr>
<td>MYSQL_TYPE_LONGLONG</td>
<td>8</td>
</tr>
<tr>
<td>MYSQL_TYPE_FLOAT</td>
<td>4</td>
</tr>
<tr>
<td>MYSQL_TYPE_DOUBLE</td>
<td>8</td>
</tr>
<tr>
<td>MYSQL_TYPE_TIME</td>
<td><code>sizeof(MYSQL_TIME)</code></td>
</tr>
<tr>
<td>MYSQL_TYPE_DATE</td>
<td><code>sizeof(MYSQL_TIME)</code></td>
</tr>
<tr>
<td>MYSQL_TYPE_DATETIME</td>
<td><code>sizeof(MYSQL_TIME)</code></td>
</tr>
<tr>
<td>MYSQL_TYPE_STRING</td>
<td><code>data_length</code></td>
</tr>
<tr>
<td>MYSQL_TYPE_BLOB</td>
<td><code>data_length</code></td>
</tr>
</tbody>
</table>

In some cases, you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or BLOB value for which you want to know how much space must be allocated. To accomplish this, use one of these strategies:

- Before invoking `mysql_stmt_fetch()` to retrieve individual rows, pass `STMT_ATTR_UPDATE_MAX_LENGTH` to `mysql_stmt_attr_set()`, then invoke `mysql_stmt_store_result()` to buffer the entire result on the client side. Setting the `STMT_ATTR_UPDATE_MAX_LENGTH` attribute causes the maximal length of column values to be indicated by the `max_length` member of the result set metadata returned by `mysql_stmt_result_metadata()`.

- Invoke `mysql_stmt_fetch()` with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with `mysql_stmt_fetch_column()`.

```c
real_length= 0;
bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length
mysql_stmt_bind_result(stmt, bind);
mysql_stmt_fetch(stmt);
if (real_length > 0)
{
    data= malloc(real_length);
    bind[0].buffer= data;
```
bind[0].buffer_length= real_length;
mysql_stmt_fetch_column(stmt, bind, 0, 0);

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success, the data has been fetched to application data buffers.</td>
</tr>
<tr>
<td>1</td>
<td>Error occurred. Error code and message can be obtained by calling</td>
</tr>
<tr>
<td></td>
<td>mysql_stmt_errno() and mysql_stmt_error().</td>
</tr>
<tr>
<td>MYSQL_NO_DATA</td>
<td>Success, no more data exists</td>
</tr>
<tr>
<td>MYSQLDATA_TRUNCATED</td>
<td>Data truncation occurred</td>
</tr>
</tbody>
</table>

MYSQL_DATA_TRUNCATED is returned when truncation reporting is enabled. To determine which column values were truncated when this value is returned, check the error members of the MYSQL_BIND structures used for fetching values. Truncation reporting is enabled by default, but can be controlled by calling mysql_options() with the MYSQL_REPORT_DATA_TRUNCATION option.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**

  Commands were executed in an improper order.

  Although mysql_stmt_fetch() can produce this error, it is more likely to occur for the following C API call if mysql_stmt_fetch() is not called enough times to read the entire result set (that is, enough times to return MYSQL_NO_DATA).

- **CR_OUT_OF_MEMORY**

  Out of memory.

- **CR_SERVER_GONE_ERROR**

  The MySQL server has gone away.

- **CR_SERVER_LOST**

  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**

  An unknown error occurred.

- **CR_UNSUPPORTED_PARAM_TYPE**

  The buffer type is MYSQL_TYPE_DATE, MYSQL_TYPE_TIME, MYSQL_TYPE_DATETIME, or MYSQL_TYPE_TIMESTAMP, but the data type is not DATE, TIME, DATETIME, or TIMESTAMP.

  All other unsupported conversion errors are returned from mysql_stmt_bind_result().

Example

The following example demonstrates how to fetch data from a table using mysql_stmt_result_metadata(), mysql_stmt_bind_result(), and mysql_stmt_fetch().
This example expects to retrieve the two rows inserted by the example shown in Section 28.6.10.10, "mysql_stmt_execute()". The mysql variable is assumed to be a valid connection handler.

```c
#define STRING_SIZE 50
#define SELECT_SAMPLE "SELECT col1, col2, col3, col4 
FROM test_table"

MYSQL_STMT *stmt;
MYSQL_BIND bind[4];
MYSQL_RES *prepare_meta_result;
MYSQL_TIME ts;
unsigned long length[4];
int           param_count, column_count, row_count;
short         small_data;
int           int_data;
char          str_data[STRING_SIZE];
bool          is_null[4];
bool          error[4];

/* Prepare a SELECT query to fetch data from test_table */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(stmt, SELECT_SAMPLE, strlen(SELECT_SAMPLE)))
{
    fprintf(stderr, " mysql_stmt_prepare(), SELECT failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}
fprintf(stdout, " prepare, SELECT successful\n");

/* Get the parameter count from the statement */
param_count= mysql_stmt_param_count(stmt);
fprintf(stdout, " total parameters in SELECT: %d\n", param_count);
if (param_count != 0) /* validate parameter count */
{
    fprintf(stderr, " invalid parameter count returned by MySQL\n");
    exit(0);
}

/* Fetch result set meta information */
prepare_meta_result = mysql_stmt_result_metadata(stmt);
if (!prepare_meta_result)
{
    fprintf(stderr, " mysql_stmt_result_metadata(), \n    returned no meta information\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get total columns in the query */
column_count= mysql_num_fields(prepare_meta_result);
fprintf(stdout, " total columns in SELECT statement: %d\n", column_count);
if (column_count != 4) /* validate column count */
{
    fprintf(stderr, " invalid column count returned by MySQL\n");
    exit(0);
}
```
/* Execute the SELECT query */
if (mysql_stmt_execute(stmt))
{
  fprintf(stderr, " mysql_stmt_execute(), failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Bind the result buffers for all 4 columns before fetching them */
memset(bind, 0, sizeof(bind));

/* INTEGER COLUMN */
bind[0].buffer_type= MYSQL_TYPE_LONG;
bind[0].buffer= (char *)&int_data;
bind[0].is_null= &is_null[0];
bind[0].length= &length[0];
bind[0].error= &error[0];

/* STRING COLUMN */
bind[1].buffer_type= MYSQL_TYPE_STRING;
bind[1].buffer= (char *)str_data;
bind[1].buffer_length= STRING_SIZE;
bind[1].is_null= &is_null[1];
bind[1].length= &length[1];
bind[1].error= &error[1];

/* SMALLINT COLUMN */
bind[2].buffer_type= MYSQL_TYPE_SHORT;
bind[2].buffer= (char *)&small_data;
bind[2].is_null= &is_null[2];
bind[2].length= &length[2];
bind[2].error= &error[2];

/* TIMESTAMP COLUMN */
bind[3].buffer_type= MYSQL_TYPE_TIMESTAMP;
bind[3].buffer= (char *)&ts;
bind[3].is_null= &is_null[3];
bind[3].length= &length[3];
bind[3].error= &error[3];

/* Bind the result buffers */
if (mysql_stmt_bind_result(stmt, bind))
{
  fprintf(stderr, " mysql_stmt_bind_result() failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Now buffer all results to client (optional step) */
if (mysql_stmt_store_result(stmt))
{
  fprintf(stderr, " mysql_stmt_store_result() failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Fetch all rows */
row_count= 0;
fprintf(stdout, "Fetching results ...
");
while (!mysql_stmt_fetch(stmt))
{
  row_count++;
  fprintf(stdout, "  row %d\n", row_count);
/* column 1 */
28.6.10.12 mysql_stmt_fetch_column()

```c
int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int column, unsigned long offset)
```

**Description**

Fetches one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0. `offset` is the offset within the data value at which to
begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- **CR_INVALID_PARAMETER_NO**
  Invalid column number.
- **CR_NO_DATA**
  The end of the result set has already been reached.

### 28.6.10.13 mysql_stmt_field_count()

```c
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

**Description**

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

**Return Values**

An unsigned integer representing the number of columns in a result set.

**Errors**

None.

### 28.6.10.14 mysql_stmt_free_result()

```c
bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

**Description**

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, `mysql_stmt_free_result()` closes it.

**Return Values**

Zero for success. Nonzero if an error occurred.

### 28.6.10.15 mysql_stmt_init()

```c
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

**Description**

Creates and returns a `MYSQL_STMT` handler. The handler should be freed with `mysql_stmt_close()`, at which point the handler becomes invalid and should no longer be used.
See also Section 28.6.8, “C API Prepared Statement Data Structures”, for more information.

Return Values

A pointer to a MYSQL_STMT structure in case of success. NULL if out of memory.

Errors

• CR_OUT_OF_MEMORY
  Out of memory.

28.6.10.16 mysql_stmt_insert_id()

    uint64_t mysql_stmt_insert_id(MYSQL_STMT *stmt)

Description

Returns the value generated for an AUTO_INCREMENT column by the prepared INSERT or UPDATE statement. Use this function after you have executed a prepared INSERT statement on a table which contains an AUTO_INCREMENT field.

See Section 28.6.6.38, “mysql_insert_id()”, for more information.

Return Values

Value for AUTO_INCREMENT column which was automatically generated or explicitly set during execution of prepared statement, or value generated by LAST_INSERT_ID(expr) function. Return value is undefined if statement does not set AUTO_INCREMENT value.

Errors

None.

28.6.10.17 mysql_stmt_next_result()

    int mysql_stmt_next_result(MYSQL_STMT *mysql)

Description

This function is used when you use prepared CALL statements to execute stored procedures, which can return multiple result sets. Use a loop that calls mysql_stmt_next_result() to determine whether there are more results. If a procedure has OUT or INOUT parameters, their values will be returned as a single-row result set following any other result sets. The values will appear in the order in which they are declared in the procedure parameter list.

For information about the effect of unhandled conditions on procedure parameters, see Section 13.6.7.8, “Condition Handling and OUT or INOUT Parameters”.

mysql_stmt_next_result() returns a status to indicate whether more results exist. If mysql_stmt_next_result() returns an error, there are no more results.

Before each call to mysql_stmt_next_result(), you must call mysql_stmt_free_result() for the current result if it produced a result set (rather than just a result status).

After calling mysql_stmt_next_result() the state of the connection is as if you had called mysql_stmt_execute(). This means that you can call mysql_stmt_bind_result(), mysql_stmt_affected_rows(), and so forth.
It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_stmt_next_result()` to advance to the next result.

For an example that shows how to use `mysql_stmt_next_result()`, see Section 28.6.24, “C API Prepared CALL Statement Support”.

**Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Successful and there are more results</td>
</tr>
<tr>
<td>-1</td>
<td>Successful and there are no more results</td>
</tr>
<tr>
<td>&gt;0</td>
<td>An error occurred</td>
</tr>
</tbody>
</table>

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

### 28.6.10.18 mysql_stmt_num_rows()

```c
uint64_t mysql_stmt_num_rows(MYSQL_STMT *stmt)
```

**Description**

Returns the number of rows in the result set.

The use of `mysql_stmt_num_rows()` depends on whether you used `mysql_stmt_store_result()` to buffer the entire result set in the statement handler. If you use `mysql_stmt_store_result()`, `mysql_stmt_num_rows()` may be called immediately. Otherwise, the row count is unavailable unless you count the rows as you fetch them.

`mysql_stmt_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_stmt_affected_rows()`.

**Return Values**

The number of rows in the result set.

**Errors**

None.
28.6.10.19 mysql_stmt_param_count()

    unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)

Description

Returns the number of parameter markers present in the prepared statement.

Return Values

An unsigned long integer representing the number of parameters in a statement.

Errors

None.

Example

See the Example in Section 28.6.10.10, “mysql_stmt_execute()”.

28.6.10.20 mysql_stmt_param_metadata()

MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)

This function currently does nothing.

28.6.10.21 mysql_stmt_prepare()

    int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long length)

Description

Given the statement handler returned by mysql_stmt_init(), prepares the SQL statement pointed to by the string stmt_str and returns a status value. The string length should be given by the length argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (;) or \g to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (?) characters into the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are permitted in the VALUES() list of an INSERT statement (to specify column values for a row), or in a comparison with a column in a WHERE clause to specify a comparison value. However, they are not permitted for identifiers (such as table or column names), or to specify both operands of a binary operator such as the = equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type.

In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using mysql_stmt_bind_param() before executing the statement.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see Section 8.10.3, “Caching of Prepared Statements and Stored Programs”.

Return Values

Zero for success. Nonzero if an error occurred.
Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_OUT_OF_MEMORY**
  Out of memory.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns nonzero), the error message can be obtained by calling `mysql_stmt_error()`.

Example

See the Example in Section 28.6.10.10, "mysql_stmt_execute()".

28.6.10.22 mysql_stmt_reset()

```c
bool mysql_stmt_reset (MYSQL_STMT *stmt)
```

Description

Resets a prepared statement on client and server to state after prepare. It resets the statement on the server, data sent using `mysql_stmt_send_long_data()`, unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.
28.6.10.23 mysql_stmt_result_metadata()

MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)

Description

If a statement passed to mysql_stmt_prepare() is one that produces a result set, mysql_stmt_result_metadata() returns the result set metadata in the form of a pointer to a MYSQL_RES structure that can be used to process the meta information such as number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- mysql_num_fields()
- mysql_fetch_field()
- mysql_fetch_field_direct()
- mysql_fetch_fields()
- mysql_field_count()
- mysql_field_seek()
- mysql_field_tell()
- mysql_free_result()

The result set structure should be freed when you are done with it, which you can do by passing it to mysql_free_result(). This is similar to the way you free a result set obtained from a call to mysql_store_result().

The result set returned by mysql_stmt_result_metadata() contains only metadata. It does not contain any row results. The rows are obtained by using the statement handler with mysql_stmt_fetch().

Return Values

A MYSQL_RES result structure. NULL if no meta information exists for the prepared query.

Errors

- CR_OUT_OF_MEMORY
  Out of memory.
- CR_UNKNOWN_ERROR
  An unknown error occurred.

Example

See the Example in Section 28.6.10.11, "mysql_stmt_fetch()".

28.6.10.24 mysql_stmt_row_seek()

MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)
Description

Sets the row cursor to an arbitrary row in a statement result set. The offset value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

Errors

None.

28.6.10.25 mysql_stmt_row_tell()

MySQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)

Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

28.6.10.26 mysql_stmt_send_long_data()

bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int parameter_number, const char *data, unsigned long length)

Description

Enables an application to send parameter data to the server in pieces (or “chunks”). Call this function after `mysql_stmt_bind_param()` and before `mysql_stmt_execute()`. It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the TEXT or BLOB data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

Note

The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.
If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See Section 28.6.10.22, "mysql_stmt_reset()".

The `max_allowed_packet` system variable controls the maximum size of parameter values that can be sent with `mysql_stmt_send_long_data()`.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- **CR_INVALID_BUFFER_USE**
  
The parameter does not have a string or binary type.

- **CR_INVALID_PARAMETER_NO**
  
  Invalid parameter number.

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_OUT_OF_MEMORY**
  
  Out of memory.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

**Example**

The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value 'MySQL - The most popular Open Source database' into the `text_column` column. The `mysql` variable is assumed to be a valid connection handler.

```c
#define INSERT_QUERY "INSERT INTO \n test_long_data(text_column) VALUES(?)"

MYSQL_BIND bind[1];
long length;

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
 fprintf(stderr, " mysql_stmt_init(), out of memory\n"); 
 exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))
{
 fprintf(stderr, "$n mysql_stmt_prepare(), INSERT failed"");
 fprintf(stderr, "$ %s", mysql_stmt_error(stmt));
 exit(0);
}
memset(bind, 0, sizeof(bind));
```
28.6.10.27 mysql_stmt_sqlstate()

    const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)

Description

For the statement specified by stmt, mysql_stmt_sqlstate() returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. "00000" means "no error." The values are specified by ANSI SQL and ODBC. For a list of possible values, see Appendix B, Errors, Error Codes, and Common Problems.

Not all MySQL errors are mapped to SQLSTATE codes. The value "HY000" (general error) is used for unmapped errors.

If the failed statement API function was mysql_stmt_close(), do not call mysql_stmt_sqlstate() to obtain error information because mysql_stmt_close() makes the statement handler invalid. Call mysql_sqlstate() instead.

Return Values

A null-terminated character string containing the SQLSTATE error code.

28.6.10.28 mysql_stmt_store_result()
Description

Result sets are produced by calling `mysql_stmt_execute()` to execute prepared statements for SQL statements such as `SELECT`, `SHOW`, `DESCRIBE`, and `EXPLAIN`. By default, result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see Section 28.6.10.11, "mysql_stmt_fetch()".)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`, `mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to Section 28.6.10.23, "mysql_stmt_result_metadata()".

Note

MySQL does not by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications do not need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See Section 28.6.10.3, "mysql_stmt_attr_set()".

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.

- **CR_OUT_OF_MEMORY**
  
  Out of memory.

- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

28.6.11 C API Asynchronous Interface

As of MySQL 8.0.16, the C API includes asynchronous functions that enable nonblocking communication with the MySQL server. Asynchronous functions enable development of applications that differ from the
query processing model based on synchronous functions that block if reads from or writes to the server connection must wait. Using the asynchronous functions, an application can check whether work on the server connection is ready to proceed. If not, the application can perform other work before checking again later.

For example, an application might open multiple connections to the server and use them to submit multiple statements for execution. The application then can poll the connections to see which of them have results to be fetched, while doing other work.

The asynchronous C API functions cover operations that might otherwise block when reading to or writing from the server connection: The initial connection operation, sending a query, reading the result, and so forth. Each asynchronous function has the same name as its synchronous counterpart, plus a _nonblocking suffix:

- `mysql_fetch_row_nonblocking()`: Asynchronously fetches the next row from the result set.
- `mysql_free_result_nonblocking()`: Asynchronously frees memory used by a result set.
- `mysql_next_result_nonblocking()`: Asynchronously returns/initiates the next result in multiple-result executions.
- `mysql_real_connect_nonblocking()`: Asynchronously connects to a MySQL server.
- `mysql_real_query_nonblocking()`: Asynchronously executes an SQL query specified as a counted string.
- `mysql_store_result_nonblocking()`: Asynchronously retrieves a complete result set to the client.

Applications can mix asynchronous and synchronous functions if there are operations that need not be done asynchronously or for which the asynchronous functions do not apply.

The following discussion describes in more detail how to use asynchronous C API functions.

- **Asynchronous Function Calling Conventions**
- **Example Program**
- **Asynchronous Function Restrictions**

### Asynchronous Function Calling Conventions

All asynchronous C API functions return an `enum net_async_status` value. The return value can be one of the following values to indicate operation status:

- `NET_ASYNC_NOT_READY`: The operation is still in progress and not yet complete.
- `NET_ASYNC_COMPLETE`: The operation completed successfully.
- `NET_ASYNC_ERROR`: The operation terminated in error.
- `NET_ASYNC_COMPLETE_NO_MORE_RESULTS`: The operation completed successfully and no more results are available. This status applies only to `mysql_next_result_nonblocking()`.

In general, to use an asynchronous function, do this:

- Call the function repeatedly until it no longer returns a status of `NET_ASYNC_NOT_READY`.
- Check whether the final status indicates successful completion (`NET_ASYNC_COMPLETE`) or an error (`NET_ASYNC_ERROR`).
The following examples illustrate some typical calling patterns. *function(args)* represents an asynchronous function and its argument list.

- If it is desirable to perform other processing while the operation is in progress:

```c
enum net_async_status status;
status = function(args);
while (status == NET_ASYNC_NOT_READY) {
    /* perform other processing */
    other_processing();
    /* invoke same function and arguments again */
    status = function(args);
}
if (status == NET_ASYNC_ERROR) {
    /* call failed; handle error */
} else {
    /* call successful; handle result */
}
```

- If there is no need to perform other processing while the operation is in progress:

```c
enum net_async_status status;
while ((status = function(args)) == NET_ASYNC_NOT_READY) {
    /* empty loop */
    if (status == NET_ASYNC_ERROR) {
        /* call failed; handle error */
    } else {
        /* call successful; handle result */
    }
}
```

- If the function success/failure result does not matter and you want to ensure only that the operation has completed:

```c
while (function(args) != NET_ASYNC_COMPLETE) {
    /* empty loop */
}
```

For `mysql_next_result_nonblocking()`, it is also necessary to account for the `NET_ASYNC_COMPLETE_NO_MORE_RESULTS` status, which indicates that the operation completed successfully and no more results are available. Use it like this:

```c
while ((status = mysql_next_result_nonblocking()) != NET_ASYNC_COMPLETE) {
    if (status == NET_ASYNC_COMPLETE_NO_MORE_RESULTS) {
    /* no more results */
    } else if (status == NET_ASYNC_ERROR) {
    /* handle error by calling mysql_error(); */
    break;
    }
}
```

In most cases, arguments for the asynchronous functions are the same as for the corresponding synchronous functions. Exceptions are `mysql_fetch_row_nonblocking()` and `mysql_store_result_nonblocking()`, each of which takes an extra argument compared to its synchronous counterpart. For details, see Section 28.6.14.1, "mysql_fetch_row_nonblocking()", and Section 28.6.14.6, "mysql_store_result_nonblocking()".

**Example Program**

This section shows an example C++ program that illustrates use of asynchronous C API functions.

To set up the SQL objects used by the program, execute the following statements. Substitute a different database or user as desired; in this case, you will need to make some adjustments to the program as well.
CREATE DATABASE db;
USE db;
CREATE TABLE test_table (id INT NOT NULL);
INSERT INTO test_table VALUES (10), (20), (30);
CREATE USER 'testuser'@'localhost' IDENTIFIED BY 'testpass';
GRANT ALL ON db.* TO 'testuser'@'localhost';

Create a file named async_app.cc containing the following program. Adjust the connection parameters as necessary.

```c
#include <stdio.h>
#include <string.h>
#include <iostream>
#include <mysql.h>
#include <mysqld_error.h>

using namespace std;

/* change following connection parameters as necessary */
static const char * c_host = "localhost";
static const char * c_user = "testuser";
static const char * c_auth = "testpass";
static int c_port = 3306;
static const char * c_sock = "/usr/local/mysql/mysql.sock";
static const char * c_dbnm = "db";

void perform_arithmetic() {
    cout<<"dummy function invoked\n";
    for (int i = 0; i < 1000; i++)
        i*i;
}

int main(int argc, char ** argv)
{
    MYSQL *mysql_local;
    MYSQL_RES *result;
    MYSQL_ROW row;
    net_async_status status;
    const char * stmt_text;
    if (!(mysql_local = mysql_init(NULL))) {
        cout<<"mysql_init() failed\n";
        exit(1);
    }
    while ((status = mysql_real_connect_nonblocking(mysql_local, c_host, c_user, c_auth, c_dbnm, c_port, c_sock, 0)) == NET_ASYNC_NOT_READY) /* empty loop */
        if (status == NET_ASYNC_ERROR) {
            cout<<"mysql_real_connect_nonblocking() failed\n";
            exit(1);
        }
    stmt_text = "SELECT * FROM test_table ORDER BY id";
    status = mysql_real_query_nonblocking(mysql_local, stmt_text, (unsigned long)strlen(stmt_text));
    /* do some other task before checking function result */
    perform_arithmetic();
    while (status == NET_ASYNC_NOT_READY) {
        status = mysql_real_query_nonblocking(mysql_local, stmt_text, (unsigned long)strlen(stmt_text));
        perform_arithmetic();
    }
    if (status == NET_ASYNC_ERROR) {
```
cout<<"mysql_real_query_nonblocking() failed\n";
exit(1);
}

/* retrieve query result asynchronously */
status = mysql_store_result_nonblocking(mysql_local, &result);
/* do some other task before checking function result */
perform_arithmetic();
while (status == NET_ASYNC_NOT_READY) {
    status = mysql_store_result_nonblocking(mysql_local, &result);
    perform_arithmetic();
}
if (status == NET_ASYNC_ERROR) {
    cout<<"mysql_store_result_nonblocking() failed\n";
    exit(1);
}
if (result == NULL) {
    cout<<"mysql_store_result_nonblocking() found 0 records\n";
    exit(1);
}

/* fetch a row synchronously */
row = mysql_fetch_row(result);
if (row != NULL && strcmp(row[0], "10") == 0)
    cout<<"ROW: " << row[0] << "\n";
else
    cout<<"incorrect result fetched\n";

/* fetch a row asynchronously, but without doing other work */
while (mysql_fetch_row_nonblocking(result, &row) != NET_ASYNC_COMPLETE)
; /* empty loop */
/* 2nd row fetched */
if (row != NULL && strcmp(row[0], "20") == 0)
    cout<<"ROW: " << row[0] << "\n";
else
    cout<<"incorrect result fetched\n";

/* fetch a row asynchronously, doing other work while waiting */
status = mysql_fetch_row_nonblocking(result, &row);
/* do some other task before checking function result */
perform_arithmetic();
while (status != NET_ASYNC_COMPLETE) {
    status = mysql_fetch_row_nonblocking(result, &row);
    perform_arithmetic();
}
/* 3rd row fetched */
if (row != NULL && strcmp(row[0], "30") == 0)
    cout<<"ROW: " << row[0] << "\n";
else
    cout<<"incorrect result fetched\n";

/* fetch a row asynchronously (no more rows expected) */
while ((status = mysql_fetch_row_nonblocking(result, &row)) != NET_ASYNC_COMPLETE)
; /* empty loop */
if (row == NULL)
    cout <<"No more rows to process.\n";
else
    cout <<"More rows found than expected.\n";

/* free result set memory asynchronously */
while (mysql_free_result_nonblocking(result) != NET_ASYNC_COMPLETE)
; /* empty loop */
mysql_close(mysql_local);
Compile the program using a command similar to this; adjust the compiler and options as necessary:

```bash
gcc -g async_app.cc -std=c++11 \
   -I/usr/local/mysql/include \
   -o async_app -L/usr/lib64/ -lstdc++ \
   -L/usr/local/mysql/lib/ -lmysqlclient
```

Run the program. The results should be similar to what you see here, although you might see a varying number of dummy function invoked instances.

```plaintext
dummy function invoked
dummy function invoked
ROW: 10
ROW: 20
dummy function invoked
ROW: 30
No more rows to process.
```

To experiment with the program, add and remove rows from `test_table`, running the program again after each change.

### Asynchronous Function Restrictions

These restrictions apply to the use of asynchronous C API functions:

- `mysql_real_connect_nonblocking()` can be used only for accounts that authenticate with one of these authentication plugins: `mysql_native_password`, `sha256_password`, or `caching_sha2_password`.

- `mysql_real_connect_nonblocking()` can be used only to establish TCP/IP or Unix socket file connections.

- These statements are not supported and must be processed using synchronous C API functions: `LOAD DATA`, `LOAD XML`.

- Protocol compression is not supported for asynchronous C API functions.

### 28.6.12 C API Asynchronous Interface Data Structures

This section describes data structures specific to asynchronous C API functions. For information about general-purpose C API data structures, see Section 28.6.4, “C API Data Structures”.

- `enum net_async_status`

  The enumeration type used to express the return status of asynchronous C API functions. The following table shows the permitted status values.

<table>
<thead>
<tr>
<th>Enumeration Status Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NET_ASYNC_COMPLETE</td>
<td>Asynchronous operation is complete</td>
</tr>
<tr>
<td>NET_ASYNC_NOT_READY</td>
<td>Asynchronous operation is still in progress</td>
</tr>
<tr>
<td>NET_ASYNC_ERROR</td>
<td>Asynchronous operation terminated in error</td>
</tr>
<tr>
<td>NET_ASYNC_COMPLETE_NO_MORE_RESULTS</td>
<td><code>mysql_next_result_nonblocking()</code>; indicates no more results available</td>
</tr>
</tbody>
</table>

For more information, see Section 28.6.11, “C API Asynchronous Interface”.

### 28.6.13 C API Asynchronous Function Overview
The following list summarizes the functions available for asynchronous interaction with the MySQL server. For greater detail, see the descriptions in Section 28.6.14, “C API Asynchronous Function Descriptions”.

- **mysql_fetch_row_nonblocking()**: Asynchronously fetches the next row from the result set.
- **mysql_free_result_nonblocking()**: Asynchronously frees memory used by a result set.
- **mysql_next_result_nonblocking()**: Asynchronously returns/initiates the next result in multiple-result executions.
- **mysql_real_connect_nonblocking()**: Asynchronously connects to a MySQL server.
- **mysql_real_query_nonblocking()**: Asynchronously executes an SQL query specified as a counted string.
- **mysql_store_result_nonblocking()**: Asynchronously retrieves a complete result set to the client.

### 28.6.14 C API Asynchronous Function Descriptions

To interact asynchronously with the MySQL server, use the functions described in the following sections. For descriptions of their synchronous counterparts, see Section 28.6.6, “C API Function Descriptions”.

#### 28.6.14.1 mysql_fetch_row_nonblocking()

```c
genetic_status mysql_fetch_row_nonblocking(MYSQL_RES *result, MYSQL_ROW *row)
```

**Description**

- **Note**

  * `mysql_fetch_row_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_fetch_row()` synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see Section 28.6.11, “C API Asynchronous Interface”.

  `mysql_fetch_row_nonblocking()` is used similarly to `mysql_fetch_row()`. For details about the latter, see Section 28.6.6.21, “mysql_fetch_row()”. The two functions differ as follows:

  - **mysql_fetch_row()** returns a `MYSQL_ROW` value containing the next row, or `NULL`. The meaning of a `NULL` return depends on which function was called preceding `mysql_fetch_row()`:

    - When used after `mysql_store_result()` or `mysql_store_result_nonblocking()`, `mysql_fetch_row()` returns `NULL` if there are no more rows to retrieve.

    - When used after `mysql_use_result()`, `mysql_fetch_row()` returns `NULL` if there are no more rows to retrieve or an error occurred.

  - `mysql_fetch_row_nonblocking()` returns an `enum net_async_status` status indicator and takes a second `row` argument that provides a pointer to a `MYSQL_ROW` value. When the return status is `NET_ASYNC_COMPLETE`, the `row` argument is a pointer to a `MYSQL_ROW` value containing the next row, or `NULL`. The meaning of `NULL` depends on which function was called preceding `mysql_fetch_row_nonblocking()`:

    - When used after `mysql_store_result()` or `mysql_store_result_nonblocking()`, the `row` argument is `NULL` if there are no more rows to retrieve.
• When used after `mysql_use_result()`, the `row` argument is `NULL` if there are no more rows to retrieve or an error occurred.

`mysql_fetch_row_nonblocking()` was added in MySQL 8.0.16.

**Return Values**

**Example**

See Section 28.6.11, “C API Asynchronous Interface”.

### 28.6.14.2 `mysql_free_result_nonblocking()`

```c
enum net_async_status mysql_free_result_nonblocking(MYSQL_RES *result)
```

**Description**

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
</table>
| `mysql_free_result_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_free_result()` synchronous function, for use by applications that require asynchronous communication with the server. For general information about writing asynchronous C API applications, see Section 28.6.11, “C API Asynchronous Interface”.

`mysql_free_result_nonblocking()` is used similarly to `mysql_free_result()`. For details about the latter, see Section 28.6.6.25, “mysql_free_result()”. The two functions differ as follows:

- `mysql_free_result()` does not return a value.
- `mysql_free_result_nonblocking()` returns an `enum net_async_status` status indicator.

`mysql_free_result_nonblocking()` was added in MySQL 8.0.16.

**Return Values**

**Example**

See Section 28.6.11, “C API Asynchronous Interface”.

### 28.6.14.3 `mysql_next_result_nonblocking()`

```c
enum net_async_status mysql_next_result_nonblocking(MYSQL *mysql)
```

**Description**

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
</table>
| `mysql_next_result_nonblocking()` is an asynchronous function. It is the counterpart of the `mysql_next_result()` synchronous function, for use by
mysql_next_result_nonblocking() is used similarly to mysql_next_result(). For details about the latter, see Section 28.6.6.47, “mysql_next_result()”. The two functions differ as follows:

- **mysql_next_result()** returns an integer status indicator.
- **mysql_next_result_nonblocking()** returns an enum net_async_status status indicator.

mysql_next_result_nonblocking() was added in MySQL 8.0.16.

**Return Values**

Returns an enum net_async_status value. See the description in Section 28.6.12, “C API Asynchronous Interface Data Structures”. A **NET_ASYNC_COMPLETE_NO_MORE_RESULTS** return status indicates there are no more results available. A **NET_ASYNC_ERROR** return status indicates an error.

**Example**

See Section 28.6.11, “C API Asynchronous Interface”.

### 28.6.14.4 mysql_real_connect_nonblocking()

```c
enum net_async_status mysql_real_connect_nonblocking(MYSQL *mysql, const char *host, const char *user, const char *passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long client_flag)
```

**Description**

mysql_real_connect_nonblocking() is used similarly to mysql_real_connect(). For details about the latter, see Section 28.6.6.54, “mysql_real_connect()”. The two functions differ as follows:

- **mysql_real_connect()** returns a connection handler or NULL.
- **mysql_real_connect_nonblocking()** returns an enum net_async_status status indicator.

mysql_real_connect_nonblocking() was added in MySQL 8.0.16.

**Return Values**

Returns an enum net_async_status value. See the description in Section 28.6.12, “C API Asynchronous Interface Data Structures”. A **NET_ASYNC_ERROR** return status indicates an error.

**Example**

See Section 28.6.11, “C API Asynchronous Interface”.
28.6.14.5 mysql_real_query_nonblocking()

    enum net_async_status mysql_real_query_nonblocking(MYSQL *mysql, const char
    *stmt_str, unsigned long length)

Description

Note

mysql_real_query_nonblocking() is an asynchronous function. It is the
counterpart of the mysql_real_query() synchronous function, for use by
applications that require asynchronous communication with the server. For general
information about writing asynchronous C API applications, see Section 28.6.11, “C
API Asynchronous Interface”.

mysql_real_query_nonblocking() is used similarly to mysql_real_query(). For details about the
latter, see Section 28.6.6.57, “mysql_real_query()”. The two functions differ as follows:

• mysql_real_query() returns an integer status indicator.

• mysql_real_query_nonblocking() returns an enum net_async_status status indicator.

mysql_real_query_nonblocking() was added in MySQL 8.0.16.

Return Values

Returns an enum net_async_status value. See the description in Section 28.6.12, “C API
Asynchronous Interface Data Structures”. A NET_ASYNC_ERROR return status indicates an error.

Example

See Section 28.6.11, “C API Asynchronous Interface”.

28.6.14.6 mysql_store_result_nonblocking()

    enum net_async_status mysql_store_result_nonblocking(MYSQL *mysql, MYSQL_RES
    **result )

Description

Note

mysql_store_result_nonblocking() is an asynchronous function. It is the
counterpart of the mysql_store_result() synchronous function, for use by
applications that require asynchronous communication with the server. For general
information about writing asynchronous C API applications, see Section 28.6.11, “C
API Asynchronous Interface”.

mysql_store_result_nonblocking() is used similarly to mysql_store_result(). For details
about the latter, see Section 28.6.6.79, “mysql_store_result()”. The two functions differ as follows:

• mysql_store_result() returns a pointer to a MYSQL_RESULT value that contains the result set, or
  NULL if there is no result set or an error occurred.

• mysql_store_result_nonblocking() returns an enum net_async_status status indicator and
takes a second result argument that is the address of a pointer to a MYSQL_RESULT into which to
store the result set. When the return status is `NET_ASYNC_COMPLETE`, the `result` argument is `NULL` if there is no result set or an error occurred.

`mysql_store_result_nonblocking()` was added in MySQL 8.0.16.

**Return Values**

Returns an `enum net_async_status` value. See the description in Section 28.6.12, "C API Asynchronous Interface Data Structures". A `NET_ASYNC_ERROR` return status indicates an error.

When the return status is `NET_ASYNC_COMPLETE`, the `result` argument is `NULL` if there is no result set or an error occurred. To determine whether an error occurred, check whether `mysql_error()` returns a nonempty string, `mysql_errno()` returns nonzero, or `mysql_field_count()` returns zero.

**Example**

See Section 28.6.11, “C API Asynchronous Interface”.

### 28.6.15 C API Threaded Function Descriptions

To create a threaded client, use the functions described in the following sections. See also Section 28.6.3.3, “Writing C API Threaded Client Programs”.

#### 28.6.15.1 mysql_thread_end()

```c
void mysql_thread_end(void)
```

**Description**

Call this function as necessary before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`:

- For release/production builds without debugging support enabled, `mysql_thread_end()` need not be called.
- For debug builds, `mysql_thread_init()` allocates debugging information for the DBUG package (see Section 29.5.4, “The DBUG Package”). `mysql_thread_end()` must be called for each `mysql_thread_init()` call to avoid a memory leak.

`mysql_thread_end()` is not invoked automatically by the client library.

**Return Values**

None.

#### 28.6.15.2 mysql_thread_init()

```c
bool mysql_thread_init(void)
```

**Description**

This function must be called early within each created thread to initialize thread-specific variables. However, it may be unnecessarily to invoke it explicitly. Calling `mysql_thread_init()` is automatically handled by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you invoke any of those functions, `mysql_thread_init()` is called for you.
Return Values

Zero for success. Nonzero if an error occurred.

28.6.15.3 mysql_thread_safe()

unsigned int mysql_thread_safe(void)

Description

This function indicates whether the client library is compiled as thread-safe.

Return Values

1 if the client library is thread-safe, 0 otherwise.

28.6.16 C API Client Plugin Functions

This section describes functions used for the client-side plugin API. They enable management of client plugins. For a description of the `st_mysql_client_plugin` structure used by these functions, see Client Plugin Descriptors.

It is unlikely that a client program needs to call the functions in this section. For example, a client that supports the use of authentication plugins normally causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```c
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";
/* ... process command-line options ... */
mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

28.6.16.1 mysql_client_find_plugin()

```c
struct st_mysql_client_plugin *mysql_client_find_plugin(MYSQL *mysql, const char *name, int type)
```

Description

Returns a pointer to a loaded plugin, loading the plugin first if necessary. An error occurs if the type is invalid or the plugin cannot be found or loaded.

Specify the parameters as follows:

- **mysql**: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- **name**: The plugin name.
- **type**: The plugin type.
C API Client Plugin Functions

Return Values

A pointer to the plugin for success. **NULL** if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See Section 28.6.6.15, “mysql_error()”, and Section 28.6.6.14, “mysql_errno()”.

Example

```c
MYSQL mysql;
struct st_mysql_client_plugin *p;
if ((p = mysql_client_find_plugin(&mysql, "myplugin",
    MYSQL_CLIENT_AUTHENTICATION_PLUGIN, 0)))
{
    printf("Plugin version: %d.%d.%d\n", p->version[0], p->version[1], p->version[2]);
}
```

28.6.16.2 mysql_client_register_plugin()

```c
struct st_mysql_client_plugin *mysql_client_register_plugin(MYSQL *mysql,
    struct st_mysql_client_plugin *plugin)
```

Description

Adds a plugin structure to the list of loaded plugins. An error occurs if the plugin is already loaded.

Specify the parameters as follows:

- **mysql**: A pointer to a **MYSQL** structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.

- **plugin**: A pointer to the plugin structure.

Return Values

A pointer to the plugin for success. **NULL** if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See Section 28.6.6.15, “mysql_error()”, and Section 28.6.6.14, “mysql_errno()”.

28.6.16.3 mysql_load_plugin()

```c
struct st_mysql_client_plugin *mysql_load_plugin(MYSQL *mysql, const char *
    name, int type, int argc, ...)
```

Description

Loads a MySQL client plugin, specified by name and type. An error occurs if the type is invalid or the plugin cannot be loaded.

It is not possible to load multiple plugins of the same type. An error occurs if you try to load a plugin of a type already loaded.
Specify the parameters as follows:

- **mysql**: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- **name**: The name of the plugin to load.
- **type**: The type of plugin to load, or `-1` to disable type checking. If type is not `-1`, only plugins matching the type are considered for loading.
- **argc**: The number of following arguments (0 if there are none). Interpretation of any following arguments depends on the plugin type.

Another way to cause plugins to be loaded is to set the `LIBMYSQL_PLUGINS` environment variable to a list of semicolon-separated plugin names. For example:

```bash
export LIBMYSQL_PLUGINS="myplugin1;myplugin2"
```

Plugins named by `LIBMYSQL_PLUGINS` are loaded when the client program calls `mysql_library_init()`. No error is reported if problems occur loading these plugins.

The `LIBMYSQL_PLUGIN_DIR` environment variable can be set to the path name of the directory in which to look for client plugins. This variable is used in two ways:

- During client plugin preloading, the value of the `--plugin-dir` option is not available, so client plugin loading fails unless the plugins are located in the hardwired default directory. If the plugins are located elsewhere, `LIBMYSQL_PLUGIN_DIR` environment variable can be set to the proper directory to enable plugin preloading to succeed.
- For explicit client plugin loading, the `mysql_load_plugin()` and `mysql_load_plugin_v()` C API functions use the `LIBMYSQL_PLUGIN_DIR` value if it exists and the `--plugin-dir` option was not given. If `--plugin-dir` is given, `mysql_load_plugin()` and `mysql_load_plugin_v()` ignore `LIBMYSQL_PLUGIN_DIR`.

### Return Values

A pointer to the plugin if it was loaded successfully. `NULL` if an error occurred.

### Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See Section 28.6.15, "mysql_error()", and Section 28.6.14, "mysql_errno()".

### Example

```c
MYSQL mysql;
if(!mysql_load_plugin(&mysql, "myplugin",
    MYSQL_CLIENT_AUTHENTICATION_PLUGIN, 0))
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
    exit(-1);
}
```

### See Also

See also Section 28.6.16.3, "mysql_load_plugin()", Section 28.6.15, "mysql_error()", Section 28.6.14, "mysql_errno()".
28.6.16.4 mysql_load_plugin_v()

```
struct st_mysql_client_plugin *mysql_load_plugin_v(MYSQL *mysql, const char *name, int type, int argc, va_list args)
```

**Description**

This function is equivalent to `mysql_load_plugin()`, but it accepts a `va_list` instead of a variable list of parameters.

**See Also**

See also Section 28.6.16.3, "mysql_load_plugin()".

28.6.16.5 mysql_plugin_options()

```
int mysql_plugin_options(struct st_mysql_client_plugin *plugin, const char *option, const void *value)
```

**Description**

Passes an option type and value to a plugin. This function can be called multiple times to set several options. If the plugin does not have an option handler, an error occurs.

Specify the parameters as follows:

- **plugin**: A pointer to the plugin structure.
- **option**: The option to be set.
- **value**: A pointer to the option value.

**Return Values**

Zero for success, 1 if an error occurred. If the plugin has an option handler, that handler should also return zero for success and 1 if an error occurred.

28.6.17 C API Binary Log Interface

The MySQL client/server protocol includes a client interface for reading a stream of replication events from a MySQL server binary log. This capability uses the `MYSQL_RPL` data structure and a small set of functions to manage communication between a client program and the server from which the binary log is to be read. The following sections describe aspects of this interface in more detail.

28.6.18 C API Binary Log Data Structures

C API functions for processing a replication event stream from a server require a connection handler (a `MYSQL` pointer) and a pointer to a `MYSQL_RPL` structure that describes the stream of replication events to read from the server binary log. For example:

```c
MYSQL *mysql = mysql_real_connect(...);
MYSQL_RPL rpl;
# ... initialize MYSQL_RPL members ...
```
This section describes the `MYSQL_RPL` structure members. Connection handles are described in Section 28.6.4, “C API Data Structures”.

The applicable `MYSQL_RPL` members depend on the binary log operation to be performed:

- Before calling `mysql_binlog_open()`, the caller must set the `MYSQL_RPL` members from `file_name_length` through `flags`. In addition, if `flags` has the `MYSQL_RPL_GTID` flag set, the caller must set the members from `gtid_set_encoded_size` through `gtid_set_arg`.
- After a successful `mysql_binlog_fetch()` call, the caller examines the `size` and `buffer` members.

**MYSQL_RPL structure member descriptions:**

- **`file_name_length`**
  The length of the name of the binary log file to read. This member is used in conjunction with `file_name`; see the `file_name` description.

- **`file_name`**
  The name of the binary log file to read:
  - If `file_name` is `NULL`, the client library sets it to the empty string and sets `file_name_length` to 0.
  - If `file_name` is not `NULL`, `file_name_length` must either be the length of the name or 0. If `file_name_length` is 0, the client library sets it to the length of the name, in which case, `file_name` must be given as a null-terminated string.
  
  To read from the beginning of the binary log without having to know the name of the oldest binary log file, set `file_name` to `NULL` or the empty string, and `start_position` to 4.

- **`start_position`**
  The position at which to start reading the binary log. The position of the first event in any given binary log file is 4.

- **`server_id`**
  The server ID to use for identifying to the server from which the binary log is read.

- **`flags`**
  The union of flags that affect binary log reading, or 0 if no flags are set. These flag values are permitted:
  - **`MYSQL_RPL_SKIP_HEARTBEAT`**
    Set this flag to cause `mysql_binlog_fetch()` to skip heartbeat events.
  - **`MYSQL_RPL_GTID`**
    Set this flag to read GTID (global transaction ID) data. If set, you must initialize the `MYSQL_RPL` structure GTID-related members from `gtid_set_encoded_size` to `gtid_set_arg` before calling `mysql_binlog_open()`.

    It is beyond the scope of this documentation to describe in detail how client programs use those GTID-related members. For more information, examine the `mysqlbinlog.cc` source file. For information about GTID-based replication, see Section 17.1.3, “Replication with Global Transaction Identifiers”.

```c
int result = mysql_binlog_open(mysql, &rpl);
```
• **gtid_set_encoded_size**
  The size of GTID set data, or 0.

• **fix_gtid_set**
  The address of a callback function for `mysql_binlog_open()` to call to fill the command packet GTID set, or `NULL` if there is no such function. The callback function, if used, should have this calling signature:
  ```c
  void my_callback(MYSQL_RPL *rpl, unsigned char *packet_gtid_set);
  ```

• **gtid_set_arg**
  Either a pointer to GTID set data (if `fix_gtid_set` is `NULL`), or a pointer to a value to be made available for use within the callback function (if `fix_gtid_set` is not `NULL`). `gtid_set_arg` is a generic pointer, so it can point to any kind of value (for example, a string, a structure, or a function). Its interpretation within the callback depends on how the callback intends to use it.

• **size**
  After a successful `mysql_binlog_fetch()` call, the size of the returned binary log event. The value is 0 for an EOF event, greater than 0 for a non-EOF event.

• **buffer**
  After a successful `mysql_binlog_fetch()` call, a pointer to the binary log event contents.

### 28.6.19 C API Binary Log Function Overview

The following list summarizes the functions available for reading a replication event stream from a binary log. For greater detail, see the descriptions in Section 28.6.20, “C API Binary Log Function Descriptions”.

• **mysql_binlog_close()**: Closes the replication event stream.

• **mysql_binlog_fetch()**: Reads an event from the replication event stream.

• **mysql_binlog_open()**: Opens the replication event stream.

### 28.6.20 C API Binary Log Function Descriptions

The following sections provide detailed descriptions of the functions that enable reading the stream of replication events from a MySQL server binary log.

The following simple example program demonstrates the binary log C API functions. Program notes:

• `mysql` is assumed to be a valid connection handler.

• The initial SET statement sets the `@master_binlog_checksum` user-defined variable that the server takes as an indication that the client is checksum-aware. This client does nothing with checksums, but without this statement, a server that includes checksums in binary log events will return an error for the first attempt to read an event containing a checksum. The value assigned to the variable is immaterial; what matters is that the variable exist. existence.

```c
if (mysql_query(mysql, "SET @master_binlog_checksum='ALL'"))
{
  fprintf(stderr, "mysql_query() failed\n");
  fprintf(stderr, "Error %u: %s\n",
           mysql_errno(mysql), mysql_error(mysql));
```
For additional examples that show how to use these functions, look in a MySQL source distribution for these source files:

- **mysqlbinlog.cc** in the **client** directory  
- **mysql_client_test.c** in the **testclients** directory

### 28.6.20.1 mysql_binlog_close()

**void mysql_binlog_close(MYSQL *mysql, MYSQL_RPL *rpl)**

**Description**

Close a replication event stream.

**Arguments:**

- **mysql**: The connection handler returned from **mysql_init()**. The handler remains open after the **mysql_binlog_close()** call.
- **rpl**: The replication stream structure. After calling **mysql_binlog_close()**, this structure should not be used further without reinitializing it and calling **mysql_binlog_open()** again.

**Errors**

None.
Example

See Section 28.6.20, “C API Binary Log Function Descriptions”.

28.6.20.2 mysql_binlog_fetch()

    int mysql_binlog_fetch(MYSQL *mysql, MYSQL_RPL *rpl)

Description

Fetch one event from the replication event stream.

Arguments:

• mysql: The connection handler returned from mysql_init().

• rpl: The replication stream structure. After a successful call, the size member indicates the event size, which is 0 for an EOF event. For a non-EOF event, size is greater than 0 and the buffer member points to the event contents.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

Example

See Section 28.6.20, “C API Binary Log Function Descriptions”.

28.6.20.3 mysql_binlog_open()

    int mysql_binlog_open(MYSQL *mysql, MYSQL_RPL *rpl)

Description

Open a new replication event stream, to read a MySQL server binary log.

Arguments:

• mysql: The connection handler returned from mysql_init().

• rpl: A MYSQL_RPL structure that has been initialized to indicate the replication event stream source. For a description of the structure members and how to initialize them, see Section 28.6.18, “C API Binary Log Data Structures”.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

• CR_FILE_NAME_TOO_LONG

    The specified binary log file name was too long.

• CR_OUT_OF_MEMORY
Out of memory.

Example

See Section 28.6.20, “C API Binary Log Function Descriptions”.

28.6.21 C API Encrypted Connection Support

This section describes how C applications use the C API capabilities for encrypted connections. By default, MySQL programs attempt to connect using encryption if the server supports encrypted connections, falling back to an unencrypted connection if an encrypted connection cannot be established (see Section 6.3.1, “Configuring MySQL to Use Encrypted Connections”). For applications that require control beyond the default behavior over how encrypted connections are established, the C API provides these capabilities:

- The `mysql_options()` function enables applications to set the appropriate SSL/TLS options before calling `mysql_real_connect()`. For example, to require the use of an encrypted connection, see Enforcing an Encrypted Connection.

- The `mysql_get_ssl_cipher()` function enables applications to determine, after a connection has been established, whether the connection uses encryption. A `NULL` return value indicates that encryption is not being used. A non-`NULL` return value indicates an encrypted connection and names the encryption cipher. See Section 28.6.6.34, “mysql_get_ssl_cipher()”.

C API Options for Encrypted Connections

- Enforcing an Encrypted Connection
- Improving Security of Encrypted Connections

C API Options for Encrypted Connections

`mysql_options()` provides the following options for control over use of encrypted connections. For option details, see Section 28.6.6.50, “mysql_options()”.

- `MYSQL_OPT_SSL_CA`: The path name of the Certificate Authority (CA) certificate file. This option, if used, must specify the same certificate used by the server.

- `MYSQL_OPT_SSL_CAPATH`: The path name of the directory that contains trusted SSL CA certificate files.

- `MYSQL_OPT_SSL_CERT`: The path name of the client public key certificate file.

- `MYSQL_OPT_SSL_CIPHER`: The list of encryption ciphers the client permits for connections that use TLS protocols up through TLSv1.2.

- `MYSQL_OPT_SSL_CRL`: The path name of the file containing certificate revocation lists.

- `MYSQL_OPT_SSL_CRLPATH`: The path name of the directory that contains certificate revocation list files.

- `MYSQL_OPT_SSL_KEY`: The path name of the client private key file.

- `MYSQL_OPT_SSL_MODE`: The connection security state.

- `MYSQL_OPT_TLS_CIPHERSUITES`: The list of encryption ciphersuites the client permits for connections that use TLSv1.3.

- `MYSQL_OPT_TLS_VERSION`: The encryption protocols the client permits.
**mysql_ssl_set()** can be used as a convenience routine that is equivalent to a set of
**mysql_options()** calls that specify certificate and key files, encryption ciphers, and so forth. See
Section 28.6.6.77, “mysql_ssl_set()”.

**Enforcing an Encrypted Connection**

**mysql_options()** options for information such as SSL certificate and key files are used to establish
an encrypted connection if such connections are available, but do not enforce any requirement that the
connection obtained be encrypted. To require an encrypted connection, use the following technique:

1. Call **mysql_options()** as necessary supply the appropriate SSL parameters (certificate and key
   files, encryption ciphers, and so forth).

2. Call **mysql_options()** to pass the **MYSQL_OPT_SSL_MODE** option with a value of
   **SSL_MODE_REQUIRED** or one of the more-restrictive option values.

3. Call **mysql_real_connect()** to connect to the server. The call fails if an encrypted connection
cannot be obtained; exit with an error.

**Improving Security of Encrypted Connections**

For additional security relative to that provided by the default encryption, clients can supply a CA certificate
matching the one used by the server and enable host name identity verification. In this way, the server and
client place their trust in the same CA certificate and the client verifies that the host to which it connected is
the one intended:

- To specify the CA certificate, call **mysql_options()** to pass the **MYSQL_OPT_SSL_CA** (or
  **MYSQL_OPT_SSL_CAPATH**) option, and call **mysql_options()** to pass the **MYSQL_OPT_SSL_MODE**
  option with a value of **SSL_MODE_VERIFY_CA**.

- To enable host name identity verification as well, call **mysql_options()** to pass the
  **MYSQL_OPT_SSL_MODE** option with a value of **SSL_MODE_VERIFY_IDENTITY** rather than
  **SSL_MODE_VERIFY_CA**.

**Note**

Host name identity verification with **SSL_MODE_VERIFY_IDENTITY** does not work
with self-signed certificates created automatically by the server, or manually using
**mysql_ssl_rsa_setup** (see Section 6.3.3.1, “Creating SSL and RSA Certificates
and Keys using MySQL”). Such self-signed certificates do not contain the server
name as the Common Name value.

Host name identity verification also does not work with certificates that specify the
Common Name using wildcards because that name is compared verbatim to the
server name.

**28.6.22 C API Multiple Statement Execution Support**

By default, **mysql_query()** and **mysql_real_query()** interpret their statement string argument as a
single statement to be executed, and you process the result according to whether the statement produces
a result set (a set of rows, as for **SELECT**) or an affected-rows count (as for **INSERT, UPDATE**, and so
forth).

MySQL also supports the execution of a string containing multiple statements separated by semicolon (**;**) characters. This capability is enabled by special options that are specified either when you connect to the
server with **mysql_real_connect()** or after connecting by calling **mysql_set_server_option()**.
Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: after handling the result from the first statement, it is necessary to check whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. These functions are used at the end of a loop that iterates as long as more results are available. The result this way may result in a dropped connection to the server.

Multiple-result processing also is required if you execute `CALL` statements for stored procedures. Results from a stored procedure have these characteristics:

- Statements within the procedure may produce result sets (for example, if it executes `SELECT` statements). These result sets are returned in the order that they are produced as the procedure executes.

  In general, the caller cannot know how many result sets a procedure will return. Procedure execution may depend on loops or conditional statements that cause the execution path to differ from one call to the next. Therefore, you must be prepared to retrieve multiple results.

- The final result from the procedure is a status result that includes no result set. The status indicates whether the procedure succeeded or an error occurred.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handlers are defined to work only with strings that contain a single statement. See Section 28.6.7, “C API Prepared Statements”.

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevant:

  - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option must be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error `Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context`. `CLIENT_MULTI_RESULTS` is enabled by default.

  - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.

- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of “simple” results for a multiple-statement string where each statement produces a single result, but is not sufficient to permit processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.
2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.

3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.

4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns nonzero. The code as written distinguishes between no more results and an error, which enables a message to be printed for the latter occurrence.

```c
/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
    db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
    printf("mysql_real_connect() failed\n");
    mysql_close(mysql);
    exit(1);
}
/* execute multiple statements */
status = mysql_query(mysql,
    "DROP TABLE IF EXISTS test_table;
    CREATE TABLE test_table(id INT);
    INSERT INTO test_table VALUES(10);
    UPDATE test_table SET id=20 WHERE id=10;
    SELECT * FROM test_table;
    DROP TABLE test_table");
if (status)
{
    printf("Could not execute statement(s)\n");
    mysql_close(mysql);
    exit(0);
}
/* process each statement result */
do {
    /* did current statement return data? */
    result = mysql_store_result(mysql);
    if (result)
    { /* yes; process rows and free the result set */
        process_result_set(mysql, result);
        mysql_free_result(result);
    } else /* no result set or error */
    { /* more results? -1 = no, >0 = error, 0 = yes (keep looping) */
        if ((status = mysql_next_result(mysql)) > 0)
            printf("Could not execute statement\n");
        break;
    }
} while (status == 0);
```
The binary (prepared statement) protocol enables you to send and receive date and time values \((\text{DATE}, \text{TIME}, \text{DATETIME}, \text{and TIMESTAMP})\), using the \textit{MYSQL\_TIME} structure. The members of this structure are described in Section 28.6.8, "C API Prepared Statement Data Structures".

To send temporal data values, create a prepared statement using \texttt{mysql\_stmt\_prepare()}\texttt{). Then, before calling \texttt{mysql\_stmt\_execute()} to execute the statement, use the following procedure to set up each temporal parameter:

1. In the \texttt{MYSQL\_BIND} structure associated with the data value, set the \texttt{buffer\_type} member to the type that indicates what kind of temporal value you're sending. For \texttt{DATE}, \texttt{TIME}, \texttt{DATETIME}, or \texttt{TIMESTAMP} values, set \texttt{buffer\_type} to \texttt{MYSQL\_TYPE\_DATE}, \texttt{MYSQL\_TYPE\_TIME}, \texttt{MYSQL\_TYPE\_DATETIME}, or \texttt{MYSQL\_TYPE\_TIMESTAMP}, respectively.

2. Set the \texttt{buffer} member of the \texttt{MYSQL\_BIND} structure to the address of the \texttt{MYSQL\_TIME} structure in which you pass the temporal value.

3. Fill in the members of the \texttt{MYSQL\_TIME} structure that are appropriate for the type of temporal value to pass.

Use \texttt{mysql\_stmt\_bind\_param()} to bind the parameter data to the statement. Then you can call \texttt{mysql\_stmt\_execute()}.

To retrieve temporal values, the procedure is similar, except that you set the \texttt{buffer\_type} member to the type of value you expect to receive, and the \texttt{buffer} member to the address of a \texttt{MYSQL\_TIME} structure into which the returned value should be placed. Use \texttt{mysql\_stmt\_bind\_result()} to bind the buffers to the statement after calling \texttt{mysql\_stmt\_execute()} and before fetching the results.

Here is a simple example that inserts \texttt{DATE}, \texttt{TIME}, and \texttt{TIMESTAMP} data. The \texttt{mysql} variable is assumed to be a valid connection handler.

```c
MYSQL\_TIME \ ts;
MYSQL\_BIND  bind[3];
MYSQL\_STMT  \*stmt;

strmov(query, "INSERT INTO test\_table(date\_field, time\_field, \n	\text{timestamp\_field}) VALUES(?, ?, ?);"

stmt = mysql\_stmt\_init(mysql);
if (!stmt)
{
    fprintf(stderr, "mysql\_stmt\_init(), out of memory\n");
    exit(0);
}
if (mysql\_stmt\_prepare(mysql, query, strlen(query)))
{
    fprintf(stderr, "\nmysql\_stmt\_prepare(), INSERT failed*");
    fprintf(stderr, "\n\$s", mysql\_stmt\_error(stmt));
    exit(0);
}

/* set up input buffers for all 3 parameters */
bind[0].buffer\_type= MYSQL\_TYPE\_DATE;
bind[0].buffer= (char *)\&ts;
bind[0].is\_null= 0;
bind[0].length= 0;
...```
bind[1]= bind[2]= bind[0];
...
mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
..

28.6.24 C API Prepared CALL Statement Support

This section describes prepared-statement support in the C API for stored procedures executed using CALL statements:

Stored procedures executed using prepared CALL statements can be used in the following ways:

• A stored procedure can produce any number of result sets. The number of columns and the data types of the columns need not be the same for all result sets.

• The final values of OUT and INOUT parameters are available to the calling application after the procedure returns. These parameters are returned as an extra single-row result set following any result sets produced by the procedure itself. The row contains the values of the OUT and INOUT parameters in the order in which they are declared in the procedure parameter list.

For information about the effect of unhandled conditions on procedure parameters, see Section 13.6.7.8, "Condition Handling and OUT or INOUT Parameters".

The following discussion shows how to use these capabilities through the C API for prepared statements. To use prepared CALL statements through the PREPARE and EXECUTE statements, see Section 13.2.1, “CALL Statement”.

An application that executes a prepared CALL statement should use a loop that fetches a result and then invokes mysql_stmt_next_result() to determine whether there are more results. The results consist of any result sets produced by the stored procedure followed by a final status value that indicates whether the procedure terminated successfully.

If the procedure has OUT or INOUT parameters, the result set preceding the final status value contains their values. To determine whether a result set contains parameter values, test whether the SERVER_PS_OUT_PARAMS bit is set in the server_status member of the MYSQL connection handler:

mysql->server_status & SERVER_PS_OUT_PARAMS

The following example uses a prepared CALL statement to execute a stored procedure that produces multiple result sets and that provides parameter values back to the caller by means of OUT and INOUT parameters. The procedure takes parameters of all three types (IN, OUT, INOUT), displays their initial values, assigns new values, displays the updated values, and returns. The expected return information from the procedure therefore consists of multiple result sets and a final status:

• One result set from a SELECT that displays the initial parameter values: 10, NULL, 30. (The OUT parameter is assigned a value by the caller, but this assignment is expected to be ineffective: OUT parameters are seen as NULL within a procedure until assigned a value within the procedure.)

• One result set from a SELECT that displays the modified parameter values: 100, 200, 300.
• One result set containing the final **OUT** and **INOUT** parameter values: 200, 300.
• A final status packet.

The code to execute the procedure:

```c
MYSQL_STMT *stmt;
MYSQL_BIND ps_params[3]; /* input parameter buffers */
int int_data[3]; /* input/output values */
bool is_null[3]; /* output value nullability */
int status;

/* set up stored procedure */
status = mysql_query(mysql, "DROP PROCEDURE IF EXISTS p1");
test_error(mysql, status);
status = mysql_query(mysql, "CREATE PROCEDURE p1(
  IN p_in INT, 
  OUT p_out INT, 
  INOUT p_inout INT) 
BEGIN 
  SELECT p_in, p_out, p_inout; 
  SET p_in = 100, p_out = 200, p_inout = 300; 
  SELECT p_in, p_out, p_inout; 
END");
test_error(mysql, status);

/* initialize and prepare CALL statement with parameter placeholders */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
  printf("Could not initialize statement\n");
  exit(1);
}
status = mysql_stmt_prepare(stmt, "CALL p1(?, ?, ?)", 16);
test_stmt_error(stmt, status);

/* initialize parameters: p_in, p_out, p_inout (all INT) */
memset(ps_params, 0, sizeof (ps_params));
ps_params[0].buffer_type = MYSQL_TYPE_LONG;
ps_params[0].buffer = (char *) &int_data[0];
ps_params[0].length = 0;
ps_params[0].is_null = 0;

ps_params[1].buffer_type = MYSQL_TYPE_LONG;
ps_params[1].buffer = (char *) &int_data[1];
ps_params[1].length = 0;
ps_params[1].is_null = 0;

ps_params[2].buffer_type = MYSQL_TYPE_LONG;
ps_params[2].buffer = (char *) &int_data[2];
ps_params[2].length = 0;
ps_params[2].is_null = 0;

/* bind parameters */
status = mysql_stmt_bind_param(stmt, ps_params);
test_stmt_error(stmt, status);

/* assign values to parameters and execute statement */
int_data[0]= 10; /* p_in */
int_data[1]= 20; /* p_out */
int_data[2]= 30; /* p_inout */
status = mysql_stmt_execute(stmt);
test_stmt_error(stmt, status);
```
/* process results until there are no more */
    do {
        int i;
        int num_fields;    /* number of columns in result */
        MYSQL_FIELD *fields;    /* for result set metadata */
        MYSQL_BIND *rs_bind;    /* for output buffers */

        /* the column count is > 0 if there is a result set */
        /* 0 if the result is only the final status packet */
        num_fields = mysql_stmt_field_count(stmt);

        if (num_fields > 0) {
            /* there is a result set to fetch */
            printf("Number of columns in result: %d\n", (int) num_fields);

            /* what kind of result set is this? */
            printf("Data: ");
            if (mysql->server_status & SERVER_PS_OUT_PARAMS)
                printf("this result set contains OUT/INOUT parameters\n");
            else
                printf("this result set is produced by the procedure\n");

            MYSQL_RES *rs_metadata = mysql_stmt_result_metadata(stmt);
            test_stmt_error(stmt, rs_metadata == NULL);
            fields = mysql_fetch_fields(rs_metadata);
            rs_bind = (MYSQL_BIND *) malloc(sizeof (MYSQL_BIND) * num_fields);
            if (!rs_bind) {
                printf("Cannot allocate output buffers\n");
                exit(1);
            }
            memset(rs_bind, 0, sizeof (MYSQL_BIND) * num_fields);

            /* set up and bind result set output buffers */
            for (i = 0; i < num_fields; ++i) {
                rs_bind[i].buffer_type = fields[i].type;
                rs_bind[i].is_null = &is_null[i];

                switch (fields[i].type) {
                    case MYSQL_TYPE_LONG:
                        rs_bind[i].buffer = (char *) &(int_data[i]);
                        rs_bind[i].buffer_length = sizeof (int_data);
                        break;
                    default:
                        fprintf(stderr, "ERROR: unexpected type: %d.\n", fields[i].type);
                        exit(1);
                }
            }

            status = mysql_stmt_bind_result(stmt, rs_bind);
            test_stmt_error(stmt, status);

            /* fetch and display result set rows */
            while (1) {
                status = mysql_stmt_fetch(stmt);
                if (status == 1 || status == MYSQL_NO_DATA)
                    break;
            }
        }
    } while (1);
for (i = 0; i < num_fields; ++i)
{
    switch (rs_bind[i].buffer_type)
    {
    case MYSQL_TYPE_LONG:
        if (*rs_bind[i].is_null)
            printf(" val[%d] = NULL;", i);
        else
            printf(" val[%d] = %ld;", i, (long) *((int *) rs_bind[i].buffer));
        break;
    default:
        printf(" unexpected type (%d)\n", rs_bind[i].buffer_type);
    }
} 
printf("\n");
}
mysql_free_result(rs_metadata); /* free metadata */
free(rs_bind);                  /* free output buffers */
}
else
{
    /* no columns = final status packet */
    printf("End of procedure output\n");
}
/* more results? -1 = no, >0 = error, 0 = yes (keep looking) */
status = mysql_stmt_next_result(stmt);
if (status > 0)
test_stmt_error(stmt, status);
} while (status == 0);
mysql_stmt_close(stmt);

Execution of the procedure should produce the following output:

Number of columns in result: 3
Data: this result set is produced by the procedure
Number of columns in result: 3
Data: this result set is produced by the procedure
  val[0] = 100; val[1] = 200; val[2] = 300;
Number of columns in result: 2
Data: this result set contains OUT/INOUT parameters
  val[0] = 200; val[1] = 300;
End of procedure output

The code uses two utility routines, test_error() and test_stmt_error(), to check for errors and terminate after printing diagnostic information if an error occurred:

static void test_error(MYSQL *mysql, int status)
{
    if (status)
    {
        fprintf(stderr, "Error: %s (errno: %d)\n", mysql_error(mysql), mysql_errno(mysql));
        exit(1);
    }
}
static void test_stmt_error(MYSQL_STMT *stmt, int status)
{
    if (status)
    {

28.6.25 C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- **TIME, TIMESTAMP, and DATETIME** do not support parts of seconds (for example, from `DATE_FORMAT()`).

- When converting an integer to string, **ZEROFILL** is honored with prepared statements in some cases where the MySQL server does not print the leading zeros. (For example, with `MIN(number-with-zerofill)`).

- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.

- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by `;` characters).

- The capabilities of prepared **CALL** statements are described in Section 28.6.24, “C API Prepared CALL Statement Support”.

28.6.26 C API Optional Result Set Metadata

When a client executes a statement that produces a result set, MySQL by default makes available both the data the result set contains, and result set metadata that provides information about the result set data. Metadata is contained in the `MYSQL_FIELD` structure (see Section 28.6.4, “C API Data Structures”), which is returned by the `mysql_fetch_field()`, `mysql_fetch_field_direct()`, and `mysql_fetch_fields()` functions.

Clients can indicate on a per-connection basis that result set metadata is optional and that the client will indicate to the server whether to return it. Suppression of metadata transfer can improve performance, particularly for sessions that execute many queries that return few rows each.

There are two ways to indicate that result set metadata is optional for a connection. They are equivalent, so either one suffices:

- At connect time, enable the **CLIENT_OPTIONAL_RESULTSET_METADATA** flag for the `client_flag` argument of `mysql_real_connect()`.

- Prior to connect time, enable the **MYSQL_OPT_OPTIONAL_RESULTSET_METADATA** option for `mysql_options()`.

For metadata-optional connections, the client sets the `resultset_metadata` system variable to control whether the server returns result set metadata. Permitted values are **FULL** (return all metadata; this is the default) and **NONE** (return no metadata).

For metadata-optional connections, the `mysql_fetch_field()`, `mysql_fetch_field_direct()`, and `mysql_fetch_fields()` functions return **NULL** when the `resultset_metadata` system variable is set to **NONE**.

To check whether a result set has metadata, use the `mysql_result_metadata()` function. This function returns **RESULTSET_METADATA_FULL** or **RESULTSET_METADATA_NONE** to indicate that the result set has full metadata or no metadata, respectively.
mysql_result_metadata() can be useful if the client does not know in advance whether a result set has metadata. For example, if a client executes a stored procedure that returns multiple result sets and might change the resultset_metadata system variable, the client can invoke mysql_result_metadata() for each result set to determine whether it has metadata.

For connections that are not metadata-optional, setting resultset_metadata to NONE produces an error.

28.6.27 C API Automatic Reconnection Control

The MySQL client library can perform an automatic reconnection to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. If auto-reconnect is enabled, the library tries once to reconnect to the server and send the statement again.

Auto-reconnect is disabled by default.

If it is important for your application to know that the connection has been dropped (so that it can exit or take action to adjust for the loss of state information), be sure that auto-reconnect is disabled. To ensure this, call mysql_options() with the MYSQL_OPT_RECONNECT option:

```c
bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);
```

If the connection has gone down, the effect of mysql_ping() depends on the auto-reconnect state. If auto-reconnect is enabled, mysql_ping() performs a reconnect. Otherwise, it returns an error.

Some client programs might provide the capability of controlling automatic reconnection. For example, mysql reconnects by default, but the --skip-reconnect option can be used to suppress this behavior.

If an automatic reconnection does occur (for example, as a result of calling mysql_ping()), there is no explicit indication of it. To check for reconnection, call mysql_thread_id() to get the original connection identifier before calling mysql_ping(), then call mysql_thread_id() again to see whether the identifier changed.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset on the server side and your application will not be notified.

The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All TEMPORARY tables are closed (and dropped).
- Session system variables are reinitialized to the values of the corresponding global system variables, including system variables that are set implicitly by statements such as SET NAMES.
- User variable settings are lost.
- Prepared statements are released.
- HANDLER variables are closed.
- The value of LAST_INSERT_ID() is reset to 0.
- Locks acquired with GET_LOCK() are released.
• The association of the client with the Performance Schema threads table row that determines connection thread instrumentation is lost. If the client reconnects after a disconnect, the session is associated with a new row in the threads table and the thread monitoring state may be different. See Section 26.12.18.5, “The threads Table”.

If reconnection occurs, any SQL statement specified by calling mysql_options() with the MYSQL_INIT_COMMAND option is re-executed.

If the connection drops, it is possible that the session associated with the connection on the server side will still be running if the server has not yet detected that the client is no longer connected. In this case, any locks held by the original connection still belong to that session, so you may want to kill it by calling mysql_kill().

28.6.28 C API Common Issues

28.6.28.1 Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success

It is possible for mysql_store_result() to return NULL following a successful call to mysql_query(). When this happens, it means one of the following conditions occurred:

• There was a malloc() failure (for example, if the result set was too large).
• The data could not be read (an error occurred on the connection).
• The query returned no data (for example, it was an INSERT, UPDATE, or DELETE).

You can always check whether the statement should have produced a nonempty result by calling mysql_field_count(). If mysql_field_count() returns zero, the result is empty and the last query was a statement that does not return values (for example, an INSERT or a DELETE). If mysql_field_count() returns a nonzero value, the statement should have produced a nonempty result. See the description of the mysql_field_count() function for an example.

You can test for an error by calling mysql_error() or mysql_errno().

28.6.28.2 What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

• mysql_affected_rows() returns the number of rows affected by the last query when doing an INSERT, UPDATE, or DELETE.

For a fast re-create, use TRUNCATE TABLE.

• mysql_num_rows() returns the number of rows in a result set. With mysql_store_result(), mysql_num_rows() may be called as soon as mysql_store_result() returns. With mysql_use_result(), mysql_num_rows() may be called only after you have fetched all the rows with mysql_fetch_row().

• mysql_insert_id() returns the ID generated by the last query that inserted a row into a table with an AUTO_INCREMENT index. See Section 28.6.38, “mysql_insert_id()”.

• Some queries (LOAD DATA, INSERT INTO ... SELECT, UPDATE) return additional information. The result is returned by mysql_info(). See the description for mysql_info() for the format of the string that it returns. mysql_info() returns a NULL pointer if there is no additional information.

28.6.28.3 How to Get the Unique ID for the Last Inserted Row
If you insert a record into a table that contains an AUTO_INCREMENT column, you can obtain the value stored into that column by calling the \texttt{mysql\_insert\_id()} function.

You can check from your C applications whether a value was stored in an AUTO_INCREMENT column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an \texttt{INSERT} with an AUTO_INCREMENT index:

\begin{verbatim}
if ((result = mysql\_store\_result(&mysql)) == 0 &&
    mysql\_field\_count(&mysql) == 0 &&
    mysql\_insert\_id(&mysql) != 0)
{
    used\_id = mysql\_insert\_id(&mysql);
}
\end{verbatim}

When a new AUTO_INCREMENT value has been generated, you can also obtain it by executing a SELECT \texttt{LAST\_INSERT\_ID()} statement with \texttt{mysql\_query()} and retrieving the value from the result set returned by the statement.

When inserting multiple values, the last automatically incremented value is returned.

For \texttt{LAST\_INSERT\_ID()}, the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another AUTO_INCREMENT column with a nonmagic value (that is, a value that is not \texttt{NULL} and not \texttt{0}). Using \texttt{LAST\_INSERT\_ID()} and AUTO_INCREMENT columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement that client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

\begin{verbatim}
INSERT INTO foo (auto,text)
VALUES(NULL,'text');         # generate ID by inserting NULL

INSERT INTO foo2 (id,text)
VALUES(LAST\_INSERT\_ID(),'text');  # use ID in second table
\end{verbatim}

\texttt{mysql\_insert\_id()} returns the value stored into an AUTO_INCREMENT column, whether that value is automatically generated by storing NULL or \texttt{0} or was specified as an explicit value. \texttt{LAST\_INSERT\_ID()} returns only automatically generated AUTO_INCREMENT values. If you store an explicit value other than NULL or \texttt{0}, it does not affect the value returned by \texttt{LAST\_INSERT\_ID()}.

For more information on obtaining the last ID in an AUTO_INCREMENT column:

- For information on \texttt{LAST\_INSERT\_ID()}, which can be used within an SQL statement, see Section 12.15, “Information Functions”.

- For information on \texttt{mysql\_insert\_id()}, the function you use from within the C API, see Section 28.6.6.38, "mysql\_insert\_id()".

- For information on obtaining the auto-incremented value when using Connector/J, see Retrieving AUTO_INCREMENT Column Values through JDBC.

- For information on obtaining the auto-incremented value when using Connector/ODBC, see Obtaining Auto-Increment Values.

\section*{28.7 MySQL PHP API}

The MySQL PHP API manual is now published in standalone form, not as part of the MySQL Reference Manual. See MySQL and PHP.
28.8 MySQL Perl API

The Perl DBI module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI with MySQL, install the following:

1. The DBI module.
2. The DBD::mysql module. This is the DataBase Driver (DBD) module for Perl.
3. Optionally, the DBD module for any other type of database server you want to access.

Perl DBI is the recommended Perl interface. It replaces an older interface called mysqlperl, which should be considered obsolete.

These sections contain information about using Perl with MySQL and writing MySQL applications in Perl:

• For installation instructions for Perl DBI support, see Section 2.13, “Perl Installation Notes”.
• For an example of reading options from option files, see Section 5.8.4, “Using Client Programs in a Multiple-Server Environment”.
• For secure coding tips, see Section 6.1.1, “Security Guidelines”.
• For debugging tips, see Section 29.5.1.4, “Debugging mysqld under gdb”.
• For some Perl-specific environment variables, see Section 4.9, “Environment Variables”.
• For considerations for running on macOS, see Section 2.4, “Installing MySQL on macOS”.
• For ways to quote string literals, see Section 9.1.1, “String Literals”.

DBI information is available at the command line, online, or in printed form:

• Once you have the DBI and DBD::mysql modules installed, you can get information about them at the command line with the perldoc command:

  \[
  \text{shell>} \text{perldoc DBI} \\
  \text{shell>} \text{perldoc DBI::FAQ} \\
  \text{shell>} \text{perldoc DBD::mysql}
  \]

  You can also use pod2man, pod2html, and so on to translate this information into other formats.

• For online information about Perl DBI, visit the DBI website, http://dbi.perl.org/. That site hosts a general DBI mailing list.

28.9 MySQL Python API

MySQLdb is a third-party driver that provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at http://sourceforge.net/projects/mysql-python/.

The new MySQL Connector/Python component provides an interface to the same Python API, and is built into the MySQL Server and supported by Oracle. See MySQL Connector/Python Developer Guide for details on the Connector, as well as coding guidelines for Python applications and sample Python code.
28.10 MySQL Ruby APIs

Two APIs are available for Ruby programmers developing MySQL applications:

- The MySQL/Ruby API is based on the libmysqlclient API library. For information on installing and using the MySQL/Ruby API, see Section 28.10.1, “The MySQL/Ruby API”.

- The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver). For information on installing and using the Ruby/MySQL API, see Section 28.10.2, “The Ruby/MySQL API”.

For background and syntax information about the Ruby language, see Ruby Programming Language.

28.10.1 The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through libmysqlclient.

For information on installing the module, and the functions exposed, see MySQL/Ruby.

28.10.2 The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see Ruby/MySQL.

28.11 MySQL Tcl API

MySQLtcl is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at http://www.xdobry.de/mysqltcl/.

28.12 MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at http://efsa.sourceforge.net/archive/ravits/mysql.htm.

29.1 MySQL Internals

This chapter describes what you need to know when working on the MySQL code. To track or contribute to MySQL development, follow the instructions in Section 2.9.5, “Installing MySQL Using a Development Source Tree”. If you are interested in MySQL internals, you should also join the MySQL Community Slack. Feel free to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

Note

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at https://dev.mysql.com/doc/index-other.html. It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.9.10, “Generating MySQL Doxygen Documentation Content”.

29.1.1 MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
The MySQL Test Suite

• Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

For information about tuning the parameters that control thread resources, see Section 8.12.4.1, “How MySQL Handles Client Connections”.

• On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.

• On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.

• A signal thread handles all signals. This thread also normally handles alarms and calls process_alarm() to force timeouts on connections that have been idle too long.

• If InnoDB is used, there will be additional read and write threads by default. The number of these are controlled by the innodb_read_io_threads and innodb_write_io_threads parameters. See Section 15.14, “InnoDB Startup Options and System Variables”.

• If the server is started with the --flush_time=val option, a dedicated thread is created to flush all tables every val seconds.

• If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See Section 24.4.1, “Event Scheduler Overview”.

mysqladmin processlist only shows the connection, replication, and event threads.

29.1.2 The MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information, including system requirements, see The MySQL Test Framework in the MySQL Server Doxygen documentation, available at https://dev.mysql.com/doc/index-other.html.

The current set of test cases does not test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (mysqltest), a Perl script to run all tests (mysql-test-run.pl), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type make test from the source root directory, or change location to the mysql-test directory and type ./mysql-test-run.pl. If you have installed a binary distribution, change location to the mysql-test directory under the installation root directory (for example, /usr/local/mysql/mysql-test), and run ./mysql-test-run.pl. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See Section 1.7, “How to Report Bugs or Problems”.

If one test fails, you should run mysql-test-run.pl with the --force option to check whether any other tests fail.
29.2 The MySQL Plugin API

MySQL supports a plugin API that enables creation of server components. Plugins can be loaded at server startup, or loaded and unloaded at runtime without restarting the server. The API is generic and does not specify what plugins can do. The components supported by this interface include, but are not limited to, storage engines, full-text parser plugins, and server extensions.

For example, full-text parser plugins can be used to replace or augment the built-in full-text parser. A plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is more general than the older user-defined function (UDF) interface.

The plugin interface uses the plugin table in the mysql database to record information about plugins that have been installed permanently with the INSTALL PLUGIN statement. This table is created as part of the MySQL installation process. Plugins can also be installed for a single server invocation with the --plugin-load option. Plugins installed this way are not recorded in the plugin table. See Section 5.6.1, "Installing and Uninstalling Plugins".

MySQL supports an API for client plugins in addition to that for server plugins. This is used, for example, by authentication plugins where a server-side plugin and a client-side plugin cooperate to enable clients to connect to the server through a variety of authentication methods.

Note
The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at https://dev.mysql.com/doc/index-other.html. It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.9.10, "Generating MySQL Doxygen Documentation Content".

Additional Resources
The book MySQL 5.1 Plugin Development by Sergei Golubchik and Andrew Hutchings provides a wealth of detail about the plugin API. Despite the fact that the book's title refers to MySQL Server 5.1, most of the information in it applies to later versions as well.

29.2.1 Types of Plugins
The plugin API enables creation of plugins that implement several capabilities:

- Storage engines
Types of Plugins

- Full-text parsers
- Daemons
- INFORMATION_SCHEMA tables
- Semisynchronous replication
- Auditing
- Authentication
- Password validation and strength checking
- Protocol tracing
- Query rewriting
- Secure keyring storage and retrieval

The following sections provide an overview of these plugin types.

- Storage Engine Plugins
- Full-Text Parser Plugins
- Daemon Plugins
- INFORMATION_SCHEMA Plugins
- Semisynchronous Replication Plugins
- Audit Plugins
- Authentication Plugins
- Password-Validation Plugins
- Protocol Trace Plugins
- Query Rewrite Plugins
- Keyring Plugins

Storage Engine Plugins

The pluggable storage engine architecture used by MySQL Server enables storage engines to be written as plugins and loaded into and unloaded from a running server. For a description of this architecture, see Section 16.11, “Overview of MySQL Storage Engine Architecture”.

For information on how to use the plugin API to write storage engines, see MySQL Internals: Writing a Custom Storage Engine.

Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). The built-in full-text parser is supported with InnoDB and MyISAM tables.

MySQL also has a character-based ngram full-text parser that supports Chinese, Japanese, and Korean (CJK), and a word-based MeCab parser plugin that supports Japanese, for use with InnoDB and MyISAM tables.
For full-text processing, “parsing” means extracting words (or “tokens”, in the case of an n-gram character-based parser) from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in Section 12.9, “Full-Text Search Functions”. These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored. For more information, see Section 12.9.4, “Full-Text Stopwords”, and Section 12.9.6, “Fine-Tuning MySQL Full-Text Search”.

The plugin API enables you to use a full-text parser other than the default built-in full-text parser. For example, if you are working with Japanese, you may choose to use the MeCab full-text parser. The plugin API also enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

• The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for token accumulation). The ngram and MeCab parsers operate as replacements for the built-in full-text parser.

You may choose to provide your own full-text parser if you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

• The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. This parsing is affected by the innodb_ft_xxx or ft_xxx system variables and the stopword list.

One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or .doc files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from non-cleartext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a WITH(Parser clause when creating individual FULLTEXT indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
  doc CHAR(255),
  FULLTEXT INDEX (doc) WITH PARSER parser_name
) ENGINE=InnoDB;
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER parser_name;
```

The only SQL change for associating the parser with the index is the WITH Parser clause. Searches are specified as before, with no changes needed for queries.
Types of Plugins

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

For more information about full-text plugins, see `Section 29.2.4.4, “Writing Full-Text Parser Plugins”`. MySQL 8.0 supports full-text plugins with `MyISAM` and `InnoDB`.

Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. MySQL distributions include an example daemon plugin that writes periodic heartbeat messages to a file.

For more information about daemon plugins, see `Section 29.2.4.5, “Writing Daemon Plugins”`.

**INFORMATION_SCHEMA** Plugins

`INFORMATION_SCHEMA` plugins enable the creation of tables containing server metadata that are exposed to users through the `INFORMATION_SCHEMA` database. For example, `InnoDB` uses `INFORMATION_SCHEMA` plugins to provide tables that contain information about current transactions and locks.

For more information about `INFORMATION_SCHEMA` plugins, see `Section 29.2.4.6, “Writing INFORMATION_SCHEMA Plugins”`.

Semisynchronous Replication Plugins

MySQL replication is asynchronous by default. With semisynchronous replication, a commit performed on the master side blocks before returning to the session that performed the transaction until at least one slave acknowledges that it has received and logged the events for the transaction. Semisynchronous replication is implemented through complementary master and client plugins. See `Section 17.4.9, “Semisynchronous Replication”`.

For more information about semisynchronous replication plugins, see `Section 29.2.4.7, “Writing Semisynchronous Replication Plugins”`.

Audit Plugins

The MySQL server provides a pluggable audit interface that enables information about server operations to be reported to interested parties. Audit notification occurs for these operations (although the interface is general and the server could be modified to report others):

- Write a message to the general query log (if the log is enabled)
- Write a message to the error log
- Send a query result to a client

Audit plugins may register with the audit interface to receive notification about server operations. When an auditable event occurs within the server, the server determines whether notification is needed. For each registered audit plugin, the server checks the event against those event classes in which the plugin is interested and passes the event to the plugin if there is a match.

This interface enables audit plugins to receive notifications only about operations in event classes they consider significant and to ignore others. The interface provides for categorization of operations into event classes and further division into event subclasses within each class.
Types of Plugins

When an audit plugin is notified of an auditable event, it receives a pointer to the current THD structure and a pointer to a structure that contains information about the event. The plugin can examine the event and perform whatever auditing actions are appropriate. For example, the plugin can see what statement produced a result set or was logged, the number of rows in a result, who the current user was for an operation, or the error code for failed operations.

For more information about audit plugins, see Section 29.2.4.8, “Writing Audit Plugins”.

Authentication Plugins

MySQL supports pluggable authentication. Authentication plugins exist on both the server and client sides. Plugins on the server side implement authentication methods for use by clients when they connect to the server. A plugin on the client side communicates with a server-side plugin to provide the authentication information that it requires. A client-side plugin may interact with the user, performing tasks such as soliciting a password or other authentication credentials to be sent to the server. See Section 6.2.17, “Pluggable Authentication”.

Pluggable authentication also enables proxy user capability, in which one user takes the identity of another user. A server-side authentication plugin can return to the server the name of the user whose identity the connecting user should have. See Section 6.2.18, “Proxy Users”.

For more information about authentication plugins, see Section 29.2.4.9, “Writing Authentication Plugins”.

Password-Validation Plugins

The MySQL server provides an interface for writing plugins that test passwords. Such a plugin implements two capabilities:

• Rejection of too-weak passwords in statements that assign passwords (such as CREATE USER and ALTER USER statements).
• Assessing the strength of potential passwords for the VALIDATE_PASSWORD_STRENGTH() SQL function.

For information about writing this type of plugin, see Section 29.2.4.10, “Writing Password-Validation Plugins”.

Protocol Trace Plugins

MySQL supports the use of protocol trace plugins: client-side plugins that implement tracing of communication between a client and the server that takes place using the client/server protocol.

For more information about protocol trace plugins, see Section 29.2.4.11, “Writing Protocol Trace Plugins”.

Query Rewrite Plugins

MySQL Server supports query rewrite plugins that can examine and possibly modify statements received by the server before the server executes them. A query rewrite plugin takes statements either before or after the server has parsed them.

A preparse query rewrite plugin has these characteristics:

• The plugin enables rewriting of SQL statements arriving at the server before the server processes them.
• The plugin receives a statement string and may return a different string.

A postparse query rewrite plugin has these characteristics:

• The plugin enables statement rewriting based on parse trees.
• The server parses each statement and passes its parse tree to the plugin, which may traverse the tree. The plugin can return the original tree to the server for further processing, or construct a different tree and return that instead.

• The plugin can use the `mysql_parser` plugin service for these purposes:
  • To activate statement digest calculation and obtain the normalized version of statements independent of whether the Performance Schema produces digests.
  • To traverse parse trees.
  • To parse statements. This is useful if the plugin constructs a new statement string from the parse tree. The plugin can have the server parse the string to produce a new tree, then return that tree as the representation of the rewritten statement.

For more information about plugin services, see Section 29.3, "MySQL Services for Plugins".

Preparse and postparse query rewrite plugins share these characteristics:

• If a query rewrite plugin is installed, the `--log-raw` option affects statement logging as follows:
  • Without `--log-raw`, the server logs the statement returned by the query rewrite plugin. This may differ from the statement as received.
  • With `--log-raw`, the server logs the original statement as received.

• If a plugin rewrites a statement, the server decides whether to write it to the binary log (and thus to any replication slaves) based on the rewritten statement, not the original statement. If a plugin rewrites only `SELECT` statements to `SELECT` statements, there is no impact on binary logging because the server does not write `SELECT` statements to the binary log.

• If a plugin rewrites a statement, the server produces a Note message that the client can view using `SHOW WARNINGS`. Messages have this format, where `stmt_in` is the original statement and `stmt_out` is the rewritten statement:

  | Query 'stmt_in' rewritten to 'stmt_out' by a query rewrite plugin |

MySQL distributions include a postparse query rewrite plugin named `Rewriter`. This plugin is rule based. You can add rows to its rules table to cause `SELECT` statement rewriting. For more information, see Section 5.6.4, "The Rewriter Query Rewrite Plugin".

Query rewrite plugins use the same API as audit plugins. For more information about audit plugins, see Section 29.2.4.8, "Writing Audit Plugins".

**Keyring Plugins**

MySQL Server supports keyring plugins that enable internal server components and plugins to securely store sensitive information for later retrieval.

All MySQL distributions include a keyring plugin named `keyring_file`. MySQL Enterprise Edition distributions include additional keyring plugins. See Section 6.4.4, "The MySQL Keyring".

For more information about keyring plugins, see Section 29.2.4.12, "Writing Keyring Plugins".

**29.2.2 Plugin API Characteristics**

The server plugin API has these characteristics:

• All plugins have several things in common.
Each plugin has a name that it can be referred to in SQL statements, as well as other metadata such as an author and a description that provide other information. This information can be examined in the INFORMATION_SCHEMA.PLUGINS table or using the SHOW PLUGINS statement.

- The plugin framework is extensible to accommodate different kinds of plugins.

Although some aspects of the plugin API are common to all types of plugins, the API also permits type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Interfaces for several types of plugins exist, such as storage engines, full-text parser, and INFORMATION_SCHEMA tables. Others can be added.

- Plugins can expose information to users.

A plugin can implement system and status variables that are available through the SHOW VARIABLES and SHOW STATUS statements.

- The plugin API includes versioning information.

The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library’s version information to determine whether it supports the plugins in the library.

There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, a library containing a full-text parser plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- The plugin API implements security restrictions.

A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

- Plugins have access to server services.

The services interface exposes server functionality that plugins can access using ordinary function calls. For details, see Section 29.3, “MySQL Services for Plugins”.

In some respects, the server plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface. For example, UDFs had no versioning information. Also, the newer plugin interface eliminates the security issues of the older UDF interface. The older interface for writing nonplugin UDFs permitted libraries to be loaded from any directory searched by the system’s dynamic linker, and the symbols that identified the UDF library were relatively nonspecific.

The client plugin API has similar architectural characteristics, but client plugins have no direct access to the server the way server plugins do.

29.2.3 Plugin API Components

The server plugin implementation comprises several components.
Writing Plugins

SQL statements:

- **INSTALL PLUGIN** registers a plugin in the `mysql.plugin` table and loads the plugin code.
- **UNINSTALL PLUGIN** unregisters a plugin from the `mysql.plugin` table and unloads the plugin code.
- The **WITH PARSER** clause for full-text index creation associates a full-text parser plugin with a given **FULLTEXT** index.
- **SHOW PLUGINS** displays information about server plugins.

Command-line options and system variables:

- The **--plugin-load** option enables plugins to be loaded at server startup time.
- The **plugin_dir** system variable indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a **--plugin_dir=dir_name** option. `mysql_config --plugindir` displays the default plugin directory path name.

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

Plugin-related tables:

- The **INFORMATION_SCHEMA.PLUGINS** table contains plugin information.
- The **mysql.plugin** table lists each plugin that was installed with **INSTALL PLUGIN** and is required for plugin use. For new MySQL installations, this table is created during the installation process.

The client plugin implementation is simpler:

- For the **mysql_options()** C API function, the **MYSQL_DEFAULT_AUTH** and **MYSQL_PLUGIN_DIR** options enable client programs to load authentication plugins.
- There are C API functions that enable management of client plugins.

To examine how MySQL implements plugins, consult the following source files in a MySQL source distribution:

- In the **include/mysql** directory, **plugin.h** exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library. **plugin_xxx.h** files provide additional information that pertains to specific types of plugins. **client_plugin.h** contains information specific to client plugins.
- In the **sql** directory, **sql_plugin.h** and **sql_plugin.cc** comprise the internal plugin implementation. **sql_acl.cc** is where the server uses authentication plugins. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.
- In the **sql-common** directory, **client_plugin.h** implements the C API client plugin functions, and **client.c** implements client authentication support. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.

### 29.2.4 Writing Plugins

To create a plugin library, you must provide the required descriptor information that indicates what plugins the library file contains, and write the interface functions for each plugin.

Every server plugin must have a general descriptor that provides information to the plugin API, and a type-specific descriptor that provides information about the plugin interface for a given type of plugin.
The structure of the general descriptor is the same for all plugin types. The structure of the type-specific descriptor varies among plugin types and is determined by the requirements of what the plugin needs to do. The server plugin interface also enables plugins to expose status and system variables. These variables become visible through the `SHOW STATUS` and `SHOW VARIABLES` statements and the corresponding `INFORMATION_SCHEMA` tables.

For client-side plugins, the architecture is a bit different. Each plugin must have a descriptor, but there is no division into separate general and type-specific descriptors. Instead, the descriptor begins with a fixed set of members common to all client plugin types, and the common members are followed by any additional members required to implement the specific plugin type.

A server plugin contains code that becomes part of the running server, so when you write the plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins originally written for older servers. For information about these constraints, see Section 2.9.7, “MySQL Source-Configuration Options”, and Section 2.9.8, “Dealing with Problems Compiling MySQL”.

Client plugin writers should avoid dependencies on what symbols the calling application has because you cannot be sure what applications will use the plugin.

### 29.2.4.1 Overview of Plugin Writing

These conditions apply to plugin writing:

- MySQL header files used by plugins contain C++ code, so plugins must be compiled as C++ code.

- You must compile plugins with the entire server source code present, not just the libraries and header files.

- Compiled plugins are not compatible across server versions. For a plugin compiled against MySQL 8.0.\textunderscore X, there is no guarantee it will work with a MySQL 8.0.\textunderscore Y server without recompiling for MySQL 8.0.\textunderscore Y.

- Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled the calling application dynamically (not statically). For server plugins, this means that `mysql\_d` must be linked dynamically.

The following procedure provides an overview of the steps needed to create a plugin library. The next sections provide additional details on setting plugin data structures and writing specific types of plugins.

1. In the plugin source file, include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

   ```c
   #include <stdlib.h>
   #include <ctype.h>
   #include <mysql/plugin.h>
   ```

2. Set up the descriptor information for the plugin library file. For server plugins, write the library descriptor, which must contain the general plugin descriptor for each server plugin in the file. For more information, see Server Plugin Library and Plugin Descriptors. In addition, set up the type-specific descriptor for each server plugin in the library. Each plugin's general descriptor points to its type-specific descriptor.

   For client plugins, write the client descriptor. For more information, see Client Plugin Descriptors.

3. Write the plugin interface functions for each plugin. For example, each plugin's general plugin descriptor points to the initialization and deinitialization functions that the server should invoke when
Writing Plugins

it loads and unloads the plugin. The plugin's type-specific description may also point to interface functions.

4. For server plugins, set up the status and system variables, if there are any.

5. Compile the plugin library as a shared library and install it in the plugin directory. For more information, see Section 29.2.4.3, “Compiling and Installing Plugin Libraries”.

6. For server plugins, register the plugin with the server. For more information, see Section 5.6.1, “Installing and Uninstalling Plugins”.

7. Test the plugin to verify that it works properly.

29.2.4.2 Plugin Data Structures

A plugin library file includes descriptor information to indicate what plugins it contains.

If the plugin library contains any server plugins, it must include the following descriptor information:

• A library descriptor indicates the general server plugin API version number used by the library and contains a general plugin descriptor for each server plugin in the library. To provide the framework for this descriptor, invoke two macros from the plugin.h header file:

  mysql_declare_plugin(name)
  ... one or more server plugin descriptors here ...
  mysql_declare_plugin_end;

  The macros expand to provide a declaration for the API version automatically. You must provide the plugin descriptors.

  • Within the library descriptor, each general server plugin is described by a st_mysql_plugin structure. This plugin descriptor structure contains information that is common to every type of server plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin, and pointers to any status or system variables the plugin implements.

  • Each general server plugin descriptor within the library descriptor also contains a pointer to a type-specific plugin descriptor. The structure of the type-specific descriptors varies from one plugin type to another because each type of plugin can have its own API. A type-specific plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.

  The plugin library also contains the interface functions that are referenced by the general and type-specific descriptors for each plugin in the library.

If the plugin library contains a client plugin, it must include a descriptor for the plugin. The descriptor begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type. To provide the descriptor framework, invoke two macros from the client_plugin.h header file:

  mysql_declare_client_plugin(plugin_type)
  ... members common to all client plugins ...
  ... type-specific extra members ...
  mysql_end_client_plugin;

  The plugin library also contains any interface functions referenced by the client descriptor.

The mysql_declare_plugin() and mysql_declare_client_plugin() macros differ somewhat in how they can be invoked, which has implications for the contents of plugin libraries. The following guidelines summarize the rules:
Writing Plugins

- `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can both be used in the same source file, which means that a plugin library can contain both server and client plugins. However, each of `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can be used at most once.

- `mysql_declare_plugin()` permits multiple server plugin declarations, so a plugin library can contain multiple server plugins.

- `mysql_declare_client_plugin()` permits only a single client plugin declaration. To create multiple client plugins, separate plugin libraries must be used.

When a client program looks for a client plugin that is in a plugin library and not built into `libmysqlclient`, it looks for a file with a base name that is the same as the plugin name. For example, if a program needs to use a client authentication plugin named `auth_xxx` on a system that uses `.so` as the library suffix, it looks in the file named `auth_xxx.so`. (On macOS, the program looks first for `auth_xxxx.dylib`, then for `auth_xxxx.so`.) For this reason, if a plugin library contains a client plugin, the library must have the same base name as that plugin.

The same is not true for a library that contains server plugins. The `--plugin-load` option and the `INSTALL PLUGIN` statement provide the library file name explicitly, so there need be no explicit relationship between the library name and the name of any server plugins it contains.

Server Plugin Library and Plugin Descriptors

Every plugin library that contains server plugins must include a library descriptor that contains the general plugin descriptor for each server plugin in the file. This section discusses how to write the library and general descriptors for server plugins.

The library descriptor must define two symbols:

- `_mysql_plugin_interface_version_` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.

- `_mysql_plugin_declarations_` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each server plugin in the library.

If the server does not find those two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The conventional way to define the two required symbols is by using the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```c
mysql_declare_plugin(name)
  ... one or more server plugin descriptors here ... 
mysql_declare_plugin_end;
```

Each server plugin must have a general descriptor that provides information to the server plugin API. The general descriptor has the same structure for all plugin types. The `st_mysql_plugin` structure in the `plugin.h` file defines this descriptor:

```c
struct st_mysql_plugin
{
  int type;             /* the plugin type (a MYSQL_XXX_PLUGIN value) */
  void *info;           /* pointer to type-specific plugin descriptor */
  const char *name;     /* plugin name */
  const char *author;   /* plugin author (for I_S.PLUGINS) */
  const char *descr;    /* general descriptive text (for I_S.PLUGINS) */
  int license;          /* the plugin license (PLUGIN_LICENSE_XXX) */
};
```
Writing Plugins

The `st_mysql_plugin` descriptor structure members are used as follows. char * members should be specified as null-terminated strings.

- **type**: The plugin type. This must be one of the plugin-type values from `plugin.h`:

```c
#define MYSQL_UDF_PLUGIN 0 /* User-defined function */
#define MYSQL_STORAGE_ENGINE_PLUGIN 1 /* Storage Engine */
#define MYSQL_FTPARSER_PLUGIN 2 /* Full-text parser plugin */
#define MYSQL_DAEMON_PLUGIN 3 /* The daemon/raw plugin type */
#define MYSQL_INFORMATION_SCHEMA_PLUGIN 4 /* The I_S plugin type */
#define MYSQL_AUDIT_PLUGIN 5 /* The Audit plugin type */
#define MYSQL_REPLICATION_PLUGIN 6 /* The replication plugin type */
#define MYSQL_AUTHENTICATION_PLUGIN 7 /* The authentication plugin type */
...```

For example, for a full-text parser plugin, the type value is `MYSQL_FTPARSER_PLUGIN`.

- **info**: A pointer to the type-specific descriptor for the plugin. This descriptor's structure depends on the particular type of plugin, unlike that of the general plugin descriptor structure. For version-control purposes, the first member of the type-specific descriptor for every plugin type is expected to be the interface version for the type. This enables the server to check the type-specific version for every plugin no matter its type. Following the version number, the descriptor includes any other members needed, such as callback functions and other information needed by the server to invoke the plugin properly. Later sections on writing particular types of server plugins describe the structure of their type-specific descriptors.

- **name**: A string that gives the plugin name. This is the name that will be listed in the `mysql.plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`, or with the `--plugin-load` option. The name is also visible in the `INFORMATION_SCHEMA.PLUGINS` table or the output from `SHOW PLUGINS`.

The plugin name should not begin with the name of any server option. If it does, the server will fail to initialize it. For example, the server has a `--socket` option, so you should not use a plugin name such as `socket`, `socket_plugin`, and so forth.

- **author**: A string naming the plugin author. This can be whatever you like.

- **desc**: A string that provides a general description of the plugin. This can be whatever you like.

- **license**: The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.

- **init**: A once-only initialization function, or `NULL` if there is no such function. The server executes this function when it loads the plugin, which happens for `INSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server startup. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.

- **deinit**: A once-only deinitialization function, or `NULL` if there is no such function. The server executes this function when it unloads the plugin, which happens for `UNINSTALL PLUGIN` or, for plugins listed
Writing Plugins

in the `mysql.plugin` table, at server shutdown. The function takes one argument that points to the
internal structure used to identify the plugin. It returns zero for success and nonzero for failure.

• **version**: The plugin version number. When the plugin is installed, this value can be retrieved from the
`INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write
the value as a hex constant, the format is `0xMMNN`, where `MM` and `NN` are the major and minor numbers,
respectively. For example, `0x0302` represents version 3.2.

• **status_vars**: A pointer to a structure for status variables associated with the plugin, or `NULL` if there
are no such variables. When the plugin is installed, these variables are displayed in the output of the
`SHOW STATUS` statement.

  The `status_vars` member, if not `NULL`, points to an array of `st_mysql_show_var` structures that
describe status variables. See `Server Plugin Status and System Variables`.

• **system_vars**: A pointer to a structure for system variables associated with the plugin, or `NULL` if there
are no such variables. These options and system variables can be used to help initialize variables
within the plugin. When the plugin is installed, these variables are displayed in the output of the `SHOW
VARIABLES` statement.

  The `system_vars` member, if not `NULL`, points to an array of `st_mysql_sys_var` structures that
describe system variables. See `Server Plugin Status and System Variables`.

• **__reserved1**: A placeholder for the future. It should be set to `NULL`.

• **flags**: Plugin flags. Individual bits correspond to different flags. The value should be set to the OR of
the applicable flags. These flags are available:

```c
#define PLUGIN_OPT_NO_INSTALL   1UL   /* Not dynamically loadable */
#define PLUGIN_OPT_NO_UNINSTALL 2UL   /* Not dynamically unloadable */
#define PLUGIN_OPT_ALLOW_EARLY  4UL   /* allow --early-plugin-load */
```

The flags have the following meanings when enabled:

• **PLUGIN_OPT_NO_INSTALL**: The plugin cannot be loaded at runtime with the `INSTALL PLUGIN`
  statement. This is appropriate for plugins that must be loaded at server startup with the
  `--plugin-load`, `--plugin-load-add`, or `--early-plugin-load` option.

• **PLUGIN_OPT_NO_UNINSTALL**: The plugin cannot be unloaded at runtime with the `UNINSTALL
  PLUGIN` statement.

• **PLUGIN_OPT_ALLOW_EARLY**: The plugin can be loaded early in the server startup sequence with the
  `--early-plugin-load` option. This flag has no effect on whether a plugin can be loaded at server
  startup with the `--plugin-load` or `--plugin-load-add` option, or at runtime with the `INSTALL
  PLUGIN` statement.

  This flag was added in MySQL 8.0.17. All plugins compiled using MySQL distributions prior to
  8.0.17 do not have this flag set. When loading these into pre-8.0.17 servers this does not matter, but
  attempts to use `--early-plugin-load` to load plugin binaries compiled using pre-8.0.17 MySQL
distributions into a 8.0.17 or higher server will fail. The plugins must be recompiled against MySQL
  8.0.17 or higher.

  The server invokes the `init` and `deinit` functions in the general plugin descriptor only when loading
  and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL
  statement causes the plugin to be invoked.

  For example, the descriptor information for a library that contains a single full-text parser plugin named
  `simple_parser` looks like this:
For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

`plugin.h` defines the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros like this:

```c
#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) 
  MYSQL_PLUGIN_EXPORT int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION; 
  MYSQL_PLUGIN_EXPORT int PSIZE= sizeof(struct st_mysql_plugin); 
  MYSQL_PLUGIN_EXPORT struct st_mysql_plugin DECLS[] = { 
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) 
  MYSQL_PLUGIN_EXPORT int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION; 
  MYSQL_PLUGIN_EXPORT int _mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin); 
  MYSQL_PLUGIN_EXPORT struct st_mysql_plugin _mysql_plugin_declarations_[] = { 
#define mysql_declare_plugin(NAME) 
  __MYSQL_DECLARE_PLUGIN(NAME, 
  builtin_ ## NAME ## _plugin_interface_version, 
  builtin_ ## NAME ## _sizeof_struct_st_plugin, 
  builtin_ ## NAME ## _plugin)
#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0,0,0,0,0})
#endif
```

**Note**

Those declarations define the `_mysql_plugin_interface_version_` symbol only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that `-DMYSQL_DYNAMIC_PLUGIN` must be provided as part of the compilation command to build the plugin as a shared library.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version_` and `_mysql_plugin_declarations_`):

```c
int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION; 
int _mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin); 
struct st_mysql_plugin _mysql_plugin_declarations_[] = { 
  MYSQL_FTPARSER_PLUGIN, /* type */ 
  &simple_parser_descriptor, /* descriptor */ 
  "simple_parser", /* name */ 
  "Oracle Corporation", /* author */ 
  "Simple Full-Text Parser", /* description */ 
  PLUGIN_LICENSE_GPL, /* plugin license */ 
  simple_parser_plugin_init, /* init function (when loaded) */ 
  simple_parser_plugin_deinit, /* deinit function (when unloaded) */ 
  0x0001, /* version */ 
  simple_status, /* status variables */ 
  simple_system_variables, /* system variables */ 
  NULL, 0
}
```
Writing Plugins

```c

simple_parser_plugin_init, /* init function (when loaded) */
simple_parser_plugin_deinit, /* deinit function (when unloaded) */
0x0001, /* version */
simple_status, /* status variables */
simple_system_variables, /* system variables */
NULL,
0,
}, {0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}
};

The preceding example declares a single plugin in the general descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin()` and `mysql_declare_plugin_end`, separated by commas.

MySQL server plugins must be compiled as C++ code. One C++ feature that you should not use is nonconstant variables to initialize global structures. Members of structures such as the `st_mysql_plugin` structure should be initialized only with constant variables. The `simple_parser` descriptor shown earlier is permissible in a C++ plugin because it satisfies that requirement:

```c

mysql_declare_plugin(ftexample)
{
  MYSQL_FTPARSER_PLUGIN, /* type */
  &simple_parser_descriptor, /* descriptor */
  "simple_parser", /* name */
  "Oracle Corporation", /* author */
  "Simple Full-Text Parser", /* description */
  PLUGIN_LICENSE_GPL, /* plugin license */
  simple_parser_plugin_init, /* init function (when loaded) */
  simple_parser_plugin_deinit, /* deinit function (when unloaded) */
  0x0001, /* version */
  simple_status, /* status variables */
  simple_system_variables, /* system variables */
  NULL,
  0,
}
mysql_declare_plugin_end;
```

Here is another valid way to write the general descriptor. It uses constant variables to indicate the plugin name, author, and description:

```c

const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "Oracle Corporation";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin(ftexample)
{
  MYSQL_FTPARSER_PLUGIN, /* type */
  &simple_parser_descriptor, /* descriptor */
  simple_parser_name, /* name */
  simple_parser_author, /* author */
  simple_parser_description, /* description */
  PLUGIN_LICENSE_GPL, /* plugin license */
  simple_parser_plugin_init, /* init function (when loaded) */
  simple_parser_plugin_deinit, /* deinit function (when unloaded) */
  0x0001, /* version */
  simple_status, /* status variables */
  simple_system_variables, /* system variables */
  NULL,
  0,
}
mysql_declare_plugin_end;
```

However, the following general descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:
typedef struct
{
    const char *name;
    const char *author;
    const char *description;
} plugin_info;

plugin_info parser_info = {
    "simple_parser",
    "Oracle Corporation",
    "Simple Full-Text Parser"
};

mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,      /* type                            */
    &simple_parser_descriptor,  /* descriptor                      */
    parser_info.name,           /* name                            */
    parser_info.author,         /* author                          */
    parser_info.description,    /* description                     */
    PLUGIN_LICENSE_GPL,         /* plugin license                  */
    simple_parser_plugin_init,  /* init function (when loaded)     */
    simple_parser_plugin_deinit,/* deinit function (when unloaded) */
    0x0001,                     /* version                         */
    simple_status,              /* status variables                */
    simple_system_variables,    /* system variables                */
    NULL,
    0
}
mysql_declare_plugin_end;

Server Plugin Status and System Variables

The server plugin interface enables plugins to expose status and system variables using the
status_vars and system_vars members of the general plugin descriptor.

The status_vars member of the general plugin descriptor, if not 0, points to an array of
st_mysql_show_var structures, each of which describes one status variable, followed by a structure with
all members set to 0. The st_mysql_show_var structure has this definition:

struct st_mysql_show_var {
    const char *name;
    char *value;
    enum enum_mysql_show_type type;
};

The following table shows the permissible status variable type values and what the corresponding
variable should be.

Table 29.1 Server Plugin Status Variable Types

<table>
<thead>
<tr>
<th>Variable Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHOW_BOOL</td>
<td>Pointer to a boolean variable</td>
</tr>
<tr>
<td>SHOW_INT</td>
<td>Pointer to an integer variable</td>
</tr>
<tr>
<td>SHOW_LONG</td>
<td>Pointer to a long integer variable</td>
</tr>
<tr>
<td>SHOW_LONGLONG</td>
<td>Pointer to a longlong integer variable</td>
</tr>
<tr>
<td>SHOW_CHAR</td>
<td>A string</td>
</tr>
<tr>
<td>SHOW_CHAR_PTR</td>
<td>Pointer to a string</td>
</tr>
<tr>
<td>SHOW_ARRAY</td>
<td>Pointer to another st_mysql_show_var array</td>
</tr>
</tbody>
</table>

4936
Writing Plugins

<table>
<thead>
<tr>
<th>Variable Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHOW_FUNC</td>
<td>Pointer to a function</td>
</tr>
<tr>
<td>SHOW_DOUBLE</td>
<td>Pointer to a double</td>
</tr>
</tbody>
</table>

For the **SHOW_FUNC** type, the function is called and fills in its **out** parameter, which then provides information about the variable to be displayed. The function has this signature:

```c
#define SHOW_VAR_FUNC_BUFF_SIZE 1024
typedef int (*mysql_show_var_func) (void *thd,
                      struct st_mysql_show_var *out,
                      char *buf);
```

The **system_vars** member, if not 0, points to an array of **st_mysql_sys_var** structures, each of which describes one system variable (which can also be set from the command-line or configuration file), followed by a structure with all members set to 0. The **st_mysql_sys_var** structure is defined as follows:

```c
struct st_mysql_sys_var {
    int flags;
    const char *name, *comment;
    int (*check)(THD*, struct st_mysql_sys_var *, void*, st_mysql_value*);
    void (*update)(THD*, struct st_mysql_sys_var *, void*, const void*);
};
```

Additional fields are append as required depending upon the flags.

For convenience, a number of macros are defined that make creating new system variables within a plugin much simpler.

Throughout the macros, the following fields are available:

- **name**: An unquoted identifier for the system variable.
- **varname**: The identifier for the static variable. Where not available, it is the same as the **name** field.
- **opt**: Additional use flags for the system variable. The following table shows the permissible flags.

### Table 29.2 Server Plugin System Variable Flags

<table>
<thead>
<tr>
<th>Flag Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PLUGIN_VAR_READONLY</td>
<td>The system variable is read only</td>
</tr>
<tr>
<td>PLUGIN_VAR_NOSYSVAR</td>
<td>The system variable is not user visible at runtime</td>
</tr>
<tr>
<td>PLUGIN_VAR_NOCMDOPT</td>
<td>The system variable is not configurable from the command line</td>
</tr>
<tr>
<td>PLUGIN_VAR_NOCMDARG</td>
<td>No argument is required at the command line (typically used for boolean variables)</td>
</tr>
<tr>
<td>PLUGIN_VAR_RQCMDARG</td>
<td>An argument is required at the command line (this is the default)</td>
</tr>
<tr>
<td>PLUGIN_VAR_OPCMDARG</td>
<td>An argument is optional at the command line</td>
</tr>
<tr>
<td>PLUGIN_VAR_MEMALLOC</td>
<td>Used for string variables; indicates that memory is to be allocated for storage of the string</td>
</tr>
</tbody>
</table>

- **comment**: A descriptive comment to be displayed in the server help message. **NULL** if this variable is to be hidden.
- **check**: The check function, **NULL** for default.
- **update**: The update function, **NULL** for default.
• **default**: The variable default value.

• **minimum**: The variable minimum value.

• **maximum**: The variable maximum value.

• **blocksize**: The variable block size. When the value is set, it is rounded to the nearest multiple of blocksize.

A system variable may be accessed either by using the static variable directly or by using the `SYSVAR()` accessor macro. The `SYSVAR()` macro is provided for completeness. Usually it should be used only when the code cannot directly access the underlying variable.

For example:

```c
static int my_foo;
static MYSQL_SYSVAR_INT(foo_var, my_foo,
                        PLUGIN_VAR_RQCMDARG, "foo comment",
                        NULL, NULL, 0, 0, INT_MAX, 0);
...
SYSVAR(foo_var)= value;
value= SYSVAR(foo_var);
my_foo= value;
value= my_foo;
```

Session variables may be accessed only through the `THDVAR()` accessor macro. For example:

```c
static MYSQL_THDVAR_BOOL(some_flag,
                         PLUGIN_VAR_NOCMDARG, "flag comment",
                         NULL, NULL, FALSE);
...
if (THDVAR(thd, some_flag))
{
    do_something();
    THDVAR(thd, some_flag)= FALSE;
}
```

All global and session system variables must be published to `mysqld` before use. This is done by constructing a NULL-terminated array of the variables and linking to it in the plugin public interface. For example:

```c
static struct st_mysql_sys_var *my_plugin_vars[] = {
    MYSQL_SYSVAR(foo_var),
    MYSQL_SYSVAR(some_flag),
    NULL
};
mysql_declare_plugin(fooplug)
{
    MYSQL_..._PLUGIN,
    &plugin_data,
    "fooplug",
    "foo author",
    "This does foo!",
    PLUGIN_LICENSE_GPL,
    foo_init,
    foo_fini,
    0x0001,
    NULL,
    my_plugin_vars,
    NULL,
    0
}
mysql_declare_plugin_end;
```
The following convenience macros enable you to declare different types of system variables:

- **Boolean system variables of type** `bool`, which is a 1-byte boolean. (0 = `false`, 1 = `true`)

  ```c
  MYSQL_THDVAR_BOOL(name, opt, comment, check, update, default)
  MYSQL_SYSVAR_BOOL(name, varname, opt, comment, check, update, default)
  ```

- **String system variables of type** `char*`, which is a pointer to a null-terminated string.

  ```c
  MYSQL_THDVAR_STR(name, opt, comment, check, update, default)
  MYSQL_SYSVAR_STR(name, varname, opt, comment, check, update, default)
  ```

- **Integer system variables, of which there are several varieties.**
  - **An** `int` **system variable, which is typically a 4-byte signed word.**

    ```c
    MYSQL_THDVAR_INT(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_INT(name, varname, opt, comment, check, update, default, minimum, maximum, blocksize)
    ```

  - **An** `unsigned int` **system variable, which is typically a 4-byte unsigned word.**

    ```c
    MYSQL_THDVAR_UINT(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_UINT(name, varname, opt, comment, check, update, default, minimum, maximum, blocksize)
    ```

  - **A** `long` **system variable, which is typically either a 4- or 8-byte signed word.**

    ```c
    MYSQL_THDVAR_LONG(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_LONG(name, varname, opt, comment, check, update, default, minimum, maximum, blocksize)
    ```

  - **An** `unsigned long` **system variable, which is typically either a 4- or 8-byte unsigned word.**

    ```c
    MYSQL_THDVAR_ULONG(name, opt, comment, check, update, default, min, max, blk)
    MYSQL_SYSVAR_ULONG(name, varname, opt, comment, check, update, default, minimum, maximum, blocksize)
    ```

  - **A** `long long` **system variable, which is typically an 8-byte signed word.**

    ```c
    MYSQL_THDVAR_LONGLONG(name, opt, comment, check, update, default, minimum, maximum, blocksize)
    MYSQL_SYSVAR_LONGLONG(name, varname, opt, comment, check, update, default, minimum, maximum, blocksize)
    ```

  - **An** `unsigned long long` **system variable, which is typically an 8-byte unsigned word.**

    ```c
    MYSQL_THDVAR_ULONGLONG(name, opt, comment, check, update, default, minimum, maximum, blocksize)
    MYSQL_SYSVAR_ULONGLONG(name, varname, opt, comment, check, update, default, minimum, maximum, blocksize)
    ```

  - **A** `double` **system variable, which is typically an 8-byte signed word.**

    ```c
    MYSQL_THDVAR_DOUBLE(name, opt, comment, check, update, default, minimum, maximum, blocksize)
    MYSQL_SYSVAR_DOUBLE(name, varname, opt, comment, check, update, default, minimum, maximum, blocksize)
    ```

  - **An** `unsigned long` **system variable, which is typically either a 4- or 8-byte unsigned word. The range of possible values is an ordinal of the number of elements in the typelib, starting from 0.**

    ```c
    MYSQL_THDVAR_ENUM(name, opt, comment, check, update, default, typelib)
    MYSQL_SYSVAR_ENUM(name, varname, opt, comment, check, update, default, minimum, maximum, blocksize)
    ```
Writing Plugins

- An unsigned long long system variable, which is typically an 8-byte unsigned word. Each bit represents an element in the typelib.

MySQL_THDVAR_SET(name, opt, comment, check, update, default, typelib)
MySQL_SYSVAR_SET(name, varname, opt, comment, check, update, default, typelib)

Internally, all mutable and plugin system variables are stored in a HASH structure.

Display of the server command-line help text is handled by compiling a DYNAMIC_ARRAY of all variables relevant to command-line options, sorting them, and then iterating through them to display each option.

When a command-line option has been handled, it is then removed from the argv by the handle_option() function (my_getopt.c); in effect, it is consumed.

The server processes command-line options during the plugin installation process, immediately after the plugin has been successfully loaded but before the plugin initialization function has been called.

Plugins loaded at runtime do not benefit from any configuration options and must have usable defaults.

Plugins should consider the thd parameter to be read only.

Client Plugin Descriptors

Each client plugin must have a descriptor that provides information to the client plugin API. The descriptor structure begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type.

The st_mysql_client_plugin structure in the client_plugin.h file defines a “generic” descriptor that contains the common members:

```c
struct st_mysql_client_plugin
{
    int type;
    unsigned int interface_version;
    const char *name;
    const char *author;
    const char *desc;
    unsigned int version[3];
    const char *license;
    void *mysql_api;
    int (*init)(char *, size_t, int, va_list);
    int (*deinit());
    int (*options)(const char *option, const void *);
};
```

The common st_mysql_client_plugin descriptor structure members are used as follows. char * members should be specified as null-terminated strings.

- **type**: The plugin type. This must be one of the plugin-type values from client_plugin.h, such as MYSQL_CLIENT_AUTHENTICATION_PLUGIN.
- **interface_version**: The plugin interface version. For example, this is MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION for an authentication plugin.
- **name**: A string that gives the plugin name. This is the name by which you refer to the plugin when you call mysql_options() with the MYSQL_DEFAULT_AUTH option or specify the --default-auth option to a MySQL client program.
Writing Plugins

- **author**: A string naming the plugin author. This can be whatever you like.
- **desc**: A string that provides a general description of the plugin. This can be whatever you like.
- **version**: The plugin version as an array of three integers indicating the major, minor, and teeny versions. For example, \(1,2,3\) indicates version 1.2.3.
- **license**: A string that specifies the license type.
- **mysql_api**: For internal use. Specify it as NULL in the plugin descriptor.
- **init**: A once-only initialization function, or NULL if there is no such function. The client library executes this function when it loads the plugin. The function returns zero for success and nonzero for failure.

  The **init** function uses its first two arguments to return an error message if an error occurs. The first argument is a pointer to a char buffer, and the second argument indicates the buffer length. Any message returned by the **init** function must be null-terminated, so the maximum message length is the buffer length minus one. The next arguments are passed to mysql_load_plugin(). The first indicates how many more arguments there are (0 if none), followed by any remaining arguments.

- **deinit**: A once-only deinitialization function, or NULL if there is no such function. The client library executes this function when it unloads the plugin. The function takes no arguments. It returns zero for success and nonzero for failure.

- **options**: A function for handling options passed to the plugin, or NULL if there is no such function. The function takes two arguments representing the option name and a pointer to its value. The function returns zero for success and nonzero for failure.

For a given client plugin type, the common descriptor members may be followed by additional members necessary to implement plugins of that type. For example, the st_mysql_client_plugin_AUTHENTICATION structure for authentication plugins has a function at the end that the client library calls to perform authentication.

To declare a plugin, use the **mysql_declare_client_plugin()** and **mysql_end_client_plugin** macros:

```c
mysql_declare_client_plugin(plugin_type)
    ... members common to all client plugins ...
    ... type-specific extra members ...
mysql_end_client_plugin;
```

Do not specify the **type** or **interface_version** member explicitly. The **mysql_declare_client_plugin()** macro uses the **plugin_type** argument to generate their values automatically. For example, declare an authentication client plugin like this:

```c
mysql_declare_client_plugin(AUTHENTICATION)
    "my_auth_plugin",
    "Author Name",
    "My Client Authentication Plugin",
    \{1,0,0\},
    "GPL",
    NULL,
    my_auth_init,
    my_auth_deinit,
    my_auth_options,
    my_auth_main
mysql_end_client_plugin;
```

This declaration uses the AUTHENTICATION argument to set the **type** and **interface_version** members to MYSQL_CLIENT_AUTHENTICATION_PLUGIN and MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION.
Depending on the plugin type, the descriptor may have other members following the common members. For example, for an authentication plugin, there is a function (my_auth_main() in the descriptor just shown) that handles communication with the server. See Section 29.2.4.9, “Writing Authentication Plugins”.

Normally, a client program that supports the use of authentication plugins causes a plugin to be loaded by calling mysql_options() to set the MYSQL_DEFAULT_AUTH and MYSQL_PLUGIN_DIR options:

```c
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";
/* ... process command-line options ... */
mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept --plugin-dir and --default-auth options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an st_mysql_client_plugin argument. See Section 28.6.16, “C API Client Plugin Functions”.

### 29.2.4.3 Compiling and Installing Plugin Libraries

After your plugin is written, you must compile it and install it. The procedure for compiling shared objects varies from system to system. If you build your library using CMake, it should be able to generate the correct compilation commands for your system. If the library is named somepluglib, you should end up with a shared library file that has a name something like somepluglib.so. (The .so file name suffix might differ on your system.)

To use CMake, you'll need to set up the configuration files to enable the plugin to be compiled and installed. Use the plugin examples under the plugin directory of a MySQL source distribution as a guide.

Create `CMakeLists.txt`, which should look something like this:

```cmake
MYSQL_ADD_PLUGIN(somepluglib somepluglib.c
  MODULE_ONLY MODULE_OUTPUT_NAME "somepluglib")
```

When CMake generates the Makefile, it should take care of passing to the compilation command the `-DMYSQL_DYNAMIC_PLUGIN` flag, and passing to the linker the `-lmysqlservices` flag, which is needed to link in any functions from services provided through the plugin services interface. See Section 29.3, “MySQL Services for Plugins”.

Run CMake, then run make:

```shell
shell> cmake .
shell> make
```

If you need to specify configuration options to CMake, see Section 2.9.7, “MySQL Source-Configuration Options”, for a list. For example, you might want to specify `CMAKE_INSTALL_PREFIX` to indicate the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with SHOW VARIABLES:

```sql
mysql> SHOW VARIABLES LIKE 'basedir';
+---------------+------------------+
| Variable_name | Value            |
+---------------+------------------+
| base          | /usr/local/mysql |
+---------------+------------------+
```

The location of the plugin directory where you should install the library is given by the plugin_dir system variable. For example:
To install the plugin library, use `make`:

```shell
make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions permit it to be executed by the server.

### 29.2.4.4 Writing Full-Text Parser Plugins

MySQL supports server-side full-text parser plugins with **MyISAM** and **InnoDB**. For introductory information about full-text parser plugins, see [Full-Text Parser Plugins](#).

A full-text parser plugin can be used to replace or modify the built-in full-text parser. This section describes how to write a full-text parser plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are nonempty runs of whitespace characters.

The instructions use the source code in the *plugin/fulltext* directory of MySQL source distributions, so change location into that directory. The following procedure describes how the plugin library is created:

1. To write a full-text parser plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

   ```c
   #include <mysql/plugin.h>
   ```

   *plugin.h* defines the **MYSQL_FTPARSER_PLUGIN** server plugin type and the data structures needed to declare the plugin.

2. Set up the library descriptor for the plugin library file.

   This descriptor contains the general plugin descriptor for the server plugin. For a full-text parser plugin, the type must be **MYSQL_FTPARSER_PLUGIN**. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

   For example, the library descriptor for a library that contains a single full-text parser plugin named `simple_parser` looks like this:

   ```c
   mysql_declare_plugin(ftexample)
   {
     MYSQL_FTPARSER_PLUGIN, /* type */
     &simple_parser_descriptor, /* descriptor */
     "simple_parser", /* name */
     "Oracle Corporation", /* author */
     "Simple Full-Text Parser", /* description */
     PLUGIN_LICENSE_GPL, /* plugin license */
     simple_parser_plugin_init, /* init function (when loaded) */
     simple_parser_plugin_deinit, /* deinit function (when unloaded) */
     0x0001, /* version */
     simple_status, /* status variables */
     simple_system_variables, /* system variables */
     NULL,
     0
   }
   mysql_declare_plugin_end;
   ```
The name member (simple_parser) indicates the name to use for references to the plugin in statements such as INSTALL PLUGIN or UNINSTALL PLUGIN. This is also the name displayed by SHOW PLUGINS or INFORMATION_SCHEMA.PLUGINS.

For more information, see Server Plugin Library and Plugin Descriptors.

3. Set up the type-specific plugin descriptor.

Each general plugin descriptor in the library descriptor points to a type-specific descriptor. For a full-text parser plugin, the type-specific descriptor is an instance of the st_mysql_ftparser structure in the plugin.h file:

```c
struct st_mysql_ftparser {
    int interface_version;
    int (*parse)(MYSQL_FTPARSER_PARAM *param);
    int (*init)(MYSQL_FTPARSER_PARAM *param);
    int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};
```

As shown by the structure definition, the descriptor has an interface version number and contains pointers to three functions.

The interface version number is specified using a symbol, which is in the form: MYSQL_xxx_INTERFACE_VERSION. For full-text parser plugins, the symbol is MYSQL_FTPARSER_INTERFACE_VERSION. In the source code, you will find the actual interface version number for the full-text parser plugin defined in include/mysql/plugin_ftparser.h. The current interface version number is 0x0101.

The init and deinit members should point to a function or be set to 0 if the function is not needed. The parse member must point to the function that performs the parsing.

In the simple_parser declaration, that descriptor is indicated by &simple_parser_descriptor. The descriptor specifies the version number for the full-text plugin interface (as given by MYSQL_FTPARSER_INTERFACE_VERSION), and the plugin's parsing, initialization, and deinitialization functions:

```c
static struct st_mysql_ftparser simple_parser_descriptor=
{
    MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version      */
    simple_parser_parse,              /* parsing function       */
    simple_parser_init,               /* parser init function   */
    simple_parser_deinit              /* parser deinit function */
};
```

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.

- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no FULLTEXT index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)
**Writing Plugins**

The plugin declaration in the general plugin descriptor has `init` and `deinit` members that point to initialization and deinitialization functions, and so does the type-specific plugin descriptor to which it points. However, these pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the general plugin descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the type-specific plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```c
typedef struct st_mysql_ftparser_param
{
    int (*mysql_parse)(struct st_mysql_ftparser_param *,
                        char *doc, int doc_len);
    int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                          char *word, int word_len,
                          MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
    void *ftparser_state;
    void *mysql_ftparam;
    struct charset_info_st *cs;
    char *doc;
    int length;
    int flags;
    enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

The structure members are used as follows:

- **mysql_parse**: A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.
  
  The first parameter for this callback function should be the `param` value itself:

  ```c
  param->mysql_parse(param, ...);
  ```

  A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- **mysql_add_word**: A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.
  
  The first parameter for this callback function should be the `param` value itself:

  ```c
  param->mysql_add_word(param, ...);
  ```

- **ftparser_state**: This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.
Writing Plugins

• **mysql_ftparam:** This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

• **cs:** A pointer to information about the character set of the text, or 0 if no information is available.

• **doc:** A pointer to the text to be parsed.

• **length:** The length of the text to be parsed, in bytes.

• **flags:** Parser flags. This is zero if there are no special flags. The only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

  This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

• **mode:** The parsing mode. This value will be one of the following constants:

  • **MYSQL_FTPARSER_SIMPLE_MODE:** Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.

  • **MYSQL_FTPARSER_WITH_STOPWORDS:** Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.

  • **MYSQL_FTPARSER_FULL_BOOLEAN_INFO:** Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens using the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

  **Note**

  For **MyISAM**, the stopword list and `ft_min_word_len` and `ft_max_word_len` are checked inside the tokenizer. For **InnoDB**, the stopword list and equivalent word length variable settings (`innodb_ft_min_token_size` and `innodb_ft_max_token_size`) are checked outside of the tokenizer. As a result, InnoDB plugin parsers do not need to check the stopword list, `innodb_ft_min_token_size`, or `innodb_ft_max_token_size`. Instead, it is recommended that all words be returned to **InnoDB**. However, if you want to check stopwords within your plugin parser, use **MYSQL_FTPARSER_SIMPLE_MODE**, which is for full-text search index and natural language search. For **MYSQL_FTPARSER_WITH_STOPWORDS** and **MYSQL_FTPARSER_FULL_BOOLEAN_INFO** modes, it is recommended that all words be returned to InnoDB including stopwords, in case of phrase searches.

  If the parser is called in boolean mode, the `param->mode` value will be **MYSQL_FTPARSER_FULL_BOOLEAN_INFO**. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

  ```
  typedef struct st_mysql_ftparser_boolean_info
  ```
The parser should fill in the structure members as follows:

- **type**: The token type. The following table shows the permissible types.

<table>
<thead>
<tr>
<th>Token Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>FT_TOKEN_EOF</td>
<td>End of data</td>
</tr>
<tr>
<td>FT_TOKEN_WORD</td>
<td>A regular word</td>
</tr>
<tr>
<td>FT_TOKEN_LEFT_PAREN</td>
<td>The beginning of a group or subexpression</td>
</tr>
<tr>
<td>FT_TOKEN_RIGHT_PAREN</td>
<td>The end of a group or subexpression</td>
</tr>
<tr>
<td>FT_TOKEN_STOPWORD</td>
<td>A stopword</td>
</tr>
</tbody>
</table>

- **yesno**: Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.

- **weight_adjust**: A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at Section 12.9.2, "Boolean Full-Text Searches", that use the < and > operators illustrate how weighting works.

- **wasign**: The sign of the weighting factor. A negative value acts like the ~ boolean-search operator, which causes the word's contribution to the relevance to be negative.

- **trunc**: Whether matching should be done as if the boolean-mode * truncation operator had been given.

- **position**: Start position of the word in the document, in bytes. Used by InnoDB full-text search. For existing plugins that are called in boolean mode, support must be added for the position member.

Plugins should not use the prev and quot members of the MYSQL_FTPARSER_BOOLEAN_INFO structure.

---

**Note**

The plugin parser framework does not support:

- The @distance boolean operator.

- A leading plus sign (+) or minus sign (-) boolean operator followed by a space and then a word ('+ apple' or '- apple'). The leading plus or
minus sign must be directly adjacent to the word, for example: `+apple` or `-apple`.

For information about boolean full-text search operators, see Section 12.9.2, “Boolean Full-Text Searches”.

4. Set up the plugin interface functions.

The general plugin descriptor in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```c
static int simple_parser_plugin_init(void *arg __attribute__((unused)))
{
    return(0);
}

static int simple_parser_plugin_deinit(void *arg __attribute__((unused)))
{
    return(0);
}
```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```c
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param __attribute__((unused)))
{
    return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param __attribute__((unused)))
{
    return(0);
}
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers nonempty runs of whitespace characters to be words, so it identifies words like this:

```c
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
    char *end, *start, *docend = param->doc + param->length;

    for (end = start = param->doc; end++)
    {
        if (end == docend)
        {
            if (end > start)
            {
                add_word(param, start, end - start);
            }
            break;
        }
```
As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```c
static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
    MYSQL_FTPARSER_BOOLEAN_INFO bool_info= {
        FT_TOKEN_WORD, 0, 0, 0, 0, 0, ' ', 0
    };
    param->mysql_add_word(param, word, len, &bool_info);
}
```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described earlier in the discussion of the `st_mysql_ftparser_boolean_info` structure.

5. Set up the status variables. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```c
long number_of_calls= 0;
struct st_mysql_show_var simple_status[]=
{
    { "simple_parser_static", (char *)"just a static text", SHOW_CHAR},
    { "simple_parser_called", (char *)&number_of_calls, SHOW_LONG},
};
```

By using status variable names that begin with the plugin name, you can easily display the variables for a plugin with `SHOW STATUS`:

```sql
mysql> SHOW STATUS LIKE 'simple_parser%';
+----------------------+--------------------+
| Variable_name        | Value              |
+----------------------+--------------------+
| simple_parser_static | just a static text |
| simple_parser_called | 0                  |
+----------------------+--------------------+
```

6. To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `simple_parser` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `mypluglib.so` (the `.so` suffix might differ depending on your platform).
Writing Plugins

7. To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN simple_parser SONAME 'mypluglib.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

8. To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

9. Test the plugin to verify that it works properly.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
                    ->    FULLTEXT (c) WITH PARSER simple_parser
                    -> ) ENGINE=MyISAM;
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all nonwhitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
                    -> ('utf8mb4_0900_as_cs is a case-sensitive collation'),
                    -> ('I\'d like a case of oranges'),
                    -> ('this is sensitive information'),
                    -> ('another row'),
                    -> ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5  Duplicates: 0  Warnings: 0
```

```
mysql> SELECT c FROM t;
+--------------------------------------------------+
| c                                                |
+--------------------------------------------------+
| utf8mb4_0900_as_cs is a case-sensitive collation |
| I'd like a case of oranges                        |
| this is sensitive information                     |
| another row                                       |
| yet another row                                   |
+--------------------------------------------------+
5 rows in set (0.00 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+--------------------------+
| MATCH(c) AGAINST('case') |
+--------------------------+
|                        0 |
| 1.2968142032623         |
|                        0 |
|                        0 |
+--------------------------+
5 rows in set (0.00 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-------------------------------+
| MATCH(c) AGAINST('sensitive') |
+-------------------------------+
|                             0 |
|                             0 |
| 1.3253291845322             |
|                             0 |
+-------------------------------+
4950
```
Neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

### 29.2.4.5 Writing Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. This section describes how to write a daemon server plugin, using the example plugin found in the `plugin/daemon_example` directory of MySQL source distributions. That directory contains the `daemon_example.cc` source file for a daemon plugin named `daemon_example` that writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory.

To write a daemon plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_DAEMON_PLUGIN` server plugin type and the data structures needed to declare the plugin.

The `daemon_example.cc` file sets up the library descriptor as follows. The library descriptor includes a single general server plugin descriptor.

```
mysql_declare_plugin(daemon_example)
{
    MYSQL_DAEMON_PLUGIN,
    &daemon_example_plugin,
    "daemon_example",
    "Brian Aker",
    "Daemon example, creates a heartbeat beat file in mysql-heartbeat.log",
    PLUGIN_LICENSE_GPL,
    daemon_example_plugin_init, /* Plugin Init */
    daemon_example_plugin_deinit, /* Plugin Deinit */
    0x0100 /* 1.0 */,
    NULL, /* status variables */
    NULL, /* system variables */
    NULL, /* config options */
    0, /* flags */
}```
Writing Plugins

The name member (daemon_example) indicates the name to use for references to the plugin in statements such as INSTALL PLUGIN or UNINSTALL PLUGIN. This is also the name displayed by SHOW PLUGINS or INFORMATION_SCHEMA.PLUGINS.

The second member of the plugin descriptor, daemon_example_plugin, points to the type-specific daemon plugin descriptor. This structure consists only of the type-specific API version number:

```c
struct st_mysql_daemon daemon_example_plugin=
{ MYSQL_DAEMON_INTERFACE_VERSION  };
```

The type-specific structure has no interface functions. There is no communication between the server and the plugin, except that the server calls the initialization and deinitialization functions from the general plugin descriptor to start and stop the plugin:

- daemon_example_plugin_init() opens the heartbeat file and spawns a thread that wakes up periodically and writes the next message to the file.
- daemon_example_plugin_deinit() closes the file and performs other cleanup.

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, "Compiling and Installing Plugin Libraries". To make the library file available for use, install it in the plugin directory (the directory named by the plugin_dir system variable). For the daemon_example plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of libdaemon_example.so (the .so suffix might differ depending on your platform).

To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (adjust the .so suffix for your platform as necessary):

```sql
INSTALL PLUGIN daemon_example SONAME 'libdaemon_example.so';
```

For additional information about plugin loading, see Section 5.6.1, "Installing and Uninstalling Plugins".

To verify plugin installation, examine the INFORMATION_SCHEMA.PLUGINS table or use the SHOW PLUGINS statement. See Section 5.6.2, "Obtaining Server Plugin Information".

While the plugin is loaded, it writes a heartbeat string at regular intervals to a file named mysql-heartbeat.log in the data directory. This file grows without limit, so after you have satisfied yourself that the plugin operates correctly, unload it:

```sql
UNINSTALL PLUGIN daemon_example;
```

29.2.4.6 Writing INFORMATION_SCHEMA Plugins

This section describes how to write a server-side INFORMATION_SCHEMA table plugin. For example code that implements such plugins, see the sql/sql_show.cc file of a MySQL source distribution. You can also look at the example plugins found in the InnoDB source. See the handler/i_s.cc and handler/ha_innodb.cc files within the InnoDB source tree (in the storage/innobase directory).

To write an INFORMATION_SCHEMA table plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```c
#include <sql_class.h>
#include <table.h>
```
These header files are located in the sql directory of MySQL source distributions. They contain C++
structures, so the source file for an INFORMATION_SCHEMA plugin must be compiled as C++ code.

The source file for the example plugin developed here is named simple_i_s_table.cc. It creates a
simple INFORMATION_SCHEMA table named SIMPLE_I_S_TABLE that has two columns named NAME and
VALUE. The general descriptor for a plugin library that implements the table looks like this:

```c
mysql_declare_plugin(simple_i_s_library)
{
    MYSQL_INFORMATION_SCHEMA_PLUGIN,
    "simple_table_info", /* type-specific descriptor */
    "SIMPLE_I_S_TABLE", /* table name */
    "Author Name", /* author */
    "Simple INFORMATION_SCHEMA table", /* description */
    PLUGIN_LICENSE_GPL, /* license type */
    simple_table_init, /* init function */
    NULL,
    0x0100, /* version = 1.0 */
    NULL, /* no status variables */
    NULL, /* no system variables */
    NULL, /* no reserved information */
    0 /* no flags */
}
mysql_declare_plugin_end;
```

The name member (SIMPLE_I_S_TABLE) indicates the name to use for references to the plugin in
statements such as INSTALL PLUGIN or UNINSTALL PLUGIN. This is also the name displayed by SHOW
PLUGINS or INFORMATION_SCHEMA.PLUGINS.

The simple_table_info member of the general descriptor points to the type-specific descriptor, which
consists only of the type-specific API version number:

```c
static struct st_mysql_information_schema simple_table_info =
{ MYSQL_INFORMATION_SCHEMA_INTERFACE_VERSION };
```

The general descriptor points to the initialization and deinitialization functions:

- The initialization function provides information about the table structure and a function that populates the
table.
- The deinitialization function performs any required cleanup. If no cleanup is needed, this descriptor
  member can be NULL (as in the example shown).

The initialization function should return 0 for success, 1 if an error occurs. The function receives a generic
pointer, which it should interpret as a pointer to the table structure:

```c
static int table_init(void *ptr)
{
    ST_SCHEMA_TABLE *schema_table= (ST_SCHEMA_TABLE*)ptr;
    schema_table->fields_info= simple_table_fields;
    schema_table->fill_table= simple_fill_table;
    return 0;
}
```

The function should set these two members of the table structure:

- fields_info: An array of ST_FIELD_INFO structures that contain information about each column.
- fill_table: A function that populates the table.

The array pointed to by fields_info should contain one element per column of the
INFORMATION_SCHEMA plus a terminating element. The following simple_table_fields array for the
example plugin indicates that `SIMPLE_I_S_TABLE` has two columns. `NAME` is string-valued with a length of 10 and `VALUE` is integer-valued with a display width of 20. The last structure marks the end of the array.

```c
static ST_FIELD_INFO simple_table_fields[] =
{  
  {"NAME", 10, MYSQL_TYPE_STRING, 0, 0, 0},
  {"VALUE", 6, MYSQL_TYPE_LONG, 0, MY_I_S_UNSIGNED, 0, 0},
  {0, 0, MYSQL_TYPE_NULL, 0, 0, 0, 0}
};
```

For more information about the column information structure, see the definition of `ST_FIELD_INFO` in the `table.h` header file. The permissible `MYSQL_TYPE_xxx` type values are those used in the C API; see Section 28.6.4, “C API Data Structures”.

The `fill_table` member should be set to a function that populates the table and returns 0 for success, 1 if an error occurs. For the example plugin, the `simple_fill_table()` function looks like this:

```c
static int simple_fill_table(THD *thd, TABLE_LIST *tables, Item *cond)
{
  TABLE *table = tables->table;
  table->field[0]->store("Name 1", 6, system_charset_info);
  table->field[1]->store(1);
  if (schema_table_store_record(thd, table))
    return 1;
  table->field[0]->store("Name 2", 6, system_charset_info);
  table->field[1]->store(2);
  if (schema_table_store_record(thd, table))
    return 1;
  return 0;
}
```

For each row of the `INFORMATION_SCHEMA` table, this function initializes each column, then calls `schema_table_store_record()` to install the row. The `store()` method arguments depend on the type of value to be stored. For column 0 (`NAME`, a string), `store()` takes a pointer to a string, its length, and information about the character set of the string:

```c
store(const char *to, uint length, CHARSET_INFO *cs);
```

For column 1 (`VALUE`, an integer), `store()` takes the value and a flag indicating whether it is unsigned:

```c
store(longlong nr, bool unsigned_value);
```

For other examples of how to populate `INFORMATION_SCHEMA` tables, search for instances of `schema_table_store_record()` in `sql_show.cc`.

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).

To test the plugin, install it:

```bash
mysql> INSTALL PLUGIN SIMPLE_I_S_TABLE SONAME 'simple_i_s_table.so';
```

Verify that the table is present:

```bash
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
    -> WHERE TABLE_NAME = 'SIMPLE_I_S_TABLE';
+------------------+
| TABLE_NAME       |
+------------------+
| SIMPLE_I_S_TABLE |
+------------------+
```
Try to select from it:

```sql
mysql> SELECT * FROM INFORMATION_SCHEMA.SIMPLE_I_S_TABLE;
+--------+-------+
| NAME   | VALUE |
+--------+-------+
| Name 1 |     1 |
| Name 2 |     2 |
+--------+-------+
```

Uninstall it:

```sql
mysql> UNINSTALL PLUGIN SIMPLE_I_S_TABLE;
```

### 29.2.4.7 Writing Semisynchronous Replication Plugins

This section describes how to write server-side semisynchronous replication plugins, using the example plugins found in the `plugin/semisync` directory of MySQL source distributions. That directory contains the source files for master and slave plugins named `rpl_semi_sync_master` and `rpl_semi_sync_slave`. The information here covers only how to set up the plugin framework. For details about how the plugins implement replication functions, see the source.

To write a semisynchronous replication plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```c
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_REPLICATION_PLUGIN` server plugin type and the data structures needed to declare the plugin.

For the master side, `semisync_master_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_master`:

```c
mysql_declare_plugin(semi_sync_master)
{
    MYSQL_REPLICATION_PLUGIN,
    &semi_sync_master_plugin,
    "rpl_semi_sync_master",
    "He Zhenxing",
    "Semi-synchronous replication master",
    PLUGIN_LICENSE_GPL,
    semi_sync_master_plugin_init, /* Plugin Init */
    semi_sync_master_plugin_deinit, /* Plugin Deinit */
    0x0100 /* 1.0 */,
    semi_sync_master_status_vars, /* status variables */
    semi_sync_master_system_vars, /* system variables */
    NULL, /* config options */
    0, /* flags */
}
```

For the slave side, `semisync_slave_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_slave`:

```c
mysql_declare_plugin(semi_sync_slave)
{
    MYSQL_REPLICATION_PLUGIN,
    &semi_sync_slave_plugin,
    "rpl_semi_sync_slave",
    "He Zhenxing",
    "Semi-synchronous replication slave",
    PLUGIN_LICENSE_GPL,
```
Writing Plugins

For both the master and slave plugins, the general descriptor has pointers to the type-specific descriptor, the initialization and deinitialization functions, and to the status and system variables implemented by the plugin. For information about variable setup, see Server Plugin Status and System Variables. The following remarks discuss the type-specific descriptor and the initialization and deinitialization functions for the master plugin but apply similarly to the slave plugin.

The `semi_sync_master_plugin` member of the master general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```c
struct Mysql_replication semi_sync_master_plugin= {
    MYSQL_REPLICATION_INTERFACE_VERSION
};
```

The initialization and deinitialization function declarations look like this:

```c
static int semi_sync_master_plugin_init(void *p);
static int semi_sync_master_plugin_deinit(void *p);
```

The initialization function uses the pointer to register transaction and binary logging “observers” with the server. After successful initialization, the server takes care of invoking the observers at the appropriate times. (For details on the observers, see the source files.) The deinitialization function cleans up by deregistering the observers. Each function returns 0 for success or 1 if an error occurs.

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `rpl_semi_sync_master` and `rpl_semi_sync_slave` plugins, they are compiled and installed when you build MySQL from source. They are also included in binary distributions. The build process produces shared object libraries with names of `semisync_master.so` and `semisync_slave.so` (the `.so` suffix might differ depending on your platform).

29.2.4.8 Writing Audit Plugins

This section describes how to write a server-side audit plugin, using the example plugin found in the `plugin/audit_null` directory of MySQL source distributions. The `audit_null.c` and `audit_null_variables.h` source files in that directory implement an audit plugin named `NULL_AUDIT`.

Note

Other examples of plugins that use the audit plugin API are the query rewrite plugin (see Section 5.6.4, “The Rewriter Query Rewrite Plugin”) and the Version Tokens plugin (see Section 5.6.6, “Version Tokens”).

Within the server, the pluggable audit interface is implemented in the `sql_audit.h` and `sql_audit.cc` files in the `sql` directory of MySQL source distributions. Additionally, several places in the server call the audit interface when an auditable event occurs, so that registered audit plugins can be notified about the event if necessary. To see where such calls occur, search the server source files for invocations of functions with names of the form `mysql_audit_xxx()`. Audit notification occurs for server operations such as these:
Writing Plugins

• Client connect and disconnect events
• Writing a message to the general query log (if the log is enabled)
• Writing a message to the error log
• Sending a query result to a client

To write an audit plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```c
#include <mysql/plugin_audit.h>
```

`plugin_audit.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_AUDIT_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_audit.h` defines data structures specific to audit plugins.

• Audit Plugin General Descriptor
• Audit Plugin Type-Specific Descriptor
• Audit Plugin Notification Function
• Audit Plugin Error Handling
• Audit Plugin Usage

Audit Plugin General Descriptor

An audit plugin, like any MySQL server plugin, has a general plugin descriptor (see Server Plugin Library and Plugin Descriptors) and a type-specific plugin descriptor. In `audit_null.c`, the general descriptor for `audit_null` looks like this:

```c
mysql_declare_plugin(audit_null)
{
    MYSQL_AUDIT_PLUGIN, /* type */
    &audit_null_descriptor, /* descriptor */
    "NULL_AUDIT", /* name */
    "Oracle Corp", /* author */
    "Simple NULL Audit", /* description */
    PLUGIN_LICENSE_GPL,
    audit_null_plugin_init, /* init function (when loaded) */
    audit_null_plugin_deinit, /* deinit function (when unloaded) */
    0x0003, /* version */
    simple_status, /* status variables */
    system_variables, /* system variables */
    NULL,
    0,
}
mysql_declare_plugin_end;
```

The first member, `MYSQL_AUDIT_PLUGIN`, identifies this plugin as an audit plugin.

`audit_null_descriptor` points to the type-specific plugin descriptor, described later.

The `name` member (`NULL_AUDIT`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The `audit_null_plugin_init` initialization function performs plugin initialization when the plugin is loaded. The `audit_null_plugin_deinit` function performs cleanup when the plugin is unloaded.
Writing Plugins

The general plugin descriptor also refers to `simple_status` and `system_variables`, structures that expose several status and system variables. When the plugin is enabled, these variables can be inspected using `SHOW` statements (`SHOW STATUS, SHOW VARIABLES`) or the appropriate Performance Schema tables.

The `simple_status` structure declares several status variables with names of the form `Audit_null_xxx`. `NULL_AUDIT` increments the `Audit_null_called` status variable for every notification that it receives. The other status variables are more specific and `NULL_AUDIT` increments them only for notifications of specific events.

`system_variables` is an array of system variable elements, each of which is defined using a `MYSQL_THDVAR_xxx` macro. These system variables have names of the form `null_audit_xxx`. These variables can be used to communicate with the plugin at runtime.

### Audit Plugin Type-Specific Descriptor

The `audit_null_descriptor` value in the general plugin descriptor points to the type-specific plugin descriptor. For audit plugins, this descriptor has the following structure (defined in `plugin_audit.h`):

```c
struct st_mysql_audit {
    int interface_version;
    void (*release_thd)(MYSQL_THD);
    int (*event_notify)(MYSQL_THD, mysql_event_class_t, const void *);
    unsigned long class_mask[MYSQL_AUDIT_CLASS_MASK_SIZE];
};
```

The type-specific descriptor for audit plugins has these members:

- **`interface_version`**: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For audit plugins, the value of the `interface_version` member is `MYSQL_AUDIT_INTERFACE_VERSION` (defined in `plugin_audit.h`).

- **`release_thd`**: A function that the server calls to inform the plugin that it is being dissociated from its thread context. This should be `NULL` if there is no such function.

- **`event_notify`**: A function that the server calls to notify the plugin that an auditable event has occurred. This function should not be `NULL`; that would not make sense because no auditing would occur.

- **`class_mask`**: An array of `MYSQL_AUDIT_CLASS_MASK_SIZE` elements. Each element specifies a bitmask for a given event class to indicate the subclasses for which the plugin wants notification. (This is how the plugin “subscribes” to events of interest.) An element should be 0 to ignore all events for the corresponding event class.

The server uses the `event_notify` and `release_thd` functions together. They are called within the context of a specific thread, and a thread might perform an activity that produces several event notifications. The first time the server calls `event_notify` for a thread, it creates a binding of the plugin to the thread. The plugin cannot be uninstalled while this binding exists. When no more events for the thread will occur, the server informs the plugin of this by calling the `release_thd` function, and then destroys the binding. For example, when a client issues a statement, the thread processing the statement might notify audit plugins about the result set produced by the statement and about the statement being logged. After these notifications occur, the server releases the plugin before putting the thread to sleep until the client issues another statement.

This design enables the plugin to allocate resources needed for a given thread in the first call to the `event_notify` function and release them in the `release_thd` function:
Writing Plugins

```c
static struct st_mysql_audit audit_null_descriptor=
{
    MYSQL_AUDIT_INTERFACE_VERSION,                    /* interface version */
    NULL,                                             /* release_thd function */
    audit_null_notify,                                /* notify function */
    (unsigned long) MYSQL_AUDIT_GENERAL_ALL,
    (unsigned long) MYSQL_AUDIT_CONNECTION_ALL,
    (unsigned long) MYSQL_AUDIT_PARSE_ALL,
    (unsigned long) MYSQL_AUDIT_AUTHORIZATION_ALL,
    (unsigned long) MYSQL_AUDIT_TABLE_ACCESS_ALL,
    (unsigned long) MYSQL_AUDIT_GLOBAL_VARIABLE_ALL,
    (unsigned long) MYSQL_AUDIT_SERVER_STARTUP_ALL,
    (unsigned long) MYSQL_AUDIT_SERVER_SHUTDOWN_ALL,
    (unsigned long) MYSQL_AUDIT_COMMAND_ALL,
    (unsigned long) MYSQL_AUDIT_QUERY_ALL,
    (unsigned long) MYSQL_AUDIT_STORED_PROGRAM_ALL
};
```

That is more efficient than allocating and releasing memory repeatedly in the notification function.

For the **NULL_AUDIT** audit plugin, the type-specific plugin descriptor looks like this:

```c
static struct st_mysql_audit audit_null_descriptor=
{
    MYSQL_AUDIT_INTERFACE_VERSION,                    /* interface version */
    NULL,                                             /* release_thd function */
    audit_null_notify,                                /* notify function */
    (unsigned long) MYSQL_AUDIT_GENERAL_ALL,
    (unsigned long) MYSQL_AUDIT_CONNECTION_ALL,
    (unsigned long) MYSQL_AUDIT_PARSE_ALL,
    (unsigned long) MYSQL_AUDIT_AUTHORIZATION_ALL,
    (unsigned long) MYSQL_AUDIT_TABLE_ACCESS_ALL,
    (unsigned long) MYSQL_AUDIT_GLOBAL_VARIABLE_ALL,
    (unsigned long) MYSQL_AUDIT_SERVER_STARTUP_ALL,
    (unsigned long) MYSQL_AUDIT_SERVER_SHUTDOWN_ALL,
    (unsigned long) MYSQL_AUDIT_COMMAND_ALL,
    (unsigned long) MYSQL_AUDIT_QUERY_ALL,
    (unsigned long) MYSQL_AUDIT_STORED_PROGRAM_ALL
};
```

The server calls `audit_null_notify()` to pass audit event information to the plugin. The plugin has no `release_thd` function.

The **class_mask** member is an array that indicates which event classes the plugin subscribes to. As shown, the array contents subscribe to all subclasses of all event classes that are available. To ignore all notifications for a given event class, specify the corresponding `class_mask` element as 0.

The number of `class_mask` elements corresponds to the number of event classes, each of which is listed in the `mysql_event_class_t` enumeration defined in `plugin_audit.h`:

```c
typedef enum
{
    MYSQL_AUDIT_GENERAL_CLASS          = 0,
    MYSQL_AUDIT_CONNECTION_CLASS       = 1,
    MYSQL_AUDITPARSE_CLASS             = 2,
    MYSQL_AUDIT_AUTHORIZATION_CLASS    = 3,
    MYSQL_AUDIT_TABLE_ACCESS_CLASS     = 4,
    MYSQL_AUDITGLOBAL_VARIABLE_CLASS   = 5,
    MYSQL_AUDITSERVER_STARTUP_CLASS    = 6,
    MYSQL_AUDITSERVER_SHUTDOWN_CLASS   = 7,
    MYSQL_AUDIT_COMMAND_CLASS          = 8,
    MYSQL_AUDIT_QUERY_CLASS            = 9,
    MYSQL_AUDITSTORED_PROGRAM_CLASS    = 10,
    /* This item must be last in the list. */
    MYSQL_AUDITCLASS_MASK_SIZE
} mysql_event_class_t;
```

For any given event class, `plugin_audit.h` defines bitmask symbols for individual event subclasses, as well as an **xxx_ALL** symbol that is the union of the all subclass bitmasks. For example, for `MYSQL_AUDIT_CONNECTION_CLASS` (the class that covers connect and disconnect events), `plugin_audit.h` defines these symbols:
typedef enum
{
    /** occurs after authentication phase is completed. */
    MYSQL_AUDIT_CONNECTION_CONNECT = 1 << 0,
    /** occurs after connection is terminated. */
    MYSQL_AUDIT_CONNECTION_DISCONNECT = 1 << 1,
    /** occurs after COM_CHANGE_USER RPC is completed. */
    MYSQL_AUDIT_CONNECTION_CHANGE_USER = 1 << 2,
    /** occurs before authentication. */
    MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE = 1 << 3
} mysql_event_connection_subclass_t;

#define MYSQL_AUDIT_CONNECTION_ALL (MYSQL_AUDIT_CONNECTION_CONNECT |
                                 MYSQL_AUDIT_CONNECTION_DISCONNECT |
                                 MYSQL_AUDIT_CONNECTION_CHANGE_USER |
                                 MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE)

To subscribe to all subclasses of the connection event class (as the NULL_AUDIT plugin does), a plugin specifies MYSQL_AUDIT_CONNECTION_ALL in the corresponding class_mask element (class_mask[1] in this case). To subscribe to only some subclasses, the plugin sets the class_mask element to the union of the subclasses of interest. For example, to subscribe only to the connect and change-user subclasses, the plugin sets class_mask[1] to this value:

MYSQL_AUDIT_CONNECTION_CONNECT | MYSQL_AUDIT_CONNECTION_CHANGE_USER

Audit Plugin Notification Function

Most of the work for an audit plugin occurs in the notification function (the event_notify member of the type-specific plugin descriptor). The server calls this function for each auditable event. Audit plugin notification functions have this prototype:

int (*event_notify)(MYSQL_THD, mysql_event_class_t, const void *);

The second and third parameters of the event_notify function prototype represent the event class and a generic pointer to an event structure. (Events in different classes have different structures. The notification function can use the event class value to determine which event structure applies.) The function processes the event and returns a status indicating whether the server should continue processing the event or terminate it.

For NULL_AUDIT, the notification function is audit_null_notify(). This function increments a global event counter (which the plugin exposes as the value of the Audit_null_called status value), and then examines the event class to determine how to process the event structure:

static int audit_null_notify(MYSQL_THD thd __attribute__((unused)),
                           mysql_event_class_t event_class,
                           const void *event)
{
    ...
    number_of_calls++;

    if (event_class == MYSQL_AUDIT_GENERAL_CLASS)
    {
        const struct mysql_event_general *event_general=
            (const struct mysql_event_general *)event;
        ...
    }
    else if (event_class == MYSQL_AUDIT_CONNECTION_CLASS)
    {
        const struct mysql_event_connection *event_connection=
            (const struct mysql_event_connection *) event;
        ...
    }
else if (event_class == MYSQL_AUDIT_PARSE_CLASS) {
    const struct mysql_event_parse *event_parse =
         (const struct mysql_event_parse *)event;
    ...
}
...
}

The notification function interprets the event argument according to the value of event_class. The event argument is a generic pointer to the event record, the structure of which differs per event class. (The plugin_audit.h file contains the structures that define the contents of each event class.) For each class, audit_null_notify() casts the event to the appropriate class-specific structure and then checks its subclass to determine which subclass counter to increment. For example, the code to handle events in the connection-event class looks like this:

else if (event_class == MYSQL_AUDIT_CONNECTION_CLASS) {
    const struct mysql_event_connection *event_connection=
         (const struct mysql_event_connection *) event;

    switch (event_connection->event_subclass) {
    case MYSQL_AUDIT_CONNECTION_CONNECT:
        number_of_calls_connection_connect++;
        break;
    case MYSQL_AUDIT_CONNECTION_DISCONNECT:
        number_of_calls_connection_disconnect++;
        break;
    case MYSQL_AUDIT_CONNECTION_CHANGE_USER:
        number_of_calls_connection_change_user++;
        break;
    case MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE:
        number_of_calls_connection_preAuthenticate++;
        break;
    default:
        break;
    }
}

Note

The general event class (MYSQL_AUDIT_GENERAL_CLASS) is deprecated and will be removed in a future MySQL release. To reduce plugin overhead, it is preferable to subscribe only to the more specific event classes of interest.

For some event classes, the NULL_AUDIT plugin performs other processing in addition to incrementing a counter. In any case, when the notification function finishes processing the event, it should return a status indicating whether the server should continue processing the event or terminate it.

Audit Plugin Error Handling

Audit plugin notification functions can report a status value for the current event two ways:

- Use the notification function return value. In this case, the function returns zero if the server should continue processing the event, or nonzero if the server should terminate the event.

- Call the my_message() function to set the error state before returning from the notification function. In this case, the notification function return value is ignored and the server aborts the event and terminates event processing with an error. The my_message() arguments indicate which error to report, and its message. For example:
Writing Plugins

```c
my_message(ER_AUDIT_API_ABORT, "This is my error message.", MYF(0));
```

Some events cannot be aborted. A nonzero return value is not taken into consideration and the `my_message()` error call must follow an `is_error()` check. For example:

```c
if (!thd->get_stmt_da()->is_error())
{
    my_message(ER_AUDIT_API_ABORT, "This is my error message.", MYF(0));
}
```

These events cannot be aborted:

- `MYSQL_AUDIT_CONNECTION_DISCONNECT`: The server cannot prevent a client from disconnecting.
- `MYSQL_AUDIT_COMMAND_END`: This event provides the status of a command that has finished executing, so there is no purpose to terminating it.

If an audit plugin returns nonzero status for a nonterminable event, the server ignores the status and continues processing the event. This is also true if an audit plugin uses the `my_message()` function to terminate a nonterminable event.

Audit Plugin Usage

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `NULL_AUDIT` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `adt_null.so` (the `.so` suffix might differ depending on your platform).

To register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```sql
INSTALL PLUGIN NULL_AUDIT SONAME 'adt_null.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

While the `NULL_AUDIT` audit plugin is installed, it exposes status variables that indicate the events for which the plugin has been called:

<table>
<thead>
<tr>
<th>Variable_name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit_null_authorization_column</td>
<td>0</td>
</tr>
<tr>
<td>Audit_null_authorization_db</td>
<td>0</td>
</tr>
<tr>
<td>Audit_null_authorization_procedure</td>
<td>0</td>
</tr>
<tr>
<td>Audit_null_authorization_proxy</td>
<td>0</td>
</tr>
<tr>
<td>Audit_null_authorization_table</td>
<td>0</td>
</tr>
<tr>
<td>Audit_null_authorization_user</td>
<td>0</td>
</tr>
<tr>
<td>Audit_null_called</td>
<td>185547</td>
</tr>
<tr>
<td>Audit_null_command_end</td>
<td>20999</td>
</tr>
<tr>
<td>Audit_null_command_start</td>
<td>21001</td>
</tr>
<tr>
<td>Audit_null_connection_change_user</td>
<td>0</td>
</tr>
<tr>
<td>Audit_null_connection_connect</td>
<td>5823</td>
</tr>
<tr>
<td>Audit_null_connection_disconnect</td>
<td>5818</td>
</tr>
<tr>
<td>Audit_null_connection_pre_authenticate</td>
<td>5823</td>
</tr>
<tr>
<td>Audit_null_general_error</td>
<td>1</td>
</tr>
<tr>
<td>Audit_null_general_log</td>
<td>26559</td>
</tr>
</tbody>
</table>
Audit_null_called counts all events, and the other variables count instances of specific event subclasses. For example, the preceding SHOW STATUS statement causes the server to send a result to the client and to write a message to the general query log if that log is enabled. Thus, a client that issues the statement repeatedly causes Audit_null_called, Audit_null_general_result, and Audit_null_general_log to be incremented each time. Notifications occur whether or not that log is enabled.

The status variables values are global and aggregated across all sessions. There are no counters for individual sessions.

NULL_AUDIT exposes several system variables that enable communication with the plugin at runtime:

mysql> SHOW VARIABLES LIKE 'null_audit%';

+---------------------------------------------------+-------+
| Variable_name                                     | Value |
+---------------------------------------------------+-------+
| null_audit_abort_message                          |       |
| null_audit_abort_value                            | 1     |
| null_audit_event_order_check                      |       |
| null_audit_event_order_check_consume_ignore_count | 0     |
| null_audit_event_order_check_exact                | 1     |
| null_audit_event_order_started                    | 0     |
| null_audit_event_record                           |       |
| null_audit_event_record_def                       |       |
| null_audit_table_access_delete                    | 104   |
| null_audit_table_access_insert                    | 2839  |
| null_audit_table_access_read                      | 97842 |
| null_audit_table_access_update                    | 278   |
+---------------------------------------------------+-------+

The NULL_AUDIT system variables have these meanings:

• null_audit_abort_message: The custom error message to use when an event is aborted.

• null_audit_abort_value: The custom error code to use when an event is aborted.

• null_audit_event_order_check: Prior to event matching, the expected event order. After event matching, the matching outcome.

• null_audit_event_order_check_consume_ignore_count: Number of times event matching should not consume matched events.

• null_audit_event_order_check_exact: Whether event matching must be exact. Disabling this variable enables skipping events not listed in null_audit_event_order_check during event-order matching. Of the events specified, they must still match in the order given.

• null_audit_event_order_started: For internal use.
• **null_audit_event_record**: The recorded events after event recording takes place.

• **null_audit_event_record_def**: The names of the start and end events to match when recording events, separated by a semicolon. The value must be set before each statement for which events are recorded.

To demonstrate use of those system variables, suppose that a table `db1.t1` exists, created as follows:

```
CREATE DATABASE db1;
CREATE TABLE db1.t1 (a VARCHAR(255));
```

For test-creation purposes, it is possible to record events that pass through the plugin. To start recording, specify the start and end events in the `null_audit_event_record_def` variable. For example:

```
SET @@null_audit_event_record_def = 'MYSQL_AUDIT_COMMAND_START;MYSQL_AUDIT_COMMAND_END';
```

After a statement occurs that matches those start and end events, the `null_audit_event_record` system variable contains the resulting event sequence. For example, after recording the events for a `SELECT 1` statement, `null_audit_event_record` is a string that has a value consisting of a set of event strings:

```
MYSQL_AUDIT_COMMAND_START;command_id="3";
MYSQL_AUDIT_PARSE_PREPARSE;;
MYSQL_AUDIT_PARSE_POSTPARSE;;
MYSQL_AUDIT_GENERAL_LOG;;
MYSQL_AUDIT_QUERY_START;sql_command_id="0";
MYSQL_AUDIT_QUERY_STATUS_END;sql_command_id="0";
MYSQL_AUDIT_GENERAL_RESULT;;
MYSQL_AUDIT_GENERAL_STATUS;;
MYSQL_AUDIT_COMMAND_END;command_id="3";
```

After recording the events for an `INSERT INTO db1.t1 VALUES ('some data')` statement, `null_audit_event_record` has this value:

```
MYSQL_AUDIT_COMMAND_START;command_id="3";
MYSQL_AUDIT.Parse PREPARSE;;
MYSQL_AUDIT.Parse POSTPARSE;;
MYSQL_AUDIT_GENERAL_LOG;;
MYSQL_AUDIT_QUERY_START;sql_command_id="5";
MYSQL_AUDIT_TABLE_ACCESS_INSERT;db="db1" table="t1";
MYSQL_AUDIT_QUERY_STATUS_END;sql_command_id="5";
MYSQL_AUDIT_GENERAL_RESULT;;
MYSQL_AUDIT_GENERAL_STATUS;;
MYSQL_AUDIT_COMMAND_END;command_id="3";
```

Each event string has this format, with semicolons separating the string parts:

```
event_name;event_data;command
```

Event strings have these parts:

• **event_name**: The event name (a symbol that begins with `MYSQL_AUDIT_`).

• **event_data**: Empty, or, as described later, data associated with the event.

• **command**: Empty, or, as described later, a command to execute when the event is matched.

**Note**

A limitation of the NULL_AUDIT plugin is that event recording works for a single session only. Once you record events in a given session, event recording in
subsequent sessions yields a null_audit_event_record value of NULL. To record events again, it is necessary to restart the plugin.

To check the order of audit API calls, set the null_audit_event_order_check variable to the expected event order for a particular operation, listing one or more event strings, each containing two semicolons internally, with additional semicolons separating adjacent event strings:

```
event_name;event_data;command [;event_name;event_data;command] ...
```

For example:

```
SET @@null_audit_event_order_check =
'MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE;;;'
'MYSQL_AUDIT_GENERAL_LOG;;;'
'MYSQL_AUDIT_CONNECTION_CONNECT;;';
```

For better readability, the statement takes advantage of the SQL syntax that concatenates adjacent strings into a single string.

After you set the null_audit_event_order_check variable to a list of event strings, the next matching operation replaces the variable value with a value that indicates the operation outcome:

- If the expected event order was matched successfully, the resulting null_audit_event_order_check value is EVENT-ORDER-OK.

- If the null_audit_event_order_check value specified aborting a matched event (as described later), the resulting null_audit_event_order_check value is EVENT-ORDER-ABORT.

- If the expected event order failed with unexpected data, the resulting null_audit_event_order_check value is EVENT-ORDER-INVALID-DATA. This occurs, for example, if an event was specified as expected to affect table t1 but actually affected t2.

When you assign to null_audit_event_order_check the list of events to be matched, some events should be specified with a nonempty event_data part of the event string. The following table shows the event_data format for these events. If an event takes multiple data values, they must be specified in the order shown. Alternatively, it is possible to specify an event_data value as <IGNORE> to ignore event data content; in this case, it does not matter whether or not an event has data.

<table>
<thead>
<tr>
<th>Applicable Events</th>
<th>Event Data Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>MYSQL_AUDIT_COMMAND_START</td>
<td>command_id=&quot;id_value&quot;</td>
</tr>
<tr>
<td>MYSQL_AUDIT_COMMAND_END</td>
<td></td>
</tr>
<tr>
<td>MYSQL_AUDIT_GLOBAL_VARIABLE_GET</td>
<td>name=&quot;var_value&quot; value=&quot;var_value&quot;</td>
</tr>
<tr>
<td>MYSQL_AUDIT_GLOBAL_VARIABLE_SET</td>
<td></td>
</tr>
<tr>
<td>MYSQL_AUDIT_QUERY_NESTED_START</td>
<td>sql_command_id=&quot;id_value&quot;</td>
</tr>
<tr>
<td>MYSQL_AUDIT_QUERY_NESTED_STATUS_END</td>
<td></td>
</tr>
<tr>
<td>MYSQL_AUDIT_QUERY_START</td>
<td></td>
</tr>
<tr>
<td>MYSQL_AUDIT_QUERY_STATUS_END</td>
<td></td>
</tr>
<tr>
<td>MYSQL_AUDIT_TABLE_ACCESS_DELETE</td>
<td>db=&quot;db_name&quot; table=&quot;table_name&quot;</td>
</tr>
<tr>
<td>MYSQL_AUDIT_TABLE_ACCESS_INSERT</td>
<td></td>
</tr>
<tr>
<td>MYSQL_AUDIT_TABLE_ACCESS_READ</td>
<td></td>
</tr>
</tbody>
</table>
Writing Plugins

<table>
<thead>
<tr>
<th>Applicable Events</th>
<th>Event Data Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>MYSQL_AUDIT_TABLE_ACCESS_UPDATE</td>
<td></td>
</tr>
</tbody>
</table>

In the `null_audit_event_order_check` value, specifying `ABORT_RET` in the `command` part of an event string makes it possible to abort the audit API call on the specified event. (Assuming that the event is one that can be aborted. Those that cannot were described previously.) For example, as shown previously, this is the expected order of events for an insert into `t1`:

```
MYSQL_AUDIT_COMMAND_START;command_id="3";
MYSQL_AUDIT_PARSE_PREPARSE;;
MYSQL_AUDIT_PARSE_POSTPARSE;;
MYSQL_AUDIT_GENERAL_LOG;;
MYSQL_AUDIT_QUERY_START;sql_command_id="5";
MYSQL_AUDIT_TABLE_ACCESS_INSERT;db="db1" table="t1";
MYSQL_AUDIT_QUERY_STATUS_END;sql_command_id="5";
MYSQL_AUDIT_GENERAL_RESULT;;
MYSQL_AUDIT_GENERAL_STATUS;;
MYSQL_AUDIT_COMMAND_END;command_id="3";
```

To abort `INSERT` statement execution when the `MYSQL_AUDIT_QUERY_STATUS_END` event occurs, set `null_audit_event_order_check` like this (remember to add semicolon separators between adjacent event strings):

```
SET @@null_audit_event_order_check =
  'MYSQL_AUDIT_COMMAND_START;command_id="3"';
  'MYSQL_AUDIT_PARSE_PREPARSE;;'
  'MYSQL_AUDIT_PARSE_POSTPARSE;;'
  'MYSQL_AUDIT_GENERAL_LOG;;'
  'MYSQL_AUDIT_QUERY_START;sql_command_id="5"';
  'MYSQL_AUDIT_TABLE_ACCESS_INSERT;db="db1" table="t1"';
  'MYSQL_AUDIT_QUERY_STATUS_END;sql_command_id="5";ABORT_RET';
```

It is not necessary to list events that are expected to occur after the event string that contains a `command` value of `ABORT_RET`.

After the audit plugin matches the preceding sequence, it aborts event processing and sends an error message to the client. It also sets `null_audit_event_order_check` to `EVENT-ORDER-ABORT`:

```
mysql> INSERT INTO db1.t1 VALUES ('some data');
ERROR 3164 (HY000): Aborted by Audit API ('MYSQL_AUDIT_QUERY_STATUS_END';1).
mysql> SELECT @@null_audit_event_order_check;
+--------------------------------+
| @@null_audit_event_order_check |
+--------------------------------+
| EVENT-ORDER-ABORT              |
+--------------------------------+
```

Returning a nonzero value from the audit API notification routine is the standard way to abort event execution. It is also possible to specify a custom error code by setting the `null_audit_abort_value` variable to the value that the notification routine should return:

```
SET @@null_audit_abort_value = 123;
```

Aborting a sequence results in a standard message with the custom error code. Suppose that you set audit log system variables like this, to abort on a match for the events that occur for a `SELECT 1` statement:

```
SET @@null_audit_abort_value = 123;
SET @@null_audit_event_order_check =
  'MYSQL_AUDIT_COMMAND_START;command_id="3"';
  'MYSQL_AUDIT_PARSE_PREPARSE;;'
  'MYSQL_AUDIT_PARSE_POSTPARSE;;'
  'MYSQL_AUDIT_GENERAL_LOG;;'
  'MYSQL_AUDIT_QUERY_START;sql_command_id="0";ABORT_RET';
```
Then execution of `SELECT 1` results in this error message that includes the custom error code:

```
mysql> SELECT 1;
ERROR 3164 (HY000): Aborted by Audit API ('MYSQL_AUDIT_QUERY_START';123).
```

```
mysql> SELECT @@null_audit_event_order_check;
+--------------------------------+
<table>
<thead>
<tr>
<th>@@null_audit_event_order_check</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT-ORDER-ABORT</td>
</tr>
</tbody>
</table>
+--------------------------------+
```

An event can be also aborted with a custom message, specified by setting the `null_audit_abort_message` variable. Suppose that you set audit log system variables like this:

```
SET @@null_audit_abort_message = 'Custom error text.';
SET @@null_audit_event_order_check =
'MYSQL_AUDIT_COMMAND_START;command_id="3";'
'MYSQL_AUDIT_PARSE_PREPARSE;;;
'MYSQL_AUDIT_PARSE_POSTPARSE;;
'MYSQL_AUDIT_GENERAL_LOG;;
'MYSQL_AUDIT_QUERY_START;sql_command_id="0";ABORT_RET';
```

Then aborting a sequence results in the following error message:

```
mysql> SELECT 1;
ERROR 3164 (HY000): Custom error text.
```

```
mysql> SELECT @@null_audit_event_order_check;
+--------------------------------+
<table>
<thead>
<tr>
<th>@@null_audit_event_order_check</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT-ORDER-ABORT</td>
</tr>
</tbody>
</table>
+--------------------------------+
```

To disable the `NULL_AUDIT` plugin after testing it, use this statement to unload it:

```
UNINSTALL PLUGIN NULL_AUDIT;
```

### 29.2.4.9 Writing Authentication Plugins

MySQL supports pluggable authentication, in which plugins are invoked to authenticate client connections. Authentication plugins enable the use of authentication methods other than the built-in method of passwords stored in the `mysql.user` system table. For example, plugins can be written to access external authentication methods. Also, authentication plugins can support the proxy user capability, such that the connecting user is a proxy for another user and is treated, for purposes of access control, as having the privileges of a different user. For more information, see Section 6.2.17, "Pluggable Authentication", and Section 6.2.18, "Proxy Users".

An authentication plugin can be written for the server side or the client side. Server-side plugins use the same plugin API that is used for the other server plugin types such as full-text parser or audit plugins (although with a different type-specific descriptor). Client-side plugins use the client plugin API.

Several header files contain information relevant to authentication plugins:

- **plugin.h**: Defines the `MYSQL_AUTHENTICATION_PLUGIN` server plugin type.
- **client_plugin.h**: Defines the API for client plugins. This includes the client plugin descriptor and function prototypes for client plugin C API calls (see Section 28.6.16, “C API Client Plugin Functions”).
- **plugin_auth.h**: Defines the part of the server plugin API specific to authentication plugins. This includes the type-specific descriptor for server-side authentication plugins and the `MYSQL_SERVER_AUTH_INFO` structure.
Writing Plugins

- **plugin_auth_common.h**: Contains common elements of client and server authentication plugins. This includes return value definitions and the `MYSQL_PLUGIN_VIO` structure.

To write an authentication plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

- For a source file that implements a server authentication plugin, include this file:

  ```c
  #include <mysql/plugin_auth.h>
  ```

- For a source file that implements a client authentication plugin, or both client and server plugins, include these files:

  ```c
  #include <mysql/plugin_auth.h>
  #include <mysql/client_plugin.h>
  #include <mysql.h>
  ```

`plugin_auth.h` includes `plugin.h` and `plugin_auth_common.h`, so you need not include the latter files explicitly.

This section describes how to write a pair of simple server and client authentication plugins that work together.

**Warning**

These plugins accept any non-empty password and the password is sent as cleartext. This is insecure, so the plugins should not be used in production environments.

The server-side and client-side plugins developed here both are named `auth_simple`. As described in Section 29.2.4.2, “Plugin Data Structures”, the plugin library file must have the same base name as the client plugin, so the source file name is `auth_simple.c` and produces a library named `auth_simple.so` (assuming that your system uses `.so` as the suffix for library files).

In MySQL source distributions, authentication plugin source is located in the `plugin/auth` directory and can be examined as a guide to writing other authentication plugins. Also, to see how the built-in authentication plugins are implemented, see `sql/sql_acl.cc` for plugins that are built in to the MySQL server and `sql-common/client.c` for plugins that are built in to the `libmysqlclient` client library. (For the built-in client plugins, note that the `auth_plugin_t` structures used there differ from the structures used with the usual client plugin declaration macros. In particular, the first two members are provided explicitly, not by declaration macros.)

**Writing the Server-Side Authentication Plugin**

Declare the server-side plugin with the usual general descriptor format that is used for all server plugin types (see Server Plugin Library and Plugin Descriptors). For the `auth_simple` plugin, the descriptor looks like this:

```c
mysql_declare_plugin(auth_simple)
{
  MYSQL_AUTHENTICATION_PLUGIN,
  &auth_simple_handler, /* type-specific descriptor */
  "auth_simple", /* plugin name */
  "Author Name", /* author */
  "Any-password authentication plugin", /* description */
  PLUGIN_LICENSE_GPL, /* license type */
  NULL, /* no init function */
  0x0100, /* version = 1.0 */
  NULL, /* no status variables */
}
```
The **name** member (**auth_simple**) indicates the name to use for references to the plugin in statements such as **INSTALL PLUGIN** or **UNINSTALL PLUGIN**. This is also the name displayed by **SHOW PLUGINS** or **INFORMATION_SCHEMA.PLUGINS**.

The **auth_simple_handler** member of the general descriptor points to the type-specific descriptor. For an authentication plugin, the type-specific descriptor is an instance of the **st_mysql_auth** structure (defined in **plugin_auth.h**):

```c
struct st_mysql_auth
{
  int interface_version;
  const char *client_auth_plugin;
  int (*authenticate_user)(MYSQL_PLUGIN_VIO *vio, MYSQL_SERVER_AUTH_INFO *info);
  int (*generate_authentication_string)(char *outbuf,
    unsigned int *outbuflen, const char *inbuf, unsigned int inbuflen);
  int (*validate_authentication_string)(char* const inbuf, unsigned int buflen);
  int (*set_salt)(const char *password, unsigned int password_len,
    unsigned char* salt, unsigned char *salt_len);
  const unsigned long authentication_flags;
};
```

The **st_mysql_auth** structure has these members:

- **interface_version**: The type-specific API version number, always **MYSQL_AUTHENTICATION_INTERFACE_VERSION**
- **client_auth_plugin**: The client plugin name
- **authenticate_user**: A pointer to the main plugin function that communicates with the client
- **generate_authentication_string**: A pointer to a plugin function that generates a password digest from an authentication string
- **validate_authentication_string**: A pointer to a plugin function that validates a password digest
- **set_salt**: A pointer to a plugin function that converts a scrambled password to binary form
- **authentication_flags**: A flags word

The **client_auth_plugin** member should indicate the name of the client plugin if a specific plugin is required. A value of **NULL** means "any plugin." In the latter case, whatever plugin the client uses will do. This is useful if the server plugin does not care about the client plugin or what user name or password it sends. For example, this might be true if the server plugin authenticates only local clients and uses some property of the operating system rather than the information sent by the client plugin.

For **auth_simple**, the type-specific descriptor looks like this:

```c
static struct st_mysql_auth auth_simple_handler =
{
  MYSQL_AUTHENTICATION_INTERFACE_VERSION,
  "auth_simple", /* required client-side plugin name */
  auth_simple_server /* server-side plugin main function */
  generate_auth_string_hash, /* generate digest from password string */
  validate_auth_string_hash, /* validate password digest */
  set_salt, /* generate password salt value */
  AUTH_FLAG_PRIVILEGED_USER_FOR_PASSWORD_CHANGE
};
```
The main function, `auth_simple_server()`, takes two arguments representing an I/O structure and a `MYSQL_SERVER_AUTH_INFO` structure. The structure definition, found in `plugin_auth.h`, looks like this:

```c
typedef struct st_mysql_server_auth_info
{
    char *user_name;
    unsigned int user_name_length;
    const char *auth_string;
    unsigned long auth_string_length;
    char authenticated_as[MYSQL_USERNAME_LENGTH+1];
    char external_user[512];
    int  password_used;
    const char *host_or_ip;
    unsigned int host_or_ip_length;
} MYSQL_SERVER_AUTH_INFO;
```

The character set for string members is UTF-8. If there is a `_length` member associated with a string, it indicates the string length in bytes. Strings are also null-terminated.

When an authentication plugin is invoked by the server, it should interpret the `MYSQL_SERVER_AUTH_INFO` structure members as follows. Some of these are used to set the value of SQL functions or system variables within the client session, as indicated.

- **`user_name`**: The user name sent by the client. The value becomes the `USER()` function value.

- **`user_name_length`**: The length of `user_name` in bytes.

- **`auth_string`**: The value of the `authentication_string` column of the row in the `mysql.user` system table for the matching account name (that is, the row that matches the client user name and host name and that the server uses to determine how to authenticate the client).

  Suppose that you create an account using the following statement:

  ```sql
  CREATE USER 'my_user'@'localhost'
  IDENTIFIED WITH my_plugin AS 'my_auth_string';
  ```

  When `my_user` connects from the local host, the server invokes `my_plugin` and passes `'my_auth_string'` to it as the `auth_string` value.

- **`auth_string_length`**: The length of `auth_string` in bytes.

- **`authenticated_as`**: The server sets this to the user name (the value of `user_name`). The plugin can alter it to indicate that the client should have the privileges of a different user. For example, if the plugin supports proxy users, the initial value is the name of the connecting (proxy) user, and the plugin can change this member to the proxied user name. The server then treats the proxy user as having the privileges of the proxied user (assuming that the other conditions for proxy user support are satisfied; see Implementing Proxy User Support in Authentication Plugins). The value is represented as a string at most `MYSQL_USER_NAME_LENGTH` bytes long, plus a terminating null. The value becomes the `CURRENT_USER()` function value.

- **`external_user`**: The server sets this to the empty string (null terminated). Its value becomes the `external_user` system variable value. If the plugin wants that system variable to have a different value, it should set this member accordingly (for example, to the connecting user name). The value is represented as a string at most 511 bytes long, plus a terminating null.

- **`password_used`**: This member applies when authentication fails. The plugin can set it or ignore it. The value is used to construct the failure error message of `Authentication fails. Password used: %s`. The value of `password_used` determines how `%s` is handled, as shown in the following table.
Writing Plugins

<table>
<thead>
<tr>
<th><strong>password_used</strong></th>
<th>Handling</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>NO</td>
</tr>
<tr>
<td>1</td>
<td>YES</td>
</tr>
<tr>
<td>2</td>
<td>There will be no %s</td>
</tr>
</tbody>
</table>

- **host_or_ip**: The name of the client host if it can be resolved, or the IP address otherwise.
- **host_or_ip_length**: The length of **host_or_ip** in bytes.

The **auth_simple** main function, **auth_simple_server()**, reads the password (a null-terminated string) from the client and succeeds if the password is nonempty (first byte not null):

```c
static int auth_simple_server (MYSQL_PLUGIN_VIO *vio,
                                MYSQL_SERVER_AUTH_INFO *info)
{
    unsigned char *pkt;
    int pkt_len;

    /* read the password as null-terminated string, fail on error */
    if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
        return CR_ERROR;

    /* fail on empty password */
    if (!pkt_len || *pkt == '\0')
    {
        info->password_used= PASSWORD_USED_NO;
        return CR_ERROR;
    }

    /* accept any nonempty password */
    info->password_used= PASSWORD_USED_YES;

    return CR_OK;
}
```

The main function should return one of the error codes shown in the following table.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CR_OK</td>
<td>Success</td>
</tr>
<tr>
<td>CR_OK_HANDSHAKE_COMPLETE</td>
<td>Do not send a status packet back to client</td>
</tr>
<tr>
<td>CR_ERROR</td>
<td>Error</td>
</tr>
<tr>
<td>CR_AUTH_USER_CREDENTIALS</td>
<td>Authentication failure</td>
</tr>
<tr>
<td>CR_AUTH_HANDSHAKE</td>
<td>Authentication handshake failure</td>
</tr>
<tr>
<td>CR_AUTH_PLUGIN_ERROR</td>
<td>Internal plugin error</td>
</tr>
</tbody>
</table>

For an example of how the handshake works, see the plugin/auth/dialog.c source file.

The server counts plugin errors in the Performance Schema **host_cache** table.

**auth_simple_server()** is so basic that it does not use the authentication information structure except to set the member that indicates whether a password was received.

A plugin that supports proxy users must return to the server the name of the proxied user (the MySQL user whose privileges the client user should get). To do this, the plugin must set the **info->authenticated_as** member to the proxied user name. For information about proxying, see Section 6.2.18, “Proxy Users”, and Implementing Proxy User Support in Authentication Plugins.
The `generate_authentication_string` member of the plugin descriptor takes the password and generates a password hash (digest) from it:

- The first two arguments are pointers to the output buffer and its maximum length in bytes. The function should write the password hash to the output buffer and reset the length to the actual hash length.
- The second two arguments indicate the password input buffer and its length in bytes.
- The function returns 0 for success, 1 if an error occurred.

For the `auth_simple` plugin, the `generate_auth_string_hash()` function implements the `generate_authentication_string` member. It just makes a copy of the password, unless it is too long to fit in the output buffer:

```c
#include <string.h>

int generate_auth_string_hash(char *outbuf, unsigned int *buflen,
                                         const char *inbuf, unsigned int inbuflen)
{
    /* fail if buffer specified by server cannot be copied to output buffer */
    if (*buflen < inbuflen)
        return 1; /* error */
    strncpy(outbuf, inbuf, inbuflen);
    *buflen= strlen(inbuf);
    return 0;     /* success */
}
```

The `validate_authentication_string` member of the plugin descriptor validates a password hash:

- The arguments are a pointer to the password hash and its length in bytes.
- The function returns 0 for success, 1 if the password hash cannot be validated.

For the `auth_simple` plugin, the `validate_auth_string_hash()` function implements the `validate_authentication_string` member. It returns success unconditionally:

```c
#include <string.h>

int validate_auth_string_hash(char* const inbuf __attribute__((unused)),
                                         unsigned int buflen __attribute__((unused)))
{
    return 0;     /* success */
}
```

The `set_salt` member of the plugin descriptor is used only by the `mysql_native_password` plugin (see Section 6.4.1.1, “Native Pluggable Authentication”). For other authentication plugins, you can use this trivial implementation:

```c
int set_salt(const char* password __attribute__((unused)),
             unsigned int password_len __attribute__((unused)),
             unsigned char* salt __attribute__((unused)),
             unsigned char* salt_len)
{
    *salt_len= 0;
    return 0;     /* success */
}
```

The `authentication_flags` member of the plugin descriptor contains flags that affect plugin operation. The permitted flags are:

- `AUTH_FLAG_PRIVILEGED_USER_FOR_PASSWORD_CHANGE`: Credential changes are a privileged operation. If this flag is set, the server requires that the user has the global `CREATE USER` privilege or the `UPDATE` privilege for the `mysql` database.
Writing Plugins

- **AUTH_FLAG_USES_INTERNAL_STORAGE**: Whether the plugin uses internal storage (in the `authentication_string` column of `mysql.user` rows). If this flag is not set, attempts to set the password fail and the server produces a warning.

Writing the Client-Side Authentication Plugin

Declare the client-side plugin descriptor with the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros (see Client Plugin Descriptors). For the `auth_simple` plugin, the descriptor looks like this:

```c
mysql_declare_client_plugin(AUTHENTICATION)
"auth_simple",       /* plugin name */
"Author Name",       /* author */
"Any-password authentication plugin", /* description */
{1,0,0},             /* version = 1.0.0 */
"GPL",               /* license type */
NULL,                /* for internal use */
NULL,                /* no init function */
NULL,                /* no deinit function */
NULL,                /* no option-handling function */
auth_simple_client   /* main function */
mysql_end_client_plugin;
```

The descriptor members from the plugin name through the option-handling function are common to all client plugin types. (For descriptions, see Client Plugin Descriptors.) Following the common members, the descriptor has an additional member specific to authentication plugins. This is the “main” function, which handles communication with the server. The function takes two arguments representing an I/O structure and a connection handler. For our simple any-password plugin, the main function does nothing but write to the server the password provided by the user:

```c
static int auth_simple_client (MYSQL_PLUGIN_VIO *vio, MYSQL *mysql)
{
    int res;

    /* send password as null-terminated string as cleartext */
    res= vio->write_packet(vio, (const unsigned char *) mysql->passwd,
                          strlen(mysql->passwd) + 1);

    return res ? CR_ERROR : CR_OK;
}
```

The main function should return one of the error codes shown in the following table.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CR_OK</td>
<td>Success</td>
</tr>
<tr>
<td>CR_OK_HANDSHAKE_COMPLETE</td>
<td>Success, client done</td>
</tr>
<tr>
<td>CR_ERROR</td>
<td>Error</td>
</tr>
</tbody>
</table>

**CR_OK_HANDSHAKE_COMPLETE** indicates that the client has done its part successfully and has read the last packet. A client plugin may return **CR_OK_HANDSHAKE_COMPLETE** if the number of round trips in the authentication protocol is not known in advance and the plugin must read another packet to determine whether authentication is finished.

Using the Authentication Plugins

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).
Register the server-side plugin with the server. For example, to load the plugin at server startup, use a `--plugin-load=auth_simple.so` option (adjust the `.so` suffix for your platform as necessary).

Create a user for whom the server will use the `auth_simple` plugin for authentication:

```
mysql> CREATE USER 'x'@'localhost'
    -> IDENTIFIED WITH auth_simple;
```

Use a client program to connect to the server as user `x`. The server-side `auth_simple` plugin communicates with the client program that it should use the client-side `auth_simple` plugin, and the latter sends the password to the server. The server plugin should reject connections that send an empty password and accept connections that send a nonempty password. Invoke the client program each way to verify this:

```
shell> mysql --user=x --skip-password
ERROR 1045 (28000): Access denied for user 'x'@'localhost' (using password: NO)
shell> mysql --user=x --password
Enter password: abc
mysql>
```

Because the server plugin accepts any nonempty password, it should be considered insecure. After testing the plugin to verify that it works, restart the server without the `--plugin-load` option so as not to inadvertently leave the server running with an insecure authentication plugin loaded. Also, drop the user with `DROP USER 'x'@'localhost'`.

For additional information about loading and using authentication plugins, see Section 5.6.1, “Installing and Uninstalling Plugins”, and Section 6.2.17, “Pluggable Authentication”.

If you are writing a client program that supports the use of authentication plugins, normally such a program causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```c
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";
/* ... process command-line options ... */
mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See Section 28.6.16, “C API Client Plugin Functions”.

### Implementing Proxy User Support in Authentication Plugins

One of the capabilities that pluggable authentication makes possible is proxy users (see Section 6.2.18, “Proxy Users”). For a server-side authentication plugin to participate in proxy user support, these conditions must be satisfied:

- When a connecting client should be treated as a proxy user, the plugin must return a different name in the `authenticated_as` member of the `MYSQL_SERVER_AUTH_INFO` structure, to indicate the proxied user name. It may also optionally set the `external_user` member, to set the value of the `external_user` system variable.

- Proxy user accounts must be set up to be authenticated by the plugin. Use the `CREATE USER` or `GRANT` statement to associate accounts with plugins.
Writing Plugins

- Proxy user accounts must have the **PROXY** privilege for the proxied accounts. Use the **GRANT** statement to grant this privilege.

In other words, the only aspect of proxy user support required of the plugin is that it set `authenticated_as` to the proxied user name. The rest is optional (setting `external_user`) or done by the DBA using SQL statements.

How does an authentication plugin determine which proxied user to return when the proxy user connects? That depends on the plugin. Typically, the plugin maps clients to proxied users based on the authentication string passed to it by the server. This string comes from the `AS` part of the `IDENTIFIED WITH` clause of the `CREATE USER` statement that specifies use of the plugin for authentication.

The plugin developer determines the syntax rules for the authentication string and implements the plugin according to those rules. Suppose that a plugin takes a comma-separated list of pairs that map external users to MySQL users. For example:

```
CREATE USER ''@'%.example.com'
  IDENTIFIED WITH my_plugin AS 'extuser1=mysqlusera, extuser2=mysqluserb'
CREATE USER ''@'%.example.org'
  IDENTIFIED WITH my_plugin AS 'extuser1=mysqluserc, extuser2=mysqluserd'
```

When the server invokes a plugin to authenticate a client, it passes the appropriate authentication string to the plugin. The plugin is responsible to:

1. Parse the string into its components to determine the mapping to use
2. Compare the client user name to the mapping
3. Return the proper MySQL user name

For example, if `extuser2` connects from an `example.com` host, the server passes `'extuser1=mysqlusera, extuser2=mysqluserb'` to the plugin, and the plugin should copy `mysqluserb` into `authenticated_as`, with a terminating null byte. If `extuser2` connects from an `example.org` host, the server passes `'extuser1=mysqluserc, extuser2=mysqluserd'`, and the plugin should copy `mysqluserd` instead.

If there is no match in the mapping, the action depends on the plugin. If a match is required, the plugin likely will return an error. Or the plugin might simply return the client name; in this case, it should not change `authenticated_as`, and the server will not treat the client as a proxy.

The following example demonstrates how to handle proxy users using a plugin named `auth_simple_proxy`. Like the `auth_simple` plugin described earlier, `auth_simple_proxy` accepts any nonempty password as valid (and thus should not be used in production environments). In addition, it examines the `auth_string` authentication string member and uses these very simple rules for interpreting it:

- If the string is empty, the plugin returns the user name as given and no proxying occurs. That is, the plugin leaves the value of `authenticated_as` unchanged.

- If the string is nonempty, the plugin treats it as the name of the proxied user and copies it to `authenticated_as` so that proxying occurs.

For testing, set up one account that is not proxied according to the preceding rules, and one that is. This means that one account has no `AS` clause, and one includes an `AS` clause that names the proxied user:

```
CREATE USER 'plugin_user1'@'localhost'
  IDENTIFIED WITH auth_simple_proxy;
CREATE USER 'plugin_user2'@'localhost'
```

IDENTIFIED WITH auth_simple_proxy AS 'proxied_user';

In addition, create an account for the proxied user and grant plugin_user2 the PROXY privilege for it:

CREATE USER 'proxied_user'@'localhost'
IDENTIFIED BY 'proxied_user_pass';
GRANT PROXY
ON 'proxied_user'@'localhost'
TO 'plugin_user2'@'localhost';

Before the server invokes an authentication plugin, it sets authenticated_as to the client user name. To indicate that the user is a proxy, the plugin should set authenticated_as to the proxied user name. For auth_simple_proxy, this means that it must examine the auth_string value, and, if the value is nonempty, copy it to the authenticated_as member to return it as the name of the proxied user. In addition, when proxying occurs, the plugin sets the external_user member to the client user name; this becomes the value of the external_user system variable.

```c
static int auth_simple_proxy_server (MYSQL_PLUGIN_VIO *vio, MYSQL_SERVER_AUTH_INFO *info)
{
    unsigned char *pkt;
    int pkt_len;

    /* read the password as null-terminated string, fail on error */
    if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
        return CR_ERROR;

    /* fail on empty password */
    if (!pkt_len || *pkt == '\0')
    {
        info->password_used= PASSWORD_USED_NO;
        return CR_ERROR;
    }

    /* accept any nonempty password */
    info->password_used= PASSWORD_USED_YES;

    /* if authentication string is nonempty, use as proxied user name */
    /* and use client name as external_user value */
    if (info->auth_string_length > 0)
    {
        strcpy (info->authenticated_as, info->auth_string);
        strcpy (info->external_user, info->user_name);
    }

    return CR_OK;
}
```

After a successful connection, the USER() function should indicate the connecting client user and host name, and CURRENT_USER() should indicate the account whose privileges apply during the session. The latter value should be the connecting user account if no proxying occurs or the proxied account if proxying does occur.

Compile and install the plugin, then test it. First, connect as plugin_user1:

```
shell> mysql --user=plugin_user1 --password
Enter password: x
```

In this case, there should be no proxying:

```
mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
*************************** 1. row ***************************
USER(): plugin_user1@localhost
CURRENT_USER(): plugin_user1@localhost
```

4976
@proxy_user: NULL
@external_user: NULL

Then connect as plugin_user2:

shell> mysql --user=plugin_user2 --password
Enter password: x

In this case, plugin_user2 should be proxied to proxied_user:

mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user;

*************************** 1. row ***************************
USER(): plugin_user2@localhost
CURRENT_USER(): proxied_user@localhost
@@proxy_user: 'plugin_user2'@'localhost'
@@external_user: 'plugin_user2'@'localhost'

29.2.4.10 Writing Password-Validation Plugins

This section describes how to write a server-side password-validation plugin. The instructions are based on the source code in the plugin/password_validation directory of MySQL source distributions. The validate_password.cc source file in that directory implements the plugin named validate_password.

---

Note

In MySQL 8.0.4, the validate_password plugin was reimplemented as the validate_password component. The plugin form of validate_password is still available but is now deprecated and will be removed in a future version of MySQL. MySQL installations that use the plugin should make the transition to using the component instead. See Section 6.4.3.3, “Transitioning to the Password Validation Component”.

---

To write a password-validation plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```c
#include <mysql/plugin_validate_password.h>
```

plugin_validate_password.h includes plugin.h, so you need not include the latter file explicitly. plugin.h defines the MYSQL_VALIDATE_PASSWORD_PLUGIN server plugin type and the data structures needed to declare the plugin. plugin_validate_password.h defines data structures specific to password-validation plugins.

A password-validation plugin, like any MySQL server plugin, has a general plugin descriptor (see Server Plugin Library and Plugin Descriptors). In validate_password.cc, the general descriptor for validate_password looks like this:

```c
mysql_declare_plugin(validate_password)
{

MYSQL_VALIDATE_PASSWORD_PLUGIN,
 validate_password_init, validate_password_deinit,
 validate_password_system_variables,

/* type */
/* descriptor */
/* name */
/* author */
/* description */
/* init function (when loaded) */
/* deinit function (when unloaded) */
/* version */
/* system variables */
```
The name member (validate_password) indicates the name to use for references to the plugin in statements such as INSTALL PLUGIN or UNINSTALL PLUGIN. This is also the name displayed by INFORMATION_SCHEMA.PLUGINS or SHOW PLUGINS.

The general descriptor also refers to validate_password_system_variables, a structure that exposes several system variables to the SHOW VARIABLES statement:

```c
static struct st_mysql_sys_var* validate_password_system_variables[] = {
    MYSQL_SYSVAR(length),
    MYSQL_SYSVAR(number_count),
    MYSQL_SYSVAR(mixed_case_count),
    MYSQL_SYSVAR(special_char_count),
    MYSQL_SYSVAR(policy),
    MYSQL_SYSVAR(dictionary_file),
    NULL
};
```

The validate_password_init initialization function reads the dictionary file if one was specified, and the validate_password_deinit function frees data structures associated with the file.

The validate_password_descriptor value in the general descriptor points to the type-specific descriptor. For password-validation plugins, this descriptor has the following structure:

```c
struct st_mysql_validate_password
{
    int interface_version;
    /*
     * This function returns TRUE for passwords which satisfy the password
     * policy (as chosen by plugin variable) and FALSE for all other
     * password
     */
    int (*validate_password)(mysql_string_handle password);
    /*
     * This function returns the password strength (0-100) depending
     * upon the policies
     */
    int (*get_password_strength)(mysql_string_handle password);
};
```

The type-specific descriptor has these members:

- **interface_version**: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks interface_version when it loads the plugin to see whether the plugin is compatible with it. For password-validation plugins, the value of the interface_version member is MYSQL_VALIDATE_PASSWORD_INTERFACE_VERSION (defined in plugin_validate_password.h).

- **validate_password**: A function that the server calls to test whether a password satisfies the current password policy. It returns 1 if the password is okay and 0 otherwise. The argument is the password, passed as a mysql_string_handle value. This data type is implemented by the mysql_string server service. For details, see the string_service.h and string_service.cc source files in the sql directory.

- **get_password_strength**: A function that the server calls to assess the strength of a password. It returns a value from 0 (weak) to 100 (strong). The argument is the password, passed as a mysql_string_handle value.
For the validate_password plugin, the type-specific descriptor looks like this:

```c
static struct st_mysql_validate_password validate_password_descriptor=
{
    MYSQL_VALIDATE_PASSWORD_INTERFACE_VERSION,
    validate_password,                         /* validate function          */
    get_password_strength                      /* validate strength function */
};
```

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the plugin_dir system variable). For the validate_password plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of validate_password.so (the .so suffix might differ depending on your platform).

To register the plugin at runtime, use this statement (adjust the .so suffix for your platform as necessary):

```
INSTALL PLUGIN validate_password SONAME 'validate_password.so';
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the INFORMATION_SCHEMA.PLUGINS table or use the SHOW PLUGINS statement. See Section 5.6.2, “Obtaining Server Plugin Information”.

While the validate_password plugin is installed, it exposes system variables that indicate the password-checking parameters:

```sql
mysql> SHOW VARIABLES LIKE 'validate_password%';
+--------------------------------------+--------+
| Variable_name                        | Value  |
| validate_password_dictionary_file    |        |
| validate_password_length             | 8      |
| validate_password_mixed_case_count   | 1      |
| validate_password_number_count       | 1      |
| validate_password_policy             | MEDIUM |
| validate_password_special_char_count | 1      |
+--------------------------------------+--------+
```

For descriptions of these variables, see Section 6.4.3.2, “Password Validation Options and Variables”.

To disable the plugin after testing it, use this statement to unload it:

```
UNINSTALL PLUGIN validate_password;
```

### 29.2.4.11 Writing Protocol Trace Plugins

MySQL supports the use of protocol trace plugins: client-side plugins that implement tracing of communication between a client and the server that takes place using the client/server protocol.

#### Using the Test Protocol Trace Plugin

MySQL includes a test protocol trace plugin that serves to illustrate the information available from such plugins, and as a guide to writing other protocol trace plugins. To see how the test plugin works, use a MySQL source distribution; binary distributions are built with the test plugin disabled.

Enable the test protocol trace plugin by configuring MySQL with the WITH_TEST_TRACE_PLUGIN CMake option enabled. This causes the test trace plugin to be built and MySQL client programs to load it, but the plugin has no effect by default. Control the plugin using these environment variables:
Writing Plugins

- **MYSQL_TEST_TRACE_DEBUG**: Set this variable to a value other than 0 to cause the test plugin to produce diagnostic output on stderr.

- **MYSQL_TEST_TRACE_CRASH**: Set this variable to a value other than 0 to cause the test plugin to abort the client program if it detects an invalid trace event.

Caution

Diagnostic output from the test protocol trace plugin can disclose passwords and other sensitive information.

Given a MySQL installation built from source with the test plugin enabled, you can see a trace of the communication between the mysql client and the MySQL server as follows:

```shell
shell> export MYSQL_TEST_TRACE_DEBUG=1
sql> mysql
```

```
test_trace: Test trace plugin initialized
test_trace: Starting tracing in stage CONNECTING
test_trace: stage: CONNECTING, event: CONNECTING
test_trace: stage: CONNECTING, event: CONNECTED
test_trace: stage: WAIT_FOR_INIT_PACKET, event: READ_PACKET
```

arguments required. To see in detail how a trace plugin can make use of trace event information, check
the source file for the test protocol trace plugin (test_trace_plugin.cc in the libmysql directory of a
MySQL source distribution). However, note that the st_mysql_client_plugin_TRACE structure used
there differs from the structures used with the usual client plugin declaration macros. In particular, the first
two members are defined explicitly, not implicitly by declaration macros.

Several header files contain information relevant to protocol trace plugins:

• client_plugin.h: Defines the API for client plugins. This includes the client plugin descriptor and
function prototypes for client plugin C API calls (see Section 28.6.16, “C API Client Plugin Functions”).

• plugin_trace.h: Contains declarations for client-side plugins of type
MYSQL_CLIENT_TRACE_PLUGIN. It also contains descriptions of the permitted protocol stages,
transitions between stages, and the types of events permitted at each stage.

To write a protocol trace plugin, include the following header files in the plugin source file. Other MySQL or
general header files might also be needed, depending on the plugin capabilities and requirements.

#include <mysql/plugin_trace.h>
#include <mysql.h>

plugin_trace.h includes client_plugin.h, so you need not include the latter file explicitly.

Declare the client-side plugin descriptor with the mysql_declare_client_plugin() and
mysql_end_client_plugin macros (see Client Plugin Descriptors). For the simple_trace plugin, the
descriptor looks like this:

mysql_declare_client_plugin(TRACE)
   "simple_trace",                /* plugin name */
   "Author Name",                  /* author */
   "Simple protocol trace plugin", /* description */
   {1,0,0},                        /* version = 1.0.0 */
   "GPL",                          /* license type */
   NULL,                           /* for internal use */
   plugin_init,                    /* initialization function */
   plugin_deinit,                  /* deinitialization function */
   plugin_options,                 /* option-handling function */
   trace_start,                    /* start-trace function */
   trace_stop,                     /* stop-trace function */
   trace_event                     /* event-handling function */
mysql_end_client_plugin;

The descriptor members from the plugin name through the option-handling function are common to all
client plugin types. The members following the common members implement trace event handling.

Function members for which the plugin needs no processing can be declared as NULL in the descriptor,
in which case you need not write any corresponding function. For illustration purposes and to show the
argument syntax, the following discussion implements all functions listed in the descriptor, even though
some of them do nothing.

The initialization, deinitialization, and options functions common to all client plugins are declared as follows.
For a description of the arguments and return values, see Client Plugin Descriptors.

static int
plugin_init(char *errbuf, size_t errbuf_len, int argc, va_list args)
{
   return 0;
}

static int
plugin_deinit()
The trace-specific members of the client plugin descriptor are callback functions. The following descriptions provide more detail on how they are used. Each has a first argument that is a pointer to the plugin instance in case your implementation needs to access it.

**trace_start()**: This function is called at the start of each traced connection (each connection that starts after the plugin is loaded). It is passed the connection handler and the protocol stage at which tracing starts. `trace_start()` allocates memory needed by the `trace_event()` function, if any, and returns a pointer to it. If no memory is needed, this function returns `NULL`.

```c
static void*
trace_start(struct st_mysql_client_plugin_TRACE *self,
            MYSQL *conn,
            enum protocol_stage stage)
{
    struct st_trace_data *plugin_data = malloc(sizeof(struct st_trace_data));
    if (plugin_data)
    {
        memset(plugin_data, 0, sizeof(struct st_trace_data));
        fprintf(stderr, "Initializing trace: stage %d\n", stage);
        return plugin_data;
    }
    fprintf(stderr, "Could not initialize trace\n");
    exit(1);
}
```

**trace_stop()**: This function is called when tracing of the connection ends. That usually happens when the connection is closed, but can happen earlier. For example, `trace_event()` can return a nonzero value at any time and that causes tracing of the connection to terminate. `trace_stop()` is then called even though the connection has not ended.

`trace_stop()` is passed the connection handler and a pointer to the memory allocated by `trace_start()` (`NULL` if none). If the pointer is non-`NULL`, `trace_stop()` should deallocate the memory. This function returns no value.

```c
static void
trace_stop(struct st_mysql_client_plugin_TRACE *self,
           MYSQL *conn,
           void *plugin_data)
{
    fprintf(stderr, "Terminating trace\n");
    if (plugin_data)
        free(plugin_data);
}
```

**trace_event()**: This function is called for each event occurrence. It is passed a pointer to the memory allocated by `trace_start()` (`NULL` if none), the connection handler, the current protocol stage and event codes, and event data. This function returns 0 to continue tracing, nonzero if tracing should stop.

```c
static int
trace_event(struct st_mysql_client_plugin_TRACE *self,
             void *plugin_data,
```
Writing Plugins

```c
MYSQL *conn,
enum protocol_stage stage,
enum trace_event event,
struct st_trace_event_args args)
{
    fprintf(stderr, "Trace event received: stage %d, event %d\n", stage, event);
    if (event == TRACE_EVENT_DISCONNECTED)
        fprintf(stderr, "Connection closed\n");
    return 0;
}
```

The tracing framework shuts down tracing of the connection when the connection ends, so
`trace_event()` should return nonzero only if you want to terminate tracing of the connection early. Suppose that you want to trace only connections for a certain MySQL account. After authentication, you can check the user name for the connection and stop tracing if it is not the user in whom you are interested.

For each call to `trace_event()`, the `st_trace_event_args` structure contains the event data. It has this definition:

```c
struct st_trace_event_args
{
    const char           *plugin_name;
    int                   cmd;
    const unsigned char  *hdr;
    size_t                hdr_len;
    const unsigned char  *pkt;
    size_t                pkt_len;
};
```

For different event types, the `st_trace_event_args` structure contains the information described following. All lengths are in bytes. Unused members are set to 0/NULL.

**AUTH_PLUGIN event:**

`plugin_name` The name of the plugin

**SEND_COMMAND event:**

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cmd</code></td>
<td>The command code</td>
</tr>
<tr>
<td><code>hdr</code></td>
<td>Pointer to the command packet header</td>
</tr>
<tr>
<td><code>hdr_len</code></td>
<td>Length of the header</td>
</tr>
<tr>
<td><code>pkt</code></td>
<td>Pointer to the command arguments</td>
</tr>
<tr>
<td><code>pkt_len</code></td>
<td>Length of the arguments</td>
</tr>
</tbody>
</table>

Other `SEND_XXX` and `XXX RECEIVED` events:

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pkt</code></td>
<td>Pointer to the data sent or received</td>
</tr>
<tr>
<td><code>pkt_len</code></td>
<td>Length of the data</td>
</tr>
</tbody>
</table>

**PACKET_SENT event:**

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pkt_len</code></td>
<td>Number of bytes sent</td>
</tr>
</tbody>
</table>

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).

After the plugin library file is compiled and installed in the plugin directory, you can test it easily by setting the `LIBMYSQL_PLUGINS` environment variable to the plugin name, which affects any client program that uses that variable. `mysql` is one such program:

```bash
shell> export LIBMYSQL_PLUGINS=simple_trace
```
Writing Plugins

shql> mysql
Initializing trace: stage 0
Trace initialized
Trace event received: stage 0, event 1
Trace event received: stage 0, event 2
...
Welcome to the MySQL monitor. Commands end with ; or \g.
Trace event received
Trace event received
...
mysql> SELECT 1;
Trace event received: stage 4, event 12
Trace event received: stage 4, event 16
...
Trace event received: stage 8, event 14
Trace event received: stage 8, event 15
+---+
| 1 |
+---+
| 1 |
+---+
1 row in set (0.00 sec)

mysql> quit
Trace event received: stage 4, event 12
Trace event received: stage 4, event 16
Trace event received: stage 4, event 3
Connection closed
Terminating trace
Bye

To stop the trace plugin from being loaded, do this:

shell> LIBMYSQL_PLUGINS=

It is also possible to write client programs that directly load the plugin. You can tell the client where the plugin directory is located by calling mysql_options() to set the MYSQL_PLUGIN_DIR option:

char *plugin_dir = "path_to_plugin_dir";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);

Typically, the program will also accept a --plugin-dir option that enables users to override the default value.

Should a client program require lower-level plugin management, the client library contains functions that take an st_mysql_client_plugin argument. See Section 28.6.16, “C API Client Plugin Functions”.

29.2.4.12 Writing Keyring Plugins

MySQL Server supports a keyring service that enables internal server components and plugins to securely store sensitive information for later retrieval. This section describes how to write a server-side keyring plugin that can be used by service functions to perform key-management operations. For general keyring information, see Section 6.4.4, “The MySQL Keyring”.

The instructions here are based on the source code in the plugin/keyring directory of MySQL source distributions. The source files in that directory implement a plugin named keyring_file that uses a file local to the server host for data storage.

To write a keyring plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.
Writing Plugins

```
#include <mysql/plugin_keyring.h>
```

`plugin_keyring.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_KEYRING_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_keyring.h` defines data structures specific to keyring plugins.

A keyring plugin, like any MySQL server plugin, has a general plugin descriptor (see Server Plugin Library and Plugin Descriptors). In `keyring.cc`, the general descriptor for `keyring_file` looks like this:

```
mysql_declare_plugin(keyring_file)
{
    MYSQL_KEYRING_PLUGIN,     /* type                                     */
    &keyring_descriptor,      /* descriptor                               */
    "keyring_file",           /* name                                     */
    "Oracle Corporation",     /* author                                   */
    "store/fetch authentication data to/from a flat file", /* description */
    PLUGIN_LICENSE_GPL,
    keyring_init,             /* init function (when loaded)              */
    keyring_deinit,           /* deinit function (when unloaded)          */
    0x0100,                   /* version                                  */
    NULL,                     /* status variables                         */
    keyring_system_variables, /* system variables                         */
    NULL,
    0,
}
mysql_declare_plugin_end;
```

The `name` member (`keyring_file`) indicates the plugin name. This is the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The general descriptor also refers to `keyring_system_variables`, a structure that exposes a system variable to the `SHOW VARIABLES` statement:

```
static struct st_mysql_sys_var *keyring_system_variables[] = {
    MYSQL_SYSVAR(data),
    NULL
};
```

The `keyring_init` initialization function creates the data file if it does not exist, then reads it and initializes the keystore. The `keyring_deinit` function frees data structures associated with the file.

The `keyring_descriptor` value in the general descriptor points to the type-specific descriptor. For keyring plugins, this descriptor has the following structure:

```
struct st_mysql_keyring
{
    int interface_version;
    bool (*mysql_key_store)(const char *key_id, const char *key_type,
                            const char *user_id, const void *key, size_t key_len);
    bool (*mysql_key_fetch)(const char *key_id, char **key_type,
                            const char *user_id, void **key, size_t *key_len);
    bool (*mysql_key_remove)(const char *key_id, const char *user_id);
    bool (*mysql_key_generate)(const char *key_id, const char *key_type,
                                const char *user_id, size_t key_len);
};
```

The type-specific descriptor has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For keyring plugins, the value of the `interface_version` member is `MYSQL_KEYRING_INTERFACE_VERSION` (defined in `plugin_keyring.h`).

4985
• **mysql_key_store**: A function that obfuscates and stores a key in the keyring.
• **mysql_key_fetch**: A function that deobfuscates and retrieves a key from the keyring.
• **mysql_key_remove**: A function that removes a key from the keyring.
• **mysql_key_generate**: A function that generates a new random key and stores it in the keyring.

For the **keyring_file** plugin, the type-specific descriptor looks like this:

```c
static struct st_mysql_keyring keyring_descriptor=
{
    MYSQL_KEYRING_INTERFACE_VERSION,
    mysql_key_store,
    mysql_key_fetch,
    mysql_key_remove,
    mysql_key_generate
};
```

The **mysql_key_***xxx* functions implemented by a keyring plugin are analogous to the **my_key_***xxx* functions exposed by the keyring service API. For example, the **mysql_key_store** plugin function is analogous to the **my_key_store** keyring service function. For information about the arguments to keyring service functions and how they are used, see Section 29.3.2, “The Keyring Service”.

To compile and install a plugin library file, use the instructions in Section 29.2.4.3, “Compiling and Installing Plugin Libraries”. To make the library file available for use, install it in the plugin directory (the directory named by the **plugin_dir** system variable). For the **keyring_file** plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of **keyring_file.so** (the **.so** suffix might differ depending on your platform).

Keyring plugins typically are loaded early during the server startup process so that they are available to built-in plugins and storage engines that might depend on them. For **keyring_file**, use these lines in the server **my.cnf** file (adjust the **.so** suffix for your platform as necessary):

```
[mysqld]
early-plugin-load=keyring_file.so
```

For additional information about plugin loading, see Section 5.6.1, “Installing and Uninstalling Plugins”.

To verify plugin installation, examine the **INFORMATION_SCHEMA.PLUGINS** table or use the **SHOW PLUGINS** statement (see Section 5.6.2, “Obtaining Server Plugin Information”). For example:

```
mysql> SELECT PLUGIN_NAME, PLUGIN_STATUS
    FROM INFORMATION_SCHEMA.PLUGINS
    WHERE PLUGIN_NAME LIKE 'keyring%';
+--------------+---------------+
| PLUGIN_NAME  | PLUGIN_STATUS |
|--------------+---------------+
| keyring_file | ACTIVE        |
+--------------+---------------+
```

While the **keyring_file** plugin is installed, it exposes a system variable that indicates the location of the data file it uses for secure information storage:

```
mysql> SHOW VARIABLES LIKE 'keyring_file%';
+-------------------+----------------------------------+
<table>
<thead>
<tr>
<th>Variable_name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyring_file_data</td>
<td>/usr/local/mysql/keyring/keyring</td>
</tr>
</tbody>
</table>
+-------------------+----------------------------------+
```
MySQL Services for Plugins

For a description of the `keyring_file_data` variable, see Section 5.1.8, “Server System Variables”.

To disable the plugin after testing it, restart the server without an `--early-plugin-load` option that names the plugin.

29.3 MySQL Services for Plugins

MySQL server plugins have access to server “plugin services.” The plugin services interface exposes server functionality that plugins can call. It complements the plugin API and has these characteristics:

• Services enable plugins to access code inside the server using ordinary function calls. Services are also available to user-defined functions (UDFs).

• Services are portable and work on multiple platforms.

• The interface includes a versioning mechanism so that service versions supported by the server can be checked at load time against plugin versions. Versioning protects against incompatibilities between the version of a service that the server provides and the version of the service expected or required by a plugin.

• For information about plugins for testing plugin services, see the Plugins for Testing Plugin Services section of the MySQL Server Doxygen documentation, available at https://dev.mysql.com/doc/index-other.html.

The plugin services interface differs from the plugin API as follows:

• The plugin API enables plugins to be used by the server. The calling initiative lies with the server to invoke plugins. This enables plugins to extend server functionality or register to receive notifications about server processing.

• The plugin services interface enables plugins to call code inside the server. The calling initiative lies with plugins to invoke service functions. This enables functionality already implemented in the server to be used by many plugins; they need not individually implement it themselves.

To determine what services exist and what functions they provide, look in the `include/mysql` directory of a MySQL source distribution. The relevant files are:

• `plugin.h` includes `services.h`, which is the “umbrella” header that includes all available service-specific header files.

• Service-specific headers have names of the form `service_XXX.h`.

Each service-specific header should contain comments that provide full usage documentation for a given service, including what service functions are available, their calling sequences, and return values.

For developers who wish to modify the server to add a new service, see MySQL Internals: MySQL Services for Plugins.

Available services include the following:

• `get_sysvar_source`: A service that enables plugins to retrieve the source of system variable settings.

• `locking_service`: A service that implements locks with three attributes: Lock namespace, lock name, and lock mode. This locking interface is available at two levels: 1) As a C language interface, callable as a plugin service from server plugins or user-defined functions; 2) At the SQL level, as a set of user-
defined functions that map onto calls to the service routines. For more information, see Section 29.3.1, “The Locking Service”.

- **my_plugin_log_service**: A service that enables plugins to report errors and specify error messages. The server writes the messages to its error log.

- **status_variable_registration**: A service for registering status variables.

- **my_thd_scheduler**: A service for plugins to select a thread scheduler.

- **mysql_keyring**: A service for keyring storage. For more information, see Section 29.3.2, “The Keyring Service”.

- **mysql_password_policy**: A service for password validation and strength checking.

- **plugin_registry_service**: MySQL Server includes a component-based infrastructure for improving server extensibility; see Section 5.5, “MySQL Server Components”. However, MySQL plugins use an interface that predates the component interface. The plugin_registry_service enables plugins to access the component registry and its services.

- **security_context**: A service that enables plugins to examine or manipulate thread security contexts. This service provides setter and getter routines to access attributes of the server Security_context class, which includes attributes such as operating system user and host, authenticated user and host, and client IP address.

- **thd_alloc**: A memory-allocation service.

- **thd_wait**: A service for plugins to report when they are going to sleep or stall.

The remainder of this section describes how a plugin uses server functionality that is available as a service. See also the source for the “daemon” example plugin, which uses the my_snprintf service. Within a MySQL source distribution, that plugin is located in the plugin/daemon_example directory.

To use a service or services from within a plugin, the plugin source file must include the plugin.h header file to access service-related information:

```
#include <mysql/plugin.h>
```

This does not represent any additional setup cost. A plugin must include that file anyway because it contains definitions and structures that every plugin needs.

To access a service, a plugin calls service functions like any other function.

To report an error that the server will write to it error log, first choose an error level. mysql/service_my_plugin_log.h defines these levels:

```c
enum plugin_log_level
{
    MY_ERROR_LEVEL,
    MY.WARNING_LEVEL,
    MY_INFORMATION_LEVEL
};
```

Then invoke `my_plugin_log_message()`:

```c
int my_plugin_log_message(MYSQL_PLUGIN *plugin, enum plugin_log_level level, const char *format, ...);
```

For example:

```c
my_plugin_log_message(plugin_ptr, MY_ERROR_LEVEL, "Cannot initialize plugin");
```
The Locking Service

Some services for plugins may be provided by plugins and thus are available only if the service-providing plugin is loaded. Any MySQL component that uses such a service should check whether the service is available.

When you build your plugin, use the `-lmysqlservices` flag at link time to link in the `libmysqlservices` library. For example, for CMake, put this in the top-level `CMakeLists.txt` file:

```cmake
FIND_LIBRARY(MYSQLSERVICES_LIB mysqlservices
    PATHS "${MYSQL_SRCDIR}/libservices" NO_DEFAULT_PATH)
```

Put this in the `CMakeLists.txt` file in the directory containing the plugin source:

```cmake
# the plugin needs the mysql services library for error logging
TARGET_LINK_LIBRARIES (your_plugin_library_name ${MYSQLSERVICES_LIB})
```

### 29.3.1 The Locking Service

MySQL distributions provide a locking interface that is available at two levels:

- As a C language interface, callable as a plugin service from server plugins or user-defined functions
- At the SQL level, as a set of user-defined functions that map onto calls to the service routines

For general information about plugin services, see Section 29.3, “MySQL Services for Plugins”. For general information about user-defined functions, see Section 29.4.2, “Adding a User-Defined Function”.

The locking interface has these characteristics:

- Locks have three attributes: Lock namespace, lock name, and lock mode:
  - Locks are identified by the combination of namespace and lock name. The namespace enables different applications to use the same lock names without colliding by creating locks in separate namespaces. For example, if applications A and B use namespaces of `ns1` and `ns2`, respectively, each application can use lock names `lock1` and `lock2` without interfering with the other application.
  - A lock mode is either read or write. Read locks are shared: If a session has a read lock on a given lock identifier, other sessions can acquire a read lock on the same identifier. Write locks are exclusive: If a session has a write lock on a given lock identifier, other sessions cannot acquire a read or write lock on the same identifier.

- Namespace and lock names must be non-`NULL`, nonempty, and have a maximum length of 64 characters. A namespace or lock name specified as `NULL`, the empty string, or a string longer than 64 characters results in an `ER_LOCKING_SERVICE_WRONG_NAME` error.

- The locking interface treats namespace and lock names as binary strings, so comparisons are case-sensitive.

- The locking interface provides functions to acquire locks and release locks. No special privilege is required to call these functions. Privilege checking is the responsibility of the calling application.

- Locks can be waited for if not immediately available. Lock acquisition calls take an integer timeout value that indicates how many seconds to wait to acquire locks before giving up. If the timeout is reached without successful lock acquisition, an `ER_LOCKING_SERVICE_TIMEOUT` error occurs. If the timeout is 0, there is no waiting and the call produces an error if locks cannot be acquired immediately.

- The locking interface detects deadlock between lock-acquisition calls in different sessions. In this case, the locking service chooses a caller and terminates its lock-acquisition request with an `ER_LOCKING_SERVICE_DEADLOCK` error. This error does not cause transactions to roll back. To
choose a session in case of deadlock, the locking service prefers sessions that hold read locks over
sessions that hold write locks.

• A session can acquire multiple locks with a single lock-acquisition call. For a given call, lock
acquisition is atomic: The call succeeds if all locks are acquired. If acquisition of any lock fails,
the call acquires no locks and fails, typically with an ER_LOCKING_SERVICE_TIMEOUT or
ER_LOCKING_SERVICE_DEADLOCK error.

• A session can acquire multiple locks for the same lock identifier (namespace and lock name
combination). These lock instances can be read locks, write locks, or a mix of both.

• Locks acquired within a session are released explicitly by calling a release-locks function, or implicitly
when the session terminates (either normally or abnormally). Locks are not released when transactions
commit or roll back.

• Within a session, all locks for a given namespace when released are released together.

The interface provided by the locking service is distinct from that provided by GET_LOCK() and related
SQL functions (see Section 12.14, “Locking Functions”). For example, GET_LOCK() does not implement
namespaces and provides only exclusive locks, not distinct read and write locks.

29.3.1.1 The Locking Service C Interface

This section describes how to use the locking service C language interface. To use the UDF interface
instead, see Section 29.3.1.2, “The Locking Service UDF Interface” For general characteristics of the
locking service interface, see Section 29.3.1, “The Locking Service”. For general information about plugin
services, see Section 29.3, “MySQL Services for Plugins”.

Source files that use the locking service should include this header file:

```c
#include <mysql/service_locking.h>
```

To acquire one or more locks, call this function:

```c
int mysql_acquire_locking_service_locks(MYSQL_THD opaque_thd,
const char* lock_namespace,
const char**lock_names,
size_t lock_num,
enum enum_locking_service_lock_type lock_type,
unsigned long lock_timeout);
```

The arguments have these meanings:

• **opaque_thd**: A thread handle. If specified as NULL, the handle for the current thread is used.

• **lock_namespace**: A null-terminated string that indicates the lock namespace.

• **lock_names**: An array of null-terminated strings that provides the names of the locks to acquire.

• **lock_num**: The number of names in the **lock_names** array.

• **lock_type**: The lock mode, either LOCKING_SERVICE_READ or LOCKING_SERVICE_WRITE to
acquire read locks or write locks, respectively.

• **lock_timeout**: An integer number of seconds to wait to acquire the locks before giving up.

To release locks acquired for a given namespace, call this function:

```c
int mysql_release_locking_service_locks(MYSQL_THD opaque_thd,
const char* lock_namespace);
```
The Locking Service

The arguments have these meanings:

- **opaque_thd**: A thread handle. If specified as **NULL**, the handle for the current thread is used.
- **lock_namespace**: A null-terminated string that indicates the lock namespace.

Locks acquired or waited for by the locking service can be monitored at the SQL level using the Performance Schema. For details, see **Locking Service Monitoring**.

### 29.3.1.2 The Locking Service UDF Interface

This section describes how to use the locking service user-defined function (UDF) interface. To use the C language interface instead, see Section 29.3.1.1, “The Locking Service C Interface” For general characteristics of the locking service interface, see Section 29.3.1, “The Locking Service”. For general information about user-defined functions, see Section 29.4.2, “Adding a User-Defined Function”.

#### Installing or Uninstalling the UDF Locking Interface

The locking service routines described in Section 29.3.1.1, “The Locking Service C Interface” need not be installed because they are built into the server. The same is not true of the user-defined functions (UDFs) that map onto calls to the service routines: The UDFs must be installed before use. This section describes how to do that. For general information about UDF installation, see Section 5.7.1, “Installing and Uninstalling User-Defined Functions”.

The locking service UDFs are implemented in a plugin library file located in the directory named by the **plugin_dir** system variable. The file base name is **locking_service**. The file name suffix differs per platform (for example, **.so** for Unix and Unix-like systems, **.dll** for Windows).

To install the locking service UDFs, use the `CREATE FUNCTION` statement (adjust the **.so** suffix for your platform as necessary):

```sql
CREATE FUNCTION service_get_read_locks RETURNS INT
  SONAME 'locking_service.so';
CREATE FUNCTION service_get_write_locks RETURNS INT
  SONAME 'locking_service.so';
CREATE FUNCTION service_release_locks RETURNS INT
  SONAME 'locking_service.so';
```

If the UDFs are used on a master replication server, install them on all slave servers as well to avoid replication problems.

Once installed, the UDFs remain installed until uninstalled. To remove them, use the `DROP FUNCTION` statement:

```sql
DROP FUNCTION service_get_read_locks;
DROP FUNCTION service_get_write_locks;
DROP FUNCTION service_release_locks;
```

#### Using the UDF Locking Interface

Before using the locking service UDFs, install them according to the instructions provided at Installing or Uninstalling the UDF Locking Interface.

To acquire one or more read locks, call this function:

```sql
mysql> SELECT service_get_read_locks('mynamespace', 'rlock1', 'rlock2', 10);
```

<table>
<thead>
<tr>
<th>service_get_read_locks('mynamespace', 'rlock1', 'rlock2', 10)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
</tbody>
</table>
The Locking Service

The first argument is the lock namespace. The final argument is an integer timeout indicating how many seconds to wait to acquire the locks before giving up. The arguments in between are the lock names.

For the example just shown, the function acquires locks with lock identifiers \((\text{mynamespace}, \text{rlock1})\) and \((\text{mynamespace}, \text{rlock2})\).

To acquire write locks rather than read locks, call this function:

```
mysql> SELECT service_get_write_locks('mynamespace', 'wlock1', 'wlock2', 10);
```

In this case, the lock identifiers are \((\text{mynamespace}, \text{wlock1})\) and \((\text{mynamespace}, \text{wlock2})\).

To release all locks for a namespace, use this function:

```
mysql> SELECT service_release_locks('mynamespace');
```

Each locking function returns nonzero for success. If the function fails, an error occurs. For example, the following error occurs because lock names cannot be empty:

```
mysql> SELECT service_get_read_locks('mynamespace', '', 10);
ERROR 3131 (42000): Incorrect locking service lock name ''. 
```

A session can acquire multiple locks for the same lock identifier. As long as a different session does not have a write lock for an identifier, the session can acquire any number of read or write locks. Each lock request for the identifier acquires a new lock. The following statements acquire three write locks with the same identifier, then three read locks for the same identifier:

```
SELECT service_get_write_locks('ns', 'lock1', 'lock1', 'lock1', 0);
SELECT service_get_read_locks('ns', 'lock1', 'lock1', 'lock1', 0);
```

If you examine the Performance Schema `metadata_locks` table at this point, you will find that the session holds six distinct locks with the same \((\text{ns}, \text{lock1})\) identifier. (For details, see Locking Service Monitoring.)

Because the session holds at least one write lock on \((\text{ns}, \text{lock1})\), no other session can acquire a lock for it, either read or write. If the session held only read locks for the identifier, other sessions could acquire read locks for it, but not write locks.

Locks for a single lock-acquisition call are acquired atomically, but atomicity does not hold across calls. Thus, for a statement such as the following, where `service_get_write_locks()` is called once per row of the result set, atomicity holds for each individual call, but not for the statement as a whole:

```
SELECT service_get_write_locks('ns', 'lock1', 'lock2', 0) FROM t1 WHERE ... ;
```

\[\textbf{Caution}\]

Because the locking service returns a separate lock for each successful request for a given lock identifier, it is possible for a single statement to acquire a large number of locks. For example:
The Locking Service

| INSERT INTO ... SELECT service_get_write_locks('ns', t1.col_name, 0) FROM t1; |

These types of statements may have certain adverse effects. For example, if the statement fails part way through and rolls back, locks acquired up to the point of failure will still exist. If the intent is for there to be a correspondence between rows inserted and locks acquired, that intent will not be satisfied. Also, if it is important that locks are granted in a certain order, be aware that result set order may differ depending on which execution plan the optimizer chooses. For these reasons, it may be best to limit applications to a single lock-acquisition call per statement.

Locking Service Monitoring

The locking service is implemented using the MySQL Server metadata locks framework, so you monitor locking service locks acquired or waited for by examining the Performance Schema `metadata_locks` table.

First, enable the metadata lock instrument:

```
mysql> UPDATE performance_schema.setup_instruments SET ENABLED = 'YES'
-> WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

Then acquire some locks and check the contents of the `metadata_locks` table:

```
mysql> SELECT service_get_write_locks('mynamespace', 'lock1', 0);
+----------------------------------------------------+
| service_get_write_locks('mynamespace', 'lock1', 0) |
+----------------------------------------------------+
|                                                  1 |
+----------------------------------------------------+

mysql> SELECT service_get_read_locks('mynamespace', 'lock2', 0);
+---------------------------------------------------+
| service_get_read_locks('mynamespace', 'lock2', 0) |
+---------------------------------------------------+
|                                                 1 |
+---------------------------------------------------+

mysql> SELECT OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME, LOCK_TYPE, LOCK_STATUS
-> FROM performance_schema.metadata_locks
-> WHERE OBJECT_TYPE = 'LOCKING SERVICE';
```

```
*************************** 1. row ***************************
OBJECT_TYPE: LOCKING SERVICE
OBJECT_SCHEMA: mynamespace
OBJECT_NAME: lock1
LOCK_TYPE: EXCLUSIVE
LOCK_STATUS: GRANTED

*************************** 2. row ***************************
OBJECT_TYPE: LOCKING SERVICE
OBJECT_SCHEMA: mynamespace
OBJECT_NAME: lock2
LOCK_TYPE: SHARED
LOCK_STATUS: GRANTED
```

Locking service locks have an `OBJECT_TYPE` value of `LOCKING SERVICE`. This is distinct from, for example, locks acquired with the `GET_LOCK()` function, which have an `OBJECT_TYPE` of `USER LEVEL LOCK`.

The lock namespace, name, and mode appear in the `OBJECT_SCHEMA`, `OBJECT_NAME`, and `LOCK_TYPE` columns. Read and write locks have `LOCK_TYPE` values of `SHARED` and `EXCLUSIVE`, respectively.

The `LOCK_STATUS` value is `GRANTED` for an acquired lock, `PENDING` for a lock that is being waited for. You will see `PENDING` if one session holds a write lock and another session is attempting to acquire a lock having the same identifier.
The Keyring Service

## Locking Service UDF Interface Reference

The SQL interface to the locking service implements the user-defined functions described in this section. For usage examples, see Using the UDF Locking Interface.

The functions share these characteristics:

- The return value is nonzero for success. Otherwise, an error occurs.
- Namespace and lock names must be non-NULL, nonempty, and have a maximum length of 64 characters.
- Timeout values must be integers indicating how many seconds to wait to acquire locks before giving up with an error. If the timeout is 0, there is no waiting and the function produces an error if locks cannot be acquired immediately.

These locking service UDFs are available:

- `service_get_read_locks(namespace, lock_name[, lock_name] ...[, timeout])`
  Acquires one or more read (shared) locks in the given namespace using the given lock names, timing out with an error if the locks are not acquired within the given timeout value.

- `service_get_write_locks(namespace, lock_name[, lock_name] ...[, timeout])`
  Acquires one or more write (exclusive) locks in the given namespace using the given lock names, timing out with an error if the locks are not acquired within the given timeout value.

- `service_release_locks(namespace)`
  For the given namespace, releases all locks that were acquired within the current session using `service_get_read_locks()` and `service_get_write_locks()`.

  It is not an error for there to be no locks in the namespace.

### 29.3.2 The Keyring Service

MySQL Server supports a keyring service that enables internal server components and plugins to securely store sensitive information for later retrieval. This section describes how to use the keyring service functions to store, retrieve, and remove keys in the MySQL keyring keystore. An SQL interface to the keyring service functions is also available as a set of user-defined functions (UDFs); see Section 6.4.4.9, “General-Purpose Keyring Key-Management Functions”. For general keyring information, see Section 6.4.4, “The MySQL Keyring”.

The keyring service uses whatever underlying keyring plugin is enabled, if any. If no keyring plugin is enabled, keyring service calls fail.

A “record” in the keystore consists of data (the key itself) and a unique identifier through which the key is accessed. The identifier has two parts:

- **key_id**: The key ID or name. `key_id` values that begin with `mysql_` are reserved by MySQL Server.
- **user_id**: The session effective user ID. If there is no user context, this value can be `NULL`. The value need not actually be a “user”; the meaning depends on the application.

Functions that implement the keyring UDF interface pass the value of `CURRENT_USER()` as the `user_id` value to keyring service functions.
The keyring service functions have these characteristics in common:

- Each function returns 0 for success, 1 for failure.
- The `key_id` and `user_id` arguments form a unique combination indicating which key in the keyring to use.
- The `key_type` argument provides additional information about the key, such as its encryption method or intended use.
- Keyring service functions treat key IDs, user names, types, and values as binary strings, so comparisons are case sensitive. For example, IDs of `MyKey` and `mykey` refer to different keys.

These keyring service functions are available:

- `my_key_fetch()`
  Deobfuscates and retrieves a key from the keyring, along with its type. The function allocates the memory for the buffers used to store the returned key and key type. The caller should zero or obfuscate the memory when it is no longer needed, then free it.

  **Syntax:**
  ```c
  bool my_key_fetch(const char *key_id, const char **key_type,
                   const char* user_id, void **key, size_t *key_len)
  ```

  **Arguments:**
  - `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier indicating which key to fetch.
  - `key_type`: The address of a buffer pointer. The function stores into it a pointer to a null-terminated string that provides additional information about the key (stored when the key was added).
  - `key`: The address of a buffer pointer. The function stores into it a pointer to the buffer containing the fetched key data.
  - `key_len`: The address of a variable into which the function stores the size in bytes of the `*key` buffer.

  **Return value:**
  Returns 0 for success, 1 for failure.

- `my_key_generate()`
  Generates a new random key of a given type and length and stores it in the keyring. The key has a length of `key_len` and is associated with the identifier formed from `key_id` and `user_id`. The type and length values must be consistent with the values supported by the underlying keyring plugin. See Section 6.4.4.8, “Supported Keyring Key Types and Lengths”.

  **Syntax:**
  ```c
  bool my_key_generate(const char *key_id, const char *key_type,
                       const char *user_id, size_t key_len)
  ```

  **Arguments:**
  - `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be generated.
• **key_type**: A null-terminated string that provides additional information about the key.

• **key_len**: The size in bytes of the key to be generated.

Return value:

Returns 0 for success, 1 for failure.

• **my_key_remove()**

Removes a key from the keyring.

Syntax:

```c
bool my_key_remove(const char *key_id, const char* user_id)
```

Arguments:

• **key_id, user_id**: Null-terminated strings that as a pair form a unique identifier for the key to be removed.

Return value:

Returns 0 for success, 1 for failure.

• **my_key_store()**

Obfuscates and stores a key in the keyring.

Syntax:

```c
bool my_key_store(const char *key_id, const char *key_type,
                  const char* user_id, void *key, size_t key_len)
```

Arguments:

• **key_id, user_id**: Null-terminated strings that as a pair form a unique identifier for the key to be stored.

• **key_type**: A null-terminated string that provides additional information about the key.

• **key**: The buffer containing the key data to be stored.

• **key_len**: The size in bytes of the **key** buffer.

Return value:

Returns 0 for success, 1 for failure.

### 29.4 Adding Functions to MySQL

There are three ways to add functions to MySQL:

• Through the user-defined function (UDF) interface. User-defined functions are compiled as library files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See Section 13.7.4.1, “CREATE FUNCTION Syntax for User-Defined Functions”. In some cases, UDFs are included in plugin or component library files and are loaded and unloaded automatically when the plugin or component is installed or uninstalled.
features of the user-defined function interface

- by creating native (built-in) MySQL functions. Native functions are compiled into the mysqld server and become available on a permanent basis.

- by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See Section 24.2, “Using Stored Routines”.

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you need not do that.

- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.

- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add functions, they can be invoked in SQL statements just like native functions such as ABS() or SOUNDEX().

For the rules describing how the server interprets references to different kinds of functions, see Section 9.2.5, “Function Name Parsing and Resolution”.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the sql/udf_example.cc file that is provided in MySQL source distributions.

Note

The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at https://dev.mysql.com/doc/index-other.html. It is also possible to generate this content locally from a MySQL source distribution using the instructions at Section 2.9.10, “Generating MySQL Doxygen Documentation Content”.

29.4.1 Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.

- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.

- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.

- You can tell MySQL to coerce arguments to a given type before passing them to a function.

- You can indicate that a function returns NULL or that an error occurred.
29.4.2 Adding a User-Defined Function

For the UDF mechanism to work, functions must be written in C++ and your operating system must support dynamic loading. MySQL source distributions include a file `sql/udf_example.cc` that defines five UDF functions. Consult this file to see how UDF calling conventions work. The `include/mysql_com.h` header file defines UDF-related symbols and data structures, although you need not include this header file directly; it is included by `mysql.h`.

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see Section 2.9.7, "MySQL Source-Configuration Options", and Section 2.9.8, "Dealing with Problems Compiling MySQL".

To be able to use UDFs, you must link `mysqld` dynamically. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.cc` uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`).

For each function that you want to use in SQL statements, you should define corresponding C++ functions. In the following discussion, the name "xxx" is used for an example function name. To distinguish between SQL and C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C++ function call.

Note

When using C++, encapsulate your C functions within this construct:

```cpp
extern "C" { ... }
```

This ensures that your C++ function names remain readable in the completed UDF.

User-Defined Function Interface Functions

The following list describes the C++ functions that you write to implement the interface for a function named `XXX()`. The main function, `xxx()`, is required. In addition, a UDF requires at least one of the other functions described here, for reasons discussed in UDF Security Precautions.

- `xxx()`

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C++ function is shown here.
Adding a User-Defined Function

<table>
<thead>
<tr>
<th>SQL Type</th>
<th>C++ Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING</td>
<td>char *</td>
</tr>
<tr>
<td>INTEGER</td>
<td>long long</td>
</tr>
<tr>
<td>REAL</td>
<td>double</td>
</tr>
</tbody>
</table>

It is also possible to declare a DECIMAL function, but the value is returned as a string, so you should write the UDF as though it were a STRING function. ROW functions are not implemented.

- **xxx_init()**

  The initialization function for xxx(). If present, it can be used for the following purposes:

  - To check the number of arguments to xxx().
  - To verify that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the required types when the main function is called.
  - To allocate any memory required by the main function.
  - To specify the maximum length of the result.
  - To specify (for REAL functions) the maximum number of decimal places in the result.
  - To specify whether the result can be NULL.

- **xxx_deinit()**

  The deinitialization function for xxx(). If present, it should deallocate any memory allocated by the initialization function.

When an SQL statement invokes xxx(), MySQL calls the initialization function xxx_init() to let it perform any required setup, such as argument checking or memory allocation. If xxx_init() returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function xxx() once for each row. After all rows have been processed, MySQL calls the deinitialization function xxx_deinit() so that it can perform any required cleanup.

For aggregate functions that work like SUM(), you must also provide the following functions:

- **xxx_clear()**

  Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- **xxx_add()**

  Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call xxx_init() to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the GROUP BY expression.
3. Call xxx_clear() for the first row in each new group.
4. Call xxx_add() for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.

6. Repeat steps 3 to 5 until all rows have been processed.

7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not permitted to allocate any global or static variables that change! If you need memory, you must allocate it in `xxx_init()` and free it in `xxx_deinit()`.

### UDF Calling Sequences for Simple Functions

This section describes the different functions that you must define to create a simple UDF. For information about the order in which MySQL calls these functions, see User-Defined Function Interface Functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```c
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
        char *result, unsigned long *length,
        char *is_null, char *error);
```

For `INTEGER` functions:

```c
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
             char *is_null, char *error);
```

For `REAL` functions:

```c
double xxx(UDF_INIT *initid, UDF_ARGS *args,
           char *is_null, char *error);
```

`DECIMAL` functions return string values and are declared the same way as `STRING` functions. `ROW` functions are not implemented.

Declare the initialization and deinitialization functions like this:

```c
bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `bool maybe_null`

  `xxx_init()` should set `maybe_null` to `1` if `xxx()` can return `NULL`. The default value is `1` if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

  The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34, 1.345, and 1.3`, the default would be `3`, because `1.345` has `3` decimal digits.
Adding a User-Defined Function

For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals permitted for the `DECIMAL`, `FLOAT`, and `DOUBLE` data types. This value is available as the constant `NOT_FIXED_DEC` in the `mysql_com.h` header file.

A `decimals` value of 31 is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10,3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other nonnumber arguments that might be converted within the function to numeric form.

The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is `NOT_FIXED_DEC` for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```c
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `bool const_item`

`xxx_init()` should set `const_item` to 1 if `xxx()` always returns the same value and to 0 otherwise.

**UDF Calling Sequences for Aggregate Functions**

This section describes the different functions that you need to define when you create an aggregate UDF. For information about the order in which MySQL calls these functions, see User-Defined Function Interface Functions.

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```c
void xxx_reset(UDF_INIT *initid, UDF_ARGS *args, char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 8.0, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in
Adding a User-Defined Function

many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

• `xxx_clear()`

  This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

  ```c
  void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
  ```

  `is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

  If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

  `xxx_clear()` is required by MySQL 8.0.

• `xxx_add()`

  This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

  ```c
  void xxx_add(UDF_INIT *initid, UDF_ARGS *args, char *is_null, char *error);
  ```

  The `xxx()` function for an aggregate UDF should be declared the same way as for a nonaggregate UDF. See UDF Calling Sequences for Simple Functions.

  For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

  Return value handling in `xxx()` should be done the same way as for a nonaggregate UDF. See UDF Return Values and Error Handling.

  The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for nonaggregate UDFs. See UDF Argument Processing.

  The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

  `*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

  If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

• `unsigned int arg_count`

  The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

  ```c
  if (args->arg_count != 2)
  ```
```c
strcpy(message, "XXX() requires two arguments");
return 1;
```

For other UDF_ARGS member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to args->arg_count - 1.

- **enum Item_result *arg_type**

A pointer to an array containing the types for each argument. The possible type values are STRING_RESULT, INT_RESULT, REAL_RESULT, and DECIMAL_RESULT.

To make sure that arguments are of a given type and return an error if they are not, check the arg_type array in the initialization function. For example:

```c
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message, "XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type DECIMAL_RESULT are passed as strings, so you handle them the same way as STRING_RESULT values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the arg_type elements to the types you want. This causes MySQL to coerce arguments to those types for each call to xxx(). For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in xxx_init():

```c
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as 1.3 or DECIMAL column values are passed with a type of DECIMAL_RESULT. However, the values are passed as strings. To receive a number, use the initialization function to specify that the argument should be coerced to a REAL_RESULT value:

```c
args->arg_type[2] = REAL_RESULT;
```

- **char ***args**

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument i, `args->args[i]` points to the argument value. (See later for instructions on how to access the value properly.) For a nonconstant argument, `args->args[i]` is 0. A constant argument is an expression that uses only constants, such as 3 or 4*7-2 or SIN(3.14). A nonconstant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with nonconstant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument i represents NULL, `args->args[i]` is a null pointer (0). If the argument is not NULL, functions can refer to it as follows:

- An argument of type STRING_RESULT is given as a string pointer plus a length, to enable handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.

For additional information about string arguments, see User-Defined Function Character Set Handling.
Adding a User-Defined Function

- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:
  
  ```c
  long long int_val;
  int_val = *((long long*) args->args[i]);
  ```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:
  
  ```c
  double real_val;
  real_val = *((double*) args->args[i]);
  ```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.

- `ROW_RESULT` arguments are not implemented.

- `unsigned long *lengths`

  For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

  For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

  `args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

  By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

  Suppose that a UDF `my_udf()` is invoked as follows:
  
  ```sql
  SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
  ```

  In this case, the `attributes` and `attribute_lengths` arrays will have these values:
  
  ```c
  args->attributes[0] = "expr1"
  args->attribute_lengths[0] = 5
  args->attributes[1] = "alias1"
  args->attribute_lengths[1] = 6
  args->attributes[2] = "alias2"
  args->attribute_lengths[2] = 6
  ```

- `unsigned long *attribute_lengths`

  The `attribute_lengths` array indicates the length of each argument name.

UDF Return Values and Error Handling
Adding a User-Defined Function

The initialization function should return 0 if no error occurred and 1 otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long. Try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```c
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function using the `result` parameter. This buffer is sufficiently long to hold 255 characters, which can be multibyte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in the `xxx_init()` function or the `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See UDFCallingSequencesforSimpleFunctions.

For additional information about string arguments, see User-Defined Function Character Set Handling.

To indicate a return value of `NULL` in the main function, set `*is_null` to 1:

```c
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to 1:

```c
*error = 1;
```

If `xxx()` sets `*error` to 1 for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

**User-Defined Function Character Set Handling**

Prior to MySQL 8.0.19, user-defined functions (UDFs) take no account of the character set or collation of string arguments or return values. In effect, string arguments and return values are treated as binary strings, with the implication that only string arguments containing single-byte characters can be handled reliably.

As of MySQL 8.0.19, UDF behavior is still the same by default, but the interface for writing UDFs has been extended to enable UDFs to determine the character set and collation of string arguments, and to return strings that have a particular character set and collation. These capabilities are optional for UDF writers, who may take advantage of them as desired.

Of the UDFs distributed with MySQL, those associated with the following features and extensions have been modified to take advantage of the character-set capabilities: MySQL Enterprise Audit, MySQL Enterprise Firewall, MySQL Enterprise Data Masking and De-Identification, MySQL Keyring (the general-purpose keyring UDFs only), and Group Replication. The modification applies only where it make sense. For example, a UDF that returns encrypted data is intended to return a binary string, not a character string.

Character-set capabilities for UDFs are implemented using the `mysql_udf_metadata` server component service. For information about this service, see the MySQL Server Doxygen documentation, available at https://dev.mysql.com/doc/index-other.html (search for `s_mysql_mysql_udf_metadata` and...
Adding a User-Defined Function

udf_metadata_imp). Source code for the MySQL Keyring UDFs is available in Community source distributions and may be examined as examples for third-party UDF writers who wish to modify their own UDFs to be character set-aware.

If a UDF takes string arguments or returns a string value and is modified to be character set-aware, the following compatibility considerations apply:

• With respect to the arguments they pass to the UDF, applications will continue to work because the UDF is now capable of handling string arguments in any character set, including binary strings.

• If a UDF is to return a string result in a character set different from the character set of its arguments, the UDF must perform the character set conversion internally. For example, this is the case if a UDF accepts latin1 arguments but returns a utf8mb4 result.

UDF Compiling and Installing

Files implementing UDFs must be compiled and installed on the host where the server runs. The process is described here for the example UDF file sql/udf_example.cc that is included in MySQL source distributions. For additional information about UDF installation, see Section 5.7.1, “Installing and Uninstalling User-Defined Functions”.

If a UDF will be referred to in statements that will be replicated to slave servers, you must ensure that every slave also has the function available. Otherwise, replication fails on the slaves when they attempt to invoke the function.

The udf_example.cc file contains the following functions:

• metaphon() returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.

• myfunc_double() returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.

• myfunc_int() returns the sum of the length of its arguments.

• sequence([const int]) returns a sequence starting from the given number or 1 if no number has been given.

• lookup() returns the IP address for a host name.

• reverse_lookup() returns the host name for an IP address. The function may be called either with a single string argument of the form 'xxx.xxx.xxx.xxx' or with four numbers.

• avgcost() returns an average cost. This is an aggregate function.

On Unix and Unix-like systems, compile user-defined functions using the following procedure:

A dynamically loadable file should be compiled as a sharable library file, using a command something like this:

```bash
gcc -shared -o udf_example.so udf_example.cc
```

If you are using gcc with CMake (which is how MySQL itself is configured), you should be able to create udf_example.so with a simpler command:

```bash
make udf_example
```

After compiling a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from udf_example.cc using gcc directly produces a file named udf_example.so. Copy
Adding a User-Defined Function

the shared object to the server's plugin directory and name it udf_example.so. This directory is given by the value of the plugin_dir system variable.

On some systems, the ldconfig program that configures the dynamic linker does not recognize a shared object unless its name begins with lib. In this case you should rename a file such as udf_example.so to libudf_example.so.

On Windows, compile user-defined functions using the following procedure:

1. Obtain a MySQL source distribution. See Section 2.1.2, “How to Get MySQL”.

2. Obtain the CMake build utility, if necessary, from http://www.cmake.org. (Version 2.6 or later is required).

3. In the source tree, look in the sql directory for files named udf_example.def and udf_example.cc. Copy both files from this directory to your working directory.

4. Create a CMake makefile (CMakeLists.txt) with these contents:

   ```
   PROJECT(udf_example)
   # Path for MySQL include directory
   INCLUDE_DIRECTORIES("c:/mysql/include")
   ADD_DEFINITIONS("-DHAVE_DLOPEN")
   ADD_LIBRARY(udf_example MODULE udf_example.cc udf_example.def)
   TARGET_LINK_LIBRARIES(udf_example wsock32)
   ```

5. Create the VC project and solution files, substituting an appropriate generator value:

   ```
   cmake -G "generator"
   ```
   Invoking cmake --help shows you a list of valid generators.

6. Create udf_example.dll:

   ```
   devenv udf_example.sln /build Release
   ```

On all platforms, after the shared library file has been copied to the plugin_dir directory, notify mysqld about the new functions with the following statements. The file name suffix differs per platform (for example, .so for Unix and Unix-like systems, .dll for Windows), so adjust the .so suffix for your platform as necessary.

```sql
CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.so';
CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.so';
CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.so';
CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.so';
CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.so';
CREATE FUNCTION reverse_lookup RETURNS STRING SONAME 'udf_example.so';
CREATE AGGREGATE FUNCTION avgcost RETURNS REAL SONAME 'udf_example.so';
```

Once installed, a function remains installed until it is uninstalled.

To remove functions, use DROP FUNCTION:
Adding a Native Function

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` table in the `mysql` system database that serves as a UDF registry. The function's name, type and shared library name are saved in the `mysql.func` table. To create functions, you must have the `INSERT` privilege for the `mysql` database. To drop functions, you must have the `DELETE` privilege for the `mysql` database.

You cannot use `CREATE FUNCTION` to reinstall a function that has previously been installed. To reinstall a function, first remove it with `DROP FUNCTION`, then install it with `CREATE FUNCTION`. You would need to do this, for example, if you upgrade to a new version of MySQL that provides an updated implementation of the function, or you recompile a new version of a function that you have written. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, the server does not load UDFs during startup and UDFs are unavailable.

**UDF Security Precautions**

MySQL takes several measures to prevent misuse of user-defined functions.

UDF library files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

To use `CREATE FUNCTION` or `DROP FUNCTION`, you must have the `INSERT` or `DELETE` privilege, respectively, for the `mysql` database. This is necessary because those statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is disabled, to prevent attempts at loading functions from shared library files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling it.

### 29.4.3 Adding a Native Function

To add a native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a native function, follow these steps to modify source files in the `sql` directory:
Adding a Native Function

1. Create a subclass for the function in item_create.cc:
   - If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.
   - If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.

2. To provide a name by which the function can be referred to in SQL statements, register the name in item_create.cc by adding a line to this array:

```c
static Native_func_registry func_array[]
```

You can register several names for the same function. For example, see the lines for "LCASE" and "LOWER", which are aliases for `Create_func_lcase`.

3. In item_func.h, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.

4. In item_func.cc, add one of the following declarations, depending on whether you are defining a numeric or string function:

```c
double Item_func_newname::val()
longlong Item_func_newname::val_int()
String *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is nondeterministic, include the following statement in the item constructor to indicate that function results should not be cached:

```c
current_thd->lex->safe_to_cache_query=0;
```

A function is nondeterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```c
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function cannot return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, these additional considerations apply:
• The \texttt{String *str} argument provides a string buffer that may be used to hold the result. (For more information about the \texttt{String} type, take a look at the \texttt{sql_string.h} file.)

• The \texttt{::str()} function should return the string that holds the result, or (\texttt{char*}) 0 if the result is \texttt{NULL}.

• All current string functions try to avoid allocating any memory unless absolutely necessary!

29.5 Debugging and Porting MySQL

This section helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See \url{https://www.mysql.com/support/supportedplatforms/database.html}. If you have created a new port of MySQL, please let us know so that we can list it here and on our website (http://www.mysql.com/), recommending it to other users.

\begin{note}
If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.
\end{note}

A working POSIX thread library is needed for the server.

To build MySQL from source, your system must satisfy the tool requirements listed at \sectionref{2.9}{Installing MySQL from Source}.

If you run into problems with a new port, you may have to do some debugging of MySQL! See \sectionref{29.5.1}{Debugging a MySQL Server}.

\begin{note}
Before you start debugging \texttt{mysqld}, first get the test program \texttt{mysys/thr_lock} to work. This ensures that your thread installation has even a remote chance to work!
\end{note}

\begin{note}
The MySQL source code contains internal documentation written using Doxygen. This documentation is useful for understanding how MySQL works from a developer perspective. The generated Doxygen content is available at \url{https://dev.mysql.com/doc/index-other.html}. It is also possible to generate this content locally from a MySQL source distribution using the instructions at \sectionref{2.9.10}{Generating MySQL Doxygen Documentation Content}.
\end{note}

29.5.1 Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run \texttt{mysqld} with the \texttt{--skip-new} option (which disables all new, potentially unsafe functionality). See \sectionref{B.4.3.3}{What to Do If MySQL Keeps Crashing}.

If \texttt{mysqld} does not want to start, verify that you have no \texttt{my.cnf} files that interfere with your setup! You can check your \texttt{my.cnf} arguments with \texttt{mysqld --print-defaults} and avoid using them by starting with \texttt{mysqld --no-defaults} ...

If \texttt{mysqld} starts to eat up CPU or memory or if it “hangs,” you can use \texttt{mysqladmin processlist status} to find out if someone is executing a query that takes a long time. It may be a good idea to run \texttt{mysqladmin -i10 processlist status} in some window if you are experiencing performance problems or problems when new clients cannot connect.
The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you have not compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See Chapter 5, *MySQL Server Administration*. You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See Section 2.1, “General Installation Guidance”.

### 29.5.1.1 Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `-DWITH_DEBUG=1` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If `mysqld` stops crashing when you configure it with the `-DWITH_DEBUG=1` CMake option, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` using the `CMAKE_C_FLAGS` and `CMAKE_CXX_FLAGS` CMake options and not use `-DWITH_DEBUG=1`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging. If you believe that you have found a bug, please use the instructions at Section 1.7, “How to Report Bugs or Problems”.

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

### 29.5.1.2 Creating Trace Files

If the `mysqld` server does not start or it crashes easily, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld`.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `\mysqld.trace` on Windows:

```shell
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```c:
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

The trace file can become very large! To generate a smaller trace file, you can use debugging options something like this:

```bash
mysqld --debug=d,info,error,query,general,where:O,/tmp/mysqld.trace
```
This only prints information with the most interesting tags to the trace file.

If you file a bug, please add only those lines from the trace file to the bug report that indicate where something seems to go wrong. If you cannot locate the wrong place, open a bug report and upload the whole trace file to the report, so that a MySQL developer can take a look at it. For instructions, see Section 1.7, “How to Report Bugs or Problems”.

The trace file is made with the DBUG package by Fred Fish. See Section 29.5.4, "The DBUG Package".

### 29.5.1.3 Using WER with PDB to create a Windows crashdump

Program Database files (with suffix .pdb) are included in the ZIP Archive Debug Binaries & Test Suite distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem. This is a separate download from the standard MSI or Zip file.

**Note**
The PDB files are available in a separate file labeled "ZIP Archive Debug Binaries & Test Suite".

The PDB file contains more detailed information about mysqld and other tools that enables more detailed trace and dump files to be created. You can use these with WinDbg or Visual Studio to debug mysqld.

For more information on PDB files, see Microsoft Knowledge Base Article 121366. For more information on the debugging options available, see Debugging Tools for Windows.

To use WinDbg, either install the full Windows Driver Kit (WDK) or install the standalone version.

**Important**
The .exe and .pdb files must be an exact match (both version number and MySQL server edition) or WinDBG will complain while attempting to load the symbols.

1. To generate a minidump mysqld.dmp, enable the core-file option under the [mysqld] section in my.ini. Restart the MySQL server after making these changes.

2. Create a directory to store the generated files, such as c:symbols

3. Determine the path to your windbg.exe executable using the Find GUI or from the command line, for example: dir /s /b windbg.exe -- a common default is C:\Program Files\Debugging Tools for Windows (x64)\windbg.exe

4. Launch windbg.exe giving it the paths to mysqld.exe, mysqld.pdb, mysqld.dmp, and the source code. Alternatively, pass in each path from the WinDbg GUI. For example:

```
windbg.exe -i "C:\mysql-8.0.20-winx64\bin"^ -z "C:\mysql-8.0.20-winx64\data\mysqld.dmp" -srcpath "E:\ade\mysql_archives\8.0\8.0.20\mysql-8.0.20"^ -y "C:\mysql-8.0.20-winx64\bin;SRV*c:symbols*http://msdl.microsoft.com/download/symbols" ^ -v -n -c "!analyze -vvvvv"
```

**Note**
The ^ character and newline are removed by the Windows command line processor, so be sure the spaces remain intact.

### 29.5.1.4 Debugging mysqld under gdb

On most systems you can also start mysqld from gdb to get more information if mysqld crashes.
Debugging a MySQL Server

With some older gdb versions on Linux you must use run --one-thread if you want to be able to debug mysqld threads. In this case, you can only have one thread active at a time.

NPTL threads (the new thread library on Linux) may cause problems while running mysqld under gdb. Some symptoms are:

- mysqld hangs during startup (before it writes ready for connections).
- mysqld crashes during a pthread_mutex_lock() or pthread_mutex_unlock() call.

In this case, you should set the following environment variable in the shell before starting gdb:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running mysqld under gdb, you should disable the stack trace with --skip-stack-trace to be able to catch segfaults within gdb.

Use the --gdb option to mysqld to install an interrupt handler for SIGINT (needed to stop mysqld with ^C to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under gdb if you do a lot of new connections the whole time as gdb does not free the memory for old threads. You can avoid this problem by starting mysqld with thread_cache_size set to a value equal to max_connections + 1. In most cases just using --thread_cache_size=5" helps a lot!

If you want to get a core dump on Linux if mysqld dies with a SIGSEGV signal, you can start mysqld with the --core-file option. This core file can be used to make a backtrace that may help you find out why mysqld died:

```
shell> gdb mysqld core
gdb> backtrace full

gdb> quit
```

See Section B.4.3.3, “What to Do If MySQL Keeps Crashing”.

If you are using gdb on Linux, you should install a .gdb file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

Here is an example how to debug mysqld:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
... 
backtrace full # Do this when mysqld crashes
```

Include the preceding output in a bug report, which you can file using the instructions in Section 1.7, “How to Report Bugs or Problems”.

If mysqld hangs, you can try to use some system tools like strace or /usr/proc/bin/pstack to examine where mysqld has hung.
strace /tmp/log libexec/mysqld

If you are using the Perl DBI interface, you can turn on debugging information by using the trace method or by setting the DBI_TRACE environment variable.

29.5.1.5 Using a Stack Trace

On some operating systems, the error log contains a stack trace if mysqld dies unexpectedly. You can use this to find out where (and maybe why) mysqld died. See Section 5.4.2, “The Error Log”. To get a stack trace, you must not compile mysqld with the -fomit-frame-pointer option to gcc. See Section 29.5.1.1, “Compiling MySQL for Debugging”.

A stack trace in the error log looks something like this:

mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32)[0x9da402]
mysqld(handle_segfault+0x28a)[0x6648e9]
/lib/libpthread.so.0[0x7f1a5af000f0]
/lib/libc.so.6[0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPCs2_Pcj+0x7c)[0x7412cb]
/my_plugin.so.6[0x7f1a5af000f0]
/my_plugin.so.6[0x7f1a5af000f0]
/mysqld(_ZN16set_var_password5checkEP3THD+0xd0)[0x688354]
/mysqld(_ZN17sql_set_variablesP3THD4ListI12set_var_baseE+0x68)[0x688494]
/mysqld(_Z11mysql_execute_commandP3THD+0x41a0)[0x67a170]
/mysqld(_ZN11my_plugin.P3THD+0xc4)[0x67fdf8]
/mysqld(_Z10do_commandP3THD+0x24d)[0x6811b6]
/mysqld(handle_one_connection+0x11c)[0x66e05e]

If resolution of function names for the trace fails, the trace contains less information:

mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5af000f0]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fdff]
[0x6811b6]
[0x66e05e]

Newer versions of glibc stack trace functions also print the address as relative to the object. On glibc-based systems (Linux), the trace for a crash within a plugin looks something like:

plugin/auth/auth_test_plugin.so(+0x9a6)[0x7ff4d11c29a6]

To translate the relative address (+0x9a6) into a file name and line number, use this command:

shell> addr2line -fie auth_test_plugin.so 0x9a6
auth_test_plugin
mysql-trunk/plugin/auth/test_plugin.cc:65
The `addr2line` utility is part of the `binutils` package on Linux.

On Solaris, the procedure is similar. The Solaris `printstack()` already prints relative addresses:

```
plugin/auth/auth_test_plugin.so:0x1510
```

To translate, use this command:

```
shell> gaddr2line -fie auth_test_plugin.so 0x1510
```

Windows already prints the address, function name and line:

```
000007FEF07E10A4 auth_test_plugin.dll!auth_test_plugin()[test_plugin.c:72]
```

---

### 29.5.1.6 Using Server Logs to Find Causes of Errors in mysqld

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See Chapter 5, *MySQL Server Administration*.

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See Section 5.4.3, “The General Query Log”. When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as `host_name.log` In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that did not complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See Section 13.8.2, “EXPLAIN Statement”.

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See Section 5.4.5, “The Slow Query Log”.

If you find the text `mysqld restarted` in the error log (normally a file named `host_name.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see Chapter 5, *MySQL Server Administration*), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this does not help, report a bug, see Section 1.7, “How to Report Bugs or Problems”.

If you have started `mysqld` with the `myisam_recover_options` system variable set, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as ‘not closed properly’ or ‘crashed’. If this happens, MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See Section 5.1.7, “Server Command Options”.

When the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

---

### 29.5.1.7 Making a Test Case If You Experience Table Corruption

The following procedure applies to `MyISAM` tables. For information about steps to take when encountering `InnoDB` table corruption, see Section 1.7, “How to Report Bugs or Problems”.
Debugging a MySQL Client

If you encounter corrupted MyISAM tables or if mysqld always fails after some update statements, you can test whether the issue is reproducible by doing the following:

1. Stop the MySQL daemon with mysqladmin shutdown.
2. Make a backup of the tables to guard against the very unlikely case that the repair does something bad.
3. Check all tables with myisamchk -s database/*.MYI. Repair any corrupted tables with myisamchk -r database/table.MYI.
4. Make a second backup of the tables.
5. Remove (or move away) any old log files from the MySQL data directory if you need more space.
6. Start mysqld with the binary log enabled. If you want to find a statement that crashes mysqld, you should start the server with the general query log enabled as well. See Section 5.4.3, "The General Query Log", and Section 5.4.4, "The Binary Log".
7. When you have gotten a crashed table, stop the mysqld server.
8. Restore the backup.
9. Restart the mysqld server without the binary log enabled.
10. Re-execute the statements with mysqlbinlog binary-log-file | mysql. The binary log is saved in the MySQL database directory with the name hostname-bin.NNNNNN.
11. If the tables are corrupted again or you can get mysqld to die with the above command, you have found a reproducible bug. FTP the tables and the binary log to our bugs database using the instructions given in Section 1.7, "How to Report Bugs or Problems". If you are a support customer, you can use the MySQL Customer Support Center (https://www.mysql.com/support/) to alert the MySQL team about the problem and have it fixed as soon as possible.

29.5.2 Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with -DWITH_DEBUG=1. See Section 2.9.7, "MySQL Source-Configuration Options".

Before running a client, you should set the MYSQL_DEBUG environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in /tmp/client.trace.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running mysql in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See Section 1.7, "How to Report Bugs or Problems".

If your client crashes at some 'legal' looking code, you should check that your mysql.h include file matches your MySQL library file. A very common mistake is to use an old mysql.h file from an old MySQL installation with new MySQL library.

29.5.3 The LOCK_ORDER Tool
The MySQL server is a multithreaded application that uses numerous internal locking and lock-related primitives, such as mutexes, rwlocks (including prlocks and sxlocks), conditions, and files. Within the server, the set of lock-related objects changes with implementation of new features and code refactoring for performance improvements. As with any multithreaded application that uses locking primitives, there is always a risk of encountering a deadlock during execution when multiple locks are held at once. For MySQL, the effect of a deadlock is catastrophic, causing a complete loss of service.

As of MySQL 8.0.17, to enable detection of lock-acquisition deadlocks and enforcement that runtime execution is free of them, MySQL supports LOCK_ORDER tooling. This enables a lock-order dependency graph to be defined as part of server design, and server runtime checking to ensure that lock acquisition is acyclic and that execution paths comply with the graph.

This section provides information about using the LOCK_ORDER tool, but only at a basic level. For complete details, see the Lock Order section of the MySQL Server Doxygen documentation, available at https://dev.mysql.com/doc/index-other.html.

The LOCK_ORDER tool is intended for debugging the server, not for production use.

To use the LOCK_ORDER tool, follow this procedure:

1. Build MySQL from source, configuring it with the
   -DWITH_LOCK_ORDER=ON
   CMake option so that the build includes LOCK_ORDER tooling.

   Note
   With the WITH_LOCK_ORDER option enabled, MySQL builds require the flex program.

2. To run the server with the LOCK_ORDER tool enabled, enable the lock_order system variable at server startup. Several other system variables for LOCK_ORDER configuration are available as well.

3. For MySQL test suite operation, mysql-test-run.pl has a --lock-order option that controls whether to enable the LOCK_ORDER tool during test case execution.

   The system variables described following configure operation of the LOCK_ORDER tool, assuming that MySQL has been built to include LOCK_ORDER tooling. The primary variable is lock_order, which indicates whether to enable the LOCK_ORDER tool at runtime:

   • If lock_order is disabled (the default), no other LOCK_ORDER system variables have any effect.

   • If lock_order is enabled, the other system variables configure which LOCK_ORDER features to enable.

   Note
   In general, it is intended that the LOCK_ORDER tool be configured by executing mysql-test-run.pl with the --lock-order option, and for mysql-test-run.pl to set LOCK_ORDER system variables to appropriate values.

   All LOCK_ORDER system variables must be set at server startup. At runtime, their values are visible but cannot be changed.

   Some system variables exist in pairs, such as lock_order_debug_loop and lock_order_trace_loop. For such pairs, the variables are distinguished as follows when the condition occurs with which they are associated:

   • If the _debug_ variable is enabled, a debug assertion is raised.
The LOCK_ORDER Tool

- If the trace variable is enabled, an error is printed to the logs.

**Table 29.4 LOCK_ORDER System Variable Summary**

<table>

<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Whether the LOCK_ORDER tool causes a debug assertion failure when it encounters a lock that is destroyed while still held.

- **lock_order_dependencies**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--lock-order-dependencies=file_name</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>8.0.17</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>lock_order_dependencies</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR</strong> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>empty string</code></td>
</tr>
</tbody>
</table>

The path to the `lock_order_dependencies.txt` file that defines the server lock-order dependency graph.

It is permitted to specify no dependencies. An empty dependency graph is used in this case.

- **lock_order_extra_dependencies**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--lock-order-extra-dependencies=file_name</code></td>
</tr>
<tr>
<td>Introduced</td>
<td>8.0.17</td>
</tr>
<tr>
<td>System Variable</td>
<td><code>lock_order_extra_dependencies</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR</strong> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>File name</td>
</tr>
<tr>
<td>Default Value</td>
<td><code>empty string</code></td>
</tr>
</tbody>
</table>

The path to a file containing additional dependencies for the lock-order dependency graph. This is useful to amend the primary server dependency graph, defined in the `lock_order_dependencies.txt` file, with additional dependencies describing the behavior of third party code. (The alternative is to modify `lock_order_dependencies.txt` itself, which is not encouraged.)

If this variable is not set, no secondary file is used.

- **lock_order_output_directory**
### The LOCK_ORDER Tool

<table>
<thead>
<tr>
<th>Property</th>

<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td><strong>SET_VAR</strong> Hint Applies</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default Value</td>
<td>ON</td>
</tr>
</tbody>
</table>

Whether the LOCK_ORDER tool prints a trace in the log file when it encounters a lock that is destroyed while still held.
The DBUG Package

29.5.4 The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is doing. See Section 29.5.1.2, "Creating Trace Files".

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support.

The DBUG package can be used by invoking a program with the `--debug[=debug_options]` or `-# [debug_options]` option. If you specify the `--debug` or `-#` option without a `debug_options` value, most MySQL programs use a default value. The server default is `d:t:i:o,/tmp/mysqld.trace` on Unix and `d:t:i:O,\mysqld.trace` on Windows. The effect of this default is:

- **d**: Enable output for all debug macros
- **t**: Trace function calls and exits
- **i**: Add PID to output lines
- **o,/tmp/mysqld.trace,0,\mysqld.trace**: Set the debug output file.

Most client programs use a default `debug_options` value of `d:t:o,/tmp/program_name.trace`, regardless of platform.

Here are some example debug control strings as they might be specified on a shell command line:

```
--debug=d:t
--debug=d:f,main,subr1:F:L:t,20
--debug=d,input,output,files:n
--debug=d:t:i:O,\mysqld.trace
```

For `mysqld`, it is also possible to change DBUG settings at runtime by setting the `debug` system variable. This variable has global and session values:

```
mysql> SET GLOBAL debug = 'debug_options';
mysql> SET SESSION debug = 'debug_options';
```

Changing the global `debug` value requires privileges sufficient to set global system variables. Changing the session `debug` value requires privileges sufficient to set restricted session system variables. See Section 5.1.9.1, "System Variable Privileges".

The `debug_options` value is a sequence of colon-separated fields:

```
field_1:field_2:...:field_N
```

Each field within the value consists of a mandatory flag character, optionally preceded by a `+` or `−` character, and optionally followed by a comma-separated list of modifiers:

```
[+−]flag[,modifier,modifier,...,modifier]
```

The following table describes the permitted flag characters. Unrecognized flag characters are silently ignored.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>Enable output from DBUG_XXX macros for the current state. May be followed by a list of keywords, which enables output only for the DBUG macros with that keyword. An empty list of keywords enables output for all macros.</td>
</tr>
</tbody>
</table>
The DBUG Package

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>In MySQL, common debug macro keywords to enable are <code>enter</code>, <code>exit</code>, <code>error</code>, <code>warning</code>, <code>info</code>, and <code>loop</code>.</td>
</tr>
<tr>
<td>D</td>
<td>Delay after each debugger output line. The argument is the delay, in tenths of seconds, subject to machine capabilities. For example, <code>D,20</code> specifies a delay of two seconds.</td>
</tr>
<tr>
<td>f</td>
<td>Limit debugging, tracing, and profiling to the list of named functions. An empty list enables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.</td>
</tr>
<tr>
<td>F</td>
<td>Identify the source file name for each line of debug or trace output.</td>
</tr>
<tr>
<td>i</td>
<td>Identify the process with the PID or thread ID for each line of debug or trace output.</td>
</tr>
<tr>
<td>L</td>
<td>Identify the source file line number for each line of debug or trace output.</td>
</tr>
<tr>
<td>n</td>
<td>Print the current function nesting depth for each line of debug or trace output.</td>
</tr>
<tr>
<td>N</td>
<td>Number each line of debug output.</td>
</tr>
<tr>
<td>o</td>
<td>Redirect the debugger output stream to the specified file. The default output is <code>stderr</code>.</td>
</tr>
<tr>
<td>O</td>
<td>Like <code>o</code>, but the file is really flushed between each write. When needed, the file is closed and reopened between each write.</td>
</tr>
<tr>
<td>p</td>
<td>Limit debugger actions to specified processes. A process must be identified with the <code>DBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.</td>
</tr>
<tr>
<td>P</td>
<td>Print the current process name for each line of debug or trace output.</td>
</tr>
<tr>
<td>r</td>
<td>When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.</td>
</tr>
<tr>
<td>S</td>
<td>Do function <code>_sanity(_file_,_line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0.</td>
</tr>
<tr>
<td>t</td>
<td>Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.</td>
</tr>
</tbody>
</table>

The leading `+` or `-` character and trailing list of modifiers are used for flag characters such as `d` or `f` that can enable a debug operation for all applicable modifiers or just some of them:

- With no leading `+` or `-`, the flag value is set to exactly the modifier list as given.
- With a leading `+` or `-`, the modifiers in the list are added to or subtracted from the current modifier list.

The following examples show how this works for the `d` flag. An empty `d` list enabled output for all debug macros. A nonempty list enables output only for the macro keywords in the list.

These statements set the `d` value to the modifier list as given:

```
mysql> SET @debug = 'd';
mysql> SELECT @@debug;
+---------+
| @@debug |
+---------+
| d       |
mysql> SET @debug = 'd,error,warning';
mysql> SELECT @@debug;
+-----------------+
| @@debug         |
+-----------------+
| d,error,warning |
```
A leading + or – adds to or subtracts from the current d value:

```sql
mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+----------------------+
<table>
<thead>
<tr>
<th>@@debug</th>
</tr>
</thead>
<tbody>
<tr>
<td>d,error,warning,loop</td>
</tr>
</tbody>
</table>
+----------------------+
mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
+-----------+
<table>
<thead>
<tr>
<th>@@debug</th>
</tr>
</thead>
<tbody>
<tr>
<td>d,warning</td>
</tr>
</tbody>
</table>
+-----------+
```

Adding to “all macros enabled” results in no change:

```sql
mysql> SET debug = 'd';
mysql> SELECT @@debug;
+---------+
<table>
<thead>
<tr>
<th>@@debug</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
</tr>
</tbody>
</table>
+---------+
mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+---------+
<table>
<thead>
<tr>
<th>@@debug</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
</tr>
</tbody>
</table>
+---------+
```

Disabling all enabled macros disables the d flag entirely:

```sql
mysql> SET debug = 'd,error,loop';
mysql> SELECT @@debug;
+--------------+
<table>
<thead>
<tr>
<th>@@debug</th>
</tr>
</thead>
<tbody>
<tr>
<td>d,error,loop</td>
</tr>
</tbody>
</table>
+--------------+
mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
+---------+
<table>
<thead>
<tr>
<th>@@debug</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>
+---------+
```
Chapter 30 MySQL Enterprise Edition

30.8 MySQL Enterprise Data Masking and De-Identification Overview .................. 5030

MySQL Enterprise Edition is a commercial product. Like MySQL Community Edition, MySQL Enterprise Edition includes MySQL Server, a fully integrated transaction-safe, ACID-compliant database with full commit, rollback, crash-recovery, and row-level locking capabilities. In addition, MySQL Enterprise Edition includes the following components designed to provide monitoring and online backup, as well as improved security and scalability:

- MySQL Enterprise Monitor
- MySQL Enterprise Backup
- MySQL Enterprise Security
- MySQL Enterprise Encryption
- MySQL Enterprise Audit
- MySQL Enterprise Firewall
- MySQL Enterprise Thread Pool
- MySQL Enterprise Data Masking and De-Identification

The following sections briefly discuss each of these components and indicate where to find more detailed information. To learn more about commercial products, see https://www.mysql.com/products/.

30.1 MySQL Enterprise Monitor Overview

MySQL Enterprise Monitor is an enterprise monitoring system for MySQL that keeps an eye on your MySQL servers, notifies you of potential issues and problems, and advises you how to fix the issues. MySQL Enterprise Monitor can monitor all kinds of configurations, from a single MySQL server that is important to your business, all the way up to a huge farm of MySQL servers powering a busy website.

The following discussion briefly summarizes the basic components that make up the MySQL Enterprise Monitor product. For more information, see the MySQL Enterprise Monitor manual, available at https://dev.mysql.com/doc/mysql-monitor/en/.

MySQL Enterprise Monitor components can be installed in various configurations depending on your database and network topology, to give you the best combination of reliable and responsive monitoring data, with minimal overhead on the database server machines. A typical MySQL Enterprise Monitor installation consists of:
MySQL Enterprise Monitor is designed to monitor one or more MySQL servers. The monitoring information is collected by using an agent, MySQL Enterprise Monitor Agent. The agent communicates with the hosts and MySQL servers that it monitors, collecting variables, status and health information, and sending this information to the MySQL Enterprise Service Manager.

The information collected by the agent about each MySQL server and host you are monitoring is sent to the MySQL Enterprise Service Manager. This server collates all of the information from the agents. As it collates the information sent by the agents, the MySQL Enterprise Service Manager continually tests the collected data, comparing the status of the server to reasonable values. When thresholds are reached, the server can trigger an event (including an alarm and notification) to highlight a potential issue, such as low memory, high CPU usage, or more complex conditions such insufficient buffer sizes and status information. We call each test, with its associated threshold value, a rule.

These rules, and the alarms and notifications, are each known as a MySQL Enterprise Advisors. Advisors form a critical part of the MySQL Enterprise Service Manager, as they provide warning information and troubleshooting advice about potential problems.

The MySQL Enterprise Service Manager includes a web server, and you interact with it through any web browser. This interface, the MySQL Enterprise Monitor User Interface, displays all of the information collected by the agents, and lets you view all of your servers and their current status as a group or individually. You control and configure all aspects of the service using the MySQL Enterprise Monitor User Interface.

The information supplied by the MySQL Enterprise Monitor Agent processes also includes statistical and query information, which you can view in the form of graphs. For example, you can view aspects such as server load, query numbers, or index usage information as a graph over time. The graph lets you pinpoint problems or potential issues on your server, and can help diagnose the impact from database or external problems (such as external system or network failure) by examining the data from a specific time interval.

The MySQL Enterprise Monitor Agent can also be configured to collect detailed information about the queries executed on your server, including the row counts and performance times for executing each query. You can correlate the detailed query data with the graphical information to identify which queries were executing when you experienced a particularly high load, index or other issue. The query data is supported by a system called Query Analyzer, and the data can be presented in different ways depending on your needs.

### 30.2 MySQL Enterprise Backup Overview

MySQL Enterprise Backup performs hot backup operations for MySQL databases. The product is architected for efficient and reliable backups of tables created by the InnoDB storage engine. For completeness, it can also back up tables from MyISAM and other storage engines.

The following discussion briefly summarizes MySQL Enterprise Backup. For more information, see the MySQL Enterprise Backup manual, available at https://dev.mysql.com/doc/mysql-enterprise-backup/en/.

Hot backups are performed while the database is running and applications are reading and writing to it. This type of backup does not block normal database operations, and it captures even changes that occur while the backup is happening. For these reasons, hot backups are desirable when your database...
“grows up” -- when the data is large enough that the backup takes significant time, and when your data is important enough to your business that you must capture every last change, without taking your application, website, or web service offline.

MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. For efficient backup operations, you can designate InnoDB as the default storage engine for new tables, or convert existing tables to use the InnoDB storage engine.

### 30.3 MySQL Enterprise Security Overview

MySQL Enterprise Edition provides plugins that implement security features using external services:

- MySQL Enterprise Edition includes an authentication plugin that enables MySQL Server to use PAM (Pluggable Authentication Modules) to authenticate MySQL users. PAM enables a system to use a standard interface to access various kinds of authentication methods, such as Unix passwords or an LDAP directory. For more information, see Section 6.4.1.5, “PAM Pluggable Authentication”.

- MySQL Enterprise Edition includes an authentication plugin that performs external authentication on Windows, enabling MySQL Server to use native Windows services to authenticate client connections. Users who have logged in to Windows can connect from MySQL client programs to the server based on the information in their environment without specifying an additional password. For more information, see Section 6.4.1.6, “Windows Pluggable Authentication”.

- MySQL Enterprise Edition 5.6 and higher includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution. For more information, see Section 30.4, “MySQL Enterprise Encryption Overview”.

- MySQL Enterprise Edition 5.7 and higher includes a keyring plugin that uses Oracle Key Vault as a back end for keyring storage. For more information, see Section 6.4.4, “The MySQL Keyring”.

For other related Enterprise security features, see Section 30.4, “MySQL Enterprise Encryption Overview”.

### 30.4 MySQL Enterprise Encryption Overview

MySQL Enterprise Edition 5.6 and higher includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable Enterprise applications to perform the following operations:

- Implement added data protection using public-key asymmetric cryptography
- Create public and private keys and digital signatures
- Perform asymmetric encryption and decryption
- Use cryptographic hashing for digital signing and data verification and validation

For more information, see Section 12.19, “MySQL Enterprise Encryption Functions”.

For other related Enterprise security features, see Section 30.3, “MySQL Enterprise Security Overview”.

### 30.5 MySQL Enterprise Audit Overview
MySQL Enterprise Edition includes MySQL Enterprise Audit, implemented using a server plugin. MySQL Enterprise Audit uses the open MySQL Audit API to enable standard, policy-based monitoring and logging of connection and query activity executed on specific MySQL servers. Designed to meet the Oracle audit specification, MySQL Enterprise Audit provides an out of box, easy to use auditing and compliance solution for applications that are governed by both internal and external regulatory guidelines.

When installed, the audit plugin enables MySQL Server to produce a log file containing an audit record of server activity. The log contents include when clients connect and disconnect, and what actions they perform while connected, such as which databases and tables they access.

For more information, see Section 6.4.5, “MySQL Enterprise Audit”.

### 30.6 MySQL Enterprise Firewall Overview

MySQL Enterprise Edition 5.6 and higher includes MySQL Enterprise Firewall, an application-level firewall that enables database administrators to permit or deny SQL statement execution based on matching against whitelists of accepted statement patterns. This helps harden MySQL Server against attacks such as SQL injection or attempts to exploit applications by using them outside of their legitimate query workload characteristics.

Each MySQL account registered with the firewall has its own statement whitelist, enabling protection to be tailored per account. For a given account, the firewall can operate in recording or protecting mode, for training in the accepted statement patterns or protection against unacceptable statements.

For more information, see Section 6.4.7, “MySQL Enterprise Firewall”.

### 30.7 MySQL Enterprise Thread Pool Overview

MySQL Enterprise Edition includes MySQL Enterprise Thread Pool, implemented using a server plugin. The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. In MySQL Enterprise Edition, a thread pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The plugin implements a thread pool that increases server performance by efficiently managing statement execution threads for large numbers of client connections.

For more information, see Section 6.5.3, “MySQL Enterprise Thread Pool”.

### 30.8 MySQL Enterprise Data Masking and De-Identification Overview

MySQL Enterprise Edition 5.7 and higher includes MySQL Enterprise Data Masking and De-Identification, implemented as a plugin library containing a plugin and a set of user-defined functions. Data masking hides sensitive information by replacing real values with substitutes. MySQL Enterprise Data Masking and De-Identification functions enable masking existing data using several methods such as obfuscation (removing identifying characteristics), generation of formatted random data, and data replacement or substitution.

For more information, see Section 6.4.8, “MySQL Enterprise Data Masking and De-Identification”.

5030
Chapter 31 MySQL Workbench

MySQL Workbench provides a graphical tool for working with MySQL servers and databases. MySQL Workbench fully supports MySQL versions 5.5 and higher.

The following discussion briefly describes MySQL Workbench capabilities. For more information, see the MySQL Workbench manual, available at https://docs.oracle.com/cd/E17952_01/workbench-en/.

MySQL Workbench provides five main areas of functionality:

• **SQL Development**: Enables you to create and manage connections to database servers. As well as enabling you to configure connection parameters, MySQL Workbench provides the capability to execute SQL queries on the database connections using the built-in SQL Editor. This functionality replaces that previously provided by the Query Browser standalone application.

• **Data Modeling**: Enables you to create models of your database schema graphically, reverse and forward engineer between a schema and a live database, and edit all aspects of your database using the comprehensive Table Editor. The Table Editor provides easy-to-use facilities for editing Tables, Columns, Indexes, Triggers, Partitioning, Options, Inserts and Privileges, Routines and Views.

• **Server Administration**: Enables you to create and administer server instances.

• **Data Migration**: Allows you to migrate from Microsoft SQL Server, Sybase ASE, SQLite, SQL Anywhere, PostreSQL, and other RDBMS tables, objects and data to MySQL. Migration also supports migrating from earlier versions of MySQL to the latest releases.

• **MySQL Enterprise Support**: Support for Enterprise products such as MySQL Enterprise Backup and MySQL Audit.

MySQL Workbench is available in two editions, the Community Edition and the Commercial Edition. The Community Edition is available free of charge. The Commercial Edition provides additional Enterprise features, such as database documentation generation, at low cost.

A.1.2 Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0? .................................................. 5034
A.1.3 Can MySQL 8.0 do subqueries? .......................................... 5034
A.1.4 Can MySQL 8.0 perform multiple-table inserts, updates, and deletes? .................................................. 5034
A.1.5 Does MySQL 8.0 have Sequences? ...................................... 5034
A.1.6 Does MySQL 8.0 have a NOW() function with fractions of seconds? .................................................. 5034
A.1.7 Does MySQL 8.0 work with multi-core processors? .................... 5034
A.1.8 Why do I see multiple processes for mysqld? ......................... 5034
A.1.9 Can MySQL 8.0 perform ACID transactions? .......................... 5034

A.1.1. Which version of MySQL is production-ready (GA)?

MySQL 8.0, 5.7, and MySQL 5.6 are supported for production use.

MySQL 8.0 achieved General Availability (GA) status with MySQL 8.0.11, which was released for production use on 19 April 2018.

MySQL 5.7 achieved General Availability (GA) status with MySQL 5.7.9, which was released for production use on 21 October 2015.

MySQL 5.6 achieved General Availability (GA) status with MySQL 5.6.10, which was released for production use on 5 February 2013.

MySQL 5.5 achieved General Availability (GA) status with MySQL 5.5.8, which was released for production use on 3 December 2010. The MySQL 5.5 series is no longer current, but still supported in production.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008. Active development for MySQL 5.1 has ended.
MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005. Active development for MySQL 5.0 has ended.

A.1.2. Why did MySQL version numbering skip versions 6 and 7 and go straight to 8.0?

Due to the many new and important features we were introducing in this MySQL version, we decided to start a fresh new series. As the series numbers 6 and 7 had actually been used before by MySQL, we went to 8.0.

A.1.3. Can MySQL 8.0 do subqueries?

Yes. See Section 13.2.11, “Subqueries”.

A.1.4. Can MySQL 8.0 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see Section 13.2.12, “UPDATE Statement”; for that required to perform multiple-table deletes, see Section 13.2.2, “DELETE Statement”.

A multiple-table insert can be accomplished using a trigger whose FOR EACH ROW clause contains multiple INSERT statements within a BEGIN ... END block. See Section 24.3, “Using Triggers”.

A.1.5. Does MySQL 8.0 have Sequences?

No. However, MySQL has an AUTO_INCREMENT system, which in MySQL 8.0 can also handle inserts in a multi-master replication setup. With the auto_increment_increment and auto_increment_offset system variables, you can set each server to generate auto-increment values that don’t conflict with other servers. The auto_increment_increment value should be greater than the number of servers, and each server should have a unique offset.

A.1.6. Does MySQL 8.0 have a NOW() function with fractions of seconds?

Yes, see Section 11.3.5, “Fractional Seconds in Time Values”.

A.1.7. Does MySQL 8.0 work with multi-core processors?

Yes. MySQL is fully multithreaded, and will make use of multiple CPUs, provided that the operating system supports them.

A.1.8. Why do I see multiple processes for mysqld?

When using LinuxThreads, you should see a minimum of three mysqld processes running. These are in fact threads. There is one thread for the LinuxThreads manager, one thread to handle connections, and one thread to handle alarms and signals.

A.1.9. Can MySQL 8.0 perform ACID transactions?

Yes. All current MySQL versions support transactions. The InnoDB storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The NDB storage engine supports the READ COMMITTED transaction isolation level only.

A.2 MySQL 8.0 FAQ: Storage Engines

A.2.1 Where can I obtain complete documentation for MySQL storage engines? ........................................ 5035
A.2.2 Are there any new storage engines in MySQL 8.0? ................................................................. 5035
A.2.3 Have any storage engines been removed in MySQL 8.0? ............................................................... 5035
A.2.4 Can I prevent the use of a particular storage engine? ................................................................. 5035
A.2.5 Is there an advantage to using the InnoDB storage engine exclusively, as opposed to a combination of InnoDB and non-InnoDB storage engines? ......................................................... 5035
A.2.6 What are the unique benefits of the ARCHIVE storage engine? ............................................... 5035

A.2.1. Where can I obtain complete documentation for MySQL storage engines?

See Chapter 16, Alternative Storage Engines. That chapter contains information about all MySQL storage engines except for the InnoDB storage engine and the NDB storage engine (used for MySQL Cluster). InnoDB is covered in Chapter 15, The InnoDB Storage Engine. NDB is covered in Chapter 22, MySQL NDB Cluster 8.0.

A.2.2. Are there any new storage engines in MySQL 8.0?

No. InnoDB is the default storage engine for new tables. See Section 15.1, “Introduction to InnoDB” for details.

A.2.3. Have any storage engines been removed in MySQL 8.0?

The PARTITION storage engine plugin which provided partitioning support is replaced by a native partitioning handler. As part of this change, the server can no longer be built using \-DWITH_PARTITION_STORAGE_ENGINE. partition is also no longer displayed in the output of SHOW PLUGINS, or shown in the INFORMATION_SCHEMA.PLUGINS table.

In order to support partitioning of a given table, the storage engine used for the table must now provide its own (“native”) partitioning handler. InnoDB is the only storage engine supported in MySQL 8.0 that includes a native partitioning handler. An attempt to create partitioned tables in MySQL 8.0 using any other storage engine fails. (The NDB storage engine used by MySQL Cluster also provides its own partitioning handler, but is currently not supported by MySQL 8.0.)

A.2.4. Can I prevent the use of a particular storage engine?

Yes. The disabled_storage_engines configuration option defines which storage engines cannot be used to create tables or tablespaces. By default, disabled_storage_engines is empty (no engines disabled), but it can be set to a comma-separated list of one or more engines.

A.2.5. Is there an advantage to using the InnoDB storage engine exclusively, as opposed to a combination of InnoDB and non-InnoDB storage engines?

Yes. Using InnoDB tables exclusively can simplify backup and recovery operations. MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. See Section 30.2, “MySQL Enterprise Backup Overview”.

A.2.6. What are the unique benefits of the ARCHIVE storage engine?

The ARCHIVE storage engine stores large amounts of data without indexes; it has a small footprint, and performs selects using table scans. See Section 16.5, “The ARCHIVE Storage Engine”, for details.

A.3 MySQL 8.0 FAQ: Server SQL Mode

A.3.1 What are server SQL modes? ........................................................................................................ 5036
A.3.2 How many server SQL modes are there? ....................................................................................... 5036
A.3.3 How do you determine the server SQL mode? ............................................................................. 5036
A.3.1. What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see Section 5.1.11, “Server SQL Modes”.

A.3.2. How many server SQL modes are there?

Each mode can be independently switched on and off. See Section 5.1.11, “Server SQL Modes”, for a complete list of available modes.

A.3.3. How do you determine the server SQL mode?

You can set the default SQL mode (for mysqld startup) with the --sql-mode option. Using the statement SET [GLOBAL|SESSION] sql_mode='modes', you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a SELECT @@sql_mode statement.

A.3.4. Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using SET [GLOBAL|SESSION] sql_mode='modes'.

A.3.5. Can the rules for strict mode be extended?

When we refer to strict mode, we mean a mode where at least one of the modes TRADITIONAL, STRICT_TRANS_TABLES, or STRICT_ALL_TABLES is enabled. Options can be combined, so you can add restrictions to a mode. See Section 5.1.11, “Server SQL Modes”, for more information.

A.3.6. Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However, if you do require it, strict mode can provide such validation.

A.3.7. What is the default server SQL mode when MySQL 8.0 is installed?

The default SQL mode in MySQL 8.0 includes these modes: ONLY_FULL_GROUP_BY, STRICT_TRANS_TABLES, NO_ZERO_IN_DATE, NO_ZERO_DATE, ERROR_FOR_DIVISION_BY_ZERO, and NO_ENGINE_SUBSTITUTION.

For information about all available modes and default MySQL behavior, see Section 5.1.11, “Server SQL Modes”.

A.4 MySQL 8.0 FAQ: Stored Procedures and Functions

A.4.1. Does MySQL 8.0 support stored procedures and functions? ........................................ 5037
A.4.2. Where can I find documentation for MySQL stored procedures and stored functions? ........ 5037
A.4.3. Is there a discussion forum for MySQL stored procedures? ........................................... 5037
A.4.4. Where can I find the ANSI SQL 2003 specification for stored procedures? ...................... 5037
A.4.1. Does MySQL 8.0 support stored procedures and functions?

Yes. MySQL 8.0 supports two types of stored routines, stored procedures and stored functions.

A.4.2. Where can I find documentation for MySQL stored procedures and stored functions?

See Section 24.2, “Using Stored Routines”.

A.4.3. Is there a discussion forum for MySQL stored procedures?

A.4.4. Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books, such as SQL-99 Complete, Really by Peter Gulutzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including coverage of stored procedures.

A.4.5. How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with CREATE [FUNCTION|PROCEDURE], ALTER [FUNCTION|PROCEDURE], DROP [FUNCTION|PROCEDURE], and SHOW CREATE [FUNCTION|PROCEDURE]. You can obtain information about existing stored procedures using the ROUTINES table in the INFORMATION_SCHEMA database (see Section 25.29, “The INFORMATION_SCHEMA ROUTINES Table”).

A.4.6. Is there a way to view all stored procedures and stored functions in a given database?
Yes. For a database named `dbname`, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```sql
SELECT ROUTINE_TYPE, ROUTINE_NAME
FROM INFORMATION_SCHEMA.ROUTINES
WHERE ROUTINE_SCHEMA='dbname';
```

For more information, see Section 25.29, “The INFORMATION_SCHEMA ROUTINES Table”.

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See Section 13.7.7.9, “SHOW CREATE PROCEDURE Statement”, for more information.

A.4.7. Where are stored procedures stored?

Stored procedures are stored in the `mysql.routines` and `mysql.parameters` tables, which are part of the data dictionary. You cannot access these tables directly. Instead, query the `INFORMATION_SCHEMA.ROUTINES` and `PARAMETERS` tables. See Section 25.29, “The INFORMATION_SCHEMA ROUTINES Table”, and Section 25.19, “The INFORMATION_SCHEMA PARAMETERS Table”.

You can also use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See Section 13.7.7.9, “SHOW CREATE PROCEDURE Statement”.

A.4.8. Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 8.0.

A.4.9. Can a stored procedure call another stored procedure?

Yes.

A.4.10. Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

A.4.11. Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

A.4.12. Do stored procedures have a statement for raising application errors?

Yes. MySQL 8.0 implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See Section 13.6.7, “Condition Handling”.

A.4.13. Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See Section 13.6.7.2, “DECLARE ... HANDLER Statement”, for details.

A.4.14. Can MySQL 8.0 stored routines return result sets?

`Stored procedures` can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or higher) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

A.4.15. Is `WITH RECOMPILE` supported for stored procedures?
MySQL 8.0 FAQ: Stored Procedures and Functions

A.4.16 Is there a MySQL equivalent to using mod_plsql as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 8.0.

A.4.17 Can I pass an array as input to a stored procedure?

Not in MySQL 8.0.

A.4.18 Can I pass a cursor as an IN parameter to a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only.

A.4.19 Can I return a cursor as an OUT parameter from a stored procedure?

In MySQL 8.0, cursors are available inside stored procedures only. However, if you do not open a cursor on a SELECT, the result will be sent directly to the client. You can also SELECT INTO variables. See Section 13.2.10, “SELECT Statement”.

A.4.20 Can I print out a variable’s value within a stored routine for debugging purposes?

Yes, you can do this in a stored procedure, but not in a stored function. If you perform an ordinary SELECT inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client/server protocol for this to work. This means that, for example, in PHP, you need to use the mysqli extension rather than the old mysql extension.

A.4.21 Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

A.4.22 Do MySQL 8.0 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in Section 24.7, “Stored Program Binary Logging”.

A.4.23 Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. ALTER and DROP statements for stored procedures and functions are also replicated.

A.4.24 How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated. Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

A.4.25 Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master’s binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:
1. Any user wishing to create stored functions must be granted the `SUPER` privilege.

2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

A.4.26 What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

A.4.27 Do the preceding limitations affect the ability of MySQL to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

A.4.28 What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

`Mixed` replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid form of replication "knows" whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see Section 17.2.1, “Replication Formats”.

A.5 MySQL 8.0 FAQ: Triggers

A.5.1 Where can I find the documentation for MySQL 8.0 triggers? ................................. 5041
A.5.2 Is there a discussion forum for MySQL Triggers? ...................................................... 5041
A.5.3 Does MySQL 8.0 have statement-level or row-level triggers? ................................. 5041
A.5.4 Are there any default triggers? ...................................................................................... 5041
A.5.5 How are triggers managed in MySQL? ................................................................. 5041
A.5.6 Is there a way to view all triggers in a given database? .................................................. 5041
A.5.7 Where are triggers stored? ........................................................................................... 5041
A.5.8 Can a trigger call a stored procedure? ................................................................. 5041
A.5.9 Can triggers access tables? ......................................................................................... 5041
A.5.10 Can a table have multiple triggers with the same trigger event and action time? .......... 5041
A.5.11 Can triggers call an external application through a UDF? ................................................. 5042
A.5.12 Is it possible for a trigger to update tables on a remote server? ................................. 5042
A.5.13 Do triggers work with replication? ................................................................. 5042
A.5.14 How are actions carried out through triggers on a master replicated to a slave? ............... 5042

A.5.1. Where can I find the documentation for MySQL 8.0 triggers?

See Section 24.3, “Using Triggers”.

A.5.2. Is there a discussion forum for MySQL Triggers?

A.5.3. Does MySQL 8.0 have statement-level or row-level triggers?

In MySQL 8.0, all triggers are FOR EACH ROW; that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 8.0 does not support triggers using FOR EACH STATEMENT.

A.5.4. Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some TIMESTAMP columns, as well as for columns which are defined using AUTO_INCREMENT.

A.5.5. How are triggers managed in MySQL?

In MySQL 8.0, triggers can be created using the CREATE TRIGGER statement, and dropped using DROP TRIGGER. See Section 13.1.22, “CREATE TRIGGER Statement”, and Section 13.1.34, “DROP TRIGGER Statement”, for more about these statements.

Information about triggers can be obtained by querying the INFORMATION_SCHEMA.TRIGGERS table. See Section 25.40, “The INFORMATION_SCHEMA TRIGGERS Table”.

A.5.6. Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database dbname using a query on the INFORMATION_SCHEMA.TRIGGERS table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see Section 25.40, “The INFORMATION_SCHEMA TRIGGERS Table”.

You can also use the SHOW TRIGGERS statement, which is specific to MySQL. See Section 13.7.7.38, “SHOW TRIGGERS Statement”.

A.5.7. Where are triggers stored?

Triggers are stored in the mysql.triggers system table, which is part of the data dictionary.

A.5.8. Can a trigger call a stored procedure?

Yes.

A.5.9. Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

A.5.10 Can a table have multiple triggers with the same trigger event and action time?
In MySQL 8.0, it is possible to define multiple triggers for a given table that have the same trigger event and action time. For example, you can have two `BEFORE UPDATE` triggers for a table. By default, triggers that have the same trigger event and action time activate in the order they were created. To affect trigger order, specify a clause after `FOR EACH ROW` that indicates `FOLLOWS` or `PRECEDES` and the name of an existing trigger that also has the same trigger event and action time. With `FOLLOWS`, the new trigger activates after the existing trigger. With `PRECEDES`, the new trigger activates before the existing trigger.

A.5.11 Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF.

A.5.12 Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See Section 16.8, “The FEDERATED Storage Engine”).

A.5.13 Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL’s “classic” statement-based or row-based replication format.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see Section 17.5.1.35, “Replication and Triggers”.

A.5.14 How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

**Statement-based replication.** First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

**Row-based replication.** When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and, in addition, the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.
In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see Section 17.5.1.35, “Replication and Triggers”.

A.6 MySQL 8.0 FAQ: Views

A.6.1 Where can I find documentation covering MySQL Views? .................................................. 5043
A.6.2 Is there a discussion forum for MySQL Views? ................................................................. 5043
A.6.3 What happens to a view if an underlying table is dropped or renamed? ............................ 5043
A.6.4 Does MySQL 8.0 have table snapshots? ............................................................................ 5043
A.6.5 Does MySQL 8.0 have materialized views? ....................................................................... 5043
A.6.6 Can you insert into views that are based on joins? ............................................................ 5043

A.6.1. Where can I find documentation covering MySQL Views?

See Section 24.5, “Using Views”.

A.6.2. Is there a discussion forum for MySQL Views?

Yes. See https://forums.mysql.com/list.php?100

A.6.3. What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the CHECK TABLE statement. (See Section 13.7.3.2, “CHECK TABLE Statement”.)

A.6.4. Does MySQL 8.0 have table snapshots?

No.

A.6.5. Does MySQL 8.0 have materialized views?

No.

A.6.6. Can you insert into views that are based on joins?

It is possible, provided that your INSERT statement has a column list that makes it clear there is only one table involved.

You cannot insert into multiple tables with a single insert on a view.

A.7 MySQL 8.0 FAQ: INFORMATION_SCHEMA

A.7.1 Where can I find documentation for the MySQL INFORMATION_SCHEMA database? .......... 5044
A.7.2 Is there a discussion forum for INFORMATION_SCHEMA? ................................................ 5044
A.7.3 Where can I find the ANSI SQL 2003 specification for INFORMATION_SCHEMA? ............ 5044
A.7.4 What is the difference between the Oracle Data Dictionary and MySQL INFORMATION_SCHEMA? .................................................................................................................. 5044
A.7.5 Can I add to or otherwise modify the tables found in the INFORMATION_SCHEMA database? .... 5044
A.7.1. Where can I find documentation for the MySQL INFORMATION_SCHEMA database?

See Chapter 25, INFORMATION_SCHEMA Tables

A.7.2. Is there a discussion forum for INFORMATION_SCHEMA?

A.7.3. Where can I find the ANSI SQL 2003 specification for INFORMATION_SCHEMA?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available, such as SQL-99 Complete, Really by Peter Gulutzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including INFORMATION_SCHEMA.

A.7.4. What is the difference between the Oracle Data Dictionary and MySQL INFORMATION_SCHEMA?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. The MySQL implementation is more similar to those found in DB2 and SQL Server, which also support INFORMATION_SCHEMA as defined in the SQL standard.

A.7.5. Can I add to or otherwise modify the tables found in the INFORMATION_SCHEMA database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, we cannot support bugs or other issues which result from modifying INFORMATION_SCHEMA tables or data.

A.8 MySQL 8.0 FAQ: Migration

A.8.1. Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0? ...................... 5044
A.8.2. How has storage engine (table type) support changed in MySQL 8.0 from previous versions? ... 5044

A.8.1. Where can I find information on how to migrate from MySQL 5.7 to MySQL 8.0?

For detailed upgrade information, see Section 2.11, “Upgrading MySQL”. Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will save time and trouble. If you encounter problems during the upgrade, their origin will be easier to identify, either by you or, if you have a MySQL Enterprise subscription, by MySQL support.

A.8.2. How has storage engine (table type) support changed in MySQL 8.0 from previous versions?

Storage engine support has changed as follows:

- Support for ISAM tables was removed in MySQL 5.0 and you should now use the MyISAM storage engine in place of ISAM. To convert a table tblname from ISAM to MyISAM, simply issue a statement such as this one:

  ALTER TABLE tblname ENGINE=MYISAM;

- Internal RAID for MyISAM tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as MERGE tables and views.

- The VARCHAR column type now retains trailing spaces in all storage engines.

- MEMORY tables (formerly known as HEAP tables) can also contain VARCHAR columns.
A.9 MySQL 8.0 FAQ: Security

A.9.1 Where can I find documentation that addresses security issues for MySQL?

The best place to start is Chapter 6, Security.

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- Section 6.1.1, “Security Guidelines”.
- Section 6.1.3, “Making MySQL Secure Against Attackers”.
- Section B.4.3.2, “How to Reset the Root Password”.
- Section 6.1.5, “How to Run MySQL as a Normal User”.
- UDF Security Precautions.
- Section 6.1.4, “Security-Related mysqld Options and Variables”.
- Section 6.1.6, “Security Issues with LOAD DATA LOCAL”.
- Section 2.10, “Postinstallation Setup and Testing”.
- Section 6.3, “Using Encrypted Connections”.

A.9.2 What is the default authentication plugin in MySQL 8.0?

The default authentication plugin in MySQL 8.0 is caching_sha2_password. For information about this plugin, see Section 6.4.1.2, “Caching SHA-2 Pluggable Authentication”.

The caching_sha2_password plugin provides more secure password encryption than the mysql_native_password plugin (the default plugin in previous MySQL series). For information about the implications of this change of default plugin for server operation and compatibility of the server with clients and connectors, see caching_sha2_password as the Preferred Authentication Plugin.

For general information about pluggable authentication and other available authentication plugins, see Section 6.2.17, “Pluggable Authentication”, and Section 6.4.1, “Authentication Plugins”.

A.9.3 Does MySQL 8.0 have native support for SSL?

Most 8.0 binaries have support for SSL connections between the client and server. See Section 6.3, “Using Encrypted Connections”.

You can also tunnel a connection using SSH, if (for example) the client application does not support SSL connections. For an example, see Section 6.3.4, “Connecting to MySQL Remotely from Windows with SSH”.

A.9.4 Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?
MySQL 8.0 FAQ: NDB Cluster

Most 8.0 binaries have SSL enabled for client/server connections that are secured, authenticated, or both. See Section 6.3, “Using Encrypted Connections”.

A.9.5. Does MySQL 8.0 have built-in authentication against LDAP directories?

The Enterprise edition includes a PAM Authentication Plugin that supports authentication against an LDAP directory.

A.9.6. Does MySQL 8.0 include support for Roles Based Access Control (RBAC)?

Not at this time.

A.10 MySQL 8.0 FAQ: NDB Cluster

In the following section, we answer questions that are frequently asked about MySQL NDB Cluster and the NDB storage engine.

A.10.1 Which versions of the MySQL software support NDB Cluster? Do I have to compile from source?

NDB Cluster is not supported in MySQL Server 8.0 releases; it is released as a separate product. NDB Cluster 8.0 is now available as a Developer Preview release for evaluation and testing of new features in the NDBCLUSTER storage engine; for more information, see Chapter 22, MySQL NDB Cluster 8.0. You are strongly advised to use NDB Cluster 7.6 for any new deployments; if you are using an older version of NDB Cluster, we recommend that you upgrade to this version soon as possible. For an overview of improvements made in NDB Cluster 7.6, see What is New in NDB Cluster 7.6.

NDB Cluster 7.6, based on MySQL Server 5.7 and version 7.6 of the NDB storage engine, is the most recent General Availability (GA) version of NDB Cluster, based on version 7.6 of the NDB storage engine and MySQL Server 5.7. NDB Cluster 7.6 is available for production use; new deployments intended for production should use the latest GA release in this series, which is currently NDB Cluster 7.6.13. You can obtain the most recent NDB Cluster 7.6 release from https://dev.mysql.com/downloads/cluster/. For information about new features and other important changes in this series, see What is New in NDB Cluster 7.6.

For detailed information about deploying and using NDB Cluster, see Chapter 22, MySQL NDB Cluster 8.0.

A.10.2 What do “NDB” and “NDBCLUSTER” mean?

“NDB” stands for Network Database. NDB and NDBCLUSTER are both names for the storage engine that enables clustering support with MySQL. NDB is preferred, but either name is correct.

A.10.3 How many computers do I need to run an NDB Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum recommended number of computers in an NDB Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.
To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

A.11 MySQL 8.0 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL’s Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

A.11.1 What CJK character sets are available in MySQL? ................................................................. 5047
A.11.2 I have inserted CJK characters into my table. Why does SELECT display them as “?” characters? .................................................................................................................. 5048
A.11.3 What problems should I be aware of when working with the Big5 Chinese character set? … 5050
A.11.4 Why do Japanese character set conversions fail? ................................................................. 5050
A.11.5 What should I do if I want to convert SJIS 81CA to cp932? ................................................. 5051
A.11.6 How does MySQL represent the Yen (¥) sign? ................................................................. 5051
A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL? … 5052
A.11.8 Why do I get incorrect string value error messages? ...................................................... 5052
A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API? .......................................................... 5052
A.11.10 I’ve upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets? ........................................................................................................ 5053
A.11.11 Why do some LIKE and FULLTEXT searches with CJK characters fail? ......................... 5054
A.11.12 How do I know whether character X is available in all character sets? .......................... 5055
A.11.13 Why do CJK strings sort incorrectly in Unicode? (I) ...................................................... 5056
A.11.14 Why do CJK strings sort incorrectly in Unicode? (II) .................................................... 5056
A.11.15 Why are my supplementary characters rejected by MySQL? ........................................... 5056
A.11.16 Should “CJK” be “CJKV”? ................................................................................................. 5057
A.11.17 Does MySQL permit CJK characters to be used in database and table names? ........... 5057
A.11.19 Where can I get help with CJK and related issues in MySQL? ........................................ 5057

A.11.1 What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the gb18030 character set is not supported prior to MySQL 5.7.4. However, since the name of the applicable language appears in the DESCRIPTION column for every entry in the INFORMATION_SCHEMA.CHARACTER_SETS table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
          FROM INFORMATION_SCHEMA.CHARACTER_SETS
          WHERE DESCRIPTION LIKE '%Chin%'
          OR DESCRIPTION LIKE '%Japanese%'
          OR DESCRIPTION LIKE '%Korean%'
          ORDER BY CHARACTER_SET_NAME;
```

<table>
<thead>
<tr>
<th>CHARACTER_SET_NAME</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>big5</td>
<td>Big5 Traditional Chinese</td>
</tr>
<tr>
<td>cp932</td>
<td>SJIS for Windows Japanese</td>
</tr>
<tr>
<td>eucjpms</td>
<td>UJIS for Windows Japanese</td>
</tr>
<tr>
<td>euckr</td>
<td>EUC-KR Korean</td>
</tr>
<tr>
<td>gb18030</td>
<td>China National Standard GB18030</td>
</tr>
</tbody>
</table>
MySQL supports three variants of the GB (Guojia Biaozhun, or National Standard, or Simplified Chinese) character sets which are official in the People's Republic of China: gb2312, gbk, and (as of MySQL 5.7.4) gb18030.

Sometimes people try to insert gbk characters into gb2312, and it works most of the time because gbk is a superset of gb2312. But eventually they try to insert a rarer Chinese character and it does not work. (For an example, see Bug #16072).

Here, we try to clarify exactly what characters are legitimate in gb2312 or gbk, with reference to the official documents. Please check these references before reporting gb2312 or gbk bugs:

- The MySQL gbk character set is in reality “Microsoft code page 936”. This differs from the official gbk for characters A1A4 (middle dot), A1AA (em dash), A6E0-A6F5, and A8BB-A8C0.
- For a listing of gbk/Unicode mappings, see http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT.

It is also possible to store CJK characters in Unicode character sets, although the available collations may not sort characters quite as you expect:

- The utf8 and ucs2 character sets support the characters from Unicode Basic Multilingual Plane (BMP). These characters have code point values between U+0000 and U+FFFF.
- The utf8mb4, utf16, utf16le, and utf32 character sets support BMP characters, as well as supplementary characters that lie outside the BMP. Supplementary characters have code point values between U+10000 and U+10FFFF.

The collation used for a Unicode character set determines the ability to sort (that is, distinguish) characters in the set:

- Collations based on Unicode Collation Algorithm (UCA) 4.0.0 distinguish only BMP characters.
- Collations based on UCA 5.2.0 or 9.0.0 distinguish BMP and supplementary characters.
- Non-UCA collations may not distinguish all Unicode characters. For example, the utf8mb4 default collation is utf8mb4_general_ci, which distinguishes only BMP characters.

Moreover, distinguishing characters is not the same as ordering them per the conventions of a given CJK language. Currently, MySQL has only one CJK-specific UCA collation, gb18030_unicode_520_ci (which requires use of the non-Unicode gb18030 character set).

For information about Unicode collations and their differentiating properties, including collation properties for supplementary characters, see Section 10.10.1, “Unicode Character Sets”.

A.11.2I have inserted CJK characters into my table. Why does SELECT display them as “?” characters?

This problem is usually due to a setting in MySQL that does not match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:
• Be certain of what MySQL version you are using.

Use the statement `SELECT VERSION();` to determine this.

• Make sure that the database is actually using the desired character set.

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or, better yet, by using this statement:

```sql
SELECT character_set_name, collation_name
FROM information_schema.columns
WHERE table_schema = your_database_name
  AND table_name = your_table_name
  AND column_name = your_column_name;
```

• Determine the hexadecimal value of the character or characters that are not being displayed correctly.

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```sql
SELECT HEX(column_name)
FROM table_name;
```

3F is the encoding for the ? character; this means that ? is the character actually stored in the column. This often happens because of a problem converting a particular character from your client character set to the target character set.

• Make sure that a round trip is possible. When you select literal (or _introducer hexadecimal-value), do you obtain literal as a result?

For example, the Japanese Katakana character Pe (#) exists in all CJK character sets, and has the code point value (hexadecimal coding) 0x30da. To test a round trip for this character, use this query:

```sql
SELECT '#' AS `#`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also #, the round trip failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('#');`. Then we can determine whether the client encoding is correct.

• Make sure that the problem is not with the browser or other application, rather than with MySQL.

Use the `mysql` client program to accomplish this task. If `mysql` displays characters correctly but your application does not, your problem is probably due to system settings.

To determine your settings, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char\%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | utf8                                   |
| character_set_connection | utf8                                   |
| character_set_database   | latin1                                 |
```
These are typical character-set settings for an international-oriented client (notice the use of \texttt{utf8} Unicode) connected to a server in the West (\texttt{latin1} is a West Europe character set).

Although Unicode (usually the \texttt{utf8} variant on Unix, and the \texttt{ucs2} variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as \texttt{cp932} for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what setting your underlying computer uses, try changing to a common character set for the country that you're in (\texttt{euckr} = Korea; \texttt{gb18030}, \texttt{gb2312} or \texttt{gbk} = People's Republic of China; \texttt{big5} = Taiwan; \texttt{sjis}, \texttt{ujis}, \texttt{cp932}, or \texttt{eucjpms} = Japan; \texttt{ucs2} or \texttt{utf8} = anywhere). Usually it is necessary to change only the client and connection and results settings. The \texttt{SET NAMES} statement changes all three at once. For example:

\begin{verbatim}
SET NAMES 'big5';
\end{verbatim}

Once the setting is correct, you can make it permanent by editing \texttt{my.cnf} or \texttt{my.ini}. For example you might add lines looking like these:

\begin{verbatim}
[mysqld]
character-set-server=big5

[client]
default-character-set=big5
\end{verbatim}

It is also possible that there are issues with the API configuration setting being used in your application; see \textit{Why does my GUI front end or browser not display CJK characters correctly...?} for more information.

\subsection{A.11.3 What problems should I be aware of when working with the Big5 Chinese character set?}

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). The MySQL \texttt{big5} character set is in reality Microsoft code page 950, which is very similar to the original \texttt{big5} character set.

A feature request for adding \texttt{HKSCS} extensions has been filed. People who need this extension may find the suggested patch for Bug \#13577 to be of interest.

\subsection{A.11.4 Why do Japanese character set conversions fail?}

MySQL supports the \texttt{sjis}, \texttt{ujis}, \texttt{cp932}, and \texttt{eucjpms} character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with \texttt{sjis} or \texttt{ujis}) and a Windows client (typically with \texttt{cp932}).

In the following conversion table, the \texttt{ucs2} column represents the source, and the \texttt{sjis}, \texttt{cp932}, \texttt{ujis}, and \texttt{eucjpms} columns represent the destinations; that is, the last 4 columns provide the hexadecimal result when we use \texttt{CONVERT(ucs2)} or we assign a \texttt{ucs2} column containing the value to an \texttt{sjis}, \texttt{cp932}, \texttt{ujis}, or \texttt{eucjpms} column.

\begin{table}[h]

</tr>
<tr>
<td>FULLWIDTH NOT SIGN</td>
<td>FFE2</td>
<td>3F</td>
<td>81CA</td>
<td>3F</td>
<td>A2CC</td>
</tr>
</tbody>
</table>

Now consider the following portion of the table.

<table>
<thead>
<tr>
<th></th>
<th>ucs2</th>
<th>sjis</th>
<th>cp932</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT SIGN</td>
<td>00AC</td>
<td>81CA</td>
<td>3F</td>
</tr>
<tr>
<td>FULLWIDTH NOT SIGN</td>
<td>FFE2</td>
<td>3F</td>
<td>81CA</td>
</tr>
</tbody>
</table>

This means that MySQL converts the NOT SIGN (Unicode U+00AC) to sjis code point 0x81CA and to cp932 code point 3F. (3F is the question mark ("?"). This is what is always used when the conversion cannot be performed.)

A.11.5 What should I do if I want to convert SJIS 81CA to cp932?

Our answer is: "?". There are disadvantages to this, and many people would prefer a “loose” conversion, so that 81CA (NOT SIGN) in sjis becomes 81CA (FULLWIDTH NOT SIGN) in cp932.

A.11.6 How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both sjis and euc) treat 5C as a reverse solidus (\, also known as a backslash), whereas others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, 5C is always the reverse solidus (\).
A.11.7 What issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (Extended Unix Code Korea) character set, only one problem has been noted. We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is WON SIGN (`#`). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```sql
mysql> SELECT
    CONVERT('#' USING euckr) AS euckr,
    HEX(CONVERT('#' USING euckr)) AS hexeuckr;
+-------+----------+
| euckr | hexeuckr |
| ?     | 3F       |
+-------+----------+
```

A.11.8 Why do I get Incorrect string value error messages?

To see the problem, create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```sql
mysql> CREATE TABLE ch
    (ucs2 CHAR(3) CHARACTER SET ucs2,
    gb2312 CHAR(3) CHARACTER SET gb2312);

mysql> SET sql_mode = '';

mysql> INSERT INTO ch VALUES ('A#B','A#B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

The `INSERT` produces a warning. Use the following statement to see what it is:

```sql
mysql> SHOW WARNINGS\G
*************************** 1. row ***************************
Level: Warning
Code: 1366
Message: Incorrect string value: '\xE6\xB1\x8CB' for column 'gb2312' at row 1
```

So it is a warning about the `gb2312` column only.

```sql
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-------+--------------+--------+-------------+
| ucs2  | HEX(ucs2)    | gb2312 | HEX(gb2312) |
| A#B   | 00416C4C0042 | A?B    | 413F42      |
+-------+--------------+--------+-------------+
```

Several things need explanation here:

1. The `#` character is not in the `gb2312` character set, as described earlier.
2. If you are using an old version of MySQL, you may see a different message.
3. A warning occurs rather than an error because MySQL is not set to use strict SQL mode. In nonstrict mode, MySQL tries to do what it can, to get the best fit, rather than give up. With strict SQL mode, the Incorrect string value message occurs as an error rather than a warning, and the `INSERT` fails.

A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API?
Obtain a direct connection to the server using the mysql client, and try the same query there. If mysql responds correctly, the trouble may be that your application interface requires initialization. Use mysql to tell you what character set or sets it uses with the statement SHOW VARIABLES LIKE 'char%';. If you are using Access, you are most likely connecting with Connector/ODBC. In this case, you should check Configuring Connector/ODBC. If, for example, you use big5, you would enter SET NAMES 'big5'. (In this case, no ; character is required.) If you are using ASP, you might need to add SET NAMES in the code. Here is an example that has worked in the past:

```sql
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \\
& "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than latin1 with Connector/NET, you must specify the character set in the connection string. See Connecting to MySQL Using Connector/NET, for more information.

If you are using PHP, try this:

```php
<?php
$link = new mysqli($host, $usr, $pwd, $db);
if( mysqli_connect_errno() )
{
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
$link->query("SET NAMES 'utf8'");
?>
```

In this case, we used SET NAMES to change character_set_client, character_set_connection, and character_set_results.

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a <meta> tag suffices to correct the problem: for example, to insure that the user agent interprets page content as UTF-8, include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the <head> section of the HTML page.

If you are using Connector/J, see Using Character Sets and Unicode.

**A.11.10** I've upgraded to MySQL 8.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in Section 10.4, “Connection Character Sets and Collations”:

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the character_set_client, character_set_results, and character_set_connection system variables. In effect, the server performs a SET NAMES operation using the character set name.
The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some Asian customers prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use. However, the server ignores this request from the client.

By way of example, suppose that your favorite server character set is `latin1`. Suppose further that the client uses `utf8` because this is what the client's operating system supports. Start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The resulting settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | utf8                                   |
| character_set_connection | utf8                                   |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | utf8                                   |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
```

Now stop the client, and stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the resulting settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | latin1                                 |
| character_set_connection | latin1                                 |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | latin1                                 |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` option is used.

**A.11.1 Why do some LIKE and FULLTEXT searches with CJK characters fail?**
For **LIKE** searches, there is a very simple problem with binary string column types such as **BINARY** and **BLOB**: we must know where characters end. With multibyte character sets, different characters might have different octet lengths. For example, in **utf8**, **A** requires one byte but **#** requires three bytes, as shown here:

<table>
<thead>
<tr>
<th>OCTET_LENGTH(_utf8 'A')</th>
<th>OCTET_LENGTH(_utf8 '#')</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

If we do not know where the first character in a string ends, we do not know where the second character begins, in which case even very simple searches such as **LIKE '_A%'** fail. The solution is to use a nonbinary string column type defined to have the proper CJK character set. For example: `mycol TEXT CHARACTER SET sjis`. Alternatively, convert to a CJK character set before comparing.

This is one reason why MySQL cannot permit encodings of nonexistent characters. If it is not strict about rejecting bad input, it has no way of knowing where characters end.

For **FULLTEXT** searches, we must know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary: the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

**A.11.12** How do I know whether character $x$ is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese Kana characters appear in all CJK character sets. The following stored procedure accepts a **UCS-2** Unicode character, converts it to other character sets, and displays the results in hexadecimal.

```sql
DELIMITER //
CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN
    CREATE TABLE tj
    (ucs2 CHAR(1) character set ucs2,
     utf8 CHAR(1) character set utf8,
     big5 CHAR(1) character set big5,
     cp932 CHAR(1) character set cp932,
     eucjpms CHAR(1) character set eucjpms,
     euckr CHAR(1) character set euckr,
     gb2312 CHAR(1) character set gb2312,
     gbk CHAR(1) character set gbk,
     sjis CHAR(1) character set sjis,
     ujis CHAR(1) character set ujis);
    INSERT INTO tj (ucs2) VALUES (ucs2_char);
    UPDATE tj SET utf8=ucs2,
                 big5=ucs2,
                 cp932=ucs2,
                 eucjpms=ucs2,
                 euckr=ucs2,
                 gb2312=ucs2,
                 gbk=ucs2,
                 sjis=ucs2,
                 ujis=ucs2;
END;
```

```sql
```
The input can be any single ucs2 character, or it can be the code value (hexadecimal representation) of that character. For example, from Unicode's list of ucs2 encodings and names (http://www.unicode.org/Public/UNIDATA/UnicodeData.txt), we know that the Katakana character Pe appears in all CJK character sets, and that its code value is X'30DA'. If we use this value as the argument to p_convert(), the result is as shown here:

<table>
<thead>
<tr>
<th>ucs2</th>
<th>utf8</th>
<th>big5</th>
<th>cp932</th>
<th>eucjpms</th>
<th>euckr</th>
<th>gb2312</th>
<th>gbk</th>
<th>sjis</th>
<th>ujis</th>
</tr>
</thead>
<tbody>
<tr>
<td>30DA</td>
<td>E3839A</td>
<td>C772</td>
<td>8379</td>
<td>A5DA</td>
<td>ABDA</td>
<td>A5DA</td>
<td>A5DA</td>
<td>8379</td>
<td>A5DA</td>
</tr>
</tbody>
</table>

Since none of the column values is 3F (that is, the question mark character, ?), we know that every conversion worked.

A.11.13 Why do CJK strings sort incorrectly in Unicode? (I)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the utf8mb4 character set and the utf8mb4_ja_0900_as_cs collation.

A.11.14 Why do CJK strings sort incorrectly in Unicode? (II)

CJK sorting problems that occurred in older MySQL versions can be solved as of MySQL 8.0 by using the utf8mb4 character set and the utf8mb4_ja_0900_as_cs collation.

A.11.15 Why are my supplementary characters rejected by MySQL?

Supplementary characters lie outside the Unicode Basic Multilingual Plane / Plane 0. BMP characters have code point values between U+0000 and U+FFFF. Supplementary characters have code point values between U+10000 and U+10FFFF.

To store supplementary characters, you must use a character set that permits them:

- The utf8 and ucs2 character sets support BMP characters only.

The utf8 character set permits only UTF-8 characters that take up to three bytes. This has led to reports such as that found in Bug #12600, which we rejected as “not a bug”. With utf8, MySQL...
must truncate an input string when it encounters bytes that it does not understand. Otherwise, it is unknown how long the bad multibyte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks. However, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters outside the BMP.

A.11.16 Should “CJK” be “CJKV”?

No. The term “CJKV” (Chinese Japanese Korean Vietnamese) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL supports the modern Vietnamese script with Western characters, but does not support the old Vietnamese script using Han characters.

As of MySQL 5.6, there are Vietnamese collations for Unicode character sets, as described in Section 10.10.1, “Unicode Character Sets”.

A.11.17 Does MySQL permit CJK characters to be used in database and table names?

Yes.

A.11.18 Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

The Japanese translation of the MySQL 5.6 manual can be downloaded from https://dev.mysql.com/doc/.

A.11.19 Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at https://wikis.oracle.com/display/mysql/List+of+MySQL+User+Groups.
- View feature requests relating to character set issues at http://tinyurl.com/y6xcuf.

A.12 MySQL 8.0 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- Section 28.6.28, “C API Common Issues”
- Common Problems with MySQL and PHP
- Connector/ODBC Notes and Tips
- Connector/.NET Programming
- MySQL Connector/J 8.0 Developer Guide

A.13 MySQL 8.0 FAQ: C API, libmysql

Frequently asked questions about MySQL C API and libmysql.
A.13.1 What is “MySQL Native C API”? What are typical benefits and use cases? 

libmysql is a C-based API that you can use in C applications to connect with the MySQL database server. It is also itself used as the foundation for drivers for standard database APIs like ODBC, Perl’s DBI, and Python’s DB API.

A.13.2 Which version of libmysql should I use?

For MySQL 8.0, 5.7, 5.6, and 5.5, we recommend libmysql 8.0.

A.13.3 What if I want to use the “NoSQL” X DevAPI?

For C-language and X DevApi Document Store for MySQL 8.0, we recommend MySQL Connector/C++. Connector/C++ 8.0 has compatible C headers. (This is not applicable to MySQL 5.7 or before.)

A.13.4 How to I download libmysql?

- Linux: The Client Utilities Package is available from the MySQL Community Server download page.
- Repos: The Client Utilities Package is available from the Yum, APT, SuSE repositories.
- Windows: The Client Utilities Package is available from Windows Installer.

A.13.5 Where is the documentation?

See Section 28.6, “MySQL C API”.

A.13.6 How do I report bugs?

Please report any bugs or inconsistencies you observe to our Bugs Database. Select the C API Client as shown.

A.13.7 Is it possible to compile the library myself?

Yes, you can download the libmysqlclient source code and compile it on your own. Here’s an example:

```
$ git clone --depth 1 https://github.com/mysql/mysql-server
$ cd mysql-server
$ mkdir build
$ cd build
$ cmake .. -GNinja -DDOWNLOAD_BOOST=1 \
  -DWITH_BOOST=/tmp -DCMAKE_BUILD_TYPE=Release -DWITHOUT_SERVER=ON \
  -DWITH_SSL=system
$ ninja libmysqlclient.a
$ ls -la archive_output_directory/libmysqlclient.a
  -rw-rw-r-- 1 kg kg 8,5M wrz 5 04:57 archive_output_directory/libmysqlclient.a
```

Note

This example uses https://ninja-build.org/ as a build system instead of make.
A.14 MySQL 8.0 FAQ: Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication.

A.14.1 Must the slave be connected to the master all the time? ......................................................... 5059
A.14.2 Must I enable networking on my master and slave to enable replication? ............................... 5059
A.14.3 How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave? ......................................................... 5059
A.14.4 How do I force the master to block updates until the slave catches up? ................................... 5060
A.14.5 What issues should I be aware of when setting up two-way replication? ................................. 5060
A.14.6 How can I use replication to improve performance of my system? ............................................. 5060
A.14.7 What should I do to prepare client code in my own applications to use performance-enhancing replication? ......................................................................................................................... 5060
A.14.8 When and how much can MySQL replication improve the performance of my system? ........ 5061
A.14.9 How can I use replication to provide redundancy or high availability? ................................. 5062
A.14.10 How do I tell whether a master server is using statement-based or row-based binary logging format? ........................................................................................................................................... 5062
A.14.11 How do I tell a slave to use row-based replication? ................................................................. 5062
A.14.12 How do I prevent GRANT and REVOKE statements from replicating to slave machines? ...... 5062
A.14.13 Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on OS X and Windows)? ........................................................................ 5062
A.14.14 Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)? ......................................................... 5062

A.14.1 Must the slave be connected to the master all the time?

No, it does not. The slave can go down or stay disconnected for hours or even days, and then reconnect and catch up on updates. For example, you can set up a master/slave relationship over a dial-up link where the link is up only sporadically and for short periods of time. The implication of this is that, at any given time, the slave is not guaranteed to be in synchrony with the master unless you take some special measures.

To ensure that catchup can occur for a slave that has been disconnected, you must not remove binary log files from the master that contain information that has not yet been replicated to the slaves. Asynchronous replication can work only if the slave is able to continue reading the binary log from the point where it last read events.

A.14.2 Must I enable networking on my master and slave to enable replication?

Yes, networking must be enabled on the master and slave. If networking is not enabled, the slave cannot connect to the master and transfer the binary log. Verify that the skip_networking system variable has not been enabled in the configuration file for either server.

A.14.3 How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave?

Check the Seconds_Behind_Master column in the output from SHOW SLAVE STATUS. See Section 17.1.7.1, "Checking Replication Status".

When the slave SQL thread executes an event read from the master, it modifies its own time to the event timestamp. (This is why TIMESTAMP is well replicated.) In the Time column in the output of SHOW PROCESSLIST, the number of seconds displayed for the slave SQL thread is the number of seconds between the timestamp of the last replicated event and the real time of the slave machine. You can use this to determine the date of the last replicated event. Note that if your slave has been disconnected from the master for one hour, and then reconnects, you may immediately
see large Time values such as 3600 for the slave SQL thread in SHOW PROCESSLIST. This is because the slave is executing statements that are one hour old. See Section 17.2.2, “Replication Implementation Details”.

A.14.4 How do I force the master to block updates until the slave catches up?

Use the following procedure:

1. On the master, execute these statements:

```sql
mysql> FLUSH TABLES WITH READ LOCK;
mysql> SHOW MASTER STATUS;
```

Record the replication coordinates (the current binary log file name and position) from the output of the SHOW statement.

2. On the slave, issue the following statement, where the arguments to the MASTER_POS_WAIT() function are the replication coordinate values obtained in the previous step:

```sql
mysql> SELECT MASTER_POS_WAIT('log_name', log_pos);
```

The SELECT statement blocks until the slave reaches the specified log file and position. At that point, the slave is in synchrony with the master and the statement returns.

3. On the master, issue the following statement to enable the master to begin processing updates again:

```sql
mysql> UNLOCK TABLES;
```

A.14.5 What issues should I be aware of when setting up two-way replication?

MySQL replication currently does not support any locking protocol between master and slave to guarantee the atomicity of a distributed (cross-server) update. In other words, it is possible for client A to make an update to co-master 1, and in the meantime, before it propagates to co-master 2, client B could make an update to co-master 2 that makes the update of client A work differently than it did on co-master 1. Thus, when the update of client A makes it to co-master 2, it produces tables that are different from what you have on co-master 1, even after all the updates from co-master 2 have also propagated. This means that you should not chain two servers together in a two-way replication relationship unless you are sure that your updates can safely happen in any order, or unless you take care of mis-ordered updates somehow in the client code.

You should also realize that two-way replication actually does not improve performance very much (if at all) as far as updates are concerned. Each server must do the same number of updates, just as you would have a single server do. The only difference is that there is a little less lock contention because the updates originating on another server are serialized in one slave thread. Even this benefit might be offset by network delays.

A.14.6 How can I use replication to improve performance of my system?

Set up one server as the master and direct all writes to it. Then configure as many slaves as you have the budget and rackspace for, and distribute the reads among the master and the slaves. You can also start the slaves with the --skip-innodb option, enable the low_priority_updates system variable, and set the delay_key_write system variable to ALL to get speed improvements on the slave end. In this case, the slave uses nontransactional MyISAM tables instead of InnoDB tables to get more speed by eliminating transactional overhead.

A.14.7 What should I do to prepare client code in my own applications to use performance-enhancing replication?
When and how much can MySQL replication improve the performance of my system?

MySQL replication is most beneficial for a system that processes frequent reads and infrequent writes. In theory, by using a single-master/multiple-slave setup, you can scale the system by adding more slaves until you either run out of network bandwidth, or your update load grows to the point that the master cannot handle it.

To determine how many slaves you can use before the added benefits begin to level out, and how much you can improve performance of your site, you must know your query patterns, and determine empirically by benchmarking the relationship between the throughput for reads and writes on a typical master and a typical slave. The example here shows a rather simplified calculation of what you can get with replication for a hypothetical system. Let reads and writes denote the number of reads and writes per second, respectively.

Let's say that system load consists of 10% writes and 90% reads, and we have determined by benchmarking that reads is 1200 - 2 * writes. In other words, the system can do 1,200 reads per second with no writes, the average write is twice as slow as the average read, and the relationship is linear. Suppose that the master and each slave have the same capacity, and that we have one master and N slaves. Then we have for each server (master or slave):

reads = 1200 - 2 * writes
reads = 9 * writes / (N + 1) (reads are split, but writes replicated to all slaves)
9 * writes / (N + 1) + 2 * writes = 1200
writes = 1200 / (2 + 9/(N + 1))

The last equation indicates the maximum number of writes for N slaves, given a maximum possible read rate of 1,200 per second and a ratio of nine reads per write.

This analysis yields the following conclusions:

- If N = 0 (which means we have no replication), our system can handle about 1200/11 = 109 writes per second.
- If N = 1, we get up to 184 writes per second.
- If N = 8, we get up to 400 writes per second.
- If N = 17, we get up to 480 writes per second.
- Eventually, as N approaches infinity (and our budget negative infinity), we can get very close to 600 writes per second, increasing system throughput about 5.5 times. However, with only eight servers, we increase it nearly four times.

These computations assume infinite network bandwidth and neglect several other factors that could be significant on your system. In many cases, you may not be able to perform a computation similar to the one just shown that accurately predicts what will happen on your system if you add N replication slaves. However, answering the following questions should help you decide whether and by how much replication will improve the performance of your system:

- What is the read/write ratio on your system?
• How much more write load can one server handle if you reduce the reads?
• For how many slaves do you have bandwidth available on your network?

A.14.9 How can I use replication to provide redundancy or high availability?

How you implement redundancy is entirely dependent on your application and circumstances. High-availability solutions (with automatic failover) require active monitoring and either custom scripts or third party tools to provide the failover support from the original MySQL server to the slave.

To handle the process manually, you should be able to switch from a failed master to a pre-configured slave by altering your application to talk to the new server or by adjusting the DNS for the MySQL server from the failed server to the new server.

For more information and some example solutions, see Section 17.4.8, “Switching Masters During Failover”.

A.14.10 How do I tell whether a master server is using statement-based or row-based binary logging format?

Check the value of the `binlog_format` system variable:

```
mysql> SHOW VARIABLES LIKE 'binlog_format';
```

The value shown will be one of `STATEMENT`, `ROW`, or `MIXED`. For `MIXED` mode, statement-based logging is used by default but replication switches automatically to row-based logging under certain conditions, such as unsafe statements. For information about when this may occur, see Section 5.4.4.3, “Mixed Binary Logging Format”.

A.14.11 How do I tell a slave to use row-based replication?

Slaves automatically know which format to use.

A.14.12 How do I prevent `GRANT` and `REVOKE` statements from replicating to slave machines?

Start the server with the `--replicate-wild-ignore-table=mysql.%` option to ignore replication for tables in the `mysql` database.

A.14.13 Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on OS X and Windows)?

Yes.

A.14.14 Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)?

Yes.

A.15 MySQL 8.0 FAQ: MySQL Enterprise Thread Pool

A.15.1 What is the Thread Pool and what problem does it solve? .................................................. 5062
A.15.2 How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput? ................................................................. 5063
A.15.3 How is the Thread Pool different from the client side Connection Pool? ........................... 5063
A.15.4 When should I use the Thread Pool? ................................................................. 5063
A.15.5 Are there recommended Thread Pool configurations? .......................................................... 5064

A.15.1 What is the Thread Pool and what problem does it solve?
The MySQL Thread Pool is a MySQL server plugin that extends the default connection-handling capabilities of the MySQL server to limit the number of concurrently executing statements/queries and transactions to ensure that each has sufficient CPU and memory resources to fulfill its task. For MySQL 8.0, the Thread Pool plugin is included in MySQL Enterprise Edition, a commercial product.

The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. The Thread Pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The Thread Pool plugin increases server performance by efficiently managing statement execution threads for large numbers of client connections, especially on modern multi-CPU/Core systems.

For more information, see Section 5.6.3, “MySQL Enterprise Thread Pool”.

**A.15.2 How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput?**

The Thread Pool uses a “divide and conquer” approach to limiting and balancing concurrency. Unlike the default connection handling of the MySQL Server, the Thread Pool separates connections and threads, so there is no fixed relationship between connections and the threads that execute statements received from those connections. The Thread Pool then manages client connections within configurable thread groups, where they are prioritized and queued based on the nature of the work they were submitted to accomplish.

For more information, see Section 5.6.3.3, “Thread Pool Operation”.

**A.15.3 How is the Thread Pool different from the client side Connection Pool?**

The MySQL Connection Pool operates on the client side to ensure that a MySQL client does not constantly connect to and disconnect from the MySQL server. It is designed to cache idle connections in the MySQL client for use by other users as they are needed. This minimizes the overhead and expense of establishing and tearing down connections as queries are submitted to the MySQL server. The MySQL Connection Pool has no visibility as to the query handling capabilities or load of the back-end MySQL server. By contrast, the Thread Pool operates on the MySQL server side and is designed to manage the execution of inbound concurrent connections and queries as they are received from the client connections accessing the back-end MySQL database. Because of the separation of duties, the MySQL Connection Pool and Thread Pool are orthogonal and can be used independent of each other.

MySQL Connection Pooling via the MySQL Connectors is covered in Chapter 28, Connectors and APIs.

**A.15.4 When should I use the Thread Pool?**

There are a few rules of thumb to consider for optimal Thread Pool use cases:

The MySQL Threads_running variable keeps track of the number of concurrent statements currently executing in the MySQL Server. If this variable consistently exceeds a region where the server won’t operate optimally (usually going beyond 40 for InnoDB workloads), the Thread Pool will be beneficial, especially in extreme parallel overload situations.

If you are using the innodb_thread_concurrency to limit the number of concurrently executing statements, you will find the Thread Pool solves the same problem, only better, by assigning connections to thread groups, then queuing executions based on transactional content, user defined designations, and so forth.

Lastly, if your workload comprises mainly short queries, the Thread Pool will be beneficial.
To learn more, see Section 5.6.3.4, “Thread Pool Tuning”.

A.15.5 Are there recommended Thread Pool configurations?

The Thread Pool has a number of user case driven configuration parameters that affect its performance. To learn about these and tips on tuning, see Section 5.6.3.4, “Thread Pool Tuning”.

A.16 MySQL 8.0 FAQ: InnoDB Change Buffer

A.16.1 What types of operations modify secondary indexes and result in change buffering? Insert, update, and delete operations can modify secondary indexes. If an affected index page is not in the buffer pool, the changes can be buffered in the change buffer.

A.16.2 What is the benefit of the InnoDB change buffer? Buffering secondary index changes when secondary index pages are not in the buffer pool avoids expensive random access I/O operations that would be required to immediately read in affected index pages from disk. Buffered changes can be applied later, in batches, as pages are read into the buffer pool by other read operations.

A.16.3 Does the change buffer support other types of indexes? No. The change buffer only supports secondary indexes. Clustered indexes, full-text indexes, and spatial indexes are not supported. Full-text indexes have their own caching mechanism.

A.16.4 How much space does InnoDB use for the change buffer? Prior to the introduction of the innodb_change_buffer_max_size configuration option in MySQL 5.6, the maximum size of the on-disk change buffer in the system tablespace was 1/3 of the InnoDB buffer pool size.

In MySQL 5.6 and later, the innodb_change_buffer_max_size configuration option defines the maximum size of the change buffer as a percentage of the total buffer pool size. By default, innodb_change_buffer_max_size is set to 25. The maximum setting is 50. InnoDB does not buffer an operation if it would cause the on-disk change buffer to exceed the defined limit.

Change buffer pages are not required to persist in the buffer pool and may be evicted by LRU operations.

A.16.5 How do I determine the current size of the change buffer? The current size of the change buffer is reported by show engine innodb status \G, under the INSERT BUFFER AND ADAPTIVE HASH INDEX heading. For example:
MySQL 8.0 FAQ: InnoDB Change Buffer

---

INSERT BUFFER AND ADAPTIVE HASH INDEX
---

Ibuf: size 1, free list len 0, seg size 2, 0 merges

Relevant data points include:

- **size**: The number of pages used within the change buffer. Change buffer size is equal to `seg size - (1 + free list len)`. The `1 +` value represents the change buffer header page.

- **seg size**: The size of the change buffer, in pages.

For information about monitoring change buffer status, see Section 15.5.2, "Change Buffer".

**A.16.6 When does change buffer merging occur?**

- When a page is read into the buffer pool, buffered changes are merged upon completion of the read, before the page is made available.

- Change buffer merging is performed as a background task. The `innodb_io_capacity` parameter sets an upper limit on the I/O activity performed by InnoDB background tasks such as merging data from the change buffer.

- A change buffer merge is performed during crash recovery. Changes are applied from the change buffer (in the system tablespace) to leaf pages of secondary indexes as index pages are read into the buffer pool.

- The change buffer is fully durable and will survive a system crash. Upon restart, change buffer merge operations resume as part of normal operations.

- A full merge of the change buffer can be forced as part of a slow server shutdown using `--innodb-fast-shutdown=0`.

**A.16.7 When is the change buffer flushed?**

Updated pages are flushed by the same flushing mechanism that flushes the other pages that occupy the buffer pool.

**A.16.8 When should the change buffer be used?**

The change buffer is a feature designed to reduce random I/O to secondary indexes as indexes grow larger and no longer fit in the InnoDB buffer pool. Generally, the change buffer should be used when the entire data set does not fit into the buffer pool, when there is substantial DML activity that modifies secondary index pages, or when there are lots of secondary indexes that are regularly changed by DML activity.

**A.16.9 When should the change buffer not be used?**

You might consider disabling the change buffer if the entire data set fits within the InnoDB buffer pool, if you have relatively few secondary indexes, or if you are using solid-state storage, where random reads are about as fast as sequential reads. Before making configuration changes, it is recommended that you run tests using a representative workload to determine if disabling the change buffer provides any benefit.

**A.16.10 Where can I find additional information about the change buffer?**

See Section 15.5.2, "Change Buffer".
A.17 MySQL 8.0 FAQ: InnoDB Data-at-Rest Encryption

A.17.1 Is data decrypted for users who are authorized to see it?  
Yes. InnoDB data-at-rest encryption is designed to transparently apply encryption within the database without impacting existing applications. Returning data in encrypted format would break most existing applications. InnoDB data-at-rest encryption provides the benefit of encryption without the overhead associated with traditional database encryption solutions, which would typically require expensive and substantial changes to applications, database triggers, and views.

A.17.2 What is the overhead associated with InnoDB data-at-rest encryption?  
There is no additional storage overhead. According to internal benchmarks, performance overhead amounts to a single digit percentage difference.

A.17.3 What are the encryption algorithms used with InnoDB data-at-rest encryption?  
InnoDB data-at-rest encryption supports the Advanced Encryption Standard (AES256) block-based encryption algorithm. It uses Electronic Codebook (ECB) block encryption mode for tablespace key encryption and Cipher Block Chaining (CBC) block encryption mode for data encryption.

A.17.4 Is it possible to use 3rd party encryption algorithms in place of the one provided by the InnoDB data-at-rest encryption feature?  
No, it is not possible to use other encryption algorithms. The provided encryption algorithm is broadly accepted.

A.17.5 Can indexed columns be encrypted?  
InnoDB data-at-rest encryption supports all indexes transparently.

A.17.6 What data types and data lengths does InnoDB data-at-rest encryption support?  
InnoDB data-at-rest encryption supports all supported data types. There is no data length limitation.

A.17.7 Does data remain encrypted on the network?  
Data encrypted by the InnoDB data-at-rest feature is decrypted when it is read from the tablespace file. Thus, if the data is on the network, it is in cleartext form. However, data on the network can be
MySQL 8.0 FAQ: InnoDB Data-at-Rest Encryption

encrypted using MySQL network encryption, which encrypts data traveling to and from a database using SSL/TLS.

A.17.8 Does database memory contain cleartext or encrypted data?

With InnoDB data-at-rest encryption, in-memory data is decrypted, which provides complete transparency.

A.17.9 How do I know which data to encrypt?

Compliance with the PCI-DSS standard requires that credit card numbers (Primary Account Number, or ‘PAN’) be stored in encrypted form. Breach Notification Laws (for example, CA SB 1386, CA AB 1950, and similar laws in 43+ more US states) require encryption of first name, last name, driver license number, and other PII data. In early 2008, CA AB 1298 added medical and health insurance information to PII data. Additionally, industry specific privacy and security standards may require encryption of certain assets. For example, assets such as pharmaceutical research results, oil field exploration results, financial contracts, or personal data of law enforcement informants may require encryption. In the health care industry, the privacy of patient data, health records and X-ray images is of the highest importance.

A.17.10 How is InnoDB data-at-rest encryption different from encryption functions MySQL already provides?

There are symmetric and asymmetric encryption APIs in MySQL that can be used to manually encrypt data within the database. However, the application must manage encryption keys and perform required encryption and decryption operations by calling API functions. InnoDB data-at-rest encryption requires no application changes, is transparent to end users, and provides automated, built-in key management.

A.17.11 Does the transportable tablespaces feature work with InnoDB data-at-rest encryption?

Yes. It is supported for encrypted file-per-table tablespaces. For more information, see Exporting Encrypted Tablespaces.

A.17.12 Does compression work with InnoDB data-at-rest encryption?

Customers using InnoDB data-at-rest encryption receive the full benefit of compression because compression is applied before data blocks are encrypted.

A.17.13 Can I use mysqlpump or mysqldump with encrypted tables?

Yes. Because these utilities create logical backups, the data dumped from encrypted tables is not encrypted.

A.17.14 How do I change (rotate, re-key) the master encryption key?

InnoDB data-at-rest encryption uses a two tier key mechanism. When data-at-rest encryption is used, individual tablespace keys are stored in the header of the underlying tablespace data file. Tablespace keys are encrypted using the master encryption key. The master encryption key is generated when tablespace encryption is enabled, and is stored outside the database. The master encryption key is rotated using the ALTER INSTANCE ROTATE INNODB MASTER KEY statement, which generates a new master encryption key, stores the key, and rotates the key into use.

A.17.15 How do I migrate data from a cleartext InnoDB tablespace to an encrypted InnoDB tablespace?

Transferring data from one tablespace to another is not required. To encrypt data in an InnoDB file-per-table tablespace, run ALTER TABLE tbl_name ENCRYPTION = 'Y'. To encrypt a general tablespace or the mysql tablespace, run ALTER TABLESPACE tablespace_name ENCRYPTION
= 'Y'. Encryption support for general tablespaces was introduced in MySQL 8.0.13. Encryption support for the `mysql` system tablespace is available as of MySQL 8.0.16.

A.18 MySQL 8.0 FAQ: Virtualization Support

A.18.1 Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others?

MySQL is supported on virtualized environments, but is certified only for Oracle VM. Contact Oracle Support for more information.

Be aware of potential problems when using virtualization software. The usual ones are related to performance, performance degradations, slowness, or unpredictability of disk, I/O, network, and memory.

  B.4.7 Known Issues in MySQL ................................................................................... 5631

This appendix describes the types of error information MySQL provides and how to obtain information about them. It also lists the error messages that the MySQL server and MySQL client programs generate. The final section is for troubleshooting. It describes common problems and errors that may occur and potential resolutions.

Additional Resources

Other sections that discuss error-related topics include:

- Information about configuring where and how the server writes the error log: Section 5.4.2, “The Error Log”
- Information about the character set used for error messages: Section 10.6, “Error Message Character Set”
- Information about the language used for error messages: Section 10.12, “Setting the Error Message Language”
- Information about errors related to InnoDB: Section 15.21.4, “InnoDB Error Handling”

B.1 Error Message Sources and Components

This section discusses how error messages originate within MySQL and the components they contain.

- Error Message Sources
- Error Message Components
- Error Code Ranges

Error Message Sources

Error messages can originate on the server side or the client side:
Error Message Components

- On the server side, error messages may occur during the startup and shutdown processes, as a result of issues that occur during SQL statement execution, and so forth.

- The MySQL server writes some error messages to its error log. These indicate issues of interest to database administrators or that require DBA action.

- The server sends other error messages to client programs. These indicate issues pertaining only to a particular client. The MySQL client library takes errors received from the server and makes them available to the host client program.

- Client-side error messages are generated from within the MySQL client library, usually involving problems communicating with the server.

Example server-side error messages written to the error log:

- This message produced during the startup process provides a status or progress indicator:

  2018-10-28T13:01:32.735983Z 0 [Note] [MY-010303] [Server] Skipping generation of SSL certificates as options related to SSL are specified.

- This message indicates an issue that requires DBA action:

  2018-10-02T03:20:39.410387Z 768 [ERROR] [MY-010045] [Server] Event Scheduler: [evtuser@localhost][myschema.e_daily] Unknown database 'mydb'

Example server-side error message sent to client programs, as displayed by the mysql client:

```
  mysql> SELECT * FROM no_such_table;
  ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Example client-side error message originating from within the client library, as displayed by the mysql client:

```
  shell> mysql -h no-such-host
  ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

Whether an error originates from within the client library or is received from the server, a MySQL client program may respond in varying ways. As just illustrated, the client may display the error message so the user can take corrective measures. The client may instead internally attempt to resolve or retry a failed operation, or take other action.

Error Message Components

When an error occurs, error information includes several components: an error code, SQLSTATE value, and message string. These components have the following characteristics:

- Error code: This value is numeric. It is MySQL-specific and is not portable to other database systems.

  Each error number has a corresponding symbolic value. Examples:

  - The symbol for server error number 1146 is ER_NO_SUCH_TABLE.
  - The symbol for client error number 2005 is CR_UNKNOWN_HOST.

The set of error codes used in error messages is partitioned into distinct ranges; see Error Code Ranges.

Error codes are stable across General Availability (GA) releases of a given MySQL series. Before a series reaches GA status, new codes may still be under development and are subject to change.
Error Code Ranges

• SQLSTATE value: This value is a five-character string (for example, '42S02'). SQLSTATE values are taken from ANSI SQL and ODBC and are more standardized than the numeric error codes. The first two characters of an SQLSTATE value indicate the error class:
  • Class = '00' indicates success.
  • Class = '01' indicates a warning.
  • Class = '02' indicates "not found." This is relevant within the context of cursors and is used to control what happens when a cursor reaches the end of a data set. This condition also occurs for SELECT ... INTO var_list statements that retrieve no rows.
  • Class > '02' indicates an exception.

For server-side errors, not all MySQL error numbers have corresponding SQLSTATE values. In these cases, 'HY000' (general error) is used.

For client-side errors, the SQLSTATE value is always 'HY000' (general error), so it is not meaningful for distinguishing one client error from another.

• Message string: This string provides a textual description of the error.

Error Code Ranges

The set of error codes used in error messages is partitioned into distinct ranges, each with its own purpose:

• 1 to 999: Global error codes. This error code range is called “global” because it is a shared range that is used by the server as well as by clients.

  When an error in this range originates on the server side, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of MY-.

  When an error in this range originates on the client side, the client library makes it available to the client program with no zero-padding or prefix.

• 1,000 to 1,999: Server error codes reserved for messages sent to clients.

• 2,000 to 2,999: Client error codes reserved for use by the client library.

• 3,000 to 4,999: Server error codes reserved for messages sent to clients.

• 5,000 to 5,999: Error codes reserved for use by X Plugin for messages sent to clients.

• 10,000 to 49,999: Server error codes reserved for messages to be written to the error log (not sent to clients).

  When an error in this range occurs, the server writes it to the error log, padding the error code with leading zeros to six digits and adding a prefix of MY-.

• 50,000 to 51,999: Error codes reserved for use by third parties.

The server handles error messages written to the error log differently from error messages sent to clients:

• When the server writes a message to the error log, it pads the error code with leading zeros to six digits and adds a prefix of MY- (examples: MY-000022, MY-010048).

• When the server sends a message to a client program, it adds no zero-padding or prefix to the error code (examples: 1036, 3013).
B.2 Error Information Interfaces

Error messages can originate on the server side or the client side, and each error message includes an error code, SQLSTATE value, and message string, as described in Section B.1, “Error Message Sources and Components”. For lists of server-side, client-side, and global (shared between server and clients) errors, see Section B.3, “Error Message Reference”.

For error checking from within programs, use error code numbers or symbols, not error message strings. Message strings do not change often, but it is possible. Also, if the database administrator changes the language setting, that affects the language of message strings; see Section 10.12, “Setting the Error Message Language”.

Error information in MySQL is available in the server error log, at the SQL level, from within client programs, and at the command line.

- Error Log
- SQL Error Message Interface
- Client Error Message Interface
- Command-Line Error Message Interface

Error Log

On the server side, some messages are intended for the error log. For information about configuring where and how the server writes the log, see Section 5.4.2, “The Error Log”.

Other server error messages are intended to be sent to client programs and are available as described in Client Error Message Interface.

The range within which a particular error code lies determines whether the server writes an error message to the error log or sends it to clients. For information about these ranges, see Error Code Ranges.

SQL Error Message Interface

At the SQL level, there are several sources of error information in MySQL:

- SQL statement warning and error information is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` system variable indicates the number of errors, warnings, and notes (with notes excluded if the `sql_notes` system variable is disabled). The `error_count` system variable indicates the number of errors. Its value excludes warnings and notes.

- The `GET DIAGNOSTICS` statement may be used to inspect the diagnostic information in the diagnostics area. See Section 13.6.7.3, “GET DIAGNOSTICS Statement”.

- `SHOW SLAVE STATUS` statement output includes information about replication errors occurring on replication slave servers.

- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an InnoDB table fails.

Client Error Message Interface

Client programs receive errors from two sources:

- Errors that originate on the client side from within the MySQL client library.
Errors that originate on the server side and are sent to the client by the server. These are received within the client library, which makes them available to the host client program.

The range within which a particular error code lies determines whether it originated from within the client library or was received by the client from the server. For information about these ranges, see Error Code Ranges.

Regardless of whether an error originates from within the client library or is received from the server, a MySQL client program obtains the error code, SQLSTATE value, message string, and other related information by calling C API functions in the client library:

- `mysql_errno()` returns the MySQL error code.
- `mysql_sqlstate()` returns the SQLSTATE value.
- `mysql_error()` returns the message string.
- `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()` are the corresponding error functions for prepared statements.
- `mysql_warning_count()` returns the number of errors, warnings, and notes for the most recent statement.

For descriptions of the client library error functions, see Section 28.6, “MySQL C API”.

A MySQL client program may respond to an error in varying ways. The client may display the error message so the user can take corrective measures, internally attempt to resolve or retry a failed operation, or take other action. For example, (using the `mysql` client), a failure to connect to the server might result in this message:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

**Command-Line Error Message Interface**

The `perror` program provides information from the command line about error numbers. See Section 4.8.2, “perror — Display MySQL Error Message Information”.

```
shell> perror 1231
MySQL error code MY-001231 (ER_WRONG_VALUE_FOR_VAR): Variable '%-.64s' can't be set to the value of '%-.200s'
```

For MySQL NDB Cluster errors, use `ndb_perror`. See Section 22.4.16, “ndb_perror — Obtain NDB Error Message Information”.

```
shell> ndb_perror 323
NDB error code 323: Invalid nodegroup id, nodegroup already existing:
Permanent error: Application error
```

**B.3 Error Message Reference**

This section provides a reference for the various types of error messages in MySQL:

- Error messages produced only by the server: Section B.3.1, “Server Error Message Reference”
- Error messages that originate only from within the MySQL client library: Section B.3.2, “Client Error Message Reference”
- Error messages that are shared between the server and the client library: Section B.3.3, “Global Error Message Reference”
B.3.1 Server Error Message Reference

The MySQL server writes some error messages to its error log, and sends others to client programs.

Example server-side error messages written to the error log:

```
2018-10-28T13:01:32.735983Z 0 [Note] [MY-010303] [Server] Skipping generation of SSL certificates as options related to SSL are specified.
```

```
2018-10-02T03:20:39.410387Z 768 [ERROR] [MY-010045] [Server] Event Scheduler: [evtuser@localhost][myschema.e_daily] Unknown database 'mydb'
```

Example server-side error message sent to client programs, as displayed by the `mysql` client:

```
mysql> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Each server error message includes an error code, SQLSTATE value, and message string, as described in Section B.1, “Error Message Sources and Components”. These components are available as described in Section B.2, “Error Information Interfaces”.

In addition to the errors in the following list, the server can also produce error messages that have error codes in the range from 1 to 999. See Section B.3.3, “Global Error Message Reference”

- **Error number**: 1002; Symbol: `ER_NO`; SQLSTATE: `HY000`
  
  Message: NO

  Used in the construction of other messages.

- **Error number**: 1003; Symbol: `ER_YES`; SQLSTATE: `HY000`
  
  Message: YES

  Used in the construction of other messages.

  Extended `EXPLAIN` format generates Note messages. `ER_YES` is used in the `Code` column for these messages in subsequent `SHOW WARNINGS` output.

- **Error number**: 1004; Symbol: `ER_CANT_CREATE_FILE`; SQLSTATE: `HY000`
  
  Message: Can't create file '%s' (errno: %d - %s)

  Occurs for failure to create or copy a file needed for some operation.

  Possible causes: Permissions problem for source file; destination file already exists but is not writeable.

- **Error number**: 1005; Symbol: `ER_CANT_CREATE_TABLE`; SQLSTATE: `HY000`
  
  Message: Can't create table '%s' (errno: %d - %s)

  `InnoDB` reports this error when a table cannot be created. If the error message refers to error 150, table creation failed because a foreign key constraint was not correctly formed. If the error message refers to error -1, table creation probably failed because the table includes a column name that matched the name of an internal `InnoDB` table.

- **Error number**: 1006; Symbol: `ER_CANT_CREATE_DB`; SQLSTATE: `HY000`
  
  Message: Can't create database '%s' (errno: %d - %s)
Server Error Message Reference

• Error number: 1007; Symbol: ER_DB_CREATE_EXISTS; SQLSTATE: HY000
  Message: Can't create database '%s'; database exists
  An attempt to create a database failed because the database already exists.
  Drop the database first if you really want to replace an existing database, or add an IF NOT EXISTS clause to the CREATE DATABASE statement if to retain an existing database without having the statement produce an error.

• Error number: 1008; Symbol: ER_DB_DROP_EXISTS; SQLSTATE: HY000
  Message: Can't drop database '%s'; database doesn't exist

• Error number: 1010; Symbol: ER_DB_DROP_RMDIR; SQLSTATE: HY000
  Message: Error dropping database (can't rmdir '%s', errno: %d - %s)

• Error number: 1012; Symbol: ER_CANT_FIND_SYSTEM_REC; SQLSTATE: HY000
  Message: Can't read record in system table
  Returned by InnoDB for attempts to access InnoDB INFORMATION_SCHEMA tables when InnoDB is unavailable.

• Error number: 1013; Symbol: ER_CANT_GET_STAT; SQLSTATE: HY000
  Message: Can't get status of '%s' (errno: %d - %s)

• Error number: 1015; Symbol: ER_CANT_LOCK; SQLSTATE: HY000
  Message: Can't lock file (errno: %d - %s)

• Error number: 1016; Symbol: ER_CANT_OPEN_FILE; SQLSTATE: HY000
  Message: Can't open file: '%s' (errno: %d - %s)
  InnoDB reports this error when the table from the InnoDB data files cannot be found.

• Error number: 1017; Symbol: ER_FILE_NOT_FOUND; SQLSTATE: HY000
  Message: Can't find file: '%s' (errno: %d - %s)

• Error number: 1018; Symbol: ER_CANT_READ_DIR; SQLSTATE: HY000
  Message: Can't read dir of '%s' (errno: %d - %s)

• Error number: 1020; Symbol: ER_CHECKREAD; SQLSTATE: HY000
  Message: Record has changed since last read in table '%s'

• Error number: 1022; Symbol: ER_DUP_KEY; SQLSTATE: 23000
  Message: Can't write; duplicate key in table '%s'

• Error number: 1024; Symbol: ER_ERROR_ON_RENAME; SQLSTATE: HY000
  Message: Error reading file '%s' (errno: %d - %s)

• Error number: 1025; Symbol: ER_ERROR_ON_RENAME; SQLSTATE: HY000
Message: Error on rename of '%s' to '%s' (errno: %d - %s)

•   Error number: 1026; Symbol: ER_ERROR_ON_WRITE; SQLSTATE: HY000

Message: Error writing file '%s' (errno: %d - %s)

•   Error number: 1027; Symbol: ER_FILE_USED; SQLSTATE: HY000

Message: '%s' is locked against change

•   Error number: 1028; Symbol: ER_FILSORT_ABORT; SQLSTATE: HY000

Message: Sort aborted

ER_FILSORT_ABORT was removed after 8.0.18.

•   Error number: 1030; Symbol: ER_GET_ERRNO; SQLSTATE: HY000

Message: Got error %d - '%s' from storage engine

Check the %d value to see what the OS error means. For example, 28 indicates that you have run out of disk space.

•   Error number: 1031; Symbol: ER_ILLEGAL_HA; SQLSTATE: HY000

Message: Table storage engine for '%s' doesn't have this option

•   Error number: 1032; Symbol: ER_KEY_NOT_FOUND; SQLSTATE: HY000

Message: Can't find record in '%s'

•   Error number: 1033; Symbol: ER_NOT_FORM_FILE; SQLSTATE: HY000

Message: Incorrect information in file: '%s'

•   Error number: 1034; Symbol: ER_NOT_KEYFILE; SQLSTATE: HY000

Message: Incorrect key file for table '%s'; try to repair it

•   Error number: 1035; Symbol: ER_OLD_KEYFILE; SQLSTATE: HY000

Message: Old key file for table '%s'; repair it!

•   Error number: 1036; Symbol: ER_OPEN_AS_READONLY; SQLSTATE: HY000

Message: Table '%s' is read only

•   Error number: 1037; Symbol: ER_OUTOFMEMORY; SQLSTATE: HY001

Message: Out of memory; restart server and try again (needed %d bytes)

•   Error number: 1038; Symbol: ER_OUT_OF_SORTMEMORY; SQLSTATE: HY001

Message: Out of sort memory, consider increasing server sort buffer size

•   Error number: 1040; Symbol: ER_CON_COUNT_ERROR; SQLSTATE: 08004

Message: Too many connections
• Error number: 1041; Symbol: ER_OUT_OF_RESOURCES; SQLSTATE: HY000
  Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

• Error number: 1042; Symbol: ER_BAD_HOST_ERROR; SQLSTATE: 08S01
  Message: Can't get hostname for your address

• Error number: 1043; Symbol: ER_HANDSHAKE_ERROR; SQLSTATE: 08S01
  Message: Bad handshake

• Error number: 1044; Symbol: ER_DBACCESS_DENIED_ERROR; SQLSTATE: 42000
  Message: Access denied for user '%s'@'%s' to database '%s'

• Error number: 1045; Symbol: ER_ACCESS_DENIED_ERROR; SQLSTATE: 28000
  Message: Access denied for user '%s'@'%s' (using password: %s)

• Error number: 1046; Symbol: ER_NO_DB_ERROR; SQLSTATE: 3D000
  Message: No database selected

• Error number: 1047; Symbol: ER_UNKNOWN_COM_ERROR; SQLSTATE: 08S01
  Message: Unknown command

• Error number: 1048; Symbol: ER_BAD_NULL_ERROR; SQLSTATE: 23000
  Message: Column '%s' cannot be null

• Error number: 1049; Symbol: ER_BAD_DB_ERROR; SQLSTATE: 42000
  Message: Unknown database '%s'

• Error number: 1050; Symbol: ER_TABLE_EXISTS_ERROR; SQLSTATE: 42S01
  Message: Table '%s' already exists

• Error number: 1051; Symbol: ER_BAD_TABLE_ERROR; SQLSTATE: 42S02
  Message: Unknown table '%s'

• Error number: 1052; Symbol: ER_NON_UNIQ_ERROR; SQLSTATE: 23000
  Message: Column '%s' in %s is ambiguous

  %s = column name
  %s = location of column (for example, "field list")

  Likely cause: A column appears in a query without appropriate qualification, such as in a select list or ON clause.

  Examples:

  mysql> SELECT i FROM t INNER JOIN t AS t2;
  ERROR 1052 (23000): Column 'i' in field list is ambiguous
mysql> SELECT * FROM t LEFT JOIN t AS t2 ON i = i;
ERROR 1052 (23000): Column 'i' in on clause is ambiguous

Resolution:

• Qualify the column with the appropriate table name:

  mysql> SELECT t2.i FROM t INNER JOIN t AS t2;

• Modify the query to avoid the need for qualification:

  mysql> SELECT * FROM t LEFT JOIN t AS t2 USING (i);

• Error number: 1053; Symbol: ER_SERVER_SHUTDOWN; SQLSTATE: 08S01

• Error number: 1204; Symbol: ER_SET_CONSTANTS_ONLY; SQLSTATE: HY000
  Message: You may only use constant expressions with SET

• Error number: 1205; Symbol: ER_LOCK_WAIT_TIMEOUT; SQLSTATE: HY000
  Message: Lock wait timeout exceeded; try restarting transaction
  InnoDB reports this error when lock wait timeout expires. The statement that waited too long was rolled back (not the entire transaction). You can increase the value of the innodb_lock_wait_timeout configuration option if SQL statements should wait longer for other transactions to complete, or decrease it if too many long-running transactions are causing locking problems and reducing concurrency on a busy system.

• Error number: 1206; Symbol: ER_LOCK_TABLE_FULL; SQLSTATE: HY000
  Message: The total number of locks exceeds the lock table size
  InnoDB reports this error when the total number of locks exceeds the amount of memory devoted to managing locks. To avoid this error, increase the value of innodb_buffer_pool_size. Within an individual application, a workaround may be to break a large operation into smaller pieces. For example, if the error occurs for a large INSERT, perform several smaller INSERT operations.

• Error number: 1207; Symbol: ER_READ_ONLY_TRANSACTION; SQLSTATE: 25000
  Message: Update locks cannot be acquired during a READ UNCOMMITTED transaction

  Message: '%s'@'%s' is not allowed to create new users

• Error number: 1213; Symbol: ER_LOCK_DEADLOCK; SQLSTATE: 40001
  Message: Deadlock found when trying to get lock; try restarting transaction
  InnoDB reports this error when a transaction encounters a deadlock and is automatically rolled back so that your application can take corrective action. To recover from this error, run all the operations in this transaction again. A deadlock occurs when requests for locks arrive in inconsistent order between
transactions. The transaction that was rolled back released all its locks, and the other transaction can now get all the locks it requested. Thus, when you re-run the transaction that was rolled back, it might have to wait for other transactions to complete, but typically the deadlock does not recur. If you encounter frequent deadlocks, make the sequence of locking operations (LOCK TABLES, SELECT ... FOR UPDATE, and so on) consistent between the different transactions or applications that experience the issue. See Section 15.7.5, “Deadlocks in InnoDB” for details.

  Message:XA_RBROLLBACK: Transaction branch was rolled back

•   Error number: 1403; Symbol: ER_NONEXISTING_PROC_GRANT; SQLSTATE: 42000
  Message: There is no such grant defined for user '%s' on host '%s' on routine '%s'
Server Error Message Reference

- **Error number: 1404; Symbol: ER_PROC_AUTO_GRANT_FAIL; SQLSTATE: HY000**
  Message: Failed to grant EXECUTE and ALTER ROUTINE privileges

- **Error number: 1405; Symbol: ER_PROC_AUTO_REVOKE_FAIL; SQLSTATE: HY000**
  Message: Failed to revoke all privileges to dropped routine

- **Error number: 1406; Symbol: ER_DATA_TOO_LONG; SQLSTATE: 22001**
  Message: Data too long for column '%s' at row %ld

- **Error number: 1407; Symbol: ER_SP_BAD_SQLSTATE; SQLSTATE: 42000**
  Message: Bad SQLSTATE: '%s'

- **Error number: 1408; Symbol: ER_STARTUP; SQLSTATE: HY000**
  Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d %s

- **Error number: 1409; Symbol: ER_LOAD_FROM_FIXED_SIZE_ROWS_TO_VAR; SQLSTATE: HY000**
  Message: Can't load value from file with fixed size rows to variable

- **Error number: 1410; Symbol: ER_CANT_CREATE_USER_WITH_GRANT; SQLSTATE: 42000**
  Message: You are not allowed to create a user with GRANT

- **Error number: 1411; Symbol: ER_WRONG_VALUE_FOR_TYPE; SQLSTATE: HY000**
  Message: Incorrect %s value: '%s' for function %s

- **Error number: 1412; Symbol: ER_TABLE_DEF_CHANGED; SQLSTATE: HY000**
  Message: Table definition has changed, please retry transaction

- **Error number: 1413; Symbol: ER_SP_DUP_HANDLER; SQLSTATE: 42000**
  Message: Duplicate handler declared in the same block

- **Error number: 1414; Symbol: ER_SP_NOT_VAR_ARG; SQLSTATE: 42000**
  Message: OUT or INOUT argument %d for routine %s is not a variable or NEW pseudo-variable in BEFORE trigger

- **Error number: 1415; Symbol: ER_SP_NO_RETSET; SQLSTATE: 0A000**
  Message: Not allowed to return a result set from a %s

- **Error number: 1416; Symbol: ER_CANT_CREATE_GEOMETRY_OBJECT; SQLSTATE: 22003**
  Message: Cannot get geometry object from data you send to the GEOMETRY field

- **Error number: 1418; Symbol: ER_BINLOG_UNSAFE_ROUTINE; SQLSTATE: HY000**
  Message: This function has none of DETERMINISTIC, NO SQL, or READS SQL DATA in its declaration and binary logging is enabled (you "might" want to use the less safe log_bin_trust_functionCreators variable)

- **Error number: 1419; Symbol: ER_BINLOG_CREATE_ROUTINE_NEED_SUPER; SQLSTATE: HY000**
Message: You do not have the SUPER privilege and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)

- Error number: 1421; Symbol: ER_STMT_HAS_NO_OPEN_CURSOR; SQLSTATE: HY000
  Message: The statement (%lu) has no open cursor.

- Error number: 1422; Symbol: ER_COMMIT_NOT_ALLOWED_IN_SF_OR_TRG; SQLSTATE: HY000
  Message: Explicit or implicit commit is not allowed in stored function or trigger.

- Error number: 1423; Symbol: ER_NO_DEFAULT_FOR_VIEW_FIELD; SQLSTATE: HY000
  Message: Field of view '%s.%s' underlying table doesn't have a default value.

- Error number: 1424; Symbol: ER_SP_NO_RECURSION; SQLSTATE: HY000
  Message: Recursive stored functions and triggers are not allowed.

- Error number: 1425; Symbol: ER_TOO_BIG_SCALE; SQLSTATE: 42000
  Message: Too big scale %d specified for column '%s'. Maximum is %lu.

- Error number: 1426; Symbol: ER_TOO_BIG_PRECISION; SQLSTATE: 42000
  Message: Too-big precision %d specified for '%s'. Maximum is %lu.

- Error number: 1427; Symbol: ER_M_BIGGER_THAN_D; SQLSTATE: 42000
  Message: For float(M,D), double(M,D) or decimal(M,D), M must be >= D (column '%s').

- Error number: 1428; Symbol: ER_WRONG_LOCK_OF_SYSTEM_TABLE; SQLSTATE: HY000
  Message: You can't combine write-locking of system tables with other tables or lock types.

- Error number: 1429; Symbol: ER_CONNECT_TO_FOREIGN_DATA_SOURCE; SQLSTATE: HY000
  Message: Unable to connect to foreign data source: %s

- Error number: 1430; Symbol: ER_QUERY_ON_FOREIGN_DATA_SOURCE; SQLSTATE: HY000
  Message: There was a problem processing the query on the foreign data source. Data source error: %s

- Error number: 1431; Symbol: ER_FOREIGN_DATA_SOURCE_DOESNT_EXIST; SQLSTATE: HY000
  Message: The foreign data source you are trying to reference does not exist. Data source error: %s

- Error number: 1432; Symbol: ER_FOREIGN_DATA_STRING_INVALID_CANT_CREATE; SQLSTATE: HY000
  Message: Can't create federated table. The data source connection string '%s' is not in the correct format.

- Error number: 1433; Symbol: ER_FOREIGN_DATA_STRING_INVALID; SQLSTATE: HY000
  Message: The data source connection string '%s' is not in the correct format.

- Error number: 1435; Symbol: ER_TRG_IN_WRONG_SCHEMA; SQLSTATE: HY000
Message: Trigger in wrong schema

- Error number: 1436; Symbol: ER_STACK_OVERRUN_NEED_MORE; SQLSTATE: HY000
  Message: Thread stack overrun: %ld bytes used of a %ld byte stack, and %ld bytes needed. Use `mysqld --thread_stack=#` to specify a bigger stack.

- Error number: 1437; Symbol: ER_TOO_LONG_BODY; SQLSTATE: 42000
  Message: Routine body for '%s' is too long

- Error number: 1438; Symbol: ER_WARN_CANT_DROP_DEFAULT_KEYCACHE; SQLSTATE: HY000
  Message: Cannot drop default keycache

- Error number: 1439; Symbol: ER_TOO_BIG_DISPLAYWIDTH; SQLSTATE: 42000
  Message: Display width out of range for column '%s' (max = %lu)

- Error number: 1440; Symbol: ER_XAER_DUPID; SQLSTATE: XAE08
  Message: XAER_DUPID: The XID already exists

- Error number: 1441; Symbol: ER_DATETIME_FUNCTION_OVERFLOW; SQLSTATE: 22008
  Message: Datetime function: %s field overflow

- Error number: 1442; Symbol: ER_CANT_UPDATE_USED_TABLE_IN_SF_OR_TRG; SQLSTATE: HY000
  Message: Can't update table '%s' in stored function/trigger because it is already used by statement which invoked this stored function/trigger.

- Error number: 1443; Symbol: ER_VIEW_PREVENT_UPDATE; SQLSTATE: HY000
  Message: The definition of table '%s' prevents operation %s on table '%s'.

- Error number: 1444; Symbol: ER_PS_NO_RECURSION; SQLSTATE: HY000
  Message: The prepared statement contains a stored routine call that refers to that same statement. It's not allowed to execute a prepared statement in such a recursive manner

- Error number: 1445; Symbol: ER_SP_CANT_SET_AUTOCOMMIT; SQLSTATE: HY000
  Message: Not allowed to set autocommit from a stored function or trigger

- Error number: 1447; Symbol: ER_VIEW_FRM_NO_USER; SQLSTATE: HY000
  Message: View '%s'.'%s' has no definer information (old table format). Current user is used as definer. Please recreate the view!

- Error number: 1448; Symbol: ER_VIEW_OTHER_USER; SQLSTATE: HY000
  Message: You need the SUPER privilege for creation view with '%s'@'%s' definer

- Error number: 1449; Symbol: ER_NO_SUCH_USER; SQLSTATE: HY000
  Message: The user specified as a definer ('%s'@'%s') does not exist

- Error number: 1450; Symbol: ER_FORBID_SCHEMA_CHANGE; SQLSTATE: HY000
Message: Changing schema from '%s' to '%s' is not allowed.

- Error number: 1451; Symbol: ER_ROW_IS_REFERENCED_2; SQLSTATE: 23000
Message: Cannot delete or update a parent row: a foreign key constraint fails (%s)

InnoDB reports this error when you try to delete a parent row that has children, and a foreign key constraint fails. Delete the children first.

- Error number: 1452; Symbol: ER_NO_REFERENCED_ROW_2; SQLSTATE: 23000
Message: Cannot add or update a child row: a foreign key constraint fails (%s)

InnoDB reports this error when you try to add a row but there is no parent row, and a foreign key constraint fails. Add the parent row first.

- Error number: 1453; Symbol: ER_SP_BAD_VAR_SHADOW; SQLSTATE: 42000
Message: Variable '%s' must be quoted with `...`, or renamed

- Error number: 1454; Symbol: ER_TRG_NO_DEFINER; SQLSTATE: HY000
Message: No definer attribute for trigger '%s'.'%s'. It's disallowed to create trigger without definer.

- Error number: 1455; Symbol: ER_OLD_FILE_FORMAT; SQLSTATE: HY000
Message: '%s' has an old format, you should re-create the '%s' object(s)

- Error number: 1456; Symbol: ER_SP_RECURSION_LIMIT; SQLSTATE: HY000
Message: Recursive limit %d (as set by the max_sp_recursion_depth variable) was exceeded for routine %s

- Error number: 1458; Symbol: ER_SP_WRONG_NAME; SQLSTATE: 42000
Message: Incorrect routine name '%s'

- Error number: 1459; Symbol: ER_TABLE_NEEDS_UPGRADE; SQLSTATE: HY000
Message: Table upgrade required. Please do "REPAIR TABLE `..." or dump/reload to fix it!

- Error number: 1460; Symbol: ER_SP_NO_AGGREGATE; SQLSTATE: 42000
Message: AGGREGATE is not supported for stored functions

- Error number: 1461; Symbol: ER_MAX_PREPARED_STMT_COUNT_REACHED; SQLSTATE: 42000
Message: Can't create more than max_prepared_stmt_count statements (current value: %lu)

- Error number: 1462; Symbol: ER_VIEW_RECURSIVE; SQLSTATE: HY000
Message: '%s'.'%s' contains view recursion

- Error number: 1463; Symbol: ER_NON_GROUPING_FIELD_USED; SQLSTATE: 42000
Message: Non-grouping field '%s' is used in %s clause

- Error number: 1464; Symbol: ER_TABLE_CANT_HANDLE_SPKEYS; SQLSTATE: HY000
Message: The used table type doesn't support SPATIAL indexes

- **Error number:** 1465; Symbol: **ER_NO_TRIGGERS_ON_SYSTEM_SCHEMA**; SQLSTATE: **HY000**
  Message: Triggers can not be created on system tables

- **Error number:** 1466; Symbol: **ER_REMOVED_SPACES**; SQLSTATE: **HY000**
  Message: Leading spaces are removed from name '%s'

- **Error number:** 1467; Symbol: **ER_AUTOINC_READ_FAILED**; SQLSTATE: **HY000**
  Message: Failed to read auto-increment value from storage engine

- **Error number:** 1468; Symbol: **ER_USERNAME**; SQLSTATE: **HY000**
  Message: user name

- **Error number:** 1469; Symbol: **ER_HOSTNAME**; SQLSTATE: **HY000**
  Message: host name

- **Error number:** 1470; Symbol: **ER_WRONG_STRING_LENGTH**; SQLSTATE: **HY000**
  Message: String '%s' is too long for %s (should be no longer than %d)

- **Error number:** 1471; Symbol: **ER_NON_INSERTABLE_TABLE**; SQLSTATE: **HY000**
  Message: The target table %s of the %s is not insertable-into

- **Error number:** 1472; Symbol: **ER_ADMIN_WRONG_MRG_TABLE**; SQLSTATE: **HY000**
  Message: Table '%s' is differently defined or of non-MyISAM type or doesn't exist

- **Error number:** 1473; Symbol: **ER_TOO_HIGH_LEVEL_OF_NESTING_FOR_SELECT**; SQLSTATE: **HY000**
  Message: Too high level of nesting for select

- **Error number:** 1474; Symbol: **ER_NAME_BECOMES_EMPTY**; SQLSTATE: **HY000**
  Message: Name '%s' has become ''

- **Error number:** 1475; Symbol: **ER_AMBIGUOUS_FIELD_TERM**; SQLSTATE: **HY000**
  Message: First character of the FIELDS TERMINATED string is ambiguous; please use non-optional and non-empty FIELDS ENCLOSED BY

- **Error number:** 1476; Symbol: **ER_FOREIGN_SERVER_EXISTS**; SQLSTATE: **HY000**
  Message: The foreign server, %s, you are trying to create already exists.

- **Error number:** 1477; Symbol: **ER_FOREIGN_SERVER_DOESNT_EXIST**; SQLSTATE: **HY000**
  Message: The foreign server name you are trying to reference does not exist. Data source error: %s

- **Error number:** 1478; Symbol: **ER_ILLEGAL_HA_CREATE_OPTION**; SQLSTATE: **HY000**
  Message: Table storage engine '%s' does not support the create option '%s'

  Message: Event '%s' already exists

• Error number: 1539; Symbol: ER_EVENT_DOES_NOT_EXIST; SQLSTATE: HY000
  Message: Unknown event '%s'

• Error number: 1542; Symbol: ER_EVENT_INTERVAL_NOT_POSITIVE_OR_TOO_BIG; SQLSTATE: HY000
  Message: INTERVAL is either not positive or too big

• Error number: 1543; Symbol: ER_EVENT_ends_BEFORE_STARTS; SQLSTATE: HY000
  Message: ENDS is either invalid or before STARTS

• Error number: 1544; Symbol: ER_EVENT_EXEC_TIME_IN_THE_PAST; SQLSTATE: HY000
  Message: Event execution time is in the past. Event has been disabled

• Error number: 1551; Symbol: ER_EVENT SAME NAME; SQLSTATE: HY000
  Message: Same old and new event name

• Error number: 1553; Symbol: ER_DROP_INDEX_FK; SQLSTATE: HY000
  Message: Cannot drop index '%s': needed in a foreign key constraint

  *InnoDB* reports this error when you attempt to drop the last index that can enforce a particular referential constraint.
For optimal performance with DML statements, InnoDB requires an index to exist on foreign key columns, so that **UPDATE** and **DELETE** operations on a parent table can easily check whether corresponding rows exist in the child table. MySQL creates or drops such indexes automatically when needed, as a side-effect of **CREATE TABLE**, **CREATE INDEX**, and **ALTER TABLE** statements.

When you drop an index, InnoDB checks if the index is used for checking a foreign key constraint. It is still OK to drop the index if there is another index that can be used to enforce the same constraint. InnoDB prevents you from dropping the last index that can enforce a particular referential constraint.

- **Error number:** 1554; Symbol: **ER_WARN_DEPRECATED_SYNTAX_WITH_VER**; SQLSTATE: **HY000**  
  Message: The syntax `%s` is deprecated and will be removed in MySQL %s. Please use %s instead

- **Error number:** 1556; Symbol: **ER_CANT_LOCK_LOG_TABLE**; SQLSTATE: **HY000**  
  Message: You can't use locks with log tables.

- **Error number:** 1557; Symbol: **ER_FOREIGN_DUPLICATE_KEY_OLD_UNUSED**; SQLSTATE: **23000**  
  Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry

- **Error number:** 1558; Symbol: **ER_COL_COUNT_DOESNT_MATCH PLEASE UPDATE**; SQLSTATE: **HY000**  
  Message: The column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please perform the MySQL upgrade procedure.

  Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = ROW
  and at least one table uses a storage engine limited to statement-based logging.

- Error number: 1663; Symbol: ER_BINLOG_UNSAFE_AND_STMT_ENGINE; SQLSTATE: HY000
  Message: Cannot execute statement: impossible to write to binary log since statement is unsafe, storage
  engine is limited to statement-based logging, and BINLOG_FORMAT = MIXED. %s

- Error number: 1664; Symbol: ER_BINLOG_ROW_INJECTION_AND_STMT_ENGINE; SQLSTATE: HY000
  Message: Cannot execute statement: impossible to write to binary log since statement is in row format
  and at least one table uses a storage engine limited to statement-based logging.

- Error number: 1665; Symbol: ER_BINLOG_STMT_MODE_AND_ROW_ENGINE; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT and at least one table uses a storage engine limited to row-based logging.

- Error number: 1666; Symbol: ER_BINLOG_ROW_INJECTION_AND_STMT_MODE; SQLSTATE: HY000
- Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT.

- Error number: 1667; Symbol: ER_BINLOG_MULTIPLE ENGINES AND SELF LOGGING ENGINE; SQLSTATE: HY000
- Message: Cannot execute statement: impossible to write to binary log since more than one engine is involved and at least one engine is self-logging.

- Error number: 1668; Symbol: ER_BINLOG_UNSAFE_LIMIT; SQLSTATE: HY000
- Message: The statement is unsafe because it uses a LIMIT clause. This is unsafe because the set of rows included cannot be predicted.

- Error number: 1670; Symbol: ER_BINLOG_UNSAFE_SYSTEM_TABLE; SQLSTATE: HY000
- Message: The statement is unsafe because it uses the general log, slow query log, or performance_schema table(s). This is unsafe because system tables may differ on slaves.

- Error number: 1671; Symbol: ER_BINLOG_UNSAFE_AUTOINC_COLUMNS; SQLSTATE: HY000
- Message: Statement is unsafe because it invokes a trigger or a stored function that inserts into an AUTO_INCREMENT column. Inserted values cannot be logged correctly.

- Error number: 1672; Symbol: ER_BINLOG_UNSAFE_UDF; SQLSTATE: HY000
- Message: Statement is unsafe because it uses a UDF which may not return the same value on the slave.

- Error number: 1673; Symbol: ER_BINLOG_UNSAFE_SYSTEM_VARIABLE; SQLSTATE: HY000
- Message: Statement is unsafe because it uses a system variable that may have a different value on the slave.

- Error number: 1674; Symbol: ER_BINLOG_UNSAFE_SYSTEM_FUNCTION; SQLSTATE: HY000
- Message: Statement is unsafe because it uses a system function that may return a different value on the slave.

- Error number: 1675; Symbol: ER_BINLOG_UNSAFE_NONTRANS AFTER TRANS; SQLSTATE: HY000
- Message: Statement is unsafe because it accesses a non-transactional table after accessing a transactional table within the same transaction.

- Error number: 1676; Symbol: ER_MESSAGE AND STATEMENT; SQLSTATE: HY000
- Message: %s Statement: %s

- Error number: 1677; Symbol: ER_SLAVE CONVERSION FAILED; SQLSTATE: HY000

  Message: The requested value for the heartbeat period is less than 1 millisecond. The value is reset to 0, meaning that heartbeating will effectively be disabled.

• Error number: **1704**; Symbol: ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MAX; SQLSTATE: HY000
  Message: The requested value for the heartbeat period exceeds the value of 'slave_net_timeout' seconds. A sensible value for the period should be less than the timeout.

• Error number: **1705**; Symbol: ER_STMT_CACHE_FULL; SQLSTATE: HY000
  Message: Multi-row statements required more than 'max_binlog_stmt_cache_size' bytes of storage; increase this mysqld variable and try again
Error number: 1706; Symbol: ER_MULTI_UPDATE_KEY_CONFLICT; SQLSTATE: HY000
Message: Primary key/partition key update is not allowed since the table is updated both as '%s' and '%%s'.

Error number: 1707; Symbol: ER_TABLE_NEEDS_REBUILD; SQLSTATE: HY000
Message: Table rebuild required. Please do "ALTER TABLE '%s' FORCE" or dump/reload to fix it!

Error number: 1708; Symbol: WARN_OPTION_BELOW_LIMIT; SQLSTATE: HY000
Message: The value of '%s' should be no less than the value of '%%s'

Error number: 1709; Symbol: ER_INDEX_COLUMN_TOO_LONG; SQLSTATE: HY000
Message: Index column size too large. The maximum column size is %lu bytes.

Error number: 1710; Symbol: ER_ERROR_IN_TRIGGER_BODY; SQLSTATE: HY000
Message: Trigger '%s' has an error in its body: '%%s'

Error number: 1711; Symbol: ER_ERROR_IN_UNKNOWN_TRIGGER_BODY; SQLSTATE: HY000
Message: Unknown trigger has an error in its body: '%%s'

Error number: 1712; Symbol: ER_INDEX_CORRUPT; SQLSTATE: HY000
Message: Index '%s' is corrupted

Error number: 1713; Symbol: ER_UNDO_RECORD_TOO_BIG; SQLSTATE: HY000
Message: Undo log record is too big.

Error number: 1714; Symbol: ER_BINLOG_UNSAFE_INSERT_IGNORE_SELECT; SQLSTATE: HY000
Message: INSERT IGNORE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

Error number: 1715; Symbol: ER_BINLOG_UNSAFE_INSERT_SELECT_UPDATE; SQLSTATE: HY000
Message: INSERT... SELECT... ON DUPLICATE KEY UPDATE is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are updated. This order cannot be predicted and may differ on master and the slave.

Error number: 1716; Symbol: ER_BINLOG_UNSAFE_REPLACE_SELECT; SQLSTATE: HY000
Message: REPLACE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

Error number: 1717; Symbol: ER_BINLOG_UNSAFE_CREATE_IGNORE_SELECT; SQLSTATE: HY000
Message: CREATE... IGNORE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

Error number: 1718; Symbol: ER_BINLOG_UNSAFE_CREATE_REPLACE_SELECT; SQLSTATE: HY000
Message: CREATE... REPLACE SELECT is unsafe because the order in which rows are retrieved by
the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ
on master and the slave.

- Error number: 1719; Symbol: ER_BINLOGUnsafeUpdateIgnore; SQLSTATE: HY000

Message: UPDATE IGNORE is unsafe because the order in which rows are updated determines which
(if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error number: 1720; Symbol: ER_PLUGIN_NO_UNINSTALL; SQLSTATE: HY000

Message: Plugin '%s' is marked as not dynamically uninstallable. You have to stop the server to uninstall
it.

- Error number: 1721; Symbol: ER_PLUGIN_NO_INSTALL; SQLSTATE: HY000

Message: Plugin '%s' is marked as not dynamically installable. You have to stop the server to install it.

- Error number: 1722; Symbol: ER_BINLOGUnsafeWriteAutoincSelect; SQLSTATE: HY000

Message: Statements writing to a table with an auto-increment column after selecting from another table
are unsafe because the order in which rows are retrieved determines what (if any) rows will be written.
This order cannot be predicted and may differ on master and the slave.

- Error number: 1723; Symbol: ER_BINLOGUnsafeCreateSelectAutoinc; SQLSTATE: HY000

Message: CREATE TABLE... SELECT... on a table with an auto-increment column is unsafe because
the order in which rows are retrieved by the SELECT determines which (if any) rows are inserted. This
order cannot be predicted and may differ on master and the slave.

- Error number: 1724; Symbol: ER_BINLOGUnsafeInsertTwoKeys; SQLSTATE: HY000

Message: INSERT... ON DUPLICATE KEY UPDATE on a table with more than one UNIQUE KEY is
unsafe

- Error number: 1725; Symbol: ER_TABLE_IN_FK_CHECK; SQLSTATE: HY000

  Message: Tables have different definitions

- Error number: 1737; Symbol: ER Row DOES NOT MATCH Partition; SQLSTATE: HY000
  Message: Found a row that does not match the partition

- Error number: 1738; Symbol: ER_BINLOG_CACHE_SIZE_GREATER_THAN_MAX; SQLSTATE: HY000
  Message: Option binlog_cache_size (%lu) is greater than max_binlog_cache_size (%lu); setting binlog_cache_size equal to max_binlog_cache_size.

- Error number: 1739; Symbol: ER WARN INDEX NOT APPLICABLE; SQLSTATE: HY000
  Message: Cannot use %s access on index '%s' due to type or collation conversion on field '%s'

- Error number: 1740; Symbol: ER_PARTITION_EXCHANGE_FOREIGN_KEY; SQLSTATE: HY000
  Message: Table to exchange with partition has foreign key references: '%s'

- Error number: 1742; Symbol: ER_RPL_INFO_DATA_TOO_LONG; SQLSTATE: HY000
  Message: Data for column '%s' too long

- Error number: 1745; Symbol: ER_BINLOG_STMT_CACHE_SIZE_GREATER_THAN_MAX; SQLSTATE: HY000
  Message: Option binlog_stmt_cache_size (%lu) is greater than max_binlog_stmt_cache_size (%lu); setting binlog_stmt_cache_size equal to max_binlog_stmt_cache_size.

- Error number: 1746; Symbol: ER CANT_UPDATE_TABLE_IN_CREATE_TABLE_SELECT; SQLSTATE: HY000
  Message: Can't update table '%s' while '%s' is being created.
• Error number: 1747; Symbol: ER_PARTITION_CLAUSE_ON_NONPARTITIONED; SQLSTATE: HY000
  Message: PARTITION () clause on non partitioned table

• Error number: 1748; Symbol: ER_ROW_DOES_NOT_MATCH_GIVEN_PARTITION_SET; SQLSTATE: HY000
  Message: Found a row not matching the given partition set

• Error number: 1750; Symbol: ER_CHANGE_RPL_INFO_REPOSITORY_FAILURE; SQLSTATE: HY000
  Message: Failure while changing the type of replication repository: %s.

• Error number: 1751; Symbol: ER_WARNING_NOT_COMPLETE_ROLLBACK_WITH_CREATED_TEMP_TABLE; SQLSTATE: HY000
  Message: The creation of some temporary tables could not be rolled back.

• Error number: 1752; Symbol: ER_WARNING_NOT_COMPLETE_ROLLBACK_WITH_DROPPED_TEMP_TABLE; SQLSTATE: HY000
  Message: Some temporary tables were dropped, but these operations could not be rolled back.

• Error number: 1753; Symbol: ER_MTS_FEATURE_IS_NOT_SUPPORTED; SQLSTATE: HY000
  Message: %s is not supported in multi-threaded slave mode. %s

• Error number: 1754; Symbol: ER_MTSUPDATED_DATABASES_GREATER_MAX; SQLSTATE: HY000
  Message: The number of modified databases exceeds the maximum %d; the database names will not be included in the replication event metadata.

• Error number: 1755; Symbol: ER_MTS_CANT_PARALLEL; SQLSTATE: HY000
  Message: Cannot execute the current event group in the parallel mode. Encountered event %s, relay-log name %s, position %s which prevents execution of this event group in parallel mode. Reason: %s.

• Error number: 1756; Symbol: ER_MTS_INCONSISTENT_DATA; SQLSTATE: HY000
  Message: %s

• Error number: 1757; Symbol: ER_FULLTEXT_NOT_SUPPORTED_WITH_PARTITIONING; SQLSTATE: HY000
  Message: FULLTEXT index is not supported for partitioned tables.

• Error number: 1758; Symbol: ER_DA_INVALID_CONDITION_NUMBER; SQLSTATE: 35000
  Message: Invalid condition number

• Error number: 1759; Symbol: ER_INSECUREPLAINTEXT; SQLSTATE: HY000
  Message: Sending passwords in plain text without SSL/TLS is extremely insecure.

• Error number: 1760; Symbol: ER_INSECURE_CHANGE_MASTER; SQLSTATE: HY000
  Message: Storing MySQL user name or password information in the master info repository is not secure and is therefore not recommended. Please consider using the USER and PASSWORD connection options for START SLAVE; see the ‘START SLAVE Syntax’ in the MySQL Manual for more information.
Error number: 1761; Symbol: ER_FOREIGN_DUPLICATE_KEY_WITH_CHILD_INFO; SQLSTATE: 23000
Message: Foreign key constraint for table '%s', record '%s' would lead to a duplicate entry in table '%s', key '%s'

Error number: 1762; Symbol: ER_FOREIGN_DUPLICATE_KEY_WITHOUT_CHILD_INFO; SQLSTATE: 23000
Message: Foreign key constraint for table '%s', record '%s' would lead to a duplicate entry in a child table

Error number: 1763; Symbol: ER_SQLTHREAD_WITH_SECURE_SLAVE; SQLSTATE: HY000
Message: Setting authentication options is not possible when only the Slave SQL Thread is being started.

Error number: 1764; Symbol: ER_TABLE_HAS_NO_FT; SQLSTATE: HY000
Message: The table does not have FULLTEXT index to support this query

Error number: 1765; Symbol: ER_VARIABLE_NOT_SETTABLE_IN_SF_OR_TRIGGER; SQLSTATE: HY000
Message: The system variable %s cannot be set in stored functions or triggers.

Error number: 1766; Symbol: ER_VARIABLE_NOT_SETTABLE_IN_TRANSACTION; SQLSTATE: HY000
Message: The system variable %s cannot be set when there is an ongoing transaction.

Error number: 1769; Symbol: ER_SET_STATEMENT_CANNOT_INVOKE_FUNCTION; SQLSTATE: HY000
Message: The statement 'SET %s' cannot invoke a stored function.

Error number: 1770; Symbol: ER_GTID_NEXT_CANT_BE_AUTOMATIC_IF_GTID_NEXT_LIST_IS_NON_NULL; SQLSTATE: HY000
Message: The system variable @@SESSION.GTID_NEXT cannot be 'AUTOMATIC' when @@SESSION.GTID_NEXT_LIST is non-NULL.

Error number: 1772; Symbol: ER_MALFORMED_GTID_SET_SPECIFICATION; SQLSTATE: HY000
Message: Malformed GTID set specification '%s'.

Error number: 1773; Symbol: ER_MALFORMED_GTID_SET_ENCODING; SQLSTATE: HY000
Message: Malformed GTID set encoding.

Error number: 1774; Symbol: ER_MALFORMED_GTID_SPECIFICATION; SQLSTATE: HY000
Message: Malformed GTID specification '%s'.

Error number: 1775; Symbol: ER_GNO_EXHAUSTED; SQLSTATE: HY000
Message: Impossible to generate Global Transaction Identifier: the integer component reached the maximal value. Restart the server with a new server_uuid.

Error number: 1776; Symbol: ER_BAD_SLAVE_AUTO_POSITION; SQLSTATE: HY000
Message: Parameters MASTER_LOG_FILE, MASTER_LOG_POS, RELAY_LOG_FILE and RELAY_LOG_POS cannot be set when MASTER_AUTO_POSITION is active.

- Error number: 1777; Symbol: ER_AUTO_POSITION_REQUIRES_GTID_MODE_NOT_OFF; SQLSTATE: HY000
  Message: CHANGE MASTER TO MASTER_AUTO_POSITION = 1 cannot be executed because @@GLOBAL.GTID_MODE = OFF.

- Error number: 1778; Symbol: ER_CANT_DO_IMPLICIT_COMMIT_IN_TRX_WHEN_GTID_NEXT_IS_SET; SQLSTATE: HY000
  Message: Cannot execute statements with implicit commit inside a transaction when @@SESSION.GTID_NEXT == 'UUID:NUMBER'.

- Error number: 1779; Symbol: ER_GTID_MODE_ON_REQUIRES_ENFORCE_GTID_CONSISTENCY_ON; SQLSTATE: HY000
  Message: GTID_MODE = ON requires ENFORCE_GTID_CONSISTENCY = ON.

- Error number: 1781; Symbol: ER_CANT_SET_GTID_NEXT_TO_GTID_WHEN_GTID_MODE_IS_OFF; SQLSTATE: HY000
  Message: @@SESSION.GTID_NEXT cannot be set to UUID:NUMBER when @@GLOBAL.GTID_MODE = OFF.

- Error number: 1782; Symbol: ER_CANT_SET_GTID_NEXT_TO_ANONYMOUS_WHEN_GTID_MODE_IS_ON; SQLSTATE: HY000
  Message: @@SESSION.GTID_NEXT cannot be set to ANONYMOUS when @@GLOBAL.GTID_MODE = ON.

- Error number: 1783; Symbol: ER_CANT_SET_GTID_NEXT_LIST_TO_NON_NULL_WHEN_GTID_MODE_IS_OFF; SQLSTATE: HY000
  Message: @@SESSION.GTID_NEXT_LIST cannot be set to a non-NULL value when @@GLOBAL.GTID_MODE = OFF.

- Error number: 1785; Symbol: ER_GTID_UNSAFE_NON_TRANSACTIONAL_TABLE; SQLSTATE: HY000
  Message: Statement violates GTID consistency: Updates to non-transactional tables can only be done in either autocommitted statements or single-statement transactions, and never in the same statement as updates to transactional tables.

- Error number: 1786; Symbol: ER_GTID_UNSAFE_CREATE_SELECT; SQLSTATE: HY000
  Message: Statement violates GTID consistency: CREATE TABLE ... SELECT.

- Error number: 1787; Symbol: ER_GTID_UNSAFE_CREATE_DROP_TEMPORARY_TABLE_IN_TRANSACTION; SQLSTATE: HY000
  Message: Statement violates GTID consistency: CREATE TEMPORARY TABLE and DROP TEMPORARY TABLE can only be executed outside transactional context. These statements are also not allowed in a function or trigger because functions and triggers are also considered to be multi-statement transactions.

  ER_GTID_UNSAFE_CREATE_DROP_TEMPORARY_TABLE_IN_TRANSACTION was removed after 8.0.12.
• Error number: 1788; Symbol: ER_GTID_MODE_CAN_ONLY_CHANGE_ONE_STEP_AT_A_TIME; SQLSTATE: HY000
Message: The value of @@GLOBAL.GTID_MODE can only be changed one step at a time: OFF <-> OFF_PERMISSIVE <-> ON_PERMISSIVE <-> ON. Also note that this value must be stepped up or down simultaneously on all servers. See the Manual for instructions.

• Error number: 1789; Symbol: ER_MASTER_HAS_PURGED_REQUIRED_GTIDS; SQLSTATE: HY000
Message: Cannot replicate because the master purged required binary logs. Replicate the missing transactions from elsewhere, or provision a new slave from backup. Consider increasing the master's binary log expiration period. %s

• Error number: 1790; Symbol: ER_CANT_SET_GTID_NEXT_WHEN_OWNING_GTID; SQLSTATE: HY000
Message: @@SESSION.GTID_NEXT cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.

• Error number: 1791; Symbol: ER_UNKNOWN_EXPLAIN_FORMAT; SQLSTATE: HY000
Message: Unknown EXPLAIN format name: '%s'

• Error number: 1792; Symbol: ER_CANT_EXECUTE_IN_READ_ONLY_TRANSACTION; SQLSTATE: 25006
Message: Cannot execute statement in a READ ONLY transaction.

• Error number: 1793; Symbol: ER_TOO_LONG_TABLE_PARTITION_COMMENT; SQLSTATE: HY000
Message: Comment for table partition '%s' is too long (max = %lu)

• Error number: 1794; Symbol: ER_SLAVE_CONFIGURATION; SQLSTATE: HY000
Message: Slave is not configured or failed to initialize properly. You must at least set --server-id to enable either a master or a slave. Additional error messages can be found in the MySQL error log.

• Error number: 1795; Symbol: ER_INNODB_FT_LIMIT; SQLSTATE: HY000
Message: InnoDB presently supports one FULLTEXT index creation at a time

• Error number: 1796; Symbol: ER_INNODB_NO_FT_TEMP_TABLE; SQLSTATE: HY000
Message: Cannot create FULLTEXT index on temporary InnoDB table

• Error number: 1797; Symbol: ER_INNODB_FT_WRONG_DOCID_COLUMN; SQLSTATE: HY000
Message: Column '%s' is of wrong type for an InnoDB FULLTEXT index

• Error number: 1798; Symbol: ER_INNODB_FT_WRONG_DOCID_INDEX; SQLSTATE: HY000
Message: Index '%s' is of wrong type for an InnoDB FULLTEXT index

• Error number: 1799; Symbol: ER_INNODB_ONLINE_LOG_TOO_BIG; SQLSTATE: HY000
Message: Creating index '%s' required more than ‘innodb_online_alter_log_max_size' bytes of modification log. Please try again.

• Error number: 1800; Symbol: ER_UNKNOWN_ALTER_ALGORITHM; SQLSTATE: HY000
Message: Unknown ALGORITHM '%%s'
- Error number: 1801; Symbol: ER_UNKNOWN_ALTER_LOCK; SQLSTATE: HY000
Message: Unknown LOCK type '%%s'
- Error number: 1802; Symbol: ER_MTS_CHANGE_MASTER_CANT_RUN_WITH_GAPS; SQLSTATE: HY000
Message: CHANGE MASTER cannot be executed when the slave was stopped with an error or killed in MTS mode. Consider using RESET SLAVE or START SLAVE UNTIL.
- Error number: 1803; Symbol: ER_MTS_RECOVERY_FAILURE; SQLSTATE: HY000
Message: Cannot recover after SLAVE errored out in parallel execution mode. Additional error messages can be found in the MySQL error log.
- Error number: 1804; Symbol: ER_MTS_RESET_WORKERS; SQLSTATE: HY000
Message: Cannot clean up worker info tables. Additional error messages can be found in the MySQL error log.
- Error number: 1805; Symbol: ER_COL_COUNT_DOESNT_MATCH_CORRUPTED_V2; SQLSTATE: HY000
Message: Column count of %s.%s is wrong. Expected %d, found %d. The table is probably corrupted.
- Error number: 1806; Symbol: ER_SLAVE_SILENT_RETRY_TRANSACTION; SQLSTATE: HY000
Message: Slave must silently retry current transaction.
- Error number: 1807; Symbol: ER_DISCARD_FK_CHECKS_RUNNING; SQLSTATE: HY000
Message: There is a foreign key check running on table '%%s'. Cannot discard the table.
- Error number: 1808; Symbol: ER_TABLE_SCHEMA_MISMATCH; SQLSTATE: HY000
Message: Schema mismatch ('%%s')
- Error number: 1809; Symbol: ER_TABLE_IN_SYSTEM_TABLESPACE; SQLSTATE: HY000
Message: Table '%%s' in system tablespace.
- Error number: 1810; Symbol: ER_IO_READ_ERROR; SQLSTATE: HY000
Message: IO Read error: (%lu, %s) '%%s'
- Error number: 1811; Symbol: ER_IO_WRITE_ERROR; SQLSTATE: HY000
Message: IO Write error: (%lu, %s) '%%s'
- Error number: 1812; Symbol: ER_TABLESPACE_MISSING; SQLSTATE: HY000
Message: Tablespace is missing for table '%%s'.
- Error number: 1813; Symbol: ER_TABLESPACE_EXISTS; SQLSTATE: HY000
Message: Tablespace '%%s' exists.
- Error number: 1814; Symbol: ER_TABLESPACE_DISCARDED; SQLSTATE: HY000
Server Error Message Reference

Message: Tablespace has been discarded for table '%s'
- Error number: 1815; Symbol: ER_INTERNAL_ERROR; SQLSTATE: HY000
Message: Internal error: %s
- Error number: 1816; Symbol: ER_INNODB_IMPORTED_ERROR; SQLSTATE: HY000
Message: ALTER TABLE %s IMPORT TABLESPACE failed with error %lu: '%s'
- Error number: 1817; Symbol: ER_INNODB_INDEX_CORRUPT; SQLSTATE: HY000
Message: Index corrupt: %s
- Error number: 1818; Symbol: ER_INVALID_YEAR_COLUMN_LENGTH; SQLSTATE: HY000
Message: Invalid display width. Use YEAR instead.
- Error number: 1819; Symbol: ER_NOT_VALID_PASSWORD; SQLSTATE: HY000
Message: Your password does not satisfy the current policy requirements
- Error number: 1820; Symbol: ER_MUST_CHANGE_PASSWORD; SQLSTATE: HY000
Message: You must reset your password using ALTER USER statement before executing this statement.
- Error number: 1821; Symbol: ER_FK_NO_INDEX_CHILD; SQLSTATE: HY000
Message: Failed to add the foreign key constraint. Missing index for constraint '%s' in the foreign table '%s'
- Error number: 1822; Symbol: ER_FK_NO_INDEX_PARENT; SQLSTATE: HY000
Message: Failed to add the foreign key constraint. Missing index for constraint '%s' in the referenced table '%s'
- Error number: 1823; Symbol: ER_FK_FAIL_ADD_SYSTEM; SQLSTATE: HY000
Message: Failed to add the foreign key constraint '%s' to system tables
- Error number: 1824; Symbol: ER_FK_CANNOT_OPEN_PARENT; SQLSTATE: HY000
Message: Failed to open the referenced table '%s'
- Error number: 1825; Symbol: ER_FK_INCORRECT_OPTION; SQLSTATE: HY000
Message: Failed to add the foreign key constraint on table '%s'. Incorrect options in FOREIGN KEY constraint '%s'
- Error number: 1826; Symbol: ER_FK_DUP_NAME; SQLSTATE: HY000
Message: Duplicate foreign key constraint name '%s'
- Error number: 1827; Symbol: ER_PASSWORD_FORMAT; SQLSTATE: HY000
Message: The password hash doesn't have the expected format.
- Error number: 1828; Symbol: ER_FK_COLUMN_CANNOT_DROP; SQLSTATE: HY000
Message: Cannot drop column '%s': needed in a foreign key constraint '%s'

- Error number: **1829**; Symbol: ER_FK_COLUMN_CANNOT_DROP_CHILD; SQLSTATE: HY000
Message: Cannot drop column '%s': needed in a foreign key constraint '%s' of table '%s'

- Error number: **1830**; Symbol: ER_FK_COLUMN_NOT_NULL; SQLSTATE: HY000
Message: Column '%s' cannot be NOT NULL: needed in a foreign key constraint '%s' SET NULL

- Error number: **1831**; Symbol: ER_DUP_INDEX; SQLSTATE: HY000
Message: Duplicate index '%s' defined on the table '%s.%s'. This is deprecated and will be disallowed in a future release.

- Error number: **1832**; Symbol: ER_FK_COLUMN_CANNOT_CHANGE; SQLSTATE: HY000
Message: Cannot change column '%s': used in a foreign key constraint '%s'

- Error number: **1833**; Symbol: ER_FK_COLUMN_CANNOT_CHANGE_CHILD; SQLSTATE: HY000
Message: Cannot change column '%s': used in a foreign key constraint '%s' of table '%s'

- Error number: **1835**; Symbol: ER_MALFORMED_PACKET; SQLSTATE: HY000
Message: Malformed communication packet.

- Error number: **1836**; Symbol: ER_READ_ONLY_MODE; SQLSTATE: HY000
Message: Running in read-only mode

- Error number: **1837**; Symbol: ER_GTID_NEXT_TYPE_UNDEFINED_GROUP; SQLSTATE: HY000
Message: When @@SESSION.GTID_NEXT is set to a GTID, you must explicitly set it to a different value after a COMMIT or ROLLBACK. Please check GTID_NEXT variable manual page for detailed explanation. Current @@SESSION.GTID_NEXT is '%s'.

**ER_GTID_NEXT_TYPE_UNDEFINED_GROUP** was removed after 8.0.4.

- Error number: **1837**; Symbol: ER_GTID_NEXT_TYPE_UNDEFINED_GTID; SQLSTATE: HY000
Message: When @@SESSION.GTID_NEXT is set to a GTID, you must explicitly set it to a different value after a COMMIT or ROLLBACK. Please check GTID_NEXT variable manual page for detailed explanation. Current @@SESSION.GTID_NEXT is '%s'.

**ER_GTID_NEXT_TYPE_UNDEFINED_GTID** was added in 8.0.11.

- Error number: **1838**; Symbol: ER_VARIABLE_NOT_SETTABLE_IN_SP; SQLSTATE: HY000
Message: The system variable %s cannot be set in stored procedures.

- Error number: **1840**; Symbol: ER_CANT_SET_GTID_PURGED_WHEN_GTID_EXECUTED_IS_NOT_EMPTY; SQLSTATE: HY000
Message: @@GLOBAL.GTID_PURGED can only be set when @@GLOBAL.GTID_EXECUTED is empty.

- Error number: **1841**; Symbol: ER_CANT_SET_GTID_PURGED_WHEN_OWNED_GTIDS_IS_NOT_EMPTY; SQLSTATE: HY000
Message: @@GLOBAL.GTID_PURGED can only be set when there are no ongoing transactions (not even in other clients).

•   Error number: 1842; Symbol: ER_GTID_PURGED_WAS_CHANGED; SQLSTATE: HY000
Message: @@GLOBAL.GTID_PURGED was changed from '%s' to '%s'.

•   Error number: 1843; Symbol: ER_GTID_EXECUTED_WAS_CHANGED; SQLSTATE: HY000
Message: @@GLOBAL.GTID_EXECUTED was changed from '%s' to '%s'.

•   Error number: 1844; Symbol: ER_BINLOG_STMT_MODE_AND_NO_REPL_TABLES; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT, and both replicated and non replicated tables are written to.

•   Error number: 1845; Symbol: ER_ALTER_OPERATION_NOT_SUPPORTED; SQLSTATE: 0A000
Message: %s is not supported for this operation. Try %s.

•   Error number: 1846; Symbol: ER_ALTER_OPERATION_NOT_SUPPORTED_REASON; SQLSTATE: 0A000
Message: %s is not supported. Reason: %s. Try %s.

•   Error number: 1847; Symbol: ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_COPY; SQLSTATE: HY000
Message: COPY algorithm requires a lock

•   Error number: 1848; Symbol: ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_PARTITION; SQLSTATE: HY000
Message: Partition specific operations do not yet support LOCK/ALGORITHM

•   Error number: 1849; Symbol: ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FK_RENAME; SQLSTATE: HY000
Message: Columns participating in a foreign key are renamed

•   Error number: 1850; Symbol: ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_COLUMN_TYPE; SQLSTATE: HY000
Message: Cannot change column type INPLACE

•   Error number: 1851; Symbol: ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FK_CHECK; SQLSTATE: HY000
Message: Adding foreign keys needs foreign_key_checks=OFF

•   Error number: 1853; Symbol: ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_NOPK; SQLSTATE: HY000
Message: Dropping a primary key is not allowed without also adding a new primary key

•   Error number: 1854; Symbol: ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_AUTOINC; SQLSTATE: HY000
Message: Adding an auto-increment column requires a lock
Server Error Message Reference

- Error number: 1855; Symbol: `ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_HIDDEN_FTS`; SQLSTATE: HY000
  Message: Cannot replace hidden FTS_DOC_ID with a user-visible one

- Error number: 1856; Symbol: `ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_CHANGE_FTS`; SQLSTATE: HY000
  Message: Cannot drop or rename FTS_DOC_ID

- Error number: 1857; Symbol: `ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FTS`; SQLSTATE: HY000
  Message: Fulltext index creation requires a lock

- Error number: 1858; Symbol: `ER_SQL_SLAVE_SKIP_COUNTER_NOT_SETTABLE_IN_GTID_MODE`; SQLSTATE: HY000
  Message: sql_slave_skip_counter can not be set when the server is running with @@GLOBAL.GTID_MODE = ON. Instead, for each transaction that you want to skip, generate an empty transaction with the same GTID as the transaction

- Error number: 1859; Symbol: `ER_DUP_UNKNOWN_IN_INDEX`; SQLSTATE: 23000
  Message: Duplicate entry for key '%s'

ER_GTID_UNSAFE_BINLOG_SPLITTABLE_STATEMENT_AND_ASSIGNED_GTID was added in 8.0.11.

• Error number: 1885; Symbol: ER_SLAVE_HAS_MORE_GTIDS_THAN_MASTER; SQLSTATE: HY000
Message: Slave has more GTIDs than the master has, using the master's SERVER_UUID. This may indicate that the end of the binary log was truncated or that the last binary log file was lost, e.g., after a power or disk failure when sync_binlog != 1. The master may or may not have rolled back transactions that were already replicated to the slave. Suggest to replicate any transactions that have been committed on master but are not included in GTID_EXECUTED.

• Error number: 1886; Symbol: ER_MISSING_KEY; SQLSTATE: HY000
Message: The table '%s.%s' does not have the necessary key(s) defined on it. Please check the table definition and create index(s) accordingly.

ER_MISSING_KEY was added in 8.0.4.

• Error number: 1887; Symbol: WARN_NAMED_PIPE_ACCESS_EVERYONE; SQLSTATE: HY000
Message: Setting named_pipe_full_access_group='%s' is insecure. Consider using a Windows group with fewer members.

WARN_NAMED_PIPE_ACCESS_EVERYONE was added in 8.0.17.

• Error number: 3000; Symbol: ER_FILE_CORRUPT; SQLSTATE: HY000
Message: File %s is corrupted

• Error number: 3001; Symbol: ER_ERROR_ON_MASTER; SQLSTATE: HY000
Message: Query partially completed on the master (error on master: %d) and was aborted. There is a chance that your master is inconsistent at this point. If you are sure that your master is ok, run this query manually on the slave and then restart the slave with SET GLOBAL SQL_SLAVE_SKIP_COUNTER=1; START SLAVE; Query:'%s'

• Error number: 3003; Symbol: ER_STORAGE_ENGINE_NOT_LOADED; SQLSTATE: HY000
Message: Storage engine for table '%s'. is not loaded.

- Error number: 3004; Symbol: ER_GET_STACKED_DA_WITHOUT_ACTIVE_HANDLER; SQLSTATE: 02002

Message: GET STACKED DIAGNOSTICS when handler not active

- Error number: 3005; Symbol: ER_WARN_LEGACY_SYNTAX_CONVERTED; SQLSTATE: HY000

Message: %s is no longer supported. The statement was converted to %s.

- Error number: 3006; Symbol: ER_BINLOG_UNSAFE_FULLTEXT_PLUGIN; SQLSTATE: HY000

Message: Statement is unsafe because it uses a fulltext parser plugin which may not return the same value on the slave.

- Error number: 3007; Symbol: ER_CANNOT_DISCARD_TEMPORARY_TABLE; SQLSTATE: HY000

Message: Cannot DISCARD/IMPORT tablespace associated with temporary table

- Error number: 3008; Symbol: ER_FK_DEPTH_EXCEEDED; SQLSTATE: HY000

Message: Foreign key cascade delete/update exceeds max depth of %d.

- Error number: 3009; Symbol: ER_COL_COUNT_DOESNT_MATCH PLEASE UPDATE V2; SQLSTATE: HY000

Message: The column count of %s.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please perform the MySQL upgrade procedure.

- Error number: 3010; Symbol: ER_WARN_TRIGGER DOESNT HAVE CREATED; SQLSTATE: HY000

Message: Trigger %s.%s.%s does not have CREATED attribute.

- Error number: 3011; Symbol: ER_REFERENCED TRG DOES NOT EXIST; SQLSTATE: HY000

Message: Referenced trigger '%s' for the given action time and event type does not exist.

- Error number: 3012; Symbol: ER_EXPLAIN NOT SUPPORTED; SQLSTATE: HY000

Message: EXPLAIN FOR CONNECTION command is supported only for SELECT/UPDATE/INSERT/DELETE/REPLACE

- Error number: 3013; Symbol: ER_INVALID_FIELD_SIZE; SQLSTATE: HY000

Message: Invalid size for column '%s'.

- Error number: 3014; Symbol: ER_MISSING HA CREATE OPTION; SQLSTATE: HY000

Message: Table storage engine '%s' found required create option missing

- Error number: 3015; Symbol: ER_ENGINE OUT OF MEMORY; SQLSTATE: HY000

Message: Out of memory in storage engine '%s'.

- Error number: 3016; Symbol: ER_PASSWORD EXPIRE ANONYMOUS USER; SQLSTATE: HY000

Message: The password for anonymous user cannot be expired.

- Error number: 3017; Symbol: ER_SLAVE SQL THREAD MUST STOP; SQLSTATE: HY000
Server Error Message Reference

Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL_THREAD first

- Error number: 3018; Symbol: ER_NO_FT_MATERIALIZED_SUBQUERY; SQLSTATE: HY000
  Message: Cannot create FULLTEXT index on materialized subquery

- Error number: 3019; Symbol: ER_INNODB_UNDO_LOG_FULL; SQLSTATE: HY000
  Message: Undo Log error: %s

- Error number: 3020; Symbol: ER_INVALID_ARGUMENT_FOR_LOGARITHM; SQLSTATE: 2201E
  Message: Invalid argument for logarithm

- Error number: 3021; Symbol: ER_SLAVE_CHANNEL_IO_THREAD_MUST_STOP; SQLSTATE: HY000
  Message: This operation cannot be performed with a running slave io thread; run STOP SLAVE IO_THREAD FOR CHANNEL '%s' first.

- Error number: 3022; Symbol: ER_WARN_OPEN_TEMP_TABLES_MUST_BE_ZERO; SQLSTATE: HY000
  Message: This operation may not be safe when the slave has temporary tables. The tables will be kept open until the server restarts or until the tables are deleted by any replicated DROP statement. Suggest to wait until slave_open_temp_tables = 0.

- Error number: 3023; Symbol: ER_WARN_ONLY_MASTER_LOG_FILE_NO_POS; SQLSTATE: HY000
  Message: CHANGE MASTER TO with a MASTER_LOG_FILE clause but no MASTER_LOG_POS clause may not be safe. The old position value may not be valid for the new binary log file.

- Error number: 3024; Symbol: ER_QUERY_TIMEOUT; SQLSTATE: HY000
  Message: Query execution was interrupted, maximum statement execution time exceeded

- Error number: 3025; Symbol: ER_NON_RO_SELECT_DISABLE_TIMER; SQLSTATE: HY000
  Message: Select is not a read only statement, disabiling timer

- Error number: 3026; Symbol: ER_DUP_LIST_ENTRY; SQLSTATE: HY000
  Message: Duplicate entry '%s'.

- Error number: 3028; Symbol: ER_AGGREGATE_ORDER_FOR_UNION; SQLSTATE: HY000
  Message: Expression #%u of ORDER BY contains aggregate function and applies to a UNION

- Error number: 3029; Symbol: ER_AGGREGATE_ORDER_NON_AGG_QUERY; SQLSTATE: HY000
  Message: Expression #%u of ORDER BY contains aggregate function and applies to the result of a non-aggregated query

- Error number: 3030; Symbol: ER_SLAVE_WORKER_STOPPED_PREVIOUS_THD_ERROR; SQLSTATE: HY000
  Message: Slave worker has stopped after at least one previous worker encountered an error when slave-preserve-commit-order was enabled. To preserve commit order, the last transaction executed by this thread has not been committed. When restarting the slave after fixing any failed threads, you should fix this worker as well.
• Error number: 3031; Symbol: ER_DONT_SUPPORT_SLAVE_PRESERVE_COMMIT_ORDER; SQLSTATE: HY000
Message: slave_preserve_commit_order is not supported %s.

• Error number: 3032; Symbol: ER_SERVER_OFFLINE_MODE; SQLSTATE: HY000
Message: The server is currently in offline mode

• Error number: 3033; Symbol: ER_GIS_DIFFERENT_SRIDS; SQLSTATE: HY000
Message: Binary geometry function %s given two geometries of different srids: %u and %u, which
should have been identical.
Geometry values passed as arguments to spatial functions must have the same SRID value.

• Error number: 3034; Symbol: ER_GIS_UNSUPPORTED_ARGUMENT; SQLSTATE: HY000
Message: Calling geometry function %s with unsupported types of arguments.
A spatial function was called with a combination of argument types that the function does not support.

• Error number: 3035; Symbol: ER_GIS_UNKNOWN_ERROR; SQLSTATE: HY000
Message: Unknown GIS error occurred in function %s.

• Error number: 3036; Symbol: ER_GIS_UNKNOWN_EXCEPTION; SQLSTATE: HY000
Message: Unknown exception caught in GIS function %s.

• Error number: 3037; Symbol: ER_GIS_INVALID_DATA; SQLSTATE: 22023
Message: Invalid GIS data provided to function %s.
A spatial function was called with an argument not recognized as a valid geometry value.

• Error number: 3038; Symbol: ER_BOOST_GEOMETRY_EMPTY_INPUT_EXCEPTION; SQLSTATE: HY000
Message: The geometry has no data in function %s.

• Error number: 3039; Symbol: ER_BOOST_GEOMETRY_CENTROID_EXCEPTION; SQLSTATE: HY000
Message: Unable to calculate centroid because geometry is empty in function %s.

• Error number: 3040; Symbol: ER_BOOST_GEOMETRY_OVERLAY_INVALID_INPUT_EXCEPTION; SQLSTATE: HY000
Message: Geometry overlay calculation error: geometry data is invalid in function %s.

• Error number: 3041; Symbol: ER_BOOST_GEOMETRY_TURN_INFO_EXCEPTION; SQLSTATE: HY000
Message: Geometry turn info calculation error: geometry data is invalid in function %s.

• Error number: 3042; Symbol: ER_BOOST_GEOMETRY_SELF_INTERSECTION_POINT_EXCEPTION; SQLSTATE: HY000
Message: Analysis procedures of intersection points interrupted unexpectedly in function %s.

• Error number: 3043; Symbol: ER_BOOST_GEOMETRY_UNKNOWN_EXCEPTION; SQLSTATE: HY000
Message: Unknown exception thrown in function %s.

- Error number: 3044; Symbol: ER_STD_BAD_ALLOC_ERROR; SQLSTATE: HY000
  Message: Memory allocation error: %s in function %s.
- Error number: 3045; Symbol: ER_STD_DOMAIN_ERROR; SQLSTATE: HY000
  Message: Domain error: %s in function %s.
- Error number: 3046; Symbol: ER_STD_LENGTH_ERROR; SQLSTATE: HY000
  Message: Length error: %s in function %s.

  Message: Logic error: %s in function %s.
- Error number: 3053; Symbol: ER_STD_RUNTIME_ERROR; SQLSTATE: HY000
  Message: Runtime error: %s in function %s.
- Error number: 3054; Symbol: ER_STD_UNKNOWN_EXCEPTION; SQLSTATE: HY000
  Message: Unknown exception: %s in function %s.
- Error number: 3055; Symbol: ER_GIS_DATA_WRONG_ENDIANESS; SQLSTATE: HY000
  Message: Geometry byte string must be little endian.
- Error number: 3056; Symbol: ER_CHANGE_MASTER_PASSWORD_LENGTH; SQLSTATE: HY000
  Message: The password provided for the replication user exceeds the maximum length of 32 characters
- Error number: 3057; Symbol: ER_USER_LOCK_WRONG_NAME; SQLSTATE: 42000
  Message: Incorrect user-level lock name ‘%s’.
- Error number: 3058; Symbol: ER_USER_LOCK_DEADLOCK; SQLSTATE: HY000
Server Error Message Reference

Message: Deadlock found when trying to get user-level lock; try rolling back transaction/releasing locks and restarting lock acquisition.

This error is returned when the metadata locking subsystem detects a deadlock for an attempt to acquire a named lock with `GET_LOCK`.

- Error number: 3059; Symbol: `ER_REPLACE_INACCESSIBLE_ROWS`; SQLSTATE: HY000
  Message: REPLACE cannot be executed as it requires deleting rows that are not in the view

- Error number: 3060; Symbol: `ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_GIS`; SQLSTATE: HY000
  Message: Do not support online operation on table with GIS index

- Error number: 3061; Symbol: `ER_ILLEGAL_USER_VAR`; SQLSTATE: 42000
  Message: User variable name '%s' is illegal

- Error number: 3062; Symbol: `ER_GTID_MODE_OFF`; SQLSTATE: HY000
  Message: Cannot %s when GTID_MODE = OFF.

- Error number: 3064; Symbol: `ER_INCORRECT_TYPE`; SQLSTATE: HY000
  Message: Incorrect type for argument %s in function %s.

- Error number: 3065; Symbol: `ER_FIELD_IN_ORDER_NOT_SELECT`; SQLSTATE: HY000
  Message: Expression #%u of ORDER BY clause is not in SELECT list, references column '%s' which is not in SELECT list; this is incompatible with %s

- Error number: 3066; Symbol: `ER_AGGREGATE_IN_ORDER_NOT_SELECT`; SQLSTATE: HY000
  Message: Expression #%u of ORDER BY clause is not in SELECT list, contains aggregate function; this is incompatible with %s

- Error number: 3067; Symbol: `ER_INVALID_RPL_WILD_TABLE_FILTER_PATTERN`; SQLSTATE: HY000
  Message: Supplied filter list contains a value which is not in the required format 'db_pattern.table_pattern'

- Error number: 3068; Symbol: `ER_NET_OK_PACKET_TOO_LARGE`; SQLSTATE: 08S01
  Message: OK packet too large

- Error number: 3069; Symbol: `ER_INVALID_JSON_DATA`; SQLSTATE: HY000
  Message: Invalid JSON data provided to function %s: %s

- Error number: 3070; Symbol: `ER_INVALID_GEOJSON_MISSING_MEMBER`; SQLSTATE: HY000
  Message: Invalid GeoJSON data provided to function %s: Missing required member '%s'

- Error number: 3071; Symbol: `ER_INVALID_GEOJSON_WRONG_TYPE`; SQLSTATE: HY000
  Message: Invalid GeoJSON data provided to function %s: Member '%s' must be of type '%s'
Server Error Message Reference

- Error number: 3072; Symbol: `ER_INVALID_GEOJSON_UNSPECIFIED`; SQLSTATE: `HY000`
  Message: Invalid GeoJSON data provided to function `%s`

- Error number: 3073; Symbol: `ER_DIMENSION_UNSUPPORTED`; SQLSTATE: `HY000`
  Message: Unsupported number of coordinate dimensions in function `%s`: Found `%u`, expected `%u`

- Error number: 3074; Symbol: `ER_SLAVE_CHANNEL_DOES_NOT_EXIST`; SQLSTATE: `HY000`
  Message: Slave channel '%s' does not exist.

- Error number: 3076; Symbol: `ER_SLAVE_CHANNEL_NAME_INVALID_OR_TOO_LONG`; SQLSTATE: `HY000`
  Message: Couldn't create channel: Channel name is either invalid or too long.

- Error number: 3077; Symbol: `ER_SLAVE_NEW_CHANNEL_WRONG_REPOSITORY`; SQLSTATE: `HY000`
  Message: To have multiple channels, repository cannot be of type FILE; Please check the repository configuration and convert them to TABLE.

- Error number: 3079; Symbol: `ER_SLAVE_MULTIPLE_CHANNELS_CMD`; SQLSTATE: `HY000`
  Message: Multiple channels exist on the slave. Please provide channel name as an argument.

- Error number: 3080; Symbol: `ER_SLAVE_MAX_CHANNELS_EXCEEDED`; SQLSTATE: `HY000`
  Message: Maximum number of replication channels allowed exceeded.

- Error number: 3081; Symbol: `ER_SLAVE_CHANNEL_MUST_STOP`; SQLSTATE: `HY000`
  Message: This operation cannot be performed with running replication threads; run STOP SLAVE FOR CHANNEL '%s' first.

- Error number: 3082; Symbol: `ER_SLAVE_CHANNEL_NOT_RUNNING`; SQLSTATE: `HY000`
  Message: This operation requires running replication threads; configure slave and run START SLAVE FOR CHANNEL '%s'.

- Error number: 3083; Symbol: `ER_SLAVE_CHANNEL_WAS_RUNNING`; SQLSTATE: `HY000`
  Message: Replication thread(s) for channel '%s' are already running.

- Error number: 3084; Symbol: `ER_SLAVE_CHANNEL_WAS_NOT_RUNNING`; SQLSTATE: `HY000`
  Message: Replication thread(s) for channel '%s' are already stopped.

- Error number: 3085; Symbol: `ER_SLAVE_CHANNEL_SQL_THREAD_MUST_STOP`; SQLSTATE: `HY000`
  Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL_THREAD FOR CHANNEL '%s' first.

- Error number: 3086; Symbol: `ER_SLAVE_CHANNEL_SQL_SKIP_COUNTER`; SQLSTATE: `HY000`
  Message: When sql_slave_skip_counter > 0, it is not allowed to start more than one SQL thread by using 'START SLAVE [SQL_THREAD]'. Value of sql_slave_skip_counter can only be used by one SQL thread at a time. Please use 'START SLAVE [SQL_THREAD] FOR CHANNEL' to start the SQL thread which will use the value of sql_slave_skip_counter.
• Error number: 3087; Symbol: ER_WRONG_FIELD_WITH_GROUP_V2; SQLSTATE: HY000
Message: Expression #%u of %s is not in GROUP BY clause and contains nonaggregated column '%s' which is not functionally dependent on columns in GROUP BY clause; this is incompatible with sql_mode=only_full_group_by

• Error number: 3088; Symbol: ER_MIX_OF_GROUP_FUNC_AND_FIELDS_V2; SQLSTATE: HY000
Message: In aggregated query without GROUP BY, expression #%u of %s contains nonaggregated column '%s'; this is incompatible with sql_mode=only_full_group_by

• Error number: 3089; Symbol: ER_WARN_DEPRECATED_SYSVAR_UPDATE; SQLSTATE: HY000
Message: Updating '%s' is deprecated. It will be made read-only in a future release.

• Error number: 3090; Symbol: ER_WARN_DEPRECATED_SQLMODE; SQLSTATE: HY000
Message: Changing sql mode '%s' is deprecated. It will be removed in a future release.

• Error number: 3091; Symbol: ER_CANNOT_LOG_PARTIAL_DROP_DATABASE_WITH_GTID; SQLSTATE: HY000
Message: DROP DATABASE failed; some tables may have been dropped but the database directory remains. The GTID has not been added to GTID_EXECUTED and the statement was not written to the binary log. Fix this as follows: (1) remove all files from the database directory %s; (2) SET GTID_NEXT='%s'; (3) DROP DATABASE '%s'.

• Error number: 3092; Symbol: ER_GROUP_REPLICATION_CONFIGURATION; SQLSTATE: HY000
Message: The server is not configured properly to be an active member of the group. Please see more details on error log.

• Error number: 3093; Symbol: ER_GROUP_REPLICATION_RUNNING; SQLSTATE: HY000
Message: The START GROUP_REPLICATION command failed since the group is already running.

• Error number: 3094; Symbol: ER_GROUP_REPLICATION_APPLIER_INIT_ERROR; SQLSTATE: HY000
Message: The START GROUP_REPLICATION command failed as the applier module failed to start.

• Error number: 3095; Symbol: ER_GROUP_REPLICATION_STOP_APPLIER_THREAD_TIMEOUT; SQLSTATE: HY000
Message: The STOP GROUP_REPLICATION command execution is incomplete: The applier thread got the stop signal while it was busy. The applier thread will stop once the current task is complete.

• Error number: 3096; Symbol: ER_GROUP_REPLICATION_COMMUNICATION_LAYER_SESSION_ERROR; SQLSTATE: HY000
Message: The START GROUP_REPLICATION command failed as there was an error when initializing the group communication layer.

• Error number: 3097; Symbol: ER_GROUP_REPLICATION_COMMUNICATION_LAYER_JOIN_ERROR; SQLSTATE: HY000
Message: The START GROUP_REPLICATION command failed as there was an error when joining the communication group.
Server Error Message Reference

- **Error number: 3098; Symbol: ER_BEFORE_DML_VALIDATION_ERROR; SQLSTATE: HY000**
  Message: The table does not comply with the requirements by an external plugin.

- **Error number: 3099; Symbol: ER_PREVENTS_VARIABLE_WITHOUT_RBR; SQLSTATE: HY000**
  Message: Cannot change the value of variable `%s` without binary log format as ROW.
  The `transaction_write_set_extraction` option value is set and `binlog_format` is not ROW.

- **Error number: 3100; Symbol: ER_RUN_HOOK_ERROR; SQLSTATE: HY000**
  Message: Error on observer while running replication hook '%s'.

- **Error number: 3101; Symbol: ER_TRANSACTION_ROLLBACK_DURING_COMMIT; SQLSTATE: 40000**
  Message: Plugin instructed the server to rollback the current transaction.
  When using Group Replication, this means that a transaction failed the group certification process, due to
  one or more members detecting a potential conflict, and was thus rolled back. See Chapter 18, Group
  Replication.

- **Error number: 3102; Symbol: ER_GENERATED_COLUMN_FUNCTION_IS_NOT_ALLOWED; SQLSTATE: HY000**
  Message: Expression of generated column '%s' contains a disallowed function.

- **Error number: 3103; Symbol: ER_UNSUPPORTED_ALTER_INPLACE_ON_VIRTUAL_COLUMN; SQLSTATE: HY000**
  Message: INPLACE ADD or DROP of virtual columns cannot be combined with other ALTER TABLE actions.

- **Error number: 3104; Symbol: ER_WRONG_FK_OPTION_FOR_GENERATED_COLUMN; SQLSTATE: HY000**
  Message: Cannot define foreign key with %s clause on a generated column.

- **Error number: 3105; Symbol: ER_NON_DEFAULT_VALUE_FOR_GENERATED_COLUMN; SQLSTATE: HY000**
  Message: The value specified for generated column '%s' in table '%s' is not allowed.

- **Error number: 3106; Symbol: ER_UNSUPPORTED_ACTION_ON_GENERATED_COLUMN; SQLSTATE: HY000**
  Message: '%s' is not supported for generated columns.

- **Error number: 3107; Symbol: ER_GENERATED_COLUMN_NON_PRIOR; SQLSTATE: HY000**
  Message: Generated column can refer only to generated columns defined prior to it.
  To address this issue, change the table definition to define each generated column later than any
  generated columns to which it refers.

- **Error number: 3108; Symbol: ER_DEPENDENT_BY_GENERATED_COLUMN; SQLSTATE: HY000**
  Message: Column '%s' has a generated column dependency.
You cannot drop or rename a generated column if another column refers to it. You must either drop those columns as well, or redefine them not to refer to the generated column.

- **Error number:** 3109; Symbol: `ER_GENERATED_COLUMN_REF_AUTO_INC`; SQLSTATE: HY000
  Message: Generated column '%s' cannot refer to auto-increment column.

- **Error number:** 3110; Symbol: `ER_FEATURE_NOT_AVAILABLE`; SQLSTATE: HY000
  Message: The '%s' feature is not available; you need to remove '%s' or use MySQL built with '%s'.

- **Error number:** 3111; Symbol: `ER_CANT_SET_GTID_MODE`; SQLSTATE: HY000
  Message: SET @@GLOBAL.GTID_MODE = %s is not allowed because %s.

- **Error number:** 3112; Symbol: `ER_CANT_USE_AUTO_POSITION_WITH_GTID_MODE_OFF`; SQLSTATE: HY000
  Message: The replication receiver thread's cannot start in AUTO_POSITION mode: this server uses @@GLOBAL.GTID_MODE = OFF.

- **Error number:** 3116; Symbol: `ER_CANT_ENFORCE_GTID_CONSISTENCY_WITH_ONGOING_GTID_VIOLATING_TX`; SQLSTATE: HY000
  Message: Cannot set ENFORCE_GTID_CONSISTENCY = ON because there are ongoing transactions that violate GTID consistency.

  `ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` was renamed to `ER_CANT_ENFORCE_GTID_CONSISTENCY_WITH_ONGOING_GTID_VIOLATING_TX`.

- **Error number:** 3117; Symbol: `ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TX`; SQLSTATE: HY000
  Message: There are ongoing transactions that violate GTID consistency.

  `ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` was renamed to `ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TX`.

- **Error number:** 3118; Symbol: `ER_ACCOUNT_HAS_BEEN_LOCKED`; SQLSTATE: HY000
  Message: Access denied for user '%s'@'%s'. Account is locked.

  The account was locked with CREATE USER ... ACCOUNT LOCK or ALTER USER ... ACCOUNT LOCK. An administrator can unlock it with ALTER USER ... ACCOUNT UNLOCK.

- **Error number:** 3119; Symbol: `ER_WRONG_TABLESPACE_NAME`; SQLSTATE: 42000
  Message: Incorrect tablespace name '%s'.

- **Error number:** 3120; Symbol: `ER_TABLESPACE_IS_NOT_EMPTY`; SQLSTATE: HY000
  Message: Tablespace '%s' is not empty.

- **Error number:** 3121; Symbol: `ER_WRONG_FILE_NAME`; SQLSTATE: HY000
  Message: Incorrect File Name '%s'.
• Error number: 3122; Symbol: ER_BOOST_GEOMETRY_INCONSISTENT_TURNS_EXCEPTION; SQLSTATE: HY000
  Message: Inconsistent intersection points.
• Error number: 3123; Symbol: ER_WARN_OPTIMIZER_HINT_SYNTAX_ERROR; SQLSTATE: HY000
  Message: Optimizer hint syntax error
• Error number: 3124; Symbol: ER_WARN_BAD_MAX_EXECUTION_TIME; SQLSTATE: HY000
  Message: Unsupported MAX_EXECUTION_TIME
• Error number: 3125; Symbol: ER_WARN_UNSUPPORTED_MAX_EXECUTION_TIME; SQLSTATE: HY000
  Message: MAX_EXECUTION_TIME hint is supported by top-level standalone SELECT statements only.
The MAX_EXECUTION_TIME optimizer hint is supported only for SELECT statements.
• Error number: 3126; Symbol: ER_WARN_CONFLICTING_HINT; SQLSTATE: HY000
  Message: Hint %s is ignored as conflicting/duplicated
• Error number: 3127; Symbol: ER_WARN_UNKNOWN_QB_NAME; SQLSTATE: HY000
  Message: Query block name %s is not found for %s hint
• Error number: 3128; Symbol: ER_UNRESOLVED_HINT_NAME; SQLSTATE: HY000
  Message: Unresolved name %s for %s hint
• Error number: 3129; Symbol: ER_WARN_ON_MODIFYING_GTID_EXECUTED_TABLE; SQLSTATE: HY000
  Message: Please do not modify the %s table. This is a mysql internal system table to store GTIDs for committed transactions. Modifying it can lead to an inconsistent GTID state.
• Error number: 3130; Symbol: ER_PLUGGABLE_PROTOCOL_COMMAND_NOT_SUPPORTED; SQLSTATE: HY000
  Message: Command not supported by pluggable protocols
• Error number: 3131; Symbol: ER_LOCKING_SERVICE_WRONG_NAME; SQLSTATE: 42000
  Message: Incorrect locking service lock name '%s'.
  A locking service name was specified as NULL, the empty string, or a string longer than 64 characters. Namespace and lock names must be non-NULL, nonempty, and no more than 64 characters long.
• Error number: 3132; Symbol: ER_LOCKING_SERVICE_DEADLOCK; SQLSTATE: HY000
  Message: Deadlock found when trying to get locking service lock; try releasing locks and restarting lock acquisition.
• Error number: 3133; Symbol: ER_LOCKING_SERVICE_TIMEOUT; SQLSTATE: HY000
  Message: Service lock wait timeout exceeded.
• Error number: 3134; Symbol: ER_GIS_MAX_POINTS_IN_GEOMETRY_OVERFLOWED; SQLSTATE: HY000
Message: Parameter %s exceeds the maximum number of points in a geometry (%lu) in function %s.

- Error number: 3135; Symbol: ER_SQL_MODE_MERGED; SQLSTATE: HY000

Message: 'NO_ZERO_DATE', 'NO_ZERO_IN_DATE' and 'ERROR_FOR_DIVISION_BY_ZERO' sql modes should be used with strict mode. They will be merged with strict mode in a future release.

- Error number: 3136; Symbol: ER_VTOKEN_PLUGIN_TOKEN_MISMATCH; SQLSTATE: HY000

Message: Version token mismatch for %.*s. Correct value %.*s

The client has set its version_tokens_session system variable to the list of tokens it requires the server to match, but the server token list has at least one matching token name that has a value different from what the client requires. See Section 5.6.6, “Version Tokens”.

- Error number: 3137; Symbol: ER_VTOKEN_PLUGIN_TOKEN_NOT_FOUND; SQLSTATE: HY000

Message: Version token %.*s not found.

The client has set its version_tokens_session system variable to the list of tokens it requires the server to match, but the server token list is missing at least one of those tokens. See Section 5.6.6, “Version Tokens”.

- Error number: 3138; Symbol: ER_CANT_SET_VARIABLE_WHEN_OWNING_GTID; SQLSTATE: HY000

Message: Variable %s cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.

- Error number: 3139; Symbol: ER_SLAVE_CHANNEL_OPERATION_NOT_ALLOWED; SQLSTATE: HY000

Message: %s cannot be performed on channel '%s'.

- Error number: 3140; Symbol: ER_INVALID_JSON_TEXT; SQLSTATE: 22032

Message: Invalid JSON text: "%s" at position %u in value for column '%s'.

- Error number: 3141; Symbol: ER_INVALID_JSON_TEXT_IN_PARAM; SQLSTATE: 22032

Message: Invalid JSON text in argument %u to function %s: "%s" at position %u.%s

- Error number: 3142; Symbol: ER_INVALID_JSON_BINARY_DATA; SQLSTATE: HY000

Message: The JSON binary value contains invalid data.

- Error number: 3143; Symbol: ER_INVALID_JSON_PATH; SQLSTATE: 42000

Message: Invalid JSON path expression. The error is around character position %u.%s

- Error number: 3144; Symbol: ER_INVALID_JSON_CHARSET; SQLSTATE: 22032

Message: Cannot create a JSON value from a string with CHARACTER SET '%s'.

- Error number: 3145; Symbol: ER_INVALID_JSON_CHARSET_IN_FUNCTION; SQLSTATE: 22032

Message: Invalid JSON character data provided to function %s: '%s'; utf8 is required.
• Error number: 3146; Symbol: ER_INVALID_TYPE_FOR_JSON; SQLSTATE: 22032
  Message: Invalid data type for JSON data in argument %u to function %s; a JSON string or JSON type is required.

• Error number: 3147; Symbol: ER_INVALID_CAST_TO_JSON; SQLSTATE: 22032
  Message: Cannot CAST value to JSON.

• Error number: 3148; Symbol: ER_INVALID_JSON_PATH_CHARSET; SQLSTATE: 42000
  Message: A path expression must be encoded in the utf8 character set. The path expression '%s' is encoded in character set '%s'.

• Error number: 3149; Symbol: ER_INVALID_JSON_PATH_WILDCARD; SQLSTATE: 42000
  Message: In this situation, path expressions may not contain the * and ** tokens or an array range.

• Error number: 3150; Symbol: ER_JSON_VALUE_TOO_BIG; SQLSTATE: 22032
  Message: The JSON value is too big to be stored in a JSON column.

• Error number: 3151; Symbol: ER_JSON_KEY_TOO_BIG; SQLSTATE: 22032
  Message: The JSON object contains a key name that is too long.

• Error number: 3152; Symbol: ER_JSON_USED_AS_KEY; SQLSTATE: 42000
  Message: JSON column '%s' supports indexing only via generated columns on a specified JSON path.

• Error number: 3153; Symbol: ER_JSON_VACUOUS_PATH; SQLSTATE: 42000
  Message: The path expression '$' is not allowed in this context.

• Error number: 3154; Symbol: ER_JSON_BAD_ONE_OR_ALL_ARG; SQLSTATE: 42000
  Message: The oneOrAll argument to %s may take these values: 'one' or 'all'.

• Error number: 3155; Symbol: ER_NUMERIC_JSON_VALUE_OUT_OF_RANGE; SQLSTATE: 22003
  Message: Out of range JSON value for CAST to %s%s from column %s at row %ld

• Error number: 3156; Symbol: ER_INVALID_JSON_VALUE_FOR_CAST; SQLSTATE: 22018
  Message: Invalid JSON value for CAST to %s%s from column %s at row %ld

• Error number: 3157; Symbol: ER_JSONocument_TOO_DEEP; SQLSTATE: 22032
  Message: The JSON document exceeds the maximum depth.

• Error number: 3158; Symbol: ER_JSONocument_NULL_KEY; SQLSTATE: 22032
  Message: JSON documents may not contain NULL member names.

• Error number: 3159; Symbol: ER_SECURE_TRANSPORT_REQUIRED; SQLSTATE: HY000
  Message: Connections using insecure transport are prohibited while --require_secure_transport=ON.

With the require_secure_transport system variable, clients can connect only using secure transports. Qualifying connections are those using SSL, a Unix socket file, or shared memory.
• Error number: 3160; Symbol: ER_NO_SECURE_TRANSPORTS_CONFIGURED; SQLSTATE: HY000
  Message: No secure transports (SSL or Shared Memory) are configured, unable to set require_secure_transport=ON.
  The require_secure_transport system variable cannot be enabled if the server does not support at least one secure transport. Configure the server with the required SSL keys/certificates to enable SSL connections, or enable the shared_memory system variable to enable shared-memory connections.

• Error number: 3161; Symbol: ER_DISABLED_STORAGE_ENGINE; SQLSTATE: HY000
  Message: Storage engine %s is disabled (Table creation is disallowed).
  An attempt was made to create a table or tablespace using a storage engine listed in the value of the disabled_storage_engines system variable, or to change an existing table or tablespace to such an engine. Choose a different storage engine.

• Error number: 3162; Symbol: ER_USER_DOES_NOT_EXIST; SQLSTATE: HY000
  Message: Authorization ID %s does not exist.

• Error number: 3163; Symbol: ER_USER_ALREADY_EXISTS; SQLSTATE: HY000
  Message: Authorization ID %s already exists.

• Error number: 3164; Symbol: ER_AUDIT_API_ABORT; SQLSTATE: HY000
  Message: Aborted by Audit API ('%s';%d).
  This error indicates that an audit plugin terminated execution of an event. The message typically indicates the event subclass name and a numeric status value.

• Error number: 3165; Symbol: ER_INVALID_JSON_PATH_ARRAY_CELL; SQLSTATE: 42000
  Message: A path expression is not a path to a cell in an array.

• Error number: 3166; Symbol: ER_BUFFPOOL_RESIZE_INPROGRESS; SQLSTATE: HY000
  Message: Another buffer pool resize is already in progress.

• Error number: 3167; Symbol: ER_FEATURE_DISABLED_SEE_DOC; SQLSTATE: HY000
  Message: The '%s' feature is disabled; see the documentation for '%s'

• Error number: 3168; Symbol: ER_SERVER_ISNT_AVAILABLE; SQLSTATE: HY000
  Message: Server isn't available

• Error number: 3169; Symbol: ER_SESSION_WAS_KILLED; SQLSTATE: HY000
  Message: Session was killed

• Error number: 3170; Symbol: ER_CAPACITY_EXCEEDED; SQLSTATE: HY000
  Message: Memory capacity of %llu bytes for '%s' exceeded. %s

• Error number: 3171; Symbol: ER_CAPACITY_EXCEEDED_IN_RANGE_OPTIMIZER; SQLSTATE: HY000
  Message: Range optimization was not done for this query.
Server Error Message Reference

- Error number: 3173; Symbol: `ER_CANT_WAIT_FOR_EXECUTED_GTID_SET WHILE_OWNING_A_GTID`; SQLSTATE: `HY000`
  Message: The client holds ownership of the GTID %s. Therefore, WAIT_FOR_EXECUTED_GTID_SET cannot wait for this GTID.

- Error number: 3174; Symbol: `ER_CANNOT_ADD_FOREIGN_BASE_COL_Virtual`; SQLSTATE: `HY000`
  Message: Cannot add foreign key on the base column of indexed virtual column.

- Error number: 3175; Symbol: `ER_CANNOT_CREATE_VIRTUAL_INDEX_CONSTRAINT`; SQLSTATE: `HY000`
  Message: Cannot create index on virtual column whose base column has foreign constraint.

- Error number: 3176; Symbol: `ER_ERROR_ON_MODIFYING_GTID_EXECUTED_TABLE`; SQLSTATE: `HY000`
  Message: Please do not modify the %s table with an XA transaction. This is an internal system table used to store GTIDs for committed transactions. Although modifying it can lead to an inconsistent GTID state, if necessary you can modify it with a non-XA transaction.

- Error number: 3177; Symbol: `ER_LOCK_REFUSED_BY_ENGINE`; SQLSTATE: `HY000`
  Message: Lock acquisition refused by storage engine.

- Error number: 3178; Symbol: `ER_UNSUPPORTED_ALTER_ONLINE_ON_VIRTUAL_COLUMN`; SQLSTATE: `HY000`
  Message: ADD COLUMN col...VIRTUAL, ADD INDEX(col)

- Error number: 3179; Symbol: `ER_MASTER_KEY_ROTATION_NOT_SUPPORTED_BY_SE`; SQLSTATE: `HY000`
  Message: Master key rotation is not supported by storage engine.

- Error number: 3181; Symbol: `ER_MASTER_KEY_ROTATION_BINLOG_FAILED`; SQLSTATE: `HY000`
  Message: Write to binlog failed. However, master key rotation has been completed successfully.

- Error number: 3182; Symbol: `ER_MASTER_KEY_ROTATION_SE_UNAVAILABLE`; SQLSTATE: `HY000`
  Message: Storage engine is not available.

- Error number: 3183; Symbol: `ER_TABLESPACE_CANNOT_ENCRYPT`; SQLSTATE: `HY000`
  Message: This tablespace can't be encrypted.

- Error number: 3184; Symbol: `ER_INVALID_ENCRYPTION_OPTION`; SQLSTATE: `HY000`
  Message: Invalid encryption option.

- Error number: 3185; Symbol: `ER_CANNOT_FIND_KEY_IN_KEYRING`; SQLSTATE: `HY000`
  Message: Can't find master key from keyring, please check in the server log if a keyring plugin is loaded and initialized successfully.

- Error number: 3186; Symbol: `ER_CAPACITY_EXCEEDED_IN_PARSER`; SQLSTATE: `HY000`
Message: Parser bailed out for this query.

- **Error number: 3187; Symbol: ER_UNSUPPORTED_ALTER_ENCRYPTION_INPLACE; SQLSTATE: HY000**
  
  Message: Cannot alter encryption attribute by inplace algorithm.

- **Error number: 3188; Symbol: ER_KEYRING_UDF_KEYRING_SERVICE_ERROR; SQLSTATE: HY000**
  
  Message: Function '%s' failed because underlying keyring service returned an error. Please check if a keyring plugin is installed and that provided arguments are valid for the keyring you are using.

- **Error number: 3189; Symbol: ER_USER_COLUMN_OLD_LENGTH; SQLSTATE: HY000**
  
  Message: It seems that your db schema is old. The %s column is 77 characters long and should be 93 characters long. Please perform the MySQL upgrade procedure.

- **Error number: 3190; Symbol: ER_CANT_RESET_MASTER; SQLSTATE: HY000**
  
  Message: RESET MASTER is not allowed because %s.

- **Error number: 3191; Symbol: ER_GROUP_REPLICATION_MAX_GROUP_SIZE; SQLSTATE: HY000**
  
  Message: The START GROUP_REPLICATION command failed since the group already has 9 members.

- **Error number: 3192; Symbol: ER_CANNOT_ADD_FOREIGN_BASE_COL_STORED; SQLSTATE: HY000**
  
  Message: Cannot add foreign key on the base column of stored column.

- **Error number: 3193; Symbol: ER_TABLE REFERENCED; SQLSTATE: HY000**
  
  Message: Cannot complete the operation because table is referenced by another connection.

- **Error number: 3197; Symbol: ER_XA_RETRY; SQLSTATE: HY000**
  
  Message: The resource manager is not able to commit the transaction branch at this time. Please retry later.

  `ER_XA_RETRY` was added in 8.0.2.

- **Error number: 3198; Symbol: ER_KEYRING_AWS_UDF_AWS_KMS_ERROR; SQLSTATE: HY000**
  
  Message: Function '%s' failed due to: %s.

  `ER_KEYRING_AWS_UDF_AWS_KMS_ERROR` was added in 8.0.2.

- **Error number: 3199; Symbol: ER_BINLOGUnsafe_XA; SQLSTATE: HY000**
  
  Message: Statement is unsafe because it is being used inside a XA transaction. Concurrent XA transactions may deadlock on slaves when replicated using statements.

  `ER_BINLOGUnsafe_XA` was added in 8.0.2.

- **Error number: 3200; Symbol: ER_UDF_ERROR; SQLSTATE: HY000**
  
  Message: %s UDF failed; %s

  `ER_UDF_ERROR` was added in 8.0.4.
• Error number: 3201; Symbol: ER_KEYRING_MIGRATION_FAILURE; SQLSTATE: HY000
  Message: Can not perform keyring migration : %s
  ER_KEYRING_MIGRATION_FAILURE was added in 8.0.4.

• Error number: 3202; Symbol: ER_KEYRING_ACCESS_DENIED_ERROR; SQLSTATE: 42000
  Message: Access denied; you need %s privileges for this operation
  ER_KEYRING_ACCESS_DENIED_ERROR was added in 8.0.4.

• Error number: 3203; Symbol: ER_KEYRING_MIGRATION_STATUS; SQLSTATE: HY000
  Message: Keyring migration %s.
  ER_KEYRING_MIGRATION_STATUS was added in 8.0.4.

• Error number: 3218; Symbol: ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_VALUE; SQLSTATE: HY000
  Message: Invalid "max_array_length" argument value.
  ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_VALUE was added in 8.0.11.

• Error number: 3500; Symbol: ER_UNSUPPORT_COMPRESSED_TEMPORARY_TABLE; SQLSTATE: HY000
  Message: CREATE TEMPORARY TABLE is not allowed with ROW_FORMAT=COMPRESSED or KEY_BLOCK_SIZE.

• Error number: 3501; Symbol: ER_ACL_OPERATION_FAILED; SQLSTATE: HY000
  Message: The ACL operation failed due to the following error from SE: errcode %d - %s

• Error number: 3502; Symbol: ER_UNSUPPORTED_INDEX_ALGORITHM; SQLSTATE: HY000
  Message: This storage engine does not support the %s index algorithm, storage engine default was used instead.

• Error number: 3503; Symbol: ER_NO_SUCH_DB; SQLSTATE: 42Y07
  Message: Database ‘%s’ doesn’t exist

• Error number: 3504; Symbol: ER_TOO_BIG_ENUM; SQLSTATE: HY000
  Message: Too many enumeration values for column %s.

• Error number: 3505; Symbol: ER_TOO_LONG_SET_ENUM_VALUE; SQLSTATE: HY000
  Message: Too long enumeration/set value for column %s.

• Error number: 3506; Symbol: ER_INVALID_DD_OBJECT; SQLSTATE: HY000
  Message: %s dictionary object is invalid. (%s)

• Error number: 3507; Symbol: ER_UPDATING_DD_TABLE; SQLSTATE: HY000
  Message: Failed to update %s dictionary object.
Server Error Message Reference

- **Error number:** 3508; Symbol: ER_INVALID_DD_OBJECT_ID; SQLSTATE: HY000
  Message: Dictionary object id (\%lu) does not exist.

- **Error number:** 3509; Symbol: ER_INVALID_DD_OBJECT_NAME; SQLSTATE: HY000
  Message: Dictionary object name '%%s' is invalid. (%%s)

  Message: Recursive Common Table Expression '%s' should have one or more non-recursive query blocks followed by one or more recursive ones **ER_CTE_RECURSIVEQUIRES_NONRECURSIVE_FIRST** was added in 8.0.1.

- **Error number:** 3575; Symbol: **ER_CTE_RECURSIVEFORBIDS_AGGREGATION**; SQLSTATE: **HY000**
  
  Message: Recursive Common Table Expression '%s' can contain neither aggregation nor window functions in recursive query block **ER_CTE_RECURSIVEFORBIDS_AGGREGATION** was added in 8.0.1.

- **Error number:** 3576; Symbol: **ER_CTE_RECURSIVEFORBIDDENJOIN_ORDER**; SQLSTATE: **HY000**
  
  Message: In recursive query block of Recursive Common Table Expression '%s', the recursive table must neither be in the right argument of a LEFT JOIN, nor be forced to be non-first with join order hints **ER_CTE_RECURSIVEFORBIDDENJOIN_ORDER** was added in 8.0.1.

- **Error number:** 3577; Symbol: **ER_CTE_RECURSIVEQUIRES_SINGLE_REFERENCE**; SQLSTATE: **HY000**
  
  Message: In recursive query block of Recursive Common Table Expression '%s', the recursive table must be referenced only once, and not in any subquery **ER_CTE_RECURSIVEQUIRES_SINGLE_REFERENCE** was added in 8.0.1.

- **Error number:** 3578; Symbol: **ER_SWITCH_TMP_ENGINE**; SQLSTATE: **HY000**
  
  Message: '%s' requires @@internal_tmp_disk_storage_engine=InnoDB **ER_SWITCH_TMP_ENGINE** was added in 8.0.1.

- **Error number:** 3579; Symbol: **ER_WINDOWNO_SUCH_WINDOW**; SQLSTATE: **HY000**
  
  Message: Window name '%s' is not defined. **ER_WINDOWNO_SUCH_WINDOW** was added in 8.0.2.
•   Error number: 3580; Symbol: `ER_WINDOW_CIRCULARITY_IN_WINDOW_GRAPH`; SQLSTATE: HY000
Message: There is a circularity in the window dependency graph.
`ER_WINDOW_CIRCULARITY_IN_WINDOW_GRAPH` was added in 8.0.2.

•   Error number: 3581; Symbol: `ER_WINDOW_NO_CHILD_PARTITIONING`; SQLSTATE: HY000
Message: A window which depends on another cannot define partitioning.
`ER_WINDOW_NO_CHILD_PARTITIONING` was added in 8.0.2.

•   Error number: 3582; Symbol: `ER_WINDOW_NO_INHERIT_FRAME`; SQLSTATE: HY000
Message: Window '%s' has a frame definition, so cannot be referenced by another window.
`ER_WINDOW_NO_INHERIT_FRAME` was added in 8.0.2.

•   Error number: 3583; Symbol: `ER_WINDOW_NO_REDEFINE_ORDER_BY`; SQLSTATE: HY000
Message: Window '%s' cannot inherit '%s' since both contain an ORDER BY clause.
`ER_WINDOW_NO_REDEFINE_ORDER_BY` was added in 8.0.2.

•   Error number: 3584; Symbol: `ER_WINDOW_Frame_START_ILLEGAL`; SQLSTATE: HY000
Message: Window '%s': frame start cannot be UNBOUNDED FOLLOWING.
`ER_WINDOW_Frame_START_ILLEGAL` was added in 8.0.2.

•   Error number: 3585; Symbol: `ER_WINDOW_Frame_END_ILLEGAL`; SQLSTATE: HY000
Message: Window '%s': frame end cannot be UNBOUNDED PRECEDING.
`ER_WINDOW_Frame_END_ILLEGAL` was added in 8.0.2.

•   Error number: 3586; Symbol: `ER_WINDOW_FRAME_ILLEGAL`; SQLSTATE: HY000
Message: Window '%s': frame start or end is negative, NULL or of non-integral type.
`ER_WINDOW_FRAME_ILLEGAL` was added in 8.0.2.

•   Error number: 3587; Symbol: `ER_WINDOW_RANGE_FRAME_ORDER_TYPE`; SQLSTATE: HY000
Message: Window '%s' with RANGE N PRECEDING/FOLLOWING frame requires exactly one ORDER BY expression, of numeric or temporal type.
`ER_WINDOW_RANGE_FRAME_ORDER_TYPE` was added in 8.0.2.

•   Error number: 3588; Symbol: `ER_WINDOW_RANGE_FRAME_TEMPORAL_TYPE`; SQLSTATE: HY000
Message: Window '%s' with RANGE frame has ORDER BY expression of datetime type. Only INTERVAL bound value allowed.
`ER_WINDOW_RANGE_FRAME_TEMPORAL_TYPE` was added in 8.0.2.

•   Error number: 3589; Symbol: `ER_WINDOW_RANGE_FRAME_NUMERIC_TYPE`; SQLSTATE: HY000
Message: Window '%s' with RANGE frame has ORDER BY expression of numeric type, INTERVAL bound value not allowed.
ER_WINDOW_RANGE_FRAME_NUMERIC_TYPE was added in 8.0.2.

- Error number: 3590; Symbol: ER_WINDOW_RANGE_BOUND_NOT_CONSTANT; SQLSTATE: HY000
  Message: Window '%s' has a non-constant frame bound.
  ER_WINDOW_RANGE_BOUND_NOT_CONSTANT was added in 8.0.2.

- Error number: 3591; Symbol: ER_WINDOW_DUPLICATE_NAME; SQLSTATE: HY000
  Message: Window '%s' is defined twice.
  ER_WINDOW_DUPLICATE_NAME was added in 8.0.2.

- Error number: 3592; Symbol: ER_WINDOW_ILLEGAL_ORDER_BY; SQLSTATE: HY000
  Message: Window '%s': ORDER BY or PARTITION BY uses legacy position indication which is not supported, use expression.
  ER_WINDOW_ILLEGAL_ORDER_BY was added in 8.0.2.

- Error number: 3593; Symbol: ER_WINDOW_INVALID_WINDOW_FUNC_USE; SQLSTATE: HY000
  Message: You cannot use the window function '%s' in this context.
  ER_WINDOW_INVALID_WINDOW_FUNC_USE was added in 8.0.2.

- Error number: 3594; Symbol: ER_WINDOW_INVALID_WINDOW_FUNC_ALIAS_USE; SQLSTATE: HY000
  Message: You cannot use the alias '%s' of an expression containing a window function in this context.
  ER_WINDOW_INVALID_WINDOW_FUNC_ALIAS_USE was added in 8.0.2.

- Error number: 3595; Symbol: ER_WINDOW_NESTED_WINDOW_FUNC_USE_IN_WINDOW_SPEC; SQLSTATE: HY000
  Message: You cannot nest a window function in the specification of window '%s'.
  ER_WINDOW_NESTED_WINDOW_FUNC_USE_IN_WINDOW_SPEC was added in 8.0.2.

- Error number: 3596; Symbol: ER_WINDOW_ROWS_INTERVAL_USE; SQLSTATE: HY000
  Message: Window '%s': INTERVAL can only be used with RANGE frames.
  ER_WINDOW_ROWS_INTERVAL_USE was added in 8.0.2.

- Error number: 3597; Symbol: ER_WINDOW_NO_GROUP_ORDER; SQLSTATE: HY000
  Message: ASC or DESC with GROUP BY isn't allowed with window functions; put ASC or DESC in ORDER BY
  ER_WINDOW_NO_GROUP_ORDER was added in 8.0.2, removed after 8.0.12.

- Error number: 3597; Symbol: ER_WINDOW_NO_GROUP_ORDER_UNUSED; SQLSTATE: HY000
  Message: ASC or DESC with GROUP BY isn't allowed with window functions; put ASC or DESC in ORDER BY
**Server Error Message Reference**

**ER_WINDOW_NO_GROUP_ORDER_UNUSED** was added in 8.0.13.

- Error number: 3598; Symbol: `ER_WINDOW_EXPLAIN_JSON`; SQLSTATE: HY000
  
  Message: To get information about window functions use `EXPLAIN FORMAT=JSON`.

  **ER_WINDOW_EXPLAIN_JSON** was added in 8.0.2.

- Error number: 3599; Symbol: `ER_WINDOW_FUNCTION_IGNORES_FRAME`; SQLSTATE: HY000
  
  Message: Window function '%s' ignores the frame clause of window '%s' and aggregates over the whole partition.

  **ER_WINDOW_FUNCTION_IGNORES_FRAME** was added in 8.0.2.

- Error number: 3600; Symbol: `ER_WINDOW_SE_NOT_ACCEPTABLE`; SQLSTATE: HY000
  
  Message: Windowing requires `@@internal_tmp_mem_storage_engine=TempTable`.

  **ER_WINDOW_SE_NOT_ACCEPTABLE** was added in 8.0.2, removed after 8.0.3.

- Error number: 3600; Symbol: `ER_WL9236_NOW_UNUSED`; SQLSTATE: HY000
  
  Message: Windowing requires `@@internal_tmp_mem_storage_engine=TempTable`.

  **ER_WL9236_NOW_UNUSED** was added in 8.0.4.

- Error number: 3601; Symbol: `ER_INVALID_NO_OF_ARGS`; SQLSTATE: HY000
  
  Message: Too many arguments for function '%s': %lu; maximum allowed is %s.

  **ER_INVALID_NO_OF_ARGS** was added in 8.0.1.

- Error number: 3602; Symbol: `ER_FIELD_IN_GROUPING_NOT_GROUP_BY`; SQLSTATE: HY000
  
  Message: Argument #%u of GROUPING function is not in GROUP BY.

  **ER_FIELD_IN_GROUPING_NOT_GROUP_BY** was added in 8.0.1.

- Error number: 3603; Symbol: `ER_TOO_LONG_TABLESPACE_COMMENT`; SQLSTATE: HY000
  
  Message: Comment for tablespace '%s' is too long (max = %lu).

  **ER_TOO_LONG_TABLESPACE_COMMENT** was added in 8.0.1.

- Error number: 3604; Symbol: `ER_ENGINE_CANT_DROP_TABLE`; SQLSTATE: HY000
  
  Message: Storage engine can't drop table '%s'.

  **ER_ENGINE_CANT_DROP_TABLE** was added in 8.0.1.

- Error number: 3605; Symbol: `ER_ENGINE_CANT_DROP_MISSING_TABLE`; SQLSTATE: HY000
  
  Message: Storage engine can't drop table '%s' because it is missing. Use DROP TABLE IF EXISTS to remove it from data-dictionary.

  **ER_ENGINE_CANT_DROP_MISSING_TABLE** was added in 8.0.1.

- Error number: 3606; Symbol: `ER_TABLESPACE_DUP_FILENAME`; SQLSTATE: HY000

5158
Message: Duplicate file name for tablespace '%s'

**ER_TABLESPACE_DUP_FILENAME** was added in 8.0.1.

- Error number: 3607; Symbol: **ER_DB_DROP_RMDIR2**; SQLSTATE: **HY000**
  Message: Problem while dropping database. Can't remove database directory (%s). Please remove it manually.

**ER_DB_DROP_RMDIR2** was added in 8.0.1.

- Error number: 3608; Symbol: **ER_IMP_NO_FILES_MATCHED**; SQLSTATE: **HY000**
  Message: No SDI files matched the pattern '%s'

**ER_IMP_NO_FILES_MATCHED** was added in 8.0.1.

- Error number: 3609; Symbol: **ER_IMP_SCHEMA_DOES_NOT_EXIST**; SQLSTATE: **HY000**
  Message: Schema '%s', referenced in SDI, does not exist.

**ER_IMP_SCHEMA_DOES_NOT_EXIST** was added in 8.0.1.

- Error number: 3610; Symbol: **ER_IMP_TABLE_ALREADY_EXISTS**; SQLSTATE: **HY000**
  Message: Table '%s.%s', referenced in SDI, already exists.

**ER_IMP_TABLE_ALREADY_EXISTS** was added in 8.0.1.

- Error number: 3611; Symbol: **ER_IMP_INCOMPATIBLE_MYSQLD_VERSION**; SQLSTATE: **HY000**
  Message: Imported mysqld_version (%llu) is not compatible with current (%llu)

**ER_IMP_INCOMPATIBLE_MYSQLD_VERSION** was added in 8.0.1.

- Error number: 3612; Symbol: **ER_IMP_INCOMPATIBLE_DD_VERSION**; SQLSTATE: **HY000**
  Message: Imported dd version (%u) is not compatible with current (%u)

**ER_IMP_INCOMPATIBLE_DD_VERSION** was added in 8.0.1.

- Error number: 3613; Symbol: **ER_IMP_INCOMPATIBLE SDI_VERSION**; SQLSTATE: **HY000**
  Message: Imported sdi version (%llu) is not compatible with current (%llu)

**ER_IMP_INCOMPATIBLE_SDIVERSION** was added in 8.0.1.

- Error number: 3614; Symbol: **ER_WARN_INVALID_HINT**; SQLSTATE: **HY000**
  Message: Invalid number of arguments for hint %s

**ER_WARN_INVALID_HINT** was added in 8.0.1.

- Error number: 3615; Symbol: **ER_VAR_DOES_NOT_EXIST**; SQLSTATE: **HY000**
  Message: Variable %s does not exist in persisted config file

**ER_VAR_DOES_NOT_EXIST** was added in 8.0.1.
• Error number: 3616; Symbol: ER_LONGITUDE_OUT_OF_RANGE; SQLSTATE: 22S02
Message: Longitude %f is out of range in function %s. It must be within (%f, %f].
ER_LONGITUDE_OUT_OF_RANGE was added in 8.0.1.

• Error number: 3617; Symbol: ER_LATITUDE_OUT_OF_RANGE; SQLSTATE: 22S03
Message: Latitude %f is out of range in function %s. It must be within [%f, %f].
ER_LATITUDE_OUT_OF_RANGE was added in 8.0.1.

• Error number: 3618; Symbol: ER_NOT_IMPLEMENTED_FOR_GEOGRAPHIC_SRS; SQLSTATE: 22S00
Message: %s(%s) has not been implemented for geographic spatial reference systems.
ER_NOT_IMPLEMENTED_FOR_GEOGRAPHIC_SRS was added in 8.0.1.

• Error number: 3619; Symbol: ER_ILLEGAL_PRIVILEGE_LEVEL; SQLSTATE: HY000
Message: Illegal privilege level specified for %s
ER_ILLEGAL_PRIVILEGE_LEVEL was added in 8.0.1.

• Error number: 3620; Symbol: ER_NO_SYSTEM_VIEW_ACCESS; SQLSTATE: HY000
Message: Access to system view INFORMATION_SCHEMA.'%s' is rejected.
ER_NO_SYSTEM_VIEW_ACCESS was added in 8.0.2.

• Error number: 3621; Symbol: ER_COMPONENT_FILTER_FLABBERGASTED; SQLSTATE: HY000
Message: The log-filter component "%s" got confused at "%s" ...
ER_COMPONENT_FILTER_FLABBERGASTED was added in 8.0.2.

• Error number: 3622; Symbol: ER_PART_EXPR_TOO_LONG; SQLSTATE: HY000
Message: Partitioning expression is too long.
ER_PART_EXPR_TOO_LONG was added in 8.0.2.

• Error number: 3623; Symbol: ER_UDF_DROP_DYNAMICALLY_REGISTERED; SQLSTATE: HY000
Message: DROP FUNCTION can't drop a dynamically registered user defined function
ER_UDF_DROP_DYNAMICALLY_REGISTERED was added in 8.0.2.

• Error number: 3624; Symbol: ER_UNABLE_TO_STORE_COLUMN_STATISTICS; SQLSTATE: HY000
Message: Unable to store column statistics for column '%s' in table '%s'. %s
ER_UNABLE_TO_STORE_COLUMN_STATISTICS was added in 8.0.2.

• Error number: 3625; Symbol: ER_UNABLE_TO_UPDATE_COLUMN_STATISTICS; SQLSTATE: HY000
Message: Unable to update column statistics for column '%s' in table '%s'. %s
ER_UNABLE_TO_UPDATE_COLUMN_STATISTICS was added in 8.0.2.
• Error number: 3626; Symbol: **ER_UNABLE_TO_DROP_COLUMN_STATISTICS**; SQLSTATE: **HY000**
  Message: Unable to remove column statistics for column '%s' in table '%s'.
  **ER_UNABLE_TO_DROP_COLUMN_STATISTICS** was added in 8.0.2.

• Error number: 3627; Symbol: **ER_UNABLE_TO_BUILD_HISTOGRAM**; SQLSTATE: **HY000**
  Message: Unable to build histogram statistics for column '%s' in table '%s'.
  **ER_UNABLE_TO_BUILD_HISTOGRAM** was added in 8.0.2.

• Error number: 3628; Symbol: **ER_MANDATORY_ROLE**; SQLSTATE: **HY000**
  Message: The role %s is a mandatory role and can't be revoked or dropped. The restriction can be lifted by excluding the role identifier from the global variable mandatory_roles.
  **ER_MANDATORY_ROLE** was added in 8.0.2.

• Error number: 3629; Symbol: **ER_MISSING_TABLESPACE_FILE**; SQLSTATE: **HY000**
  Message: Tablespace '%s' does not have a file named '%s'.
  **ER_MISSING_TABLESPACE_FILE** was added in 8.0.3.

• Error number: 3630; Symbol: **ER_PERSIST_ONLY_ACCESS_DENIED_ERROR**; SQLSTATE: **42000**
  Message: Access denied; you need %s privileges for this operation.
  **ER_PERSIST_ONLY_ACCESS_DENIED_ERROR** was added in 8.0.3.

• Error number: 3631; Symbol: **ER_CMD_NEED_SUPER**; SQLSTATE: **HY000**
  Message: You need the SUPER privilege for command '%s'.
  **ER_CMD_NEED_SUPER** was added in 8.0.3.

• Error number: 3632; Symbol: **ER_PATH_IN_DATADIR**; SQLSTATE: **HY000**
  Message: Path is within the current data directory '%s'.
  **ER_PATH_IN_DATADIR** was added in 8.0.3.

• Error number: 3633; Symbol: **ER_DDL_IN_PROGRESS**; SQLSTATE: **HY000**
  Message: Concurrent DDL is performed during the operation. Please try again.
  **ER_DDL_IN_PROGRESS** was added in 8.0.3, removed after 8.0.16.

• Error number: 3633; Symbol: **ER_CLONE_DDL_IN_PROGRESS**; SQLSTATE: **HY000**
  Message: Concurrent DDL is performed during clone operation. Please try again.
  **ER_CLONE_DDL_IN_PROGRESS** was added in 8.0.17.

• Error number: 3634; Symbol: **ER_TOO_MANY_CONCURRENT_CLONES**; SQLSTATE: **HY000**
  Message: Too many concurrent clone operations. Maximum allowed - %d.
  **ER_TOO_MANY_CONCURRENT_CLONES** was added in 8.0.3, removed after 8.0.16.
- **Error number: 3634; Symbol: ER_CLONE_TOO_MANY_CONCURRENT_CLONES; SQLSTATE: HY000**
  Message: Too many concurrent clone operations. Maximum allowed - %d.
  ER_CLONE_TOO_MANY_CONCURRENT_CLONES was added in 8.0.17.

- **Error number: 3635; Symbol: ER_APPLIER_LOG_EVENT_VALIDATION_ERROR; SQLSTATE: HY000**
  Message: The table in transaction %s does not comply with the requirements by an external plugin.
  ER_APPLIER_LOG_EVENT_VALIDATION_ERROR was added in 8.0.3.

- **Error number: 3636; Symbol: ER_CTE_MAX_RECURSION_DEPTH; SQLSTATE: HY000**
  Message: Recursive query aborted after %u iterations. Try increasing @@cte_max_recursion_depth to a larger value.
  ER_CTE_MAX_RECURSION_DEPTH was added in 8.0.3.

- **Error number: 3637; Symbol: ER_NOT_HINT_UPDATABLE_VARIABLE; SQLSTATE: HY000**
  Message: Variable %s cannot be set using SET_VAR hint.
  ER_NOT_HINT_UPDATABLE_VARIABLE was added in 8.0.3.

- **Error number: 3638; Symbol: ER_CREDENTIALS_CONTRADICT_TO_HISTORY; SQLSTATE: HY000**
  Message: Cannot use these credentials for '%s@%s' because they contradict the password history policy
  ER_CREDENTIALS_CONTRADICT_TO_HISTORY was added in 8.0.3.

- **Error number: 3639; Symbol: ER_WARNING_PASSWORD_HISTORY_CLAUSES_VOID; SQLSTATE: HY000**
  Message: Non-zero password history clauses ignored for user '%s'@'%s' as its authentication plugin %s does not support password history
  ER_WARNING_PASSWORD_HISTORY_CLAUSES_VOID was added in 8.0.3.

- **Error number: 3640; Symbol: ER_CLIENT_DOES_NOT_SUPPORT; SQLSTATE: HY000**
  Message: The client doesn't support %s
  ER_CLIENT_DOES_NOT_SUPPORT was added in 8.0.3.

- **Error number: 3641; Symbol: ER_I_S_SKIPPED_TABLESPACE; SQLSTATE: HY000**
  Message: Tablespace '%s' was skipped since its definition is being modified by concurrent DDL statement
  ER_I_S_SKIPPED_TABLESPACE was added in 8.0.3.

- **Error number: 3642; Symbol: ER_TABLESPACE_ENGINE_MISMATCH; SQLSTATE: HY000**
  Message: Engine '%s' does not match stored engine '%s' for tablespace '%s'
  ER_TABLESPACE_ENGINE_MISMATCH was added in 8.0.3.

- **Error number: 3643; Symbol: ER_WRONG_SRID_FOR_COLUMN; SQLSTATE: HY000**
Message: The SRID of the geometry does not match the SRID of the column '%s'. The SRID of the geometry is %lu, but the SRID of the column is %lu. Consider changing the SRID of the geometry or the SRID property of the column.

`ER_WRONG_SRID_FOR_COLUMN` was added in 8.0.3.

- Error number: 3644; Symbol: `ER_CANNOT_ALTER_SRID_DUE_TO_INDEX`; SQLSTATE: HY000
  Message: The SRID specification on the column '%s' cannot be changed because there is a spatial index on the column. Please remove the spatial index before altering the SRID specification.

`ER_CANNOT_ALTER_SRID_DUE_TO_INDEX` was added in 8.0.3.

- Error number: 3645; Symbol: `ER_WARN_BINLOG_PARTIAL_UPDATES_DISABLED`; SQLSTATE: HY000
  Message: When %s, the option binlog_row_value_options=%s will be ignored and updates will be written in full format to binary log.

`ER_WARN_BINLOG_PARTIAL_UPDATES_DISABLED` was added in 8.0.3.

- Error number: 3646; Symbol: `ER_WARN_BINLOG_V1_ROW_EVENTS_DISABLED`; SQLSTATE: HY000
  Message: When %s, the option log_bin_use_v1_row_events=1 will be ignored and row events will be written in new format to binary log.

`ER_WARN_BINLOG_V1_ROW_EVENTS_DISABLED` was added in 8.0.3.

- Error number: 3647; Symbol: `ER_WARN_BINLOG_PARTIAL_UPDATES_SUGGESTS_PARTIAL_IMAGES`; SQLSTATE: HY000
  Message: When %s, the option binlog_row_value_options=%s will be used only for the after-image. Full values will be written in the before-image, so the saving in disk space due to binlog_row_value_options is limited to less than 50%.

`ER_WARN_BINLOG_PARTIAL_UPDATES_SUGGESTS_PARTIAL_IMAGES` was added in 8.0.3.

- Error number: 3648; Symbol: `ER_COULD_NOT_APPLY_JSON_DIFF`; SQLSTATE: HY000
  Message: Could not apply JSON diff in table %.s, column %s.

`ER_COULD_NOT_APPLY_JSON_DIFF` was added in 8.0.3.

- Error number: 3649; Symbol: `ER_CORRUPTED_JSON_DIFF`; SQLSTATE: HY000
  Message: Corrupted JSON diff for table %.s, column %s.

`ER_CORRUPTED_JSON_DIFF` was added in 8.0.3.

- Error number: 3650; Symbol: `ER_RESOURCE_GROUP_EXISTS`; SQLSTATE: HY000
  Message: Resource Group '%s' exists

`ER_RESOURCE_GROUP_EXISTS` was added in 8.0.3.

- Error number: 3651; Symbol: `ER_RESOURCE_GROUP_NOT_EXISTS`; SQLSTATE: HY000
  Message: Resource Group '%s' does not exist.
ERRESOURCE_GROUP_NOT_EXISTS was added in 8.0.3.

- Error number: 3652; Symbol: ER_INVALID_VCPU_ID; SQLSTATE: HY000
  Message: Invalid cpu id %u
  ER_INVALID_VCPU_ID was added in 8.0.3.

- Error number: 3653; Symbol: ER_INVALID_VCPU_RANGE; SQLSTATE: HY000
  Message: Invalid VCPU range %u-%u
  ER_INVALID_VCPU_RANGE was added in 8.0.3.

- Error number: 3654; Symbol: ER_INVALID_THREAD_PRIORITY; SQLSTATE: HY000
  Message: Invalid thread priority value %d for %s resource group %s. Allowed range is [%d, %d].
  ER_INVALID_THREAD_PRIORITY was added in 8.0.3.

- Error number: 3655; Symbol: ER_DISALLOWED_OPERATION; SQLSTATE: HY000
  Message: %s operation is disallowed on %s
  ER_DISALLOWED_OPERATION was added in 8.0.3.

- Error number: 3656; Symbol: ER_RESOURCE_GROUP_BUSY; SQLSTATE: HY000
  Message: Resource group %s is busy.
  ER_RESOURCE_GROUP_BUSY was added in 8.0.3.

- Error number: 3657; Symbol: ER_RESOURCE_GROUP_DISABLED; SQLSTATE: HY000
  Message: Resource group %s is disabled.
  ER_RESOURCE_GROUP_DISABLED was added in 8.0.3.

- Error number: 3658; Symbol: ER_FEATURE_UNSUPPORTED; SQLSTATE: HY000
  Message: Feature %s is unsupported (%s).
  ER_FEATURE_UNSUPPORTED was added in 8.0.3.

- Error number: 3659; Symbol: ER_ATTRIBUTE_IGNORED; SQLSTATE: HY000
  Message: Attribute %s is ignored (%s).
  ER_ATTRIBUTE_IGNORED was added in 8.0.3.

- Error number: 3660; Symbol: ER_INVALID_THREAD_ID; SQLSTATE: HY000
  Message: Invalid thread id (%llu).
  ER_INVALID_THREAD_ID was added in 8.0.3.

- Error number: 3661; Symbol: ER_RESOURCE_GROUP_BIND_FAILED; SQLSTATE: HY000
  Message: Unable to bind resource group %s with thread id (%llu),(%s).
**ER_RESOURCE_GROUP_BIND_FAILED** was added in 8.0.3.

- Error number: 3662; Symbol: **ER_INVALID_USE_OF_FORCE_OPTION**; SQLSTATE: **HY000**
  Message: Option FORCE invalid as DISABLE option is not specified.

**ER_INVALID_USE_OF_FORCE_OPTION** was added in 8.0.3.

- Error number: 3663; Symbol: **ER_GROUP_REPLICATION_COMMAND_FAILURE**; SQLSTATE: **HY000**
  Message: The %s command encountered a failure. %s

**ER_GROUP_REPLICATION_COMMAND_FAILURE** was added in 8.0.4.

- Error number: 3664; Symbol: **ER_SDI_OPERATION_FAILED**; SQLSTATE: **HY000**
  Message: Failed to %s SDI '%s.%s' in tablespace '%s'.

**ER_SDI_OPERATION_FAILED** was added in 8.0.3.

- Error number: 3665; Symbol: **ER_MISSING_JSON_TABLE_VALUE**; SQLSTATE: **22035**
  Message: Missing value for JSON_TABLE column '%s'

**ER_MISSING_JSON_TABLE_VALUE** was added in 8.0.4.

- Error number: 3666; Symbol: **ER_WRONG_JSON_TABLE_VALUE**; SQLSTATE: **2203F**
  Message: Can't store an array or an object in the scalar JSON_TABLE column '%s'

**ER_WRONG_JSON_TABLE_VALUE** was added in 8.0.4.

- Error number: 3667; Symbol: **ER_TF_MUST_HAVE_ALIAS**; SQLSTATE: **42000**
  Message: Every table function must have an alias

**ER_TF_MUST_HAVE_ALIAS** was added in 8.0.4.

- Error number: 3668; Symbol: **ER_TF_FORBIDDEN_JOIN_TYPE**; SQLSTATE: **HY000**
  Message: INNER or LEFT JOIN must be used for LATERAL references made by '%s'

**ER_TF_FORBIDDEN_JOIN_TYPE** was added in 8.0.4.

- Error number: 3669; Symbol: **ER_JT_VALUE_OUT_OF_RANGE**; SQLSTATE: **22003**
  Message: Value is out of range for JSON_TABLE's column '%s'

**ER_JT_VALUE_OUT_OF_RANGE** was added in 8.0.4.

- Error number: 3670; Symbol: **ER_JT_MAX_NESTED_PATH**; SQLSTATE: **42000**
  Message: More than supported %u NESTED PATHs were found in JSON_TABLE '%s'

**ER_JT_MAX_NESTED_PATH** was added in 8.0.4.

- Error number: 3671; Symbol: **ER_PASSWORD_EXPIRATION_NOT_SUPPORTED_BY_AUTH_METHOD**; SQLSTATE: **HY000**
Server Error Message Reference

Message: The selected authentication method %s does not support password expiration
ER_PASSWORD_EXPIRATION_NOT_SUPPORTED_BY_AUTH_METHOD was added in 8.0.4.

• Error number: 3672; Symbol: ER_INVALID_GEOJSON_CRS_NOT_TOP_LEVEL; SQLSTATE: HY000
Message: Invalid GeoJSON data provided to function %s: Member 'crs' must be specified in the top level object.
ER_INVALID_GEOJSON_CRS_NOT_TOP_LEVEL was added in 8.0.4.

• Error number: 3673; Symbol: ER_BAD_NULL_ERROR_NOT_IGNORED; SQLSTATE: 23000
Message: Column %s cannot be null
ER_BAD_NULL_ERROR_NOT_IGNORED was added in 8.0.4.

• Error number: 3674; Symbol: WARN_USELESS_SPATIAL_INDEX; SQLSTATE: HY000
Message: The spatial index on column %s will not be used by the query optimizer since the column does not have an SRID attribute. Consider adding an SRID attribute to the column.
WARN_USELESS_SPATIAL_INDEX was added in 8.0.4.

• Error number: 3675; Symbol: ER_DISK_FULL_NOWAIT; SQLSTATE: HY000
Message: Create table/tablespace %s failed, as disk is full
ER_DISK_FULL_NOWAIT was added in 8.0.4.

• Error number: 3676; Symbol: ER_PARSE_ERROR_IN_DIGEST_FN; SQLSTATE: HY000
Message: Could not parse argument to digest function: "%s".
ER_PARSE_ERROR_IN_DIGEST_FN was added in 8.0.4.

• Error number: 3677; Symbol: ER_UNDISCLOSED_PARSE_ERROR_IN_DIGEST_FN; SQLSTATE: HY000
Message: Could not parse argument to digest function.
ER_UNDISCLOSED_PARSE_ERROR_IN_DIGEST_FN was added in 8.0.4.

• Error number: 3678; Symbol: ER_SCHEMA_DIR_EXISTS; SQLSTATE: HY000
Message: Schema directory %s already exists. This must be resolved manually (e.g. by moving the schema directory to another location).
ER_SCHEMA_DIR_EXISTS was added in 8.0.4.

• Error number: 3679; Symbol: ER_SCHEMA_DIR_MISSING; SQLSTATE: HY000
Message: Schema directory %s does not exist
ER_SCHEMA_DIR_MISSING was added in 8.0.4.

• Error number: 3680; Symbol: ER_SCHEMA_DIR_CREATE_FAILED; SQLSTATE: HY000
Message: Failed to create schema directory %s (errno: %d - %s)
ER_SCHEMA_DIR_CREATE_FAILED was added in 8.0.4.

- Error number: 3681; Symbol: ER_SCHEMA_DIR_UNKNOWN; SQLSTATE: HY000
  Message: Schema '%s' does not exist, but schema directory '%s' was found. This must be resolved manually (e.g. by moving the schema directory to another location).

ER_SCHEMA_DIR_UNKNOWN was added in 8.0.4.

- Error number: 3682; Symbol: ER_ONLY_IMPLEMENTED_FOR_SRID_0_AND_4326; SQLSTATE: 22S00
  Message: Function %s is only defined for SRID 0 and SRID 4326.

ER_ONLY_IMPLEMENTED_FOR_SRID_0_AND_4326 was added in 8.0.4.

- Error number: 3683; Symbol: ER_BINLOG_EXPIRE_LOG_DAYS_AND_SECS_USED_TOGETHER; SQLSTATE: HY000
  Message: The option expire_logs_days and binlog_expire_logs_seconds cannot be used together. Please use binlog_expire_logs_seconds to set the expire time (expire_logs_days is deprecated)

ER_BINLOG_EXPIRE_LOG_DAYS_AND_SECS_USED_TOGETHER was added in 8.0.11.

- Error number: 3684; Symbol: ER_REGEXP_STRING_NOT_TERMINATED; SQLSTATE: HY000
  Message: An output string could not be zero-terminated because the length exceeds the buffer capacity.

ER_REGEXP_STRING_NOT_TERMINATED was added in 8.0.4, removed after 8.0.4.

- Error number: 3684; Symbol: ER_REGEXP_BUFFER_OVERFLOW; SQLSTATE: HY000
  Message: The result string is larger than the result buffer.

ER_REGEXP_BUFFER_OVERFLOW was added in 8.0.4.

- Error number: 3685; Symbol: ER_REGEXP_ILLEGAL_ARGUMENT; SQLSTATE: HY000
  Message: Illegal argument to a regular expression.

ER_REGEXP_ILLEGAL_ARGUMENT was added in 8.0.4.

- Error number: 3686; Symbol: ER_REGEXP_INDEX_OUTOFBOUNDS_ERROR; SQLSTATE: HY000
  Message: Index out of bounds in regular expression search.

ER_REGEXP_INDEX_OUTOFBOUNDS_ERROR was added in 8.0.4.

- Error number: 3687; Symbol: ER_REGEXP_INTERNAL_ERROR; SQLSTATE: HY000
  Message: Internal error in the regular expression library.

ER_REGEXP_INTERNAL_ERROR was added in 8.0.4.

- Error number: 3688; Symbol: ER_REGEXP_RULE_SYNTAX; SQLSTATE: HY000
  Message: Syntax error in regular expression on line %u, character %u.

ER_REGEXP_RULE_SYNTAX was added in 8.0.4.
• Error number: 3689; Symbol: ER_REGEXP_BAD_ESCAPE_SEQUENCE; SQLSTATE: HY000
  Message: Unrecognized escape sequence in regular expression.
  \textbf{ER\_REGEXP\_BAD\_ESCAPE\_SEQUENCE} was added in 8.0.4.

• Error number: 3690; Symbol: ER_REGEXP_UNIMPLEMENTED; SQLSTATE: HY000
  Message: The regular expression contains a feature that is not implemented in this library version.
  \textbf{ER\_REGEXP\_UNIMPLEMENTED} was added in 8.0.4.

• Error number: 3691; Symbol: ER_REGEXP_MISMATCHED_PAREN; SQLSTATE: HY000
  Message: Mismatched parenthesis in regular expression.
  \textbf{ER\_REGEXP\_MISMATCHED\_PAREN} was added in 8.0.4.

• Error number: 3692; Symbol: ER_REGEXP_BAD_INTERVAL; SQLSTATE: HY000
  Message: Incorrect description of a \{min,max\} interval.
  \textbf{ER\_REGEXP\_BAD\_INTERVAL} was added in 8.0.4.

• Error number: 3693; Symbol: ER_REGEXP_MAX_LT_MIN; SQLSTATE: HY000
  Message: The maximum is less than the minimum in a \{min,max\} interval.
  \textbf{ER\_REGEXP\_MAX\_LT\_MIN} was added in 8.0.4.

• Error number: 3694; Symbol: ER_REGEXP_INVALID_BACK_REF; SQLSTATE: HY000
  Message: Invalid back-reference in regular expression.
  \textbf{ER\_REGEXP\_INVALID\_BACK\_REF} was added in 8.0.4.

• Error number: 3695; Symbol: ER_REGEXP_LOOK_BEHIND_LIMIT; SQLSTATE: HY000
  Message: The look-behind assertion exceeds the limit in regular expression.
  \textbf{ER\_REGEXP\_LOOK\_BEHIND\_LIMIT} was added in 8.0.4.

• Error number: 3696; Symbol: ER_REGEXP_MISSING_CLOSE_BRACKET; SQLSTATE: HY000
  Message: The regular expression contains an unclosed bracket expression.
  \textbf{ER\_REGEXP\_MISSING\_CLOSE\_BRACKET} was added in 8.0.4.

• Error number: 3697; Symbol: ER_REGEXP_INVALID_RANGE; SQLSTATE: HY000
  Message: The regular expression contains an \[x-y\] character range where x comes after y.
  \textbf{ER\_REGEXP\_INVALID\_RANGE} was added in 8.0.4.

• Error number: 3698; Symbol: ER_REGEXP_STACK_OVERFLOW; SQLSTATE: HY000
  Message: Overflow in the regular expression backtrack stack.
  \textbf{ER\_REGEXP\_STACK\_OVERFLOW} was added in 8.0.4.
Server Error Message Reference

- **Error number: 3699; Symbol: ER_REGEXP_TIME_OUT; SQLSTATE: HY000**
  Message: Timeout exceeded in regular expression match.
  
  `ER_REGEXP_TIME_OUT` was added in 8.0.4.

- **Error number: 3700; Symbol: ER_REGEXP_PATTERN_TOO_BIG; SQLSTATE: HY000**
  Message: The regular expression pattern exceeds limits on size or complexity.
  
  `ER_REGEXP_PATTERN_TOO_BIG` was added in 8.0.4.

- **Error number: 3701; Symbol: ER_CANT_SET_ERROR_LOG_SERVICE; SQLSTATE: HY000**
  Message: Value for %s got confusing at or around "%s". Syntax may be wrong, component may not be INSTALLed, or a component that does not support instances may be listed more than once.
  
  `ER_CANT_SET_ERROR_LOG_SERVICE` was added in 8.0.4.

- **Error number: 3702; Symbol: ER_EMPTY_PIPELINE_FOR_ERROR_LOG_SERVICE; SQLSTATE: HY000**
  Message: Setting an empty %s pipeline disables error logging!
  
  `ER_EMPTY_PIPELINE_FOR_ERROR_LOG_SERVICE` was added in 8.0.4.

- **Error number: 3703; Symbol: ER_COMPONENT_FILTER_DIAGNOSTICS; SQLSTATE: HY000**
  Message: filter %s: %s
  
  `ER_COMPONENT_FILTER_DIAGNOSTICS` was added in 8.0.4.

- **Error number: 3704; Symbol: ER_INNODB_CANNOT_BE_IGNORED; SQLSTATE: HY000**
  Message: ignore-built-ininnodb is ignored and will be removed in future releases.
  
  `ER_INNODB_CANNOT_BE_IGNORED` was added in 8.0.2, removed after 8.0.2.

- **Error number: 3704; Symbol: ER_NOT_IMPLEMENTED_FOR_CARTESIAN_SRS; SQLSTATE: 22S00**
  Message: %s(%s) has not been implemented for Cartesian spatial reference systems.
  
  `ER_NOT_IMPLEMENTED_FOR_CARTESIAN_SRS` was added in 8.0.4.

- **Error number: 3705; Symbol: ER_NOT_IMPLEMENTED_FOR_PROJECTED_SRS; SQLSTATE: 22S00**
  Message: %s(%s) has not been implemented for projected spatial reference systems.
  
  `ER_NOT_IMPLEMENTED_FOR_PROJECTED_SRS` was added in 8.0.4.

- **Error number: 3706; Symbol: ER_NONPOSITIVE_RADIUS; SQLSTATE: 22003**
  Message: Invalid radius provided to function %s: Radius must be greater than zero.
  
  `ER_NONPOSITIVE_RADIUS` was added in 8.0.4.

- **Error number: 3707; Symbol: ER_RESTART_SERVER_FAILED; SQLSTATE: HY000**
  Message: Restart server failed (%s).
ER_RESTART_SERVER_FAILED was added in 8.0.4.

- Error number: 3708; Symbol: ER_SRS_MISSING_MANDATORY_ATTRIBUTE; SQLSTATE: SR006
  Message: Missing mandatory attribute %s.
  ER_SRS_MISSING_MANDATORY_ATTRIBUTE was added in 8.0.4.

- Error number: 3709; Symbol: ER_SRS_MULTIPLE_ATTRIBUTE_DEFINITIONS; SQLSTATE: SR006
  Message: Multiple definitions of attribute %s.
  ER_SRS_MULTIPLE_ATTRIBUTE_DEFINITIONS was added in 8.0.4.

- Error number: 3710; Symbol: ER_SRS_NAME_CANT_BE_EMPTY_OR_WHITESPACE; SQLSTATE: SR006
  Message: The spatial reference system name can't be an empty string or start or end with whitespace.
  ER_SRS_NAME_CANT_BE_EMPTY_OR_WHITESPACE was added in 8.0.4.

- Error number: 3711; Symbol: ER_SRS_ORGANIZATION_CANT_BE_EMPTY_OR_WHITESPACE; SQLSTATE: SR006
  Message: The organization name can't be an empty string or start or end with whitespace.
  ER_SRS_ORGANIZATION_CANT_BE_EMPTY_OR_WHITESPACE was added in 8.0.4.

- Error number: 3712; Symbol: ER_SRS_ID_ALREADY_EXISTS; SQLSTATE: SR004
  Message: There is already a spatial reference system with SRID %u.
  ER_SRS_ID_ALREADY_EXISTS was added in 8.0.4.

- Error number: 3713; Symbol: ER_WARN_SRS_ID_ALREADY_EXISTS; SQLSTATE: 01S00
  Message: There is already a spatial reference system with SRID %u.
  ER_WARN_SRS_ID_ALREADY_EXISTS was added in 8.0.4.

- Error number: 3714; Symbol: ER_CANT_MODIFY_SRID_0; SQLSTATE: SR000
  Message: SRID 0 is not modifiable.
  ER_CANT_MODIFY_SRID_0 was added in 8.0.4.

- Error number: 3715; Symbol: ER_WARN_RESERVED_SRID_RANGE; SQLSTATE: 01S01
  Message: The SRID range [%u, %u] has been reserved for system use. SRSs in this range may be added, modified or removed without warning during upgrade.
  ER_WARN_RESERVED_SRID_RANGE was added in 8.0.4.

- Error number: 3716; Symbol: ER_CANT_MODIFY_SRS_USED_BY_COLUMN; SQLSTATE: SR005
  Message: Can't modify SRID %u. There is at least one column depending on it.
  ER_CANT_MODIFY_SRS_USED_BY_COLUMN was added in 8.0.4.
• Error number: 3717; Symbol: ER_SRS_INVALID_CHARACTER_IN_ATTRIBUTE; SQLSTATE: SR006
  Message: Invalid character in attribute %s.
  ER_SRS_INVALID_CHARACTER_IN_ATTRIBUTE was added in 8.0.4.
• Error number: 3718; Symbol: ER_SRS_ATTRIBUTE_STRING_TOO_LONG; SQLSTATE: SR006
  Message: Attribute %s is too long. The maximum length is %u characters.
  ER_SRS_ATTRIBUTE_STRING_TOO_LONG was added in 8.0.4.
• Error number: 3719; Symbol: ER_DEPRECATED_UTF8_ALIAS; SQLSTATE: HY000
  Message: 'utf8' is currently an alias for the character set UTF8MB3, but will be an alias for UTF8MB4 in a future release. Please consider using UTF8MB4 in order to be unambiguous.
  ER_DEPRECATED_UTF8_ALIAS was added in 8.0.11.
• Error number: 3720; Symbol: ER_DEPRECATED_NATIONAL; SQLSTATE: HY000
  Message: NATIONAL/NCHAR/NVARCHAR implies the character set UTF8MB3, which will be replaced by UTF8MB4 in a future release. Please consider using CHAR(x) CHARACTER SET UTF8MB4 in order to be unambiguous.
  ER_DEPRECATED_NATIONAL was added in 8.0.11.
• Error number: 3721; Symbol: ER_INVALID_DEFAULT_UTF8MB4_COLLATION; SQLSTATE: HY000
  Message: Invalid default collation %s: utf8mb4_0900_ai_ci or utf8mb4_general_ci expected
  ER_INVALID_DEFAULT_UTF8MB4_COLLATION was added in 8.0.11.
• Error number: 3722; Symbol: ER_UNABLE_TO_COLLECT_LOG_STATUS; SQLSTATE: HY000
  Message: Unable to collect information for column '%s': %s.
  ER_UNABLE_TO_COLLECT_LOG_STATUS was added in 8.0.11.
• Error number: 3723; Symbol: ER_RESERVED_TABLESPACE_NAME; SQLSTATE: HY000
  Message: The table '%s' may not be created in the reserved tablespace '%s'.
  ER_RESERVED_TABLESPACE_NAME was added in 8.0.11.
• Error number: 3724; Symbol: ER_UNABLE_TO_SET_OPTION; SQLSTATE: HY000
  Message: This option cannot be set %s.
  ER_UNABLE_TO_SET_OPTION was added in 8.0.11.
• Error number: 3725; Symbol: ER_SLAVE_POSSIBLY_DIVERGED_AFTER_DDL; SQLSTATE: HY000
  Message: A commit for an atomic DDL statement was unsuccessful on the master and the slave. The slave supports atomic DDL statements but the master does not, so the action taken by the slave and master might differ. Check that their states have not diverged before proceeding.
  ER_SLAVE_POSSIBLY_DIVERGED_AFTER_DDL was added in 8.0.11.
• Error number: 3726; Symbol: ER_SRS_NOT_GEOGRAPHIC; SQLSTATE: 22S00
Message: Function %s is only defined for geographic spatial reference systems, but one of its arguments is in SRID %u, which is not geographic.

ER_SRS_NOT_GEOGRAPHIC was added in 8.0.12.

- Error number: 3727; Symbol: ER_POLYGON_TOO_LARGE; SQLSTATE: 22023

Message: Function %s encountered a polygon that was too large. Polygons must cover less than half the planet.

ER_POLYGON_TOO_LARGE was added in 8.0.12.

- Error number: 3728; Symbol: ER_SPATIAL_UNIQUE_INDEX; SQLSTATE: HY000

Message: Spatial indexes can't be primary or unique indexes.

ER_SPATIAL_UNIQUE_INDEX was added in 8.0.12.

- Error number: 3729; Symbol: ER_INDEX_TYPE_NOT_SUPPORTED_FOR_SPATIAL_INDEX; SQLSTATE: HY000

Message: The index type %s is not supported for spatial indexes.

ER_INDEX_TYPE_NOT_SUPPORTED_FOR_SPATIAL_INDEX was added in 8.0.12.

- Error number: 3730; Symbol: ER_FK_CANNOT_DROP_PARENT; SQLSTATE: HY000

Message: Cannot drop table '%s' referenced by a foreign key constraint '%s' on table '%s'.

ER_FK_CANNOT_DROP_PARENT was added in 8.0.12.

- Error number: 3731; Symbol: ER_GEOMETRY_PARAM_LONGITUDE_OUT_OF_RANGE; SQLSTATE: 22S02

Message: A parameter of function %s contains a geometry with longitude %f, which is out of range. It must be within (%f, %f].

ER_GEOMETRY_PARAM_LONGITUDE_OUT_OF_RANGE was added in 8.0.12.

- Error number: 3732; Symbol: ER_GEOMETRY_PARAM_LATITUDE_OUT_OF_RANGE; SQLSTATE: 22S03

Message: A parameter of function %s contains a geometry with latitude %f, which is out of range. It must be within [%f, %f].

ER_GEOMETRY_PARAM_LATITUDE_OUT_OF_RANGE was added in 8.0.12.

- Error number: 3733; Symbol: ER_FK_CANNOT_USE_VIRTUAL_COLUMN; SQLSTATE: HY000

Message: Foreign key '%s' uses virtual column '%s' which is not supported.

ER_FK_CANNOT_USE_VIRTUAL_COLUMN was added in 8.0.12.
• Error number: 3734; Symbol: ER_FK_NO_COLUMN_PARENT; SQLSTATE: HY000
Message: Failed to add the foreign key constraint. Missing column ‘%s’ for constraint ‘%s’ in the referenced table ‘%s’

ER_FK_NO_COLUMN_PARENT was added in 8.0.12.

• Error number: 3735; Symbol: ER_CANT_SET_ERROR_SUPPRESSION_LIST; SQLSTATE: HY000
Message: %s: Could not add suppression rule for code "%s". Rule-set may be full, or code may not correspond to an error-log message.

ER_CANT_SET_ERROR_SUPPRESSION_LIST was added in 8.0.13.

• Error number: 3736; Symbol: ER_SRS_GEOGCS_INVALID_AXES; SQLSTATE: SR002
Message: The spatial reference system definition for SRID %u specifies invalid geographic axes ‘%s’ and ‘%s’. One axis must be NORTH or SOUTH and the other must be EAST or WEST.

ER_SRS_GEOGCS_INVALID_AXES was added in 8.0.13.

• Error number: 3737; Symbol: ER_SRS_INVALID_SEMI_MAJOR_AXIS; SQLSTATE: SR002
Message: The length of the semi-major axis must be a positive number.

ER_SRS_INVALID_SEMI_MAJOR_AXIS was added in 8.0.13.

• Error number: 3738; Symbol: ER_SRS_INVALID_INVERSE_FLATTENING; SQLSTATE: SR002
Message: The inverse flattening must be larger than 1.0, or 0.0 if the ellipsoid is a sphere.

ER_SRS_INVALID_INVERSE_FLATTENING was added in 8.0.13.

• Error number: 3739; Symbol: ER_SRS_INVALID_ANGULAR_UNIT; SQLSTATE: SR002
Message: The angular unit conversion factor must be a positive number.

ER_SRS_INVALID_ANGULAR_UNIT was added in 8.0.13.

• Error number: 3740; Symbol: ER_SRS_INVALID_PRIME_MERIDIAN; SQLSTATE: SR002
Message: The prime meridian must be within (-180, 180] degrees, specified in the SRS angular unit.

ER_SRS_INVALID_PRIME_MERIDIAN was added in 8.0.13.

• Error number: 3741; Symbol: ER_TRANSFORM_SOURCE_SRS_NOT_SUPPORTED; SQLSTATE: 22S00
Message: Transformation from SRID %u is not supported.

ER_TRANSFORM_SOURCE_SRS_NOT_SUPPORTED was added in 8.0.13.

• Error number: 3742; Symbol: ER_TRANSFORM_TARGET_SRS_NOT_SUPPORTED; SQLSTATE: 22S00
Message: Transformation to SRID %u is not supported.

ER_TRANSFORM_TARGET_SRS_NOT_SUPPORTED was added in 8.0.13.

• Error number: 3743; Symbol: ER_TRANSFORM_SOURCE_SRS_MISSING_TOWGS84; SQLSTATE: 22S00
Message: Transformation from SRID %u is not supported. The spatial reference system has no TOWGS84 clause.

ER_TRANSFORM_SOURCE_SRS_MISSING_TOWGS84 was added in 8.0.13.

- Error number: 3744; Symbol: ER_TRANSFORM_SOURCE_SRS_MISSING_TOWGS84; SQLSTATE: 22S00

Message: Transformation to SRID %u is not supported. The spatial reference system has no TOWGS84 clause.

ER_TRANSFORM_TARGET_SRS_MISSING_TOWGS84 was added in 8.0.13.

- Error number: 3745; Symbol: ER_TEMP_TABLE_PREVENTS_SWITCH_SESSION_BINLOG_FORMAT; SQLSTATE: HY000

Message: Changing @@session.binlog_format is disallowed when the session has open temporary table(s). You could wait until these temporary table(s) are dropped and try again.

ER_TEMP_TABLE_PREVENTS_SWITCH_SESSION_BINLOG_FORMAT was added in 8.0.13.

- Error number: 3746; Symbol: ER_TEMP_TABLE_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT; SQLSTATE: HY000

Message: Changing @@global.binlog_format or @@persist.binlog_format is disallowed when any replication channel has open temporary table(s). You could wait until Slave_open_temp_tables = 0 and try again.

ER_TEMP_TABLE_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT was added in 8.0.13.

- Error number: 3747; Symbol: ER_RUNNING_APPLIER_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT; SQLSTATE: HY000

Message: Changing @@global.binlog_format or @@persist.binlog_format is disallowed when any replication channel applier thread is running. You could execute STOP SLAVE SQL_THREAD and try again.

ER_RUNNING_APPLIER_PREVENTS_SWITCH_GLOBAL_BINLOG_FORMAT was added in 8.0.13.

- Error number: 3748; Symbol: ER_CLIENT_GTID_UNSAFE_CREATE_DROP_TEMP_TABLE_IN_TRX_IN_SBR; SQLSTATE: HY000

Message: Statement violates GTID consistency: CREATE TEMPORARY TABLE and DROP TEMPORARY TABLE are not allowed inside a transaction or inside a procedure in a transactional context when @@session.binlog_format=STATEMENT.

ER_CLIENT_GTID_UNSAFE_CREATE_DROP_TEMP_TABLE_IN_TRX_IN_SBR was added in 8.0.13.

- Error number: 3750; Symbol: ER_TABLE_WITHOUT_PK; SQLSTATE: HY000

Message: Unable to create or change a table without a primary key, when the system variable 'sql_require_primary_key' is set. Add a primary key to the table or unset this variable to avoid this message. Note that tables without a primary key can cause performance problems in row-based replication, so please consult your DBA before changing this setting.

ER_TABLE_WITHOUT_PK was added in 8.0.13.
• Error number: 3751; Symbol: WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX; SQLSTATE: 01000
  Message: Data truncated for functional index '%s' at row %ld
  WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX was added in 8.0.13, removed after 8.0.16.

• Error number: 3751; Symbol: ER_WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX; SQLSTATE: 01000
  Message: Data truncated for functional index '%s' at row %ld
  ER_WARN_DATA_TRUNCATED_FUNCTIONAL_INDEX was added in 8.0.17.

• Error number: 3752; Symbol: ER_WARN_DATA_OUT_OF_RANGE_FUNCTIONAL_INDEX; SQLSTATE: 22003
  Message: Value is out of range for functional index '%s' at row %ld
  ER_WARN_DATA_OUT_OF_RANGE_FUNCTIONAL_INDEX was added in 8.0.13.

• Error number: 3753; Symbol: ER_FUNCTIONAL_INDEX_ON_JSON_OR_GEOMETRY_FUNCTION; SQLSTATE: 42000
  Message: Cannot create a functional index on a function that returns a JSON or GEOMETRY value.
  ER_FUNCTIONAL_INDEX_ON_JSON_OR_GEOMETRY_FUNCTION was added in 8.0.13.

• Error number: 3754; Symbol: ER_FUNCTIONAL_INDEX_REF_AUTO_INCREMENT; SQLSTATE: HY000
  Message: Functional index '%s' cannot refer to an auto-increment column.
  ER_FUNCTIONAL_INDEX_REF_AUTO_INCREMENT was added in 8.0.13.

• Error number: 3755; Symbol: ER_CANNOT_DROP_COLUMN_FUNCTIONAL_INDEX; SQLSTATE: HY000
  Message: Cannot drop column '%s' because it is used by a functional index. In order to drop the column, you must remove the functional index.
  ER_CANNOT_DROP_COLUMN_FUNCTIONAL_INDEX was added in 8.0.13.

• Error number: 3756; Symbol: ER_FUNCTIONAL_INDEX_PRIMARY_KEY; SQLSTATE: HY000
  Message: The primary key cannot be a functional index
  ER_FUNCTIONAL_INDEX_PRIMARY_KEY was added in 8.0.13.

• Error number: 3757; Symbol: ER_FUNCTIONAL_INDEX_ON_LOB; SQLSTATE: HY000
  Message: Cannot create a functional index on an expression that returns a BLOB or TEXT. Please consider using CAST.
  ER_FUNCTIONAL_INDEX_ON_LOB was added in 8.0.13.

• Error number: 3758; Symbol: ER_FUNCTIONAL_INDEX_FUNCTION_IS_NOT_ALLOWED; SQLSTATE: HY000
  Message: Expression of functional index '%s' contains a disallowed function.
  ER_FUNCTIONAL_INDEX_FUNCTION_IS_NOT_ALLOWED was added in 8.0.13.
• Error number: 3759; Symbol: ER_FULLTEXT_FUNCTIONAL_INDEX; SQLSTATE: HY000
  Message: Fulltext functional index is not supported.
  ER_FULLTEXT_FUNCTIONAL_INDEX was added in 8.0.13.

• Error number: 3760; Symbol: ER_SPATIAL_FUNCTIONAL_INDEX; SQLSTATE: HY000
  Message: Spatial functional index is not supported.
  ER_SPATIAL_FUNCTIONAL_INDEX was added in 8.0.13.

• Error number: 3761; Symbol: ER_WRONG_KEY_COLUMN_FUNCTIONAL_INDEX; SQLSTATE: HY000
  Message: The used storage engine cannot index the expression '%s'.
  ER_WRONG_KEY_COLUMN_FUNCTIONAL_INDEX was added in 8.0.13.

• Error number: 3762; Symbol: ER_FUNCTIONAL_INDEX_ON_FIELD; SQLSTATE: HY000
  Message: Functional index on a column is not supported. Consider using a regular index instead.
  ER_FUNCTIONAL_INDEX_ON_FIELD was added in 8.0.13.

• Error number: 3763; Symbol: ER_GENERATED_COLUMN_NAMED_FUNCTION_IS_NOT_ALLOWED; SQLSTATE: HY000
  Message: Expression of generated column '%s' contains a disallowed function: %s.
  ER_GENERATED_COLUMN_NAMED_FUNCTION_IS_NOT_ALLOWED was added in 8.0.13.

• Error number: 3764; Symbol: ER_GENERATED_COLUMN_ROW_VALUE; SQLSTATE: HY000
  Message: Expression of generated column '%s' cannot refer to a row value.
  ER_GENERATED_COLUMN_ROW_VALUE was added in 8.0.13.

• Error number: 3765; Symbol: ER_GENERATED_COLUMN_VARIABLES; SQLSTATE: HY000
  Message: Expression of generated column '%s' cannot refer user or system variables.
  ER_GENERATED_COLUMN_VARIABLES was added in 8.0.13.

• Error number: 3766; Symbol: ER_DEPENDENT_BY_DEFAULT_GENERATED_VALUE; SQLSTATE: HY000
  Message: Column '%s' of table '%s' has a default value expression dependency and cannot be dropped or renamed.
  ER_DEPENDENT_BY_DEFAULT_GENERATED_VALUE was added in 8.0.13.

• Error number: 3767; Symbol: ER_DEFAULT_VAL_GENERATED_NON_PRIOR; SQLSTATE: HY000
  Message: Default value expression of column '%s' cannot refer to a column defined after it if that column is a generated column or has an expression as default value.
  ER_DEFAULT_VAL_GENERATED_NON_PRIOR was added in 8.0.13.

• Error number: 3768; Symbol: ER_DEFAULT_VAL_GENERATED_REF_AUTO_INC; SQLSTATE: HY000
Message: Default value expression of column '%s' cannot refer to an auto-increment column.

**ER_DEFAULT_VAL_GENERATED_REF_AUTO_INC** was added in 8.0.13.

- Error number: 3769; Symbol: **ER_DEFAULT_VAL_GENERATED_FUNCTION_IS_NOT_ALLOWED**; SQLSTATE: **HY000**

Message: Default value expression of column '%s' contains a disallowed function.

**ER_DEFAULT_VAL_GENERATED_FUNCTION_IS_NOT_ALLOWED** was added in 8.0.13.

- Error number: 3770; Symbol: **ER_DEFAULT_VAL_GENERATED_NAMED_FUNCTION_IS_NOT_ALLOWED**; SQLSTATE: **HY000**

Message: Default value expression of column '%s' contains a disallowed function: %s.

**ER_DEFAULT_VAL_GENERATED_NAMED_FUNCTION_IS_NOT_ALLOWED** was added in 8.0.13.

- Error number: 3771; Symbol: **ER_DEFAULT_VAL_GENERATED_ROW_VALUE**; SQLSTATE: **HY000**

Message: Default value expression of column '%s' cannot refer to a row value.

**ER_DEFAULT_VAL_GENERATED_ROW_VALUE** was added in 8.0.13.

- Error number: 3772; Symbol: **ER_DEFAULT_VAL_GENERATED_VARIABLES**; SQLSTATE: **HY000**

Message: Default value expression of column '%s' cannot refer user or system variables.

**ER_DEFAULT_VAL_GENERATED_VARIABLES** was added in 8.0.13.

- Error number: 3773; Symbol: **ER_DEFAULT_AS_VAL_GENERATED**; SQLSTATE: **HY000**

Message: DEFAULT function cannot be used with default value expressions

**ER_DEFAULT_AS_VAL_GENERATED** was added in 8.0.13.

- Error number: 3774; Symbol: **ER_UNSUPPORTED_ACTION_ON_DEFAULT_VAL_GENERATED**; SQLSTATE: **HY000**

Message: '%s' is not supported for default value expressions.

**ER_UNSUPPORTED_ACTION_ON_DEFAULT_VAL_GENERATED** was added in 8.0.13.

- Error number: 3775; Symbol: **ER_GTID_UNSAFE_ALTER_ADD_COL_WITH_DEFAULT_EXPRESSION**; SQLSTATE: **HY000**

Message: Statement violates GTID consistency: ALTER TABLE ... ADD COLUMN .. with expression as DEFAULT.

**ER_GTID_UNSAFE_ALTER_ADD_COL_WITH_DEFAULT_EXPRESSION** was added in 8.0.13.

- Error number: 3776; Symbol: **ER_FK_CANNOT_CHANGE_ENGINE**; SQLSTATE: **HY000**

Message: Cannot change table’s storage engine because the table participates in a foreign key constraint.

**ER_FK_CANNOT_CHANGE_ENGINE** was added in 8.0.13.

- Error number: 3777; Symbol: **ER_WARN_DEPRECATED_USER_SET_EXPR**; SQLSTATE: **HY000**
Message: Setting user variables within expressions is deprecated and will be removed in a future release. Consider alternatives: 'SET variable=expression, ...', or 'SELECT expression(s) INTO variables(s)'.

ER_WARN_DEPRECATED_USER_SET_EXPR was added in 8.0.13.

• Error number: 3778; Symbol: ER_WARN_DEPRECATED_UTF8MB3_COLLATION; SQLSTATE: HY000
Message: '%s' is a collation of the deprecated character set UTF8MB3. Please consider using UTF8MB4 with an appropriate collation instead.

ER_WARN_DEPRECATED_UTF8MB3_COLLATION was added in 8.0.13.

• Error number: 3779; Symbol: ER_WARN_DEPRECATED_NESTED_COMMENT_SYNTAX; SQLSTATE: HY000
Message: Nested comment syntax is deprecated and will be removed in a future release.

ER_WARN_DEPRECATED_NESTED_COMMENT_SYNTAX was added in 8.0.13.

• Error number: 3780; Symbol: ER_FK_INCOMPATIBLE_COLUMNS; SQLSTATE: HY000
Message: Referencing column '%s' and referenced column '%s' in foreign key constraint '%s' are incompatible.

ER_FK_INCOMPATIBLE_COLUMNS was added in 8.0.14.

• Error number: 3781; Symbol: ER_GR_HOLD_WAIT_TIMEOUT; SQLSTATE: HY000
Message: Timeout exceeded for held statement while new Group Replication primary member is applying backlog.

ER_GR_HOLD_WAIT_TIMEOUT was added in 8.0.14.

• Error number: 3782; Symbol: ER_GR_HOLD_KILLED; SQLSTATE: HY000
Message: Held statement aborted because Group Replication plugin got shut down or thread was killed while new primary member was applying backlog.

ER_GR_HOLD_KILLED was added in 8.0.14.

• Error number: 3783; Symbol: ER_GR_HOLD_MEMBER_STATUS_ERROR; SQLSTATE: HY000
Message: Held statement was aborted due to member being in error state, while backlog is being applied during Group Replication primary election.

ER_GR_HOLD_MEMBER_STATUS_ERROR was added in 8.0.14.

• Error number: 3784; Symbol: ER_RPL_ENCRYPTION_FAILED_TO_FETCH_KEY; SQLSTATE: HY000
Message: Failed to fetch key from keyring, please check if keyring plugin is loaded.

ER_RPL_ENCRYPTION_FAILED_TO_FETCH_KEY was added in 8.0.14.

• Error number: 3785; Symbol: ER_RPL_ENCRYPTION_KEY_NOT_FOUND; SQLSTATE: HY000
Message: Can't find key from keyring, please check in the server log if a keyring plugin is loaded and initialized successfully.
**ER_RPL_ENCRYPTION_KEY_NOT_FOUND** was added in 8.0.14.

- Error number: 3786; Symbol: **ER_RPL_ENCRYPTION_KEYRING_INVALID_KEY**; SQLSTATE: HY000
  
  Message: Fetched an invalid key from keyring.
  
  **ER_RPL_ENCRYPTION_KEYRING_INVALID_KEY** was added in 8.0.14.

- Error number: 3787; Symbol: **ER_RPL_ENCRYPTION_HEADER_ERROR**; SQLSTATE: HY000
  
  Message: Error reading a replication log encryption header: %s.
  
  **ER_RPL_ENCRYPTION_HEADER_ERROR** was added in 8.0.14.

- Error number: 3788; Symbol: **ER_RPL_ENCRYPTION_FAILED_TO_ROTATE_LOGS**; SQLSTATE: HY000
  
  Message: Failed to rotate some logs after changing binlog encryption settings. Please fix the problem and rotate the logs manually.
  
  **ER_RPL_ENCRYPTION_FAILED_TO_ROTATE_LOGS** was added in 8.0.14.

- Error number: 3789; Symbol: **ER_RPL_ENCRYPTION_KEY_EXISTS_UNEXPECTED**; SQLSTATE: HY000
  
  Message: Key %s exists unexpected.
  
  **ER_RPL_ENCRYPTION_KEY_EXISTS_UNEXPECTED** was added in 8.0.14.

- Error number: 3790; Symbol: **ER_RPL_ENCRYPTION_FAILED_TO_GENERATE_KEY**; SQLSTATE: HY000
  
  Message: Failed to generate key, please check if keyring plugin is loaded.
  
  **ER_RPL_ENCRYPTION_FAILED_TO_GENERATE_KEY** was added in 8.0.14.

- Error number: 3791; Symbol: **ER_RPL_ENCRYPTION_FAILED_TO_STORE_KEY**; SQLSTATE: HY000
  
  Message: Failed to store key, please check if keyring plugin is loaded.
  
  **ER_RPL_ENCRYPTION_FAILED_TO_STORE_KEY** was added in 8.0.14.

- Error number: 3792; Symbol: **ER_RPL_ENCRYPTION_FAILED_TO_REMOVE_KEY**; SQLSTATE: HY000
  
  Message: Failed to remove key, please check if keyring plugin is loaded.
  
  **ER_RPL_ENCRYPTION_FAILED_TO_REMOVE_KEY** was added in 8.0.14.

- Error number: 3793; Symbol: **ER_RPL_ENCRYPTION_UNABLE_TO_CHANGE_OPTION**; SQLSTATE: HY000
  
  Message: Failed to change binlog_encryption value. %s.
  
  **ER_RPL_ENCRYPTION_UNABLE_TO_CHANGE_OPTION** was added in 8.0.14.

- Error number: 3794; Symbol: **ER_RPL_ENCRYPTION_MASTER_KEY_RECOVERY_FAILED**; SQLSTATE: HY000
  
  Message: Unable to recover binlog encryption master key, please check if keyring plugin is loaded.
**ER_RPL_ENCRYPTION_MASTER_KEY_RECOVERY_FAILED** was added in 8.0.14.

- **Error number:** 3795; **Symbol:** ER_SLOW_LOG_MODE_IGNORED_WHEN_NOT_LOGGING_TO_FILE; **SQLSTATE:** HY000
  
  Message: slow query log file format changed as requested, but setting will have no effect when not actually logging to a file.

  **ER_SLOW_LOG_MODE_IGNORED_WHEN_NOT_LOGGING_TO_FILE** was added in 8.0.14.

- **Error number:** 3796; **Symbol:** ER_GRP_TRX_CONSISTENCY_NOT_ALLOWED; **SQLSTATE:** HY000
  
  Message: The option group_replication_consistency cannot be used on the current member state.

  **ER_GRP_TRX_CONSISTENCY_NOT_ALLOWED** was added in 8.0.14.

- **Error number:** 3797; **Symbol:** ER_GRP_TRX_CONSISTENCY_BEFORE; **SQLSTATE:** HY000
  
  Message: Error while waiting for group transactions commit on group_replication_consistency='BEFORE'.

  **ER_GRP_TRX_CONSISTENCY_BEFORE** was added in 8.0.14.

- **Error number:** 3798; **Symbol:** ER_GRP_TRX_CONSISTENCY_AFTER_ON_TRX_BEGIN; **SQLSTATE:** HY000
  
  Message: Error while waiting for transactions with group_replication_consistency= 'AFTER' to commit.

  **ER_GRP_TRX_CONSISTENCY_AFTER_ON_TRX_BEGIN** was added in 8.0.14.

- **Error number:** 3799; **Symbol:** ER_GRP_TRX_CONSISTENCY_BEGIN_NOT_ALLOWED; **SQLSTATE:** HY000
  
  Message: The Group Replication plugin is stopping, therefore new transactions are not allowed to start.

  **ER_GRP_TRX_CONSISTENCY_BEGIN_NOT_ALLOWED** was added in 8.0.14.

- **Error number:** 3800; **Symbol:** ER_FUNCTIONAL_INDEX_ROW_VALUE_IS_NOT_ALLOWED; **SQLSTATE:** HY000
  
  Message: Expression of functional index '%s' cannot refer to a row value.

  **ER_FUNCTIONAL_INDEX_ROW_VALUE_IS_NOT_ALLOWED** was added in 8.0.14.

- **Error number:** 3801; **Symbol:** ER_RPL_ENCRYPTION_FAILED_TO_ENCRYPT; **SQLSTATE:** HY000
  
  Message: Failed to encrypt content to write into binlog file: %s.

  **ER_RPL_ENCRYPTION_FAILED_TO_ENCRYPT** was added in 8.0.14.

- **Error number:** 3802; **Symbol:** ER_PAGE_TRACKING_NOT_STARTED; **SQLSTATE:** HY000
  
  Message: Page Tracking is not started yet.

  **ER_PAGE_TRACKING_NOT_STARTED** was added in 8.0.16.

- **Error number:** 3803; **Symbol:** ER_PAGE_TRACKING_RANGE_NOT_TRACKED; **SQLSTATE:** HY000
  
  Message: Tracking was not enabled for the LSN range specified
Server Error Message Reference

**ER_PAGE_TRACKING_RANGE_NOT_TRAKCED** was added in 8.0.16.

- Error number: **3804**; Symbol: **ER_PAGE_TRACKING_CANNOT_PURGE**; SQLSTATE: **HY000**
  
  Message: Cannot purge data when concurrent clone is in progress. Try later.

**ER_PAGE_TRACKING_CANNOT_PURGE** was added in 8.0.16.

- Error number: **3805**; Symbol: **ER_RPL_ENCRYPTION_CANNOT_ROTATE_BINLOG_MASTER_KEY**; SQLSTATE: **HY000**
  
  Message: Cannot rotate binary log master key when 'binlog-encryption' is off.

**ER_RPL_ENCRYPTION_CANNOT_ROTATE_BINLOG_MASTER_KEY** was added in 8.0.16.

- Error number: **3806**; Symbol: **ER_BINLOG_MASTER_KEY_RECOVERY_OUT_OF_COMBINATION**; SQLSTATE: **HY000**
  
  Message: Unable to recover binary log master key, the combination of new_master_key_seqno=%u, master_key_seqno=%u and old_master_key_seqno=%u are wrong.

**ER_BINLOG_MASTER_KEY_RECOVERY_OUT_OF_COMBINATION** was added in 8.0.16.

- Error number: **3807**; Symbol: **ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_OPERATE_KEY**; SQLSTATE: **HY000**
  
  Message: Failed to operate binary log master key on keyring, please check if keyring plugin is loaded. The statement had no effect: the old binary log master key is still in use, the keyring, binary and relay log files are unchanged, and the server could not start using a new binary log master key for encrypting new binary and relay log files.

**ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_OPERATE_KEY** was added in 8.0.16.

- Error number: **3808**; Symbol: **ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_ROTATE_LOGS**; SQLSTATE: **HY000**
  
  Message: Failed to rotate one or more binary or relay log files. A new binary log master key was generated and will be used to encrypt new binary and relay log files. There may still exist binary or relay log files using the previous binary log master key.

**ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_ROTATE_LOGS** was added in 8.0.16.

- Error number: **3809**; Symbol: **ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_REENCRYPT_LOG**; SQLSTATE: **HY000**
  
  Message: %s. A new binary log master key was generated and will be used to encrypt new binary and relay log files. There may still exist binary or relay log files using the previous binary log master key.

**ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_REENCRYPT_LOG** was added in 8.0.16.
• Error number: 3810; Symbol: `ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_UNUSED_KEYS`; SQLSTATE: `HY000`
  Message: Failed to remove unused binary log encryption keys from the keyring, please check if keyring plugin is loaded. The unused binary log encryption keys may still exist in the keyring, and they will be removed upon server restart or next 'ALTER INSTANCE ROTATE BINLOG MASTER KEY' execution. `ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_UNUSED_KEYS` was added in 8.0.16.

• Error number: 3811; Symbol: `ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_AUX_KEY`; SQLSTATE: `HY000`
  Message: Failed to remove auxiliary binary log encryption key from keyring, please check if keyring plugin is loaded. The cleanup of the binary log master key rotation process did not finish as expected and the cleanup will take place upon server restart or next 'ALTER INSTANCE ROTATE BINLOG MASTER KEY' execution. `ER_BINLOG_MASTER_KEY_ROTATION_FAIL_TO_CLEANUP_AUX_KEY` was added in 8.0.16.

• Error number: 3812; Symbol: `ER_NON_BOOLEAN_EXPR_FOR_CHECKCONSTRAINT`; SQLSTATE: `HY000`
  Message: An expression of non-boolean type specified to a check constraint '%%s'. `ER_NON_BOOLEAN_EXPR_FOR_CHECKCONSTRAINT` was added in 8.0.16.

• Error number: 3813; Symbol: `ER_COLUMN_CHECKCONSTRAINT_REFERENCESOTHERCOLUMN`; SQLSTATE: `HY000`
  Message: Column check constraint '%%s' references other column. `ER_COLUMN_CHECKCONSTRAINT_REFERENCESOTHERCOLUMN` was added in 8.0.16.

• Error number: 3814; Symbol: `ER_CHECKCONSTRAINTNAMEDFUNCTIONISNOTALLOWED`; SQLSTATE: `HY000`
  Message: An expression of a check constraint '%%s' contains disallowed function: %%s. `ER_CHECKCONSTRAINTNAMEDFUNCTIONISNOTALLOWED` was added in 8.0.16.

• Error number: 3815; Symbol: `ER_CHECKCONSTRAINTFUNCTIONISNOTALLOWED`; SQLSTATE: `HY000`
  Message: An expression of a check constraint '%%s' contains disallowed function. `ER_CHECKCONSTRAINTFUNCTIONISNOTALLOWED` was added in 8.0.16.

• Error number: 3816; Symbol: `ER_CHECKCONSTRAINTVARIABLES`; SQLSTATE: `HY000`
  Message: An expression of a check constraint '%%s' cannot refer to a user or system variable. `ER_CHECKCONSTRAINTVARIABLES` was added in 8.0.16.

• Error number: 3817; Symbol: `ER_CHECKCONSTRAINTROWVALUE`; SQLSTATE: `HY000`
  Message: Check constraint '%%s' cannot refer to a row value. `ER_CHECKCONSTRAINTROWVALUE` was added in 8.0.16.
• Error number: 3818; Symbol: ER_CHECK_CONSTRAINT_REFERS_AUTO_INCREMENT_COLUMN; SQLSTATE: HY000
  
  Message: Check constraint '%s' cannot refer to an auto-increment column.
  
  **ER_CHECK_CONSTRAINT_REFERS_AUTO_INCREMENT_COLUMN** was added in 8.0.16.

• Error number: 3819; Symbol: ER_CHECK_CONSTRAINT_VIOLATED; SQLSTATE: HY000
  
  Message: Check constraint '%s' is violated.
  
  **ER_CHECK_CONSTRAINT_VIOLATED** was added in 8.0.16.

• Error number: 3820; Symbol: ER_CHECK_CONSTRAINT_REFERS_UNKNOWN_COLUMN; SQLSTATE: HY000
  
  Message: Check constraint '%s' refers to non-existing column '%s'.
  
  **ER_CHECK_CONSTRAINT_REFERS_UNKNOWN_COLUMN** was added in 8.0.16.

• Error number: 3821; Symbol: ER_CHECK_CONSTRAINT_NOT_FOUND; SQLSTATE: HY000
  
  Message: Check constraint '%s' is not found in the table.
  
  **ER_CHECK_CONSTRAINT_NOT_FOUND** was added in 8.0.16.

• Error number: 3822; Symbol: ER_CHECK_CONSTRAINT_DUP_NAME; SQLSTATE: HY000
  
  Message: Duplicate check constraint name '%s'.
  
  **ER_CHECK_CONSTRAINT_DUP_NAME** was added in 8.0.16.

• Error number: 3823; Symbol:
  
  ER_CHECK_CONSTRAINT_CLAUSE_USING_FK_REFER_ACTION_COLUMN; SQLSTATE: HY000
  
  Message: Column '%s' cannot be used in a check constraint '%s': needed in a foreign key constraint '%s' referential action.
  
  **ER_CHECK_CONSTRAINT_CLAUSE_USING_FK_REFER_ACTION_COLUMN** was added in 8.0.16.

• Error number: 3824; Symbol: WARN_UNENCRYPTED_TABLE_IN_ENCRYPTED_DB; SQLSTATE: HY000
  
  Message: Creating an unencrypted table in a database with default encryption enabled.
  
  **WARN_UNENCRYPTED_TABLE_IN_ENCRYPTED_DB** was added in 8.0.16.

• Error number: 3825; Symbol: ER_INVALID_ENCRYPTION_REQUEST; SQLSTATE: HY000
  
  Message: Request to create %s table while using an %s tablespace.
  
  **ER_INVALID_ENCRYPTION_REQUEST** was added in 8.0.16.

• Error number: 3826; Symbol: ER_CANNOT_SET_TABLE_ENCRYPTION; SQLSTATE: HY000
  
  Message: Table encryption differ from its database default encryption, and user doesn't have enough privilege.
  
  **ER_CANNOT_SET_TABLE_ENCRYPTION** was added in 8.0.16.

• Error number: 3827; Symbol: ER_CANNOT_SET_DATABASE_ENCRYPTION; SQLSTATE: HY000
Message: Database default encryption differ from ‘default_table_encryption’ setting, and user doesn't have enough privilege.

ER_CANNOT_SET_DATABASE_ENCRYPTION was added in 8.0.16.

- Error number: 3828; Symbol: ER_CANNOT_SET_TABLESPACE_ENCRYPTION; SQLSTATE: HY000

Message: Tablespace encryption differ from ‘default_table_encryption’ setting, and user doesn't have enough privilege.

ER_CANNOT_SET_TABLESPACE_ENCRYPTION was added in 8.0.16.

- Error number: 3829; Symbol: ER_TABLESPACE_CANNOT_BE_ENCRYPTED; SQLSTATE: HY000

Message: This tablespace can't be encrypted, because one of table's schema has default encryption OFF and user doesn't have enough privilege.

ER_TABLESPACE_CANNOT_BE_ENCRYPTED was added in 8.0.16.

- Error number: 3830; Symbol: ER_TABLESPACE_CANNOT_BE_DECRYPTED; SQLSTATE: HY000

Message: This tablespace can't be decrypted, because one of table's schema has default encryption ON and user doesn't have enough privilege.

ER_TABLESPACE_CANNOT_BE_DECRYPTED was added in 8.0.16.

- Error number: 3831; Symbol: ER_TABLESPACE_TYPE_UNKNOWN; SQLSTATE: HY000

Message: Cannot determine the type of the tablespace named '%s'.

ER_TABLESPACE_TYPE_UNKNOWN was added in 8.0.16.

- Error number: 3832; Symbol: ER_TARGET_TABLESPACE_UNENCRIPTED; SQLSTATE: HY000

Message: Source tablespace is encrypted but target tablespace is not.

ER_TARGET_TABLESPACE_UNENCRIPTED was added in 8.0.16.

- Error number: 3833; Symbol: ER_CANNOT_USE_ENCRYPTION_CLAUSE; SQLSTATE: HY000

Message: ENCRYPTION clause is not valid for %s tablespace.

ER_CANNOT_USE_ENCRYPTION_CLAUSE was added in 8.0.16.

- Error number: 3834; Symbol: ER_INVALID_MULTIPLE_CLAUSES; SQLSTATE: HY000

Message: Multiple %s clauses

ER_INVALID_MULTIPLE_CLAUSES was added in 8.0.16.

- Error number: 3835; Symbol: ER_UNSUPPORTED_USE_OF_GRANT_AS; SQLSTATE: HY000

Message: GRANT ... AS is currently supported only for global privileges.

ER_UNSUPPORTED_USE_OF_GRANT_AS was added in 8.0.16.

- Error number: 3836; Symbol: ER_UNKNOWN_AUTH_ID_OR_ACCESS_DENIED_FOR_GRANT_AS; SQLSTATE: HY000
Message: Either some of the authorization IDs in the AS clause are invalid or the current user lacks privileges to execute the statement.

ER_UNKNOWN_AUTH_ID_OR_ACCESS_DENIED_FOR_GRANT_AS was added in 8.0.16.

• Error number: 3837; Symbol: ER_DEPENDENT_BY_FUNCTIONAL_INDEX; SQLSTATE: HY000
Message: Column '%s' has a functional index dependency and cannot be dropped or renamed.

ER_DEPENDENT_BY_FUNCTIONAL_INDEX was added in 8.0.17.

• Error number: 3838; Symbol: ER_PLUGIN_NOT_EARLY; SQLSTATE: HY000
Message: Plugin '%s' is not to be used as an "early" plugin. Don't add it to --early-plugin-load, keyring migration etc.

ER_PLUGIN_NOT_EARLY was added in 8.0.17.

• Error number: 3839; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_START_SUBDIR_PATH; SQLSTATE: HY000
Message: Redo log archiving start prohibits path name in 'subdir' argument

ER_INNODB_REDO_LOG_ARCHIVE_START_SUBDIR_PATH was added in 8.0.17.

• Error number: 3840; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_START_TIMEOUT; SQLSTATE: HY000
Message: Redo log archiving start timed out

ER_INNODB_REDO_LOG_ARCHIVE_START_TIMEOUT was added in 8.0.17.

• Error number: 3841; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_DIRS_INVALID; SQLSTATE: HY000
Message: Server variable 'innodb_redo_log_archive_dirs' is NULL or empty

ER_INNODB_REDO_LOG_ARCHIVE_DIRS_INVALID was added in 8.0.17.

• Error number: 3842; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_LABEL_NOT_FOUND; SQLSTATE: HY000
Message: Label '%s' not found in server variable 'innodb_redo_log_archive_dirs'

ER_INNODB_REDO_LOG_ARCHIVE_LABEL_NOT_FOUND was added in 8.0.17.

• Error number: 3843; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_DIR_EMPTY; SQLSTATE: HY000
Message: Directory is empty after label '%s' in server variable 'innodb_redo_log_archive_dirs'

ER_INNODB_REDO_LOG_ARCHIVE_DIR_EMPTY was added in 8.0.17.

• Error number: 3844; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_NO_SUCH_DIR; SQLSTATE: HY000
Message: Redo log archive directory '%s' does not exist or is not a directory

ER_INNODB_REDO_LOG_ARCHIVE_NO_SUCH_DIR was added in 8.0.17.

• Error number: 3845; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_DIR_CLASH; SQLSTATE: HY000
Message: Redo log archive directory '%s' is in, under, or over server directory '%s' - '%s'

ER_INNODB_REDO_LOG_ARCHIVE_DIR_CLASH was added in 8.0.17.

- Error number: 3846; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_DIR_PERMISSIONS; SQLSTATE: HY000

Message: Redo log archive directory '%s' is accessible to all OS users

ER_INNODB_REDO_LOG_ARCHIVE_DIR_PERMISSIONS was added in 8.0.17.

- Error number: 3847; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_FILE_CREATE; SQLSTATE: HY000

Message: Cannot create redo log archive file '%s' (OS errno: %d - %s)

ER_INNODB_REDO_LOG_ARCHIVE_FILE_CREATE was added in 8.0.17.

- Error number: 3848; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_ACTIVE; SQLSTATE: HY000

Message: Redo log archiving has been started on '%s' - Call innodb_redo_log_archive_stop() first

ER_INNODB_REDO_LOG_ARCHIVE_ACTIVE was added in 8.0.17.

- Error number: 3849; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_INACTIVE; SQLSTATE: HY000

Message: Redo log archiving is not active

ER_INNODB_REDO_LOG_ARCHIVE_INACTIVE was added in 8.0.17.

- Error number: 3850; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_FAILED; SQLSTATE: HY000

Message: Redo log archiving failed: %s

ER_INNODB_REDO_LOG_ARCHIVE_FAILED was added in 8.0.17.

- Error number: 3851; Symbol: ER_INNODB_REDO_LOG_ARCHIVE_SESSION; SQLSTATE: HY000

Message: Redo log archiving has not been started by this session

ER_INNODB_REDO_LOG_ARCHIVE_SESSION was added in 8.0.17.

- Error number: 3852; Symbol: ER_STD_REGEX_ERROR; SQLSTATE: HY000

Message: Regex error: %s in function %s.

ER_STD_REGEX_ERROR was added in 8.0.17.

- Error number: 3853; Symbol: ER_INVALID_JSON_TYPE; SQLSTATE: 22032

Message: Invalid JSON type in argument %u to function %s; an %s is required.

ER_INVALID_JSON_TYPE was added in 8.0.17.

- Error number: 3854; Symbol: ER_CANNOT_CONVERT_STRING; SQLSTATE: HY000

Message: Cannot convert string '%s' from %s to %s

ER_CANNOT_CONVERT_STRING was added in 8.0.17.
• Error number: 3855; Symbol: ER_DEPENDENT_BY_PARTITION_FUNC; SQLSTATE: HY000
  Message: Column '%s' has a partitioning function dependency and cannot be dropped or renamed.
  ER_DEPENDENT_BY_PARTITION_FUNC was added in 8.0.17.

• Error number: 3856; Symbol: ER_WARN_DEPRECATED_FLOAT_AUTO_INCREMENT; SQLSTATE: HY000
  Message: AUTO_INCREMENT support for FLOAT/DIDOUBLE columns is deprecated and will be removed in a future release. Consider removing AUTO_INCREMENT from column '%s'.
  ER_WARN_DEPRECATED_FLOAT_AUTO_INCREMENT was added in 8.0.17.

• Error number: 3857; Symbol: ER_RPL_CANT_STOP_SLAVE_WHILE_LOCKED_BACKUP; SQLSTATE: HY000
  Message: Cannot stop the slave SQL thread while the instance is locked for backup. Try running 'UNLOCK INSTANCE' first.
  ER_RPL_CANT_STOP_SLAVE_WHILE_LOCKED_BACKUP was added in 8.0.17.

• Error number: 3858; Symbol: ER_WARN_DEPRECATED_FLOAT_DIGITS; SQLSTATE: HY000
  Message: Specifying number of digits for floating point data types is deprecated and will be removed in a future release.
  ER_WARN_DEPRECATED_FLOAT_DIGITS was added in 8.0.17.

• Error number: 3859; Symbol: ER_WARN_DEPRECATED_FLOAT_UNSIGNED; SQLSTATE: HY000
  Message: UNSIGNED for decimal and floating point data types is deprecated and support for it will be removed in a future release.
  ER_WARN_DEPRECATED_FLOAT_UNSIGNED was added in 8.0.17.

• Error number: 3860; Symbol: ER_WARN_DEPRECATED_INTEGER_DISPLAY_WIDTH; SQLSTATE: HY000
  Message: Integer display width is deprecated and will be removed in a future release.
  ER_WARN_DEPRECATED_INTEGER_DISPLAY_WIDTH was added in 8.0.17.

• Error number: 3861; Symbol: ER_WARN_DEPRECATED_ZEROFILL; SQLSTATE: HY000
  Message: The ZEROFILL attribute is deprecated and will be removed in a future release. Use the LPAD function to zero-pad numbers, or store the formatted numbers in a CHAR column.
  ER_WARN_DEPRECATED_ZEROFILL was added in 8.0.17.

• Error number: 3862; Symbol: ER_CLONE_DONOR; SQLSTATE: HY000
  Message: Clone Donor Error: %s.
  ER_CLONE_DONOR was added in 8.0.17.

• Error number: 3863; Symbol: ER_CLONE_PROTOCOL; SQLSTATE: HY000
  Message: Clone received unexpected response from Donor : %s.
**ER_CLONE_PROTOCOL** was added in 8.0.17.

- **Error number:** 3864; **Symbol:** ER_CLONE_DONOR_VERSION; **SQLSTATE:** HY000
  Message: Clone Donor MySQL version: %s is different from Recipient MySQL version %s.
  **ER_CLONE_DONOR_VERSION** was added in 8.0.17.

- **Error number:** 3865; **Symbol:** ER_CLONE_OS; **SQLSTATE:** HY000
  Message: Clone Donor OS: %s is different from Recipient OS: %s.
  **ER_CLONE_OS** was added in 8.0.17.

- **Error number:** 3866; **Symbol:** ER_CLONE_PLATFORM; **SQLSTATE:** HY000
  Message: Clone Donor platform: %s is different from Recipient platform: %s.
  **ER_CLONE_PLATFORM** was added in 8.0.17.

- **Error number:** 3867; **Symbol:** ER_CLONE_CHARSET; **SQLSTATE:** HY000
  Message: Clone Donor collation: %s is unavailable in Recipient.
  **ER_CLONE_CHARSET** was added in 8.0.17.

- **Error number:** 3868; **Symbol:** ER_CLONE_CONFIG; **SQLSTATE:** HY000
  Message: Clone Configuration %s: Donor value: %s is different from Recipient value: %s.
  **ER_CLONE_CONFIG** was added in 8.0.17.

- **Error number:** 3869; **Symbol:** ER_CLONE_SYS_CONFIG; **SQLSTATE:** HY000
  Message: Clone system configuration: %s
  **ER_CLONE_SYS_CONFIG** was added in 8.0.17.

- **Error number:** 3870; **Symbol:** ER_CLONE_PLUGIN_MATCH; **SQLSTATE:** HY000
  Message: Clone Donor plugin %s is not active in Recipient.
  **ER_CLONE_PLUGIN_MATCH** was added in 8.0.17.

- **Error number:** 3871; **Symbol:** ER_CLONE_LOOPBACK; **SQLSTATE:** HY000
  Message: Clone cannot use loop back connection while cloning into current data directory.
  **ER_CLONE_LOOPBACK** was added in 8.0.17.

- **Error number:** 3872; **Symbol:** ER_CLONE_ENCRYPTION; **SQLSTATE:** HY000
  Message: Clone needs SSL connection for encrypted table.
  **ER_CLONE_ENCRYPTION** was added in 8.0.17.

- **Error number:** 3873; **Symbol:** ER_CLONE_DISK_SPACE; **SQLSTATE:** HY000
  Message: Clone estimated database size is %s. Available space %s is not enough.
Server Error Message Reference

**ER_CLONE_DISK_SPACE** was added in 8.0.17.

- Error number: 3874; Symbol: **ER_CLONE_IN_PROGRESS**; SQLSTATE: **HY000**
  Message: Concurrent clone in progress. Please try after clone is complete.

**ER_CLONE_IN_PROGRESS** was added in 8.0.17.

- Error number: 3875; Symbol: **ER_CLONE_DISALLOWED**; SQLSTATE: **HY000**
  Message: The clone operation cannot be executed when %s.

**ER_CLONE_DISALLOWED** was added in 8.0.17.

- Error number: 3876; Symbol: **ER_CANNOT_GRANT_ROLES_TO_ANONYMOUS_USER**; SQLSTATE: **HY000**
  Message: Cannot grant roles to an anonymous user.

**ER_CANNOT_GRANT_ROLES_TO_ANONYMOUS_USER** was added in 8.0.16.

- Error number: 3877; Symbol: **ER_SECONDARY_ENGINE_PLUGIN**; SQLSTATE: **HY000**
  Message: %s

**ER_SECONDARY_ENGINE_PLUGIN** was added in 8.0.14.

- Error number: 3878; Symbol: **ER_SECOND_PASSWORD_CANNOT_BE_EMPTY**; SQLSTATE: **HY000**
  Message: Empty password can not be retained as second password for user '%s'@'%s'.

**ER_SECOND_PASSWORD_CANNOT_BE_EMPTY** was added in 8.0.14.

- Error number: 3879; Symbol: **ER_DB_ACCESS_DENIED**; SQLSTATE: **HY000**
  Message: Access denied for AuthId `%s`@`%s` to database `%s`.

**ER_DB_ACCESS_DENIED** was added in 8.0.16.

- Error number: 3880; Symbol: **ER_DA_AUTH_ID_WITH_SYSTEM_USER_PRIV_IN_MANDATORY_ROLES**; SQLSTATE: **HY000**
  Message: Cannot set mandatory_roles: AuthId `%s`@`%s` has `%s` privilege.

**ER_DA_AUTH_ID_WITH_SYSTEM_USER_PRIV_IN_MANDATORY_ROLES** was added in 8.0.17.

- Error number: 3881; Symbol: **ER_DA_RPL_GTID_TABLE_CANNOT_OPEN**; SQLSTATE: **HY000**
  Message: Gtid table is not ready to be used. Table `%s.%s` cannot be opened.

**ER_DA_RPL_GTID_TABLE_CANNOT_OPEN** was added in 8.0.17.

- Error number: 3882; Symbol: **ER_GEOMETRY_IN_UNKNOWN_LENGTH_UNIT**; SQLSTATE: **SU001**
  Message: The geometry passed to function %s is in SRID 0, which doesn't specify a length unit. Can't convert to '%s'.

**ER_GEOMETRY_IN_UNKNOWN_LENGTH_UNIT** was added in 8.0.14.
- Error number: 3883; Symbol: `ER_DA_PLUGIN_INSTALL_ERROR`; SQLSTATE: HY000
  Message: Error installing plugin '%s': %s
  `ER_DA_PLUGIN_INSTALL_ERROR` was added in 8.0.17.

- Error number: 3884; Symbol: `ER_NO_SESSION_TEMP`; SQLSTATE: HY000
  Message: Storage engine could not allocate temporary tablespace for this session.
  `ER_NO_SESSION_TEMP` was added in 8.0.13.

- Error number: 3885; Symbol: `ER_DA_UNKNOWN_ERROR_NUMBER`; SQLSTATE: HY000
  Message: Got unknown error: %d
  `ER_DA_UNKNOWN_ERROR_NUMBER` was added in 8.0.17.

- Error number: 3886; Symbol: `ER_COLUMN_CHANGE_SIZE`; SQLSTATE: HY000
  Message: Could not change column '%s' of table '%s'. The resulting size of index '%s' would exceed the max key length of %d bytes.
  `ER_COLUMN_CHANGE_SIZE` was added in 8.0.14.

- Error number: 3887; Symbol: `ER_REGEXP_INVALID_CAPTURE_GROUP_NAME`; SQLSTATE: HY000
  Message: A capture group has an invalid name.
  `ER_REGEXP_INVALID_CAPTURE_GROUP_NAME` was added in 8.0.11.

- Error number: 3888; Symbol: `ER_DA_SSL_LIBRARY_ERROR`; SQLSTATE: HY000
  Message: Failed to set up SSL because of the following SSL library error: %s
  `ER_DA_SSL_LIBRARY_ERROR` was added in 8.0.17.

- Error number: 3889; Symbol: `ER_SECONDARY_ENGINE`; SQLSTATE: HY000
  Message: Secondary engine operation failed. %s.
  `ER_SECONDARY_ENGINE` was added in 8.0.13.

- Error number: 3890; Symbol: `ER_SECONDARY_ENGINE_DDL`; SQLSTATE: HY000
  Message: DDLs on a table with a secondary engine defined are not allowed.
  `ER_SECONDARY_ENGINE_DDL` was added in 8.0.13.

- Error number: 3891; Symbol: `ER_INCORRECT_CURRENT_PASSWORD`; SQLSTATE: HY000
  Message: Incorrect current password. Specify the correct password which has to be replaced.
  `ER_INCORRECT_CURRENT_PASSWORD` was added in 8.0.13.

- Error number: 3892; Symbol: `ER_MISSING_CURRENT_PASSWORD`; SQLSTATE: HY000
  Message: Current password needs to be specified in the REPLACE clause in order to change it.
  `ER_MISSING_CURRENT_PASSWORD` was added in 8.0.13.
Server Error Message Reference

- **Error number: 3893**: Symbol: `ER_CURRENT_PASSWORD_NOT_REQUIRED`; SQLSTATE: `HY000`
  
  Message: Do not specify the current password while changing it for other users.

  `ER_CURRENT_PASSWORD_NOT_REQUIRED` was added in 8.0.13.

- **Error number: 3894**: Symbol: `ER_PASSWORD_CANNOT_BE RETAINED_ON_PLUGIN_CHANGE`; SQLSTATE: `HY000`
  
  Message: Current password can not be retained for user '%s'@'%s' because authentication plugin is being changed.

  `ER_PASSWORD_CANNOT_BE_RETAINED_ON_PLUGIN_CHANGE` was added in 8.0.14.

- **Error number: 3895**: Symbol: `ER_CURRENT_PASSWORD_CANNOT_BE_RETAINED`; SQLSTATE: `HY000`
  
  Message: Current password can not be retained for user '%s'@'%s' because new password is empty.

  `ER_CURRENT_PASSWORD_CANNOT_BE_RETAINED` was added in 8.0.14.

- **Error number: 3896**: Symbol: `ER_PARTIAL_REVOKE_EXIST`; SQLSTATE: `HY000`
  
  Message: At least one partial revoke exists on a database. The system variable '@@partial_revoke' must be set to ON.

  `ER_PARTIAL_REVOKE_EXIST` was added in 8.0.16.

- **Error number: 3897**: Symbol: `ER_CANNOT_GRANT_SYSTEM_PRIV_TO_MANDATORY_ROLE`; SQLSTATE: `HY000`
  
  Message: AuthId '%s'@'%s' is set as mandatory_roles. Cannot grant the '%s' privilege.

  `ER_CANNOT_GRANT_SYSTEM_PRIV_TO_MANDATORY_ROLE` was added in 8.0.16.

- **Error number: 3898**: Symbol: `ER_XA_REPLICATION_FILTERS`; SQLSTATE: `HY000`
  
  Message: The use of replication filters with XA transactions is not supported, and can lead to an undefined state in the replication slave.

  `ER_XA_REPLICATION_FILTERS` was added in 8.0.12.

- **Error number: 3899**: Symbol: `ER_UNSUPPORTED_SQL_MODE`; SQLSTATE: `HY000`
  
  Message: sql_mode=0x%08x is not supported.

  `ER_UNSUPPORTED_SQL_MODE` was added in 8.0.11.

- **Error number: 3900**: Symbol: `ER_REGEXP_INVALID_FLAG`; SQLSTATE: `HY000`
  
  Message: Invalid match mode flag in regular expression.

  `ER_REGEXP_INVALID_FLAG` was added in 8.0.12.
• Error number: 3901; Symbol: ER_PARTIAL_REVOKE_AND_DB_GRANT_BOTH_EXISTS; SQLSTATE: HY000
  Message: '%s' privilege for database '%s' exists both as partial revoke and mysql.db simultaneously. It could mean that the 'mysql' schema is corrupted.
  ER_PARTIAL_REVOKE_AND_DB_GRANT_BOTH_EXISTS was added in 8.0.16.
• Error number: 3902; Symbol: ER_UNIT_NOT_FOUND; SQLSTATE: SU001
  Message: There's no unit of measure named '%s'.
  ER_UNIT_NOT_FOUND was added in 8.0.14.
• Error number: 3903; Symbol: ER_INVALID_JSON_VALUE_FOR_FUNC_INDEX; SQLSTATE: 22018
  Message: Invalid JSON value for CAST for functional index '%s'.
  ER_INVALID_JSON_VALUE_FOR_FUNC_INDEX was added in 8.0.16.
• Error number: 3904; Symbol: ER_JSON_VALUE_OUT_OF_RANGE_FOR_FUNC_INDEX; SQLSTATE: 22003
  Message: Out of range JSON value for CAST for functional index '%s'.
  ER_JSON_VALUE_OUT_OF_RANGE_FOR_FUNC_INDEX was added in 8.0.16.
• Error number: 3905; Symbol: ER_EXCEEDED_MV_KEYS_NUM; SQLSTATE: HY000
  Message: Exceeded max number of values per record for multi-valued index '%s' by %u value(s).
  ER_EXCEEDED_MV_KEYS_NUM was added in 8.0.16.
• Error number: 3906; Symbol: ER_EXCEEDED_MV_KEYS_SPACE; SQLSTATE: HY000
  Message: Exceeded max total length of values per record for multi-valued index '%s' by %u bytes.
  ER_EXCEEDED_MV_KEYS_SPACE was added in 8.0.16.
• Error number: 3907; Symbol: ER_FUNCTIONAL_INDEX_DATA_IS_TOO_LONG; SQLSTATE: 22001
  Message: Data too long for functional index '%s'.
  ER_FUNCTIONAL_INDEX_DATA_IS_TOO_LONG was added in 8.0.16.
• Error number: 3908; Symbol: ER_WRONG_MVI_VALUE; SQLSTATE: HY000
  Message: Cannot store an array or an object in a scalar key part of the index '%s'.
  ER_WRONG_MVI_VALUE was added in 8.0.16.
• Error number: 3909; Symbol: ER_WARN_FUNC_INDEX_NOT_APPLICABLE; SQLSTATE: HY000
  Message: Cannot use functional index '%s' due to type or collation conversion.
  ER_WARN_FUNC_INDEX_NOT_APPLICABLE was added in 8.0.16.
• Error number: 3910; Symbol: ER_GRP_RPL_UDF_ERROR; SQLSTATE: HY000
  Message: The function '%s' failed. %s
**ER_GRP_RPL_UDF_ERROR** was added in 8.0.13.

- **Error number:** 3911; Symbol: **ER_UPDATE_GTID_PURGED_WITH_GR**; SQLSTATE: **HY000**
  
  Message: Cannot update GTID_PURGED with the Group Replication plugin running

**ER_UPDATE_GTID_PURGED_WITH_GR** was added in 8.0.12.

- **Error number:** 3912; Symbol: **ER_GROUPING_ON_TIMESTAMP_IN_DST**; SQLSTATE: **HY000**
  
  Message: Grouping on temporal is non-deterministic for timezones having DST. Please consider switching to UTC for this query.

**ER_GROUPING_ON_TIMESTAMP_IN_DST** was added in 8.0.17.

- **Error number:** 3913; Symbol: **ER_TABLE_NAME_CAUSES_TOO_LONG_PATH**; SQLSTATE: **HY000**
  
  Message: Long database name and identifier for object resulted in a path length too long for table '%s'. Please check the path limit for your OS.

**ER_TABLE_NAME_CAUSES_TOO_LONG_PATH** was added in 8.0.4.

- **Error number:** 3914; Symbol: **ER_AUDIT_LOG_INSUFFICIENT_PRIVILEGE**; SQLSTATE: **HY000**
  
  Message: Request ignored for '%s'@'%s'. Role needed to perform operation: '%s'

**ER_AUDIT_LOG_INSUFFICIENT_PRIVILEGE** was added in 8.0.16.

- **Error number:** 3916; Symbol: **ER_DA_GRP_RPL_STARTED_AUTO_REJOIN**; SQLSTATE: **HY000**
  
  Message: Started auto-rejoin procedure attempt %lu of %lu

**ER_DA_GRP_RPL_STARTED_AUTO_REJOIN** was added in 8.0.17.

- **Error number:** 3917; Symbol: **ER_SYSVAR_CHANGE_DURING_QUERY**; SQLSTATE: **HY000**
  
  Message: A plugin was loaded or unloaded during a query, a system variable table was changed.

**ER_SYSVAR_CHANGE_DURING_QUERY** was added in 8.0.18.

- **Error number:** 3918; Symbol: **ER_GLOBSTAT_CHANGE_DURING_QUERY**; SQLSTATE: **HY000**
  
  Message: A plugin was loaded or unloaded during a query, a global status variable was changed.

**ER_GLOBSTAT_CHANGE_DURING_QUERY** was added in 8.0.18.

- **Error number:** 3919; Symbol: **ER_GRP_RPL_MESSAGE_SERVICE_INIT_FAILURE**; SQLSTATE: **HY000**
  
  Message: The START GROUP_REPLICATION command failed to start its message service.

**ER_GRP_RPL_MESSAGE_SERVICE_INIT_FAILURE** was added in 8.0.18.

- **Error number:** 3920; Symbol: **ER_CHANGE_MASTER_WRONG_COMPRESSION_ALGORITHM_CLIENT**; SQLSTATE: **HY000**
  
  Message: Invalid MASTER_COMPRESSION_ALGORITHMS '%s' for channel '%s'.

**ER_CHANGE_MASTER_WRONG_COMPRESSION_ALGORITHM_CLIENT** was added in 8.0.18.
• Error number: 3921; Symbol: `ER CHANGE MASTER WRONG COMPRESSION LEVEL CLIENT`; SQLSTATE: `HY000`
Message: Invalid `MASTER_ZSTD COMPRESSION LEVEL %u` for channel '%s'.
`ER CHANGE MASTER WRONG COMPRESSION LEVEL CLIENT` was added in 8.0.18.

• Error number: 3922; Symbol: `ER WRONG COMPRESSION ALGORITHM CLIENT`; SQLSTATE: `HY000`
Message: Invalid compression algorithm '%s'.
`ER WRONG COMPRESSION ALGORITHM CLIENT` was added in 8.0.18.

• Error number: 3923; Symbol: `ER WRONG COMPRESSION LEVEL CLIENT`; SQLSTATE: `HY000`
Message: Invalid `zstd compression level for algorithm '%s'`. 
`ER WRONG COMPRESSION LEVEL CLIENT` was added in 8.0.18.

• Error number: 3924; Symbol: `ER CHANGE MASTER WRONG COMPRESSION ALGORITHM LIST CLIENT`; SQLSTATE: `HY000`
Message: Specified compression algorithm list '%s' exceeds total count of 3 for channel '%s'.
`ER CHANGE MASTER WRONG COMPRESSION ALGORITHM LIST CLIENT` was added in 8.0.18.

• Error number: 3925; Symbol: `ER CLIENT PRIVILEGE CHECKS USER CANNOT BE ANONYMOUS`; SQLSTATE: `HY000`
Message: PRIVILEGE_CHECKS_USER for replication channel '%s' was set to `@%s`, but anonymous users are disallowed for PRIVILEGE_CHECKS_USER.
`ER CLIENT PRIVILEGE CHECKS USER CANNOT BE ANONYMOUS` was added in 8.0.18.

• Error number: 3926; Symbol: `ER CLIENT PRIVILEGE CHECKS USER DOES NOT EXIST`; SQLSTATE: `HY000`
Message: PRIVILEGE_CHECKS_USER for replication channel '%s' was set to `%s`@`%s`, but this is not an existing user.
`ER CLIENT PRIVILEGE CHECKS USER DOES NOT EXIST` was added in 8.0.18.

• Error number: 3927; Symbol: `ER CLIENT PRIVILEGE CHECKS USER CORRUPT`; SQLSTATE: `HY000`
Message: Invalid, corrupted PRIVILEGE_CHECKS_USER was found in the replication configuration repository for channel '%s'. Use CHANGE MASTER TO PRIVILEGE_CHECKS_USER to correct the configuration.
`ER CLIENT PRIVILEGE CHECKS USER CORRUPT` was added in 8.0.18.

• Error number: 3928; Symbol: `ER CLIENT PRIVILEGE CHECKS USER NEEDS RPL APPLIER PRIV`; SQLSTATE: `HY000`
Message: PRIVILEGE_CHECKS_USER for replication channel '%s' was set to '%s'@'%s', but this user does not have REPLICATION_APPLIER privilege.
`ER CLIENT PRIVILEGE_CHECKS_USER NEEDS RPL APPLIER PRIV` was added in 8.0.18.
Server Error Message Reference

- Error number: 3929; Symbol: ER_WARN_DA_PRIVILEGE_NOT_REGISTERED; SQLSTATE: HY000
  Message: Dynamic privilege '%s' is not registered with the server.
  ER_WARN_DA_PRIVILEGE_NOT_REGISTERED was added in 8.0.18.

Message: Misplaced INTO clause, INTO is not allowed inside subqueries, and must be placed at end of UNION clauses.

ER_MISPLACED_INTO was added in 8.0.19.
Server Error Message Reference

- **Error number: 3955; Symbol:**
  `ER_USER_ACCESS_DENIED_FOR_USER_ACCOUNT_BLOCKED_BY_PASSWORD_LOCK`; SQLSTATE: HY000
  
  Message: Access denied for user `%'@'%'`. Account is blocked for `%s` day(s) (%s day(s) remaining) due to %u consecutive failed logins.
  
  `ER_USER_ACCESS_DENIED_FOR_USER_ACCOUNT_BLOCKED_BY_PASSWORD_LOCK` was added in 8.0.19.

- **Error number: 3956; Symbol:**
  `ER_WARN_DEPRECATED_YEAR_UNSIGNED`; SQLSTATE: HY000
  
  Message: UNSIGNED for the YEAR data type is deprecated and support for it will be removed in a future release.
  
  `ER_WARN_DEPRECATED_YEAR_UNSIGNED` was added in 8.0.19.

- **Error number: 3957; Symbol:**
  `ER_CLONE_NETWORK_PACKET`; SQLSTATE: HY000
  
  Message: Clone needs `max_allowed_packet` value to be %u or more. Current value is %u
  
  `ER_CLONE_NETWORK_PACKET` was added in 8.0.19.

- **Error number: 3958; Symbol:**
  `ER_SDI_OPERATION_FAILED_MISSING_RECORD`; SQLSTATE: HY000
  
  Message: Failed to %s sdi for %s.%s in %s due to missing record.
  
  `ER_SDI_OPERATION_FAILED_MISSING_RECORD` was added in 8.0.19.

- **Error number: 3959; Symbol:**
  `ER_DEPENDENT_BY_CHECK_CONSTRAINT`; SQLSTATE: HY000
  
  Message: Check constraint '%s' uses column '%s', hence column cannot be dropped or renamed.
  
  `ER_DEPENDENT_BY_CHECK_CONSTRAINT` was added in 8.0.19.

- **Error number: MY-010000; Symbol:**
  `ER_PARSER_TRACE`; SQLSTATE: XX999
  
  Message: Parser saw: %s
  
  `ER_PARSER_TRACE` was added in 8.0.2.

- **Error number: MY-010001; Symbol:**
  `ER_BOOTSTRAP_CANT_THREAD`; SQLSTATE: HY000
  
  Message: Can't create thread to handle bootstrap (errno: %d)
  
  `ER_BOOTSTRAP_CANT_THREAD` was added in 8.0.2.

- **Error number: MY-010002; Symbol:**
  `ER_TRIGGER_INVALID_VALUE`; SQLSTATE: HY000
  
  Message: Trigger for table '%s'.'%s': invalid %s value (%s).
  
  `ER_TRIGGER_INVALID_VALUE` was added in 8.0.2.

- **Error number: MY-010003; Symbol:**
  `ER_OPT_WRONG_TREE`; SQLSTATE: HY000
  
  Message: Wrong tree: %s
  
  `ER_OPT_WRONG_TREE` was added in 8.0.2.

- **Error number: MY-010004; Symbol:**
  `ER_DD_FAILSAFE`; SQLSTATE: HY000
Message: Error: Invalid %s

ER_DD_FAILSAFE was added in 8.0.2.

• Error number: MY-010005; Symbol: ER_DD_NO_WRITES_NO_REPOPULATION; SQLSTATE: HY000

Message: Skip re-populating collations and character sets tables in %s%sread-only mode.

ER_DD_NO_WRITES_NO_REPOPULATION was added in 8.0.2.

• Error number: MY-010006; Symbol: ER_DD_VERSION_FOUND; SQLSTATE: HY000

Message: Using data dictionary with version '%d'.

ER_DD_VERSION_FOUND was added in 8.0.2.

• Error number: MY-010007; Symbol: ER_DD_VERSION_INSTALLED; SQLSTATE: HY000

Message: Installed data dictionary with version '%d'.

ER_DD_VERSION_INSTALLED was added in 8.0.2.

• Error number: MY-010008; Symbol: ER_DD_VERSION_UNSUPPORTED; SQLSTATE: HY000

Message: Data Dictionary version '%d' not supported.

ER_DD_VERSION_UNSUPPORTED was added in 8.0.2.

• Error number: MY-010009; Symbol: ER_LOG_SYSLOG_FACILITY_FAIL; SQLSTATE: HY000

Message: Failed to set syslog facility to "%s", setting to "%s" (%d) instead.

ER_LOG_SYSLOG_FACILITY_FAIL was added in 8.0.2, removed after 8.0.12.

• Error number: MY-010010; Symbol: ER_LOG_SYSLOG_CANNOT_OPEN; SQLSTATE: HY000

Message: Cannot open %s; check privileges, or remove syseventlog from --log-error-services!

ER_LOG_SYSLOG_CANNOT_OPEN was added in 8.0.2.

• Error number: MY-010011; Symbol: ER_LOG_SLOW_CANNOT_OPEN; SQLSTATE: HY000

Message: Either restart the query logging by using "SET GLOBAL SLOW_QUERY_LOG=ON" or

ER_LOG_SLOW_CANNOT_OPEN was added in 8.0.2.

• Error number: MY-010012; Symbol: ER_LOG_GENERAL_CANNOT_OPEN; SQLSTATE: HY000

Message: Either restart the query logging by using "SET GLOBAL GENERAL_LOG=ON" or

ER_LOG_GENERAL_CANNOT_OPEN was added in 8.0.2.

• Error number: MY-010013; Symbol: ER_LOG_CANNOT_WRITE; SQLSTATE: HY000

Message: Failed to write to %s: %s

ER_LOG_CANNOT_WRITE was added in 8.0.2.

• Error number: MY-010014; Symbol: ER_RPL_ZOMBIE_ENCOUNTERED; SQLSTATE: HY000
Message: While initializing dump thread for slave with %s <%(s>, found a zombie dump thread with the same %s. Master is killing the zombie dump thread(%u).

**ER_RPL_ZOMBIE_ENCOUNTERED** was added in 8.0.2.

- **Error number:** MY-010015; Symbol: **ER_RPL_GTID_TABLE_CANNOT_OPEN**; SQLSTATE: HY000
  
  Message: Gtid table is not ready to be used. Table '%s.%s' cannot be opened.

  **ER_RPL_GTID_TABLE_CANNOT_OPEN** was added in 8.0.2.

- **Error number:** MY-010016; Symbol: **ER_SYSTEM_SCHEMA_NOT_FOUND**; SQLSTATE: HY000
  
  Message: System schema directory does not exist.

  **ER_SYSTEM_SCHEMA_NOT_FOUND** was added in 8.0.2.

- **Error number:** MY-010017; Symbol: **ER_DD_INIT_UPGRADE_FAILED**; SQLSTATE: HY000
  
  Message: Error in initializing dictionary, upgrade will do a cleanup and exit.

  **ER_DD_INIT_UPGRADE_FAILED** was added in 8.0.2.

- **Error number:** MY-010018; Symbol: **ER_VIEW_UNKNOWN_CHARSET_OR_COLLATION**; SQLSTATE: HY000
  
  Message: View '%s'.%s': unknown charset name and/or collation name (client: '%s'; connection: '%s').

  **ER_VIEW_UNKNOWN_CHARSET_OR_COLLATION** was added in 8.0.2.

- **Error number:** MY-010019; Symbol: **ER_DD_VIEW_CANT_ALLOC_CHARSET**; SQLSTATE: HY000
  
  Message: Error in allocating memory for character set name for view %s.%s.

  **ER_DD_VIEW_CANT_ALLOC_CHARSET** was added in 8.0.2.

- **Error number:** MY-010020; Symbol: **ER_DD_INIT_FAILED**; SQLSTATE: HY000
  
  Message: Data Dictionary initialization failed.

  **ER_DD_INIT_FAILED** was added in 8.0.2.

- **Error number:** MY-010021; Symbol: **ER_DD_UPDATING_PLUGIN_MD_FAILED**; SQLSTATE: HY000
  
  Message: Failed to update plugin metadata in dictionary tables.

  **ER_DD_UPDATING_PLUGIN_MD_FAILED** was added in 8.0.2.

- **Error number:** MY-010022; Symbol: **ER_DD_POPULATING_TABLES_FAILED**; SQLSTATE: HY000
  
  Message: Failed to Populate DD tables.

  **ER_DD_POPULATING_TABLES_FAILED** was added in 8.0.2.

- **Error number:** MY-010023; Symbol: **ER_DD_VIEW_CANT_CREATE**; SQLSTATE: HY000
  
  Message: Error in Creating View %s.%s

  **ER_DD_VIEW_CANT_CREATE** was added in 8.0.2.
• Error number: MY-010024; Symbol: ER_DD_METADATA_NOT_FOUND; SQLSTATE: HY000
  Message: Unable to start server. Cannot find the meta data for data dictionary table '%s'.
  ER_DD_METADATA_NOT_FOUND was added in 8.0.2.

• Error number: MY-010025; Symbol: ER_DD_CACHE_NOT_EMPTY_AT_SHUTDOWN; SQLSTATE: HY000
  Message: Dictionary cache not empty at shutdown.
  ER_DD_CACHE_NOT_EMPTY_AT_SHUTDOWN was added in 8.0.2.

• Error number: MY-010026; Symbol: ER_DD_OBJECT_REMAINS; SQLSTATE: HY000
  Message: Dictionary objects used but not released.
  ER_DD_OBJECT_REMAINS was added in 8.0.2.

• Error number: MY-010027; Symbol: ER_DD_OBJECT_REMAINS_IN_RELEASER; SQLSTATE: HY000
  Message: Dictionary objects left in default releaser.
  ER_DD_OBJECT_REMAINS_IN_RELEASER was added in 8.0.2.

• Error number: MY-010028; Symbol: ER_DD_OBJECT_RELEASER_REMAINS; SQLSTATE: HY000
  Message: Dictionary object auto releaser not deleted
  ER_DD_OBJECT_RELEASER_REMAINS was added in 8.0.2.

• Error number: MY-010029; Symbol: ER_DD_CANT_GET_OBJECT_KEY; SQLSTATE: HY000
  Message: Error: Unable to create primary object key
  ER_DD_CANT_GET_OBJECT_KEY was added in 8.0.2.

• Error number: MY-010030; Symbol: ER_DD_CANT_CREATE_OBJECT_KEY; SQLSTATE: HY000
  Message: Error: Unable to create object key
  ER_DD_CANT_CREATE_OBJECT_KEY was added in 8.0.2.

• Error number: MY-010031; Symbol: ER_CANT_CREATE_HANDLE_MGR_THREAD; SQLSTATE: HY000
  Message: Can't create handle_manager thread (errno= %d)
  ER_CANT_CREATE_HANDLE_MGR_THREAD was added in 8.0.2.

• Error number: MY-010032; Symbol: ER_RPL_REPO_HAS_GAPS; SQLSTATE: HY000
  Message: It is not possible to change the type of the relay log's repository because there are workers' repositories with gaps. Please, fix the gaps first before doing such change.
  ER_RPL_REPO_HAS_GAPS was added in 8.0.2.

• Error number: MY-010033; Symbol: ER_INVALID_VALUE_FOR_ENFORCE_GTID_CONSISTENCY; SQLSTATE: HY000
  Message: option 'enforce-gtid-consistency': value '%s' was not recognized. Setting enforce-gtid-consistency to OFF.
ER_INVALID_VALUE_FOR_ENFORCE_GTID_CONSISTENCY was added in 8.0.2.

- Error number: MY-010034; Symbol: ER_CHANGED_ENFORCE_GTID_CONSISTENCY; SQLSTATE: HY000
  Message: Changed ENFORCE_GTID_CONSISTENCY from %s to %s.
  ER_CHANGED_ENFORCE_GTID_CONSISTENCY was added in 8.0.2.

- Error number: MY-010035; Symbol: ER_CHANGED_GTID_MODE; SQLSTATE: HY000
  Message: Changed GTID_MODE from %s to %s.
  ER_CHANGED_GTID_MODE was added in 8.0.2.

- Error number: MY-010036; Symbol: ER_DISABLED_STORAGE_ENGINE_AS_DEFAULT; SQLSTATE: HY000
  Message: %s is set to a disabled storage engine %s.
  ER_DISABLED_STORAGE_ENGINE_AS_DEFAULT was added in 8.0.2.

- Error number: MY-010037; Symbol: ER_DEBUG_SYNC_HIT; SQLSTATE: HY000
  Message: Debug sync points hit: %s
  ER_DEBUG_SYNC_HIT was added in 8.0.2.

- Error number: MY-010038; Symbol: ER_DEBUG_SYNC_EXECUTED; SQLSTATE: HY000
  Message: Debug sync points executed: %s
  ER_DEBUG_SYNC_EXECUTED was added in 8.0.2.

- Error number: MY-010039; Symbol: ER_DEBUG_SYNC_THREAD_MAX; SQLSTATE: HY000
  Message: Debug sync points max active per thread: %s
  ER_DEBUG_SYNC_THREAD_MAX was added in 8.0.2.

- Error number: MY-010040; Symbol: ER_DEBUG_SYNC_OOM; SQLSTATE: HY000
  Message: Debug Sync Facility disabled due to lack of memory.
  ER_DEBUG_SYNC_OOM was added in 8.0.2.

- Error number: MY-010041; Symbol: ER_CANT_INIT_TC_LOG; SQLSTATE: HY000
  Message: Can't init tc log
  ER_CANT_INIT_TC_LOG was added in 8.0.2.

- Error number: MY-010042; Symbol: ER_EVENT_CANT_INIT_QUEUE; SQLSTATE: HY000
  Message: Event Scheduler: Can't initialize the execution queue
  ER_EVENT_CANT_INIT_QUEUE was added in 8.0.2.

- Error number: MY-010043; Symbol: ER_EVENT_PURGING_QUEUE; SQLSTATE: HY000
Message: Event Scheduler: Purging the queue. %u events

\texttt{ER\_EVENT\_PURGING\_QUEUE} was added in 8.0.2.

- Error number: \texttt{MY-010044}; Symbol: \texttt{ER\_EVENT\_LAST\_EXECUTION}; SQLSTATE: HY000

Message: Event Scheduler: Last execution of %s.%s. %s

\texttt{ER\_EVENT\_LAST\_EXECUTION} was added in 8.0.2.

- Error number: \texttt{MY-010045}; Symbol: \texttt{ER\_EVENT\_MESSAGE\_STACK}; SQLSTATE: HY000

Message: %s

\texttt{ER\_EVENT\_MESSAGE\_STACK} was added in 8.0.2.

- Error number: \texttt{MY-010046}; Symbol: \texttt{ER\_EVENT\_EXECUTION\_FAILED}; SQLSTATE: HY000

Message: Event Scheduler: [%s].[%s.%s] event execution failed.

\texttt{ER\_EVENT\_EXECUTION\_FAILED} was added in 8.0.2.

- Error number: \texttt{MY-010047}; Symbol: \texttt{ER\_CANT\_INIT\_SCHEDULER\_THREAD}; SQLSTATE: HY000

Message: Event Scheduler: Cannot initialize the scheduler thread

\texttt{ER\_CANT\_INIT\_SCHEDULER\_THREAD} was added in 8.0.2.

- Error number: \texttt{MY-010048}; Symbol: \texttt{ER\_SCHEDULER\_STOPPED}; SQLSTATE: HY000

Message: Event Scheduler: Stopped

\texttt{ER\_SCHEDULER\_STOPPED} was added in 8.0.2.

- Error number: \texttt{MY-010049}; Symbol: \texttt{ER\_CANT\_CREATE\_SCHEDULER\_THREAD}; SQLSTATE: HY000

Message: Event scheduler: Failed to start scheduler, Can not create thread for event scheduler (errno= %d)

\texttt{ER\_CANT\_CREATE\_SCHEDULER\_THREAD} was added in 8.0.2.

- Error number: \texttt{MY-010050}; Symbol: \texttt{ER\_SCHEDULER\_WAITING}; SQLSTATE: HY000

Message: Event Scheduler: Waiting for the scheduler thread to reply

\texttt{ER\_SCHEDULER\_WAITING} was added in 8.0.2.

- Error number: \texttt{MY-010051}; Symbol: \texttt{ER\_SCHEDULER\_STARTED}; SQLSTATE: HY000

Message: Event Scheduler: scheduler thread started with id %u

\texttt{ER\_SCHEDULER\_STARTED} was added in 8.0.2.

- Error number: \texttt{MY-010052}; Symbol: \texttt{ER\_SCHEDULER\_STOPPING\_FAILED\_TO\_GET\_EVENT}; SQLSTATE: HY000

Message: Event Scheduler: Serious error during getting next event to execute. Stopping

\texttt{ER\_SCHEDULER\_STOPPING\_FAILED\_TO\_GET\_EVENT} was added in 8.0.2.
• Error number: MY-010053; Symbol: ER_SCHEDULER_STOPPING_FAILED_TO_CREATE_WORKER; SQLSTATE: HY000

Message: Event_scheduler::execute_top: Can not create event worker thread (errno=%d). Stopping event scheduler

ER_SCHEDULER_STOPPING_FAILED_TO_CREATE_WORKER was added in 8.0.2.

• Error number: MY-010054; Symbol: ER_SCHEDULER_KILLING; SQLSTATE: HY000

Message: Event Scheduler: Killing the scheduler thread, thread id %u

ER_SCHEDULER_KILLING was added in 8.0.2.

• Error number: MY-010055; Symbol: ER_UNABLE_TO_RESOLVE_IP; SQLSTATE: HY000

Message: IP address '%s' could not be resolved: %s

ER_UNABLE_TO_RESOLVE_IP was added in 8.0.2.

• Error number: MY-010056; Symbol: ER_UNABLE_TO_RESOLVE_HOSTNAME; SQLSTATE: HY000

Message: Host name '%s' could not be resolved: %s

ER_UNABLE_TO_RESOLVE_HOSTNAME was added in 8.0.2.

• Error number: MY-010057; Symbol: ER_HOSTNAME_RESEMBLES_IPV4; SQLSTATE: HY000

Message: IP address '%s' has been resolved to the host name '%s', which resembles IPv4-address itself.

ER_HOSTNAME_RESEMBLES_IPV4 was added in 8.0.2.

• Error number: MY-010058; Symbol: ER_HOSTNAME_DOESNT_RESOLVE_TO; SQLSTATE: HY000

Message: Hostname '%s' does not resolve to '%s'.

ER_HOSTNAME_DOESNT_RESOLVE_TO was added in 8.0.2.

• Error number: MY-010059; Symbol: ER_ADDRESSES_FOR_HOSTNAME_HEADER; SQLSTATE: HY000

Message: Hostname '%s' has the following IP addresses:

ER_ADDRESSES_FOR_HOSTNAME_HEADER was added in 8.0.2.

• Error number: MY-010060; Symbol: ER_ADDRESSES_FOR_HOSTNAME_LIST_ITEM; SQLSTATE: HY000

Message: - %s

ER_ADDRESSES_FOR_HOSTNAME_LIST_ITEM was added in 8.0.2.

• Error number: MY-010061; Symbol: ER_TRG_WITHOUT_DEFINER; SQLSTATE: HY000

Message: Definer clause is missing in Trigger of Table %s. Rebuild Trigger to fix definer.

ER_TRG_WITHOUT_DEFINER was added in 8.0.2.

• Error number: MY-010062; Symbol: ER_TRG_NO_CLIENT_CHARSET; SQLSTATE: HY000
Message: Client character set is missing for trigger of table %s. Using default character set.

`ER_TRG_NO_CLIENT_CHARSET` was added in 8.0.2.

- Error number: `MY-010063`; Symbol: `ER_PARSING_VIEW`; SQLSTATE: `HY000`

Message: Error in parsing view %s.%s

`ER_PARSING_VIEW` was added in 8.0.2.

- Error number: `MY-010064`; Symbol: `ER_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP`; SQLSTATE: `HY000`

Message: Failed to bootstrap components infrastructure.

`ER_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP` was added in 8.0.2.

- Error number: `MY-010065`; Symbol: `ER_COMPONENTS_INFRASTRUCTURE_SHUTDOWN`; SQLSTATE: `HY000`

Message: Failed to shutdown components infrastructure.

`ER_COMPONENTS_INFRASTRUCTURE_SHUTDOWN` was added in 8.0.2.

- Error number: `MY-010066`; Symbol: `ER_COMPONENTS_PERSIST_LOADER_BOOTSTRAP`; SQLSTATE: `HY000`

Message: Failed to bootstrap persistent components loader.

`ER_COMPONENTS_PERSIST_LOADER_BOOTSTRAP` was added in 8.0.2.

- Error number: `MY-010067`; Symbol: `ER_DEPART_WITH_GRACE`; SQLSTATE: `HY000`

Message: Giving %d client threads a chance to die gracefully

`ER_DEPART_WITH_GRACE` was added in 8.0.2.

- Error number: `MY-010068`; Symbol: `ER_CA_SELF_SIGNED`; SQLSTATE: `HY000`

Message: CA certificate %s is self signed.

`ER_CA_SELF_SIGNED` was added in 8.0.2.

- Error number: `MY-010069`; Symbol: `ER_SSL_LIBRARY_ERROR`; SQLSTATE: `HY000`

Message: Failed to set up SSL because of the following SSL library error: %s

`ER_SSL_LIBRARY_ERROR` was added in 8.0.2.

- Error number: `MY-010070`; Symbol: `ER_NO_THD_NO_UUID`; SQLSTATE: `HY000`

Message: Failed to generate a server UUID because it is failed to allocate the THD.

`ER_NO_THD_NO_UUID` was added in 8.0.2.

- Error number: `MY-010071`; Symbol: `ER_UUID_SALT`; SQLSTATE: `HY000`

Message: Salting uuid generator variables, current_pid: %lu, server_start_time: %lu, bytes_sent: %llu,
**ER_UUID_SALT** was added in 8.0.2.

- **Error number:** MY-010072; Symbol: ER_UUID_IS; SQLSTATE: HY000
  Message: Generated uuid: '%s', server_start_time: %lu, bytes_sent: %llu
  **ER_UUID_IS** was added in 8.0.2.

- **Error number:** MY-010073; Symbol: ER_UUID_INVALID; SQLSTATE: HY000
  Message: The server_uuid stored in auto.cnf file is not a valid UUID.
  **ER_UUID_INVALID** was added in 8.0.2.

- **Error number:** MY-010074; Symbol: ER_UUID_SCRUB; SQLSTATE: HY000
  Message: Garbage characters found at the end of the server_uuid value in auto.cnf file. It should be of length '%d' (UUID_LENGTH). Clear it and restart the server.
  **ER_UUID_SCRUB** was added in 8.0.2.

- **Error number:** MY-010075; Symbol: ER_CREATING_NEW_UUID; SQLSTATE: HY000
  Message: No existing UUID has been found, so we assume that this is the first time that this server has been started. Generating a new UUID: %s.
  **ER_CREATING_NEW_UUID** was added in 8.0.2.

- **Error number:** MY-010076; Symbol: ER_CANT_CREATE_UUID; SQLSTATE: HY000
  Message: Initialization of the server’s UUID failed because it could not be read from the auto.cnf file. If this is a new server, the initialization failed because it was not possible to generate a new UUID.
  **ER_CANT_CREATE_UUID** was added in 8.0.2.

- **Error number:** MY-010077; Symbol: ER_UNKNOWN_UNSUPPORTED_STORAGE_ENGINE; SQLSTATE: HY000
  Message: Unknown/unsupported storage engine: %s
  **ER_UNKNOWN_UNSUPPORTED_STORAGE_ENGINE** was added in 8.0.2.

- **Error number:** MY-010078; Symbol: ER_SECURE_AUTH_VALUE_UNSUPPORTED; SQLSTATE: HY000
  Message: Unsupported value 0 for secure-auth
  **ER_SECURE_AUTH_VALUE_UNSUPPORTED** was added in 8.0.2.

- **Error number:** MY-010079; Symbol: ER_INVALID_INSTRUMENT; SQLSTATE: HY000
  Message: Invalid instrument name or value for performance_schema_instrument '%s'
  **ER_INVALID_INSTRUMENT** was added in 8.0.2.

- **Error number:** MY-010080; Symbol: ER_INNODB_MANDATORY; SQLSTATE: HY000
  Message: The use of InnoDB is mandatory since MySQL 5.7. The former options like '--innodb=0/1/OFF/ON' or '--skip-innodb' are ignored.
**ER_INNODB_MANDATORY** was added in 8.0.2.

- **Error number:** MY-010082; **Symbol:** ER_OLD_PASSWORDS_NO_MIDDLE_GROUND; **SQLSTATE:** HY000
  
  Message: Invalid old_passwords mode: 1. Valid values are 2 and 0

  **ER_OLD_PASSWORDS_NO_MIDDLE_GROUND** was added in 8.0.2, removed after 8.0.15.

- **Error number:** MY-010083; **Symbol:** ER_VERBOSEREQUIRESHELP; **SQLSTATE:** HY000
  
  Message: --verbose is for use with --help; did you mean --log-error-verbosity?

  **ER_VERBOSEREQUIRESHELP** was added in 8.0.2.

- **Error number:** MY-010084; **Symbol:** ER_POINTLESSWITHOUTSLOWLOG; **SQLSTATE:** HY000
  
  Message: options --log-slow-admin-statements, --log-queries-not-using-indexes and --log-slow-slave-statements have no effect if --log-slow-query-log is not set

  **ER_POINTLESSWITHOUTSLOWLOG** was added in 8.0.2.

- **Error number:** MY-010085; **Symbol:** ER_WASTEFUL_NET_BUFFER_SIZE; **SQLSTATE:** HY000
  
  Message: net_buffer_length (%lu) is set to be larger than max_allowed_packet (%lu). Please rectify.

  **ER_WASTEFUL_NET_BUFFER_SIZE** was added in 8.0.2.

- **Error number:** MY-010086; **Symbol:** ER_DEPRECATED_TIMESTAMP_IMPLICIT_DEFAULTS; **SQLSTATE:** HY000
  
  Message: TIMESTAMP with implicit DEFAULT value is deprecated. Please use --explicit_defaults_for_timestamp server option (see documentation for more details).

  **ER_DEPRECATED_TIMESTAMP_IMPLICIT_DEFAULTS** was added in 8.0.2.

- **Error number:** MY-010087; **Symbol:** ER_FT_BOOL_SYNTAX_INVALID; **SQLSTATE:** HY000
  
  Message: Invalid ft-boolean-syntax string: %s

  **ER_FT_BOOL_SYNTAX_INVALID** was added in 8.0.2.

- **Error number:** MY-010088; **Symbol:** ER_CREDENTIALLESS_AUTO_USER_BAD; **SQLSTATE:** HY000
  
  Message: 'NO_AUTO_CREATE_USER' sql mode was not set.

  **ER_CREDENTIALLESS_AUTO_USER_BAD** was added in 8.0.2.

- **Error number:** MY-010089; **Symbol:** ER_CONNECTION_HANDLING_OOM; **SQLSTATE:** HY000
  
  Message: Could not allocate memory for connection handling

  **ER_CONNECTION_HANDLING_OOM** was added in 8.0.2.

- **Error number:** MY-010090; **Symbol:** ER_THREAD_HANDLING_OOM; **SQLSTATE:** HY000
  
  Message: Could not allocate memory for thread handling

  **ER_THREAD_HANDLING_OOM** was added in 8.0.2.
Server Error Message Reference

- Error number: MY-010091; Symbol: ER_CANT_CREATE_TEST_FILE; SQLSTATE: HY000
  Message: Can't create test file %s
  ER_CANT_CREATE_TEST_FILE was added in 8.0.2.

- Error number: MY-010092; Symbol: ER_CANT_CREATE_PID_FILE; SQLSTATE: HY000
  Message: Can't start server: can't create PID file: %s
  ER_CANT_CREATE_PID_FILE was added in 8.0.2.

- Error number: MY-010093; Symbol: ER_CANT_REMOVE_PID_FILE; SQLSTATE: HY000
  Message: Unable to delete pid file: %s
  ER_CANT_REMOVE_PID_FILE was added in 8.0.2.

- Error number: MY-010094; Symbol: ER_CANT_CREATE_SHUTDOWN_THREAD; SQLSTATE: HY000
  Message: Can't create thread to handle shutdown requests (errno= %d)
  ER_CANT_CREATE_SHUTDOWN_THREAD was added in 8.0.2.

- Error number: MY-010095; Symbol: ER_SEC_FILE_PRIV_CANT_ACCESS_DIR; SQLSTATE: HY000
  Message: Failed to access directory for --secure-file-priv. Please make sure that directory exists and is accessible by MySQL Server. Supplied value : %s
  ER_SEC_FILE_PRIV_CANT_ACCESS_DIR was added in 8.0.2.

- Error number: MY-010096; Symbol: ER_SEC_FILE_PRIV_IGNORED; SQLSTATE: HY000
  Message: Ignoring --secure-file-priv value as server is running with --initialize(-insecure).
  ER_SEC_FILE_PRIV_IGNORED was added in 8.0.2.

- Error number: MY-010097; Symbol: ER_SEC_FILE_PRIV_EMPTY; SQLSTATE: HY000
  Message: Insecure configuration for --secure-file-priv: Current value does not restrict location of generated files. Consider setting it to a valid, non-empty path.
  ER_SEC_FILE_PRIV_EMPTY was added in 8.0.2.

- Error number: MY-010098; Symbol: ER_SEC_FILE_PRIV_NULL; SQLSTATE: HY000
  Message: --secure-file-priv is set to NULL. Operations related to importing and exporting data are disabled
  ER_SEC_FILE_PRIV_NULL was added in 8.0.2.

- Error number: MY-010099; Symbol: ER_SEC_FILE_PRIV_DIRECTORY_INSECURE; SQLSTATE: HY000
  Message: Insecure configuration for --secure-file-priv: %s is accessible through --secure-file-priv. Consider choosing a different directory.
  ER_SEC_FILE_PRIV_DIRECTORY_INSECURE was added in 8.0.2.

- Error number: MY-010100; Symbol: ER_SEC_FILE_PRIV_CANT_STAT; SQLSTATE: HY000
Message: Failed to get stat for directory pointed out by --secure-file-priv

**ER_SEC_FILE_PRIV_CANT_STAT** was added in 8.0.2.

- **Error number:** MY-010101; Symbol: **ER_SEC_FILE_PRIV_DIRECTORY_PERMISSIONS**; SQLSTATE: HY000
  
  Message: Insecure configuration for --secure-file-priv: Location is accessible to all OS users. Consider choosing a different directory.

  **ER_SEC_FILE_PRIV_DIRECTORY_PERMISSIONS** was added in 8.0.2.

- **Error number:** MY-010102; Symbol: **ER_SEC_FILE PRIV_ARGUMENT_TOO_LONG**; SQLSTATE: HY000
  
  Message: Value for --secure-file-priv is longer than maximum limit of %d

  **ER_SEC_FILE PRIV_ARGUMENT_TOO_LONG** was added in 8.0.2.

- **Error number:** MY-010103; Symbol: **ER_CANT_CREATE_NAMED_PIPES_THREAD**; SQLSTATE: HY000
  
  Message: Can't create thread to handle named pipes (errno= %d)

  **ER_CANT_CREATE_NAMED_PIPES_THREAD** was added in 8.0.2.

- **Error number:** MY-010104; Symbol: **ER_CANT_CREATE_TCPIP_THREAD**; SQLSTATE: HY000
  
  Message: Can't create thread to handle TCP/IP (errno= %d)

  **ER_CANT_CREATE_TCPIP_THREAD** was added in 8.0.2.

- **Error number:** MY-010105; Symbol: **ER_CANT_CREATE_SHM_THREAD**; SQLSTATE: HY000
  
  Message: Can't create thread to handle shared memory (errno= %d)

  **ER_CANT_CREATE_SHM_THREAD** was added in 8.0.2.

- **Error number:** MY-010106; Symbol: **ER_CANT_CREATE_INTERRUPT_THREAD**; SQLSTATE: HY000
  
  Message: Can't create interrupt-thread (error %d, errno: %d)

  **ER_CANT_CREATE_INTERRUPT_THREAD** was added in 8.0.2.

- **Error number:** MY-010107; Symbol: **ER_WRITABLE_CONFIG_REMOVED**; SQLSTATE: HY000
  
  Message: World-writable config file '%s' has been removed.

  **ER_WRITABLE_CONFIG_REMOVED** was added in 8.0.2.

- **Error number:** MY-010108; Symbol: **ER_CORE_VALUES**; SQLSTATE: HY000
  
  Message: setrlimit could not change the size of core files to 'infinity'; We may not be able to generate a core file on signals

  **ER_CORE_VALUES** was added in 8.0.2.

- **Error number:** MY-010109; Symbol: **ER_WRONG_DATETIME_SPEC**; SQLSTATE: HY000
  
  Message: Wrong date/time format specifier: %s
Server Error Message Reference

**ER_WRONG_DATETIME_SPEC** was added in 8.0.2.

- Error number: **MY-010110**; Symbol: **ER_RPL_BINLOG_FILTERS_OOM**; SQLSTATE: **HY000**
  
  Message: Could not allocate replication and binlog filters: %s

  **ER_RPL_BINLOG_FILTERS_OOM** was added in 8.0.2.

- Error number: **MY-010111**; Symbol: **ER_KEYCACHE_OOM**; SQLSTATE: **HY000**
  
  Message: Cannot allocate the keycache

  **ER_KEYCACHE_OOM** was added in 8.0.2.

- Error number: **MY-010112**; Symbol: **ER_CONFIRMING_THE_FUTURE**; SQLSTATE: **HY000**
  
  Message: Current time has got past year 2038. Validating current time with %d iterations before initiating the normal server shutdown process.

  **ER_CONFIRMING_THE_FUTURE** was added in 8.0.2.

- Error number: **MY-010113**; Symbol: **ER_BACK_IN_TIME**; SQLSTATE: **HY000**
  
  Message: Iteration %d: Obtained valid current time from system

  **ER_BACK_IN_TIME** was added in 8.0.2.

- Error number: **MY-010114**; Symbol: **ER_FUTURE_DATE**; SQLSTATE: **HY000**
  
  Message: Iteration %d: Current time obtained from system is greater than 2038

  **ER_FUTURE_DATE** was added in 8.0.2.

- Error number: **MY-010115**; Symbol: **ER_UNSUPPORTED_DATE**; SQLSTATE: **HY000**
  
  Message: This MySQL server doesn't support dates later then 2038

  **ER_UNSUPPORTED_DATE** was added in 8.0.2.

- Error number: **MY-010116**; Symbol: **ER_STARTING_AS**; SQLSTATE: **HY000**
  
  Message: %s (mysqld %s) starting as process %lu

  **ER_STARTING_AS** was added in 8.0.2.

- Error number: **MY-010117**; Symbol: **ER_SHUTTING_DOWN_SLAVE_THREADS**; SQLSTATE: **HY000**
  
  Message: Shutting down slave threads

  **ER_SHUTTING_DOWN_SLAVE_THREADS** was added in 8.0.2.

- Error number: **MY-010118**; Symbol: **ER_DISCONNECTING_REMAINING_CLIENTS**; SQLSTATE: **HY000**
  
  Message: Forcefully disconnecting %d remaining clients

  **ER_DISCONNECTING_REMAINING_CLIENTS** was added in 8.0.2.

- Error number: **MY-010119**; Symbol: **ER_ABORTING**; SQLSTATE: **HY000**
Message: Aborting

ER_ABORTING was added in 8.0.2.

- Error number: MY-010120; Symbol: ER_BINLOG_END; SQLSTATE: HY000
  Message: Binlog end

ER_BINLOG_END was added in 8.0.2.

- Error number: MY-010121; Symbol: ER_CALL_ME_LOCALHOST; SQLSTATE: HY000
  Message: gethostname failed, using '%s' as hostname

ER_CALL_ME_LOCALHOST was added in 8.0.2.

- Error number: MY-010122; Symbol: ER_USER_REQUIRES_ROOT; SQLSTATE: HY000
  Message: One can only use the --user switch if running as root

ER_USER_REQUIRES_ROOT was added in 8.0.2.

- Error number: MY-010123; Symbol: ER_REALLY_RUN_AS_ROOT; SQLSTATE: HY000
  Message: Fatal error: Please read “Security” section of the manual to find out how to run mysqld as root!

ER_REALLY_RUN_AS_ROOT was added in 8.0.2.

- Error number: MY-010124; Symbol: ER_USER_WHAT_USER; SQLSTATE: HY000
  Message: Fatal error: Can't change to run as user '%s' ; Please check that the user exists!

ER_USER_WHAT_USER was added in 8.0.2.

- Error number: MY-010125; Symbol: ER_TRANSPORTS_WHAT_TRANSPORTS; SQLSTATE: HY000
  Message: Server is started with --require-secure-transport=ON but no secure transports (SSL or Shared Memory) are configured.

ER_TRANSPORTS_WHAT_TRANSPORTS was added in 8.0.2.

- Error number: MY-010126; Symbol: ER_FAIL_SETGID; SQLSTATE: HY000
  Message: setgid: %s

ER_FAIL_SETGID was added in 8.0.2.

- Error number: MY-010127; Symbol: ER_FAIL_SETUID; SQLSTATE: HY000
  Message: setuid: %s

ER_FAIL_SETUID was added in 8.0.2.

- Error number: MY-010128; Symbol: ER_FAIL_SETREGID; SQLSTATE: HY000
  Message: setregid: %s

ER_FAIL_SETREGID was added in 8.0.2.
• Error number: MY-010129; Symbol: ER_FAIL_SETREUID; SQLSTATE: HY000
  Message: setreuid: %s
  ER_FAIL_SETREUID was added in 8.0.2.

• Error number: MY-010130; Symbol: ER_FAIL_CHROOT; SQLSTATE: HY000
  Message: chroot: %s
  ER_FAIL_CHROOT was added in 8.0.2.

• Error number: MY-010131; Symbol: ER_WIN_LISTEN_BUT_HOW; SQLSTATE: HY000
  Message: TCP/IP, --shared-memory, or --named-pipe should be configured on NT OS
  ER_WIN_LISTEN_BUT_HOW was added in 8.0.2.

• Error number: MY-010132; Symbol: ER_NOT_RIGHT_NOW; SQLSTATE: HY000
  Message: CTRL-C ignored during startup
  ER_NOT_RIGHT_NOW was added in 8.0.2.

• Error number: MY-010133; Symbol: ER_FIXING_CLIENT_CHARSET; SQLSTATE: HY000
  Message: '%s' can not be used as client character set. '%s' will be used as default client character set.
  ER_FIXING_CLIENT_CHARSET was added in 8.0.2.

• Error number: MY-010134; Symbol: ER_OOM; SQLSTATE: HY000
  Message: Out of memory
  ER_OOM was added in 8.0.2.

• Error number: MY-010135; Symbol: ER_FAILED_TO_LOCK_MEM; SQLSTATE: HY000
  Message: Failed to lock memory. Errno: %d
  ER_FAILED_TO_LOCK_MEM was added in 8.0.2.

• Error number: MY-010136; Symbol: ER_MYINIT_FAILED; SQLSTATE: HY000
  Message: my_init() failed.
  ER_MYINIT_FAILED was added in 8.0.2.

• Error number: MY-010137; Symbol: ER_BEG_INITFILE; SQLSTATE: HY000
  Message: Execution of init_file '%s' started.
  ER_BEG_INITFILE was added in 8.0.2.

• Error number: MY-010138; Symbol: ER_END_INITFILE; SQLSTATE: HY000
  Message: Execution of init_file '%s' ended.
  ER_END_INITFILE was added in 8.0.2.
• Error number: MY-010139; Symbol: ER_CHANGED_MAX_OPEN_FILES; SQLSTATE: HY000
  Message: Changed limits: max_open_files: %lu (requested %lu)
  ER_CHANGED_MAX_OPEN_FILES was added in 8.0.2.

• Error number: MY-010140; Symbol: ER_CANT_INCREASE_MAX_OPEN_FILES; SQLSTATE: HY000
  Message: Could not increase number of max_open_files to more than %lu (request: %lu)
  ER_CANT_INCREASE_MAX_OPEN_FILES was added in 8.0.2.

• Error number: MY-010141; Symbol: ER_CHANGED_MAX_CONNECTIONS; SQLSTATE: HY000
  Message: Changed limits: max_connections: %lu (requested %lu)
  ER_CHANGED_MAX_CONNECTIONS was added in 8.0.2.

• Error number: MY-010142; Symbol: ER_CHANGED_TABLE_OPEN_CACHE; SQLSTATE: HY000
  Message: Changed limits: table_open_cache: %lu (requested %lu)
  ER_CHANGED_TABLE_OPEN_CACHE was added in 8.0.2.

• Error number: MY-010143; Symbol: ER_THE_USER_ABIDES; SQLSTATE: HY000
  Message: Ignoring user change to '%s' because the user was set to '%s' earlier on the command line
  ER_THE_USER_ABIDES was added in 8.0.2.

• Error number: MY-010144; Symbol: ER_RPL_CANT_ADD_DO_TABLE; SQLSTATE: HY000
  Message: Could not add do table rule '%s'!
  ER_RPL_CANT_ADD_DO_TABLE was added in 8.0.2.

• Error number: MY-010145; Symbol: ER_RPL_CANT_ADD_IGNORE_TABLE; SQLSTATE: HY000
  Message: Could not add ignore table rule '%s'!
  ER_RPL_CANT_ADD_IGNORE_TABLE was added in 8.0.2.

• Error number: MY-010146; Symbol: ER_TRACK_VARIABLES_BOGUS; SQLSTATE: HY000
  Message: The variable session_track_system_variables either has duplicate values or invalid values.
  ER_TRACK_VARIABLES_BOGUS was added in 8.0.2.

• Error number: MY-010147; Symbol: ER_EXCESS_ARGUMENTS; SQLSTATE: HY000
  Message: Too many arguments (first extra is '%s').
  ER_EXCESS_ARGUMENTS was added in 8.0.2.

• Error number: MY-010148; Symbol: ER_VERBOSE_HINT; SQLSTATE: HY000
  Message: Use --verbose --help to get a list of available options!
  ER_VERBOSE_HINT was added in 8.0.2.
• Error number: MY-010149; Symbol: ER_CANT_READ_ERRMSGS; SQLSTATE: HY000
  Message: Unable to read errmsg.sys file
  ER_CANT_READ_ERRMSGS was added in 8.0.2.

• Error number: MY-010150; Symbol: ER_CANT_INIT_DBS; SQLSTATE: HY000
  Message: Can't init databases
  ER_CANT_INIT_DBS was added in 8.0.2.

• Error number: MY-010151; Symbol: ER_LOG_OUTPUT_CONTRADICTORY; SQLSTATE: HY000
  Message: There were other values specified to log-output besides NONE. Disabling slow and general logs anyway.
  ER_LOG_OUTPUT_CONTRADICTORY was added in 8.0.2.

• Error number: MY-010152; Symbol: ER_NO_CSV_NO_LOG_TABLES; SQLSTATE: HY000
  Message: CSV engine is not present, falling back to the log files
  ER_NO_CSV_NO_LOG_TABLES was added in 8.0.2.

• Error number: MY-010153; Symbol: ER_RPL_REWRITEDB_MISSING_ARROW; SQLSTATE: HY000
  Message: Bad syntax in replicate-rewrite-db - missing '->'!
  ER_RPL_REWRITEDB_MISSING_ARROW was added in 8.0.2.

• Error number: MY-010154; Symbol: ER_RPL_REWRITEDB_EMPTY_FROM; SQLSTATE: HY000
  Message: Bad syntax in replicate-rewrite-db - empty FROM db!
  ER_RPL_REWRITEDB_EMPTY_FROM was added in 8.0.2.

• Error number: MY-010155; Symbol: ER_RPL_REWRITEDB_EMPTY_TO; SQLSTATE: HY000
  Message: Bad syntax in replicate-rewrite-db - empty TO db!
  ER_RPL_REWRITEDB_EMPTY_TO was added in 8.0.2.

• Error number: MY-010156; Symbol: ER_LOG_FILES_GIVEN_LOG_OUTPUT_IS_TABLE; SQLSTATE: HY000
  Message: Although a path was specified for the %s, log tables are used. To enable logging to files use the --log-output=file option.
  ER_LOG_FILES_GIVEN_LOG_OUTPUT_IS_TABLE was added in 8.0.2.

• Error number: MY-010157; Symbol: ER_LOG_FILE_INVALID; SQLSTATE: HY000
  Message: Invalid value for %s: %s
  ER_LOG_FILE_INVALID was added in 8.0.2.

• Error number: MY-010158; Symbol: ER_LOWER_CASE_TABLE_NAMES_CS_DD_ON_CI_FS_UNSUPPORTED; SQLSTATE: HY000
Message: The server option 'lower_case_table_names' is configured to use case sensitive table names but the data directory is on a case-insensitive file system which is an unsupported combination. Please consider either using a case sensitive file system for your data directory or switching to a case-insensitive table name mode.

ER_LOWER_CASE_TABLE_NAMES_CS_DD_ON_CI_FS_UNSUPPORTED was added in 8.0.2.

- **Error number:** MY-010159; **Symbol:** ER_LOWER_CASE_TABLE_NAMES_USING_2; **SQLSTATE:** HY000
  Message: Setting lower_case_table_names=2 because file system for %s is case insensitive

ER_LOWER_CASE_TABLE_NAMES_USING_2 was added in 8.0.2.

- **Error number:** MY-010160; **Symbol:** ER_LOWER_CASE_TABLE_NAMES_USING_0; **SQLSTATE:** HY000
  Message: lower_case_table_names was set to 2, even though your the file system '%s' is case sensitive. Now setting lower_case_table_names to 0 to avoid future problems.

ER_LOWER_CASE_TABLE_NAMES_USING_0 was added in 8.0.2.

- **Error number:** MY-010161; **Symbol:** ER_NEED_LOG_BIN; **SQLSTATE:** HY000
  Message: You need to use --log-bin to make %s work.

ER_NEED_LOG_BIN was added in 8.0.2.

- **Error number:** MY-010162; **Symbol:** ER_NEED_FILE_INSTEAD_OF_DIR; **SQLSTATE:** HY000
  Message: Path '%s' is a directory name, please specify a file name for %s option

ER_NEED_FILE_INSTEAD_OF_DIR was added in 8.0.2.

- **Error number:** MY-010163; **Symbol:** ER_LOG_BIN_BETTER_WITH_NAME; **SQLSTATE:** HY000
  Message: No argument was provided to --log-bin, and --log-bin-index was not used; so replication may break when this MySQL server acts as a master and has his hostname changed!! Please use '--log-bin=%s' to avoid this problem.

ER_LOG_BIN_BETTER_WITH_NAME was added in 8.0.2.

- **Error number:** MY-010164; **Symbol:** ER_BINLOG_NEEDS_SERVERID; **SQLSTATE:** HY000
  Message: You have enabled the binary log, but you haven't provided the mandatory server-id. Please refer to the proper server start-up parameters documentation

ER_BINLOG_NEEDS_SERVERID was added in 8.0.2.

- **Error number:** MY-010165; **Symbol:** ER_RPL_CANT_MAKE_PATHS; **SQLSTATE:** HY000
  Message: Unable to create replication path names: out of memory or path names too long (path name exceeds %d or file name exceeds %d).

ER_RPL_CANT_MAKE_PATHS was added in 8.0.2.
• **Error number:** MY-010166; **Symbol:** ER_CANT_INITIALIZE_GTID; **SQLSTATE:** HY000
  Message: Failed to initialize GTID structures.
  
  ER_CANT_INITIALIZE_GTID was added in 8.0.2.

• **Error number:** MY-010167; **Symbol:** ER_CANT_INITIALIZE_EARLY_PLUGINS; **SQLSTATE:** HY000
  Message: Failed to initialize early plugins.
  
  ER_CANT_INITIALIZE_EARLY_PLUGINS was added in 8.0.2.

• **Error number:** MY-010168; **Symbol:** ER_CANT_INITIALIZE_BUILTIN_PLUGINS; **SQLSTATE:** HY000
  Message: Failed to initialize builtin plugins.
  
  ER_CANT_INITIALIZE_BUILTIN_PLUGINS was added in 8.0.2.

• **Error number:** MY-010169; **Symbol:** ER_CANT_INITIALIZE_DYNAMIC_PLUGINS; **SQLSTATE:** HY000
  Message: Failed to initialize dynamic plugins.
  
  ER_CANT_INITIALIZE_DYNAMIC_PLUGINS was added in 8.0.2.

• **Error number:** MY-010170; **Symbol:** ER_PERFSHEMA_INIT_FAILED; **SQLSTATE:** HY000
  
  ER_PERFSHEMA_INIT_FAILED was added in 8.0.2.

• **Error number:** MY-010171; **Symbol:** ER_STACKSIZE_UNEXPECTED; **SQLSTATE:** HY000
  Message: Asked for %lu thread stack, but got %ld
  
  ER_STACKSIZE_UNEXPECTED was added in 8.0.2.

• **Error number:** MY-010172; **Symbol:** ER_CANT_SET_DATADIR; **SQLSTATE:** HY000
  Message: failed to set datadir to %
  
  ER_CANT_SET_DATADIR was added in 8.0.2, removed after 8.0.13.

• **Error number:** MY-010173; **Symbol:** ER_CANT_STAT_DATADIR; **SQLSTATE:** HY000
  Message: Can't read data directory's stats (%d): %s. Assuming that it's not owned by the same user/group
  
  ER_CANT_STAT_DATADIR was added in 8.0.2.

• **Error number:** MY-010174; **Symbol:** ER_CANT_CHOWN_DATADIR; **SQLSTATE:** HY000
  Message: Can't change data directory owner to %
  
  ER_CANT_CHOWN_DATADIR was added in 8.0.2.

• **Error number:** MY-010175; **Symbol:** ER_CANT_SET_UP_PERSISTED_VALUES; **SQLSTATE:** HY000
  Message: Setting persistent options failed.
Server Error Message Reference

**ER_CANT_SET_UP_PERSISTED_VALUES** was added in 8.0.2.

- **Error number:** MY-010176; **Symbol:** ER_CANT_SAVE_GTIDS; **SQLSTATE:** HY000
  
  **Message:** Failed to save the set of Global Transaction Identifiers of the last binary log into the mysql.gtid_executed table while the server was shutting down. The next server restart will make another attempt to save Global Transaction Identifiers into the table.

**ER_CANT_SAVE_GTIDS** was added in 8.0.2.

- **Error number:** MY-010177; **Symbol:** ER_AUTH_CANT_SET_DEFAULT_PLUGIN; **SQLSTATE:** HY000
  
  **Message:** Can't start server: Invalid value for --default-authentication-plugin

**ER_AUTH_CANT_SET_DEFAULT_PLUGIN** was added in 8.0.2.

- **Error number:** MY-010178; **Symbol:** ER_CANT_JOIN_SHUTDOWN_THREAD; **SQLSTATE:** HY000
  
  **Message:** Could not join %sthread. error:%d

**ER_CANT_JOIN_SHUTDOWN_THREAD** was added in 8.0.2.

- **Error number:** MY-010179; **Symbol:** ER_CANT_HASH_DO_AND_IGNORE_RULES; **SQLSTATE:** HY000
  
  **Message:** An error occurred while building do_table and ignore_table rules to hashes for global replication filter.

**ER_CANT_HASH_DO_AND_IGNORE_RULES** was added in 8.0.2.

- **Error number:** MY-010180; **Symbol:** ER_CANT_OPEN_CA; **SQLSTATE:** HY000
  
  **Message:** Error opening CA certificate file

**ER_CANT_OPEN_CA** was added in 8.0.2.

- **Error number:** MY-010181; **Symbol:** ER_CANT_ACCESS_CAPATH; **SQLSTATE:** HY000
  
  **Message:** Error accessing directory pointed by --ssl-capath

**ER_CANT_ACCESS_CAPATH** was added in 8.0.2.

- **Error number:** MY-010182; **Symbol:** ER_SSL_TRYING_DATADIR_DEFAULTS; **SQLSTATE:** HY000
  
  **Message:** Found %s, %s and %s in data directory. Trying to enable SSL support using them.

**ER_SSL_TRYING_DATADIR_DEFAULTS** was added in 8.0.2.

- **Error number:** MY-010183; **Symbol:** ER_AUTO_OPTIONS_FAILED; **SQLSTATE:** HY000
  
  **Message:** Failed to create %s(file: '%s', errno %d)

**ER_AUTO_OPTIONS_FAILED** was added in 8.0.2.

- **Error number:** MY-010184; **Symbol:** ER_CANT_INIT_TIMER; **SQLSTATE:** HY000
  
  **Message:** Failed to initialize timer component (errno %d).

**ER_CANT_INIT_TIMER** was added in 8.0.2.
• Error number: **MY-010185**; Symbol: **ER_SERVERID_TOO_LARGE**; SQLSTATE: **HY000**
Message: server-id configured is too large to represent with server-id-bits configured.

**ER_SERVERID_TOO_LARGE** was added in 8.0.2.

• Error number: **MY-010186**; Symbol: **ER_DEFAULT_SE_UNAVAILABLE**; SQLSTATE: **HY000**
Message: Default storage engine (%s) is not available

**ER_DEFAULT_SE_UNAVAILABLE** was added in 8.0.2.

• Error number: **MY-010187**; Symbol: **ER_CANT_OPEN_ERROR_LOG**; SQLSTATE: **HY000**
Message: Could not open file '%s' for error logging%s%s

**ER_CANT_OPEN_ERROR_LOG** was added in 8.0.2.

• Error number: **MY-010188**; Symbol: **ER_INVALID_ERROR_LOG_NAME**; SQLSTATE: **HY000**
Message: Invalid log file name after expanding symlinks: '%s'

**ER_INVALID_ERROR_LOG_NAME** was added in 8.0.2.

• Error number: **MY-010189**; Symbol: **ER_RPL_INFINITY_DENIED**; SQLSTATE: **HY000**
Message: using --replicate-same-server-id in conjunction with --log-slave-updates is impossible, it would lead to infinite loops in this server.

**ER_RPL_INFINITY_DENIED** was added in 8.0.2.

• Error number: **MY-010190**; Symbol: **ER_RPL_INFINITY_IGNORED**; SQLSTATE: **HY000**
Message: using --replicate-same-server-id in conjunction with --log-slave-updates would lead to infinite loops in this server. However this will be ignored as the --log-bin option is not defined or your server is running with global transaction identifiers enabled.

**ER_RPL_INFINITY_IGNORED** was added in 8.0.2.

• Error number: **MY-010191**; Symbol: **ER_NDB_TABLES_NOT_READY**; SQLSTATE: **HY000**
Message: NDB: Tables not available after %lu seconds. Consider increasing --ndb-wait-setup value

**ER_NDB_TABLES_NOT_READY** was added in 8.0.2, removed after 8.0.13.

• Error number: **MY-010192**; Symbol: **ER_TABLE_CHECK_INTACT**; SQLSTATE: **HY000**
Message: %s

**ER_TABLE_CHECK_INTACT** was added in 8.0.2.

• Error number: **MY-010193**; Symbol: **ER_DD_TABLESPACE_NOT_FOUND**; SQLSTATE: **HY000**
Message: Unable to start server. The data dictionary tablespace '%s' does not exist.

**ER_DD_TABLESPACE_NOT_FOUND** was added in 8.0.2.

• Error number: **MY-010194**; Symbol: **ER_DD_TRG_CONNECTION_COLLATION_MISSING**; SQLSTATE: **HY000**
Message: Connection collation is missing for trigger of table %s. Using default connection collation.

ER_DD_TRG_CONNECTION_COLLATION_MISSING was added in 8.0.2.

- Error number: MY-010195; Symbol: ER_DD_TRG_DB_COLLATION_MISSING; SQLSTATE: HY000
Message: Database collation is missing for trigger of table %s. Using Default character set.

ER_DD_TRG_DB_COLLATION_MISSING was added in 8.0.2.

- Error number: MY-010196; Symbol: ER_DD_TRG_DEFINER_OOM; SQLSTATE: HY000
Message: Error in Memory allocation for Definer %s for Trigger.

ER_DD_TRG_DEFINER_OOM was added in 8.0.2.

- Error number: MY-010197; Symbol: ER_DD_TRG_FILE_UNREADABLE; SQLSTATE: HY000
Message: Error in reading %s.TRG file.

ER_DD_TRG_FILE_UNREADABLE was added in 8.0.2.

- Error number: MY-010198; Symbol: ER_TRG_CANT_PARSE; SQLSTATE: HY000
Message: Error in parsing Triggers from %s.TRG file.

ER_TRG_CANT_PARSE was added in 8.0.2.

- Error number: MY-010199; Symbol: ER_DD_TRG_CANT_ADD; SQLSTATE: HY000
Message: Error in creating DD entry for Trigger %s.%s

ER_DD_TRG_CANT_ADD was added in 8.0.2.

- Error number: MY-010200; Symbol: ER_DD_CANT_RESOLVE_VIEW; SQLSTATE: HY000
Message: Resolving dependency for the view '%s.%s' failed. View is no more valid to use

ER_DD_CANT_RESOLVE_VIEW was added in 8.0.2.

- Error number: MY-010201; Symbol: ER_DD_VIEW_WITHOUT_DEFINER; SQLSTATE: HY000
Message: %s.%s has no definer (as per an old view format). Current user is used as definer. Please recreate the view.

ER_DD_VIEW_WITHOUT_DEFINER was added in 8.0.2.

- Error number: MY-010202; Symbol: ER_PLUGIN_INIT_FAILED; SQLSTATE: HY000
Message: Plugin '%s' init function returned error.

ER_PLUGIN_INIT_FAILED was added in 8.0.2.

- Error number: MY-010203; Symbol: ER_RPL_TRX_DELEGATES_INIT_FAILED; SQLSTATE: HY000

ER_RPL_TRX_DELEGATES_INIT_FAILED was added in 8.0.2.
Server Error Message Reference

- **Error number:** MY-010204; Symbol: ER_RPL_BINLOG_STORAGE_DELEGATES_INIT_FAILED; SQLSTATE: HY000
  
  
  ER_RPL_BINLOG_STORAGE_DELEGATES_INIT_FAILED was added in 8.0.2.

- **Error number:** MY-010205; Symbol: ER_RPL_BINLOG_TRANSMIT_DELEGATES_INIT_FAILED; SQLSTATE: HY000
  
  
  ER_RPL_BINLOG_TRANSMIT_DELEGATES_INIT_FAILED was added in 8.0.2.

- **Error number:** MY-010206; Symbol: ER_RPL_BINLOG_RELAY_DELEGATES_INIT_FAILED; SQLSTATE: HY000
  
  
  ER_RPL_BINLOG_RELAY_DELEGATES_INIT_FAILED was added in 8.0.2.

- **Error number:** MY-010207; Symbol: ER_RPL_PLUGIN_FUNCTION_FAILED; SQLSTATE: HY000
  
  Message: Run function '...' in plugin '%s' failed
  
  ER_RPL_PLUGIN_FUNCTION_FAILED was added in 8.0.2.

- **Error number:** MY-010208; Symbol: ER_SQL_HA_READ_FAILED; SQLSTATE: HY000
  
  Message: mysql_ha_read: Got error %d when reading table '%s'
  
  ER_SQL_HA_READ_FAILED was added in 8.0.2.

- **Error number:** MY-010209; Symbol: ER_SR_BOGUS_VALUE; SQLSTATE: HY000
  
  Message: Stored routine '%s'.'%s': invalid value in column %s.
  
  ER_SR_BOGUS_VALUE was added in 8.0.2.

- **Error number:** MY-010210; Symbol: ER_SR_INVALID_CONTEXT; SQLSTATE: HY000
  
  Message: Invalid creation context '%s.%s'.
  
  ER_SR_INVALID_CONTEXT was added in 8.0.2.

- **Error number:** MY-010211; Symbol: ER_READING_TABLE_FAILED; SQLSTATE: HY000
  
  Message: Got error %d when reading table '%s'
  
  ER_READING_TABLE_FAILED was added in 8.0.2.

- **Error number:** MY-010212; Symbol: ER_DES_FILE_WRONG_KEY; SQLSTATE: HY000
  
  Message: load_des_file: Found wrong key_number: %c
  
  ER_DES_FILE_WRONG_KEY was added in 8.0.2.

- **Error number:** MY-010213; Symbol: ER_CANT_SET_PERSISTED; SQLSTATE: HY000
  
  Message: Failed to set persisted options.
**ER_CANT_SET_PERSISTED** was added in 8.0.2.

- **Error number:** MY-010214; **Symbol:** ER_JSON_PARSE_ERROR; **SQLSTATE:** HY000
  - **Message:** JSON parsing error
  
  **ER_JSON_PARSE_ERROR** was added in 8.0.2.

- **Error number:** MY-010215; **Symbol:** ER_CONFIG_OPTION_WITHOUT_GROUP; **SQLSTATE:** HY000
  - **Message:** Found option without preceding group in config file
  
  **ER_CONFIG_OPTION_WITHOUT_GROUP** was added in 8.0.2.

- **Error number:** MY-010216; **Symbol:** ER_VALGRIND_DO_QUICK_LEAK_CHECK; **SQLSTATE:** HY000
  - **Message:** VALGRIND_DO_QUICK_LEAK_CHECK
  
  **ER_VALGRIND_DO_QUICK_LEAK_CHECK** was added in 8.0.2.

- **Error number:** MY-010217; **Symbol:** ER_VALGRIND_COUNT_LEAKS; **SQLSTATE:** HY000
  - **Message:** VALGRIND_COUNT_LEAKS reports %lu leaked bytes for query '%.*s'
  
  **ER_VALGRIND_COUNT_LEAKS** was added in 8.0.2.

- **Error number:** MY-010218; **Symbol:** ER_LOAD_DATA_INFILE_FAILED_IN_UNEXPECTED_WAY; **SQLSTATE:** HY000
  - **Message:** LOAD DATA INFILE in the slave SQL Thread can only read from --slave-load-tmpdir. Please, report a bug.
  
  **ER_LOAD_DATA_INFILE_FAILED_IN_UNEXPECTED_WAY** was added in 8.0.2.

- **Error number:** MY-010219; **Symbol:** ER_UNKNOWN_ERROR_NUMBER; **SQLSTATE:** HY000
  - **Message:** Got unknown error: %d
  
  **ER_UNKNOWN_ERROR_NUMBER** was added in 8.0.2.

- **Error number:** MY-010220; **Symbol:** ER_UDF_CANT_ALLOC_FOR_STRUCTURES; **SQLSTATE:** HY000
  - **Message:** Can't allocate memory for udf structures
  
  **ER_UDF_CANT_ALLOC_FOR_STRUCTURES** was added in 8.0.2.

- **Error number:** MY-010221; **Symbol:** ER_UDF_CANT_ALLOC_FOR_FUNCTION; **SQLSTATE:** HY000
  - **Message:** Can't alloc memory for udf function: '%s'
  
  **ER_UDF_CANT_ALLOC_FOR_FUNCTION** was added in 8.0.2.

- **Error number:** MY-010222; **Symbol:** ER_UDF_INVALID_ROW_IN_FUNCTION_TABLE; **SQLSTATE:** HY000
  - **Message:** Invalid row in mysql.func table for function '%s'
  
  **ER_UDF_INVALID_ROW_IN_FUNCTION_TABLE** was added in 8.0.2.
• Error number: MY-010223; Symbol: ER_UDF_CANT_OPEN_FUNCTION_TABLE; SQLSTATE: HY000
  Message: Could not open the mysql.func table. Please perform the MySQL upgrade procedure.
  ER_UDF_CANT_OPEN_FUNCTION_TABLE was added in 8.0.2.

• Error number: MY-010224; Symbol: ER_XA_RECOVER_FOUND_TRX_IN_SE; SQLSTATE: HY000
  Message: Found %d prepared transaction(s) in %s
  ER_XA_RECOVER_FOUND_TRX_IN_SE was added in 8.0.2.

• Error number: MY-010225; Symbol: ER_XA_RECOVER_FOUND_XA_TRX; SQLSTATE: HY000
  Message: Found %d prepared XA transactions
  ER_XA_RECOVER_FOUND_XA_TRX was added in 8.0.2.

• Error number: MY-010226; Symbol: ER_XA_IGNORING_XID; SQLSTATE: HY000
  Message: ignore xid %s
  ER_XA_IGNORING_XID was added in 8.0.2.

• Error number: MY-010227; Symbol: ER_XA_COMMITTING_XID; SQLSTATE: HY000
  Message: commit xid %s
  ER_XA_COMMITTING_XID was added in 8.0.2.

• Error number: MY-010228; Symbol: ER_XA_ROLLING_BACK_XID; SQLSTATE: HY000
  Message: rollback xid %s
  ER_XA_ROLLING_BACK_XID was added in 8.0.2.

• Error number: MY-010229; Symbol: ER_XA_STARTING_RECOVERY; SQLSTATE: HY000
  Message: Starting XA crash recovery...
  ER_XA_STARTING_RECOVERY was added in 8.0.2.

• Error number: MY-010230; Symbol: ER_XA_NO_MULTI_2PC_HEURISTIC_RECOVER; SQLSTATE: HY000
  Message: --tc-heuristic-recover rollback strategy is not safe on systems with more than one 2-phase-commit-capable storage engine. Aborting crash recovery.
  ER_XA_NO_MULTI_2PC_HEURISTIC_RECOVER was added in 8.0.2.

• Error number: MY-010231; Symbol: ER_XA_RECOVER_EXPLANATION; SQLSTATE: HY000
  Message: Found %d prepared transactions! It means that mysqld was not shut down properly last time and critical recovery information (last binlog or %s file) was manually deleted after a crash. You have to start mysqld with --tc-heuristic-recover switch to commit or rollback pending transactions.
  ER_XA_RECOVER_EXPLANATION was added in 8.0.2.

• Error number: MY-010232; Symbol: ER_XA_RECOVERY_DONE; SQLSTATE: HY000
Message: XA crash recovery finished.

ER_XA_RECOVERY_DONE was added in 8.0.2.

- Error number: MY-010233; Symbol: ER_TRX_GTID_COLLECT_REJECT; SQLSTATE: HY000
  Message: Failed to collect GTID to send in the response packet!
  ER_TRX_GTID_COLLECT_REJECT was added in 8.0.2.

- Error number: MY-010234; Symbol: ER_SQL_AUTHOR_DEFAULT_ROLES_FAIL; SQLSTATE: HY000
  Message: MYSQL.DEFAULT_ROLES couldn't be updated for authorization identifier %s
  ER_SQL_AUTHOR_DEFAULT_ROLES_FAIL was added in 8.0.2.

- Error number: MY-010235; Symbol: ER_SQL_USER_TABLE_CREATE_WARNING; SQLSTATE: HY000
  Message: Following users were specified in CREATE USER IF NOT EXISTS but they already exist. Corresponding entry in binary log used default authentication plugin '%s' to rewrite authentication information (if any) for them: %s
  ER_SQL_USER_TABLE_CREATE_WARNING was added in 8.0.2.

- Error number: MY-010236; Symbol: ER_SQL_USER_TABLE_ALTER_WARNING; SQLSTATE: HY000
  Message: Following users were specified in ALTER USER IF EXISTS but they do not exist. Corresponding entry in binary log used default authentication plugin '%s' to rewrite authentication information (if any) for them: %s
  ER_SQL_USER_TABLE_ALTER_WARNING was added in 8.0.2.

- Error number: MY-010237; Symbol: ER_ROW_IN_WRONG_PARTITION PLEASE_REPAIR; SQLSTATE: HY000
  Message: Table '%s' corrupted: row in wrong partition: %s -- Please REPAIR the table!
  ER_ROW_IN_WRONG_PARTITION PLEASE_REPAIR was added in 8.0.2.

- Error number: MY-010238; Symbol: ER_MYISAM_CRASHED_ERROR_IN_THREAD; SQLSTATE: HY000
  Message: Got an error from thread_id=%u, %s:%d
  ER_MYISAM_CRASHED_ERROR_IN_THREAD was added in 8.0.2.

- Error number: MY-010239; Symbol: ER_MYISAM_CRASHED_ERROR_IN; SQLSTATE: HY000
  Message: Got an error from unknown thread, %s:%d
  ER_MYISAM_CRASHED_ERROR_IN was added in 8.0.2.

- Error number: MY-010240; Symbol: ER_TOO_MANY_STORAGE_ENGINES; SQLSTATE: HY000
  Message: Too many storage engines!
  ER_TOO_MANY_STORAGE_ENGINES was added in 8.0.2.

- Error number: MY-010241; Symbol: ER_SE_TYPECODE_CONFLICT; SQLSTATE: HY000
Server Error Message Reference

Message: Storage engine '%%s' has conflicting typecode. Assigning value %d.

ER_SE_TYPECODE_CONFLICT was added in 8.0.2.

•   Error number: MY-010242; Symbol: ER_TRX_WRITE_SET_OOM; SQLSTATE: HY000

   Message: Out of memory on transaction write set extraction

   ER_TRX_WRITE_SET_OOM was added in 8.0.2.

•   Error number: MY-010243; Symbol: ER_HANDLERTON_OOM; SQLSTATE: HY000

   Message: Unable to allocate memory for plugin '%%s' handlerton.

   ER_HANDLERTON_OOM was added in 8.0.2.

•   Error number: MY-010244; Symbol: ER_CONN_SHM_LISTENER; SQLSTATE: HY000

   Message: Shared memory setting up listener

   ER_CONN_SHM_LISTENER was added in 8.0.2.

•   Error number: MY-010245; Symbol: ER_CONN_SHM_CANT_CREATE_SERVICE; SQLSTATE: HY000

   Message: Can't create shared memory service: %%s : %%s

   ER_CONN_SHM_CANT_CREATE_SERVICE was added in 8.0.2.

•   Error number: MY-010246; Symbol: ER_CONN_SHM_CANT_CREATE_CONNECTION; SQLSTATE: HY000

   Message: Can't create shared memory connection: %%s : %%s

   ER_CONN_SHM_CANT_CREATE_CONNECTION was added in 8.0.2.

•   Error number: MY-010247; Symbol: ER_CONN_PIP_CANT_CREATE_EVENT; SQLSTATE: HY000

   Message: Can't create event, last error=%u

   ER_CONN_PIP_CANT_CREATE_EVENT was added in 8.0.2.

•   Error number: MY-010248; Symbol: ER_CONN_PIP_CANT_CREATE_PIPE; SQLSTATE: HY000

   Message: Can't create new named pipe!: %%s

   ER_CONN_PIP_CANT_CREATE_PIPE was added in 8.0.2.

•   Error number: MY-010249; Symbol: ER_CONN_PER_THREAD_NO_THREAD; SQLSTATE: HY000

   Message: Can't create thread to handle new connection(errno= %d)

   ER_CONN_PER_THREAD_NO_THREAD was added in 8.0.2.

•   Error number: MY-010250; Symbol: ER_CONN_TCP_NO_SOCKET; SQLSTATE: HY000

   Message: Failed to create a socket for %%s '%%s': errno: %d.

   ER_CONN_TCP_NO_SOCKET was added in 8.0.2.
•   Error number: MY-010251; Symbol: ER_CONN_TCP_CREATED; SQLSTATE: HY000
    Message: Server socket created on IP: '%s'.
    ER_CONN_TCP_CREATED was added in 8.0.2.

•   Error number: MY-010252; Symbol: ER_CONN_TCP_ADDRESS; SQLSTATE: HY000
    Message: Server hostname (bind-address): '%s'; port: %d
    ER_CONN_TCP_ADDRESS was added in 8.0.2.

•   Error number: MY-010253; Symbol: ER_CONN_TCP_IPV6_AVAILABLE; SQLSTATE: HY000
    Message: IPv6 is available.
    ER_CONN_TCP_IPV6_AVAILABLE was added in 8.0.2.

•   Error number: MY-010254; Symbol: ER_CONN_TCP_IPV6_UNAVAILABLE; SQLSTATE: HY000
    Message: IPv6 is not available.
    ER_CONN_TCP_IPV6_UNAVAILABLE was added in 8.0.2.

•   Error number: MY-010255; Symbol: ER_CONN_TCP_ERROR_WITH_STRERROR; SQLSTATE: HY000
    Message: Can't create IP socket: %s
    ER_CONN_TCP_ERROR_WITH_STRERROR was added in 8.0.2.

•   Error number: MY-010256; Symbol: ER_CONN_TCP_CANT_RESOLVE_HOSTNAME; SQLSTATE: HY000
    Message: Can't start server: cannot resolve hostname!
    ER_CONN_TCP_CANT_RESOLVE_HOSTNAME was added in 8.0.2.

•   Error number: MY-010257; Symbol: ER_CONN_TCP_IS_THERE_ANOTHER_USING_PORT; SQLSTATE: HY000
    Message: Do you already have another mysqld server running on port: %d?
    ER_CONN_TCP_IS_THERE_ANOTHER_USING_PORT was added in 8.0.2.

•   Error number: MY-010258; Symbol: ER_CONN_UNIX_IS_THERE_ANOTHER_USING_SOCKET; SQLSTATE: HY000
    Message: Do you already have another mysqld server running on socket: %s?
    ER_CONN_UNIX_IS_THERE_ANOTHER_USING_SOCKET was added in 8.0.2.

•   Error number: MY-010259; Symbol: ER_CONN_UNIX_PID_CLAIMED_SOCKET_FILE; SQLSTATE: HY000
    Message: Another process with pid %d is using unix socket file.
    ER_CONN_UNIX_PID_CLAIMED_SOCKET_FILE was added in 8.0.2.

•   Error number: MY-010260; Symbol: ER_CONN_TCP_CANT_RESET_V6ONLY; SQLSTATE: HY000
    Message: Failed to reset IPV6_V6ONLY flag (error: %d). The server will listen to IPv6 addresses only.
**ER_CONN_TCP_CANT_RESET_V6ONLY** was added in 8.0.2.

- **Error number:** MY-010261; Symbol: ER_CONN_TCP_BIND_RETRY; SQLSTATE: HY000
  - Message: Retrying bind on TCP/IP port %u

**ER_CONN_TCP_BIND_RETRY** was added in 8.0.2.

- **Error number:** MY-010262; Symbol: ER_CONN_TPC_BIND_FAIL; SQLSTATE: HY000
  - Message: Can't start server: Bind on TCP/IP port: %s

**ER_CONN_TPC_BIND_FAIL** was added in 8.0.2, removed after 8.0.11.

- **Error number:** MY-010262; Symbol: ER_CONN_TCP_BIND_FAIL; SQLSTATE: HY000
  - Message: Can't start server: Bind on TCP/IP port: %s

**ER_CONN_TCP_BIND_FAIL** was added in 8.0.12.

- **Error number:** MY-010263; Symbol: ER_CONN_TCP_IP_NOT_LOGGED; SQLSTATE: HY000
  - Message: Fails to print out IP-address.

**ER_CONN_TCP_IP_NOT_LOGGED** was added in 8.0.2.

- **Error number:** MY-010264; Symbol: ER_CONN_TCP_RESOLVE_INFO; SQLSTATE: HY000
  - Message: - '%s' resolves to '%s';

**ER_CONN_TCP_RESOLVE_INFO** was added in 8.0.2.

- **Error number:** MY-010265; Symbol: ER_CONN_TCP_START_FAIL; SQLSTATE: HY000
  - Message: Can't start server: listen() on TCP/IP port: %s

**ER_CONN_TCP_START_FAIL** was added in 8.0.2.

- **Error number:** MY-010266; Symbol: ER_CONN_TCP_LISTEN_FAIL; SQLSTATE: HY000
  - Message: listen() on TCP/IP failed with error %d

**ER_CONN_TCP_LISTEN_FAIL** was added in 8.0.2.

- **Error number:** MY-010267; Symbol: ER_CONN_UNIX_PATH_TOO_LONG; SQLSTATE: HY000
  - Message: The socket file path is too long (> %u): %s

**ER_CONN_UNIX_PATH_TOO_LONG** was added in 8.0.2.

- **Error number:** MY-010268; Symbol: ER_CONN_UNIX_LOCK_FILE_FAIL; SQLSTATE: HY000
  - Message: Unable to setup unix socket lock file.

**ER_CONN_UNIX_LOCK_FILE_FAIL** was added in 8.0.2.

- **Error number:** MY-010269; Symbol: ER_CONN_UNIX_NO_FD; SQLSTATE: HY000
  - Message: Can't start server: UNIX Socket: %s
Server Error Message Reference

ER_CONN_UNIX_NO_FD was added in 8.0.2.

- Error number: MY-010270; Symbol: ER_CONN_UNIX_NO_BIND_NO_START; SQLSTATE: HY000
  Message: Can't start server: Bind on unix socket: %s

ER_CONN_UNIX_NO_BIND_NO_START was added in 8.0.2.

- Error number: MY-010271; Symbol: ER_CONN_UNIX_LISTEN_FAILED; SQLSTATE: HY000
  Message: listen() on Unix socket failed with error %d

ER_CONN_UNIX_LISTEN_FAILED was added in 8.0.2.

- Error number: MY-010272; Symbol: ER_CONN_UNIX_LOCK_FILE_GIVING_UP; SQLSTATE: HY000
  Message: Unable to create unix socket lock file %s after retries.

ER_CONN_UNIX_LOCK_FILE_GIVING_UP was added in 8.0.2.

- Error number: MY-010273; Symbol: ER_CONN_UNIX_LOCK_FILE_CANT_CREATE; SQLSTATE: HY000
  Message: Could not create unix socket lock file %s.

ER_CONN_UNIX_LOCK_FILE_CANT_CREATE was added in 8.0.2.

- Error number: MY-010274; Symbol: ER_CONN_UNIX_LOCK_FILE_CANT_OPEN; SQLSTATE: HY000
  Message: Could not open unix socket lock file %s.

ER_CONN_UNIX_LOCK_FILE_CANT_OPEN was added in 8.0.2.

- Error number: MY-010275; Symbol: ER_CONN_UNIX_LOCK_FILE_CANT_READ; SQLSTATE: HY000
  Message: Could not read unix socket lock file %s.

ER_CONN_UNIX_LOCK_FILE_CANT_READ was added in 8.0.2.

- Error number: MY-010276; Symbol: ER_CONN_UNIX_LOCK_FILE_EMPTY; SQLSTATE: HY000
  Message: Unix socket lock file is empty %s.

ER_CONN_UNIX_LOCK_FILE_EMPTY was added in 8.0.2.

- Error number: MY-010277; Symbol: ER_CONN_UNIX_LOCK_FILE_PIDLESS; SQLSTATE: HY000
  Message: Invalid pid in unix socket lock file %s.

ER_CONN_UNIX_LOCK_FILE_PIDLESS was added in 8.0.2.

- Error number: MY-010278; Symbol: ER_CONN_UNIX_LOCK_FILE_CANT_WRITE; SQLSTATE: HY000
  Message: Could not write unix socket lock file %s errno %d.

ER_CONN_UNIX_LOCK_FILE_CANT_WRITE was added in 8.0.2.

- Error number: MY-010279; Symbol: ER_CONN_UNIX_LOCK_FILE_CANT_DELETE; SQLSTATE: HY000
Message: Could not remove unix socket lock file %s errno %d.
ER_CONN_UNIX_LOCK_FILE_CANT_DELETE was added in 8.0.2.

• Error number: MY-010280; Symbol: ER_CONN_UNIX_LOCK_FILE_CANT_SYNC; SQLSTATE: HY000
Message: Could not sync unix socket lock file %s errno %d.
ER_CONN_UNIX_LOCK_FILE_CANT_SYNC was added in 8.0.2.

• Error number: MY-010281; Symbol: ER_CONN_UNIX_LOCK_FILE_CANT_CLOSE; SQLSTATE: HY000
Message: Could not close unix socket lock file %s errno %d.
ER_CONN_UNIX_LOCK_FILE_CANT_CLOSE was added in 8.0.2.

• Error number: MY-010282; Symbol: ER_CONN_SOCKET_SELECT_FAILED; SQLSTATE: HY000
Message: mysqld: Got error %d from select
ER_CONN_SOCKET_SELECT_FAILED was added in 8.0.2.

• Error number: MY-010283; Symbol: ER_CONN_SOCKET_ACCEPT_FAILED; SQLSTATE: HY000
Message: Error in accept: %s
ER_CONN_SOCKET_ACCEPT_FAILED was added in 8.0.2.

• Error number: MY-010284; Symbol: ER_AUTH_RSA_CANT_FIND; SQLSTATE: HY000
Message: RSA %s key file not found: %s. Some authentication plugins will not work.
ER_AUTH_RSA_CANT_FIND was added in 8.0.2.

• Error number: MY-010285; Symbol: ER_AUTH_RSA_CANT_PARSE; SQLSTATE: HY000
Message: Failure to parse RSA %s key (file exists): %s: %s
ER_AUTH_RSA_CANT_PARSE was added in 8.0.2.

• Error number: MY-010286; Symbol: ER_AUTH_RSA_CANT_READ; SQLSTATE: HY000
Message: Failure to read key file: %s
ER_AUTH_RSA_CANT_READ was added in 8.0.2.

• Error number: MY-010287; Symbol: ER_AUTH_RSA_FILES_NOT_FOUND; SQLSTATE: HY000
Message: RSA key files not found. Some authentication plugins will not work.
ER_AUTH_RSA_FILES_NOT_FOUND was added in 8.0.2.

• Error number: MY-010288; Symbol: ER_CONN_ATTR_TRUNCATED; SQLSTATE: HY000
Message: Connection attributes of length %lu were truncated (%d bytes lost) for connection %llu, user %s@%s (as %s), auth: %s
ER_CONN_ATTR_TRUNCATED was added in 8.0.2.
• Error number: MY-010289; Symbol: ER_X509_CIPHERS_MISMATCH; SQLSTATE: HY000
  Message: X.509 ciphers mismatch: should be '%s' but is '%s'
  ER_X509_CIPHERS_MISMATCH was added in 8.0.2.

• Error number: MY-010290; Symbol: ER_X509_ISSUER_MISMATCH; SQLSTATE: HY000
  Message: X.509 issuer mismatch: should be '%s' but is '%s'
  ER_X509_ISSUER_MISMATCH was added in 8.0.2.

• Error number: MY-010291; Symbol: ER_X509_SUBJECT_MISMATCH; SQLSTATE: HY000
  Message: X.509 subject mismatch: should be '%s' but is '%s'
  ER_X509_SUBJECT_MISMATCH was added in 8.0.2.

• Error number: MY-010292; Symbol: ER_AUTH_CANT_ACTIVATE_ROLE; SQLSTATE: HY000
  Message: Failed to activate default role %s for %s
  ER_AUTH_CANT_ACTIVATE_ROLE was added in 8.0.2.

• Error number: MY-010293; Symbol: ER_X509_NEEDS_RSA_PRIVKEY; SQLSTATE: HY000
  Message: Could not generate RSA private key required for X.509 certificate.
  ER_X509_NEEDS_RSA_PRIVKEY was added in 8.0.2.

• Error number: MY-010294; Symbol: ER_X509_CANT_WRITE_KEY; SQLSTATE: HY000
  Message: Could not write key file: %s
  ER_X509_CANT_WRITE_KEY was added in 8.0.2.

• Error number: MY-010295; Symbol: ER_X509_CANT_CHMOD_KEY; SQLSTATE: HY000
  Message: Could not set file permission for %s
  ER_X509_CANT_CHMOD_KEY was added in 8.0.2.

• Error number: MY-010296; Symbol: ER_X509_CANT_READ_CA_KEY; SQLSTATE: HY000
  Message: Could not read CA key file: %s
  ER_X509_CANT_READ_CA_KEY was added in 8.0.2.

• Error number: MY-010297; Symbol: ER_X509_CANT_READ_CA_CERT; SQLSTATE: HY000
  Message: Could not read CA certificate file: %s
  ER_X509_CANT_READ_CA_CERT was added in 8.0.2.

• Error number: MY-010298; Symbol: ER_X509_CANT_CREATE_CERT; SQLSTATE: HY000
  Message: Could not generate X.509 certificate.
  ER_X509_CANT_CREATE_CERT was added in 8.0.2.
• Error number: MY-010299; Symbol: ER_X509_CANT_WRITE_CERT; SQLSTATE: HY000
Message: Could not write certificate file: %s
ER_X509_CANT_WRITE_CERT was added in 8.0.2.

• Error number: MY-010300; Symbol: ER_AUTH_CANT_CREATE_RSA_PAIR; SQLSTATE: HY000
Message: Could not generate RSA Private/Public key pair
ER_AUTH_CANT_CREATE_RSA_PAIR was added in 8.0.2.

• Error number: MY-010301; Symbol: ER_AUTH_CANT_WRITE_PRIVKEY; SQLSTATE: HY000
Message: Could not write private key file: %s
ER_AUTH_CANT_WRITE_PRIVKEY was added in 8.0.2.

• Error number: MY-010302; Symbol: ER_AUTH_CANT_WRITE_PUBKEY; SQLSTATE: HY000
Message: Could not write public key file: %s
ER_AUTH_CANT_WRITE_PUBKEY was added in 8.0.2.

• Error number: MY-010303; Symbol: ER_AUTH_SSL_CONF_PREVENTS_CERT_GENERATION; SQLSTATE: HY000
Message: Skipping generation of SSL certificates as options related to SSL are specified.
ER_AUTH_SSL_CONF_PREVENTS_CERT_GENERATION was added in 8.0.2.

• Error number: MY-010304; Symbol: ER_AUTH_USING_EXISTING_CERTS; SQLSTATE: HY000
Message: Skipping generation of SSL certificates as certificate files are present in data directory.
ER_AUTH_USING_EXISTING_CERTS was added in 8.0.2.

• Error number: MY-010305; Symbol: ER_AUTH_CERTS_SAVED_TO_DATADIR; SQLSTATE: HY000
Message: Auto generated SSL certificates are placed in data directory.
ER_AUTH_CERTS_SAVED_TO_DATADIR was added in 8.0.2.

• Error number: MY-010306; Symbol: ER_AUTH_CERT_GENERATION_DISABLED; SQLSTATE: HY000
Message: Skipping generation of SSL certificates as --auto_generate_certs is set to OFF.
ER_AUTH_CERT_GENERATION_DISABLED was added in 8.0.2.

• Error number: MY-010307; Symbol: ER_AUTH_RSA_CONF_PREVENTS_KEY_GENERATION; SQLSTATE: HY000
Message: Skipping generation of RSA key pair through %s as options related to RSA keys are specified.
ER_AUTH_RSA_CONF_PREVENTS_KEY_GENERATION was added in 8.0.2.

• Error number: MY-010308; Symbol: ER_AUTH_KEY_GENERATION_SKIPPED_PAIR_PRESENT; SQLSTATE: HY000
Message: Skipping generation of RSA key pair through %s as key files are present in data directory.
**ER_AUTH_KEY_GENERATION_SKIPPED_PAIR_PRESENT** was added in 8.0.2.

- **Error number:** MY-010309; **Symbol:** ER_AUTH_KEYS_SAVED_TO_DATADIR; **SQLSTATE:** HY000
  
  Message: Auto generated RSA key files through %s are placed in data directory.

  **ER_AUTH_KEYS_SAVED_TO_DATADIR** was added in 8.0.2.

- **Error number:** MY-010310; **Symbol:** ER_AUTH_KEY_GENERATION_DISABLED; **SQLSTATE:** HY000
  
  Message: Skipping generation of RSA key pair as %s is set to OFF.

  **ER_AUTH_KEY_GENERATION_DISABLED** was added in 8.0.2.

- **Error number:** MY-010311; **Symbol:** ER_AUTHCACHE_PROXIES_PRIV_SKIPPED_NEEDS_RESOLVE; **SQLSTATE:** HY000
  
  Message: 'proxies_priv' entry '%s@%s %s@%s' ignored in --skip-name-resolve mode.

  **ER_AUTHCACHE_PROXIES_PRIV_SKIPPED_NEEDS_RESOLVE** was added in 8.0.2.

- **Error number:** MY-010312; **Symbol:** ER_AUTHCACHE_PLUGIN_MISSING; **SQLSTATE:** HY000
  
  Message: The plugin '%.*s' used to authenticate user '%s'@'%.*s' is not loaded. Nobody can currently login using this account.

  **ER_AUTHCACHE_PLUGIN_MISSING** was added in 8.0.2.

- **Error number:** MY-010313; **Symbol:** ER_AUTHCACHE_PLUGIN_CONFIG; **SQLSTATE:** HY000
  
  Message: The plugin '%s' is used to authenticate user '%s'@'%.*s', %s configured. Nobody can currently login using this account.

  **ER_AUTHCACHE_PLUGIN_CONFIG** was added in 8.0.2.

- **Error number:** MY-010314; **Symbol:** ER_AUTHCACHE_ROLE_TABLES_DODGY; **SQLSTATE:** HY000
  
  Message: Could not load mysql.role_edges and mysql.default_roles tables. ACL DDLs will not work unless mysql_upgrade is executed.

  **ER_AUTHCACHE_ROLE_TABLES_DODGY** was added in 8.0.2, removed after 8.0.4.

- **Error number:** MY-010315; **Symbol:** ER_AUTHCACHE_USER_SKIPPED_NEEDS_RESOLVE; **SQLSTATE:** HY000
  
  Message: 'user' entry '%s@%s' ignored in --skip-name-resolve mode.

  **ER_AUTHCACHE_USER_SKIPPED_NEEDS_RESOLVE** was added in 8.0.2.

- **Error number:** MY-010316; **Symbol:** ER_AUTHCACHE_USER_TABLE_DODGY; **SQLSTATE:** HY000
  
  Message: Fatal error: Could not read the column 'authentication_string' from table 'mysql.user'. Please perform the MySQL upgrade procedure.

  **ER_AUTHCACHE_USER_TABLE_DODGY** was added in 8.0.2.

- **Error number:** MY-010317; **Symbol:** ER_AUTHCACHE_USER_IGNORED_DEPRECATED_PASSWORD; **SQLSTATE:** HY000
Message: User entry '%s'@'%s' has a deprecated pre-4.1 password. The user will be ignored and no one can login with this user anymore.

ER_AUTHCACHE_USER_IGNORED_DEPRECATED_PASSWORD was added in 8.0.2.

•   Error number: MY-010318; Symbol: ER_AUTHCACHE_USER_IGNORED_NEEDS_PLUGIN; SQLSTATE: HY000

Message: User entry '%s'@'%s' has an empty plugin value. The user will be ignored and no one can login with this user anymore.

ER_AUTHCACHE_USER_IGNORED_NEEDS_PLUGIN was added in 8.0.2.

•   Error number: MY-010319; Symbol: ER_AUTHCACHE_USER_IGNORED_INVALID_PASSWORD; SQLSTATE: HY000

Message: Found invalid password for user: '%s'@'%s'; Ignoring user

ER_AUTHCACHE_USER_IGNORED_INVALID_PASSWORD was added in 8.0.2.

•   Error number: MY-010320; Symbol: ER_AUTHCACHE_EXPIRED_PASSWORD_UNSUPPORTED; SQLSTATE: HY000

Message: 'user' entry '%s'@'%s' has the password ignore flag raised, but its authentication plugin doesn't support password expiration. The user id will be ignored.

ER_AUTHCACHE_EXPIRED_PASSWORD_UNSUPPORTED was added in 8.0.2.

•   Error number: MY-010321; Symbol: ER_NO_SUPER_WITHOUT_USER_PLUGIN; SQLSTATE: HY000

Message: Some of the user accounts with SUPER privileges were disabled because of empty mysql.user.plugin value. If you are upgrading from MySQL 5.6 to MySQL 5.7 it means that substitution for the empty plugin column was not possible. Probably because of pre 4.1 password hash. If your account is disabled you will need to perform the MySQL upgrade procedure. For complete instructions on how to upgrade MySQL to a new version please see the 'Upgrading MySQL' section from the MySQL manual.

ER_NO_SUPER_WITHOUT_USER_PLUGIN was added in 8.0.2.

•   Error number: MY-010322; Symbol: ER_AUTHCACHE_DB_IGNORED_EMPTY_NAME; SQLSTATE: HY000

Message: Found an entry in the 'db' table with empty database name; Skipped

ER_AUTHCACHE_DB_IGNORED_EMPTY_NAME was added in 8.0.2.

•   Error number: MY-010323; Symbol: ER_AUTHCACHE_DB_SKIPPED_NEEDS_RESOLVE; SQLSTATE: HY000

Message: 'db' entry '%s'@'%s' ignored in --skip-name-resolve mode.

ER_AUTHCACHE_DB_SKIPPED_NEEDS_RESOLVE was added in 8.0.2.
• Error number: MY-010324; Symbol: ER_AUTHCACHE_DB_ENTRY_LOWERCASED_REVOKE_WILL_FAIL; SQLSTATE: HY000
Message: 'db' entry '%s %s@%s' had database in mixed case that has been forced to lowercase because lower_case_table_names is set. It will not be possible to remove this privilege using REVOKE.
ER_AUTHCACHE_DB_ENTRY_LOWERCASED_REVOKE_WILL_FAIL was added in 8.0.2.

• Error number: MY-010325; Symbol: ER_AUTHCACHE_TABLE_PROXIES_PRIV_MISSING; SQLSTATE: HY000
Message: The system table mysql.proxies_priv is missing. Please perform the MySQL upgrade procedure.
ER_AUTHCACHE_TABLE_PROXIES_PRIV_MISSING was added in 8.0.2.

• Error number: MY-010326; Symbol: ER_AUTHCACHE_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES; SQLSTATE: HY000
Message: Fatal error: Can't open and lock privilege tables: %s
ER_AUTHCACHE_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES was added in 8.0.2.

• Error number: MY-010327; Symbol: ER_AUTHCACHE_CANT_INIT_GRANT_SUBSYSTEM; SQLSTATE: HY000
Message: Fatal: can't initialize grant subsystem - '%s'
ER_AUTHCACHE_CANT_INIT_GRANT_SUBSYSTEM was added in 8.0.2.

• Error number: MY-010328; Symbol: ER_AUTHCACHE_PROCS_PRIV_SKIPPED_NEEDS_RESOLVE; SQLSTATE: HY000
Message: 'procs_priv' entry '%s %s@%s' ignored in --skip-name-resolve mode.
ER_AUTHCACHE_PROCS_PRIV_SKIPPED_NEEDS_RESOLVE was added in 8.0.2.

• Error number: MY-010329; Symbol: ER_AUTHCACHE_PROCS_PRIV_ENTRY_IGNORED_BAD_ROUTINE_TYPE; SQLSTATE: HY000
Message: 'procs_priv' entry '%s' ignored, bad routine type
ER_AUTHCACHE_PROCS_PRIV_ENTRY_IGNORED_BAD_ROUTINE_TYPE was added in 8.0.2.

• Error number: MY-010330; Symbol: ER_AUTHCACHE_TABLES_PRIV_SKIPPED_NEEDS_RESOLVE; SQLSTATE: HY000
Message: 'tables_priv' entry '%s %s@%s' ignored in --skip-name-resolve mode.
ER_AUTHCACHE_TABLES_PRIV_SKIPPED_NEEDS_RESOLVE was added in 8.0.2.

• Error number: MY-010331; Symbol: ER_USER_NOT_IN_EXTRA_USERS_BINLOG_POSSIBLY_INCOMPLETE; SQLSTATE: HY000
Message: Failed to add %s in extra_users. Binary log entry may miss some of the users.
ER_USER_NOT_IN_EXTRA_USERS_BINLOG_POSSIBLY_INCOMPLETE was added in 8.0.2.

• Error number: MY-010332; Symbol: ER_DD_SCHEMA_NOT_FOUND; SQLSTATE: HY000
Message: Unable to start server. The data dictionary schema '%s' does not exist.

ER_DD_SCHEMA_NOT_FOUND was added in 8.0.2.

• Error number: MY-010333; Symbol: ER_DD_TABLE_NOT_FOUND; SQLSTATE: HY000
Message: Unable to start server. The data dictionary table '%s' does not exist.

ER_DD_TABLE_NOT_FOUND was added in 8.0.2.

• Error number: MY-010334; Symbol: ER_DD_SE_INIT_FAILED; SQLSTATE: HY000
Message: Failed to initialize DD Storage Engine

ER_DD_SE_INIT_FAILED was added in 8.0.2.

• Error number: MY-010335; Symbol: ER_DD_ABORTING_PARTIAL_UPGRADE; SQLSTATE: HY000
Message: Found partially upgraded DD. Aborting upgrade and deleting all DD tables. Start the upgrade process again.

ER_DD_ABORTING_PARTIAL_UPGRADE was added in 8.0.2.

• Error number: MY-010336; Symbol: ER_DD_FRM_EXISTS_FOR_TABLE; SQLSTATE: HY000
Message: Found .frm file with same name as one of the Dictionary Tables.

ER_DD_FRM_EXISTS_FOR_TABLE was added in 8.0.2.

• Error number: MY-010337; Symbol: ER_DD_CREATED_FOR_UPGRADE; SQLSTATE: HY000
Message: Created Data Dictionary for upgrade

ER_DD_CREATED_FOR_UPGRADE was added in 8.0.2.

• Error number: MY-010338; Symbol: ER_ERRMSG_CANT_FIND_FILE; SQLSTATE: HY000
Message: Can't find error-message file '%s'. Check error-message file location and 'lc-messages-dir' configuration directive.

ER_ERRMSG_CANT_FIND_FILE was added in 8.0.2.

• Error number: MY-010339; Symbol: ER_ERRMSG_LOADING_55_STYLE; SQLSTATE: HY000
Message: Using pre 5.5 semantics to load error messages from %s. If this is not intended, refer to the documentation for valid usage of --lc-messages-dir and --language parameters.

ER_ERRMSG_LOADING_55_STYLE was added in 8.0.2.

• Error number: MY-010340; Symbol: ER_ERRMSG_MISSING_IN_FILE; SQLSTATE: HY000
Message: Error message file '%s' had only %d error messages, but it should contain at least %d error messages. Check that the above file is the right version for this program!

ER_ERRMSG_MISSING_IN_FILE was added in 8.0.2.

• Error number: MY-010341; Symbol: ER_ERRMSG_OOM; SQLSTATE: HY000
Message: Not enough memory for messagefile '%s'
ER_ERRMSG_OOM was added in 8.0.2.

- Error number: MY-010342; Symbol: ER_ERRMSG_CANT_READ; SQLSTATE: HY000
  Message: Can't read from messagefile '%s'
  ER_ERRMSG_CANT_READ was added in 8.0.2.

- Error number: MY-010343; Symbol: ER_TABLE_INCOMPATIBLE_DECIMAL_FIELD; SQLSTATE: HY000
  Message: Found incompatible DECIMAL field '%s' in %s; Please do "ALTER TABLE `%%s` FORCE" to fix it!
  ER_TABLE_INCOMPATIBLE_DECIMAL_FIELD was added in 8.0.2.

- Error number: MY-010344; Symbol: ER_TABLE_INCOMPATIBLE_YEAR_FIELD; SQLSTATE: HY000
  Message: Found incompatible YEAR(x) field '%s' in %s; Please do "ALTER TABLE `%%s` FORCE" to fix it!
  ER_TABLE_INCOMPATIBLE_YEAR_FIELD was added in 8.0.2.

- Error number: MY-010345; Symbol: ER_INVALID_CHARSET_AND_DEFAULT_IS_MB; SQLSTATE: HY000
  Message: '%s' had no or invalid character set, and default character set is multi-byte, so character column sizes may have changed
  ER_INVALID_CHARSET_AND_DEFAULT_IS_MB was added in 8.0.2.

- Error number: MY-010346; Symbol: ER_TABLE_WRONG_KEY_DEFINITION; SQLSTATE: HY000
  Message: Found wrong key definition in %s; Please do "ALTER TABLE `%%s` FORCE" to fix it!
  ER_TABLE_WRONG_KEY_DEFINITION was added in 8.0.2.

- Error number: MY-010347; Symbol: ER_CANT_OPEN_FRM_FILE; SQLSTATE: HY000
  Message: Unable to open file %s
  ER_CANT_OPEN_FRM_FILE was added in 8.0.2.

- Error number: MY-010348; Symbol: ER_CANT_READ_FRM_FILE; SQLSTATE: HY000
  Message: Error in reading file %s
  ER_CANT_READ_FRM_FILE was added in 8.0.2.

- Error number: MY-010349; Symbol: ER_TABLE_CREATED_WITH_DIFFERENT_VERSION; SQLSTATE: HY000
  Message: Table '%s' was created with a different version of MySQL and cannot be read
  ER_TABLE_CREATED_WITH_DIFFERENT_VERSION was added in 8.0.2.

- Error number: MY-010350; Symbol: ER_VIEW_UNPARSABLE; SQLSTATE: HY000
  Message: Unable to read view %s
ER_VIEW_UNPARSABLE was added in 8.0.2.

- Error number: MY-010351; Symbol: ER_FILE_TYPE_UNKNOWN; SQLSTATE: HY000
  Message: File %s has unknown type in its header.
  ER_FILE_TYPE_UNKNOWN was added in 8.0.2.

- Error number: MY-010352; Symbol: ER_INVALID_INFO_IN_FRM; SQLSTATE: HY000
  Message: Incorrect information in file %s
  ER_INVALID_INFO_IN_FRM was added in 8.0.2.

- Error number: MY-010353; Symbol: ER_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES; SQLSTATE: HY000
  Message: Can't open and lock privilege tables: %s
  ER_CANT_OPEN_AND_LOCK_PRIVILEGE_TABLES was added in 8.0.2.

- Error number: MY-010354; Symbol: ER_AUDIT_PLUGIN_DOES_NOT_SUPPORT_AUDIT_AUTH_EVENTS; SQLSTATE: HY000
  Message: Plugin '%s' cannot subscribe to MYSQL_AUDIT_AUTHORIZATION events. Currently not supported.
  ER_AUDIT_PLUGIN_DOES_NOT_SUPPORT_AUDIT_AUTH_EVENTS was added in 8.0.2.

- Error number: MY-010355; Symbol: ER_AUDIT_PLUGIN_HAS_INVALID_DATA; SQLSTATE: HY000
  Message: Plugin '%s' has invalid data.
  ER_AUDIT_PLUGIN_HAS_INVALID_DATA was added in 8.0.2.

- Error number: MY-010356; Symbol: ER_TZ_OOM_INITIALIZING_TIME_ZONES; SQLSTATE: HY000
  Message: Fatal error: OOM while initializing time zones
  ER_TZ_OOM_INITIALIZING_TIME_ZONES was added in 8.0.2.

- Error number: MY-010357; Symbol: ER_TZ_CANT_OPEN_AND_LOCK_TIME_ZONE_TABLE; SQLSTATE: HY000
  Message: Can't open and lock time zone table: %s trying to live without them
  ER_TZ_CANT_OPEN_AND_LOCK_TIME_ZONE_TABLE was added in 8.0.2.

- Error number: MY-010358; Symbol: ER_TZ_OOM_LOADING_LEAP_SECOND_TABLE; SQLSTATE: HY000
  Message: Fatal error: Out of memory while loading mysql.time_zone_leap_second table
  ER_TZ_OOM_LOADING_LEAPSECOND_TABLE was added in 8.0.2.

- Error number: MY-010359; Symbol: ER_TZ_TOO_MANY_LEAPS_IN_LEAP_SECOND_TABLE; SQLSTATE: HY000
  Message: Fatal error: While loading mysql.time_zone_leap_second table: too much leaps
**ER_TZ_TOO_MANY_LEAPS_IN_LEAP_SECOND_TABLE** was added in 8.0.2.

- **Error number:** MY-010360; **Symbol:** ER_TZ_ERROR>Loading_LEAP_SECOND_TABLE; **SQLSTATE:** HY000
  
  **Message:** Fatal error: Error while loading mysql.time_zone_leap_second table

**ER_TZ_ERROR>Loading_LEAP_SECOND_TABLE** was added in 8.0.2.

- **Error number:** MY-010361; **Symbol:** ER_TZ_UNKNOWN_OR_ILLEGAL_DEFAULT_TIME_ZONE; **SQLSTATE:** HY000
  
  **Message:** Fatal error: Illegal or unknown default time zone '%s'

**ER_TZ_UNKNOWN_OR_ILLEGAL_DEFAULT_TIME_ZONE** was added in 8.0.2.

- **Error number:** MY-010362; **Symbol:** ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE; **SQLSTATE:** HY000
  
  **Message:** Can't find description of time zone '%.*s'

**ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE** was added in 8.0.2.

- **Error number:** MY-010363; **Symbol:** ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE_ID; **SQLSTATE:** HY000
  
  **Message:** Can't find description of time zone '%u'

**ER_TZ_CANT_FIND_DESCRIPTION_FOR_TIME_ZONE_ID** was added in 8.0.2.

- **Error number:** MY-010364; **Symbol:** ER_TZ_TRANSITION_TYPE_TABLE_TYPE_TOO_LARGE; **SQLSTATE:** HY000
  
  **Message:** Error while loading time zone description from mysql.time_zone_transition_type table: too big transition type id

**ER_TZ_TRANSITION_TYPE_TABLE_TYPE_TOO_LARGE** was added in 8.0.2.

- **Error number:** MY-010365; **Symbol:** ER_TZ_TRANSITION_TYPE_TABLE_ABBREVIATIONS_EXCEED_SPACE; **SQLSTATE:** HY000
  
  **Message:** Error while loading time zone description from mysql.time_zone_transition_type table: not enough room for abbreviations

**ER_TZ_TRANSITION_TYPE_TABLE_ABBREVIATIONS_EXCEED_SPACE** was added in 8.0.2.

- **Error number:** MY-010366; **Symbol:** ER_TZ_TRANSITION_TYPE_TABLE_LOAD_ERROR; **SQLSTATE:** HY000
  
  **Message:** Error while loading time zone description from mysql.time_zone_transition_type table

**ER_TZ_TRANSITION_TYPE_TABLE_LOAD_ERROR** was added in 8.0.2.

- **Error number:** MY-010367; **Symbol:** ER_TZ_TRANSITION_TABLE_TOO_MANY_TRANSITIONS; **SQLSTATE:** HY000
  
  **Message:** Error while loading time zone description from mysql.time_zone_transition table: too much transitions
ER_TZ_TRANSITION_TABLE_TOO_MANY_TRANSITIONS was added in 8.0.2.

- Error number: MY-010368; Symbol: ER_TZ_TRANSITION_TABLE_BAD_TRANSITION_TYPE; SQLSTATE: HY000

  Message: Error while loading time zone description from mysql.time_zone_transition table: bad transition type id

ER_TZ_TRANSITION_TABLE_BAD_TRANSITION_TYPE was added in 8.0.2.

- Error number: MY-010369; Symbol: ER_TZ_TRANSITION_TABLE_LOAD_ERROR; SQLSTATE: HY000

  Message: Error while loading time zone description from mysql.time_zone_transition table

ER_TZ_TRANSITION_TABLE_LOAD_ERROR was added in 8.0.2.

- Error number: MY-010370; Symbol: ER_TZ_NO_TRANSITION_TYPES_IN_TIME_ZONE; SQLSTATE: HY000

  Message: loading time zone without transition types

ER_TZ_NO_TRANSITION_TYPES_IN_TIME_ZONE was added in 8.0.2.

- Error number: MY-010371; Symbol: ER_TZ_OOM_LOADING_TIME_ZONE_DESCRIPTION; SQLSTATE: HY000

  Message: Out of memory while loading time zone description

ER_TZ_OOM_LOADING_TIME_ZONE_DESCRIPTION was added in 8.0.2.

- Error number: MY-010372; Symbol: ER_TZ_CANT_BUILD_MKTIME_MAP; SQLSTATE: HY000

  Message: Unable to build mktime map for time zone

ER_TZ_CANT_BUILD_MKTIME_MAP was added in 8.0.2.

- Error number: MY-010373; Symbol: ER_TZ_OOM_WHILE_LOADING_TIME_ZONE; SQLSTATE: HY000

  Message: Out of memory while loading time zone

ER_TZ_OOM_WHILE_LOADING_TIME_ZONE was added in 8.0.2.

- Error number: MY-010374; Symbol: ER_TZ_OOM_WHILE_SETTING_TIME_ZONE; SQLSTATE: HY000

  Message: Fatal error: Out of memory while setting new time zone

ER_TZ_OOM_WHILE_SETTING_TIME_ZONE was added in 8.0.2.

- Error number: MY-010375; Symbol: ER_SLAVE_SQL_THREAD_STOPPED_UNTIL_CONDITION_BAD; SQLSTATE: HY000

  Message: Slave SQL thread is stopped because UNTIL condition is bad(%s:%llu).

ER_SLAVE_SQL_THREAD_STOPPED_UNTIL_CONDITION_BAD was added in 8.0.2.

- Error number: MY-010376; Symbol: ER_SLAVE_SQL_THREAD_STOPPED_UNTIL_POSITION_REACHED; SQLSTATE: HY000

  Message: Slave SQL thread stopped because it reached its UNTIL position %llu
ER_SLAVE_SQL_THREAD_STOPPED_UNTIL_POSITION_REACHED was added in 8.0.2.

- Error number: MY-010377; Symbol: ER_SLAVE_SQL_THREAD_STOPPED_BEFORE_GTIDS_ALREADY_APPLIED; SQLSTATE: HY000
  Message: Slave SQL thread stopped because UNTIL SQL_BEFORE_GTIDS %s is already applied.

ER_SLAVE_SQL_THREAD_STOPPED_BEFORE_GTIDS_ALREADY_APPLIED was added in 8.0.2.

- Error number: MY-010378; Symbol: ER_SLAVE_SQL_THREAD_STOPPED_BEFORE_GTIDS_REACHED; SQLSTATE: HY000
  Message: Slave SQL thread stopped because it reached UNTIL SQL_BEFORE_GTIDS %s.

ER_SLAVE_SQL_THREAD_STOPPED_BEFORE_GTIDS_REACHED was added in 8.0.2.

- Error number: MY-010379; Symbol: ER_SLAVE_SQL_THREAD_STOPPED_AFTER_GTIDS_REACHED; SQLSTATE: HY000
  Message: Slave SQL thread stopped because it reached UNTIL SQL_AFTER_GTIDS %s.

ER_SLAVE_SQL_THREAD_STOPPED_AFTER_GTIDS_REACHED was added in 8.0.2.

- Error number: MY-010380; Symbol: ER_SLAVE_SQL_THREAD_STOPPED_GAP_TRX_PROCESSED; SQLSTATE: HY000
  Message: Slave SQL thread stopped according to UNTIL SQL_AFTER_MTS_GAPS as it has processed all gap transactions left from the previous slave session.

ER_SLAVE_SQL_THREAD_STOPPED_GAP_TRX_PROCESSED was added in 8.0.2.

- Error number: MY-010381; Symbol: ER_GROUP_REPLICATION_PLUGIN_NOT_INSTALLED; SQLSTATE: HY000
  Message: Group Replication plugin is not installed.

ER_GROUP_REPLICATION_PLUGIN_NOT_INSTALLED was added in 8.0.2.

- Error number: MY-010382; Symbol: ER_GTID_ALREADY_ADDED_BY_USER; SQLSTATE: HY000
  Message: The transaction owned GTID is already in the %s table, which is caused by an explicit modifying from user client.

ER_GTID_ALREADY_ADDED_BY_USER was added in 8.0.2.

- Error number: MY-010383; Symbol: ER_FAILED_TO_DELETE_FROM_GTID_EXECUTED_TABLE; SQLSTATE: HY000
  Message: Failed to delete the row: '%s' from the gtid_executed table.

ER_FAILED_TO_DELETE_FROM_GTID_EXECUTED_TABLE was added in 8.0.2.

- Error number: MY-010384; Symbol: ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE; SQLSTATE: HY000
  Message: Failed to compress the gtid_executed table.

ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE was added in 8.0.2.
• Error number: MY-010385; Symbol: ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE_OOM; SQLSTATE: HY000

Message: Failed to compress the gtid_executed table, because it is failed to allocate the THD.

ER_FAILED_TO_COMPRESS_GTID_EXECUTED_TABLE_OOM was added in 8.0.2.

• Error number: MY-010386; Symbol: ER_FAILED_TO_INIT_THREAD_ATTR_FOR_GTID_TABLE_COMPRESSION; SQLSTATE: HY000

Message: Failed to initialize thread attribute when creating compression thread.

ER_FAILED_TO_INIT_THREAD_ATTR_FOR_GTID_TABLE_COMPRESSION was added in 8.0.2.

• Error number: MY-010387; Symbol: ER_FAILED_TO_CREATE_GTID_TABLE_COMPRESSION_THREAD; SQLSTATE: HY000

Message: Can not create thread to compress gtid_executed table (errno= %d)

ER_FAILED_TO_CREATE_GTID_TABLE_COMPRESSION_THREAD was added in 8.0.2.

• Error number: MY-010388; Symbol: ER_FAILED_TO_JOIN_GTID_TABLE_COMPRESSION_THREAD; SQLSTATE: HY000

Message: Could not join gtid_executed table compression thread. error:%d

ER_FAILED_TO_JOIN_GTID_TABLE_COMPRESSION_THREAD was added in 8.0.2.

• Error number: MY-010389; Symbol: ER_NPIPE_FAILED_TO_INIT_SECURITY_DESCRIPTOR; SQLSTATE: HY000

Message: Can't start server : Initialize security descriptor: %s

ER_NPIPE_FAILED_TO_INIT_SECURITY_DESCRIPTOR was added in 8.0.2.

• Error number: MY-010390; Symbol: ER_NPIPE_FAILED_TO_SET_SECURITY_DESCRIPTOR; SQLSTATE: HY000

Message: Can't start server : Set security descriptor: %s

ER_NPIPE_FAILED_TO_SET_SECURITY_DESCRIPTOR was added in 8.0.2.

• Error number: MY-010391; Symbol: ER_NPIPE_PIPE_ALREADY_IN_USE; SQLSTATE: HY000

Message: Can't start server : Named Pipe "%s" already in use.

ER_NPIPE_PIPE_ALREADY_IN_USE was added in 8.0.2.

• Error number: MY-010392; Symbol: ER_NDB_SLAVE_SAW_EPOCH_LOWER_THAN_PREVIOUS_ON_START; SQLSTATE: HY000

Message: NDB Slave : At SQL thread start applying epoch %llu/%llu (%llu) from Master ServerId %u which is lower than previously applied epoch %llu/%llu (%llu). Group Master Log : %s Group Master Log Pos : %llu. Check slave positioning.

ER_NDB_SLAVE_SAW_EPOCH_LOWER_THAN_PREVIOUS_ON_START was added in 8.0.2, removed after 8.0.13.
Server Error Message Reference

- **Error number:** MY-010393; **Symbol:** ER_NDB_SLAVE_SAW_EPOCH_LOWER_THAN_PREVIOUS; **SQLSTATE:** HY000
  
  Message: NDB Slave : SQL thread stopped as applying epoch %llu/%llu (%llu) from Master ServerId %u which is lower than previously applied epoch %llu/%llu (%llu). Group Master Log : %s Group Master Log Pos : %llu

  ER_NDB_SLAVE_SAW_EPOCH_LOWER_THAN_PREVIOUS was added in 8.0.2, removed after 8.0.13.

- **Error number:** MY-010394; **Symbol:** ER_NDB_SLAVE_SAW_ALREADY_COMMITTED_EPOCH; **SQLSTATE:** HY000
  
  Message: NDB Slave : SQL thread stopped as attempted to reapply already committed epoch %llu/%llu (%llu) from server id %u. Group Master Log : %s Group Master Log Pos : %llu.

  ER_NDB_SLAVE_SAW_ALREADY_COMMITTED_EPOCH was added in 8.0.2, removed after 8.0.13.

- **Error number:** MY-010395; **Symbol:** ER_NDB_SLAVE_PREVIOUS_EPOCH_NOT_COMMITTED; **SQLSTATE:** HY000
  
  Message: NDB Slave : SQL thread stopped as attempting to apply new epoch %llu/%llu (%llu) while lower received epoch %llu/%llu (%llu) has not been committed. Master server id : %u. Group Master Log : %s Group Master Log Pos : %llu.

  ER_NDB_SLAVE_PREVIOUS_EPOCH_NOT_COMMITTED was added in 8.0.2, removed after 8.0.13.

- **Error number:** MY-010396; **Symbol:** ER_NDB_SLAVE_MISSING_DATA_FOR_TIMESTAMP_COLUMN; **SQLSTATE:** HY000
  
  Message: NDB Slave: missing data for %s timestamp column %u.

  ER_NDB_SLAVE_MISSING_DATA_FOR_TIMESTAMP_COLUMN was added in 8.0.2, removed after 8.0.13.

- **Error number:** MY-010397; **Symbol:** ER_NDB_SLAVE_LOGGING_EXCEPTIONS_TO; **SQLSTATE:** HY000
  
  Message: NDB Slave: Table %s.%s logging exceptions to %s.%s

  ER_NDB_SLAVE_LOGGING_EXCEPTIONS_TO was added in 8.0.2, removed after 8.0.13.

- **Error number:** MY-010398; **Symbol:** ER_NDB_SLAVE_LOW_EPOCH_RESOLUTION; **SQLSTATE:** HY000
  
  Message: NDB Slave: Table %s.%s : %s, low epoch resolution

  ER_NDB_SLAVE_LOW_EPOCH_RESOLUTION was added in 8.0.2, removed after 8.0.13.

  Message: Found unexpected field type %u

  ER_NDB_INFO_FOUND_UNEXPECTED_FIELD_TYPE was added in 8.0.2, removed after 8.0.13.

- **Error number:** MY-010400; **Symbol:** ER_NDB_INFO_FAILED_TO_CREATE_NDBINFO; **SQLSTATE:** HY000
  
  Message: Failed to create NdbInfo

  ER_NDB_INFO_FAILED_TO_CREATE_NDBINFO was added in 8.0.2, removed after 8.0.13.
• Error number: MY-010401; Symbol: ER_NDB_INFO_FAILED_TO_INIT_NDBINFO; SQLSTATE: HY000
  Message: Failed to init NdbInfo
  ER_NDB_INFO_FAILED_TO_INIT_NDBINFO was added in 8.0.2, removed after 8.0.13.

• Error number: MY-010402; Symbol: ER_NDB_CLUSTER_WRONG_NUMBER_OF_FUNCTION_ARGUMENTS; SQLSTATE: HY000
  Message: ndb_serialize_cond: Unexpected mismatch of found and expected number of function arguments %u
  ER_NDB_CLUSTER_WRONG_NUMBER_OF_FUNCTION_ARGUMENTS was added in 8.0.2, removed after 8.0.13.

• Error number: MY-010403; Symbol: ER_NDB_CLUSTER_SCHEMA_INFO; SQLSTATE: HY000
  Message: %s - %s.%s
  ER_NDB_CLUSTER_SCHEMA_INFO was added in 8.0.2, removed after 8.0.13.

• Error number: MY-010404; Symbol: ER_NDB_CLUSTER_GENERIC_MESSAGE; SQLSTATE: HY000
  Message: %s
  ER_NDB_CLUSTER_GENERIC_MESSAGE was added in 8.0.2, removed after 8.0.13.

• Error number: MY-010405; Symbol: ER_RPL_CANT_OPEN_INFO_TABLE; SQLSTATE: HY000
  Message: Info table is not ready to be used. Table '%s.%s' cannot be opened.
  ER_RPL_CANT_OPEN_INFO_TABLE was added in 8.0.2.

• Error number: MY-010406; Symbol: ER_RPL_CANT_SCAN_INFO_TABLE; SQLSTATE: HY000
  Message: Info table is not ready to be used. Table '%s.%s' cannot be scanned.
  ER_RPL_CANT_SCAN_INFO_TABLE was added in 8.0.2.

• Error number: MY-010407; Symbol: ER_RPL_CORRUPTED_INFO_TABLE; SQLSTATE: HY000
  Message: Corrupted table %s.%s. Check out table definition.
  ER_RPL_CORRUPTED_INFO_TABLE was added in 8.0.2.

• Error number: MY-010408; Symbol: ER_RPL_CORRUPTED_KEYS_IN_INFO_TABLE; SQLSTATE: HY000
  Message: Info table has a problem with its key field(s). Table '%s.%s' expected field #%u to be '%s' but found '%s' instead.
  ER_RPL_CORRUPTED_KEYS_IN_INFO_TABLE was added in 8.0.2.

• Error number: MY-010409; Symbol: ER_RPL_WORKER_ID_IS; SQLSTATE: HY000
  Message: Choosing worker id %lu, the following is going to be %lu
  ER_RPL_WORKER_ID_IS was added in 8.0.2.
Server Error Message Reference

- **Error number:** MY-010410; **Symbol:** ER_RPL_INCONSISTENT_TIMESTAMPS_IN_TRX; **SQLSTATE:** HY000
  
  Message: Transaction is tagged with inconsistent logical timestamps: `sequence_number (%lld) <= last_committed (%lld)`

  *ER_RPL_INCONSISTENT_TIMESTAMPS_IN_TRX* was added in 8.0.2.

- **Error number:** MY-010411; **Symbol:** ER_RPL_INCONSISTENT_SEQUENCE_NO_IN_TRX; **SQLSTATE:** HY000
  
  Message: Transaction’s sequence number is inconsistent with that of a preceding one: `sequence_number (%lld) <= previous sequence_number (%lld)`

  *ER_RPL_INCONSISTENT_SEQUENCE_NO_IN_TRX* was added in 8.0.2.

- **Error number:** MY-010412; **Symbol:** ER_RPL_CHANNELS_REQUIRE_TABLES_AS_INFO_REPOSITORIES; **SQLSTATE:** HY000
  
  Message: For the creation of replication channels the master info and relay log info repositories must be set to TABLE

  *ER_RPL_CHANNELS_REQUIRE_TABLES_AS_INFO_REPOSITORIES* was added in 8.0.2.

- **Error number:** MY-010413; **Symbol:** ER_RPL_CHANNELS_REQUIRE_NON_ZERO_SERVER_ID; **SQLSTATE:** HY000
  
  Message: For the creation of replication channels the server id must be different from 0

  *ER_RPL_CHANNELS_REQUIRE_NON_ZERO_SERVER_ID* was added in 8.0.2.

- **Error number:** MY-010414; **Symbol:** ER_RPL_REPO_SHOULD_BE_TABLE; **SQLSTATE:** HY000
  
  Message: Slave: Wrong repository. Repository should be TABLE

  *ER_RPL_REPO_SHOULD_BE_TABLE* was added in 8.0.2.

- **Error number:** MY-010415; **Symbol:** ER_RPL_ERROR_CREATING_MASTER_INFO; **SQLSTATE:** HY000
  
  Message: Error creating master info: %s.

  *ER_RPL_ERROR_CREATING_MASTER_INFO* was added in 8.0.2.

- **Error number:** MY-010416; **Symbol:** ER_RPL_ERROR_CHANGING_MASTER_INFO_REPO_TYPE; **SQLSTATE:** HY000
  
  Message: Error changing the type of master info’s repository: %s.

  *ER_RPL_ERROR_CHANGING_MASTER_INFO_REPO_TYPE* was added in 8.0.2.

- **Error number:** MY-010417; **Symbol:** ER_RPL_CHANGING_RELAY_LOG_INFO_REPO_TYPE_FAILED_DUE_TO_GAPS; **SQLSTATE:** HY000
  
  Message: It is not possible to change the type of the relay log repository because there are workers repositories with possible execution gaps. The value of --relay_log_info_repository is altered to one of the found Worker repositories. The gaps have to be sorted out before resuming with the type change.

  *ER_RPL_CHANGING_RELAY_LOG_INFO_REPO_TYPE_FAILED_DUE_TO_GAPS* was added in 8.0.2.
• Error number: MY-010418; Symbol: ER_RPL_ERROR_CREATING_RELAY_LOG_INFO; SQLSTATE: HY000
Message: Error creating relay log info: %s.

ER_RPL_ERROR_CREATING_RELAY_LOG_INFO was added in 8.0.2.

• Error number: MY-010419; Symbol: ER_RPL_ERROR_CHANGING_RELAY_LOG_INFO_REPO_TYPE; SQLSTATE: HY000
Message: Error changing the type of relay log info’s repository: %s.

ER_RPL_ERROR_CHANGING_RELAY_LOG_INFO_REPO_TYPE was added in 8.0.2.

• Error number: MY-010420; Symbol:
ER_RPL_FAILED_TO_DELETE_FROM_SLAVE_WORKERS_INFO_REPOSITORY; SQLSTATE: HY000
Message: Could not delete from Slave Workers info repository.

ER_RPL_FAILED_TO_DELETE_FROM_SLAVE_WORKERS_INFO_REPOSITORY was added in 8.0.2.

• Error number: MY-010421; Symbol:
ER_RPL_FAILED_TO_RESET_STATE_IN_SLAVE_INFO_REPOSITORY; SQLSTATE: HY000
Message: Could not store the reset Slave Worker state into the slave info repository.

ER_RPL_FAILED_TO_RESET_STATE_IN_SLAVE_INFO_REPOSITORY was added in 8.0.2.

• Error number: MY-010422; Symbol:
ER_RPL_ERROR_CHECKING_REPOSITORY; SQLSTATE: HY000
Message: Error in checking %s repository info type of %s.

ER_RPL_ERROR_CHECKING_REPOSITORY was added in 8.0.2.

Message: Failed to flush master info file.

ER_RPL_SLAVE_CANT_FLUSH_MASTER_INFO_FILE was added in 8.0.2.

- Error number: MY-010553; Symbol: ER_RPL_SLAVE_REPORT_HOST_TOO_LONG; SQLSTATE: HY000
  Message: The length of report_host is %zu. It is larger than the max length(%d), so this slave cannot be registered to the master%s.

ER_RPL_SLAVE_REPORT_HOST_TOO_LONG was added in 8.0.2.

- Error number: MY-010554; Symbol: ER_RPL_SLAVE_REPORT_USER_TOO_LONG; SQLSTATE: HY000
  Message: The length of report_user is %zu. It is larger than the max length(%d), so this slave cannot be registered to the master%s.

ER_RPL_SLAVE_REPORT_USER_TOO_LONG was added in 8.0.2.

- Error number: MY-010555; Symbol: ER_RPL_SLAVE_REPORT_PASSWORD_TOO_LONG; SQLSTATE: HY000
  Message: The length of report_password is %zu. It is larger than the max length(%d), so this slave cannot be registered to the master%s.

ER_RPL_SLAVE_REPORT_PASSWORD_TOO_LONG was added in 8.0.2.

- Error number: MY-010556; Symbol: ER_RPL_SLAVE_ERROR_RETRYING; SQLSTATE: HY000
  Message: Error on %s: %d %s, will retry in %d secs

ER_RPL_SLAVE_ERROR_RETRYING was added in 8.0.2.

- Error number: MY-010557; Symbol: ER_RPL_SLAVE_ERROR_READING_FROM_SERVER; SQLSTATE: HY000
  Message: Error reading packet from server%s: %s (server_errno=%d)

ER_RPL_SLAVE_ERROR_READING_FROM_SERVER was added in 8.0.2.

- Error number: MY-010558; Symbol: ER_RPL_SLAVE_DUMP_THREAD_KILLED_BY_MASTER; SQLSTATE: HY000
  Message: Slave%s: received end packet from server due to dump thread being killed on master. Dump threads are killed for example during master shutdown, explicitly by a user, or when the master receives a binlog send request from a duplicate server UUID <%s> : Error %s

ER_RPL_SLAVE_DUMP_THREAD_KILLED_BY_MASTER was added in 8.0.2.

- Error number: MY-010559; Symbol: ER_RPL_MTS_STATISTICS; SQLSTATE: HY000
  Message: Multi-threaded slave statistics%s: seconds elapsed = %lu; events assigned = %llu; worker queues filled over overrun level = %lu; waited due a Worker queue full = %lu; waited due the total size = %lu; waited at clock conflicts = %llu waited (count) when Workers occupied = %lu waited when Workers occupied = %llu

ER_RPL_MTS_STATISTICS was added in 8.0.2.

- Error number: MY-010560; Symbol: ER_RPL_MTS_RECOVERY_COMPLETE; SQLSTATE: HY000
Message: Slave%s: MTS Recovery has completed at relay log %s, position %llu master log %s, position %llu.

ER_RPL_MTS_RECOVERY_COMPLETE was added in 8.0.2.

- Error number: MY-010561; Symbol: ER_RPL_SLAVE_CANT_INIT_RELAY_LOG_POSITION; SQLSTATE: HY000

Message: Error initializing relay log position%s: %s

ER_RPL_SLAVE_CANT_INIT_RELAY_LOG_POSITION was added in 8.0.2.

- Error number: MY-010562; Symbol: ER_RPL_SLAVE_CONNECTED_TO_MASTER_REPLICATION_STARTED; SQLSTATE: HY000

Message: Slave I/O thread%s: connected to master '%s@%s:%d', replication started in log '%s' at position %s

ER_RPL_SLAVE_CONNECTED_TO_MASTER_REPLICATION_STARTED was added in 8.0.2.

- Error number: MY-010563; Symbol: ER_RPL_SLAVE_IO_THREAD_KILLED; SQLSTATE: HY000

Message: Slave I/O thread%s killed while connecting to master

ER_RPL_SLAVE_IO_THREAD_KILLED was added in 8.0.2.

- Error number: MY-010564; Symbol: ER_RPL_SLAVE_IO_THREAD_CANT_REGISTER_ON_MASTER; SQLSTATE: HY000

Message: Slave I/O thread couldn't register on master

ER_RPL_SLAVE_IO_THREAD_CANT_REGISTER_ON_MASTER was added in 8.0.2.

- Error number: MY-010565; Symbol: ER_RPL_SLAVE_FORCING_TO_RECONNECT_IO_THREAD; SQLSTATE: HY000

Message: Forcing to reconnect slave I/O thread%s

ER_RPL_SLAVE_FORCING_TO_RECONNECT_IO_THREAD was added in 8.0.2.

- Error number: MY-010566; Symbol: ER_RPL_SLAVE_ERROR_REQUESTING_BINLOG_DUMP; SQLSTATE: HY000

Message: Failed on request_dump()%s

ER_RPL_SLAVE_ERROR_REQUESTING_BINLOG_DUMP was added in 8.0.2.

- Error number: MY-010567; Symbol: ER_RPL_LOG_ENTRY_EXCEEDS_SLAVE_MAX_ALLOWED_PACKET; SQLSTATE: HY000

Message: Log entry on master is longer than slave_max_allowed_packet (%lu) on slave. If the entry is correct, restart the server with a higher value of slave_max_allowed_packet

ER_RPL_LOG_ENTRY_EXCEEDS_SLAVE_MAX_ALLOWED_PACKET was added in 8.0.2.

- Error number: MY-010568; Symbol: ER_RPL_SLAVE_STOPPING_AS_MASTER_OOM; SQLSTATE: HY000
**Server Error Message Reference**

Message: Stopping slave I/O thread due to out-of-memory error from master

`ER_RPL_SLAVE_STOPPING_AS_MASTER_OOM` was added in 8.0.2.

- **Error number:** MY-010569; Symbol: `ER_RPL_SLAVE_IO_THREAD_ABORTED_WAITING_FOR_RELAY_LOG_SPACE`; **SQLSTATE:** HY000

Message: Slave I/O thread aborted while waiting for relay log space

`ER_RPL_SLAVE_IO_THREAD_ABORTED_WAITING_FOR_RELAY_LOG_SPACE` was added in 8.0.2.

- **Error number:** MY-010570; Symbol: `ER_RPL_SLAVE_IO_THREAD_EXITING`; **SQLSTATE:** HY000

Message: Slave I/O thread exiting%s, read up to log '%s', position %s

`ER_RPL_SLAVE_IO_THREAD_EXITING` was added in 8.0.2.

- **Error number:** MY-010571; Symbol: `ER_RPL_SLAVE_CANT_INITIALIZE_SLAVE_WORKER`; **SQLSTATE:** HY000

Message: Failed during slave worker initialization%s

`ER_RPL_SLAVE_CANT_INITIALIZE_SLAVE_WORKER` was added in 8.0.2.

- **Error number:** MY-010572; Symbol: `ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO_FOR_WORKER`; **SQLSTATE:** HY000

Message: Slave: MTS group recovery relay log info based on Worker-Id %lu, group_relay_log_name %s, group_relay_log_pos %llu, group_master_log_name %s, group_master_log_pos %llu

`ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO_FOR_WORKER` was added in 8.0.2.

- **Error number:** MY-010573; Symbol: `ER_RPL_ERROR_LOOKING_FOR_LOG`; **SQLSTATE:** HY000

Message: Error looking for %s.

`ER_RPL_ERROR_LOOKING_FOR_LOG` was added in 8.0.2.

- **Error number:** MY-010574; Symbol: `ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO`; **SQLSTATE:** HY000

Message: Slave: MTS group recovery relay log info group_master_log_name %s, event_master_log_pos %llu.

`ER_RPL_MTS_GROUP_RECOVERY_RELAY_LOG_INFO` was added in 8.0.2.

- **Error number:** MY-010575; Symbol: `ER_RPL_CANT_FIND_FOLLOWUP_FILE`; **SQLSTATE:** HY000

Message: Error looking for file after %s.

`ER_RPL_CANT_FIND_FOLLOWUP_FILE` was added in 8.0.2.

- **Error number:** MY-010576; Symbol: `ER_RPL_MTS_CHECKPOINT_PERIOD_DIFFERS_FROM_CNT`; **SQLSTATE:** HY000

Message: This an error cnt != mts_checkpoint_period

`ER_RPL_MTS_CHECKPOINT_PERIOD_DIFFERS_FROM_CNT` was added in 8.0.2.
• Error number: **MY-010577**; Symbol: **ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED**; SQLSTATE: **HY000**

Message: Failed during slave worker thread creation%s

**ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED** was added in 8.0.2.

• Error number: **MY-010578**; Symbol: **ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED_WITH_ERRNO**; SQLSTATE: **HY000**

Message: Failed during slave worker thread creation%s (errno= %d)

**ER_RPL_SLAVE_WORKER_THREAD_CREATION_FAILED_WITH_ERRNO** was added in 8.0.2.

• Error number: **MY-010579**; Symbol: **ER_RPL_SLAVE_FAILED_TO_INIT_PARTITIONS_HASH**; SQLSTATE: **HY000**

Message: Failed to init partitions hash

**ER_RPL_SLAVE_FAILED_TO_INIT_PARTITIONS_HASH** was added in 8.0.2.

• Error number: **MY-010580**; Symbol: **ER_RPL_SLAVE_NDB_TABLES_NOT_AVAILABLE**; SQLSTATE: **HY000**

Message: Slave SQL thread : NDB : Tables not available after %lu seconds. Consider increasing --ndb-wait-setup value

**ER_RPL_SLAVE_NDB_TABLES_NOT_AVAILABLE** was added in 8.0.2, removed after 8.0.13.

• Error number: **MY-010581**; Symbol: **ER_RPL_SLAVE_SQL_THREAD_STARTING**; SQLSTATE: **HY000**

Message: Slave SQL thread%s initialized, starting replication in log '%%s' at position %s, relay log '%%s' position: %s

**ER_RPL_SLAVE_SQL_THREAD_STARTING** was added in 8.0.2.

• Error number: **MY-010582**; Symbol: **ER_RPL_SLAVE_SKIP_COUNTER_EXECUTED**; SQLSTATE: **HY000**

Message: 'SQL_SLAVE_SKIP_COUNTER=%ld' executed at relay_log_file='%%s', relay_log_pos='%%ld', master_log_name='%%s', master_log_pos='%%ld' and new position at relay_log_file='%%s', relay_log_pos='%%ld', master_log_name='%%s', master_log_pos='%%ld'

**ER_RPL_SLAVE_SKIP_COUNTER_EXECUTED** was added in 8.0.2.

  ER_DB_OPT_NOT_FOUND_USING_DEFAULT_CHARSET was added in 8.0.2.

• Error number: MY-010773; Symbol: ER_EVENT_CANT_GET_TIMEZONE_FROM_FIELD; SQLSTATE: HY000
Server Error Message Reference

Message: Event "%'s'.%'s": invalid value in column mysql.event.time_zone.
This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the mysql.event system table and migrates its contents to the internal data dictionary. 

ER_EVENT_CANT_GET_TIMEZONE_FROM_FIELD was added in 8.0.2.

• Error number: MY-010774; Symbol: ER_EVENT_CANT_FIND_TIMEZONE; SQLSTATE: HY000
Message: Event "%'s'.%'s": has invalid time zone value
This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the mysql.event system table and migrates its contents to the internal data dictionary. 

ER_EVENT_CANT_FIND_TIMEZONE was added in 8.0.2.

• Error number: MY-010775; Symbol: ER_EVENT_CANT_GET_CHARSET; SQLSTATE: HY000
Message: Event "%'s'.%'s": invalid value in column mysql.event.character_set_client.
This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the mysql.event system table and migrates its contents to the internal data dictionary. 

ER_EVENT_CANT_GET_CHARSET was added in 8.0.2.

• Error number: MY-010776; Symbol: ER_EVENT_CANT_GET_COLLATION; SQLSTATE: HY000
Message: Event "%'s'.%'s": invalid value in column mysql.event.collation_connection.
This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the mysql.event system table and migrates its contents to the internal data dictionary. 

ER_EVENT_CANT_GET_COLLATION was added in 8.0.2.

• Error number: MY-010777; Symbol: ER_EVENT_CANT_OPEN_TABLE_MYSQL_EVENT; SQLSTATE: HY000
Message: Failed to open mysql.event Table.
This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the mysql.event system table and migrates its contents to the internal data dictionary. 

ER_EVENT_CANT_OPEN_TABLE_MYSQL_EVENT was added in 8.0.2.

• Error number: MY-010778; Symbol: ER_CANT_PARSE_STORED_ROUTINE_BODY; SQLSTATE: HY000
Message: Parsing '%s.%s' routine body failed.%s
ER_CANT_PARSE_STORED_ROUTINE_BODY was added in 8.0.2.

• Error number: MY-010779; Symbol: ER_CANT_OPEN_TABLE_MYSQL_PROC; SQLSTATE: HY000
Message: Failed to open mysql.proc Table.
This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the mysql.proc system table and migrates its contents to the internal data dictionary. 

ER_CANT_OPEN_TABLE_MYSQL_PROC was added in 8.0.2.
• Error number: **MY-010780**; Symbol: **ER_CANT_READ_TABLE_MYSQL_PROC**; SQLSTATE: **HY000**

Message: Failed to read mysql.proc table.

This error can occur for upgrades to MySQL 8.0 from previous versions. During the upgrade process, the server reads the `mysql.proc` system table and migrates its contents to the internal data dictionary.

**ER_CANT_READ_TABLE_MYSQL_PROC** was added in 8.0.2.

• Error number: **MY-010781**; Symbol: **ER_FILE_EXISTS_DURING_UPGRADE**; SQLSTATE: **HY000**

Message: Found %s file in mysql schema. DD will create .ibd file with same name. Please rename table and start upgrade process again.

**ER_FILE_EXISTS_DURING_UPGRADE** was added in 8.0.2.

• Error number: **MY-010782**; Symbol: **ER_CANT_OPEN_DATADIR_AFTER_UPGRADE_FAILURE**; SQLSTATE: **HY000**

Message: Unable to open the data directory %s during clean up after upgrade failed

**ER_CANT_OPEN_DATADIR_AFTER_UPGRADE_FAILURE** was added in 8.0.2.

• Error number: **MY-010783**; Symbol: **ER_CANT_SET_PATH_FOR**; SQLSTATE: **HY000**

Message: Failed to set path %s

**ER_CANT_SET_PATH_FOR** was added in 8.0.2.

• Error number: **MY-010784**; Symbol: **ER_CANT_OPEN_DIR**; SQLSTATE: **HY000**

Message: Failed to open dir %s

**ER_CANT_OPEN_DIR** was added in 8.0.2.

• Error number: **MY-010785**; Symbol: **ER_NDB_EMPTY_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS**; SQLSTATE: **HY000**

Message: NDB: Found empty nodeid specified in --ndb-cluster-connection-pool-nodeids='%s'.

**ER_NDB_EMPTY_NODEID_IN_NDB_CLUSTER_CONNECTION_POOL_NODEIDS** was added in 8.0.2, removed after 8.0.13.

ER_INNODB_INDEX_COLUMN_INFO_UNLIKE_MYSQLS was added in 8.0.2.

•   Error number: MY-010881; Symbol: ER_INNODB_CANT_OPEN_TABLE; SQLSTATE: HY000
Message: Failed to open table %s.

ER_INNODB_CANT_OPEN_TABLE was added in 8.0.2, removed after 8.0.18.
Server Error Message Reference

- **Error number:** MY-010882; **Symbol:** `ER_INNODB_CANT_BUILD_INDEX_XLATION_TABLE_FOR`; **SQLSTATE:** HY000
  
  Message: Build InnoDB index translation table for Table %s failed
  
  `ER_INNODB_CANT_BUILD_INDEX_XLATION_TABLE_FOR` was added in 8.0.2.

- **Error number:** MY-010883; **Symbol:** `ER_INNODB_PK_NOT_IN_MYSQL`; **SQLSTATE:** HY000
  
  Message: Table %s has a primary key in InnoDB data dictionary, but not in MySQL!
  
  `ER_INNODB_PK_NOT_IN_MYSQL` was added in 8.0.2.

- **Error number:** MY-010884; **Symbol:** `ER_INNODB_PK_ONLY_IN_MYSQL`; **SQLSTATE:** HY000
  
  Message: Table %s has no primary key in InnoDB data dictionary, but has one in MySQL! If you created the table with a MySQL version < 3.23.54 and did not define a primary key, but defined a unique key with all non-NULL columns, then MySQL internally treats that key as the primary key. You can fix this error by dump + DROP + CREATE + reimport of the table.
  
  `ER_INNODB_PK_ONLY_IN_MYSQL` was added in 8.0.2.

- **Error number:** MY-010885; **Symbol:** `ER_INNODB_CLUSTERED_INDEX_PRIVATE`; **SQLSTATE:** HY000
  
  Message: Table %s key_used_on_scan is %lu even though there is no primary key inside InnoDB.
  
  `ER_INNODB_CLUSTERED_INDEX_PRIVATE` was added in 8.0.2.

- **Error number:** MY-010886; **Symbol:** `ER_INNODB_PARTITION_TABLE_LOWERCASED`; **SQLSTATE:** HY000
  
  Message: Partition table %s opened after converting to lower case. The table may have been moved from a case-insensitive file system. Please recreate the table in the current file system.
  
  `ER_INNODB_PARTITION_TABLE_LOWERCASED` was added in 8.0.2, removed after 8.0.18.

- **Error number:** MY-010887; **Symbol:** `ER_ERRMSG_REPLACEMENT_DODGY`; **SQLSTATE:** HY000
  
  Message: Cannot replace error message (%s,%s,%s) "%s" with "%s"; wrong number or type of %% substitutions.
  
  `ER_ERRMSG_REPLACEMENT_DODGY` was added in 8.0.2.

- **Error number:** MY-010888; **Symbol:** `ER_ERRMSG_REPLACEMENTS_FAILED`; **SQLSTATE:** HY000
  
  Message: Table for error message replacements could not be found or read, or one or more replacements could not be applied.
  
  `ER_ERRMSG_REPLACEMENTS_FAILED` was added in 8.0.2.

- **Error number:** MY-010889; **Symbol:** `ER_NPIPE_CANT_CREATE`; **SQLSTATE:** HY000
  
  Message: %s: %s
  
  `ER_NPIPE_CANT_CREATE` was added in 8.0.2.

- **Error number:** MY-010890; **Symbol:** `ER_PARTITION_MOVE_CREATED_DUPLICATE_ROW_PLEASE_FIX`; **SQLSTATE:** HY000

  Message: %s: %s
  
  `ER_PARTITION_MOVE_CREATED_DUPLICATE_ROW_PLEASE_FIX` was added in 8.0.2.
Message: Table ‘%s’: Delete from part %d failed with error %d. But it was already inserted into part %d, when moving the misplaced row! Please manually fix the duplicate row: %s

**ER_PARTITION_MOVE_CREATED_DUPLICATE_ROW_PLEASE_FIX** was added in 8.0.2.

- **Error number:** MY-010891; Symbol: **ER_AUDIT_CANT_ABORT_COMMAND**; **SQLSTATE:** HY000
  Message: Command ‘%s’ cannot be aborted. The trigger error was (%d) [%s]: %s

**ER_AUDIT_CANT_ABORT_COMMAND** was added in 8.0.2.

- **Error number:** MY-010892; Symbol: **ER_AUDIT_CANT_ABORT_EVENT**; **SQLSTATE:** HY000
  Message: Event ‘%s’ cannot be aborted. The trigger error was (%d) [%s]: %s

**ER_AUDIT_CANT_ABORT_EVENT** was added in 8.0.2.

- **Error number:** MY-010893; Symbol: **ER_AUDIT_WARNING**; **SQLSTATE:** HY000
  Message: %s. The trigger error was (%d) [%s]: %s

**ER_AUDIT_WARNING** was added in 8.0.2.

- **Error number:** MY-010894; Symbol: **ER_NDB_NUMBER_OF_CHANNELS**; **SQLSTATE:** HY000
  Message: Slave SQL: Configuration with number of replication masters = %u' is not supported when applying to Ndb

**ER_NDB_NUMBER_OF_CHANNELS** was added in 8.0.2, removed after 8.0.13.

- **Error number:** MY-010895; Symbol: **ER_NDB_SLAVE_PARALLEL_WORKERS**; **SQLSTATE:** HY000
  Message: Slave SQL: Configuration 'slave_parallel_workers = %lu' is not supported when applying to Ndb

**ER_NDB_SLAVE_PARALLEL_WORKERS** was added in 8.0.2, removed after 8.0.13.

- **Error number:** MY-010896; Symbol: **ER_NDB_DISTRIBUTING_ERR**; **SQLSTATE:** HY000
  Message: NDB %s: distributing %s err: %u

**ER_NDB_DISTRIBUTING_ERR** was added in 8.0.2, removed after 8.0.13.

- **Error number:** MY-010897; Symbol: **ER_RPL_SLAVE_INSECURE_CHANGE_MASTER**; **SQLSTATE:** HY000
  Message: Storing MySQL user name or password information in the master info repository is not secure and is therefore not recommended. Please consider using the USER and PASSWORD connection options for START SLAVE; see the ‘START SLAVE Syntax’ in the MySQL Manual for more information.

**ER_RPL_SLAVE_INSECURE_CHANGE_MASTER** was added in 8.0.4.

- **Error number:** MY-010898; Symbol: **ER_RPL_SLAVE_FLUSH_RELAY_LOGS_NOT_ALLOWED**; **SQLSTATE:** HY000
  Message: FLUSH RELAY LOGS cannot be performed on channel ‘%s’.

**ER_RPL_SLAVE_FLUSH_RELAY_LOGS_NOT_ALLOWED** was added in 8.0.4, removed after 8.0.15.
• Error number: MY-010899; Symbol: ER_RPL_SLAVE_INCORRECT_CHANNEL; SQLSTATE: HY000
Message: Slave channel '%s' does not exist.

ER_RPL_SLAVE_INCORRECT_CHANNEL was added in 8.0.4.

• Error number: MY-010900; Symbol: ER_FAILED_TO_FIND_DL_ENTRY; SQLSTATE: HY000
Message: Can't find symbol '%s' in library.

ER_FAILED_TO_FIND_DL_ENTRY was added in 8.0.4.

• Error number: MY-010901; Symbol: ER_FAILED_TO_OPEN_SHARED_LIBRARY; SQLSTATE: HY000
Message: Can't open shared library '%s' (errno: %d %s).

ER_FAILED_TO_OPEN_SHARED_LIBRARY was added in 8.0.4.

• Error number: MY-010902; Symbol: ER_THREAD_PRIORITY_IGNORED; SQLSTATE: HY000
Message: Thread priority attribute setting in Resource Group SQL shall be ignored due to unsupported platform or insufficient privilege.

ER_THREAD_PRIORITY_IGNORED was added in 8.0.4.

• Error number: MY-010903; Symbol: ER_BINLOG_CACHE_SIZE_TOO_LARGE; SQLSTATE: HY000
Message: Option binlog_cache_size (%lu) is greater than max_binlog_cache_size (%lu); setting binlog_cache_size equal to max_binlog_cache_size.

ER_BINLOG_CACHE_SIZE_TOO_LARGE was added in 8.0.4.

• Error number: MY-010904; Symbol: ER_BINLOG_STMT_CACHE_SIZE_TOO_LARGE; SQLSTATE: HY000
Message: Option binlog_stmt_cache_size (%lu) is greater than max_binlog_stmt_cache_size (%lu); setting binlog_stmt_cache_size equal to max_binlog_stmt_cache_size.

ER_BINLOG_STMT_CACHE_SIZE_TOO_LARGE was added in 8.0.4.

• Error number: MY-010905; Symbol: ER_FAILED_TO_GENERATE_UNIQUE_LOGFILE; SQLSTATE: HY000
Message: Can't generate a unique log-filename %s.(1-999).

ER_FAILED_TO_GENERATE_UNIQUE_LOGFILE was added in 8.0.4.

• Error number: MY-010906; Symbol: ER_FAILED_TO_READ_FILE; SQLSTATE: HY000
Message: Error reading file '%s' (errno: %d - %s)

ER_FAILED_TO_READ_FILE was added in 8.0.4.

• Error number: MY-010907; Symbol: ER_FAILED_TO_WRITE_TO_FILE; SQLSTATE: HY000
Message: Error writing file '%s' (errno: %d - %s)

ER_FAILED_TO_WRITE_TO_FILE was added in 8.0.4.
• Error number: **MY-010908**; Symbol: **ER_BINLOG_UNSAFE_MESSAGE_AND_STATEMENT**; SQLSTATE: **HY000**

Message: %s Statement: %s

**ER_BINLOG_UNSAFE_MESSAGE_AND_STATEMENT** was added in 8.0.4.

• Error number: **MY-010909**; Symbol: **ER_FORCE_CLOSE_THREAD**; SQLSTATE: **HY000**

Message: %s: Forcing close of thread %ld user: '%s'.

**ER_FORCE_CLOSE_THREAD** was added in 8.0.4.

• Error number: **MY-010910**; Symbol: **ER_SERVER_SHUTDOWN_COMPLETE**; SQLSTATE: **HY000**

Message: %s: Shutdown complete (mysqld %s) %s.

**ER_SERVER_SHUTDOWN_COMPLETE** was added in 8.0.4.

• Error number: **MY-010911**; Symbol: **ER_RPL_CANT_HAVE_SAME_BASENAME**; SQLSTATE: **HY000**

Message: Cannot have same base name '%s' for both binary and relay logs. Please check %s (default '%s' if --log-bin option is not used, default '%s' if --log-bin option is used without argument) and %s (default '%s') options to ensure they do not conflict.

**ER_RPL_CANT_HAVE_SAME_BASENAME** was added in 8.0.3.

• Error number: **MY-010912**; Symbol: **ER_RPL_GTID_MODEQUIRES_ENFORCE_GTID_CONSISTENCY_ON**; SQLSTATE: **HY000**

Message: GTID_MODE = ON requires ENFORCE_GTID_CONSISTENCY = ON.

**ER_RPL_GTID_MODEQUIRES_ENFORCE_GTID_CONSISTENCY_ON** was added in 8.0.4.

• Error number: **MY-010913**; Symbol: **ER_WARN_NO_SERVERID_SPECIFIED**; SQLSTATE: **HY000**

Message: You have not provided a mandatory server-id. Servers in a replication topology must have unique server-ids. Please refer to the proper server start-up parameters documentation.

**ER_WARN_NO_SERVERID_SPECIFIED** was added in 8.0.3.

• Error number: **MY-010914**; Symbol: **ER_ABORTING_USER_CONNECTION**; SQLSTATE: **HY000**

Message: Aborted connection %u to db: '%s' user: '%s' host: '%s' (%s).

**ER_ABORTING_USER_CONNECTION** was added in 8.0.4.

• Error number: **MY-010915**; Symbol: **ER_SQL_MODE_MERGED_WITH_STRICT_MODE**; SQLSTATE: **HY000**

Message: 'NO_ZERO_DATE', 'NO_ZERO_IN_DATE' and 'ERROR_FOR_DIVISION_BY_ZERO' sql modes should be used with strict mode. They will be merged with strict mode in a future release.

**ER_SQL_MODE_MERGED_WITH_STRICT_MODE** was added in 8.0.4.
• Error number: MY-010916; Symbol: ER_GTID_PURGED_WAS_UPDATED; SQLSTATE: HY000
  Message: @@GLOBAL.GTID_PURGED was changed from '%s' to '%s'.
  ER_GTID_PURGED_WAS_UPDATED was added in 8.0.4.

• Error number: MY-010917; Symbol: ER_GTID_EXECUTED_WAS_UPDATED; SQLSTATE: HY000
  Message: @@GLOBAL.GTID_EXECUTED was changed from '%s' to '%s'.
  ER_GTID_EXECUTED_WAS_UPDATED was added in 8.0.4.

• Error number: MY-010918; Symbol: ER_DEPRECATE_MSG_WITH_REPLACEMENT; SQLSTATE: HY000
  Message: '%s' is deprecated and will be removed in a future release. Please use %s instead.
  ER_DEPRECATE_MSG_WITH_REPLACEMENT was added in 8.0.4.

• Error number: MY-010919; Symbol: ER_TRG_CREATION_CTX_NOT_SET; SQLSTATE: HY000
  Message: Triggers for table `%s`.`%s` have no creation context
  ER_TRG_CREATION_CTX_NOT_SET was added in 8.0.4.

• Error number: MY-010920; Symbol: ER_FILE_HAS_OLD_FORMAT; SQLSTATE: HY000
  Message: '%s' has an old format, you should re-create the '%s' object(s)
  ER_FILE_HAS_OLD_FORMAT was added in 8.0.4.

• Error number: MY-010921; Symbol: ER_VIEW_CREATION_CTX_NOT_SET; SQLSTATE: HY000
  Message: View '%s`.`%s` has no creation context
  ER_VIEW_CREATION_CTX_NOT_SET was added in 8.0.4.

• Error number: MY-010923; Symbol: ER_TABLE_UPGRADE_REQUIRED; SQLSTATE: HY000
  Message: Table upgrade required. Please do "REPAIR TABLE `%s`" or dump/reload to fix it!
  ER_TABLE_UPGRADE_REQUIRED was added in 8.0.4.

• Error number: MY-010924; Symbol: ER_GET_ERRNO_FROM_STORAGE_ENGINE; SQLSTATE: HY000
  Message: Got error %d - '%s' from storage engine.
  ER_GET_ERRNO_FROM_STORAGE_ENGINE was added in 8.0.4.

• Error number: MY-010925; Symbol: ER_ACCESS_DENIED_ERROR_WITHOUT_PASSWORD; SQLSTATE: HY000
  Message: Access denied for user '%s'@'%s'
  ER_ACCESS_DENIED_ERROR_WITHOUT_PASSWORD was added in 8.0.4.

• Error number: MY-010926; Symbol: ER_ACCESS_DENIED_ERROR_WITH_PASSWORD; SQLSTATE: HY000
  Message: Access denied for user '%s'@'%s' (using password: %s)
ER_ACCESS_DENIED_ERROR_WITH_PASSWORD was added in 8.0.4.

- Error number: MY-010927; Symbol: ER_ACCESS_DENIED_FOR_USER_ACCOUNT_LOCKED; SQLSTATE: HY000
  Message: Access denied for user '%s'@'%'s'. Account is locked.

ER_ACCESS_DENIED_FOR_USER_ACCOUNT_LOCKED was added in 8.0.4.

- Error number: MY-010928; Symbol: ER_MUST_CHANGE_EXPIRED_PASSWORD; SQLSTATE: HY000
  Message: Your password has expired. To log in you must change it using a client that supports expired passwords.

ER_MUST_CHANGE_EXPIRED_PASSWORD was added in 8.0.4.

- Error number: MY-010929; Symbol: ER_SYSTEM_TABLES_NOT_SUPPORTED_BY_STORAGE_ENGINE; SQLSTATE: HY000
  Message: Storage engine '%s' does not support system tables. [%.%s].

ER_SYSTEM_TABLES_NOT_SUPPORTED_BY_STORAGE_ENGINE was added in 8.0.4.

- Error number: MY-010930; Symbol: ER_FILESORT_TERMINATED; SQLSTATE: HY000
  Message: Sort aborted

ER_FILESORT_TERMINATED was added in 8.0.4, removed after 8.0.18.

- Error number: MY-010931; Symbol: ER_SERVER_STARTUP_MSG; SQLSTATE: HY000

ER_SERVER_STARTUP_MSG was added in 8.0.4.

- Error number: MY-010932; Symbol: ER_FAILED_TO_FIND_LOCALE_NAME; SQLSTATE: HY000
  Message: Unknown locale: '%s'.

ER_FAILED_TO_FIND_LOCALE_NAME was added in 8.0.4.

- Error number: MY-010933; Symbol: ER_FAILED_TO_FIND_COLLATION_NAME; SQLSTATE: HY000
  Message: Unknown collation: '%s'.

ER_FAILED_TO_FIND_COLLATION_NAME was added in 8.0.4.

- Error number: MY-010934; Symbol: ER_SERVER_OUT_OF_RESOURCES; SQLSTATE: HY000
  Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

ER_SERVER_OUT_OF_RESOURCES was added in 8.0.4.

- Error number: MY-010935; Symbol: ER_SERVER_OUTOFMEMORY; SQLSTATE: HY000
  Message: Out of memory; restart server and try again (needed %d bytes)

ER_SERVER_OUTOFMEMORY was added in 8.0.4.
• Error number: MY-010936; Symbol: ER_INVALID_COLLATION_FOR_CHARSET; SQLSTATE: HY000
  Message: COLLATION '%s' is not valid for CHARACTER SET '%s'
  ER_INVALID_COLLATION_FOR_CHARSET was added in 8.0.4.

• Error number: MY-010937; Symbol: ER_CANT_START_ERROR_LOG_SERVICE; SQLSTATE: HY000
  Message: Failed to set %s at or around "%s" -- service is valid, but can not be initialized; please check its configuration and make sure it can read its input(s) and write to its output(s).
  ER_CANT_START_ERROR_LOG_SERVICE was added in 8.0.4.

• Error number: MY-010938; Symbol: ER_CREATING_NEW_UUID_FIRST_START; SQLSTATE: HY000
  Message: Generating a new UUID: %s.
  ER_CREATING_NEW_UUID_FIRST_START was added in 8.0.4.

• Error number: MY-010939; Symbol: ER_FAILED_TO_GET_ABSOLUTE_PATH; SQLSTATE: HY000
  Message: Failed to get absolute path of program executable %s
  ER_FAILED_TO_GET_ABSOLUTE_PATH was added in 8.0.4.

• Error number: MY-010940; Symbol: ER_PERFSchema_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP; SQLSTATE: HY000
  Message: Failed to bootstrap performance schema components infrastructure.
  ER_PERFSchema_COMPONENTS_INFRASTRUCTURE_BOOTSTRAP was added in 8.0.4.

• Error number: MY-010941; Symbol: ER_PERFSchema_COMPONENTS_INFRASTRUCTURE_SHUTDOWN; SQLSTATE: HY000
  Message: Failed to deinit performance schema components infrastructure.
  ER_PERFSchema_COMPONENTS_INFRASTRUCTURE_SHUTDOWN was added in 8.0.4.

• Error number: MY-010942; Symbol: ER_DUP_FD_OPEN_FAILED; SQLSTATE: HY000
  Message: Could not open duplicate fd for %s: %s.
  ER_DUP_FD_OPEN_FAILED was added in 8.0.4.

• Error number: MY-010943; Symbol: ER_SYSTEM_VIEW_INIT FAILED; SQLSTATE: HY000
  Message: System views initialization failed.
  ER_SYSTEM_VIEW_INIT_FAILED was added in 8.0.4.

• Error number: MY-010944; Symbol: ER_RESOURCE_GROUP_POST_INIT_FAILED; SQLSTATE: HY000
  Message: Resource group post initialization failed.
  ER_RESOURCE_GROUP_POST_INIT_FAILED was added in 8.0.4.

• Error number: MY-010945; Symbol: ER_RESOURCE_GROUP_SUBSYSTEM_INIT_FAILED; SQLSTATE: HY000
Server Error Message Reference

ER_RESOURCE_GROUP_SUBSYSTEM_INIT_FAILED was added in 8.0.4.

- Error number: MY-010946; Symbol: ER_FAILED_START_MYSQLD_DAEMON; SQLSTATE: HY000
  Message: Failed to start mysqld daemon. Check mysqld error log.
  ER_FAILED_START_MYSQLD_DAEMON was added in 8.0.4.

- Error number: MY-010947; Symbol: ER_CANNOT_CHANGE_TO_ROOT_DIR; SQLSTATE: HY000
  Message: Cannot change to root directory: %s.
  ER_CANNOT_CHANGE_TO_ROOT_DIR was added in 8.0.4.

- Error number: MY-010948; Symbol: ER_PERSISTENT_PRIVILEGES_BOOTSTRAP; SQLSTATE: HY000
  Message: Failed to bootstrap persistent privileges.
  ER_PERSISTENT_PRIVILEGES_BOOTSTRAP was added in 8.0.4.

- Error number: MY-010949; Symbol: ER_BASEDIR_SET_TO; SQLSTATE: HY000
  Message: Basedir set to %s.
  ER_BASEDIR_SET_TO was added in 8.0.4.

- Error number: MY-010950; Symbol: ER_RPL_FILTER_ADD_WILD_DO_TABLE_FAILED; SQLSTATE: HY000
  Message: Could not add wild do table rule '%s'!
  ER_RPL_FILTER_ADD_WILD_DO_TABLE_FAILED was added in 8.0.4.

- Error number: MY-010951; Symbol: ER_RPL_FILTER_ADD_WILD_IGNORE_TABLE_FAILED; SQLSTATE: HY000
  Message: Could not add wild ignore table rule '%s'!
  ER_RPL_FILTER_ADD_WILD_IGNORE_TABLE_FAILED was added in 8.0.4.

- Error number: MY-010952; Symbol: ER_PRIVILEGE_SYSTEM_INIT_FAILED; SQLSTATE: HY000
  Message: The privilege system failed to initialize correctly. For complete instructions on how to upgrade MySQL to a new version please see the 'Upgrading MySQL' section from the MySQL manual.
  ER_PRIVILEGE_SYSTEM_INIT_FAILED was added in 8.0.4.

- Error number: MY-010953; Symbol: ER_CANNOT_SET_LOG_ERROR_SERVICES; SQLSTATE: HY000
  Message: Cannot set services "%s" requested in --log-error-services, using defaults.
  ER_CANNOT_SET_LOG_ERROR_SERVICES was added in 8.0.4.

- Error number: MY-010954; Symbol: ER_PERFSHEMA_TABLES_INIT_FAILED; SQLSTATE: HY000
  Message: Performance schema tables initialization failed.
ER_PERFSHEMA_TABLES_INIT_FAILED was added in 8.0.4.

- Error number: MY-010955; Symbol: ER_TX_EXTRACTION_ALGORITHM_FOR_BINLOG_TX_DEPEDENCY_TRACKING; SQLSTATE: HY000
  
  Message: The transaction_write_set_extraction must be set to %s when binlog_transaction_dependency_tracking is %s.

ER_TX_EXTRACTION_ALGORITHM_FOR_BINLOG_TX_DEPEDENCY_TRACKING was added in 8.0.4.

- Error number: MY-010956; Symbol: ER_INVALID_REPLICATION_TIMESTAMPS; SQLSTATE: HY000
  
  Message: Invalid replication timestamps: original commit timestamp is more recent than the immediate commit timestamp. This may be an issue if delayed replication is active. Make sure that servers have their clocks set to the correct time. No further message will be emitted until after timestamps become valid again.

ER_INVALID_REPLICATION_TIMESTAMPS was added in 8.0.4.

- Error number: MY-010957; Symbol: ER_RPL_TIMESTAMPS_RETURNED_TO_NORMAL; SQLSTATE: HY000
  
  Message: The replication timestamps have returned to normal values.

ER_RPL_TIMESTAMPS_RETURNED_TO_NORMAL was added in 8.0.4.

- Error number: MY-010958; Symbol: ER_BINLOG_FILE_OPEN_FAILED; SQLSTATE: HY000
  
  Message: %s.

ER_BINLOG_FILE_OPEN_FAILED was added in 8.0.4.

- Error number: MY-010959; Symbol: ER_BINLOG_EVENT_WRITE_TO_STMT_CACHE_FAILED; SQLSTATE: HY000
  
  Message: Failed to write an incident event into stmt_cache.

ER_BINLOG_EVENT_WRITE_TO_STMT_CACHE_FAILED was added in 8.0.4.

- Error number: MY-010960; Symbol: ER_SLAVE_RELAY_LOG_TRUNCATE_INFO; SQLSTATE: HY000
  
  Message: Relaylog file %s size was %llu, but was truncated at %llu.

ER_SLAVE_RELAY_LOG_TRUNCATE_INFO was added in 8.0.4.

- Error number: MY-010961; Symbol: ER_SLAVE_RELAY_LOG_PURGE_FAILED; SQLSTATE: HY000
  
  Message: Unable to purge relay log files. %s:%%s.

ER_SLAVE_RELAY_LOG_PURGE_FAILED was added in 8.0.4.

- Error number: MY-010962; Symbol: ER_RPL_SLAVE_FILTER_CREATE_FAILED; SQLSTATE: HY000
  
  Message: Slave: failed in creating filter for channel %s'.

ER_RPL_SLAVE_FILTER_CREATE_FAILED was added in 8.0.4.
- **Error number:** MY-010963; Symbol: `ER_RPL_SLAVE_GLOBAL_FILTERS_COPY_FAILED`; SQLSTATE: HY000
  Message: Slave: failed in copying the global filters to its own per-channel filters on configuration for channel '%s'.
  
  `ER_RPL_SLAVE_GLOBAL_FILTERS_COPY_FAILED` was added in 8.0.4.

- **Error number:** MY-010964; Symbol: `ER_RPL_SLAVE_RESET_FILTER_OPTIONS`; SQLSTATE: HY000
  Message: There are per-channel replication filter(s) configured for channel '%s' which does not exist. The filter(s) have been discarded.
  
  `ER_RPL_SLAVE_RESET_FILTER_OPTIONS` was added in 8.0.4.

- **Error number:** MY-010965; Symbol: `ER_MISSING_GRANT_SYSTEM_TABLE`; SQLSTATE: HY000
  Message: The system table `mysql.global_grants` is missing. Please perform the MySQL upgrade procedure.
  
  `ER_MISSING_GRANT_SYSTEM_TABLE` was added in 8.0.4.

- **Error number:** MY-010966; Symbol: `ER_MISSING_ACL_SYSTEM_TABLE`; SQLSTATE: HY000
  Message: ACL table `mysql.%.*s` missing. Some operations may fail.
  
  `ER_MISSING_ACL_SYSTEM_TABLE` was added in 8.0.4.

- **Error number:** MY-010967; Symbol: `ER_ANONYMOUS_AUTH_ID_NOT_ALLOWED_IN_MANDATORY_ROLES`; SQLSTATE: HY000
  Message: Can't set mandatory_role %s@%s: Anonymous authorization IDs are not allowed as roles.
  
  `ER_ANONYMOUS_AUTH_ID_NOT_ALLOWED_IN_MANDATORY_ROLES` was added in 8.0.4.

- **Error number:** MY-010968; Symbol: `ER_UNKNOWN_AUTH_ID_IN_MANDATORY_ROLE`; SQLSTATE: HY000
  Message: Can't set mandatory_role: There's no such authorization ID %s@%s.
  
  `ER_UNKNOWN_AUTH_ID_IN_MANDATORY_ROLE` was added in 8.0.4.

- **Error number:** MY-010969; Symbol: `ER_WRITE_ROW_TO_PARTITION_FAILED`; SQLSTATE: HY000
  Message: Table '%s' failed to move/insert a row from part %d into part %d: %s.
  
  `ER_WRITE_ROW_TO_PARTITION_FAILED` was added in 8.0.4.

- **Error number:** MY-010970; Symbol: `ERRESOURCE_GROUP_METADATA_UPDATE_SKIPPED`; SQLSTATE: HY000
  Message: Skipped updating resource group metadata in InnoDB read only mode.
  
  `ERRESOURCE_GROUP_METADATA_UPDATE_SKIPPED` was added in 8.0.4.

- **Error number:** MY-010971; Symbol: `ER_FAILED_TO_PERSIST_RESOURCE_GROUP_METADATA`; SQLSTATE: HY000
  Message: Failed to persist resource group %s to Data Dictionary.
Server Error Message Reference

**ER_FAILED_TO_PERSIST_RESOURCE_GROUP_METADATA** was added in 8.0.4.

- **Error number:** MY-010972; **Symbol:** ER_FAILED_TO_DESERIALIZE_RESOURCE_GROUP; **SQLSTATE:** HY000
  
  Message: Failed to deserialize resource group %s.

**ER_FAILED_TO_DESERIALIZE_RESOURCE_GROUP** was added in 8.0.4.

- **Error number:** MY-010973; **Symbol:** ER_FAILED_TO_UPDATE_RESOURCE_GROUP; **SQLSTATE:** HY000
  
  Message: Update of resource group %s failed.

**ER_FAILED_TO_UPDATE_RESOURCE_GROUP** was added in 8.0.4.

- **Error number:** MY-010974; **Symbol:** ER_RESOURCE_GROUP_VALIDATION_FAILED; **SQLSTATE:** HY000
  
  Message: Validation of resource group %s failed. Resource group is disabled.

**ER_RESOURCE_GROUP_VALIDATION_FAILED** was added in 8.0.4.

- **Error number:** MY-010975; **Symbol:** ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP; **SQLSTATE:** HY000
  
  Message: Unable to allocate memory for Resource Group %s.

**ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP** was added in 8.0.4.

- **Error number:** MY-010976; **Symbol:** ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP_HASH; **SQLSTATE:** HY000
  
  Message: Failed to allocate memory for resource group hash.

**ER_FAILED_TO_ALLOCATE_MEMORY_FOR_RESOURCE_GROUP_HASH** was added in 8.0.4.

- **Error number:** MY-010977; **Symbol:** ER_FAILED_TO_ADD_RESOURCE_GROUP_TO_MAP; **SQLSTATE:** HY000
  
  Message: Failed to add resource group %s to resource group map.

**ER_FAILED_TO_ADD_RESOURCE_GROUP_TO_MAP** was added in 8.0.4.

- **Error number:** MY-010978; **Symbol:** ER_RESOURCE_GROUP_IS_DISABLED; **SQLSTATE:** HY000
  
  Message: Resource group feature is disabled. (Server is compiled with DISABLE_PSI_THREAD).

**ER_RESOURCE_GROUP_IS_DISABLED** was added in 8.0.4.

- **Error number:** MY-010979; **Symbol:** ER_FAILED_TO_APPLY_RESOURCE_GROUP_CONTROLLER; **SQLSTATE:** HY000
  
  Message: Unable to apply resource group controller %s.

**ER_FAILED_TO_APPLY_RESOURCE_GROUP_CONTROLLER** was added in 8.0.4.
Server Error Message Reference

- **Error number:** MY-010980; Symbol: `ER_FAILED_TO_ACQUIRE_LOCK_ON_RESOURCE_GROUP`; SQLSTATE: HY000
  
  Message: Unable to acquire lock on the resource group %s. Hint to switch resource group shall be ignored.

  `ER_FAILED_TO_ACQUIRE_LOCK_ON_RESOURCE_GROUP` was added in 8.0.4.

- **Error number:** MY-010981; Symbol: `ER_PFS_NOTIFICATION_FUNCTION_REGISTER_FAILED`; SQLSTATE: HY000
  
  Message: PFS %s notification function registration failed.

  `ER_PFS_NOTIFICATION_FUNCTION_REGISTER_FAILED` was added in 8.0.4.

- **Error number:** MY-010982; Symbol: `ER_RES_GRP_SET_THR_AFFINITY_FAILED`; SQLSTATE: HY000
  
  Message: Unable to bind thread id %llu to cpu id %u (error code %d - %s).

  `ER_RES_GRP_SET_THR_AFFINITY_FAILED` was added in 8.0.4.

- **Error number:** MY-010983; Symbol: `ER_RES_GRP_SET_THR_AFFINITY_TO_CPUS_FAILED`; SQLSTATE: HY000
  
  Message: Unable to bind thread id %llu to cpu ids (error code %d - %s).

  `ER_RES_GRP_SET_THR_AFFINITY_TO_CPUS_FAILED` was added in 8.0.4.

- **Error number:** MY-010984; Symbol: `ER_RES_GRP_THD_UNBIND_FROM_CPU_FAILED`; SQLSTATE: HY000
  
  Message: Unbind thread id %llu failed. (error code %d - %s).

  `ER_RES_GRP_THD_UNBIND_FROM_CPU_FAILED` was added in 8.0.4.

- **Error number:** MY-010985; Symbol: `ER_RES_GRP_SET_THREAD_PRIORITY_FAILED`; SQLSTATE: HY000
  
  Message: Setting thread priority %d to thread id %llu failed. (error code %d - %s).

  `ER_RES_GRP_SET_THREAD_PRIORITY_FAILED` was added in 8.0.4.

- **Error number:** MY-010986; Symbol: `ER_RES_GRP_FAILED_TO_DETERMINE_NICE_CAPACITY`; SQLSTATE: HY000
  
  Message: Unable to determine CAP_SYS_NICE capability.

  `ER_RES_GRP_FAILED_TO_DETERMINE_NICE_CAPACITY` was added in 8.0.4.

- **Error number:** MY-010987; Symbol: `ER_RES_GRP_FAILED_TO_GET_THREAD_HANDLE`; SQLSTATE: HY000
  
  Message: %s failed: Failed to get handle for thread %llu.

  `ER_RES_GRP_FAILED_TO_GET_THREAD_HANDLE` was added in 8.0.4.

- **Error number:** MY-010988; Symbol: `ER_RES_GRP_GET_THREAD_PRIO_NOT_SUPPORTED`; SQLSTATE: HY000
Message: Retrieval of thread priority unsupported on %s.

ER_RES_GRP_GET_THREAD_PRIO_NOT_SUPPORTED was added in 8.0.4.

•   Error number: MY-010989; Symbol: ER_RES_GRP_FAILED_DETERMINE_CPU_COUNT; SQLSTATE: HY000

Message: Unable to determine the number of CPUs.

ER_RES_GRP_FAILED_DETERMINE_CPU_COUNT was added in 8.0.4.

•   Error number: MY-010990; Symbol: ER_RES_GRP_FEATURE_NOT_AVAILABLE; SQLSTATE: HY000

Message: Resource group feature shall not be available. Incompatible thread handling option.

ER_RES_GRP_FEATURE_NOT_AVAILABLE was added in 8.0.4.

•   Error number: MY-010991; Symbol: ER_RES_GRP_INVALID_THREAD_PRIORITY; SQLSTATE: HY000

Message: Invalid thread priority %d for a %s resource group. Allowed range is [%d, %d].

ER_RES_GRP_INVALID_THREAD_PRIORITY was added in 8.0.4.

•   Error number: MY-010992; Symbol: ER_RES_GRP_SOLARIS_PROCESSOR_BIND_TO_CPUID_FAILED; SQLSTATE: HY000

Message: bind_to_cpu failed: processor_bind for cpuid %u failed (error code %d - %s).

ER_RES_GRP_SOLARIS_PROCESSOR_BIND_TO_CPUID_FAILED was added in 8.0.4.

•   Error number: MY-010993; Symbol: ER_RES_GRP_SOLARIS_PROCESSOR_BIND_TO_THREAD_FAILED; SQLSTATE: HY000

Message: bind_to_cpu failed: processor_bind for thread %llx with cpu id %u (error code %d - %s).

ER_RES_GRP_SOLARIS_PROCESSOR_BIND_TO_THREAD_FAILED was added in 8.0.4.

•   Error number: MY-010994; Symbol: ER_RES_GRP_SOLARIS_PROCESSOR_AFFINITY_FAILED; SQLSTATE: HY000

Message: %s failed: processor_affinity failed (error code %d - %s).

ER_RES_GRP_SOLARIS_PROCESSOR_AFFINITY_FAILED was added in 8.0.4.

•   Error number: MY-010995; Symbol: ER_DD_UPGRADE_RENAME_IDX_STATS_FILE_FAILED; SQLSTATE: HY000

Message: Error in renaming mysql_index_stats.ibd.

ER_DD_UPGRADE_RENAME_IDX_STATS_FILE_FAILED was added in 8.0.4.

•   Error number: MY-010996; Symbol: ER_DD_UPGRADE_DD_OPEN_FAILED; SQLSTATE: HY000

Message: Error in opening data directory %s.

ER_DD_UPGRADE_DD_OPEN_FAILED was added in 8.0.4.
• Error number: MY-010997; Symbol: ER_DD_UPGRADE_FAILED_TO_FETCH_TABLESPACES; SQLSTATE: HY000
Message: Error in fetching list of tablespaces.
ER_DD_UPGRADE_FAILED_TO_FETCH_TABLESPACES was added in 8.0.4.

• Error number: MY-010998; Symbol: ER_DD_UPGRADE_FAILED_TO_ACQUIRE_TABLESPACE; SQLSTATE: HY000
Message: Error in acquiring Tablespace for SDI insertion %s.
ER_DD_UPGRADE_FAILED_TO_ACQUIRE_TABLESPACE was added in 8.0.4.

• Error number: MY-010999; Symbol: ER_DD_UPGRADE_FAILED_TO_RESOLVE_TABLESPACE_ENGINE; SQLSTATE: HY000
Message: Error in resolving Engine name for tablespace %s with engine %s.
ER_DD_UPGRADE_FAILED_TO_RESOLVE_TABLESPACE_ENGINE was added in 8.0.4.

• Error number: MY-011000; Symbol: ER_FAILED_TO_CREATE SDI FOR TABLESPACE; SQLSTATE: HY000
Message: Error in creating SDI for %s tablespace.
ER_FAILED_TO_CREATE SDI FOR TABLESPACE was added in 8.0.4.

• Error number: MY-011001; Symbol: ER_FAILED_TO_STORE SDI FOR TABLESPACE; SQLSTATE: HY000
Message: Error in storing SDI for %s tablespace.
ER_FAILED_TO_STORE SDI FOR TABLESPACE was added in 8.0.4.

• Error number: MY-011002; Symbol: ER_DD_UPGRADE_FAILED_TO_FETCH_TABLES; SQLSTATE: HY000
Message: Error in fetching list of tables.
ER_DD_UPGRADE_FAILED_TO_FETCH_TABLES was added in 8.0.4.

• Error number: MY-011003; Symbol: ER_DD_UPGRADE_DD_POPULATED; SQLSTATE: HY000
Message: Finished populating Data Dictionary tables with data.
ER_DD_UPGRADE_DD_POPULATED was added in 8.0.4.

• Error number: MY-011004; Symbol: ER_DD_UPGRADE_INFO_FILE_OPEN_FAILED; SQLSTATE: HY000
Message: Could not open the upgrade info file '%s' in the MySQL servers datadir, errno: %d.
ER_DD_UPGRADE_INFO_FILE_OPEN_FAILED was added in 8.0.4.

• Error number: MY-011005; Symbol: ER_DD_UPGRADE_INFO_FILE_CLOSE_FAILED; SQLSTATE: HY000
Message: Could not close the upgrade info file '%s' in the MySQL servers datadir, errno: %d.
ER_DD_UPGRADE_INFO_FILE_CLOSE_FAILED was added in 8.0.4.

- **Error number:** MY-011006; **Symbol:** ER_DD_UPGRADE_TABLESPACE_MIGRATION_FAILED; **SQLSTATE:** HY000
  - **Message:** Got error %d from SE while migrating tablespaces.
  
  ER_DD_UPGRADE_TABLESPACE_MIGRATION_FAILED was added in 8.0.4.

- **Error number:** MY-011007; **Symbol:** ER_DD_UPGRADE_FAILED_TO_CREATE_TABLE_STATS; **SQLSTATE:** HY000
  - **Message:** Error in creating TABLE statistics entry. Fix statistics data by using ANALYZE command.
  
  ER_DD_UPGRADE_FAILED_TO_CREATE_TABLE_STATS was added in 8.0.4.

- **Error number:** MY-011008; **Symbol:** ER_DD_UPGRADE_TABLE_STATS_MIGRATE_COMPLETED; **SQLSTATE:** HY000
  - **Message:** Finished migrating TABLE statistics data.
  
  ER_DD_UPGRADE_TABLE_STATS_MIGRATE_COMPLETED was added in 8.0.4.

- **Error number:** MY-011009; **Symbol:** ER_DD_UPGRADE_FAILED_TO_CREATE_INDEX_STATS; **SQLSTATE:** HY000
  - **Message:** Error in creating Index statistics entry. Fix statistics data by using ANALYZE command.
  
  ER_DD_UPGRADE_FAILED_TO_CREATE_INDEX_STATS was added in 8.0.4.

- **Error number:** MY-011010; **Symbol:** ER_DD_UPGRADE_INDEX_STATS_MIGRATE_COMPLETED; **SQLSTATE:** HY000
  - **Message:** Finished migrating INDEX statistics data.
  
  ER_DD_UPGRADE_INDEX_STATS_MIGRATE_COMPLETED was added in 8.0.4.

- **Error number:** MY-011011; **Symbol:** ER_DD_UPGRADE_FAILED_FIND_VALID_DATA_DIR; **SQLSTATE:** HY000
  - **Message:** Failed to find valid data directory.
  
  ER_DD_UPGRADE_FAILED_FIND_VALID_DATA_DIR was added in 8.0.4.

- **Error number:** MY-011012; **Symbol:** ER_DD_UPGRADE_START; **SQLSTATE:** HY000
  - **Message:** Starting upgrade of data directory.
  
  ER_DD_UPGRADE_START was added in 8.0.4.

- **Error number:** MY-011013; **Symbol:** ER_DD_UPGRADE_FAILED_INIT_DD_SE; **SQLSTATE:** HY000
  - **Message:** Failed to initialize DD Storage Engine.
  
  ER_DD_UPGRADE_FAILED_INIT_DD_SE was added in 8.0.4.

- **Error number:** MY-011014; **Symbol:** ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_ABORT; **SQLSTATE:** HY000
Message: Found partially upgraded DD. Aborting upgrade and deleting all DD tables. Start the upgrade process again.

`ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_ABORT` was added in 8.0.4.

- Error number: `MY-011015`; Symbol: `ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_CONTINUE`; SQLSTATE: `HY000`
  
  Message: Found partially upgraded DD. Upgrade will continue and start the server.

  `ER_DD_UPGRADE_FOUND_PARTIALLY_UPGRADED_DD_CONTINUE` was added in 8.0.4.

- Error number: `MY-011016`; Symbol: `ER_DD_UPGRADE_SE_LOGS_FAILED`; SQLSTATE: `HY000`
  
  Message: Error in upgrading engine logs.

  `ER_DD_UPGRADE_SE_LOGS_FAILED` was added in 8.0.4.

- Error number: `MY-011017`; Symbol: `ER_DD_UPGRADE_SDII_INFO_UPDATE_FAILED`; SQLSTATE: `HY000`
  
  Message: Error in updating SDI information.

  `ER_DD_UPGRADE_SDII_INFO_UPDATE_FAILED` was added in 8.0.4.

- Error number: `MY-011018`; Symbol: `ER_SKIP_UPDATING_METADATA_IN_SE_RO_MODE`; SQLSTATE: `HY000`
  
  Message: Skip updating %s metadata in InnoDB read-only mode.

  `ER_SKIP_UPDATING_METADATA_IN_SE_RO_MODE` was added in 8.0.4.

- Error number: `MY-011019`; Symbol: `ER_CREATED_SYSTEM_WITH_VERSION`; SQLSTATE: `HY000`
  
  Message: Created system views with I_S version %d.

  `ER_CREATED_SYSTEM_WITH_VERSION` was added in 8.0.4.

- Error number: `MY-011020`; Symbol: `ER_UNKNOWN_ERROR_DETECTED_IN_SE`; SQLSTATE: `HY000`
  
  Message: Unknown error detected %d in handler.

  `ER_UNKNOWN_ERROR_DETECTED_IN_SE` was added in 8.0.4.

- Error number: `MY-011021`; Symbol: `ER_READ_LOG_EVENT_FAILED`; SQLSTATE: `HY000`
  
  Message: Error in `Log_event::read_log_event()`: '%s', data_len: %lu, event_type: %d.

  `ER_READ_LOG_EVENT_FAILED` was added in 8.0.4.

- Error number: `MY-011022`; Symbol: `ER_ROW_DATA_TOO_BIG_TO_WRITE_IN_BINLOG`; SQLSTATE: `HY000`
  
  Message: The row data is greater than 4GB, which is too big to write to the binary log.

  `ER_ROW_DATA_TOO_BIG_TO_WRITE_IN_BINLOG` was added in 8.0.4.

- Error number: `MY-011023`; Symbol: `ER_FAILED_TO_CONSTRUCT_DROP_EVENT_QUERY`; SQLSTATE: `HY000`
Message: Unable to construct DROP EVENT SQL query string.

ER_FAILED_TO_CONSTRUCT_DROP_EVENT_QUERY was added in 8.0.4.

• Error number: MY-011024; Symbol: ER_FAILED_TO_BINLOG_DROP_EVENT; SQLSTATE: HY000

Message: Unable to binlog drop event %s.%s.

ER_FAILED_TO_BINLOG_DROP_EVENT was added in 8.0.4.

• Error number: MY-011025; Symbol: ER_FAILED_TO_START_SLAVE_THREAD; SQLSTATE: HY000

Message: Failed to start slave threads for channel '%s'.

ER_FAILED_TO_START_SLAVE_THREAD was added in 8.0.4.

• Error number: MY-011026; Symbol: ER_RPL_IO_THREAD_KILLED; SQLSTATE: HY000

Message: %s%s.

ER_RPL_IO_THREAD_KILLED was added in 8.0.4.

• Error number: MY-011027; Symbol: ER_SLAVE_RECONNECT_FAILED; SQLSTATE: HY000

Message: Failed registering on master, reconnecting to try again, log '%s' at position %s. %s.

ER_SLAVE_RECONNECT_FAILED was added in 8.0.4.

• Error number: MY-011028; Symbol: ER_SLAVE_KILLED_AFTER_RECONNECT; SQLSTATE: HY000

Message: Slave I/O thread killed during or after reconnect.

ER_SLAVE_KILLED_AFTER_RECONNECT was added in 8.0.4.

• Error number: MY-011029; Symbol: ER_SLAVE_NOT_STARTED_ON_SOME_CHANNELS; SQLSTATE: HY000

Message: Some of the channels are not created/initialized properly. Check for additional messages above. You will not be able to start replication on those channels until the issue is resolved and the server restarted.

ER_SLAVE_NOT_STARTED_ON_SOME_CHANNELS was added in 8.0.4.

• Error number: MY-011030; Symbol: ER_FAILED_TO_ADD_RPL_FILTER; SQLSTATE: HY000

Message: Failed to add a replication filter into filter map for channel '%s'.

ER_FAILED_TO_ADD_RPL_FILTER was added in 8.0.4.

• Error number: MY-011031; Symbol: ER_PER_CHANNEL_RPL_FILTER_CONF_FOR_GRP_RPL; SQLSTATE: HY000

Message: There are per-channel replication filter(s) configured for group replication channel '%s' which is disallowed. The filter(s) have been discarded.

ER_PER_CHANNEL_RPL_FILTER_CONF_FOR_GRP_RPL was added in 8.0.4.

• Error number: MY-011032; Symbol: ER_RPL_FILTERS_NOT_ATTACHED_TO_CHANNEL; SQLSTATE: HY000
Message: There are per-channel replication filter(s) configured for channel '%s' which does not exist. The filter(s) have been discarded.

**ER_RPL_FILTERS_NOT.Attached_TO_Channel** was added in 8.0.4.

- Error number: MY-011033; Symbol: ER_FAILED_TO_BUILD_DO_AND_IGNORE_TABLE_HASHES; SQLSTATE: HY000

Message: An error occurred while building do_table and ignore_table rules to hashes for per-channel filter.

**ER_FAILED_TO_BUILD_DO_AND_IGNORE_TABLE_HASHES** was added in 8.0.4.

- Error number: MY-011034; Symbol: ER_CLONE_PLUGIN_NOT_LOADED; SQLSTATE: HY000

Message: Clone plugin not loaded.

**ER_CLONE_PLUGIN_NOT_LOADED** was added in 8.0.4, removed after 8.0.16.

- Error number: MY-011034; Symbol: ER_CLONE_PLUGIN_NOT_LOADED_TRACE; SQLSTATE: HY000

Message: Clone plugin cannot be loaded.

**ER_CLONE_PLUGIN_NOT_LOADED_TRACE** was added in 8.0.17.

- Error number: MY-011035; Symbol: ER_CLONE_HANDLER_EXISTS; SQLSTATE: HY000

Message: Clone Handler exists.

**ER_CLONE_HANDLER_EXISTS** was added in 8.0.4, removed after 8.0.16.

- Error number: MY-011035; Symbol: ER_CLONE_HANDLER_EXIST_TRACE; SQLSTATE: HY000

Message: Clone Handler exists.

**ER_CLONE_HANDLER_EXIST_TRACE** was added in 8.0.17.

- Error number: MY-011036; Symbol: ER_FAILED_TO_CREATE_CLONE_HANDLER; SQLSTATE: HY000

Message: Could not create Clone Handler.

**ER_FAILED_TO_CREATE_CLONE_HANDLER** was added in 8.0.4, removed after 8.0.16.

- Error number: MY-011036; Symbol: ER_CLONE_CREATE_HANDLER_FAIL_TRACE; SQLSTATE: HY000

Message: Could not create Clone Handler.

**ER_CLONE_CREATE_HANDLER_FAIL_TRACE** was added in 8.0.17.

- Error number: MY-011037; Symbol: ER_CYCLE_TIMER_IS_NOT_AVAILABLE; SQLSTATE: HY000

Message: The CYCLE timer is not available. WAIT events in the performance_schema will not be timed.

**ER_CYCLE_TIMER_IS_NOT_AVAILABLE** was added in 8.0.4.

- Error number: MY-011038; Symbol: ER_NANOSECOND_TIMER_IS_NOT_AVAILABLE; SQLSTATE: HY000

Message: The NANOSECOND timer is not available. IDLE/STAGE/STATEMENT/TRANSACTION events in the performance_schema will not be timed.

`ER_NANOSECOND_TIMER_IS_NOT_AVAILABLE` was added in 8.0.4.

- **Error number:** `MY-011039`; **Symbol:** `ER_MICROSECOND_TIMER_IS_NOT_AVAILABLE`; **SQLSTATE:** `HY000`

Message: The MICROSECOND timer is not available. IDLE/STAGE/STATEMENT/TRANSACTION events in the performance_schema will not be timed.

`ER_MICROSECOND_TIMER_IS_NOT_AVAILABLE` was added in 8.0.4.

- **Error number:** `MY-011040`; **Symbol:** `ER_PFS_MALLOC_ARRAY_OVERFLOW`; **SQLSTATE:** `HY000`

Message: Failed to allocate memory for %zu chunks each of size %zu for buffer ‘%s’ due to overflow.

`ER_PFS_MALLOC_ARRAY_OVERFLOW` was added in 8.0.4.

- **Error number:** `MY-011041`; **Symbol:** `ER_PFS_MALLOC_ARRAY_OOM`; **SQLSTATE:** `HY000`

Message: Failed to allocate %zu bytes for buffer ‘%s’ due to out-of-memory.

`ER_PFS_MALLOC_ARRAY_OOM` was added in 8.0.4.

- **Error number:** `MY-011042`; **Symbol:** `ER_INNODB_FAILED_TO_FIND_IDX_WITH_KEY_NO`; **SQLSTATE:** `HY000`

Message: InnoDB could not find index %s key no %u for table %s through its index translation table.

`ER_INNODB_FAILED_TO_FIND_IDX_WITH_KEY_NO` was added in 8.0.4.

- **Error number:** `MY-011043`; **Symbol:** `ER_INNODB_FAILED_TO_FIND_IDX`; **SQLSTATE:** `HY000`

Message: Cannot find index %s in InnoDB index translation table.

`ER_INNODB_FAILED_TO_FIND_IDX` was added in 8.0.4.

- **Error number:** `MY-011044`; **Symbol:** `ER_INNODB_FAILED_TO_FIND_IDX_FROM_DICT_CACHE`; **SQLSTATE:** `HY000`

Message: InnoDB could not find key no %u with name %s from dict cache for table %s.

`ER_INNODB_FAILED_TO_FIND_IDX_FROM_DICT_CACHE` was added in 8.0.4.

- **Error number:** `MY-011045`; **Symbol:** `ER_INNODB_ACTIVE_INDEX_CHANGE_FAILED`; **SQLSTATE:** `HY000`

Message: InnoDB: change_active_index(%u) failed.

`ER_INNODB_ACTIVE_INDEX_CHANGE_FAILED` was added in 8.0.4.

- **Error number:** `MY-011046`; **Symbol:** `ER_INNODB_DIFF_IN_REF_LEN`; **SQLSTATE:** `HY000`

Message: Stored ref len is %lu, but table ref len is %lu.

`ER_INNODB_DIFF_IN_REF_LEN` was added in 8.0.4.
• Error number: MY-011047; Symbol: ER_WRONG_TYPE_FOR_COLUMN_PREFIX_IDX_FLD; SQLSTATE: HY000
Message: MySQL is trying to create a column prefix index field, on an inappropriate data type. Table name %s, column name %s.

ER_WRONG_TYPE_FOR_COLUMN_PREFIX_IDX_FLD was added in 8.0.4.

• Error number: MY-011048; Symbol: ER_INNODB_CANNOT_CREATE_TABLE; SQLSTATE: HY000
Message: Cannot create table %s.

ER_INNODB_CANNOT_CREATE_TABLE was added in 8.0.4.

• Error number: MY-011049; Symbol: ER_INNODB_INTERNAL_INDEX; SQLSTATE: HY000
Message: Found index %s in InnoDB index list but not its MySQL index number. It could be an InnoDB internal index.

ER_INNODB_INTERNAL_INDEX was added in 8.0.4.

• Error number: MY-011050; Symbol: ER_INNODB_IDX_CNT_MORE_THAN_DEFINED_IN_MYSQL; SQLSTATE: HY000
Message: InnoDB: Table %s contains %lu indexes inside InnoDB, which is different from the number of indexes %u defined in MySQL.

ER_INNODB_IDX_CNT_MORE_THAN_DEFINED_IN_MYSQL was added in 8.0.4.

• Error number: MY-011051; Symbol: ER_INNODB_IDX_CNT_FEWER_THAN_DEFINED_IN_MYSQL; SQLSTATE: HY000
Message: Table %s contains fewer indexes inside InnoDB than are defined in the MySQL. Have you mixed up with data dictionary from different installation?

ER_INNODB_IDX_CNT_FEWER_THAN_DEFINED_IN_MYSQL was added in 8.0.4.

• Error number: MY-011052; Symbol: ER_INNODB_IDX_COLUMN_CNT_DIFF; SQLSTATE: HY000
Message: Index %s of %s has %lu columns unique inside InnoDB, but MySQL is asking statistics for %lu columns. Have you mixed data dictionary from different installation?

ER_INNODB_IDX_COLUMN_CNT_DIFF was added in 8.0.4.

• Error number: MY-011053; Symbol: ER_INNODB_USE_MONITOR_GROUP_NAME; SQLSTATE: HY000
Message: Monitor counter '%s' cannot be turned on/off individually. Please use its module name to turn on/off the counters in the module as a group.

ER_INNODB_USE_MONITOR_GROUP_NAME was added in 8.0.4.

• Error number: MY-011054; Symbol: ER_INNODB_MONITOR_DEFAULT_VALUE_NOT_DEFINED; SQLSTATE: HY000
Message: Default value is not defined for this set option. Please specify correct counter or module name.

ER_INNODB_MONITOR_DEFAULT_VALUE_NOT_DEFINED was added in 8.0.4.

• Error number: MY-011055; Symbol: ER_INNODB_MONITOR_IS_ENABLED; SQLSTATE: HY000
Message: InnoDB: Monitor %s is already enabled.

ER_INNODB_MONITOR_IS_ENABLED was added in 8.0.4.

• Error number: MY-011056; Symbol: ER_INNODB_INVALID_MONITOR_COUNTER_NAME; SQLSTATE: HY000
  Message: Invalid monitor counter: %s.
  ER_INNODB_INVALID_MONITOR_COUNTER_NAME was added in 8.0.4.

• Error number: MY-011057; Symbol: ER_WIN_LOAD_LIBRARY_FAILED; SQLSTATE: HY000
  Message: LoadLibrary("%s") failed: GetLastError returns %lu.
  ER_WIN_LOAD_LIBRARY_FAILED was added in 8.0.4.

• Error number: MY-011058; Symbol: ER_PARTITION_HANDLER_ADMIN_MSG; SQLSTATE: HY000
  Message: %s.
  ER_PARTITION_HANDLER_ADMIN_MSG was added in 8.0.4.

• Error number: MY-011059; Symbol: ER_RPL_RLI_INIT_INFO_MSG; SQLSTATE: HY000
  Message: %s.
  ER_RPL_RLI_INIT_INFO_MSG was added in 8.0.4.

• Error number: MY-011060; Symbol: ER_DD_UPGRADE_TABLE_INTACT_ERROR; SQLSTATE: HY000
  Message: %s.
  ER_DD_UPGRADE_TABLE_INTACT_ERROR was added in 8.0.4.

• Error number: MY-011061; Symbol: ER_SERVER_INITCompiled_IN_COMMANDS; SQLSTATE: HY000
  Message: %s.
  ER_SERVER_INITCompiled_IN_COMMANDS was added in 8.0.4.

• Error number: MY-011062; Symbol: ER_MYISAM_CHECK_METHOD_ERROR; SQLSTATE: HY000
  Message: %s.
  ER_MYISAM_CHECK_METHOD_ERROR was added in 8.0.4.

• Error number: MY-011063; Symbol: ER_MYISAM_CRASHED_ERROR; SQLSTATE: HY000
  Message: %s.
  ER_MYISAM_CRASHED_ERROR was added in 8.0.4.

• Error number: MY-011064; Symbol: ER_WAITPID_FAILED; SQLSTATE: HY000
  Message: Unable to wait for process %lld.
  ER_WAITPID_FAILED was added in 8.0.4.
- **Error number:** MY-011065; Symbol: `ER_FAILED_TO_FIND_MYSQLD_STATUS`; SQLSTATE: HY000
  Message: Unable to determine if daemon is running: %s (rc=%d).
  `ER_FAILED_TO_FIND_MYSQLD_STATUS` was added in 8.0.4.

- **Error number:** MY-011066; Symbol: `ER_INNODB_ERROR_LOGGER_MSG`; SQLSTATE: HY000
  Message: %s
  `ER_INNODB_ERROR_LOGGER_MSG` was added in 8.0.4.

- **Error number:** MY-011067; Symbol: `ER_INNODB_ERROR_LOGGER_FATAL_MSG`; SQLSTATE: HY000
  Message: [FATAL] InnoDB: %s
  `ER_INNODB_ERROR_LOGGER_FATAL_MSG` was added in 8.0.4.

- **Error number:** MY-011068; Symbol: `ER_DEPRECATED_SYNTAX_WITH_REPLACEMENT`; SQLSTATE: HY000
  Message: The syntax '%s' is deprecated and will be removed in a future release. Please use '%s' instead.
  `ER_DEPRECATED_SYNTAX_WITH_REPLACEMENT` was added in 8.0.4.

- **Error number:** MY-011069; Symbol: `ER_DEPRECATED_SYNTAX_NO_REPLACEMENT`; SQLSTATE: HY000
  Message: The syntax '%s' is deprecated and will be removed in a future release.
  `ER_DEPRECATED_SYNTAX_NO_REPLACEMENT` was added in 8.0.4.

- **Error number:** MY-011070; Symbol: `ER_DEPRECAE_MSG_NO_REPLACEMENT`; SQLSTATE: HY000
  Message: '%s' is deprecated and will be removed in a future release.
  `ER_LOG_PRINTF_MSG` was added in 8.0.4.

- **Error number:** MY-011072; Symbol: `ER_BINLOG_LOGGING_NOT_POSSIBLE`; SQLSTATE: HY000
  Message: Binary logging not possible. Message: %s.
  `ER_BINLOG_LOGGING_NOT_POSSIBLE` was added in 8.0.4.

- **Error number:** MY-011073; Symbol: `ER_FAILED_TO_SET_PERSISTED_OPTIONS`; SQLSTATE: HY000
  Message: Failed to set persisted options.
  `ER_FAILED_TO_SET_PERSISTED_OPTIONS` was added in 8.0.4.

- **Error number:** MY-011074; Symbol: `ER_COMPONENTS_FAILED_TO_ACQUIRE_SERVICE_IMPLEMENTATION`; SQLSTATE: HY000
Message: Cannot acquire specified service implementation: '%s'.

*ER_COMPONENTS_FAILED_TO_ACQUIRE_SERVICE_IMPLEMENTATION* was added in 8.0.4.

- Error number: MY-011075; Symbol: ER_RES_GRP_INVALID_VCPU_RANGE; SQLSTATE: HY000

Message: Invalid VCPU range %u-%u.

*ER_RES_GRP_INVALID_VCPU_RANGE* was added in 8.0.4.

- Error number: MY-011076; Symbol: ER_RES_GRP_INVALID_VCPU_ID; SQLSTATE: HY000

Message: Invalid cpu id %u.

*ER_RES_GRP_INVALID_VCPU_ID* was added in 8.0.4.

- Error number: MY-011077; Symbol: ER_ERROR_DURING_FLUSH_LOG_COMMIT_PHASE; SQLSTATE: HY000

Message: Got error %d during FLUSH_LOGS.

*ER_ERROR_DURING_FLUSH_LOG_COMMIT_PHASE* was added in 8.0.4.

- Error number: MY-011078; Symbol: ER_DROP_DATABASE_FAILED_RMDIR_MANUALLY; SQLSTATE: HY000

Message: Problem while dropping database. Can't remove database directory (%s). Please remove it manually.

*ER_DROP_DATABASE_FAILED_RMDIR_MANUALLY* was added in 8.0.4.

- Error number: MY-011079; Symbol: ER_BINLOG_EXPIRAY_LOG_DAYS_AND_SECS_USED_TOGETHER; SQLSTATE: HY000

Message: The option expire_logs_days cannot be used together with option binlog_expire_logs_seconds. Therefore, value of expire_logs_days is ignored.

*ER_BINLOG_EXPIRAY_LOG_DAYS_AND_SECS_USED_TOGETHER* was added in 8.0.4, removed after 8.0.4.

- Error number: MY-011079; Symbol: ER_EXPIRE_LOGS_DAYS_IGNORED; SQLSTATE: HY000

Message: The option expire_logs_days cannot be used together with option binlog_expire_logs_seconds. Therefore, value of expire_logs_days is ignored.

*ER_EXPIRE_LOGS_DAYS_IGNORED* was added in 8.0.4.

- Error number: MY-011080; Symbol: ER_BINLOG_MALFORMED_OR_OLD_RELAY_LOG; SQLSTATE: HY000

Message: malformed or very old relay log which does not have FormatDescriptor.

*ER_BINLOG_MALFORMED_OR_OLD_RELAY_LOG* was added in 8.0.4.
• Error number: **MY-011081**; Symbol: **ER_DD_UPGRADE_VIEW_COLUMN_NAME_TOO_LONG**; SQLSTATE: **HY000**
  
  Message: Upgrade of view '%s.%s' failed. Re-create the view with the explicit column name lesser than 64 characters.

  **ER_DD_UPGRADE_VIEW_COLUMN_NAME_TOO_LONG** was added in 8.0.4.

• Error number: **MY-011082**; Symbol: **ER_TABLE_NEEDS_DUMP_UPGRADE**; SQLSTATE: **HY000**
  
  Message: Table upgrade required for '%s.%s'. Please dump/reload table to fix it!

  **ER_TABLE_NEEDS_DUMP_UPGRADE** was added in 8.0.4.

• Error number: **MY-011083**; Symbol: **ER_DD_UPGRADE_FAILED_TO_UPDATE_VER_NO_IN_TABLESPACE**; SQLSTATE: **HY000**
  
  Message: Error in updating version number in %s tablespace.

  **ER_DD_UPGRADE_FAILED_TO_UPDATE_VER_NO_IN_TABLESPACE** was added in 8.0.4.

• Error number: **MY-011084**; Symbol: **ER_KEYRING_MIGRATION_FAILED**; SQLSTATE: **HY000**
  
  Message: Keyring migration failed.

  **ER_KEYRING_MIGRATION_FAILED** was added in 8.0.4.

• Error number: **MY-011085**; Symbol: **ER_KEYRING_MIGRATION_SUCCESSFUL**; SQLSTATE: **HY000**
  
  Message: Keyring migration successful.

  **ER_KEYRING_MIGRATION_SUCCESSFUL** was added in 8.0.4.

• Error number: **MY-011086**; Symbol: **ER_RESTART_RECEIVED_INFO**; SQLSTATE: **HY000**
  
  Message: Received RESTART from user %s. Restarting mysqld (Version: %s).

  **ER_RESTART_RECEIVED_INFO** was added in 8.0.4.

• Error number: **MY-011087**; Symbol: **ER_LCTN_CHANGED**; SQLSTATE: **HY000**
  
  Message: Different lower_case_table_names settings for server ('%u') and data dictionary ('%u').

  **ER_LCTN_CHANGED** was added in 8.0.4.

• Error number: **MY-011088**; Symbol: **ER_DD_INITIALIZE**; SQLSTATE: **HY000**
  
  Message: Data dictionary initializing version '%u'.

  **ER_DD_INITIALIZE** was added in 8.0.4.

• Error number: **MY-011089**; Symbol: **ER_DD_RESTART**; SQLSTATE: **HY000**
  
  Message: Data dictionary restarting version '%u'.

  **ER_DD_RESTART** was added in 8.0.4.

• Error number: **MY-011090**; Symbol: **ER_DD_UPGRADE**; SQLSTATE: **HY000**
  
  Message: Data dictionary upgrading from version '%u' to '%u'.
**ER_DD_UPGRADE** was added in 8.0.4.

- **Error number:** MY-011091; **Symbol:** ER_DD_UPGRADE_OFF; **SQLSTATE:** HY000
  
  Message: Data dictionary upgrade prohibited by the command line option `--no_dd_upgrade`.
  
  **ER_DD_UPGRADE_OFF** was added in 8.0.4.

- **Error number:** MY-011092; **Symbol:** ER_DD_UPGRADE_VERSION_NOT_SUPPORTED; **SQLSTATE:** HY000
  
  Message: Upgrading the data dictionary from dictionary version '%u' is not supported.
  
  **ER_DD_UPGRADE_VERSION_NOT_SUPPORTED** was added in 8.0.4.

- **Error number:** MY-011093; **Symbol:** ER_DD_UPGRADE_SCHEMA_UNAVAILABLE; **SQLSTATE:** HY000
  
  Message: Upgrading the data dictionary failed, temporary schema name '%s' not available.
  
  **ER_DD_UPGRADE_SCHEMA_UNAVAILABLE** was added in 8.0.4.

- **Error number:** MY-011094; **Symbol:** ER_DD_MINOR_DOWNGRADE; **SQLSTATE:** HY000
  
  Message: Data dictionary minor downgrade from version '%u' to '%u'.
  
  **ER_DD_MINOR_DOWNGRADE** was added in 8.0.4.

- **Error number:** MY-011095; **Symbol:** ER_DD_MINOR_DOWNGRADE_VERSION_NOT_SUPPORTED; **SQLSTATE:** HY000
  
  Message: Minor downgrade of the Data dictionary from dictionary version '%u' is not supported.
  
  **ER_DD_MINOR_DOWNGRADE_VERSION_NOT_SUPPORTED** was added in 8.0.4.

- **Error number:** MY-011096; **Symbol:** ER_DD_NO_VERSION_FOUND; **SQLSTATE:** HY000
  
  Message: No data dictionary version number found.
  
  **ER_DD_NO_VERSION_FOUND** was added in 8.0.4.

- **Error number:** MY-011097; **Symbol:** ER_THREAD_POOL_NOT_SUPPORTED_ON_PLATFORM; **SQLSTATE:** HY000
  
  Message: Thread pool not supported, requires a minimum of %s.
  
  **ER_THREAD_POOL_NOT_SUPPORTED_ON_PLATFORM** was added in 8.0.4.

- **Error number:** MY-011098; **Symbol:** ER_THREAD_POOL_SIZE_TOO_LOW; **SQLSTATE:** HY000
  
  Message: thread_pool_size=0 means thread pool disabled. Allowed range of thread_pool_size is %d-%d.
  
  **ER_THREAD_POOL_SIZE_TOO_LOW** was added in 8.0.4.

- **Error number:** MY-011099; **Symbol:** ER_THREAD_POOL_SIZE_TOO_HIGH; **SQLSTATE:** HY000
  
  Message: thread_pool_size=%lu is too high, %d is maximum, thread pool is disabled. Allowed range of thread_pool_size is %d-%d.
**ER_THREAD_POOL_SIZE_TOO_HIGH** was added in 8.0.4.

- **Error number:** MY-011100; Symbol: ER_THREAD_POOL_ALGORITHM_INVALID; SQLSTATE: HY000

Message: thread_pool_algorithm can be set to 0 and 1, 0 indicates the default low concurrency algorithm, 1 means a high concurrency algorithm.

**ER_THREAD_POOL_ALGORITHM_INVALID** was added in 8.0.4.

- **Error number:** MY-011101; Symbol: ER_THREAD_POOL_INVALIDSTALL_LIMIT; SQLSTATE: HY000

Message: thread_pool_stall_limit can be %d at minimum and %d at maximum, smaller values would render the thread pool fairly useless and higher values could make it possible to have undetected deadlock issues in the MySQL Server.

**ER_THREAD_POOL_INVALIDSTALL_LIMIT** was added in 8.0.4.

- **Error number:** MY-011102; Symbol: ER_THREAD_POOL_INVALIDPRIO_KICKUP_TIMER; SQLSTATE: HY000

Message: Invalid value of thread_pool_prio_kickup_timer specified. Value of thread_pool_prio_kickup_timer should be in range 0-4294967294.

**ER_THREAD_POOL_INVALIDPRIO_KICKUP_TIMER** was added in 8.0.4.

- **Error number:** MY-011103; Symbol: ER_THREAD_POOL_MAXUNUSED_THREADS_INVALID; SQLSTATE: HY000

Message: thread_pool_max_unused_threads cannot be set higher than %d.

**ER_THREAD_POOL_MAXUNUSED_THREADS_INVALID** was added in 8.0.4.

- **Error number:** MY-011104; Symbol: ER_THREAD_POOL_CON_HANDLER_INIT_FAILED; SQLSTATE: HY000

Message: Failed to instantiate the connection handler object.

**ER_THREAD_POOL_CON_HANDLER_INIT_FAILED** was added in 8.0.4.

- **Error number:** MY-011105; Symbol: ER_THREAD_POOL_INIT_FAILED; SQLSTATE: HY000

Message: Failed to initialize thread pool plugin.

**ER_THREAD_POOL_INIT_FAILED** was added in 8.0.4.

- **Error number:** MY-011106; Symbol: ER_THREAD_POOL_PLUGIN_STARTED; SQLSTATE: HY000

Message: Thread pool plugin started successfully with parameters: thread_pool_size = %lu, thread_pool_algorithm = %s, thread_pool_stall_limit = %u, thread_pool_prio_kickup_timer = %u, thread_pool_max_unused_threads = %u, thread_pool_high_priority_connection = %d.

**ER_THREAD_POOL_PLUGIN_STARTED** was added in 8.0.4.

- **Error number:** MY-011107; Symbol: ER_THREAD_POOL_CANNOT_SET_THREAD_SPECIFIC_DATA; SQLSTATE: HY000

Message: Can't setup connection teardown thread-specific data.
ER_THREAD_POOL_CANNOT_SET_THREAD_SPECIFIC_DATA was added in 8.0.4.

- Error number: MY-011108; Symbol: ER_THREAD_POOL_FAILED_TO_CREATE_CONNECT_HANDLER_THD; SQLSTATE: HY000
  Message: Creation of connect handler thread failed.

ER_THREAD_POOL_FAILED_TO_CREATE_CONNECT_HANDLER_THD was added in 8.0.4.

- Error number: MY-011109; Symbol: ER_THREAD_POOL_FAILED_TO_CREATE_THD_AND_AUTH_CONN; SQLSTATE: HY000
  Message: Failed to create thd and authenticate connection.

ER_THREAD_POOL_FAILED_TO_CREATE_THD_AND_AUTH_CONN was added in 8.0.4.

- Error number: MY-011110; Symbol: ER_THREAD_POOL_FAILED_PROCESS_CONNECT_EVENT; SQLSTATE: HY000
  Message: Failed to process connection event.

ER_THREAD_POOL_FAILED_PROCESS_CONNECT_EVENT was added in 8.0.4.

- Error number: MY-011111; Symbol: ER_THREAD_POOL_FAILED_TO_CREATE_POOL; SQLSTATE: HY000
  Message: Can't create pool thread (error %d, errno: %d).

ER_THREAD_POOL_FAILED_TO_CREATE_POOL was added in 8.0.4.

- Error number: MY-011112; Symbol: ER_THREAD_POOL_RATE_LIMITED_ERROR_MSGS; SQLSTATE: HY000
  Message: %.*s.

ER_THREAD_POOL_RATE_LIMITED_ERROR_MSGS was added in 8.0.4.

- Error number: MY-011113; Symbol: ER_THREAD_POOL_LOW_LEVEL_INIT_FAILED; SQLSTATE: HY000
  Message: tp_group_low_level_init() failed.

ER_THREAD_POOL_LOW_LEVEL_INIT_FAILED was added in 8.0.4.

- Error number: MY-011114; Symbol: ER_THREAD_POOL_LOW_LEVEL_REARM_FAILED; SQLSTATE: HY000
  Message: Rearm failed even after 30 seconds, can't continue without notify socket.

ER_THREAD_POOL_LOW_LEVEL_REARM_FAILED was added in 8.0.4.

- Error number: MY-011115; Symbol: ER_THREAD_POOL_BUFFER_TOO_SMALL; SQLSTATE: HY000
  Message: %s: %s buffer is too small

ER_THREAD_POOL_BUFFER_TOO_SMALL was added in 8.0.4.

- Error number: MY-011116; Symbol: ER_MECAB_NOT_SUPPORTED; SQLSTATE: HY000
Message: Mecab v%s is not supported, the lowest version supported is v%s.

`ER_MECAB_NOT_SUPPORTED` was added in 8.0.4.

- Error number: `MY-011117`; Symbol: `ER_MECAB_NOT_VERIFIED`; SQLSTATE: `HY000`
  Message: Mecab v%s is not verified, the highest version supported is v%s.

`ER_MECAB_NOT_VERIFIED` was added in 8.0.4.

- Error number: `MY-011118`; Symbol: `ER_MECAB_CREATING_MODEL`; SQLSTATE: `HY000`
  Message: Mecab: Trying createModel(%s).

`ER_MECAB_CREATING_MODEL` was added in 8.0.4.

- Error number: `MY-011119`; Symbol: `ER_MECAB_FAILED_TO_CREATE_MODEL`; SQLSTATE: `HY000`
  Message: Mecab: createModel() failed: %s.

`ER_MECAB_FAILED_TO_CREATE_MODEL` was added in 8.0.4.

- Error number: `MY-011120`; Symbol: `ER_MECAB_FAILED_TO_CREATE_TRIGGER`; SQLSTATE: `HY000`
  Message: Mecab: createTagger() failed: %s.

`ER_MECAB_FAILED_TO_CREATE_TRIGGER` was added in 8.0.4.

- Error number: `MY-011121`; Symbol: `ER_MECAB_UNSUPPORTED_CHARSET`; SQLSTATE: `HY000`
  Message: Mecab: Unsupported dictionary charset %s.

`ER_MECAB_UNSUPPORTED_CHARSET` was added in 8.0.4.

- Error number: `MY-011122`; Symbol: `ER_MECAB_CHARSET_LOADED`; SQLSTATE: `HY000`
  Message: Mecab: Loaded dictionary charset is %s.

`ER_MECAB_CHARSET_LOADED` was added in 8.0.4.

- Error number: `MY-011123`; Symbol: `ER_MECAB_PARSE_FAILED`; SQLSTATE: `HY000`
  Message: Mecab: parse() failed: %s.

`ER_MECAB_PARSE_FAILED` was added in 8.0.4.

- Error number: `MY-011124`; Symbol: `ER_MECAB_OOM_WHILE_PARSING_TEXT`; SQLSTATE: `HY000`

`ER_MECAB_OOM_WHILE_PARSING_TEXT` was added in 8.0.4.

- Error number: `MY-011125`; Symbol: `ER_MECAB_CREATE_LATTICE_FAILED`; SQLSTATE: `HY000`
  Message: Mecab: createLattice() failed: %s.

`ER_MECAB_CREATE_LATTICE_FAILED` was added in 8.0.4.

- Error number: `MY-011126`; Symbol: `ER_SEMISYNC_TRACE_ENTER_FUNC`; SQLSTATE: `HY000`
Message: ---> %s enter.

ER_SEMISYNC_TRACE_ENTER_FUNC was added in 8.0.4.

- Error number: MY-011127; Symbol: ER_SEMISYNC_TRACE_EXIT_WITH_INT_EXIT_CODE; SQLSTATE: HY000

Message: <--- %s exit (%d).

ER_SEMISYNC_TRACE_EXIT_WITH_INT_EXIT_CODE was added in 8.0.4.

- Error number: MY-011128; Symbol: ER_SEMISYNC_TRACE_EXIT_WITH_BOOL_EXIT_CODE; SQLSTATE: HY000

Message: <--- %s exit (%s).

ER_SEMISYNC_TRACE_EXIT_WITH_BOOL_EXIT_CODE was added in 8.0.4.

- Error number: MY-011129; Symbol: ER_SEMISYNC_TRACE_EXIT; SQLSTATE: HY000

Message: <--- %s exit.

ER_SEMISYNC_TRACE_EXIT was added in 8.0.4.

- Error number: MY-011130; Symbol: ER_SEMISYNC_RPL_INIT_FOR_TRX; SQLSTATE: HY000

Message: Semi-sync replication initialized for transactions.

ER_SEMISYNC_RPL_INIT_FOR_TRX was added in 8.0.4.

- Error number: MY-011131; Symbol: ER_SEMISYNC_FAILED_TO_ALLOCATE_TRX_NODE; SQLSTATE: HY000

Message: %s: transaction node allocation failed for: (%s, %lu).

ER_SEMISYNC_FAILED_TO_ALLOCATE_TRX_NODE was added in 8.0.4.

- Error number: MY-011132; Symbol: ER_SEMISYNC_BINLOG_WRITE_OUT_OF_ORDER; SQLSTATE: HY000

Message: %s: binlog write out-of-order, tail (%s, %lu), new node (%s, %lu).

ER_SEMISYNC_BINLOG_WRITE_OUT_OF_ORDER was added in 8.0.4.

- Error number: MY-011133; Symbol: ER_SEMISYNC_INSERT_LOG_INFO_IN_ENTRY; SQLSTATE: HY000

Message: %s: insert (%s, %lu) in entry(%u).

ER_SEMISYNC_INSERT_LOG_INFO_IN_ENTRY was added in 8.0.4.

- Error number: MY-011134; Symbol: ER_SEMISYNC_PROBE_LOG_INFO_IN_ENTRY; SQLSTATE: HY000

Message: %s: probe (%s, %lu) in entry(%u).

ER_SEMISYNC_PROBE_LOG_INFO_IN_ENTRY was added in 8.0.4.
• Error number: MY-011135; Symbol: ER_SEMISYNC_CLEARED_ALL_ACTIVE_TRANSACTION_NODES; SQLSTATE: HY000
  Message: %s: cleared all nodes.
  ER_SEMISYNC_CLEARED_ALL_ACTIVE_TRANSACTION_NODES was added in 8.0.4.

• Error number: MY-011136; Symbol: ER_SEMISYNC_CLEARED_ACTIVE_TRANSACTION_TILL_POS; SQLSTATE: HY000
  Message: %s: cleared %d nodes back until pos (%s, %lu).
  ER_SEMISYNC_CLEARED_ACTIVE_TRANSACTION_TILL_POS was added in 8.0.4.

• Error number: MY-011137; Symbol: ER_SEMISYNC_REPLY_MAGIC_NO_ERROR; SQLSTATE: HY000
  Message: Read semi-sync reply magic number error.
  ER_SEMISYNC_REPLY_MAGIC_NO_ERROR was added in 8.0.4.

• Error number: MY-011138; Symbol: ER_SEMISYNC_REPLY_PKT_LENGTH_TOO_SMALL; SQLSTATE: HY000
  Message: Read semi-sync reply length error: packet is too small.
  ER_SEMISYNC_REPLY_PKT_LENGTH_TOO_SMALL was added in 8.0.4.

• Error number: MY-011139; Symbol: ER_SEMISYNC_REPLY_BINLOG_FILE_TOO_LARGE; SQLSTATE: HY000
  Message: Read semi-sync reply binlog file length too large.
  ER_SEMISYNC_REPLY_BINLOG_FILE_TOO_LARGE was added in 8.0.4.

• Error number: MY-011140; Symbol: ER_SEMISYNC_SERVER_REPLY; SQLSTATE: HY000
  Message: %s got reply(%s, %lu) from server %u.
  ER_SEMISYNC_SERVER_REPLY was added in 8.0.4.

• Error number: MY-011141; Symbol: ER_SEMISYNC_FUNCTION_CALLED_TWICE; SQLSTATE: HY000
  Message: %s called twice.
  ER_SEMISYNC_FUNCTION_CALLED_TWICE was added in 8.0.4.

• Error number: MY-011142; Symbol: ER_SEMISYNC_RPL_ENABLED_ON_MASTER; SQLSTATE: HY000
  Message: Semi-sync replication enabled on the master.
  ER_SEMISYNC_RPL_ENABLED_ON_MASTER was added in 8.0.4.

• Error number: MY-011143; Symbol: ER_SEMISYNC_MASTER_OOM; SQLSTATE: HY000
  Message: Cannot allocate memory to enable semi-sync on the master.
  ER_SEMISYNC_MASTER_OOM was added in 8.0.4.

• Error number: MY-011144; Symbol: ER_SEMISYNC_DISABLED_ON_MASTER; SQLSTATE: HY000
Message: Semi-sync replication disabled on the master.

ER_SEMISYNC_DISABLED_ON_MASTER was added in 8.0.4.

- Error number: MY-011145; Symbol: ER_SEMISYNC_FORCED_SHUTDOWN; SQLSTATE: HY000
  ER_SEMISYNC_FORCED_SHUTDOWN was added in 8.0.4.

- Error number: MY-011146; Symbol: ER_SEMISYNC_MASTER_GOT_REPLY_AT_POS; SQLSTATE: HY000
  Message: %s: Got reply at (%s, %lu).
  ER_SEMISYNC_MASTER_GOT_REPLY_AT_POS was added in 8.0.4.

- Error number: MY-011147; Symbol: ER_SEMISYNC_MASTER_SIGNAL_ALL_WAITING_THREADS; SQLSTATE: HY000
  Message: %s: signal all waiting threads.
  ER_SEMISYNC_MASTER_SIGNAL_ALL_WAITING_THREADS was added in 8.0.4.

- Error number: MY-011148; Symbol: ER_SEMISYNC_MASTER_TRX_WAIT_POS; SQLSTATE: HY000
  Message: %s: wait pos (%s, %lu), repl(%d).
  ER_SEMISYNC_MASTER_TRX_WAIT_POS was added in 8.0.4.

- Error number: MY-011149; Symbol: ER_SEMISYNC_BINLOG_REPLY_IS_AHEAD; SQLSTATE: HY000
  Message: %s: Binlog reply is ahead (%s, %lu).
  ER_SEMISYNC_BINLOG_REPLY_IS_AHEAD was added in 8.0.4.

- Error number: MY-011150; Symbol: ER_SEMISYNC_MOVE_BACK_WAIT_POS; SQLSTATE: HY000
  Message: %s: move back wait position (%s, %lu).
  ER_SEMISYNC_MOVE_BACK_WAIT_POS was added in 8.0.4.

- Error number: MY-011151; Symbol: ER_SEMISYNC_INIT_WAIT_POS; SQLSTATE: HY000
  Message: %s: init wait position (%s, %lu).
  ER_SEMISYNC_INIT_WAIT_POS was added in 8.0.4.

- Error number: MY-011152; Symbol: ER_SEMISYNC_WAIT_TIME_FOR_BINLOG_SENT; SQLSTATE: HY000
  Message: %s: wait %lu ms for binlog sent (%s, %lu).
  ER_SEMISYNC_WAIT_TIME_FOR_BINLOG_SENT was added in 8.0.4.

- Error number: MY-011153; Symbol: ER_SEMISYNC_WAIT_FOR_BINLOG_TIMEDOUT; SQLSTATE: HY000
  Message: Timeout waiting for reply of binlog (file: %s, pos: %lu), semi-sync up to file %s, position %lu.
ER_SEMISYNC_WAIT_FOR_BINLOG_TIMEDOUT was added in 8.0.4.

- Error number: MY-011154; Symbol: ER_SEMISYNC_WAIT_TIME_ASSESSMENT_FOR_COMMIT_TRX_FAILED; SQLSTATE: HY000
  Message: Assessment of waiting time for commitTrx failed at wait position (%s, %lu).

ER_SEMISYNC_WAIT_TIME_ASSESSMENT_FOR_COMMIT_TRX_FAILED was added in 8.0.4.

- Error number: MY-011155; Symbol: ER_SEMISYNC_RPL_SWITCHED_OFF; SQLSTATE: HY000
  Message: Semi-sync replication switched OFF.

ER_SEMISYNC_RPL_SWITCHED_OFF was added in 8.0.4.

- Error number: MY-011156; Symbol: ER_SEMISYNC_RPL_SWITCHED_ON; SQLSTATE: HY000
  Message: Semi-sync replication switched ON at (%s, %lu).

ER_SEMISYNC_RPL_SWITCHED_ON was added in 8.0.4.

- Error number: MY-011157; Symbol: ER_SEMISYNC_NO_SPACE_IN_THE_PKT; SQLSTATE: HY000
  Message: No enough space in the packet for semi-sync extra header, semi-sync replication disabled.

ER_SEMISYNC_NO_SPACE_IN_THE_PKT was added in 8.0.4.

- Error number: MY-011158; Symbol: ER_SEMISYNC_SYNC_HEADER_UPDATE_INFO; SQLSTATE: HY000
  Message: %s: server(%d), (%s, %lu) sync(%d), repl(%d).

ER_SEMISYNC_SYNC_HEADER_UPDATE_INFO was added in 8.0.4.

- Error number: MY-011159; Symbol: ER_SEMISYNC_FAILED_TO_INSERT_TRX_NODE; SQLSTATE: HY000
  Message: Semi-sync failed to insert tranx_node for binlog file: %s, position: %lu.

ER_SEMISYNC_FAILED_TO_INSERT_TRX_NODE was added in 8.0.4.

- Error number: MY-011160; Symbol: ER_SEMISYNC_TRX_SKIPPED_AT_POS; SQLSTATE: HY000
  Message: %s: Transaction skipped at (%s, %lu).

ER_SEMISYNC_TRX_SKIPPED_AT_POS was added in 8.0.4.

- Error number: MY-011161; Symbol: ER_SEMISYNC_MASTER_FAILED_ON_NET_FLUSH; SQLSTATE: HY000
  Message: Semi-sync master failed on net_flush() before waiting for slave reply.

ER_SEMISYNC_MASTER_FAILED_ON_NET_FLUSH was added in 8.0.4.

- Error number: MY-011162; Symbol: ER_SEMISYNC_RECEIVED_ACK_IS_SMALLER; SQLSTATE: HY000
  Message: The received ack is smaller than m_greatest_ack.
ER_SEMISYNC_RECEIVED_ACK_IS_SMALLER was added in 8.0.4.

• Error number: MY-011163; Symbol: ER_SEMISYNC_ADD_ACK_TO_SLOT; SQLSTATE: HY000
  Message: Add the ack into slot %u.

ER_SEMISYNC_ADD_ACK_TO_SLOT was added in 8.0.4.

• Error number: MY-011164; Symbol: ER_SEMISYNC_UPDATE_EXISTING_SLAVE_ACK; SQLSTATE: HY000
  Message: Update an existing ack in slot %u.

ER_SEMISYNC_UPDATE_EXISTING_SLAVE_ACK was added in 8.0.4.

• Error number: MY-011165; Symbol: ER_SEMISYNC_FAILED_TO_START_ACK_RECEIVER_THD; SQLSTATE: HY000
  Message: Failed to start semi-sync ACK receiver thread, could not create thread(errno:%d).

ER_SEMISYNC_FAILED_TO_START_ACK_RECEIVER_THD was added in 8.0.4.

• Error number: MY-011166; Symbol: ER_SEMISYNC_STARTING_ACK_RECEIVER_THD; SQLSTATE: HY000
  Message: Starting ack receiver thread.

ER_SEMISYNC_STARTING_ACK_RECEIVER_THD was added in 8.0.4.

• Error number: MY-011167; Symbol: ER_SEMISYNC_FAILED_TO_WAIT_ON_DUMP_SOCKET; SQLSTATE: HY000
  Message: Failed to wait on semi-sync dump sockets, error: errno=%d.

ER_SEMISYNC_FAILED_TO_WAIT_ON_DUMP_SOCKET was added in 8.0.4.

• Error number: MY-011168; Symbol: ER_SEMISYNC_STOPPING_ACK_RECEIVER_THREAD; SQLSTATE: HY000
  Message: Stopping ack receiver thread.

ER_SEMISYNC_STOPPING_ACK_RECEIVER_THREAD was added in 8.0.4.

• Error number: MY-011169; Symbol: ER_SEMISYNC_FAILED_REGISTER_SLAVE_TO_RECEIVER; SQLSTATE: HY000
  Message: Failed to register slave to semi-sync ACK receiver thread.

ER_SEMISYNC_FAILED_REGISTER_SLAVE_TO_RECEIVER was added in 8.0.4.

• Error number: MY-011170; Symbol: ER_SEMISYNC_START_BINLOG_DUMP_TO_SLAVE; SQLSTATE: HY000
  Message: Start %s binlog_dump to slave (server_id: %d), pos(%s, %lu).

ER_SEMISYNC_START_BINLOG_DUMP_TO_SLAVE was added in 8.0.4.
- **Error number:** MY-011171; **Symbol:** ER_SEMISYNC_STOP_BINLOG_DUMP_TO_SLAVE; **SQLSTATE:** HY000
  
  Message: Stop %s binlog_dump to slave (server_id: %d).

  ER_SEMISYNC_STOP_BINLOG_DUMP_TO_SLAVE was added in 8.0.4.

- **Error number:** MY-011172; **Symbol:** ER_SEMISYNC_UNREGISTER_TRX_OBSERVER_FAILED; **SQLSTATE:** HY000
  
  Message: unregister_trans Observer failed.

  ER_SEMISYNC_UNREGISTER_TRX_OBSERVER_FAILED was added in 8.0.4.

- **Error number:** MY-011173; **Symbol:** ER_SEMISYNC_UNREGISTER_BINLOG_STORAGE_OBSERVER_FAILED; **SQLSTATE:** HY000
  
  Message: unregister_binlog_storage Observer failed.

  ER_SEMISYNC_UNREGISTER_BINLOG_STORAGE_OBSERVER_FAILED was added in 8.0.4.

- **Error number:** MY-011174; **Symbol:** ER_SEMISYNC_UNREGISTER_BINLOG_TRANSMIT_OBSERVER_FAILED; **SQLSTATE:** HY000
  
  Message: unregister_binlog_transmit Observer failed.

  ER_SEMISYNC_UNREGISTER_BINLOG_TRANSMIT_OBSERVER_FAILED was added in 8.0.4.

- **Error number:** MY-011175; **Symbol:** ER_SEMISYNC_UNREGISTERED_REPLICATOR; **SQLSTATE:** HY000
  
  Message: unregister_replicator OK.

  ER_SEMISYNC_UNREGISTERED_REPLICATOR was added in 8.0.4.

- **Error number:** MY-011176; **Symbol:** ER_SEMISYNC_SOCKET_FD_TOO_LARGE; **SQLSTATE:** HY000
  
  Message: Semisync slave socket fd is %u. select() cannot handle if the socket fd is bigger than %u (FD_SETSIZE).

  ER_SEMISYNC_SOCKET_FD_TOO_LARGE was added in 8.0.4.

- **Error number:** MY-011177; **Symbol:** ER_SEMISYNC_SLAVE_REPLY; **SQLSTATE:** HY000
  
  Message: %s: reply - %d.

  ER_SEMISYNC_SLAVE_REPLY was added in 8.0.4.

- **Error number:** MY-011178; **Symbol:** ER_SEMISYNC_MISSING_MAGIC_NO_FOR_SEMISYNC_PKT; **SQLSTATE:** HY000
  
  Message: Missing magic number for semi-sync packet, packet len: %lu.

  ER_SEMISYNC_MISSING_MAGIC_NO_FOR_SEMISYNC_PKT was added in 8.0.4.
• Error number: **MY-011179**; Symbol: ER_SEMISYNC_SLAVE_START; SQLSTATE: HY000
  
  Message: Slave I/O thread: Start replication to master '%s' in log '%s' at position %lu.

  ER_SEMISYNC_SLAVE_START was added in 8.0.4.

• Error number: **MY-011180**; Symbol: ER_SEMISYNC_SLAVE_REPLY_WITH_BINLOG_INFO; SQLSTATE: HY000
  
  Message: %s: reply (%s, %lu).

  ER_SEMISYNC_SLAVE_REPLY_WITH_BINLOG_INFO was added in 8.0.4.

• Error number: **MY-011181**; Symbol: ER_SEMISYNC_SLAVE_NET_FLUSH_REPLY_FAILED; SQLSTATE: HY000
  
  Message: Semi-sync slave net_flush() reply failed.

  ER_SEMISYNC_SLAVE_NET_FLUSH_REPLY_FAILED was added in 8.0.4.

• Error number: **MY-011182**; Symbol: ER_SEMISYNC_SLAVE_SEND_REPLY_FAILED; SQLSTATE: HY000
  
  Message: Semi-sync slave send reply failed: %s (%d).

  ER_SEMISYNC_SLAVE_SEND_REPLY_FAILED was added in 8.0.4.

• Error number: **MY-011183**; Symbol: ER_SEMISYNC_EXECUTION_FAILED_ON_MASTER; SQLSTATE: HY000
  
  Message: Execution failed on master: %s; error %d

  ER_SEMISYNC_EXECUTION_FAILED_ON_MASTER was added in 8.0.4.

• Error number: **MY-011184**; Symbol: ER_SEMISYNC_NOT_SUPPORTED_BY_MASTER; SQLSTATE: HY000
  
  Message: Master server does not support semi-sync, fallback to asynchronous replication

  ER_SEMISYNC_NOT_SUPPORTED_BY_MASTER was added in 8.0.4.

• Error number: **MY-011185**; Symbol: ER_SEMISYNC_SLAVE_SET_FAILED; SQLSTATE: HY000
  
  Message: Set 'rpl_semi_sync_slave=1' on master failed

  ER_SEMISYNC_SLAVE_SET_FAILED was added in 8.0.4.

• Error number: **MY-011186**; Symbol: ER_SEMISYNC_FAILED_TO_STOP_ACK_RECEIVER_THD; SQLSTATE: HY000
  
  Message: Failed to stop ack receiver thread on my_thread_join, errno(%d).

  ER_SEMISYNC_FAILED_TO_STOP_ACK_RECEIVER_THD was added in 8.0.4.
• Error number: MY-011187; Symbol: ER_FIREWALL_FAILED_TO_READ_FIREWALL_TABLES; SQLSTATE: HY000
Message: Failed to read the firewall tables
ER_FIREWALL_FAILED_TO_READ_FIREWALL_TABLES was added in 8.0.4.

• Error number: MY-011188; Symbol: ER_FIREWALL_FAILED_TO_REG_DYNAMIC_PRIVILEGES; SQLSTATE: HY000
Message: Failed to register dynamic privileges
ER_FIREWALL_FAILED_TO_REG_DYNAMIC_PRIVILEGES was added in 8.0.4.

• Error number: MY-011189; Symbol: ER_FIREWALL_RECORDING_STMT_WAS_TRUNCATED; SQLSTATE: HY000
Message: Statement was truncated and not recorded: %s
ER_FIREWALL_RECORDING_STMT_WAS_TRUNCATED was added in 8.0.4.

• Error number: MY-011190; Symbol: ER_FIREWALL_RECORDING_STMT WITHOUT_TEXT; SQLSTATE: HY000
Message: Statement with no text was not recorded
ER_FIREWALL_RECORDING_STMT WITHOUT_TEXT was added in 8.0.4.

• Error number: MY-011191; Symbol: ER_FIREWALL_SUSPICIOUS_STMT; SQLSTATE: HY000
Message: SUSPICIOUS STATEMENT from '%s'. Reason: %s Statement: %s
ER_FIREWALL_SUSPICIOUS_STMT was added in 8.0.4.

• Error number: MY-011192; Symbol: ER_FIREWALL_ACCESS_DENIED; SQLSTATE: HY000
Message: ACCESS DENIED for '%s'. Reason: %s Statement: %s
ER_FIREWALL_ACCESS_DENIED was added in 8.0.4.

• Error number: MY-011193; Symbol: ER_FIREWALL_SKIPPED_UNKNOWN_USER_MODE; SQLSTATE: HY000
Message: Skipped unknown user mode '%s'
ER_FIREWALL_SKIPPED_UNKNOWN_USER_MODE was added in 8.0.4.

• Error number: MY-011194; Symbol: ER_FIREWALL_RELOADING_CACHE; SQLSTATE: HY000
Message: Reloading cache from disk
ER_FIREWALL_RELOADING_CACHE was added in 8.0.4.

• Error number: MY-011195; Symbol: ER_FIREWALL_RESET_FOR_USER; SQLSTATE: HY000
Message: FIREWALL RESET for '%s'
ER_FIREWALL_RESET_FOR_USER was added in 8.0.4.

• Error number: MY-011196; Symbol: ER_FIREWALL_STATUS_FLUSHED; SQLSTATE: HY000
Message: Counters are reset to zero

```
ER_FIREWALL_STATUS_FLUSHED was added in 8.0.4.
```

- Error number: **MY-011197**; Symbol: **ER_KEYRING_LOGGER_ERROR_MSG**; SQLSTATE: **HY000**

Message: %s

```
ER_KEYRING_LOGGER_ERROR_MSG was added in 8.0.4.
```

- Error number: **MY-011198**; Symbol: **ER_AUDIT_LOG_FILTER_IS_NOT_INSTALLED**; SQLSTATE: **HY000**

Message: Audit Log plugin supports a filtering, which has not been installed yet. Audit Log plugin will run in the legacy mode, which will be disabled in the next release.

```
ER_AUDIT_LOG_FILTER_IS_NOT_INSTALLED was added in 8.0.4.
```

- Error number: **MY-011199**; Symbol: **ER_AUDIT_LOG_SWITCHING_TO_INCLUDE_LIST**; SQLSTATE: **HY000**

Message: Previously exclude list is used, now we start using include list, exclude list is set to NULL.

```
ER_AUDIT_LOG_SWITCHING_TO_INCLUDE_LIST was added in 8.0.4.
```

- Error number: **MY-011200**; Symbol: **ER_AUDIT_LOG_CANNOT_SET_LOG_POLICY_WITH_OTHER_POLICIES**; SQLSTATE: **HY000**

Message: Cannot set audit_log_policy simultaneously with either audit_log_connection_policy or audit_log_statement_policy, setting audit_log_connection_policy and audit_log_statement_policy based on audit_log_policy.

```
ER_AUDIT_LOG_CANNOT_SET_LOG_POLICY_WITH_OTHER_POLICIES was added in 8.0.4.
```

- Error number: **MY-011201**; Symbol: **ER_AUDIT_LOG_ONLY_INCLUDE_LIST_USED**; SQLSTATE: **HY000**

Message: Both include and exclude lists provided, include list is preferred, exclude list is set to NULL.

```
ER_AUDIT_LOG_ONLY_INCLUDE_LIST_USED was added in 8.0.4.
```

- Error number: **MY-011202**; Symbol: **ER_AUDIT_LOG_INDEX_MAP_CANNOT_ACCESS_DIR**; SQLSTATE: **HY000**

Message: Could not access '%s' directory.

```
ER_AUDIT_LOG_INDEX_MAP_CANNOT_ACCESS_DIR was added in 8.0.4.
```

- Error number: **MY-011203**; Symbol: **ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED**; SQLSTATE: **HY000**

Message: Could not rename file from '%s' to '%s'.

```
ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED was added in 8.0.4.
```

- Error number: **MY-011204**; Symbol: **ER_AUDIT_LOG_WRITER_DEST_FILE_ALREADY_EXISTS**; SQLSTATE: **HY000**
Message: File '%s' should not exist. It may be incomplete. The server crashed.

ER_AUDIT_LOG_WRITER_DEST_FILE_ALREADY_EXISTS was added in 8.0.4.

- Error number: MY-011205; Symbol: ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED_REMOVE_FILE_MANUALLY; SQLSTATE: HY000

Message: Could not rename file from '%s' to '%s'. Remove the file manually.

ER_AUDIT_LOG_WRITER_RENAME_FILE_FAILED_REMOVE_FILE_MANUALLY was added in 8.0.4.

- Error number: MY-011206; Symbol: ER_AUDIT_LOG_WRITER_INCOMPLETE_FILE_RENAMED; SQLSTATE: HY000

Message: Incomplete file renamed from '%s' to '%s'.

ER_AUDIT_LOG_WRITER_INCOMPLETE_FILE_RENAMED was added in 8.0.4.

- Error number: MY-011207; Symbol: ER_AUDIT_LOG_WRITER_FAILED_TO_WRITE_TO_FILE; SQLSTATE: HY000

Message: Error writing file '%s' (errno: %d - %s).

ER_AUDIT_LOG_WRITER_FAILED_TO_WRITE_TO_FILE was added in 8.0.4.

- Error number: MY-011208; Symbol: ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_ENCRYPTION; SQLSTATE: HY000

Message: Could not initialize audit log file encryption.

ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_ENCRYPTION was added in 8.0.4.

- Error number: MY-011209; Symbol: ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_COMPRESSION; SQLSTATE: HY000

Message: Could not initialize audit log file compression.

ER_AUDIT_LOG_EC_WRITER_FAILED_TO_INIT_COMPRESSION was added in 8.0.4.

- Error number: MY-011210; Symbol: ER_AUDIT_LOG_EC_WRITER_FAILED_TO_CREATE_FILE; SQLSTATE: HY000

Message: Could not create '%s' file for audit logging.

ER_AUDIT_LOG_EC_WRITER_FAILED_TO_CREATE_FILE was added in 8.0.4.

- Error number: MY-011211; Symbol: ER_AUDIT_LOG_RENAME_LOG_FILE_BEFORE_FLUSH; SQLSTATE: HY000

Message: Audit log file (%s) must be manually renamed before audit_log_flush is set to true.

ER_AUDIT_LOG_RENAME_LOG_FILE_BEFORE_FLUSH was added in 8.0.4.

- Error number: MY-011212; Symbol: ER_AUDIT_LOG_FILTER_RESULT_MSG; SQLSTATE: HY000

Message: %s

ER_AUDIT_LOG_FILTER_RESULT_MSG was added in 8.0.4.
Server Error Message Reference

• Error number: **MY-011213**; Symbol: **ER_AUDIT_LOG_JSON_READER_FAILED_TO_PARSE**; SQLSTATE: **HY000**
  Message: Error parsing JSON event. Event not accessible.
  
  **ER_AUDIT_LOG_JSON_READER_FAILED_TO_PARSE** was added in 8.0.4.

• Error number: **MY-011214**; Symbol: **ER_AUDIT_LOG_JSON_READER_BUF_TOO_SMALL**; SQLSTATE: **HY000**
  Message: Buffer is too small to hold JSON event. Number of events skipped: %zu.
  
  **ER_AUDIT_LOG_JSON_READER_BUF_TOO_SMALL** was added in 8.0.4.

• Error number: **MY-011215**; Symbol: **ER_AUDIT_LOG_JSON_READER_FAILED_TO_OPEN_FILE**; SQLSTATE: **HY000**
  Message: Could not open JSON file for reading. Reading next file if exists.
  
  **ER_AUDIT_LOG_JSON_READER_FAILED_TO_OPEN_FILE** was added in 8.0.4.

• Error number: **MY-011216**; Symbol: **ER_AUDIT_LOG_JSON_READER_FILE_PARSING_ERROR**; SQLSTATE: **HY000**
  Message: JSON file parsing error. Reading next file if exists.
  
  **ER_AUDIT_LOG_JSON_READER_FILE_PARSING_ERROR** was added in 8.0.4.

• Error number: **MY-011217**; Symbol: **ER_AUDIT_LOG_FILTER_INVALID_COLUMN_COUNT**; SQLSTATE: **HY000**
  Message: Invalid column count in the '%s.%s' table.
  
  **ER_AUDIT_LOG_FILTER_INVALID_COLUMN_COUNT** was added in 8.0.4.

• Error number: **MY-011218**; Symbol: **ER_AUDIT_LOG_FILTER_INVALID_COLUMN_DEFINITION**; SQLSTATE: **HY000**
  Message: Invalid column definition of the '%s.%s' table.
  
  **ER_AUDIT_LOG_FILTER_INVALID_COLUMN_DEFINITION** was added in 8.0.4.

• Error number: **MY-011219**; Symbol: **ER_AUDIT_LOG_FILTER_FAILED_TO_STORE_TABLE_FLDS**; SQLSTATE: **HY000**
  Message: Could not store field of the %s table.
  
  **ER_AUDIT_LOG_FILTER_FAILED_TO_STORE_TABLE_FLDS** was added in 8.0.4.

• Error number: **MY-011220**; Symbol: **ER_AUDIT_LOG_FILTER_FAILED_TO_UPDATE_TABLE**; SQLSTATE: **HY000**
  Message: Could not update %s table.
  
  **ER_AUDIT_LOG_FILTER_FAILED_TO_UPDATE_TABLE** was added in 8.0.4.

• Error number: **MY-011221**; Symbol: **ER_AUDIT_LOG_FILTER_FAILED_TO_INSERT_INTO_Table**; SQLSTATE: **HY000**
Server Error Message Reference

Message: Could not insert into %s table.

ER_AUDIT_LOG_FILTER_FAILED_TO_INSERT_INTO_TABLE was added in 8.0.4.

- Error number: MY-011222; Symbol: ER_AUDIT_LOG_FILTER_FAILED_TO_DELETE_FROM_TABLE; SQLSTATE: HY000

Message: Could not delete from %s table.

ER_AUDIT_LOG_FILTER_FAILED_TO_DELETE_FROM_TABLE was added in 8.0.4.

- Error number: MY-011223; Symbol: ER_AUDIT_LOG_FILTER_FAILED_TO_INIT_TABLE_FOR_READ; SQLSTATE: HY000

Message: Could not initialize %s table for reading.

ER_AUDIT_LOG_FILTER_FAILED_TO_INIT_TABLE_FOR_READ was added in 8.0.4.

- Error number: MY-011224; Symbol: ER_AUDIT_LOG_FILTER_FAILED_TO_READ_TABLE; SQLSTATE: HY000

Message: Could not read %s table.

ER_AUDIT_LOG_FILTER_FAILED_TO_READ_TABLE was added in 8.0.4.

- Error number: MY-011225; Symbol: ER_AUDIT_LOG_FILTER_FAILED_TO_CLOSE_TABLE_AFTER_READING; SQLSTATE: HY000

Message: Could not close %s table reading.

ER_AUDIT_LOG_FILTER_FAILED_TO_CLOSE_TABLE_AFTER_READING was added in 8.0.4.

- Error number: MY-011226; Symbol: ER_VALIDATE_PWD_DICT_FILE_NOT_SPECIFIED; SQLSTATE: HY000

Message: Both user and host columns of %s table cannot be empty.

ER_VALIDATE_PWD_DICT_FILE_NOT_SPECIFIED was added in 8.0.4.

- Error number: MY-011227; Symbol: ER_VALIDATE_PWD_DICT_FILE_NOT_SPECIFIED; SQLSTATE: HY000

Message: Filtername column of %s table cannot be empty.

ER_VALIDATE_PWD_DICT_FILE_NOT_SPECIFIED was added in 8.0.4.

- Error number: MY-011228; Symbol: ER_VALIDATE_PWD_DICT_FILE_NOT_SPECIFIED; SQLSTATE: HY000

Message: Dictionary file not specified

ER_VALIDATE_PWD_DICT_FILE_NOT_SPECIFIED was added in 8.0.4.
Server Error Message Reference

Message: Out of memory for component system variable '%s'.
ER_SYS_VAR_COMPONENT_OOM was added in 8.0.4.

• Error number: MY-011257; Symbol: ER_SYS_VAR_COMPONENT_VARIABLE_SET_READ_ONLY;
SQLSTATE: HY000
Message: variable %s of component %s was forced to be read-only: string variable without update_func
and PLUGIN_VAR_MEMALLOC flag.
ER_SYS_VAR_COMPONENT_VARIABLE_SET_READ_ONLY was added in 8.0.4.

• Error number: MY-011258; Symbol: ER_SYS_VAR_COMPONENT_UNKNOWN_VARIABLE_TYPE;
SQLSTATE: HY000
Message: Unknown variable type code 0x%x in component '%s'.
ER_SYS_VAR_COMPONENT_UNKNOWN_VARIABLE_TYPE was added in 8.0.4.

• Error number: MY-011259; Symbol:
ER_SYS_VAR_COMPONENT_FAILED_TO_PARSE_VARIABLE_OPTIONS; SQLSTATE: HY000
Message: Parsing options for variable '%s' failed.
ER_SYS_VAR_COMPONENT_FAILED_TO_PARSE_VARIABLE_OPTIONS was added in 8.0.4.

• Error number: MY-011260; Symbol:
ER_SYS_VAR_COMPONENT_FAILED_TO_MAKE_VARIABLE_PERSISTENT; SQLSTATE: HY000
Message: Setting persistent options for component variable '%s' failed.
ER_SYS_VAR_COMPONENT_FAILED_TO_MAKE_VARIABLE_PERSISTENT was added in 8.0.4.

• Error number: MY-011261; Symbol: ER_COMPONENT_FILTER_CONFUSED; SQLSTATE: HY000
Message: The log-filter component "%s" got confused at "%s" (state: %s) ...
ER_COMPONENT_FILTER_CONFUSED was added in 8.0.4.

• Error number: MY-011262; Symbol: ER_STOP_SLAVE_IO_THREAD_DISK_SPACE; SQLSTATE: HY000
Message: Waiting until I/O thread for channel '%s' finish writing to disk before stopping. Free some disk
space or use 'KILL' to abort I/O thread operation. Notice that aborting the I/O thread while rotating the
relay log might corrupt the relay logs, requiring a server restart to fix it.
ER_STOP_SLAVE_IO_THREAD_DISK_SPACE was added in 8.0.2.

• Error number: MY-011263; Symbol: ER_LOG_FILE_CANNOT_OPEN; SQLSTATE: HY000
Message: Could not use %s for logging (error %d - %s). Turning logging off for the server process. To
turn it on again: fix the cause, then%s restart the MySQL server.
ER_LOG_FILE_CANNOT_OPEN was added in 8.0.2.

• Error number: MY-011268; Symbol: ER_PERSIST_OPTION_STATUS; SQLSTATE: HY000
Message: Configuring persisted options failed: "%s".

**ER_PERSIST_OPTION_STATUS** was added in 8.0.11.

- Error number: **MY-011269**; Symbol: **ER_NOT_IMPLEMENTED_GET_TABLESPACE_STATISTICS**; SQLSTATE: **HY000**
  Message: The storage engine "%s" does not provide dynamic table statistics

**ER_NOT_IMPLEMENTED_GET_TABLESPACE_STATISTICS** was added in 8.0.11.

- Error number: **MY-011272**; Symbol: **ER_SSL_FIPS_MODE_ERROR**; SQLSTATE: **HY000**
  Message: SSL fips mode error: %s

**ER_SSL_FIPS_MODE_ERROR** was added in 8.0.11.

- Error number: **MY-011273**; Symbol: **ER_CONN_INIT_CONNECT_IGNORED**; SQLSTATE: **HY000**
  Message: init_connect variable is ignored for user: %s host: %s due to expired password.

**ER_CONN_INIT_CONNECT_IGNORED** was added in 8.0.11.

- Error number: **MY-011275**; Symbol: **ER_REWRITER_OOM**; SQLSTATE: **HY000**
  Message: Out of memory.

**ER_REWRITER_OOM** was added in 8.0.11.

- Error number: **MY-011276**; Symbol: **ER_REWRITER_TABLE_MALFORMED_ERROR**; SQLSTATE: **HY000**
  Message: Wrong column count or names when loading rules.

**ER_REWRITER_TABLE_MALFORMED_ERROR** was added in 8.0.11.

- Error number: **MY-011277**; Symbol: **ER_REWRITER_LOAD_FAILED**; SQLSTATE: **HY000**
  Message: Some rules failed to load.

**ER_REWRITER_LOAD_FAILED** was added in 8.0.11.

- Error number: **MY-011278**; Symbol: **ER_REWRITER_READ_FAILED**; SQLSTATE: **HY000**
  Message: Got error from storage engine while refreshing rewrite rules.

**ER_REWRITER_READ_FAILED** was added in 8.0.11.

- Error number: **MY-011279**; Symbol: **ER_CONN_CONTROL_EVENT_COORDINATOR_INIT_FAILED**; SQLSTATE: **HY000**
  Message: Failed to initialize Connection_event_coordinator

**ER_CONN_CONTROL_EVENT_COORDINATOR_INIT_FAILED** was added in 8.0.11.

- Error number: **MY-011280**; Symbol: **ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_UPDATE_FAILED**; SQLSTATE: **HY000**
  Message: Failed to update connection delay triggered stats
ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_UPDATE_FAILED was added in 8.0.11.

- Error number: MY-011281; Symbol: ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_RESET_FAILED; SQLSTATE: HY000
  Message: Failed to reset connection delay triggered stats

ER_CONN_CONTROL_STAT_CONN_DELAY_TRIGGERED_RESET_FAILED was added in 8.0.11.

- Error number: MY-011282; Symbol: ER_CONN_CONTROL_INVALID_CONN_DELAY_TYPE; SQLSTATE: HY000
  Message: Unexpected option type for connection delay.

ER_CONN_CONTROL_INVALID_CONN_DELAY_TYPE was added in 8.0.11.

- Error number: MY-011283; Symbol: ER_CONN_CONTROL_DELAY_ACTION_INIT_FAILED; SQLSTATE: HY000
  Message: Failed to initialize Connection_delay_action

ER_CONN_CONTROL_DELAY_ACTION_INIT_FAILED was added in 8.0.11.

- Error number: MY-011284; Symbol: ER_CONN_CONTROL_FAILED_TO_SET_CONN_DELAY; SQLSTATE: HY000
  Message: Could not set %s delay for connection delay.

ER_CONN_CONTROL_FAILED_TO_SET_CONN_DELAY was added in 8.0.11.

- Error number: MY-011285; Symbol: ER_CONN_CONTROL_FAILED_TO_UPDATE_CONN_DELAY_HASH; SQLSTATE: HY000
  Message: Failed to update connection delay hash for account : %s

ER_CONN_CONTROL_FAILED_TO_UPDATE_CONN_DELAY_HASH was added in 8.0.11.

- Error number: MY-011286; Symbol: ER_XPLUGIN_FORCE_STOP_CLIENT; SQLSTATE: HY000
  Message: %s: Force stopping client because exception occurred: %s

ER_XPLUGIN_FORCE_STOP_CLIENT was added in 8.0.11.

- Error number: MY-011287; Symbol: ER_XPLUGIN_MAX_AUTH_ATTEMPTS_REACHED; SQLSTATE: HY000
  Message: %s.%u: Maximum number of authentication attempts reached, login failed.

ER_XPLUGIN_MAX_AUTH_ATTEMPTS_REACHED was added in 8.0.11.

- Error number: MY-011288; Symbol: ER_XPLUGIN_BUFFER_PAGE_ALLOC_FAILED; SQLSTATE: HY000
  Message: Error allocating Buffer_page: %s

ER_XPLUGIN_BUFFER_PAGE_ALLOC_FAILED was added in 8.0.11.
• Error number: MY-011289; Symbol: ER_XPLUGIN_DETECTED_HANGING_CLIENTS; SQLSTATE: HY000
  
  Message: Detected %u hanging client(s)

  ER_XPLUGIN_DETECTED_HANGING_CLIENTS was added in 8.0.11.

• Error number: MY-011290; Symbol: ER_XPLUGIN_FAILED_TO_ACCEPT_CLIENT; SQLSTATE: HY000
  
  Message: Error accepting client

  ER_XPLUGIN_FAILED_TO_ACCEPT_CLIENT was added in 8.0.11.

• Error number: MY-011291; Symbol: ER_XPLUGIN_FAILED_TO_SCHEDULE_CLIENT; SQLSTATE: HY000
  
  Message: Internal error scheduling client for execution

  ER_XPLUGIN_FAILED_TO_SCHEDULE_CLIENT was added in 8.0.11.

• Error number: MY-011292; Symbol: ER_XPLUGIN_FAILED_TO_PREPARE_IO_INTERFACES; SQLSTATE: HY000
  
  Message: Preparation of I/O interfaces failed, X Protocol won't be accessible

  ER_XPLUGIN_FAILED_TO_PREPARE_IO_INTERFACES was added in 8.0.11.

• Error number: MY-011293; Symbol: ER_XPLUGIN_SRV_SESSION_INIT_THREAD_FAILED; SQLSTATE: HY000
  
  Message: srv_session_init_thread returned error

  ER_XPLUGIN_SRV_SESSION_INIT_THREAD_FAILED was added in 8.0.11.

• Error number: MY-011294; Symbol: ER_XPLUGIN_UNABLE_TO_USE_USER_SESSION_ACCOUNT; SQLSTATE: HY000
  
  Message: Unable to use user mysql.session account when connecting the server for internal plugin requests.

  ER_XPLUGIN_UNABLE_TO_USE_USER_SESSION_ACCOUNT was added in 8.0.11.

• Error number: MY-011295; Symbol: ER_XPLUGIN_REFERENCE_TO_USER_ACCOUNT_DOC_SECTION; SQLSTATE: HY000
  
  Message: For more information, please see the X Plugin User Account section in the MySQL documentation

  ER_XPLUGIN_REFERENCE_TO_USER_ACCOUNT_DOC_SECTION was added in 8.0.11.

• Error number: MY-011296; Symbol: ER_XPLUGIN_UNEXPECTED_EXCEPTION_DISPATCHING_CMD; SQLSTATE: HY000
  
  Message: %s: Unexpected exception dispatching command: %s

  ER_XPLUGIN_UNEXPECTED_EXCEPTION_DISPATCHING_CMD was added in 8.0.11.
Server Error Message Reference

- **Error number:** MY-011297; Symbol: ER_XPLUGIN_EXCEPTION_IN_TASK_SCHEDULER; SQLSTATE: HY000
  
  Message: Exception in post: %s

  ER_XPLUGIN_EXCEPTION_IN_TASK_SCHEDULER was added in 8.0.11.

- **Error number:** MY-011298; Symbol: ER_XPLUGIN_TASK_SCHEDULING_FAILED; SQLSTATE: HY000
  
  Message: Internal error scheduling task

  ER_XPLUGIN_TASK_SCHEDULING_FAILED was added in 8.0.11.

- **Error number:** MY-011299; Symbol: ER_XPLUGIN_EXCEPTION_IN_EVENT_LOOP; SQLSTATE: HY000
  
  Message: Exception in event loop: "%s": %s

  ER_XPLUGIN_EXCEPTION_IN_EVENT_LOOP was added in 8.0.11.

- **Error number:** MY-011300; Symbol: ER_XPLUGIN_LISTENER_SETUP_FAILED; SQLSTATE: HY000
  
  Message: Setup of %s failed, %s

  ER_XPLUGIN_LISTENER_SETUP_FAILED was added in 8.0.11.

- **Error number:** MY-011301; Symbol: ER_XPLUING_NET_STARTUP_FAILED; SQLSTATE: HY000
  
  Message: %s

  ER_XPLUING_NET_STARTUP_FAILED was added in 8.0.11.

- **Error number:** MY-011302; Symbol: ER_XPLUGIN_FAILED_AT_SSL_CONF; SQLSTATE: HY000
  
  Message: Failed at SSL configuration: "%s"

  ER_XPLUGIN_FAILED_AT_SSL_CONF was added in 8.0.11.

- **Error number:** MY-011303; Symbol: ER_XPLUGIN_CLIENT_SSL_HANDSHAKE_FAILED; SQLSTATE: HY000
  
  Message: Error during SSL handshake for client connection (%i)

  ER_XPLUGIN_CLIENT_SSL_HANDSHAKE_FAILED was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011304; Symbol: ER_XPLUGIN_SSL_HANDSHAKE_WITH_SERVER_FAILED; SQLSTATE: HY000
  
  Message: %s: Error during SSL handshake

  ER_XPLUGIN_SSL_HANDSHAKE_WITH_SERVER_FAILED was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011305; Symbol: ER_XPLUGIN_FAILED_TO_CREATE_SESSION_FOR_CONN; SQLSTATE: HY000
  
  Message: %s: Error creating session for connection from %s

  ER_XPLUGIN_FAILED_TO_CREATE_SESSION_FOR_CONN was added in 8.0.11.
Server Error Message Reference

- **Error number:** MY-011306; Symbol: ER_XPLUGIN_FAILED_TO_INITIALIZE_SESSION; SQLSTATE: HY000
  
  **Message:** %s: Error initializing session for connection: %s

  ER_XPLUGIN_FAILED_TO_INITIALIZE_SESSION was added in 8.0.11.

- **Error number:** MY-011307; Symbol: ER_XPLUGIN_MESSAGE_TOO_LONG; SQLSTATE: HY000
  
  **Message:** %s: Message of size %u received, exceeding the limit of %i

  ER_XPLUGIN_MESSAGE_TOO_LONG was added in 8.0.11.

- **Error number:** MY-011308; Symbol: ER_XPLUGIN_UNINITIALIZED_MESSAGE; SQLSTATE: HY000
  
  **Message:** Message is not properly initialized: %s

  ER_XPLUGIN_UNINITIALIZED_MESSAGE was added in 8.0.11.

- **Error number:** MY-011309; Symbol: ER_XPLUGIN_FAILED_TO_SET_MIN_NUMBER_OF_WORKERS; SQLSTATE: HY000
  
  **Message:** Unable to set minimal number of workers to %u; actual value is %i

  ER_XPLUGIN_FAILED_TO_SET_MIN_NUMBER_OF_WORKERS was added in 8.0.11.

- **Error number:** MY-011310; Symbol: ER_XPLUGIN_UNABLE_TO_ACCEPT_CONNECTION; SQLSTATE: HY000
  
  **Message:** Unable to accept connection, disconnecting client

  ER_XPLUGIN_UNABLE_TO_ACCEPT_CONNECTION was added in 8.0.11.

- **Error number:** MY-011311; Symbol: ER_XPLUGIN_ALL_IO_INTERFACES_DISABLED; SQLSTATE: HY000
  
  **Message:** All I/O interfaces are disabled, X Protocol won't be accessible

  ER_XPLUGIN_ALL_IO_INTERFACES_DISABLED was added in 8.0.11.

- **Error number:** MY-011312; Symbol: ER_XPLUGIN_INVALID_MSG_DURING_CLIENT_INIT; SQLSTATE: HY000
  
  **Message:** %s: Invalid message %i received during client initialization

  ER_XPLUGIN_INVALID_MSG_DURING_CLIENT_INIT was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011313; Symbol: ER_XPLUGIN_CLOSING_CLIENTS_ON_SHUTDOWN; SQLSTATE: HY000
  
  **Message:** %s: closing client because of shutdown (state: %i)

  ER_XPLUGIN_CLOSING_CLIENTS_ON_SHUTDOWN was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011314; Symbol: ER_XPLUGIN_ERROR_READING_SOCKET; SQLSTATE: HY000
  
  **Message:** %s: Error reading from socket %s (%i)

  ER_XPLUGIN_ERROR_READING_SOCKET was added in 8.0.11.
Server Error Message Reference

- **Error number:** MY-011315; Symbol: \texttt{ER\_XPLUGIN\_PEER\_DISCONNECTED\_WHILE\_READING\_MSG\_BODY}; SQLSTATE: HY000
  
  **Message:** %s: peer disconnected while reading message body

  \texttt{ER\_XPLUGIN\_PEER\_DISCONNECTED\_WHILE\_READING\_MSG\_BODY} was added in 8.0.11.

  **Message:** Scheduler "%s" stopped.

  \texttt{ER\_XPLUGIN\_SCHEDULER\_STOPPED} was added in 8.0.11, removed after 8.0.12.

- **Error number:** MY-011322; Symbol: \texttt{ER\_XPLUGIN\_LISTENER\_SYS\_VARIABLE\_ERROR}; SQLSTATE: HY000
  
  **Message:** Please see the MySQL documentation for '%s's' system variables to fix the error

  \texttt{ER\_XPLUGIN\_LISTENER\_SYS\_VARIABLE\_ERROR} was added in 8.0.11.

- **Error number:** MY-011323; Symbol: \texttt{ER\_XPLUGIN\_LISTENER\_STATUS\_MSG}; SQLSTATE: HY000
  
  **Message:** X Plugin ready for connections. %s

  \texttt{ER\_XPLUGIN\_LISTENER\_STATUS\_MSG} was added in 8.0.11.
• Error number: MY-011324; Symbol: ER_XPLUGIN_RETRYING_BIND_ON_PORT; SQLSTATE: HY000
Message: Retrying `bind()` on TCP/IP port %i

ER_XPLUGIN_RETRYING_BIND_ON_PORT was added in 8.0.11.

• Error number: MY-011325; Symbol: ER_XPLUGIN_SHUTDOWN_TRIGGERED; SQLSTATE: HY000
Message: Shutdown triggered by mysqld abort flag

ER_XPLUGIN_SHUTDOWN_TRIGGERED was added in 8.0.11, removed after 8.0.12.

• Error number: MY-011326; Symbol: ER_XPLUGIN_USER_ACCOUNT_WITH_ALL_PERMISSIONS; SQLSTATE: HY000
Message: Using %s account for authentication which has all required permissions

ER_XPLUGIN_USER_ACCOUNT_WITH_ALL_PERMISSIONS was added in 8.0.11, removed after 8.0.12.

• Error number: MY-011327; Symbol: ER_XPLUGIN_EXISTING_USER_ACCOUNT_WITH_INCOMPLETE_GRANTS; SQLSTATE: HY000
Message: Using existing %s account for authentication. Incomplete grants will be fixed

ER_XPLUGIN_EXISTING_USER_ACCOUNT_WITH_INCOMPLETE_GRANTS was added in 8.0.11.

• Error number: MY-011328; Symbol: ER_XPLUGIN_SERVER_STARTS_HANDLING_CONNECTIONS; SQLSTATE: HY000
Message: Server starts handling incoming connections

ER_XPLUGIN_SERVER_STARTS_HANDLING_CONNECTIONS was added in 8.0.11, removed after 8.0.12.

• Error number: MY-011329; Symbol: ER_XPLUGIN_SERVER_STOPPED_HANDLING_CONNECTIONS; SQLSTATE: HY000
Message: Stopped handling incoming connections

ER_XPLUGIN_SERVER_STOPPED_HANDLING_CONNECTIONS was added in 8.0.11, removed after 8.0.12.

• Error number: MY-011330; Symbol: ER_XPLUGIN_FAILED_TO_INTERRUPT_SESSION; SQLSTATE: HY000
Message: %s: Could not interrupt client session

ER_XPLUGIN_FAILED_TO_INTERRUPT_SESSION was added in 8.0.11, removed after 8.0.12.

• Error number: MY-011331; Symbol: ER_XPLUGIN_CLIENT_RELEASE_TRIGGERED; SQLSTATE: HY000
Message: %s: release triggered by timeout in state:%i

ER_XPLUGIN_CLIENT_RELEASE_TRIGGERED was added in 8.0.11, removed after 8.0.12.
• Error number: MY-011332; Symbol: ER_XPLUGIN_IPv6_AVAILABLE; SQLSTATE: HY000
  Message: IPv6 is available
  ER_XPLUGIN_IPv6_AVAILABLE was added in 8.0.11.

• Error number: MY-011333; Symbol: ER_XPLUGIN_UNIX_SOCKET_NOT_CONFIGURED; SQLSTATE: HY000
  Message: UNIX socket not configured
  ER_XPLUGIN_UNIX_SOCKET_NOT_CONFIGURED was added in 8.0.11, removed after 8.0.12.

• Error number: MY-011334; Symbol: ER_XPLUGIN_CLIENT_KILL_MSG; SQLSTATE: HY000
  Message: Kill client: %i %s
  ER_XPLUGIN_CLIENT_KILL_MSG was added in 8.0.11.

• Error number: MY-011335; Symbol: ER_XPLUGIN_FAILED_TO_GET_SECURITY_CTX; SQLSTATE: HY000
  Message: Could not get security context for session
  ER_XPLUGIN_FAILED_TO_GET_SECURITY_CTX was added in 8.0.11.

• Error number: MY-011336; Symbol: ER_XPLUGIN_FAILED_TO_SWITCH_SECURITY_CTX_TO_ROOT; SQLSTATE: HY000
  Message: Unable to switch security context to root
  ER_XPLUGIN_FAILED_TO_SWITCH_SECURITY_CTX_TO_ROOT was added in 8.0.11, removed after 8.0.12.

• Error number: MY-011337; Symbol: ER_XPLUGIN_FAILED_TO_CLOSE_SQL_SESSION; SQLSTATE: HY000
  Message: Error closing SQL session
  ER_XPLUGIN_FAILED_TO_CLOSE_SQL_SESSION was added in 8.0.11.

• Error number: MY-011338; Symbol: ER_XPLUGIN_FAILED_TO_EXECUTE_ADMIN_CMD; SQLSTATE: HY000
  Message: Error executing admin command %s: %s
  ER_XPLUGIN_FAILED_TO_EXECUTE_ADMIN_CMD was added in 8.0.11.

• Error number: MY-011339; Symbol: ER_XPLUGIN_EMPTY_ADMIN_CMD; SQLSTATE: HY000
  Message: Error executing empty admin command
  ER_XPLUGIN_EMPTY_ADMIN_CMD was added in 8.0.11.

• Error number: MY-011340; Symbol: ER_XPLUGIN_FAILED_TO_GET_SYS_VAR; SQLSTATE: HY000
  Message: Unable to retrieve system variable \"%s\"
  ER_XPLUGIN_FAILED_TO_GET_SYS_VAR was added in 8.0.11.
Server Error Message Reference

Message: %s: get peer address failed, can't resolve IP to hostname

ER_XPLUGIN_GET_PEER_ADDRESS_FAILED was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011350; Symbol: ER_XPLUGIN_CAPABILITY_CLIENT_INTERACTIVE_FAILED; SQLSTATE: HY000

Message: Capability client interactive failed with error: %s

ER_XPLUGIN_CAPABILITY_CLIENT_INTERACTIVE_FAILED was added in 8.0.11, removed after 8.0.12.

- Error number: MY-011351; Symbol: ER_XPLUGIN_FAILED_TO_RESET_IPV6_V6ONLY_FLAG; SQLSTATE: HY000

Message: Failed to reset IPV6_V6ONLY flag (error: %d). The server will listen to IPv6 addresses only.

ER_XPLUGIN_FAILED_TO_RESET_IPV6_V6ONLY_FLAG was added in 8.0.11.

- Error number: MY-011352; Symbol: ER_KEYRING_INVALID_KEY_TYPE; SQLSTATE: HY000

Message: Invalid key type

ER_KEYRING_INVALID_KEY_TYPE was added in 8.0.11.

- Error number: MY-011353; Symbol: ER_KEYRING_INVALID_KEY_LENGTH; SQLSTATE: HY000

Message: Invalid key length for given block cipher

ER_KEYRING_INVALID_KEY_LENGTH was added in 8.0.11.

- Error number: MY-011354; Symbol: ER_KEYRING_FAILED_TO_CREATE_KEYRING_DIR; SQLSTATE: HY000

Message: Could not create keyring directory. The keyring_file will stay unusable until correct path to the keyring directory gets provided

ER_KEYRING_FAILED_TO_CREATE_KEYRING_DIR was added in 8.0.11.

- Error number: MY-011355; Symbol: ER_KEYRING_FILE_INIT_FAILED; SQLSTATE: HY000

Message: keyring_file initialization failure. Please check if the keyring_file_data points to readable keyring file or keyring file can be created in the specified location. The keyring_file will stay unusable until correct path to the keyring file gets provided

ER_KEYRING_FILE_INIT_FAILED was added in 8.0.11.

- Error number: MY-011356; Symbol: ER_KEYRING_INTERNAL_EXCEPTION_FAILED_FILE_INIT; SQLSTATE: HY000

Message: keyring_file initialization failure due to internal exception inside the plugin.

ER_KEYRING_INTERNAL_EXCEPTION_FAILED_FILE_INIT was added in 8.0.11.
Server Error Message Reference

- Error number: MY-011357; Symbol: ER_KEYRING_FAILED_TO_GENERATE_KEY; SQLSTATE: HY000
  Message: Failed to generate a key due to internal exception inside keyring_file plugin
  
  ER_KEYRING_FAILED_TO_GENERATE_KEY was added in 8.0.11.

- Error number: MY-011358; Symbol: ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_INVALID_KEY; SQLSTATE: HY000
  Message: Error while %s key: invalid key_type
  
  ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_INVALID_KEY was added in 8.0.11.

- Error number: MY-011359; Symbol: ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_EMPTY_KEY_ID; SQLSTATE: HY000
  Message: Error while %s key: key_id cannot be empty
  
  ER_KEYRING_CHECK_KEY_FAILED_DUE_TO_EMPTY_KEY_ID was added in 8.0.11.

- Error number: MY-011360; Symbol: ER_KEYRING_OPERATION_FAILED_DUE_TO_INTERNAL_ERROR; SQLSTATE: HY000
  Message: Failed to %s due to internal exception inside %s plugin
  
  ER_KEYRING_OPERATION_FAILED_DUE_TO_INTERNAL_ERROR was added in 8.0.11.

- Error number: MY-011361; Symbol: ER_KEYRING_INCORRECT_FILE; SQLSTATE: HY000
  Message: Incorrect Keyring file
  
  ER_KEYRING_INCORRECT_FILE was added in 8.0.11.

- Error number: MY-011362; Symbol: ER_KEYRING_FOUND_MALFORMED_BACKUP_FILE; SQLSTATE: HY000
  Message: Found malformed keyring backup file - removing it
  
  ER_KEYRING_FOUND_MALFORMED_BACKUP_FILE was added in 8.0.11.

- Error number: MY-011363; Symbol: ER_KEYRING_FAILED_TO_RESTORE_FROM_BACKUP_FILE; SQLSTATE: HY000
  Message: Error while restoring keyring from backup file cannot overwrite keyring with backup
  
  ER_KEYRING_FAILED_TO_RESTORE_FROM_BACKUP_FILE was added in 8.0.11.

- Error number: MY-011364; Symbol: ER_KEYRING_FAILED_TO_FLUSH_KEYRING_TO_FILE; SQLSTATE: HY000
  Message: Error while flushing in-memory keyring into keyring file
  
  ER_KEYRING_FAILED_TO_FLUSH_KEYRING_TO_FILE was added in 8.0.11.

- Error number: MY-011365; Symbol: ER_KEYRING_FAILED_TO_GET_FILE_STAT; SQLSTATE: HY000
  Message: Error while reading stat for %s. Please check if file %s was not removed. OS returned this error: %s
ER_KEYRING_FAILED_TO_GET_FILE_STAT was added in 8.0.11.

- **Error number:** MY-011366; **Symbol:** ER_KEYRING_FAILED_TO_REMOVE_FILE; **SQLSTATE:** HY000
  Message: Could not remove file %s OS retuned this error: %s

ER_KEYRING_FAILED_TO_REMOVE_FILE was added in 8.0.11.

- **Error number:** MY-011367; **Symbol:** ER_KEYRING_FAILED_TO_TRUNCATE_FILE; **SQLSTATE:** HY000
  Message: Could not truncate file %s. OS retuned this error: %s

ER_KEYRING_FAILED_TO_TRUNCATE_FILE was added in 8.0.11.

- **Error number:** MY-011368; **Symbol:** ER_KEYRING_UNKNOWN_ERROR; **SQLSTATE:** HY000
  Message: Unknown error %d

ER_KEYRING_UNKNOWN_ERROR was added in 8.0.11.

- **Error number:** MY-011369; **Symbol:** ER_KEYRING_FAILED_TO_SET_KEYRING_FILE_DATA; **SQLSTATE:** HY000
  Message: keyring_file_data cannot be set to new value as the keyring file cannot be created/accessed in the provided path

ER_KEYRING_FAILED_TO_SET_KEYRING_FILE_DATA was added in 8.0.11.

- **Error number:** MY-011370; **Symbol:** ER_KEYRING_FILE_IO_ERROR; **SQLSTATE:** HY000
  Message: %s

ER_KEYRING_FILE_IO_ERROR was added in 8.0.11.

- **Error number:** MY-011371; **Symbol:** ER_KEYRING_FAILED_TO_LOAD_KEYRING_CONTENT; **SQLSTATE:** HY000
  Message: Error while loading keyring content. The keyring might be malformed

ER_KEYRING_FAILED_TO_LOAD_KEYRING_CONTENT was added in 8.0.11.

- **Error number:** MY-011372; **Symbol:** ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING; **SQLSTATE:** HY000
  Message: Could not flush keys to keyring

ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING was added in 8.0.11.

- **Error number:** MY-011373; **Symbol:** ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING_BACKUP; **SQLSTATE:** HY000
  Message: Could not flush keys to keyring's backup

ER_KEYRING_FAILED_TO_FLUSH_KEYS_TO_KEYRING_BACKUP was added in 8.0.11.

- **Error number:** MY-011374; **Symbol:** ER_KEYRING_KEY_FETCH_FAILED_DUE_TO_EMPTY_KEY_ID; **SQLSTATE:** HY000
Message: Error while fetching key: key_id cannot be empty

ER_KEYRING_KEY_FETCH_FAILED_DUE_TO_EMPTY_KEY_ID was added in 8.0.11.

- Error number: MY-011375; Symbol: ER_KEYRING_FAILED_TO_REMOVE_KEY_DUE_TO_EMPTY_ID;
  SQLSTATE: HY000

Message: Error while removing key: key_id cannot be empty

ER_KEYRING_FAILED_TO_REMOVE_KEY_DUE_TO_EMPTY_ID was added in 8.0.11.

- Error number: MY-011376; Symbol: ER_KEYRING_OKV_INCORRECT_KEY_VAULT_CONFIGURED;
  SQLSTATE: HY000

Message: For keyring_okv to be initialized, please point keyring_okv_conf_dir variable to a directory with Oracle Key Vault configuration file and ssl materials

ER_KEYRING_OKV_INCORRECT_KEY_VAULT_CONFIGURED was added in 8.0.11.

- Error number: MY-011377; Symbol: ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INCORRECT_CONF;
  SQLSTATE: HY000

Message: keyring_okv initialization failure. Please check that the keyring_okv_conf_dir points to a readable directory and that the directory contains Oracle Key Vault configuration file and ssl materials. Please also check that Oracle Key Vault is up and running.

ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INCORRECT_CONF was added in 8.0.11.

- Error number: MY-011378; Symbol: ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INTERNAL_ERROR;
  SQLSTATE: HY000

Message: keyring_okv initialization failure due to internal exception inside the plugin

ER_KEYRING_OKV_INIT_FAILED_DUE_TO_INTERNAL_ERROR was added in 8.0.11.

- Error number: MY-011379; Symbol: ER_KEYRING_OKV_INVALID_KEY_TYPE;
  SQLSTATE: HY000

Message: Invalid key type

ER_KEYRING_OKV_INVALID_KEY_TYPE was added in 8.0.11.

- Error number: MY-011380; Symbol: ER_KEYRING_OKV_INVALID_KEY_LENGTH_FOR_CIPHER;
  SQLSTATE: HY000

Message: Invalid key length for given block cipher

ER_KEYRING_OKV_INVALID_KEY_LENGTH_FOR_CIPHER was added in 8.0.11.

- Error number: MY-011381; Symbol:
  ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY_DUE_TO_INTERNAL_ERROR;
  SQLSTATE: HY000

Message: Failed to generate a key due to internal exception inside keyring_okv plugin

ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY_DUE_TO_INTERNAL_ERROR was added in 8.0.11.

- Error number: MY-011382; Symbol:
  ER_KEYRING_OKV_FAILED_TO_FIND_SERVER_ENTRY;
  SQLSTATE: HY000
Message: Could not find entry for server in configuration file %s

ER_KEYRING_OKV_FAILED_TO_FIND_SERVER_ENTRY was added in 8.0.11.

- Error number: MY-011383; Symbol:
  ER_KEYRING_OKV_FAILED_TO_FIND_SERVER_ENTRY; SQLSTATE: HY000

Message: Could not find entry for standby server in configuration file %s

ER_KEYRING_OKV_FAILED_TO_FIND_STANDBY_SERVER_ENTRY was added in 8.0.11.

- Error number: MY-011384; Symbol: ER_KEYRING_OKV_FAILED_TO_PARSE_CONF_FILE;
  SQLSTATE: HY000

Message: Could not parse the %s file provided

ER_KEYRING_OKV_FAILED_TO_PARSE_CONF_FILE was added in 8.0.11.

- Error number: MY-011385; Symbol: ER_KEYRING_OKV_FAILED_TO_LOAD_KEY_UID;
  SQLSTATE: HY000

Message: Could not load keys' uids from the OKV server

ER_KEYRING_OKV_FAILED_TO_LOAD_KEY_UID was added in 8.0.11.

- Error number: MY-011386; Symbol: ER_KEYRING_OKV_FAILED_TO_INIT_SSL_LAYER;
  SQLSTATE: HY000

Message: Could not initialize ssl layer

ER_KEYRING_OKV_FAILED_TO_INIT_SSL_LAYER was added in 8.0.11.

- Error number: MY-011387; Symbol: ER_KEYRING_OKV_FAILED_TO_INIT_CLIENT;
  SQLSTATE: HY000

Message: Could not initialize OKV client

ER_KEYRING_OKV_FAILED_TO_INIT_CLIENT was added in 8.0.11.

- Error number: MY-011388; Symbol: ER_KEYRING_OKV_CONNECTION_TO_SERVER_FAILED;
  SQLSTATE: HY000

Message: Could not connect to the OKV server

ER_KEYRING_OKV_CONNECTION_TO_SERVER_FAILED was added in 8.0.11.

- Error number: MY-011389; Symbol: ER_KEYRING_OKV_FAILED_TO_REMOVE_KEY;
  SQLSTATE: HY000

Message: Could not remove the key

ER_KEYRING_OKV_FAILED_TO_REMOVE_KEY was added in 8.0.11.
• Error number: MY-011390; Symbol: ER_KEYRING_OKV_FAILED_TO_ADD_ATTRIBUTE; SQLSTATE: HY000

Message: Could not add attribute, attribute_name=%s attribute value=%s

ER_KEYRING_OKV_FAILED_TO_ADD_ATTRIBUTE was added in 8.0.11.

• Error number: MY-011391; Symbol: ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY; SQLSTATE: HY000

Message: Could not generate the key.

ER_KEYRING_OKV_FAILED_TO_GENERATE_KEY was added in 8.0.11.

• Error number: MY-011392; Symbol: ER_KEYRING_OKV_FAILED_TO_STORE_KEY; SQLSTATE: HY000

Message: Could not store the key.

ER_KEYRING_OKV_FAILED_TO_STORE_KEY was added in 8.0.11.

• Error number: MY-011393; Symbol: ER_KEYRING_OKV_FAILED_TO_ACTIVATE_KEYS; SQLSTATE: HY000

Message: Could not activate the key.

ER_KEYRING_OKV_FAILED_TO_ACTIVATE_KEYS was added in 8.0.11.

• Error number: MY-011394; Symbol: ER_KEYRING_OKV_FAILED_TO_FETCH_KEY; SQLSTATE: HY000

Message: Could not fetch generated key

ER_KEYRING_OKV_FAILED_TO_FETCH_KEY was added in 8.0.11.

• Error number: MY-011395; Symbol: ER_KEYRING_OKV_FAILED_TO_STORE_OR_GENERATE_KEY; SQLSTATE: HY000

Message: Could not store/generate the key - failed to set key attribute x-key-ready

ER_KEYRING_OKV_FAILED_TO_STORE_OR_GENERATE_KEY was added in 8.0.11.

• Error number: MY-011396; Symbol: ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY_SIGNATURE; SQLSTATE: HY000

Message: Could not retrieve key signature from custom attributes

ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY_SIGNATURE was added in 8.0.11.

• Error number: MY-011397; Symbol: ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY; SQLSTATE: HY000

Message: Could not retrieve key from OKV

ER_KEYRING_OKV_FAILED_TO_RETRIEVE_KEY was added in 8.0.11.

• Error number: MY-011398; Symbol: ER_KEYRING_OKV_FAILED_TO_LOAD_SSL_TRUST_STORE; SQLSTATE: HY000
Message: Error loading trust store

ER_KEYRING_OKV_FAILED_TO_LOAD_SSL_TRUST_STORE was added in 8.0.11.

- Error number: MY-011399; Symbol: ER_KEYRING_OKV_FAILED_TO_SET_CERTIFICATE_FILE; SQLSTATE: HY000

Message: Error setting the certificate file.

ER_KEYRING_OKV_FAILED_TO_SET_CERTIFICATE_FILE was added in 8.0.11.

- Error number: MY-011400; Symbol: ER_KEYRING_OKV_FAILED_TO_SET_KEY_FILE; SQLSTATE: HY000

Message: Error setting the key file.

ER_KEYRING_OKV_FAILED_TO_SET_KEY_FILE was added in 8.0.11.

- Error number: MY-011401; Symbol: ER_KEYRING_OKV_KEY_MISMATCH; SQLSTATE: HY000

Message: Private key does not match the certificate public key

ER_KEYRING_OKV_KEY_MISMATCH was added in 8.0.11.

- Error number: MY-011402; Symbol: ER_KEYRING_ENCRYPTED_FILE_INCORRECT_KEYRING_FILE; SQLSTATE: HY000

Message: Incorrect Keyring file

ER_KEYRING_ENCRYPTED_FILE_INCORRECT_KEYRING_FILE was added in 8.0.11.

- Error number: MY-011403; Symbol: ER_KEYRING_ENCRYPTED_FILE_DECRYPTION_FAILED; SQLSTATE: HY000

ER_KEYRING_ENCRYPTED_FILE_DECRYPTION_FAILED was added in 8.0.11.

- Error number: MY-011404; Symbol: ER_KEYRING_ENCRYPTED_FILE_FOUND_MALFORMED_BACKUP_FILE; SQLSTATE: HY000

Message: Found malformed keyring backup file - removing it

ER_KEYRING_ENCRYPTED_FILE_FOUND_MALFORMED_BACKUP_FILE was added in 8.0.11.

- Error number: MY-011405; Symbol: ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_RESTORE_KEYRING; SQLSTATE: HY000

Message: Error while restoring keyring from backup file cannot overwrite keyring with backup

ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_RESTORE_KEYRING was added in 8.0.11.
• Error number: MY-011406; Symbol:
  ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_FLUSH_KEYRING; SQLSTATE: HY000
  Message: Error while flushing in-memory keyring into keyring file
  ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_FLUSH_KEYRING was added in 8.0.11.

• Error number: MY-011407; Symbol: ER_KEYRING_ENCRYPTED_FILE_ENCRYPTION_FAILED;
  SQLSTATE: HY000
  Message: Keyring_encrypted_file encryption failed. Please verify --keyring-encrypted-file-password
  option value.
  ER_KEYRING_ENCRYPTED_FILE_ENCRYPTION_FAILED was added in 8.0.11.

• Error number: MY-011408; Symbol: ER_KEYRING_ENCRYPTED_FILE_INVALID_KEYRING_DIR;
  SQLSTATE: HY000
  Message: keyring_encrypted_file_data cannot be set to new value as the keyring file cannot be created/
  accessed in the provided path
  ER_KEYRING_ENCRYPTED_FILE_INVALID_KEYRING_DIR was added in 8.0.11.

• Error number: MY-011409; Symbol:
  ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_CREATE_KEYRING_DIR; SQLSTATE: HY000
  Message: Could not create keyring directory The keyring_encrypted_file will stay unusable until correct
  path to the keyring directory gets provided
  ER_KEYRING_ENCRYPTED_FILE_FAILED_TO_CREATE_KEYRING_DIR was added in 8.0.11.

• Error number: MY-011410; Symbol: ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_INVALID;
  SQLSTATE: HY000
  Message: The keyring_encrypted_file_password must be set to a valid value.
  ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_INVALID was added in 8.0.11.

• Error number: MY-011411; Symbol: ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_TOO_LONG;
  SQLSTATE: HY000
  Message: Too long keyring_encrypted_file_password value.
  ER_KEYRING_ENCRYPTED_FILE_PASSWORD_IS_TOO_LONG was added in 8.0.11.

• Error number: MY-011412; Symbol: ER_KEYRING_ENCRYPTED_FILE_INIT_FAILURE; SQLSTATE: HY000
  Message: keyring_encrypted_file initialization failure. Please check if the keyring_encrypted_file_data
  points to readable keyring file or keyring file can be created in the specified location or password to
  decrypt keyring file is correct.
  ER_KEYRING_ENCRYPTED_FILE_INIT_FAILURE was added in 8.0.11.

• Error number: MY-011413; Symbol:
  ER_KEYRING_ENCRYPTED_FILE_INIT_FAILED_DUE_TO_INTERNAL_ERROR; SQLSTATE: HY000
  Message: keyring_encrypted_file initialization failure due to internal exception inside the plugin
ER_KEYRING_ENCRYPTED_FILE_INIT_FAILED_DUE_TO_INTERNAL_ERROR was added in 8.0.11.

- Error number: MY-011414; Symbol: ER_KEYRING_ENCRYPTED_FILE_GEN_KEY_FAILED_DUE_TO_INTERNAL_ERROR; SQLSTATE: HY000
  
  Message: Failed to generate a key due to internal exception inside keyring_encrypted_file plugin

ER_KEYRING_ENCRYPTED_FILE_GEN_KEY_FAILED_DUE_TO_INTERNAL_ERROR was added in 8.0.11.

- Error number: MY-011415; Symbol: ER_KEYRING_AWS_FAILED_TO_SET_CMK_ID; SQLSTATE: HY000
  
  Message: keyring_aws_cmk_id cannot be set to the new value as AWS KMS seems to not understand the id provided. Please check that CMK id provided is correct.

ER_KEYRING_AWS_FAILED_TO_SET_CMK_ID was added in 8.0.11.

- Error number: MY-011416; Symbol: ER_KEYRING_AWS_FAILED_TO_SET_REGION; SQLSTATE: HY000
  
  Message: keyring_aws_region cannot be set to the new value as AWS KMS seems to not understand the region provided. Please check that region provided is correct.

ER_KEYRING_AWS_FAILED_TO_SET_REGION was added in 8.0.11.

- Error number: MY-011417; Symbol: ER_KEYRING_AWS_FAILED_TO_OPEN_CONF_FILE; SQLSTATE: HY000
  
  Message: Could not open keyring_aws configuration file: %s. OS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_OPEN_CONF_FILE was added in 8.0.11.

- Error number: MY-011418; Symbol: ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_ID_FROM_CONF_FILE; SQLSTATE: HY000
  
  Message: Could not read AWS access key id from keyring_aws configuration file: %s. OS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_ID_FROM_CONF_FILE was added in 8.0.11.

- Error number: MY-011419; Symbol: ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_FROM_CONF_FILE; SQLSTATE: HY000
  
  Message: Could not read AWS access key from keyring_aws configuration file: %s. OS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_ACCESS_KEY_FROM_CONF_FILE was added in 8.0.11.

- Error number: MY-011420; Symbol: ER_KEYRING_AWS_INVALID_CONF_FILE_PATH; SQLSTATE: HY000
  
  Message: Path to keyring aws configuration file cannot be empty

ER_KEYRING_AWS_INVALID_CONF_FILE_PATH was added in 8.0.11.
• Error number: MY-011421; Symbol: ER_KEYRING_AWS_INVALID_DATA_FILE_PATH; SQLSTATE: HY000
Message: Path to keyring_aws storage file cannot be empty.
ER_KEYRING_AWS_INVALID_DATA_FILE_PATH was added in 8.0.11.

• Error number: MY-011422; Symbol: ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DIR; SQLSTATE: HY000
Message: Unable to create/access keyring directory.
ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DIR was added in 8.0.11.

• Error number: MY-011423; Symbol: ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DATA_FILE; SQLSTATE: HY000
Message: Unable to create/access keyring_aws storage file. Please check if keyring_aws_data_file points to location where keyring file can be created/accessed. Please also make sure that MySQL server's user has high enough privileges to access this location.
ER_KEYRING_AWS_FAILED_TO_ACCESS_OR_CREATE_KEYRING_DATA_FILE was added in 8.0.11.

• Error number: MY-011424; Symbol: ER_KEYRING_AWS_FAILED_TO_INIT_DUE_TO_INTERNAL_ERROR; SQLSTATE: HY000
Message: keyring_aws initialization failed due to internal error when initializing synchronization primitive - %s. OS returned this error: %s:
ER_KEYRING_AWS_FAILED_TO_INIT_DUE_TO_INTERNAL_ERROR was added in 8.0.11.

• Error number: MY-011425; Symbol: ER_KEYRING_AWS_FAILED_TO_GET_KMS_CREDENTIAL_FROM_CONF_FILE; SQLSTATE: HY000
Message: Could not get AWS KMS credentials from the configuration file
ER_KEYRING_AWS_FAILED_TO_GET_KMS_CREDENTIAL_FROM_CONF_FILE was added in 8.0.11.

• Error number: MY-011426; Symbol: ER_KEYRING_AWS_CMK_ID_NOT_SET; SQLSTATE: HY000
Message: keyring_aws_cmk_id has to be set
ER_KEYRING_AWS_CMK_ID_NOT_SET was added in 8.0.11.

• Error number: MY-011427; Symbol: ER_KEYRING_AWS_INIT_FAILURE; SQLSTATE: HY000
Message: keyring_aws initialization failure.
ER_KEYRING_AWS_INIT_FAILURE was added in 8.0.11.
• Error number: MY-011429; Symbol: ER_KEYRING_AWS_FAILED_TO_INIT_DUE_TO_PLUGIN_INTERNAL_ERROR; SQLSTATE: HY000
Message: keyring_aws initialization failure due to internal exception inside the plugin
ER_KEYRING_AWS_FAILED_TO_INIT_DUE_TO_PLUGIN_INTERNAL_ERROR was added in 8.0.11.

• Error number: MY-011430; Symbol: ER_KEYRING_AWS_INVALID_KEY_LENGTH_FOR_CIPHER; SQLSTATE: HY000
Message: Invalid key length for given block cipher
ER_KEYRING_AWS_INVALID_KEY_LENGTH_FOR_CIPHER was added in 8.0.11.

• Error number: MY-011431; Symbol: ER_KEYRING_AWS_FAILED_TO_GENERATE_KEY_DUE_TO_INTERNAL_ERROR; SQLSTATE: HY000
Message: Failed to generate a key due to internal exception inside keyring_file plugin
ER_KEYRING_AWS_FAILED_TO_GENERATE_KEY_DUE_TO_INTERNAL_ERROR was added in 8.0.11.

• Error number: MY-011432; Symbol: ER_KEYRING_AWS_INCORRECT_FILE; SQLSTATE: HY000
Message: Incorrect Keyring file
ER_KEYRING_AWS_INCORRECT_FILE was added in 8.0.11.

• Error number: MY-011433; Symbol: ER_KEYRING_AWS_FOUND_MALFORMED_BACKUP_FILE; SQLSTATE: HY000
Message: Found malformed keyring backup file - removing it
ER_KEYRING_AWS_FOUND_MALFORMED_BACKUP_FILE was added in 8.0.11.

• Error number: MY-011434; Symbol: ER_KEYRING_AWS_FAILED_TO_RESTORE_FROM_BACKUP_FILE; SQLSTATE: HY000
Message: Error while restoring keyring from backup file cannot overwrite keyring with backup
ER_KEYRING_AWS_FAILED_TO_RESTORE_FROM_BACKUP_FILE was added in 8.0.11.

• Error number: MY-011435; Symbol: ER_KEYRING_AWS_FAILED_TO_FLUSH_KEYRING_TO_FILE; SQLSTATE: HY000
Message: Error while flushing in-memory keyring into keyring file
ER_KEYRING_AWS_FAILED_TO_FLUSH_KEYRING_TO_FILE was added in 8.0.11.

• Error number: MY-011436; Symbol: ER_KEYRING_AWS_INCORRECT_REGION; SQLSTATE: HY000
Message: Wrong region
ER_KEYRING_AWS_INCORRECT_REGION was added in 8.0.11.

• Error number: MY-011437; Symbol: ER_KEYRING_AWS_FAILED_TO_CONNECT_KMS; SQLSTATE: HY000
Message: Could not connect to AWS KMS with the credentials provided. Please make sure they are correct. AWS KMS returned this error: %s
ER_KEYRING_AWS_FAILED_TO_CONNECT_KMS was added in 8.0.11.

- Error number: MY-011438; Symbol: ER_KEYRING_AWS_FAILED_TO_GENERATE_NEW_KEY; SQLSTATE: HY000
  
  Message: Could not generate a new key. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_GENERATE_NEW_KEY was added in 8.0.11.

- Error number: MY-011439; Symbol: ER_KEYRING_AWS_FAILED_TO_ENCRYPT_KEY; SQLSTATE: HY000
  
  Message: Could not encrypt key. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_ENCRYPT_KEY was added in 8.0.11.

- Error number: MY-011440; Symbol: ER_KEYRING_AWS_FAILED_TO_RE_ENCRYPT_KEY; SQLSTATE: HY000
  
  Message: Could not re-encrypt key. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_RE_ENCRYPT_KEY was added in 8.0.11.

- Error number: MY-011441; Symbol: ER_KEYRING_AWS_FAILED_TO_DECRYPT_KEY; SQLSTATE: HY000
  
  Message: Could not decrypt key. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_DECRYPT_KEY was added in 8.0.11.

- Error number: MY-011442; Symbol: ER_KEYRING_AWS_FAILED_TO_ROTATE_CMK; SQLSTATE: HY000
  
  Message: Could not rotate the CMK. AWS KMS returned this error: %s

ER_KEYRING_AWS_FAILED_TO_ROTATE_CMK was added in 8.0.11.

- Error number: MY-011443; Symbol: ER_GRP_RPL_GTID_ALREADY_USED; SQLSTATE: HY000
  
  Message: The requested GTID '%s:%lld' was already used, the transaction will rollback.

ER_GRP_RPL_GTID_ALREADY_USED was added in 8.0.11.

- Error number: MY-011444; Symbol: ER_GRP_RPL_APPLIER_THD_KILLED; SQLSTATE: HY000
  
  Message: The group replication applier thread was killed.

ER_GRP_RPL_APPLIER_THD_KILLED was added in 8.0.11.

- Error number: MY-011445; Symbol: ER_GRP_RPL_EVENT_HANDLING_ERROR; SQLSTATE: HY000
  
  Message: Error at event handling! Got error: %d.

ER_GRP_RPL_EVENT_HANDLING_ERROR was added in 8.0.11.
• Error number: MY-011446; Symbol: ER_GRP_RPL_ERROR_GTID_EXECUTION_INFO; SQLSTATE: HY000
Message: Error when extracting group GTID execution information, some recovery operations may face future issues.
ER_GRP_RPL_ERROR_GTID_EXECUTION_INFO was added in 8.0.11.

• Error number: MY-011447; Symbol: ER_GRP_RPL_CERTIFICATE_SIZE_ERROR; SQLSTATE: HY000
Message: An error occurred when trying to reduce the Certification information size for transmission.
ER_GRP_RPL_CERTIFICATE_SIZE_ERROR was added in 8.0.11.

• Error number: MY-011448; Symbol: ER_GRP_RPL_CREATE_APPLIER_CACHE_ERROR; SQLSTATE: HY000
Message: Failed to create group replication pipeline applier cache!
ER_GRP_RPL_CREATE_APPLIER_CACHE_ERROR was added in 8.0.11.

• Error number: MY-011449; Symbol: ER_GRP_RPL_UNBLOCK_WAITING_THD; SQLSTATE: HY000
Message: Unblocking the group replication thread waiting for applier to start, as the start group replication was killed.
ER_GRP_RPL_UNBLOCK_WAITING_THD was added in 8.0.11.

• Error number: MY-011450; Symbol: ER_GRP_RPL_APPLIER_PIPELINE_NOT_DISPOSED; SQLSTATE: HY000
Message: The group replication applier pipeline was not properly disposed. Check the error log for further info.
ER_GRP_RPL_APPLIER_PIPELINE_NOT_DISPOSED was added in 8.0.11.

• Error number: MY-011451; Symbol: ER_GRP_RPL_APPLIER_THD_EXECUTION_ABORTED; SQLSTATE: HY000
Message: The applier thread execution was aborted. Unable to process more transactions, this member will now leave the group.
ER_GRP_RPL_APPLIER_THD_EXECUTION_ABORTED was added in 8.0.11.

• Error number: MY-011452; Symbol: ER_GRP_RPL_APPLIER_EXECUTION_FATAL_ERROR; SQLSTATE: HY000
Message: Fatal error during execution on the Applier process of Group Replication. The server will now leave the group.
ER_GRP_RPL_APPLIER_EXECUTION_FATAL_ERROR was added in 8.0.11.

• Error number: MY-011453; Symbol: ER_GRP_RPL_ERROR_STOPPING_CHANNELS; SQLSTATE: HY000
Message: Error stopping all replication channels while server was leaving the group. %s
ER_GRP_RPL_ERROR_STOPPING_CHANNELS was added in 8.0.11.
Server Error Message Reference

- **Error number:** MY-011454; **Symbol:** ER_GRP_RPL_ERROR_SENDING_SINGLE_PRIMARY_MSSG; **SQLSTATE:** HY000
  
  Message: Error sending single primary message informing that primary did apply relay logs.
  
  ER_GRP_RPL_ERROR_SENDING_SINGLE_PRIMARY_MSSG was added in 8.0.11.

- **Error number:** MY-011455; **Symbol:** ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_VER_ERROR; **SQLSTATE:** HY000
  
  Message: Error updating transaction snapshot version after transaction being positively certified.
  
  ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_VER_ERROR was added in 8.0.11.

- **Error number:** MY-011456; **Symbol:** ER_GRP_RPL_SIDNO_FETCH_ERROR; **SQLSTATE:** HY000
  
  Message: Error fetching transaction sidno after transaction being positively certified.
  
  ER_GRP_RPL_SIDNO_FETCH_ERROR was added in 8.0.11.

- **Error number:** MY-011457; **Symbol:** ER_GRP_RPL_BROADCAST_COMMIT_TRANS_MSSG_FAILED; **SQLSTATE:** HY000
  
  Message: Broadcast of committed transactions message failed.
  
  ER_GRP_RPL_BROADCAST_COMMIT_TRANS_MSSG_FAILED was added in 8.0.11.

- **Error number:** MY-011458; **Symbol:** ER_GRP_RPL_GROUP_NAME_PARSE_ERROR; **SQLSTATE:** HY000
  
  Message: Unable to parse the group name during the Certification module initialization.
  
  ER_GRP_RPL_GROUP_NAME_PARSE_ERROR was added in 8.0.11.

- **Error number:** MY-011459; **Symbol:** ER_GRP_RPL_ADD_GRPSID_TO_GRPGTIDSID_MAP_ERROR; **SQLSTATE:** HY000
  
  Message: Unable to add the group_sid in the group_gtid_sid_map during the Certification module initialization.
  
  ER_GRP_RPL_ADD_GRPSID_TO_GRPGTIDSID_MAP_ERROR was added in 8.0.11.

- **Error number:** MY-011460; **Symbol:** ER_GRP_RPL_UPDATE_GRPGTID_EXECUTED_ERROR; **SQLSTATE:** HY000
  
  Message: Error updating group_gtid_executed GITD set during the Certification module initialization.
  
  ER_GRP_RPL_UPDATE_GRPGTID_EXECUTED_ERROR was added in 8.0.11.

- **Error number:** MY-011461; **Symbol:** ER_GRP_RPL_DONOR_TRANS_INFO_ERROR; **SQLSTATE:** HY000
  
  Message: Unable to handle the donor's transaction information when initializing the conflict detection component. Possible out of memory error.
  
  ER_GRP_RPL_DONOR_TRANS_INFO_ERROR was added in 8.0.11.
• Error number: MY-011462; Symbol: ER_GRP_RPL_SERVER_CONN_ERROR; SQLSTATE: HY000
Message: Error when establishing a server connection during the Certification module initialization.
  ER_GRP_RPL_SERVER_CONN_ERROR was added in 8.0.11.

• Error number: MY-011463; Symbol: ER_GRP_RPL_ERROR_FETCHING_GTID_EXECUTED_SET; SQLSTATE: HY000
Message: Error when extracting this member GTID executed set. Certification module can't be properly initialized.
  ER_GRP_RPL_ERROR_FETCHING_GTID_EXECUTED_SET was added in 8.0.11.

• Error number: MY-011464; Symbol: ER_GRP_RPL_ADD_GTID_TO_GRP_GTID_EXECUTED_ERROR; SQLSTATE: HY000
Message: Error while adding the server GTID EXECUTED set to the group_gtid_execute during the Certification module initialization.
  ER_GRP_RPL_ADD_GTID_TO_GRP_GTID_EXECUTED_ERROR was added in 8.0.11.

• Error number: MY-011465; Symbol: ER_GRP_RPL_ERROR_FETCHING_GTID_SET; SQLSTATE: HY000
Message: Error when extracting this member retrieved set for its applier. Certification module can't be properly initialized.
  ER_GRP_RPL_ERROR_FETCHING_GTID_SET was added in 8.0.11.

• Error number: MY-011466; Symbol: ER_GRP_RPL_ADD_RETRIEVED_SET_TO_GRP_GTID_EXECUTED_ERROR; SQLSTATE: HY000
Message: Error while adding the member retrieved set to the group_gtid_executed during the Certification module initialization.
  ER_GRP_RPL_ADD_RETRIEVED_SET_TO_GRP_GTID_EXECUTED_ERROR was added in 8.0.11.

• Error number: MY-011467; Symbol: ER_GRP_RPL_CERTIFICATION_INITIALIZATION_FAILURE; SQLSTATE: HY000
Message: Error during Certification module initialization.
  ER_GRP_RPL_CERTIFICATION_INITIALIZATION_FAILURE was added in 8.0.11.

• Error number: MY-011468; Symbol: ER_GRP_RPL_UPDATE_LAST_CONFLICT_FREE_TRANS_ERROR; SQLSTATE: HY000
Message: Unable to update last conflict free transaction, this transaction will not be tracked on performance_schema.replication_group_member_stats.last_conflict_free_transaction.
  ER_GRP_RPL_UPDATE_LAST_CONFLICT_FREE_TRANS_ERROR was added in 8.0.11.

• Error number: MY-011469; Symbol: ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_REF_VER_ERROR; SQLSTATE: HY000
Message: Error updating transaction snapshot version reference for internal storage.
  ER_GRP_RPL_UPDATE_TRANS_SNAPSHOT_REF_VER_ERROR was added in 8.0.11.
• Error number: MY-011470; Symbol: ER_GRP_RPL_FETCH_TRANS_SIDNO_ERROR; SQLSTATE: HY000
  Message: Error fetching transaction sidno while adding to the group_gtid_executed set.
  ER_GRP_RPL_FETCH_TRANS_SIDNO_ERROR was added in 8.0.11.

• Error number: MY-011471; Symbol: ER_GRP_RPL_ERROR_VERIFYING_SIDNO; SQLSTATE: HY000
  Message: Error while ensuring the sidno be present in the group_gtid_executed.
  ER_GRP_RPL_ERROR_VERIFYING_SIDNO was added in 8.0.11.

• Error number: MY-011472; Symbol: ER_GRP_RPL_CANT_GENERATE_GTID; SQLSTATE: HY000
  Message: Impossible to generate Global Transaction Identifier: the integer component reached the maximal value. Restart the group with a new group_replication_group_name.
  ER_GRP_RPL_CANT_GENERATE_GTID was added in 8.0.11.

• Error number: MY-011473; Symbol: ER_GRP_RPL_INVALID_GTID_SET; SQLSTATE: HY000
  Message: Invalid stable transactions set.
  ER_GRP_RPL_INVALID_GTID_SET was added in 8.0.11.

• Error number: MY-011474; Symbol: ER_GRP_RPL_UPDATE_GTID_SET_ERROR; SQLSTATE: HY000
  Message: Error updating stable transactions set.
  ER_GRP_RPL_UPDATE_GTID_SET_ERROR was added in 8.0.11.

• Error number: MY-011475; Symbol: ER_GRP_RPL_RECEIVED_SET_MISSING_GTIDS; SQLSTATE: HY000
  Message: There was an error when filling the missing GTIDs on the applier channel received set. Despite not critical, on the long run this may cause performance issues.
  ER_GRP_RPL_RECEIVED_SET_MISSING_GTIDS was added in 8.0.11.

• Error number: MY-011476; Symbol: ER_GRP_RPL_SKIP_COMPUTATION_TRANS_COMMITTED; SQLSTATE: HY000
  Message: Skipping the computation of the Transactions_committed_all_members field as an older instance of this computation is still ongoing.
  ER_GRP_RPL_SKIP_COMPUTATION_TRANS_COMMITTED was added in 8.0.11.

• Error number: MY-011477; Symbol: ER_GRP_RPL_NULL_PACKET; SQLSTATE: HY000
  Message: Null packet on certifier's queue.
  ER_GRP_RPL_NULL_PACKET was added in 8.0.11.

• Error number: MY-011478; Symbol: ER_GRP_RPL_CANT_READ_GTID; SQLSTATE: HY000
  Message: Error reading GTIDs from the message.
  ER_GRP_RPL_CANT_READ_GTID was added in 8.0.11.
• Error number: MY-011479; Symbol: ER_GRP_RPL_PROCESS_GTID_SET_ERROR; SQLSTATE: HY000
Message: Error processing stable transactions set.
ER_GRP_RPL_PROCESS_GTID_SET_ERROR was added in 8.0.11.

• Error number: MY-011480; Symbol: ER_GRP_RPL_PROCESS_INTERSECTION_GTID_SET_ERROR; SQLSTATE: HY000
Message: Error processing intersection of stable transactions set.
ER_GRP_RPL_PROCESS_INTERSECTION_GTID_SET_ERROR was added in 8.0.11.

• Error number: MY-011481; Symbol: ER_GRP_RPL_SET_STABLE_TRANS_ERROR; SQLSTATE: HY000
Message: Error setting stable transactions set.
ER_GRP_RPL_SET_STABLE_TRANS_ERROR was added in 8.0.11.

• Error number: MY-011482; Symbol: ER_GRP_RPL_CANT_READ_GRP_GTID_EXTRACTED; SQLSTATE: HY000
Message: Error reading group_gtid_extracted from the View_change_log_event.
ER_GRP_RPL_CANT_READ_GRP_GTID_EXTRACTED was added in 8.0.11.

• Error number: MY-011483; Symbol: ER_GRP_RPL_CANT_READ_WRITE_SET_ITEM; SQLSTATE: HY000
Message: Error reading the write set item ‘%s’ from the View_change_log_event.
ER_GRP_RPL_CANT_READ_WRITE_SET_ITEM was added in 8.0.11.

• Error number: MY-011484; Symbol: ER_GRP_RPL_INIT_CERTIFICATION_INFO_FAILURE; SQLSTATE: HY000
Message: Error during certification_info initialization.
ER_GRP_RPL_INIT_CERTIFICATION_INFO_FAILURE was added in 8.0.11.

• Error number: MY-011485; Symbol: ER_GRP_RPL_CONFLICT_DETECTION_DISABLED; SQLSTATE: HY000
Message: Primary had applied all relay logs, disabled conflict detection.
ER_GRP_RPL_CONFLICT_DETECTION_DISABLED was added in 8.0.11.

• Error number: MY-011486; Symbol: ER_GRP_RPL_MSG_DISCARDED; SQLSTATE: HY000
Message: Message received while the plugin is not ready, message discarded.
ER_GRP_RPL_MSG_DISCARDED was added in 8.0.11.

• Error number: MY-011487; Symbol: ER_GRP_RPL_MISSING_GRP_RPL_APPLIER; SQLSTATE: HY000
Message: Message received without a proper group replication applier.
ER_GRP_RPL_MISSING_GRP_RPL_APPLIER was added in 8.0.11.

</table>
ER_GRP_RPL_SRV_BLOCKED_FOR_SECS was added in 8.0.11.

- **Error number:** MY-011497; Symbol: ER_GRP_RPL_CHANGE_GRP_MEM_NOT_PROCESSED; SQLSTATE: HY000
  
  Message: A group membership change was received but the plugin is already leaving due to the configured timeout on group_replication_unreachable_majority_timeout option.

ER_GRP_RPL_CHANGE_GRP_MEM_NOT_PROCESSED was added in 8.0.11.

- **Error number:** MY-011498; Symbol: ER_GRP_RPL_MEMBER_CONTACT_RESTORED; SQLSTATE: HY000

  Message: The member has resumed contact with a majority of the members in the group. Regular operation is restored and transactions are unblocked.

ER_GRP_RPL_MEMBER_CONTACT_RESTORED was added in 8.0.11.

- **Error number:** MY-011499; Symbol: ER_GRP_RPL_MEMBER_REMOVED; SQLSTATE: HY000

  Message: Members removed from the group: %s

ER_GRP_RPL_MEMBER_REMOVED was added in 8.0.11.

- **Error number:** MY-011500; Symbol: ER_GRP_RPL_PRIMARY_MEMBER_LEFT_GRP; SQLSTATE: HY000

  Message: Primary server with address %s left the group. Electing new Primary.

ER_GRP_RPL_PRIMARY_MEMBER_LEFT_GRP was added in 8.0.11.

- **Error number:** MY-011501; Symbol: ER_GRP_RPL_MEMBER_ADDED; SQLSTATE: HY000

  Message: Members joined the group: %s

ER_GRP_RPL_MEMBER_ADDED was added in 8.0.11.

- **Error number:** MY-011502; Symbol: ER_GRP_RPL_MEMBER_EXIT_PLUGIN_ERROR; SQLSTATE: HY000

  Message: There was a previous plugin error while the member joined the group. The member will now exit the group.

ER_GRP_RPL_MEMBER_EXIT_PLUGIN_ERROR was added in 8.0.11.

- **Error number:** MY-011503; Symbol: ER_GRP_RPL_MEMBER_CHANGE; SQLSTATE: HY000

  Message: Group membership changed to %s on view %s.

ER_GRP_RPL_MEMBER_CHANGE was added in 8.0.11.

- **Error number:** MY-011504; Symbol: ER_GRP_RPL_MEMBER_LEFT_GRP; SQLSTATE: HY000

  Message: Group membership changed: This member has left the group.

ER_GRP_RPL_MEMBER_LEFT_GRP was added in 8.0.11.

- **Error number:** MY-011505; Symbol: ER_GRP_RPL_MEMBER_EXPELLED; SQLSTATE: HY000
Message: Member was expelled from the group due to network failures, changing member status to ERROR.

**ER_GRP_RPL_MEMBER_EXPelled** was added in 8.0.11.

- Error number: **MY-011506**; Symbol: **ER_GRP_RPL_SESSION_OPEN_FAILED**; SQLSTATE: **HY000**
  
  Message: Unable to open session to (re)set read only mode. Skipping.

**ER_GRP_RPL_SESSION_OPEN_FAILED** was added in 8.0.11.

- Error number: **MY-011507**; Symbol: **ER_GRP_RPL_NEW_PRIMARY_ELECTED**; SQLSTATE: **HY000**
  
  Message: A new primary with address %s:%u was elected. %s

**ER_GRP_RPL_NEW_PRIMARY_ELECTED** was added in 8.0.11.

- Error number: **MY-011508**; Symbol: **ER_GRP_RPL_DISABLE_READ_ONLY_FAILED**; SQLSTATE: **HY000**
  
  Message: Unable to disable super read only flag. Try to disable it manually

**ER_GRP_RPL_DISABLE_READ_ONLY_FAILED** was added in 8.0.11.

- Error number: **MY-011509**; Symbol: **ER_GRP_RPL_ENABLE_READ_ONLY_FAILED**; SQLSTATE: **HY000**
  
  Message: Unable to set super read only flag. Try to set it manually.

**ER_GRP_RPL_ENABLE_READ_ONLY_FAILED** was added in 8.0.11.

- Error number: **MY-011510**; Symbol: **ER_GRP_RPL_SRV_PRIMARY_MEM**; SQLSTATE: **HY000**
  
  Message: This server is working as primary member.

**ER_GRP_RPL_SRV_PRIMARY_MEM** was added in 8.0.11.

- Error number: **MY-011511**; Symbol: **ER_GRP_RPL_SRV_SECONDARY_MEM**; SQLSTATE: **HY000**
  
  Message: This server is working as secondary member with primary member address %s:%u.

**ER_GRP_RPL_SRV_SECONDARY_MEM** was added in 8.0.11.

- Error number: **MY-011512**; Symbol: **ER_GRP_RPL_NO_SUITABLE_PRIMARY_MEM**; SQLSTATE: **HY000**
  
  Message: Unable to set any member as primary. No suitable candidate.

**ER_GRP_RPL_NO_SUITABLE_PRIMARY_MEM** was added in 8.0.11.

- Error number: **MY-011513**; Symbol: **ER_GRP_RPL_SUPER_READ_ONLY_ACTIVATE_ERROR**; SQLSTATE: **HY000**
  
  Message: Error when activating super_read_only mode on start. The member will now exit the group.

**ER_GRP_RPL_SUPER_READ_ONLY_ACTIVATE_ERROR** was added in 8.0.11.

- Error number: **MY-011514**; Symbol: **ER_GRP_RPL_EXCEEDS_AUTO_INC_VALUE**; SQLSTATE: **HY000**
Message: Group contains %lu members which is greater than auto_increment_increment value of %lu. This can lead to a higher transactional abort rate.

`ER_GRP_RPL_EXCEEDS_AUTO_INC_VALUE` was added in 8.0.11.

- **Error number:** MY-011515; Symbol: `ER_GRP_RPL_DATA_NOT_PROVIDED_BY_MEM`; SQLSTATE: HY000
  
  Message: Member with address '%s:%u' didn't provide any data during the last group change. Group information can be outdated and lead to errors on recovery.

  `ER_GRP_RPL_DATA_NOT_PROVIDED_BY_MEM` was added in 8.0.11.

- **Error number:** MY-011516; Symbol: `ER_GRP_RPL_MEMBER_ALREADY_EXISTS`; SQLSTATE: HY000
  
  Message: There is already a member with server_uuid %s. The member will now exit the group.

  `ER_GRP_RPL_MEMBER_ALREADY_EXISTS` was added in 8.0.11.

- **Error number:** MY-011517; Symbol: `ER_GRP_RPL_GRP_CHANGE_INFO_EXTRACT_ERROR`; SQLSTATE: HY000
  
  Message: Error when extracting information for group change. Operations and checks made to group joiners may be incomplete.

  `ER_GRP_RPL_GRP_CHANGE_INFO_EXTRACT_ERROR` was added in 8.0.11.

- **Error number:** MY-011518; Symbol: `ER_GRP_RPL_GTID_EXECUTED_EXTRACT_ERROR`; SQLSTATE: HY000
  
  Message: Error when extracting this member GTID executed set. Operations and checks made to group joiners may be incomplete.

  `ER_GRP_RPL_GTID_EXECUTED_EXTRACT_ERROR` was added in 8.0.11.

- **Error number:** MY-011519; Symbol: `ER_GRP_RPL_GTID_SET_EXTRACT_ERROR`; SQLSTATE: HY000
  
  Message: Error when extracting this member retrieved set for its applier. Operations and checks made to group joiners may be incomplete.

  `ER_GRP_RPL_GTID_SET_EXTRACT_ERROR` was added in 8.0.11.

- **Error number:** MY-011520; Symbol: `ER_GRP_RPL_START_FAILED`; SQLSTATE: HY000
  
  Message: The START GROUP_REPLICATION command failed since the group already has 9 members.

  `ER_GRP_RPL_START_FAILED` was added in 8.0.11.

- **Error number:** MY-011521; Symbol: `ER_GRP_RPL_MEMBER_VER_INCOMPATIBLE`; SQLSTATE: HY000
  
  Message: Member version is incompatible with the group.

  `ER_GRP_RPL_MEMBER_VER_INCOMPATIBLE` was added in 8.0.11.

- **Error number:** MY-011522; Symbol: `ER_GRP_RPL_TRANS_NOT_PRESENT_IN_GRP`; SQLSTATE: HY000
Message: The member contains transactions not present in the group. The member will now exit the group.

ER_GRP_RPL_TRANS_NOT_PRESENT_IN_GRP was added in 8.0.11.

•   Error number: MY-011523; Symbol: ER_GRP_RPL_TRANS_GREATER_THAN_GRP; SQLSTATE: HY000

Message: It was not possible to assess if the member has more transactions than the group. The member will now exit the group.

ER_GRP_RPL_TRANS_GREATER_THAN_GRP was added in 8.0.11.

•   Error number: MY-011524; Symbol: ER_GRP_RPL_MEMBER_VERSION_LOWER_THAN_GRP; SQLSTATE: HY000

Message: Member version is lower than some group member, but since option ‘group_replication_allow_local_lower_version_join is enabled, member will be allowed to join.

ER_GRP_RPL_MEMBER_VERSION_LOWER_THAN_GRP was added in 8.0.11.

•   Error number: MY-011525; Symbol: ER_GRP_RPL_LOCAL_GTID_SETS_PROCESS_ERROR; SQLSTATE: HY000

Message: Error processing local GTID sets when comparing this member transactions against the group.

ER_GRP_RPL_LOCAL_GTID_SETS_PROCESS_ERROR was added in 8.0.11.

•   Error number: MY-011526; Symbol: ER_GRP_RPL_MEMBER_TRANS_GREATER_THAN_GRP; SQLSTATE: HY000

Message: This member has more executed transactions than those present in the group. Local transactions: %s > Group transactions: %s

ER_GRP_RPL_MEMBER_TRANS_GREATER_THAN_GRP was added in 8.0.11.

•   Error number: MY-011527; Symbol: ER_GRP_RPL_BLOCK_SIZE_DIFF_FROM_GRP; SQLSTATE: HY000

Message: The member is configured with a group_replication_gtid_assignment_block_size option value '%llu' different from the group '%llu'. The member will now exit the group.

ER_GRP_RPL_BLOCK_SIZE_DIFF_FROM_GRP was added in 8.0.11.

•   Error number: MY-011528; Symbol: ER_GRP_RPL_TRANS_WRITE_SET_EXTRACT_DIFF_FROM_GRP; SQLSTATE: HY000

Message: The member is configured with a transaction-write-set-extraction option value '%s' different from the group '%s'. The member will now exit the group.

ER_GRP_RPL_TRANS_WRITE_SET_EXTRACT_DIFF_FROM_GRP was added in 8.0.11.
• Error number: MY-011529; Symbol: ER_GRP_RPL_MEMBER_CFG_INCOMPATIBLE_WITH_GRP_CFG; SQLSTATE: HY000
Message: The member configuration is not compatible with the group configuration. Variables such as single_primary_mode or enforce_update_everywhere_checks must have the same value on every server in the group. (member configuration option: [%s], group configuration option: [%s]).

ER_GRP_RPL_MEMBER_CFG_INCOMPATIBLE_WITH_GRP_CFG was added in 8.0.11.

• Error number: MY-011530; Symbol: ER_GRP_RPL_MEMBER_STOP_RPL_CHANNELS_ERROR; SQLSTATE: HY000
Message: Error stopping all replication channels while server was leaving the group. %s

ER_GRP_RPL_MEMBER_STOP_RPL_CHANNELS_ERROR was added in 8.0.11.

• Error number: MY-011531; Symbol: ER_GRP_RPL_PURGE_APPLIER_LOGS; SQLSTATE: HY000
Message: Detected previous RESET MASTER invocation or an issue exists in the group replication applier relay log. Purging existing applier logs.

ER_GRP_RPL_PURGE_APPLIER_LOGS was added in 8.0.11.

• Error number: MY-011532; Symbol: ER_GRP_RPL_RESET_APPLIER_MODULE_LOGS_ERROR; SQLSTATE: HY000
Message: Unknown error occurred while resetting applier's module logs.

ER_GRP_RPL_RESET_APPLIER_MODULE_LOGS_ERROR was added in 8.0.11.

• Error number: MY-011533; Symbol: ER_GRP_RPL_APPLIER_THD_SETUP_ERROR; SQLSTATE: HY000
Message: Failed to setup the group replication applier thread.

ER_GRP_RPL_APPLIER_THD_SETUP_ERROR was added in 8.0.11.

• Error number: MY-011534; Symbol: ER_GRP_RPL_APPLIER_THD_START_ERROR; SQLSTATE: HY000
Message: Error while starting the group replication applier thread

ER_GRP_RPL_APPLIER_THD_START_ERROR was added in 8.0.11.

• Error number: MY-011535; Symbol: ER_GRP_RPL_APPLIER_THD_STOP_ERROR; SQLSTATE: HY000
Message: Failed to stop the group replication applier thread.

ER_GRP_RPL_APPLIER_THD_STOP_ERROR was added in 8.0.11.

• Error number: MY-011536; Symbol: ER_GRP_RPL_FETCH_TRANS_DATA_FAILED; SQLSTATE: HY000
Message: Failed to fetch transaction data containing required transaction info for applier

ER_GRP_RPL_FETCH_TRANS_DATA_FAILED was added in 8.0.11.

• Error number: MY-011537; Symbol: ER_GRP_RPL_SLAVE_IO_THD_PRIMARY_UNKNOWN; SQLSTATE: HY000
Message: Can't start slave IO THREAD of channel '%s' when group replication is running with single-primary mode and the primary member is not known.

ER_GRP_RPL_SLAVE_IO_THD_PRIMARY_UNKNOWN was added in 8.0.11.

• Error number: MY-011538; Symbol: ER_GRP_RPL_SLAVE_IO_THD_ON_SECONDARY_MEMBER; SQLSTATE: HY000

Message: Can't start slave IO THREAD of channel '%s' when group replication is running with single-primary mode on a secondary member.
