<td>all_runs</td>
<td>If TRUE, returns recommendations/findings for all runs of auto segment advisor. If FALSE, returns the results of the LATEST run only. LATEST does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.</td>
</tr>
<tr>
<td>show_manual</td>
<td>If TRUE, we show the results of manual invocations only. The auto advisor results are excluded. If FALSE, results of manual invocation of segment advisor are not returned.</td>
</tr>
<tr>
<td>show_findings</td>
<td>Show only the findings instead of the recommendations</td>
</tr>
</tbody>
</table>
CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```
DBMS_SPACE.CREATE_INDEX_COST ( 
    ddl             IN    VARCHAR2, 
    used_bytes      OUT   NUMBER, 
    alloc_bytes     OUT   NUMBER, 
    plan_table      IN    VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(create_index_cost,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl</td>
<td>The create index DDL statement</td>
</tr>
<tr>
<td>used_bytes</td>
<td>The number of bytes representing the actual index data</td>
</tr>
<tr>
<td>alloc_bytes</td>
<td>Size of the index when created in the tablespace</td>
</tr>
<tr>
<td>plan_table</td>
<td>Which plan table to use, default NULL</td>
</tr>
</tbody>
</table>

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.
CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

Syntax

```sql
DBMS_SPACE.CREATE_TABLE_COST (  
tablespace_name    IN VARCHAR2,  
avg_row_size       IN NUMBER,  
row_count          IN NUMBER,  
pct_free           IN NUMBER,  
used_bytes         OUT NUMBER,  
alloc_bytes        OUT NUMBER);  

DBMS_SPACE.CREATE_TABLE_COST (  
tablespace_name    IN VARCHAR2,  
colinfos           IN CREATE_TABLE_COST_COLUMNS,  
row_count          IN NUMBER,  
pct_free           IN NUMBER,  
used_bytes         OUT NUMBER,  
alloc_bytes        OUT NUMBER);  

CREATE TYPE create_table_cost_colinfo IS OBJECT (  
COL_TYPE   VARCHAR(200),  
COL_SIZE   NUMBER);  
```

Parameters

**Table 132–6  CREATE_TABLE_COST Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The tablespace in which the object will be created. The default is SYSTEM tablespace.</td>
</tr>
<tr>
<td>avg_row_size</td>
<td>The anticipated average row size in the table</td>
</tr>
<tr>
<td>colinfos</td>
<td>The description of the columns</td>
</tr>
<tr>
<td>row_count</td>
<td>The anticipated number of rows in the table</td>
</tr>
<tr>
<td>pct_free</td>
<td>The percentage of free space in each block for future expansion of existing rows due to updates</td>
</tr>
<tr>
<td>used_bytes</td>
<td>The space used by user data</td>
</tr>
<tr>
<td>alloc_bytes</td>
<td>The size of the object taking into account the tablespace extent characteristics</td>
</tr>
</tbody>
</table>
Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, pctfree etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```sql
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
  ub NUMBER;
  ab NUMBER;
  cl sys.create_table_cost_columns;
BEGIN
  cl := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
                                         sys.create_table_cost_colinfo('VARCHAR2',30),
                                         sys.create_table_cost_colinfo('VARCHAR2',30),
                                         sys.create_table_cost_colinfo('DATE',NULL));
  DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',cl,100000,0,ub,ab);
  DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
  DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/
```
FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster). See SPACE_USAGE Procedures for returning free block information in an auto segment space managed segment.

Syntax

```sql
DBMS_SPACE.FREE_BLOCKS (  
    segment_owner IN VARCHAR2,  
    segment_name IN VARCHAR2,  
    segment_type IN VARCHAR2,  
    freelist_group_id IN NUMBER,  
    free_blks OUT NUMBER,  
    scan_limit IN NUMBER DEFAULT NULL,  
    partition_name IN VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_type</td>
<td>Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER):</td>
</tr>
<tr>
<td></td>
<td>- TABLE</td>
</tr>
<tr>
<td></td>
<td>- TABLE PARTITION</td>
</tr>
<tr>
<td></td>
<td>- TABLE SUBPARTITION</td>
</tr>
<tr>
<td></td>
<td>- INDEX</td>
</tr>
<tr>
<td></td>
<td>- INDEX PARTITION</td>
</tr>
<tr>
<td></td>
<td>- INDEX SUBPARTITION</td>
</tr>
<tr>
<td></td>
<td>- CLUSTER</td>
</tr>
<tr>
<td></td>
<td>- LOB</td>
</tr>
<tr>
<td></td>
<td>- LOB PARTITION</td>
</tr>
<tr>
<td></td>
<td>- LOB SUBPARTITION</td>
</tr>
<tr>
<td>freelist_group_id</td>
<td>Freelist group (instance) whose free list size is to be computed</td>
</tr>
<tr>
<td>free_blks</td>
<td>Returns count of free blocks for the specified group</td>
</tr>
<tr>
<td>scan_limit</td>
<td>Maximum number of free list blocks to read (optional). Use a scan limit of X you are interested only in the question, &quot;Do I have X blocks on the free list?&quot;</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition name of the segment to be analyzed. This is only used for partitioned tables. The name of subpartition should be used when partitioning is composite.</td>
</tr>
</tbody>
</table>
Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```sql
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

**Note:** An error is raised if `scan_limit` is not a positive number.
ISDATAFILEDROPPABLE_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

Syntax

DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (    filename    IN     VARCHAR2,    retval       OUT    NUMBER);

Pragmas

pragma restrict_references(free_blocks,WNDS);

Parameters

Table 132–8  ISDATAFILEDROPPABLE_NAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Name of the file</td>
</tr>
<tr>
<td>retval</td>
<td>Values: 0 if the file is not droppable, 1 if the file is droppable.</td>
</tr>
</tbody>
</table>

Examples

DECLARE    fname    VARCHAR2(100);    retval    NUMBER;    BEGIN    SELECT file_name    INTO fname    FROM dba_data_files    WHERE file_name like '%empty%';    DBMS_SPACE.ISDATAFILEDROPPABLE_NAME(fname, retval);    DBMS_OUTPUT.PUT_LINE(retval);    END;
/*
OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS(
    objowner IN VARCHAR2,
    objname  IN VARCHAR2,
    partname IN VARCHAR2,
    objtype  IN NUMBER)
RETURN dependent_segments_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objowner</td>
<td>The schema containing the object</td>
</tr>
<tr>
<td>objname</td>
<td>The name of the object</td>
</tr>
<tr>
<td>partname</td>
<td>The name of the partition</td>
</tr>
<tr>
<td>objtype</td>
<td>Type of the object:</td>
</tr>
</tbody>
</table>
|           | ■ OBJECT_TYPE_TABLE
|           | constant positive := 1; |
|           | ■ OBJECT_TYPE_NESTED_TABLE
|           | constant positive := 2; |
|           | ■ OBJECT_TYPE_INDEX
|           | constant positive := 3; |
|           | ■ OBJECT_TYPE_CLUSTER

|           | constant positive := 7; |
|           | ■ OBJECT_TYPE_INDEX_PARTITION
|           | constant positive := 8; |
|           | ■ OBJECT_TYPE_TABLE_SUBPARTITION
|           | constant positive := 9; |
|           | ■ OBJECT_TYPE_INDEX_SUBPARTITION
|           | constant positive := 10; |
|           | ■ OBJECT_TYPE_MV
|           | constant positive := 13; |
|           | ■ OBJECT_TYPE_MVLOG
|           | constant positive := 14; |

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD {
    segment_owner VARCHAR2(100),
    segment_name  VARCHAR2(100),
    segment_type  VARCHAR2(100),
    tablespace_name VARCHAR2(100),
    partition_name VARCHAR2(100),
};
```
lob_column_name    VARCHAR2(100));

Table 132–10  OBJECT_DEPENDENT_SEGMENT Type Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>The schema containing the segment</td>
</tr>
<tr>
<td>segment_name</td>
<td>The name of the segment</td>
</tr>
<tr>
<td>segment_type</td>
<td>The type of the segment, such as table, index or LOB</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>The name of the tablespace</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition, if any</td>
</tr>
<tr>
<td>lob_column_name</td>
<td>The name of the LOB column, if any</td>
</tr>
</tbody>
</table>
OBJECT_GROWTH_TREND Function

This is a table function. The output will be in the form of one or more rows where each row describes the space usage of the object at a specific point in time. Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```sql
DBMS_SPACE.OBJECT_GROWTH_TREND (  
    object_owner           IN    VARCHAR2,  
    object_name            IN    VARCHAR2,  
    object_type            IN    VARCHAR2,  
    partition_name         IN    VARCHAR2 DEFAULT NULL,  
    start_time             IN    TIMESTAMP DEFAULT NULL,  
    end_time               IN    TIMESTAMP DEFAULT NULL,  
    interval               IN    DSINTERVAL_UNCONSTRAINED DEFAULT NULL,  
    skip_interpolated      IN    VARCHAR2 DEFAULT 'FALSE',  
    timeout_seconds        IN    NUMBER DEFAULT NULL,  
    single_datapoint_flag  IN    VARCHAR2 DEFAULT 'TRUE')  
RETURN object_growth_trend_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_owner</td>
<td>The schema containing the object</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object</td>
</tr>
<tr>
<td>object_type</td>
<td>The type of the object</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition</td>
</tr>
<tr>
<td>start_time</td>
<td>Statistics generated after this time will be used in generating the growth trend</td>
</tr>
<tr>
<td>end_time</td>
<td>Statistics generated until this time will be used in generating the growth trend</td>
</tr>
<tr>
<td>interval</td>
<td>The interval at which to sample</td>
</tr>
<tr>
<td>skip_interpolated</td>
<td>Whether interpolation of missing values should be skipped</td>
</tr>
<tr>
<td>timeout_seconds</td>
<td>The time-out value for the function in seconds</td>
</tr>
<tr>
<td>single_data_point_flag</td>
<td>Whether in the absence of statistics the segment should be sampled</td>
</tr>
</tbody>
</table>

Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```sql
TYPE object_growth_trend_row IS RECORD(  
    timepoint       TIMESTAMP,  
    space_usage     NUMBER,  
    space_alloc     NUMBER,  
    quality         VARCHAR(20));
```
Table 132–12  OBJECT_GROWTH_TREND_ROW Type Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timepoint</td>
<td>The time at which the statistic was recorded</td>
</tr>
<tr>
<td>space_usage</td>
<td>The space used by data</td>
</tr>
<tr>
<td>space_alloc</td>
<td>The size of the segment including overhead and unused space</td>
</tr>
<tr>
<td>quality</td>
<td>The quality of result: &quot;GOOD&quot;, &quot;INTERPOLATED&quot;, &quot;PROJECTION&quot;</td>
</tr>
</tbody>
</table>

TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
SPACE_USAGE Procedures

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBs, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBs.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBs in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBs.

Syntax

```
DBMS_SPACE.SPACE_USAGE(
    segment_owner IN VARCHAR2,
    segment_name IN VARCHAR2,
    segment_type IN VARCHAR2,
    unformatted_blocks OUT NUMBER,
    unformatted_bytes OUT NUMBER,
    fs1_blocks OUT NUMBER,
    fs1_bytes OUT NUMBER,
    fs2_blocks OUT NUMBER,
    fs2_bytes OUT NUMBER,
    fs3_blocks OUT NUMBER,
    fs3_bytes OUT NUMBER,
    fs4_blocks OUT NUMBER,
    fs4_bytes OUT NUMBER,
    full_blocks OUT NUMBER,
    full_bytes OUT NUMBER,
    partition_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_SPACE.SPACE_USAGE(
    segment_owner IN VARCHAR2,
    segment_name IN VARCHAR2,
    segment_type IN VARCHAR2,
    segment_size_blocks OUT NUMBER,
    segment_size_bytes OUT NUMBER,
    used_blocks OUT NUMBER,
    used_bytes OUT NUMBER,
    expired_blocks OUT NUMBER,
    expired_bytes OUT NUMBER,
    unexpired_blocks OUT NUMBER,
    unexpired_bytes OUT NUMBER,
    partition_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_name</td>
<td>Name of the segment to be analyzed</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition name of the segment to be analyzed</td>
</tr>
</tbody>
</table>

SECUREFILE LOBs.

### Examples

```sql
variable unf number;
variable unfb number;
variable fs1 number;
```
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
    dbms_space.space_usage('U1', 'T',
        'TABLE',
        :unf, :unfb,
        :fs1, :fs1b,
        :fs2, :fs2b,
        :fs3, :fs3b,
        :fs4, :fs4b,
        :full, :fullb);
end;
/
print unf ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;
UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```sql
DBMS_SPACE.UNUSED_SPACE (  
    segment_owner              IN  VARCHAR2,  
    segment_name               IN  VARCHAR2,  
    segment_type               IN  VARCHAR2,  
    total_blocks               OUT NUMBER,  
    total_bytes                OUT NUMBER,  
    unused_blocks              OUT NUMBER,  
    unused_bytes               OUT NUMBER,  
    last_used_extent_file_id   OUT NUMBER,  
    last_used_extent_block_id  OUT NUMBER,  
    last_used_block            OUT NUMBER,  
    partition_name             IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_type</td>
<td>Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER):</td>
</tr>
<tr>
<td></td>
<td>■ TABLE</td>
</tr>
<tr>
<td></td>
<td>■ TABLE PARTITION</td>
</tr>
<tr>
<td></td>
<td>■ TABLE SUBPARTITION</td>
</tr>
<tr>
<td></td>
<td>■ INDEX</td>
</tr>
<tr>
<td></td>
<td>■ INDEX PARTITION</td>
</tr>
<tr>
<td></td>
<td>■ INDEX SUBPARTITION</td>
</tr>
<tr>
<td></td>
<td>■ CLUSTER</td>
</tr>
<tr>
<td></td>
<td>■ LOB</td>
</tr>
<tr>
<td></td>
<td>■ LOB PARTITION</td>
</tr>
<tr>
<td></td>
<td>■ LOB SUBPARTITION</td>
</tr>
<tr>
<td>total_blocks</td>
<td>Returns total number of blocks in the segment</td>
</tr>
<tr>
<td>total_bytes</td>
<td>Returns total number of blocks in the segment, in bytes</td>
</tr>
<tr>
<td>unused_blocks</td>
<td>Returns number of blocks which are not used</td>
</tr>
<tr>
<td>unused_bytes</td>
<td>Returns, in bytes, number of blocks which are not used</td>
</tr>
<tr>
<td>last_used_extent_file_id</td>
<td>Returns the file ID of the last extent which contains data</td>
</tr>
<tr>
<td>last_used_extent_block_id</td>
<td>Returns the starting block ID of the last extent which contains data</td>
</tr>
<tr>
<td>last_used_block</td>
<td>Returns the last block within this extent which contains data</td>
</tr>
</tbody>
</table>
The following declares the necessary bind variables and executes.

```
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,
:total_bytes, :unused_blocks, :unused_bytes, :lastextf,
:last_extb, :lastusedblock);
```
The DBMS_SPACE_ADMIN package provides functionality for locally managed tablespaces.

Security Model

This package runs with SYS privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.
### Constants

#### Table 133–1  DBMS_SPACE_ADMIN Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEGMENT_VERIFY_EXTENTS</td>
<td>POSITIVE 1</td>
<td>1</td>
<td>Verifies that the space owned by segment is appropriately reflected in the bitmap as used</td>
</tr>
<tr>
<td>SEGMENT_VERIFY_EXTENTS_GLOBAL</td>
<td>POSITIVE 2</td>
<td>2</td>
<td>Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it</td>
</tr>
<tr>
<td>SEGMENT_MARK_CORRUPT</td>
<td>POSITIVE 3</td>
<td>3</td>
<td>Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation)</td>
</tr>
<tr>
<td>SEGMENT_MARK_VALID</td>
<td>POSITIVE 4</td>
<td>4</td>
<td>Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.</td>
</tr>
<tr>
<td>SEGMENT_DUMP_EXTENT_MAP</td>
<td>POSITIVE 5</td>
<td>5</td>
<td>Dumps the extent map for a given segment</td>
</tr>
<tr>
<td>TABLESPACE_VERIFY_BITMAP</td>
<td>POSITIVE 6</td>
<td>6</td>

Operational Notes

Before migrating the **SYSTEM** tablespace, the following conditions must be met. These conditions are enforced by the `TABLESPACE_MIGRATE_TO_LOCAL` procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not **SYSTEM**.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, then an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.
## Summary of DBMS_SPACE_ADMIN Subprograms

</tbody>
</table>
ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in Automatic Segment Space Management (ASSM) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, and whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks.

Syntax

```sql
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (
    segment_owner   IN VARCHAR2,
    segment_name    IN VARCHAR2,
    segment_type    IN VARCHAR2,
    partition_name  IN VARCHAR2,
    verify_option   IN POSITIVE  DEFAULT SEGMENT_VERIFY_BASIC,
    attrib          IN POSITIVE  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema that owns the segment</td>
</tr>
<tr>
<td>segment_name</td>
<td>Name of the segment to be verified</td>
</tr>
<tr>
<td>segment_type</td>
<td>Segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition or subpartition</td>
</tr>
<tr>
<td>verify_option</td>
<td>One of the following options:</td>
</tr>
<tr>
<td>attrib</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>SEGMENT_VERIFY_BASIC := 9. Performs deep verification</td>
</tr>
<tr>
<td></td>
<td>SEGMENT_VERIFY_DEEP := 10. Performs the basic metadata checks (Default)</td>
</tr>
<tr>
<td></td>
<td>SEGMENT_VERIFY_SPECIFIC := 11. Performs a specific check for the segment</td>
</tr>
</tbody>
</table>
Table 133–3  (Cont.) ASSM_SEGMENT_VERIFY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attrib</td>
<td>When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>- HWM_CHECK := 12. Checks whether high water mark information is accurate</td>
</tr>
<tr>
<td></td>
<td>- BMB_CHECK := 13. Checks whether space bitmap blocks have correct backpointers to the segment header</td>
</tr>
<tr>
<td></td>
<td>- SEG_DICT_CHECK := 14. Checks whether dictionary information for segment is accurate</td>
</tr>
<tr>
<td></td>
<td>- EXTENT_TS_BITMAP_CHECK := 15. Checks whether extent maps are consistent with file level bitmaps</td>
</tr>
<tr>
<td></td>
<td>- DB_BACKPOINTER_CHECK := 16. Checks whether datablocks have correct backpointers to the space metadata blocks</td>
</tr>
<tr>
<td></td>
<td>- EXTENT_SEGMENT_BITMAP_CHECK := 17. Checks whether extent map in the segment matches the bitmaps in the segment</td>
</tr>
<tr>
<td></td>
<td>- BITMAPS_CHECK := 18. Checks whether space bitmap blocks are accurate</td>
</tr>
</tbody>
</table>

Usage Notes

- Using this procedure requires SYSDBA privileges.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.
- This procedure outputs a dump file named sid_ora_process_ID.trc to the location specified in the USER_DUMP_DEST initialization parameter.
ASSM_TABLESPACE_VERIFY Procedure

This procedure verifies all the segments created in an ASSM tablespace. The verification for each segment performs basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```sql
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (  
tablespace_name IN VARCHAR2,  
ts_option IN POSITIVE,  
segment_option IN POSITIVE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace to verify. The tablespace must be an ASSM tablespace.</td>
</tr>
<tr>
<td>ts_option</td>
<td></td>
</tr>
</tbody>
</table>
|                  |   ■ TS_VERIFY_BITMAPS := 19. The bitmaps are verified against the extents. This detects bits that are marked used or free wrongly and detects multiple allocation of extents. The file metadata is validated against file$ and control file.  
|                  |   ■ TS_VERIFY_DEEP := 20. This option is used to verify the file bitmaps as well perform checks on all the segments.  
|                  |   ■ TS_VERIFY_SEGMENTS := 21. This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally you can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY. |
| segment_option   | When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following:  
|                  |   ■ SEGMENT_VERIFY_BASIC := 9  
|                  |   ■ SEGMENT_VERIFY_DEEP := 10  
|                  | The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BITMAPS is specified. |

Usage Notes

- Using this procedure requires SYSDBA privileges.
- This procedure outputs a dump file named sid_ora_process_ID.trc to the location specified in the USER_DUMP_DEST initialization parameter.
*DROP_EMPTY_SEGMENTS Procedure*

This procedure drops segments from empty tables or table fragments and dependent objects.

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

**Syntax**

```sql
DBMS_SPACE_ADMIN.DROP_EMPTY_SEGMENTS (  
  schema_name       IN     VARCHAR2   DEFAULT NULL,  
  table_name        IN     VARCHAR2   DEFAULT NULL,  
  partition_name    IN     VARCHAR2   DEFAULT NULL);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of table</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of partition</td>
</tr>
</tbody>
</table>

**Usage Notes**

Given a schema name, this procedure scans all tables in the schema. For each table, if the table or any of its fragments are found to be empty, and the table satisfies certain criteria (restrictions being the same as those described in "Restrictions on Deferred Segment Creation"), then the empty table fragment and associated index segments are dropped along with the corresponding LOB data and index segments. A subsequent insert creates segments with the same properties.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned
- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects
MATERIALIZE_DEFERRED_SEGMENTS Procedure

This procedure materializes segments for tables and table fragments with deferred segment creation and their dependent objects.

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

**Syntax**

```sql
DBMS_SPACE_ADMIN.MATERIALIZE_DEFERRED_SEGMENTS (
    schema_name       IN     VARCHAR2   DEFAULT NULL,
    table_name        IN     VARCHAR2   DEFAULT NULL,
    partition_name    IN     VARCHAR2   DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of table</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of partition</td>
</tr>
</tbody>
</table>

**Usage Notes**

Given a schema name, this procedure scans all tables in the schema. For each table, if the deferred or delayed segment property is set for the table or any of its fragments, then a new segment is created for those fragments and their dependent objects.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned.
- Both `schema_name` and `table_name` are specified to perform the operation on a specified table.
- All three arguments are supplied, restricting the operation to the partition and its dependent objects.
SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be done. It cannot be used on the SYSTEM tablespace.

Syntax

```sql
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
    tablespace_name         IN    VARCHAR2,
    header_relative_file    IN    POSITIVE,
    header_block            IN    POSITIVE,
    corrupt_option          IN    POSITIVE  DEFAULT SEGMENT_MARK_CORRUPT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
<tr>
<td>corrupt_option</td>
<td>SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID</td>
</tr>
</tbody>
</table>

Usage Notes

You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

The following example marks the segment as corrupt:

```sql
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_MARK_CORRUPT);
```

Alternately, the next example marks a corrupt segment valid:

```sql
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_MARK_VALID);
```
SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space). For this to work, the segment must be marked temporary. To mark a corrupt segment as temporary, issue a DROP command on the segment.

Syntax

```sql
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (  
  tablespace_name IN VARCHAR2,  
  header_relative_file IN POSITIVE,  
  header_block IN POSITIVE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
</tbody>
</table>

Usage Notes

- The space for the segment is not released, and it must be fixed by using the TABLESPACE_FIX_BITMAPS Procedure or the TABLESPACE_REBUILD_BITMAPS Procedure.
- The procedure cannot be used on the SYSTEM tablespace.
- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

```sql
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```
SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (  
  tablespace_name         IN    VARCHAR2,  
  header_relative_file    IN    POSITIVE,  
  header_block            IN    POSITIVE,  
  dump_option             IN    POSITIVE  DEFAULT SEGMENT_DUMP_EXTENT_MAP);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
<tr>
<td>dump_option</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>■ SEGMENT_DUMP_EXTENT_MAP</td>
</tr>
<tr>
<td></td>
<td>■ SEGMENT_DUMP_BITMAP_SUMMARY</td>
</tr>
</tbody>
</table>

Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass SEGMENT_DUMP_BITMAP_SUMMARY as the dump_option parameter.

- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);  
```
SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
    tablespace_name         IN    VARCHAR2,
    header_relative_file    IN    POSITIVE,
    header_block            IN    POSITIVE,
    verify_option           IN    POSITIVE  DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters

Table 133–10 SEGMENT_VERIFY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
<tr>
<td>verify_option</td>
<td>What kind of check to do: SEGMENT_VERIFY_EXTENTS or SEGMENT_VERIFY_EXTENTS_GLOBAL</td>
</tr>
</tbody>
</table>

Usage Notes

- Anomalies are output as block range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all block ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.

- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps synchronized.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_VERIFY_EXTENTS);
```
TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate block range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (  
    tablespace_name         IN    VARCHAR2,  
    dbarange_relative_file  IN    POSITIVE,  
    dbarange_begin_block    IN    POSITIVE,  
    dbarange_end_block      IN    POSITIVE,  
    fix_option              IN    POSITIVE);
```

Parameters

Table 133–11  TABLESPACE_FIX_BITMAPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>dbarange_relative_file</td>
<td>Relative file number of block range (extent)</td>
</tr>
<tr>
<td>dbarange_begin_block</td>
<td>Block number of beginning of extent</td>
</tr>
<tr>
<td>dbarange_end_block</td>
<td>Block number (inclusive) of end of extent</td>
</tr>
<tr>
<td>fix_option</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>TABLESPACE_EXTENT_MAKE_FREE</td>
</tr>
<tr>
<td></td>
<td>TABLESPACE_EXTENT_MAKE_USED</td>
</tr>
</tbody>
</table>

Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as USED in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83, DBMS_SPACE_ADMIN.EXTENT_MAKE_USED);
```

Alternatively, specifying an option of TABLESPACE_EXTENT_MAKE_FREE marks the bits free in bitmaps. The BEGIN and END blocks must be in extent boundary and be extent multiple; otherwise, an error is raised.
TABLESPACE_FIX_SEGMENT_STATES Procedure

This procedure fixes the state of the segments in a tablespace in which migration was aborted. During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, then the segment states are corrected by SMON when event 10906 is set. A database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (  
   tablespace_name   IN   VARCHAR);
```

Parameters

- `tablespace_name`: Name of the tablespace whose segments must be fixed

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES ('TS1')
```
TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally managed tablespace to a dictionary-managed tablespace.

Syntax

DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (tablespace_name IN VARCHAR2);

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
</tbody>
</table>

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
TABLESPACE_MIGRATE_TO_LOCAL Procedure

This procedure migrates the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
  tablespace_name     IN     VARCHAR2,
  unit_size           IN     POSITIVE DEFAULT NULL,
  rfno                IN     POSITIVE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace to be migrated</td>
</tr>
<tr>
<td>unit_size</td>
<td>Bitmap unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace specified in number of blocks</td>
</tr>
<tr>
<td>rfno</td>
<td>Relative File Number of the file where the bitmap blocks are placed</td>
</tr>
</tbody>
</table>

Usage Notes

- Before you migrate the SYSTEM tablespace, migrate any dictionary-managed tablespaces that you want to use in read/write mode to locally managed. After the SYSTEM tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

  See Also:  *Oracle Database Administrator’s Guide*

- The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.

- Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the MINIMUM EXTENT for the tablespace (5 if MINIMUM EXTENT is not specified). Thus, the calculated value will not be larger than the MINIMUM EXTENT for the tablespace. The last free extent in every file is ignored for GCD calculation. If you specify the unit size, then it must be a factor of the unit_size calculated by the system; otherwise an error message is returned.

- The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, then an error is issued. The data file specified must be part of the tablespace being migrated. If the dataflow is not specified, then the system chooses a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, then an error is raised.

Examples

To migrate a tablespace ‘TS1’ in 2KB blocksize with minimum extent size 1MB:

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL(‘TS1’, 512, 2);
```

The bitmaps are placed in file with relative file number 2.
TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

Syntax

```sql
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (    
tablespace_name IN VARCHAR2,    
bitmap_relative_file IN POSITIVE DEFAULT NULL,  
bitmap_block IN POSITIVE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>bitmap_relative_file</td>
<td>Relative file number of bitmap block to rebuild</td>
</tr>
<tr>
<td>bitmap_block</td>
<td>Block number of bitmap block to rebuild</td>
</tr>
</tbody>
</table>

Usage Notes

Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the USERS tablespace.

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```
TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS {
    tablespace_name IN VARCHAR2};

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
</tbody>
</table>

Examples

EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
TABLESPACE_RELOCATE_BITMAPS Procedure

This procedure relocates the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (
  tablespace_name    IN      VARCHAR2,
  filno              IN      POSITIVE,
  blkno              IN      POSITIVE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>filno</td>
<td>Relative File Number of the destination file</td>
</tr>
<tr>
<td>blkno</td>
<td>Block Number of the destination range</td>
</tr>
</tbody>
</table>

Usage Notes

- Migration of a tablespace from dictionary-managed to locally managed format could result in the creation of `SPACE HEADER` segment that contains the bitmap blocks. The `SPACE HEADER` segment is treated as user data. If you explicitly resize a file at or below the space header segment, then an error is issued. Use the `TABLESPACE_RELOCATE_BITMAPS` command to move the control information to a different destination and then resize the file.
- This procedure cannot be used on the `SYSTEM` tablespace.
- The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE  DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

---

**Note:** The source and the destination addresses must not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location, then an error is raised.
TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized.

Syntax

```sql
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (
    tablespace_name IN VARCHAR2,
    verify_option IN POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>verify_option</td>
<td>One option is supported: TABLESPACE_VERIFY_BITMAP</td>
</tr>
</tbody>
</table>

Examples

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```
The DBMS_SPM package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

Using DBMS_SPM

- Overview
- Security Model
- Constants
- Examples
Overview

The **DBMS_SPM** package allows the user to manage SQL execution plans using SQL plan management. SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.

- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.

- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution plans developed under a standard test configuration for the new SQL statements. If the system production configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.
Security Model

The package is owned by SYS. The EXECUTE package privilege is required to execute its procedures. Any user granted the ADMINISTER SQL MANAGEMENT OBJECT privilege is able to execute the DBMS_SPM package.
**Constants**

The `DBMS_SPM` package uses the constants shown in Table 134–1, "DBMS_SPM Constants". These constants are defined as standard input for the `time_limit` parameter of the `EVOLVE_SQL_PLAN_BASELINE` function.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTO_LIMIT</td>
<td>INTEGER</td>
<td>2147483647</td>
<td>Oracle determines the appropriate time spent by the EVOLVE_SQL_PLAN_BASELINE Function.</td>
</tr>
<tr>
<td>NO_LIMIT</td>
<td>INTEGER</td>
<td>2147483647 -1</td>
<td>There is no limit to the time spent by the EVOLVE_SQL_PLAN_BASELINE Function.</td>
</tr>
</tbody>
</table>
Examples

Detailed examples are located under the following topics:

- Migrating Stored Outlines to SQL Plan Baselines
- Migrating Outlines to Utilize SQL Plan Management Features
- Migrating Outlines to Preserve Stored Outline Behavior
- Performing Follow-Up Tasks After Stored Outline Migration
Data Structures

The DBMS_SPM package defines a TABLE type.

Table Types

- NAMELIST Table Type
NAMELIST Table Type

This type allows for a list of names as an input parameter.

Syntax

```sql
TYPE name_list IS TABLE OF VARCHAR2(30);
```
Summary of DBMS_SPM Subprograms

This table lists the package subprograms in alphabetical order.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_SQL_PLAN_BASELINE Function on page 134-10</td>
<td>Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format</td>
</tr>
<tr>
<td>CONFIGURE Procedure on page 134-12</td>
<td>Sets configuration options for SQL management base, in parameter/value format</td>
</tr>
<tr>
<td>CREATE_STGTAB_BASELINE Procedure on page 134-13</td>
<td>Creates a staging table that used for transporting SQL plan baselines from one system to another</td>
</tr>
<tr>
<td>DROP_SQL_PLAN_BASELINE Function on page 134-14</td>
<td>Drops a single plan, or all plans associated with a SQL statement</td>
</tr>
<tr>
<td>EVOLVE_SQL_PLAN_BASELINE Function on page 134-15</td>
<td>Evolves SQL plan baselines associated with one or more SQL statements</td>

<td>Unpacks (imports) SQL plan baselines from a staging table into SQL management base</td>
</tr>
</tbody>
</table>
ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

**Syntax**

```sql
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (  
    sql_handle        IN VARCHAR2 := NULL,  
    plan_name         IN VARCHAR2 := NULL,  
    attribute_name    IN VARCHAR2,  
    attribute_value   IN VARCHAR2)  
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of plan attribute to set (see table below).</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Value of plan attribute to use (see table below)</td>
</tr>
</tbody>
</table>

**Table 134–3 ALTER_SQL_PLAN_BASELINE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of plan attribute to set (see table below).</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Value of plan attribute to use (see table below)</td>
</tr>
</tbody>
</table>

**Table 134–4 Names & Values for ALTER_SQL_PLAN_BASELINE Function Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>'YES' means the plan is available for use by the optimizer. It may or may</td>
<td>'YES' or 'NO'</td>
</tr>
<tr>
<td></td>
<td>not be used depending on accepted status.</td>
<td></td>
</tr>
<tr>
<td>fixed</td>
<td>'YES' means the SQL plan baseline is not evolved over time. A fixed plan</td>
<td>'YES' or 'NO'</td>
</tr>
<tr>
<td></td>
<td>takes precedence over a non-fixed plan.</td>
<td></td>
</tr>
<tr>
<td>autopurge</td>
<td>'YES' means the plan is purged if it is not used for a time period. 'NO'</td>
<td>'YES' or 'NO'</td>
</tr>
<tr>
<td></td>
<td>means it is never purged.</td>
<td></td>
</tr>
<tr>
<td>plan_name</td>
<td>Name of the plan</td>
<td>String of up to 30-characters</td>
</tr>
<tr>
<td>description</td>
<td>Plan description.</td>
<td>String of up to 500-characters</td>
</tr>
</tbody>
</table>

**Return Values**

The number of plans altered.
Usage Notes

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).
CONFIGURE Procedure

This procedure sets configuration options for SQL management base, in parameter/value format. This function can be called numerous times, each time setting a different configuration option.

Syntax

```
DBMS_SPM.CONFIGURE (
    parameter_name    IN VARCHAR2,
    parameter_value   IN NUMBER);
```

Parameters

**Table 134–5  CONFIGURE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter_name</td>
<td>Name of parameter to set (see table below)</td>
</tr>
<tr>
<td>parameter_value</td>
<td>Value of parameter to use (see table below)</td>
</tr>
</tbody>
</table>

**Table 134–6  Names & Values for CONFIGURE Procedure Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Possible Values</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>space_budget_percent</td>
<td>Maximum percent of SYSAUX space that can be used for SQL management base</td>
<td>1,2, …, 50</td>
<td>10</td>
</tr>
<tr>
<td>plan_retention_weeks</td>
<td>Number of weeks to retain unused plans before they are purged</td>
<td>5,6, …, 523</td>
<td>53</td>
</tr>
</tbody>
</table>

Usage Notes

- The default space budget for SQL management base is no more than ten percent of the size of SYSAUX tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).
- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.
CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

Syntax

```sql
DBMS_SPM.CREATE_STGTAB_BASELINE (
    table_name        IN VARCHAR2,
    table_owner       IN VARCHAR2 := NULL,
    tablespace_name   IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table to create for the purpose of packing and unpacking SQL plan baselines</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of owner of the staging table. Default NULL means current schema is the table owner.</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace. Default NULL means create staging table in the default tablespace.</td>
</tr>
</tbody>
</table>

Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system
DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
    sql_handle   IN VARCHAR2 := NULL,
    plan_name    IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

Parameters

Table 134-8  DROP_SQL_PLAN_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If NULL then plan_name must be specified.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name. It identifies a specific plan. Default NULL means to drop all plans associated with the SQL statement identified by sql_handle.</td>
</tr>
</tbody>
</table>

Return Values

The number of plans dropped
EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans. If interrogated by the user (parameter `verify = 'YES'`), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter `commit = 'YES'`).

The second form of the function employs a plan list format.

Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  sql_handle   IN VARCHAR2 := NULL,
  plan_name    IN VARCHAR2 := NULL,
  time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  plan_list    IN DBMS_SPM.NAME_LIST,
  time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement identifier. Unless plan_name is specified, NULL means to consider all statements with non-accepted plans in their SQL plan baselines.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan identifier. Default NULL means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if sql_handle is NULL.</td>
</tr>
<tr>
<td>plan_list</td>
<td>A list of plan names. Each plan in the list can belong to same or different SQL statement.</td>
</tr>
<tr>
<td>time_limit</td>
<td>Time limit in number of minutes. This applies only if <code>verify = 'YES'</code>. The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on.</td>
</tr>
</tbody>
</table>

- **DBMS_SPM.AUTO_LIMIT** (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done.
- **DBMS_SPM.NO_LIMIT** means there is no time limit.
- A positive integer value represents a user specified time limit.
Table 134–9  (Cont.) EVOLVE_SQL_PLAN_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verify</td>
<td>Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan.</td>
</tr>
<tr>
<td></td>
<td>- 'YES' (Default) - verifies that a non-accepted plan gives better performance before changing it to an accepted plan</td>
</tr>
<tr>
<td></td>
<td>- 'NO' - directs not to execute plans but only to change non-accepted plans into accepted plans</td>
</tr>
<tr>
<td>commit</td>
<td>Specifies whether to update the ACCEPTED status of non-accepted plans from 'NO' to 'YES'.</td>
</tr>
<tr>
<td></td>
<td>- 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when verify = 'YES'.</td>
</tr>
<tr>
<td></td>
<td>- 'NO' - generate a report without any updates. Note that commit = 'NO' together with verify = 'NO' represents a no-op.</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if verify = 'YES' the result of their performance verification.

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.
LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using attribute_name and attribute_value pair.

Syntax

```sql
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (sql_id            IN  VARCHAR2,
                                          plan_hash_value   IN  NUMBER   := NULL,
                                          sql_text          IN  CLOB,
                                          fixed             IN  VARCHAR2 := 'NO',
                                          enabled           IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```sql
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (sql_id            IN  VARCHAR2,
                                          plan_hash_value   IN  NUMBER   := NULL,
                                          sql_handle        IN  VARCHAR2,
                                          fixed             IN  VARCHAR2 := 'NO',
                                          enabled           IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```sql
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (sql_id            IN  VARCHAR2,
                                          plan_hash_value   IN  NUMBER   := NULL,
                                          fixed             IN  VARCHAR2 := 'NO',
                                          enabled           IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```sql
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (attribute_name   IN VARCHAR2,
                                          attribute_value  IN VARCHAR2,
                                          fixed            IN VARCHAR2 := 'NO',
                                          enabled          IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID.</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.</td>
</tr>
</tbody>
</table>
LOAD_PLANS_FROM_CURSOR_CACHE Functions

### Table 134-10 (Cont.) LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The sql_handle must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.</td>
</tr>
<tr>
<td>fixed</td>
<td>Default ‘NO’ means the loaded plans are used as non-fixed plans. Value ‘YES’ means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>One of possible attribute names:</td>
</tr>
<tr>
<td></td>
<td>■ SQL_TEXT&quot;</td>
</tr>
<tr>
<td></td>
<td>■ 'PARSING_SCHEMA_NAME'</td>
</tr>
<tr>
<td></td>
<td>■ 'MODULE'</td>
</tr>
<tr>
<td></td>
<td>■ 'ACTION'</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Attribute value is used as a search pattern of LIKE predicate if attribute name is 'SQL_TEXT'. Otherwise, it is used as an equality search value. (for example, for specifying attribute_name =&gt; 'SQL_TEXT', and attribute_value =&gt; '% HR-123 %' means applying SQL_TEXT LIKE '% HR-123 %' as a selection filter. Similarly, specifying attribute_name =&gt; 'MODULE', and attribute_value =&gt; 'HR' means applying 'MODULE = 'HR' as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is 'SQL_TEXT'.</td>
</tr>
<tr>
<td>enabled</td>
<td>Default 'YES' means the loaded plans are enabled for use by the optimizer</td>
</tr>
</tbody>
</table>

### Return Values

Number of plans loaded

### Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.
LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

Syntax

```sql
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
    sqlset_name      IN  VARCHAR2,
    sqlset_owner     IN  VARCHAR2 := NULL,
    basic_filter     IN  VARCHAR2 := NULL,
    fixed            IN  VARCHAR2 := 'NO',
    enabled          IN  VARCHAR2 := 'YES'
RETURN PLS_INTEGER;
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Name of the STS from where the plans are loaded into SQL plan baselines</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Owner of STS. NULL means current schema is the owner.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>A filter applied to the STS to select only qualifying plans to be loaded.</td>
</tr>
<tr>
<td></td>
<td>The filter can take the form of any WHERE clause predicate that can specified</td>
</tr>
<tr>
<td></td>
<td>against the view DBA_SQLSET_STATEMENTS. For example basic_filter =&gt; 'sql_text'</td>
</tr>
<tr>
<td></td>
<td>like '~/select /<em>LOAD_STS</em>/%'' or basic_filter =&gt; 'sql_id=&quot;b62q7nc33gzwx&quot;'.</td>
</tr>
<tr>
<td>fixed</td>
<td>Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES'</td>
</tr>
<tr>
<td></td>
<td>means the loaded plans are used as fixed plans and the SQL plan baseline will</td>
</tr>
<tr>
<td></td>
<td>not be evolved over time.</td>
</tr>
<tr>
<td>enabled</td>
<td>Default 'YES' means the loaded plans are enabled for use by the optimizer.</td>
</tr>
<tr>
<td>commit_rows</td>
<td>Number of SQL plans to load before doing a periodic commit.</td>
</tr>
<tr>
<td></td>
<td>This helps to shorten the undo log.</td>
</tr>
</tbody>
</table>

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.
MIGRATE_STORED_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

Syntax

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (   
    attribute_name     IN  VARCHAR2,
    attribute_value    IN  CLOB,
    fixed              IN  VARCHAR2 := 'NO')  
RETURN CLOB;
```

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (   
    outln_list         IN  DBMS_SPM.NAME_LIST,
    fixed              IN  VARCHAR2 := 'NO')  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name</td>
<td>Specifies the type of parameter used in attribute_value to identify the migrated stored outlines. It is case insensitive. Possible values:</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Based on attribute_name, this can be:</td>
</tr>
<tr>
<td>fixed</td>
<td>NO (default) or YES. Specifies the “fixed” status of the plans generated during migration. By default, plans are generated as “non-fixed” plans.</td>
</tr>
<tr>
<td>outln_list</td>
<td>List of outline names to be migrated</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

- Number of stored outlines successfully migrated
- Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

**Usage Note**

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.

- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to `DEFAULT`. The module name of a plan baseline is set to be the same as the stored outline.

- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.

- When user specifies to migrate all, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.
PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```sql
DBMS_SPM.PACK_STGTAB_BASELINE (  
    table_name       IN VARCHAR2,
    table_owner      IN VARCHAR2 := NULL,
    sql_handle       IN VARCHAR2 := NULL,
    plan_name        IN VARCHAR2 := NULL,
    sql_text         IN CLOB     := NULL,
    creator          IN VARCHAR2 := NULL,
    origin           IN VARCHAR2 := NULL,
    enabled          IN VARCHAR2 := NULL,
    accepted         IN VARCHAR2 := NULL,
    fixed            IN VARCHAR2 := NULL,
    module           IN VARCHAR2 := NULL,
    action           IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of staging table owner. Default NULL means current schema is the table owner</td>
</tr>
<tr>
<td>sql_handle</td>
<td>SQL handle (case sensitive)</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL text string (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>creator</td>
<td>Creator of SQL plan baseline (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>origin</td>
<td>Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)</td>
</tr>
<tr>
<td>enabled</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>accepted</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>fixed</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>module</td>
<td>Module (case sensitive)</td>
</tr>
<tr>
<td>action</td>
<td>Action (case sensitive)</td>
</tr>
</tbody>
</table>

Return Values

Number of SQL plan baselines packed
**UNPACK_STGTAB_BASELINE Function**

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

**Syntax**

```sql
DBMS_SPM.UNPACK_STGTAB_BASELINE (
    table_name       IN VARCHAR2,
    table_owner      IN VARCHAR2 := NULL,
    sql_handle       IN VARCHAR2 := NULL,
    plan_name        IN VARCHAR2 := NULL,
    sql_text         IN CLOB     := NULL,
    creator          IN VARCHAR2 := NULL,
    origin           IN VARCHAR2 := NULL,
    enabled          IN VARCHAR2 := NULL,
    accepted         IN VARCHAR2 := NULL,
    fixed            IN VARCHAR2 := NULL,
    module           IN VARCHAR2 := NULL,
    action           IN VARCHAR2 := NULL)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of staging table owner. Default NULL means current schema is the table owner</td>
</tr>
<tr>
<td>sql_handle</td>
<td>SQL handle (case sensitive)</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL text string (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>creator</td>
<td>Creator of SQL plan baseline (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>origin</td>
<td>Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)</td>
</tr>
<tr>
<td>enabled</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>accepted</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>fixed</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>module</td>
<td>Module (case sensitive)</td>
</tr>
<tr>
<td>action</td>
<td>Action (case sensitive)</td>
</tr>
</tbody>
</table>

**Return Values**

Number of plans unpacked
The DBMS_SQL package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL. For example, you can enter a DROP TABLE statement from within a stored procedure by using the PARSE procedure supplied with the DBMS_SQL package.

**See Also:** For more information on native dynamic SQL, see Oracle Database PL/SQL Language Reference.

Using DBMS_SQL

- Overview
- Security Model
- Constants
- Exceptions
- Operational Notes
- Examples
Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to DBMS_SQL that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than DBMS_SQL. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)

Also, there are some tasks that can only be performed using DBMS_SQL.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

See Also: Oracle Call Interface Programmer’s Guide

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the DBMS_SQL package. These differences include the following:

- The OCI uses bind by address, while the DBMS_SQL package uses bind by value.
- With DBMS_SQL you must call VARIABLE_VALUE to retrieve the value of an OUT parameter for an anonymous block, and you must call COLUMN_VALUE after fetching rows to actually retrieve the values of the columns in the rows into your program.
- The current release of the DBMS_SQL package does not provide CANCEL cursor procedures.
- Indicator variables are not required, because NULLs are fully supported as values of a PL/SQL variable.

A sample usage of the DBMS_SQL package follows. For users of the Oracle Call Interface, this code should seem fairly straightforward.
DBMS_SQL is a SYS-owned package compiled with AUTHID CURRENT_USER. Any DBMS_SQL subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

See Also: Oracle Database PL/SQL Language Reference for more information about using Invoker Rights or Definer Rights

In Oracle Database 11g, Release 1 (11.1), Oracle introduces a number of enhancements to DBMS_SQL to improve the security of the package.

Preventing Malicious or Accidental Access of Open Cursor Numbers
An error, ORA-29471, is raised when any DBMS_SQL subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and DBMS_SQL becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the IS_OPEN Function denotes a cursor currently open in the session, the return value is TRUE. If the actual value is NULL, then the return value is FALSE. Otherwise, this raises an ORA-29471 error.

Note that the OPEN_CURSOR Function is the only DBMS_SQL subprogram that has no formal parameter for the cursor number; rather, it returns a cursor number. Therefore it is not within the scope of these rules.

Preventing Inappropriate Use of a Cursor
Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single DBMS_SQL subprogram call. The check is:

- The current_user is the same on calling the subprogram as it was on calling the most recent parse.
- The enabled roles on calling the subprogram must be a superset of the enabled roles on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, and ORA-29470 error is raised.

The mechanism for defining when checks are performed is a new overload for the OPEN_CURSOR subprogram which takes a formal parameter, security_level, with allowed values NULL, 1 and 2.

- When security_level = 1 (or is NULL), the checks are made only when binding and executing.
- When security_level = 2, the checks are always made.

Upgrade Considerations
This security regime is stricter than those in Oracle Database 10g, Release 2 (10.2) and previous releases. As a consequence, users of DBMS_SQL may encounter runtime errors on upgrade. While these security enhancements make for more secure applications, users may wish to relax the security checks temporarily as they migrate to Oracle Database 11g, Release 1 (11.1). If so, please consult with Oracle Support on steps to relax the above security restrictions.
Constants

The constants described in Table 135–1 are used with the `language_flag` parameter of the PARSE Procedures.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V6</td>
<td>INTEGER</td>
<td>0</td>
<td>Specifies Oracle database version 6 behavior</td>
</tr>
<tr>
<td>NATIVE</td>
<td>INTEGER</td>
<td>1</td>
<td>Specifies normal behavior for the database to which the program is connected</td>
</tr>
<tr>
<td>V7</td>
<td>INTEGER</td>
<td>2</td>
<td>Specifies Oracle database version 7 behavior</td>
</tr>
</tbody>
</table>
Exceptions

```
inconsistent_type EXCEPTION;
   pragma exception_init(inconsistent_type, -6562);
```

This exception is raised by the `COLUMN_VALUE Procedure` or the `VARIABLE_VALUE Procedures` when the type of the given `OUT` parameter (for where to put the requested value) is different from the type of the value.
Operational Notes

- Execution Flow
- Processing Queries
- Processing Updates, Inserts, and Deletes
- Locating Errors

Execution Flow

1. OPEN_CURSOR
2. PARSE
3. BIND_VARIABLE or BIND_ARRAY
4. DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY
5. EXECUTE
6. FETCH_ROWS or EXECUTE_AND_FETCH
7. VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG
8. CLOSE_CURSOR

**OPEN_CURSOR**

To process a SQL statement, you must have an open cursor. When you call the OPEN_CURSOR Function, you receive a cursor ID number for the data structure representing a valid cursor maintained by Oracle. These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the DBMS_SQL package.

**PARSE**

Every SQL statement must be parsed by calling the PARSE Procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

The execution flow of DBMS_SQL is shown in Figure 135–1.
Figure 135–1  DBMS_SQL Execution Flow

This illustration describes execution flow in DBMS_SQL that begins with "open_cursor" and ends with "close_cursor". Key to the symbols used:

- ... -> denotes "continue to next step", for example "open cursor" -> "PARSE"
- ... material enclosed in double quotation marks denotes an action, for example "PARSE"
- ... material enclosed in single quotation marks denotes a choice point, for example 'Use bind variables': Yes/No

"open_cursor" -> "PARSE" -> Choice point: 'Use bind variables': Yes/No
'Use bind variables': Yes/No ...Yes -> "bind variable" (option to repeat) -> Choice point: 'query' ->
'Use bind variables': Yes/No ...No -> Choice point: 'query' ->
Choice point: 'query': Yes/No
  - Choice point: 'query': Yes/No ...Yes -> "DEFINE_COLUMN" (option to repeat) ->
    "EXECUTE" -> "FETCH_ROWS" -> "column_value, variable_value" (option to repeat) ->
    option to loop back to "EXECUTE", option to loop back to "fetch_rows",
    option to loop back to 'PARSE', option to loop back to 'Use bind variables', option
    to loop back to 'query' -> "close_cursor"
  - Choice point: query Yes/No ...No -> "EXECUTE" -> Choice point: pl/sql block(s):
    Yes/No
      – Choice point: pl/sql block(s): Yes/No ...Yes -> Choice point: 'Use variable
        values': Yes/No
        * Choice point: 'Use variable values': Yes/No ... Yes -> "variable_value"
          (option to repeat) -> option to loop back to "PARSE", option to loop back to
          'Use bind variables', option to loop back to 'query' -> close_cursor
        * Choice point: 'Use variable values': Yes/No ... No -> option to loop back to
          "PARSE", option to loop back to 'Use bind variables', option to loop back to
          'query' -> close_cursor
      – Choice point: pl/sql block(s): Yes/No ...No -> option to loop back to "PARSE",
        option to loop back to 'Use bind variables', option to loop back to 'query' ->
        close_cursor
***********************************************************************************************
BIND_VARIABLE or BIND_ARRAY
Many DML statements require that data in your program be input to Oracle. When
you define a SQL statement that contains input data to be supplied at runtime, you
must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the bind procedures,
the BIND_ARRAY Procedures on page 135-52 or the BIND_VARIABLE Procedures on
page 135-55, to supply the value of a variable in your program (or the values of an
array) to the placeholder. When the SQL statement is subsequently run, Oracle uses
the data that your program has placed in the output and input, or bind, variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind
variable. The BIND_ARRAY procedure lets you bind a collection of scalars, each value
of which is used as an input variable once for each EXECUTE. This is similar to the
array interface supported by the OCI.

DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY
The columns of the row being selected in a SELECT statement are identified by their
relative positions as they appear in the select list, from left to right. For a query, you
must call one of the define procedures (DEFINE_COLUMN, DEFINE_COLUMN_LONG, or
DEFINE_ARRAY) to specify the variables that are to receive the SELECT values, much
the way an INTO clause does for a static query.

Use the DEFINE_COLUMN_LONG procedure to define LONG columns, in the same way
that DEFINE_COLUMN is used to define non-LONG columns. You must call DEFINE_
COLUMN_LONG before using the COLUMN_VALUE_LONG procedure to fetch from the
LONG column.

Use the DEFINE_ARRAY procedure to define a PL/SQL collection into which you want
to fetch rows in a single SELECT statement. DEFINE_ARRAY provides an interface to
fetch multiple rows at one fetch. You must call DEFINE_ARRAY before using the
COLUMN_VALUE procedure to fetch the rows.
EXECUTE
Call the EXECUTE function to run your SQL statement.

FETCH_ROWS or EXECUTE_AND_FETCH
The FETCH_ROWS function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve anymore rows. Instead of calling EXECUTE and then FETCH_ROWS, you may find it more efficient to call EXECUTE_AND_FETCH if you are calling EXECUTE for a single execution.

VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG
For queries, call COLUMN_VALUE to determine the value of a column retrieved by the FETCH_ROWS call. For anonymous blocks containing calls to PL/SQL procedures or DML statements with returning clause, call VARIABLE_VALUE to retrieve the values assigned to the output variables when statements were run.

To fetch just part of a LONG database column (which can be up to two gigabytes in size), use the COLUMN_VALUE_LONG procedure. You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

CLOSE_CURSOR
When you no longer need a cursor for a session, close the cursor by calling CLOSE_CURSOR. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your Oracle Open Gateway documentation for additional information.

If you neglect to close a cursor, then the memory used by that cursor remains allocated even though it is no longer needed.

Processing Queries
If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the SELECT statement by calling the DEFINE_COLUMN Procedures, the DEFINE_COLUMN_LONG Procedure, or the DEFINE_ARRAY Procedure.
2. Run your SELECT statement by calling the EXECUTE Function.
3. Call the FETCH_ROWS Function (or EXECUTE_AND_FETCH) to retrieve the rows that satisfied your query.
4. Call COLUMN_VALUE Procedure or COLUMN_VALUE_LONG Procedure to determine the value of a column retrieved by the FETCH_ROWS Function for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables of these procedures.

Processing Updates, Inserts, and Deletes
If you are using dynamic SQL to process an INSERT, UPDATE, or DELETE, then you must perform the following steps:

1. You must first run your INSERT, UPDATE, or DELETE statement by calling the EXECUTE Function.
2. If statements have the returning clause, then you must call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables.
Locating Errors

There are additional functions in the DBMS_SQL package for obtaining information about the last referenced cursor in the session. The values returned by these functions are only meaningful immediately after a SQL statement is run. In addition, some error-locating functions are only meaningful after certain DBMS_SQL calls. For example, you call the LAST_ERROR_POSITION Function immediately after a PARSE.
Examples

This section provides example procedures that make use of the **DBMS_SQL** package.

**Example 1**

This example does not require the use of dynamic SQL because the text of the statement is known at compile time, but it illustrate the basic concept underlying the package.

The **DEMO** procedure deletes all of the employees from the **EMP** table whose salaries are greater than the salary that you specify when you run **DEMO**.

```sql
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
  cursor_name INTEGER;
  rows_processed INTEGER;
BEGIN
  cursor_name := dbms_sql.open_cursor;
  DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',
                  DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
  rows_processed := DBMS_SQL.EXECUTE(cursor_name);
  DBMS_SQL.CLOSE_CURSOR(cursor_name);
EXCEPTION
  WHEN OTHERS THEN
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

**Example 2**

The following sample procedure is passed a SQL statement, which it then parses and runs:

```sql
CREATE OR REPLACE PROCEDURE exec(STRING IN varchar2) AS
  cursor_name INTEGER;
  ret INTEGER;
BEGIN
  cursor_name := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
  ret := DBMS_SQL.EXECUTE(cursor_name);
  DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

DDL statements are run by the parse call, which performs the implied commit.

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@hq.com('CREATE TABLE acct(c1 integer)');
```
Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

- id of type NUMBER
- name of type VARCHAR2(30)
- birthdate of type DATE

This procedure does not specifically require the use of dynamic SQL; however, it illustrates the concepts of this package.

```sql
CREATE OR REPLACE PROCEDURE copy (
  source      IN VARCHAR2,
  destination IN VARCHAR2) IS

  id_var             NUMBER;
  name_var           VARCHAR2(30);
  birthdate_var      DATE;
  source_cursor      INTEGER;
  destination_cursor INTEGER;
  ignore             INTEGER;

BEGIN

  -- Prepare a cursor to select from the source table:
  source_cursor := dbms_sql.open_cursor;
  DBMS_SQL.PARSE(source_cursor,
    'SELECT id, name, birthdate FROM ' || source,
    DBMS_SQL.NATIVE);
  DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
  DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
  DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
  ignore := DBMS_SQL.EXECUTE(source_cursor);

  -- Prepare a cursor to insert into the destination table:
  destination_cursor := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(destination_cursor,
    'INSERT INTO ' || destination ||
    ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
    DBMS_SQL.NATIVE);

  -- Fetch a row from the source table and insert it into the destination table:
  LOOP
    IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
      -- get column values of the row
      DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
      DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
      DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

      DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
      DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
      DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
                                 birthdate_var);
      ignore := DBMS_SQL.EXECUTE(destination_cursor);
    ELSE
      -- No more rows to copy:
      EXIT;
    END IF;
  END LOOP;

END;
```

The procedure uses DBMS_SQL to prepare and execute SQL statements to copy rows from the source table to the destination table.
EXIT;
END IF;
END LOOP;

-- Commit and close all cursors:
COMMIT;
DBMS_SQL.CLOSE_CURSOR(source_cursor);
DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(source_cursor) THEN
    DBMS_SQL.CLOSE_CURSOR(source_cursor);
  END IF;
  IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
    DBMS_SQL.CLOSE_CURSOR(destination_cursor);
  END IF;
  RAISE;
END;
/

Examples 3, 4, and 5: Bulk DML
This series of examples shows how to use bulk array binds (table items) in the SQL DML statements INSERT, UPDATE and DELETE.

Here is an example of a bulk INSERT statement that demonstrates adding seven new employees to the emp table:

DECLARE
  stmt VARCHAR2(200);
  empno_array  DBMS_SQL.NUMBER_TABLE;
  empname_array DBMS_SQL.VARCHAR2_TABLE;
  jobs_array   DBMS_SQL.VARCHAR2_TABLE;
  mgr_array    DBMS_SQL.NUMBER_TABLE;
  hiredate_array DBMS_SQL.VARCHAR2_TABLE;
  sal_array    DBMS_SQL.NUMBER_TABLE;
  comm_array   DBMS_SQL.NUMBER_TABLE;
  deptno_array DBMS_SQL.NUMBER_TABLE;
  c            NUMBER;
  dummy        NUMBER;
BEGIN
  empno_array(1) := 9001;
  empno_array(2) := 9002;
  empno_array(3) := 9003;
  empno_array(4) := 9004;
  empno_array(5) := 9005;
  empno_array(6) := 9006;
  empno_array(7) := 9007;
  empname_array(1) := 'Dopey';
  empname_array(2) := 'Grumpy';
  empname_array(3) := 'Doc';
  empname_array(4) := 'Happy';
  empname_array(5) := 'Bashful';
  empname_array(6) := 'Sneezy';
  empname_array(7) := 'Sleepy';
  jobs_array(1) := 'Miner';
  jobs_array(2) := 'Miner';
  jobs_array(3) := 'Miner';
  jobs_array(4) := 'Miner';
Using DBMS_SQL

```sql
stmt := 'INSERT INTO emp VALUES(
    :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
    :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
```
Here is an example of a bulk UPDATE statement that demonstrates updating salaries for four existing employees in the emp table:

DECLARE
    stmt VARCHAR2(200);
    empno_array     DBMS_SQL.NUMBER_TABLE;
    salary_array    DBMS_SQL.NUMBER_TABLE;
    c               NUMBER;
    dummy           NUMBER;
BEGIN
    empno_array(1):= 7369;
    empno_array(2):= 7876;
    empno_array(3):= 7900;
    empno_array(4):= 7934;
    salary_array(1) := 10000;
    salary_array(2) := 10000;
    salary_array(3) := 10000;
    salary_array(4) := 10000;
    stmt := 'update emp set sal = :salary_array
            WHERE empno = :num_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
    DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
    dummy := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.CLOSE_CURSOR(c);
END;
/
SHOW ERRORS;

In a DELETE statement, for example, you could bind in an array in the WHERE clause and have the statement be run for each element in the array:

DECLARE
    stmt VARCHAR2(200);
    dept_no_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
BEGIN
    dept_no_array(1) := 10; dept_no_array(2) := 20;
    dept_no_array(3) := 30; dept_no_array(4) := 40;
    dept_no_array(5) := 30; dept_no_array(6) := 40;
    stmt := 'delete from emp where deptno = :dept_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);

EXCEPTION WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(c) THEN
    DBMS_SQL.CLOSE_CURSOR(c);
  END IF;
  RAISE;
END;
/

In the preceding example, only elements 1 through 4 are used as specified by the BIND_ARRAY call. Each element of the array potentially deletes a large number of employees from the database.

Examples 6 and 7: Defining an Array
The following examples show how to use the DEFINE_ARRAY procedure:

declare
  c       NUMBER;
  d       NUMBER;
  n_tab   DBMS_SQL.NUMBER_TABLE;
  indx    NUMBER := -10;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  dBMS_SQL.PARSE(c, 'select n from t order by 1', DBMS_SQL.NATIVE);
  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);
  d := DBMS_SQL.EXECUTE(c);
  loop
    d := DBMS_SQL.FETCH_ROWS(c);
    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    EXIT WHEN d != 10;
  END LOOP;
  DBMS_SQL.CLOSE_CURSOR(c);

EXCEPTION WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(c) THEN
    DBMS_SQL.CLOSE_CURSOR(c);
  END IF;
  RAISE;
END;
/

Each time the preceding example does a FETCH_ROWS Function call, it fetches 10 rows that are kept in DBMS_SQL buffers. When the COLUMN_VALUE Procedure call is run, those rows move into the PL/SQL table specified (in this case n_tab), at positions -10 to -1, as specified in the DEFINE statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at EXECUTE and keeps getting updated every time a COLUMN_VALUE call is made. If you re-execute at any point, then the current index for each DEFINE is re-initialized to "indx".
In this way the entire result of the query is fetched into the table. When FETCH_ROWS cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the DEFINE_ARRAY procedure:

Consider a table MULTI_TAB defined as:

```
CREATE TABLE multi_tab (num NUMBER,
  dat1 DATE,
  var VARCHAR2(24),
  dat2 DATE)
```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```plsql
declare
  c       NUMBER;
  d       NUMBER;
  n_tab  DBMS_SQL.NUMBER_TABLE;
  d_tab1 DBMS_SQL.DATE_TABLE;
  v_tab  DBMS_SQL.VARCHAR2_TABLE;
  d_tab2 DBMS_SQL.DATE_TABLE;
  indx NUMBER := 10;
begin
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);
  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);
  d := DBMS_SQL.EXECUTE(c);
  loop
    d := DBMS_SQL.FETCH_ROWS(c);
    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
    DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
    DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);
    exit when d != 5;
  end loop;
  DBMS_SQL.CLOSE_CURSOR(c);
/
```

The four tables can be used for anything. One usage might be to use BIND_ARRAY to move the rows to another table by using a statement such as 'INSERT into SOME_T values (:a, :b, :c, :d);

*/

exception when others then
  if dbms_sql.is_open(c) then
    dbms_sql.close_cursor(c);
  end if;
  raise;
```
Example 8: Describe Columns
This can be used as a substitute to the SQL*Plus DESCRIBE call by using a SELECT * query on the table that you want to describe.

```
DECLARE
  c           NUMBER;
  d           NUMBER;
  col_cnt     INTEGER;
  f           BOOLEAN;
  rec_tab     DBMS_SQL.DESC_TAB;
  col_num    NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);
  d := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);
  col_num := rec_tab.first;
  IF (col_num IS NOT NULL) THEN
    LOOP
      print_rec(rec_tab(col_num));
      col_num := rec_tab.next(col_num);
      EXIT WHEN (col_num IS NULL);
    END LOOP;
  END IF;
END;
/
```

```
/*
   Following loop could simply be for j in 1..col_cnt loop.
   Here we are simply illustrating some of the PL/SQL table
   features.
*/
```
Example 9: RETURNING clause

The RETURNING clause was added to DML statements in an earlier Oracle database release. With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions. These values are returned in bind variables.

DBMS_SQL.BIND_VARIABLE is used to bind these outbinds if a single row is inserted, updated, or deleted. If multiple rows are inserted, updated, or deleted, then DBMS_SQL.BIND_ARRAY is used. DBMS_SQL.VARIABLE_VALUE must be called to get the values in these bind variables.

---

Note: This is similar to DBMS_SQL.VARIABLE_VALUE, which must be called after running a PL/SQL block with an out-bind inside DBMS_SQL.

---

i) Single row insert

```sql
CREATE OR REPLACE PROCEDURE single_Row_insert
(c1 NUMBER, c2 NUMBER, r OUT NUMBER) is
    c NUMBER;
    n NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
        'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

ii) Single row update

```sql
CREATE OR REPLACE PROCEDURE single_Row_update
(c1 NUMBER, c2 NUMBER, r out NUMBER) IS
    c NUMBER;
    n NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
        'WHERE rownum < 2 ' ||
        'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```
iii) Single row delete

CREATE OR REPLACE PROCEDURE single_Row_Delete
  (c1 NUMBER, r OUT NUMBER) is
  c NUMBER;
  n number;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE ROWNUM = :bnd1 ' ||
                  'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

iv) Multiple row insert

CREATE OR REPLACE PROCEDURE multi_Row_insert
  (c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
   r OUT DBMS_SQL.NUMBER_TABLE) is
  c NUMBER;
  n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
                  'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

v) Multiple row Update.

CREATE OR REPLACE PROCEDURE multi_Row_update
  (c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
                  'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
vi) Multiple row delete

```
CREATE OR REPLACE PROCEDURE multi_row_delete
  (c1 DBMS_SQL.NUMBER_TABLE,
   r OUT DBMS_SQL.NUMBER_TABLE) is
  c NUMBER;
  n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
                   'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

vii) Out-bind in bulk PL/SQL

```
CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
  (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  r NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
  r := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/
```

---

**Note:**

bnd1 and bnd2 can be arrays as well. The value of the expression for all the rows updated will be in bnd3. There is no way of differentiating which rows were updated of each value of bnd1 and bnd2.

---

**Example 10: Binds and Defines of User-defined Types in DBMS_SQL**

CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/

INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
/*
  INSERT INTO depts
  VALUES('Asia', dnames_var('Finance','Payroll','Shipping','Sales'))
*/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2) IS
  some_dnames dnames_var;
  c NUMBER;
  r NUMBER;
  sql_stmt VARCHAR2(32767) :=
    'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names INTO :b3';

BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);
  DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
  DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
  DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);
  r := DBMS_SQL.EXECUTE(c);

  -- Get value of outbind variable
  DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);
  DBMS_SQL.CLOSE_CURSOR(c);

  -- select dept_names
  sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);
  DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
  DBMS_SQL.BIND_VARIABLE(c, 'b1', region);
  r := DBMS_SQL.EXECUTE_AND_FETCH(c);
  DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);
  DBMS_SQL.CLOSE_CURSOR(c);

  -- loop through some_dnames collections
  FOR i IN some_dnames.FIRST .. some_dnames.LAST  LOOP
    DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
  END LOOP;
END;

DECLARE
  new_dnames dnames_var;
BEGIN
  new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                           'Executive', 'Marketing');
  update_depts(new_dnames, 'Asia');
END;
Data Structures

The DBMS_SQL package defines the following RECORD types and TABLE types.

**RECORD Types**
- DESC_REC Record Type
- DESC_REC2 Record Type
- DESC_REC3 Record Type

**TABLE Types**
- BFILE_TABLE Table Type
- BINARY_DOUBLE_TABLE Table Type
- BINARY_FLOAT_TABLE Table Type
- BLOB_TABLE Table Type
- CLOB_TABLE Table Type
- DATE_TABLE Table Type
- DESC_TAB Table Type
- DESC_TAB2 Table Type
- DESC_TAB3 Table Type
- INTERVAL_DAY_TO_SECOND_TABLE Table Type
- INTERVAL_YEAR_TO_MONTH_TABLE Table Type
- NUMBER_TABLE Table Type
- TIME_TABLE Table Type
- TIME_WITH_TIME_ZONE_TABLE Table Type
- TIMESTAMP_TABLE Table Type
- TIMESTAMP_WITH_LTZ_TABLE Table Type
- TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type
- UROWID_TABLE Table Type
- VARCHAR2_TABLE Table Type
- VARCHAR2A Table Type
- VARCHAR2S Table Type
DESC_REC Record Type

Note: This type has been deprecated in favor of the DESC_REC2 Record Type.

This record type holds the describe information for a single column in a dynamic query. It is the element type of the DESCTAB table type and the DESCRIBE_COLUMNS Procedure.

Syntax

```
TYPE desc_rec IS RECORD (
  col_type            BINARY_INTEGER := 0,
  col_max_len         BINARY_INTEGER := 0,
  col_name            VARCHAR2(32)   := '',
  col_name_len        BINARY_INTEGER := 0,
  col_schema_name     VARCHAR2(32)   := '',
  col_schema_name_len BINARY_INTEGER := 0,
  col_schema_name_len BINARY_INTEGER := 0,
  col_precision       BINARY_INTEGER := 0,
  col_scale           BINARY_INTEGER := 0,
  col_charsetid       BINARY_INTEGER := 0,
  col_charsetform     BINARY_INTEGER := 0,
  col_null_ok         BOOLEAN        := TRUE);
```

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col_type</td>
<td>Type of column</td>
</tr>
<tr>
<td>col_max_len</td>
<td>Maximum column length</td>
</tr>
<tr>
<td>col_name</td>
<td>Name of column</td>
</tr>
<tr>
<td>col_name_len</td>
<td>Length of column name</td>
</tr>
<tr>
<td>col_schema_name</td>
<td>Column schema name</td>
</tr>
<tr>
<td>col_schema_name_len</td>
<td>Length of column schema name</td>
</tr>
<tr>
<td>col_precision</td>
<td>Precision of column</td>
</tr>
<tr>
<td>col_scale</td>
<td>Scale of column</td>
</tr>
<tr>
<td>col_charsetid</td>
<td>Column character set id</td>
</tr>
<tr>
<td>col_charsetform</td>
<td>Column character set form</td>
</tr>
<tr>
<td>col_null_ok</td>
<td>NULL column flag; TRUE, if NULL possible</td>
</tr>
</tbody>
</table>
DESC_REC2 Record Type

DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

This record type is identical to DESC_REC except for the col_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC_REC because column name values can be greater than 32 characters. DESC_REC is deprecated as a result.

Syntax

```
TYPE desc_rec2 IS RECORD (  
    col_type            binary_integer := 0,  
    col_max_len         binary_integer := 0,  
    col_name            varchar2(32767) := '',  
    col_name_len        binary_integer := 0,  
    col_schema_name     varchar2(32)   := '',  
    col_schema_name_len binary_integer := 0,  
    col_precision       binary_integer := 0,  
    col_scale           binary_integer := 0,  
    col_charsetid       binary_integer := 0,  
    col_charsetform     binary_integer := 0,  
    col_null_ok         boolean        := TRUE);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col_type</td>
<td>Type of column</td>
</tr>
<tr>
<td>col_max_len</td>
<td>Maximum column length</td>
</tr>
<tr>
<td>col_name</td>
<td>Name of column</td>
</tr>
<tr>
<td>col_name_len</td>
<td>Length of column name</td>
</tr>
<tr>
<td>col_schema_name</td>
<td>Column schema name</td>
</tr>
<tr>
<td>col_schema_name_len</td>
<td>Length of column schema name</td>
</tr>
<tr>
<td>col_precision</td>
<td>Precision of column</td>
</tr>
<tr>
<td>col_scale</td>
<td>Scale of column</td>
</tr>
<tr>
<td>col_charsetid</td>
<td>Column character set id</td>
</tr>
<tr>
<td>col_charsetform</td>
<td>Column character set form</td>
</tr>
<tr>
<td>col_null_ok</td>
<td>NULL column flag; TRUE, if NULL possible</td>
</tr>
</tbody>
</table>
DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (type_name) and type name len (type_name_len) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The col_type_name and col_type_name_len fields are only populated when the col_type field's value is 109, the Oracle type number for user-defined types.

Syntax

```sql
TYPE desc_rec3 IS RECORD (
    col_type                  binary_integer := 0,
    col_max_len               binary_integer := 0,
    col_name                  varchar2(32767) := '',
    col_name_len              binary_integer := 0,
    col_schema_name           varchar2(32) := '',
    col_schema_name_len       binary_integer := 0,
    col_precision             binary_integer := 0,
    col_scale                 binary_integer := 0,
    col_charsetid             binary_integer := 0,
    col_charsetform           binary_integer := 0,
    col_null_ok               boolean := TRUE,
    col_type_name             varchar2(32767) := '',
    col_type_name_len         binary_integer := 0);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col_type</td>
<td>Type of column</td>
</tr>
<tr>
<td>col_max_len</td>
<td>Maximum column length</td>
</tr>
<tr>
<td>col_name</td>
<td>Name of column</td>
</tr>
<tr>
<td>col_name_len</td>
<td>Length of column name</td>
</tr>
<tr>
<td>col_schema_name</td>
<td>Column schema name</td>
</tr>
<tr>

<td>NULL column flag; TRUE, if NULL possible</td>
</tr>
<tr>
<td>col_type_name</td>
<td>User-define type column type name, this field is valid when col_type is 109</td>
</tr>
<tr>
<td>col_type_name_len</td>
<td>Length of user-define type column type name, this field is valid when col_type is 109</td>
</tr>
</tbody>
</table>
**BFILE_TABLE Table Type**

This is a table of BFILE.

**Syntax**

```sql
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```
BINARY_DOUBLE_TABLE Table Type

This is a table of BINARY_DOUBLE.

Syntax

TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
**BINARY_FLOAT_TABLE Table Type**

This is a table of BINARY_FLOAT.

**Syntax**

```sql
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```
BLOB_TABLE Table Type

This is a table of BLOB.

Syntax

TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
CLOB_TABLE Table Type

This is a table of CLOB.

Syntax

```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
```
DATE_TABLE Table Type

This is a table of DATE.

Syntax

```plsql
type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
```
DESC_TAB Table Type

This is a table of DESC_REC Record Type.

Syntax

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```
DESC_TAB2 Table Type

This is a table of DESC_REC2 Record Type.

Syntax

```plsql
TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;
```
DESC_TAB3 Table Type

This is a table of DESC_REC3 Record Type.

Syntax

TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;
INTERVAL_DAY_TO_SECOND_TABLE Table Type

This is a table of DSINTERVAL_UNCONSTRAINED.

Syntax

```sql
TYPE interval_day_to_second_table IS TABLE OF
  DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
```
INTERVAL_YEAR_TO_MONTH_TABLE Table Type

This is a table of YMINTERVAL_UNCONSTRAINED.

Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED
  INDEX BY BINARY_INTEGER;
```
NUMBER_TABLE Table Type

This is a table of NUMBER.

Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```
TIME_TABLE Table Type

This is a table of TIME_UNCONSTRAINED.

Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```
TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of TIME_TZ_UNCONSTRAINED.

Syntax

TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED
INDEX BY BINARY_INTEGER;
**TIMESTAMP_TABLE Table Type**

This is a table of `TIMESTAMP_UNCONSTRAINED`.

**Syntax**

```sql
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```
TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of TIMESTAMP_LTZ_UNCONSTRAINED

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF
    TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```
TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of TIMESTAMP_TZ_UNCONSTRAINED.

Syntax

```
TYPE timestamp_with_time_zone_table IS TABLE OF TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```
UROWID_TABLE Table Type

This is a table of UROWID.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```
VARCHAR2_TABLE Table Type

This is table of VARCHAR2 (2000).

Syntax

```sql
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```
VARCHAR2A Table Type

This is table of VARCHAR2 (32767).

Syntax

```sql
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```
**VARCHAR2S Table Type**

This is table of `VARCHAR2 (256)`.

---

**Note:** This type has been superseded by the [VARCHAR2A Table Type](#). Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

---

**Syntax**

```sql
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```
Summary of DBMS_SQL Subprograms

Table 135–5  DBMS_SQL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIND_ARRAY Procedures on page 135-52</td>
<td>Binds a given value to a given collection</td>
</tr>

</tbody>
</table>
BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```sql
DBMS_SQL.BIND_ARRAY ( 
    c                   IN INTEGER, 
    name                IN VARCHAR2, 
    <table_variable>    IN <datatype> 
    [,index1              IN INTEGER, 
    index2              IN INTEGER]) );
```

Where the `<table_variable>` and its corresponding `<datatype>` can be any one of the following matching pairs:

- `<clob_tab>`     Clob_Table
- `<bflt_tab>`     Binary_Float_Table
- `<bdbl_tab>`     Binary_Double_Table
- `<blob_tab>`     Blob_Table
- `<bfile_tab>`    Bfile_Table
- `<date_tab>`     Date_Table
- `<num_tab>`      Number_Table
- `<urowid_tab>`   Urowid_Table
- `<vchr2_tab>`    Varchar2_Table
- `<tm_tab>`       Time_Table
- `<ttz_tab>`      Time_With_Time_Zone_Table
- `<tms_tab>`      Timestamp_Table
- `<tstz_tab>`     Timestamp_With_Tz_Table
- `<tstz_tab>`     Timestamp_With_Time_Zone_Table
- `<ids_tab>`      Interval_Day_To_Second_Table
- `<iym_tab>`      Interval_Year_To_Month_Table

Notice that the BIND_ARRAY procedure is overloaded to accept different datatypes.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind a value.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the collection in the statement.</td>
</tr>
<tr>
<td>table_variable</td>
<td>Local variable that has been declared as <code>&lt;datatype&gt;</code>.</td>
</tr>
<tr>
<td>index1</td>
<td>Index for the table element that marks the lower bound of the range.</td>
</tr>
<tr>
<td>index2</td>
<td>Index for the table element that marks the upper bound of the range.</td>
</tr>
</tbody>
</table>

Usage Notes

The length of the bind variable name should be <=30 bytes.

For binding a range, the table must contain the elements that specify the range — `tab(index1)` and `tab(index2)` — but the range does not have to be dense. `Index1` must be less than or equal to `index2`. All elements between `tab(index1)` and `tab(index2)` are used in the bind.
If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

See Also: "Examples 3, 4, and 5: Bulk DML" on page 135-14 for examples of how to bind collections.

Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The `DBMS_SQL` package lets you work on collections of data using the PL/SQL table type.

Table items are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local `DBMS_SQL` buffers (the same as for all scalar types) and then the table is manipulated from the local `DBMS_SQL` buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in `DBMS_SQL`.

```plsql
TYPE binary_double_table
  IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;

TYPE binary_float_table
  IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;

TYPE bfile_table
  IS TABLE OF BFILE INDEX BY BINARY_INTEGER;

TYPE blob_table
  IS TABLE OF BLOB INDEX BY BINARY_INTEGER;

TYPE clob_table
  IS TABLE OF CLOB INDEX BY BINARY_INTEGER;

TYPE date_table
  IS TABLE OF DATE INDEX BY BINARY_INTEGER;

TYPE interval_day_to_second_Table
  IS TABLE OF dsinterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE interval_year_to_MONTH_Table
  IS TABLE OF yminterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE number_table
  IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;

TYPE time_table
  IS TABLE OF time_unconstrained INDEX BY BINARY_INTEGER;

TYPE time_with_time_zone_table
```
IS TABLE OF time_tz_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_table IS TABLE OF timestamp_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_with_ltz_Table IS TABLE OF timestamp_ltz_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_with_time_zone_Table IS TABLE OF timestamp_tz_unconstrained INDEX BY BINARY_INTEGER;

TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;

TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
**BIND_VARIABLE Procedures**

This procedures binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

**Syntax**

```sql
DBMS_SQL.BIND_VARIABLE (  
c              IN INTEGER,  
name           IN VARCHAR2,  
value          IN <datatype>);
```

Where `<datatype>` can be any one of the following types:

- BINARY_DOUBLE
- BINARY_FLOAT
- BFILE
- BLOB
- CLOB CHARACTER SET ANY_CS
- DATE
- DSINTERVAL_UNCONSTRAINED
- NUMBER
- TIME_UNCONSTRAINED
- TIME_TZ_UNCONSTRAINED
- TIMESTAMP_LTZ_UNCONSTRAINED
- TIMESTAMP_TZ_UNCONSTRAINED
- TIMESTAMP_UNCONSTRAINED
- UROWID
- VARCHAR2 CHARACTER SET ANY_CS
- YMINTERVAL_UNCONSTRAINED
- user-defined object types
- collections (VARRAYs and nested tables)
- REFs
- Opaque types

Notice that `BIND_VARIABLE` is overloaded to accept different datatypes.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets `[]` indicate an optional parameter for the `BIND_VARIABLE` function.

```sql
DBMS_SQL.BIND_VARIABLE (  
c              IN INTEGER,  
name           IN VARCHAR2,  
value          IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```sql
DBMS_SQL.BIND_VARIABLE_CHAR (  
c              IN INTEGER,  
name           IN VARCHAR2,  
value          IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

```sql
DBMS_SQL.BIND_VARIABLE_RAW (  
c              IN INTEGER,  
name           IN VARCHAR2,  
value          IN RAW [,out_value_size IN INTEGER]);
```

```sql
DBMS_SQL.BIND_VARIABLE_ROWID (  
c              IN INTEGER,  
name           IN VARCHAR2,  
value          IN UROWID [,out_value_size IN INTEGER]);
```
name           IN VARCHAR2,  
value          IN ROWID);  

See Also: Oracle Database SecureFiles and Large Objects Developer’s Guide

Pragmas

pragma restrict_references(bind_variable,WNDS);  

Parameters

Table 135–7  BIND_VARIABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind a value.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the variable in the statement.</td>
</tr>
<tr>
<td>value</td>
<td>Value that you want to bind to the variable in the cursor.</td>
</tr>
<tr>
<td>out_value_size</td>
<td>Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable.</td>
</tr>
<tr>
<td></td>
<td>If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized.</td>
</tr>
</tbody>
</table>

Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```sql
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```sql
BIND_VARIABLE(cursor_name, ':X', 3500);  
```

or

```sql
BIND_VARIABLE (cursor_name, 'X', 3500);  
```

The length of the bind variable name should be <=30 bytes.

See Also: "Examples 3, 4, and 5: Bulk DML" on page 135-14 for examples of how to bind collections.
CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

DBMS_SQL.CLOSE_CURSOR (c IN OUT INTEGER);

Pragmas

pragma restrict_references(close_cursor,RNDS,WNDS);

Parameters

<table>
<thead>
<tr>
<th>Table 135–8</th>
<th>CLOSE_CURSOR Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Mode</td>
</tr>
<tr>
<td>c</td>
<td>IN</td>
</tr>
<tr>
<td>c</td>
<td>OUT</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.

Syntax

```
DBMS_SQL.COLUMN_VALUE ( 
  c                 IN  INTEGER, 
  position          IN  INTEGER, 
  value             OUT <datatype>, 
  [,column_error    OUT NUMBER], 
  [,actual_length   OUT INTEGER]);
```

Where square brackets [ ] indicate optional parameters and `<datatype>` can be any one of the following types:

- BINARY_DOUBLE
- BINARY_FLOAT
- BFILE
- BLOB
- CLOB CHARACTER SET ANY_CS
- DATE
- DSINTERVAL_UNCONSTRAINED
- NUMBER
- TIME_TZ_UNCONSTRAINED
- TIME_UNCONSTRAINED
- TIMESTAMP_LTZ_UNCONSTRAINED
- TIMESTAMP_TZ_UNCONSTRAINED
- TIMESTAMP_UNCONSTRAINED
- UROWID
- VARCHAR2 CHARACTER SET ANY_CS
- YMINTERVAL_UNCONSTRAINED
- user-defined object types
- collections (VARRAYs and nested tables)
- REFS
- Opaque types

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR ( 
  c               IN  INTEGER, 
  position        IN  INTEGER, 
  value           OUT CHAR CHARACTER SET ANY_CS, 
  [,column_error    OUT NUMBER], 
  [,actual_length   OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_RAW ( 
  c               IN  INTEGER, 
  position        IN  INTEGER, 
  value           OUT RAW, 
  [,column_error    OUT NUMBER], 
  [,actual_length   OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_ROWID ( 
  c               IN  INTEGER, 
  position        IN  INTEGER, 
  value           OUT ROWID, 
  [,column_error    OUT NUMBER]);
```
\[,\text{actual_length} \quad \text{OUT INTEGER}]\};

The following syntax enables the `COLUMN_VALUE` procedure to accommodate bulk operations:

```sql
DBMS_SQL.COLUMN_VALUE(
    c                  IN             INTEGER,
    position           IN             INTEGER,
    <param_name>       IN OUT NOCOPY  <table_type>);
```

Where the `<param_name>` and its corresponding `<table_type>` can be any one of these matching pairs:

- `bdbl_tab`       Binary_Double_Table
- `bflt_tab`       Binary_Float_Table
- `bf_tab`         Bfile_Table
- `bl_tab`         Blob_Table
- `cl_tab`         Clob_Table
- `d_tab`          Date_Table
- `ids_tab`        Interval_Day_To_Sec_Table
- `iym_tab`        Interval_Year_To_Month_Table
- `n_tab`          Number_Table
- `tm_tab`         Time_Table
- `ttz_tab`        Time_With_Time_Zone_Table
- `tms_tab`        Timestamp_Table
- `tstz_tab`       Timestamp_With_Time_Zone_Table
- `ur_tab`         Urowid_Table
- `c_tab`          Varchar2_Table

**Pragmas**

```sql
pragma restrict_references(column_value,RNDS,WNDS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>c</code></td>
<td>ID number of the cursor from which you are fetching the values.</td>
</tr>
<tr>
<td><code>position</code></td>
<td>Relative position of the column in the cursor.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>Returns the value at the specified column.</td>
</tr>
<tr>
<td></td>
<td>Oracle raises exception ORA-06562, <code>inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>DEFINE_COLUMN</code>.</td>
</tr>
<tr>
<td><code>column_error</code></td>
<td>Returns any error code for the specified column value.</td>
</tr>
<tr>
<td><code>actual_length</code></td>
<td>The actual length, before any truncation, of the value in the specified column.</td>
</tr>
</tbody>
</table>
### Exceptions

INCONSISTENT_TYPE (ORA-06562) is raised if the type of the given OUT parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure DEFINE_COLUMN.

**See Also:** Oracle Database SecureFiles and Large Objects Developer’s Guide
COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

```sql
DBMS_SQL.COLUMN_VALUE_LONG (  
c            IN  INTEGER,  
position     IN  INTEGER,  
length       IN  INTEGER,  
offset       IN  INTEGER,  
value        OUT VARCHAR2,  
value_length OUT INTEGER);  
```

Pragmas

```sql
pragma restrict_references(column_value_long,RNDS,WNDS);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor from which to get the value.</td>
</tr>
<tr>
<td>position</td>
<td>Position of the column of which to get the value.</td>
</tr>
<tr>
<td>length</td>
<td>Number of bytes of the long value to fetch.</td>
</tr>
<tr>
<td>offset</td>
<td>Offset into the long field for start of fetch.</td>
</tr>
<tr>
<td>value</td>
<td>Value of the column as a VARCHAR2.</td>
</tr>
<tr>
<td>value_length</td>
<td>Number of bytes actually returned in value.</td>
</tr>
</tbody>
</table>
DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a FETCH_ROWS call). This procedure lets you do batch fetching of rows from a single SELECT statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into DBMS_SQL buffers until you run a COLUMN_VALUE call, at which time the rows are copied into the table that was passed as an argument to the COLUMN_VALUE call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using DBMS_SQL. (These are the same types as you can specify for the BIND_ARRAY procedure.)

```
TYPE binary_double_table
  IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;

TYPE binary_float_table
  IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;

TYPE bfile_table
  IS TABLE OF BFILE INDEX BY BINARY_INTEGER;

TYPE blob_table
  IS TABLE OF BLOB INDEX BY BINARY_INTEGER;

TYPE clob_table
  IS TABLE OF CLOB INDEX BY BINARY_INTEGER;

TYPE date_table
  IS TABLE OF DATE INDEX BY BINARY_INTEGER;

TYPE interval_day_to_second_Table
  IS TABLE OF dsinterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE interval_year_to_MONTH_Table
  IS TABLE OF yminterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE number_table
  IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;

TYPE time_table
  IS TABLE OF time_unconstrained INDEX BY BINARY_INTEGER;

TYPE time_with_time_zone_table
  IS TABLE OF time_tz_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_table
  IS TABLE OF timestamp_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_with_ltz_Table
  IS TABLE OF timestamp_ltz_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_with_time_zone_Table
  IS TABLE OF timestamp_tz_unconstrained INDEX BY BINARY_INTEGER;

TYPE urowid_table
  IS TABLE OF UROWID INDEX BY BINARY_INTEGER;

TYPE varchar2_table
  IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

Syntax

```
DBMS_SQL.DEFINE_ARRAY (  
c           IN INTEGER,  
position    IN INTEGER,  
<table_variable>    IN <datatype>  
cnt         IN INTEGER,  
lower_bnd   IN INTEGER);
```
Where <table_variable> and its corresponding <datatype> can be any one of the following matching pairs, DEFINE_ARRAY being overloaded to accept different datatypes:

- <clob_tab>     Clob_Table
- <bflt_tab>     Binary_Float_Table
- <dbd1_tab>     Binary_Double_Table
- <blob_tab>     Blob_Table
- <bfile_tab>    Bfile_Table
- <date_tab>     Date_Table
- <num_tab>      Number_Table
- <urowid_tab>   Urowid_Table
- <vchr2_tab>    Varchar2_Table
- <tm_tab>       Time_Table
- <ttz_tab>      Time_With_Time_Zone_Table
- <ttms_tab>     Time_With_Time_Zone_Table
- <ids_tab>      Interval_Day_To_Second_Table
- <iym_tab>      Interval_Year_To_Month_Table

**Pragmas**

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent FETCH_ROWS call fetch "count" rows. When the COLUMN_VALUE call is made, these rows are placed in positions lower_bnd, lower_bnd+1, lower_bnd+2, and so on. While there are still rows coming, the user keeps issuing FETCH_ROWS/COLUMN_VALUE calls. The rows keep accumulating in the table specified as an argument in the COLUMN_VALUE call.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind an array.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the array being defined.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
<tr>
<td>table_variable</td>
<td>Local variable that has been declared as &lt;datatype&gt;.</td>
</tr>
<tr>
<td>cnt</td>
<td>Number of rows that must be fetched.</td>
</tr>
<tr>
<td>lower_bnd</td>
<td>Results are copied into the collection, starting at this lower bound index.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The count (cnt) must be an integer greater than zero; otherwise an exception is raised. The lower_bnd can be positive, negative, or zero. A query on which a DEFINE_ARRAY call was issued cannot contain array binds.

**Examples**

```sql
PROCEDURE BULK_PLSQL(deptid NUMBER)
    TYPE namelist IS TABLE OF employees.last_name%TYPE;
    TYPE sallist IS TABLE OF employees.salary%TYPE;
    names    namelist;
    sals     sallist;
```

DBMS_SQL  135-63
DEFINE_ARRAY Procedure

```
c        NUMBER;
r        NUMBER;
sql_stmt VARCHAR2(32767) :=
    'SELECT last_name, salary FROM employees WHERE department_id = :b1';
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);
    DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);
    DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
    DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);
    r := DBMS_SQL.EXECUTE(c);
    LOOP
        r := DBMS_SQL.FETCH_ROWS(c);
        DBMS_SQL.COLUMN_VALUE(c, 1, names);
        DBMS_SQL.COLUMN_VALUE(c, 2, sals);
        EXIT WHEN r != 5;
    END LOOP;
    DBMS_SQL.CLOSE_CURSOR(c);
    -- loop through the names and sals collections
    FOR i IN names.FIRST .. names.LAST  LOOP
        DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
    END LOOP;
END;
/```

See Also: “Examples 6 and 7: Defining an Array” on page 135-17 for examples of how to define collections.
**DEFINE_COLUMN Procedures**

This procedure defines a column to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

**Syntax**

```sql
DBMS_SQL.DEFINE_COLUMN (
    c              IN INTEGER,
    position       IN INTEGER,
    column         IN <datatype>);
```

Where `<datatype>` can be any one of the following types:

- BINARY_DOUBLE
- BINARY_FLOAT
- BFILE
- BLOB
- CLOB CHARACTER SET ANY_CS
- DATE
- DSINTERVAL_UNCONSTRAINED
- NUMBER
- TIME_UNCONSTRAINED
- TIME_TZ_UNCONSTRAINED
- TIMESTAMP_LTZ_UNCONSTRAINED
- TIMESTAMP_TZ_UNCONSTRAINED
- TIMESTAMP_UNCONSTRAINED
- UROWID
- YMINTERVAL_UNCONSTRAINED
- user-defined object types
- collections (VARRAYs and nested tables)
- REFs
- Opaque types

Note that DEFINE_COLUMN is overloaded to accept different datatypes.

The following syntax is also supported for the DEFINE_COLUMN procedure:

```sql
DBMS_SQL.DEFINE_COLUMN (
    c              IN INTEGER,
    position       IN INTEGER,
    column         IN VARCHAR2 CHARACTER SET ANY_CS,
    column_size    IN INTEGER);
```

**See Also:** Oracle Database SecureFiles and Large Objects Developer’s Guide

**Pragmas**

```sql
pragma restrict_references(define_column,RNDS,WNDS);
```
Parameters

When using character length semantics the maximum number of bytes that can be returned for a column value of type `VARCHAR2` is calculated as: `column_size` * maximum character byte size for the current characterset. For example, specifying the `column_size` as 10 means that a maximum of 30 (10*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.
DEFINe_COLUMN_CHAR Procedure

This procedure defines a column with CHAR data to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_LONG Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_CHAR (
    c              IN INTEGER,
    position       IN INTEGER,
    column         IN CHAR CHARACTER SET ANY_CS,
    column_size    IN INTEGER);
```

See Also: Oracle Database SecureFiles and Large Objects Developer's Guide

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined. The type of this value determines the type for the column being defined.</td>
</tr>
<tr>
<td>column_size</td>
<td>Maximum expected size of the column value in characters for columns of type CHAR.</td>
</tr>
</tbody>
</table>

DEFINE_COLUMN_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```sql
DBMS_SQL.DEFINE_COLUMN_LONG (  
c              IN INTEGER,  
position       IN INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
</tbody>
</table>
DEFINE_COLUMN_RAW Procedure

This procedure defines a column of type RAW to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```sql
DBMS_SQL.DEFINE_COLUMN_RAW (
    c              IN INTEGER,
    position       IN INTEGER,
    column         IN RAW,
    column_size    IN INTEGER);
```

**Pragmas**

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined. The type of this value determines the type for the column being defined.</td>
</tr>
<tr>
<td>column_size</td>
<td>Maximum expected size of the column value in bytes for columns of and RAW</td>
</tr>
</tbody>
</table>

**See Also:** Oracle Database SecureFiles and Large Objects Developer’s Guide
DEFINE_COLUMN_ROWID Procedure

This procedure defines a column of type ROWID to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure and DEFINE_COLUMN_RAW Procedure.

Syntax

```sql
DBMS_SQL.DEFINE_COLUMN_ROWID (  
c              IN INTEGER,  
position       IN INTEGER,  
column         IN ROWID);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined. The type of this value determines the type for the column being defined.</td>
</tr>
</tbody>
</table>
```

See Also: Oracle Database SecureFiles and Large Objects Developer’s Guide
DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

Syntax

```dbms_sql
dbms_sql.describe_columns (  
c              in  integer,  
col_cnt        out integer,  
desc_t         out desc_tab);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the columns being described</td>
</tr>
<tr>
<td>col_cnt</td>
<td>Number of columns in the select list of the query</td>
</tr>
<tr>
<td>desc_t</td>
<td>Describe table to fill in with the description of each of the columns of the query</td>
</tr>
</tbody>
</table>

See Also: "Example 8: Describe Columns" on page 135-19 illustrates how to use DESCRIBE_COLUMNS.
DESCRIBE_COLUMN2 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIPTION_COLUMN2 (  
    c              IN  INTEGER,  
    col_cnt        OUT INTEGER,  
    desc_t         OUT DESC_TAB2);  
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_column2, WNDS);  
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the columns being described.</td>
</tr>
<tr>
<td>col_cnt</td>
<td>Number of columns in the select list of the query.</td>
</tr>
<tr>
<td>desc_t</td>
<td>Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.</td>
</tr>
</tbody>
</table>
```
**DESCRIBE_COLUMNS3 Procedure**

This procedure describes the specified column. This is an alternative to `DESCRIBE_COLUMNS` Procedure.

**Syntax**

```sql
DBMS_SQL.DESCRIBE_COLUMNS3 ( c              IN  INTEGER,
                                col_cnt        OUT INTEGER,
                                desc_t         OUT DESC_TAB3);
```

**Pragmas**

```sql
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the columns being described.</td>
</tr>
<tr>
<td>col_cnt</td>
<td>Number of columns in the select list of the query.</td>
</tr>
<tr>
<td>desc_t</td>
<td>Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The cursor passed in by the cursor ID has to be **OPENed** and **PARSED**, otherwise an "invalid cursor id" error is raised.

**Examples**

```sql
CREATE TYPE PROJECT_T AS OBJECT
    ( projname          VARCHAR2(20),
      mgr               VARCHAR2(20))
/
CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/
DECLARE
    curid      NUMBER;
    desctab    DBMS_SQL.DESC_TAB3;
    colcnt     NUMBER;
    sql_stmt   VARCHAR2(200) := 'select * from projecttab';
BEGIN
    curid := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);
    FOR i IN 1 .. colcnt LOOP
        IF desctab(i).col_type = 109 THEN
            -- Further processing...
        END IF;
    END LOOP;
END;
```

---

**Table 135–20  DESCRIBE_COLUMNS3 Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the columns being described.</td>
</tr>
<tr>
<td>col_cnt</td>
<td>Number of columns in the select list of the query.</td>
</tr>
<tr>
<td>desc_t</td>
<td>Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.</td>
</tr>
</tbody>
</table>
DESCRIBE_COLUMNS3 Procedure

```
DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '. ' ||
                      desctab(i).col_type_name);
END IF;
END LOOP;

DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

Output:

PROJECT is user-defined type: HR.PROJECT_T
```
EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed. The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types of statements, including DDL, the return value is undefined and should be ignored.

Syntax

```sql
DBMS_SQL.EXECUTE (  
   c   IN INTEGER)  
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor to execute.</td>
</tr>
</tbody>
</table>

Return Values

Returns number of rows processed

Usage Notes

The DBMS_SQL cursor that is returned by the TO_CURSOR_NUMBER Function performs in the same way as a DBMS_SQL cursor that has already been executed. Consequently, calling EXECUTE for this cursor will cause an error.
EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows. This function provides the same functionality as calling EXECUTE and then calling FETCH_ROWS. Calling EXECUTE_AND_FETCH instead, however, may reduce the number of network round-trips when used against a remote database.

The EXECUTE_AND_FETCH function returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (c              IN INTEGER,
                              exact          IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(execute_and_fetch,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to execute and fetch.</td>
</tr>
<tr>
<td>exact</td>
<td>Set to TRUE to raise an exception if the number of rows actually matching the query differs from one.</td>
</tr>
<tr>
<td></td>
<td>Note: Oracle does not support the exact fetch TRUE option with LONG columns.</td>
</tr>
<tr>
<td></td>
<td>Even if an exception is raised, the rows are still fetched and available.</td>
</tr>
</tbody>
</table>

Return Values

Returns designated rows
FETCH_ROWS Function

This function fetches a row from a given cursor. You can call FETCH_ROWS repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling COLUMN_VALUE, for each column, after each call to FETCH_ROWS.

The FETCH_ROWS function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

DBMS_SQL.FETCH_ROWS (c              IN INTEGER) RETURN INTEGER;

Pragmas

pragma restrict_references(fetch_rows,WNDS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number.</td>
</tr>
</tbody>
</table>

Return Values

Returns a row from a given cursor
IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

```
DBMS_SQL.IS_OPEN (  
c              IN INTEGER)  
RETURN BOOLEAN;
```

Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor to check.</td>
</tr>
</tbody>
</table>

Return Values

Returns **TRUE** for any cursor number that has been opened but not closed, and **FALSE** for a **NULL** cursor number. Note that the **CLOSE_CURSOR Procedure** Procedure **NULLs** out the cursor variable passed to it.

Exceptions

**ORA-29471 DBMS_SQL access denied:** This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent DBMS_SQL call in the same session will raise this error, meaning that DBMS_SQL is non-operational for this session.
LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```
DBMS_SQL.LAST_ERROR_POSITION
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_error_position,RNDS,WNDS);
```

Return Values

Returns the byte offset in the SQL statement text where the error occurred

Usage Notes

Call this function after a PARSE call, before any other DBMS_SQL procedures or functions are called.
LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```sql
DBMS_SQL.LAST_ROW_COUNT
    RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(last_row_count,RNDS,WNDS);
```

Return Values

Returns the cumulative count of the number of rows fetched

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call. If called after an EXECUTE call, then the value returned is zero.
LAST_ROW_ID Function

This function returns the ROWID of the last row processed.

Syntax

```sql
DBMS_SQL.LAST_ROW_ID
    RETURN ROWID;
```

Pragmas

```sql
pragma restrict_references(last_row_id,RNDS,WNDS);
```

Return Values

Returns the ROWID of the last row processed

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call.
LAST_SQL_FUNCTION_CODE Function

This function returns the SQL function code for the statement. These codes are listed in the Oracle Call Interface Programmer’s Guide.

Syntax

```sql
DBMS_SQL.LAST_SQL_FUNCTION_CODE
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

Return Values

Returns the SQL function code for the statement

Usage Notes

You should call this function immediately after the SQL statement is run; otherwise, the return value is undefined.
OPEN_CURSOR Function

This procedure opens a new cursor. The second overload takes a `security_level` parameter to apply fine-grained control to the security of the opened cursor.

When you no longer need this cursor, you must close it explicitly by calling the CLOSE_CURSOR Procedure.

Syntax

```dbms_sql
DBMS_SQL.OPEN_CURSOR
RETURN INTEGER;
```

```dbms_sql
DBMS_SQL.OPEN_CURSOR (security_level IN INTEGER)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `security_level` | Specifies the level of security protection to enforce on the opened cursor. Valid security level values are 0, 1, and 2. When a NULL argument value is provided to this overload, as well as for cursors opened using the overload of open_cursor without the `security_level` parameter, the default security level value 1 will be enforced on the opened cursor.  
  - Level 0 - allows all DBMS_SQL operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default.  
  - Level 1 - requires that the effective userid and roles of the caller to DBMS_SQL for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.  
  - Level 2 - requires that the effective userid and roles of the caller to DBMS_SQL for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor. |

Pragmas

```dbms_sql
pragma restrict_references(open_cursor,RNDS,WNDS);
```

Return Values

Returns the cursor ID number of the new cursor

Usage Notes

You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.
PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are three versions of the PARSE procedure:

- Taking a VARCHAR2 statement as an argument
- Taking VARCHAR2a, table of VARCHAR2(32767), as an argument. The VARCHAR2A overload version of the procedure concatenates elements of a PL/SQL table statement and parses the resulting string. You can use this procedure to parse a statement that is longer than the limit for a single VARCHAR2 variable by splitting up the statement.
- Taking a CLOB statement as an argument. You can use the CLOB overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

```
DBMS_SQL.PARSE (  
c                           IN   INTEGER,  
statement                   IN   VARCHAR2,  
language_flag               IN   INTEGER,  
edition                     IN   VARCHAR2 DEFAULT NULL,  
apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,  
fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE);  
```

```
DBMS_SQL.PARSE (  
c                           IN   INTEGER,  
statement                   IN   CLOB,  
language_flag               IN   INTEGER,  
edition                     IN   VARCHAR2 DEFAULT NULL,  
apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,  
fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE);  
```

```
DBMS_SQL.PARSE (  
c                           IN   INTEGER,  
statement                   IN   VARCHAR2A,  
lb                           IN   INTEGER,  
ub                           IN   INTEGER,  
lfflg                        IN   BOOLEAN,  
language_flag               IN   INTEGER,  
edition                     IN   VARCHAR2 DEFAULT NULL,  
apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,  
fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE);  
```
Parameters

Table 135–26 PARSE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor in which to parse the statement.</td>
</tr>
<tr>
<td>statement</td>
<td>SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs.</td>
</tr>
<tr>
<td></td>
<td>Unlike PL/SQL statements, your SQL statement should not include a final semicolon. For example:</td>
</tr>
<tr>
<td></td>
<td>DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2);</td>
</tr>
<tr>
<td></td>
<td>DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);</td>
</tr>
<tr>
<td>lb</td>
<td>Lower bound for elements in the statement</td>
</tr>
<tr>
<td>ub</td>
<td>Upper bound for elements in the statement</td>
</tr>
<tr>
<td>lfflg</td>
<td>If TRUE, then insert a linefeed after each element on concatenation.</td>
</tr>
<tr>
<td>language_flag</td>
<td>Determines how Oracle handles the SQL statement. The following options are recognized:</td>
</tr>
<tr>
<td></td>
<td>■ V6 (or 0) specifies version 6 behavior.</td>
</tr>
<tr>
<td></td>
<td>■ NATIVE (or 1) specifies normal behavior for the database to which the program is connected.</td>
</tr>
<tr>
<td></td>
<td>■ V7 (or 2) specifies Oracle database version 7 behavior.</td>
</tr>
<tr>
<td>edition</td>
<td>Specifies the edition to run the statement in. Passing NULL indicates the statement should to run in the caller’s current edition. The contents of the string are processed as a SQL identifier; double-quotes must surround the remainder of the string if special characters or lower case characters are present in the edition’s actual name, and if double-quotes are not used the contents will be uppercased. If the edition is specified with a non-NULL value, the user with which the statement is to be executed must have USE privilege on the named edition.</td>
</tr>
<tr>
<td>apply_crossedition_trigger</td>
<td>Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user that will execute the statement.</td>
</tr>
<tr>
<td></td>
<td>If a non-NULL value is specified, the specified crossedition trigger will be executed assuming fire_apply_trigger is TRUE, the trigger is enabled, the trigger is defined on the table which is the target of the statement, the type of the statement matches the trigger’s dml_event_clause, any effective WHEN and UPDATE OF restrictions are satisfied, and so on. Other forward crossedition triggers may also be executed, selected using the “crossedition trigger DML rules” applied as if the specified trigger was doing a further DML to the table that is the target of the statement. Non-crossedition triggers and reverse crossedition triggers will not be executed.</td>
</tr>
<tr>
<td></td>
<td>The contents of the string are processed as a SQL identifier; double-quotes must surround the remainder of the string if special characters or lower case characters are present in the trigger’s actual name, and if double-quotes are not used, the contents will be uppercased.</td>
</tr>
</tbody>
</table>
Usage Notes

- Using `DBMS_SQL` to dynamically run DDL statements can result in the program hanging. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, results in a hang.

- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

For example, the following code does not compile on the client:

```sql
DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE);  -- uses constant DBMS_SQL.NATIVE
```

The following code works on the client, because the argument is explicitly provided:

```sql
DBMS_SQL.PARSE(cur_hdl, stmt_str, 1);  -- compiles on the client
```

- The `VARCHAR2S` type is currently supported for backward compatibility of legacy code. However, you are advised to use `VARCHAR2A` both for its superior capability and because `VARCHAR2S` will be deprecated in a future release.

- To parse SQL statements larger than 32 KB, the new `CLOB` overload version of the `PARSE` procedure can be used instead of the `VARCHAR2A` overload.

Exceptions

If you create a type/procedure/function/package using `DBMS_SQL` that has compilation warnings, an `ORA-24344` exception is raised, and the procedure is still created.
TO_CURSOR_NUMBER Function

This function takes an OPENed strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.

Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER(
    rc IN OUT SYS_REFCURSOR)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rc</td>
<td>REF CURSOR to be transformed into a cursor number</td>
</tr>
</tbody>
</table>

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a REF CURSOR.

Usage Notes

- The REF CURSOR passed in has to be OPENed, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- The DBMS_SQL cursor that is returned by this subprogram performs in the same way as a DBMS_SQL cursor that has already been executed.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
    TYPE CurType IS REF CURSOR;
    src_cur         CurType;
    curid           NUMBER;
    desctab         DBMS_SQL.DESC_TAB;
    colcnt          NUMBER;
    namevar         VARCHAR2(50);
    numvar          NUMBER;
    datevar         DATE;
    empno           NUMBER := 100;
BEGIN
    -- sql_stmt := 'select ...... from employees where employee_id = :b1';
    OPEN src_cur FOR sql_stmt USING empno;
    -- Switch from native dynamic SQL to DBMS_SQL
    curid := DBMS_SQL.TO_CURSOR_NUMBER (src_cur);
    DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);
    -- Define columns
    FOR i IN 1 .. colcnt LOOP
        IF desctab(i).col_type = 2 THEN
            DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
        END IF;
    END LOOP;
END;
```

Table 135–27  TO_CURSOR_NUMBER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rc</td>
<td>REF CURSOR to be transformed into a cursor number</td>
</tr>
</tbody>
</table>
ELSIF desctab(i).col_type = 12 THEN
    DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
    ....
ELSE
    DBMS_SQL.DEFINE_COLUMN(curid, i, namevar, 25);
END IF;
END LOOP;

-- Fetch Rows
WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
    FOR i IN 1 .. colcnt LOOP
        IF (desctab(i).col_type = 1) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
        ELSIF (desctab(i).col_type = 2) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
        ELSIF (desctab(i).col_type = 12) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
        END IF;
    END LOOP;
END LOOP;

DBMS_SQL.CLOSE_CURSOR(curid);
END;
/
TO_REFCURSOR Function

This function takes an OPENed, PARSEd, and EXECUTEd cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL. This subprogram is only used with SELECT cursors.

Syntax

```
DBMS_SQL.TO_REFCURSOR(
    cursor_number IN OUT INTEGER)
RETURN SYS_REFCURSOR;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cursor_number</td>
<td>Cursor number of the cursor to be transformed into REF CURSOR</td>
</tr>
</tbody>
</table>

Return Values

Returns a PL/SQL REF CURSOR transformed from a DBMS_SQL cursor number

Usage Notes

- The cursor passed in by the cursor_number has to be OPENed, PARSEd, and EXECUTEd; otherwise an error is raised.
- Once the cursor_number is transformed into a REF CURSOR, the cursor_number is no longer accessible by any DBMS_SQL operations.
- After a cursor_number is transformed into a REF CURSOR, using DBMS_SQL.IS_OPEN to check to see if the cursor_number is still open results in an error.

Examples

```sql
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
  TYPE CurType IS REF CURSOR;
  src_cur         CurType;
  curid           NUMBER;
  sql_stmt        VARCHAR2(200);
  ret             INTEGER;
  empnos          DBMS_SQL.Number_Table;
  depts           DBMS_SQL.Number_Table;
BEGIN
  -- DBMS_SQL.OPEN_CURSOR
  curid := DBMS_SQL.OPEN_CURSOR;

  sql_stmt :=
      'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID = :b1';

  DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
  ret := DBMS_SQL.EXECUTE(curid);

  -- Switch from DBMS_SQL to native dynamic SQL
```
src_cur := DBMS_SQL.TO_REFCURSOR(curid);

-- Fetch with native dynamic SQL
FETCH src_cur BULK COLLECT INTO empnos, depts;

IF empnos.COUNT > 0 THEN
    DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
    DBMS_OUTPUT.PUT_LINE('----- ------');
    -- Loop through the empnos and depts collections
    FOR i IN 1 .. empnos.COUNT LOOP
        DBMS_OUTPUT.PUT_LINE(empnos(i) || ' ' || depts(i));
    END LOOP;
END IF;

-- Close cursor
CLOSE src_cur;
END;
/
VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause.

Syntax

```sql
DBMS_SQL.VARIABLE_VALUE (  
c               IN  INTEGER,  
name            IN  VARCHAR2,  
value           OUT NOCOPY <datatype>);
```

Where `<datatype>` can be any one of the following types:

- BINARY_DOUBLE
- BINARY_FLOAT
- BFILE
- BLOB
- CLOB CHARACTER SET ANY_CS
- DATE
- DSINTERVAL_UNCONSTRAINED
- NUMBER
- TIME_TZ_UNCONSTRAINED
- TIME_UNCONSTRAINED
- TIMESTAMP_LTZ_UNCONSTRAINED
- TIMESTAMP_TZ_UNCONSTRAINED
- TIMESTAMP_UNCONSTRAINED
- UROWID
- VARCHAR2 CHARACTER SET ANY_CS
- YMINTERVAL_UNCONSTRAINED
- user-defined object types
- collections (VARRAYs and nested tables)
- REFs
- Opaque types

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```sql
DBMS_SQL.VARIABLE_VALUE_CHAR (  
c               IN  INTEGER,  
name            IN  VARCHAR2,  
value           OUT CHAR CHARACTER SET ANY_CS);
```

```sql
DBMS_SQL.VARIABLE_VALUE_RAW (  
c               IN  INTEGER,  
name            IN  VARCHAR2,  
value           OUT RAW);
```

```sql
DBMS_SQL.VARIABLE_VALUE_ROWID (  
c               IN  INTEGER,  
name            IN  VARCHAR2,  
value           OUT ROWID);
```

The following syntax enables the VARIABLE_VALUE procedure to accommodate bulk operations:

```sql
DBMS_SQL.VARIABLE_VALUE (  
c               IN  INTEGER,  
name            IN  VARCHAR2,
```
value            OUT NOCOPY <table_type>);

For bulk operations, `<table_type>` can be:

Binary_Double_Table
Binary_Float_Table
Bfile_Table
Blob_Table
Clob_Table
Date_Table
Interval_Day_To_Second_Table
Interval_Year_To_Month_Table
Number_Table
Time_Table
Time_With_Time_Zone_Table
Timestamp_Table
Timestamp_With_Itz_Table;
Timestamp_With_Time_Zone_Table
Urowid_Table
Varchar2_Table

Pragmas

pragma restrict_references(variable_value,RNDS,WNDS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor from which to get the values.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the variable for which you are retrieving the value.</td>
</tr>
<tr>
<td>value</td>
<td>Single row option: Returns the value of the variable for the specified position. Oracle raises the exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to BIND_VARIABLE.</td>
</tr>
<tr>
<td></td>
<td>Array option: Local variable that has been declared <code>&lt;table_type&gt;</code>. For bulk operations, <code>value</code> is an OUT NOCOPY parameter.</td>
</tr>
</tbody>
</table>
The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement.

This section covers the following topics:
- **About the SQL Repair Advisor**
- **Running the SQL Repair Advisor**
- **Removing a SQL Patch**

**About the SQL Repair Advisor**

You run the SQL Repair Advisor after a SQL statement fails with a critical error. The advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

**Running the SQL Repair Advisor**

You run the SQL Repair Advisor by creating and executing a diagnostic task using the `CREATE_DIAGNOSIS_TASK` and `EXECUTE_DIAGNOSIS_TASK` respectively. The SQL Repair Advisor first reproduces the critical error and then tries to produce a workaround in the form of SQL patch.

1. **Identify the problem SQL statement**

   Consider the SQL statement that gives a critical error:

   ```sql
   DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (SELECT MAX(ROWID) FROM t t2 WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d)
   ```

   You use the SQL Repair advisor to repair this critical error.

2. **Create a diagnosis task**

   Invoke `DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK`. You can specify an optional task name, an optional time limit for the advisor task, and problem type. In the example below, we specify the SQL text, the task name as 'error_task' and a problem type as 'DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR'.

   ```sql
   DECLARE
       rep_out CLOB;
       t_id VARCHAR2(50);
   BEGIN
       t_id := DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK(
           sql_text => 'DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (SELECT MAX(ROWID) FROM t t2 WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d)',
           task_name => 'error_task',
           problem_type => DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR);
   ```

3. **Execute the diagnosis task**

   To execute the workaround generation and analysis phase of the SQL Repair Advisor, you call `DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK` with the task ID returned by the `CREATE_DIAGNOSIS_TASK`. After a short delay, the SQL Repair Advisor returns. As part of its execution, the SQL Repair Advisor keeps a record of its findings which can be accessed through the reporting facilities of SQL Repair Advisor.
4. **Report the diagnosis task**

The analysis of the diagnosis task is accessed through `dbms_sqldiag.report_diagnosis_task`. If the SQL Repair Advisor was able to find a workaround, it recommends a SQL Patch. A SQL Patch is similar to a SQL profile but unlike the SQL Profile, it is used to workaround compilation or execution errors.

```sql
rep_out := DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (t_id, DBMS_SQLDIAG.TYPE_TEXT);

DBMS_OUTPUT.PUT_LINE ('Report : ' || rep_out);
END;
/
```

5. **Applying the patch**

If a patch recommendation is present in the report, you can run the `ACCEPT_SQL_PATCH` command to accept the patch by invoking `DBMS_SQLDIAG.ACCEPT_SQL_PATCH`. This procedure takes the `task_name` as an argument.

```sql
EXECUTE DBMS_SQLDIAG.ACCEPT_SQL_PATCH(task_name => 'error_task', task_owner => 'SYS', replace => TRUE);
```

6. **Test the patch**

Now that you have accepted the patch, you can rerun the SQL statement. This time, it will not give you the critical error. If you run `explain plan` for this statement, you will see that a SQL patch was used to generate the plan.

```sql
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (select max(rowid) FROM t t2 WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d);
```

**Removing a SQL Patch**

In a situation where you obtained an official patch from Oracle to fix an error, or upgraded to the next patchset or release of Oracle which included the fix for the error, you call `DBMS_SQLDIAG.DROP_SQL_PATCH` with the patch name to drop the SQL patch. The patch name can be obtained from the explain plan section or by querying the view `DBA_SQL_PATCHES`. 
Constants

The DBMS_SQLDIAG package uses the constants shown in the following tables:

- Table 136–1, "DBMS_SQLDIAG Constants - SQLDIAG Advisor Name" describes the name of SQL repair advisor as seen by the advisor framework.
- Table 136–2, "DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values" describes SQLDIAG advisor task scope parameter values.
- Table 136–3, "DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants" describes SQLDIAG advisor time_limit constants.
- Table 136–4, "DBMS_SQLDIAG Constants - Report Type (possible values) Constants" describes possible formats for a report.
- Table 136–5, "DBMS_SQLDIAG Constants - Report Level (possible values) Constants" describes possible levels of detail in the report.
- Table 136–6, "DBMS_SQLDIAG Constants - Report Section (possible values) Constants" describes possible report sections (comma delimited).
- Table 136–7, "DBMS_SQLDIAG Constants - Problem Type Constants" describes possible values for the problem_type parameter of the CREATE_DIAGNOSIS_TASK Functions.
- Table 136–8, "DBMS_SQLDIAG Constants - Findings Filter Constants" describes possible values for the _sql_findings_mode parameter.

### Table 136–1  DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>

</table>
Examples

Patch Pack / Unpack

Patches can be exported out of one system and imported into another by means of a staging table, provided by subprograms in this package. Like with SQL diagnosis sets, the operation of inserting into the staging table is called a "pack", and the operation of creating patches from staging table data is termed the "unpack".

DBAs should perform a pack/unpack as follows:

1. Create a staging table owned by user 'SH' through a call to CREATE_STGTAB_SQLPATCH:
   
   ```
   EXEC DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH(
     table_name => 'STAGING_TABLE',
     schema_name => 'SH';
   ```

2. Call PACK_STGTAB_SQLPATCH one or more times to write SQL patch data into the staging table. In this case, copy data for all SQL patches in the DEFAULT category into a staging table owned by the current schema owner:
   
   ```
   EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
     staging_table_name => 'STAGING_TABLE');
   ```

3. In this case, only a single SQL patch SP_FIND_EMPLOYEE is copied into a staging table owned by the current schema owner:
   
   ```
   EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
     patch_name => 'SP_FIND_EMPLOYEE',
     staging_table_name => 'STAGING_TABLE');
   ```

   The staging table can then be moved to another system using either datapump, import/export commands or through a databaselink.

4. Call UNPACK_STGTAB_SQLPATCH to create SQL patches on the new system from the patch data in the staging table. In this case, change the name in the data for the SP_FIND_EMPLOYEE patch stored in the staging table to 'SP_FIND_EMP_PROD':
   
   ```
   exec dbms_sqldiag.remap_stgtab_sqlpatch(
     old_patch_name => 'SP_FIND_EMPLOYEE',
     new_patch_name => 'SP_FIND_EMP_PROD',
   ```
# Summary of DBMS_SQLDIAG Subprograms

## Table 136–9  DBMS_SQLDIAG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>

ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (  
  task_name IN VARCHAR2,  
  object_id IN NUMBER := NULL,  
  name IN VARCHAR2 := NULL,  
  description IN VARCHAR2 := NULL,  
  category IN VARCHAR2 := NULL,  
  task_owner IN VARCHAR2 := NULL,  
  replace IN BOOLEAN := FALSE,  
  force_match IN BOOLEAN := FALSE)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of the SQL diagnosis task</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task</td>
</tr>
<tr>
<td>name</td>
<td>Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.</td>
</tr>
<tr>
<td>description</td>
<td>User specified string describing the purpose of this SQL patch. Maximum size of description is 500.</td>
</tr>
<tr>
<td>category</td>
<td>Category name which must match the value of the SQLDIAGNOSE_CATEGORY parameter in a session for the session to use this patch. It defaults to the value DEFAULT. This is also the default of the SQLDIAGNOSE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.</td>
</tr>
</tbody>
</table>
Table 136–10 (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replace</td>
<td>If the patch already exists, it will be replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.</td>
</tr>
<tr>
<td>force_match</td>
<td>If TRUE this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the CURSOR_SHARING parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the CURSOR_SHARING parameter.</td>
</tr>
</tbody>
</table>

Return Values

Name of the SQL patch

Usage Notes

Requires CREATE ANY SQL PROFILE privilege
ALTER_SQL_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (
    name            IN  VARCHAR2,
    attribute_name  IN  VARCHAR2,
    value           IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of SQL patch to alter.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of SQL patch to alter. Possible values:</td>
</tr>
<tr>
<td></td>
<td>- STATUS -&gt; can be set to ENABLED or DISABLED</td>
</tr>
<tr>
<td></td>
<td>- NAME -&gt; can be reset to a valid name (must be a valid Oracle identifier and must be unique).</td>
</tr>
<tr>
<td></td>
<td>- DESCRIPTION -&gt; can be set to any string of size no more than 500</td>
</tr>
<tr>
<td></td>
<td>- CATEGORY -&gt; can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text)</td>
</tr>
</tbody>
</table>

This parameter is mandatory and is case sensitive.

value New value of the attribute. See attribute_name for valid attribute values. This parameter is mandatory.

Usage Notes

Requires ALTER ANY SQL PATCH privilege
CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```sql
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (  
    taskname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name.

Syntax

Prepares the diagnosis of a single statement given its text:

```sql
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
  sql_text         IN   CLOB,
  bind_list        IN   sql_binds := NULL,
  user_name        IN   VARCHAR2  := NULL,
  scope            IN   VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit       IN   NUMBER    := TIME_LIMIT_DEFAULT,
  task_name        IN   VARCHAR2  := NULL,
  description      IN   VARCHAR2  := NULL,
  problem_type     IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```sql
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
  sql_id           IN   VARCHAR2,
  plan_hash_value  IN   NUMBER    := NULL,
  scope            IN   VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit       IN   NUMBER    := TIME_LIMIT_DEFAULT,
  task_name        IN   VARCHAR2  := NULL,
  description      IN   VARCHAR2  := NULL,
  problem_type     IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```sql
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
  sqlset_name      IN VARCHAR2,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter    IN VARCHAR2 := NULL,
  rank1            IN VARCHAR2 := NULL,
  rank2            IN VARCHAR2 := NULL,
  rank3            IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := NULL,
  result_limit     IN NUMBER   := NULL,
  scope            IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2 := NULL,
  description      IN VARCHAR2 := NULL,
  plan_filter      IN VARCHAR2 := 'MAX_ELAPSED_TIME',
  sqlset_owner     IN VARCHAR2 := NULL,
  problem_type     IN NUMBER   := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>Text of a SQL statement</td>
</tr>
<tr>
<td>bind_list</td>
<td>Set of bind values</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>user_name</td>
<td>Username for who the statement/sqlset will be diagnosed</td>
</tr>
<tr>
<td>scope</td>
<td>Diagnosis scope (limited/comprehensive)</td>
</tr>
<tr>
<td>time_limit</td>
<td>Maximum duration in seconds for the diagnosis session</td>
</tr>
<tr>
<td>task_name</td>
<td>Optional diagnosis task name</td>
</tr>
<tr>
<td>description</td>
<td>Maximum of 256 SQL diagnosis session description</td>
</tr>
<tr>
<td>problem_type</td>
<td>Determines the goal of the task. Possible values are:</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifier of the statement</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Hash value of the SQL execution plan</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>Sqlset name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from the SQL tuning set (STS)</td>
</tr>
<tr>
<td>object_filter</td>
<td>Object filter</td>
</tr>
<tr>
<td>rank(i)</td>
<td>Order-by clause on the selected SQL</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Percentage on the sum of a ranking measure</td>
</tr>
<tr>
<td>result_limit</td>
<td>Top L(limit) SQL from (filtered/ranked) SQL</td>
</tr>
<tr>
<td>plan_filter</td>
<td>Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are:</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Owner of the sqlset, or null for current schema owner</td>
</tr>
</tbody>
</table>

Table 136–13 (Cont.) CREATE_DIAGNOSIS_TASK Function Parameters
CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```sql
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (  
    table_name       IN  VARCHAR2,  
    schema_name      IN  VARCHAR2 := NULL,  
    tablespace_name  IN  VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>(Mandatory) Name of the table to create (case-sensitive)</td>
</tr>
<tr>
<td>schema_name</td>
<td>Schema to create the table in, or NULL for current schema (case-sensitive)</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive)</td>
</tr>
</tbody>
</table>
DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

```sql
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (  
    taskname    IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
DROP_SQL_PATCH Procedure

This procedure drops the named SQL patch from the database.

Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (
    name     IN  VARCHAR2,
    ignore   IN  BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of patch to be dropped. The name is case sensitive.</td>
</tr>
<tr>
<td>ignore</td>
<td>Ignore errors due to object not existing.</td>
</tr>
</tbody>
</table>

Usage Notes

Requires DROP ANY SQL PATCH privilege
EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```sql
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (
    taskname          IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (  
    sqlTestCase IN CLOB  
)  
RETURN CLOB;
```

Parameters

Table 136–18  EXPLAIN_SQL_TESTCASE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlTestCase</td>
<td>XML document describing the SQL test case</td>
</tr>
</tbody>
</table>
EXPORT_SQL_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (  
directory IN VARCHAR2,  
sql_text IN CLOB,  
user_name IN VARCHAR2 := NULL,  
bind_list IN sql_bind := NULL,  
exportEnvironment IN BOOLEAN := TRUE,  
exportMetadata IN BOOLEAN := TRUE,  
exportData IN BOOLEAN := FALSE,  
exportPkgbody IN BOOLEAN := FALSE,  
samplingPercent IN NUMBER := 100,  
ctrlOptions IN VARCHAR2 := NULL,  
timeLimit IN NUMBER := 0,  
testcase_name IN VARCHAR2 := NULL,  
testcase IN OUT NOCOPY CLOB,  
preserveSchemaMapping IN BOOLEAN := FALSE);
```

This variant extracts the SQL information from an incident file.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (  
directory IN VARCHAR2,  
incident_id IN VARCHAR2,  
exportEnvironment IN BOOLEAN := TRUE,  
exportMetadata IN BOOLEAN := TRUE,  
exportData IN BOOLEAN := FALSE,  
exportPkgbody IN BOOLEAN := FALSE,  
samplingPercent IN NUMBER := 100,  
ctrlOptions IN VARCHAR2 := NULL,  
timeLimit IN NUMBER := DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,  
testcase_name IN VARCHAR2 := NULL,  
testcase IN OUT NOCOPY CLOB,  
preserveSchemaMapping IN BOOLEAN := FALSE);
```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use V$SQL to get the SQL identifier and the SQL hash value.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (  
directory IN VARCHAR2,  
sql_id IN VARCHAR2,  
plan_hash_value IN NUMBER := NULL,  
exportEnvironment IN BOOLEAN := TRUE,  
exportMetadata IN BOOLEAN := TRUE,  
exportData IN BOOLEAN := TRUE,  
exportPkgbody IN BOOLEAN := FALSE,  
samplingPercent IN NUMBER := 100,  
ctrlOptions IN VARCHAR2 := NULL,  
timeLimit IN NUMBER := DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,  
testcase_name IN VARCHAR2 := NULL,  
testcase IN OUT NOCOPY CLOB,  
preserveSchemaMapping IN BOOLEAN := FALSE);
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Directory to store the various generated files</td>
</tr>
<tr>
<td>sql_text</td>
<td>Text of the SQL statement to export</td>
</tr>
<tr>
<td>incident_id</td>
<td>Incident ID containing the offending SQL</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifier of the statement in the cursor cache</td>
</tr>
<tr>
<td>username</td>
<td>Name of the user schema to use to parse the SQL, defaults to SYS</td>
</tr>
<tr>
<td>bind_list</td>
<td>List of bind values associated to the statement</td>
</tr>
<tr>
<td>exportEnvironment</td>
<td>TRUE if the compilation environment should be exported</td>
</tr>
<tr>
<td>exportMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>exportData</td>
<td>TRUE if the data of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>exportPkgbody</td>
<td>TRUE if the body of the packages referenced in the SQL are exported</td>
</tr>
<tr>
<td>samplingPercent</td>
<td>If is TRUE, specify the sampling percentage to use to create the dump file</td>
</tr>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters</td>
</tr>
<tr>
<td>timeLimit</td>
<td>How much time should we spend exporting the SQL test case</td>
</tr>
<tr>
<td>testcaseName</td>
<td>An optional name for the SQL test case. This is used to prefix all the generated scripts</td>
</tr>
<tr>
<td>testcase</td>
<td>Resulting testcase</td>
</tr>
<tr>
<td>preservesSchemaMappinng</td>
<td>TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment</td>
</tr>
</tbody>
</table>

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (.dmp)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata. (xxxxxmain.xml)

- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA role.

- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call EXPORT_SQL_TESTCASE with exportData=>TRUE and the data will be imported by default, unless turned OFF by importData=>FALSE.
TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call EXPORT_SQL_TESTCASE with exportPkgbody=>TRUE. To import a PL/SQL package body, call IMPORT_SQL_TESTCASE Procedures with importPkgbody=>TRUE.
**EXPORT_SQL_TESTCASE_DIR_BY_INC Function**

This function generates a SQL Test Case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

**Syntax**

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (    incident_id        IN   NUMBER,
    directory          IN   VARCHAR2,
    exportEnvironment  IN   VARCHAR2 := 'TRUE',
    exportMetadata     IN   VARCHAR2 := 'TRUE',
    exportData         IN   VARCHAR2 := 'FALSE',
    samplingPercent    IN   VARCHAR2 := '100',
    ctrlOptions        IN   VARCHAR2 := NULL)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Incident ID containing the offending SQL. For more information about Incidents, see Oracle Database Performance Tuning Guide.</td>
</tr>
<tr>
<td>directory</td>
<td>Directory to store the various generated files</td>
</tr>
<tr>
<td>exportEnvironment</td>
<td>TRUE if the compilation environment should be exported</td>
</tr>
<tr>
<td>exportMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>exportData</td>
<td>TRUE if the data of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>samplingPercent</td>
<td>If is TRUE, specify the sampling percentage to use to create the dump file</td>
</tr>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters</td>
</tr>
</tbody>
</table>
EXPORT_SQL_TESTCASE_DIR_BY_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

Syntax

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (  
    incident_id    IN   NUMBER,  
    directory      IN   VARCHAR2,  
    sql_text       IN   CLOB,  
    user_name      IN   VARCHAR2 := 'SYS',  
    exportEnvironment IN   VARCHAR2 := 'TRUE',  
    exportMetadata  IN   VARCHAR2 := 'TRUE',  
    exportData     IN   VARCHAR2 := 'FALSE',  
    samplingPercent IN   VARCHAR2 := '100',  
    ctrlOptions    IN   VARCHAR2 := NULL)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Incident ID containing the offending SQL</td>
</tr>
<tr>
<td>directory</td>
<td>Directory to store the various generated files</td>
</tr>
<tr>
<td>sql_text</td>
<td>Text of the SQL statement to explain</td>
</tr>
<tr>
<td>username</td>
<td>Name of the user schema to use to parse the SQL, defaults to SYS</td>
</tr>
<tr>
<td>exportEnvironment</td>
<td>TRUE if the compilation environment should be exported</td>
</tr>
<tr>
<td>exportMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>exportData</td>
<td>TRUE if the data of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>samplingPercent</td>
<td>If is TRUE, specify the sampling percentage to use to create the dump file</td>
</tr>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters</td>
</tr>
</tbody>
</table>
GET_FIX_CONTROL Function

This function returns the value of fix control for a given bug number.

Syntax

```sql
DBMS_SQLDIAG.GET_FIX_CONTROL (    bug_number IN NUMBER)    RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bug_number</td>
<td>Bug number</td>
</tr>
</tbody>
</table>
GET_SQL Function

This function loads a sql_setrow from the trace file associated to an given incident ID.

Syntax

```sql
DBMS_SQLDIAG.GET_SQL (  
  incident_id IN VARCHAR2)  
RETURN SQLSET_ROW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Identifier of the incident</td>
</tr>
</tbody>
</table>
IMPORT_SQL_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (  
directory                IN   VARCHAR2,  
sqlTestCase              IN   CLOB,  
importEnvironment        IN   BOOLEAN   :=  TRUE,  
importMetadata           IN   BOOLEAN   :=  TRUE,  
importData               IN   BOOLEAN   :=  TRUE,  
importPkgbody            IN   BOOLEAN   :=  FALSE,  
importDiagnosis          IN   BOOLEAN   :=  TRUE,  
ignoreStorage            IN   BOOLEAN   :=  TRUE,  
ctrlOptions              IN   VARCHAR2  :=  NULL,  
preserveSchemaMapping    IN   BOOLEAN   :=  FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (  
directory                IN   VARCHAR2,  
filename                 IN   VARCHAR2,  
importEnvironment        IN   BOOLEAN   :=  TRUE,  
importMetadata           IN   BOOLEAN   :=  TRUE,  
importData               IN   BOOLEAN   :=  TRUE,  
importPkgbody            IN   BOOLEAN   :=  FALSE,  
importDiagnosis          IN   BOOLEAN   :=  TRUE,  
ignoreStorage            IN   BOOLEAN   :=  TRUE,  
ctrlOptions              IN   VARCHAR2  :=  NULL,  
preserveSchemaMapping    IN   BOOLEAN   :=  FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Directory containing test case files</td>
</tr>
<tr>
<td>filename</td>
<td>Name of a file containing an XML document describing the SQL test case</td>
</tr>
<tr>
<td>importEnvironment</td>
<td>TRUE if the compilation environment should be imported</td>
</tr>
<tr>
<td>importMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be imported</td>
</tr>
<tr>
<td>importData</td>
<td>TRUE if the data of the objects referenced in the SQL should be imported</td>
</tr>
<tr>
<td>importPkgbody</td>
<td>TRUE if the body of the packages referenced in the SQL are imported</td>
</tr>
<tr>
<td>importDiagnosis</td>
<td>TRUE if the diagnostic information associated to the task should be imported</td>
</tr>
<tr>
<td>ignoreStorage</td>
<td>TRUE if the storage attributes should be ignored</td>
</tr>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters</td>
</tr>
</tbody>
</table>
Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (.dmp)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata. (xxxxmain.xml)

- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the SYSDBA privilege.

- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call `EXPORT_SQL_TESTCASE Procedures` with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.

- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call `EXPORT_SQL_TESTCASE Procedures` with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call `IMPORT_SQL_TESTCASE Procedures` with `importPkgbody=>TRUE`.

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>preservesSchemaMapping</td>
<td>TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment</td>
</tr>
</tbody>
</table>
INCIDENTID_2_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

Syntax

```sql
DBMS_SQLDIAG.INCIDENTID_2_SQL (  
    incident_id   IN     VARCHAR2,  
    sql_stmt      OUT    SQLSET_ROW,  
    problem_type  OUT    NUMBER,  
    err_code      OUT    BINARY_INTEGER,  
    err_msg       OUT    VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Identifier of the incident</td>
</tr>
<tr>
<td>sql_stmt</td>
<td>Resulting SQL</td>
</tr>
<tr>
<td>problem_type</td>
<td>Tentative type of SQL problem (currently among PROBLEM_TYPE_COMPILATION_ERROR and PROBLEM_TYPE_EXECUTION_ERROR)</td>
</tr>
<tr>
<td>err_code</td>
<td>Error code if any otherwise it is set to NULL</td>
</tr>
<tr>
<td>err_msg</td>
<td>Error message if any otherwise it is set to NULL</td>
</tr>
</tbody>
</table>
INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

Syntax

DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (
    taskname    IN    VARCHAR2);

Parameters

Table 136–26  INTERRPT_DIAGNOSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
LOAD_SQLSET_FROM_TCB Function

This function loads a SQLSET from a Test Case Builder file.

Syntax

```sql
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB ( directory IN VARCHAR2,
                                        filename IN VARCHAR2,
                                        sqlset_name IN VARCHAR2 DEFAULT NULL )
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Name of directory</td>
</tr>
<tr>
<td>filename</td>
<td>Name of file</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>Name of SQLSET</td>
</tr>
</tbody>
</table>
PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.

Syntax

```sql
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
    patch_name            IN  VARCHAR2 := '%',
    patch_category        IN  VARCHAR2 := 'DEFAULT',
    staging_table_name    IN  VARCHAR2,
    staging_schema_owner  IN  VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patch_name</td>
<td>Name of patch to pack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>patch_category</td>
<td>Category to which to pack patches (% wildcards acceptable, case-insensitive)</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>(Mandatory) Name of the table to use (case-sensitive)</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>Schema where the table resides, or NULL for current schema (case-sensitive)</td>
</tr>
</tbody>
</table>

Usage Notes

- Requires: ADMINISTER SQL PLAN MANAGEMENT OBJECT privilege and INSERT privilege on the staging table
- By default, we move all SQL patches in category DEFAULT. See the Examples on page 136-8 for details. Note that the subprogram issues a COMMIT after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.
REPORT_DIAGNOSIS_TASK Function

This function reports on a diagnostic task. It returns a CLOB containing the desired report.

Syntax

```sql
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (  
    taskname           IN   VARCHAR2,  
    type               IN   VARCHAR2  := TYPE_TEXT,  
    level              IN   VARCHAR2  := LEVEL_TYPICAL,  
    section            IN   VARCHAR2  := SECTION_ALL,  
    object_id          IN   NUMBER    := NULL,  
    result_limit       IN   NUMBER    := NULL,  
    owner_name         IN   VARCHAR2  := NULL)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task to report</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report. Possible values are: TEXT, HTML, XML (see Table 136-4, “DBMS_SQLDIAG Constants - Report Type (possible values) Constants”).</td>
</tr>
<tr>
<td>level</td>
<td>Format of the recommendations. Possible values are TYPICAL, BASIC, ALL (Table 136-5, “DBMS_SQLDIAG Constants - Report Level (possible values) Constants”).</td>
</tr>
<tr>
<td>section</td>
<td>Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL (Table 136-6, “DBMS_SQLDIAG Constants - Report Section (possible values) Constants”).</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).</td>
</tr>
<tr>
<td>result_limit</td>
<td>Number of statements in a STS for which the report is generated</td>
</tr>
<tr>
<td>owner_name</td>
<td>Name of the task execution to use. If NULL, the report will be generated for the last task execution.</td>
</tr>
</tbody>
</table>
RESET_DIAGNOSIS_TASK Procedure

This procedure resets a diagnostic task.

Syntax

```sql
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (  
    taskname    IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
RESUME_DIAGNOSIS_TASK Procedure

This procedure resumes a diagnostic path.

Syntax

```plaintext
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (  
    taskname    IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
SET_DIAGNOSIS_TASK_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2. The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- **MODE**: diag scope (comprehensive, limited)
- **_SQLDIAG_FINDING_MODE**: findings in the report (see "DBMS_SQLDIAG Constants - Findings Filter Constants" on page 136-7 for possible values)

**Syntax**

```sql
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (  
  taskname           IN   VARCHAR2,
  parameter          IN   VARCHAR2,
  value              IN   NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Identifier of the task to execute</td>
</tr>
<tr>
<td>parameter</td>
<td>Name of the parameter to set</td>
</tr>
<tr>
<td>value</td>
<td>New value of the specified parameter</td>
</tr>
</tbody>
</table>
UNPACK_STGTAB_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the ACCEPT_SQL_PATCH Function & Procedure).

Syntax

```sql
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (  
    patch_name            IN  VARCHAR2 := '%',  
    patch_category        IN  VARCHAR2 := '%',  
    replace               IN  BOOLEAN,  
    staging_table_name    IN  VARCHAR2,  
    staging_schema_owner  IN  VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patch_name</td>
<td>Name of patch to unpack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>patch_category</td>
<td>Category from which to unpack patches (% wildcards acceptable, case-insensitive)</td>
</tr>
<tr>
<td>replace</td>
<td>Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>(Mandatory) Name of the table to use (case-sensitive)</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>Schema where the table resides, or NULL for current schema (case-sensitive)</td>
</tr>
</tbody>
</table>

Usage Notes

- Requires: ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT privilege on the staging table.
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.
The DBMS_SQLPA package provides the interface to implement the SQL Performance Analyzer.

The chapter contains the following topics:

- Using DBMS_SQLPA
  - Overview
  - Security Model
- Summary of DBMS_SQLPA Subprograms
Using DBMS_SQLPA

- Overview
- Security Model
Overview

The DBMS_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the CREATE_ANALYSIS_TASK Functions to create an analysis task for a single statement or a group of SQL statements.

2. The EXECUTE_ANALYSIS_TASK Function & Procedure executes a previously created analysis task.

3. The REPORT_ANALYSIS_TASK Function displays the results of an analysis task.
Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (XXX_ANALYSIS_TASK) require privilege ADVISOR.
Summary of DBMS_SQLPA Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CANCEL_ANALYSIS_TASK Procedure on page 137-6</td>
<td>Cancels the currently executing task analysis of one or more SQL statements</td>
</tr>
<tr>
<td>CREATE_ANALYSIS_TASK Functions on page 137-7</td>
<td>Creates an advisor task to process and analyze one or more SQL statements</td>
</tr>
<tr>
<td>DROP_ANALYSIS_TASK Procedure on page 137-10</td>
<td>Drops a SQL analysis task</td>
</tr>
<tr>
<td>EXECUTE_ANALYSIS_TASK Function &amp; Procedure on page 137-11</td>
<td>Executes a previously created analysis task</td>
</tr>
<tr>
<td>INTERRUPT_ANALYSIS_TASK Procedure on page 137-14</td>
<td>Interrupts the currently executing analysis task</td>
</tr>
<tr>
<td>REPORT_ANALYSIS_TASK Function on page 137-15</td>
<td>Displays the results of an analysis task</td>
</tr>
<tr>
<td>RESET_ANALYSIS_TASK Procedure on page 137-17</td>
<td>Resets the currently executing analysis task to its initial state</td>
</tr>
<tr>
<td>RESUME_ANALYSIS_TASK Procedure on page 137-18</td>
<td>Resumes a previously interrupted analysis task that was created to process a SQL tuning set.</td>
</tr>
<tr>
<td>SET_ANALYSIS_TASK_PARAMETER Procedures on page 137-19</td>
<td>Sets the SQL analysis task parameter value</td>
</tr>
<tr>
<td>SET_ANALYSIS_DEFAULT_PARAMETER Procedures on page 137-21</td>
<td>Sets the SQL analysis task parameter default value</td>
</tr>
</tbody>
</table>
CANCEL_ANALYSIS_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

Syntax

DBMS_SQLPA.CANCEL_ANALYSIS_TASK(
    task_name IN VARCHAR2);

Parameters

Table 137–2   CANCEL_ANALYSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to cancel</td>
</tr>
</tbody>
</table>

Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
CREATE_ANALYSIS_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements. You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
   sql_text         IN CLOB,
   bind_list        IN sql_binds := NULL,
   parsing_schema   IN VARCHAR2  := NULL,
   task_name        IN VARCHAR2  := NULL,
   description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
   sql_id           IN VARCHAR2,
   plan_hash_value  IN NUMBER    := NULL,
   task_name        IN VARCHAR2  := NULL,
   description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
   begin_snap       IN NUMBER,
   end_snap         IN NUMBER,
   sql_id           IN VARCHAR2,
   plan_hash_value  IN NUMBER    := NULL,
   task_name        IN VARCHAR2  := NULL,
   description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
   sqlset_name       IN VARCHAR2,
   basic_filter      IN VARCHAR2 :=  NULL,
   order_by          IN VARCHAR2 :=  NULL,
   top_sql           IN VARCHAR2 :=  NULL,
   task_name         IN VARCHAR2 :=  NULL,
   description       IN VARCHAR2 :=  NULL)
RETURN VARCHAR2;
```
CREATE ANALYSIS_TASK Functions

```sql
CREATE ANALYSIS_TASK (sql_text IN VARCHAR2 := NULL,
                        bind_list IN VARCHAR2 := NULL,
                        parsing_schema IN VARCHAR2 := NULL,
                        task_name IN VARCHAR2 := NULL,
                        description IN VARCHAR2 := NULL,
                        sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>Text of a SQL statement</td>
</tr>
<tr>
<td>bind_list</td>
<td>A set of bind values</td>
</tr>
<tr>
<td>parsing_schema</td>
<td>Name of the schema where the statement can be compiled</td>
</tr>
<tr>
<td>task_name</td>
<td>Optional analysis task name</td>
</tr>
<tr>
<td>description</td>
<td>Description of the SQL analysis task to a maximum of 256 characters</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifier of a SQL statement</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Hash value of the SQL execution plan</td>
</tr>
<tr>
<td>begin_snap</td>
<td>Begin snapshot identifier</td>
</tr>
<tr>
<td>end_snap</td>
<td>End snapshot identifier</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>SQL tuning set name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from the SQL tuning set</td>
</tr>
<tr>
<td>order_by</td>
<td>Order-by clause on the selected SQL</td>
</tr>
<tr>
<td>top_sql</td>
<td>Top N SQL after filtering and ranking</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or NULL for the current schema owner</td>
</tr>
</tbody>
</table>

### Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

### Examples

```sql
variable stmt_task VARCHAR(64);
variable sts_task VARCHAR(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text => 'select quantity_sold from sales s, times t where s.time_id = t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id       => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap  => 1,
    end_snap    => 2,
    sql_id      => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
```
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -
   sqlset_name   =>   'my_workload', -
   order_by      =>   'BUFFER_GETS', -
   description   =>   'process workload ordered by buffer gets');
DROP_ANALYSIS_TASK Procedure

This procedure drops a SQL analysis task. The task and all its result data are deleted.

Syntax

```sql
DBMS_SQLPA.DROP_ANALYSIS_TASK(
    task_name     IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the analysis task to drop</td>
</tr>
</tbody>
</table>
EXECUTE_ANALYSIS_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

Syntax

```sql
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name         IN VARCHAR2,
    execution_type    IN VARCHAR2               := 'test execute',
    execution_name    IN VARCHAR2               := NULL,
    execution_params  IN dbms_advisor.argList   := NULL,
    execution_desc    IN VARCHAR2               := NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the task to execute</td>
</tr>
<tr>
<td>execution_type</td>
<td>Type of the action to perform by the function. If NULL it will default to</td>
</tr>
<tr>
<td></td>
<td>the value of the DEFAULT_EXECUTION_TYPE parameter. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>▪ [TEST] EXECUTE - test-execute every SQL statement and collect its</td>
</tr>
<tr>
<td></td>
<td>execution plans and execution statistics. The resulting plans and</td>
</tr>
<tr>
<td></td>
<td>statistics will be stored in the advisor framework. This is default.</td>
</tr>
<tr>
<td></td>
<td>▪ EXPLAIN PLAN - generate explain plan for every statement in the SQL</td>
</tr>
<tr>
<td></td>
<td>workload. This is similar to the EXPLAIN PLAN command. The resulting</td>
</tr>
<tr>
<td></td>
<td>plans will be stored in the advisor framework in association with the</td>
</tr>
<tr>
<td></td>
<td>task.</td>
</tr>
<tr>
<td></td>
<td>▪ COMPARE [PERFORMANCE] - analyze and compare two versions of SQL</td>
</tr>
<tr>
<td></td>
<td>performance data. The performance data is generated by test-executing</td>
</tr>
<tr>
<td></td>
<td>or generating explain plan of the SQL statements. Use this option when</td>
</tr>
<tr>
<td></td>
<td>two executions of type EXPLAIN_PLAN or TEST_EXECUTE already exist in the</td>
</tr>
<tr>
<td></td>
<td>task.</td>
</tr>
<tr>
<td></td>
<td>▪ CONVERT SQLSET - used to read the statistics captured in a SQL Tuning</td>
</tr>
<tr>
<td></td>
<td>Set and model them as a task execution. This can be used when you wish</td>
</tr>
<tr>
<td></td>
<td>to avoid executing the SQL statements because valid data for the</td>
</tr>
<tr>
<td></td>
<td>experiment already exists in the SQL Tuning Set.</td>
</tr>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it will</td>
</tr>
<tr>
<td></td>
<td>be generated by the advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>List of parameters (name, value) for the specified execution. The execution</td>
</tr>
<tr>
<td></td>
<td>parameters have effect only on the execution for which they are specified.</td>
</tr>
<tr>
<td></td>
<td>They will override the values for the parameters stored in the task</td>
</tr>
<tr>
<td></td>
<td>(set through the SET_ANALYSIS_DEFAULT_PARAMETER Procedures).</td>
</tr>
</tbody>
</table>
EXECUTE_ANALYSIS_TASK Function & Procedure

Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

Examples

1. Create a task with a purpose of change impact analysis

```plsql
EXEC :tname := DBMS_SQLPA.CREATE_ANALYSIS_TASK( sqlset_name => 'my_sts');
```

2. Make baseline or the before change execution

```plsql
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK( task_name => :tname, execution_type => 'test execute', execution_name => 'before_change');
```

3. Make change

...  

4. Make the after change version of the workload performance

```plsql
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK( task_name => :tname, execution_type => 'test execute', execution_name => 'after_change');
```

5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the elapsed_time as a default metric for comparison. Here we are changing it to buffer_gets instead.

```plsql
EXEC DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER( :tname, 'comparison_metric', 'buffer_gets');
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK( task_name => :tname, execution_type => 'test execute', execution_name => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```plsql
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK( task_name => :tname, execution_type => 'compare performance', execution_params => dbms_advisor.arglist( execution_desc A 256-length string describing the execution
```
'execution_name1',
'before_change',
'execution_name2',
'after_change',
'comparion_metric',
'buffer_gets'});
**INTERRUPT_ANALYSIS_TASK Procedure**

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

**Syntax**

```sql
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(
    task_name   IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the analysis task to interrupt</td>
</tr>
</tbody>
</table>

**Examples**

```sql
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```
REPORT_ANALYSIS_TASK Function

This procedure displays the results of an analysis task.

Syntax

```sql
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
    task_name       IN   VARCHAR2,
    type            IN   VARCHAR2   := 'TEXT',
    level           IN   VARCHAR2   := 'TYPICAL',
    section         IN   VARCHAR2   := 'SUMMARY',
    object_id       IN   NUMBER     := NULL,
    top_sql         IN   NUMBER     := 100,
    execution_name  IN   VARCHAR2   := NULL,
    task_owner      IN   VARCHAR2   := NULL,
    order_by        IN   VARCHAR2   := NULL)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to report</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes).</td>
</tr>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>- ALL - details of all SQL</td>
</tr>
<tr>
<td></td>
<td>- BASIC - currently the same as typical</td>
</tr>
<tr>
<td></td>
<td>- CHANGED - only SQL with changed performance</td>
</tr>
<tr>
<td></td>
<td>- CHANGED_PLANS - only SQL with plan changes</td>
</tr>
<tr>
<td></td>
<td>- ERRORS - SQL with errors only</td>
</tr>
<tr>
<td></td>
<td>- IMPROVED - only improved SQL</td>
</tr>
<tr>
<td></td>
<td>- REGRESSED - only regressed SQL</td>
</tr>
<tr>
<td></td>
<td>- TIMEOUT - only SQL which timed-out during execution</td>
</tr>
<tr>
<td></td>
<td>- TYPICAL (default) - show information about every statement analyzed, including changing and errors</td>
</tr>
<tr>
<td></td>
<td>- UNCHANGED - only SQL with unchanged performance</td>
</tr>
<tr>
<td></td>
<td>- UNCHANGED_PLANS - only SQL with unchanged plans</td>
</tr>
<tr>
<td></td>
<td>- UNSUPPORTED - only SQL not supported by SPAs</td>
</tr>
<tr>
<td>section</td>
<td>Optionally limit the report to a single section (ALL for all sections):</td>
</tr>
<tr>
<td></td>
<td>- SUMMARY (default) - workload summary only</td>
</tr>
<tr>
<td></td>
<td>- ALL - summary and details on SQL</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)</td>
</tr>
<tr>
<td>top_sql</td>
<td>Number of SQL statements in a STS for which the report is generated</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, the report will be generated for the last task execution.</td>
</tr>
</tbody>
</table>
### REPORT_ANALYSIS_TASK Function

**Return Values**

A CLOB containing the desired report.

**Usage Notes**

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

**Examples**

```sql
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the STS case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'ALL', 5)
FROM DUAL;
```

---

**Table 137-7 (Cont.) REPORT_ANALYSIS_TASK Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>

<td>• METRIC_DELTA - same as CHANGE_DIFF</td>
</tr>
</tbody>
</table>
RESET_ANALYSIS_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution. All intermediate result data will be deleted.

Syntax

```sql
DBMS_SQLPA.RESET_ANALYSIS_TASK(
    task_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the analysis task to reset</td>
</tr>
</tbody>
</table>

Examples

```sql
-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```
RESUME_ANALYSIS_TASK Procedure

This procedure resumes a previously interrupted or FAILED (with a fatal error) task execution.

Syntax

```sql
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
    task_name         IN VARCHAR2,
    basic_filter      IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the analysis task to resume</td>
</tr>
<tr>
<td>basic_filter</td>
<td>A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter basic_filter) that was specified when calling the CREATE_ANALYSIS_TASK Functions.</td>
</tr>
</tbody>
</table>

Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```sql
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check -- out its results and then decide. For this example we will just resume.
EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```
SET_ANALYSIS_TASK_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
    task_name         IN VARCHAR2,
    parameter         IN VARCHAR2,
    value             IN VARCHAR2);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
    task_name         IN VARCHAR2,
    parameter         IN VARCHAR2,
    value             IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the task to execute</td>
</tr>
<tr>
<td>parameter</td>
<td>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</td>
</tr>
<tr>
<td></td>
<td>- APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</td>
</tr>
<tr>
<td></td>
<td>- BASIC_FILTER: basic filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>- CELL_SIMULATION_ENABLED: Set it to 'TRUE' to simulate Exadata Cell effect on SQL tuning set. For more details, see the helper script tcellsimm.sql in the ADMIN directory.</td>
</tr>
<tr>
<td></td>
<td>- COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>)</td>
</tr>
<tr>
<td></td>
<td>- DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all TEST EXECUTE and EXPLAIN PLAN operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.</td>
</tr>
<tr>
<td></td>
<td>- DAYS_TO_EXPIRE: number of days until the task is deleted</td>
</tr>
<tr>
<td></td>
<td>- DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function &amp; Procedure.</td>
</tr>
</tbody>
</table>
### Table 137–10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter (contd.)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE_MULTI_EXEC:</td>
<td>SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to 'TRUE' to disable this capability. In this case, each SQL in the SQL tuning set is executed only once.</td>
</tr>
<tr>
<td>EXECUTION_DAYS_TO_EXPIRE:</td>
<td>number of days until the task's executions will be deleted (without deleting the task)</td>
</tr>
<tr>
<td>EXECUTE_FULLDML:</td>
<td>TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML.</td>
</tr>
<tr>
<td>EXECUTION_NAME1:</td>
<td>name of the first task execution to analyze</td>
</tr>
<tr>
<td>EXECUTION_NAME2:</td>
<td>name of the second task execution to analyze</td>
</tr>
<tr>
<td>LOCAL_TIME_LIMIT:</td>
<td>per-statement time out (seconds)</td>
</tr>
<tr>
<td>METRIC_DELTA_THRESHOLD:</td>
<td>threshold of the difference between the SQL performance metric before and after the change. The default value is zero.</td>
</tr>
<tr>
<td>PLAN_FILTER:</td>
<td>plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</td>
</tr>
<tr>
<td>RANK_MEASURE1:</td>
<td>first ranking measure for SQL tuning set</td>
</tr>
<tr>
<td>RANK_MEASURE2:</td>
<td>second possible ranking measure for SQL tuning set</td>
</tr>
<tr>
<td>RANK_MEASURE3:</td>
<td>third possible ranking measure for SQL tuning set</td>
</tr>
<tr>
<td>RESUME_FILTER:</td>
<td>a extra filter for SQL tuning sets besides BASIC_FILTER</td>
</tr>
<tr>
<td>SQL_IMPACT_THRESHOLD:</td>
<td>threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement.</td>
</tr>
<tr>
<td>SQL_LIMIT:</td>
<td>maximum number of SQL statements to process</td>
</tr>
<tr>
<td>SQL_PERCENTAGE:</td>
<td>percentage filter of SQL tuning set statements</td>
</tr>
<tr>
<td>SQLSET_NAME:</td>
<td>name of the SQL tuning set to associate to the specified task or task execution. This parameter is mainly using in comparing two SQL tuning sets using SPA.</td>
</tr>
<tr>
<td>SQLSET_OWNER:</td>
<td>owner of the SQL tuning set specified using task parameter SQLSET_NAME.</td>
</tr>
<tr>
<td>TIME_LIMIT:</td>
<td>global time out (seconds)</td>
</tr>
<tr>
<td>WORKLOAD_IMPACT_THRESHOLD:</td>
<td>threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.</td>
</tr>
</tbody>
</table>

value: New value of the specified parameter
SET_ANALYSIS_DEFAULT_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
    parameter  IN  VARCHAR2,
    value      IN  VARCHAR2);

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
    parameter  IN  VARCHAR2,
    value      IN  NUMBER);
### Parameters

value: New value of the specified parameter
The DBMS_SQLTUNE package is the interface for tuning SQL on demand. The related package DBMS_AUTO_SQLTUNE package provides the interface for SQL Tuning Advisor run as an automated task.

The chapter contains the following topics:

- **Using DBMS_SQLTUNE**
  - Overview
  - Security Model

- **Data Structures**

- **Subprogram Groups**
  - SQL Tuning Advisor Subprograms
  - SQL Profile Subprograms
  - SQL Tuning Set Subprograms
  - Real-time SQL Monitoring Subprograms
  - SQL Performance Reporting Subprograms

- **Summary of DBMS_SQLTUNE Subprograms**
Using DBMS_SQLTUNE

- Overview
- Security Model
Overview

The `DBMS_SQLTUNE` package provides a number interrelated areas of functionality:

- SQL Tuning Advisor Subprograms
- SQL Profile Subprograms
- SQL Tuning Set Subprograms
- Real-time SQL Monitoring Subprograms

SQL Tuning Advisor

The SQL Tuning Advisor is one of a suite of Advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, the SQL Tuning Advisor automates the tuning process of problematic SQL statements. That is, it takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advice is provided in the form of precise SQL actions for tuning the SQL along with their expected performance benefit.

The group of SQL Tuning Advisor Subprograms provide a task-oriented interface that lets you access the Advisor. You can call the following subprograms in the order given to use some of the SQL Tuning Advisor's features:

1. You use the `CREATE_TUNING_TASK` Functions to create a tuning task for tuning a single statement or a group of SQL statements.
2. The `EXECUTE_TUNING_TASK` Function & Procedure executes a previously created tuning task.
3. The `REPORT_TUNING_TASK` Function displays the results of a tuning task.
4. You use the `SCRIPT_TUNING_TASK` Function to create a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations

SQL Profile Subprograms

The SQL Tuning Advisor may recommend the creation of a SQL profile to improve the performance of a statement. SQL profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of SQL Profile Subprograms provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the `ACCEPT_SQL_PROFILE` Procedure and Function to accept a SQL profile recommended by the SQL Tuning Advisor.
- You can alter the STATUS, NAME, DESCRIPTION, and CATEGORY attributes of an existing SQL profile with the `ALTER_SQL_PROFILE` Procedure.
- You can drop a SQL profile with the `DROP_SQL_PROFILE` Procedure.

SQL Tuning Sets

The SQL Tuning Advisor input can be a single SQL statement or a set of statements. When tuning multiple statements in one advisor task, you give the input in the form of a SQL tuning set (STS). A SQL tuning set is a database object that stores SQL
SQL tuning sets store SQL statements along with

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans - which are the sequence of operations Oracle performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

SQL tuning sets can be created by filtering or ranking SQL statements from several sources:

- The cursor cache using the `SELECT_CURSOR_CACHE` Function
- Top SQL statements from the Automatic Workload Repository using the `SELECT_WORKLOAD_REPOSITORY` Functions
- Other SQL tuning sets using the `SELECT_SQLSET` Function
- SQL Performance Analyzer task comparison results using the `SELECT_SQLPA_TASK` Function
- SQL Trace files using the `SELECT_SQL_TRACE` Function
- A user-defined workload

The complete group of SQL Tuning Set Subprograms facilitates this functionality. As examples:

- You use the `CREATE_SQLSET` Procedure and Function to create a SQL tuning set object in the database
- The `LOAD_SQLSET` Procedure populates the SQL tuning set with a set of selected SQL
- The `CAPTURE_CURSOR_CACHE_SQLSET` Procedure collects SQL statements from the cursor cache over a specified time interval, attempting to build a realistic picture of system workload.

**Import/Export SQL Tuning Sets and SQL Profiles**

You use `DBMS_SQLTUNE` subprograms to move SQL profiles and SQL tuning sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source system and populate that staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as datapump, import/export, or database link), where it is used to reconstitute the objects in their original form. These steps are implemented by means of subprograms included in this package:

1. Call the `CREATE_STGTAB_SQLPROF` Procedure or the `CREATE_STGTAB_SQLSET` Procedure to create the staging table on the source system.
2. Call the `PACK_STGTAB_SQLPROF` Procedure or `PACK_STGTAB_SQLSET` Procedure to populate the staging table with information from the source system.
3. Once you have moved the staging table to the destination system, you call the UNPACK_STGTAB_SQLPROF Procedure or the UNPACK_STGTAB_SQLSET Procedure to recreate the object on the new system.

See Also: Oracle Database Performance Tuning Guide for more information about programmatic flow

Automatic Tuning Task Functions
The automated system task SYS_AUTO_SQL_TUNING_TASK is created by the database as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs the SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

You can obtain a report on the activity of the Automatic SQL Tuning task through the DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK API. See the DBMS_AUTO_SQLTUNE package for the list of subprograms that you can use to manage the automated SQL tuning task.

See Also: Using DBMS_AUTO_SQLTUNE

Real-time SQL Monitoring
Real-time SQL Monitoring allows DBAs or performance analysts to monitor the execution of long-running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated close to real-time during statement execution. These statistics are exposed by the V$SQL_MONITOR and V$SQL_PLAN_MONITOR views. In addition, DBMS_SQLTUNE provides a subprogram REPORT_SQL_MONITOR to report on monitoring information.
Security Model

This package is available to PUBLIC and performs its own security checking:

■ As the SQL Tuning advisor relies on the advisor framework, all tuning task interfaces (XXX_TUNING_TASK) require privilege ADVISOR.

■ SQL tuning set subprograms (XXX_SQLSET) require either the ADMINISTER SQL TUNING SET or the ADMINISTER ANY SQL TUNING SET privilege. Users having the ADMINISTER SQL TUNING SET privilege can only create and modify a SQL tuning set they own, while the ADMINISTER ANY SQL TUNING SET privilege allows them to operate upon all SQL tuning sets, even those owned by other users. For example, using the CREATE_SQLSET Procedure and Function you can create a SQL tuning set to be owned by another user. In this case, the user need not necessarily have the ADMINISTER SQL TUNING SET privilege to operate upon her tuning set.

■ Previously, three different privileges were needed to invoke subprograms concerned with SQL profiles:
  
  - CREATE ANY SQL PROFILE
  - ALTER ANY SQL PROFILE
  - DROP ANY SQL PROFILE

These have now been deprecated in favor of ADMINISTER SQL MANAGEMENT OBJECT.
Data Structures

The DBMS_SQLTUNE package defines the following OBJECT type

Object Types

- SQLSET_ROW Object Type
SQLSET_ROW Object Type

The SQLSET_ROW object models the content of a SQL tuning set for the user. Logically, a SQL tuning set is a collection of SQLSET_ROWS where each SQLSET_ROW contains a single SQL statement along with its execution context, statistics, binds, and plan. The SELECT_XXX subprograms each model a data source as a collection of SQLSET_ROWS, unique by (sql_id, plan_hash_value). Similarly, the LOAD_SQLSET procedure takes as input a cursor whose row type is SQLSET_ROW, treating each SQLSET_ROW in isolation according to the policies requested by the user.

Several subprograms in the DBMS_SQLTUNE package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the SQLSET_ROW as defined.

Syntax

```sql
CREATE TYPE sqlset_row AS object {
    sql_id                   VARCHAR(13),
    forcing_matching_signature NUMBER,
    sql_text                 CLOB,
    object_list              sql_objects,
    bind_data                RAW(2000),
    parsing_schema_name      VARCHAR2(30),
    module                   VARCHAR2(48),
    action                   VARCHAR2(32),
    elapsed_time             NUMBER,
    cpu_time                 NUMBER,
    buffer_gets              NUMBER,
    disk_reads               NUMBER,
    direct_writes            NUMBER,
    rows_processed           NUMBER,
    fetches                  NUMBER,
    executions               NUMBER,
    end_of_fetch_count       NUMBER,
    optimizer_cost           NUMBER,
    optimizer_env            RAW(2000),
    priority                 NUMBER,
    command_type             NUMBER,
    first_load_time          VARCHAR2(19),
    stat_period              NUMBER,
    active_stat_period       NUMBER,
    other                    CLOB,
    plan_hash_value          NUMBER,
    sql_plan                 sql_plan_table_type,
    bind_list                sql_binds)
```

Attributes

<table>
<thead>
<tr>

</table>
Subprogram Groups

DBMS_SQLTUNE subprograms are grouped by function:

- SQL Tuning Advisor Subprograms
- SQL Profile Subprograms
- SQL Tuning Set Subprograms
- Real-time SQL Monitoring Subprograms
- SQL Performance Reporting Subprograms
SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

Table 138–2  SQL Tuning Task Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CANCEL_TUNING_TASK Procedure on page 138-25</td>
<td>Cancels the currently executing tuning task</td>
</tr>
<tr>
<td>CREATE_SQL_PLAN_BASELINE Procedure on page 138-28</td>
<td>Creates a SQL plan baseline for an existing plan</td>
</tr>
<tr>
<td>CREATE_TUNING_TASK Functions on page 138-33</td>
<td>Creates a tuning of a single statement or SQL tuning set for either the SQL Tuning Advisor</td>
</tr>
<tr>
<td>DROP_TUNING_TASK Procedure on page 138-40</td>
<td>Drops a SQL tuning task</td>
</tr>
<tr>

</tr>
</tbody>
</table>
ACCEPT_SQL_PROFILE Procedure and Function

This procedure creates a SQL profile recommended by the SQL Tuning Advisor. The SQL text is normalized for matching purposes though it is stored in the data dictionary in de-normalized form for readability. SQL text is provided through a reference to the SQL Tuning task. If the referenced SQL statement doesn’t exist, an error is reported.

See Also: SQL Profile Subprograms on page 138-12 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name IN VARCHAR2,
object_id IN NUMBER := NULL,
name IN VARCHAR2 := NULL,
description IN VARCHAR2 := NULL,
category IN VARCHAR2 := NULL,
task_owner IN VARCHAR2 := NULL,
replace IN BOOLEAN := FALSE,
force_match IN BOOLEAN := FALSE,
profile_type IN VARCHAR2 := REGULAR_PROFILE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The (mandatory) name of the SQL tuning task</td>
</tr>
<tr>
<td>object_id</td>
<td>The identifier of the advisor framework object representing the SQL statement associated with the tuning task</td>
</tr>
<tr>
<td>name</td>
<td>The name of the SQL profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system generates a unique name for the SQL profile.</td>
</tr>
<tr>
<td>description</td>
<td>A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.</td>
</tr>
</tbody>
</table>
Return Values

The name of the SQL profile.

Usage Notes

The CREATE ANY SQL PROFILE privilege is required.

Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement from the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```sql
variable stmt_task VARCHAR2(64);
variable sts_task VARCHAR2(64);
-- create a tuning task tune the statement
```

---

**Table 138–8 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category</td>
<td>This is the category name which must match the value of the SQLTUNE_CATEGORY parameter in a session for the session to use this SQL profile. It defaults to the value &quot;DEFAULT&quot;. This is also the default of the SQLTUNE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An ACCEPT_SQL_PROFILE fails if this combination is duplicated.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.</td>
</tr>
<tr>
<td>replace</td>
<td>If the profile already exists, it is replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.</td>
</tr>
<tr>
<td>force_match</td>
<td>If TRUE this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the cursor_sharing parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the cursor_sharing parameter.</td>
</tr>
</tbody>
</table>
| profile_type | Options:  
- REGULAR_PROFILE - profile without a change to parallel execution (Default, equivalent to NULL). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan.  
- PX_PROFILE - regular profile with a change to parallel execution |
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    begin_snap => 1, -
    end_snap => 2, -
    sql_id => 'ay1m3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);

Note that you do not have to specify the ID (that is, object_id) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, TEST), so that it is not used by default.

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
    task_name => :stmt_task, -
    category => 'TEST');

You can use command ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same force_matching_signature as the tuned statement.

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name => :stmt_task, -
    force_match => TRUE);

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to '5'. Please notice that you must pass an object id to the ACCEPT_SQL_PROFILE procedure because there are potentially many SQL profiles for the tuning task. This object id is given along with the report.

EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK ( -
    sqlset_name => 'my_workload', -
    rank1 => 'ELAPSED_TIME', -
    time_limit => 3600, -
    description => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);

-- create the profile for the sql statement corresponding to object_id = 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE {
    task_name => :sts_task, -
    object_id => 5});
ADD_SQLSET_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
    sqlset_name  IN  VARCHAR2,
    description  IN  VARCHAR2 := NULL
) RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>description</td>
<td>The description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.</td>
</tr>
</tbody>
</table>

Return Values

The identifier of the added reference.

Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only.

The function returns a reference ID that is used to remove it later. You use the REMOVE_SQLSET_REFERENCE Procedure to delete references to a SQL tuning set.

```
variable rid number;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (  
    sqlset_name => 'my_workload',  
    description => 'my sts reference');
```

You can use the views USER/DBA_SQLSET_REFERENCES to find all references on a given SQL tuning set.
**ALTER_SQL_PROFILE Procedure**

This procedure alters specific attributes of an existing SQL profile object. The following attributes can be altered (using these attribute names):

- "STATUS" can be set to "ENABLED" or "DISABLED"
- "NAME" can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- "DESCRIPTION" can be set to any string of size no more than 500 characters
- "CATEGORY" can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text)

**See Also:** SQL Profile Subprograms on page 138-12 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.ALTER_SQL_PROFILE (  
  name                 IN  VARCHAR2,
  attribute_name       IN  VARCHAR2,
  value                IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The (mandatory) name of the existing SQL profile to alter</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The (mandatory) attribute name to alter (case insensitive) using valid attribute names</td>
</tr>
<tr>
<td>value</td>
<td>The (mandatory) new value of the attribute using valid attribute values</td>
</tr>
</tbody>
</table>

**Usage Notes**

Requires the ALTER ANY SQL PROFILE privilege.

**Examples**

-- Disable a profile, so it is not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name => :pname, -  
attribute_name  =>  'STATUS', -  
value           =>  'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name => :pname, -  
attribute_name  =>  'STATUS', -  
value           =>  'ENABLED');

-- Change the category of the profile so it is used only by sessions  
-- with category set to TEST.  
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile  
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name => :pname, -  
attribute_name  =>  'CATEGORY', -  
value           =>  'TEST');
-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (name => :pname, -
attribute_name => 'CATEGORY', -
value => 'DEFAULT');
CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

See Also: SQL Tuning Advisor Subprograms on page 138-11 for other subprograms in this group

Syntax

DBMS_SQLTUNE.CANCEL_TUNING_TASK(  
task_name IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task to cancel</td>
</tr>
</tbody>
</table>

Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
CAPTURE_CURSOR_CACHE_SQLSET Procedure

Over a specified time interval this procedure incrementally captures a workload from the cursor cache into a SQL tuning set. The procedure captures a workload from the cursor cache into a SQL tuning set, polling the cache multiple times over a time period and updating the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (  
  sqlset_name         IN VARCHAR2,  
  time_limit          IN POSITIVE := 1800,  
  repeat_interval     IN POSITIVE := 300,  
  capture_option      IN VARCHAR2 := 'MERGE',  
  capture_mode        IN NUMBER   := MODE_REPLACE_OLD_STATS,  
  basic_filter        IN VARCHAR2 := NULL,  
  sqlset_owner        IN VARCHAR2 := NULL,  
  recursive_sql       IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>time_limit</td>
<td>The total amount of time, in seconds, to execute</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>The amount of time, in seconds, to pause between sampling</td>
</tr>
<tr>
<td>capture_option</td>
<td>During capture, either insert new statements, update existing statements, or both. 'INSERT', 'UPDATE', or 'MERGE' just like load_option in load_sqlset</td>
</tr>
<tr>
<td>capture_mode</td>
<td>Capture mode (UPDATE and MERGE capture options). Possible values: MODE_REPLACE_OLD_STATS - Replace statistics when the number of executions seen is greater than that stored in the SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>MODE_ACCUMULATE_STATS - Add new values to current values for SQL we already store. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Filter to apply to cursor cache on each sampling (see SELECT_XXX subprograms). If basic_filter is not set by the caller, the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set or NULL for current schema owner</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).</td>
</tr>
</tbody>
</table>
Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the time_limit and repeat_interval parameters based on the workload time and cursor cache turnover properties of your system.

EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET(
    sqlset_name     => 'my_workload',
    time_limit      => 30,
    repeat_interval => 5);

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET(
    sqlset_name     => 'my_workload',
    time_limit      => 30,
    repeat_interval => 5,
    capture_mode    => dbms_sqltune.MODE_ACCUMULATE_STATS);

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET(
    sqlset_name     => 'my_workload',
    time_limit      => 30,
    repeat_interval => 5,
    capture_option  => 'INSERT');
CREATE_SQL_PLAN_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by the SQL Tuning Advisor.

See Also: SQL Tuning Advisor Subprograms on page 138-11 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.CREATE_SQL_PLAN_BASELINE (
    task_name            IN VARCHAR2,
    object_id            IN NUMBER := NULL,
    plan_hash_value      IN NUMBER,
    owner_name           IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task for which to get a script</td>
</tr>
<tr>
<td>object_id</td>
<td>Object ID to which the SQL corresponds</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Plan to create plan baseline</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task. Defaults to the current schema owner.</td>
</tr>
</tbody>
</table>
CREATE_SQLSET Procedure and Function

The procedure creates a SQL tuning set object in the database.
The function causes the system to generate a name for the SQL tuning set.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

DBMS_SQLTUNE.CREATE_SQLSET (  
sqlset_name  IN  VARCHAR2,  
description  IN  VARCHAR2 := NULL  
sqlset_owner IN  VARCHAR2 := NULL);

Parameters

Table 138–14 CREATE_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>description</td>
<td>The description of the SQL tuning set</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or NULL for the current schema owner</td>
</tr>
</tbody>
</table>

Examples

EXEC DBMS_SQLTUNE.CREATE_SQLSET(-  
sqlset_name => 'my_workload', -  
description => 'complete application workload');
CREATE_STGTAB_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

See Also: SQL Profile Subprograms on page 138-12 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name  => table_name,
schema_name  => schema_name := NULL,
tablespace_name  => tablespace_name := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table to create (case-insensitive unless double quoted). Required.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The schema to create the table in, or NULL for current schema (case-insensitive unless double quoted)</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>The tablespace to store the staging table within, or NULL for current user's default tablespace (case-insensitive unless double quoted)</td>
</tr>
</tbody>
</table>

Usage Notes

- Call this procedure once before issuing a call to the PACK_STGTAB_SQLPROF Procedure.
- This procedure can be called multiple times if you would like to have different SQL profiles in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.

Examples

Create a staging table to store profile data that can be moved to another system.

```sql
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name  => 'PROFILE_STGTAB');
```
CREATE_STGTAB_SQLSET Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group.

Syntax

DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (  
  table_name IN VARCHAR2,  
  schema_name IN VARCHAR2 := NULL,  
  tablespace_name IN VARCHAR2 := NULL,  
  db_version IN NUMBER   := NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of the table to create (case-sensitive)</td>
</tr>
<tr>
<td>schema_name</td>
<td>Schema in which to create the table in, or NULL for current schema (case-sensitive)</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Tablespace in which to store the staging table, or NULL for current user's default tablespace (case-sensitive)</td>
</tr>
<tr>
<td>db_version</td>
<td>Database (DB) version determining the format of the staging table. User can also create an older DB version staging table to export STS to an older DB version. One of the following values:</td>
</tr>
<tr>
<td></td>
<td>■ NULL (default) — current DB version</td>
</tr>
<tr>
<td></td>
<td>■ STS_STGTAB_10_2_VERSION — 10.2 DB version</td>
</tr>
<tr>
<td></td>
<td>■ STS_STGTAB_11_1_VERSION — 11.1 DB version</td>
</tr>
<tr>
<td></td>
<td>■ STS_STGTAB_11_2_VERSION — 11.2 DB version</td>
</tr>
</tbody>
</table>

Usage Notes

- Call this procedure once before issuing a call to the PACK_STGTAB_SQLSET Procedure.
- This procedure can be called multiple times if you would like to have different tuning sets in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.
- Users issuing the call must have permission to CREATE TABLE in the schema provided and the relevant tablespace.
- Please note that the staging table contains nested table columns and indexes, so it should not be renamed.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
Create a staging table to pack a SQL tuning set in 10.2 DB release format
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
    table_name => 'STGTAB_SQLSET',
    db_version => DBMS_SQLTUNE.STS_STGTAB_10_2_VERSION)

Create a staging table to pack a SQL tuning set in 11.1 DB release format
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
    table_name => 'STGTAB_SQLSET',
    db_version => DBMS_SQLTUNE.STS_STGTAB_11_1_VERSION)
CREATE_TUNING_TASK Functions

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the Cursor Cache given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.
- Create tuning task for a SQL Performance Analyzer

In all cases, the function mainly creates an advisor task and sets its parameters.

See Also: SQL Tuning Advisor Subprograms on page 138-11 for other subprograms in this group

Syntax

SQL text format:

```sql
DBMS_SQLTUNE.CREATE_TUNING_TASK(
    sql_text         IN CLOB,
    bind_list        IN sql_binds := NULL,
    user_name        IN VARCHAR2  := NULL,
    scope            IN VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit       IN NUMBER    := TIME_LIMIT_DEFAULT,
    task_name        IN VARCHAR2  := NULL,
    description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format:

```sql
DBMS_SQLTUNE.CREATE_TUNING_TASK(
    sql_id           IN VARCHAR2,
    plan_hash_value  IN NUMBER    := NULL,
    scope            IN VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit       IN NUMBER    := TIME_LIMIT_DEFAULT,
    task_name        IN VARCHAR2  := NULL,
    description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

Workload Repository format:

```sql
DBMS_SQLTUNE.CREATE_TUNING_TASK(
    begin_snap       IN NUMBER,
    end_snap         IN NUMBER,
    sql_id           IN VARCHAR2,
    plan_hash_value  IN NUMBER    := NULL,
    scope            IN VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit       IN NUMBER    := TIME_LIMIT_DEFAULT,
    task_name        IN VARCHAR2  := NULL,
    description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQLSET format:

```sql
DBMS_SQLTUNE.CREATE_TUNING_TASK(
    sqlset_name       IN VARCHAR2,
    ...
)
CREATE_TUNING_TASK Functions

```
CREATE_TUNING_TASK PARAMETERS

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>Text of a SQL statement</td>
</tr>
<tr>
<td>begin_snap</td>
<td>Begin snapshot identifier</td>
</tr>
<tr>
<td>end_snap</td>
<td>End snapshot identifier</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifier of a SQL statement</td>
</tr>
<tr>
<td>bind_list</td>
<td>An ordered list of bind values in ANYDATA type</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Hash value of the SQL execution plan</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>SQL tuning set name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from the SQL tuning set</td>
</tr>
<tr>
<td>object_filter</td>
<td>Object filter</td>
</tr>
<tr>
<td>rank(i)</td>
<td>Order-by clause on the selected SQL</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Percentage on the sum of a ranking measure</td>
</tr>
<tr>
<td>result_limit</td>
<td>Top L(imit) SQL from the (filtered/ranked) SQL</td>
</tr>
<tr>
<td>user_name</td>
<td>Username for whom the statement is to be tuned</td>
</tr>
<tr>
<td>scope</td>
<td>Tuning scope (limited/comprehensive)</td>
</tr>
<tr>
<td>time_limit</td>
<td>The maximum duration in seconds for the tuning session</td>
</tr>
<tr>
<td>task_name</td>
<td>Optional tuning task name</td>
</tr>
<tr>
<td>description</td>
<td>Description of the SQL tuning session to a maximum of 256 characters</td>
</tr>
</tbody>
</table>
```

Parameters:

```
CREATE_TUNING_TASK(matrix)
```

where `matrix` is a list of parameters:

- `sql_text` Text of a SQL statement
- `begin_snap` Begin snapshot identifier
- `end_snap` End snapshot identifier
- `sql_id` Identifier of a SQL statement
- `bind_list` An ordered list of bind values in ANYDATA type
- `plan_hash_value` Hash value of the SQL execution plan
- `sqlset_name` SQL tuning set name
- `basic_filter` SQL predicate to filter the SQL from the SQL tuning set
- `object_filter` Object filter
- `rank(i)` Order-by clause on the selected SQL
- `result_percentage` Percentage on the sum of a ranking measure
- `result_limit` Top L(imit) SQL from the (filtered/ranked) SQL
- `user_name` Username for whom the statement is to be tuned
- `scope` Tuning scope (limited/comprehensive)
- `time_limit` The maximum duration in seconds for the tuning session
- `task_name` Optional tuning task name
- `description` Description of the SQL tuning session to a maximum of 256 characters
### Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

### Usage Notes

With regard to the form of this subprogram that takes a SQL tuning set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user’s security privileges and can contain any constructs and subqueries that user can access, but no more.

### Examples

```sql
variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

Create Tuning Task with SQL Text format
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    sql_text => 'select quantity_sold from sales s, times t where s.time_id ='
);```

---

**Table 138–17 (Cont.) CREATE_TUNING_TASK Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan_filter</td>
<td>Plan filter. It is applicable in case there are multiple plans (plan_hash_value) associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- LAST_GENERATED: plan with the most recent timestamp</td>
</tr>
<tr>
<td></td>
<td>- FIRST_GENERATED: plan with the earliest timestamp, the opposite to LAST_GENERATED</td>
</tr>
<tr>
<td></td>
<td>- LAST_LOADED: plan with the most recent first_load_time statistics information</td>
</tr>
<tr>
<td></td>
<td>- FIRST_LOADED: plan with the earliest first_load_time statistics information, the opposite to LAST_LOADED</td>
</tr>
<tr>
<td></td>
<td>- MAX_ELAPSED_TIME: plan with the maximum elapsed time</td>
</tr>
<tr>
<td></td>
<td>- MAX_BUFFER_GETS: plan with the maximum buffer gets</td>
</tr>
<tr>
<td></td>
<td>- MAX_DISK_READS: plan with the maximum disk reads</td>
</tr>
<tr>
<td></td>
<td>- MAX_DIRECT_WRITES: plan with the maximum direct writes</td>
</tr>
<tr>
<td></td>
<td>- MAX_OPTIMIZER_COST: plan with the maximum optimizer cost</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Owner of the SQL tuning set, or NULL for the current schema owner</td>
</tr>
<tr>
<td>spa_task_name</td>
<td>Name of the SQL Performance Analyzer task whose regressions are to be tuned</td>
</tr>
<tr>
<td>spa_task_owner</td>
<td>Owner of specified SQL Performance Analyzer task or NULL for current user</td>
</tr>
<tr>
<td>spa_compare_exec</td>
<td>Execution name of Compare Performance trial of SQL Performance Analyzer task. If NULL, we use the most recent execution of the given SQL Performance Analyzer task, of type COMPARE PERFORMANCE</td>
</tr>
</tbody>
</table>
Create Tuning Task with SQL ID format
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24');

-- tune in limited scope
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24', scope => 'LIMITED');

-- only give 10 minutes for tuning statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24', time_limit => 600);

Create Tuning Task with AWR Snapshot format
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, end_snap => 2, sql_id => 'ay1m3ssvtrh24');

Create Tuning Task with SQL Tuning Set format
-- First we need to load an STS, then tune it
-- Tune our statements in order by buffer gets, time limit of one hour
-- the default ranking measure is elapsed time.
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( sqlset_name  => 'my_workload', rank1        => 'BUFFER_GETS', time_limit   => 3600, description  => 'tune my workload ordered by buffer gets');

Create Tuning Task with SPA Task format:
-- Tune the SQLs that were
-- reported as having
-- regressed from the
-- compare performance
-- execution of the
-- SPA task named task_123
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( spa_task_name => 'task_123', spa_task_owner => 'SCOTT', spa_compare_exec => 'exec1');
DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

See Also:  SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (  
    sqlset_name   IN  VARCHAR2,  
    basic_filter  IN  VARCHAR2 := NULL,  
    sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the Tuning Set.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or NULL for current schema owner</td>
</tr>
</tbody>
</table>

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload', -
                                basic_filter => 'elapsed_time < 1000000');
```
DROP_SQL_PROFILE Procedure

This procedure drops the named SQL profile from the database.

See Also: SQL Profile Subprograms on page 138-12 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.DROP_SQL_PROFILE (
    name          IN  VARCHAR2,
    ignore        IN  BOOLEAN  := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The (mandatory) name of SQL profile to be dropped. The name is case sensitive.</td>
</tr>
<tr>
<td>ignore</td>
<td>Ignores errors due to object not existing</td>
</tr>
</tbody>
</table>

Usage Notes

Requires the "DROP ANY SQL PROFILE" privilege.

Examples

```sql
-- Drop the profile:
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```
DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (
    sqlset_name   IN  VARCHAR2,
    sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or NULL for current schema owner</td>
</tr>
</tbody>
</table>

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```
DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

See Also: SQL Tuning Advisor Subprograms on page 138-11 for other subprograms in this group

Syntax

DBMS_SQLTUNE.DROP_TUNING_TASK(
  task_name      IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the tuning task to drop</td>
</tr>
</tbody>
</table>
EXECUTE_TUNING_TASK Function & Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

**See Also:** SQL Tuning Advisor Subprograms on page 138-11 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.EXECUTE_TUNING_TASK(
  task_name         IN VARCHAR2,
  execution_name    IN VARCHAR2               := NULL,
  execution_params  IN dbms_advisor.argList   := NULL,
  execution_desc    IN VARCHAR2               := NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task to execute</td>
</tr>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_TUNING_TASK_PARAMETER Procedures).</td>
</tr>
<tr>
<td>execution_desc</td>
<td>A 256-length string describing the execution</td>
</tr>
</tbody>
</table>

**Usage Notes**

A tuning task can be executed multiples times without having to reset it.

**Examples**

```sql
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```
IMPLEMENT_TUNING_TASK Function

This function implements a set of SQL profile recommendations made by the SQL Tuning Advisor. Call this subprogram is equivalent to calling the SCRIPT_TUNING_TASK Function and then running the script.

See Also: SQL Tuning Advisor Subprograms on page 138-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
    task_name  IN VARCHAR2,
    rec_type   IN VARCHAR2 := REC_TYPE_SQL_PROFILES,
    owner_name IN VARCHAR2 := NULL,
    execution_name IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task for which to implement recommendations</td>
</tr>
<tr>
<td>rec_type</td>
<td>Filter the types of recommendations to implement. Only 'PROFILES' is supported.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task or NULL for the current user.</td>
</tr>
<tr>
<td>execution_name</td>
<td>name of the task execution to use. If NULL, recommendations from the last task execution are implemented.</td>
</tr>
</tbody>
</table>
INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

See Also: SQL Tuning Advisor Subprograms on page 138-11 for other subprograms in this group

Syntax

DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(
    task_name       IN VARCHAR2);

Parameters

Table 138–24 INTERRUPT_TUNING_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task to interrupt</td>
</tr>
</tbody>
</table>

Examples

EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

**See Also:** SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.LOAD_SQLSET (  
  sqlset_name       IN  VARCHAR2,  
  populate_cursor   IN  sqlset_cursor,  
  load_option       IN VARCHAR2 := 'INSERT',  
  update_option     IN VARCHAR2 := 'REPLACE',  
  update_condition  IN VARCHAR2 := NULL,  
  update_attributes IN VARCHAR2 := NULL,  
  ignore_null       IN BOOLEAN  := TRUE,  
  commit_rows       IN POSITIVE := NULL,  
  sqlset_owner      IN VARCHAR2 := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Table 138–25</th>
<th>LOAD_SQLSET Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name to populate</td>
</tr>
<tr>
<td>populate_cursor</td>
<td>The cursor reference from which to populate</td>
</tr>
<tr>
<td>load_option</td>
<td>Specifies how the statements are loaded into the SQL tuning set. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- INSERT (default) - add only new statements</td>
</tr>
<tr>
<td></td>
<td>- UPDATE - update existing the SQL statements and ignores any new statements</td>
</tr>
<tr>
<td></td>
<td>- MERGE - this is a combination of the two other options. This option inserts new statements and updates the information of the existing ones.</td>
</tr>
<tr>
<td>update_option</td>
<td>Specifies how the existing statements are updated. This parameter is considered only if load_option is specified with 'UPDATE'/'MERGE' as an option. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- REPLACE (default) - update the statement using the new statistics, bind list, object list, and so on.</td>
</tr>
<tr>
<td></td>
<td>- ACCUMULATE - when possible combine attributes (for example, statistics like elapsed_time, and so on) otherwise just replace the old values (for example, module, action, and so on) by the new provided ones. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.</td>
</tr>
</tbody>
</table>

138-44  Oracle Database PL/SQL Packages and Types Reference
Table 138–25 (Cont.) LOAD_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>update_condition</td>
<td>Specifies a where clause to execute the update operation. The update is performed only if the specified condition is true. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination:</td>
</tr>
<tr>
<td></td>
<td>- OLD - to refer to statement attributes from the SQL tuning set (destination)</td>
</tr>
<tr>
<td></td>
<td>- NEW - to refer to statements attributes from the input statements (source)</td>
</tr>
<tr>
<td>update_attributes</td>
<td>Specifies the list of a SQL statement attributes to update during a merge or update operation. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- NULL (default) - the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution context like module, action, and so on.</td>
</tr>
<tr>
<td></td>
<td>- BASIC - statistics and binds only</td>
</tr>
<tr>
<td></td>
<td>- TYPICAL - BASIC + SQL plans (without row source statistics) and without object reference list</td>
</tr>
<tr>
<td></td>
<td>- ALL - all attributes including the execution context attributes like module, action, and so on.</td>
</tr>
<tr>
<td></td>
<td>- List of comma separated attribute names to update - EXECUTION_CONTEXT, EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)</td>
</tr>
<tr>
<td>ignore_null</td>
<td>If TRUE do not update an attribute if the new value is NULL. That is, do not override with NULL values unless intentional.</td>
</tr>
<tr>
<td>commit_rows</td>
<td>If a value is provided, the load commits after each set of that many statements is inserted. If NULL is provided, the load commits only once, at the end of the operation. Providing a value for this argument allows you to monitor the progress of a SQL tuning set load operation in the DBA_/USER_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or the current schema owner or NULL for current owner</td>
</tr>
</tbody>
</table>

Exceptions

- This procedure returns an error when sqlset_name is invalid, or a corresponding SQL tuning set does not exist, or the populate_cursor is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don’t parse (for example, they refer to attributes not in sqlset_row), or because they violate the user’s privileges.

Usage Notes

Rows in the input populate_cursor must be of type SQLSET_ROW.

Examples

In this example, you create and populate a SQL tuning set with all cursor cache statements with an elapsed time of 5 seconds or more excluding statements that...
belong to SYS schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```sql
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the cursor cache
DECLARE
cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(
    DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
      'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
      NULL, NULL, NULL, NULL, 1, NULL,
      'ALL')) P;
  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur);
END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your update_option because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the elapsed_time filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```sql
DECLARE
cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(
    DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
      'parsing_schema_name <> ''SYS''',
      NULL, NULL,NULL,NULL, 1,
      NULL,
      'ALL')) P;
  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur,
    load_option => 'MERGE',
    update_option => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the load_option argument of the LOAD_SQLSET procedure.

```sql
DECLARE
cur sys_refcursor;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
populate_cursor => cur);
END;
/

The next example demonstrates a load with UPDATE option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur, 
    load_option => 'UPDATE');
END;
/
PACK_STGTAB_SQLPROF Procedure

This procedure copies profile data from the SYS. schema into the staging table.

See Also: SQL Profile Subprograms on page 138-12 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (  
  profile_name          IN VARCHAR2 := '%',  
  profile_category      IN VARCHAR2 := 'DEFAULT',  
  staging_table_name    IN VARCHAR2,  
  staging_schema_owner  IN VARCHAR2 := NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>The name of the profile to pack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>profile_category</td>
<td>The category to pack profiles from (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table to use (case-insensitive unless double quoted). Required.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedures requires ADMINISTER SQL MANAGEMENT OBJECT privilege and INSERT privilege on the staging table.
- Note that this function issues a COMMIT after packing each SQL profile, so if an error is raised mid-execution, clear the staging table by deleting its rows.

Examples

Put only those profiles in the DEFAULT category into the staging table. This corresponds to all profiles used by default on this system.

```sql
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name => 'PROFILE_STGTAB');  
```

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```sql
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -  
  staging_table_name => 'PROFILE_STGTAB');  
```
PACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB_SQLSET Procedure.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

DBMS_SQLTUNE.PACK_STGTAB_SQLSET (  
    sqlset_name          IN VARCHAR2,  
    sqlset_owner         IN VARCHAR2 := NULL,  
    staging_table_name   IN VARCHAR2,  
    staging_schema_owner IN VARCHAR2 := NULL,  
    db_version           IN NUMBER := NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The name of the SQL tuning set to pack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The category from which to pack SQL tuning sets (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table to use (case-sensitive)</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-sensitive)</td>
</tr>
<tr>
<td>db_version</td>
<td>Database (DB) version determining the format of the staging table. User can also create an older DB version staging table to export STS to an older DB version. One of the following values:</td>
</tr>
</tbody>
</table>

  * NULL (default) — current DB version
  * STS_STGTAB_10_2_VERSION — 10.2 DB version
  * STS_STGTAB_11_1_VERSION — 11.1 DB version
  * STS_STGTAB_11_2_VERSION — 11.2 DB version

Usage Notes

- This procedure can be called several times to move more than one SQL tuning set. Users can then move the populated staging table to another system using any method, such as database link or datapump. Users can then call the UNPACK_STGTAB_SQLSET Procedure create the SQL tuning set on the other system.
- Note that this function issues a COMMIT after packing each SQL tuning set, so if an error is raised mid-execution, clear the staging table by deleting its rows.

Examples

Put all SQL tuning sets on the system in the staging table
-- to create a staging table, see the CREATE_STGTAB_SQLSET Procedure
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name => '%', -
sqlset_owner       => '%', -
staging_table_name => 'STGTAB_SQLSET');

Put only those SQL tuning sets owned by the current user in the staging table
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name => '%', -
    staging_table_name => 'STGTAB_SQLSET');

Pack a specific SQL tuning set
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name => 'my_workload', -
    staging_table_name => 'STGTAB_SQLSET');

Pack a second SQL tuning set
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name => 'workload_subset', -
    staging_table_name => 'STGTAB_SQLSET');

Pack the STS my_workload to a staging table STGTAB_SQLSET created for 10.2 DB release
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name => 'workload_subset', -
    staging_table_name => 'STGTAB_SQLSET',
    db_version => DBMS_SQLTUNE.STS_STGTAB_10_2_VERSION);

Pack the STS my_workload to a staging table STGTAB_SQLSET created for 11.1 DB release
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name => 'workload_subset', -
    staging_table_name => 'STGTAB_SQLSET',
    db_version => DBMS_SQLTUNE.STS_STGTAB_11_1_VERSION);
REMAP_STGTAB_SQLPROF Procedure

This procedure allows DBAs to change the profile data values kept in the staging table prior to performing an unpack operation. The procedure can be used to change the category of a profile. It can be used to change the name of a profile if one already exists on the system with the same name.

**See Also:** SQL Profile Subprograms on page 138-12 for other subprograms in this group

### Syntax

```sql
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (  
  old_profile_name      IN VARCHAR2,  
  new_profile_name      IN VARCHAR2 := NULL,  
  new_profile_category  IN VARCHAR2 := NULL,  
  staging_table_name    IN VARCHAR2,  
  staging_schema_owner  IN VARCHAR2 := NULL);
```

### Parameters

**Table 138–28 REMAP_STGTAB_SQLPROF Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_profile_name</td>
<td>The name of the profile to target for a remap operation (case-sensitive)</td>
</tr>
<tr>
<td>new_profile_name</td>
<td>The new name of the profile, or NULL to remain the same (case-sensitive)</td>
</tr>
<tr>
<td>new_profile_category</td>
<td>The new category for the profile, or NULL to remain the same (case-sensitive)</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table on which to perform the remap operation (case-sensitive). Required.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-sensitive)</td>
</tr>
</tbody>
</table>

### Usage Notes

Using this procedure requires the UPDATE privilege on the staging table.

### Examples

Change the name of a profile before we unpack, to avoid conflicts

```sql
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (old_profile_name => :pname,  
                                         new_profile_name => 'IMP' || :pname,  
                                         staging_table_name => 'PROFILE_STGTAB');
```

Change the SQL profile in the staging table to be 'TEST' category before we import it. This way users can test the profile on the new system before it is active.

```sql
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (old_profile_name    => :pname,  
                                         new_profile_category => 'TEST',  
                                         staging_table_name => 'PROFILE_STGTAB');
```
REMAP_STGTAB_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system.

See Also: SQL Profile Subprograms on page 138-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
    old_sqlset_name        IN VARCHAR2,
    old_sqlset_owner       IN VARCHAR2 := NULL,
    new_sqlset_name        IN VARCHAR2 := NULL,
    new_sqlset_owner       IN VARCHAR2 := NULL,
    staging_table_name     IN VARCHAR2,
    staging_schema_owner   IN VARCHAR2 := NULL);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_sqlset_name</td>
<td>The name of the tuning set to target for a remap operation. Wildcards are not supported.</td>
</tr>
<tr>
<td>old_sqlset_owner</td>
<td>The new name of the tuning set owner to target for a remap operation. NULL for current schema owner</td>
</tr>
<tr>
<td>new_sqlset_name</td>
<td>The new name for the tuning set, or NULL to keep the same tuning set name.</td>
</tr>
<tr>
<td>new_sqlset_owner</td>
<td>The new owner for the tuning set, or NULL to remain the same owner name.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table on which to perform the remap operation (case-sensitive)</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The name of staging table owner, or NULL for current schema owner (case-sensitive)</td>
</tr>
</tbody>
</table>
```

Usage Notes

You can call this procedure multiple times to remap more than one tuning set name or owner. Note that this procedure only handles one tuning set per call.

Examples

```
-- Change the name of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name => 'my_workload', -
    old_sqlset_owner => 'SH', -
    new_sqlset_name  => 'imp_workload', -
    staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name => 'imp_workload', -
    old_sqlset_owner => 'SH', -
    new_sqlset_owner => 'SYS', -
    staging_table_name => 'STGTAB_SQLSET');
```
REMOVE_SQLSET_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate it is no longer used by the client.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (    
   sqlset_name   IN  VARCHAR2,    
   reference_id  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>reference_id</td>
<td>The identifier of the reference to remove</td>
</tr>
</tbody>
</table>

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again.

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE(    
   sqlset_name   => 'my_workload',    
   reference_id  => :rid);
```

Use views USER/DBA_SQLSET_REFERENCES to find all references on a given SQL tuning set.
REPORT_AUTO_TUNING_TASK Function

This function displays a report from the automatic tuning task. This function reports on a range of task executions, whereas the REPORT_TUNING_TASK Function reports on a single execution. Note that this function is deprecated in Oracle Database 11gR2 (11.2.0.2) in favor of DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK.

See Also:
- SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group
- REPORT_AUTO_TUNING_TASK Function on page 28-7

Syntax

DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
   begin_exec     IN VARCHAR2  := NULL,
   end_exec       IN VARCHAR2  := NULL,
   type           IN VARCHAR2  := TYPE_TEXT,
   level          IN VARCHAR2  := LEVEL_TYPICAL,
   section        IN VARCHAR2  := SECTION_ALL,
   object_id      IN NUMBER    := NULL,
   result_limit   IN NUMBER    := NULL)
RETURN CLOB;

Parameters

Table 138–31 REPORT_AUTO_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_exec</td>
<td>Name of execution from which to begin the report. NULL retrieves a report on the most recent run</td>
</tr>
<tr>
<td>end_exec</td>
<td>Name of execution at which to end the report. NULL retrieves a report on the most recent run.</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TYPE_TEXT which produces a text report</td>
</tr>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>■ LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor.</td>
</tr>
<tr>
<td></td>
<td>■ LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented.</td>
</tr>
<tr>
<td></td>
<td>■ LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.</td>
</tr>
<tr>
<td>section</td>
<td>Optionally limit the report to a single section (ALL for all sections):</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_SUMMARY - summary information</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_FINDINGS - tuning findings</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_PLAN - explain plans</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_INFORMATION - general information</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_ERROR - statements with errors</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_ALL - all statements</td>
</tr>
</tbody>
</table>
Return Values

A CLOB containing the desired report.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_id</td>
<td>Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Maximum number of SQL statements to show in the report</td>
</tr>
</tbody>
</table>
REPORT_SQL_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the V$ views and AWR.

See Also: SQL Performance Reporting Subprograms on page 138-15 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.REPORT_SQL_DETAIL(
  sql_id                   IN  VARCHAR2   DEFAULT NULL,
  sql_plan_hash_value      IN  NUMBER     DEFAULT NULL,
  start_time               IN  DATE       DEFAULT NULL,
  duration                 IN  NUMBER     DEFAULT NULL,
  inst_id                  IN  NUMBER     DEFAULT NULL,
  dbid                     IN  NUMBER     DEFAULT NULL,
  event_detail             IN  VARCHAR2   DEFAULT 'YES',
  bucket_max_count         IN  NUMBER     DEFAULT 128,
  bucket_interval          IN  NUMBER     DEFAULT NULL,
  top_n                    IN  NUMBER     DEFAULT 10,
  report_level             IN  VARCHAR2   DEFAULT 'TYPICAL',
  type                     IN  VARCHAR2   DEFAULT 'ACTIVE')
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session.</td>
</tr>
<tr>
<td>sql_plan_hash_value</td>
<td>Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID.</td>
</tr>
<tr>
<td>start_time</td>
<td>If specified, shows SQL activity (from gv$ACTIVE_SESSION_HISTORY) starting at this time. On Oracle RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance.</td>
</tr>
<tr>
<td>dbid</td>
<td>DBID from which to get SQL details. If NULL, uses current DBID.</td>
</tr>
<tr>
<td>event_detail</td>
<td>When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class, event_name).</td>
</tr>
<tr>
<td>bucket_max_count</td>
<td>If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used.</td>
</tr>
</tbody>
</table>
Summary of DBMS_SQLTUNE Subprograms

Table 138–32 (Cont.) REPORT_SQL_DETAIL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bucket_interval</td>
<td>If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.</td>
</tr>
<tr>
<td>top_n</td>
<td>Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used.</td>
</tr>
<tr>
<td>report_level</td>
<td>Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below. In addition, individual report sections can also be enabled or disabled by using a +/- section_name. Several sections are defined:</td>
</tr>
<tr>
<td></td>
<td>- 'TOP' - Show top values for the ASH dimensions for a SQL statement; ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'SPM' - Show existing plan baselines for a SQL statement; OFF by default</td>
</tr>
<tr>
<td></td>
<td>- 'MISMATCH' - Show reasons for creating new child cursors (sharing criteria violations); OFF by default.</td>
</tr>
<tr>
<td></td>
<td>- 'STATS' - Show SQL execution statistics per plan from GV$SQLAREA_PLAN_HASH; ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'ACTIVITY' - Show top activity from ASH for each plan of a SQL statement; ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'ACTIVITY_ALL' - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default</td>
</tr>
<tr>
<td></td>
<td>- 'HISTOGRAM' - Show activity histogram for each plan of a SQL statement (plan timeline histogram); ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'SESSIONS' - Show activity for top sessions for each plan of a SQL statement; OFF by default</td>
</tr>
<tr>
<td></td>
<td>- 'MONITOR' - Show show one monitored SQL execution per execution plan; ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'XPLAN' - Show execution plans; ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'BINDS' - Show captured bind data; ON by default</td>
</tr>
<tr>
<td>type</td>
<td>Report format: ‘ACTIVE’ by default. Can also be ‘XML’ (see Usage Notes).</td>
</tr>
</tbody>
</table>

In addition, SQL text can be specified at different levels:

- SQL_TEXT - No SQL text in report
- +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV$SQL_MONITOR
- -SQL_FULLTEXT - No full SQL text (+SQL_TEXT)
- +SQL_FULLTEXT - Show full SQL text (default value)

The meanings of the three top-level report levels are:

- NONE - minimum possible
- BASIC - SQL_TEXT+STATS+ACTIVITY+HISTOGRAM
- TYPICAL - SQL_FULLTEXT+TOP+STATS+ACTIVITY+HISTOGRAM+X PLAN+MONITOR
- ALL - everything

Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string.
Return Values

A CLOB containing the desired report.

Usage Notes

- **ACTIVE** reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

- The invoker needs the **SELECT** privilege on the following views:
  - V$SESSION
  - DBA_ADVISOR_FINDINGS
  - V$DATABASE
  - GV$ASH_INFO
  - GV$ACTIVE_SESSION_HISTORY
  - GV$SQLAREA_PLAN_HASH
  - GV$SQL
  - DBA_HIST_SNAPSHOT
  - DBA_HIST_WR_CONTROL
  - DBA_HIST_ACTIVE_SESS_HISTORY
  - DBA_HIST_SQLSTAT
  - DBA_HIST_SQL_BIND_METADATA
  - DBA_HIST_SQLTEXT
  - DBA_SQL_PLAN_BASELINES
  - DBA_SQL_PROFILES
  - DBA_ADVISOR_TASKS
  - DBA_SERVICES
  - DBA_USERS
  - DBA_OBJECTS
  - DBA_PROCEDURES

- The invoker needs the **EXECUTE** privilege on the **DBMS_XPLAN** package.

- Finally, the invoker requires all privileges required by **DBMS_SQLTUNE.REPORT_SQL_MONITOR** and **DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST** as it calls these functions.
REPORT_SQL_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

See Also: Real-time SQL Monitoring Subprograms on page 138-14 for other subprograms in this group

Syntax

DBMS_SQLTUNE.REPORT_SQL_MONITOR(
  sql_id                    IN VARCHAR2  DEFAULT  NULL,
  session_id                IN NUMBER    DEFAULT  NULL,
  session_serial            IN NUMBER    DEFAULT  NULL,
  sql_exec_start            IN DATE      DEFAULT  NULL,
  sql_exec_id               IN NUMBER    DEFAULT  NULL,
  inst_id                   IN NUMBER    DEFAULT  NULL,
  start_time_filter         IN DATE      DEFAULT  NULL,
  end_time_filter           IN DATE      DEFAULT  NULL,
  instance_id_filter        IN NUMBER    DEFAULT  NULL,
  parallel_filter           IN VARCHAR2  DEFAULT  NULL,
  plan_line_filter          IN NUMBER    DEFAULT  NULL,
  event_detail              IN VARCHAR2  DEFAULT  'YES',
  bucket_max_count          IN NUMBER    DEFAULT  128,
  bucket_interval           IN NUMBER    DEFAULT  NULL,
  base_path                 IN VARCHAR2  DEFAULT  NULL,
  last_refresh_time         IN DATE      DEFAULT  NULL,
  report_level              IN VARCHAR2  DEFAULT  'TYPICAL',
  type                      IN VARCHAR2  DEFAULT  'TEXT',
  sql_plan_hash_value       IN NUMBER    DEFAULT  NULL)
RETURN CLOB;

Parameters

Table 138–33  REPORT_SQL_MONITOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.</td>
</tr>
<tr>
<td>session_id</td>
<td>If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.</td>
</tr>
<tr>
<td>sql_exec_start</td>
<td>This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.</td>
</tr>
</tbody>
</table>
REPORT_SQL_MONITOR Function

This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.

inst_id

Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.

start_time_filter

If not NULL, the report considers only the activity (from GV$ACTIVE_SESSION_HISTORY) recorded after the specified date. If NULL, the reported activity starts when the execution of the targeted SQL statement has started.

end_time_filter

If not NULL, the report shows only the activity (from GV$ACTIVE_SESSION_HISTORY) collected before the date end_time_filter. If NULL, the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing.

instance_id_filter

Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (Oracle RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.

parallel_filter

Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be:

- NULL to target all processes
- [qc] [servers(<svr_grp>[,] <svr_set>[,] <srv_num>)]: 'qc' stands for query coordinator and servers() stipulate which PX servers to consider.

The following examples show how to target a subset of the parallel processes:

- qc: targets only the query coordinator
- servers(1): targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel.
- servers(,2): targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers)
- servers(1,1): consider only group 1, set 1
- servers(1,2,4): consider only group 1, set 2, server number 4. This reports for a single parallel server process
- qc servers(1,2,4): same as above by also including the query coordinator

event_detail

When value is 'YES' (the default), reported activity from GV$ACTIVE_SESSION_HISTORY is aggregated by (wait_class, event_name). Use 'NO' to only aggregate by wait_class.

bucket_max_count

If specified, this should be the maximum number of histogram buckets created in the report.
**Summary of DBMS_SQLTUNE Subprograms**

**bucket_interval** If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.

**base_path** URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)

**last_refresh_time** If not NULL (default is NULL), the time when the report was last retrieved (see SYSDATE attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized:

- SQL text is not returned when this option is specified
- activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket

**report_level** Level of detail for the report, either 'NONE', 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below.

In addition, individual report sections can also be enabled or disabled by using a +/- section_name. Several sections are defined:

- 'XPLAN' - Show explain plan; ON by default
- 'PLAN' - Show plan monitoring statistics; ON by default
- 'SESSIONS' - Show session details. Applies only to parallel queries; ON by default
- 'INSTANCE' - Show instance details. Applies only to parallel and cross instance; ON by default
- 'PARALLEL' - An umbrella parameter for specifying sessions+instance details
- 'ACTIVITY' - Show activity summary at global level, plan line level and session or instance level (if applicable); ON by default
- 'BINDS' - Show bind information when available; ON by default
- 'METRICS' - Show metric data (CPU, IOs, ...) over time; ON by default
- 'ACTIVITY_HISTOGRAM' - Show an histogram of the overall query activity; ON by default
- 'PLAN_HISTOGRAM' - Show activity histogram at plan line level; OFF by default
- 'OTHER' - Other info; ON by default

In addition, SQL text can be specified at different levels:

- SQL_TEXT - No SQL text in report
- +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV$SQL_MONITOR
- -SQL_FULLTEXT - No full SQL text (+SQL_TEXT)
- +SQL_FULLTEXT - Show full SQL text (default value)
REPORT_SQL_MONITOR Function

### Return Values

A CLOB containing the desired report.

### Usage Notes

- The target SQL statement for this report can be:
  - The last SQL monitored by Oracle (this is the default behavior, so there is no need to specify any parameter)
  - The last SQL executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally it serial number. For example, use `session_id => USERENV ('SID')` for the current session or `session_id=>20, session_serial=>103` for session ID 20, serial number 103.
  - The last execution of a specific statement identified by its `sql_id`.
  - A specific execution of a SQL statement identified by its execution key `(sql_id, sql_exec_start and sql_exec_id)`.

- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).
  - `GV$SQL_MONITOR`
  - `GV$SQL_PLAN_MONITOR`
  - `GV$SQL_PLAN`
  - `GV$ACTIVE_SESSION_HISTORY`
  - `GV$SESSION_LONGOPS`
  - `GV$SQL`

- The `bucket_max_count` and `bucket_interval` parameters control the activity histogram. By default, the maximum number of buckets is set to 128 and the RDBMS derives the `bucket_interval` based on this. The `bucket_interval` (value is in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1s) without exceeding the maximum number of buckets. For example, if the query has executed for 600s, the RDBMS selects a `bucket_interval` of 8s.
(a power of two) given that \(600/8 = 74\) which is less than 128 buckets maximum. Smaller than 8s would be 4s which would lead to more buckets than the 128 maximum. If bucket_interval is specified, the RDBMS uses that value instead of deriving it from bucket_max_count.

- **ACTIVE** reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

**See Also:** *Oracle Database Performance Tuning Guide* for more information about SQL real-time monitoring.
REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a sub-set of statements monitored by Oracle. For each statement, the subprogram gives key information and associated global statistics.

Use the REPORT_SQL_MONITOR Function to get detail monitoring information for a single SQL statement.

See Also: SQL Performance Reporting Subprograms on page 138-15 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST(
  sql_id                    IN VARCHAR2  DEFAULT  NULL,
  session_id                IN NUMBER    DEFAULT  NULL,
  session_serial            IN NUMBER    DEFAULT  NULL,
  inst_id                   IN NUMBER    DEFAULT  NULL,
  active_since_date         IN DATE      DEFAULT  NULL,
  active_since_sec          IN NUMBER    DEFAULT  NULL,
  last_refresh_time         IN DATE      DEFAULT  NULL,
  report_level              IN VARCHAR2  DEFAULT  'TYPICAL',
  auto_refresh              IN NUMBER    DEFAULT  NULL,
  base_path                 IN VARCHAR2  DEFAULT  NULL,
  type                      IN VARCHAR2  DEFAULT 'TEXT')
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.</td>
</tr>
<tr>
<td>session_id</td>
<td>If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>In addition to the session_id parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.</td>
</tr>
<tr>
<td>active_since_date</td>
<td>If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time.</td>
</tr>
<tr>
<td>active_since_sec</td>
<td>Same as active_since_date but with the date specified relative to the current sysdate minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour.</td>
</tr>
</tbody>
</table>
Return Values

A report (XML, text, HTML) for the list of SQL statements that have been monitored.

Usage Notes

The user tuning this function needs to have privilege to access the following fixed views: GV$SQL_MONITOR and GV$SQL

See Also:  Oracle Database Performance Tuning Guide for more information about SQL real-time monitoring.
REPORT_TUNING_TASK Function

This procedure displays the results of a tuning task.

See Also: SQL Performance Reporting Subprograms on page 138-15 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK(
    task_name       IN   VARCHAR2,
    type            IN   VARCHAR2   := 'TEXT',
    level           IN   VARCHAR2   := 'TYPICAL',
    section         IN   VARCHAR2   := ALL,
    object_id       IN   NUMBER     := NULL,
    result_limit    IN   NUMBER     := NULL,
    owner_name      IN    VARCHAR2  := NULL,
    execution_name  IN  VARCHAR2    := NULL)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task to report</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TEXT which produces a text report.</td>
</tr>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>■ BASIC: simple version of the report. Just show info about the actions taken by the advisor.</td>
</tr>
<tr>
<td></td>
<td>■ TYPICAL: show information about every statement analyzed, including requests not implemented.</td>
</tr>
<tr>
<td></td>
<td>■ ALL: highly detailed report level, also provides annotations about statements skipped over.</td>
</tr>
<tr>
<td>section</td>
<td>Optionally limit the report to a single section (ALL for all sections):</td>
</tr>
<tr>
<td></td>
<td>■ SUMMARY - summary information</td>
</tr>
<tr>
<td></td>
<td>■ FINDINGS - tuning findings</td>
</tr>
<tr>
<td></td>
<td>■ PLAN - explain plans</td>
</tr>
<tr>
<td></td>
<td>■ INFORMATION - general information</td>
</tr>
<tr>
<td></td>
<td>■ ERROR - statements with errors</td>
</tr>
<tr>
<td></td>
<td>■ ALL - all statements</td>
</tr>
<tr>
<td>object_id</td>
<td>Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Maximum number of SQL statements to show in the report</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task. Defaults to the current schema owner.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, the report is generated for the last task execution.</td>
</tr>
</tbody>
</table>
Return Values

A CLOB containing the desired report.

Examples

-- Get the whole report for the single statement case.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'FINDINGS', 5) from dual;
RESET_TUNING_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

See Also: SQL Tuning Advisor Subprograms on page 138-11 for other subprograms in this group

Syntax

DBMS_SQLTUNE.RESET_TUNING_TASK(
    task_name  IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the tuning task to reset</td>
</tr>
</tbody>
</table>

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```
RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

See Also: SQL Tuning Advisor Subprograms on page 138-11 for other subprograms in this group

Syntax

DBMS_SQLTUNE.RESUME_TUNING_TASK(
    task_name       IN VARCHAR2,
    basic_filter    IN VARCHAR2 := NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the tuning task to resume</td>
</tr>
<tr>
<td>basic_filter</td>
<td>A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter is applied in conjunction with the basic filter (i.e., parameter basic_filter) when calling CREATE_TUNING_TASK Functions.</td>
</tr>
</tbody>
</table>

Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL tuning set) is not supported.

Examples

-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check -- out its results and then decide. For this example we will just resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
SCRIPT_TUNING_TASK Function

This function creates a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations.

See Also: SQL Tuning Advisor Subprograms on page 138-11 for other subprograms in this group

Syntax

DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
  task_name         IN VARCHAR2,
  rec_type          IN VARCHAR2  := REC_TYPE_ALL,
  object_id         IN NUMBER    := NULL,
  result_limit      IN NUMBER   := NULL,
  owner_name        IN VARCHAR2  := NULL,
  execution_name    IN VARCHAR2  := NULL)
RETURN CLOB;

Parameters

Table 138–38  SCRIPT_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task for which to apply a script</td>
</tr>
<tr>
<td>rec_type</td>
<td>Filter the script by types of recommendations to include. Any subset of the following separated by commas: or 'ALL: 'PROFILES','STATISTICS','INDEXES'. For example, a script with profiles and statistics: 'PROFILES,STATISTICS'</td>
</tr>
<tr>
<td>object_id</td>
<td>Optionally filters by a single object ID</td>
</tr>
<tr>
<td>result_limit</td>
<td>Optionally shows commands for only top N SQL (ordered by object_id and ignored if an object_id is also specified)</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task. Defaults to the current schema owner</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, the script is generated for the last task execution.</td>
</tr>
</tbody>
</table>

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- Once the script is returned, it should then be checked by the DBA and executed.
- Wrap with a call to DBMS_ADVISOR.CREATE_FILE to put it into a file.

Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of just the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;
```
-- get a script of just stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about just one SQL statement when we have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
SELECT_CURSOR_CACHE Function

This function collects SQL statements from the SQL Cursor Cache.

**See Also:** SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
    basic_filter        IN   VARCHAR2 := NULL,
    object_filter       IN   VARCHAR2 := NULL,
    ranking_measure1    IN   VARCHAR2 := NULL,
    ranking_measure2    IN   VARCHAR2 := NULL,
    ranking_measure3    IN   VARCHAR2 := NULL,
    result_percentage   IN   NUMBER   := 1,
    result_limit        IN   NUMBER   := NULL,
    attribute_list      IN   VARCHAR2 := NULL,
    recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic_filter</td>
<td>The SQL predicate to filter the SQL from the cursor cache defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>An order-by clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.</td>
</tr>
<tr>
<td>result_limit</td>
<td>The top L(limit) SQL from the (filtered) source ranked by the ranking measure</td>
</tr>
<tr>
<td>attribute_list</td>
<td>List of SQL statement attributes to return in the result. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default)</td>
</tr>
<tr>
<td></td>
<td>- BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</td>
</tr>
<tr>
<td></td>
<td>- ALL - return all attributes</td>
</tr>
<tr>
<td></td>
<td>- Comma separated list of attribute names this allows to return only a subset of SQL attributes:</td>
</tr>
<tr>
<td></td>
<td>EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN, SQL_PLAN_STATISTICS: similar to SQL_PLAN + row source statistics</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).</td>
</tr>
</tbody>
</table>
Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the cursor cache views.

Examples

-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = '4rm4183czbs7j'));

-- Notice that some statements can have multiple plans. The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value). This is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = 'aylm3ssvtrh24'))
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor, along the
-- lines given below

-- Select all statements in the cursor cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/

-- Look for statements not parsed by SYS.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <> ''SYS''')) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
-- All statements from a particular module/action.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE('module = 'MY_APPLICATION' and action = 'MY_ACTION')
    ) P;

  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
END;
/

-- all statements that ran for at least five seconds
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('elapsed_time > 500000')) P;

  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
end;
/

-- select all statements that pass a simple buffer_gets threshold and
-- are coming from an APPS user
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 100 and parsing_schema_name = 'APPS')) P;

  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
end;
/

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of sqlset_row
-- is NULL)
DECLARE
  cur sys_refcursor;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(dbms_sqltune.select_cursor_cache(
    'elapsed_time > 5000000', NULL, NULL, NULL, NULL, 1, NULL,
    'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN')) P;

-- Process each statement (or pass cursor to load_sqlset)
CLOSE cur;
END;
/

-- Select the top 100 statements in the cursor cache ordering by elapsed_time.
DECLARE
    cur sys_refcursor;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
    NULL,
    'ELAPSED_TIME', NULL, NULL,
    1,
    100)) P;

-- Process each statement (or pass cursor to load_sqlset)
CLOSE cur;
end;
/

-- Select the set of statements which cumulatively account for 90% of the
-- buffer gets in the cursor cache. This means that the buffer gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
    cur sys_refcursor;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
    NULL,
    'BUFFER_GETS', NULL, NULL,
    .9)) P;

-- Process each statement (or pass cursor to load_sqlset).
CLOSE cur;
END;
/
SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of sqlset_row.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.SELECT_SQL_TRACE (  
directory              IN VARCHAR2,  
file_name              IN VARCHAR2 := NULL,  
mapping_table_name     IN VARCHAR2 := NULL,  
mapping_table_owner    IN VARCHAR2 := NULL,,  
select_mode            IN POSITIVE := SINGLE_EXECUTION,  
options                IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,  
pattern_start          IN VARCHAR2 := NULL,  
pattern_end            IN VARCHAR2 := NULL,  
result_limit           IN POSITIVE := NULL)  
RETURN sys.sqlset PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>The directory object containing the trace file(s). This field is mandatory.</td>
</tr>
<tr>
<td>file_name</td>
<td>All or part of name of the trace file(s) to process. If NULL then the current or most recent file in the specified location or path is used. '% ' wildcards are supported for matching trace file names.</td>
</tr>
<tr>
<td>mapping_table_name</td>
<td>The mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, the mappings in the current database is used.</td>
</tr>
<tr>
<td>mapping_table_owner</td>
<td>the mapping table owner. If it is NULL, the current user is used.</td>
</tr>
<tr>
<td>select_mode</td>
<td>the mode for selecting SQL from the trace. By default, it is SINGLE_EXECUTION.</td>
</tr>
<tr>
<td></td>
<td>■ SINGLE_EXECUTION - return one execution of a SQL.(default).</td>
</tr>
<tr>
<td></td>
<td>■ ALL_EXECUTIONS - return all executions.</td>
</tr>
<tr>
<td>options</td>
<td>The options. By default, it is LIMITED_COMMAND_TYPE which can be specified to include SQL statements from all Oracle command types.</td>
</tr>
<tr>
<td></td>
<td>■ LIMITED_COMMAND_TYPE - returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, UPSERT. It is the default.</td>
</tr>
<tr>
<td></td>
<td>■ ALL_COMMAND_TYPE - returns the SQL statements with all command types.</td>
</tr>
<tr>
<td>pattern_start</td>
<td>Opening delimiting pattern of the trace file section(s) to consider. CURRENTLY INOPERABLE.</td>
</tr>
<tr>
<td>pattern_end</td>
<td>closing delimiting pattern of the trace file section(s) to process. CURRENTLY INOPERABLE.</td>
</tr>
</tbody>
</table>
Return Values

This function returns a SQLSET_ROW object.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```sql
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run SQL statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
  SELECT object_id id, owner, substr(object_name, 1, 30) name
  FROM dba_objects
  WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')
  UNION ALL
  SELECT user_id id, username owner, NULL name
  FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(p)
    FROM TABLE(DBMS_SQLTUNE.SELECT_SQL_TRACE(
      directory=>'SQL_TRACE_DIR',
      file_name=>'%trc',
      mapping_table_name=>'mapping')) p;
  DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
/

SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

See Also:
- SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group
- Oracle Database Real Application Testing User’s Guide

Syntax

```sql
DBMS_SQLTUNE.SELECT_SQLPA_TASK(
    task_name         IN VARCHAR2,
    task_owner        IN VARCHAR2 := NULL,
    execution_name    IN VARCHAR2 := NULL,
    level_filter      IN VARCHAR2 := 'REGRESSED',
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    attribute_list    IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the SQL Performance Analyzer task</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the SQL Performance Analyzer task. If NULL, then assume the current user.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the SQL Performance Analyzer task execution (type COMPARE PERFORMANCE) from which the provided filters will be applied. If NULL, then assume the most recent COMPARE PERFORMANCE execution.</td>
</tr>
<tr>
<td>level_filter</td>
<td>Filter to specify which subset of SQLs to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</td>
</tr>
<tr>
<td></td>
<td>- IMPROVED includes only improved SQL.</td>
</tr>
<tr>
<td></td>
<td>- REGRESSED includes only regressed SQL (default).</td>
</tr>
<tr>
<td></td>
<td>- CHANGED includes only SQL with changed performance.</td>
</tr>
<tr>
<td></td>
<td>- UNCHANGED includes only SQL with unchanged performance.</td>
</tr>
<tr>
<td></td>
<td>- CHANGED_PLANS includes only SQL with plan changes.</td>
</tr>
<tr>
<td></td>
<td>- UNCHANGED_PLANS includes only SQL with unchanged plans.</td>
</tr>
<tr>
<td></td>
<td>- ERRORS includes only SQL with errors only.</td>
</tr>
<tr>
<td></td>
<td>- MISSING_SQL includes only missing SQL statements (across STS).</td>
</tr>
<tr>
<td></td>
<td>- NEW_SQL includes only new SQL statements (across STS).</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL in addition to the level filters.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
</tbody>
</table>
Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.
SELECT_SQLSET Function

This function reads SQLSET contents.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.SELECT_SQLSET (  
    sqlset_name         IN   VARCHAR2,  
    basic_filter        IN   VARCHAR2 := NULL,  
    object_filter       IN   VARCHAR2 := NULL,  
    ranking_measure1    IN   VARCHAR2 := NULL,  
    ranking_measure2    IN   VARCHAR2 := NULL,  
    ranking_measure3    IN   VARCHAR2 := NULL,  
    result_percentage   IN   NUMBER   := 1,  
    result_limit        IN   NUMBER   := NULL,  
    attribute_list      IN   VARCHAR2 := NULL,  
    plan_filter         IN   VARCHAR2 := NULL,  
    sqlset_owner        IN   VARCHAR2 := NULL,  
    recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)  
RETURN sys.sqlset PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>The SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the SQLSET_ROW</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>An order-by clause on the selected SQL</td>
</tr>
<tr>
<td>result_percentage</td>
<td>A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.</td>
</tr>
<tr>
<td>result_limit</td>
<td>The top L(imit) SQL from the (filtered) source ranked by the ranking measure</td>
</tr>
<tr>
<td>attribute_list</td>
<td>List of SQL statement attributes to return in the result. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default)</td>
</tr>
<tr>
<td></td>
<td>• BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</td>
</tr>
<tr>
<td></td>
<td>• ALL - return all attributes</td>
</tr>
<tr>
<td></td>
<td>• Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).</td>
</tr>
<tr>
<td>plan_filter</td>
<td>The plan filter</td>
</tr>
</tbody>
</table>
Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user’s security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END; cur;
/```
SELECT_WORKLOAD_REPOSITORY Functions

This function collects SQL statements from the workload repository. The overloaded forms let you:

- Collect SQL statements from all snapshots between `begin_snap` and `end_snap`.
- Collect SQL statements from a workload repository baseline.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (  
    begin_snap        IN NUMBER,  
    end_snap          IN NUMBER,  
    basic_filter      IN VARCHAR2 := NULL,  
    object_filter     IN VARCHAR2 := NULL,  
    ranking_measure1  IN VARCHAR2 := NULL,  
    ranking_measure2  IN VARCHAR2 := NULL,  
    ranking_measure3  IN VARCHAR2 := NULL,  
    result_percentage IN NUMBER   := 1,  
    result_limit      IN NUMBER   := NULL,  
    attribute_list    IN VARCHAR2 := NULL,  
    recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL)  
RETURN sys.sqlset PIPELINED;
```

```sql
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (  
    baseline_name     IN VARCHAR2,  
    basic_filter      IN VARCHAR2 := NULL,  
    object_filter     IN VARCHAR2 := NULL,  
    ranking_measure1  IN VARCHAR2 := NULL,  
    ranking_measure2  IN VARCHAR2 := NULL,  
    ranking_measure3  IN VARCHAR2 := NULL,  
    result_percentage IN NUMBER   := 1,  
    result_limit      IN NUMBER   := NULL,  
    attribute_list    IN VARCHAR2 := NULL,  
    recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL)  
RETURN sys.sqlset PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>begin_snap</code></td>
<td>Begin snapshot (non-inclusive).</td>
</tr>
<tr>
<td><code>end_snap</code></td>
<td>End snapshot (inclusive).</td>
</tr>
<tr>
<td><code>baseline_name</code></td>
<td>The name of the baseline period.</td>
</tr>
<tr>
<td><code>basic_filter</code></td>
<td>The SQL predicate to filter the SQL from the workload repository defined on attributes of the <code>SQLSET_ROW</code>. If <code>basic_filter</code> is not set by the caller, the subprogram captures only statements of the type <code>CREATE TABLE</code>, <code>INSERT</code>, <code>SELECT</code>, <code>UPDATE</code>, <code>DELETE</code>, and <code>MERGE</code>.</td>
</tr>
<tr>
<td><code>object_filter</code></td>
<td>Currently not supported.</td>
</tr>
<tr>
<td><code>ranking_measure(n)</code></td>
<td>An order-by clause on the selected SQL.</td>
</tr>
</tbody>
</table>
Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user’s security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```sql
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_workload_repository(1,2)) P;
  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
END;
/```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result_percentage</td>
<td>A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.</td>
</tr>
<tr>
<td>result_limit</td>
<td>The top L(limit) SQL from the (filtered) source ranked by the ranking measure.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>List of SQL statement attributes to return in the result. The possible values are:</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).</td>
</tr>
</tbody>
</table>
This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER.

**See Also:** [SQL Tuning Set Subprograms](#) on page 138-13 for other subprograms in this group

### Syntax

```sql
DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER(
    task_name    IN  VARCHAR2,
    parameter    IN  VARCHAR2,
    value        IN  VARCHAR2);

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER(
    task_name    IN  VARCHAR2,
    parameter    IN  VARCHAR2,
    value        IN  NUMBER);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the task to execute</td>
</tr>
</tbody>
</table>
### Table 138–44 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</td>
</tr>
<tr>
<td>▪ APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</td>
<td></td>
</tr>
<tr>
<td>▪ BASIC_FILTER: basic filter for SQL tuning set</td>
<td></td>
</tr>
<tr>
<td>▪ DAYS_TO_EXPIRE: number of days until the task is deleted</td>
<td></td>
</tr>
<tr>
<td>▪ DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_TUNING_TASK Function &amp; Procedure</td>
<td></td>
</tr>
<tr>
<td>▪ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task)</td>
<td></td>
</tr>
<tr>
<td>▪ LOCAL_TIME_LIMIT: per-statement time out (seconds)</td>
<td></td>
</tr>
<tr>
<td>▪ MODE: tuning scope (comprehensive, limited)</td>
<td></td>
</tr>
<tr>
<td>▪ OBJECT_FILTER: object filter for SQL tuning set</td>
<td></td>
</tr>
<tr>
<td>▪ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</td>
<td></td>
</tr>
<tr>
<td>▪ RANK_MEASURE1: first ranking measure for SQL tuning set</td>
<td></td>
</tr>
<tr>
<td>▪ RANK_MEASURE2: second possible ranking measure for SQL tuning set</td>
<td></td>
</tr>
<tr>
<td>▪ RANK_MEASURE3: third possible ranking measure for SQL tuning set</td>
<td></td>
</tr>
<tr>
<td>▪ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</td>
<td></td>
</tr>
<tr>
<td>▪ SQL_LIMIT: maximum number of SQL statements to tune</td>
<td></td>
</tr>
<tr>
<td>▪ SQL_PERCENTAGE: percentage filter of SQL tuning set statements</td>
<td></td>
</tr>
<tr>
<td>▪ TEST_EXECUTE: FULL/AUTO/OFF.</td>
<td></td>
</tr>
<tr>
<td>* FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set)</td>
<td></td>
</tr>
<tr>
<td>* AUTO - test-execute for an automatically-chosen time proportional to the tuning time</td>
<td></td>
</tr>
<tr>
<td>* OFF - do not test-execute</td>
<td></td>
</tr>
<tr>
<td>▪ TIME_LIMIT: global time out (seconds)</td>
<td></td>
</tr>
<tr>
<td>▪ USERNAME: username under which the statement is parsed</td>
<td></td>
</tr>
<tr>
<td>value</td>
<td>New value of the specified parameter</td>
</tr>
</tbody>
</table>

### Usage Notes

When setting automatic tuning task parameters, use the SET_AUTO_TUNING_TASK_PARAMETER Procedures in the DBMS_AUTO_SQLTUNE package.
SQLTEXT_TO_SIGNATURE Function

This function returns a SQL text’s signature. The signature can be used to identify SQL text in dba_sql_profiles.

See Also: SQL Profile Subprograms on page 138-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (  
    sql_text    IN CLOB,  
    force_match IN BOOLEAN := FALSE)  
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>SQL text whose signature is required. Required.</td>
</tr>
<tr>
<td>force_match</td>
<td>If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed</td>
</tr>
</tbody>
</table>

Return Values

This function returns the signature of the specified SQL text.
UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

See Also: SQL Profile Subprograms on page 138-12 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (  
    profile_name          IN VARCHAR2 := '%',  
    profile_category      IN VARCHAR2 := 'DEFAULT',  
    replace               IN BOOLEAN,  
    staging_table_name    IN VARCHAR2,  
    staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>The name of the profile to unpack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>profile_category</td>
<td>The category from which to unpack profiles (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>replace</td>
<td>The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)</td>
</tr>
</tbody>
</table>

Usage Notes

Using this procedure requires the CREATE ANY SQL PROFILE privilege and the SELECT privilege on staging table.

Examples

```sql
-- Unpack all profiles stored in a staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace => FALSE, -  
    staging_table_name => 'PROFILE_STGTAB');

-- If there is a failure during the unpack operation, users can find the profile  
-- we failed on and perform a remap_stgtab_sqlprof operation targeting it. Then  
-- they can resume the unpack operation by setting replace to TRUE so that  
-- the profiles that were already created are replaced
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace => TRUE, -  
    staging_table_name => 'PROFILE_STGTAB');
```
**UNPACK_STGTAB_SQLSET Procedure**

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

**See Also:** SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (    sqlset_name          IN VARCHAR2 := '%',    sqlset_owner         IN VARCHAR2 := NULL,    replace              IN BOOLEAN,    staging_table_name   IN VARCHAR2,    staging_schema_owner IN VARCHAR2 := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The name of the tuning set to unpack (not NULL). Wildcard characters ('%') are supported to unpack multiple tuning sets in a single call. For example, just specify '%' to unpack all tuning sets from the staging table.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The name of tuning set owner, or NULL for current schema owner. Wildcards supported.</td>
</tr>
<tr>
<td>replace</td>
<td>Replaces tuning set if they already exist. If FALSE, raises errors if you try to create a tuning set that already exists</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the staging table, moved after a call to the PACK_STGTAB_SQLSET Procedure (case-sensitive)</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The name of staging table owner, or NULL for current schema owner (case-sensitive)</td>
</tr>
</tbody>
</table>

**Usage Notes**

- Users can drop the staging table after this procedure completes successfully.
- The unpack procedure commits after successfully loading each SQL tuning set. If it fails with one tuning set, no part of that tuning set will have been unpacked, but those which the subprogram had already apprehended continue to exist.
- When failures occur due to SQL tuning set name or owner conflicts, users should use the REMAP_STGTAB_SQLSET Procedure to patch the staging table, and then call this procedure again to unpack those tuning sets that remain.

**Examples**

```sql
-- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name => '%', -
sqlset_owner => '%', -
replace => FALSE, -
staging_table_name => 'STGTAB_SQLSET');
```

-- errors can arise during STS unpack when a STS in the staging table has the same name/owner as STS on the system. In this case, users should call
-- remap_stgtab_sqlset to patch the staging table and with which to call unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name => '%',-
  sqlset_owner => '%', -
  replace => TRUE, -
  staging_table_name => 'STGTAB_SQLSET');
UPDATE_SQLSET Procedures

This procedure updates selected fields for SQL statement in a SQL tuning set.

See Also: SQL Tuning Set Subprograms on page 138-13 for other subprograms in this group

Syntax

DBMS_SQLTUNE.UPDATE_SQLSET (
   sqlset_name IN VARCHAR2,
   sql_id IN VARCHAR2,
   attribute_name IN VARCHAR2,
   attribute_value IN VARCHAR2 := NULL);

DBMS_SQLTUNE.UPDATE_SQLSET (
   sqlset_name IN VARCHAR2,
   sql_id IN VARCHAR2,
   attribute_name IN VARCHAR2,
   attribute_value IN NUMBER := NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>sql_id</td>
<td>The identifier of the statement to update</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The name of the attribute to modify</td>
</tr>
<tr>
<td>attribute_value</td>
<td>The new value of the attribute</td>
</tr>
</tbody>
</table>
The DBMS_STAT_FUNCS package provides statistical functions. This chapter contains the following topic:

- Summary of DBMS_STAT_FUNCS Subprograms
### Summary of DBMS_STAT_FUNCS Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPONENTIAL_DIST_FIT Procedure on page 139-3</td>
<td>Tests how well a sample of values fits an exponential distribution</td>

<td>Tests how well a sample of values fits a normal distribution</td>
</tr>
<tr>
<td>POISSON_DIST_FIT Procedure on page 139-5</td>
<td>Tests how well a sample of values fits a Poisson distribution</td>
</tr>
<tr>
<td>SUMMARY Procedure on page 139-6</td>
<td>Summarizes a numerical column of a table</td>
</tr>
<tr>
<td>UNIFORM_DIST_FIT Procedure on page 139-7</td>
<td>Tests how well a sample of values fits a uniform distribution</td>
</tr>
<tr>
<td>WEIBULL_DIST_FIT Procedure on page 139-8</td>
<td>Tests how well a sample of values fits a Weibull distribution</td>
</tr>
</tbody>
</table>
EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (  
  ownername IN VARCHAR2,   
  tablename IN VARCHAR2,   
  columnname IN VARCHAR2,   
  test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',   
  lambda IN NUMBER,  
  mu IN NUMBER,  
  sig OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>lambda</td>
<td>The scale parameter.</td>
</tr>
<tr>
<td>mu</td>
<td>The location parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```sql
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (  
    ownername    IN    VARCHAR2,  
    tablename    IN    VARCHAR2,  
    columnname   IN    VARCHAR2,  
    test_type    IN    VARCHAR2 DEFAULT 'SHAPIRO_WILKS',  
    mean         IN    NUMBER,  
    stdev        IN    NUMBER,  
    sig          OUT   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.</td>
</tr>
<tr>
<td>mean</td>
<td>The mean of the distribution against which to compare.</td>
</tr>
<tr>
<td>stdev</td>
<td>The standard deviation of the distribution against which to compare.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (  
    ownername IN VARCHAR2,  
    tablename IN VARCHAR2,  
    columnname IN VARCHAR2,  
    test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',  
    lambda IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',  
    sig OUT NUMBER,  
    lambda IN NUMBER,  
    sig OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>

</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>lambda</td>
<td>The lambda parameter is the shape parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a</td>
</tr>
<tr>
<td></td>
<td>significant difference between the sample and the Poisson distribution. A</td>
</tr>
<tr>
<td></td>
<td>number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
SUMMARY Procedure

This procedure summarizes the numerical column specified in the columnname of tablename. The summary is returned as a Summary Type. Note that most of the output of SUMMARY can be obtained with currently available SQL.

Syntax

```sql
DBMS_STAT_FUNCS.SUMMARY (  
    ownername    IN    VARCHAR2,  
    tablename    IN    VARCHAR2,  
    columnname   IN    VARCHAR2,  
    sigma_value  IN    NUMBER DEFAULT 3,  
    s           OUT    SummaryType);
```

Parameters

Table 139–5  SUMMARY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table to be summarized.</td>
</tr>
<tr>
<td>sigma_value</td>
<td>The number of sigmas for the set of extreme values, defaults to 3.</td>
</tr>
<tr>
<td>s</td>
<td>The Record containing summary information about given column.</td>
</tr>
</tbody>
</table>

Definition of SummaryType

```sql
TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (  
    count             NUMBER,  
    min               NUMBER,  
    max               NUMBER,  
    range             NUMBER,  
    mean              NUMBER,  
    cmode             num_table,  
    variance          NUMBER,  
    stddev            NUMBER,  
    quantile_5        NUMBER,  
    quantile_25       NUMBER,  
    median            NUMBER,  
    quantile_75       NUMBER,  
    quantile_95       NUMBER,  
    plus_x_sigma      NUMBER,  
    minus_x_sigma     NUMBER,  
    extreme_values    num_table,  
    top_5_values      n_arr,  
    bottom_5_values   n_arr);
```
UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

```sql
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
    ownername IN VARCHAR2,
    tablename IN VARCHAR2,
    columnname IN VARCHAR2,
    var_type IN VARCHAR2 DEFAULT 'CONTINUOUS',
    test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    paramA IN NUMBER,
    paramB IN NUMBER,
    sig OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>var_type</td>
<td>The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>paramA</td>
<td>Parameter A estimated from the sample (the location parameter).</td>
</tr>
<tr>
<td>paramB</td>
<td>Parameter B estimated from the sample (the scale parameter).</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```sql
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
    ownername IN VARCHAR2,
    tablename IN VARCHAR2,
    columnname IN VARCHAR2,
    test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    alpha IN NUMBER,
    mu IN NUMBER,
    beta IN NUMBER,
    sig OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>alpha</td>
<td>The scale parameter.</td>
</tr>
<tr>
<td>mu</td>
<td>The location parameter.</td>
</tr>
<tr>
<td>beta</td>
<td>The slope/shape parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
With the `DBMS_STATS` package you can view and modify optimizer statistics gathered for database objects.

Using DBMS_STATS

This section contains topics which relate to using the DBMS_STATS package.

- Overview
- Types
- Constants
- Operational Notes
- Deprecated Subprograms
- Examples
Overview

The Oracle RDBMS allows you to collect statistics of many different kinds as an aid to improving performance. This package is concerned with optimizer statistics only. Given that Oracle sets automatic statistics collection of this kind on by default, this package is intended for only specialized cases.

The statistics of interest to be viewed or modified can reside in the dictionary or in a table created in the user’s schema for this purpose. You can also collect and manage user-defined statistics for tables and domain indexes using this package.

For example, if the DELETE_COLUMN_STATS procedure is invoked on a column for which an association is defined, user-defined statistics for that column are deleted in addition to deletion of the standard statistics.

Only statistics stored in the dictionary have an impact on the cost-based optimizer. You can also use DBMS_STATS to gather statistics in parallel.

See Also: Oracle Database Performance Tuning Guide for more information about "Managing Optimizer Statistics".
Types for the minimum and maximum values and histogram endpoints include:

```sql
TYPE numarray  IS VARRAY(256) OF NUMBER;
TYPE datearray IS VARRAY(256) OF DATE;
TYPE chararray IS VARRAY(256) OF VARCHAR2(4000);
TYPE rawarray  IS VARRAY(256) OF RAW(2000);
TYPE fltarray IS VARRAY(256) OF BINARY_FLOAT;
TYPE dblarray IS VARRAY(256) OF BINARY_DOUBLE;

TYPE StatRec IS RECORD (
  epc    NUMBER,
  minval RAW(2000),
  maxval RAW(2000),
  bkvals NUMARRAY,
  novals NUMARRAY);
```

Types for listing stale tables include:

```sql
TYPE ObjectElem IS RECORD (
  ownname     VARCHAR2(30),     -- owner
  objtype     VARCHAR2(6),      -- 'TABLE' or 'INDEX'
  objname     VARCHAR2(30),     -- table/index
  partname    VARCHAR2(30),     -- partition
  subpartname VARCHAR2(30));    -- subpartition

type ObjectTab is TABLE of ObjectElem;
```

Type for displaying statistics difference report:

```sql
TYPE DiffRepElem IS RECORD (
  report     CLOB,              -- stats difference report
  maxdiffpct number);           -- max stats difference (percentage)

type DiffRepTab is table of DiffRepElem;
```
Constants

The DBMS_STATS package uses the constants shown in Table 140–1:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTO_CASCADE</td>
<td>BOOLEAN</td>
<td>NULL</td>
<td>Lets Oracle decide whether to collect statistics for indexes or not</td>
</tr>
<tr>
<td>AUTO_DEGREE</td>
<td>NUMBER</td>
<td>32768</td>
<td>Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters. For definition of default parallel degree, see &quot;Degree of Parallelism&quot; in Oracle Database VLDB and Partitioning Guide.</td>
</tr>
<tr>
<td>AUTO_INVALIDATE</td>
<td>BOOLEAN</td>
<td>NULL</td>
<td>Lets Oracle decide when to invalidate dependent cursors</td>
</tr>
<tr>
<td>AUTO_SAMPLE_SIZE</td>
<td>NUMBER</td>
<td>0</td>
<td>Indicates that auto-sample size algorithms should be used</td>
</tr>
</tbody>
</table>
Operational Notes

The **DBMS_STATS** subprograms perform the following general operations:

- Gathering Optimizer Statistics
- Setting or Getting Statistics
- Deleting Statistics
- Transferring Statistics
- Locking or Unlocking Statistics
- Restoring and Purging Statistics History
- User-Defined Statistics
- Pending Statistics
- Comparing Statistics
- Extended Statistics

Most of the **DBMS_STATS** procedures include the three parameters **statown, stattab**, and **statid**. These parameters allow you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with sets of statistics.

The **stattab** parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the **statown** parameter is specified). You can create multiple tables with different **stattab** identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single **stattab** by using the **statid** parameter, which avoids cluttering the user's schema.

For the **SET** and **GET** procedures, if **stattab** is not provided (that is, **NULL**), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if **stattab** is not **NULL**, then the **SET** or **GET** operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of **DBMS_STATS** procedures using the **SET_DATABASE_PREFS Procedure**, **SET_GLOBAL_PREFS Procedure**, **SET_SCHEMA_PREFS Procedure** and **SET_TABLE_PREFS Procedure**.

Most of the procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a parameter, **force** which allows you to override any lock on statistics.

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the **ANALYZE** command:

- **GATHER_DATABASE_STATS Procedures**
- **GATHER_DICTIONARY_STATS Procedure**
- **GATHER_FIXED_OBJECTS_STATS Procedure**
GATHER_INDEX_STATS Procedure
GATHER_SCHEMA_STATS Procedures
GATHER_SYSTEM_STATS Procedure
GATHER_TABLE_STATS Procedure

The GATHER_* procedures also collect user-defined statistics for columns and domain indexes.

The statown, statstab, and statid parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

GENERATE_STATS Procedure

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

PREPARE_COLUMN_VALUES Procedures
PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure
PREPARE_COLUMN_VALUES_ROWID Procedure

SEED_COL_USAGE Procedure
SET_INDEX_STATS Procedures
SET_SYSTEM_STATS Procedure
SET_TABLE_STATS Procedure

GET_COLUMN_STATS Procedures
GET_INDEX_STATS Procedures
GET_SYSTEM_STATS Procedure
GET_TABLE_STATS Procedure

In the special versions of the set_*_stats procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or external statistics table:

- User-defined statistics (extstats)
- The statistics type schema name (statsschema)
- The statistics type name (statsname)

The user-defined statistics and the corresponding statistics type are inserted into the USTATS$ dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the get_*_stats procedures return user-defined statistics and the statistics type owner and name as OUT arguments corresponding to the schema object specified. If user-defined statistics are not collected, NULL values are returned.

Deleting Statistics

The DELETE_* procedures delete both user-defined statistics and the standard statistics for the given schema object.

DELETE_COLUMN_STATS Procedure
DELETE_DATABASE_STATS Procedure
DELETE_DICTIONARY_STATS Procedure
DELETE_FIXED_OBJECTS_STATS Procedure
DELETE_INDEX_STATS Procedure
DELETE_SCHEMA_STATS Procedure
DELETE_SYSTEM_STATS Procedure
DELETE_TABLE_STATS Procedure

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

CREATE_STAT_TABLE Procedure
DROP_STAT_TABLE Procedure

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table (EXPORT_*)
- from a user statistics table to the dictionary (IMPORT_*)

EXPORT_COLUMN_STATS Procedure
EXPORT_DATABASE_STATS Procedure
EXPORT_DICTIONARY_STATS Procedure
EXPORT_FIXED_OBJECTS_STATS Procedure
EXPORT_INDEX_STATS Procedure
EXPORT_SCHEMA_STATS Procedure
EXPORT_SYSTEM_STATS Procedure
EXPORT_TABLE_STATS Procedure

IMPORT_COLUMN_STATS Procedure
IMPORT_DATABASE_STATS Procedure
IMPORT_DICTIONARY_STATS Procedure
IMPORT_FIXED_OBJECTS_STATS Procedure
IMPORT_INDEX_STATS Procedure
IMPORT_SCHEMA_STATS Procedure
IMPORT_SYSTEM_STATS Procedure
IMPORT_TABLE_STATS Procedure

Note: Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

LOCK_SCHEMA_STATS Procedure
LOCK_TABLE_STATS Procedure

UNLOCK_SCHEMA_STATS Procedure
UNLOCK_TABLE_STATS Procedure

The LOCK_* procedures either freeze the current set of the statistics or to keep the statistics empty (uncollected). When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

- **RESET_GLOBAL_PREF_DEFAULTS** Procedure
- **RESTORE_DICTIONARY_STATS** Procedure
- **RESTORE_FIXED_OBJECTS_STATS** Procedure
- **RESTORE_SCHEMA_STATS** Procedure
- **RESTORE_SYSTEM_STATS** Procedure
- **RESTORE_TABLE_STATS** Procedure

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the **ALTER_STATS_HISTORY_RETENTION** Procedure.

The other **DBMS_STATS** procedures related to restoring statistics are:

- **PURGE_STATS** Procedure: This procedure lets you manually purge old versions beyond a time stamp.
- **GET_STATS_HISTORY_RETENTION** Function: This function gets the current statistics history retention value.
- **GET_STATS_HISTORY_AVAILABILITY** Function: This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

**RESTORE_** operations are not supported for user defined statistics.

User-Defined Statistics

The **DBMS_STATS** package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the **associate** statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the **GET_INDEX_STATS** Procedures invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

**SET_** and **GET_** operations for user-defined statistics are also supported using a special version of the **SET** and **GET** interfaces for columns and indexes.

**EXPORT_**, **IMPORT_** and **RESTORE_** operations are not supported for user defined statistics.

Pending Statistics

The package gather statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the **PUBLISH** option to **FALSE** using the **SET*PREFS** procedures. The default value for **PUBLISH** is **TRUE**. The statistics stored in private area are not used by Cost Based Optimizer unless parameter **optimizer_use_private_statistics** is set to **TRUE**. The default value of this parameter is **FALSE** and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.
Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the `EXPORT_PENDING_STATS Procedure`) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

Once the performance or query plans have been verified, the pending statistics can be published (run the `PUBLISH_PENDING_STATS Procedure`) if the performance is acceptable or delete (run the `DELETE_PENDING_STATS Procedure`) if not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- `DELETE_PENDING_STATS Procedure`
- `EXPORT_PENDING_STATS Procedure`
- `PUBLISH_PENDING_STATS Procedure`

### Comparing Statistics

The `DIFF_TABLE_STATS_*` statistics can be used to compare statistics for a table from two different sources. The statistics can be from:

- two different user statistics tables
- a single user statistics table containing two sets of statistics that can be identified using `statids`
- a user statistics table and dictionary history
- pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They display statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function, with a default of 10%. The statistics corresponding to the first source (`stattab1` or `timel`) will be used as basis for computing the differential percentage.

### Extended Statistics

This package allows you to collect statistics for column groups and expressions (known as "statistics extensions"). The statistics collected for column groups and expressions are called "extended statistics".

Statistics on Column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates `c1=1` and `c2=1` and if there are statistics on `(c1, c2)`, the optimizer will use this statistics for estimating the combined selectivity of the predicates. The expression statistics are used by optimizer for estimating selectivity of predicates on those expressions. The extended statistics are similar to column statistics and the procedures that take columns names will accept extension names in place of column names.

Related subprograms:

- `CREATE_EXTENDED_STATS Function`
- `DROP_EXTENDED_STATS Procedure`
- SHOW_EXTENDED_STATS_NAME Function
Deprecated Subprograms

The following subprograms are obsolete with Release 11g:

- **GET_PARAM Function**
  Instead, use **GET_PREFS Function**

- **SET_PARAM Procedure**
  Instead, use **SET_GLOBAL_PREFS Procedure**

- **RESET_PARAM_DEFAULTS Procedure**
  Instead use **RESET_GLOBAL_PREF_DEFAULTS Procedure**
Examples

- Using Pending Statistics
- Gathering Daytime System Statistics

Using Pending Statistics

Assume many modifications have been made to the employees table since the last time statistics were gathered. To ensure that the cost-based optimizer is still picking the best plan, statistics should be gathered once again; however, the user is concerned that new statistics will cause the optimizer to choose bad plans when the current ones are acceptable. The user can do the following:

EXEC DBMS_STATS.SET_TABLE_PREFS('hr', 'employees', 'PUBLISH', 'false');

By setting the employees tables publish preference to FALSE, any statistics gather from now on will not be automatically published. The newly gathered statistics will be marked as pending.

EXEC DBMS_STATS.GATHER_TABLE_STATS ('hr', 'employees');

To test the newly gathered statistics, set optimizer_pending_statistics to TRUE in a session and run sample queries.

ALTER SESSION SET optimizer_use_pending_statistics = TRUE;

If the pending statistics generate sound execution plans, they can be published:

EXEC DBMS_STATS.PUBLISH_PENDING_STATS('hr', 'employees');
EXEC DBMS_STATS.SET_TABLE_PREF('hr', 'employees', 'PUBLISH', 'true');

Gathering Daytime System Statistics

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

BEGIN
    DBMS_STATS.GATHER_SYSTEM_STATS (
        interval => 720,
        stattab => 'mystats',
        statid => 'OLTP');
END;

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

BEGIN
    DBMS_STATS.GATHER_SYSTEM_STATS (
        interval => 720,
        stattab => 'mystats',
        statid => 'OLAP');
END;

Update the dictionary with the gathered statistics.

VARIABLE   jobno   number;
BEGIN
    DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
('mystats', 'OLTP');
sysdate, 'sysdate + 1');
COMMIT;
END;

BEGIN
    DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
    ('mystats', 'OLAP');
    sysdate + 0.5, 'sysdate + 1');
    COMMIT;
END;

<td>Upgrades user statistics on an older table</td>
</tr>
</tbody>
</table>
ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value. Statistics history retention is used by both the automatic purge and PURGE_STATS Procedure.

Syntax

```sql
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
    retention       IN     NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| retention | The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1, 365000]. Also you can use the following values for special purposes:
  ■ -1 : Statistics history is never purged by automatic purge
  ■ 0 : Old statistics are never saved. The automatic purge will delete all statistics history
  ■ NULL : Change statistics history retention to default value |

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges
CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

DBMS_STATS.CONVERT_RAW_VALUE (rawval RAW, resval OUT BINARY_FLOAT);

DBMS_STATS.CONVERT_RAW_VALUE (rawval RAW, resval OUT BINARY_DOUBLE);

DBMS_STATS.CONVERT_RAW_VALUE (rawval RAW, resval OUT DATE);

DBMS_STATS.CONVERT_RAW_VALUE (rawval RAW, resval OUT NUMBER);

DBMS_STATS.CONVERT_RAW_VALUE (rawval RAW, resval OUT VARCHAR2);

Pragmas

pragma restrict_references(convert_raw_value, WNDS, RNDS, WNPS, RNPS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rawval</td>
<td>The raw representation of a column minimum or maximum datatype-specific output parameters</td>
</tr>
<tr>
<td>resval</td>
<td>The converted, type-specific value</td>
</tr>
</tbody>
</table>
CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (  
    rawval    RAW,  
    resval   OUT NVARCHAR2);  

Pragmas

pragma restrict_references(convert_raw_value_nvarchar, WNDS, RNDS, WNPS, RNPS);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rawval</td>
<td>The raw representation of a column minimum or maximum datatype-specific output parameters</td>
</tr>
<tr>
<td>resval</td>
<td>The converted, type-specific value</td>
</tr>
</tbody>
</table>
CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the StatRec structure as filled in by GET.COLUMN_STATS or PREPARE.COLUMN_VALUES are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
    rawval RAW,
    resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rawval</td>
<td>The raw representation of a column minimum or maximum datatype-specific output parameters</td>
</tr>
<tr>
<td>resval</td>
<td>The converted, type-specific value</td>
</tr>
</tbody>
</table>
COPY_TABLE_STATS Procedure

This procedure copies the statistics of the source [sub] partition to the destination [sub] partition after scaling (the number of blks, number of rows). It sets the high bound partitioning value as the maximum value of the first partitioning column and high bound partitioning value of the previous partition as the minimum value of the first partitioning column for a range partitioned table. It finds the maximum and minimum from the list of values for the list partitioned table. It also sets the normalized maximum and minimum values. If the destination partition is the first partition then minimum values are equal to maximum values. If the statistics for source are not available then nothing is copied.

Syntax

```sql
DBMS_STATS.COPY_TABLE_STATS ( 
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  srcpartname      VARCHAR2,
  dstpartname      VARCHAR2,
  scale_factor     VARCHAR2 DEFAULT 1,
  force            BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of the table of source and destination [sub] partitions</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name of source and destination [sub] partitions</td>
</tr>
<tr>
<td>srcpartname</td>
<td>Source [sub] partition</td>
</tr>
<tr>
<td>dstpartname</td>
<td>Destination [sub] partition</td>
</tr>
<tr>
<td>scale_factor</td>
<td>Scale factor to scale nblks, nrows etc. in dstpartname</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, copy statistics even if locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Invalid partition name
ORA-20001: Bad input value
CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user specified column group or an expression in a table. Statistics for this extension will be gathered when user or auto statistics gathering job gathers statistics for the table. We call statistics for such an extension, "extended statistics". This function returns the name of this newly created entry for the extension.

Syntax

```
DBMS_STATS.CREATE_EXTENDED_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    extension  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>extension</td>
<td>Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be &quot;(c1, c2)&quot; and an example expression can be &quot;(c1 + c2)&quot;.</td>
</tr>
</tbody>
</table>

Return Values

This function returns the name of this newly created entry for the extension.

Exceptions

- ORA-20000: Insufficient privileges / creating extension is not supported
- ORA-20001: Error when processing extension
- ORA-20007: Extension already exists
- ORA-20008: Reached the upper limit on number of extensions

Usage Notes

There are nine restrictions on the extension:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by SYS.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables or external tables.
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column can not appear more than once in a column group.
- A column group can not contain expressions.
CREATE_EXTENDED_STATS Function

- An expression must contain at least one column.
- An expression cannot contain a subquery.
- The COMPATIBLE parameter needs to be 11.0.0.0.0 or greater.
CREATE_STAT_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```sql
DBMS_STATS.CREATE_STAT_TABLE (  
    ownname  VARCHAR2,  
    stattab  VARCHAR2,  
    tblspace VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ownname</code></td>
<td>Name of the schema</td>
</tr>
<tr>
<td><code>stattab</code></td>
<td>Name of the table to create. This value should be passed as the <code>stattab</code> parameter to other procedures when the user does not want to modify the dictionary statistics directly.</td>
</tr>
<tr>
<td><code>tblspace</code></td>
<td>Tablespace in which to create the statistics tables. If none is specified, then they are created in the user’s default tablespace.</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Table already exists or insufficient privileges
- ORA-20001: Tablespace does not exist
DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```sql
DBMS_STATS.DELETE_COLUMN_STATS (  
  ownname VARCHAR2,  
  tabname VARCHAR2,  
  colname VARCHAR2,  
  partname VARCHAR2 DEFAULT NULL,  
  stattab VARCHAR2 DEFAULT NULL,  
  statid VARCHAR2 DEFAULT NULL,  
  cascade_parts BOOLEAN DEFAULT TRUE,  
  statown VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE')),  
  force BOOLEAN DEFAULT FALSE,  
  col_stat_type VARCHAR2 DEFAULT 'ALL');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>cascade_parts</td>
<td>If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes column statistics even if locked</td>
</tr>
</tbody>
</table>
Table 140–10 (Cont.) DELETE_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col_stat_type</td>
<td>Type of column statistics to be deleted. This argument takes the following values:</td>
</tr>
<tr>
<td></td>
<td>- HISTOGRAM - delete column histogram only</td>
</tr>
<tr>
<td></td>
<td>- ALL - delete base column statistics and histogram</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked
DELETE_DATABASE_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing TRUE for the add_sys parameter.

Syntax

```sql
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Preference name. The default value for following parameters can be deleted:</td>
</tr>
<tr>
<td></td>
<td>- CASCADE</td>
</tr>
<tr>
<td></td>
<td>- DEGREE</td>
</tr>
<tr>
<td></td>
<td>- ESTIMATE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>- METHOD_OPT</td>
</tr>
<tr>
<td></td>
<td>- NO_INVALIDATE</td>
</tr>
<tr>
<td></td>
<td>- GRANULARITY</td>
</tr>
<tr>
<td></td>
<td>- PUBLISH</td>
</tr>
<tr>
<td></td>
<td>- INCREMENTAL</td>
</tr>
<tr>
<td></td>
<td>- STALE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics</td>
</tr>
<tr>
<td></td>
<td>DEGREE - The value determines degree of parallelism used for gathering statistics</td>
</tr>
<tr>
<td></td>
<td>ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</td>
</tr>
</tbody>
</table>
Table 140–11 (Cont.) DELETE_DATABASE_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>METHOD_OPT</td>
<td>The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</td>
</tr>
<tr>
<td></td>
<td>▪ FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>▪ FOR COLUMNS [size clause] column [size clause] [,column [size_clause]... ]</td>
</tr>
<tr>
<td></td>
<td>size_clause is defined as size_clause := SIZE (integer</td>
</tr>
<tr>
<td></td>
<td>column is defined as column := column_name</td>
</tr>
<tr>
<td></td>
<td>- integer: Number of histogram buckets. Must be in the range [1,254].</td>
</tr>
<tr>
<td></td>
<td>- REPEAT: Collects histograms only on the columns that already have histograms</td>
</tr>
<tr>
<td></td>
<td>- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns</td>
</tr>
<tr>
<td></td>
<td>- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns</td>
</tr>
<tr>
<td></td>
<td>- column_name: name of a column</td>
</tr>
<tr>
<td></td>
<td>- extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression</td>
</tr>
<tr>
<td></td>
<td>The default is FOR ALL COLUMNS SIZE AUTO.</td>
</tr>
<tr>
<td>NO_INVALIDATE</td>
<td>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</td>
</tr>
<tr>
<td>GRANULARITY</td>
<td>The value determines granularity of statistics to collect (only pertinent if the table is partitioned)</td>
</tr>
<tr>
<td><code>ALL</code></td>
<td>gathers all (subpartition, partition, and global) statistics</td>
</tr>
<tr>
<td><code>AUTO</code></td>
<td>determines the granularity based on the partitioning type. This is the default value.</td>
</tr>
<tr>
<td><code>DEFAULT</code></td>
<td>gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the <code>GLOBAL AND PARTITION</code> for this functionality. Note that the default value is now <code>AUTO</code>.</td>
</tr>
<tr>
<td><code>GLOBAL</code></td>
<td>gathers global statistics</td>
</tr>
<tr>
<td><code>GLOBAL AND PARTITION</code></td>
<td>gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</td>
</tr>
<tr>
<td><code>PARTITION</code></td>
<td>gathers partition-level statistics</td>
</tr>
<tr>
<td><code>SUBPARTITION</code></td>
<td>gathers subpartition-level statistics</td>
</tr>
</tbody>
</table>
DELETE_DATABASE_PREFS Procedure

Table 140–11 (Cont.) DELETE_DATABASE_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUBLISH</td>
<td>This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</td>
</tr>
<tr>
<td></td>
<td>■ the INCREMENTAL value for the partitioned table is set to TRUE;</td>
</tr>
<tr>
<td></td>
<td>■ the PUBLISH value for the partitioned table is set to TRUE;</td>
</tr>
<tr>
<td></td>
<td>■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</td>
</tr>
<tr>
<td>add_sys</td>
<td>Value TRUE will include the Oracle-owned tables</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges
ORA-20001: Invalid or Illegal input values

Usage Notes

■ To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
■ All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT', TRUE);
DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (  
        get_param('NO_INVALIDATE')),  
    force            BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```sql
DBMS_STATS.DELETE_DICTIONARY_STATS (
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure</td>
</tr>
<tr>
<td>force</td>
<td>When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

- `ORA-20000`: Object does not exist or insufficient privileges
- `ORA-20002`: Bad user statistics table, may need to upgrade it
DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```sql
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (  
  stattab           VARCHAR2 DEFAULT NULL,  
  statid           VARCHAR2 DEFAULT NULL,  
  statown          VARCHAR2 DEFAULT NULL,  
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE')),  
  force            BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>The user statistics table identifier describing from where to delete the current statistics. If stattab is NULL, the statistics will be deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab. This only applies if stattab is not NULL.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure</td>
</tr>
<tr>
<td>force</td>
<td>Ignores the statistics lock on objects and deletes the statistics if set to TRUE</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges
ORA-20002: Bad user statistics table, may need to upgrade it
DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```sql
DBMS_STATS.DELETE_INDEX_STATS ( 
  ownname VARCHAR2, 
  indname VARCHAR2, 
  partname VARCHAR2 DEFAULT NULL, 
  stattab VARCHAR2 DEFAULT NULL, 
  statid VARCHAR2 DEFAULT NULL, 
  cascade_parts BOOLEAN DEFAULT TRUE, 
  statown VARCHAR2 DEFAULT NULL, 
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type ( 
    get_param('NO_INVALIDATE')), 
  force BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>cascade_parts</td>
<td>If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE, to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes index statistics even if locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20005: Object statistics are locked
DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (
    ownname    IN  VARCHAR2  DEFAULT USER,
    tabname    IN  VARCHAR2);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
</tbody>
</table>
```

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter `tabname` is NULL delete applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```
DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (  
    ownname   IN   VARCHAR2,  
    pname     IN   VARCHAR2);  
```

Parameters

SUMMARY OF DBMS_STATS SUBPROGRAMS

DBMS_STATS

140-39

METHOD_OPT - Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:

- FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]
- FOR COLUMNS [size clause] column [size clause] [,column [size clause]...]

size_clause is defined as size_clause := SIZE (integer | REPEAT | AUTO | SKEWONLY)

column is defined as column := column_name |

extension name | extension

- integer: Number of histogram buckets. Must be in the range [1,254].
- REPEAT: Collects histograms only on the columns that already have histograms
- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.
- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns
- column_name: name of a column
- extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression

The default is FOR ALL COLUMNS SIZE AUTO.

NO_INVALIDATE - Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTOINVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned).

- 'ALL' - gathers all (subpartition, partition, and global) statistics
- 'AUTO' - determines the granularity based on the partitioning type. This is the default value.
- 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
- 'GLOBAL' - gathers global statistics
- 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- 'PARTITION' - gathers partition-level statistics
- 'SUBPARTITION' - gathers subpartition-level statistics.

</tbody>
</table>
Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist
ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```
DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```sql
DBMS_STATS.DELETE_SCHEMA_STATS (   ownname VARCHAR2,   stattab VARCHAR2 DEFAULT NULL,   statid VARCHAR2 DEFAULT NULL,   statown VARCHAR2 DEFAULT NULL,   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (       get_param('NO_INVALIDATE')),   force BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes statistics of tables in a schema even if locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to noworkload statistics (collected using 'NOWORKLOAD' option) if stattab is not specified. If stattab is specified, the subprogram deletes all system statistics with the associated statid from the stattab.

Syntax

```sql
DBMS_STATS.DELETE_SYSTEM_STATS ( 
    stattab VARCHAR2 DEFAULT NULL, 
    statid  VARCHAR2 DEFAULT NULL, 
    statown VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table where the statistics will be saved</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics saved in the stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20002: Bad user statistics table; may need to be upgraded
DELETE_TABLE_PREFS Procedure

This procedure is used to delete the statistics preferences of the specified table in the specified schema.

Syntax

```sql
DBMS_STATS.DELETE_TABLE_PREFS (  
   ownname    IN  VARCHAR2,
   tabname    IN  VARCHAR2,
   pname      IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
</tbody>
</table>
| pname     | Preference name. The default value for following preferences can be deleted:  
- CASCADE  
- DEGREE  
- ESTIMATE_PERCENT  
- METHOD_OPT  
- NO_INVALIDATE  
- GRANULARITY  
- PUBLISH  
- INCREMENTAL  
- STALE_PERCENT  
- CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics  
- DEGREE - Determines degree of parallelism used for gathering statistics  
- ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:

- FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]
- FOR COLUMNS [size_clause] column [size_clause] [,column [size_clause]...]

size_clause is defined as size_clause := SIZE (integer | REPEAT | AUTO | SKEWONLY)

column is defined as column := column_name | extension name | extension
- integer: Number of histogram buckets. Must be in the range [1,254].
- REPEAT: Collects histograms only on the columns that already have histograms.
- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.
- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns.
- column_name: name of a column
- extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression

The default is FOR ALL COLUMNS SIZE AUTO.

NO_INVALIDATE - Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.

GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned).

'ALL' - Gathers all (subpartition, partition, and global) statistics
'AUTO' - Determines the granularity based on the partitioning type. This is the default value.
'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
'GLOBAL' - Gathers global statistics
'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
'PARTITION' - Gathers partition-level statistics
'SUBPARTITION' - Gathers subpartition-level statistics.
### Summary of DBMS_STATS Subprograms

#### Exceptions
- **ORA-20000**: Insufficient privileges
- **ORA-20001**: Invalid or Illegal input values

#### Usage Notes
- To run this procedure, you need to connect as owner of the table, be granted **ANALYZE** privilege on the table, or **ANALYZE ANY** system privilege.
- All arguments are of type **VARCHAR2** and values are enclosed in quotes, even when they represent numbers.

#### Examples
```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

### Table 140–20 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUBLISH</td>
<td>Determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</td>
</tr>
<tr>
<td></td>
<td>- INCREMENTAL value for the partitioned table is set to <strong>TRUE</strong></td>
</tr>
<tr>
<td></td>
<td>- PUBLISH value for the partitioned table is set to <strong>TRUE</strong>;</td>
</tr>
<tr>
<td></td>
<td>- User specifies <strong>AUTO_SAMPLE_SIZE</strong> for <strong>ESTIMATE_PERCENT</strong> and <strong>AUTO</strong> for <strong>GRANULARITY</strong> when gathering statistics on the table.</td>
</tr>
<tr>
<td></td>
<td>If the INCREMENTAL value for the partitioned table was set to <strong>FALSE</strong> (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</td>
</tr>
<tr>
<td>pvalue</td>
<td>Preference value. If NULL is specified, it will set the Oracle default value.</td>
</tr>
</tbody>
</table>
DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```sql
DBMS_STATS.DELETE_TABLE_STATS (  
    ownname          VARCHAR2,  
    tabname          VARCHAR2,  
    partname         VARCHAR2 DEFAULT NULL,  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    cascade_parts    BOOLEAN  DEFAULT TRUE,  
    cascade_columns  BOOLEAN  DEFAULT TRUE,  
    cascade_indexes  BOOLEAN  DEFAULT TRUE,  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (  
        get_param('NO_INVALIDATE')),  
    force            BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>cascade_parts</td>
<td>If the table is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this table for all underlying partitions as well</td>
</tr>
<tr>
<td>cascade_columns</td>
<td>Indicates that DELETE_COLUMN_STATS should be called for all underlying columns (passing the cascade_parts parameter)</td>
</tr>
<tr>
<td>cascade_indexes</td>
<td>Indicates that DELETE_INDEX_STATS should be called for all underlying indexes (passing the cascade_parts parameter)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE, to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes table statistics even if locked</td>
</tr>
</tbody>
</table>
Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20002: Bad user statistics table, may need to upgrade it
ORA-20005: Object statistics are locked
DIFF_TABLE_STATS_IN_HISTORY Function

This function can be used to compare statistics for a table from two timestamps in past and compare the statistics as of that timestamps.

Syntax

```sql
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    time1      IN  TIMESTAMP WITH TIME ZONE,
    time2      IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    pctthreshold IN NUMBER  DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the table. Specify NULL for current schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table for which statistics are to be compared</td>
</tr>
<tr>
<td>time1</td>
<td>First timestamp 1</td>
</tr>
<tr>
<td>time2</td>
<td>Second timestamp 2</td>
</tr>
<tr>
<td>pctthreshold</td>
<td>The function reports difference in statistics only if it exceeds this limit. The default value is 10.</td>
</tr>
</tbody>
</table>

Usage Notes

If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.
DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics and statistics as of a timestamp or statistics from dictionary.

Syntax

```sql
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
  ownname        IN  VARCHAR2,
  tabname        IN  VARCHAR2,
  timestamp      IN  TIMESTAMP WITH TIME ZONE,
  pctthreshold   IN  NUMBER  DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the table. Specify NULL for current schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table for which statistics are to be compared</td>
</tr>
<tr>
<td>timestamp</td>
<td>Time stamp to get statistics from the history</td>
</tr>
<tr>
<td>pctthreshold</td>
<td>The function reports difference in statistics only if it exceeds this limit.</td>
</tr>
</tbody>
</table>

Usage Notes

If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.
DIFF_TABLE_STATS_IN_STATTAB Function

This function can be used to compare statistics for a table from two different sources. The statistics can be drawn from

- two different user statistics tables
- a single user statistics table containing 2 sets of statistics that can be identified using statids
- a user statistics table and dictionary

The function also compares the statistics of the dependent objects (indexes, columns, partitions) as well. It displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function. The statistics corresponding to the first source (stattab1 or time1) will be used as basis for computing the difference percentage.

Syntax

```sql
DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(
    ownname        IN  VARCHAR2,
    tabname        IN  VARCHAR2,
    stattab1       IN  VARCHAR2,
    stattab2       IN  VARCHAR2 DEFAULT NULL,
    pctthreshold   IN  NUMBER  DEFAULT 10,
    statid1        IN  VARCHAR2 DEFAULT NULL,
    statid2        IN  VARCHAR2 DEFAULT NULL,
    stattab1own    IN  VARCHAR2 DEFAULT NULL,
    stattab2own    IN  VARCHAR2 DEFAULT NULL)
RETURN DiffRepTab pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the table. Specify NULL for current schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table for which statistics are to be compared</td>
</tr>
<tr>
<td>stattab1</td>
<td>User statistics table 1</td>
</tr>
<tr>
<td>stattab2</td>
<td>User statistics table 2. If NULL, statistics in stattab1 is compared with current statistics in dictionary. This is the default. Specify same table as stattab1 to compare two sets within the statistics table (see statid below).</td>
</tr>
<tr>
<td>pctthreshold</td>
<td>The function reports difference in statistics only if it exceeds this limit. The default value is 10.</td>
</tr>
<tr>
<td>statid1</td>
<td>(optional) Identifies statistics set within stattab1.</td>
</tr>
<tr>
<td>statid2</td>
<td>(optional) Identifies statistics set within stattab2</td>
</tr>
<tr>
<td>stattab1own</td>
<td>Schema containing stattab1 (if other than ownname)</td>
</tr>
<tr>
<td>stattab2own</td>
<td>Schema containing stattab2 (if other than ownname)</td>
</tr>
</tbody>
</table>
DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension. This cancels the effects of the CREATE_EXTENDED_STATS Function.

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS ( 
    ownname    VARCHAR2, 
    tabname    VARCHAR2, 
    extension  VARCHAR2);
```

Parameters

Table 140–25  DROP_EXTENDED_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>extension</td>
<td>Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be &quot;(c1, c2)&quot; and an example expression can be &quot;(c1 + c2)&quot;.</td>
</tr>
</tbody>
</table>

Usage Notes

If no extended statistics set is created for the extension, this function throws an error.

Exceptions

- ORA-20000: Insufficient privileges or extension does not exist
- ORA-20001: Error when processing extension
DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

```sql
DBMS_STATS.DROP_STAT_TABLE (
    ownname VARCHAR2,
    stattab VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Table does not exists or insufficient privileges.
EXPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column and stores them in the user statistics table identified by `stattab`.

Syntax

```sql
DBMS_STATS.EXPORT_COLUMN_STATS (  
    ownname  VARCHAR2,  
    tabname  VARCHAR2,  
    colname  VARCHAR2,  
    partname VARCHAR2 DEFAULT NULL,  
    stattab  VARCHAR2,  
    statid   VARCHAR2 DEFAULT NULL,  
    statown  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if <code>partname</code> is NULL, then global and partition column statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code></td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code> (if different than <code>ownname</code>)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

DBMS_STATS.EXPORT_DATABASE_PREFS (  
    stattab    IN  VARCHAR2,  
    statid     IN  VARCHAR2 DEFAULT NULL,  
    statown    IN  VARCHAR2 DEFAULT NULL  
    add_sys    IN  BOOLEAN DEFAULT FALSE);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Statistics table name to where statistics should be exported</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
<tr>
<td>add_sys</td>
<td>Value TRUE will include the Oracle-owned tables</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
**EXPORT_DATABASE_STATS Procedure**

This procedure retrieves statistics for all objects in the database and stores them in the user statistics tables identified by `statown.stattab`.

**Syntax**

```
DBMS_STATS.EXPORT_DATABASE_STATS (  
  stattab         VARCHAR2,  
  statid          VARCHAR2 DEFAULT NULL,  
  statown         VARCHAR2 DEFAULT NULL,  
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>stattab</code></td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code></td>
</tr>
<tr>
<td><code>statown</code></td>
<td>Schema containing <code>stattab</code> (if different from current schema)</td>
</tr>
</tbody>
</table>
| `stat_category` | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:  
  - `'OBJECT_STATS'` - table statistics, column statistics and index statistics (Default)  
  - `'SYNOPSES'` - auxiliary statistics information gathered on a partitioned table when incremental is TRUE |

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

**Usage Notes**

Oracle does not support export or import of statistics across databases of different character sets.
**EXPORT_DICTIONARY_STATS Procedure**

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by `stattab`.

**Syntax**

```sql
DBMS_STATS.EXPORT_DICTIONARY_STATS (  
  stattab         VARCHAR2,  
  statid          VARCHAR2 DEFAULT NULL,  
  statown         VARCHAR2 DEFAULT NULL,  
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>stattab</code></td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code></td>
</tr>
<tr>
<td><code>statown</code></td>
<td>Schema containing <code>stattab</code> (if different from current schema)</td>
</tr>
<tr>
<td><code>stat_category</code></td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>† 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>† 'SYNOPSES' - auxiliary statistics information gathered on a partitioned table when incremental is TRUE</td>
</tr>
</tbody>
</table>

**Usage Notes**

- You must have the SYSDBA or ANALYZE ANY DICTIONARY and ANALYZE ANY SYSTEM privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

**Exceptions**

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20002: Bad user statistics table, may need to upgrade it
**EXPORT_FIXED_OBJECTS_STATS Procedure**

This procedure retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

**Syntax**

```sql
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
    stattab  VARCHAR2,
    statid   VARCHAR2 DEFAULT NULL,
    statown  VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

**Usage Notes**

Oracle does not support export or import of statistics across databases of different character sets.
EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

Syntax

```sql
DBMS_STATS.EXPORT_INDEX_STATS (  
    ownname  VARCHAR2,
    indname  VARCHAR2,
    partname VARCHAR2 DEFAULT NULL,
    stattab  VARCHAR2,
    statid   VARCHAR2 DEFAULT NULL,
    statown  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

Syntax

```sql
DBMS_STATS.EXPORT_PENDING_STATS (  
    ownname   IN  VARCHAR2  DEFAULT USER,  
    tabname   IN  VARCHAR2,  
    stattab   IN  VARCHAR2,  
    statid    IN  VARCHAR2 DEFAULT NULL,  
    statown   IN  VARCHAR2 DEFAULT USER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name to where to export the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- If the parameter `tabname` is NULL then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```sql
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```
EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```sql
DBMS_STATS.EXPORT_SCHEMA_PREFS (  
    ownname    IN  VARCHAR2,  
    stattab    IN  VARCHAR2,  
    statid     IN  VARCHAR2 DEFAULT NULL,  
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name to where to export the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```sql
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```
EXPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname and stores them in the user statistics tables identified by stattab.

Syntax

```sql
DBMS_STATS.EXPORT_SCHEMA_STATS (  
    ownname        VARCHAR2,  
    stattab        VARCHAR2,  
    statid          VARCHAR2 DEFAULT NULL,  
    statown        VARCHAR2 DEFAULT NULL,  
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>■ 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>■ 'SYNOPSES' - auxiliary statistics information gathered on a partitioned table when incremental is TRUE</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
**EXPORT_SYSTEM_STATS Procedure**

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

**Syntax**

```sql
DBMS_STATS.EXPORT_SYSTEM_STATS (
  stattab       VARCHAR2,
  statid        VARCHAR2 DEFAULT NULL,
  statown       VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>stattab</code></td>
<td>Identifier of the user statistics table that describes where the statistics will be stored</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Optional identifier associated with the statistics stored from the <code>stattab</code></td>
</tr>
<tr>
<td><code>statown</code></td>
<td>Schema containing <code>stattab</code> (if different from current schema)</td>
</tr>
</tbody>
</table>

**Exceptions**

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20002: Bad user statistics table; may need to be upgraded
- ORA-20003: Unable to export system statistics

**Usage Notes**

Oracle does not support export or import of statistics across databases of different character sets.
EXPORT_TABLE_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

Syntax

```sql
DBMS_STATS.EXPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name where to export the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```sql
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```
EXPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table and stores them in the user statistics table. Cascade results in all index statistics associated with the specified table being exported as well.

Syntax

```sql
DBMS_STATS.EXPORT_TABLE_STATS (  
   ownname    VARCHAR2,  
   tabname    VARCHAR2,  
   partname   VARCHAR2 DEFAULT NULL,  
   stattab    VARCHAR2,  
   statid     VARCHAR2 DEFAULT NULL,  
   cascade    BOOLEAN  DEFAULT TRUE,  
   statown    VARCHAR2 DEFAULT NULL,  
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>cascade</td>
<td>If true, then column and index statistics for this table are also exported</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>'SYNOPSIS' - auxiliary statistics information gathered on a partitioned table when incremental is TRUE</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure flushes in-memory monitoring information for all tables in the dictionary. Corresponding entries in the *_TAB_MODIFICATIONS, *_TAB_STATISTICS and *_IND_STATISTICS views are updated immediately, without waiting for the Oracle database to flush them periodically. This procedure is useful when you need up-to-date information in those views. Because the GATHER_*_STATS procedures internally flush monitoring information, it is not necessary to run this procedure before gathering the statistics.

Syntax

DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

The ANALYZE_ANY system privilege is required to run this procedure.
This procedure gathers statistics for all objects in the database.

**Syntax**

```sql
DBMS_STATS.GATHER_DATABASE_STATS (
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type
        (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
    granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    options          VARCHAR2 DEFAULT 'GATHER',
    objlist          OUT      ObjectTab,
    statown          VARCHAR2 DEFAULT NULL,
    gather_sys       BOOLEAN  DEFAULT TRUE,
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
        get_param('NO_INVALIDATE')),
    obj_filter_list ObjectTab DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STATS Subprograms

Table 140–39 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method_opt</td>
<td>Accepts:</td>
</tr>
<tr>
<td></td>
<td>■ FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>■ FOR COLUMNS [size clause] column [size_clause] [,column [size_clause]...]</td>
</tr>
<tr>
<td>size_clause is defined as size_clause := SIZE (integer</td>
<td>REPEAT</td>
</tr>
<tr>
<td>column is defined as column := column_name</td>
<td>extension name</td>
</tr>
<tr>
<td></td>
<td>- integer: Number of histogram buckets. Must be in the range [1,254].</td>
</tr>
<tr>
<td></td>
<td>- REPEAT: Collects histograms only on the columns that already have histograms.</td>
</tr>
<tr>
<td></td>
<td>- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td></td>
<td>- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns.</td>
</tr>
<tr>
<td></td>
<td>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>degree</td>
<td>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.</td>
</tr>
<tr>
<td>granularity</td>
<td>Granularity of statistics to collect (only pertinent if the table is partitioned).</td>
</tr>
<tr>
<td></td>
<td>‘ALL’ - Gathers all (subpartition, partition, and global) statistics</td>
</tr>
<tr>
<td></td>
<td>‘AUTO’ - Determines the granularity based on the partitioning type. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>‘DEFAULT’ - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the ‘GLOBAL AND PARTITION’ for this functionality. Note that the default value is now ‘AUTO’.</td>
</tr>
<tr>
<td></td>
<td>‘GLOBAL’ - Gathers global statistics</td>
</tr>
<tr>
<td></td>
<td>‘GLOBAL AND PARTITION’ - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</td>
</tr>
<tr>
<td></td>
<td>‘PARTITION’ - Gathers partition-level statistics</td>
</tr>
<tr>
<td></td>
<td>‘SUBPARTITION’ - Gathers subpartition-level statistics</td>
</tr>
</tbody>
</table>

Table 140–39 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cascade</td>
<td>Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO.Cascade to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to save the current statistics. The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab.</td>
</tr>
</tbody>
</table>
| options   | Further specification of which objects to gather statistics for:  
GATHER: Gathers statistics on all objects in the schema.  
GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects.  
GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale.  
GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics.  
LIST AUTO: Returns a list of objects to be processed with GATHER AUTO  
LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views  
LIST EMPTY: Returns a list of objects which currently have no statistics |
| objlist   | List of objects found to be stale or empty |
| statown   | Schema containing stattab (if different from current schema) |
| gather_sys| Gathers statistics on the objects owned by the 'SYS' user |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. |
Usage Notes

Statistics for external tables are not collected by this procedure.

Exceptions

ORA-20000: Insufficient privileges
ORA-20001: Bad input value

Table 140–39 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj_filter_list</td>
<td>A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.</td>
</tr>
</tbody>
</table>

See Applying an Object Filter List.
This procedure gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components.

**Syntax**

```sql
DBMS_STATS.GATHER_DICTIONARY_STATS (  
    comp_id          VARCHAR2 DEFAULT NULL,  
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type  
        (get_param('ESTIMATE_PERCENT')),  
    block_sample     BOOLEAN  DEFAULT FALSE,  
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
    degree           NUMBER DEFAULT to_degree_type(get_param('DEGREE')),  
    granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),  
    cascade          BOOLEAN DEFAULT to_cascade_type(GET_PARAM('CASCADE')),  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    options          VARCHAR2 DEFAULT 'GATHER AUTO',  
    objlist          OUT   ObjectTab,  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (  
        get_param('NO_INVALIDATE')),  
    obj_filter_list  ObjectTab DEFAULT NULL);
```

<tr>
<td>integer</td>
<td>- integer: Number of histogram buckets. Must be in the range [1,254].</td>
</tr>
<tr>
<td>REPEAT</td>
<td>- REPEAT: Collects histograms only on the columns that already have histograms.</td>
</tr>
<tr>
<td>AUTO</td>
<td>- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td>SKEWONLY</td>
<td>- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns.</td>
</tr>
<tr>
<td>The default</td>
<td>is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>degree</td>
<td>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use of table default value that was specified by the DEGREE clause in the CREATE or ALTER INDEX statement. Use the constant DBMS_STATS.DEFAULT_DEGREE for the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.</td>
</tr>
</tbody>
</table>
GATHER_DICTIONARY_STATS Procedure

Granularity of statistics to collect (only pertinent if the table is partitioned).

- 'ALL' - Gathers all (subpartition, partition, and global) statistics
- 'AUTO' - Determines the granularity based on the partitioning type. This is the default value.
- 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
- 'GLOBAL' - Gathers global statistics
- 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- 'PARTITION' - Gathers partition-level statistics
- 'SUBPARTITION' - gathers subpartition-level statistics

Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

User statistics table identifier describing where to save the current statistics

The (optional) identifier to associate with these statistics within statstab

Further specification of objects for which to gather statistics:

- 'GATHER' - Gathers statistics on all objects in the schema
- 'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, statstab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed.
- 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale.
- 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics.
- 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO'
- 'LIST STALE' - Returns list of stale objects as determined by looking at the *_tab_modifications views
- 'LIST EMPTY' - Returns list of objects which currently have no statistics

Table 140–40 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

<table>

DBMS_STATS

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges
ORA-20001: Bad input value
ORA-20002: Bad user statistics table, may need to upgrade it

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objlist</td>
<td>The list of objects found to be stale or empty</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>obj_filter_list</td>
<td>A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.</td>
</tr>
</tbody>
</table>
GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```sql
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (  
    stattab VARCHAR2 DEFAULT NULL,  
    statid VARCHAR2 DEFAULT NULL,  
    statown VARCHAR2 DEFAULT NULL,  
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (  
        get_param('NO_INVALIDATE')));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to save the current statistics</td>
</tr>
<tr>
<td>statid</td>

<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges
ORA-20001: Bad input value
ORA-20002: Bad user statistics table, may need to upgrade it
GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible. Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The granularity and no_invalidate arguments are not relevant to these types of indexes.

Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (  
  ownname          VARCHAR2,  
  indname          VARCHAR2,  
  partname         VARCHAR2 DEFAULT NULL,  
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type  
                         (GET_PARAM('ESTIMATE_PERCENT')),  
  stattab          VARCHAR2 DEFAULT NULL,  
  statid           VARCHAR2 DEFAULT NULL,  
  statown          VARCHAR2 DEFAULT NULL,  
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),  
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),  
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type  
                         (GET_PARAM('NO_INVALIDATE')),  
  force            BOOLEAN DEFAULT FALSE);
```

Parameters

<td>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO.</td>
</tr>
<tr>
<td></td>
<td>LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views.</td>
</tr>
<tr>
<td></td>
<td>LIST EMPTY: Returns list of objects which currently have no statistics.</td>
</tr>
</tbody>
</table>
When you use a specific value for the sampling percentage, `DBMS_STATS` honors it except for when:

- The result is less than 2500 rows (too small a sample) and
- The specified percentage is more than the certain percentage.

Statistics for external tables are not collected by this procedure.

### Exceptions

- **ORA-20000**: Schema does not exist or insufficient privileges
- **ORA-20001**: Bad input value

### Examples

#### Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the `SAMPLE` schema and any table in the `SYS` schema, if stale, will have statistics gathered upon it.

```sql
DECLARE
    filter_lst  DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
    filter_lst.extend(2);
    filter_lst(1).ownname := 'SAMPLE';
    filter_lst(1).objname := 'T%';
    filter_lst(2).ownname := 'SYS';
    DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                    options => 'gather_stale');
END;
```

---

<td>Does not invalidate the dependent cursors if set to <code>TRUE</code>. The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code>. Use <code>DBMS_STATS.AUTO_INVALIDATE</code>, to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <code>SET_DATABASE_PREFS Procedure</code>, <code>SET_GLOBAL_PREFS Procedure</code>, <code>SET_SCHEMA_PREFS Procedure</code> and <code>SET_TABLE_PREFS Procedure</code>.</td>
</tr>
<tr>
<td><code>force</code></td>
<td>Gather statistics on objects even if they are locked</td>
</tr>
<tr>
<td><code>obj_filter_list</code></td>
<td>A list of object filters. When provided, <code>GATHER_SCHEMA_STATS</code> will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1, s2, ...</code> are specified for attributes <code>a1, a2, ...</code> in one object filter. An object <code>o</code> is said to satisfy this object filter if <code>(o.a1 like s1) and (o.a2 like s2) and ...</code> is true. See Applying an Object Filter List.</td>
</tr>
</tbody>
</table>
GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```sql
DBMS_STATS.GATHER_SYSTEM_STATS (
    gathering_mode   VARCHAR2 DEFAULT 'NOWORKLOAD',
    interval         INTEGER  DEFAULT NULL,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gathering_mode</td>
<td>Mode values are:</td>
</tr>
</tbody>
</table>
|               | `NOWORKLOAD`: Will capture characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period Oracle will estimate the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. Oracle recommends to run `GATHER_SYSTEM_STATS ('noworkload')` after creation of the database and tablespaces. To fine tune system statistics for the workload use `START` and `STOP` or `'INTERVAL'` options. If you gather both `NOWORKLOAD` and workload specific (statistics collected using `'INTERVAL'` or `START` and `STOP'`), the workload statistics will be used by optimizer. Collected components: `cpuspeednw, ioseektim, iotfrspeed`.
|               | `INTERVAL`: Captures system activity during a specified interval. This works in combination with the `interval` parameter. You should provide an interval value in minutes, after which system statistics are created or updated in the dictionary or `stattab`. You can use `GATHER_SYSTEM_STATS (gathering_mode=> ´STOP´)` to stop gathering earlier than scheduled. Collected components: `maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc`.
|               | `START` | `STOP`: Captures system activity during specified start and stop times and refreshes the dictionary or `stattab` with statistics for the elapsed period. Interval value is ignored. Collected components: `maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc`.
| interval      | Time, in minutes, to gather statistics. This parameter applies only when `gathering_mode= ´INTERVAL´` |
| stattab       | Identifier of the user statistics table where the statistics will be saved |
| statid        | Optional identifier associated with the statistics saved in the `stattab` |
| statown       | Schema containing `stattab` (if different from current schema) |

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid input value
ORA-20002: Bad user statistics table; may need to be upgraded
ORA-20003: Unable to gather system statistics
ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0
GATHER_TABLE_STATS Procedure

This procedure gathers table and column (and index) statistics. It attempts to parallelize as much of the work as possible, but there are some restrictions as described in the individual parameters.

Syntax

```sql
DBMS_STATS.GATHER_TABLE_STATS (  
  ownname          VARCHAR2,  
  tabname          VARCHAR2,  
  partname         VARCHAR2 DEFAULT NULL,  
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type  
                          (get_param('ESTIMATE_PERCENT')),  
  block_sample     BOOLEAN  DEFAULT FALSE,  
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),  
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),  
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),  
  stattab          VARCHAR2 DEFAULT NULL,  
  statid           VARCHAR2 DEFAULT NULL,  
  statown          VARCHAR2 DEFAULT NULL,  
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (  
                          get_param('NO_INVALIDATE')),  
  stattype         VARCHAR2 DEFAULT 'DATA',  
  force            BOOLEAN  DEFAULT FALSE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of table to analyze</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of partition</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute) The valid range is ([0.000001,100]). Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.</td>
</tr>
</tbody>
</table>
GATHER_TABLE_STATS Procedure

Table 140–45 (Cont.) GATHER_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method_opt</td>
<td>Accepts either of the following options, or both in combination:</td>
</tr>
<tr>
<td></td>
<td>■ FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>■ FOR COLUMNS [size clause] column [size_clause] [,column [size_clause]...]</td>
</tr>
<tr>
<td>size_clause is defined as</td>
<td>size_clause := SIZE (integer</td>
</tr>
<tr>
<td>column is defined as</td>
<td>column := column_name</td>
</tr>
<tr>
<td>integer: Number of histogram buckets. Must be in the range [1,254].</td>
<td></td>
</tr>
<tr>
<td>REPEAT: Collects histograms only on the columns that already have histograms</td>
<td></td>
</tr>
<tr>
<td>AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</td>
<td></td>
</tr>
<tr>
<td>SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns.</td>
<td></td>
</tr>
<tr>
<td>column_name: Name of a column</td>
<td></td>
</tr>
<tr>
<td>extension: can be either a column group in the format of (column_name, Column_name [, ...]) or an expression</td>
<td></td>
</tr>
</tbody>
</table>

The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

degree

Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| granularity | Granularity of statistics to collect (only pertinent if the table is partitioned).

- `'ALL'` - Gathers all (subpartition, partition, and global) statistics.
- `'APPROX_GLOBAL AND PARTITION'` - similar to `'GLOBAL AND PARTITION'` but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if `partname` is `NULL` or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).
- `'AUTO'` - Determines the granularity based on the partitioning type. This is the default value.
- `'DEFAULT'` - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the `'GLOBAL AND PARTITION'` for this functionality. Note that the default value is now `'AUTO'`.
- `'GLOBAL'` - Gathers global statistics.
- `'GLOBAL AND PARTITION'` - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- `'PARTITION'` - Gathers partition-level statistics.
- `'SUBPARTITION'` - Gathers subpartition-level statistics.

| cascade | Gathers statistics on the indexes for this table. Using this option is equivalent to running the `GATHER_INDEX_STATS Procedure` on each of the table's indexes. Use the constant `DBMS_STATS.AUTO_CASCADE` to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the `SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure`.

| stattab | User statistics table identifier describing where to save the current statistics.

| statid | Identifier (optional) to associate with these statistics within `stattab`.

| statown | Schema containing `stattab` (if different than `ownname`).

| no_invalidate | Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE` to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the `SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure`.

| stattype | Statistics type. The only value allowed is `DATA`.

| force | Gather statistics of table even if it is locked.
Usage Notes

Index statistics collection can be parallelized except for cluster, domain and join indexes.

Exceptions

ORA-20000: Table does not exist or insufficient privileges
ORA-20001: Bad input value

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```plsql
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```plsql
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```
**GENERATE_STATS Procedure**

This procedure generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

**Syntax**

```sql
DBMS_STATS.GENERATE_STATS (    ownname VARCHAR2,
    objname VARCHAR2,
    organized NUMBER DEFAULT 7,
    force BOOLEAN default FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of object</td>
</tr>
<tr>
<td>objname</td>
<td>Name of object</td>
</tr>
<tr>
<td>organized</td>
<td>Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, generates statistics for the target object even if it is locked</td>
</tr>
</tbody>
</table>

**Usage Notes**

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

**Exceptions**

ORA-20000: Unsupported object type of object does not exist

ORA-20001: Invalid option or invalid statistics
GET_COLUMN_STATS Procedures

These procedures get all column-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```sql
DBMS_STATS.GET_COLUMN_STATS (  
  ownname  VARCHAR2,  
  tabname  VARCHAR2,  
  colname  VARCHAR2,  
  partname  VARCHAR2 DEFAULT NULL,  
  stattab  VARCHAR2 DEFAULT NULL,  
  statid  VARCHAR2 DEFAULT NULL,  
  distcnt OUT NUMBER,  
  density OUT NUMBER,  
  nullcnt OUT NUMBER,  
  srec OUT StatRec,  
  avgclen OUT NUMBER,  
  statown  VARCHAR2 DEFAULT NULL);
```

Use the following for user-defined statistics:

```sql
DBMS_STATS.GET_COLUMN_STATS (  
  ownname  VARCHAR2,  
  tabname  VARCHAR2,  
  colname  VARCHAR2,  
  partname  VARCHAR2 DEFAULT NULL,  
  stattab  VARCHAR2 DEFAULT NULL,  
  statid  VARCHAR2 DEFAULT NULL,  
  ext_stats OUT RAW,  
  stattypown OUT VARCHAR2 DEFAULT NULL,  
  stattypname OUT VARCHAR2 DEFAULT NULL,  
  statown  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>ext_stats</td>
<td>The user-defined statistics</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>stattytypename</td>
<td>Name of the statistics type</td>
</tr>
<tr>
<td>distcnt</td>
<td>Number of distinct values</td>
</tr>
<tr>
<td>density</td>
<td>Column density</td>
</tr>
<tr>
<td>nullcnt</td>
<td>Number of NULLs</td>
</tr>
<tr>
<td>srec</td>
<td>Structure holding internal representation of column minimum, maximum, and histogram values</td>
</tr>
<tr>
<td>avgclen</td>
<td>Average length of the column (in bytes)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object
GET_INDEX_STATS Procedures

These procedures get all index-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_INDEX_STATS (  
    ownname        VARCHAR2,  
    indname        VARCHAR2,  
    partname       VARCHAR2 DEFAULT NULL,  
    stattab        VARCHAR2 DEFAULT NULL,  
    statid         VARCHAR2 DEFAULT NULL,  
    numrows    OUT NUMBER,  
    numblks   OUT NUMBER,  
    numdist    OUT NUMBER,  
    avglblk    OUT NUMBER,  
    avgdblk    OUT NUMBER,  
    clstfct    OUT NUMBER,  
    indlevel   OUT NUMBER,  
    statown        VARCHAR2 DEFAULT NULL,  
    cachedblk  OUT NUMBER,  
    cachehit   OUT NUMBER);  
```

```
DBMS_STATS.GET_INDEX_STATS (  
    ownname        VARCHAR2,  
    indname        VARCHAR2,  
    partname       VARCHAR2 DEFAULT NULL,  
    stattab        VARCHAR2 DEFAULT NULL,  
    statid         VARCHAR2 DEFAULT NULL,  
    numrows    OUT NUMBER,  
    numblks   OUT NUMBER,  
    numdist    OUT NUMBER,  
    avglblk    OUT NUMBER,  
    avgdblk    OUT NUMBER,  
    clstfct    OUT NUMBER,  
    indlevel   OUT NUMBER,  
    statown        VARCHAR2 DEFAULT NULL,  
    guessq     OUT NUMBER,  
    cachedblk  OUT NUMBER,  
    cachehit   OUT NUMBER);  
```

```
DBMS_STATS.GET_INDEX_STATS (  
    ownname          VARCHAR2,  
    indname          VARCHAR2,  
    partname         VARCHAR2 DEFAULT NULL,  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    ext_stats   OUT  RAW,  
    stattypown  OUT  VARCHAR2 DEFAULT NULL,  
    stattypname OUT  VARCHAR2 DEFAULT NULL,  
    statown          VARCHAR2 DEFAULT NULL,  
    cachedblk        OUT NUMBER,  
    cachehit          OUT NUMBER);  
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (  
    ownname          VARCHAR2,  
    indname          VARCHAR2,  
    partname         VARCHAR2 DEFAULT NULL,  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    ext_stats    OUT  RAW,  
    stattypown  OUT  VARCHAR2 DEFAULT NULL,  
    stattypname OUT  VARCHAR2 DEFAULT NULL,  
    statown          VARCHAR2 DEFAULT NULL,  
    cachedblk        OUT NUMBER,  
    cachehit          OUT NUMBER);  
```
### Parameters

**Table 140–48  GET_INDEX_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition for which to get the statistics. If the index is partitioned and if partname is NULL, then the statistics are retrieved for the global index level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>ext_stats</td>
<td>User-defined statistics</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type</td>
</tr>
<tr>
<td>stattypname</td>
<td>Name of the statistics type</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the index (partition)</td>
</tr>
<tr>
<td>numlblks</td>
<td>Number of leaf blocks in the index (partition)</td>
</tr>
<tr>
<td>numdist</td>
<td>Number of distinct keys in the index (partition)</td>
</tr>
<tr>
<td>avglblk</td>
<td>Average integral number of leaf blocks in which each distinct key appears for this index (partition)</td>
</tr>
<tr>
<td>avgdblk</td>
<td>Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)</td>
</tr>
<tr>
<td>clstfct</td>
<td>Clustering factor for the index (partition)</td>
</tr>
<tr>
<td>indlevel</td>
<td>Height of the index (partition)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>guessq</td>
<td>Guess quality for the index (partition)</td>
</tr>
<tr>
<td>cachedblk</td>
<td>The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)</td>
</tr>
<tr>
<td>cachehit</td>
<td>The average cache hit ratio for the segment (index/table/index partition/table partition)</td>
</tr>
</tbody>
</table>

### Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachedhit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the system does not have one major workload resulting in averages not corresponding to real values.

**Exceptions**

`ORA-20000`: Object does not exist or insufficient privileges or no statistics have been stored for requested object
GET_PARAM Function

**Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the GET_PREFS Function.

See also Deprecated Subprograms on page 140-12.

This function returns the default value of parameters of DBMS_STATS procedures.

**Syntax**

```sql
DBMS_STATS.GET_PARAM (  
    pname     IN   VARCHAR2)  
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Parameter name</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20001: Invalid input values
GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```sql
DBMS_STATS.GET_PREFS ( pname IN VARCHAR2, ownname IN VARCHAR2 DEFAULT NULL, tabname IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Preference name. The default value for following preferences can be retrieved:</td>
</tr>
<tr>
<td></td>
<td>- AUTOSTATS_TARGET</td>
</tr>
<tr>
<td></td>
<td>- CASCADE</td>
</tr>
<tr>
<td></td>
<td>- DEGREE</td>
</tr>
<tr>
<td></td>
<td>- ESTIMATE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>- METHOD_OPT</td>
</tr>
<tr>
<td></td>
<td>- NO_INVALIDATE</td>
</tr>
<tr>
<td></td>
<td>- GRANULARITY</td>
</tr>
<tr>
<td></td>
<td>- PUBLISH</td>
</tr>
<tr>
<td></td>
<td>- INCREMENTAL</td>
</tr>
<tr>
<td></td>
<td>- STALE_PERCENT</td>
</tr>
</tbody>
</table>

**AUTOSTATS_TARGET** - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection. It takes the following values:

- `'ALL'` - Statistics collected for all objects in system
- `'ORACLE'` - Statistics collected for all Oracle owned objects
- `'AUTO'` - Oracle decides on which objects to collect statistics

**CASCADE** - Determines whether or not index statistics are collected as part of gathering table statistics.

**DEGREE** - Determines degree of parallelism used for gathering statistics.

**ESTIMATE_PERCENT** - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
**Table 140–50 (Cont.) GET_PREFS Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>METHOD_OPT</td>
<td>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</td>
</tr>
<tr>
<td></td>
<td>■ FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>■ FOR COLUMNS [size clause] column [size_clause] [,column [size_clause]...]</td>
</tr>
<tr>
<td>size_clause is defined as size_clause := SIZE (integer</td>
<td>REPEAT</td>
</tr>
<tr>
<td>column is defined as column := column_name</td>
<td>extension name</td>
</tr>
<tr>
<td>- integer: Number of histogram buckets. Must be in the range [1,254].</td>
<td></td>
</tr>
<tr>
<td>- REPEAT: Collects histograms only on the columns that already have histograms.</td>
<td></td>
</tr>
<tr>
<td>- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.</td>
<td></td>
</tr>
<tr>
<td>- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns.</td>
<td></td>
</tr>
<tr>
<td>- column_name: name of a column</td>
<td></td>
</tr>
<tr>
<td>- extension: can be either a column group in the format of (column_name, column_name [, , ...]) or an expression</td>
<td></td>
</tr>
<tr>
<td>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
<td></td>
</tr>
<tr>
<td>NO_INVALIDATE</td>
<td>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</td>
</tr>
<tr>
<td>GRANULARITY</td>
<td>Determines granularity of statistics to collect (only pertinent if the table is partitioned).</td>
</tr>
<tr>
<td>‘ALL’</td>
<td>Gathers all (subpartition, partition, and global) statistics</td>
</tr>
<tr>
<td>‘AUTO’</td>
<td>Determines the granularity based on the partitioning type. This is the default value.</td>
</tr>
<tr>
<td>‘DEFAULT’</td>
<td>Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the ‘GLOBAL AND PARTITION’ for this functionality. Note that the default value is now ‘AUTO’.</td>
</tr>
<tr>
<td>‘GLOBAL’</td>
<td>Gathers global statistics</td>
</tr>
<tr>
<td>‘GLOBAL AND PARTITION’</td>
<td>Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</td>
</tr>
<tr>
<td>‘PARTITION’</td>
<td>Gathers partition-level statistics</td>
</tr>
<tr>
<td>‘SUBPARTITION’</td>
<td>Gathers subpartition-level statistics.</td>
</tr>
</tbody>
</table>
GET_PREFS Function

Table 140–50  (Cont.)  GET_PREFS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUBLISH</td>
<td>Determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</td>
</tr>
<tr>
<td></td>
<td>- INCREMENTAL value for the partitioned table is set to TRUE;</td>
</tr>
<tr>
<td></td>
<td>- PUBLISH value for the partitioned table is set to TRUE;</td>
</tr>
<tr>
<td></td>
<td>- User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table</td>
</tr>
<tr>
<td>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</td>
<td></td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</td>
</tr>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20001: Invalid input values

Usage Notes

If the ownname and tabname are provided and a preference has been entered for the table, the function returns the preference as specified for the table. In all other cases it returns the global preference if it has been specified, otherwise the default value is returned.
GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY
RETURN TIMESTAMP WITH TIMEZONE;
```
GET_STATS_HISTORY_RETENTION Function

This function returns the current retention value.

Syntax

```sql
DBMS_STATS.GET_STATS_HISTORY_RETENTION
RETURN NUMBER;
```
GET_SYSTEM_STATS Procedure

This procedure gets system statistics from stattab, or from the dictionary if stattab is NULL.

Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (  
  status    OUT  VARCHAR2,  
  dstart    OUT  DATE,      
  dstop     OUT  DATE,      
  pname          VARCHAR2,  
  pvalue    OUT  NUMBER,    
  stattab   IN   VARCHAR2 DEFAULT NULL,  
  statid    IN   VARCHAR2 DEFAULT NULL,  
  statown   IN   VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>Output is one of the following:</td>
</tr>
<tr>
<td></td>
<td>■ COMPLETED:</td>
</tr>
<tr>
<td></td>
<td>■ AUTOGATHERING:</td>
</tr>
<tr>
<td></td>
<td>■ MANUALGATHERING:</td>
</tr>
<tr>
<td></td>
<td>■ BADSTATS:</td>
</tr>
<tr>
<td>dstart</td>
<td>Date when statistics gathering started.</td>
</tr>
<tr>
<td></td>
<td>If status = MANUALGATHERING, the start date is returned.</td>
</tr>
<tr>
<td>dstop</td>
<td>Date when statistics gathering stopped.</td>
</tr>
<tr>
<td></td>
<td>■ If status = COMPLETE, the finish date is returned.</td>
</tr>
<tr>
<td></td>
<td>■ If status = AUTOGATHERING, the future finish date is returned.</td>
</tr>
<tr>
<td></td>
<td>■ If status = BADSTATS, the must-finished-by date is returned.</td>
</tr>
</tbody>
</table>
### Table 140–51 (Cont.) GET_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pname</strong></td>
<td>The parameter name to get, which can have one of the following values:</td>
</tr>
<tr>
<td></td>
<td>■ <code>iotfrspeed</code> - I/O transfer speed in bytes for each millisecond</td>
</tr>
<tr>
<td></td>
<td>■ <code>ioseektim</code> - seek time + latency time + operating system overhead time, in milliseconds</td>
</tr>
<tr>
<td></td>
<td>■ <code>sreadtim</code> - average time to read single block (random read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>■ <code>mreadtim</code> - average time to read an mbrc block at once (sequential read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>■ <code>cpuspeed</code> - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using ‘INTERVAL’ or ‘START’ and ‘STOP’ options)</td>
</tr>
<tr>
<td></td>
<td>■ <code>cpuspeednw</code> - average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using ‘NOWORKLOAD’ option.</td>
</tr>
<tr>
<td></td>
<td>■ <code>mbrc</code> - average multiblock read count for sequential read, in blocks</td>
</tr>
<tr>
<td></td>
<td>■ <code>maxthr</code> - maximum I/O system throughput, in bytes/second</td>
</tr>
<tr>
<td></td>
<td>■ <code>slavethr</code> - average slave I/O throughput, in bytes/second</td>
</tr>
<tr>
<td><strong>pvalue</strong></td>
<td>Parameter value to get</td>
</tr>
<tr>
<td><strong>stattab</strong></td>
<td>Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.</td>
</tr>
<tr>
<td><strong>statid</strong></td>
<td>Optional identifier associated with the statistics saved in the stattab</td>
</tr>
<tr>
<td><strong>statown</strong></td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

### Exceptions

- **ORA-20000**: Object does not exist or insufficient privileges
- **ORA-20002**: Bad user statistics table; may need to be upgraded
- **ORA-20003**: Unable to gather system statistics
- **ORA-20004**: Parameter does not exist
GET_TABLE_STATS Procedure

This procedure gets all table-related information.

Syntax

```sql
DBMS_STATS.GET_TABLE_STATS (
    ownname         VARCHAR2,
    tabname         VARCHAR2,
    partname        VARCHAR2 DEFAULT NULL,
    stattab         VARCHAR2 DEFAULT NULL,
    statid          VARCHAR2 DEFAULT NULL,
    numrows     OUT NUMBER,
    numblks     OUT NUMBER,
    avgrlen     OUT NUMBER,
    statown         VARCHAR2 DEFAULT NULL,
    cachedblk   OUT NUMBER,
    cachehit    OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition from which to get the statistics. If the table is partitioned and if <code>partname</code> is NULL, then the statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If <code>stattab</code> is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not NULL)</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the table (partition)</td>
</tr>
<tr>
<td>numblks</td>
<td>Number of blocks the table (partition) occupies</td>
</tr>
<tr>
<td>avgrlen</td>
<td>Average row length for the table (partition)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code> (if different than <code>ownname</code>)</td>
</tr>
<tr>
<td>cachedblk</td>
<td>The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)</td>
</tr>
<tr>
<td>cachehit</td>
<td>The average cache hit ratio for the segment (index/table/index partition/table partition)</td>
</tr>
</tbody>
</table>

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_`
[TABLE/INDEX(SCHEMA/DATABASE)]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachehit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by \texttt{stattab} and stores them in the dictionary.

Syntax

\begin{verbatim}
DBMS_STATS.IMPORT_COLUMN_STATS (    
  ownname VARCHAR2,
  tabname VARCHAR2,
  colname VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab VARCHAR2,
  statid VARCHAR2 DEFAULT NULL,
  statown VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (    
    get_param('NO_INVALIDATE')),    
  force BOOLEAN DEFAULT FALSE);
\end{verbatim}

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier to associate with these statistics within stattab (optional)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to \texttt{TRUE}. The procedure invalidates the dependent cursors immediately if set to \texttt{FALSE}. Use \texttt{DBMS_STATS.AUTO_INVALIDATE} to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the \texttt{SET_DATABASE_PREFS} Procedure, \texttt{SET_GLOBAL_PREFS} Procedure, \texttt{SET_SCHEMA_PREFS} Procedure and \texttt{SET_TABLE_PREFS} Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>If set to \texttt{TRUE}, imports statistics even if statistics are locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table
ORA-20005: Object statistics are locked
Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
IMPORT_DATABASE_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing TRUE for the add_sys parameter.

Syntax

```sql
DBMS_STATS.IMPORT_DATABASE_PREFS (
    stattab IN VARCHAR2,
    statid IN VARCHAR2 DEFAULT NULL,
    statown IN VARCHAR2 DEFAULT NULL,
    add_sys IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Statistics table name where to import the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>add_sys</td>
<td>Value TRUE will include the Oracle-owned tables</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```sql
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```
IMPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database from the user statistics table(s) and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_DATABASE_STATS (  
stattab         VARCHAR2,  
statid          VARCHAR2 DEFAULT NULL,  
statown         VARCHAR2 DEFAULT NULL,  
no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(  
                         get_param('NO_INVALIDATE')),  
force           BOOLEAN DEFAULT FALSE,  
stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics locked at the object (table) level:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
IMPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas (‘SYS’, ‘SYSTEM’ and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (  
  stattab         VARCHAR2,  
  statid          VARCHAR2 DEFAULT NULL,  
  statown         VARCHAR2 DEFAULT NULL,  
  no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(    
    get_param('NO_INVALIDATE'))),  
  force           BOOLEAN DEFAULT FALSE,  
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);  
```

Parameters

**Table 140–56 IMPORT_DICTIONARY_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics lock at the object (table) level:</td>
</tr>
<tr>
<td></td>
<td>- TRUE - Ignores the statistics lock and imports the statistics.</td>
</tr>
<tr>
<td></td>
<td>- FALSE - The statistics will be imported only if there is no lock.</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>- 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>- 'SYNOPTES' - auxiliary statistics information gathered on a partitioned table when incremental is TRUE</td>
</tr>
</tbody>
</table>

Usage Notes

- You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.
Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table
ORA-20002: Bad user statistics table, may need to upgrade it
IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables from the user statistics table(s) and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (  
stattab VARCHAR2,  
statid VARCHAR2 DEFAULT NULL,  
statown VARCHAR2 DEFAULT NULL,  
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(    
   get_param('NO_INVALIDATE')),  
force BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics lock:</td>
</tr>
<tr>
<td></td>
<td>■ TRUE - Ignores the statistics lock and imports the statistics</td>
</tr>
<tr>
<td></td>
<td>■ FALSE - The statistics will be imported only if there is no lock</td>
</tr>
</tbody>
</table>

Usage Notes

- You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table
ORA-20002: Bad user statistics table, may need to upgrade it
IMPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_INDEX_STATS (  
    ownname VARCHAR2,
    indname VARCHAR2,
    partname VARCHAR2 DEFAULT NULL,
    stattab VARCHAR2,
    statid VARCHAR2 DEFAULT NULL,
    statown VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
        get_param('NO_INVALIDATE')),
    force BOOLEAN DEFAULT FALSE);
```

Parameters

Table 140–58 IMPORT_INDEX_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Imports statistics even if index statistics are locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table
ORA-20005: Object statistics are locked

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name from where to import the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```
IMPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the dictionary.

Syntax

```plsql
DBMS_STATS.IMPORT_SCHEMA_STATS (
    ownname         VARCHAR2,
    stattab         VARCHAR2,
    statid          VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE')),
    force           BOOLEAN DEFAULT FALSE,
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics locked at the object (table) level:</td>
</tr>
<tr>
<td></td>
<td>- TRUE - Ignores the statistics lock and imports the statistics.</td>
</tr>
<tr>
<td></td>
<td>- FALSE - Statistics will be imported only if there is no lock.</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>- 'OBJECT_STATS' - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>- 'SYNOPSES' - auxiliary statistics information gathered on a partitioned table when incremental is TRUE</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table
Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
IMPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by stattab, and stores the statistics in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (    stattab       VARCHAR2,    statid        VARCHAR2 DEFAULT NULL,    statown       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table where the statistics will be retrieved</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics retrieved from the stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

Exceptions

- **ORA-20000**: Object does not exist or insufficient privileges
- **ORA-20001**: Invalid or inconsistent values in the user statistics table
- **ORA-20002**: Bad user statistics table; may need to be upgraded
- **ORA-20003**: Unable to import system statistics

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```sql
DBMS_STATS.IMPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name from where to import the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```sql
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```
IMPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table from the user statistics table identified by `stattab` and stores them in the dictionary. Cascade results in all index statistics associated with the specified table being imported as well.

Syntax

```sql
DBMS_STATS.IMPORT_TABLE_STATS (ownname VARCHAR2,
tabname VARCHAR2,
partname VARCHAR2 DEFAULT NULL,
stattab VARCHAR2,
statid VARCHAR2 DEFAULT NULL,
cascade BOOLEAN DEFAULT TRUE,
statown VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(get_param('NO_INVALIDATE')),
force BOOLEAN DEFAULT FALSE,
stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ownname</code></td>
<td>Name of the schema</td>
</tr>
<tr>
<td><code>tabname</code></td>
<td>Name of the table</td>
</tr>
<tr>
<td><code>partname</code></td>
<td>Name of the table partition. If the table is partitioned and if <code>partname</code> is NULL, then global and partition table statistics are imported.</td>
</tr>
<tr>
<td><code>stattab</code></td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code></td>
</tr>
<tr>
<td><code>cascade</code></td>
<td>If true, column and index statistics for this table are also imported</td>
</tr>
<tr>
<td><code>statown</code></td>
<td>Schema containing <code>stattab</code> (if different than <code>ownname</code>)</td>
</tr>
<tr>
<td><code>no_invalidate</code></td>
<td>Does not invalidate the dependent cursors if set to <code>TRUE</code>. The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code>. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <code>SET_DATABASE_PREFS Procedure</code>, <code>SET_GLOBAL_PREFS Procedure</code>, <code>SET_SCHEMA_PREFS Procedure</code> and <code>SET_TABLE_PREFS Procedure</code></td>
</tr>
<tr>
<td><code>force</code></td>
<td>Imports statistics even if table statistics are locked</td>
</tr>
<tr>
<td><code>stat_category</code></td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td><code>OBJECT_STATS</code> - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td><code>SYNOPSES</code> - auxiliary statistics information gathered on a partitioned table when incremental is <code>TRUE</code></td>
</tr>
</tbody>
</table>
Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.
LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

```sql
DBMS_STATS.LOCK_PARTITION_STATS (
    ownname VARCHAR2,
    tabname VARCHAR2,
    partname VARCHAR2);
```

Parameters

Table 140–64  LOCK_PARTITION_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema to lock</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>Partition name</td>
</tr>
</tbody>
</table>
LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (
    ownname    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema to lock</td>
</tr>
</tbody>
</table>

Usage Notes

See "Usage Notes" for LOCK_TABLE_STATS Procedure.
LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```sql
DBMS_STATS.LOCK_TABLE_STATS(
    ownname VARCHAR2,
    tabname VARCHAR2);
```

Parameters

Table 140–66  LOCK_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>The name of the table</td>
</tr>
</tbody>
</table>

Usage Notes

- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use Dynamic Sampling.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
**MERGE_COL_USAGE Procedure**

This procedure merges column usage information from a source database by means of a dblink into the local database. If column usage information already exists for a given table or column MERGE_COL_USAGE will combine both the local and the remote information.

**Syntax**

```sql
DBMS_STATS.MERGE_COL_USAGE (dblink IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dblink</td>
<td>Name of dblink</td>
</tr>
</tbody>
</table>

**Usage Notes**

User must be SYS to execute this procedure.

**Exceptions**

- ORA-20000: Insufficient privileges
- ORA-20001: Parameter dblink cannot be NULL
- ORA-20002: Unable to create a TEMP table
These procedures convert user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using `SET_COLUMN_STATS`.

### Syntax

```sql
DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, charvals CHARARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, datevals DATEARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, dblvals DBLARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, fltvals FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, numvals NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, rawvals RAWARRAY);
```

### Pragmas

```
pragma restrict_references(prepare_column_values, WNDS, RNDS, WNPS, RNPS);
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS, RNPS);
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srec.epc</td>
<td>Number of values specified in <code>charvals</code>, <code>datevals</code>, <code>dblvals</code>, <code>fltvals</code>, <code>numvals</code>, or <code>rawvals</code>. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to <code>SET_COLUMN_STATS</code>.</td>
</tr>
</tbody>
</table>
Datatype-specific input parameters (use one) are shown in Table 140–69.

### Table 140–69  Datatype-Specific Input Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charvals</td>
<td>The array of values when the column type is character-based. Up to the first 32 bytes of each string should be provided. Arrays must have between 2 and 256 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.</td>
</tr>
<tr>
<td>datevals</td>
<td>Array of values when the column type is date-based</td>
</tr>
<tr>
<td>dblvals</td>
<td>Array of values when the column type is double-based</td>
</tr>
<tr>
<td>fltvals</td>
<td>Array of values when the column type is float-based</td>
</tr>
<tr>
<td>numvals</td>
<td>Array of values when the column type is numeric-based</td>
</tr>
<tr>
<td>rawvals</td>
<td>Array of values when the column type is RAW. Up to the first 32 bytes of each strings should be provided.</td>
</tr>
<tr>
<td>nvmin, nvmax</td>
<td>Minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.</td>
</tr>
<tr>
<td>rwmin, rwmax</td>
<td>Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>srec.bkvals</td>
<td>Array suitable for use in a call to SET_COLUMN_STATS</td>
</tr>
<tr>
<td>srec.novals</td>
<td>Array suitable for use in a call to SET_COLUMN_STATS</td>
</tr>
</tbody>
</table>

### Exceptions

ORA-20001: Invalid or inconsistent input values
PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR2 (
  srec     IN OUT StatRec,
  nvmin           NVARCHAR2,
  nvmax           NVARCHAR2);
```

Pragmas

```
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS, RNPS);
```

Parameters

</tbody>
</table>

Exceptions

ORA-20001: Invalid or inconsistent input values
This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```sql
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (  
  srec  IN OUT StatRec,
  rwmin        ROWID,
  rwmax        ROWID);
```

Pragmas

```sql
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

</tbody>
</table>

**Exceptions**

ORA-20001: Invalid or inconsistent input values
This procedure is used to publish the statistics gathered and stored as pending.

Syntax

```sql
DBMS_STATS.PUBLISH_PENDING_STATS (  
    ownname     IN  VARCHAR2 DEFAULT USER,  
    tabname     IN  VARCHAR2,  
    no_invalidate BOOLEAN DEFAULT  
        to_no_invalidate_type(get_param('NO_INVALIDATE')),  
    force       IN  BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Do not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, will override the lock</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter `tabname` is NULL then publish applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```sql
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```
PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary. To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Syntax

```sql
DBMS_STATS.PURGE_STATS(
    before_timestamp   TIMESTAMP WITH TIME ZONE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>before_timestamp</td>
<td>Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values
RESETGLOBAL_PREF_DEFAULTS Procedure

This procedure sets global preference, such as CASCADE, ESTIMATE_PERCENT and GRANULARITY, to default values. This reverses the global preferences set by the SET_GLOBAL_PREFS Procedure.

Syntax

DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
RESET_PARAM_DEFAULTS Procedure

Note: This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the RESSET_GLOBAL_PREF_DEFAULTS Procedure.

See also Deprecated Subprograms on page 140-12.

This procedure resets the default values of all parameters to Oracle recommended values.

Syntax

DBMS_STATS.RESET_PARAM_DEFAULTS;
RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (as_of_timestamp).

Syntax

```sql
DBMS_STATS.RESTORE_DATABASE_STATS(
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE,
    no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                          (GET_PARAM('NO_INVALIDATE'));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available
RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (as_of_timestamp).

Syntax

DBMS_STATS.RESTORE_DICTIONARY_STATS(
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE,
    no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
));

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>Timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values
ORA-20006: Unable to restore statistics, statistics history not available
RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (as_of_timestamp).

Syntax

```sql
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
  as_of_timestamp        TIMESTAMP WITH TIME ZONE,
  force                  BOOLEAN DEFAULT FALSE,
  no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
) {
  GET_PARAM('NO_INVALIDATE'));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

- **ORA-20000**: Object does not exist or insufficient privileges
- **ORA-20001**: Invalid or inconsistent values
- **ORA-20006**: Unable to restore statistics, statistics history not available
RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
    ownname                VARCHAR2,
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE,
    no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                           (GET_PARAM('NO_INVALIDATE'));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of the tables for which the statistics are to be restored</td>
</tr>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure</td>
</tr>
<tr>
<td></td>
<td>invalidates the dependent cursors immediately if set to FALSE. Use</td>
</tr>
<tr>
<td></td>
<td>DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate</td>
</tr>
<tr>
<td></td>
<td>dependent cursors. This is the default. The default can be changed using</td>
</tr>
<tr>
<td></td>
<td>the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_</td>
</tr>
<tr>
<td></td>
<td>TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values
ORA-20006: Unable to restore statistics, statistics history not available
RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (as_of_timestamp).

Syntax

```sql
DBMS_STATS.RESTORE_SCHEMA_STATS(
    as_of_timestamp TIMESTAMP WITH TIME ZONE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent values
- ORA-20006: Unable to restore statistics, statistics history not available
RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). The procedure will restore statistics of associated indexes and columns as well. If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS {
    ownname       VARCHAR2,
    tabname       VARCHAR2,
    as_of_timestamp       TIMESTAMP WITH TIME ZONE,
    restore_cluster_index  BOOLEAN DEFAULT FALSE,
    force               BOOLEAN DEFAULT FALSE,
    no_invalidate      BOOLEAN DEFAULT to_no_invalidate_type
                         (GET_PARAM('NO_INVALIDATE'));
}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The schema of the table for which the statistics are to be restored</td>
</tr>
<tr>
<td>tabname</td>
<td>The table name</td>
</tr>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>restore_cluster_index</td>
<td>If the table is part of a cluster, restore statistics of the cluster index if set to TRUE</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE, to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values
ORA-20006: Unable to restore statistics, statistics history not available
SEED_COL_USAGE Procedure

This procedure iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements.

Syntax

```
DBMS_STATS.SEED_COL_USAGE (   sqlset_name    IN    VARCHAR2,   owner_name     IN    VARCHAR2,   time_limit     IN    POSITIVE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Name of the SQL tuning set</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the SQL tuning set</td>
</tr>
<tr>
<td>time_limit</td>
<td>Time limit (in seconds)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges
SET_COLUMN_STATS Procedures

This procedure sets column-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```sql
DBMS_STATS.SET_COLUMN_STATS (  
  ownname       VARCHAR2,  
  tabname       VARCHAR2,  
  colname       VARCHAR2,  
  partname      VARCHAR2 DEFAULT NULL,  
  stattab       VARCHAR2 DEFAULT NULL,  
  statid        VARCHAR2 DEFAULT NULL,  
  distcnt       NUMBER DEFAULT NULL,  
  density       NUMBER DEFAULT NULL,  
  nullcnt       NUMBER DEFAULT NULL,  
  src           StatRec DEFAULT NULL,  
  avgclen       NUMBER DEFAULT NULL,  
  flags         NUMBER DEFAULT NULL,  
  statown       VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(    
    get_param('NO_INVALIDATE')),  
  force         BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```sql
DBMS_STATS.SET_COLUMN_STATS (  
  ownname       VARCHAR2,  
  tabname       VARCHAR2,  
  colname       VARCHAR2,  
  partname      VARCHAR2 DEFAULT NULL,  
  stattab       VARCHAR2 DEFAULT NULL,  
  statid        VARCHAR2 DEFAULT NULL,  
  ext_stats     RAW,  
  stattypown     VARCHAR2 DEFAULT NULL,  
  stattypname   VARCHAR2 DEFAULT NULL,  
  statown       VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(    
    get_param('NO_INVALIDATE')),  
  force         BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs.</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.</td>
</tr>
</tbody>
</table>
### SET_COLUMN_STATS Procedures

#### Table 140–86 (Cont.) SET_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>stattab</code></td>
<td>User statistics table identifier describing where to store the statistics. If <code>stattab</code> is <code>null</code>, then the statistics are stored directly in the dictionary.</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>null</code>)</td>
</tr>
<tr>

### Exceptions

- **ORA-20000**: Object does not exist or insufficient privileges
- **ORA-20001**: Invalid or inconsistent input values
- **ORA-20005**: Object statistics are locked
SET_DATABASE_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing TRUE for the add_sys parameter.

Syntax

```sql
DBMS_STATS.SET_DATABASE_PREFS (
  pname            IN   VARCHAR2,
  pvalue           IN   VARCHAR2,
  add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| pname     | Preference name. The default value for following parameters can be set:  
  - CASCADE  
  - DEGREE  
  - ESTIMATE_PERCENT  
  - METHOD_OPT  
  - NO_INVALIDATE  
  - GRANULARITY  
  - PUBLISH  
  - INCREMENTAL  
  - STALE_PERCENT  

- CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics.
- DEGREE - Determines degree of parallelism used for gathering statistics.
- ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
**METHOD**

Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:

- **FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]**
- **FOR COLUMNS [size_clause] column [size_clause] [, column [size_clause]...]**

`size_clause` is defined as:
```plaintext
size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}
```

- `integer`: Number of histogram buckets. Must be in the range [1,254].
- **REPEAT**: Collects histograms only on the columns that already have histograms
- **AUTO**: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.
- **SKEWONLY**: Oracle determines the columns to collect histograms based on the data distribution of the columns.

- **column_name**: Name of a column
- **extension**: Can be either a column group in the format of `(column_name, column_name [, ...])` or an expression

The default is **FOR ALL COLUMNS SIZE AUTO**.

**NO_INVALIDATE**

Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to **TRUE**. The procedure invalidates the dependent cursors immediately if set to **FALSE**. Use **DBMS_STATS.AUTO_INVALIDATE** to have Oracle decide when to invalidate dependent cursors. This is the default.

**GRANULARITY**

Determines granularity of statistics to collect (only pertinent if the table is partitioned).

- **'ALL'**: Gathers all (subpartition, partition, and global) statistics
- **'AUTO'**: Determines the granularity based on the partitioning type. This is the default value.
- **'DEFAULT'**: Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
- **'GLOBAL'**: Gathers global statistics
- **'GLOBAL AND PARTITION'**: Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- **'PARTITION'**: Gathers partition-level statistics
- **'SUBPARTITION'**: Gathers subpartition-level statistics.
Summary of DBMS_STATS Subprograms

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid or illegal input values

### Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

### Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE', '99');
```
SET_GLOBAL_PREFS Procedure

This procedure is used to set the global statistics preferences.

Syntax

```sql
DBMS_STATS.SET_GLOBAL_PREFS (
    pname IN VARCHAR2,
    pvalue IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| pname     | Preference name. The default value for the following preferences can be set:  
  - AUTOSTATS_TARGET  
  - CASCADE  
  - DEGREE  
  - ESTIMATE_PERCENT  
  - METHOD_OPT  
  - NO_INVALIDATE  
  - GRANULARITY  
  - PUBLISH  
  - INCREMENTAL  
  - STALE_PERCENT  

- AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for stats collection. It takes the following values:  
  - 'ALL' - Statistics collected for all objects in system  
  - 'ORACLE' - Statistics collected for all Oracle owned objects  
  - 'AUTO' - Oracle decides on which objects to collect statistics

- CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics

- DEGREE - Determines degree of parallelism used for gathering statistics

- ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001, 100]. Use the constant `DBMS_STATS.AUTO_SAMPLE_SIZE` to have Oracle determine the appropriate sample size for good statistics. This is the default.
Summary of DBMS_STATS Subprograms

DBMS_STATS

METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:

- FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]
- FOR COLUMNS [size clause] column [size clause] [,column [size clause] ...]

size_clause is defined as size_clause := SIZE (integer | REPEAT | AUTO | SKEWONLY)

column is defined as column := column_name | extension name | extension

- integer: Number of histogram buckets. Must be in the range [1,254].
- REPEAT: Collects histograms only on the columns that already have histograms.
- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.
- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns.
- column_name: Name of a column
- extension: Can be either a column group in the format of (column_name, column_name [, ...]) or an expression

The default is FOR ALL COLUMNS SIZE AUTO.

NO_INVALIDATE - Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.

GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned).

- 'ALL' - Gathers all (subpartition, partition, and global) statistics
- 'AUTO' - Determines the granularity based on the partitioning type. This is the default value.
- 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
- 'GLOBAL' - Gathers global statistics
- 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- 'PARTITION' - gathers partition-level statistics
- 'SUBPARTITION' - gathers subpartition-level statistics.

SET_GLOBAL_PREFS Procedure

**Table 140–88 (Cont.) SET_GLOBAL_PREFS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUBLISH</td>
<td>This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</td>
</tr>
<tr>
<td></td>
<td>■ INCREMENTAL value for the partitioned table is set to TRUE;</td>
</tr>
<tr>
<td></td>
<td>■ PUBLISH value for the partitioned table is set to TRUE;</td>
</tr>
<tr>
<td></td>
<td>■ User specifies AUTO SAMPLE SIZE for ESTIMATE PERCENT and AUTO for GRANULARITY when gathering statistics on the table</td>
</tr>
<tr>
<td></td>
<td>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</td>
</tr>
</tbody>
</table>

pvalue Preference value. If NULL is specified, it will set the Oracle default value.

**Exceptions**

ORA-20000: Insufficient privileges
ORA-20001: Invalid or illegal input values

**Usage Notes**

- This setting is honored only if there is no preference specified for the table to be analyzed.
- To run this procedure, you need to have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

**Examples**

```
DBMS_STATS.SET_GLOBAL_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_GLOBAL_PREFS('DEGREE','99');
```
SET_INDEX_STATS Procedures

These procedures set index-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

DBMS_STATS.SET_INDEX_STATS (  
  ownname VARCHAR2,  
  indname VARCHAR2,  
  partname VARCHAR2 DEFAULT NULL,  
  stattab VARCHAR2 DEFAULT NULL,  
  statid VARCHAR2 DEFAULT NULL,  
  numrows NUMBER DEFAULT NULL,  
  numlblks NUMBER DEFAULT NULL,  
  numdist NUMBER DEFAULT NULL,  
  avglblk NUMBER DEFAULT NULL,  
  avgdblk NUMBER DEFAULT NULL,  
  clstfct NUMBER DEFAULT NULL,  
  indlevel NUMBER DEFAULT NULL,  
  flags NUMBER DEFAULT NULL,  
  statown VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
    get_param('NO_INVALIDATE')),  
  guessq NUMBER DEFAULT NULL,  
  cachedblk NUMBER DEFAULT NULL,  
  cachehit NUMBER DEFAULT NULL,  
  force BOOLEAN DEFAULT FALSE);

Use the following for user-defined statistics:

DBMS_STATS.SET_INDEX_STATS (  
  ownname VARCHAR2,  
  indname VARCHAR2,  
  partname VARCHAR2 DEFAULT NULL,  
  stattab VARCHAR2 DEFAULT NULL,  
  statid VARCHAR2 DEFAULT NULL,  
  ext_stats RAW,  
  stattypown VARCHAR2 DEFAULT NULL,  
  stattypname VARCHAR2 DEFAULT NULL,  
  statown VARCHAR2 DEFAULT NULL,  
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
    get_param('NO_INVALIDATE')),  
  cachedblk NUMBER DEFAULT NULL,  
  cachehit NUMBER DEFAULT NULL,  
  force BOOLEAN DEFAULT FALSE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
</tbody>
</table>
Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other “minor” workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
- When not enough data has been analyzed, such as when an object has been recently create
- When the system does not have one major workload resulting in averages not corresponding to real values.

**Exceptions**

- **ORA-20000**: Object does not exist or insufficient privileges
- **ORA-20001**: Invalid input value
- **ORA-20005**: Object statistics are locked
SET_PARAM Procedure

Note: This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the SET_GLOBAL_PREFS Procedure.

See also Deprecated Subprograms on page 140-12.

This procedure sets default values for parameters of DBMS_STATS procedures. You can use the GET_PARAM Function to get the current default value of a parameter.

Syntax

```sql
DBMS_STATS.SET_PARAM (
  pname      IN    VARCHAR2,
  pval       IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>The parameter name. The default value for following parameters can be set.</td>
</tr>
<tr>
<td></td>
<td>- CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures. It is used only by gather procedures.</td>
</tr>
<tr>
<td></td>
<td>- DEGREE</td>
</tr>
<tr>
<td></td>
<td>- ESTIMATE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>- METHOD_OPT</td>
</tr>
<tr>
<td></td>
<td>- NO_INVALIDATE</td>
</tr>
<tr>
<td></td>
<td>- GRANULARITY</td>
</tr>
<tr>
<td></td>
<td>- AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)</td>
</tr>
<tr>
<td>pval</td>
<td>The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values:</td>
</tr>
<tr>
<td></td>
<td>- 'ALL' - Statistics are collected for all objects in the system</td>
</tr>
<tr>
<td></td>
<td>- 'ORACLE' - Statistics are collected for all Oracle owned objects</td>
</tr>
<tr>
<td></td>
<td>- 'AUTO' - Oracle decides for which objects to collect statistics</td>
</tr>
</tbody>
</table>

Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
Note also the difference between `NULL` and `'NULL'`:

- When `NULL` is unquoted, this sets the parameter to the value Oracle recommends.
- In the case of the quoted `'NULL'`, this sets the value of the parameter to `NULL`.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or illegal input value

Examples

```sql
DBMS_STATS.SET_PARAM('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT', '5');
DBMS_STATS.SET_PARAM('DEGREE', 'NULL');
```
SET_SCHEMA_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname   IN   VARCHAR2,
    pname     IN   VARCHAR2,
    pvalue    IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
</tbody>
</table>
| pname     | Preference name. The default value for following parameters can be set:  
|           |  ■ CASCADE  |
|           |  ■ DEGREE   |
|           |  ■ ESTIMATE_PERCENT |
|           |  ■ METHOD_OPT  |
|           |  ■ NO_INVALIDATE |
|           |  ■ GRANULARITY |
|           |  ■ PUBLISH   |
|           |  ■ INCREMENTAL |
|           |  ■ STALE_PERCENT |
| pvalue    | Preference value. If NULL is specified, it will set the Oracle default value.s |

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or illegal input value

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'DEGREE', '99');
```
SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```sql
DBMS_STATS.SET_SYSTEM_STATS (
    pname          VARCHAR2,
    pvalue         NUMBER,
    stattab   IN   VARCHAR2 DEFAULT NULL,
    statid    IN   VARCHAR2 DEFAULT NULL,
    statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pname</strong></td>
<td>The parameter name to get, which can have one of the following values:</td>
</tr>
<tr>
<td></td>
<td>■ iotfrspeed—I/O transfer speed in bytes for each millisecond</td>
</tr>
<tr>
<td></td>
<td>■ ioseektim - Seek time + latency time + operating system overhead time, in milliseconds</td>
</tr>
<tr>
<td></td>
<td>■ sreadtim - Average time to read single block (random read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>■ mreadtim - Average time to read an mbrc block at once (sequential read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>■ cpuspeed - Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</td>
</tr>
<tr>
<td></td>
<td>■ cpuspeednw - Average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option)</td>
</tr>
<tr>
<td></td>
<td>■ mbrc - Average multiblock read count for sequential read, in blocks</td>
</tr>
<tr>
<td></td>
<td>■ maxthr - Maximum I/O system throughput, in bytes/second</td>
</tr>
<tr>
<td></td>
<td>■ slavethr - Average slave I/O throughput, in bytes/second</td>
</tr>
<tr>
<td><strong>pvalue</strong></td>
<td>Parameter value to get</td>
</tr>
<tr>
<td><strong>stattab</strong></td>
<td>Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.</td>
</tr>
<tr>
<td><strong>statid</strong></td>
<td>Optional identifier associated with the statistics saved in the stattab</td>
</tr>
<tr>
<td><strong>statown</strong></td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid input value
ORA-20002: Bad user statistics table; may need to be upgraded
ORA-20003: Unable to set system statistics
ORA-20004: Parameter does not exist
SET_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.SET_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2,
    pvalue     IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
</tbody>
</table>
| pname     | Preference name. The default value for following preferences can be set:
|           | - CASCADE  |
|           | - DEGREE   |
|           | - ESTIMATE_PERCENT |
|           | - METHOD_OPT |
|           | - NO_INVALIDATE |
|           | - GRANULARITY |
|           | - PUBLISH   |
|           | - INCREMENTAL |
|           | - STALE_PERCENT |

- CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics.
- DEGREE - Determines degree of parallelism used for gathering statistics.
- ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
METHOD_OPT - Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:

- FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]
- FOR COLUMNS [size clause] column [size clause] [, column [size clause] ...]

size_clause is defined as size_clause := SIZE (integer | REPEAT | AUTO | SKEWONLY)

column is defined as column := column_name | extension name | extension

- integer: Number of histogram buckets. Must be in the range [1,254].
- REPEAT: Collects histograms only on the columns that already have histograms
- AUTO: Oracle determines the columns to collect histograms based on data distribution and the workload of the columns.
- SKEWONLY: Oracle determines the columns to collect histograms based on the data distribution of the columns.
- column_name: Name of a column
- extension: Can be either a column group in the format of (column_name, column_name [, ...]) or an expression

The default is FOR ALL COLUMNS SIZE AUTO.

NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.

GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned).

- 'ALL' - Gathers all (subpartition, partition, and global) statistics
- 'AUTO' - Determines the granularity based on the partitioning type. This is the default value.
- 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
- 'GLOBAL' - Gathers global statistics
- 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- 'PARTITION' - Gathers partition-level statistics
- 'SUBPARTITION' - Gathers subpartition-level statistics.
Summary of DBMS_STATS Subprograms

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table or should have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT','9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

SET_TABLE_STATS Procedure

This procedure sets table-related information.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (
    ownname       VARCHAR2,
    tabname       VARCHAR2,
    partname      VARCHAR2 DEFAULT NULL,
    stattab       VARCHAR2 DEFAULT NULL,
    statid        VARCHAR2 DEFAULT NULL,
    numrows       NUMBER   DEFAULT NULL,
    numblks       NUMBER   DEFAULT NULL,
    avgrlen       NUMBER   DEFAULT NULL,
    flags         NUMBER   DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type (  
        get_param('NO_INVALIDATE')),
    cachedblk     NUMBER    DEFAULT NULL,
    cachehit      NUMBER    DEFAULT NULL,
    force         BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the table (partition)</td>
</tr>
<tr>
<td>numblks</td>
<td>Number of blocks the table (partition) occupies</td>
</tr>
<tr>
<td>avgrlen</td>
<td>Average row length for the table (partition)</td>
</tr>
<tr>
<td>flags</td>
<td>For internal Oracle use (should be left as NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>cachedblk</td>
<td>The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)</td>
</tr>
</tbody>
</table>
Summary of DBMS_STATS Subprograms

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_{TABLE/INDEX/SHEMA/DATABASE}_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a ‘confidence factor’ for each `cachehit` and a `cachedblk` for each object. If the ‘confidence factor’ for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other “minor” workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid input value
- ORA-20005: Object statistics are locked

Table 140–94 (Cont.) SET_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cachehit</td>
<td>The average cache hit ratio for the segment (index/table/index partition/table partition)</td>
</tr>
<tr>
<td>force</td>
<td>Sets the values even if statistics of the table are locked</td>
</tr>
</tbody>
</table>
This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```sql
DBMS_STATS.SHOW_EXTENDED_STATS_NAME(
    ownname VARCHAR2,
    tabname VARCHAR2,
    extension VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>extension</td>
<td>Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be &quot;(c1, c2)&quot; and an example expression can be &quot;(c1 + c2)&quot;.</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Error when processing extension
UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    partname   VARCHAR2);  
```

Parameters

```
Table 140–96  UNLOCK_PARTITION_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema to unlock</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>Partition name</td>
</tr>
</tbody>
</table>
```
UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```sql
DBMS_STATS.UNLOCK_SCHEMA_STATS (ownname VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The name of the schema</td>
</tr>
</tbody>
</table>

Usage Notes

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
**UNLOCK_TABLE_STATS Procedure**

This procedure unlocks the statistics on the table.

**Syntax**

```sql
DBMS_STATS.UNLOCK_TABLE_STATS (    ownname    VARCHAR2,    tabname    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>The name of the table</td>
</tr>
</tbody>
</table>

**Usage Notes**

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (  
  ownname    VARCHAR2,  
  stattab    VARCHAR2);
```

Parameters

Table 140–99  UPGRADE_STAT_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>Name of the table</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Unable to upgrade table
With the DBMS_STORAGE_MAP package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- Using DBMS_STORAGE_MAP
  - Overview
  - Operational Notes
- Summary of DBMS_STORAGE_MAP Subprograms
Using DBMS_STORAGE_MAP

- Overview
- Operational Notes
Overview

The following terminology and descriptions will help you understand the DBMS_STORAGE_MAP API:

- **Mapping libraries**
  Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in filemap.ora.

- **Mapping files**
  A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- **Mapping elements and sub-elements**
  A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack.

- **Mapping file extents**
  A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

**See Also:**

- *Oracle Database Administrator’s Guide* for more information
- *Oracle Database Reference* for V$MAP views, including V$MAP_FILE, V$MAP_ELEMENT, V$MAP_SUBELEMENT, V$MAP_FILE_EXTENT
Operational Notes

For MAP_ELEMENT, MAP_FILE, and MAP_ALL: Invoking these functions when mapping information already exists will refresh the mapping if configuration IDs are supported. If configuration IDs are not supported, then invoking these functions again will rebuild the mapping.

See Also: Oracle Database Administrator’s Guide for a discussion of the configuration ID, an attribute of the element or file that is changed.
## Summary of DBMS_STORAGE_MAP Subprograms

### Table 141–1  DBMS_STORAGE_MAP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DROP_ALL Function</td>
<td>Drops all mapping information in the shared memory of the instance</td>
</tr>
<tr>
<td>DROP_ELEMENT Function</td>
<td>Drops the mapping information for the element defined by elemname</td>
</tr>
<tr>
<td>DROP_FILE Function</td>
<td>Drops the file mapping information defined by filename</td>
</tr>
<tr>
<td>LOCK_MAP Procedure</td>
<td>Locks the mapping information in the shared memory of the instance</td>
</tr>
<tr>
<td>MAP_ALL Function</td>
<td>Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements</td>
</tr>
<tr>
<td>MAP_ELEMENT Function</td>
<td>Builds mapping information for the element identified by elemname</td>
</tr>
<tr>
<td>MAP_FILE Function</td>
<td>Builds mapping information for the file identified by filename</td>
</tr>
<tr>
<td>MAP_OBJECT Function</td>
<td>Builds the mapping information for the Oracle object identified by the object name, owner, and type</td>
</tr>
<tr>
<td>RESTORE Function</td>
<td>Loads the entire mapping information from the data dictionary into the shared memory of the instance</td>
</tr>
<tr>
<td>SAVE Function</td>
<td>Saves information needed to regenerate the entire mapping into the data dictionary</td>
</tr>
<tr>
<td>UNLOCK_MAP Procedure</td>
<td>Unlocks the mapping information in the shared memory of the instance</td>
</tr>
</tbody>
</table>
**DROP_ALL Function**

This function drops all mapping information in the shared memory of the instance.

**Syntax**

```sql
DBMS_STORAGE_MAP.DROP_ALL(
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>
**DROP_ELEMENT Function**

This function drops the mapping information for the element defined by `elemname`.

**Syntax**

```sql
DBMS_STORAGE_MAP.DROP_ELEMENT(
    elemname          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>elemname</code></td>
<td>The element for which mapping information is dropped.</td>
</tr>
<tr>
<td><code>cascade</code></td>
<td>If TRUE, then DROP_ELEMENT is invoked recursively on all elements of the DAG defined by <code>elemname</code>, if possible.</td>
</tr>
<tr>
<td><code>dictionary_update</code></td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; <code>dictionary_update</code> is an overloaded argument.</td>
</tr>
</tbody>
</table>
DROP_FILE Function

This function drops the file mapping information defined by filename.

Syntax

DBMS_STORAGE_MAP.DROP_FILE(
    filename          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>The file for which file mapping information is dropped.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then the mapping DAGs for the elements where the file resides are also dropped, if possible.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>
LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance. This is useful when you need a consistent snapshot of the V$MAP tables. Without locking the mapping information, V$MAP_ELEMENT and V$MAP_SUBELEMENT, for example, may be inconsistent.

Syntax

```sql
DBMS_STORAGE_MAP.LOCK_MAP;
```
MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```sql
DBMS_STORAGE_MAP.MAP_ALL(
    max_num_fileext   IN NUMBER DEFAULT 100,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>max_num_fileext</code></td>
<td>Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; <code>max_num_fileextent</code> is an overloaded argument.</td>
</tr>
<tr>
<td><code>dictionary_update</code></td>
<td>If <code>TRUE</code>, mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code>; <code>dictionary_update</code> is an overloaded argument.</td>
</tr>
</tbody>
</table>

Usage Notes

You must explicitly call `MAP_ALL` in a cold startup scenario.
**MAP_ELEMENT Function**

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

**Syntax**

```
DBMS_STORAGE_MAP.MAP_ELEMENT(
    elemname          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>elemname</code></td>
<td>The element for which mapping information is built.</td>
</tr>
<tr>
<td><code>cascade</code></td>
<td>If <code>TRUE</code>, all elements within the <code>elemname</code> I/O stack DAG are mapped.</td>
</tr>
<tr>
<td><code>dictionary_update</code></td>
<td>If <code>TRUE</code>, mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code>; <code>dictionary_update</code> is an overloaded argument.</td>
</tr>
</tbody>
</table>
MAP_FILE Function

This function builds mapping information for the file identified by filename. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

DBMS_STORAGE_MAP.MAP_FILE(
    filename           IN VARCHAR2,
    filetype           IN VARCHAR2,
    cascade            IN BOOLEAN,
    max_num_fileextent IN NUMBER DEFAULT 100,
    dictionary_update  IN BOOLEAN DEFAULT TRUE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>The file for which mapping information is built.</td>
</tr>
<tr>
<td>filetype</td>
<td>Defines the type of the file to be mapped. It can be &quot;DATAFILE&quot;, &quot;SPFILE&quot;, &quot;TEMPFILE&quot;, &quot;CONTROLFILE&quot;, &quot;LOGFILE&quot;, or &quot;ARCHIVEFILE&quot;.</td>
</tr>
<tr>
<td>cascade</td>
<td>Should be TRUE only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an ALTER SYSTEM command or DML operations on extended files), cascade can be set to FALSE because the mapping changes are limited to the file extents only. If TRUE, mapping DAGs are also built for the elements where the file resides.</td>
</tr>
<tr>
<td>max_num_fileextent</td>
<td>Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if cascade is TRUE), is owned by a library that must be explicitly synchronized.
MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

DBMS_STORAGE_MAP.MAP_OBJECT(
    objname  IN  VARCHAR2,
    owner    IN  VARCHAR2,
    objtype  IN  VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objname</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>owner</td>
<td>The owner of the object.</td>
</tr>
<tr>
<td>objtype</td>
<td>The type of the object.</td>
</tr>
</tbody>
</table>
RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance. You can invoke RESTORE only after a SAVE operation. You must explicitly call RESTORE in a warm startup scenario.

Syntax

DBMS_STORAGE_MAP.RESTORE;
SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```
DBMS_STORAGE_MAP.SAVE;
```
UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

DBMS_STORAGE_MAP.UNLOCK_MAP;
The **DBMS_STREAMS** package, one of a set of Oracle Streams packages, provides subprograms to convert **ANYDATA** objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

This chapter contains the following topics:

- **Using DBMS_STREAMS**
  - Overview
  - Security Model
- **Summary of DBMS_STREAMS Subprograms**
Using DBMS_STREAMS

This section contains topics which relate to using the DBMS_STREAMS package.

- Overview
- Security Model
Overview

This package provides subprograms to convert ANYDATA objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

See Also: Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and Oracle Streams
Security Model

PUBLIC is granted EXECUTE privilege on this package.

See Also: Oracle Database Security Guide for more information about user group PUBLIC
## Summary of DBMS_STREAMS Subprograms

### Table 142–1  DBMS_STREAMS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPATIBLE_11_2 Function on page 142-6</td>
<td>Returns the DBMS_STREAMS.COMPATIBLE_11_2 constant</td>

<tr>
<td>CONVERT_LCR_TO_XML Function on page 142-13</td>
<td>Converts a logical change record (LCR) encapsulated in a ANYDATA object into an XML object that conforms to the XML schema for LCRs</td>
</tr>
<tr>
<td>CONVERT_XML_TO_LCR Function on page 142-14</td>
<td>Converts an XML object that conforms to the XML schema for LCRs into a logical change record (LCR) encapsulated in a ANYDATA object</td>
</tr>
<tr>
<td>GET_INFORMATION Function on page 142-15</td>
<td>Returns information about various Oracle Streams attributes</td>
</tr>
<tr>
<td>GET_STREAMS_NAME Function on page 142-16</td>
<td>Returns the name of the invoker</td>
</tr>
<tr>
<td>GET_STREAMS_TYPE Function on page 142-17</td>
<td>Returns the type of the invoker</td>
</tr>
<tr>
<td>GET_TAG Function on page 142-18</td>
<td>Gets the binary tag for all redo entries generated by the current session</td>
</tr>
<tr>
<td>MAX_COMPATIBLE Function on page 142-19</td>
<td>Returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database</td>
</tr>
<tr>
<td>SET_TAG Procedure on page 142-20</td>
<td>Sets the binary tag for all redo entries subsequently generated by the current session</td>
</tr>
</tbody>
</table>

**Note:** The subprograms in this package do not commit.
COMPATIBLE_11_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_11_2 constant.

Syntax

DBMS_STREAMS.COMPATIBLE_11_2
RETURN INTEGER;

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 247-38
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
COMPATIBLE_11_1 Function

This function returns the DBMS_STREAMS.COMPATIBLE_11_1 constant.

Syntax

DBMS_STREAMS.COMPATIBLE_11_1
RETURN INTEGER;

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:
- GET_COMPATIBLE Member Function on page 247-38
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
COMPATIBLE_10_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_10_2 constant.

Syntax

DBMS_STREAMS.COMPATIBLE_10_2
RETURN INTEGER;

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

■ GET_COMPATIBLE Member Function on page 247-38
■ Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
■ Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
**COMPATIBLE_10_1 Function**

This function returns the DBMS_STREAMS.COMPATIBLE_10_1 constant.

**Syntax**

```
DBMS_STREAMS.COMPATIBLE_10_1
RETURN INTEGER;
```

**Usage Notes**

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

**See Also:**
- GET_COMPATIBLE Member Function on page 247-38
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
COMPATIBLE_9_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.

Syntax

DBMS_STREAMS.COMPATIBLE_9_2
RETURN INTEGER;

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 9.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 247-38
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
CONVERT_ANYDATA_TO_LCR_DDL Function

This function converts a ANYDATA object into a SYS.LCR$$_DDL$$RECORD object.

Syntax

```java
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_DDL(
    source  IN  ANYDATA)
RETURN SYS.LCR$$_DDL$$RECORD;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>The ANYDATA object to be converted. If this object is not a DDL logical change record (DDL LCR), then the function raises an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of DDL LCRs from a ANYDATA queue to a SYS.LCR$$_DDL$$RECORD typed queue.

See Also: Oracle Streams Advanced Queuing User’s Guide
CONVERT_ANYDATA_TO_LCR_ROW Function

This function converts a ANYDATA object into a SYS.LCR$_ROW_RECORD object.

Syntax

```sql
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_ROW(
    source  IN  ANYDATA)
RETURN SYS.LCR$_ROW_RECORD;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>The ANYDATA object to be converted. If this object is not a row logical change record (row LCR), then the function raises an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of row LCRs from a ANYDATA queue to a SYS.LCR$_ROW_RECORD typed queue.

See Also: Oracle Streams Advanced Queuing User’s Guide
CONVERT_LCR_TO_XML Function

This function converts a logical change record (LCR) encapsulated in a ANYDATA object into an XML object that conforms to the XML schema for LCRs. The LCR can be a row LCR or a DDL LCR.

**See Also:** Oracle Streams Concepts and Administration for more information about the XML schema for LCRs

**Syntax**

```sql
DBMS_STREAMS.CONVERT_LCR_TO_XML(
    anylcr IN ANYDATA)
RETURN SYS.XMLTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>anylcr</td>
<td>The ANYDATA encapsulated LCR to be converted. If this object is not a ANYDATA encapsulated LCR, then the function raises an exception.</td>
</tr>
</tbody>
</table>
CONVERT_XML_TO_LCR Function

This function converts an XML object that conforms to the XML schema for logical change records (LCRs) into an LCR encapsulated in a ANYDATA object. The LCR can be a row or DDL LCR.

See Also: Oracle Streams Concepts and Administration for more information about the XML schema for LCRs

Syntax

```
DBMS_STREAMS.CONVERT_XML_TO_LCR(
    xmldat  IN  SYS.XMLTYPE)
RETURN ANYDATA;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmldat</td>
<td>The XML LCR object to be converted. If this object does not conform to XML schema for LCRs, then the function raises an exception.</td>
</tr>
</tbody>
</table>
GET_INFORMATION Function

This function returns information about various Oracle Streams attributes.

Syntax

DBMS_STREAMS.GET_INFORMATION(
   name  IN  VARCHAR2)
RETURN ANYDATA;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The type of information you want to retrieve. Currently, the following names are available:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>SENDER</td>
<td>Returns the name of the sender for the current logical change record (LCR) from its AQ message properties. This function is called inside a procedure DML handler, a DDL handler, an error handler, or a message handler. Returns NULL if called outside of an apply handler. The return value is to be interpreted as a VARCHAR2.</td>
</tr>
<tr>
<td>CONSTRAINT_NAME</td>
<td>Returns the name of the constraint that was violated for an LCR that raised an error. This function is called inside a procedure DML handler or error handler for an apply process. Returns NULL if called outside of a procedure DML handler or error handler. The return value is to be interpreted as a VARCHAR2.</td>
</tr>
</tbody>
</table>
GET_STREAMS_NAME Function

This function gets the Oracle Streams name of the invoker if the invoker is one of the following Oracle Streams types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_NAME
RETURN VARCHAR2;
```

Usage Notes

You can use this function in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, if you use one error handler for multiple apply processes, then you can use the GET_STREAMS_NAME function to determine the name of the apply process that raised the error.
GET_STREAMS_TYPE Function

This function gets the Oracle Streams type of the invoker and returns one of the following types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_TYPE
RETURN VARCHAR2;
```

Usage Notes

This function can be used in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, you can use the GET_STREAMS_TYPE function to instruct a procedure DML handler to operate differently if it is processing messages from the error queue (ERROR_EXECUTION type) instead of the apply process's queue (APPLY type).
GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

---

**Note:**

- To execute this function, a user must be granted either `EXECUTE_CATALOG_ROLE` or `EXECUTE` privilege on the `DBMS_STREAMS_ADM` package.
- The `DBMS_STREAMS.GET_TAG` function might be deprecated in a future release of Oracle Database. Oracle recommends that you use the `DBMS_STREAMS_ADM.GET_TAG` function. See GET_TAG Function on page 143-86.

---

**See Also:** Oracle Streams Replication Administrator’s Guide for more information about tags

**Syntax**

```sql
DBMS_STREAMS.GET_TAG
RETURN RAW;
```

**Examples**

The following example illustrates how to display the current logical change record (LCR) tag as output:

```sql
SET SERVEROUTPUT ON
DECLARE
    raw_tag RAW(2000);
BEGIN
    raw_tag := DBMS_STREAMS.GET_TAG();
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the `DUAL` view:

```sql
SELECT DBMS_STREAMS.GET_TAG FROM DUAL;
```
MAX_COMPATIBLE Function

This function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

Syntax

```
DBMS_STREAMS.MAX_COMPATIBLE
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The MAX_COMPATIBLE function always returns the maximum compatibility for the release of Oracle Database on which it is run. Therefore, when you use this function in rule conditions, the rule conditions do not need to be changed when you upgrade to a later release of Oracle Database.

See Also:

- GET_COMPATIBLE Member Function on page 247-38
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

Syntax

DBMS_STREAMS.SET_TAG(
    tag IN RAW DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.</td>
</tr>
</tbody>
</table>

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

EXEC DBMS_STREAMS.SET_TAG(tag => HEXTORAW('17'));

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.
See Also:  BUILD Procedure on page 32-18
The `DBMS_STREAMS_ADM` package, one of a set of Oracle Streams packages, provides subprograms for configuring Oracle Streams environments. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. This package also includes subprograms for configuring and managing XStream outbound servers and inbound servers.

This chapter contains the following topics:

- **Using DBMS_STREAMS_ADM**
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Operational Notes

- **Summary of DBMS_STREAMS_ADM Subprograms**
Using DBMS_STREAMS_ADM

This section contains topics that relate to using the DBMS_STREAMS_ADM package.

- Overview
- Deprecated Subprograms
- Security Model
- Operational Notes
Overview

The DBMS STREAMS ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring an Oracle Streams environment. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. These rules support logical change records (LCRs), which include row LCRs and data definition language (DDL) LCRs. This package also contains subprograms for creating message rules for specific message types. This package also contains subprograms for creating queues, and for managing Oracle Streams metadata, such as data dictionary information.

If you require more sophisticated rules, then refer to Chapter 125, "DBMS_RULE" package.

See Also:

- Oracle Streams Concepts and Administration, Oracle Streams Replication Administrator’s Guide, and Oracle Database 2 Day + Data Replication and Integration Guide for more information about this package and Oracle Streams
- Chapter 125, "DBMS_RULE"
Deprecated Subprograms

The following subprograms are deprecated with Oracle Database 10g Release 2 and later:

- **MAINTAIN_SIMPLE_TABLESPACE**
  This procedure is replaced by the MAINTAIN_SIMPLE_TTS procedure.
  
  **See Also:** MAINTAIN_SIMPLE_TTS Procedure on page 143-111

- **MAINTAIN_TABLESPACES**
  This procedure is replaced by the MAINTAIN_TTS procedure.
  
  **See Also:** MAINTAIN_TTS Procedure on page 143-126

**Note:** Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.
Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

A user is associated with each Oracle Streams client. The following sections describe these users:

- Oracle Streams Administrator
- Capture User
- Propagation User
- Apply User for an Oracle Streams Apply Process
- Apply User for an XStream Inbound Server
- Messaging Client User

**Note:** The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as creating a synchronous capture. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

Oracle Streams Administrator

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:** Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator

Capture User

The following procedures can create a capture process:

- ADD_GLOBAL_RULES Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

The following procedures can create a synchronous capture:

- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates a capture process or a synchronous capture, then it configures the current user as the capture user. The capture user is the user in whose security domain a capture process or synchronous capture captures changes that
satisfy its rule set(s) and runs custom rule-based transformations configured for these rules. This user must have the necessary privileges to capture changes. The procedure grants the capture user ENQUEUE privilege on the queue used by the capture process or synchronous capture and configures the user as a secure queue user of the queue.

**See Also:** CREATE_CAPTURE Procedure on page 32-19 and CREATE_SYNC_CAPTURE Procedure on page 32-29 for information about the privileges required to capture changes (refer to the capture_user parameter)

**Propagation User**

The following procedures can create a propagation:

- ADD_GLOBAL_PROPAGATION_RULES Procedure
- ADD_MESSAGE_PROPAGATION_RULE Procedure
- ADD_SCHEMA_PROPAGATION_RULES Procedure
- ADD_SUBSET_PROPAGATION_RULES Procedure
- ADD_TABLE_PROPAGATION_RULES Procedure

When a propagation is created, a propagation job also might be created. If a propagation job is created when one of these procedures is run, then the user who runs the procedure owns the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

**Note:**

- The source queue owner performs the propagation, but the propagation job is owned by the user who creates it. These two users might or might not be the same.
- For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate messages.

**See Also:**

- CREATE_PROPAGATION Procedure on page 106-8 for more information about the required privileges
- "Propagation Rules for LCRs" on page 143-11 for information about when a propagation job is created

**Apply User for an Oracle Streams Apply Process**

The following procedures can create an apply process:

- ADD_GLOBAL_RULES Procedure
- ADD_MESSAGE_RULE Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure
If one of these procedures creates an apply process, then it configures the current user as the apply user. For an apply process, the apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets.

An apply user applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. The procedure grants the apply user **DEQUEUE** privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.

**See Also:** CREATE_APPLY Procedure on page 21-18 for information about the privileges required to apply changes (refer to the apply_user parameter)

### Apply User for an XStream Inbound Server

The following procedures in can create an XStream inbound server:

- **ADD_GLOBAL_RULES Procedure**
- **ADD_SCHEMA_RULES Procedure**
- **ADD_SUBSET_RULES Procedure**
- **ADD_TABLE_RULES Procedure**

**Note:** These procedures cannot create an outbound server.

If the streams_name parameter is set to **NULL** and no relevant apply process, inbound server, or outbound server exists, then the procedure creates an apply process automatically with a system-generated name.

The apply process remains an apply process if it receives captured logical change records (LCRs) from a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives captured LCRs from a capture process. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

If one of these procedures creates an inbound server, then it configures the current user as the apply user. The apply user is the user in whose security domain an XStream client application attaches to an Oracle database.

An apply user applies changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to apply changes. The procedure grants the apply user **DEQUEUE** privilege on the queue used by the inbound server and configures the user as a secure queue user.

Each inbound server must have a unique name. The name cannot be used by an apply process, outbound server, or messaging client in the same database, and the name cannot be used by another inbound server in the same database.

If a relevant apply process, inbound server, or outbound server exists, then the procedure does not create an inbound server. Instead, the procedure uses the relevant apply process, inbound server, or outbound server. If the streams_name parameter specifies an existing apply process, inbound server, or outbound server, then the specified client is used.
When `streams_name` parameter is NULL and the `streams_type` parameter is set to apply, the relevant apply process, inbound server, or outbound server is identified in one of the following ways:

- If one existing apply process or outbound server has the source database specified in the `source_database` parameter and uses the queue specified in the `queue_name` parameter, then the procedure uses this apply process or outbound server.

- If the `source_database` parameter is set to NULL and one existing apply process, inbound server, or outbound server is using the queue specified in the `queue_name` parameter, then the procedure uses this apply process, inbound server, or outbound server.

If the `streams_name` parameter is set to NULL and multiple relevant apply processes, inbound servers, or outbound servers exist, then the procedure raises an error.

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

---

### Messaging Client User

The following procedures can create a messaging client:

- `ADD_GLOBAL_RULES Procedure`
- `ADD_MESSAGE_RULE Procedure`
- `ADD_SCHEMA_RULES Procedure`
- `ADD_SUBSET_RULES Procedure`
- `ADD_TABLE_RULES Procedure`

If one of these procedures creates a messaging client, then the user who runs this procedure is granted the privileges to dequeue from the queue using the messaging client. The procedure configures this user as a secure queue user of the queue, and only this user can use the messaging client.
Operational Notes

Several procedures in this package create rules for Oracle Streams clients and XStream clients, and several procedures configure an Oracle Streams environment. The following sections provide information about using these procedures:

- Procedures That Create Rules for Oracle Streams Clients and XStream Clients
- Procedures That Configure an Oracle Streams Environment

Procedures That Create Rules for Oracle Streams Clients and XStream Clients

Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. XStream clients include XStream outbound servers and inbound servers. Some of the procedures in the DBMS_STREAMS_ADM package add rules to the rule sets of Oracle Streams clients and XStream clients. The rules can pertain to changes in the redo log, to data manipulation language (DML) changes made to a table, to logical change records (LCRs), or to user messages.

An LCR represents either a row change that results from a DML operation or a data definition language (DDL) change. An LCR that represents a row change is a row LCR, and an LCR that represents a DDL change is a DDL LCR. LCRs can either represent changes that were captured by a capture process or a synchronous capture, or they can represent changes created by a user or application. A user message is a custom message that is based on a user-defined type and created by users or applications.

A capture process, propagation, apply process, messaging client, outbound server, or inbound server can have both positive and negative rule sets. A synchronous capture can have only a positive rule set.

For all of the procedures except the ones that create subset rules, and for all clients except for synchronous captures, you use the inclusion_rule parameter to specify the type of rule set (either positive or negative) for the created rules. If the client does not have a rule set of the specified type, then a rule set is created automatically, and the rules are added to the rule set. Other rules in an existing rule set for the client are not affected. Additional rules can be added to a rule set using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If an client has both a positive and a negative rule set, then the negative rule set is always evaluated first.

The following sections describe each type of rule in detail:

- Capture Process Rules for Changes in the Redo Log
- Synchronous Capture Rules for DML Changes to Tables
- Propagation Rules for LCRs
- Propagation Rules for User Messages
- Apply Process Rules for LCRs
- Apply Process Rules for User Messages
- Messaging Client Rules for LCRs
- Messaging Client Rules for User Messages
- XStream Outbound Server Rules for LCRs
- XStream Inbound Server Rules for LCRs
Capture Process Rules for Changes in the Redo Log

The following procedures add rules to a rule set of a capture process when you specify capture for the streams_type parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all changes made to a source database. See ADD_GLOBAL_RULES Procedure on page 143-34.
- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for changes made to a specified schema. See ADD_SCHEMA_RULES Procedure on page 143-50.
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for DML changes made to a subset of rows in a specified table. See ADD_SUBSET_RULES Procedure on page 143-59.
- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for changes made to a specified table. See ADD_TABLE_RULES Procedure on page 143-70.

If one of these procedures adds rules to the positive rule set for a capture process, then the capture process captures row changes resulting from DML changes, or DDL changes, or both from a source database and enqueues these changes into the specified queue. If one of these procedures adds rules to the negative rule set for a capture process, then the capture process discards row changes, or DDL changes, or both from a source database.

A capture process can capture changes locally at a source database or remotely at a downstream database. Therefore, for capture process rules, you should execute the procedure either at the source database or at a downstream database.

If the capture process is a local capture process, or if the capture process is a downstream capture process that uses a database link to the source database, then these procedures automatically prepare the appropriate database objects for instantiation:

- ADD_GLOBAL_RULES invokes the PREPARE_GLOBAL_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package at the source database.
- ADD_SCHEMA_RULES invokes the PREPARE_SCHEMA_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package at the source database.
- ADD_SUBSET_RULES and ADD_TABLE_RULES invoke the PREPARE_TABLE_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package at the source database.

These procedures also enable supplemental logging for the primary key, unique key, foreign key, and bitmap index columns in the tables prepared for instantiation. The primary key columns are unconditionally logged. The unique key, foreign key, and bitmap index columns are conditionally logged.

If the capture process is a downstream capture process that does not use a database link to the source database, then you must prepare the appropriate objects for instantiation.

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

**See Also:** *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams.
instantiation and specify the necessary supplemental logging manually at the source database.

If one of these procedures is executed at a downstream database, then you specify the source database using the source_database parameter, and the specified capture process must exist. The procedure cannot create a capture process if it is run at a downstream database. You can create a capture process at a downstream database using the CREATE_CAPTURE procedure in the DBMS_CAPTURE_ADM package.

See Also: Chapter, “Summary of DBMS_CAPTURE_ADM Subprograms” on page 32-5 for more information about the CREATE_CAPTURE procedure and the procedures that prepare database objects for instantiation.

Synchronous Capture Rules for DML Changes to Tables

The following procedures add rules to the rule set of a synchronous capture when you specify sync_capture for the streams_type parameter:

- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for DML changes made to a subset of rows in a specified table. See ADD_SUBSET_RULES Procedure on page 143-59.

- The ADD_TABLE_RULES procedure adds a rule whose rule condition evaluates to TRUE for DML changes made to a specified table. See ADD_TABLE_RULES Procedure on page 143-70.

If one of these procedures adds rules to the positive rule set for a synchronous capture, then the synchronous capture captures row changes resulting from DML changes to the table at the source database and enqueues these changes into the specified queue. A synchronous capture cannot have a negative rule set.

A synchronous capture captures changes locally at the database where it is configured. This database is the source database for changes captured by the synchronous capture. Therefore, for synchronous capture rules, you should execute the procedure at the source database.

These procedures automatically prepare the appropriate tables for instantiation by invoking the PREPARE_SYNC_INSTANTIATION function in the DBMS_CAPTURE_ADM package at the source database.

---

Note:

- A synchronous capture ignores rules in its rule set that were created by a procedure other than ADD_SUBSET_RULES or ADD_TABLE_RULES.

- When the ADD_TABLE_RULES or the ADD_SUBSET_RULES procedure adds rules to a synchronous capture rule set, the procedure must obtain an exclusive lock on the specified table. If there are outstanding transactions on the specified table, then the procedure waits until it can obtain a lock.

---

Propagation Rules for LCRs

The following procedures add propagation rules for LCRs to a rule set of a propagation:
The `ADD_GLOBAL_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in a source queue. See "ADD_GLOBAL_PROPAGATION_RULES Procedure" on page 143-30.

The `ADD_SCHEMA_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified schema. See "ADD_SCHEMA_PROPAGATION_RULES Procedure" on page 143-46.

The `ADD_SUBSET_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in a source queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_PROPAGATION_RULES Procedure" on page 143-55.

The `ADD_TABLE_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified table. See "ADD_TABLE_PROPAGATION_RULES Procedure" on page 143-65.

If one of these procedures adds rules to the positive rule set for the propagation, then the rules specify that the propagation propagates LCRs in a source queue to a destination queue. If one of these procedures adds rules to the negative rule set for the propagation, then the rules specify that the propagation discards LCRs in a source queue. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database.

**Propagation Rules for User Messages**
The `ADD_MESSAGE_PROPAGATION_RULE` procedure adds a message rule to a rule set of a propagation. If this procedure adds a rule to the positive rule set for the propagation, then the rule specifies that the propagation propagates the user messages of a specific message type that evaluate to `TRUE` for the rule condition from a source queue to a destination queue. If this procedure adds a rule to the negative rule set for the propagation, then the rule specifies that the propagation discards the user messages in a source queue of a specific message type that evaluate to `TRUE` for the rule condition. This procedure generates a rule name for the rule.

See Also: "ADD_MESSAGE_PROPAGATION_RULE Procedure" on page 143-39

**Apply Process Rules for LCRs**
The following procedures add rules to a rule set of an apply process when you specify `apply` for the `streams_type` parameter and an apply process for the `streams_name` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in the apply process's queue. See "ADD_GLOBAL_RULES Procedure" on page 143-34.

- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the apply process's queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure" on page 143-50.

- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in the apply process's queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure" on page 143-59.
The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process's queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure" on page 143-70.

If one of these procedures adds rules to the positive rule set for the apply process, then the rules specify that the apply process applies LCRs in its queue. If one of these procedures adds rules to the negative rule set for the apply process, then the rules specify that the apply process discards LCRs in its queue. For apply process rules, you should execute these procedures at the destination database.

Changes applied by an apply process created by one of these procedures generate tags in the redo log at the destination database with a value of '00' (double zero). You can use the ALTER_APPLY procedure in the DBMS_APPLY_ADM package to alter the tag value after the apply process is created, if necessary.

An apply process can apply captured LCRs from only one source database. If one of these procedures creates an apply process, then specify the source database for the apply process using the source_database parameter. If the source_database parameter is NULL, and one of these procedures creates an apply process, then the source database name of the first LCR received by the apply process is used for the source database.

The rules in the apply process rule sets determine which messages are dequeued by the apply process. When you create rules with one of these procedures, and you specify a value for the source_database parameter, then the rules include conditions for the specified source database. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. In addition, when adding rules to an existing apply process, the database specified in the source_database parameter cannot be different than the source database for the apply process. You can determine the source database for an apply process by querying the DBA_APPLY_PROGRESS data dictionary view.

An apply process created by one of these procedures can apply messages only at the local database and can apply only captured messages. To create an apply process that applies messages at a remote database or an apply process that applies user messages, use the CREATE_APPLY procedure in the DBMS_APPLY_ADM package.

You can also use the DBMS_APPLY_ADM.CREATE_APPLY procedure to specify nondefault values for the apply_captured, apply_user, apply_database_link, and apply_tag parameters when you run that procedure. You can use one of the procedures in the DBMS_STREAMS_ADM package to add rules to a rule set used by the apply process after you create it.

See Also:
- "ALTER_APPLY Procedure" on page 21-10
- "CREATE_APPLY Procedure" on page 21-18

Apply Process Rules for User Messages
The ADD_MESSAGE_RULE procedure adds a message rule to a rule set of an apply process when you specify apply for the streams_type parameter. For an apply process rule, you should execute this procedure at the destination database.

If this procedure adds a rule to the positive rule set for an apply process, then the apply process dequeues user messages of a specific message type that satisfy the apply process rule and sends these messages to its message handler. If no message handler is specified for the apply process, then use the ALTER_APPLY procedure in the DBMS_APPLY_ADM package to set the message handler. If this procedure adds a rule to the
negative rule set for an apply process, then the apply process discards user messages of a specific message type that satisfy the apply process rule.

See Also:
- ADD_MESSAGE_RULE Procedure on page 143-43
- ALTER_APPLY Procedure on page 21-10

Messaging Client Rules for LCRs
The following procedures add rules to a rule set of a messaging client when you specify dequeue for the streams_type parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in the messaging client's queue. See "ADD_GLOBAL_RULES Procedure" on page 143-34.
- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the messaging client's queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure" on page 143-50.
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in the messaging client's queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure" on page 143-59.
- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the messaging client's queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure" on page 143-70.

If one of these procedures adds rules to the positive rule set for a messaging client, then the messaging client can dequeue persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the source_database parameter. If one of these procedures adds rules to the negative rule set for a messaging client, then the messaging client discards persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the source_database parameter. You should execute these procedures at the database where you want to dequeue the messages with the messaging client.

Messaging Client Rules for User Messages
The ADD_MESSAGE_RULE procedure adds a message rule to a rule set of a messaging client when you specify dequeue for the streams_type parameter. You should execute this procedure at the database that will dequeue messages.

If this procedure adds a rule to the positive rule set for a messaging client, then the messaging client dequeues user messages of a specific message type that satisfy the message rule. If this procedure adds a rule to the negative rule set for a messaging client, then the messaging client discards user messages of a specific message type that satisfy the message rule.

See Also: "ADD_MESSAGE_RULE Procedure" on page 143-43

XStream Outbound Server Rules for LCRs
When you specify apply for the streams_type parameter and an XStream outbound server for the streams_name parameter, the following procedures add rules to a rule set of the specified outbound server:

- The ADD_GLOBAL_RULES procedure adds rules whose rule conditions evaluate to TRUE for all LCRs.
The **ADD_SCHEMA_RULES** procedure adds rules whose rule conditions evaluate to \( \text{TRUE} \) for LCRs that contain changes made to a specified schema.

The **ADD_SUBSET_RULES** procedure adds rules whose rule conditions evaluate to \( \text{TRUE} \) for row LCRs that contain the results of DML changes made to a subset of rows in a specified table.

The **ADD_TABLE_RULES** procedure adds rules whose rule conditions evaluate to \( \text{TRUE} \) for LCRs that contain changes made to a specified table.

These rules are evaluated against LCRs in the outbound server’s queue.

If one of the preceding procedures adds rules to the positive rule set for the outbound server, then the rules specify that the outbound server sends LCRs in its queue to the XStream client application. If one of these procedures adds rules to the negative rule set for the outbound server, then the rules specify that the outbound server discards LCRs in its queue. For outbound server rules, execute these procedures at the database to which the XStream client application attaches.

An outbound server can process captured LCRs from only one source database. The source database is the database where the changes originated. If one of these procedures adds rules to the rule set of an outbound server, then specify the source database for the outbound server using the `source_database` parameter.

The rules in the outbound server’s rule sets determine which LCRs are dequeued by the outbound server. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database. If the outbound server dequeues an LCR with a source database that is different from the source database for the outbound server, then an error is raised. In addition, when adding rules to an existing outbound server, the database specified in the `source_database` parameter cannot be different from the source database for the outbound server. You can determine the source database for an outbound server by querying the `DBA_XSTREAM_OUTBOUND` data dictionary view.

**Note:** These procedures cannot create an XStream outbound server. You can use one of the procedures in the **DBMS_STREAMS_ADM** package to add rules to a rule set used by the outbound server after you create it.

**See Also:** *Oracle Database XStream Guide* for information about creating an outbound server

**XStream Inbound Server Rules for LCRs**

When you specify `apply` for the `streams_type` parameter and an XStream inbound server for the `streams_name` parameter, the following procedures add rules to a rule set of the specified inbound server:

- The **ADD_GLOBAL_RULES** procedure adds rules whose rule conditions evaluate to \( \text{TRUE} \) for all LCRs sent to the inbound server.
- The **ADD_SCHEMA_RULES** procedure adds rules whose rule conditions evaluate to \( \text{TRUE} \) for LCRs sent to the inbound server that contain changes made to a specified schema.
- The **ADD_SUBSET_RULES** procedure adds rules whose rule condition evaluates to \( \text{TRUE} \) for row LCRs sent to the inbound server that contain the results of data definition language (DML) changes made to a subset of rows in a specified table.
The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs sent to the inbound server that contain changes made to a specified table.

If one of the preceding procedures adds rules to the positive rule set for the inbound server, then the rules specify that the inbound server applies LCRs sent to it by the XStream client application. If one of these procedures adds rules to the negative rule set for the inbound server, then the rules specify that the inbound server discards LCRs sent to it by the XStream client application. For inbound server rules, execute these procedures at the database to which the XStream client application attaches. If an inbound server has no rule sets, then it applies all of the LCRs sent to it by the XStream client application.

Changes applied by an inbound server created by one of these procedures generate tags in the redo log at the destination database with a value of ‘00’ (double zero). You can use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to alter the tag value after the inbound server is created, if necessary.

The rules in the XStream inbound server rule sets determine which LCRs are either applied or discarded after the LCRs are received from the XStream client application. An inbound server can only process LCRs sent from an XStream client application.

When one of these procedures creates rules for an inbound server, the procedure ignores the `source_database` parameter.

---

**Note:** If the name specified in the `streams_name` parameter does not exist, then these procedures always create an apply process. The apply process remains an apply process if it receives captured LCRs from a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives LCRs from a capture process. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

---

**See Also:** [Oracle Database XStream Guide](#) for information about creating an inbound server

### Procedures That Configure an Oracle Streams Environment

The following procedures in this package configure an environment that is maintained by Oracle Streams:

- **MAINTAIN_CHANGE_TABLE Procedure** configures an Oracle Streams environment that records in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database.

- **MAINTAIN_GLOBAL Procedure** configures an Oracle Streams environment that replicates changes at the database level between two databases.

- **MAINTAIN_SCHEMAS Procedure** configures an Oracle Streams environment that replicates changes to specified schemas between two databases.

- **MAINTAIN_SIMPLE_TTS Procedure** clones a simple tablespace from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespace between these two databases.
MAINTAIN_TABLES Procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases.

MAINTAIN_TTS Procedure clones a set of tablespaces from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespaces between these two databases.

PRE_INSTANTIATION_SETUP Procedure and POST_INSTANTIATION_SETUP Procedure

The PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures must be used together to complete the Oracle Streams replication configuration. Typically, the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures are used to perform database maintenance operations with little or no down time. See Oracle Streams Concepts and Administration for more information.

The following sections contain information about using these procedures:

- Automatic Platform Conversion
- Actions Performed by These Procedures
- Configuration Progress and Recoverability
- Requirements for Running These Procedures
- Common Parameters for the Configuration Procedures

See Also: Oracle Streams Replication Administrator’s Guide for more information about using these procedures

Automatic Platform Conversion

If the source and destination databases are running on different platforms, then these procedures, or the scripts generated by these procedures, convert transferred datafiles to the appropriate platform automatically.

Actions Performed by These Procedures

To view all of the actions performed by one of these procedures in detail, use the procedure to generate a script, and view the script in a text editor.

Configuration Progress and Recoverability

When one of these procedures is run with the perform_actions parameter set to TRUE, metadata about its configuration actions is recorded in the following data dictionary views: DBA_RECOVERABLE_SCRIPT, DBA_RECOVERABLE_SCRIPT_PARAMS, DBA_RECOVERABLE_SCRIPT_BLOCKS, and DBA_RECOVERABLE_SCRIPT_ERRORS. If the procedure stops because it encounters an error, then you can use the RECOVER_OPERATION procedure to complete the configuration after you correct the conditions that caused the error.

Note: When one of these procedures is run with the perform_actions parameter set to FALSE, these views are not populated. Also, the views are not populated when a script generated by one of these procedures is run.

See Also: "RECOVER_OPERATION Procedure" on page 143-147
**Requirements for Running These Procedures**

Meet the following requirements when you use one of these procedures:

- Run the procedure at the capture database. The capture database is the database that will contain the capture process that captures changes made to the source database. If the capture database is the same as the source database, then a local capture process is configured. If the capture database is not the same as the source database, then a downstream capture process is configured. See *Oracle Streams Replication Administrator’s Guide* for more information about the capture database.

- The user who runs the procedure must be able to use a database link from the source database to the destination database. This database link should have the same name as the global name of the destination database.

- If the procedure configures downstream capture, then the corresponding user at the capture database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

- If the procedure configures downstream capture, and the capture database is not the same as the destination database, then the corresponding user at the capture database must be able to use a database link to access the destination database. This database link should have the same name as the global name of the destination database.

- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.

- Grant the user who runs the procedure the `DBA` role. This user must have the necessary privileges to complete the following actions:
  - Create `ANYDATA` queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the `DBMS_STREAMS_ADM` and `DBMS_AQADM` packages.
  - Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.

  Typically, the `DBA` role can be revoked from the user, if necessary, after the configuration is complete.

- The procedure, or the scripts generated by these procedure, must be run at an Oracle Database 10g Release 2 or later database.

- If the `perform_actions` parameter is set to `TRUE` in the procedure to configure the Oracle Streams environment directly, then all of the databases configured by the procedure must be Oracle Database 10g Release 2 or later databases.

- If the `perform_actions` parameter is set to `FALSE` in the procedure, and the environment is configured with a generated script, then the databases configured by the script must be Oracle Database 10g Release 1 or later databases. If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.
Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes the procedure must have `READ` and `WRITE` privilege on each one.

For procedures that include the `bi_directional` parameter, if the `bi_directional` parameter is set to `TRUE`, or if the source database is not the capture database, then the `source_database` parameter must specify a database that contains the database objects to be shared. The database specified in the `destination_database` parameter might or might not contain these database objects. If the destination database does not contain the shared database objects, then the procedure instantiates the database objects at the destination database (excluding the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures).

For procedures that include the `bi_directional` parameter, if the `bi_directional` parameter is set to `TRUE` or if a network instantiation will be performed, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

To ensure that the user who runs these procedures has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator's schema.

See Also: Oracle Streams Replication Administrator's Guide for information about configuring an Oracle Streams administrator.

Common Parameters for the Configuration Procedures

Table 143–1 describes the common parameters for the procedures in this package that configure an Oracle Streams environment. Some of the procedures do not include all of the parameters in Table 143–1.

Table 143–1  Common Parameters for Configuration Procedures

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `perform_actions` | If `TRUE`, then the procedure performs the necessary actions to configure the environment directly. If `FALSE`, then the procedure does not perform the necessary actions to configure the environment directly. Specify `FALSE` when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify `FALSE` and either of the following parameters is `NULL`:
|                 | ■ `script_name`                                                            |
|                 | ■ `script_directory_object`                                                |
Table 143–1 (Cont.) Common Parameters for Configuration Procedures

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script_name</td>
<td>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the environment directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to configure the environment directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of each capture process configured to capture changes. Do not specify an owner. If the bi_directional parameter is set to TRUE, then each capture process created by this procedure has the specified name. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If NULL, then the system generates a name for each capture process it creates. Note: The capture process name cannot be altered after the capture process is created.</td>
</tr>
<tr>
<td>capture_queue_table</td>
<td>The name of the queue table for each queue used by a capture process, specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.</td>
</tr>
</tbody>
</table>
### Table 143–1 (Cont.) Common Parameters for Configuration Procedures

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_queue_name</td>
<td>The name of each queue used by a capture process, specified as <code>[schema_name.]queue_name</code>. For example, <code>strmadmin.streams_queue</code>. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If <code>NULL</code>, then the system generates a name for each queue used by a capture process.</td>
</tr>
<tr>
<td>capture_queue_user</td>
<td>The name of the user who requires <code>ENQUEUE</code> and <code>DEQUEUE</code> privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the <code>GRANT</code> option. If <code>NULL</code>, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the <code>DBMS_AQADM</code> package.</td>
</tr>
<tr>
<td>propagation_name</td>
<td>The name of each propagation configured to propagate changes. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set. If <code>NULL</code>, then the system generates a name for each propagation it creates. <strong>Note:</strong> The propagation name cannot be altered after the propagation is created.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of each apply process configured to apply changes. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If <code>NULL</code>, then the system generates a name for each apply process it creates. When set to <code>NULL</code>, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-<code>NULL</code> value for this parameter. <strong>Note:</strong> The apply process name cannot be altered after the apply process is created.</td>
</tr>
<tr>
<td>apply_queue_table</td>
<td>The name of the queue table for each queue used by an apply process, specified as <code>[schema_name.]queue_table_name</code>. For example, <code>strmadmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default. If <code>NULL</code>, then the system generates a name for the queue table of each queue used by an apply process, and the current user is the owner of each queue table.</td>
</tr>
</tbody>
</table>
Operational Notes

The name of each queue used by an apply process, specified as \([\text{schema\_name}.]\text{queue\_name}\). For example, stradmin.streams_queue.

If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.

If NULL, then the system generates a name for each queue used by an apply process.

The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.

If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.

Specify TRUE to configure bi-directional replication between the database specified in source_database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured to capture changes to both databases, and propagations are configured to propagate these changes. If TRUE, then a database link from the destination database to the source database with the same global name as the source database must exist.

Specify FALSE to configure one way replication from the database specified in source_database and the database specified in destination_database. A capture process is configured at the current database and an apply process is configured at the destination database. A propagation is configured if necessary.

See Also: Oracle Streams Replication Administrator’s Guide for information about when propagations are configured

Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes.

Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, are not replicated.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_queue_name</td>
<td>The name of each queue used by an apply process, specified as ([\text{schema_name}.]\text{queue_name}). For example, stradmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the system generates a name for each queue used by an apply process.</td>
</tr>
<tr>
<td>apply_queue_user</td>
<td>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</td>
</tr>
<tr>
<td>bi_directional</td>
<td>Specify TRUE to configure bi-directional replication between the database specified in source_database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured to capture changes to both databases, and propagations are configured to propagate these changes. If TRUE, then a database link from the destination database to the source database with the same global name as the source database must exist. Specify FALSE to configure one way replication from the database specified in source_database and the database specified in destination_database. A capture process is configured at the current database and an apply process is configured at the destination database. A propagation is configured if necessary.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes. Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, are not replicated.</td>
</tr>

**Note:** All subprograms commit unless specified otherwise.
ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The column_value and column_function parameters are mutually exclusive.

Note:

- ADD_COLUMN transformations cannot add columns of the following data types: BLOB, CLOB, NCLOB, BFILE, LONG, LONG RAW, ROWID, user-defined types (including object types, REFs, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: Oracle Streams Concepts and Administration for more information about declarative rule-based transformations

Syntax

```sql
DBMS_STREAMS_ADM.ADD_COLUMN(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    column_value  IN  ANYDATA,
    value_type    IN  VARCHAR2     DEFAULT 'NEW',
    step_number   IN  NUMBER       DEFAULT 0,
    operation     IN  VARCHAR2     DEFAULT 'ADD');

DBMS_STREAMS_ADM.ADD_COLUMN(
    rule_name        IN  VARCHAR2,
    table_name       IN  VARCHAR2,
    column_name      IN  VARCHAR2,
    column_function  IN  VARCHAR2,
    value_type       IN  VARCHAR2     DEFAULT 'NEW',
    step_number      IN  NUMBER       DEFAULT 0,
    operation        IN  VARCHAR2     DEFAULT 'ADD');
```
Parameters

Table 143–3  ADD_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table to which the column is added in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column added to each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>column_value</td>
<td>The value of the added column. Specify the appropriate ANYDATA function for the column data type and the column value. For example, if the data type of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified.</td>
</tr>
<tr>
<td>column_function</td>
<td>Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to add the column to the new values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>

ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically.</td>
</tr>
<tr>
<td></td>
<td>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
</tbody>
</table>
### Table 143–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. <strong>See Also:</strong> Oracle Streams Replication Administrator’s Guide for more information about tags.</td>
</tr>
</tbody>
</table>
### Table 143–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
| and_condition     | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: :

\[
(\text{system\_condition}) \text{ AND } (\text{and\_condition})
\]

The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:

\[
:lcr\text{.get\_tag()} = \text{HEXTORAW('02')}\]

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule.

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.

See Also: Chapter 247, "Logical Change Record TYPES"
This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

**Usage Notes**

See Also:

- "Operational Notes" on page 143-9 and "Propagation Rules for LCRs" on page 143-11 for more information about the rules created by this procedure
- "Propagation User" on page 143-6

**Examples**

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```
This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database. See "Capture Process Rules for Changes in the Redo Log" on page 143-10 for more information about these rules.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying all logical change records (LCRs) in a queue. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 143-12 for more information about these rules.

- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing all persistent LCRs from a queue. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 143-14 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

---

**Caution:** If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

---

**Note:** Currently, messaging clients cannot dequeue buffered messages.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(
    streams_type IN VARCHAR2,
    streams_name IN VARCHAR2 DEFAULT NULL,
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    dml_rule_name OUT VARCHAR2,
    ddl_rule_name OUT VARCHAR2,
    inclusion_rule IN BOOLEAN DEFAULT TRUE,
    and_condition IN VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(
    streams_type IN VARCHAR2,
    streams_name IN VARCHAR2 DEFAULT NULL,
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    dml_rule_name OUT VARCHAR2,
   ddl_rule_name OUT VARCHAR2,
    inclusion_rule IN BOOLEAN DEFAULT TRUE,
    and_condition IN VARCHAR2 DEFAULT NULL);
```
Parameters

**Table 143–5  ADD_GLOBAL_RULES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_type</td>
<td>The type of Oracle Streams client:</td>
</tr>
<tr>
<td>sessions</td>
<td>- Specify capture for a capture process.</td>
</tr>
<tr>
<td></td>
<td>- Specify apply for an apply process.</td>
</tr>
<tr>
<td></td>
<td>- Specify dequeue for a messaging client.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the capture process, apply process, or messaging client. Do not specify an owner.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as ([\text{schema_name}].\text{queue_name}). The current database must contain the queue, and the queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a queue named \text{streams_queue} in the \text{strmadmin} schema, enter \text{strmadmin.streams_queue} for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>include_dml</td>
<td>IN BOOLEAN DEFAULT TRUE,</td>
</tr>
<tr>
<td>include_ddl</td>
<td>IN BOOLEAN DEFAULT FALSE,</td>
</tr>
<tr>
<td>include_tagged_lcr</td>
<td>IN BOOLEAN DEFAULT FALSE,</td>
</tr>
<tr>
<td>source_database</td>
<td>IN VARCHAR2 DEFAULT NULL,</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>IN BOOLEAN DEFAULT TRUE,</td>
</tr>
<tr>
<td>and_condition</td>
<td>IN VARCHAR2 DEFAULT NULL.</td>
</tr>
</tbody>
</table>

If NULL if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error.

If NULL if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:

- If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.
- If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.

If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.

If NULL and multiple relevant apply processes exist, then the procedure raises an error.

Each apply process and messaging client must have a unique name.

For capture process rules, this is the queue into which a capture process queues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.
### ADD_GLOBAL_RULES Procedure Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. <strong>See Also:</strong> Oracle Streams Replication Administrator’s Guide for more information about tags</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
</tbody>
</table>
Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

- "Security Model" on page 143-5

Examples

The following is an example of a global rule condition created for DML changes:
(:dml.is_null_tag() = 'Y' and dml.get_source_database_name() = 'DBS1.NET')
ADD_MESSAGE_PROPAGATION_RULE Procedure

This procedure adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains the OUT parameter rule_name, and the other does not.

Syntax

```sql
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
message_type            IN   VARCHAR2,
rule_condition          IN   VARCHAR2,
streams_name            IN   VARCHAR2  DEFAULT NULL,
source_queue_name       IN   VARCHAR2,
destination_queue_name  IN   VARCHAR2,
inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
rule_name               OUT  VARCHAR2,
queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
message_type            IN   VARCHAR2,
rule_condition          IN   VARCHAR2,
streams_name            IN   VARCHAR2  DEFAULT NULL,
source_queue_name       IN   VARCHAR2,
destination_queue_name  IN   VARCHAR2,
inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_type</td>
<td>The type of the message. The type can be an Oracle built-in type, such as VARCHAR2 or NUMBER, or it can be a user-defined type. If the type is not an Oracle built-in type, then it is specified as [schema_name.]type_name. If the schema is not specified, then the current user is the default. For example, to specify VARCHAR2, enter VARCHAR2(n), where n is the size specification. To specify a type named usr_msg in the strmadmin schema, enter strmadmin.usr_msg for this parameter. The following data types require a size specification: VARCHAR2, NVARCHAR2, and RAW. See Also: Oracle Database SQL Language Reference for more information about data types.</td>
</tr>
<tr>
<td>rule_condition</td>
<td>The rule condition for this message type. The rule variable name specified in the rule condition must be the following: :msg See Also: Examples on page 143-41</td>
</tr>
</tbody>
</table>
ADD_MESSAGE_PROPAGATION_RULE Procedure

The name of the propagation. Do not specify an owner.

If the specified propagation does not exist, then the procedure creates it automatically.

If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.

If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type.

For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter.

If the schema is not specified, then the current user is the default.

The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type.

For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter.

If the schema is not specified, then the current user is the default.

If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.

Note: Connection qualifiers are not allowed.

If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the propagation.

If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the propagation.

In either case, the system creates the rule set if it does not exist.

Contains the rule name

</table>
This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

"Operational Notes" on page 143-9 and "Propagation Rules for User Messages" on page 143-12 for more information about the rules created by this procedure.

"Propagation User" on page 143-6

Examples

Suppose the message type is VARCHAR2 (128). Given this type, the following rule condition can be specified:

```
':msg = ''HQ''
```

This rule condition evaluates to TRUE if a user message of type VARCHAR2 (128) has HQ for its value.

Suppose the message type is usr_msg, and that this type has the following attributes: source_dbname, owner, name, and message. Given this type, the following rule condition can be specified:
'msg.source_dbname = ''DBS1.NET'' AND ''msg.owner = ''HR'' AND ''msg.name = ''EMPLOYEES''

This rule condition evaluates to TRUE if a user message of type usr_msg has DBS1.NET for its source_dbname attribute, HR for its owner attribute, and EMPLOYEES for its name attribute.

**Note:** The quotation marks in the preceding examples are all single quotation marks.
ADD_MESSAGE_RULE Procedure

This procedure adds a message rule to a rule set of one of the following types of Oracle Streams clients:

- When the streams_type parameter is set to apply, this procedure adds an apply process rule for dequeuing user messages of a specific message type from a queue. See "Apply Process Rules for User Messages" on page 143-13 for more information about such rules.

- When the streams_type parameter is set to dequeue, this procedure adds a messaging client rule for dequeuing user messages of a specific message type from a queue. See "Messaging Client Rules for User Messages" on page 143-14 for more information about such rules.

This procedure also creates the specified Oracle Streams client if it does not exist.

This procedure is overloaded. One version of this procedure contains the OUT parameter rule_name, and the other does not.

---

**Note:** Currently, messaging clients cannot dequeue buffered messages.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(  
    message_type IN VARCHAR2,  
    rule_condition IN VARCHAR2,  
    streams_type IN VARCHAR2,  
    streams_name IN VARCHAR2 DEFAULT NULL,  
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',  
    inclusion_rule IN BOOLEAN DEFAULT TRUE,  
    rule_name OUT VARCHAR2);

DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(  
    message_type IN VARCHAR2,  
    rule_condition IN VARCHAR2,  
    streams_type IN VARCHAR2,  
    streams_name IN VARCHAR2 DEFAULT NULL,  
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',  
    inclusion_rule IN BOOLEAN DEFAULT TRUE);
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_type</td>
<td>The type of the message. The type can be an Oracle built-in type, such as VARCHAR2 or NUMBER, or it can be a user-defined type. If the type is not an Oracle built-in type, then it is specified as [schema_name.]type_name. If the schema is not specified, then the current user is the default. For example, to specify VARCHAR2, enter VARCHAR2(n), where n is the size specification. To specify a type named usr_msg in the strmadmin schema, enter strmadmin.usr_msg for this parameter. The following data types require a size specification: VARCHAR2, NVARCHAR2, and RAW. See Also: Oracle Database SQL Language Reference for more information about data types.</td>
</tr>
<tr>
<td>rule_condition</td>
<td>The rule condition for this message type. The rule variable name specified in the rule condition must be the following: :msg See Also: “Examples” on page 143-45</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of message consumer, either apply for apply process or dequeue for messaging client</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the Oracle Streams apply process or messaging client. If the specified streams_type is apply, then specify the name of the apply process. Do not specify an owner. If the specified apply process does not exist, then the procedure creates it automatically with a system-generated name. If the specified streams_type is dequeue, then specify the messaging client. For example, if the user strmadmin is the messaging client, then specify strmadmin. If NULL and a relevant apply process or messaging client for the queue exists, then the procedure uses the relevant apply process or messaging client. If NULL and multiple relevant apply processes or messaging clients for the queue exist, then the procedure raises an error. If NULL and no Oracle Streams client of the specified streams_type exists for the queue, then the procedure creates an apply process or messaging client automatically with a system-generated name. An apply process and a messaging client cannot have the same name.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue from which messages will be dequeued, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the apply process or messaging client. If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the apply process or messaging client. In either case, the system creates the rule set if it does not exist.</td>
</tr>
<tr>
<td>rule_name</td>
<td>Contains the rule name</td>
</tr>
</tbody>
</table>
Usage Notes

If an apply process rule is added, then this procedure creates the apply process if it
does not exist. An apply process created by this procedure can apply only user
messages, and dequeued messages are sent to the message handler for the apply
process. If a messaging client rule is added, then this procedure creates a messaging
client if it does not exist.

When you use this procedure to create a rule set for a message rule, the new rule set
does not have an evaluation context. If no evaluation context exists for the specified
message type, then this procedure creates a new evaluation context and associates it
with the new rule. The evaluation context also has a system-generated name. If you
create new rules that use an existing message type, then the new rules use the existing
evaluation context for the message type.

See Also:

- "Operational Notes" on page 143-9
- "Security Model" on page 143-5
- ALTER_APPLY Procedure on page 21-10 for more information
  about setting a message handler for an apply process

Examples

Suppose the message type is VARCHAR2(128). Given this type, the following rule
condition can be specified:

':msg = ''HQ'''

This rule condition evaluates to TRUE if a user message of type VARCHAR2(128) has
HQ for its value.

Suppose the message type is usr_msg, and that this type has the following attributes:
source_dbname, owner, name, and message. Given this type, the following rule
condition can be specified:

':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND ' ||
':msg.name = ''EMPLOYEES'''

This rule condition evaluates to TRUE if a user message of type usr_msg has
DBS1.NET for its source_dbname attribute, HR for its owner attribute, and
EMPLOYEES for its name attribute.

Note: The quotation marks in the preceding examples are all
single quotation marks.
ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
  schema_name IN VARCHAR2,
  streams_name IN VARCHAR2 DEFAULT NULL,
  source_queue_name IN VARCHAR2,
  destination_queue_name IN VARCHAR2,
  include_dml IN BOOLEAN DEFAULT TRUE,
  include_ddl IN BOOLEAN DEFAULT FALSE,
  include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
  source_database IN VARCHAR2 DEFAULT NULL,
  dml_rule_name OUT VARCHAR2,
  ddl_rule_name OUT VARCHAR2,
  inclusion_rule IN BOOLEAN DEFAULT TRUE,
  and_condition IN VARCHAR2 DEFAULT NULL,
  queue_to_queue IN BOOLEAN DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
  schema_name IN VARCHAR2,
  streams_name IN VARCHAR2 DEFAULT NULL,
  source_queue_name IN VARCHAR2,
  destination_queue_name IN VARCHAR2,
  include_dml IN BOOLEAN DEFAULT TRUE,
  include_ddl IN BOOLEAN DEFAULT FALSE,
  include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
  source_database IN VARCHAR2 DEFAULT NULL,
  inclusion_rule IN BOOLEAN DEFAULT TRUE,
  and_condition IN VARCHAR2 DEFAULT NULL,
  queue_to_queue IN BOOLEAN DEFAULT NULL);
```

Parameters

**Table 143–8 ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified propagation does not exist, then the procedure creates it automatically.</td>
</tr>
<tr>
<td></td>
<td>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
</tbody>
</table>
The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type.

For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter.

If the schema is not specified, then the current user is the default.

destination_queue_name

The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type.

For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter.

If the schema is not specified, then the current user is the default.

If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.

Note: Connection qualifiers are not allowed.

include_dml

If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

include_ddl

If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

include_tagged_lcr

If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.

If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.

In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

See Also: Oracle Streams Replication Administrator's Guide for more information about tags
ADD_SCHEMA_PROPAGATION_RULES Procedure

Table 143–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
| and_condition   | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: 

\[
\text{(system_condition) AND (and_condition)}
\]

The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:

\[
:lcr.get_tag() = \text{HEXTORAW('02')}
\]

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.

See Also: Chapter 247, "Logical Change Record TYPES"
Summary of DBMS_STREAMS_ADM Subprograms

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations

Examples

The following is an example of a schema rule condition created for DML changes:

```
(:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```
ADD_SCHEMA_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema. See "Capture Process Rules for Changes in the Redo Log" on page 143-10 for more information about these rules.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 143-12 for more information about these rules.

- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 143-14 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

---

**Caution:** If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

---

**Note:** Currently, messaging clients cannot dequeue buffered messages.

---

**Syntax**

```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES(
    schema_name IN VARCHAR2,
    streams_type IN VARCHAR2,
    streams_name IN VARCHAR2 DEFAULT NULL,
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    dml_rule_name OUT VARCHAR2,
    ddl_rule_name OUT VARCHAR2,
    inclusion_rule IN BOOLEAN DEFAULT TRUE,
    and_condition IN VARCHAR2 DEFAULT NULL);
```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES(
    schema_name         IN   VARCHAR2,
    streams_type        IN   VARCHAR2,
    streams_name        IN   VARCHAR2  DEFAULT NULL,
    queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml         IN   BOOLEAN   DEFAULT TRUE,
    include_ddl         IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
    source_database     IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
    and_condition       IN   VARCHAR2  DEFAULT NULL);

<tr>
<td></td>
<td>Each apply process and messaging client must have a unique name.</td>
</tr>
</tbody>
</table>
### ADD_SCHEMA_RULES Procedure

The name of the local queue, specified as `schema_name.queue_name`. The current database must contain the queue, and the queue must be `ANYDATA` type.

For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.

For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.

**include_dml**

- If `TRUE`, then the procedure creates a rule for DML changes. If `FALSE`, then the procedure does not create a DML rule. `NULL` is not permitted.

**include_ddl**

- If `TRUE`, then the procedure creates a rule for DDL changes. If `FALSE`, then the procedure does not create a DDL rule. `NULL` is not permitted.

**include_tagged_lcr**

- If `TRUE`, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to `TRUE` regardless of whether a redo entry or LCR has a non-`NULL` tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-`NULL` tag. If the rules are added to a positive rule set, then setting this parameter to `TRUE` is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.

- If `FALSE`, then the procedure adds a condition to each generated rule that causes the rule to evaluate to `TRUE` only if a redo entry or LCR has a `NULL` Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a `NULL` tag. If the rules are added to a positive rule set, then setting this parameter to `FALSE` might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a `NULL` tag.

In most cases, specify `TRUE` for this parameter if the inclusion_rule parameter is set to `FALSE`.

If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry or LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a <code>NULL</code> tag. In most cases, specify <code>TRUE</code> for this parameter if the inclusion_rule parameter is set to <code>FALSE</code>. See Also: Oracle Streams Replication Administrator’s Guide for more information about tags.</td>
</tr>
</tbody>
</table>
source_database
The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.

For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.

For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

dml_rule_name
If include_dml is TRUE, then this parameter contains the DML rule name.
If include_dml is FALSE, then this parameter contains a NULL.

ddl_rule_name
If include_ddl is TRUE, then this parameter contains the DDL rule name.
If include_ddl is FALSE, then this parameter contains a NULL.

inclusion_rule
If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client.
If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client.
In either case, the system creates the rule set if it does not exist.
This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

**Usage Notes**

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

**Examples**

The following is an example of a schema rule condition created for DML changes:

```sql
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```
ADD_SUBSET_PROPAGATION_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
    table_name               IN   VARCHAR2,
    dml_condition            IN   VARCHAR2,
    streams_name             IN   VARCHAR2  DEFAULT NULL,
    source_queue_name        IN   VARCHAR2,
    destination_queue_name   IN   VARCHAR2,
    include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
    source_database          IN   VARCHAR2  DEFAULT NULL,
    insert_rule_name         OUT  VARCHAR2,
    update_rule_name         OUT  VARCHAR2,
    delete_rule_name         OUT  VARCHAR2,
    queue_to_queue           IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
    table_name               IN   VARCHAR2,
    dml_condition            IN   VARCHAR2,
    streams_name             IN   VARCHAR2  DEFAULT NULL,
    source_queue_name        IN   VARCHAR2,
    destination_queue_name   IN   VARCHAR2,
    include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
    source_database          IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as <code>[schema_name.]object_name</code>. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</td>
</tr>
<tr>
<td>dml_condition</td>
<td>The subset condition. Specify this condition similar to the way you specify conditions in a <code>WHERE</code> clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is <code>SA_MAN</code>, enter the following as the condition: <code>'salary &gt; 4000 and job_id = 'SA_MAN''</code></td>
</tr>
</tbody>
</table>

**Note:** The quotation marks in the preceding example are all single quotation marks.
Table 143–10  (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

<table>

<tr>
<td></td>
<td>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as [schema_name.] queue_name. The current database must contain the source queue, and the queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</td>
</tr>
<tr>
<td></td>
<td>Note: Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as [schema_name.] queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter <a href="mailto:strmadmin.streams_queue@dbs2.net">strmadmin.streams_queue@dbs2.net</a> for this parameter.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</td>
</tr>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NUL tag. This setting is appropriate for a full (for example, standby) copy of a database.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</td>
</tr>
<tr>
<td></td>
<td>See Also: Oracle Streams Replication Administrator’s Guide for more information about tags</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td></td>
<td>Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
</tbody>
</table>
Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified dml_condition, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified dml_condition, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified dml_condition, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified dml_condition, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

Table 143–10 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert_rule_name</td>
<td>Contains the system-generated INSERT rule name. This rule handles inserts, as well as updates that must be converted into inserts.</td>
</tr>
<tr>
<td>update_rule_name</td>
<td>Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.</td>
</tr>
<tr>
<td>delete_rule_name</td>
<td>Contains the system-generated DELETE rule name. This rule handles deletes, as well as updates that must be converted into deletes</td>
</tr>
<tr>
<td>queue_to_queue</td>
<td>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</td>
</tr>
</tbody>
</table>

- If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.
- If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.
- If NULL, then the procedure does not change the queue to queue property of the propagation. |

See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations
A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

---

**Attention:** Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

---

**See Also:**
- "Operational Notes" on page 143-9 and "Propagation Rules for LCRs" on page 143-11 for more information about the rules created by this procedure
- "Propagation User" on page 143-6

**Examples**

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```sql
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```
ADD_SUBSET_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table. See "Capture Process Rules for Changes in the Redo Log" on page 143-10 for more information about these rules.

- When the streams_type parameter is set to sync_capture, this procedure adds rules for capturing changes to a subset of rows in a specified table. See “Synchronous Capture Rules for DML Changes to Tables” on page 143-11 for more information about these rules.

- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. See “Apply Process Rules for LCRs” on page 143-12 for more information about these rules.

- When the streams_type parameter is set to dequeue, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 143-14 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

---

Note:

- Currently, messaging clients cannot dequeue buffered messages.
- The invoking user must be granted the DBA role to create a synchronous capture.

---

Syntax

```sql
DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
    table_name IN VARCHAR2,
    dml_condition IN VARCHAR2,
    streams_type IN VARCHAR2 DEFAULT 'apply',
    streams_name IN VARCHAR2 DEFAULT NULL,
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    insert_rule_name OUT VARCHAR2,
    update_rule_name OUT VARCHAR2,
    delete_rule_name OUT VARCHAR2);
```

```sql
DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
    table_name IN VARCHAR2,
    dml_condition IN VARCHAR2,
    streams_type IN VARCHAR2 DEFAULT 'apply',
);```
ADD_SUBSET_RULES Procedure

```sql
STREAMS_NAME        IN   VARCHAR2 DEFAULT NULL,
queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
source_database     IN   VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as <code>schema_name.object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process, synchronous capture, apply process, or messaging client. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</td>
</tr>
<tr>
<td>dml_condition</td>
<td>The subset condition. Specify this condition similar to the way you specify conditions in a <code>WHERE</code> clause in SQL. For example, to specify rows in the <code>hr.employees</code> table where the <code>salary</code> is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code>, enter the following as the condition: `' salary &gt; 4000 and job_id = 'SA_MAN' ' Note: The quotation marks in the preceding example are all single quotation marks.</td>
</tr>
</tbody>
</table>
| streams_type     | The type of Oracle Streams client:  
  - Specify `capture` for a capture process.  
  - Specify `sync_capture` for a synchronous capture.  
  - Specify `apply` for an apply process.  
  - Specify `dequeue` for a messaging client. |
**Summary of DBMS_STREAMS_ADM Subprograms**

### streams_name

The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner.

If NULL, if `streams_type` is `capture`, `sync_capture`, or `dequeue`, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified `streams_type` for the queue exist, then the procedure raises an error.

If NULL, if `streams_type` is `apply`, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:

- If one existing apply process has the source database specified in `source_database` and uses the queue specified in `queue_name`, then the procedure uses this apply process.
- If `source_database` is NULL and one existing apply process is using the queue specified in `queue_name`, then the procedure uses this apply process.

If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.

If NULL and multiple relevant apply processes exist, then the procedure raises an error.

Each apply process and messaging client must have a unique name.

### queue_name

The name of the local queue, specified as `[schema_name.]queue_name`. The current database must contain the queue, and the queue must be ANYDATA type.

For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.

For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.

source_database
Usage Notes

Running this procedure generates three rules for the specified capture process, synchronous capture, apply process, or messaging client: one for `INSERT` statements, one for `UPDATE` statements, and one for `DELETE` statements. For `INSERT` and `DELETE` statements, only DML changes that satisfy the condition specified for the `dml_condition` parameter are captured, applied, or dequeued. For `UPDATE` statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified `dml_condition`, then the DML change is captured, applied, or dequeued without any changes.
- If neither the new or old values in a DML change satisfy the specified `dml_condition`, then the DML change is not captured, applied, or dequeued.
- If the old values for a DML change satisfy the specified `dml_condition`, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified `dml_condition`, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering. If the Oracle Streams client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

**Attention:** Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

- "Security Model" on page 143-5

Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
ADD_TABLE_PROPAGATION_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

\[
\text{DBMS STREAMS ADM.ADD_TABLE_PROPAGATION_RULES(}
\begin{align*}
\text{table_name} & \quad \text{IN VARCHAR2,} \\
\text{streams_name} & \quad \text{IN VARCHAR2 DEFAULT NULL,} \\

\text{include_ddl} & \quad \text{IN BOOLEAN DEFAULT FALSE,} \\
\text{include_tagged_lcr} & \quad \text{IN BOOLEAN DEFAULT FALSE,} \\
\text{source_database} & \quad \text{IN VARCHAR2 DEFAULT NULL,} \\
\text{inclusion_rule} & \quad \text{IN BOOLEAN DEFAULT TRUE,} \\
\text{and_condition} & \quad \text{IN VARCHAR2 DEFAULT NULL,} \\
\text{queue_to_queue} & \quad \text{IN BOOLEAN DEFAULT NULL);} \\
\end{align*}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
</tbody>
</table>
### ADD_TABLE_PROPAGATION_RULES Procedure

#### Table 143–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as <code>{schema_name.}queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as <code>{schema_name.}queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. <strong>Note:</strong> Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.</td>
</tr>
</tbody>
</table>
If **TRUE**, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to **TRUE** regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to **TRUE** is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.

If **FALSE**, then the procedure adds a condition to each generated rule that causes the rule to evaluate to **TRUE** only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to **FALSE** might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.

In most cases, specify **TRUE** for this parameter if the **inclusion_rule** parameter is set to **FALSE**.

**See Also:** *Oracle Streams Replication Administrator’s Guide* for more information about tags.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>include_tagged_lcr</strong></td>
<td>If <strong>TRUE</strong>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. If <strong>FALSE</strong>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <strong>TRUE</strong> only if an LCR has a NULL Oracle Streams tag.</td>
</tr>
<tr>
<td><strong>source_database</strong></td>
<td>The global name of the source database. The source database is where the change originated. If <strong>NULL</strong>, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
<tr>
<td><strong>dml_rule_name</strong></td>
<td>If <strong>include_dml</strong> is <strong>TRUE</strong>, then this parameter contains the DML rule name. If <strong>include_dml</strong> is <strong>FALSE</strong>, then this parameter contains a NULL.</td>
</tr>
<tr>
<td><strong>ddl_rule_name</strong></td>
<td>If <strong>include_ddl</strong> is <strong>TRUE</strong>, then this parameter contains the DDL rule name. If <strong>include_ddl</strong> is <strong>FALSE</strong>, then this parameter contains a NULL.</td>
</tr>
<tr>
<td><strong>inclusion_rule</strong></td>
<td>If <strong>inclusion_rule</strong> is <strong>TRUE</strong>, then the procedure adds the rules to the positive rule set for the propagation. If <strong>inclusion_rule</strong> is <strong>FALSE</strong>, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
ADD_TABLE_PROPAGATION_RULES Procedure

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| and_condition   | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:  
= (system_condition) AND (and_condition)  
The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:  
= :lcr.get_tag() = HEXTORAW('02')  
The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.  
Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the `include_dml` parameter and FALSE for the `include_ddl` parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the `include_dml` parameter and TRUE for the `include_ddl` parameter.  
See Also: Chapter 247, "Logical Change Record TYPES"

queue_to_queue
If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.

If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.

This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:
- If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.
- If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.
- If NULL, then the procedure does not change the queue to queue property of the propagation.

See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations
sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

**See Also:**
- "Operational Notes" on page 143-9 and "Propagation Rules for LCRs" on page 143-11 for more information about the rules created by this procedure
- "Security Model" on page 143-5

**Examples**

The following is an example of a table rule condition created for filtering DML statements:

```sql
{((dml.get_object_owner() = 'HR' and dml.get_object_name() = 'LOCATIONS'))
 and dml.is_null_tag() = 'Y' and dml.get_source_database_name() = 'DBS1.NET')
```
ADD_TABLE_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table. See “Capture Process Rules for Changes in the Redo Log” on page 143-10 for more information about these rules.

- When the `streams_type` parameter is set to `sync_capture`, this procedure adds rules for capturing changes to a specified table. See “Synchronous Capture Rules for DML Changes to Tables” on page 143-11 for more information about these rules.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database. See “Apply Process Rules for LCRs” on page 143-12 for more information about these rules.

- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database. See “Messaging Client Rules for LCRs” on page 143-14 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

---

**Note:**

- Currently, messaging clients cannot dequeue buffered messages.
- The invoking user must be granted the DBA role to create a synchronous capture.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_TABLE_RULES(
  table_name          IN   VARCHAR2,
  streams_type        IN   VARCHAR2,
  streams_name        IN   VARCHAR2 DEFAULT NULL,
  queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
  include_dml         IN   BOOLEAN  DEFAULT TRUE,
  include_ddl         IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
  source_database     IN   VARCHAR2 DEFAULT NULL,
  dml_rule_name       OUT  VARCHAR2,
  ddl_rule_name       OUT  VARCHAR2,
  inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
  and_condition       IN   VARCHAR2  DEFAULT NULL);
```

```sql
DBMS_STREAMS_ADM.ADD_TABLE_RULES(
  table_name          IN   VARCHAR2,
```

Parameters

Table 143–13 ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Oracle Streams does not validate the existence of the table.</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of Oracle Streams client:</td>
</tr>
<tr>
<td></td>
<td>■ Specify capture for a capture process.</td>
</tr>
<tr>
<td></td>
<td>■ Specify sync_capture for a synchronous capture.</td>
</tr>
<tr>
<td></td>
<td>■ Specify apply for an apply process.</td>
</tr>
<tr>
<td></td>
<td>■ Specify dequeue for a messaging client.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner. If NULL, if streams_type is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</td>
</tr>
<tr>
<td></td>
<td>■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</td>
</tr>
<tr>
<td></td>
<td>■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</td>
</tr>
<tr>
<td></td>
<td>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>Each apply process and messaging client must have a unique name.</td>
</tr>
</tbody>
</table>
The name of the local queue, specified as \( \text{[schema\_name.]queue\_name} \). The current database must contain the queue, and the queue must be ANYDATA type.

For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.

For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.

If `TRUE`, then the procedure creates a DML rule for DML changes. If `FALSE`, then the procedure does not create a DML rule. `NULL` is not permitted.

If `TRUE`, then the procedure creates a DDL rule for DDL changes. If `FALSE`, then the procedure does not create a DDL rule. `NULL` is not permitted.

The generated rule evaluates to `TRUE` for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to `FALSE` for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to `FALSE` for changes that create synonyms or views based on the table. The rule also evaluates to `FALSE` for a change to a PL/SQL subprogram that refers to the table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as ( \text{[schema_name.]queue_name} ). The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default. For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If <code>TRUE</code>, then the procedure creates a DML rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If <code>TRUE</code>, then the procedure creates a DDL rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</td>
</tr>
</tbody>
</table>
include_tagged_lcr

If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the Oracle Streams client, then the Oracle Streams client performs its action regardless of the tag:

- A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.
- A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag.
- An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag.

If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the Oracle Streams client, then whether a database change is discarded does not depend on the tag.

If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry, session, or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for an Oracle Streams client, then the Oracle Streams client performs its action only when the tag is NULL:

- A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag.
- A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag.
- An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag.

If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the Oracle Streams client, then a database change can be discarded only if it has a NULL tag.

A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.

In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags.

If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. A synchronous capture cannot have a negative rule set. Specifying FALSE for a synchronous capture raises an error. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STREAMS_ADM Subprograms

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering.

\]
CLEANUP INSTANTIATION SETUP Procedure

This procedure removes an Oracle Streams replication configuration that was set up by the \texttt{PRE_INSTANTIATION_SETUP} and \texttt{POST_INSTANTIATION_SETUP} procedures in this package. This procedure either remove the configuration directly, or it can generate a script that removes the configuration.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

\begin{center}
\textbf{Attention:} When the \texttt{CLEANUP_INSTANTIATION_SETUP} procedure is run, the parameter values must match the parameter values specified when the corresponding \texttt{PRE_INSTANTIATION_SETUP} and \texttt{POST_INSTANTIATION_SETUP} procedures were run, except for the values of the following parameters: \texttt{perform_actions}, \texttt{script_name}, and \texttt{script_directory_object}.
\end{center}

\textbf{See Also:}
\begin{itemize}
  \item "\texttt{PRE_INSTANTIATION_SETUP Procedure}" on page 143-141
  \item "\texttt{POST_INSTANTIATION_SETUP Procedure}" on page 143-136
  \item "Procedures That Configure an Oracle Streams Environment" on page 143-16 for more information about this procedure
\end{itemize}

\textbf{Syntax}

\texttt{DBMS_STREAMS_ADM.CLEANUP_INSTANTIATION_SETUP(}
  \texttt{maintain_mode IN VARCHAR2,}
  \texttt{tablespace_names IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,}
  \texttt{source_database IN VARCHAR2,}
  \texttt{destination_database IN VARCHAR2,}
  \texttt{perform_actions IN BOOLEAN DEFAULT TRUE,}
  \texttt{script_name IN VARCHAR2 DEFAULT NULL,}
  \texttt{script_directory_object IN VARCHAR2 DEFAULT NULL,}
  \texttt{capture_name IN VARCHAR2 DEFAULT NULL,}
  \texttt{capture_queue_table IN VARCHAR2 DEFAULT NULL,}
  \texttt{capture_queue_name IN VARCHAR2 DEFAULT NULL,}
  \texttt{capture_queue_user IN VARCHAR2 DEFAULT NULL,}
  \texttt{propagation_name IN VARCHAR2 DEFAULT NULL,}
  \texttt{apply_name IN VARCHAR2 DEFAULT NULL,}
  \texttt{apply_queue_table IN VARCHAR2 DEFAULT NULL,}
  \texttt{apply_queue_name IN VARCHAR2 DEFAULT NULL,}
  \texttt{apply_queue_user IN VARCHAR2 DEFAULT NULL,}
  \texttt{bi_directional IN BOOLEAN DEFAULT FALSE,}
  \texttt{change_global_name IN BOOLEAN DEFAULT FALSE)};
Parameters

Table 143–14  CLEANUP_INSTANTIATION_SETUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maintain_mode</td>
<td>Specify one of the following:</td>
</tr>
<tr>
<td></td>
<td>■ GLOBAL to clean up the Oracle Streams configuration that maintained the entire database in both the source and destination databases</td>
</tr>
<tr>
<td></td>
<td>■ TRANSPORTABLE TABLESPACES to cleanup the Oracle Streams configuration that maintained a set of tablespace set at both the source and destination database</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The table space set in the tablespace set must exist at the source database, but these table spaces must not exist at the destination database. A directory object must exist for each directory that contains the data files for the table space set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty table space set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL. See Also: TABLESPACE_SET Table Type on page 148-9</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the global name of the local database.</td>
</tr>
<tr>
<td>destination_database</td>
<td>The global name of the destination database. A database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>perform_actions</td>
<td>If TRUE, then this procedure performs the necessary actions to clean up the Oracle Streams configuration directly. If FALSE, then the procedure does not perform the necessary actions to clean up the Oracle Streams configuration directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: script_name, script_directory_object</td>
</tr>
</tbody>
</table>
Table 143–14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script_name</td>
<td>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to clean up the Oracle Streams configuration. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the statements are appended to the existing file. If non-NULL and the perform_actions parameter is TRUE, then this procedure generates the specified script and performs the actions to clean up the Oracle Streams configuration directly. If NULL and the perform_actions parameter is TRUE, then this procedure directly performs the actions to clean up the Oracle Streams configuration without generating a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then this parameter is ignored, and this procedure does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of the capture processes configured to capture changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the capture processes with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</td>
</tr>
<tr>
<td>capture_queue_table</td>
<td>The name of the queue table for each queue used by a capture process, specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure automatically identifies the capture queue tables with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</td>
</tr>
<tr>
<td>capture_queue_name</td>
<td>The name of each queue used by a capture process, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the procedure automatically identifies the capture queues with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</td>
</tr>
<tr>
<td>capture_queue_user</td>
<td>The name of the user who has ENQUEUE and DEQUEUE privileges for the queue at the source database. This user is a secure queue user of the queue.</td>
</tr>
</tbody>
</table>
### Table 143–14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagations configured to propagate changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the propagations with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply processes configured to apply changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the apply processes with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</td>
</tr>
<tr>
<td>apply_queue_table</td>
<td>The name of the queue table for each queue used by an apply process, specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure automatically identifies the apply queue tables with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</td>
</tr>
<tr>
<td>apply_queue_name</td>
<td>The name of each queue used by an apply process, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the procedure automatically identifies the apply queues with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</td>
</tr>
<tr>
<td>apply_queue_user</td>
<td>The name of the user who has ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user is a secure queue user of the queue.</td>
</tr>
<tr>
<td>bi_directional</td>
<td>Specify TRUE if the Oracle Streams replication configuration is bi-directional between the database specified in source_database and the database specified in destination_database. Specify FALSE if the Oracle Streams replication configuration is one way replication from the current database to the database specified in destination_database.</td>
</tr>
<tr>
<td>change_global_name</td>
<td>If TRUE, then the procedure changes the global name of the database specified in destination_database to match the global name of the current database. If FALSE, then the procedure does not change the global name of the database specified in destination_database.</td>
</tr>
</tbody>
</table>
DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

---

**Note:**

- The DELETE_COLUMN procedure supports the same data types supported by Oracle Streams capture processes.
- The DELETE_COLUMN procedure is useful when you want to delete a relatively small number of columns in a row LCR. If you want to delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the KEEP_COLUMNS procedure in this package.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

---

**See Also:**

- *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- "KEEP_COLUMNS Procedure” on page 143-87

**Syntax**

```sql
DBMS_STREAMS_ADM.DELETE_COLUMN(
    rule_name  IN  VARCHAR2,
    table_name IN  VARCHAR2,
    column_name IN  VARCHAR2,
    value_type IN  VARCHAR2   DEFAULT '*',
    step_number IN  NUMBER     DEFAULT 0,
    operation   IN  VARCHAR2   DEFAULT 'ADD');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified column_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified table_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations with the specified column_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations with the specified table_name and column_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations with the specified table_name for the specified rule.</td>
</tr>
</tbody>
</table>
### DELETE_COLUMN Procedure

Remove all delete column transformations with the specified `table_name`, `column_name`, and `step_number` for the specified rule.

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified <code>table_name</code>, <code>column_name</code>, and <code>step_number</code> for the specified rule.</td>
</tr>
</tbody>
</table>
GET_MESSAGE_TRACKING Function

Returns the tracking label for the current session.

See Also: SET_MESSAGE_TRACKING Procedure on page 143-166

Syntax

```
DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```
GET_SCN_MAPPING Procedure

This procedure gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment. This information can be used for the following purposes:

- To recover transactions after point-in-time recovery is performed on a source database in a multiple source Oracle Streams environment
- To run flashback queries for the corresponding SCN at a source database and destination database in an Oracle Streams single source replication environment

See Also: Oracle Streams Replication Administrator’s Guide for information about point-in-time recovery and flashback queries in an Oracle Streams replication environment

Syntax

```sql
DBMS_STREAMS_ADM.GET_SCN_MAPPING(
    apply_name IN VARCHAR2,
    src_pit_scn IN NUMBER,
    dest_instantiation_scn OUT NUMBER,
    dest_start_scn OUT NUMBER,
    dest_skip_txn_ids OUT DBMS_UTILITY.NAME_ARRAY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>Name of the apply process which applies logical change records (LCRs) from the source database. The procedure raises an error if the specified apply process does not exist.</td>
</tr>
<tr>
<td>src_pit_scn</td>
<td>The SCN at the source database. For point-in-time recovery, specify the point-in-time recovery SCN at the source database. If the specified SCN is greater than the source commit SCN of the last applied transaction, then NULL is returned for both dest_start_scn and dest_instantiation_scn. In this case, no values can be returned for these parameters because the corresponding transaction has not been applied at the destination database yet.</td>
</tr>
<tr>
<td>dest_instantiation_scn</td>
<td>The SCN at the destination database that corresponds to the specified src_pit_scn at the source database. For point-in-time recovery, use this value for the instantiation SCNs at the source database during recovery.</td>
</tr>
<tr>
<td>dest_start_scn</td>
<td>For point in time recovery, the SCN to use for the start_scn parameter for the recovery capture process.</td>
</tr>
</tbody>
</table>
### Table 143–16 GET_SCN_MAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_skip_txn_ids</td>
<td>Transaction IDs of transactions that were skipped at the dest_instantiation_scn because the apply process was applying nondependent transactions out of order. For point in time recovery, these transaction IDs should be ignored by the recovery apply process. This parameter is relevant only if the commit_serialization for the apply process that applied these transactions was set to DEPENDENT_TRANSACTIONS, and the transactions were applied out of order.</td>
</tr>
</tbody>
</table>
GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

See Also:
- "SET_TAG Procedure" on page 143-171
- Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

DBMS_STREAMS_ADM.GET_TAG
RETURN RAW;

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

SET SERVEROUTPUT ON
DECLARE
  raw_tag RAW(2000);
BEGIN
  raw_tag := DBMS_STREAMS_ADM.GET_TAG();
  DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/

You can also display the value by querying the DUAL view:

SELECT DBMS_STREAMS_ADM.GET_TAG FROM DUAL;
KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The column_list parameter is type VARCHAR2 and the column_table parameter is type DBMS_UTILITY.LNAME_ARRAY. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:
- The KEEP_COLUMNS procedure supports the same data types supported by Oracle Streams capture processes.
- The KEEP_COLUMNS procedure is useful when you want to keep a relatively small number of columns in a row LCR. If you want to keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the DELETE_COLUMN procedure in this package.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also:
- Oracle Streams Concepts and Administration for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- "DELETE_COLUMN Procedure" on page 143-80

Syntax

```
DBMS_STREAMS_ADM.KEEP_COLUMNS(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_list   IN  VARCHAR2,
    value_type    IN  VARCHAR2 DEFAULT '*',
    step_number   IN  NUMBER DEFAULT 0,
    operation     IN  VARCHAR2 DEFAULT 'ADD');

DBMS_STREAMS_ADM.KEEP_COLUMNS(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_table  IN  DBMS_UTILITY.LNAME_ARRAY,
    value_type    IN  VARCHAR2 DEFAULT '*',
    step_number   IN  NUMBER DEFAULT 0,
```
operation IN VARCHAR2 DEFAULT 'ADD');

Parameters

Table 143–17 KEEP_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current</td>
</tr>
<tr>
<td></td>
<td>user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table for which the columns are kept in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If</td>
</tr>
<tr>
<td></td>
<td>the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_list</td>
<td>The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation</td>
</tr>
<tr>
<td></td>
<td>removes columns that are not in the list from the row LCR.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>column_table</td>
<td>The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL index-by table of type DBMS_UTILITY.LNAME_ARRAY,</td>
</tr>
<tr>
<td></td>
<td>where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation</td>
</tr>
<tr>
<td></td>
<td>removes columns that are not in the table from the row LCR.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify ‘NEW’ to keep the columns in the new values in the row LCR.</td>
</tr>
<tr>
<td></td>
<td>Specify ‘OLD’ to keep the columns in the old values in the row LCR.</td>
</tr>
<tr>
<td></td>
<td>Specify ‘*’ to keep the columns in both the old and new values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify ‘ADD’ to add the transformation to the rule.</td>
</tr>
<tr>
<td></td>
<td>Specify ‘REMOVE’ to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

See Also: Oracle Streams Concepts and Administration for more information about transformation ordering.

Usage Notes

When ‘REMOVE’ is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_list, column_table, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP_COLUMNS procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_list/column_table</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all keep columns transformations for the specified rule.</td>

</tr>
</tbody>
</table>
This procedure configures an Oracle Streams environment that uses change handlers to record in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

A change handler is a special type of statement DML handler that tracks table changes and was created by either this `MAINTAIN_CHANGE_TABLE` procedure or the `DBMS_APPLY_ADM.SET_CHANGE_HANDLER` procedure. Information about change handlers is stored in the `ALL_APPLY_CHANGE_HANDLERS` and `DBA_APPLY_CHANGE_HANDLERS` views.

The change table can reside in the same database as the source table or in a different database.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

**Note:** The environment configured by this procedure does not record or replicate data definition language (DDL) changes made to the source table.

**See Also:** "Procedures That Configure an Oracle Streams Environment" on page 143-16 for more information about this procedure

### Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE(
  change_table_name        IN VARCHAR2,
  source_table_name        IN VARCHAR2,
  column_type_list         IN VARCHAR2,
  extra_column_list        IN VARCHAR2  DEFAULT 'command_type, value_type',
  capture_values           IN VARCHAR2,
  options_string           IN VARCHAR2  DEFAULT NULL,
  script_name              IN VARCHAR2  DEFAULT NULL,
  script_directory_object  IN VARCHAR2  DEFAULT NULL,
  perform_actions          IN BOOLEAN   DEFAULT TRUE,
  capture_name             IN VARCHAR2  DEFAULT NULL,
  propagation_name         IN VARCHAR2  DEFAULT NULL,
  apply_name               IN VARCHAR2  DEFAULT NULL,
  source_database          IN VARCHAR2  DEFAULT NULL,
  destination_database     IN VARCHAR2  DEFAULT NULL,
  keep_change_columns_only IN BOOLEAN   DEFAULT TRUE,
  execute_lcr              IN BOOLEAN   DEFAULT FALSE);
```
Parameters

Table 143–18  MAINTAIN_CHANGE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_table_name</td>
<td>The table that records changes to the source table. This table is maintained by Oracle Streams after configuration. Specify the table as [schema_name.]table_name. For example, hr.jobs_change_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error. If the specified table exists at the database specified in the destination_database parameter, then the procedure raises an error.</td>
</tr>
<tr>
<td>source_table_name</td>
<td>The table at the source database for which changes are recorded. Specify the table as [schema_name.]table_name. For example, hr.jobs. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>column_type_list</td>
<td>A list of the columns in the source table for which changes are recorded. Specify a comma-separated list of each column and its datatype. For example, specify the following for the hr.jobs table: job_id VARCHAR2(10), job_title VARCHAR2(35), min_salary NUMBER(6), max_salary NUMBER(6) The procedure automatically places columns with names that match the source database columns into an unconditional supplemental log group. If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
The following metadata attributes can be included:

- value_type
- source_database_name
- command_type
- object_owner
- object_name
- tag
- transaction_id
- scn
- commit_scn
- compatible
- instance_number
- message_number
- row_text
- row_id
- serial#
- session#
- source_time
- thread#
- tx_name
- username

All of these metadata attributes, except for value_type and message_number, are row LCR attributes that can be stored in row LCRs. For information about LCR attributes, see Oracle Streams Concepts and Administration.

The value_type$ column in the change table contains either OLD or NEW, depending on whether the column value is the original column value or the new column value, respectively.

The message_number$ column in the change table contains the identification number of each row LCR within a transaction. The message number increases incrementally for each row LCR within a transaction and shows the order of the row LCRs within a transaction.

The procedure automatically configures the source database to place information about extra attributes, such as serial#, into the redo log so that the information can be captured and recorded.
**Table 143–18 (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters**

<table>

</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>options_string</td>
<td>String of options passed to the CREATE TABLE statement that creates the change table. The string is appended to the generated CREATE TABLE statement after the closing parenthesis that defines the columns of the table. The string must be syntactically correct.</td>
</tr>
<tr>
<td>script_name</td>
<td>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.</td>
</tr>
<tr>
<td></td>
<td>If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the replication environment directly.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to configure the replication environment directly and does not generate a script.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed.</td>
</tr>
<tr>
<td></td>
<td>If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
<tr>
<td>perform_actions</td>
<td>If TRUE, then the procedure performs the necessary actions to configure the environment directly.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure does not perform the necessary actions to configure the environment directly.</td>
</tr>
<tr>
<td></td>
<td>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</td>
</tr>
<tr>
<td></td>
<td>- script_name</td>
</tr>
<tr>
<td></td>
<td>- script_directory_object</td>
</tr>
</tbody>
</table>
The name of each capture process configured to capture changes. Do not specify an owner.

If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.

If NULL, then the system generates a name for each capture process it creates.

Note: The capture process name cannot be altered after the capture process is created.

The name of the propagation configured to propagate changes from the source database to the destination database. Do not specify an owner.

If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set.

If NULL, then the system generates a name for the propagation.

If non-NULL and the source_database and destination_database are set to the same value, then this procedure raises an error. When the capture process and apply process are in the same database, they can use the same queue, and a propagation is not needed.

Note: The propagation name cannot be altered after the propagation is created.

The name of each apply process configured to apply changes. Do not specify an owner.

If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set.

The specified name must not match the name of an existing messaging client at the destination database.

If NULL, then the system generates a name for the apply process. When set to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter.

Note: The apply process name cannot be altered after the apply process is created.

The global name of the source database.

If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.

If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.

If NULL, then the procedure uses the global name of the local database.
Usage Notes

The following are usage notes for this procedure:

Types of Oracle Streams Environments Configured by the Procedure

This procedure can configure the following types of Oracle Streams environments:

- **Local capture and apply on one database**: Specify the same global name for the `source_database` and the `destination_database` parameter.

- **Local capture and remote apply**: Specify the global name of the local database for the `source_database` parameter and a remote database for the `destination_database` parameter.

- **Downstream capture and local apply**: Specify a remote database for the `source_database` parameter and the local database for the `destination_database` parameter.

- **Downstream capture and remote apply**: Specify a remote database for the `source_database` parameter and a remote database for the `destination_database` parameter.
Optional One-Way Replication With This Procedure

To configure one-way replication of the table, in addition to recording changes to the table, set the execute_lcr parameter to TRUE. The apply process executes each row LCR and applies the change in the row LCR to the replica table at the destination database. In this case, ensure that the source table is instantiated at the destination database before running the procedure. Specifically, the source table must be prepared for instantiation, the instantiation SCN must be set for the replica table at the destination database, and, in most cases, the source table replica table should be consistent.

See Also: Oracle Streams Replication Administrator’s Guide

Statement DML Handlers, the Change Table, and Row LCR Execution

This procedure configures one or more statement DML handlers that perform the following actions:

- Record changes in the change table using the information in row LCRs.
- Execute row LCRs if the execute_lcr parameter is set to TRUE.

The procedure ensures that the row LCRs contain the required attributes to record the changes specified in the capture_type_list, extra_column_list, and capture_values parameters. The procedure adds the statement DML handlers to the apply process specified in the apply_name parameter.

See Also: Chapter 146, "DBMS_STREAMS_HANDLER_ADM"
**MAINTAIN_GLOBAL Procedure**

This procedure configures an Oracle Streams environment that replicates changes at the database level between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

**Syntax**

```sql
DBMS_STREAMS_ADM.MAINTAIN_GLOBAL(
  source_directory_object      IN VARCHAR2,
  destination_directory_object IN VARCHAR2,
  source_database              IN VARCHAR2,
  destination_database         IN VARCHAR2,
  perform_actions              IN BOOLEAN   DEFAULT TRUE,
  script_name                  IN VARCHAR2  DEFAULT NULL,
  script_directory_object      IN VARCHAR2  DEFAULT NULL,
  dump_file_name               IN VARCHAR2  DEFAULT NULL,
  capture_name                 IN VARCHAR2  DEFAULT NULL,
  capture_queue_table          IN VARCHAR2  DEFAULT NULL,
  capture_queue_name           IN VARCHAR2  DEFAULT NULL,
  capture_queue_user           IN VARCHAR2  DEFAULT NULL,
  propagation_name             IN VARCHAR2  DEFAULT NULL,
  apply_name                   IN VARCHAR2  DEFAULT NULL,
  apply_queue_table            IN VARCHAR2  DEFAULT NULL,
  apply_queue_name             IN VARCHAR2  DEFAULT NULL,
  apply_queue_user             IN VARCHAR2  DEFAULT NULL,
  log_file                     IN VARCHAR2  DEFAULT NULL,
  bi_directional               IN BOOLEAN   DEFAULT FALSE,
  include_ddl                  IN BOOLEAN   DEFAULT FALSE,
)
```

**Note:**

- This procedure automatically excludes database objects that are not supported by Oracle Streams from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

- If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the destination database while the MAINTAIN_GLOBAL procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

- A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

**See Also:** "Procedures That Configure an Oracle Streams Environment" on page 143-16 for more information about this procedure.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_directory_object</td>
<td>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes.</td>
</tr>
<tr>
<td></td>
<td>This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter.</td>
</tr>
<tr>
<td></td>
<td>If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
<tr>
<td>destination_directory_object</td>
<td>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred.</td>
</tr>
<tr>
<td></td>
<td>If the source database and destination database are running on the same computer system, then the source and destination directories must be different.</td>
</tr>
<tr>
<td></td>
<td>This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In these cases, specify NULL for the destination_directory_object parameter.</td>
</tr>
<tr>
<td></td>
<td>If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
</tbody>
</table>
### Table 143–19 (Cont.) MAINTAIN_GLOBAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.</td>
</tr>
<tr>
<td>destination_database</td>
<td>The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>dump_file_name</td>
<td>The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the export dump file name is generated by the system. In this case, the export dump file name is expatnn.dmp, where nn is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</td>
</tr>
<tr>
<td>log_file</td>
<td>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the log file name is the same name as the export dump file name with an extension of .clg.</td>
</tr>
</tbody>
</table>
Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:

- **DBMS_STREAMS_ADM.INSTANTIATION_FULL** performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package.

- **DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK** performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.

- **DBMS_STREAMS_ADM.INSTANTIATION_NONE** does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If you use the RMAN DUPLICATE or CONVERT DATABASE command for database instantiation, then the destination database cannot be the capture database.

If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL or DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK, then the database objects being instantiated must exist at the source database.

If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.

</tbody>
</table>
MAINTAIN_SCHEMAS Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified schemas between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One schema_names parameter is type VARCHAR2 and the other schema_names parameter is type DBMSUTILITY.UNCL_ARRAY. These parameters enable you to enter the list of schemas in different ways and are mutually exclusive.

**Note:**

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the schemas from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

- If the bi_directional parameter is set to TRUE, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the MAINTAIN_SCHEMAS procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

**See Also:** "Procedures That Configure an Oracle Streams Environment" on page 143-16 for more information about this procedure

**Syntax**

```
DBMS_STREAMS_ADM.MAINTAIN_SCHEMAS(
    schema_names IN VARCHAR2,
    source_directory_object IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database IN VARCHAR2,
    destination_database IN VARCHAR2,
    perform_actions IN BOOLEAN DEFAULT TRUE,
    script_name IN VARCHAR2 DEFAULT NULL,
    script_directory_object IN VARCHAR2 DEFAULT NULL,
    dump_file_name IN VARCHAR2 DEFAULT NULL,
    capture_name IN VARCHAR2 DEFAULT NULL,
    capture_queue_table IN VARCHAR2 DEFAULT NULL,
    capture_queue_name IN VARCHAR2 DEFAULT NULL,

<tr>
<td>capture_queue_user</td>
<td>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</td>
</tr>
<tr>
<td>log_file</td>
<td>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the log file name is the same name as the export dump file name with an extension of .clg.</td>
</tr>
</tbody>
</table>
Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:

DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package.

DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.

DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly.

If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA or DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK, then the database objects being instantiated must exist at the source database, and the tablespaces that contain the schemas must exist at the destination database.

If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.
MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the MAINTAIN_SIMPLE_TTS procedure.

See Also:
- "Deprecated Subprograms" on page 143-4
- MAINTAIN_SIMPLE_TTS Procedure on page 143-111

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TABLESPACE(
    tablespace_name              IN VARCHAR2,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_database         IN VARCHAR2,
    setup_streams                IN BOOLEAN   DEFAULT TRUE,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams.</td>
</tr>
<tr>
<td></td>
<td>The tablespace must exist at the source database, but it must not exist at the destination database.</td>
</tr>
<tr>
<td></td>
<td>A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have READ privilege on this directory object. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>source_directory_object</td>
<td>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>Note: The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
</tbody>
</table>
Table 143–21 (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| destination_directory_object | The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred.  
If the source database and destination database are running on the same computer system, then the source and destination directories must be different.  
If NULL, then the procedure raises an error.  
*Note:* The specified directory object cannot point to an Oracle ASM disk group. |
| destination_database     | The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist. If NULL, then the procedure raises an error. |
| setup_streams            | If TRUE, then the procedure performs the necessary actions to maintain the tablespace directly.  
If FALSE, then the procedure does not perform the necessary actions to maintain the tablespace directly.  
Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:  
- script_name  
- script_directory_object |
| script_name              | If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace.  
If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.  
If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly.  
If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace directly.  
If NULL and the setup_streams parameter is FALSE, then the procedure raises an error. |
| script_directory_object  | The directory object for the directory on the local computer system into which the generated script is placed.  
If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.  
If NULL and the script_name parameter is non-NULL, then the procedure raises an error.  
*Note:* The specified directory object cannot point to an Oracle ASM disk group. |
Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Documentation for this Procedure

The following documentation applies to the MAINTAIN_SIMPLE_TABLESPACE procedure:

- Automatic Platform Conversion on page 143-17
- Oracle Streams Replication Administrator's Guide

Requirements for Running this Procedure

Meet the following requirements when run the MAINTAIN_SIMPLE_TABLESPACE procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the destination_database parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- Grant the user who runs this procedure the DBA role. This user must have the necessary privileges to complete the following actions:
  - Create ANYDATA queues, capture processes, propagations, and apply processes.

Table 143–21 (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bi_directional</td>
<td>Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages. Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.</td>
</tr>
</tbody>
</table>
– Specify supplemental logging
– Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
– Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.
– Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
– The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 148-18 for the list of required privileges.
– The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 148-11 for the list of required privileges.

To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator's schema.

Typically, the DBA role can be revoked from the user, if necessary, after the configuration is complete.

- If the bi_directional parameter is set to TRUE, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- Each specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes this procedure must have READ and WRITE privilege on each one.
- The databases configured by this procedure must be Oracle Database 10g Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The setup_streams parameter is set to TRUE to configure the Oracle Streams replication environment directly.
- The databases configured by this procedure must be Oracle Database 10g Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The setup_streams parameter is set to FALSE in this procedure, and the replication environment is configured with a generated script.

If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

- If the procedure is run at an Oracle Database 10g Release 1 database, then the databases configured by the procedure must be Oracle Database 10g Release 1 or later databases.

See Also: Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator
Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure uses the default values for the parameters in the MAINTAIN_TABLESPACES procedure that do not exist in the MAINTAIN_SIMPLE_TABLESPACE procedure. For example, this procedure creates a capture process at the source database named capture, because that is the default value for the capture_name parameter in the MAINTAIN_TABLESPACES procedure.

See Also:  MAINTAIN_TABLESPACES Procedure on page 143-119

Configuration Progress and Recoverability

When this procedure is run with the setup_streams parameter set to TRUE, metadata about its configuration actions is recorded in the following data dictionary views: DBA_RECOVERABLE_SCRIPT, DBA_RECOVERABLE_SCRIPT_PARAMS, DBA_RECOVERABLE_SCRIPT_BLOCKS, and DBA_RECOVERABLE_SCRIPT_ERRORS. If the procedure stops because it encounters an error, then you can use the RECOVER_OPERATION procedure to complete the configuration after you correct the conditions that caused the error.

Note:  When this procedure is run with the setup_streams parameter set to FALSE, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

See Also:  "RECOVER_OPERATION Procedure" on page 143-147
MAINTAIN_SIMPLE_TTS Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespace from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated MAINTAIN_SIMPLE_TABLESPACE procedure.

See Also: “Procedures That Configure an Oracle Streams Environment” on page 143-16 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TTS(
    tablespace_name IN VARCHAR2,
    source_directory_object IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database IN VARCHAR2,
    destination_database IN VARCHAR2,
    perform_actions IN BOOLEAN DEFAULT TRUE,
    script_name IN VARCHAR2 DEFAULT NULL,
    script_directory_object IN VARCHAR2 DEFAULT NULL,
    bi_directional IN BOOLEAN DEFAULT FALSE);
```

Parameters

<td>If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code>, then the procedure uses the global name of the local database.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STREAMS_ADM Subprograms

Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Privileges Required by the MAINTAIN_SIMPLE_TTS Procedure

In addition to the required privileges described in "Requirements for Running These Procedures" on page 143-18, the user who runs the MAINTAIN_SIMPLE_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 148-18 for the list of required privileges.
- The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 148-11 for the list of required privileges.

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TTS Procedure

This procedure uses the default values for the parameters in the MAINTAIN_TTS procedure that do not exist in the MAINTAIN_SIMPLE_TTS procedure. For example, this procedure automatically generates the capture process name, because NULL is the default value for the capture_name parameter in the MAINTAIN_TTS procedure, and the procedure generates the capture process name when NULL is specified for capture_name.

See Also: MAINTAIN_TTS Procedure on page 143-126

<table>
<thead>

Table 143–22 (Cont.) MAINTAIN_SIMPLE_TTS Procedure Parameters
This procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables in different ways and are mutually exclusive.

**Note:** If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_TABLES` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

**See Also:** "Procedures That Configure an Oracle Streams Environment" on page 143-16 for more information about this procedure

**Syntax**

```sql
DBMS_STREAMS_ADM.MAINTAIN_TABLES(
    table_names                  IN VARCHAR2,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database              IN VARCHAR2,
    destination_database         IN VARCHAR2,
    perform_actions              IN BOOLEAN   DEFAULT TRUE,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    dump_file_name               IN VARCHAR2  DEFAULT NULL,
    capture_name                 IN VARCHAR2  DEFAULT NULL,
    capture_queue_table          IN VARCHAR2  DEFAULT NULL,
    capture_queue_name           IN VARCHAR2  DEFAULT NULL,
    capture_queue_user           IN VARCHAR2  DEFAULT NULL,
    propagation_name             IN VARCHAR2  DEFAULT NULL,
    apply_name                   IN VARCHAR2  DEFAULT NULL,
    apply_queue_table            IN VARCHAR2  DEFAULT NULL,
    apply_queue_name             IN VARCHAR2  DEFAULT NULL,
    apply_queue_user             IN VARCHAR2  DEFAULT NULL,
    log_file                     IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT FALSE,
    include_ddl                  IN BOOLEAN   DEFAULT FALSE,
    instantiation                IN INTEGER   DEFAULT 0);
```

```sql
DBMS_STREAMS_ADM.MAINTAIN_TABLES(
    table_names                  IN DBMS_UTILITY.UNCL_ARRAY,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database              IN VARCHAR2,
    destination_database         IN VARCHAR2,
    perform_actions              IN BOOLEAN   DEFAULT TRUE,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    dump_file_name               IN VARCHAR2  DEFAULT NULL,
    capture_name                 IN VARCHAR2  DEFAULT NULL,
    capture_queue_table          IN VARCHAR2  DEFAULT NULL,
    capture_queue_name           IN VARCHAR2  DEFAULT NULL,
    capture_queue_user           IN VARCHAR2  DEFAULT NULL,
    propagation_name             IN VARCHAR2  DEFAULT NULL,
    apply_name                   IN VARCHAR2  DEFAULT NULL,
    apply_queue_table            IN VARCHAR2  DEFAULT NULL,
    apply_queue_name             IN VARCHAR2  DEFAULT NULL,
    apply_queue_user             IN VARCHAR2  DEFAULT NULL,
    log_file                     IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT FALSE,
    include_ddl                  IN BOOLEAN   DEFAULT FALSE,
    instantiation                IN INTEGER   DEFAULT 0);
```
Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 143-19 for descriptions of the procedure parameters that are not in Table 143–23

Table 143–23 MAINTAIN_TABLES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| table_names         | The tables to be configured for replication and maintained by Oracle Streams after configuration. The tables can be specified in the following ways:  
  ■ Comma-delimited list of type VARCHAR2  
  ■ A PL/SQL index-by table of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. The first table should be in position 1. The last position must be NULL.  
Each table should be specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.  
This procedure raises an error in any of the following cases:  
  ■ When a specified table does not exist at the source database  
  ■ When the table_names parameter is set to NULL |
source_directory_object  
The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remain in this directory after the procedure completes.

This parameter is ignored if instantiation is set to DBMS_STREAMS_ADMIN.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADMIN.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter.

If NULL and instantiation is set to DBMS_STREAMS_ADMIN.INSTANTIATION_TABLE, then the procedure raises an error.

Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

destination_directory_object  
The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred.

If the source database and destination database are running on the same computer system, then the source and destination directories must be different.

This parameter is ignored if instantiation is set to DBMS_STREAMS_ADMIN.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADMIN.INSTANTIATION_NONE. In this case, specify NULL for the destination_directory_object parameter.

If NULL and instantiation is set to DBMS_STREAMS_ADMIN.INSTANTIATION_TABLE, then the procedure raises an error.

Note: The specified directory object cannot point to an Oracle ASM disk group.

source_database  
The global name of the source database.

If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.

If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.

If NULL, then the procedure uses the global name of the local database.

destination_database

The global name of the destination database.

If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.

If NULL, then the procedure raises an error.

dump_file_name

The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error.

This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE.

If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK, then the export dump file name is expatnn.dmp, where nn is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.

capture_queue_user

The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.

If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.

log_file

The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.

This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE.

If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the log file name is the same name as the export dump file name with an extension of .clg.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instantiation</td>
<td>Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:</td>
</tr>
<tr>
<td></td>
<td><strong>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</strong> performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package.</td>
</tr>
<tr>
<td></td>
<td><strong>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</strong> performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</td>
</tr>
<tr>
<td></td>
<td><strong>DBMS_STREAMS_ADM.INSTANTIATION_NONE</strong> does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is set to <strong>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</strong> or <strong>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</strong>, then the tables being instantiated must exist at the source database, and the tablespaces that contain the tables must exist at the destination database.</td>
</tr>
<tr>
<td></td>
<td>If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.</td>
</tr>
<tr>
<td></td>
<td>Also, if an instantiated table does not exist at the destination database, then this procedure sets the instantiation SCN for the table. However, if an instantiated table already exist at the destination database before instantiation, then this procedure does not set the instantiation SCN for the table. In this case, you must set the instantiation SCN for the table manually after the procedure completes.</td>
</tr>
</tbody>
</table>
MAINTAIN_TABLESPACES Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

**Note:** This procedure is deprecated. It is replaced by the MAINTAIN_TTS procedure.

See Also:
- "Deprecated Subprograms" on page 143-4
- MAINTAIN_TTS Procedure on page 143-126

**Syntax**

```sql
DBMS_STREAMS_ADM.MAINTAIN_TABLESPACES(
    tablespace_names             IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_database         IN VARCHAR2,
    setup_streams                IN BOOLEAN   DEFAULT TRUE,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    dump_file_name               IN VARCHAR2  DEFAULT NULL,
    source_queue_table           IN VARCHAR2  DEFAULT 'streams_queue_table',
    source_queue_name            IN VARCHAR2  DEFAULT 'streams_queue',
    source_queue_user            IN VARCHAR2  DEFAULT NULL,
    destination_queue_table      IN VARCHAR2  DEFAULT 'streams_queue_table',
    destination_queue_name       IN VARCHAR2  DEFAULT 'streams_queue',
    destination_queue_user       IN VARCHAR2  DEFAULT NULL,
    capture_name                 IN VARCHAR2  DEFAULT 'capture',
    propagation_name             IN VARCHAR2  DEFAULT NULL,
    apply_name                    IN VARCHAR2  DEFAULT NULL,
    log_file                      IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT FALSE,
    include_ddl                  IN BOOLEAN   DEFAULT FALSE);
```
Parameters

Table 143–24  MAINTAIN_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tablespace_names</code></td>
<td>The local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If <code>NULL</code>, then the procedure raises an error. <strong>See Also:</strong> TABLESPACE_SET Table Type on page 148-9</td>
</tr>
<tr>
<td><code>source_directory_object</code></td>
<td>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes. If <code>NULL</code>, then the procedure raises an error. <strong>Note:</strong> The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
<tr>
<td><code>destination_directory_object</code></td>
<td>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred. If the source database and destination database are running on the same computer system, then the source and destination directories must be different. If <code>NULL</code>, then the procedure raises an error. <strong>Note:</strong> The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
<tr>
<td><code>destination_database</code></td>
<td>The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STREAMS_ADM Subprograms

### DBMS_STREAMS_ADM

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| setup_streams        | If TRUE, then the procedure performs the necessary actions to maintain the tablespaces directly. If FALSE, then the procedure does not perform the necessary actions to maintain the tablespaces directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:  
  - script_name  
  - script_directory_object |
| script_name          | If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace set. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.  
  If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly.  
  If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace set directly.  
  If NULL and the setup_streams parameter is FALSE, then the procedure raises an error. |
| script_directory_object | The directory object for the directory on the local computer system into which the generated script is placed.  
  If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.  
  If NULL and the script_name parameter is non-NULL, then the procedure raises an error.  
  **Note:** The specified directory object cannot point to an Oracle ASM disk group. |
| dump_file_name       | The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error.  
  If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is expatnn.dmp, where nn is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory. |
The name of the queue table for the queue at the source database, specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.

The name of the queue at the source database that will function as the ANYDATA queue, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.

The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.

If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.

The name of the queue table for the queue at the destination database, specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.

The name of the queue at the destination database that will function as the ANYDATA queue, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.

The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.

If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.

The name of each capture process configured to capture changes to the database objects in the tablespace set. Do not specify an owner.

If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database objects in the tablespace set to the positive capture process rule set.

Note: The capture process name cannot be altered after the capture process is created.
**Table 143–24 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of each propagation configured to propagate changes to the database objects in the tablespace set. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the database objects in the tablespace set to the positive propagation rule set.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the system generates a name for each propagation it creates.</td>
</tr>
<tr>
<td>Note:</td>
<td>The propagation name cannot be altered after the propagation is created.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of each apply process configured to apply changes to the database objects in the tablespace set. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the database objects in the tablespace set to the positive apply process rule set.</td>
</tr>
<tr>
<td></td>
<td>The specified name must not match the name of an existing messaging client at the destination database.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the system generates a name for each apply process it creates.</td>
</tr>
<tr>
<td>Note:</td>
<td>The apply process name cannot be altered after the apply process is created.</td>
</tr>

<td>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the log file name is the same name as the export dump file name with an extension of .clg.</td>
</tr>
<tr>
<td>bi_directional</td>
<td>Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages.</td>
</tr>
<tr>
<td></td>
<td>Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes.</td>
</tr>
<tr>
<td></td>
<td>Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, will not be replicated.</td>
</tr>
</tbody>
</table>
Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also: Oracle Database Administrator’s Guide for more information about self-contained tablespace sets

Additional Documentation for this Procedure

The following documentation applies to the MAINTAIN_TABLESPACES procedure:

- Automatic Platform Conversion on page 143-17
- Oracle Streams Replication Administrator’s Guide

Requirements for Running this Procedure

Meet the following requirements when run the MAINTAIN_TABLESPACES procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the destination_database parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs this procedure should be granted the DBA role. This user must have the necessary privileges to complete the following actions:
  - Create ANYDATA queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
  - Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.
  - Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
  - The necessary privileges to run the CLONE_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_TABLESPACES Procedure on page 148-20 for the list of required privileges.
  - The necessary privileges to run the ATTACH_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_TABLESPACES Procedure on page 148-13 for the list of required privileges.
- To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator’s schema.
- If the bi_directional parameter is set to TRUE, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes this procedure must have `READ` and `WRITE` privilege on each one.

The databases configured by this procedure must be Oracle Database 10g Release 2 or later databases when this procedure is run under the following conditions:
- The procedure is run at an Oracle Database 10g Release 2 or later database.
- The `setup_streams` parameter is set to `TRUE` to configure the Oracle Streams replication environment directly.

The databases configured by this procedure must be Oracle Database 10g Release 1 or later databases when this procedure is run under the following conditions:
- The procedure is run at an Oracle Database 10g Release 2 or later database.
- The `setup_streams` parameter is set to `FALSE` in this procedure, and the replication environment is configured with a generated script.

If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

If the procedure is run at an Oracle Database 10g Release 1 database, then the databases configured by the procedure must be Oracle Database 10g Release 1 or later databases.

**See Also:** *Oracle Streams Replication Administrator’s Guide* for information about configuring an Oracle Streams administrator

**Configuration Progress and Recoverability**

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

**Note:** When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

**See Also:** “RECOVER_OPERATION Procedure” on page 143-147
MAINTAIN_TTS Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespaces from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

- This procedure replaces the deprecated MAINTAIN_TABLESPACES procedure.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 143-16 for more information about this procedure

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_TTS(
    tablespace_names             IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database              IN VARCHAR2,
    destination_database         IN VARCHAR2,
    perform_actions              IN BOOLEAN   DEFAULT TRUE,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    dump_file_name               IN VARCHAR2  DEFAULT NULL,
    capture_name                 IN VARCHAR2  DEFAULT NULL,
    capture_queue_table          IN VARCHAR2  DEFAULT NULL,
    capture_queue_name           IN VARCHAR2  DEFAULT NULL,
    capture_queue_user           IN VARCHAR2  DEFAULT NULL,
    propagation_name             IN VARCHAR2  DEFAULT NULL,
    apply_name                   IN VARCHAR2  DEFAULT NULL,
    apply_queue_table            IN VARCHAR2  DEFAULT NULL,
    apply_queue_name             IN VARCHAR2  DEFAULT NULL,
    apply_queue_user             IN VARCHAR2  DEFAULT NULL,
    log_file                     IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT FALSE,
    include_ddl                  IN BOOLEAN   DEFAULT FALSE);
```

</table>
Additional Privileges Required by the MAINTAIN_TTS Procedure

In addition to the required privileges described in "Requirements for Running These Procedures" on page 143-18, the user who runs the MAINTAIN_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the CLONE_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_TABLESPACES Procedure on page 148-20 for the list of required privileges.
- The necessary privileges to run the ATTACH_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_TABLESPACES Procedure on page 148-13 for the list of required privileges.
MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process. Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.

However, you can choose to run the MERGE_STREAMS procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The CAPTURE_MESSAGE>Create_TIME in the GV$STREAMS_CAPTURE view of the cloned capture process has caught up to, or nearly caught up to, the CAPTURE_MESSAGE>Create_TIME of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The MERGE_STREAMS procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   - The acknowledged SCN of the cloned propagation.
   - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.
5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

See Also:
- MERGE_STREAMS_JOB Procedure on page 143-133
- SPLIT_STREAMS Procedure on page 143-175

Syntax

```sql
DBMS_STREAMS_ADM.MERGE_STREAMS(  
    cloned_propagation_name  IN  VARCHAR2,  
    propagation_name         IN  VARCHAR2  DEFAULT NULL,  
    queue_name               IN  VARCHAR2  DEFAULT NULL,  
    perform_actions          IN  BOOLEAN   DEFAULT TRUE,  
    script_name              IN  VARCHAR2  DEFAULT NULL,  
    script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 143–26 MERGE_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>propagation_name</td>
<td>The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you want to use a name that is different than the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. See &quot;Usage Notes&quot; on page 143-132 for more information. If a non-NULL value is specified, then an error is raised under either of the following conditions:</td>
</tr>
<tr>
<td></td>
<td>■ The queue specified in the queue_name parameter does not exist.</td>
</tr>
<tr>
<td></td>
<td>■ The queue specified in the queue_name parameter exists but is not used by a capture process.</td>
</tr>
</tbody>
</table>
You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.
MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

If the auto_merge_threshold parameter was set to a positive number in the SPLIT_STREAMS procedure that split the streams, then a merge job runs the MERGE_STREAMS_JOB procedure automatically according to its schedule. The schedule name is specified for the schedule_name parameter, and the merge job name is specified for the merge_job_name parameter when the MERGE_STREAMS_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT_STREAMS procedure.

If the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams, then you can run the MERGE_STREAMS_JOB procedure manually. In this case, it is not run automatically.

See Also:

- MERGE_STREAMS Procedure on page 143-130
- SPLIT_STREAMS Procedure on page 143-175
- Oracle Streams Replication Administrator’s Guide for instructions on using the MERGE_STREAMS_JOB procedure

Syntax

```sql
DBMS_STREAMS_ADM.MERGE_STREAMS_JOB(
    cloned_propagation_name        IN VARCHAR2,
    propagation_name               IN VARCHAR2 DEFAULT NULL,
    queue_name                     IN VARCHAR2 DEFAULT NULL,
    merge_threshold                IN NUMBER,
    schedule_name                  IN VARCHAR2 DEFAULT NULL,
    merge_job_name                 IN VARCHAR2 DEFAULT NULL);
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
| propagation_name                 | The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you want to use a name that is different than the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. See “Usage Notes” on page 143-135 for more information. If a non-NULL value is specified, then an error is raised under either of the following conditions:  
  - The queue specified in the queue_name parameter does not exist.  
  - The queue specified in the queue_name parameter exists but is not used by a capture process. |
| queue_name                       | The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See “Usage Notes” on page 143-135 for more information. |
| merge_threshold                  | The merge threshold in seconds. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines whether or not the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing. |
| schedule_name                    | The name of the schedule for the merge job. If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually. |
You can use the `MERGE_STREAMS_JOB` procedure to merge two streams that were not split using the `SPLIT_STREAMS` procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the `MERGE_STREAMS_JOB` procedure completes, you can query the `DBA_CAPTURE` and `DBA_PROPAGATION` views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the `schedule_name` and `merge_job_name` parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

The `DBA_STREAMS_SPLIT_MERGE` view contains information about split and merge operations.

### Table 143–27 (Cont.) `MERGE_STREAMS_JOB` Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>merge_job_name</code></td>
<td>The name of the job that merges the streams. If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the <code>SPLIT_STREAMS</code> procedure that split the streams. Specify NULL if you run this procedure manually.</td>
</tr>
</tbody>
</table>
This procedure performs the actions required after instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the source database.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

**Attention:** When the `POST_INSTANTIATION_SETUP` procedure is run, the parameter values must match the parameter values specified when the corresponding `PRE_INSTANTIATION_SETUP` procedure was run, except for the values of the following parameters: `perform_actions`, `script_name`, `script_directory_object`, and `start_processes`.

**Note:** A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

POST_INSTANTIATION_SETUP Procedure

The source_database parameter specifies the global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.

The destination_database parameter specifies the global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.

The start_processes parameter is a boolean value that specifies whether to start each capture process and apply process. If TRUE, then the procedure starts each capture process and apply process. Any disabled capture or apply process created by the PRE_INSTANTIATION_SETUP procedure also is started. If FALSE, then the procedure does not start any capture processes or apply processes.

The instantiation_scn parameter specifies the instantiation SCN for the database objects at the destination database if the instantiation SCN was not set during instantiation. The instantiation SCN is not set automatically during RMAN instantiations, but the correct instantiation SCN value should be determined during an RMAN instantiation. See the Oracle Streams Replication Administrator’s Guide for more information. Specify NULL if the instantiation SCN was set for the database objects at the destination database during instantiation. The instantiation SCN can be set during export/import instantiations.

The exclude_schemas parameter is a comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas. Specify an asterisk (*) to exclude all of the schemas in the database. If NULL, then the procedure does not exclude any schemas in the database.

This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.

<table>
<thead>
<tr>

This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.</td>
</tr>
</tbody>
</table>
The following sections contain usage notes for this procedure.

**Self-Contained Tablespace Sets**

If the `maintain_mode` parameter is set to `TRANSPORTABLE TABLESPACES`, then the specified set of tablespaces must be self-contained. In this context “self-contained” means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

**See Also:** Oracle Database Administrator’s Guide for more information about self-contained tablespace sets

**Destination Database Renamed During RMAN Database Instantiation**

If the `maintain_mode` parameter is set to `GLOBAL`, then database instantiation is required before running the `POST_INSTANTIATION_SETUP` procedure. If the RMAN `DUPLICATE` or `CONVERT DATABASE` command is used for database instantiation, then the global name of the destination database can be renamed to the global name of the source database during instantiation. In this case, before you run the `POST_INSTANTIATION_SETUP` procedure, complete the following steps:

1. Rename the global name of the destination database back to the name specified in the `destination_database` parameter.

2. At the destination database, drop and recreate any loopback database links that existed on the source and were cloned on the destination database. For example, suppose the source database `dbs1.net` has a database link that refers to itself. Suppose the destination database is `dbs2.net`. At the destination database, drop and recreate this database link as a loopback database link that refers to itself (`dbs2.net`).

3. At the destination database, drop any database links that were cloned from the source database and are from the source database to the destination database. For example, if the source database is `dbs1.net` and the destination database is `dbs2.net`, then drop any database links on the destination database that are from `dbs1.net` to `dbs2.net`.

4. Create a database link from the destination database to the source database with the same name as the global name of the source database. The database link must be accessible to the Oracle Streams administrator at the destination database.

This database link is required because the `POST_INSTANTIATION_SETUP` procedure runs the `SET_GLOBAL_INSTANTIATION_SCN` procedure in the `DBMS_APPLY_ADM` package at the destination database, and the `SET_GLOBAL_INSTANTIATION_SCN` procedure requires the database link. The instantiation procedure...
SCN is set to the value specified in the instantiation_scn parameter of the POST_INSTANTIATION_SETUP procedure.

**Note:** When the RMAN DUPLICATE or CONVERT DATABASE command is used for database instantiation, the destination database cannot be the capture database.

**Oracle Streams Components Removed From the Destination Database**
If the maintain_mode parameter is set to GLOBAL, then database instantiation is required before running the POST_INSTANTIATION_SETUP procedure. During database instantiation, Oracle Streams components created by the PRE_INSTANTIATION_SETUP procedure, such as Oracle Streams clients and queues, can be copied from the source database to the destination database. The POST_INSTANTIATION_SETUP procedure removes the Stream components created by the PRE_INSTANTIATION_SETUP procedure from the destination database.

In some cases, rule sets and rules created by the PRE_INSTANTIATION_SETUP procedure might not be removed from the destination database. The POST_INSTANTIATION_SETUP procedure does not associate these rule sets and rules with any Stream clients in the destination database. Optionally, you can remove these rule sets and rules from the destination database after the POST_INSTANTIATION_SETUP procedure, or the script generated by the procedure, completes.

**Note:** The POST_INSTANTIATION_SETUP procedure only removes Oracle Streams components that were created by the PRE_INSTANTIATION_SETUP procedure. It does not remove Oracle Streams components that were created in a different way.
PRE_INSTANTIATION_SETUP Procedure

This procedure performs the actions required before instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the PRE_INSTANTIATION_SETUP procedure at the database that will be the source database in the Stream replication environment.
2. Perform any necessary instantiation actions.
3. Run the POST_INSTANTIATION_SETUP procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such as migrating a database to a different platform. In this case, use the CLEANUP_INSTANTIATION_SETUP procedure to remove the replication environment after the maintenance operation is complete.

**Note:**

- A capture process never captures changes in the SYS, SYSTEM, or CTXSYS schemas. This procedure does not configure replication for these schemas.
- When the RMAN DUPLICATE or CONVERT DATABASE command is used for database instantiation, the destination database cannot be the capture database.

**See Also:**

<td>If NULL, then the procedure uses the global name of the local database.</td>
</tr>
<tr>
<td>destination_database</td>
<td>The global name of the destination database.</td>
</tr>
<tr>
<td></td>
<td>If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>capture_queue_table</td>
<td>The name of the queue table for each queue used by a capture process, specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.</td>
</tr>
<tr>
<td>start_processes</td>
<td>If TRUE, then the procedure starts each capture process and apply process.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure does not start any capture processes or apply processes.</td>
</tr>
<tr>
<td>exclude_schemas</td>
<td>A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas. Specify an asterisk (*) to exclude all of the schemas in the database.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure does not exclude any schemas in the database.</td>
</tr>
<tr>
<td></td>
<td>This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.</td>
</tr>
<tr>
<td>exclude_flags</td>
<td>Specify what to exclude from the replication configuration in the schemas specified by the exclude_schemas parameter. See “Usage Notes” on page 143-143 for more information.</td>
</tr>
</tbody>
</table>
Self-Contained Tablespace Sets

If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then the specified set of tablespace must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespace pointing outside of the set of tablespace. For example, if a partitioned table is partially contained in the set of tablespace, then the set of tablespace is not self-contained.

See Also: Oracle Database Administrator’s Guide for more information about self-contained tablespace sets

The exclude_flags Parameter

Specify one of the following values:

- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL` to exclude changes to the schemas and all of the database objects in the schemas
- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED` to exclude changes to the database objects that are not supported by Oracle Streams in the schemas

If both of these values are specified, then the procedure raises an error.

In addition to `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL` or `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED`, specify one or both of the following values:

- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML` to exclude data manipulation language (DML) changes made to the excluded database objects
- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL` to exclude data definition language (DDL) changes made to the excluded database objects

Use the plus sign (+) to specify more than one of these values. For example, to maintain DML changes to the tables in a schemas specified by the exclude_schemas parameter but exclude DDL changes to these schemas and the database objects in these schemas, specify the following for this parameter:

```sql
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL + DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

To exclude DML and DDL changes made to unsupported database objects in the schemas specified by the exclude_schemas parameter, specify the following for this parameter:

```sql
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED + DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML + DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

Rules for the excluded database objects are added to the negative rule set of each capture process. Therefore, changes to the excluded database objects will not be captured and replicated.

This parameter is valid only if the maintain_mode parameter is set to GLOBAL and the exclude_schemas parameter is set to a non-NULL value. If the maintain_mode parameter is set to GLOBAL and the exclude_schemas parameter is set to a NULL, then the procedure ignores this parameter. If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then this the procedure ignores this parameter and excludes any database objects in the specified tablespace set that are not supported by Oracle Streams from the Oracle Streams configuration automatically.

Also, if schemas are specified in the exclude_schemas parameter, but the exclude_flags parameter is set to NULL, then the procedure does not add any rules to the negative rule set of any capture process, and the procedure includes the
schemas specified in the exclude_schemas parameter in the replication environment.
This procedure removes all Oracle Streams data dictionary information at the local database for the specified object. You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

Syntax

```sql
DBMS_STREAMS_ADM.PURGE_SOURCE_CATALOG(
    source_database     IN  VARCHAR2,
    source_object_name  IN  VARCHAR2,
    source_object_type  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database containing the object.</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>source_object_name</td>
<td>The name of the object specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>source_object_type</td>
<td>Type of the object. Currently, TABLE is the only possible object type.</td>
</tr>
</tbody>
</table>

Usage Notes

The global name of the source database containing the object must be specified for the source_database parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination database. Also, suppose hr.employees at dbs2.net is not a source at all. In this case, specifying dbs2.net as the source_database for this table results in an error. However, specifying dbs1.net as the source_database for this table while running the PURGE_SOURCE_CATALOG procedure at the dbs2.net database removes data dictionary information about the table at dbs2.net.

Do not run this procedure at a database if either of the following conditions are true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

**Note:** These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.
RECOVER_OPERATION Procedure

This procedure provides options for operations that stopped because they encountered an error. These operations include split and merge operations, Oracle Streams replication configuration operations, and Oracle Streams change table configuration operations. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.

This procedure only can perform these actions for the following operations:

- Split and merge operations using:
  - The split_threshold and merge_threshold capture process parameters set to non-NULL values to enable automatic split and merge
  - SPLIT_STREAMS Procedure
  - MERGE_STREAMS_JOB Procedure
- Change table configuration operations performed by the MAINTAIN_CHANGE_TABLE Procedure
- Replication configuration operations performed by the following procedures:
  - MAINTAIN_GLOBAL Procedure
  - MAINTAIN_SCHEMAS Procedure
  - MAINTAIN_SIMPLE_TABLESPACE Procedure
  - MAINTAIN_SIMPLE_TTS Procedure
  - MAINTAIN_TABLES Procedure
  - MAINTAIN_TABLESPACES Procedure
  - MAINTAIN_TTS Procedure
  - PRE_INSTANTIATION_SETUP Procedure
  - POST_INSTANTIATION_SETUP Procedure

Information about the operation is stored in the following data dictionary views when the operation is in process:

- DBA_RECOVERABLE_SCRIPT
- DBA_RECOVERABLE_SCRIPT_PARAMS
- DBA_RECOVERABLE_SCRIPT_BLOCKS
- DBA_RECOVERABLE_SCRIPT_ERRORS

For split and merge operations, the data dictionary views are populated at the database that contains the capture process. For the configuration operations, the data dictionary views are populated at the database where the replication configuration procedure was run.

When the operation completes successfully, metadata about the operation is moved from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views, DBA_RECOVERABLE_SCRIPT_PARAMS, DBA_RECOVERABLE_SCRIPT_BLOCKS, and DBA_RECOVERABLE_SCRIPT_ERRORS, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or
purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

For split and merge operations, run the `RECOVER_OPERATION` procedure at the database that contains the capture process. For the configuration operations, run the `RECOVER_OPERATION` procedure at the database where the replication configuration procedure was run.

---

**Note:**

- Regarding the configuration operations, the procedure must configure the environment directly (`perform_actions => TRUE`), not by generating a script, for information about the operation to be stored in the recoverable views and for the operation to be managed by the `RECOVER_OPERATION` procedure.
- To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10g Release 2 or later databases.

---

See Also: *Oracle Streams Replication Administrator’s Guide*

**Syntax**

```sql
DBMS_STREAMS_ADM.RECOVER_OPERATION(
   script_id       IN  RAW,
   operation_mode  IN  VARCHAR2  DEFAULT 'FORWARD');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script_id</td>
<td>The operation id of the operation that is being rolled forward, rolled back, or purged. Query the <code>SCRIPT_ID</code> column of the <code>DBA_RECOVERABLE_SCRIPT</code> data dictionary view to determine the operation id.</td>
</tr>
<tr>
<td>operation_mode</td>
<td>If <code>FORWARD</code>, then the procedure rolls forward the operation. Specify <code>FORWARD</code> to try to complete the operation.</td>
</tr>
<tr>
<td></td>
<td>If <code>ROLLBACK</code>, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view. The other views retain information about the operation for 30 days.</td>
</tr>
<tr>
<td></td>
<td>If <code>PURGE</code>, then the procedure moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view without rolling the operation back. The other views retain information about the operation for 30 days.</td>
</tr>
</tbody>
</table>
REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the Oracle Streams clients that are using the queue.

---

**Note:** The specified queue must be a ANYDATA queue.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.REMOVE_QUEUE(
    queue_name               IN  VARCHAR2,
    cascade                  IN  BOOLEAN DEFAULT FALSE,
    drop_unused_queue_table  IN  BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue to remove, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then the procedure drops any Oracle Streams clients that use the queue. If FALSE, then the procedure raises an error if there are any Oracle Streams clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no Oracle Streams clients are using the queue currently.</td>
</tr>
<tr>
<td>drop_unused_queue_table</td>
<td>If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.</td>
</tr>
</tbody>
</table>
**REMOVE_RULE Procedure**

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, apply process, propagation, or messaging client.

If this procedure results in an empty positive rule set for a messaging client, then the procedure drops the messaging client automatically.

---

**Note:** If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.REMOVE_RULE(
    rule_name         IN  VARCHAR2,
    streams_type      IN  VARCHAR2,
    streams_name      IN  VARCHAR2,
    drop_unused_rule  IN  BOOLEAN  DEFAULT TRUE,
    inclusion_rule    IN  BOOLEAN  DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule to remove, specified as <code>{schema_name.}</code>rule_name. If NULL, then the procedure removes all rules from the specified capture process, synchronous capture, apply process, propagation, or messaging client rule set. For example, to specify a rule in the hr schema named prop_rule1, enter hr.prop_rule1. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of Oracle Streams client:</td>
</tr>
<tr>
<td></td>
<td>- Specify capture for a capture process.</td>
</tr>
<tr>
<td></td>
<td>- Specify sync_capture for a synchronous capture.</td>
</tr>
<tr>
<td></td>
<td>- Specify propagation for a propagation.</td>
</tr>
<tr>
<td></td>
<td>- Specify apply for an apply process.</td>
</tr>
<tr>
<td></td>
<td>- Specify dequeue for a messaging client.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the Oracle Streams client, which can be a capture process, synchronous capture, propagation, apply process, or messaging client. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified Oracle Streams client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata.</td>
</tr>
<tr>
<td></td>
<td>If the specified Oracle Streams client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
drop_unused_rule
If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database.
If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database.
If FALSE, then the procedure does not drop the rule from the database.

inclusion_rule
If inclusion_rule is TRUE, then the procedure removes the rule from the positive rule set for the Oracle Streams client.
If inclusion_rule is FALSE, then the procedure removes the rule from the negative rule set for the Oracle Streams client.
REMOVE_STREAMS_CONFIGURATION Procedure

This procedure removes the Oracle Streams configuration at the local database.

**Syntax**

```sql
DBMS_STREAMS_ADM.REMOVE_STREAMS_CONFIGURATION;
```

**Usage Notes**

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_STREAMS_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_STREAMS_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_STREAMS_ADM` package.
Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

This procedure stops capture processes and apply processes before it drops them. This procedure does not drop rule sets or rules if they meet both of the following conditions:
- The rule sets or rules were created using the DBMS_RULE_ADM package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

**Attention:** Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire Oracle Streams configuration at a database.

**Note:**
- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

**See Also:**
- STOP_CAPTURE Procedure on page 32-50 in the DBMS_CAPTURE_ADM package
- STOP_APPLY Procedure on page 21-78 in the DBMS_APPLY_ADM package
- REMOVE_RULE Procedure on page 143-150 in the DBMS_STREAMS_ADM package
RENAMET_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule. For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

**Note:**
- The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Streams capture processes.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

**See Also:** *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes.

**Syntax**

```sql
DBMS_STREAMS_ADM.RENAME_COLUMN(
  rule_name         IN  VARCHAR2,
  table_name        IN  VARCHAR2,
  from_column_name  IN  VARCHAR2,
  to_column_name    IN  VARCHAR2,
  value_type        IN  VARCHAR2  DEFAULT '*',
  step_number       IN  NUMBER    DEFAULT 0,
  operation         IN  VARCHAR2  DEFAULT 'ADD');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as <code>[schema_name.]rule_name</code>. If NULL, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code>, enter <code>hr.employees12</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table in which the column is renamed in the row LCR, specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_column_name</td>
<td>The name of the column to be renamed in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>to_column_name</td>
<td>The new name of the column in each row LCR that satisfies the rule.</td>
</tr>
</tbody>
</table>
When 'REMOVE' is specified for the operation parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_COLUMN procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>from_column_name</th>
<th>to_column_name</th>
<th>step_number</th>
<th>Result</th>

</table>
RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule. For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

**Note:** Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

**See Also:** *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

### Syntax

```sql
DBMS_STREAMS_ADM.RENAME_SCHEMA(
  rule_name         IN  VARCHAR2,
  from_schema_name  IN  VARCHAR2,
  to_schema_name    IN  VARCHAR2,
  step_number       IN  NUMBER    DEFAULT 0,
  operation         IN  VARCHAR2  DEFAULT 'ADD');
```

### Parameters

**Table 143–35 RENAME_SCHEMA Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_schema_name</td>
<td>The name of the schema to be renamed in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>to_schema_name</td>
<td>The new name of the schema in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify ‘ADD’ to add the transformation to the rule.</td>
</tr>
<tr>
<td></td>
<td>Specify ‘REMOVE’ to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

### Usage Notes

When ‘REMOVE’ is specified for the `operation` parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified `from_schema_name`, `to_schema_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table
lists the behavior of the `RENAME_SCHEMA` procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>from_schema_name</th>
<th>to_schema_name</th>
<th>step_number</th>
<th>Result</th>

<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations with the specified to_schema_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.</td>
</tr>
</tbody>
</table>
RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

---

**Note:** Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

---

**See Also:** Oracle Streams Concepts and Administration for more information about declarative rule-based transformations

---

**Syntax**

```sql
DBMS_STREAMS_ADM.RENAME_TABLE(
    rule_name        IN  VARCHAR2,
    from_table_name  IN  VARCHAR2,
    to_table_name    IN  VARCHAR2,
    step_number      IN  NUMBER    DEFAULT 0,
    operation        IN  VARCHAR2  DEFAULT 'ADD');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as <code>[schema_name.]rule_name</code>. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter <code>hr.employees12</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_table_name</td>
<td>The name of the table to be renamed in each row LCR that satisfies the rule, specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>to_table_name</td>
<td>The new name of the table in each row LCR that satisfies the rule, specified as <code>[schema_name.]object_name</code>. For example, <code>humres.staff</code>. The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
</tbody>
</table>

**See Also:** Oracle Streams Concepts and Administration for more information about transformation ordering
Usage Notes

When ‘REMOVE’ is specified for the operation parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified from_table_name, to_table_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_TABLE procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>from_table_name</th>
<th>to_table_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all rename table transformations for the specified rule.</td>
</tr>

</tr>
</thead>
<tbody>
<tr>
<td>operation</td>
<td>Specify ‘ADD’ to add the transformation to the rule. Specify ‘REMOVE’ to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>
SET_MESSAGE_NOTIFICATION Procedure

This procedure sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue. A notification is sent when a message is enqueued into the specified queue and the specified messaging client can dequeue the message because the message satisfies its rule sets.

---

**Note:**

- Currently, messaging clients cannot dequeue buffered messages.
- The DBMS_AQ package can also configure notifications. The DBMS_AQ package provides some notification features that are not available in DBMS_STREAMS_ADM package, such as buffered message notifications and notification grouping by time.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.SET_MESSAGE_NOTIFICATION(
    streams_name          IN  VARCHAR2,
    notification_action   IN  VARCHAR2,
    notification_type     IN  VARCHAR2     DEFAULT 'PROCEDURE',
    notification_context  IN  ANYDATA      DEFAULT NULL,
    include_notification  IN  BOOLEAN      DEFAULT TRUE,
    queue_name            IN  VARCHAR2     DEFAULT 'streams_queue');
```

**Parameters**

*Table 143–37  SET_MESSAGE_NOTIFICATION Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the Oracle Streams messaging client. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>For example, if the user strmadmin is the messaging client, then specify strmadmin.</td>
</tr>
</tbody>
</table>
### Table 143–37  (Cont.) SET_MESSAGE_NOTIFICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notification_action</td>
<td>The action to be performed on message notification. Specify one of the following:</td>
</tr>
<tr>
<td></td>
<td>- For URL notifications, specify a URL without the prefix http://.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify the URL <a href="http://www.company.com:8080">http://www.company.com:8080</a>, enter the following:</td>
</tr>
<tr>
<td></td>
<td><a href="http://www.company.com:8080">www.company.com:8080</a></td>
</tr>
<tr>
<td></td>
<td>- For email notifications, specify an email address.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify an email address <a href="mailto:xyz@company.com">xyz@company.com</a>, enter the following:</td>
</tr>
<tr>
<td></td>
<td><a href="mailto:xyz@company.com">xyz@company.com</a></td>
</tr>
<tr>
<td></td>
<td>- For PL/SQL procedure notifications, specify an existing user-defined PL/SQL procedure in the form <code>{schema_name}.procedure_name</code>. If the schema_name is not specified, then the user who invokes the SET_MESSAGE_NOTIFICATION procedure is the default. The procedure must be a PLSQLCALLBACK data structure.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a procedure named notify_orders in the oe schema, enter the following:</td>
</tr>
<tr>
<td></td>
<td>oe.notify_orders</td>
</tr>
<tr>
<td>See Also:</td>
<td>Examples on page 143-164 for more information about message notification procedures</td>
</tr>
<tr>
<td>notification_type</td>
<td>The type of notification. Specify one of the following:</td>
</tr>
<tr>
<td></td>
<td>- HTTP if you specified a URL for notification_action</td>
</tr>
<tr>
<td></td>
<td>- MAIL if you specified an email address for notification_action</td>
</tr>
<tr>
<td></td>
<td>- PROCEDURE if you specified a user-defined procedure for notification_action</td>
</tr>
<tr>
<td></td>
<td>The type must match the specification for the notification_action parameter.</td>
</tr>
<tr>
<td>notification_context</td>
<td>The context of the notification. The context must be specified using RAW data type information. For example, to specify the hexadecimal equivalent of 'FF', enter the following:</td>
</tr>
<tr>
<td></td>
<td>ANYDATA.ConvertRaw(HEXTORAW('FF'))</td>
</tr>
<tr>
<td></td>
<td>The notification context is passed the PL/SQL procedure in procedure notifications and is not relevant for mail or HTTP notifications.</td>
</tr>
<tr>
<td>include_notification</td>
<td>If TRUE, then the procedure adds this notification for the specified streams_name and queue_name. That is, specifying TRUE turns on the notification for the streams_name and queue_name.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure removes this notification for the specified streams_name and queue_name. That is, specifying FALSE turns off the notification for the streams_name and queue_name. If you specify FALSE, then this procedure ignores any specified values for the notification_action or notification_context parameters.</td>
</tr>
</tbody>
</table>
**Usage Notes**

You can specify one of the following types of notifications:

- An email address to which message notifications are sent. When a relevant message is enqueued into the queue, an email with the message properties is mailed to the specified email address.

- A PL/SQL procedure to be invoked on a notification. When a relevant message is enqueued into the queue, the specified PL/SQL procedure is invoked with the message properties. This PL/SQL procedure can dequeue the message.

- An HTTP URL to which the notification is posted. When a relevant message is enqueued into the queue, a notification with the message properties is posted to the specified URL specified.

A client does not need to be connected to the database to receive a notification.

If you register for email notifications, then you should use the `DBMS_AQELM` package to set the host name and port name for the SMTP server that will be used by the database to send email notifications. If required, then you should set the send-from email address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you might want to use the `DBMS_AQELM` package to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

Each notification is an `AQXmlNotification`, which includes the following:

- `notification_options`, which includes the following:
  - `destination` - The destination queue from which the message was dequeued
  - `consumer_name` - The name of the messaging client that dequeued the message
  - `message_set` - The set of message properties
See Also:

- The documentation for the `DBMS_AQELM` package for more information on email notifications and HTTP notifications
- *Oracle Database 2 Day + Data Replication and Integration Guide* for an example that configures message notification to automatically dequeue of messages of interest
- *Oracle Streams Advanced Queuing User’s Guide* and *Oracle XML DB Developer’s Guide* for more information about message notifications and XML
- *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

Examples

If you use a message notification procedure, then this PL/SQL procedure must have the following signature:

```plsql
PROCEDURE procedure_name(
    context  IN  ANYDATA,
    reginfo  IN  SYS.AQ$_REG_INFO,
    descr    IN  SYS.AQ$_DESCRIPTOR);
```

Here, `procedure_name` stands for the name of the procedure. The procedure is a `PLSQLCALLBACK` data structure that specifies the user-defined PL/SQL procedure to be invoked on message notification.

The following is a simple example of a notification procedure that dequeues a message of type `oe.user_msg` using the message identifier and consumer name sent by the notification. To complete the example, first create the type:

```sql
CREATE TYPE oe.user_msg AS OBJECT(
    object_name    VARCHAR2(30),
    object_owner   VARCHAR2(30),
    message        VARCHAR2(50)); /
```

Next, create the procedure:

```sql
CREATE OR REPLACE PROCEDURE oe.notification_dequeue(
    context  ANYDATA,
    reginfo  SYS.AQ$_REG_INFO,
    descr    SYS.AQ$_DESCRIPTOR)
AS
    dequeue_options     DBMS_AQ.DEQUEUE_OPTIONS_T;
    message_properties  DBMS_AQ.MESSAGE_PROPERTIES_T;
    message_handle      RAW(16);
    message             ANYDATA;
    oe_message          oe.user_msg;
    rc                  PLS_INTEGER;
BEGIN
    -- Get the message identifier and consumer name from the descriptor
    dequeue_options.msgid := descr.msg_id;
    dequeue_options.consumer_name := descr.consumer_name;
    -- Dequeue the message
    DBMS_AQ.DEQUEUE(
        queue_name => descr.queue_name,
        dequeue_options => dequeue_options,
        message_properties => message_properties,
        message_properties => message_properties,
```
See Also: Oracle Database PL/SQL Packages and Types Reference for more information about PLSQLCALLBACK data structures
SET_MESSAGE_TRACKING Procedure

Sets the tracking label for logical change records (LCRs) produced by the current session. This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

---

**Note:** The tracking label set by this procedure does not track non-LCR messages.

---

See Also: GET_MESSAGE_TRACKING Function on page 143-83

Syntax

```sql
DBMS_STREAMS_ADM.SET_MESSAGE_TRACKING(
    tracking_label IN VARCHAR2  DEFAULT 'Streams_tracking',
    actions        IN NUMBER    DEFAULT DBMS_STREAMS_ADM.ACTION_MEMORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tracking_label</td>
<td>The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session. The size limit for a label is 4,000 bytes.</td>
</tr>
<tr>
<td>actions</td>
<td>When DBMS_STREAMS_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory, and the V$STREAMS_MESSAGE_TRACKING dynamic performance view is populated with information about the LCRs. Currently, DBMS_STREAMS_ADM.ACTION_MEMORY is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.</td>
</tr>
</tbody>
</table>
SET_RULE_TRANSFORM_FUNCTION Procedure

This procedure sets or removes the transformation function name for a custom rule-based transformation.

**Syntax**

```sql
DBMS_STREAMS_ADM.SET_RULE_TRANSFORM_FUNCTION(
    rule_name           IN  VARCHAR2,
    transform_function  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule whose rule-based transformation function you are setting or removing, specified as [schema_name.]rule_name. For example, to specify a rule in the hr schema named prop_rule1, enter hr.prop_rule1. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>transform_function</td>
<td>Either the name of the transformation function to be used in the rule-based transformation for the rule or NULL. If you specify a transformation function name, then specify an existing function in one of the following forms:</td>
</tr>
<tr>
<td></td>
<td>■ [schema_name.]function_name</td>
</tr>
<tr>
<td></td>
<td>■ [schema_name.]package_name.function_name</td>
</tr>
<tr>
<td></td>
<td>If the function is in a package, then you must specify the package_name. For example, to specify a function in the transform_pkg package in the hr schema named executive_to_management, enter hr.transform_pkg.executive_to_management. An error is returned if the specified procedure does not exist.</td>
</tr>
<tr>
<td></td>
<td>If the schema_name is not specified, then the user who invokes the rule-based transformation function is the default.</td>
</tr>
<tr>
<td></td>
<td>If you specify NULL, then the SET_RULE_TRANSFORM_FUNCTION procedure removes the current custom rule-based transformation from the rule.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following sections contain usage notes for this procedure:

- Transformation Function Signature
- Rule Action Context
- User Who Calls the Transformation Function
- Function Verification

**Transformation Function Signature**

A custom rule-based transformation function always operates on one message, but it can return one message or many messages. A custom rule-based transformation function that returns one message is a one-to-one transformation function. A one-to-one transformation function must have the following signature:
FUNCTION user_function (  
    parameter_name  IN ANYDATA)  
RETURN ANYDATA;

Here, *user_function* stands for the name of the function and *parameter_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an *ANYDATA* encapsulation of a message, and the function must return an *ANYDATA* encapsulation of a message.

A custom rule-based transformation function that can return more than one message is a one-to-many transformation function. A one-to-many transformation function must have the following signature:

FUNCTION user_function (  
    parameter_name  IN ANYDATA)  
RETURN STREAMS$_ANYDATA_ARRAY;

Here, *user_function* stands for the name of the function and *parameter_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an *ANYDATA* encapsulation of a message, and the function must return an array that contains zero or more *ANYDATA* encapsulations of a message. If the array contains zero *ANYDATA* encapsulations of a message, then the original message is discarded.

The *STREAMS$_ANYDATA_ARRAY* type is an Oracle-supplied type that has the following definition:

```
CREATE OR REPLACE TYPE SYS.STREAMS$_ANYDATA_ARRAY
  AS VARRAY(2147483647) of ANYDATA
/
```

The following restrictions apply to custom rule-based transformations that use one-to-many functions:

- Rules that are associated with one-to-many functions are supported for Oracle Streams capture processes only. These rules must not be added to rule sets used by other Oracle Streams clients, including propagations, apply processes, and messaging clients.
- One-to-many functions only can operate on row logical change records (row LCRs). They cannot operate on DDL LCRs.
- Row LCRs returned by a one-to-many function cannot contain piecewise LOB, LONG, or LONG RAW operations.
- The one-to-many function must return row LCRs in the correct order. The order of row LCRs in the array (starting from index 1) is the order that the row LCRs will be executed in the transaction.

When an apply process dequeues row LCRs that are the result of a transformation by a one-to-many function, the apply process uses the instantiation SCN of the LCR passed to the one-to-many function for all of row LCRs.
Summary of DBMS_STREAMS_ADM Subprograms

Rule Action Context
This procedure modifies the specified rule's action context to specify the transformation. A rule's action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. The client of the rules engine can be a user-created application or an internal feature of Oracle, such as Oracle Streams. The Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A custom rule-based transformation in Oracle Streams always consists of the following name-value pair in an action context:

- If the function is a one-to-one transformation function, then the name is STREAMS$_TRANSFORM_FUNCTION. If the function is a one-to-many transformation function, then the name is STREAMS$_ARRAY_TRANS_FUNCTION.
- The value is a ANYDATA instance containing a PL/SQL function name specified as a VARCHAR2. This function performs the transformation.

User Who Calls the Transformation Function
The user that calls the transformation function must have EXECUTE privilege on the function. The following list describes which user calls the transformation function:

- If a transformation is specified for a rule used by a capture process, then the user who calls the transformation function is the capture user for the capture process.
- If a transformation is specified for a rule used by a synchronous capture, then the user who calls the transformation function is the capture user for the synchronous capture.
- If a transformation is specified for a rule used by a propagation, then the user who calls the transformation function is the owner of the source queue for the propagation.
- If a transformation is specified on a rule used by an apply process, then the user who calls the transformation function is the apply user for the apply process.
- If a transformation is specified on a rule used by a messaging client, then the user who calls the transformation function is the user who invokes the messaging client.

Note:
- An error is raised if a one-to-one or one-to-many transformation function returns NULL.
- Only one custom rule-based transformation can be specified for a particular rule. You cannot specify both a one-to-one and a one-to-many transformation function for the same rule.
- For any LCR constructed and returned by a custom rule-based transformation, the source_database_name, transaction_id, and scn parameter values must match the values in the original LCR. Oracle automatically specifies the values in the original LCR for these parameters, even if an attempt is made to construct LCRs with different values.
Function Verification
This procedure does not verify that the specified transformation function exists. If the function does not exist, then an error is raised when an Oracle Streams client tries to invoke the transformation function.
SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

See Also:

- "GET_TAG Function" on page 143-86
- Oracle Streams Replication Administrator's Guide for more information about tags

Syntax

DBMS_STREAMS_ADM.SET_TAG(
    tag  IN RAW  DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.</td>
</tr>
</tbody>
</table>

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

EXEC DBMS_STREAMS_ADM.SET_TAG(tag => HEXTORAW('17'));

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also: BUILD Procedure on page 32-18
SET_UP_QUEUE Procedure

This procedure creates a queue table and a **ANYDATA** queue.

**Syntax**

```
DBMS_STREAMS_ADM.SET_UP_QUEUE(
  queue_table IN VARCHAR2 DEFAULT 'streams_queue_table',
  storage_clause IN VARCHAR2 DEFAULT NULL,
  queue_name IN VARCHAR2 DEFAULT 'streams_queue',
  queue_user IN VARCHAR2 DEFAULT NULL,
  comment IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

**Table 143-41 SET_UP_QUEUE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>The name of the queue table specified as <code>[schema_name.]queue_table_name</code>. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner. Queue table names can be a maximum of 24 bytes.</td>
</tr>
<tr>
<td>storage_clause</td>
<td>The storage clause for queue table. The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause. If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause. If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created. <strong>See Also</strong>: Oracle Database SQL Language Reference for more information about storage clauses</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the queue that will function as the ANYDATA queue, specified as <code>[schema_name.]queue_name</code>. For example, strmadmin.streams_queue. If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue. If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default. Queue names can be a maximum of 24 bytes.</td>
</tr>
</tbody>
</table>
Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the `CREATE_QUEUE_TABLE` procedure in the `DBMS_AQADM` package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

  Also, if the database is Oracle Database 10g release 2 or later, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `commit_time`. If the database is a release prior to Oracle Database 10g release 2, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `enq_time`.

- If the specified queue table already exists, then the queue uses the properties of the existing queue table.

- If the specified queue name does not exist, then this procedure runs the `CREATE_QUEUE` procedure in the `DBMS_AQADM` package to create the queue.

- This procedure starts the queue.

- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants `ENQUEUE` and `DEQUEUE` privileges on the queue to the specified queue user.

  To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not already exist. If an agent with this name already exists and is associated with the queue user only, then it is used. `SET_UP_QUEUE` then runs the `ENABLE_DB_ACCESS` procedure in the `DBMS_AQADM` package, specifying the agent and the user.
Note:

- To enqueue messages into and dequeue messages from a queue, a queue user must have EXECUTE privilege on the DBMS_STREAMS_MESSAGING package or the DBMS_AQ package. The SET_UP_QUEUE procedure does not grant this privilege.

- If the agent that SET_UP_QUEUE tries to create already exists and is associated with a user other than the user specified by queue_user, then the procedure raises an error. In this case, rename or remove the existing agent, and retry SET_UP_QUEUE.

See Also: Oracle Streams Concepts and Administration for more information about secure queue users
**SPLIT_STREAMS Procedure**

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill messages to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.

2. Creates a new propagation that propagates messages from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.

3. Stops the capture process.

4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.

5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.

6. Drops the original propagation.

7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.

8. If the **auto_merge_threshold** parameter is set to a positive number, then creates an Oracle Scheduler job to run the **MERGE_STREAMS_JOB** procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the **MERGE_STREAMS_JOB** procedure runs the **MERGE_STREAMS** procedure to merge the streams automatically.

After the SPLIT_STREAMS procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the **START_CAPTURE** procedure in the **DBMS_CAPTURE_ADM** package.

The **DBA_STREAMS_SPLIT_MERGE** view contains the name of each cloned component, as well as other information about the split and merge operation.
SPLIT_STREAMS Procedure

Note: If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

See Also:
- "MERGE_STREAMS Procedure" on page 143-130
- "MERGE_STREAMS_JOB Procedure" on page 143-133
- Oracle Streams Replication Administrator’s Guide for instructions on using the SPLIT_STREAMS procedure

Syntax

```sql
DBMS_STREAMS_ADM.SPLIT_STREAMS(
    propagation_name IN VARCHAR2,
    cloned_propagation_name IN VARCHAR2 DEFAULT NULL,
    cloned_queue_name IN VARCHAR2 DEFAULT NULL,
    cloned_capture_name IN VARCHAR2 DEFAULT NULL,
    perform_actions IN BOOLEAN DEFAULT TRUE,
    script_name IN VARCHAR2 DEFAULT NULL,
    script_directory_object IN VARCHAR2 DEFAULT NULL,
    auto_merge_threshold IN NUMBER DEFAULT NULL,
    schedule_name IN OUT VARCHAR2,
    merge_job_name IN OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation that cannot send messages to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.</td>
</tr>
<tr>
<td>cloned_queue_name</td>
<td>The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.</td>
</tr>
<tr>
<td>cloned_capture_name</td>
<td>The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.</td>
</tr>
</tbody>
</table>
perform_actions
If TRUE, then the procedure performs the necessary actions to split the stream directly.
If FALSE, then the procedure does not perform the necessary actions to split the stream directly.
Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:
- script_name
- script_directory_object

script_name
If non-NULL and the perform_actions parameter is TRUE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.
If non-NULL and the perform_actions parameter is FALSE, then the procedure generates the specified script and performs the actions to split the stream directly.
If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script.
If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.

script_directory_object
The directory object for the directory on the local computer system into which the generated script is placed.
If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.
If NULL and the script_name parameter is non-NULL, then the procedure raises an error.
Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. The value of the `CAPTURE_MESSAGE_CREATE_TIME` column for each capture process in the `GV$STREAMS_CAPTURE` dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between `CAPTURE_MESSAGE_CREATE_TIME` of the cloned capture process and the original capture process is less than or equal to the value specified for the `auto_merge_threshold` parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.

If `NULL` or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the `MERGE_STREAM` procedure manually when the `CAPTURE_MESSAGE_CREATE_TIME` of the cloned capture process catches up to, or nearly catches up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process.

The `CAPTURE_MESSAGE_CREATE_TIME` records the time when a captured change was recorded in the redo log.

### schedule_name

The Oracle Scheduler schedule name, specified as `[schema_name].schedule_name`. For example, `strmadmin.merge_schedule`. If the schema is not specified, then the current user is the default.

If `auto_merge_threshold` is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name if you want to adhere to naming conventions or if you want to track the schedule more easily.

If `NULL` and `auto_merge_threshold` is a non-NULL positive number, then the system generates a schedule name.

If `auto_merge_threshold` is `NULL` or 0 (zero), then this parameter must be `NULL`.

If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.

If an existing schedule name is specified, an error is raised.

### merge_job_name

The Oracle Scheduler job name, specified as `[schema_name].merge_job_name`. For example, `strmadmin.merge_job`. If the schema is not specified, then the current user is the default.

If `auto_merge_threshold` is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name if you want to adhere to naming conventions or if you want to track the job more easily.

If `NULL` and `auto_merge_threshold` is a non-NULL positive number, then the system generates a job name.

If `auto_merge_threshold` is `NULL` or 0 (zero), then this parameter must be `NULL`.

If an existing job name is specified, an error is raised.

### Table 143–42 (Cont.) SPLIT_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto_merge_threshold</td>
<td>If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the <code>MERGE_STREAMS_JOB</code> procedure at set intervals according to its schedule. The value of the <code>CAPTURE_MESSAGE_CREATE_TIME</code> column for each capture process in the <code>GV$STREAMS_CAPTURE</code> dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process and the original capture process is less than or equal to the value specified for the <code>auto_merge_threshold</code> parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream. If <code>NULL</code> or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the <code>MERGE_STREAM</code> procedure manually when the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process catches up to, or nearly catches up to, the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the original capture process. The <code>CAPTURE_MESSAGE_CREATE_TIME</code> records the time when a captured change was recorded in the redo log.</td>
</tr>
<tr>
<td>schedule_name</td>
<td>The Oracle Scheduler schedule name, specified as <code>[schema_name].schedule_name</code>. For example, <code>strmadmin.merge_schedule</code>. If the schema is not specified, then the current user is the default. If <code>auto_merge_threshold</code> is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name if you want to adhere to naming conventions or if you want to track the schedule more easily. If <code>NULL</code> and <code>auto_merge_threshold</code> is a non-NULL positive number, then the system generates a schedule name. If <code>auto_merge_threshold</code> is <code>NULL</code> or 0 (zero), then this parameter must be <code>NULL</code>. If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run. If an existing schedule name is specified, an error is raised.</td>
</tr>
<tr>
<td>merge_job_name</td>
<td>The Oracle Scheduler job name, specified as <code>[schema_name].merge_job_name</code>. For example, <code>strmadmin.merge_job</code>. If the schema is not specified, then the current user is the default. If <code>auto_merge_threshold</code> is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name if you want to adhere to naming conventions or if you want to track the job more easily. If <code>NULL</code> and <code>auto_merge_threshold</code> is a non-NULL positive number, then the system generates a job name. If <code>auto_merge_threshold</code> is <code>NULL</code> or 0 (zero), then this parameter must be <code>NULL</code>. If an existing job name is specified, an error is raised.</td>
</tr>
</tbody>
</table>

  See Also: Oracle Streams Concepts and Administration for instructions about using this package
Using DBMS_STREAMS_ADVISOR_ADM

This section contains topics which relate to using the DBMS_STREAMS_ADVISOR_ADM package.

- Overview
- Security Model
- Constants
- Views
Overview

The `DBMSSTREAMSADVISOR_ADM` package enables you to gather and analyze information about an Oracle Streams environment. You can use this information in the following ways:

- To populate data dictionary views with an Oracle Streams topology that contains information about the Oracle Streams components at one or more databases
- To examine the Oracle Streams components at one or more databases in your environment and the ways in which information flows through streams that include these components
- To analyze the performance of the Oracle Streams components in your environment
- To detect performance problems with Oracle Streams components and correct these problems

See Also: *Oracle Streams Concepts and Administration* for instructions about using this package
Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

See Also: Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator.
Constants

The DBMS_STREAMS_ADVISOR_ADM package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_DBMS_ADVISOR_ADM.CAPTURE_TYPE.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component_type</td>
<td>CAPTURE_TYPE</td>
<td>NUMBER</td>
<td>CAPTURE_TYPE indicates that the Oracle Streams component is a capture process. The constant number for this option is 1.</td>
</tr>
<tr>
<td></td>
<td>PROPAGATION_SENDER_TYPE</td>
<td></td>
<td>PROPAGATION_SENDER_TYPE indicates that the Oracle Streams component is a propagation sender. The constant number for this option is 2.</td>
</tr>
<tr>
<td></td>
<td>PROPAGATION_RECEIVER_TYPE</td>
<td></td>
<td>PROPAGATION_RECEIVER_TYPE indicates that the Oracle Streams component is a propagation receiver. The constant number for this option is 3.</td>
</tr>
<tr>
<td></td>
<td>APPLY_TYPE</td>
<td></td>
<td>APPLY_TYPE indicates that the Oracle Streams component is an apply process. The constant number for this option is 4.</td>
</tr>
<tr>
<td></td>
<td>QUEUE_TYPE</td>
<td></td>
<td>QUEUE_TYPE indicates that the Oracle Streams component is a queue. The constant number for this option is 5.</td>
</tr>
</tbody>
</table>
Views

The `DBMS_STREAMS_ADVISOR_ADM` package uses the following views:

- `DBA_STREAMS_TP_COMPONENT` contains information about each Oracle Streams component at each database.
- `DBA_STREAMS_TP_COMPONENT_LINK` contains information about how messages flow between Oracle Streams components.
- `DBA_STREAMS_TP_COMPONENT_STAT` contains temporary performance statistics about each Oracle Streams component.
- `DBA_STREAMS_TP_DATABASE` contains information about each database that contains Oracle Streams components.
- `DBA_STREAMS_TP_PATH_BOTTLENECK` contains temporary information about Oracle Streams components that might be slowing down the flow of a stream.
- `DBA_STREAMS_TP_PATH_STAT` contains temporary performance statistics about each stream path that exists in the Oracle Streams topology.

The topology information is stored permanently in the following data dictionary views: `DBA_STREAMS_TP_DATABASE`, `DBA_STREAMS_TP_COMPONENT`, and `DBA_STREAMS_TP_COMPONENT_LINK`.

However, the following views contain temporary information: `DBA_STREAMS_TP_COMPONENT_STAT`, `DBA_STREAMS_TP_PATH_BOTTLENECK`, and `DBA_STREAMS_TP_PATH_STAT`. Some of the data in these views is retained only for the user session that runs the `ANALYZE_CURRENT_PERFORMANCE` procedure. When this user session ends, this temporary information is purged.

See Also:

- *Oracle Database Reference*
- *Oracle Streams Concepts and Administration* for sample queries that use these views
Operational Notes

This section contains the following operational notes for the DBMS_STREAMS_ADVISOR_ADM package:

- Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package
- General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package

The DBMS_STREAMS_ADVISOR_ADM analyzes the following Oracle Streams components at the specified databases:

- Capture processes
- Propagations
- Apply processes
- Queues

The DBMS_STREAMS_ADVISOR_ADM package does not analyze the following Oracle Streams components:

- Synchronous captures
- Messaging clients

General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

To use the DBMS_STREAMS_ADVISOR_ADM package, complete the following general steps:

1. Identify the database that you will use to gather the information.
   
   An administrative user at this database must meet the following requirements:
   
   - The user must have access to a database link to each database that contains Oracle Streams components.
   - The user must have been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure.

   In an Oracle Streams environment, the Oracle Streams administrator uses this package.

   If no database in your environment meets these requirements, then choose a database, configure the necessary database links, and grant the necessary privileges to the users before proceeding.

2. Connect as the administrative user to the database you identified in Step 1, and remain connected to the session while you complete the remaining steps.

3. Run the ANALYZE_CURRENT_PERFORMANCE procedure.

4. Optionally, allow messages to flow in the environment for some time.

5. Optionally, rerun the ANALYZE_CURRENT_PERFORMANCE procedure one or more times.
6. Query the data dictionary views listed in "Views" on page 144-6 to analyze the Oracle Streams environment.

7. If you want to update the information in the data dictionary views or if you add new Oracle Streams components to any database in the environment, repeat Steps 2-6.

---

**Note:** When you exit the user session, the rate, bandwidth, event, and flow control statistics are purged from the data dictionary views.
Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms

Table 144–2  DBMS_STREAMS_ADVISOR_ADM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYZE_CURRENT_PERFORMANCE Procedure on page 144-10</td>
<td>Gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered</td>
</tr>
</tbody>
</table>
ANALYZE_CURRENT_PERFORMANCE Procedure

This procedure gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered.

The performance analyses includes:

- Calculating bottleneck components for each separate stream
- Calculating the throughput of each Oracle Streams component
- Calculating the latency of each Oracle Streams component
- Calculating the top wait event of each Oracle Streams component
- Calculating the message rate of each stream
- Calculating the transaction rate of each stream

The procedure places the gathered information in data dictionary views.

---

**Note:** The parameters in this procedure must all be either non-NULL or NULL.

---

**See Also:**

- *Oracle Streams Concepts and Administration* for instructions on using this procedure
- "Views" on page 144-6

**Syntax**

```sql
DBMSSTREAMS_ADM.ANALYZE_CURRENT_PERFORMANCE(
    component_name  IN  VARCHAR2  DEFAULT NULL,
    component_db    IN  VARCHAR2  DEFAULT NULL,
    component_type  IN  NUMBER    DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component_name</td>
<td>The name of the Oracle Streams component to analyze. For example, to analyze a capture process named capture01, then specify capture01. If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.</td>
</tr>
<tr>
<td>component_db</td>
<td>The global name of the database that contains the component specified in the component_name parameter. For example, if the db.net database contains the component, then specify db.net. If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.</td>
</tr>
</tbody>
</table>
component_type

The type of the component specified in the component_name parameter. If the component_name parameter is non-NULL, then specify one of the following:

- DBMS_STREAMS_ADVISOR_ADM.CAPTURE_TYPE
- DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_SENDER_TYPE
- DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_RECEIVER_TYPE
- DBMS_STREAMS_ADVISOR_ADM.APPLY_TYPE
- DBMS_STREAMS_ADVISOR_ADM.QUEUE_TYPE

See "Constants" on page 144-5 for information about these constants.

If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.
The DBMS_STREAMS_AUTH package, one of a set of Oracle Streams packages, provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

This chapter contains the following topics:

- Using DBMS_STREAMS_AUTH
  - Overview
  - Security Model
- Summary of DBMS_STREAMS_AUTH Subprograms
Using DBMS_STREAMS_AUTH

This section contains topics which relate to using the DBMS_STREAMS_AUTH package.

- Overview
- Security Model
Overview

This package provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

**See Also:** Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and Oracle Streams administrators.
Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.
### Summary of DBMS_STREAMS_AUTH Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT_ADMIN_PRIVILEGE Procedure on page 145-6</td>
<td>Either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that can be used to grant these privileges.</td>
</tr>
<tr>
<td>GRANT_REMOTE_ADMIN_ACCESS Procedure on page 145-9</td>
<td>Enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.</td>
</tr>
<tr>
<td>REVOKE_ADMIN_PRIVILEGE Procedure on page 145-10</td>
<td>Either revokes Oracle Streams administrator privileges from a user directly, or generates a script that can be used to revoke these privileges.</td>
</tr>
<tr>
<td>REVOKE_REMOTE_ADMIN_ACCESS Procedure on page 145-12</td>
<td>Disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link.</td>
</tr>
</tbody>
</table>

**Note:** All subprograms commit unless specified otherwise.
GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that can be used to grant these privileges.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE(
  grantee           IN  VARCHAR2,
  grant_privileges  IN  BOOLEAN   DEFAULT TRUE,
  file_name         IN  VARCHAR2  DEFAULT NULL,
  directory_name    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user to whom privileges are granted</td>
</tr>
<tr>
<td>grant_privileges</td>
<td>If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fail, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.</td>
</tr>
<tr>
<td>directory_name</td>
<td>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED_SESSION system privilege
- EXECUTE on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ
  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQELM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
  - DBMS_LOCK
  - DBMS_PROPAGATION_ADM
  - DBMS_RULE_ADM
  - DBMS_STREAMS_ADM
  - DBMS_STREAMS_ADVISOR_ADM
  - DBMS_STREAMS_HANDLER_ADM
  - DBMS_STREAMS_MESSAGING
  - DBMS_TRANSFORM

- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

In addition, the grantee has the ability to grant these privileges to other users.

- SELECT_CATALOG_ROLE
- SELECT privilege on data dictionary views related to Oracle Streams
- The ability to allow a remote Oracle Streams administrator to perform administrative actions through a database link by connecting to the grantee. This ability is enabled by running the `GRANT_REMOTE_ADMIN_ACCESS` procedure in this package.

**Note:**
- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure does not grant any roles to the grantee.
- This procedure grants only the privileges necessary to configure and administer an Oracle Streams environment. You can grant more privileges to the grantee if necessary.
See Also:

- GRANT_REMOTE_ADMIN_ACCESS Procedure on page 145-9
- Oracle Streams Replication Administrator’s Guide for more information about configuring an Oracle Streams administrator
GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```sql
DBMS_STREAMS_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
    grantee IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user who allows remote access. The procedure adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.</td>
</tr>
</tbody>
</table>

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The Oracle Streams administrator at a downstream capture database administers the source database using this connection. You can also run the procedure at a database running an apply process so that a remote Oracle Streams administrator can set instantiation SCNs at the local database.

---

**Note:** The GRANT_ADMIN_PRIVILEGE procedure runs this procedure.

---

**See Also:** GRANT_ADMIN_PRIVILEGE Procedure on page 145-6
REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes Oracle Streams administrator privileges from a user directly, or generates a script that can be used to revoke these privileges.

Syntax

```sql
DBMS_STREAMS_AUTH.REVOKE_ADMIN_PRIVILEGE(
  grantee            IN  VARCHAR2,
  revoke_privileges  IN  BOOLEAN   DEFAULT TRUE,
  file_name          IN  VARCHAR2  DEFAULT NULL,
  directory_name     IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user from whom privileges are revoked</td>
</tr>
<tr>
<td>revoke_privileges</td>
<td>If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fail, then the procedure raises an error. A revoke statement will fail if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges to the specified user directly, and does not remove the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.</td>
</tr>
<tr>
<td>directory_name</td>
<td>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NUL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.
Note: To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

See Also: GRANT_ADMIN_PRIVILEGE Procedure on page 145-6
REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link.

**Note:** The REVOKE_ADMIN_PRIVILEGE procedure runs this procedure.

**See Also:** REVOKE_ADMIN_PRIVILEGE Procedure on page 145-10

**Syntax**

```sql
DBMS_STREAMS_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
    grantee  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user for whom access from a remote Oracle Streams administrator is disabled.</td>
</tr>
</tbody>
</table>

If a row for the grantee exists in the `DBA_STREAMS_ADMINISTRATOR` data dictionary view, then the procedure updates the `ACCESS_FROM_REMOTE` column for the grantee to `NO`. If, after this update, both the `LOCAL_PRIVILEGES` column and the `ACCESS_FROM_REMOTE` column are `NO` for the grantee, then the procedure removes the grantee from the view.

If no row for the grantee exists in the `DBA_STREAMS_ADMINISTRATOR` data dictionary view, then the procedure does not update the view and does not raise an error.
The DBMS_STREAMS_HANDLER_ADM package, one of a set of Oracle Streams packages, provides interfaces to manage statement DML handlers.

This chapter contains the following topics:

- **Using DBMS_STREAMS_HANDLER_ADM**
  - Overview
  - Security Model
  - Views
  - Operational Notes

- **Summary of DBMS_STREAMS_HANDLER_ADM Subprograms**
Using DBMS_STREAMS_HANDLER_ADM

This section contains topics that relate to using the `DBMS_STREAMS_HANDLER_ADM` package.

- Overview
- Security Model
- Views
- Operational Notes
Overview

A statement DML handler runs one or more data manipulation language (DML) statements on row logical change records (row LCRs) that are dequeued by an apply process. A single statement DML handler can include multiple statements, and you control the execution order of the statements.

Statement DML handlers are similar to procedure DML handlers for apply processes. Both statement DML handlers and procedure DML handlers provide custom processing of row changes that are encapsulated in row LCRs. Statement DML handlers and procedure DML handlers both run when an apply process dequeues a row LCR. However, statement DML handlers have the following advantages over procedure DML handlers:

- Statement DML handlers typically perform better than procedure DML handlers because statement DML handlers do not require PL/SQL processing.
- The syntax for statement DML handlers is same as DML syntax. Statement DML handlers do not require PL/SQL programming. Procedure DML handlers require PL/SQL programming.
- Statement DML handlers do not require the manipulation of ANYDATA values to access the information in row LCRs. Typically, procedure DML handlers must manipulate ANYDATA values.
- A statement DML handler can co-exist with an error handler for same operation on the same database object. In contrast, you cannot specify both a procedure DML handler and an error handler for the same operation on the same database object.

Note: You can specify multiple statement DML handlers for the same operation on the database object. In this case, the statement DML handlers can execute in any order, and each statement DML handler receives a copy of the original row LCR that was dequeued by the apply process.

See Also: Oracle Streams Concepts and Administration
Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

See Also: Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator
Views

The DBMS_STREAMS_HANDLER_ADM package uses the views listed in the Oracle Database Reference.

- DBA_APPLY_DML_HANDLERS
- DBA_STREAMS_STMTS
- DBA_STREAMS_STMT_HANDLER
Operational Notes

The following sections contain operational notes about the DBMS_STREAMS_HANDLER_ADM package:

- Statement Execution Order
- Supported SQL Statements
- Supported Row LCR Column Attributes
- Supported Row LCR Attributes
- Supported Row LCR Extra Attributes
- Supported Row LCR Method

Statement Execution Order

Each statement in a statement DML handler has a unique execution sequence number. When a statement DML handler is invoked, it executes its statements in order from the statement with the lowest execution sequence number to the statement with the highest execution sequence number.

Supported SQL Statements

You can use statement DML handlers for any valid DML operation on a row logical change record (row LCR). For example, a statement DML handler can audit the DML changes made to a table.

The following SQL statements are supported in statement DML handlers:

- INSERT
- UPDATE
- DELETE
- MERGE

In addition, define variables are not supported in the SQL statements in a statement DML handler.

However, the SQL statements in a statement DML handler can include calls to member subprograms for the row LCR type (LCR$_ROW_RECORD), such as ADD_COLUMN, DELETE_COLUMN, KEEP_COLUMNS, and RENAME_COLUMN.

Note: A statement DML handler cannot modify the value of a column in a row LCR.

See Also: "LCR$_ROW_RECORD Type" on page 247-15

Supported Row LCR Column Attributes

Statements in statement DML handlers can contain the row LCR column attributes described in Table 146–1.
Specify these attributes in the following way in a statement:

```
:attribute.column_name
```

For example, to specify the `new_only` attribute for the `salary` column, enter the following in a statement:

```
:new_only.salary
```

**Supported Row LCR Attributes**

Statements in statement DML handlers can contain the row LCR attributes described in Table 146–2.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>new</code></td>
<td>Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns the old value.</td>
</tr>
<tr>
<td><code>new_exists</code></td>
<td>Returns <code>TRUE</code> if a new column value exists in a row LCR. Returns <code>FALSE</code> if a new column value does not exist in a row LCR.</td>
</tr>
<tr>
<td><code>new_only</code></td>
<td>Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns <code>NULL</code> and does not return the old column value.</td>
</tr>
<tr>
<td><code>old</code></td>
<td>Returns the old column value in a row LCR.</td>
</tr>
<tr>
<td><code>old_exists</code></td>
<td>Returns <code>TRUE</code> if an old column value exists in a row LCR. Returns <code>FALSE</code> if an old column value does not exist in a row LCR.</td>
</tr>
<tr>
<td><code>command_type</code></td>
<td>Returns the type of DML statement that produced the change, either <code>INSERT</code>, <code>UPDATE</code>, or <code>DELETE</code>. DBMS_LOB piecewise LOB operations are not supported by statement DML handlers.</td>
</tr>
<tr>
<td><code>commit_scn</code></td>
<td>Returns the commit system change number (SCN) of the transaction to which the LCR belongs.</td>
</tr>
<tr>
<td><code>compatible</code></td>
<td>Returns the minimal database compatibility required to support the LCR.</td>
</tr>
<tr>
<td><code>instance_number</code></td>
<td>Returns the instance number of the database instance that made the change that is encapsulated in the LCR. Typically, the instance number is relevant in an Oracle Real Application Clusters (Oracle RAC) configuration.</td>
</tr>
<tr>
<td><code>object_owner</code></td>
<td>Returns the schema name that contains the table with the changed row.</td>
</tr>
<tr>
<td><code>object_name</code></td>
<td>Returns the name of the table that contains the changed row.</td>
</tr>
<tr>
<td><code>scn</code></td>
<td>Returns the SCN at the time when the change was made.</td>
</tr>
<tr>
<td><code>source_database_name</code></td>
<td>Returns the name of the source database where the row change occurred.</td>
</tr>
<tr>
<td><code>source_time</code></td>
<td>Returns the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.</td>
</tr>
<tr>
<td><code>tag</code></td>
<td>Returns a raw tag that can be used to track the LCR.</td>
</tr>
</tbody>
</table>
Operational Notes

Specify these attributes in the following way in a statement:

`:attribute_name`

For example, to specify the `source_database_name` attribute for a row LCR, enter the following in a statement:

`:source_database_name`

### Supported Row LCR Extra Attributes

Statements in statement DML handlers can contain the row LCR extra attributes described in Table 146–3.

**Table 146–3 Row LCR Extra Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>row_id</code></td>
<td>Returns the rowid of the row changed in a row LCR.</td>
</tr>
<tr>
<td><code>serial#</code></td>
<td>Returns the serial number of the session that performed the change captured in the LCR.</td>
</tr>
<tr>
<td><code>session#</code></td>
<td>Returns the identifier of the session that performed the change captured in the LCR.</td>
</tr>
<tr>
<td><code>thread#</code></td>
<td>Returns the thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle RAC configuration.</td>
</tr>
<tr>
<td><code>tx_name</code></td>
<td>Returns the name of the transaction that includes the LCR.</td>
</tr>
<tr>
<td><code>username</code></td>
<td>Returns the name of the current user who performed the change captured in the LCR.</td>
</tr>
</tbody>
</table>

Specify these attributes in the following way in a statement:

`:extra_attribute.attribute_name`

For example, to specify the `row_id` extra attribute for a row LCR, enter the following in a statement:

`:extra_attribute.row_id`

### Supported Row LCR Method

A statement in a statement DML handler can include a call to the `EXECUTE` member procedure for row LCRs. The `EXECUTE` member procedure executes the row LCR under the security domain of the current user.

A statement that runs the `EXECUTE` member procedure can be placed anywhere in the execution sequence order of the statement DML handler. It is not necessary to execute a row LCR unless the goal is to apply the changes in the row LCR to a table in addition to performing any other SQL statements in the statement DML handler.

When you call the `EXECUTE` member procedure in a statement, the `conflict_resolution` parameter controls whether any conflict resolution defined for the table
using the `SET_UPDATE_CONFLICT_HANDLER` procedure in the `DBMS_APPLY_ADM` package is used to resolve conflicts resulting from the execution of the LCR:

```sql
:lcr.execute TRUE|FALSE
```

A `TRUE` argument indicates that conflict resolution is used. A `FALSE` argument indicates that conflict resolution is not used.

For example, to use conflict resolution, enter the following in a statement:

```sql
:lcr.execute TRUE
```

An error is raised if this parameter is not specified or is set to `NULL`.

#### Note:  The subprograms in this package do not commit.
ADD_STMT_TO_HANDLER Procedure

This procedure adds a statement to a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.ADD_STMT_TO_HANDLER(
  handler_name       IN VARCHAR2,
  statement          IN CLOB,
  execution_sequence IN NUMBER  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td>statement</td>
<td>The text of the SQL statement to add to the statement DML handler.</td>
</tr>
<tr>
<td>execution_sequence</td>
<td>The position of the statement in the statement DML handler at which a SQL statement is to be set to execute. Statements are executed in order from the lowest execution sequence number to the highest execution sequence number. You can specify a positive or negative integer or decimal, or you can specify 0 (zero). If you specify an execution sequence number that is used by an existing statement in the statement DML handler, then the statement in the statement parameter replaces the existing statement. If NULL, then the statement is added to the statement DML handler with an execution sequence number that is larger than the execution sequence number for any statement in the statement DML handler.</td>
</tr>
</tbody>
</table>

CREATE_STMT_HANDLER Procedure

This procedure creates a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.CREATE_STMT_HANDLER(
    handler_name IN VARCHAR2,
    comment      IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td>comment</td>
<td>A comment for the statement DML handler. If NULL, then no comment is recorded for the statement DML handler.</td>
</tr>
</tbody>
</table>
DROP_STMT_HANDLER Procedure

This procedure drops a statement DML handler.

Syntax

DBMS_STREAMS_HANDLER_ADM.DROP_STMT_HANDLER(
   handler_name IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
</tbody>
</table>
This procedure removes a statement from a statement DML handler.

Syntax

```sql
DBMS_STREAMS_HANDLER_ADM.REMOVE_STMT_FROM_HANDLER(
    handler_name       IN VARCHAR2,
    execution_sequence IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td>execution_sequence</td>
<td>The position of the statement to remove.</td>
</tr>
<tr>
<td></td>
<td>You can specify a positive or negative integer or decimal, or you can specify 0 (zero).</td>
</tr>
<tr>
<td></td>
<td>If NULL, the procedure removes the last statement in the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If the specified execution sequence number does not exist for the statement DML handler, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
The DBMS_STREAMS_MESSAGING package, one of a set of Oracle Streams packages, provides interfaces to enqueue messages into and dequeue messages from a ANYDATA queue.

This chapter contains the following topics:

- Using DBMS_STREAMS_MESSAGING
  - Overview
  - Security Model
- Summary of DBMS_STREAMS_MESSAGING Subprograms
Using DBMS_STREAMS_MESSAGING

This section contains topics which relate to using the DBMS_CAPTURE_ADM package.

- Overview
- Security Model
Overview

This package provides interfaces to enqueue messages into and dequeue messages from a **ANYDATA** queue.

---

**Note:** Currently, messaging clients cannot dequeue buffered messages. In addition, the **DBMS_STREAMS_MESSAGING** package cannot be used to enqueue messages into or dequeue messages from a buffered queue. However, the **DBMS_AQ** package can be used to enqueue and dequeue buffered messages.

---

**See Also:**

- *Oracle Database 2 Day + Data Replication and Integration Guide* for more information about Oracle Streams and for an example that uses the procedures in this package
- *Oracle Streams Advanced Queuing User’s Guide* for more information about queues, messaging, and the **DBMS_AQ** package
Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

See Also: Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator
### Summary of DBMS_STREAMS_MESSAGING Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEQUEUE Procedure on 147-6</td>
<td>Uses the specified Oracle Streams messaging client to dequeue a message from the specified queue</td>
</tr>
<tr>
<td>ENQUEUE Procedure on 147-8</td>
<td>The current user enqueues a message into the specified queue</td>
</tr>
</tbody>
</table>

**Note:** The subprograms in this package do not commit.
DEQUEUE Procedure

This procedure uses the specified Oracle Streams messaging client to dequeue a message from the specified queue.

This procedure is overloaded. One version of this procedure contains the msgid OUT parameter, and the other does not.

Syntax

```
DBMS_STREAMS_MESSAGING.DEQUEUE(
  queue_name    IN   VARCHAR2,
  streams_name  IN   VARCHAR2,
  payload       OUT  ANYDATA,
  dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
  navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
  wait          IN   BINARY_INTEGER  DEFAULT FOREVER,
  msgid         OUT  RAW);
```

```
DBMS_STREAMS_MESSAGING.DEQUEUE(
  queue_name    IN   VARCHAR2,
  streams_name  IN   VARCHAR2,
  payload       OUT  ANYDATA,
  dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
  navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
  wait          IN   BINARY_INTEGER  DEFAULT FOREVER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue from which messages will be dequeued, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be a secure queue of ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the Oracle Streams messaging client. For example, if the user strmadmin is the messaging client, then specify strmadmin. If NULL and a relevant messaging client for the queue exists, then the procedure uses the relevant messaging client. If NULL and multiple relevant messaging clients for the queue exist, then the procedure raises an error.</td>
</tr>
<tr>
<td>payload</td>
<td>The payload that is dequeued</td>
</tr>
<tr>
<td>dequeue_mode</td>
<td>Specify one of the following settings: REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.</td>
</tr>
</tbody>
</table>
Exceptions

Table 147–3  DEQUEUE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
</table>
| ENDOFCURTRANS | Dequeue has reached the end of the messages in the current transaction. Specify this exception in the following way:  
SYS.DBMS_STREAMS_MESSAGING.ENDOFCURTRANS
Every dequeue procedure should include an exception handler that handles this exception. |
| NOMOREMSGS    | There are no more messages in the queue for the dequeue operation. Specify this exception in the following way:  
SYS.DBMS_STREAMS_MESSAGING.NOMOREMSGS
A dequeue procedure that specifies NO_WAIT for the wait parameter should include an exception handler that handles this exception. |
ENQUEUE Procedure

This procedure enables the current user to enqueue a message into the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid OUT` parameter, and the other does not.

Syntax

```sql
DBMS_STREAMS_MESSAGING.ENQUEUE(
    queue_name  IN   VARCHAR2,
    payload     IN   ANYDATA,
    msgid       OUT  RAW);

DBMS_STREAMS_MESSAGING.ENQUEUE(
    queue_name  IN   VARCHAR2,
    payload     IN   ANYDATA);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue into which messages will be enqueued, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be a secure queue of ANYDATA type. For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>payload</td>
<td>The payload that is enqueued</td>
</tr>
<tr>
<td>msgid</td>
<td>The message identifier of the message that is enqueued</td>
</tr>
</tbody>
</table>

Usage Notes

To successfully enqueue messages into a queue, the current user must be mapped to a unique Advanced Queuing agent with the same name as the current user. You can run the `DBMS_STREAMS_ADM.SET_UP_QUEUE` procedure and specify a user as the queue user to grant the necessary privileges to the user to perform enqueues. The Advanced Queuing agent is created automatically when you run `SET_UP_QUEUE` and specify a queue user.

See Also: SET_UP_QUEUE Procedure on page 143-172
The DBMS_STREAMS_TABLESPACE_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for copying tablespaces between databases and moving tablespaces from one database to another. This package uses transportable tablespaces, Data Pump, the DBMS_FILE_TRANSFER package, and the DBMS_FILE_GROUP package.

This chapter contains the following topics:

- Using DBMS_STREAMS_TABLESPACE_ADM
  - Overview
  - Security Model
- Data Structures
- Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

See Also: Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and Oracle Streams
Using DBMS_STREAMS_TABLESPACE_ADM

This section contains topics which relate to using the DBMS_STREAMS_TABLESPACE_ADM package.

- Overview
- Security Model
Overview

Either a simple tablespace or a self-contained tablespace set must be specified in each procedure in this package.

A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. A simple tablespace is a self-contained tablespace that uses only one datafile.

A simple tablespace must be specified in the following procedures:

- ATTACH_SIMPLE_TABLESPACE Procedure
- CLONE_SIMPLE_TABLESPACE Procedure
- DETACH_SIMPLE_TABLESPACE Procedure
- PULL_SIMPLE_TABLESPACE Procedure

A self-contained tablespace set has no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

A self-contained tablespace set must be specified in the following procedures:

- ATTACH_TABLESPACES Procedure
- CLONE_TABLESPACES Procedure
- DETACH_TABLESPACES Procedure
- PULL_TABLESPACES Procedure

To determine whether a set of tablespaces is self-contained, use the TRANSPORT_SET_CHECK procedure in the Oracle supplied package DBMS_TTS.

See Also: Oracle Database Administrator’s Guide for more information about self-contained tablespaces and tablespace sets
Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.
Data Structures

The `DBMS_STREAMS_TABLESPACE_ADM` package defines RECORD types and TABLE types.

**RECORD Types**
- FILE Record Type

**TABLE Types**
- DIRECTORY_OBJECT_SET Table Type
- FILE_SET Table Type
- TABLESPACE_SET Table Type
DIRECTORY_OBJECT_SET Table Type

Contains the names of one or more directory objects. Each name must be a directory object created using the SQL statement CREATE DIRECTORY.

Syntax

```
TYPE DIRECTORY_OBJECT_SET IS TABLE OF VARCHAR2(32)
   INDEX BY BINARY_INTEGER;
```
FILE Record Type

Contains the directory object associated with a directory and the name of the file in the directory.

Syntax

```
TYPE FILE IS RECORD(
    directory_object VARCHAR2(32),
    file_name        VARCHAR2(4000));
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_object</td>
<td>The name of a directory object. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file in the corresponding directory associated with the directory object</td>
</tr>
</tbody>
</table>
FILE_SET Table Type

Contains one or more files.

Syntax

```plsql
TYPE FILE_SET IS TABLE OF FILE
INDEX BY BINARY_INTEGER;
```
TABLESPACE_SET Table Type

Contains the names of one or more tablespaces.

Syntax

```
TYPE TABLESPACE_SET IS TABLE OF VARCHAR2(32)
  INDEX BY BINARY_INTEGER;
```
## Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

<td>Copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database</td>
</tr>
</tbody>
</table>

**Note:** All subprograms commit unless specified otherwise.
ATTACH_SIMPLE_TABLESPACE Procedure

This procedure uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_SIMPLE_TABLESPACE(
    directory_object      IN  VARCHAR2,
    tablespace_file_name  IN  VARCHAR2,
    converted_file_name   IN  VARCHAR2  DEFAULT NULL,
    datafile_platform     IN  VARCHAR2  DEFAULT NULL,
    tablespace_name       OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_object</td>
<td>The directory that contains the Data Pump dump file and the datafile for the tablespace. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The name of the Data Pump export dump file must be the same as the datafile name for the tablespace, except with a .dmp extension. If the converted_file_name is non-NULL, specify the dump file produced by the export database, not the file name after conversion. The Data Pump import log file is written to this directory. The name of the log file is the same as the datafile name for the tablespace, except with an .alg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>tablespace_file_name</td>
<td>The name of the datafile for the tablespace being imported. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>converted_file_name</td>
<td>If the datafile_platform parameter is non-NULL and is not the same as the platform of the local import database, then specify a file name for the converted datafile. The datafile is converted to the platform of the local import database and copied to the new file name. The existing datafile is not modified nor deleted. If non-NULL and the datafile_platform parameter is NULL, then the procedure ignores this parameter. If non-NULL and the datafile_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter. If NULL and the datafile_platform parameter is non-NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Usage Notes

To run this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role
- Have READ and WRITE privilege on the directory object that contains the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the directory_object parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also: Overview on page 148-3
ATTACH_TABLESPACES Procedure

This procedure uses Data Pump to import a self-contained tablespace set previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump import to complete the attach operation. In addition, if the platform at the export database is different than the local database platform, then this procedure optionally can create datafiles for the tablespace set that can be used with the local platform.

- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump import is performed. This version of the procedure uses the files in a file group version and can copy the export dump file, export log file, and the datafiles that comprise the tablespace set into the specified directories. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a datafiles platform specification if the platform at the export database is different than the local database platform. Instead, the tablespace set is migrated automatically to the correct platform when it is attached.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
    datapump_job_name          IN OUT VARCHAR2,
    dump_file                  IN     FILE,
    tablespace_files           IN     FILE_SET,
    converted_files            IN     FILE_SET,
    datafiles_platform         IN     VARCHAR2  DEFAULT NULL,
    log_file                   IN     FILE      DEFAULT NULL,
    tablespace_names           OUT    TABLESPACE_SET);

DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
    file_group_name            IN   VARCHAR2,
    version_name               IN   VARCHAR2  DEFAULT NULL,
    datafiles_directory_object IN   VARCHAR2  DEFAULT NULL,
    logfile_directory_object   IN   VARCHAR2  DEFAULT NULL,
    repository_db_link         IN   VARCHAR2  DEFAULT NULL,
    tablespace_names           OUT  TABLESPACE_SET);
```

Parameters

**Table 148–4  ATTACH_TABLESPACES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
</tbody>
</table>
**Table 148–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>dump_file</strong></td>
<td>The file name of the Data Pump dump file to import. If NULL or if a file attribute is NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><strong>tablespace_files</strong></td>
<td>The file set that contains the datafiles for the tablespace set being imported. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><strong>converted_files</strong></td>
<td>If the datafiles_platform parameter is non-NULL and is not the same as the platform for the local import database, then specify a file set with the names of the converted datafiles. The datafiles are converted to the platform of the local import database and copied to the new file names. In this case, the number of files in the specified file set must match the number of files in the file set specified for the tablespace_files parameter. The existing datafiles are not modified nor deleted. If non-NULL and the datafiles_platform parameter is NULL, then the procedure ignores this parameter. If non-NULL and the datafiles_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter. If NULL and the datafiles_platform parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><strong>datafiles_platform</strong></td>
<td>Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
<tr>
<td><strong>log_file</strong></td>
<td>Specify the log file name for the Data Pump import. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .alg and places it in the Data Pump export dump file directory. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td><strong>file_group_name</strong></td>
<td>The name of the file group, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><strong>version_name</strong></td>
<td>The name of the file group version to attach. If NULL, then the procedure uses the version with the latest creation time for the file group.</td>
</tr>
</tbody>
</table>
### Usage Notes

The following sections contain usage notes for this procedure:

- **User Requirements**
- **Procedures Used to Clone or Detach a Tablespace Set**
- **When the Attach Database Is Different Than the Clone or Detach Database**
- **Automatic Storage Management Directories**

#### See Also:

- **Overview** on page 148-3
- **Oracle Streams Concepts and Administration**

#### User Requirements

To run either version of this procedure, a user must meet the following requirements:

- Have **IMP_FULL_DATABASE** role

### Table 148–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| datafiles_directory_object | The directory object into which the datafiles and Data Pump export dump file are copied. The files are copied from the tablespace repository directories to this directory.  
If non-NULL, the attached tablespaces use the files in specified directory. However, the file group version specified in the version_name parameter consists of the files in the original directory, not in the directory specified by this datafiles_directory_object parameter.  
If NULL, then the procedure does not copy the datafiles and dump file. |
| logfile_directory_object   | The directory object into which the Data Pump import log file is placed. The system generates a log file name with the extension .alg.  
If NULL, then the procedure places the import log file in the same directory as the dump file. |
| repository_db_link        | If the file group is in a different database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure.  
If this parameter is non-NULL, then meet the following requirements:  
- Each directory object that contains files in the version being attached must exist on both databases.  
- The corresponding directory objects must have the same names on both databases.  
If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database. |
| tablespace_names          | Contains the names of the attached tablespaces. The attached tablespaces are read-only. Use **ALTER TABLESPACE** statements to make the tablespaces read/write if necessary. |
Have **READ** and **WRITE** privilege on the directory objects that contain the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the `dump_file` and `tablespace_files` parameters, or by the `datafiles_directory_object` parameter.

Have **WRITE** privilege on the directory object that will hold the Data Pump import log file, specified by the `log_file` parameter or `logfile_directory_object` parameter if it is non-NULL.

If the Data Pump job version of the procedure is run, then the user must have **WRITE** privilege on the directory objects that will hold the converted datafiles for the tablespaces in the set if platform conversion is necessary. These directory objects are specified by the `converted_files` parameter if it is non-NULL.

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

**Procedures Used to Clone or Detach a Tablespace Set**

After a tablespace set is cloned or detached using the `CLONE_TABLESPACES` or `DETACH_TABLESPACES` procedure, respectively, the tablespace set can be attached to a database using the `ATTACH_TABLESPACES` procedure. If the Data Pump job version of the `CLONE_TABLESPACES` or `DETACH_TABLESPACES` procedure was used, then use the Data Pump job version of the `ATTACH_TABLESPACES` procedure. If the file group version of the `CLONE_TABLESPACES` or `DETACH_TABLESPACES` procedure was used, then use the file group version of the `ATTACH_TABLESPACES` procedure.

**See Also:**

- `CLONE_TABLESPACES Procedure` on page 148-20
- `DETACH_TABLESPACES Procedure` on page 148-26

**When the Attach Database Is Different Than the Clone or Detach Database**

You can attach a tablespace set to a different database than the database from which the tablespace set was cloned or detached. The two databases might or might not share a file system. If the two databases do not share a file system, then you must transfer the dump file and datafiles to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method. You can attach the tablespace set in one of the following ways depending on the version of the `ATTACH_TABLESPACES` procedure you use:

- If you use the Data Pump job version of the procedure, then specify the relevant files on the file system. The directory object names can be different in the databases.

- If you use the file group version of the procedure, then you can use the `repository_db_link` parameter to specify the database where tablespace repository resides. The directory objects for the files must exist and must match in the databases.

**See Also:**

- `CLONE_TABLESPACES Procedure` on page 148-20
- `DETACH_TABLESPACES Procedure` on page 148-26
- Chapter 66, "DBMS_FILE_GROUP" for more information about file groups
Automatic Storage Management Directories
Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

See Also: Oracle Database Utilities for information about specifying ASM directories for directory objects
CLONE_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace. The specified tablespace must be online. Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the specified directory
3. Places the datafile for the specified tablespace in the specified directory
4. If this procedure made the tablespace read-only, then makes the tablespace read/write

In addition, this procedure optionally can create a datafile for the tablespace that can be used with a platform that is different than the local database platform.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.CLONE_SIMPLE_TABLESPACE(
    tablespace_name      IN  VARCHAR2,
    directory_object     IN  VARCHAR2,
    destination_platform IN  VARCHAR2  DEFAULT NULL,
    tablespace_file_name OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The tablespace to be cloned.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>directory_object</td>
<td>The directory where the Data Pump export dump file, the Data Pump export log file, and the datafile for the tablespace are placed. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.</td>
</tr>
<tr>
<td></td>
<td>The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file already exists with the same name as the dump file in the directory, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>The name of the log file is the same as the data file name for the tablespace, except with a .clg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>destination_platform</td>
<td>Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
</tbody>
</table>
To run this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `directory_object` parameter
- If the file group version of the procedure is run, then the user must have the necessary privileges to manage file group.

After cloning a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

**Usage Notes**

CLONE_TABLESPACES Procedure

This procedure clones a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set and places the dump file in the specified directory
3. Places the datafiles that comprise the specified tablespace set in the specified directory
4. If this procedure made a tablespace read-only, then makes the tablespace read/write

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the datapump_job_name parameter. This job performs the Data Pump export. This version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the specified directories, but the files are not added to a file group version. In addition, this version of the procedure optionally can create datafiles for the tablespace set that can be used with a platform that is different than the local database platform.

- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the appropriate file group version. The file group and version are specified using the file_group_name and version_name parameters, respectively. This version of the procedure does not require a destination platform specification if the destination platform is different. Instead, the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the ATTACH_TABLESPACES procedure.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
    datapump_job_name            IN OUT VARCHAR2,
    tablespace_names             IN     TABLESPACE_SET,
    dump_file                    IN     FILE,
    tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
    destination_platform         IN     VARCHAR2  DEFAULT NULL,
    log_file                     IN     FILE      DEFAULT NULL,
    tablespace_files             OUT    FILE_SET);

DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
    tablespace_names             IN  TABLESPACE_SET,
    tablespace_directory_object  IN  VARCHAR2  DEFAULT NULL,
    log_file_directory_object    IN  VARCHAR2  DEFAULT NULL,
    file_group_name              IN  VARCHAR2,
    version_name                 IN  VARCHAR2  DEFAULT NULL,
    repository_db_link           IN  VARCHAR2  DEFAULT NULL);
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>data_pump_job_name</code></td>
<td>The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td><code>tablespace_names</code></td>
<td>The tablespace set to be cloned. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>dump_file</code></td>
<td>The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file already exists, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>tablespace_directory_objects</code></td>
<td>The set of directory objects into which the datafiles for the tablespaces are copied. If more than one directory object is in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure copies datafiles for the tablespace set to the dump file directory.</td>
</tr>
<tr>
<td><code>destination_platform</code></td>
<td>Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the <code>PLATFORM_NAME</code> column in the <code>V$DATABASE</code> dynamic performance view. The <code>V$TRANSPORTABLE_PLATFORM</code> dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
<tr>
<td><code>log_file</code></td>
<td>Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension <code>.clg</code> and places it in the dump file directory. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
</tbody>
</table>
The directory object into which the data files are copied and Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp.

If NULL, then the procedure copies the datafiles to and places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group.

If NULL and no default directory object exists for the version or file group, then the procedure raises an error.

The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .clg.

If NULL, then the procedure uses the directory object specified in tablespace_directory_object.

The name of the file group, specified as /[schema_name.]/file_group_name. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.

If the specified file group does not exist, then the procedure creates it.

The name of the version into which the cloned tablespace set is placed. The specified version name cannot be a positive integer.

If the specified version does not exist, then the procedure creates it.

If the specified version exists, then the procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version.

If NULL, then the procedure creates a new version, and the version number can be used to manage the version.

If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure.

If this parameter is non-NULL, then the directory object specified in tablespace_directory_object must exist on the local database and on the remote database. If tablespace_directory_object is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system.

If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.

Contains the datafiles for the cloned tablespace set. These datafiles are placed in the directories specified by the directory objects in the parameter tablespace_directory_objects.
Usage Notes

To run either version of this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the `tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `dump_file` parameter or the `tablespace_directory_object` parameter
- Have `WRITE` privilege on the directory objects that will contain the copied datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter if non-NULL or the `tablespace_directory_object` parameter
- Have `WRITE` privilege on the directory object that will contain the Data Pump export log file, specified by the `log_file` parameter if non-NULL or the `log_file_directory_object` parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After cloning a tablespace set using this procedure, you can attach the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure.

DETACH_SIMPLE_TABLESPACE Procedure

This procedure detaches a simple tablespace. The specified tablespace must be online. Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the directory that contains the tablespace datafile
3. Drops the tablespace and its contents from the database

Syntax

DBMS_STREAMS_TABLESPACE_ADM.DEATTACH_SIMPLE_TABLESPACE(
  tablespace_name       IN  VARCHAR2,
  directory_object      OUT VARCHAR2,
  tablespace_file_name  OUT VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>directory_object</td>
<td>Contains the directory where the Data Pump export dump file and the Data Pump export log file are placed. The procedure uses the directory of the datafile for the tablespace. Therefore, make sure a directory object created using the SQL statement CREATE DIRECTORY exists for this directory. The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file already exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the data file name for the tablespace, except with a .dlg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td>tablespace_file_name</td>
<td>Contains the name of the detached tablespace datafile.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
Have **READ** and **WRITE** privilege on the directory object for the directory that contains the tablespace datafile. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure. This directory also will contain the Data Pump export dump file generated by this procedure.

After detaching a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method. You can use the two **OUT** parameters in this procedure to accomplish the attach or pull operation.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

---

**Note:** Do not use the `DETACH_SIMPLE_TABLESPACE` procedure on a tablespace if the tablespace is using the Oracle-managed files feature. If you do, then the datafile for the tablespace is dropped automatically when the tablespace is dropped.

---

**See Also:**

- **Overview** on page 148-3

DETACH_TABLESPACES Procedure

This procedure detaches a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online and any table partitions must not span tablespaces in the tablespace set.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespace set and places the dump file in the specified directory
3. Drops the tablespaces in the specified tablespace set and their contents from the database

This procedure does not move or copy the datafiles that comprise the specified tablespace set.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the datapump_job_name parameter. This job performs the Data Pump export. This version of the procedure completes the detach operation by placing the export dump file and export log file in the specified directories, but the files are not added to a file group version.

- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the detach operation by placing the export dump file and export log file in the appropriate file group version. The datafiles that comprise the tablespace set are not moved or copied, but they are referenced in the version that is detached. The file group and version are specified using the file_group_name and version_name parameters, respectively. Also, if the destination platform is different, then the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the ATTACH_TABLESPACES procedure.

**Note:** Do not use the DETACH_TABLESPACES procedure if any of the tablespaces in the tablespace set are using the Oracle-managed files feature. If you do, then the datafiles for these tablespaces are dropped automatically when the tablespaces are dropped.

**Syntax**

```sql
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
    datapump_job_name         IN OUT VARCHAR2,
    tablespace_names          IN     TABLESPACE_SET,
    dump_file                 IN     FILE,
    log_file                  IN     FILE DEFAULT NULL,
    tablespace_files          OUT    FILE_SET);
```

```sql
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
    tablespace_names          IN TABLESPACE_SET,
    export_directory_object   IN VARCHAR2 DEFAULT NULL,
    log_file_directory_object IN VARCHAR2 DEFAULT NULL,
    file_group_name           IN VARCHAR2,
)`
version_name IN VARCHAR2 DEFAULT NULL,
repository_db_link IN VARCHAR2 DEFAULT NULL);

Parameters

Table 148–8 DETACH_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>The tablespace set to be detached. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>dump_file</td>
<td>The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file already exists, then the procedure raises an error.</td>
</tr>
<tr>
<td>log_file</td>
<td>Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .dlg and places it in the dump file directory. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td>tablespace_files</td>
<td>Contains the names of the datafiles for the detached tablespace set.</td>
</tr>
<tr>
<td>export_directory_object</td>
<td>The directory object into which the Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp. If NULL, then procedure places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group. If NULL and no default directory object exists for the version or file group, then the procedure raises an error.</td>
</tr>
<tr>
<td>log_file_directory_object</td>
<td>The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .dlg. If NULL, then the procedure places the export log file in the same directory as the export dump file.</td>
</tr>
<tr>
<td>file_group_name</td>
<td>The name of the file group, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default. If the specified file group does not exist, then the procedure creates it.</td>
</tr>
</tbody>
</table>
To run this either version of this procedure, a user must meet the following requirements:

- Have **EXP_FULL_DATABASE** role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include **DBA_TABLESPACES** and **USER_TABLESPACES**.
- Have **DROP TABLESPACE** privilege
- Have **MANAGE TABLESPACE** or **ALTER TABLESPACE** on a tablespace if the tablespace must be made read-only
- Have **READ** privilege on the directory objects for the directories that contain the datafiles for the tablespsace set. The names of these tablespaces are specified by the **tablespace_names** parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have **READ** and **WRITE** privilege on the directory object that will contain the Data Pump export dump file, specified by the **dump_file** parameter or the **export_directory_object** parameter
- Have **WRITE** privilege on the directory object that will contain the Data Pump export the log file, specified by the **log_file** parameter if non-NULL or by the **log_file_directory_object** parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.
Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After detaching a tablespace set using this procedure, you can attach the tablespaces to a different database using the ATTACH_TABLESPACES procedure.

- Oracle Database Administrator’s Guide for more information about the Oracle-managed files feature
**PULL_SIMPLE_TABLESPACE Procedure**

This procedure copies a simple tablespace from a remote database and attaches it to the current database. The specified tablespace at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only at the remote database if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace
3. Uses a database link and the DBMS_FILE_TRANSFER package to transfer the datafile for the tablespace and the log file for the Data Pump export to the current database
4. Places the datafile for the specified tablespace and the log file for the Data Pump export in the specified directory at the local database
5. If this procedure made the tablespace read-only, then makes the tablespace read/write
6. Uses Data Pump to import the metadata for the tablespace in the local database

In addition, this procedure optionally can create a datafile for the tablespace that can be used with the local platform, if the platform at the remote database is different than the local database platform.

**Syntax**

```sql
DBMS_STREAMS_TABLESPACE_ADM.PULL_SIMPLE_TABLESPACE(
    tablespace_name          IN VARCHAR2,
    database_link            IN VARCHAR2,
    directory_object         IN VARCHAR2  DEFAULT NULL,
    conversion_extension     IN VARCHAR2  DEFAULT NULL,
    convert_directory_object IN VARCHAR2  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tablespace_name</code></td>
<td>The tablespace to be pulled.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>database_link</code></td>
<td>The name of the database link to the database that contains the tablespace to pull. The database link must be accessible to the user who runs the procedure.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>directory_object</code></td>
<td>The directory object to which the datafile for the tablespace is copied on the local database. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code>.</td>
</tr>
<tr>
<td></td>
<td>The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with a <code>.plg</code> extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the EXP_FULL_DATABASE role
- Have EXECUTE privilege on the DBMS_STREAMS_TABLESPACE_ADM package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE privilege on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the tablespace_name parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles IMP_FULL_DATABASE and EXECUTE_CATALOG_ROLE
- Have WRITE privilege on the directory object that will contain the Data Pump export the log file, specified by the log_file parameter if non-NULL
- Have WRITE privilege on the directory object that will hold the datafile for the tablespace, specified by the directory_object parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also:  Overview on page 148-3
This procedure copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database. All of the tablespaces in the specified tablespace set at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set at the remote database read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set
3. Uses a database link and the DBMS_FILE_TRANSFER package to transfer the datafiles for the tablespace set and the log file for the Data Pump export to the current database
4. Places the datafiles that comprise the specified tablespace set in the specified directories at the local database
5. Places the log file for the Data Pump export in the specified directory at the local database
6. If this procedure made a tablespace read-only, then makes the tablespace read/write
7. Uses Data Pump to import the metadata for the tablespaces in the tablespace set at the local database

In addition, this procedure optionally can create datafiles for the tablespace set that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.PULL_TABLESPACES(
    datapump_job_name            IN OUT VARCHAR2,
    database_link                IN     VARCHAR2,
    tablespace_names             IN     TABLESPACE_SET,
    tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
    log_file                     IN     FILE,
    conversion_extension         IN     VARCHAR2 DEFAULT NULL,
    convert_directory_object     IN     VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>database_link</td>
<td>The name of the database link to the database that contains the tablespace set to pull. The database link must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the `EXP_FULL_DATABASE` role
- Have `EXECUTE` privilege on the `DBMS_STREAMS_TABLESPACE_ADM` package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` privilege on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the

---

### Table 148–10 (Cont.) PULL_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_names</td>
<td>The tablespace set to be pulled. If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
<tr>
<td>tablespace_directory_objects</td>
<td>The set of directory objects to which the datafiles for the tablespaces are copied. If more than one directory object is in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
<tr>
<td>log_file</td>
<td>Specify the log file name for the Data Pump export. If <code>NULL</code> or if at least one file parameter is <code>NULL</code>, then the system generates a log file name with the extension <code>.plg</code> and places it in one of the data file directories. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td>conversion_extension</td>
<td>Specify <code>NULL</code> if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafiles that is different than the extension for the tablespace datafiles at the remote database. In this case, the procedure transfers the datafiles to the import database and converts them to be compatible with the current import database platform automatically. After conversion is complete, the original datafiles are deleted at the import database.</td>
</tr>
<tr>
<td>convert_directory_object</td>
<td>Specify <code>NULL</code> if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code>.</td>
</tr>
</tbody>
</table>
tablespace_names parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles IMP_FULL_DATABASE and EXECUTE_CATALOG_ROLE
- Have WRITE privilege on the directory object that will contain the Data Pump export the log file, specified by the log_file parameter if non-NULL
- Have WRITE privilege on the directory objects that will hold the datafiles for the tablespaces in the set, specified by the tablespace_directory_objects parameter

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

See Also: Overview on page 148-3
The DBMS_TDB package reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

**See Also:** Oracle Database Backup and Recovery User’s Guide regarding database transport using CONVERT DATABASE

This chapter contains the following topics:

Using DBMS_TDB

This section contains topics which relate to using DBMS_TDB.

- Overview
- Constants
- Views
- Operational Notes
Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The DBMS_TDB package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager CONVERT DATABASE command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the DBMS_TDB subprograms in the conversion process, see Oracle Database Backup and Recovery User’s Guide.
Security Model

Use of this package requires the DBA privilege.
Constants

The DBMS_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_TDB.SKIP_NONE.

The DBMS_TDB package uses the constants shown in Table 149–1.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SKIP_NONE</td>
<td>NUMBER</td>
<td>0</td>
<td>Check all files when checking whether a database is ready for transport.</td>
</tr>
<tr>
<td>SKIP_OFFLINE</td>
<td>NUMBER</td>
<td>2</td>
<td>Skip files in offline tablespaces when checking whether a database is ready for transport.</td>
</tr>
<tr>
<td>SKIP_READONLY</td>
<td>NUMBER</td>
<td>3</td>
<td>Skip files in readonly tablespaces when checking whether a database is ready for transport.</td>
</tr>
</tbody>
</table>
Views

The `DBMS_TDB` package uses the following view listed in *Oracle Database Reference*:

- `V$DB_TRANSPORTABLE_PLATFORM`, which specifies which combinations of source and target platforms support database transport.
Operational Notes

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See Oracle Database Backup and Recovery User’s Guide for details on the different uses of these subprograms are used in the conversion process.

- The subprograms in this package return simple TRUE or FALSE results to indicate whether database transport is possible. Use the subprograms with SERVEROUTPUT ON for informative messages about why transport is not possible.
## Summary of DBMS_TDB Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CHECK_DB Function</code> on page 149-9</td>
<td>Checks whether a database can be transported to a target platform</td>
</tr>
<tr>
<td><code>CHECK_EXTERNAL Function</code> on page 149-9</td>
<td>Checks whether a database has external tables, directory or BFILES</td>
</tr>
</tbody>
</table>
CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```sql
DBMS_TDB.CHECK_DB (  
    target_platform_name   IN VARCHAR2,  
    skip_option            IN  NUMBER)  
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (  
    target_platform_name   IN VARCHAR2)  
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>target_platform_name</td>
<td>The name of the destination platform, as it appears in V$DB_TRANSPORTABLE_PLATFORM.</td>
</tr>
<tr>
<td>skip_option</td>
<td>Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 149–1, &quot;DBMS_TDB Constants&quot; on page 149-5.</td>
</tr>
</tbody>
</table>

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns FALSE. If the database is ready for transport, returns TRUE.

Usage Notes

- If SERVEROUTPUT is ON, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see Table 149–4, "Reasons for CHECK_DB Function to Return FALSE" on page 149-9.

### Table 149–4 Reasons for CHECK_DB Function to Return FALSE

<table>
<thead>
<tr>
<th>Cause</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unrecognized target platform name.</td>
<td>Check V$DB_TRANSPORTABLE_PLATFORM for recognized platform names.</td>
</tr>
</tbody>
</table>
**Table 149–4  (Cont.) Reasons for CHECK_DB Function to Return FALSE**

<table>
<thead>
<tr>
<th>Cause</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target platform has a different endian format.</td>
<td>Conversion is not supported.</td>
</tr>
<tr>
<td>Database is not open read-only.</td>
<td>Open database read-only and retry.</td>
</tr>
<tr>
<td>There are active or in-doubt transactions in the database.</td>
<td>Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.</td>
</tr>
<tr>
<td>Deferred transaction rollback needs to be done.</td>
<td>Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.</td>
</tr>
<tr>
<td>Database compatibility version is below 10.0.0.</td>
<td>Change the COMPATIBLE initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.</td>
</tr>
<tr>
<td>Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.</td>
<td>Change the COMPATIBLE initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.</td>
</tr>
</tbody>
</table>

**Examples**

This example illustrates the use of CHECK_DB with a database that is open read-write:

```sql
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
    db_ready BOOLEAN;
BEGIN
    db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
END;
/

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.
```
CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

```
DBMS_TDB.CHECK_EXTERNAL
    RETURN BOOLEAN;
```

Return Values

If the database has external tables, directories, or BFILEs, return TRUE. Otherwise, return FALSE.

Usage Notes

- If SERVEROUTPUT is ON, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of CHECK_EXTERNAL with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
    
    external BOOLEAN;
    BEGIN
        external := DBMS_TDB.CHECK_EXTERNAL;
    END;
/

The following external tables exist in the database:
SH.SALES_TRANSACTIONS_EXT
The following directories exist in the database:
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
The following BFILEs exist in the database:
PM.PRINT_MEDIA

PL/SQL procedure successfully completed.
```
The DBMS_TRACE package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- **Using DBMS_TRACE**
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Operational Notes
- **Summary of DBMS_TRACE Subprograms**
Using DBMS_TRACE

- Overview
- Security Model
- Constants
- Restrictions
- Operational Notes
Overview

DBMS_TRACE provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:
- Starting PL/SQL tracing in session (DBMS_TRACE.SET_PLSQL_TRACE).
- Running an application to be traced.
- Stopping PL/SQL tracing in session (DBMS_TRACE.CLEAR_PLSQL_TRACE).
Security Model

This package must be created under SYS.
Constants

The DBMS_TRACE package uses the constants shown in Table 150-1, "DBMS_TRACE Constants":

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRACE_MINOR_VERSION</td>
<td>INTEGER</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>TRACE_MAJOR_VERSION</td>
<td>INTEGER</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>TRACE_ALL_CALLS</td>
<td>INTEGER</td>
<td>1</td>
<td>Traces calls or returns</td>
</tr>
<tr>
<td>TRACE_ENABLED_CALLS</td>
<td>INTEGER</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>TRACE_ALL_EXCEPTIONS</td>
<td>INTEGER</td>
<td>4</td>
<td>Traces exceptions</td>
</tr>
<tr>
<td>TRACE_ENABLED_EXCEPTIONS</td>
<td>INTEGER</td>
<td>8</td>
<td>Traces exceptions and handlers</td>
</tr>
<tr>
<td>TRACE_LIMIT</td>
<td>INTEGER</td>
<td>16</td>
<td>Save only the last few records. This allows tracing up to a problem area,</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>without filling the database up with masses of irrelevant information. If</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>event 10940 is set, the limit is 1023*(the value of event 10940). This can</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>be overridden by the use of &quot;TRACE_LIMIT&quot; flag.</td>
</tr>
<tr>
<td>TRACE_ALL_SQL</td>
<td>INTEGER</td>
<td>32</td>
<td>Traces SQL statements</td>
</tr>
<tr>
<td>TRACE_ENABLED_SQL</td>
<td>INTEGER</td>
<td>64</td>
<td>Traces SQL statements at PL/SQL level. This does not invoke SQL Trace</td>
</tr>
<tr>
<td>TRACE_ALL_LINES</td>
<td>INTEGER</td>
<td>128</td>
<td>Traces each line</td>
</tr>
<tr>
<td>TRACE_ENABLED_LINES</td>
<td>INTEGER</td>
<td>256</td>
<td></td>
</tr>
<tr>
<td>TRACE_PAUSE</td>
<td>INTEGER</td>
<td>4096</td>
<td>Pauses tracing</td>
</tr>
<tr>
<td>TRACE_RESUME</td>
<td>INTEGER</td>
<td>8192</td>
<td>Resume tracing</td>
</tr>
<tr>
<td>TRACE_STOP</td>
<td>INTEGER</td>
<td>16384</td>
<td>Stops tracing</td>
</tr>
<tr>
<td>NO_TRACE_ADMINISTRATIVE</td>
<td>INTEGER</td>
<td>32768</td>
<td>Prevents tracing of administrative events such as</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- PL/SQL Trace Tool started</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- Trace flags changed</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- PL/SQL Virtual Machine started</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- PL/SQL Virtual Machine stopped</td>
</tr>
<tr>
<td>NO_TRACE_HANDLED_EXCEPTIONS</td>
<td>INTEGER</td>
<td>65536</td>
<td>Prevents tracing of handled exceptions</td>
</tr>
</tbody>
</table>

Oracle recommends using the symbolic form for all these constants.
Restrictions

You cannot use PL/SQL tracing in a shared server environment.
Operational Notes

- Controlling Data Volume
- Creating Database Tables to Collect DBMS_TRACE Output
- Collecting Trace Data
- Collected Data
- Trace Control

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by enabling specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```sql
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be generated */
```

or:

```sql
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

**Note:** You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the DBMS_TRACE package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by SYS.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMSPBT.SQL`. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`. 

- Level 2: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

**Tracing Exceptions**

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

**Tracing SQL**

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

**Tracing Lines**

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

---

**Note:** For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

---

**Collected Data**

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller's unit is enabled, the calling procedure name will also be output. If the callee's unit is enabled, the called procedure name will be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled.

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.
Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level $n$ changes the record limit to $1024 \times n$. 
### Summary of DBMS_TRACE Subprograms

**Table 150–2  DBMS_TRACE Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR_PLSQL_TRACE Procedure</td>
<td>Stops trace data dumping in session</td>

<td>Gets the version number of the trace package</td>
</tr>
<tr>
<td>SET_PLSQL_TRACE Procedure</td>
<td>Starts tracing in the current session</td>
</tr>
</tbody>
</table>
CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

DBMS_TRACE.CLEAR_PLSQL_TRACE;
GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as a list of the enabled constants.

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL
RETURN BINARY_INTEGER;
```
PLSQL TRACE VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```sql
DBMS_TRACE.PLSQL_TRACE_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>major</td>
<td>Major version number of DBMS_TRACE.</td>
</tr>
<tr>
<td>minor</td>
<td>Minor version number of DBMS_TRACE.</td>
</tr>
</tbody>
</table>
SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE {
  trace_level INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trace_level</td>
<td>You must supply one or more of the constants as listed in Table 150–1, &quot;DBMS_TRACE Constants&quot;. By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants &quot;TRACE_PAUSE&quot;, &quot;TRACE_RESUME&quot; and &quot;TRACE_STOP&quot; should not be used in combination with other constants. Also see &quot;Collecting Trace Data&quot; on page 150-7 for more information.</td>
</tr>
</tbody>
</table>
The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

</tr>
</tbody>
</table>
ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE COMMIT
```

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```
ADVISE NOTHING Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE NOTHING
```

Syntax

```
DBMS_TRANSACTION.ADVISE NOTHING;
```
**ADVISE_ROLLBACK Procedure**

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE ROLLBACK
```

**Syntax**

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```
COMMIT Procedure

This procedure is equivalent to the SQL statement:

COMMIT

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

DBMS_TRANSACTION.COMMIT;
COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT COMMENT <text>
```

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT ( 
    cmnt VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmnt</td>
<td>Comment to associate with this commit.</td>
</tr>
</tbody>
</table>
COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement:

```sql
COMMIT FORCE <text>, <number>"
```

Syntax

```sql
DBMS_TRANSACTION.COMMIT_FORCE (
    xid VARCHAR2,
    scn VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Local or global transaction ID.</td>
</tr>
<tr>
<td>scn</td>
<td>System change number.</td>
</tr>
</tbody>
</table>
LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```sql
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (  
    create_transaction BOOLEAN := FALSE)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>create_transaction</td>
<td>If true, then start a transaction if one is not currently active.</td>
</tr>
</tbody>
</table>
PURGE_LOST_DB_ENTRY Procedure

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in DBA_2PC_PENDING and associated tables are never removed, and recovery will periodically retry. Procedure PURGE_LOST_DB_ENTRY enables removal of such transactions from the local site.

Syntax

```sql
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Must be set to the value of the LOCAL_TRNS_ID column in the DBA_2PC_PENDING table.</td>
</tr>
</tbody>
</table>

Usage Notes

**WARNING:** PURGE_LOST_DB_ENTRY should only be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA_2PC_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure PURGE_LOST_DB_ENTRY to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:
### Table 151–6 PURGE_LOST_DB_ENTRY Procedure States

<td>Rolled back</td>
<td>(See Note 2)</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE 1:** Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

**NOTE 2:** Examine and take any manual action to remove inconsistencies; then use the procedure PURGE_MIXED.
PURGE_MIXED Procedure

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome: Some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle; however, Oracle flags entries in `DBA_2PC_PENDING` by setting the MIXED column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (  
   xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Must be set to the value of the LOCAL_TRAN_ID column in the <code>DBA_2PC_PENDING</code> table.</td>
</tr>
</tbody>
</table>
**READ_ONLY Procedure**

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ ONLY
```

**Syntax**

```
DBMS_TRANSACTION.READ_ONLY;
```
READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```
**ROLLBACK Procedure**

This procedure is equivalent to the SQL statement:

```
ROLLBACK
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

**Syntax**

```
DBMS_TRANSACTION.ROLLBACK;
```
ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK FORCE <text>
```

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE ( xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Local or global transaction ID.</td>
</tr>
</tbody>
</table>
ROLLBACKSAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

ROLLBACK TO SAVEPOINT <savepoint_name>

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (savept VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>savept</td>
<td>Savepoint identifier.</td>
</tr>
</tbody>
</table>
SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:
SAVEPOINT <savepoint_name>

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```sql
DBMS_TRANSACTION.SAVEPOINT {
    savept VARCHAR2;
}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>savept</td>
<td>Savepoint identifier.</td>
</tr>
</tbody>
</table>
**STEP_ID Function**

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

**Syntax**

```sql
DBMS_TRANSACTION.STEP_ID
RETURN NUMBER;
```
USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement:

\[\text{SET TRANSACTION USE ROLLBACK SEGMENT } \langle\text{rb\_seg\_name}\rangle\]

Syntax

\[
\text{DBMS\_TRANSACTION.\text{USE\_ROLLBACK\_SEGMENT} \{} \\
\quad \text{rb\_name VARCHAR2}\};
\]

Parameters

<table>
<thead>
<tr>
<th>Table 151–11 USE_ROLLBACK_SEGMENT Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>------------------</td>
</tr>
<tr>
<td>rb_name</td>
</tr>
</tbody>
</table>
The DBMS_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

See Also: Oracle Streams Advanced Queuing User’s Guide for more on message format transformations.

This chapter contains the following topic:

- Summary of DBMS_TRANSFORM Subprograms
### Summary of DBMS_TRANSFORM Subprograms

**Table 152–1 DBMS_TRANSFORM Package Subprograms**

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_TRANSFORMATION Procedure on page 152-3</td>
<td>Creates a transformation that maps an object of the source type to an object of the destination type</td>
</tr>
<tr>
<td>DROP_TRANSFORMATION Procedure on page 152-5</td>
<td>Drops the given transformation</td>
</tr>
<tr>
<td>MODIFY_TRANSFORMATION Procedure on page 152-6</td>
<td>Modifies an existing transformation</td>
</tr>
</tbody>
</table>
CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```sql
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
    schema       VARCHAR2(30),
    name         VARCHAR2(30),
    from_schema  VARCHAR2(30),
    from_type    VARCHAR2(30),
    to_schema    VARCHAR2(30),
    to_type      VARCHAR2(30),
    transformation VARCHAR2(4000));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
<tr>
<td>from_schema</td>
<td>Specifies the schema of the source type.</td>
</tr>
<tr>
<td>from_type</td>
<td>Specifies the source type.</td>
</tr>
<tr>
<td>to_schema</td>
<td>Specifies the target type schema.</td>
</tr>
<tr>
<td>to_type</td>
<td>Specifies the target type.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.</td>
</tr>
</tbody>
</table>

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on DBMS_TRANSFORM. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form `source.user_data`.
Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PL/SQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.
DROP TRANSFORMATION Procedure

This procedure drops the given transformation.

Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORMATION (    
  schema  VARCHAR2(30),
  name    VARCHAR2(30));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
</tbody>
</table>
MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```sql
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
    schema             VARCHAR2(30),
    name               VARCHAR2(30),
    attribute_number   INTEGER,
    transformation     VARCHAR2(4000));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
<tr>
<td>attribute_number</td>
<td>The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.</td>
</tr>
<tr>
<td>transformation</td>
<td>The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.</td>
</tr>
</tbody>
</table>

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an `attribute_number` of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.
The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view TRANSPORT_SET_VIOLATIONS.

- Oracle Database Administrator’s Guide
- Oracle Database Upgrade Guide

This chapter contains the following topics:
- Using DBMS_TTS
  - Security Model
  - Exceptions
  - Operational Notes
- Summary of DBMS_TTS Subprograms
Using DBMS_TTS

- Security Model
- Exceptions
- Operational Notes
Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.
Exceptions

ts_not_found EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently:

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.
Summary of DBMS_TTS Subprograms

These two procedures are designed to be called by database administrators.

Table 153–1  DBMS_TTS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOWNGRADE Procedure on page 153-7</td>
<td>Downgrades transportable tablespace related data</td>
</tr>
<tr>
<td>TRANSPORT_SET_CHECK Procedure on page 153-8</td>
<td>Checks if a set of tablespaces (to be transported) is self-contained</td>
</tr>
</tbody>
</table>
**DOWNGRADE Procedure**

This procedure downgrades transportable tablespace related data.

**Syntax**

```
DBMS_TTS.DOWNGRADE;
```
TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```sql
DBMS_TTS.TRANSPORT_SET_CHECK (
    ts_list          IN CLOB,
    incl_constraints IN BOOLEAN DEFAULT FALSE,
    full_check       IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ts_list</td>
<td>List of tablespace, separated by comma.</td>
</tr>
<tr>
<td>incl_constraints</td>
<td>TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The incl_constraints parameter is a default so that TRANSPORT_SET_CHECK will work if it is called with only the ts_list argument.)</td>
</tr>
<tr>
<td>full_check</td>
<td>Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to false. It will only consider OUT pointers as violations.</td>
</tr>
</tbody>
</table>

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```sql
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```
The DBMS_TYPES package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- Using DBMS_TYPES
  - Constants
  - Exceptions
Using DBMS_TYPES

- Constants
- Exceptions
## Constants

The following table lists the constants in the DBMS_TYPES package.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_DATA</td>
<td>Is only relevant if PieceWise is called, for a collection or anydataset. Denotes the end of collection/anydataset when all the elements have been accessed.</td>
</tr>
<tr>
<td>SUCCESS</td>
<td>The operation succeeded.</td>
</tr>
<tr>
<td>TYPECODE_BDOUBLE</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_BFILE</td>
<td>A BFILE type</td>
</tr>
<tr>
<td>TYPECODE_BFLOAT</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_BLOB</td>
<td>A BLOB type</td>
</tr>
<tr>
<td>TYPECODE_CFILE</td>
<td>A CFILE type</td>
</tr>
<tr>
<td>TYPECODE_CHAR</td>
<td>A CHAR type</td>
</tr>
<tr>
<td>TYPECODE_CLOB</td>
<td>A CLOB type</td>
</tr>
<tr>
<td>TYPECODE_DATE</td>
<td>A DATE type</td>
</tr>
<tr>
<td>TYPECODE_INTERVAL_DS</td>
<td>An INTERVAL_DS type</td>
</tr>
<tr>
<td>TYPECODE_INTERVAL_YM</td>
<td>An INTERVAL_YM type</td>
</tr>
<tr>
<td>TYPECODE_MLSLABEL</td>
<td>An MLSLABEL type</td>
</tr>
<tr>
<td>TYPECODE_NAMEDCOLLECTION</td>
<td>A named collection (VARRAY/nested table) type</td>
</tr>
<tr>
<td>TYPECODE_NCHAR</td>
<td>A NCHAR type</td>
</tr>
<tr>
<td>TYPECODE_NCLOB</td>
<td>A NCLOB type</td>
</tr>
<tr>
<td>TYPECODE_NUMBER</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_NVARCHAR2</td>
<td>A NVARCHAR2 type</td>
</tr>
<tr>
<td>TYPECODE_OBJECT</td>
<td>An OBJECT type</td>
</tr>
<tr>
<td>TYPECODE_OPAQUE</td>
<td>An OPAQUE type</td>
</tr>
<tr>
<td>TYPECODE_RAW</td>
<td>A RAW type</td>
</tr>
<tr>
<td>TYPECODE_REF</td>
<td>A REF type</td>
</tr>
<tr>
<td>TYPECODE_TABLE</td>
<td>A nested table collection type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP</td>
<td>A TIMESTAMP type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP_LTZ</td>
<td>A TIMESTAMP_LTZ type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP_TZ</td>
<td>A TIMESTAMP_TZ type</td>
</tr>
<tr>
<td>TYPECODE_UROWID</td>
<td>A UROWID type</td>
</tr>
<tr>
<td>TYPECODE_VARCHAR2</td>
<td>A VARCHAR2 type</td>
</tr>
<tr>
<td>TYPECODE_VARCHAR</td>
<td>A VARCHAR type</td>
</tr>
<tr>
<td>TYPECODE_VARRAY</td>
<td>A VARRAY collection type</td>
</tr>
</tbody>
</table>
Exceptions

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH
The DBMS.Utility package provides various utility subprograms. This chapter contains the following topics:

- **Using DBMS.Utility**
  - Security Model
  - Constants
  - Exceptions

- **Data Structures**
  - Record Types
  - Table Types

- **Summary of DBMS.Utility Subprograms**
Using DBMS_UTILITY

- Security Model
- Constants
- Exceptions
Security Model

DBMS_UTIL runs with the privileges of the calling user for the NAME_RESOLVE Procedure and the COMPILCE_SCHEMA Procedure. This is necessary so that the SQL works correctly.

The package does not run as SYS. The privileges are checked using DBMS_DDL.
The DBMS_UTILITY package uses the constants shown in Table 155–1, "DBMS_UTILITY Constants".

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INV_ERROR_ON_RESTRIC</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>This constant is the only legal value for the p_option_flags parameter of the INVALIDATE subprogram</td>
</tr>
</tbody>
</table>
Exceptions

The following table lists the exceptions raised by DBMS_UTILITY.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INV_NOT_EXIST_OR_NO_PRIV</td>
<td>-24237</td>
<td>Raised by the INVALIDATE subprogram when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated</td>
</tr>
<tr>
<td>INV_MALFORMED_SETTINGS</td>
<td>-24238</td>
<td>Raised by the INVALIDATE subprogram if a compiler setting is specified more than once in the p_plsql_object_settings parameter</td>
</tr>
<tr>
<td>INV_RESTRICTED_OBJECT</td>
<td>-24239</td>
<td>Raised by the INVALIDATE subprogram when different combinations of conditions pertaining to the p_object_id parameter are contravened</td>
</tr>
</tbody>
</table>
The `DBMS_UTILITY` package defines a single `RECORD` type and `TABLE` types.

**Record Types**
- `INSTANCE_RECORD` Record Type

**Table Types**
- `DBLINK_ARRAY` TABLE Type
- `INDEX_TABLE_TYPE` Table Type
- `INSTANCE_TABLE` Table Type
- `LNAME_ARRAY` Table Type
- `NAME_ARRAY` Table Type
- `NUMBER_ARRAY` Table Type
- `UNCL_ARRAY` Table Type
INSTAN
CE
REC
O
D Record Type

This type describes a list of active instance number-name pairs.

Syntax

TYPE INSTANCE_RECORD IS RECORD (
    inst_number NUMBER,
    inst_name VARCHAR2(60));

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inst_number</td>
<td>Active instance number</td>
</tr>
<tr>
<td>inst_name</td>
<td>Instance name</td>
</tr>
</tbody>
</table>
DBLINK_ARRAY TABLE Type

This type stores a list of database links.

Syntax

```
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```
INDEX_TABLE_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

Syntax

    TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
INSTANCE_TABLE Table Type

This type describes a table of INSTANCE_RECORD Record Type.

Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

Usage Notes

The starting index of INSTANCE_TABLE Is 1; INSTANCE_TABLE Is Dense.
LNAME_ARRAY Table Type

This type stores lists of LONG NAME including fully qualified attribute names.

Syntax

```sql
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```
NAME_ARRAY Table Type

This type stores lists of NAME.

Syntax

```
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```
NUMBER_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

Syntax

```sql
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```
UNCL_ARRAY Table Type

This type stores lists of "user"."name"."column"@link

Syntax

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```
## Summary of DBMS_UTILITY Subprograms

</tr>
</tbody>
</table>
**ACTIVE_INSTANCES Procedure**

This procedure returns the active instance.

**Syntax**

```sql
DBMS_UTILITY.ACTIVE_INSTANCES (
    instance_table   OUT INSTANCE_TABLE,
    instance_count   OUT NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_table</td>
<td>Contains a list of the active instance numbers and names. When no instance is up, the list is empty.</td>
</tr>
<tr>
<td>instance_count</td>
<td>Number of active instances</td>
</tr>
</tbody>
</table>
**ANALYZE_DATABASE Procedure**

This procedure analyzes all the tables, clusters and indexes in a database.

**Syntax**

```sql
DBMS_UTILITY.ANALYZE_DATABASE (
    method             IN  VARCHAR2,
    estimate_rows      IN  NUMBER DEFAULT NULL,
    estimate_percent   IN  NUMBER DEFAULT NULL,
    method_opt         IN  VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.</td>
</tr>
<tr>
<td>estimate_rows</td>
<td>Number of rows to estimate</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Method options of the following format:</td>
</tr>
<tr>
<td></td>
<td>[ FOR TABLE ]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL [INDEXED] COLUMNS][SIZE n]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL INDEXES ]</td>
</tr>
</tbody>
</table>

**Exceptions**

Ora-20000: Insufficient privileges for some object in this database
ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL:

`ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [ <command_type>] [ <command_opt>] [ <sample_clause>]`

Syntax

```sql
DBMS_UTILITY.ANALYZE_PART_OBJECT (  
    schema        IN VARCHAR2 DEFAULT NULL,  
    object_name   IN VARCHAR2 DEFAULT NULL,  
    object_type   IN CHAR     DEFAULT 'T',  
    command_type  IN CHAR     DEFAULT 'E',  
    command_opt   IN VARCHAR2 DEFAULT NULL,  
    sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

Parameters

*Table 155–7  ANALYZE_PART_OBJECT Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Schema of the object_name</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of object to be analyzed, must be partitioned</td>
</tr>
<tr>
<td>object_type</td>
<td>Type of object, must be T (table) or I (index)</td>
</tr>
<tr>
<td>command_type</td>
<td>Must be V (validate structure)</td>
</tr>
<tr>
<td>command_opt</td>
<td>Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the ‘for’ options of analyze statistics (table). For V, it can be CASCADE when object_type is T.</td>
</tr>
<tr>
<td>sample_clause</td>
<td>Sample clause to use when command_type is 'E'</td>
</tr>
</tbody>
</table>

Usage Notes

For each partition of the object, run in parallel using job queues.
ANALYZE_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

Syntax

```
DBMS_UTILITY.ANALYZE_SCHEMA (
    schema             IN  VARCHAR2,
    method             IN  VARCHAR2,
    estimate_rows      IN  NUMBER DEFAULT NULL,
    estimate_percent   IN  NUMBER DEFAULT NULL,
    method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>method</td>
<td>One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.</td>
</tr>
<tr>
<td>estimate_rows</td>
<td>Number of rows to estimate</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Method options of the following format:</td>
</tr>
<tr>
<td></td>
<td>[ FOR TABLE ]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL [INDEXED] COLUMNS ] [ SIZE n]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL INDEXES ]</td>
</tr>
</tbody>
</table>

Exceptions

Ora-20000: Insufficient privileges for some object in this schema
**CANONICALIZE Procedure**

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that 'table' becomes TABLE.

**Syntax**

```sql
DBMS_UTILITY.CANONICALIZE(
  name           IN    VARCHAR2,
  canon_name     OUT   VARCHAR2,
  canon_len      IN    BINARY_INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String to be canonicalized</td>
</tr>
<tr>
<td>canon_name</td>
<td>Canonicalized string</td>
</tr>
<tr>
<td>canon_len</td>
<td>Length of the string (in bytes) to canonicalize</td>
</tr>
</tbody>
</table>

**Return Values**

Returns the first `canon_len` bytes in `canon_name`.

**Usage Notes**

- If `name` is NULL, `canon_name` becomes NULL.
- If `name` is not a dotted name, and if `name` begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If `name` is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after a\.b\* will be ignored.
- The procedure does not handle cases like 'A B.'

**Examples**

- `a` becomes A
- "a" becomes a
- "a".b becomes "a"."B"
- "a".b,c.f becomes "a"."B" with ",c.f" ignored.
COMMA_TO_TABLE Procedures

These procedures converts a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```sql
DBMS_UTILITY.COMMA_TO_TABLE (  
list   IN  VARCHAR2,  
tablen OUT BINARY_INTEGER,  
tab    OUT unci_array);

DBMS_UTILITY.COMMA_TO_TABLE (  
list   IN  VARCHAR2,  
tablen OUT BINARY_INTEGER,  
tab    OUT lname_array);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| list      | Comma separated list of list of 'names', where a name should have the following format for the first overloading: 
  a [. b [. c ]][ @ d ] 
  and the following format for the second overloading: 
  a [. b]* 
  where a, b, c, d are simple identifiers (quoted or unquoted). |
| tablen    | Number of tables in the PL/SQL table |
| tab       | PL/SQL table which contains list of names |

Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

Usage Notes

The list must be a non-empty comma-delimited list. Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.

Entries in the comma-delimited list cannot include multibyte characters.

The values in tab are copied from the original list, with no transformations.
### COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

**Syntax**

```sql
DBMS_UTILITY.COMPILE_SCHEMA (  
    schema         IN VARCHAR2,  
    compile_all    IN BOOLEAN DEFAULT TRUE,  
    reuse_settings IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Name of the schema</td>
</tr>
</tbody>
</table>
| compile_all    | If TRUE, will compile everything within the schema regardless of whether it is VALID  
                  | If FALSE, will compile only INVALID objects                                   |
| reuse_settings | Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead |

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000</td>
<td>Insufficient privileges for some object in this schema</td>
</tr>
<tr>
<td>ORA-20001</td>
<td>Cannot recompile SYS objects</td>
</tr>
<tr>
<td>ORA-20002</td>
<td>Maximum iterations exceeded. Some objects may not have been recompiled.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- Note that this subprogram is a wrapper for the RECOMP_SERIAL Procedure included with the UTL_RECOMP package.
- After calling this procedure, you should select from view ALL_OBJECTS for items with status of INVALID to see if all objects were successfully compiled.
- To see the errors associated with INVALID objects, you may use the Enterprise Manager command:

```sql
SHOW ERRORS <type> <schema>.<name>
```
CREATE_AlTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the EXCEPTION clause of the ALTER TYPE statement.

Syntax

DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(
    schema_name IN VARCHAR2,
    table_name IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table created</td>
</tr>
</tbody>
</table>

Exceptions

An error is returned if the table already exists.
CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns NULL when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE
RETURN NUMBER;
```
DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (dba NUMBER) RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dba</td>
<td>Data block address</td>
</tr>
</tbody>
</table>

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.
DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```sql
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (dba NUMBER)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dba</td>
<td>Data block address</td>
</tr>
</tbody>
</table>

Pragmas

```sql
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.
DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```sql
DBMS_UTILITY.DB_VERSION (  
    version OUT VARCHAR2,  
    compatibility OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.</td>
</tr>
<tr>
<td>compatibility</td>
<td>The compatibility setting of the database determined by the &quot;compatible&quot; init.ora parameter. If the parameter is not specified in the init.ora file, then NULL is returned.</td>
</tr>
</tbody>
</table>
EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in parse_string.

Syntax

```sql
DBMS_UTILITY.EXEC_DDL_STATEMENT (    parse_string IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parse_string</td>
<td>DDL statement to be executed</td>
</tr>
</tbody>
</table>
FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```sql
DBMS_UTILITY.FORMAT_CALL_STACK
RETURN VARCHAR2;
```

Pragmas

```sql
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.
FORMAT_ERROR_BACKTRACE Function

This procedure displays the call stack at the point where an exception was raised, even if the procedure is called from an exception handler in an outer scope. The output is similar to the output of the SQLERRM function, but not subject to the same size limitation.

Syntax

```sql
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
    RETURN VARCHAR2;
```

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

```sql
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
    g_start_pos integer := 1;
    g_end_pos  integer;

    FUNCTION Output_One_Line RETURN BOOLEAN IS
        BEGIN
            g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );
            CASE g_end_pos > 0
                WHEN true THEN
                    DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
                        g_end_pos-g_start_pos ) );
                    g_start_pos := g_end_pos+1;
                    RETURN TRUE;
                WHEN FALSE THEN
                    DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
                        (Length(i_buff)-g_start_pos)+1 ) );
                    RETURN FALSE;
            END CASE;
        END Output_One_Line;

    BEGIN
        WHILE Output_One_Line() LOOP NULL;
        END LOOP;
    END Log_Errors;
/
```

```sql
CREATE OR REPLACE PROCEDURE P0 IS
    e_01476 EXCEPTION; pragma exception_init ( e_01476, -1476 );
    BEGIN
        RAISE e_01476;
    END P0;
/
```

```sql
CREATE OR REPLACE PROCEDURE P1 IS
```

Show Errors
BEGIN
  P0();
END P1;
/
SHOW ERRORS

CREATE OR REPLACE PROCEDURE P2 IS

 */
FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

DBMS_UTILITY.FORMAT_ERROR_STACK
RETURN VARCHAR2;

Return Values

This returns the error stack, up to 2000 bytes.
GET_CPU_TIME Function

This function returns the current CPU time in 100th's of a second. The returned CPU time is the number of 100th’s of a second from some arbitrary epoch.

Syntax

```
DBMS_UTILITY.GET_CPU_TIME
RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

This subprogram reports cycles (CPU time) used in performing work, and is unrelated to clock time or any other fixed reference. Since the base line is rubricator, and the relationship between work performed and the number generated is Operating System specific, the amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.
GET_DEPENDENCY Procedure

This procedure shows the dependencies on the object passed in.

Syntax

```sql
DBMS_UTILITY.GET_DEPENDENCY
  type      IN     VARCHAR2,
  schema    IN     VARCHAR2,
  name      IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of the object, for example if the object is a table give the type as 'TABLE'</td>
</tr>
<tr>
<td>schema</td>
<td>Schema name of the object</td>
</tr>
<tr>
<td>name</td>
<td>Name of the object</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure uses the `DBMS_OUTPUT` package to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`. 
GET_ENDIANNESS Function

This Function Gets The Endianness Of The Database Platform.

Syntax

```
DBMS_UTILITY.GET_ENDIANNESS
    Return Number;
```

Return Values

The endianness of the database platform.
**GET_HASH_VALUE Function**

This function computes a hash value for the given string.

**Syntax**

```sql
DBMS_UTILITY.GET_HASH_VALUE (  
    name      VARCHAR2,  
    base      NUMBER,  
    hash_size NUMBER)  
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String to be hashed.</td>
</tr>
<tr>
<td>base</td>
<td>Base value for the returned hash value at which to start</td>
</tr>
<tr>
<td>hash_size</td>
<td>Desired size of the hash table</td>
</tr>
</tbody>
</table>

**Pragmas**

```sql
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

**Return Values**

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the `hash_size` value. Using a power of 2 for the `hash_size` parameter works best.
**GET_PARAMETER_VALUE Function**

This function gets the value of specified `init.ora` parameter.

**Syntax**

```sql
DBMS_UTILITY.GET_PARAMETER_VALUE (  
    parnam     IN        VARCHAR2,  
    intval     IN OUT    BINARY_INTEGER,  
    strval     IN OUT    VARCHAR2,  
    listno     IN        BINARY_INTEGER DEFAULT 1)  
RETURN BINARY_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parnam</td>
<td>Parameter name</td>
</tr>
<tr>
<td>intval</td>
<td>Value of an integer parameter or the value length of a string parameter</td>
</tr>
<tr>
<td>strval</td>
<td>Value of a string parameter</td>
</tr>
<tr>
<td>listno</td>
<td>List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.</td>
</tr>
</tbody>
</table>

**Return Values**

Parameter type:

- 0 if parameter is an INTEGER/BOOLEAN parameter
- 1 if parameter is a string/file parameter

**Usage Notes**

When using `DBMS_UTILITY.GET_PARAMETER_VALUE`, only the first parameter setting of `/dir1` is returned when `init.ora` is set as follows:

```sql
utl_file_dir = /dir1  
utl_file_dir = /dir2
```

However, the full comma-delimited string is returned if you are using:

```sql
utl_file_dir = /dir1, /dir2
```

**Examples**

```sql
DECLARE  
    parnam VARCHAR2(256);  
    intval BINARY_INTEGER;  
    strval VARCHAR2(256);  
    partyp BINARY_INTEGER;  
BEGIN  
    partyp := dbms_utility.get_parameter_value('max_dump_file_size',  
        intval, strval);  
    dbms_output.put({'parameter value is: '};  
    IF partyp = 1 THEN  
        dbms_output.put_line(strval);
```
ELSE
    dbms_output.put_line(intval);
END IF;
IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
END IF;
dbms_output.put('parameter type is: ');
IF partyp = 1 THEN
    dbms_output.put_line('string');
ELSE
    dbms_output.put_line('integer');
END IF;
END;
GET_SQL_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

Syntax

```sql
Dbms_utility.get_sql_hash (    
    name          IN   VARCHAR2, 
    hash          OUT  RAW, 
    pre10ihash    OUT  NUMBER)    
RETURN NUMBER;
```

Pragmas

Pragma Restrict_references(Get_sql_hash,Wnds,Rnds,Wnps,Rnps);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String to be hashed</td>
</tr>
<tr>
<td>hash</td>
<td>Optional field to store all 16 bytes of returned hash value</td>
</tr>
<tr>
<td>pre10ihash</td>
<td>Optional field to store the pre 10i database version hash value</td>
</tr>
</tbody>
</table>

Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. one could use an optional raw parameter to get all 16 bytes and to store the pre 10i hash value of 4 bytes in the pre10i hash optional parameter.
GET_TIME Function

This function determines the current time in 100th's of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME
RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers, application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.
INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```
DBMS_UTILITY.INVALIDATE (
  p_object_id              NUMBER,
  p_plsql_object_settings  VARCHAR2 DEFAULT NULL,
  p_option_flags           PLS_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_object_id</td>
<td>ID number of object to be invalidated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS. If the object_id argument is NULL or invalid then the exception inv_not_exist_or_no_priv is raised. The caller of this procedure must have create privileges on the object being invalidated else the inv_not_exist_or_no_priv exception is raised.</td>
</tr>
<tr>
<td>p_plsql_object_settings</td>
<td>Optional parameter that ignored if the object specified by p_object_id is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to REUSE SETTINGS. If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else inv_malformed_settings exception will be raised. The setting values are changed only for the object specified by p_object_id and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and REUSE_SETTINGS is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and REUSE_SETTINGS was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.</td>
</tr>
<tr>
<td>p_option_flags</td>
<td>Optional parameter defaults to zero (no flags). Option flags supported by invalidate.</td>
</tr>
<tr>
<td></td>
<td>inv_error_on_restrictions (see Constants on page 155-4): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by p_object_id cannot be a table. By default, invalidate quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception inv_restricted_object is raised.</td>
</tr>
</tbody>
</table>
Exceptions

Table 155–23 INVALIDATE Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INV_NOT_EXIST_OR_NO_PRIV</td>
<td>Raised when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated</td>
</tr>
<tr>
<td>INV_MALFORMED_SETTINGS</td>
<td>Raised if a compiler setting is specified more than once in the p_plsql_object_settings parameter</td>
</tr>
<tr>
<td>INV_RESTRICTED_OBJECT</td>
<td>Raised when different combinations of conditions pertaining to the p_object_id parameter are contravened</td>
</tr>
</tbody>
</table>

Usage Notes

The object type (object_type column from ALL_OBJECTS) of the object specified by p_object_id must be a PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, TYPE, TYPE BODY, LIBRARY, VIEW, OPERATOR, SYNONYM, or JAVA CLASS. If the object is not one of these types and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is the package specification of STANDARD, DBMS_STANDARD, or specification or body of DBMSUTILITY and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is an object type specification and there exist tables which depend on the type and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

Examples

Example 1

DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');

Assume that the object_id 1232 refers to the procedure remove_emp in the HR schema. Then the above call will mark the remove_emp procedure invalid and change its PLSQL_OPTIMIZE_LEVEL compiler setting to 2. The values of other compiler settings will remain unchanged since REUSE SETTINGS is specified.

Objects that depend on hr.remove_emp will also get marked invalid. Their compiler parameters will not be changed.

Example 2

DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');

Assume that the object_id 40775 refers to the type body leaf_category_typ in the OE schema. Then the above call will mark the type body invalid and change its PLSQL_CODE_TYPE compiler setting to NATIVE. The values of other compiler settings will be picked up from the current session environment since REUSE SETTINGS has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.
Example 3

DBMS_UTILITY.INVALIDATE (40796);

Assume that the object_id 40796 refers to the view oc_orders in the OE schema. Then the above call will mark the oc_orders view invalid.

Objects that depend on oe.oc_orders will also get marked invalid.
IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE
    RETURN BOOLEAN;
```

Return Values

This function returns TRUE if this instance was started in cluster database mode; FALSE otherwise.
MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number. A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
    file  NUMBER,
    block NUMBER)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File that contains the block</td>
</tr>
<tr>
<td>block</td>
<td>Offset of the block within the file in terms of block increments</td>
</tr>
</tbody>
</table>

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.
NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```sql
DBMS_UTILITY.NAME_RESOLVE ( 
    name          IN  VARCHAR2,
    context       IN  NUMBER,
    schema        OUT VARCHAR2,
    part1         OUT VARCHAR2,
    part2         OUT VARCHAR2,
    dblink        OUT VARCHAR2,
    part1_type    OUT NUMBER,
    object_number OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the object. This can be of the form [[a.]b.][c@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in. a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).</td>
</tr>
<tr>
<td>context</td>
<td>Must be an integer between 0 and 9.</td>
</tr>
<tr>
<td></td>
<td>■ 0 - table</td>
</tr>
<tr>
<td></td>
<td>■ 1 - PL/SQL (for 2 part names)</td>
</tr>
<tr>
<td></td>
<td>■ 2 - sequences</td>
</tr>
<tr>
<td></td>
<td>■ 3 - trigger</td>
</tr>
<tr>
<td></td>
<td>■ 4 - Java Source</td>
</tr>
<tr>
<td></td>
<td>■ 5 - Java resource</td>
</tr>
<tr>
<td></td>
<td>■ 6 - Java class</td>
</tr>
<tr>
<td></td>
<td>■ 7 - type</td>
</tr>
<tr>
<td></td>
<td>■ 8 - Java shared data</td>
</tr>
<tr>
<td></td>
<td>■ 9 - index</td>
</tr>
<tr>
<td>schema</td>
<td>Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.</td>
</tr>
<tr>
<td>part1</td>
<td>First part of the name. The type of this name is specified part1_type (synonym or package).</td>
</tr>
<tr>
<td>part2</td>
<td>If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram.</td>
</tr>
</tbody>
</table>
Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

Table 155–25 (Cont.) NAME_RESOLVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dblink</td>
<td>If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.</td>
</tr>
<tr>
<td>part1_type</td>
<td>Type of part1 is:</td>
</tr>
<tr>
<td></td>
<td>- 5 - synonym</td>
</tr>
<tr>
<td></td>
<td>- 7 - procedure (top level)</td>
</tr>
<tr>
<td></td>
<td>- 8 - function (top level)</td>
</tr>
<tr>
<td></td>
<td>- 9 - package</td>
</tr>
<tr>
<td>object_number</td>
<td>Object identifier</td>
</tr>
</tbody>
</table>
NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as "a [. b [. c ]][@ dblink ]". It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

Syntax

```sql
DBMS_UTILITY.NAME_TOKENIZE (
    name    IN  VARCHAR2,
    a       OUT VARCHAR2,
    b       OUT VARCHAR2,
    c       OUT VARCHAR2,
    dblink  OUT VARCHAR2,
    nextpos OUT BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Input name, consisting of SQL identifiers (for example, scott.foo@dblink)</td>
</tr>
<tr>
<td>a</td>
<td>Output for the first token of the name</td>
</tr>
<tr>
<td>b</td>
<td>Output for the second token of the name (if applicable)</td>
</tr>
<tr>
<td>c</td>
<td>Output for the third token of the name (if applicable)</td>
</tr>
<tr>
<td>dblink</td>
<td>Output for the dblink of the name</td>
</tr>
<tr>
<td>nextpos</td>
<td>Next position after parsing the input name</td>
</tr>
</tbody>
</table>
OLD_CURRENT_SCHEMA Function

This function returns the session value from sys_context('userenv', 'current_schema').

Syntax

```
DBMS_UTILITY.OLD_CURRENT_SCHEMA
RETURN VARCHAR2;
```
OLD_CURRENT_USER Function

This function returns the session value from `sys_context('userenv','current_user')`.

Syntax

```sql
DBMS_UTILITY.OLD_CURRENT_USER
RETURN VARCHAR2;
```
**PORT_STRING Function**

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

**Syntax**

```sql
DBMS_UTILITY.PORT_STRING
    RETURN VARCHAR2;
```

**Pragmas**

```sql
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```
SQLID_TO_SQLHASH Function

This function converts a SQL ID into a hash value.

Syntax

```sql
DBMS_UTILITY.SQLID_TO_SQLHASH (
    sql_id    IN   VARCHAR2)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL ID of a SQL statement. Must be VARCHAR2(13).</td>
</tr>
</tbody>
</table>
TABLE_TO_COMMA Procedures

These procedures convert a PL/SQL table of names into a comma-delimited list of names. This takes a PL/SQL table, 1..n, terminated with n+1 null. The second version supports fully-qualified attribute names.

Syntax

```sql
DBMS_UTILITY.TABLE_TO_COMMA (    tab INTEGER,    list OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tab</td>
<td>PL/SQL table which contains list of table names</td>
</tr>
<tr>
<td>tablen</td>
<td>Number of tables in the PL/SQL table</td>
</tr>
<tr>
<td>list</td>
<td>Comma separated list of tables</td>
</tr>
</tbody>
</table>

Return Values

A comma-delimited list and the number of elements found in the table.
VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

DBMS_UTILITY.VALIDATE(
    object_id       NUMBER);

DBMS_UTILITY.VALIDATE(
    owner          VARCHAR2,
    objname        VARCHAR2,
    namespace      NUMBER,
    edition_name   := SYS_CONTEXT ('USERENV', 'CURRENT_EDITION'));

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace of the object. Same as the namespace field in obj$. Equivalent numeric values are as follows:</td>
</tr>
<tr>
<td></td>
<td>■ 1 = TABLE/PROCEDURE/TYPEx</td>
</tr>
<tr>
<td></td>
<td>■ 2 = BODY</td>
</tr>
<tr>
<td></td>
<td>■ 3 = TRIGGER</td>
</tr>
<tr>
<td></td>
<td>■ 4 = INDEX</td>
</tr>
<tr>
<td></td>
<td>■ 5 = CLUSTER</td>
</tr>
<tr>
<td></td>
<td>■ 8 = LOB</td>
</tr>
<tr>
<td></td>
<td>■ 9 = DIRECTORY</td>
</tr>
<tr>
<td></td>
<td>■ 10 = QUEUE</td>
</tr>
<tr>
<td></td>
<td>■ 11 = REPLICATION OBJECT GROUP</td>
</tr>
<tr>
<td></td>
<td>■ 12 = REPLICATION PROPAGATOR</td>
</tr>
<tr>
<td></td>
<td>■ 13 = JAVA SOURCE</td>
</tr>
<tr>
<td></td>
<td>■ 14 = JAVA RESOURCE</td>
</tr>
<tr>
<td></td>
<td>■ 58 = (Data Mining) MODEL</td>
</tr>
<tr>
<td>edition_name</td>
<td>[Note: Currently not operable. Reserved for future use]</td>
</tr>
</tbody>
</table>

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.
The **INVALIDATE Procedure** invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its `object_id`. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to INVALIDATE will not actualize the object in the current edition.
WAIT_ON_PENDING_DML Function

This procedure waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified scn have either committed or been rolled back.

Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (    
tables    IN       VARCHAR2,    
timeout   IN       BINARY_INTEGER,    
scn       IN OUT   NUMBER)    
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tables</td>
<td>Comma-separated list of one or more table names. The list must be valid for COMMA_TO_TABLE Procedures, and each item valid to the NAME_RESOLVE Procedure. Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum number of seconds to wait, totalled across all tables/transactions. A NULL or negative value will cause a very long wait.</td>
</tr>
<tr>
<td>scn</td>
<td>SCN prior to which transactions must have begun to be considered relevant to this request. If the value is NULL or not recognized as a meaningful scn on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output.</td>
</tr>
</tbody>
</table>

Return Values

TRUE if all relevant transactions have committed or been rolled back, FALSE if the timeout occurred prior to all relevant transactions committing or being rolled back.
The DBMS_WARNING package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the PLSQL_WARNINGS initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- Using DBMS_WARNING
  - Security Model
- Summary of DBMS_WARNING Subprograms
Using DBMS_WARNING

- Security Model
Security Model

Note that for all the following interfaces, if value of the scope parameter is SYSTEM, then the user must have ALTER SYSTEM privilege.
## Summary of DBMS_WARNING Subprograms

### Table 156–1  DBMS_WARNING Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_WARNING_SETTING_CAT Procedure on page 156-5</td>
<td>Modifies the current session or system warning settings of the warning_category previously supplied</td>
</tr>
<tr>
<td>ADD_WARNING_SETTING_NUM Procedure on page 156-6</td>
<td>Modifies the current session or system warning settings of the or warning_number previously supplied</td>
</tr>
<tr>
<td>GET_CATEGORY Function on page 156-7</td>
<td>Returns the category name, given the message number</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_CAT Function on page 156-8</td>
<td>Returns the specific warning category in the session</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_NUM Function on page 156-9</td>
<td>Returns the specific warning number in the session</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_STRING Function on page 156-10</td>
<td>Returns the entire warning string for the current session</td>
</tr>
<tr>
<td>SET_WARNING_SETTING_STRING Procedure on page 156-11</td>
<td>Replaces previous settings with the new value</td>
</tr>
</tbody>
</table>
ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied. The value will be added to the existing parameter setting if the value for the warning_category or warning_value has not been set, or override the existing value. The effect of calling this function is same as adding the qualifier (ENABLE/DISABLE/ERROR) on the category specified to the end of the current session or system setting.

Syntax

```sql
DBMS_WARNING.ADD_WARNING_SETTING_CAT (warning_category IN VARCHAR2,
                              warning_value IN VARCHAR2,
                              scope IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_category</td>
<td>Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.</td>
</tr>
<tr>
<td>warning_value</td>
<td>Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.</td>
</tr>
<tr>
<td>scope</td>
<td>Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
ADD_WARNING_SETTING_NUM Procedure

You can modify the current session or system warning settings with the value supplied. If the value was already set, you will override the existing value. The effect of calling this function is same as adding the qualifier (ENABLE / DISABLE / ERROR) on the category specified to the end of the current session or system setting.

Syntax

```sql
DBMS_WARNING.ADD_WARNING_SETTING_NUM (  
  warning_number      IN    NUMBER,  
  warning_value       IN    VARCHAR2,  
  scope               IN    VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>The warning number. Allowed values are all valid warning numbers.</td>
</tr>
<tr>
<td>warning_value</td>
<td>Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.</td>
</tr>
<tr>
<td>scope</td>
<td>Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
GETCATEGORY Function

This function returns the category name, given the message number.

Syntax

DBMS_WARNING.GET_CATEGORY (warning_number IN pls_integer)
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>The warning message number.</td>
</tr>
</tbody>
</table>
GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (  
    warning_category IN VARCHAR2)  
RETURN warning_value;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_category</td>
<td>Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).</td>
</tr>
</tbody>
</table>
GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (
    warning_number IN NUMBER
)
RETURN warning_value;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>Warning number. Allowed values are all valid warning numbers.</td>
</tr>
</tbody>
</table>
GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING
RETURN pls_integer;
```

Usage Notes

Use this function when you do not have SELECT privilege on v$parameter or v$paramater2 fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using SET_WARNING_SETTING_STRING.
SET_WARNING_SETTING_STRING Procedure

This procedure replaces previous settings with the new value. The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of ‘=’ when issuing an ALTER SESSION or SYSTEM SET PLSQL_WARNINGS command. This will have same effect as ALTER SESSION OR ALTER SYSTEM command.

Syntax

```sql
DBMS_WARNING.SET_WARNING_SETTING_STRING (  
    warning_value   IN   VARCHAR2,  
    scope           IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_value</td>
<td>The new string that will constitute the new value.</td>
</tr>
<tr>
<td>scope</td>
<td>This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
The DBMS_WM package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

- Documentation of DBMS_WM
For a complete description of this package, see DBMS_WM in Oracle Database Workspace Manager Developer's Guide.
The DBMS_WORKLOAD_CAPTURE package configures the Workload Capture system and produce the workload capture data. Replay of this capture is implemented by way of the DBMS_WORKLOAD_REPLAY package.

**See Also:** Oracle Database Real Application Testing User’s Guide for more information about Database Replay

This chapter contains the following topics:

- **Using DBMS_WORKLOAD_CAPTURE**
  - Overview
  - Security Model

- **Summary of DBMS_WORKLOAD_CAPTURE Subprograms**
Using DBMS_WORKLOAD_CAPTURE

- Overview
- Security Model
Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.
The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (wrc `someuser/somepassword` or wrc `USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.
Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table lists the package subprograms in alphabetical order.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_FILTER Procedures</td>
<td>Adds a specified filter</td>
</tr>
<tr>
<td>DELETE_CAPTURE_INFO Procedure</td>
<td>Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID</td>
</tr>
<tr>
<td>DELETE_FILTER Procedure</td>
<td>Deletes a specified filter</td>
</tr>
<tr>
<td>EXPORT_AWR Procedure</td>
<td>Exports the AWR snapshots associated with a given capture ID</td>
</tr>
<tr>
<td>FINISH_CAPTURE Procedure</td>
<td>Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured</td>
</tr>
<tr>
<td>GET_CAPTURE_INFO Function</td>
<td>Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID</td>
</tr>
<tr>
<td>IMPORT_AWR Function</td>
<td>Imports the AWR snapshots associated with a given capture ID</td>
</tr>
<tr>
<td>PROCESS_CAPTURE Procedure</td>
<td>Processes the workload capture found in capture_dir in place, analyzes it, and creates new workload replay specific metadata files that are required to replay the given workload capture</td>
</tr>
<tr>
<td>REPORT Function</td>
<td>Returns a report on the workload capture under consideration using one or more different sources</td>
</tr>
<tr>
<td>START_CAPTURE Procedure</td>
<td>Initiates workload capture on all instances</td>
</tr>
</tbody>
</table>
ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.ADD_FILTER ( fname IN VARCHAR2 NOT NULL, fattribute IN VARCHAR2 NOT NULL, fvalue IN VARCHAR2 NOT NULL);

DBMS_WORKLOAD_CAPTURE.ADD_FILTER ( fname IN VARCHAR2 NOT NULL, fattribute IN VARCHAR2 NOT NULL, fvalue IN NUMBER NOT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fname</td>
<td>Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)</td>
</tr>
<tr>
<td>fattribute</td>
<td>Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- INSTANCE_NUMBER - type NUMBER</td>
</tr>
<tr>
<td></td>
<td>- USER - type STRING</td>
</tr>
<tr>
<td></td>
<td>- MODULE - type STRING</td>
</tr>
<tr>
<td></td>
<td>- ACTION - type STRING</td>
</tr>
<tr>
<td></td>
<td>- PROGRAM - type STRING</td>
</tr>
<tr>
<td></td>
<td>- SERVICE - type STRING</td>
</tr>
<tr>
<td>fvalue</td>
<td>Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as &quot;attribute = value&quot;, with the filter for a STRING attribute parsed as &quot;attribute like value&quot; (Mandatory).</td>
</tr>
</tbody>
</table>

Usage Notes

- The workload capture filters work in either the DEFAULT INCLUSION or the DEFAULT EXCLUSION mode as determined by the default_action input to the START_CAPTURE Procedure.
- ADD_FILTER adds a new filter that affects the next workload capture, and whether the filters are considered as INCLUSION filters or EXCLUSION filters depends on the value of the default_action input to START_CAPTURE Procedure.
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the START_CAPTURE Procedure is executed.
- All the filters are listed in the DBA_WORKLOAD_FILTERS view.
DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
  capture_id IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the workload capture that needs to be deleted. Corresponds to DBA_WORKLOAD_CAPTURES.ID. (Mandatory)</td>
</tr>
</tbody>
</table>

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.
DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
    filter_name IN VARCHAR2(40) NOT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter_name</td>
<td>Filter to be deleted</td>
</tr>
</tbody>
</table>

Usage Notes

The DELETE_FILTER Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the ADD_FILTER Procedures after any capture has been completed. Filters that have been added using ADD_FILTER before a START_CAPTURE and FINISH_CAPTURE cannot be deleted anymore using this subprogram.
EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
   capture_id   IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the capture whose AWR snapshots are to be exported. (Mandatory)</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_CAPTURES` was not created by calling the `GET_CAPTURE_INFO Function`) and the AWR snapshots that correspond to the original capture time period are still available.
FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
    timeout IN NUMBER DEFAULT 30
    reason IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush its capture buffers. Default value: 30 seconds</td>
</tr>
<tr>
<td>reason</td>
<td>Specifies a reason for calling the procedure. The reason appears in the column ERROR_MESSAGE of the view DBA_WORKLOAD_CAPTURES.</td>
</tr>
</tbody>
</table>

Usage Notes

- By default, FINISH_CAPTURE waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.
- All sessions that either were in the middle of executing a user request or received a new user request, while FINISH_CAPTURE was waiting for acknowledgements, flush their buffers and send back their acknowledgement to FINISH_CAPTURE.
- If a database session remains idle (waiting for the next user request) throughout the duration of FINISH_CAPTURE, the session might have unflushed capture buffers and does not send its acknowledgement to FINISH_CAPTURE.

To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking FINISH_CAPTURE. Either close the database session(s) before running FINISH_CAPTURE or send new database requests to those sessions during FINISH_CAPTURE.
**GET_CAPTURE_INFO Function**

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views, and returns the appropriate `DBA_WORKLOAD_CAPTURES.ID`.

**Syntax**

```sql
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
   dir IN VARCHAR2)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir</td>
<td>Name of the DIRECTORY object (case sensitive) where all the workload capture files are located (Mandatory)</td>
</tr>
</tbody>
</table>

**Usage Notes**

If an appropriate row describing the capture in the stipulated directory already exists in `DBA_WORKLOAD_CAPTURES`, the `GET_CAPTURE_INFO Function` simply returns that row’s `DBA_WORKLOAD_CAPTURES.ID`. If no existing row matches the capture present in the stipulated directory a new row is inserted to `DBA_WORKLOAD_CAPTURES` and that row’s ID is returned.
IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the EXPORT_AWR Procedure.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (  
capture_id       IN   NUMBER,  
staging_schema   IN   VARCHAR2,  
force_cleanup    IN   BOOLEAN DEFAULT FALSE)  
RETURN NUMBER;
```

Parameters

**Table 158-8  IMPORT_AWR Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the capture whose AWR snapshots should be imported. (Mandatory)</td>
</tr>
<tr>
<td>staging_schema</td>
<td>Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory, Case sensitive).</td>
</tr>
</tbody>
</table>
| force_cleanup       | Values:  
  - TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL:
    ```sql
    SELECT table_name FROM dba_tables
    WHERE owner = staging_schema
    AND table_name like 'WR_${}';
    ```
    Use this option only if you are sure that there are no important data in any such tables in the staging_schema.  
  - FALSE - (default) no tables dropped from the staging_schema prior to the import operation |

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

**IMPORT_AWR** fails if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.
PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in capture_dir in place, analyzes it, and creates new workload replay specific metadata files that are required to replay the given workload capture.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.PROCESS_CAPTURE (
    capture_dir        IN VARCHAR2,
    parallel_level     IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_dir</td>
<td>Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has appropriate permissions. New files are added to this directory. (Mandatory)</td>
</tr>
<tr>
<td>parallel_level</td>
<td>Number of oracle processes used to process the capture in a parallel fashion. The NULL default value auto-computes the parallelism level, whereas a value of 1 enforces serial execution.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure can be run multiple times on the same capture directory, which is useful when it encounters unexpected errors or is cancelled by the user.

Once this procedure runs successfully, the capture_dir can be used as input to INITIALIZE_REPLAY Procedure in the DBMS_WORKLOAD_REPLAY package in order to replay the captured workload present in capture_dir.
REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.REPORT (  
capture_id      IN   NUMBER,  
format          IN   VARCHAR2)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the workload capture whose capture report is required. (Mandatory)</td>
</tr>
<tr>
<td></td>
<td>This relates to the directory that contains the workload capture on which</td>
</tr>
<tr>
<td></td>
<td>the Report needs to be generated. Should be a valid DIRECTORY object that</td>
</tr>
<tr>
<td></td>
<td>points to a valid directory in the host system that contains a workload</td>
</tr>
<tr>
<td></td>
<td>capture.</td>
</tr>
<tr>
<td>format</td>
<td>Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_</td>
</tr>
<tr>
<td></td>
<td>TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML. (Mandatory)</td>
</tr>
</tbody>
</table>

Return Values

The report body in the desired format returned as a CLOB.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_HTML</td>
<td>VARCHAR2 (4)</td>
<td>'HTML'</td>
<td>Generates the HTML version of the report</td>
</tr>
<tr>
<td>TYPE_TEXT</td>
<td>VARCHAR2 (4)</td>
<td>'TEXT'</td>
<td>Used as as input to the format argument to generate the text version of the report</td>
</tr>
</tbody>
</table>
START_CAPTURE Procedure

This procedure initiates workload capture on all instances.

Note: The functionality associated with the capture_sts and sts_cap_interval parameters is available starting with Oracle Database 11g Release 2 (11.2.0.2).

Syntax

DBMS_WORKLOAD_CAPTURE.START_CAPTURE (  
  name              IN  VARCHAR2,  
  dir               IN  VARCHAR2,  
  duration          IN  NUMBER   DEFAULT NULL,  
  default_action    IN  VARCHAR2 DEFAULT 'INCLUDE',  
  auto_unrestrict   IN  BOOLEAN  DEFAULT TRUE,  
  capture_sts       IN  BOOLEAN  DEFAULT FALSE,  
  sts_cap_interval  IN  NUMBER   DEFAULT 300);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the workload capture. Allows the workload capture to be given a label, such as &quot;Thanksgiving weekend&quot; or &quot;Christmas peak workload&quot; for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)</td>
</tr>
<tr>
<td>dir</td>
<td>Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)</td>
</tr>
<tr>
<td>duration</td>
<td>Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.</td>
</tr>
<tr>
<td>default_action</td>
<td>Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters.</td>
</tr>
<tr>
<td></td>
<td>- If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.)</td>
</tr>
<tr>
<td></td>
<td>- If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured.</td>
</tr>
</tbody>
</table>
START_CAPTURE Procedure

**Usage Notes**

- All user requests sent to database after a successful invocation of `START_CAPTURE` are recorded in the given `dir` directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the `FINISH_CAPTURE` Procedure is executed.

- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until `FINISH_CAPTURE` is executed, whichever occurs first.

- One can use workload filters (as described with regard to the `ADD_FILTER Procedures`) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.

- Workload that is initiated from Oracle Database background processes (such as `SMON`, `PMON`, `MMON`) and Oracle Database Scheduler Jobs (as detailed in the `DBMS_SCHEDULER` package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.

- By default, all database instances that were started up in `RESTRICTED` mode using `STARTUP RESTRICT` are automatically unrestricted upon a successful `START_CAPTURE`. (DEFAULT)

- If `FALSE`, no database instance is automatically unrestricted.

- If TRUE, all instances started up in `RESTRICTED` mode using `STARTUP RESTRICT` are automatically unrestricted upon a successful `START_CAPTURE`. (DEFAULT)

- If starting SQL set capture fails, workload capture is stopped. The reason is stored in `DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE`.

- The default value is `FALSE`.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>auto_unrestrict</code></td>
<td>Can be either <code>TRUE</code> or <code>FALSE</code>.</td>
</tr>
<tr>
<td></td>
<td>- If <code>TRUE</code>, all instances started up in <code>RESTRICTED</code> mode using <code>STARTUP RESTRICT</code> are automatically</td>
</tr>
<tr>
<td></td>
<td>unrestricted upon a successful <code>START_CAPTURE</code>. (DEFAULT)</td>
</tr>
<tr>
<td></td>
<td>- If <code>FALSE</code>, no database instance is automatically unrestricted.</td>
</tr>
<tr>
<td><code>capture_sts</code></td>
<td>If this parameter is <code>TRUE</code>, a SQL tuning set capture is also started in parallel with workload capture.</td>
</tr>
<tr>
<td></td>
<td>The resulting SQL tuning set can be exported using the <code>EXPORT_AWR Procedure</code> along with the AWR data.</td>
</tr>
<tr>
<td></td>
<td>Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no</td>

<td><code>sts_cap_interval</code></td>
<td>Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default</td>
</tr>
<tr>
<td></td>
<td>value is <code>300</code>.</td>
</tr>
</tbody>
</table>

Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context.

Capture filters defined using the `DBMS_WORKLOAD_REPLAY` interface do not apply to the SQL tuning set capture.

The calling user must have the appropriate privileges (`ADMINISTER SQL TUNING SET`).

If starting SQL set capture fails, workload capture is stopped. The reason is stored in `DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE`.

The default value is `FALSE`.

If `TRUE`, all instances started up in `RESTRICTED` mode using `STARTUP RESTRICT` are automatically unrestricted upon a successful `START_CAPTURE`. (DEFAULT)

If `FALSE`, no database instance is automatically unrestricted.

Capture filters defined using the `DBMS_WORKLOAD_REPLAY` interface do not apply to the SQL tuning set capture.

The calling user must have the appropriate privileges (`ADMINISTER SQL TUNING SET`).

If starting SQL set capture fails, workload capture is stopped. The reason is stored in `DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE`.

The default value is `FALSE`.

```

</tbody>
</table>
```
transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after START_CAPTURE are replayed.
The DBMS_WORKLOAD_REPLAY package provides an interface to replay a workload capture that was originally created by way of the DBMS_WORKLOAD_CAPTURE package. Typically, the DBMS_WORKLOAD_CAPTURE package will be used in the production system to capture a production workload, and the DBMS_WORKLOAD_REPLAY package will be subsequently used in a test system to replay the captured production workload for testing purposes.

See Also: Oracle Database Real Application Testing User’s Guide for more information about “Database Replay”

This chapter contains the following topics:

- Using DBMS_WORKLOAD_REPLAY
  - Security Model
- Summary of DBMS_WORKLOAD_REPLAY Subprograms
Using DBMS_WORKLOAD_REPLAY

- Security Model
Security Model

The following code describes the minimum set of privileges required to

- Create directory objects
- Operate the interface provided by the DBMS_WORKLOAD_CAPTURE and DBMS_WORKLOAD_REPLAY packages
- Act as a replay client user (wrc someuser/somepassword or wrc USER=someuser PASSWORD=somepassword)

DROP USER roml CASCADE;
CREATE USER roml IDENTIFIED BY roml;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO roml;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO roml;

GRANT CREATE SESSION TO roml;
GRANT CREATE ANY DIRECTORY TO roml;
GRANT SELECT_CATALOG_ROLE TO roml;
GRANT BECOME USER TO roml;

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay must be able to execute wrc on hosts that will be used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.
### Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table lists the package subprograms in alphabetical order.

| Subprogram                        | Description                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------- Adam's filter only a subset of the captured workload |
| ADD_FILTER Procedure              | Adds a filter to replay only a subset of the captured workload                                                                         |
| CALIBRATE Function                | Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload |
| CANCEL_REPLAY Procedure           | Cancels the workload replay in progress                                                                                                  |
| COMPARE_PERIOD_REPORT Procedure   | Generates a report comparing a replay to its capture or to another replay of the same capture                                        |
| COMPARE_SQLSET_REPORT Function    | Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture |
| CREATE_FILTER_SET Procedure       | Uses the replay filters added to create a set of filters to use against the replay in replay_dir                                        |
| DELETE_FILTER Procedure           | Deletes the named filter                                                                                                                  |
| DELETE_REPLAY_INFO Procedure      | Deletes the rows in DBA_WORKLOAD_REPLAYS that corresponds to the given workload replay ID                                                        |
| EXPORT_AWR Procedure              | Exports the AWR snapshots associated with a given replay ID                                                                            |
| GET_DIVERGING_STATEMENT Function   | Exports the AWR snapshots associated with a given replay ID                                                                            |
| GET_REPLAY_INFO Function          | Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory |
| GET_REPLAY_TIMEOUT Procedure      | Retrieves the replay timeout setting                                                                                                   |
| IMPORT_AWR Function               | Imports the AWR snapshots associated with a given replay ID                                                                            |
| INITIALIZE_REPLAY Procedure       | Initializes replay, and loads specific data produced during processing into the database                                                |
| IS_REPLAY_PAUSED Function         | Reports whether the replay is currently paused                                                                                                |
| PAUSE_REPLAY Procedure            | Pauses the in-progress workload replay                                                                                                |
| POPULATE_DIVERGENCE Procedure     | Precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls |
| PREPARE_REPLAY Procedure          | Puts the RDBMS in a special "Prepare" mode                                                                                               |

<td>USE_FILTER_SET Procedure on page 159-35</td>
<td>Uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay</td>
</tr>
</tbody>
</table>
ADD_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the CREATE_FILTER_SET Procedure. This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to CREATE_FILTER_SET when creating the filter set.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.ADD_FILTER (fname          IN VARCHAR2,
fattribute     IN VARCHAR2,
fvalue         IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.ADD_FILTER (fname          IN VARCHAR2,
fattribute     IN VARCHAR2,
fvalue         IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fname</td>
<td>Name of the filter. Can be used to delete the filter later if it is not required. (Mandatory)</td>
</tr>
<tr>
<td>fattribute</td>
<td>(Mandatory) Specifies the attribute on which the filter is defined as one of the following values:</td>
</tr>
<tr>
<td></td>
<td>- USER - type STRING</td>
</tr>
<tr>
<td></td>
<td>- MODULE - type STRING</td>
</tr>
<tr>
<td></td>
<td>- ACTION - type STRING</td>
</tr>
<tr>
<td></td>
<td>- PROGRAM - type STRING</td>
</tr>
<tr>
<td></td>
<td>- SERVICE - type STRING</td>
</tr>
<tr>
<td></td>
<td>- CONNECTION_STRING - type STRING</td>
</tr>
<tr>
<td>fvalue</td>
<td>Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type STRING. (Mandatory)</td>
</tr>
</tbody>
</table>
CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.CALIBRATE ( 
   capture_dir          IN VARCHAR2,
   process_per_cpu      IN BINARY_INTEGER DEFAULT 4,
   threads_per_process  IN BINARY_INTEGER DEFAULT 50)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_dir</td>
<td>Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data</td>
</tr>
<tr>
<td>process_per_cpu</td>
<td>Maximum number of process allowed per CPU (default is 4)</td>
</tr>
<tr>
<td>threads_per_process</td>
<td>Maximum number of threads allowed per process (default is 50)</td>
</tr>
</tbody>
</table>

Return Values

Returns a CLOB formatted as XML, that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the `PROCESS_CAPTURE Procedure` in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```bash
$ wrc mode=calibrate replaydir= 
```
CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (    
    error_msg IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_msg</td>
<td>An optional reason for cancelling the replay can be passed which will be recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE. DEFAULT is NULL</td>
</tr>
</tbody>
</table>

Usage Notes

Prerequisite: A call to the INITIALIZE_REPLAY Procedure, or PREPARE_REPLAY Procedure, or START_REPLAY Procedure was already issued.
COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (  
    replay_id1   IN   NUMBER,  
    replay_id2   IN   NUMBER,  
    format       IN   VARCHAR2,  
    result       OUT  CLOB );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id1</td>
<td>First ID of the workload replay whose report is requested</td>
</tr>
<tr>
<td>replay_id2</td>
<td>Second ID of the workload replay whose report is requested. If this is NULL,</td>
</tr>
<tr>
<td></td>
<td>then the comparison is done with the capture.</td>
</tr>
<tr>
<td>format</td>
<td>Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_</td>
</tr>
<tr>
<td></td>
<td>HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.</td>
</tr>
<tr>
<td>result</td>
<td>Output of the report (CLOB)</td>
</tr>
</tbody>
</table>
COMPARE_SQLSET_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

Note: This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

Syntax

```sql
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (  
  replay_id1    IN NUMBER,
  replay_id2    IN NUMBER,
  format        IN VARCHAR2,
  r_level       IN VARCHAR2 := 'ALL',
  r_sections    IN VARCHAR2 := 'ALL',
  result        OUT CLOB )
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id1</td>
<td>First ID of the workload replay after a change</td>
</tr>
<tr>
<td>replay_id2</td>
<td>Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture.</td>
</tr>
<tr>
<td>format</td>
<td>Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT.</td>
</tr>
<tr>
<td>r_level</td>
<td>See level parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package</td>
</tr>
<tr>
<td>r_sections</td>
<td>See section parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package</td>
</tr>
<tr>
<td>result</td>
<td>Output of the report (CLOB)</td>
</tr>
</tbody>
</table>
CREATE_FILTER_SET Procedure

This procedure uses the replay filters added since the previous successful call to create a set of filters to use against the replay in `replay_dir`. After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in `replay_dir` by calling the `USE_FILTER_SET Procedure`.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
    replay_dir       IN  VARCHAR2,
    filter_set       IN  VARCHAR2,
    default_action   IN  VARCHAR2 DEFAULT 'INCLUDE');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir</td>
<td>Object directory of the replay to be filtered</td>
</tr>
<tr>
<td>filter_set</td>
<td>Name of the filter set to create (to use in <code>USE_FILTER_SET Procedure</code>)</td>
</tr>
<tr>
<td>default_action</td>
<td>Can be either <code>INCLUDE</code> or <code>EXCLUDE</code>. Determines whether, by default, every captured call must be replayed or not. Also determines, whether the workload filters specified must be considered as <code>INCLUSION</code> filters or <code>EXCLUSION</code> filters.</td>
</tr>
</tbody>
</table>

If it is `INCLUDE`, then by default all captured calls will be replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the `ADD_FILTER Procedure` will be treated as `EXCLUSION` filters, and will determine the workload that will not be replayed.

If it is `EXCLUDE`, then by default no captured call to the database will be replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the `ADD_FILTER Procedure` will be treated as `INCLUSION` filters, and will determine the workload that will be replayed.

Default: `INCLUDE` and all the filters specified will be assumed to be `EXCLUSION` filters.

Usage Notes

This operation needs to be done when no replay is initialized, prepared, or in progress.
DELETE_FILTER Procedure

This procedure deletes the named filter.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(
    fname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fname</td>
<td>Name of the filter that must be deleted (Mandatory)</td>
</tr>
</tbody>
</table>
DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in DBA_WORKLOAD_REPLAYS that correspond to the given workload replay ID.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (    replay_id   IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>ID of the workload replay that needs to be deleted. Corresponds to DBA_WORKLOAD_REPLAYS.ID (Mandatory)</td>
</tr>
</tbody>
</table>
EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
   replay_id   IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>ID of the replay whose AWR snapshots are to be exported (Mandatory)</td>
</tr>
</tbody>
</table>

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic EXPORT_AWR invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_REPLAYS was not created by calling the GET_REPLAY_INFO Function) and the AWR snapshots that correspond to that replay time period are still available.
GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (  
    replay_id    IN NUMBER,  
    stream_id    IN NUMBER,  
    call_counter IN NUMBER)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>ID of the replay in which that call diverged</td>
</tr>
<tr>
<td>stream_id</td>
<td>Stream ID of the diverging call</td>
</tr>
<tr>
<td>call_counter</td>
<td>Call counter of the diverging call</td>
</tr>
</tbody>
</table>

Usage Notes

- Returns a CLOB formatted as XML that contains:
  - SQL ID
  - SQL Text
  - Bind information: position, name and value
- This function will silently invoke the POPULATE_DIVERGENCE Procedure to read the information from the capture files. Therefore, if divergence has not been populated, the first call to this function for a particular diverging call might take longer, especially in very large captures.
GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
    dir    IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 159–12 GET_REPLAY_INFO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir</td>
<td>Name of the workload replay directory object (case sensitive). (Mandatory)</td>
</tr>
</tbody>
</table>

Return Values

The procedure returns the `CAPTURE_ID`, which can be associated with both `DBA_WORKLOAD_CAPTURE_ID` and `DBA_WORKLOAD_REPLAYS.CAPTURE_ID` to access the imported information.

Usage Notes

- The procedure first imports a row into `DBA_WORKLOAD_CAPTURES` which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into `DBA_WORKLOAD_REPLAYS`.
- The procedure will not insert new rows to `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_REPLAYS` if these views already contain rows describing the capture and replay history present in the given directory.
GET_REPLAY_TIMEOUT Procedure

This procedure gets the replay timeout setting.

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

### Syntax

```sql
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (  
    enabled       OUT  BOOLEAN,  
    min_delay     OUT  NUMBER,  
    max_delay     OUT  NUMBER,  
    delay_factor  OUT  NUMBER);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>TRUE if the timeout action is enabled, FALSE otherwise.</td>
</tr>
<tr>
<td>min_delay</td>
<td>Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than <code>min_delay</code>.</td>
</tr>
<tr>
<td>max_delay</td>
<td>Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than <code>max_delay</code>.</td>
</tr>
<tr>
<td>delay_factor</td>
<td>Factor for the call delay that is between <code>min_delay</code> and <code>max_delay</code>. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of <code>capture elapsed time</code> and <code>delay_factor</code>.</td>
</tr>
</tbody>
</table>

### Usage Notes

This procedure can be called anytime during replay.
IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
  replay_id       IN   NUMBER,
  staging_schema  IN   VARCHAR2)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>ID of the replay whose AWR snapshots must be exported. (Mandatory)</td>
</tr>
<tr>
<td>staging_schema</td>
<td>Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory)</td>
</tr>
</tbody>
</table>

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the EXPORT_AWR Procedure.
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.
INITIALIZE_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).

Syntax

DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (  
  replay_name IN VARCHAR2,  
  replay_dir IN VARCHAR2);  

Parameters

Table 159–15 INITIALIZE_REPLAY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_name</td>
<td>Name of the workload replay. Every replay of a processed workload capture can be given a name. (Mandatory)</td>
</tr>
<tr>
<td>replay_dir</td>
<td>Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data</td>
</tr>
</tbody>
</table>

Usage Notes

- Prerequisites:
  - Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  - Database state has been logically restored to what it was at the beginning of the original workload capture.

- The subprogram loads data into the replay system that is required before preparing for the replay by calling the PAUSE_REPLAY Procedure.

For instance, during capture the user may record the connection string each session used to connect to the server. The INITIALIZE_REPLAY Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

Elaborating on the example described in the PROCESS_CAPTURE Procedure, the user could invoke the following:

DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');

This command will load up the connection map and by default will set all replay time connection strings to be equal to NULL. A NULL replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client’s runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the REMAP_CONNECTION Procedure.
IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED
   RETURN BOOLEAN;
```

Return Values

Returns TRUE if the PAUSE_REPLAY Procedure has been called successfully and the RESUME_REPLAY Procedure has not been called yet.

Usage Notes

A call to the START_REPLAY Procedure must have already been issued as a pre-requisite.
PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay. All subsequent user calls from the replay clients will be stalled until either a call to the RESUME_REPLAY Procedure is issued or the replay is cancelled.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

Usage Notes

- Prerequisite: A call to the START_REPLAY Procedure must have already been issued.
- User calls that were already in-progress when PAUSE_REPLAY was issued will be allowed to run to completion. Only subsequent user calls, when issued, will be paused.
POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls.

Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
    replay_id    IN   NUMBER,
    stream_id    IN   NUMBER DEFAULT NULL,
    call_counter IN   NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>ID of the replay</td>
</tr>
<tr>
<td>stream_id</td>
<td>Stream ID of the diverging call. If NULL is provided, then divergence information will be precomputed for all diverging calls in the given replay.</td>
</tr>
<tr>
<td>call_counter</td>
<td>Call counter of the diverging call. If NULL is provided, then divergence information will be precomputed for all diverging calls in the given stream.</td>
</tr>
</tbody>
</table>
**PREPARE_REPLAY Procedure**

This procedure puts the database state in *PREPARE FOR REPLAY* mode.

---

**Note:** The functionality associated with the `capture_sts` and `sts_cap_interval` parameters is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

### Syntax

```sql
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
    synchronization           IN BOOLEAN   DEFAULT TRUE,
    connect_time_scale        IN NUMBER    DEFAULT 100,
    think_time_scale          IN NUMBER    DEFAULT 100,
    think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
    scale_up_multiplier       IN NUMBER    DEFAULT 1,
    capture_sts               IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval          IN NUMBER    DEFAULT 300);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>synchronization</td>
<td>Turns synchronization ON or OFF during workload replay.</td>
</tr>
<tr>
<td></td>
<td>When synchronization is ON, the COMMIT order observed during the original</td>
</tr>
<tr>
<td></td>
<td>workload capture will be preserved during replay. Every action that is</td>
</tr>
<tr>
<td></td>
<td>replayed will be executed ONLY AFTER all of its dependent COMMITS (all</td>
</tr>
<tr>
<td></td>
<td>COMMITS that were issued before the given action in the original workload</td>
</tr>
<tr>
<td></td>
<td>capture) have finished execution. DEFAULT is TRUE which preserves commit</td>
</tr>
<tr>
<td></td>
<td>order.</td>
</tr>
<tr>
<td></td>
<td>When synchronization is OBJECT_ID, a more advanced synchronization scheme is</td>
</tr>
<tr>
<td></td>
<td>used. Every action that is replayed will be executed only after the relevant</td>
</tr>
<tr>
<td></td>
<td>COMMITS have finished executing. The relevant COMMITS are the ones that</td>
</tr>
<tr>
<td></td>
<td>were issued before the given action in the original workload capture and</td>
</tr>
<tr>
<td></td>
<td>that had modified at least one of the database objects the given action is</td>
</tr>
<tr>
<td></td>
<td>referencing (either implicitly or explicitly). This object_id scheme has the</td>
</tr>
<tr>
<td></td>
<td>same logical property of making sure that any action will see the same</td>
</tr>
<tr>
<td></td>
<td>data it saw during capture, but will allow more concurrency during</td>
</tr>
<tr>
<td></td>
<td>replays for the actions that do not touch the same objects/tables.</td>
</tr>
<tr>
<td></td>
<td>DEFAULT VALUE: SCN, preserve commit order. For legacy reasons, there is a</td>
</tr>
<tr>
<td></td>
<td>boolean version of this procedure:</td>
</tr>
<tr>
<td></td>
<td>■ TRUE means ‘SCN’</td>
</tr>
<tr>
<td></td>
<td>■ FALSE means ‘OFF’</td>
</tr>
</tbody>
</table>

---

**DBMS_WORKLOAD_REPLAY** 159-23
### Usage Notes

- **Prerequisites:**
  - The database has been initialized for replay using the `INITIALIZE_REPLAY Procedure`.
  - Any capture time connection strings that require remapping have been already done using the `REMAP_CONNECTION Procedure`.
- **One or more external replay clients (WRC) can be started once the `PREPARE_REPLAY` procedure has been executed.**
- **With regard to `scale_up_multiplier`:**
  - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.
  - The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database will be skipped. `SELECT FOR UPDATE` statements are also skipped.
  - Readonly calls from the scale-up are synchronized appropriately and obey the timings defined by `think_time_scale`, `connect_time_scale`, and

### Table 159–17 (Cont.) PREPARE_REPLAY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>connect_time_scale</code></td>
<td>Scales the time elapsed between the instant the workload capture was started and session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. <strong>DEFAULT VALUE</strong> is 100. See Application of the <code>connect_time_scale</code> Parameter.</td>
</tr>
<tr>
<td><code>think_time_scale</code></td>
<td>Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. <strong>DEFAULT VALUE</strong> is 100. See Application of the <code>think_time_scale</code> Parameter.</td>
</tr>
<tr>
<td><code>think_time_auto_correct</code></td>
<td>Auto corrects the think time between calls appropriately when user calls takes longer time to complete during replay than how long the same user call took to complete during the original capture. <strong>DEFAULT</strong> is <code>TRUE</code> which is to reduce think time if replay goes slower than capture. See Application of the <code>think_time_auto_correct</code> Parameter</td>
</tr>
<tr>
<td><code>scale_up_multiplier</code></td>
<td>Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the <code>scale_up_multiplier</code>. However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.</td>
</tr>
<tr>
<td><code>capture_sts</code></td>
<td>If this parameter is <code>TRUE</code>, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the <code>EXPORT_AWR Procedure</code> along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges (‘ADMINISTER SQL TUNING SET’). The default value is <code>FALSE</code>.</td>
</tr>
<tr>
<td><code>sts_cap_interval</code></td>
<td>Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.</td>
</tr>
</tbody>
</table>
think_time_auto_correct. Also, the queries are made to wait for the appropriate commits.

- No replay data or error divergence records will be generated for the scale-up sessions.
- All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

**Examples**

**Application of the connect_time_scale Parameter**

If the following was observed during the original workload capture:

12:00 : Capture was started
12:10 : First session connect (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect (42m after)

If the connect_time_scale is 50, then the session connects will happen as follows:

12:00 : Replay was started with 50% connect time scale
12:05 : First session connect ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect (21m after)

If the connect_time_scale is 200, then the session connects will happen as follows:

12:00 : Replay was started with 200% connect time scale
12:20 : First session connect (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect (84m after)

**Application of the think_time_scale Parameter**

If the following was observed during the original workload capture:

12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m

If the think_time_scale is 50 during the workload replay, then the user calls will look something like below:

12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min (50% of 2m) after the completion of prev call
12:35 : Third user call completes in 9m (takes a minute longer)

**Application of the think_time_auto_correct Parameter**

If the following was observed during the original workload capture:
If the think\_time\_scale is 100 and the think\_time\_auto\_correct is TRUE during the workload replay, then the user calls will look something like below:

12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in capture_dir in place.

Syntax

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
  capture_dir            IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_dir</td>
<td>Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files will be added to this directory. (Mandatory)</td>
</tr>
</tbody>
</table>

Usage Notes

- This subprogram analyzes the workload capture found in the capture_dir and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.

- Once this procedure runs successfully, the capture_dir can be used as input to the INITIALIZE_REPLAY Procedure in order to replay the captured workload present in capture_dir.

- Before a workload capture can be replayed in a particular database version, the capture needs to be "processed" using this PROCESS_CAPTURE procedure in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

For example, suppose workload "foo" was captured in rec_dir in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload needs to be processed in version 11.1.0.1. The following procedure needs to be executed in a 11.1.0.1 database in order to process the capture directory rec_dir:

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
```

Now, rec_dir contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.
REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (  
    connection_id         IN  NUMBER,  
    replay_connection     IN  VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connection_id</td>
<td>ID of the connection to be remapped. Corresponds to DBA_WORKLOAD_CONNECTION_MAP.CONN_ID</td>
</tr>
<tr>
<td>replay_connection</td>
<td>New connection string to be used during replay</td>
</tr>
</tbody>
</table>

Usage Notes

- By default, all instances of `replay_connection` will be equal to NULL. When `replay_connection` is NULL (default), replay sessions will connect to the default host as determined by the replay client's runtime environment. Consequently, if no capture time connect strings are remapped, then all the replay sessions will simply connect to the default host to replay the workload.

- A valid `replay_connection` must specify a connect identifier or a service point. See the Oracle Database Net Services Reference for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.

- An error is returned if no row matches the given `connection_id`.

- Use the DBA_WORKLOAD_CONNECTION_MAP view to review all the connection strings that will be used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.
REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT ( 
    replay_id            IN NUMBER, 
    format              IN VARCHAR2 ) 
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>Specifies the ID of the workload replay whose report is requested. (Mandatory)</td>
</tr>
<tr>
<td>format</td>
<td>Specifies the report format. Valid values are XML, HTML, or TEXT. (Mandatory)</td>
</tr>
</tbody>
</table>

Return Values

The report body in the desired format returned as a CLOB

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_HTML</td>
<td>VARCHAR2(4)</td>
<td>'HTML'</td>
<td>Generates the HTML version of the report</td>
</tr>
<tr>
<td>TYPE_TEXT</td>
<td>VARCHAR2(4)</td>
<td>'TEXT'</td>
<td>Use this as input to the format argument to generate the text version of the report.</td>
</tr>
<tr>
<td>TYPE_XML</td>
<td>VARCHAR2(3)</td>
<td>'XML'</td>
<td>Generates the XML version of the report</td>
</tr>
</tbody>
</table>

Table 159–20  REPORT Function Parameters

Table 159–21  Constants Used by Report Function
RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;

Usage Notes

Prerequisite: A call to the PAUSE_REPLAY Procedure must have already been issued.
REUSE_REPLAY_FILTER_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the ADD_FILTER Procedure. Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and existing filter can be deleted before invoking the CREATE_FILTER_SET Procedure to create a new filter set.

---

Note: This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

Syntax

DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET(
  replay_dir  IN VARCHAR2,
  filter_set  IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir</td>
<td>Capture ID of the existing filter set with which it is associated</td>
</tr>
<tr>
<td>filter_set</td>
<td>Name of the filter set to be reused</td>
</tr>
</tbody>
</table>
SET ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure. The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname    IN   VARCHAR2,
    pvalue   IN   VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname    IN   VARCHAR2,
    pvalue   IN   NUMBER);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname    IN   VARCHAR2,
    pvalue   IN   BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Name of the parameter (case insensitive)</td>
</tr>
<tr>
<td>pvalue</td>
<td>Value of the parameter</td>
</tr>
</tbody>
</table>

Usage Notes

The current parameters and values that can be used are:

'DO_NO_WAIT_COMMITS': (default: FALSE)

This parameter controls whether the COMMITs issued by replay sessions will be NOWAIT. The default value for this parameter is FALSE. In this case all the COMMITs are issued with the mode they were captured (wait, no-wait, batch, no-batch). If the parameter is set to TRUE, then all COMMITs are issued in no-wait mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent COMMITs. Setting the parameter to TRUE will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.
SET_REPLAY_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
    enabled       OUT  BOOLEAN DEFAULT TRUE,
    min_delay     OUT  NUMBER DEFAULT 10,
    max_delay     OUT  NUMBER DEFAULT 120,
    delay_factor  OUT  NUMBER DEFAULT 8);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>TRUE to enable the timeout action, and FALSE to disable. Default = TRUE.</td>
</tr>
<tr>
<td>min_delay</td>
<td>Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay. Default = 10.</td>
</tr>
<tr>
<td>max_delay</td>
<td>Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120.</td>
</tr>
<tr>
<td>delay_factor</td>
<td>Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- This procedure can be called anytime during replay.
- Call delay is defined as the difference of call elapsed time between replay and capture if replay elapsed time is longer.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error will be reported as error divergence.
- Replay timeout operates as follows:
  - The timeout action has no effect if it is not enabled.
  - If the call delay in minutes is less than a lower bound specified by parameter min_delay, then the timeout action is non-operational.
  - If the delay in minutes is more than a upper bound specified by parameter max_delay, the timeout action will abort the user call and throw ORA-15569.
  - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter delay_factor.
START_REPLAY Procedure

This procedure starts the workload replay. All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified and those replay clients (WRC) will begin issuing the captured workload.

Syntax

DBMS_WORKLOAD_REPLAY.START_REPLAY;

Usage Notes

- Prerequisites:
  - The call to the PREPARE_REPLAY Procedure was already issued.
  - Enough number of external replay clients (WRC) that can faithfully replay the captured workload have already been started. The status of such external replay clients can be monitored using V$WORKLOAD_REPLAY_CLIENTS.

- Use the WRC’s CALIBRATE mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:
  $ wrc mode=calibrate replaydir=. 
USE_FILTER_SET Procedure

This procedure uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay.

Syntax

DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
  filter_set IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter_set</td>
<td>Name of the filter set used in this replay</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure must be called after the replay has been initialized and before it is prepared.
The **DBMS_WORKLOAD_REPOSITORY** package lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.

**See Also:** *Oracle Database Performance Tuning Guide* for more information about the "Automatic Workload Repository"

The chapter contains the following topics:

- **Using DBMS_WORKLOAD_REPOSITORY**
  - Examples
- **Data Structures**
  - Object Types
  - Table Types
- **Summary of DBMS_WORKLOAD_REPOSITORY Subprograms**
Using DBMS_WORKLOAD_REPOSITORY

This section contains topics which relate to using the DBMS_WORKLOAD_REPOSITORY package.

- Examples
Examples

This example shows how to generate an AWR text report with the `DBMS_WORKLOAD_REPOSITORY` package for database identifier 1557521192, instance id 1, snapshot ids 5390 and 5391 and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
    DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
        1557521192, 1, 5390, 5392)
) ;
```

You can call the `DBMS_WORKLOAD_REPOSITORY` packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (`awrrpt.sql` in this case) for the packaged function, which prompts the user for required information.
Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table types.

**OBJECT Types**
- `AWR_BASELINE_METRIC_TYPE` Object Type

**TABLE Types**
- `AWR_BASELINE_METRIC_TYPE_TABLE` Table Type
- `AWRRPT_INSTANCE_LIST_TYPE` Table Type
AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```sql
TYPE breakpoint_info AS OBJECT (  
  baseline_name      VARCHAR2(64),  
  dbid               NUMBER NOT NULL,  
  instance_number    NUMBER NOT NULL,  
  beg_time           DATE NOT NULL,  
  end_time           DATE NOT NULL,  
  metric_id          NUMBER NOT NULL,  
  metric_name        VARCHAR2(64) NOT NULL,  
  metric_unit        VARCHAR2(64) NOT NULL,  
  num_interval       NUMBER NOT NULL,  
  interval_size      NUMBER NOT NULL,  
  average            NUMBER NOT NULL,  
  minimum            NUMBER NOT NULL,  
  maximum            NUMBER NOT NULL);  
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name</td>
<td>Name of the Baseline</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID for the snapshot</td>
</tr>
<tr>
<td>instance_number</td>
<td>Instance number for the snapshot</td>
</tr>
<tr>
<td>beg_time</td>
<td>Begin time of the interval</td>
</tr>
<tr>
<td>end_time</td>
<td>End time of the interval</td>
</tr>
<tr>
<td>metric_id</td>
<td>Metric ID</td>
</tr>
<tr>
<td>metric_name</td>
<td>Metric name</td>
</tr>
<tr>
<td>metric_unit</td>
<td>Unit of measurement</td>
</tr>
<tr>
<td>num_interval</td>
<td>Number of intervals observed</td>
</tr>
<tr>
<td>interval_size</td>
<td>Interval size (in hundredths of a second)</td>
</tr>
<tr>
<td>average</td>
<td>Average over the period</td>
</tr>
<tr>
<td>minimum</td>
<td>Minimum value observed</td>
</tr>
<tr>
<td>maximum</td>
<td>Maximum value observed</td>
</tr>
</tbody>
</table>
AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRICS Function.

Syntax

    CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
## Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

</tr>
</tbody>
</table>
ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID. If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a TOP SQL). Capture occurs if the SQL is found in the cursor cache at snapshot time.

To uncolor the SQL, invoke the REMOVE_COLORED_SQL Procedure.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
   sql_id    IN VARCHAR2,
   dbid      IN NUMBER DEFAULT NULL);
```

Parameters

Table 160–3  ADD_COLORED_SQL Procedure Parameters

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>13-character external SQL ID</td>
</tr>
<tr>
<td>dbid</td>
<td>Optional dbid, defaults to Local DBID</td>
</tr>
</tbody>
</table>
### ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

#### Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML(
    l_dbid          IN NUMBER,
    l_inst_num      IN VARCHAR2((1023),
    l_btime         IN DATE,
    l_etime         IN DATE,
    l_options       IN NUMBER    DEFAULT 0,
    l_slot_width    IN NUMBER    DEFAULT 0,
    l_sid           IN NUMBER    DEFAULT NULL,
    l_sql_id        IN VARCHAR2  DEFAULT NULL,
    l_wait_class    IN VARCHAR2  DEFAULT NULL,
    l_service_hash  IN NUMBER    DEFAULT NULL,
    l_module        IN VARCHAR2  DEFAULT NULL,
    l_action        IN VARCHAR2  DEFAULT NULL,
    l_client_id     IN VARCHAR2  DEFAULT NULL,
    l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
    l_data_src      IN NUMBER    DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>List of instances (such as ‘1, 2, 3’), or NULL to report on all instances in the database</td>
</tr>
<tr>
<td>l_btime</td>
<td>The ‘begin time’</td>
</tr>
<tr>
<td>l_etime</td>
<td>The ‘end time’</td>
</tr>
<tr>
<td>l_options</td>
<td>Report level (currently not used)</td>
</tr>
<tr>
<td>l_slot_width</td>
<td>Specifies (in seconds) how wide the slots used in the “Top Activity” section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.</td>
</tr>
<tr>
<td>l_sid</td>
<td>Session ID (see Usage Notes)</td>
</tr>
<tr>
<td>l_sql_id</td>
<td>SQL ID (see Usage Notes)</td>
</tr>
<tr>
<td>l_wait_class</td>
<td>Wait class name (see Usage Notes)</td>
</tr>
<tr>
<td>l_service_hash</td>
<td>Service name hash (see Usage Notes)</td>
</tr>
<tr>
<td>l_module</td>
<td>Module name (see Usage Notes)</td>
</tr>
<tr>
<td>l_action</td>
<td>Action name (see Usage Notes)</td>
</tr>
<tr>
<td>l_client_id</td>
<td>Client ID for end-to-end backtracing (see Usage Notes)</td>
</tr>
<tr>
<td>l_plsql_entry</td>
<td>PL/SQL entry point (see Usage Notes)</td>
</tr>
<tr>
<td>l_data_src</td>
<td>Ignored since the report works off of data on disk only</td>
</tr>
</tbody>
</table>
Return Values

The output will be one column of VARCHAR2(1500).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpt.sql script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (l_btime and l_et ime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_et ime found in memory, use

  l_data_src => 1

Similarly, to generate a report on samples found only on disk, use

  l_data_src => 2

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123' pass that sql_id value to the l_sql_id argument:

  l_sql_id => 'abcdefghij123'

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  l_module => 'PAYROLL', l_action => 'PROCESS'

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

<table>
<thead>
<tr>
<th>Argument Name</th>
<th>Comment</th>
<th>Wildcard Allowed</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_sid</td>
<td>Session ID (for example, V$SESSION.SID)</td>
<td>No</td>
</tr>
<tr>
<td>l_sql_id</td>
<td>SQL ID (for example, V$SQL.SQL_ID)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_wait_class</td>
<td>Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_service_hash</td>
<td>Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)</td>
<td>No</td>
</tr>
<tr>

<td>Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_data_src</td>
<td>Wildcards are not allowed for l_data_src as it is of numeric datatype</td>
<td>No</td>
</tr>
</tbody>
</table>
ASH_GLOBAL_REPORT_TEXT Function

This table function Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
    l_dbid          IN VARCHAR2(1023),
    l_inst_num      IN NUMBER,
    l_btime         IN DATE,
    l_etime         IN DATE,
    l_options       IN NUMBER    DEFAULT 0,
    l_slot_width    IN NUMBER    DEFAULT 0,
    l_sid           IN NUMBER    DEFAULT NULL,
    l_sql_id        IN VARCHAR2  DEFAULT NULL,
    l_wait_class    IN VARCHAR2  DEFAULT NULL,
    l_service_hash  IN NUMBER    DEFAULT NULL,
    l_module        IN VARCHAR2  DEFAULT NULL,
    l_action        IN VARCHAR2  DEFAULT NULL,
    l_client_id     IN VARCHAR2  DEFAULT NULL,
    l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
    l_data_src      IN NUMBER    DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

<td>l_plsql_entry</td>
<td>PL/SQL entry point (see Usage Notes)</td>
</tr>
<tr>
<td>l_data_src</td>
<td>Ignored since the report works off of data on disk only</td>
</tr>
</tbody>
</table>
Return Values

The output will be one column of VARCHAR2(320).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpt.sql script which prompts users for the required information.

- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_etime found in memory, use

  l_data_src => 1

Similarly, to generate a report on samples found only on disk, use

  l_data_src => 2

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123' pass that sql_id value to the l_sql_id argument:

  l_sql_id => 'abcdefghij123'

Table 160–7  ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

<table>
<thead>
<tr>
<th>Argument Name</th>
<th>Comment</th>
<th>Wildcard Allowed</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_sid</td>
<td>Session ID (for example, V$SESSION.SID)</td>
<td>No</td>
</tr>
<tr>
<td>l_sql_id</td>
<td>SQL ID (for example, V$SQL.SQL_ID)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_wait_class</td>
<td>Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_service_hash</td>
<td>Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)</td>
<td>No</td>
</tr>
<tr>
<td>l_module</td>
<td>Module name (for example, V$SESSION.MODULE)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_action</td>
<td>Action name (for example, V$SESSION.ACTION)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_client_id</td>
<td>Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_plsql_entry</td>
<td>PL/SQL entry point (for example, &quot;SYS.DBMS_LOB.*&quot;)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_data_src</td>
<td>Wildcards are not allowed for l_data_src as it is of numeric datatype</td>
<td>No</td>
</tr>
</tbody>
</table>

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to
generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

l_module => 'PAYROLL', l_action => 'PROCESS'

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.
ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>The 'Begin Snapshot' ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>The 'End Snapshot' ID</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, Oracle supports one value:</td>
</tr>
<tr>
<td></td>
<td>■ l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2 (1500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.
AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
    l_dbid       IN    NUMBER,
    l_inst_num   IN    NUMBER,
    l_bid        IN    NUMBER,
    l_eid        IN    NUMBER,
    l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>The 'Begin Snapshot' ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>The 'End Snapshot' ID</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, Oracle supports one value:</td>
</tr>
<tr>
<td></td>
<td>l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.
**AWR_SQL_REPORT_HTML Function**

This table function displays the AWR SQL Report in HTML format.

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
    l_dbid       IN    NUMBER,
    l_inst_num   IN    NUMBER,
    l_bid        IN    NUMBER,
    l_eid        IN    NUMBER,
    l_sqlid      IN    VARCHAR2,
    l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>The 'Begin Snapshot' ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>The 'End Snapshot' ID</td>
</tr>
<tr>
<td>l_sqlid</td>
<td>SQL ID of statement to be analyzed</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, not used.</td>
</tr>
</tbody>
</table>

**Return Values**

The output will be one column of VARCHAR2(500).

**Usage Notes**

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.
AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
  l_dbid       IN    NUMBER,
  l_inst_num   IN    NUMBER,
  l_bid        IN    NUMBER,
  l_eid        IN    NUMBER,
  l_sqlid      IN    VARCHAR2,
  l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 160–21  AWR_SQL_REPORT_TEXT Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>The 'Begin Snapshot' ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>The 'End Snapshot' ID</td>
</tr>
<tr>
<td>l_sqlid</td>
<td>SQL ID of statement to be analyzed</td>
</tr>
<tr>
<td>l_options</td>
<td>Flag to specify to control the output of the report. Currently, not used.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(120).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.
CREATE_BASELINE Functions & Procedures

This function and procedure creates a baseline.

Syntax

```
CREATE_BASELINE Functions & Procedures

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_snap_id    IN  NUMBER,
    end_snap_id      IN  NUMBER,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_snap_id    IN  NUMBER,
    end_snap_id      IN  NUMBER,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL)
RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_time       IN  DATE,
    end_time         IN  DATE,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_time       IN  DATE,
    end_time         IN  DATE,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL);

RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_snap_id</td>
<td>Start snapshot sequence number for the baseline’</td>
</tr>
<tr>
<td>end_snap_id</td>
<td>End snapshot sequence number for the baseline</td>
</tr>
<tr>
<td>start_time</td>
<td>Start time for the baseline’</td>
</tr>
<tr>
<td>end_time</td>
<td>End time for the baseline</td>
</tr>
<tr>
<td>baseline_name</td>
<td>Name of baseline</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.</td>
</tr>
<tr>
<td>expiration</td>
<td>Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.</td>
</tr>
</tbody>
</table>

Exceptions

- An error will be returned if this baseline name already exists in the system.
The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

**Examples**

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
end_snap_id => 107,
baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the CREATE_BASELINE action, you will see the newly created baseline in the Workload Repository.
CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
    start_time              IN DATE,
    end_time                IN DATE,
    baseline_name           IN VARCHAR2,
    template_name           IN VARCHAR2,
    expiration              IN NUMBER,
    dbid                    IN NUMBER DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
    day_of_week             IN VARCHAR2,
    hour_in_day             IN NUMBER,
    duration                IN NUMBER,
    start_time              IN DATE,
    end_time                IN DATE,
    baseline_name_prefix    IN VARCHAR2,
    template_name           IN VARCHAR2,
    expiration              IN NUMBER,
    dbid                    IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_time</td>
<td>Start Time for the baseline to be created’</td>
</tr>
<tr>
<td>end_time</td>
<td>End Time for the baseline to be created</td>
</tr>
<tr>
<td>baseline_name</td>
<td>Name of baseline to be created</td>
</tr>
<tr>
<td>template_name</td>
<td>Name for the template</td>
</tr>
<tr>
<td>expiration</td>
<td>Expiration in number of days for the baseline. If NULL, then expiration is</td>
</tr>
<tr>
<td></td>
<td>infinite, meaning do not drop baseline ever. Defaults to NULL</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.</td>
</tr>
<tr>
<td>day_of_week</td>
<td>Day of week that the baseline should repeat on. Specify one of the</td>
</tr>
<tr>
<td></td>
<td>following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY,</td>
</tr>
<tr>
<td></td>
<td>SATURDAY.</td>
</tr>
<tr>
<td>hour_in_day</td>
<td>Value of 0-23 to specify the Hour in the Day the baseline should start</td>
</tr>
<tr>
<td>duration</td>
<td>Duration (in number of hours) after hour in the day that the baseline</td>
</tr>
<tr>
<td></td>
<td>should last</td>
</tr>
<tr>
<td>baseline_name_prefix</td>
<td>Name for baseline prefix. When creating the baseline, the name of the</td>
</tr>
<tr>
<td></td>
<td>baseline will be the prefix appended with the date information.</td>
</tr>
</tbody>
</table>
CREATE_SNAPSHOT Function and Procedure

This function and procedure create snapshots. In the case of the function, the snapshot ID is returned.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'TYPICAL');
```

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'TYPICAL')
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flush_level</td>
<td>Flush level for the snapshot is either 'TYPICAL' or 'ALL'</td>
</tr>
</tbody>
</table>

Examples

This example creates a manual snapshot at the TYPICAL level:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT();
```

If you query the DBA_HIST_SNAPSHOT view after the CREATE_SNAPSHOT action, you will see one more snapshot ID added to the Workload Repository.
**DROP_BASELINE Procedure**

This procedure drops a baseline.

**Syntax**

```sql
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
    baseline_name IN VARCHAR2,
    cascade        IN BOOLEAN DEFAULT FALSE,
    dbid           IN NUMBER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name</td>
<td>Name of baseline to drop from the system</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.</td>
</tr>
</tbody>
</table>

**Examples**

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
    baseline_name => 'oltp_peakload_bl');
```

If you query the `DBA_HIST_BASELINE` view after the `DROP_BASELINE` action, you will see the specified baseline definition is removed. You can query the `DBA_HIST_SNAPSHOT` view to find that the underlying snapshots are left intact.
**DROP_BASELINE_TEMPLATE Procedure**

This procedure removes a template that is no longer needed.

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(
    template_name    IN VARCHAR2,
    dbid             IN NUMBER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template_name</td>
<td>Name of the template to remove</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.</td>
</tr>
</tbody>
</table>
DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(
  low_snap_id    IN  NUMBER,
  high_snap_id   IN  NUMBER
  dbid           IN  NUMBER DEFAULT NULL);
```

Parameters

```
Table 160–27  DROP_SNAPSHOT_RANGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>low_snap_id</td>
<td>Low snapshot id of snapshots to drop.</td>
</tr>
<tr>
<td>high_snap_id</td>
<td>High snapshot id of snapshots to drop.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database id (default to local DBID.</td>
</tr>
</tbody>
</table>
```

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.
MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The INTERVAL setting affects how often snapshots are automatically captured.
- The RETENTION setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a NUMBER and the second takes a VARCHAR2 for the topnsql argument. The differences are described under the Parameters description.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
    retention   IN  NUMBER    DEFAULT NULL,
    interval    IN  NUMBER    DEFAULT NULL,
    topnsql     IN  NUMBER    DEFAULT NULL,
    dbid        IN  NUMBER    DEFAULT NULL);
```

```sql
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
    retention   IN  NUMBER    DEFAULT NULL,
    interval    IN  NUMBER    DEFAULT NULL,
    topnsql     IN  VARCHAR2,
    dbid        IN  NUMBER    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>New retention time (in minutes). The specified value must be in the range of MIN_RETENTION (1 day) to MAX_RETENTION (100 years).</td>
</tr>
<tr>
<td></td>
<td>If ZERO is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting.</td>
</tr>
<tr>
<td></td>
<td>If NULL is specified, the old value for retention is preserved.</td>
</tr>
<tr>
<td></td>
<td>NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.</td>
</tr>
<tr>
<td>interval</td>
<td>New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year).</td>
</tr>
<tr>
<td></td>
<td>If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting.</td>
</tr>
<tr>
<td></td>
<td>If NULL is specified, the current value is preserved.</td>
</tr>
</tbody>
</table>
This example changes the interval setting to one hour and the retention setting to two weeks for the local database:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
  interval => 60,
  retention => 20160);
```

If you query the `DBA_HIST_WR_CONTROL` table after this procedure is executed, you will see the changes to these settings.
MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(
    window_size IN NUMBER,
    dbid IN NUMBER DEFAULT NULL);

Parameters

Table 160–29  MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_size</td>
<td>New Window size for the default Moving Window Baseline, in number of days.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID (default to local DBID)</td>
</tr>
</tbody>
</table>

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the MODIFY_SNAPSHOT_SETTINGS Procedures can be used to adjust the retention setting.
REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
    sql_id IN VARCHAR2,
    dbid IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>13-character external SQL ID</td>
</tr>
<tr>
<td>dbid</td>
<td>Optional dbid, defaults to Local DBID</td>
</tr>
</tbody>
</table>

RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
    old_baseline_name     IN   VARCHAR2,
    new_baseline_name     IN VARCHAR2,
    dbid                  IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_baseline_name</td>
<td>Old baseline name</td>
</tr>
<tr>
<td>new_baseline_name</td>
<td>New baseline name</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID (default to local DBID)</td>
</tr>
</tbody>
</table>
SELECT_BASELINE_METRICS Function

This table function shows the values of the metrics corresponding to a baseline. The table function will return an object of the AWR_BASELINE_METRIC_TYPE Object Type.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRICS(
    baseline_name     IN VARCHAR2,
    dbid              IN NUMBER DEFAULT NULL,
    instance_num      IN NUMBER DEFAULT NULL)
RETURN awr_baseline_metric_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name</td>
<td>Name of the baseline for which we would like to view metrics</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, then use the database identifier for the local database. Defaults to NULL.</td>
</tr>
<tr>
<td>instance_num</td>
<td>Instance for which number the user wants to see statistics. If NULL, show statistics for the local instance. Defaults to NULL.</td>
</tr>
</tbody>
</table>
The DBMS_XA package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

See Also: Oracle Database Advanced Application Developer’s Guide for more information about “Developing Applications with Oracle XA”

The chapter contains the following topics:

- Using DBMS_XA
  - Overview
  - Security Model
  - Constants
  - Operational Notes

- Data Structures
  - OBJECT Types
  - TABLE Types

- Summary of DBMS_XA Subprograms
Using DBMS_XA

- Overview
- Security Model
- Constants
- Operational Notes
Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (XID) and associate or disassociate the current session with the transaction branch. Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.
Security Model

This package is created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS.

Any DBMS_XA subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_XA subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

SELECT privilege on SYS.DBA_PENDING_TRANSACTIONS is required for users who need to execute XA_RECOVER subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.
Constants

The DBMS_XA package uses the constants shown in Table 161–1 for use in the flag field of the XA_START Function and the XA_END Function.

Table 161–1  DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TMNOFLAGS</td>
<td>PLS_INTEGER</td>
<td>00000000</td>
<td>Indicates no flag value is selected.</td>
</tr>

</table>
Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, XA_PREPARE/COMMIT/ROLLBACK/FORGET may not be called when the transaction is still associated with the current session. Only after XA_END has been called so that there is not any transaction associated with the current session, the application may call XA_PREPARE/COMMIT/ROLLBACK/FORGET.

XAER_PROTO error is returned from XA_PREPARE/COMMIT/ROLLBACK/FORGET if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.
The DBMS_XA package uses the following OBJECT type and associated TABLE type.

**OBJECT Types**
- DBMS_XA_XID Object Type

**TABLE Types**
- DBMS_XA_XID_ARRAY Table Type
DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

See Also: For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```sql
TYPE DBMS_XA_XID IS OBJECT(
    formatid NUMBER,  
gtrid RAW(64),  
bqual RAW(64),
constructor function DBMS_XA_XID(
    gtrid IN NUMBER)  
RETURN SELF AS RESULT,
constructor function DBMS_XA_XID (
    gtrid IN RAW,  
bqual IN RAW)  
RETURN SELF AS RESULT,
constructor function DBMS_XA_XID(
    formatid IN NUMBER,  
gtrid IN RAW,  
bqual IN RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))  
RETURN SELF AS RESULT)
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatid</td>
<td>Format identifier, a number identifying different transaction managers (TM)</td>
</tr>
<tr>
<td>gtrid</td>
<td>Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes</td>
</tr>
<tr>
<td>bqual</td>
<td>Branch qualifier, of which the maximum size is 64 bytes</td>
</tr>
</tbody>
</table>
DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of xid that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```
## Summary of DBMS_XA Subprograms

### Table 161-4  DBMS_Xa Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIST_TXN_SYNC Procedure on page 161-12</td>
<td>Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)</td>
</tr>
<tr>
<td>XA_COMMIT Function on page 161-13</td>
<td>Commits the global transaction specified by xid</td>
</tr>
<tr>
<td>XA_END Function on page 161-14</td>
<td>Disassociates the current session from the transaction branch specified by xid</td>
</tr>
<tr>
<td>XA_FORGET Function on page 161-15</td>
<td>Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.</td>
</tr>
<tr>
<td>XA_GETLASTOER Function on page 161-16</td>
<td>Obtains the last Oracle error code, in case of failure of previous XA calls.</td>
</tr>
<tr>
<td>XA_PREPARE Function on page 161-17</td>
<td>Prepares the transaction branch specified in xid for committing the transaction subsequently if possible</td>
</tr>
<tr>
<td>XA_RECOVER Function on page 161-18</td>
<td>Obtains a list of prepared or heuristically completed transaction branches from a resource manager</td>
</tr>
<tr>
<td>XA_ROLLBACK Function on page 161-19</td>
<td>Informs the resource manager to roll back work done on behalf of a transaction branch</td>
</tr>
<tr>
<td>XA_SETTIMEOUT Function on page 161-20</td>
<td>Sets the transaction timeout in seconds for the current session</td>
</tr>
<tr>
<td>XA_START Function on page 161-21</td>
<td>Associates the current session with the transaction branch specified by xid</td>
</tr>
</tbody>
</table>
DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```
**XA_COMMIT Function**

This function commits the global transaction specified by `xid`.

**Syntax**

```sql
DBMS_XA.XA_COMMIT (  
    xid  IN  DBMS_XA_XID,  
    onePhase  IN  BOOLEAN)  
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xid</code></td>
<td>See DBMS_XA_XID Object Type on page 161-9</td>
</tr>
<tr>
<td><code>onePhase</code></td>
<td>If TRUE, apply single phase commit</td>
</tr>
</tbody>
</table>

**Return Values**

See Table 161–2, "DBMS_XA Constants for Possible Return Values". Possible return values indicating error are: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAERINVAL, or XAER_PROTO. Other possible return values include: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, and XA_HEURMIX.

**Usage Notes**

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is TRUE, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.
- If the resource manager did not commit the transaction and the parameter `onePhase` is set to TRUE, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.
**XA_END Function**

This function disassociates the current session from the transaction branch specified by xid.

A transaction manager calls XA_END when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When XA_END successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists.

### Syntax

```sql
DBMS_XA.XA_END (
    xid   IN  DBMS_XA_XID,
    flag  IN  PLS_INTEGER
) RETURN PLS_INTEGER;
```

### Parameters

**Table 161–6 XA_END Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type on page 161-9</td>
</tr>
<tr>
<td>flag</td>
<td>See Table 161–1, ”DBMS_XA Constants for Flag Field of XA_START &amp; XA_END Functions”</td>
</tr>
</tbody>
</table>

### Return Values

See Table 161–2, ”DBMS_XA Constants for Possible Return Values”. Possible return values in error are XAER_RMERR, XAER_RMFAILED, XAER_NOTA, XAER_INVAL, XAER_PROTO, or XA_RB.

### Usage Notes

- **TMSUCCESS** or TMSUSPEND may be specified in flag, and the transaction branch is disassociated with the current session in detached state if the return value is XA_OK. TMFAIL is not supported. XA_END may be called with either TMSUCCESS or TMSUSPEND to disassociate the transaction branch identified by xid from the current session.
- **XA_OK** is returned if XA_END succeeds. An application must check the return value and handle error cases. Only when XA_OK is returned, the application should proceed for other normal operations.
- Executing a ROLLBACK statement without calling XA_END first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until XA_END is called.
- Executing a COMMIT statement without calling XA_END first will result in ORA-02089: COMMIT is not allowed in a subordinate session.
- Executing a COMMIT or a ROLLBACK statement after XA_END has no effect on the transaction identified by xid, since this transaction is no longer associated with the current session. To commit the transaction ID or the XA_ROLLBACK Function to commit/rollback the transaction specified by the xid.
**XA_FORGET Function**

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

**Syntax**

```sql
DBMS_XA.XA_FORGET (
    xid       IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type on page 161-9</td>
</tr>
</tbody>
</table>

**Return Values**

See Table 161-2, "DBMS_XA Constants for Possible Return Values". Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAERINVAL, or XAER_PROTO.
XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```
DBMS_XA.XA_GETLASTOER
RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.
**XA_PREPARE Function**

This function prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible.

**Syntax**

```sql
DBMS_XA.XA_PREPARE (
   xid IN DBMS_XA_XID
)
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type on page 161-9</td>
</tr>
</tbody>
</table>

**Return Values**

See Table 161–2, "DBMS_XA Constants for Possible Return Values". Possible return codes include: XA_OK, XA_RDONLY, XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAIL, or XAER_PROTO.

**Usage Notes**

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`. 
**XA_RECOVER Function**

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

**Syntax**

```sql
DBMS_XA.XA_RECOVER
RETURN DBMS_XA_XID_ARRAY;
```

**Return Values**

See [DBMS_XA_XID_ARRAY Table Type](#)

**Usage Notes**

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`. 
XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```plaintext
DBMS_XA.XA_ROLLBACK (
    xid       IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

See Table 161–9, "XA_ROLLBACK Function Parameters".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type on page 161-9</td>
</tr>
</tbody>
</table>

Return Values

See Table 161–2, "DBMS_XA Constants for Possible Return Values". Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege FORCE ANY TRANSACTION must be granted to the user.
**XA_SETTIMEOUT Function**

This function sets the transaction timeout in seconds for the current session.

**Syntax**

```plsql
DBMS_XA.XA_SETTIMEOUT (
    seconds IN PLS_INTEGER
) RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.</td>
</tr>
</tbody>
</table>

**Return Values**

See Table 161–2, "DBMS_XA Constants for Possible Return Values". Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, or XAER_INVAL.

**Usage Notes**

Only if return value is XA_OK, is the timeout value successfully set.
**XA_START Function**

This function associates the current session with a transaction branch specified by the xid.

**Syntax**

```plsql
DBMS_XA.XA_START (
    xid   IN  DBMS_XA_XID,
    flag  IN  PLS_INTEGER
) RETURN PLS_INTEGER;
```

**Parameters**

- **xid**: See DBMS_XA_XID Object Type on page 161-9
- **flag**: See Table 161–1, "DBMS_XA Constants for Flag Field of XA_START & XA_END Functions".

**Return Values**

See Table 161–2, " DBMS_XA Constants for Possible Return Values"

**Usage Notes**

- If TMJOIN or TMRESUME is specified in flag, the start is for joining an existing transaction branch identified by the xid. TMJOIN flag should be used when the transaction is detached with TMSUCCESS flag. TMRESUME should be used when the transaction branch is detached with TMSUSPEND flag. XA_START may be called with either flag to join an existing transaction branch.
- If TMNOFLAGS is specified in flag, and neither TMJOIN nor TMRESUME is specified, a new transaction branch is to be started. If the transaction branch specified in xid already exists, XA_START returns an XAER_DUPID error code.
- Possible return values in error include: XAER_RMERR, XAER_RMFAL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, and XAER_PROTO.
- XA_OK is returned if XA_START succeeds. An application must check the return value and handle error cases. Only when XA_OK is returned, the PL/SQL application should proceed for other normal operations.
- Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. XAER_PROTO will be returned if XA_START is called with an active global transaction branch associated with the session. XAER_OUTSIDE will be returned if XA_START is called with a local transaction associated with the current session.
The DBMS_XDB package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

This chapter contains the following topics:

- Using DBMS_XDB
  - Overview
  - Constants
- Summary of DBMS_XDB Subprograms
Using DBMS_XDB

This section contains topics which relate to using the DBMS_XDB package.

- Overview
- Constants
Overview

The DBMS_XDB package supports the following features:

- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use CHECKPRIVILEGES Function, GETACLDOCUMENT Function, CHANGEPRIVILEGES Function and GETCHILDRENPATHS Function for Oracle Resources. ACLCHECKPRIVILEGES Function provides access to Oracle’s ACL-based Security mechanism without storing objects in the Hierarchy.

- Configuration Session Management is supported by CFG_REFRESH Procedure, CFG_GET Function and CFG_UPDATE Procedure methods.

- The XDB username is created during XDB installation. This user owns a set of default tables and packages. GETXDB_TABLESPACE Function and MOVEXDB_TABLESPACE Procedure enable movement of schemas to a specified tablespace, and support the default SYSAUX tablespace introduction.
## Constants

Table 162–1  Defined Constants for DBMS_XDB

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_RESOURCE</td>
<td>NUMBER</td>
<td>1</td>
<td>Deletes a resource; fails if the resource has children.</td>
</tr>
<tr>
<td>DELETE_RECURSIVE</td>
<td>NUMBER</td>
<td>2</td>
<td>Deletes a resource and its children, if any.</td>
</tr>
<tr>
<td>DELETE_FORCE</td>
<td>NUMBER</td>
<td>3</td>
<td>Deletes the resource, even if the object it contains is invalid.</td>
</tr>
<tr>
<td>DELETE_RECURSIVE_FORCE</td>
<td>NUMBER</td>
<td>4</td>
<td>Deletes a resource and its children, if any, even if the object it contains is invalid.</td>
</tr>
</tbody>
</table>
## Summary of DBMS_XDB Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ACLCHECKPRIVILEGES Function</strong> on page 162-8</td>
<td>Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the ‘owner’ parameter.</td>
</tr>
<tr>
<td><strong>ADDHTTPEXPIREMAPPING Procedure</strong> on page 162-9</td>
<td>Adds to $xdb$config a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.</td>
</tr>
<tr>
<td><strong>ADDMIMEMAPPING Procedure</strong> on page 162-10</td>
<td>Adds a mime mapping to the XDB configuration</td>
</tr>
<tr>
<td><strong>ADDSCHEMALOCMAPPING Procedure</strong> on page 162-11</td>
<td>Adds a schema location mapping to the XDB configuration</td>
</tr>
<tr>
<td><strong>ADDSERVLET Procedure</strong> on page 162-12</td>
<td>Adds a servlet to XDB configuration</td>
</tr>
<tr>
<td><strong>ADDSERVLETMAPPING Procedure</strong> on page 162-13</td>

<tr>
<td>TOUCHRESOURCE Procedure on page 162-72</td>
<td>Changes the modification time of the resource to the current time</td>
</tr>
<tr>
<td>UPDATERESOURCEMETADATA Procedures on page 162-73</td>
<td>Updates metadata for a resource</td>
</tr>
<tr>
<td>UNLOCKRESOURCE Function on page 162-75</td>
<td>Unlocks the resource given a lock token and resource path</td>
</tr>
</tbody>
</table>
ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the OWNER of the resource. Returns positive integer if all privileges are granted.

Syntax

```sql
DBMS_XDB.ACLCHECKPRIVILEGES(
    acl_path  IN  VARCHAR2,
    owner     IN  VARCHAR2,
    privs     IN  xmltype)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL document</td>
</tr>
<tr>
<td>owner</td>
<td>Resource owner name; the pseudo user &quot;DAV:owner&quot; is replaced by this user during ACL privilege resolution</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.</td>
</tr>
</tbody>
</table>
**ADDHTTPEXPIREMAPPING Procedure**

This procedure adds to xdb$config a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

**Syntax**

```sql
DBMS_XDB.ADDHTTPEXPIREMAPPING (  
    pattern    IN    VARCHAR2,  
    expire     IN    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>URL pattern (only * accepted as wildcards)</td>
</tr>
<tr>
<td>expire</td>
<td>Expiration directive, follows the ExpireDefault in Apache's mod_expires:</td>
</tr>
</tbody>
</table>

- base [plus] {num type}*  
- type: year|years|month|months|week|weeks|day|days| minute|milliseconds|second|seconds  

**Examples**

```sql
DBMS_XDB.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB.ADDHTTPEXPIREMAPPING ('/public/test2/*', 'modification plus 1 day 30 seconds');
```
ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
  <extension>extension</extension>
  <mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB.ADDMIMEMAPPING(
    extension    IN   VARCHAR2,
    mimetype     IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>Extension for which a mime type is being added</td>
</tr>
<tr>
<td>mimetype</td>
<td>Mime type</td>
</tr>
</tbody>
</table>
ADDSCHEMALLOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```xml
<schemaLocation-mapping>
  <namespace>namespace</namespace>
  <element>element</element>
  <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```sql
DBMS_XDB.ADDSCHEMALLOCMAPPING(
    namespace IN VARCHAR2,
    element IN VARCHAR2,
    schemaURL IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
<tr>
<td>element</td>
<td>Element</td>
</tr>
<tr>
<td>schemaURL</td>
<td>Schema URL</td>
</tr>
</tbody>
</table>
ADDSEVRTLET Procedure

This procedure adds the following servlet to XDB configuration:

```xml
<servlet>
  <servlet-name>name</servlet-name>
  <servlet-language>language</servlet-language>
  <display-name>dispname</display-name>
  <description>descript</description>
  <servlet-class>class</servlet-class>
  <servlet-schema>schema</servlet-schema>
</servlet>
```

Syntax

```sql
DBMS_XDB.ADDSERVLET(
  name       IN   VARCHAR2,
  language   IN   VARCHAR2,
  dispname   IN   VARCHAR2,
  icon       IN   VARCHAR2 := NULL,
  descript   IN   VARCHAR2 := NULL,
  class      IN   VARCHAR2 := NULL,
  jspfile    IN   VARCHAR2 := NULL,
  plsql      IN   VARCHAR2 := NULL
);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
<tr>
<td>language</td>
<td>Must be one of &quot;C&quot;, &quot;Java&quot;, &quot;PL/SQL&quot;</td>
</tr>
<tr>
<td>dispname</td>
<td>Display name</td>
</tr>
<tr>
<td>icon</td>
<td>Icon</td>
</tr>
<tr>
<td>descript</td>
<td>Description</td>
</tr>
<tr>
<td>class</td>
<td>The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>jspfile</td>
<td>The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>plsql</td>
<td>The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>schema</td>
<td>Schema</td>
</tr>
</tbody>
</table>
**ADDSERVLETMAPPING Procedure**

This procedure adds the following servlet mapping to XDB configuration:

```xml
<servlet-mapping>
  <servlet-pattern>pattern</servlet-pattern>
  <servlet-name>name</servlet-name>
</servlet-mapping>
```

**Syntax**

```sql
DBMS_XDB.ADDSERVLETMAPPING(
    pattern   IN   VARCHAR2,
    name      IN   VARCHAR2);
```

**Parameters**

**Table 162–8 ADDSERVLETMAPPING Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>Servlet pattern</td>
</tr>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>
ADDSERVLETSECROLE Procedure

This procedure adds the following security role `<ref>` to a specified servlet in XDB configuration:

```
<security-role-ref>
    <role-name>rolename</role-name>
    <role-link>rolelink</role-link>
    <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB.ADDSERVLETSECROLE(
    servname    IN   VARCHAR2,
    rolename    IN   VARCHAR2,
    rolelink    IN   VARCHAR2,
    descript    IN   VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>servname</td>
<td>Servlet name</td>
</tr>
<tr>
<td>rolename</td>
<td>Role name</td>
</tr>
<tr>
<td>rolelink</td>
<td>Role link</td>
</tr>
<tr>
<td>descript</td>
<td>Description</td>
</tr>
</tbody>
</table>
ADDXMLEXTENSION Procedure

This procedure adds the following XML extension to the XDB configuration under <xml-extensions>:
<extension>extension</extension>

Syntax

DBMS_XDB.ADDXMLEXTENSION(
    extension  IN  VARCHAR2);

Parameters

Table 162–10  ADDXMLEXTENSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>XML extension to be added</td>
</tr>
</tbody>
</table>
APPENDPATH Procedure

This procedure appends a childpath to a parentpath.

Syntax

```
DBMS_XDB.APPENDPATH (
  absPath OUT VARCHAR2,
  parentPath IN VARCHAR2,
  childPath IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>absPath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>parentPath</td>
<td>Parentpath</td>
</tr>
<tr>
<td>childPath</td>
<td>Childpath</td>
</tr>
</tbody>
</table>
APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
    abspath   IN  VARCHAR2,
    metadata  IN  XMLTYPE);
```

```
DBMS_XDB.APPENDRESOURCEMETADATA (
    abspath   IN  VARCHAR2,
    metadata  IN  REF SYS.XMLTYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>metadata</td>
<td>Metadata can be schema based or nonschema-based.</td>
</tr>
<tr>
<td></td>
<td>Schema-based metadata is stored in its own table.</td>
</tr>
</tbody>
</table>

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that the REF passed in must be unique. In other words, there must not be a REF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.

- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.
CFG_GET Function

This function retrieves the session’s configuration information as an XMLType instance.

Syntax

```
DBMS_XDB.CFG_GET
RETURN SYS.XMLType;
```
CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

DBMS_XDB.CFG_REFRESH;
CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```sql
DBMS_XDB.CFG_UPDATE(
    xdbconfig   IN  SYS.XMLTYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xdbconfig</td>
<td>The new configuration data</td>
</tr>
</tbody>
</table>
**CHANGEOWNER Procedure**

This procedure changes the owner of the resource/s to the specified owner.

**Syntax**

```sql
DBMS_XDB.CHANGEOWNER(
    abspath    IN   VARCHAR2,
    owner      IN   VARCHAR2,
    recurse    IN   BOOLEAN := FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>owner</td>
<td>New owner for the resource</td>
</tr>
<tr>
<td>recurse</td>
<td>If TRUE, recursively change owner of all resources in the folder tree</td>
</tr>
</tbody>
</table>
CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```sql
DBMS_XDB.CHANGEPRIVILEGES(
    res_path    IN    VARCHAR2,
    ace         IN    xmltype
    RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Path name of the resource for which privileges need to be changed</td>
</tr>
<tr>
<td>ace</td>
<td>An XMLType instance of the <code>&lt;ace&gt;</code> element which specifies the <code>&lt;principal&gt;</code>, the operation <code>&lt;grant&gt;</code> and the list of privileges</td>
</tr>
</tbody>
</table>

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.
CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

DBMS_XDB.CHECKPRIVILEGES(
    res_path   IN  VARCHAR2,
    privs      IN  xmltype)
RETURN PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set of access privileges</td>
</tr>
</tbody>
</table>

Return Values

A positive integer if all requested privileges granted.
CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

**Syntax**

```
DBMS_XDB.CREATEFOLDER(
    path IN VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name for the new folder</td>
</tr>
</tbody>
</table>

**Return Values**

TRUE if operation successful; FALSE, otherwise.

**Usage Notes**

The given path name's parent folder must already exist in the hierarchy: if `/folder1/folder2` is passed as the path parameter, then `/folder1` must already exist.
CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```sql
DBMS_XDB.CREATEOIDPATH(
    oid IN RAW
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oid</td>
<td>Object ID of the resource</td>
</tr>
</tbody>
</table>
CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Creates a new resource with a specified string as its contents:

```sql
DBMS_XDB.CREATERESOURCE(
   abspath        IN  VARCHAR2,
   data           IN  VARCHAR2,
   createfolders  IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```sql
DBMS_XDB.CREATERESOURCE(
   abspath        IN  VARCHAR2,
   data           IN  SYS.XMLTYPE,
   createfolders  IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```sql
DBMS_XDB.CREATERESOURCE(
   abspath        IN  VARCHAR2,
   datarow        IN  REF SYS.XMLTYPE,
   createfolders  IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```sql
DBMS_XDB.CREATERESOURCE(
   abspath        IN  VARCHAR2,
   data           IN  BLOB,
   csid           IN  NUMBER :=0,
   createfolders  IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```sql
DBMS_XDB.CREATERESOURCE(
   abspath        IN  VARCHAR2,
   data           IN  BFILE,
   csid           IN  NUMBER :=0,
   createfolders  IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```sql
DBMS_XDB.CREATERESOURCE(
   abspath        IN  VARCHAR2,
   data           IN  CLOB,
   createfolders  IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```
Given a string, inserts a new resource into the hierarchy with the string as the contents:

```sql
DBMS_XDB.CREATERESOURCE (  
  abspath        IN  VARCHAR2,  
  data           IN  VARCHAR2,  
  schemaur1      IN  VARCHAR2 := NULL,  
  elem           IN  VARCHAR2 := NULL)  
RETURN BOOLEAN;
```

Given an `XMLTYPE` and a schema URL, inserts a new resource into the hierarchy with the `XMLTYPE` as the contents:

```sql
DBMS_XDB.CREATERESOURCE (  
  abspath        IN  VARCHAR2,  
  data           IN  SYS.XMLTYPE,  
  schemaur1      IN  VARCHAR2 := NULL,  
  elem           IN  VARCHAR2 := NULL)  
RETURN BOOLEAN;
```

### Parameters

**Table 162–19 CREATERESOURCE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist.</td>
</tr>
<tr>
<td>data</td>
<td>String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema’s default table. Otherwise, it is saved as binary data.</td>
</tr>
<tr>
<td>datarow</td>
<td>REF to an <code>XMLType</code> row to be used as the contents</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the document. Must be a valid Oracle ID; otherwise returns an error.</td>
</tr>
<tr>
<td></td>
<td>If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows:</td>
</tr>
<tr>
<td></td>
<td>- From the abspath extension, determine the resource's MIME type.</td>
</tr>
<tr>
<td></td>
<td>- If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at <a href="http://www.w3.org/TR/2000/REC-xml-20001006">http://www.w3.org/TR/2000/REC-xml-20001006</a>;</td>
</tr>
<tr>
<td></td>
<td>- Otherwise, it is defaulted to the database character set.</td>
</tr>
<tr>
<td>createfolders</td>
<td>If TRUE, create the parent folders if they do not exist</td>
</tr>
<tr>
<td>schemaur1</td>
<td>For XML data, schema URL data conforms to (default NULL)</td>
</tr>
<tr>
<td>elem</td>
<td>Element name (default NULL)</td>
</tr>
</tbody>
</table>

### Return Values

TRUE if operation successful; FALSE, otherwise.
DELETEHTTPXPIREMAPPING Procedure

This procedure deletes from xdb$config all mappings of the URL pattern to an expiration date.

Syntax

```sql
DBMS_XDB.DELETEHTTPXPIREMAPPING(
    pattern IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>URL pattern (only * accepted as wildcards)</td>
</tr>
</tbody>
</table>
DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB.DELETEMIMEMAPPING(
   extension IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>Extension for which a mime type is to be deleted</td>
</tr>
</tbody>
</table>
DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```sql
DBMS_XDB.DELETERESOURCE(
    path          IN      VARCHAR2,
    delete_option IN      PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to delete</td>
</tr>
<tr>
<td>delete_option</td>
<td>The option that controls how a resource is deleted; defined in Table 162-1 on page 162-4:</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_RESOURCE</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_RECURSIVE</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_FORCE</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_RECURSIVE_FORCE</td>
</tr>
</tbody>
</table>
DELETERESOURCENMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only for schema-based metadata:

```sql
DBMS_XDB.DELETERESOURCENMETADATA (
    abspath IN VARCHAR2,
    metadata IN REF SYS.XMLTYPE,
    delete_option IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```sql
DBMS_XDB.DELETERESOURCENMETADATA (
    abspath IN VARCHAR2,
    metadatans IN VARCHAR2,
    metadataname IN VARCHAR2,
    delete_option IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>metadata</td>
<td>REF to the piece of metadata (schema based) to be deleted</td>
</tr>
<tr>
<td>metadatans</td>
<td>Namespace of the metadata fragment to be removed</td>
</tr>
<tr>
<td>metadataname</td>
<td>Local name of the metadata fragment to be removed</td>
</tr>
<tr>
<td>delete_option</td>
<td>Only applicable for schema-based metadata, this can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table</td>
</tr>
</tbody>
</table>

Table 162–23  DELETERESOURCENMETADATA Procedure Parameters
DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESCHEMALOCMAPPING(
   schemaURL IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaURL</td>
<td>Schema URL</td>
</tr>
</tbody>
</table>
DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLET(
    name        IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>
DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```sql
DBMS_XDB.DELETESERVLETMAPPING(
    name  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>
**DELETESERVLETSECROLE Procedure**

This procedure deletes the specified role from a servlet in the XDB configuration.

**Syntax**

```sql
DBMS_XDB.DELETESERVLETSECROLE(
    servname    IN   VARCHAR2,
    rolename    IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>servname</td>
<td>Servlet name</td>
</tr>
<tr>
<td>rolename</td>
<td>Name of the role to be deleted</td>
</tr>
</tbody>
</table>
DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

DBMS_XDB.DELETEXMLEXTENSION(
    extension IN VARCHAR2);

Parameters

Table 162–28  DELETEXMLEXTENSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>XML extension to be deleted</td>
</tr>
</tbody>
</table>
EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Syntax

```sql
DBMS_XDB.EXISTSRESOURCE(
    abspath  IN  VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource is found.
GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```sql
DBMS_XDB.GETACLDOCUMENT(
    abspath  IN  VARCHAR2)
RETURN sys.xmltype;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required</td>
</tr>
</tbody>
</table>

Return Values

The `XMLType` for ACL document.
GETCHILDRESPATHS Function

This function returns a cursor over the absolute paths of all the child resources.

Syntax

```sql
DBMS_XDB.GETCHILDRESPATHS(
    abspath IN VARCHAR2);
RETURN SYS_REFCURSOR;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

A cursor over the absolute paths of all the child resources.
GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```sql
DBMS_XDB.GETCONTENTBLOB(
    abspath    IN     VARCHAR2,
    csid       OUT    PLS_INTEGER,
    locksrc    IN     BOOLEAN := FALSE
) RETURN BLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>csid</td>
<td>If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.</td>
</tr>
<tr>
<td>locksrc</td>
<td>Contents of the resource as a BLOB</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a BLOB.
GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

DBMS_XDB.GETCONTENTCLOB(
    abspath    IN     VARCHAR2,
RETURN CLOB;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a CLOB.
GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```sql
DBMS_XDB.GETCONTENTVARCHAR2(
    abspath    IN     VARCHAR2,
    RETURN BLOB;
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a string.
GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a REF to an XMLTYPE.

Syntax

DBMS_XDB.GETCONTENTXMLREF(
    abspath    IN     VARCHAR2,
    RETURN SYS.XMLTYPE;
)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a REF to an XMLTYPE.
GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE(
    abspath    IN     VARCHAR2,
RETURN SYS.XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Table 162–36 GETCONTENTXMLTYPE Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>abspath</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as an XMLTYPE.
GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB.GETFTPPORT
RETURN NUMBER;
```
GETHTTPPORT Function

This procedure gets the value of the current HTTP port.

Syntax

```sql
DBMS_XDB.GETHTTPPORT
RETURN NUMBER;
```
GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```sql
DBMS_XDB.GETLISTENERENDPOINT {
    endpoint IN NUMBER,
    host OUT VARCHAR2,
    port OUT NUMBER,
    protocol OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>End point to be retrieved. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.</td>
</tr>
<tr>
<td>host</td>
<td>Interface on which the listener end point listens</td>
</tr>
<tr>
<td>port</td>
<td>Port on which the listener end point listens</td>
</tr>
<tr>
<td>protocol</td>
<td>Transport protocol accepted by the listener end point</td>
</tr>
</tbody>
</table>
GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource’s lock token for the current user.

Syntax

```sql
DBMS_XDB.GETLOCKTOKEN(
    path IN VARCHAR2,
    locktoken OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource</td>
</tr>
<tr>
<td>locktoken</td>
<td>Logged-in user’s lock token for the resource</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have **READPROPERTIES** privilege on the resource.
GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```sql
DBMS_XDB.GETPRIVILEGES(
    res_path    IN     VARCHAR2)
RETURN sys.xmltype;
```

Parameters

Table 162–39  GETPRIVILEGES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the hierarchy of the resource</td>
</tr>
</tbody>
</table>

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.
GETRESOID Function

Returns the object ID of the resource from its absolute path.

Syntax

```sql
DBMS_XDB.GETRESOID(
    abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

NULL if the resource is not present.
GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```sql
DBMS_XDB.GETXDB_TABLESPACE
RETURN VARCHAR2;
```
HASBLOBCONTENT Function

This function returns `TRUE` if the resource has BLOB content.

Syntax

```sql
DBMS_XDB.DBMS_XDB.HASBLOBCONTENT
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

`TRUE` if the resource has BLOB content.
HASCHARCONTENT Function

This function returns TRUE if the resource has character content.

Syntax

```sql
DBMS_XDB.DBMS_XDB.HASCHARCONTENT
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has character content.
HASXMLCONTENT Function

This function returns TRUE if the resource has XML content.

Syntax

```sql
DBMS_XDB.DBMS_XDB.HASXMLCONTENT
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has XML content.
HASXMLREFERENCE Function

This function returns TRUE if the resource has a REF to XML content.

Syntax

DBMS_XDB.DBMS_XDB.HASXMLREFERENCE
    abspath    IN     VARCHAR2)
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE resource has a REF to XML content.
ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

Syntax

```sql
DBMS_XDB.DBMS_XDB.ISFOLDER
    abspath    IN     VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource is a folder or container.
LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```sql
DBMS_XDB.LINK(
    srcpath      IN   VARCHAR2,
    linkfolder   IN   VARCHAR2,
    linkname     IN   VARCHAR2);

DBMS_XDB.LINK(
    srcpath      IN   VARCHAR2,
    linkfolder   IN   VARCHAR2,
    linkname     IN   VARCHAR2,
    linktype     IN   PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Path name of the resource to which a link is created</td>
</tr>
<tr>
<td>linkfolder</td>
<td>Folder in which the new link is placed</td>
</tr>
<tr>
<td>linkname</td>
<td>Name of the new link</td>
</tr>
<tr>
<td>linktype</td>
<td>Type of link to be created:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDB.LINK_TYPE_HARD (default)</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDB.LINK_TYPE_WEAK</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDB.LINK_TYPE_SYMBOLIC</td>
</tr>
</tbody>
</table>
**LOCKRESOURCE Function**

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

**Syntax**

```sql
DBMS_XDB.LOCKRESOURCE(
    path      IN  VARCHAR2,
    depthzero IN  BOOLEAN,
    shared    IN  boolean)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to lock.</td>
</tr>
<tr>
<td>depthzero</td>
<td>Currently not supported</td>
</tr>
<tr>
<td>shared</td>
<td>Passing TRUE obtains a shared write lock</td>
</tr>
</tbody>
</table>

**Return Values**

TRUE if successful.

**Usage Notes**

The user must have UPDATE privileges on the resource.
MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB.MOVEXDB_TABLESPACE(
    new_tablespace   IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_tablespace</td>
<td>Name of the tablespace to where the XDB is moved</td>
</tr>
</tbody>
</table>

Usage Notes

This operation waits for all concurrent XDB sessions to exit.
PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

Syntax

```sql
DBMS_XDB.PURGERESOURCEMETADATA(
    abspath IN VARCHAR2,
    recurse IN BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource. If the path is a folder, use the recurse flag.</td>
</tr>
<tr>
<td>recurse</td>
<td>Used only if abspath specifies a folder. If TRUE, process links of all resources in the folder hierarchy rooted at the specified resource. If FALSE, process links of all documents in this folder only.</td>
</tr>
</tbody>
</table>
PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
    abspath IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>
REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

DBMS_XDB.REBUILDHIERARCHICALINDEX;
**RENAMERESOURCE Procedure**

This procedure renames the XDB resource.

**Syntax**

```sql
DBMS_XDB.RENAMERESOURCE(
    srcpath    IN  VARCHAR2,
    destfolder IN  CARCHAR2,
    newname    IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Absolute path in the Hierarchy for the source resource destination folder</td>
</tr>
<tr>
<td>destfolder</td>
<td>Absolute path in the Hierarchy for the destination folder</td>
</tr>
<tr>
<td>newname</td>
<td>Name of the child in the destination folder</td>
</tr>
</tbody>
</table>
SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```sql
DBMS_XDB.SETACL(
    res_path   IN  VARCHAR2,
    acl_path   IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Table 162–52 SETACL Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-------------------</td>
</tr>
<tr>
<td>res_path</td>
</tr>
<tr>
<td>acl_path</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have `<write-acl>` privileges on the resource.
SETCONTENT Procedures

This procedure replaces the contents of a resource with a specified datatype.

Syntax

Replaces the contents of the a resource with a specified CLOB:

\[
\text{DBMS\_XDB\_SETCONTENT}\{
\text{abspath IN VARCHAR2,}
\text{data IN CLOB};
\}
\]

Replaces the contents of a resource with a specified BLOB:

\[
\text{DBMS\_XDB\_SETCONTENT}\{
\text{abspath IN VARCHAR2,}
\text{data IN BLOB,}
\text{csid IN PLS\_INTEGER};
\}
\]

Replaces the contents of a resource with a specified XMLTYPE:

\[
\text{DBMS\_XDB\_SETCONTENT}\{
\text{abspath IN VARCHAR2,}
\text{data IN SYS\_XMLTYPE};
\}
\]

Replaces the contents of a resource with a specified string:

\[
\text{DBMS\_XDB\_SETCONTENT}\{
\text{abspath IN VARCHAR2,}
\text{data IN VARCHAR2};
\}
\]

Replaces the contents of a resource with a specified REF to an XMLTYPE

\[
\text{DBMS\_XDB\_SETCONTENT}\{
\text{abspath IN VARCHAR2,}
\text{data IN CLOB,}
\text{sticky IN BOOLEAN := TRUE};
\}
\]

Replaces the contents of a resource with a specified BFILE:

\[
\text{DBMS\_XDB\_SETCONTENT}\{
\text{abspath IN VARCHAR2,}
\text{data IN CLOB,}
\text{csid IN PLS\_INTEGER};
\}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path in the Hierarchy for resource</td>
</tr>
<tr>
<td>data</td>
<td>Input varying with overload:</td>
</tr>
<tr>
<td></td>
<td>- CLOB data</td>
</tr>
<tr>
<td></td>
<td>- BLOB data</td>
</tr>
<tr>
<td></td>
<td>- XMLTYPE data</td>
</tr>
<tr>
<td></td>
<td>- string data</td>
</tr>
<tr>
<td></td>
<td>- REF to XMLTYPE data</td>
</tr>
<tr>
<td></td>
<td>- a BFILE</td>
</tr>
</tbody>
</table>

DBMS_XDB 162-65
### Table 162–53 (Cont.) SETCONTENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csid</td>
<td>Character set id of the BLOB or BFILE</td>
</tr>
<tr>
<td>sticky</td>
<td>Whether or not the REF is sticky</td>
</tr>
</tbody>
</table>
**SETFTPPORT Procedure**

This procedure sets the FTP port to a new value.

**Syntax**

```
DBMS_XDB.SETFTPPORT(
    new_port  IN  NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the FTP port is set</td>
</tr>
</tbody>
</table>
SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

DBMS_XDB.SETHTTPPORT(
    new_port  IN  NUMBER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the HTTP port is set</td>
</tr>
</tbody>
</table>
SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server. Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```sql
DBMS_XDB.SETLISTENERENDPOINT (
    endpoint  IN  NUMBER,
    host      IN  VARCHAR2,
    port      IN  NUMBER,
    protocol  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.</td>
</tr>
<tr>
<td>host</td>
<td>Interface on which the listener end point is to listen. Its value can be 'LOCALHOST', NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.</td>
</tr>
<tr>
<td>port</td>
<td>Port on which the listener end point is to listen</td>
</tr>
<tr>
<td>protocol</td>
<td>Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS</td>
</tr>
</tbody>
</table>
SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when \_access is set to TRUE) or to listen on both localhost and non-localhost interfaces (when \_access is set to FALSE).

Syntax

```sql
DBMS_XDB.SETLISTENERLOCALACCESS (l_access BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_access</td>
<td>TRUE or FALSE.</td>
</tr>
</tbody>
</table>
SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB.SPLITPATH(
    abspath IN VARCHAR2,
    parentpath OUT VARCHAR2,
    childpath OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path to be split</td>
</tr>
<tr>
<td>parentpath</td>
<td>Parentpath</td>
</tr>
<tr>
<td>childpath</td>
<td>Childpath</td>
</tr>
</tbody>
</table>

TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

```sql
DBMS_XDB.DBMS_XDB.TOUCHRESOURCE
   abspath IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>
UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource. The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath   IN VARCHAR2,
    oldmetadata    IN   REF SYS.XMLTYPE,
    newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath   IN   VARCHAR2,
    oldmetadata    IN   REF SYS.XMLTYPE,
    newmetadata    IN   XMLTYPE)
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath   IN   VARCHAR2,
    oldns          IN   VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath   IN   VARCHAR2,
    oldns         IN   VARCHAR2,
    oldname       IN   VARCHAR,
    newmetadata   IN   REF SYS.XMLTYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>oldmetadata</td>
<td>REF to the old of metadata</td>
</tr>
<tr>
<td>newmetadata</td>
<td>REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)</td>
</tr>
<tr>
<td>oldns</td>
<td>Namespace identifying old metadata</td>
</tr>
<tr>
<td>oldname</td>
<td>Local name identifying old metadata</td>
</tr>
</tbody>
</table>
Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.
UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB.UNLOCKRESOURCE(
    path     IN  VARCHAR2,
    delttoken IN  VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource</td>
</tr>
<tr>
<td>delttoken</td>
<td>Lock token to be removed</td>
</tr>
</tbody>
</table>

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.
UNLOCKRESOURCE Function
The DBMS_XDB_ADMIN package provides an interface to manage the XMLIndex on the XML DB repository.

See Also: Oracle XML DB Developer’s Guide for information about "Using XMLIndex on Oracle XML DB Repository"

This chapter contains the following topics:

- Summary of DBMS_XDB_ADMIN Subprograms
Summary of DBMS_XDB_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_REPOSITORY_XMLINDEX Procedure on page 163-3</td>
<td>Creates an XMLIndex on the XML DB repository</td>
</tr>
<tr>
<td>DROP_REPOSITORY_XMLINDEX Procedure on page 163-4</td>
<td>Drops the XMLIndex on the XML DB repository</td>
</tr>
<tr>
<td>XMLINDEX_ADDPATH Procedure on page 163-5</td>
<td>Takes a path in XML DB repository as an input and index all the resources under this given path</td>
</tr>
<tr>
<td>XMLINDEX_REMOVEPATH Procedure on page 163-6</td>
<td>Removes the index for the given path</td>
</tr>
</tbody>
</table>
CREATEREPOSITORYXMLINDEX Procedure

This procedure creates an XMLIndex on the XML DB repository.

Syntax

DBMS_XDB_ADMIN.CREATEREPOSITORYXMLINDEX;
DROPREPOSITORYXMLINDEX Procedure

This procedure drops the XMLIndex on the XML DB repository.

Syntax

```
DBMS_XDB_ADMIN.DROPREPOSITORYXMLINDEX;
```
XMLINDEXADDPATH Procedure

This procedure adds to the repository xmlindex the resource identified by path (when
recurse is FALSE) or adds to the repository xmlindex the sub-tree of resources
rooted at path (when recurse is TRUE). The default value for recurse is TRUE.

Syntax

DBMS_XDB_ADMIN.XMLINDEXADDPATH(
    path         IN  VARCHAR2,
    recurse      IN  BOOLEAN);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path to a resource</td>
</tr>
<tr>
<td>recurse</td>
<td>TRUE or FALSE</td>
</tr>
</tbody>
</table>
This procedure removes from the repository xmlindex the resource identified by path (when recurse is FALSE) or removes from the repository xmlindex the sub-tree of resources rooted at path (when recurse is TRUE). The default value for recurse is TRUE.

Syntax

```sql
DBMS_XDB_ADMIN.XMLINDEXREMOVEPATH(
    path              IN  VARCHAR2,
    isrecursive       IN  BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path to a resource</td>
</tr>
<tr>
<td>recurse</td>
<td>TRUE or FALSE</td>
</tr>
</tbody>
</table>
Oracle XML DB versioning interfaces are found in the `DBMS_XDB_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- **Summary of DBMS_XDB_VERSION Subprograms**

  **See Also:** *Oracle XML DB Developer’s Guide*
# Summary of DBMS_XDB_VERSION Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CHECKIN Function</strong> on page 164-3</td>
<td>Checks in a checked-out VCR and returns the resource id of the newly-created version</td>

<tr>
<td><strong>UNCHECKOUT Function</strong> on page 164-14</td>
<td>Checks in a checked-out resource, returns the resource id of the version before the resource is checked out</td>
</tr>
</tbody>
</table>
CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```sql
DBMS_XDB_VERSION.CHECKIN(
    pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the checked-out resource.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. CHECKIN Function doesn’t have to take the same path name that was passed to CHECKOUT Procedure operation. However, the CHECKIN Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to CHECKIN Function because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to CHECKIN Function the resource.
CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```plsql
DBMS_XDB_VERSION.Checkout(
    pathname VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the VCR to be checked out.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot CHECKOUT Procedure the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the CHECKOUT Procedure operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn’t exist.
GETCONTENTSBLOBBYRESID Function

This function obtains contents as a BLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSBLOBBYRESID(
    resid      DBMS_XDB.resid_type)
RETURN BLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>
GETCONTENTSCLOBBYRESID Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLOBBYRESID(
    resid    DBMS_XDB.resid_type)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>
GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

Syntax

DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
   resid     DBMS_XDB.resid_type)
RETURN XMLType;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Return Values

If the contents are not valid XML, returns NULL.
GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
    pathname       VARCHAR2)
RETURN resid_list_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource.</td>
</tr>
</tbody>
</table>

Return Values

An exception is raised if `pathname` is illegal.
GETPREDSTYPE by RESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```objectivec
DBMS_XDB_VERSION.GETPREDSTYPE(resid resid_type)
RETURN resid_list_type;
```

Parameters

Table 164–8  GETPREDSTYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Usage Notes

Getting predecessors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the RESID is illegal.
GETRESOURCEBYRESID Function

This function obtains the resource as an XMLType, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
    resid resid_type
) RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>
GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

DBMS_XDB_VERSION.GETSUCCESSORS (  
    pathname VARCHAR2) 
RETURN resid_list_type;

Parameters

Table 164–10  GETSUCCESSORS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource.</td>
</tr>
</tbody>
</table>

Usage Notes

Getting successors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the pathname is illegal.
GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```sql
DBMS_XDB_VERSION.GETSUCCSBYRESID(
    resid    resid_type)
RETURN resid_list_type;
```

Parameters

Table 164–11  GETSUCCSBYRESID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Usage Notes

Getting successors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the pathname is illegal.
MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
   pathname   VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource to be put under version control.</td>
</tr>
</tbody>
</table>

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn’t exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.
UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(
   pathname   VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

- `pathname` - The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. The UNCHECKOUT Function does not have to take the same path name that was passed to the operation by the CHECKOUT Procedure. However, the UNCHECKOUT Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to UNCHECKOUT Function, because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to UNCHECKOUT Function the resource.

Exceptions

An exception is raised if the path name doesn’t exist.
The `DBMS_XDBRESOURCE` package provides the interface to operate on the resource's metadata and contents.

**See Also:** Oracle XML DB Developer's Guide for examples of "Using `DBMS_XDBRESOURCE`"

This chapter contains the following topics:

- **Using DBMS_XDBRESOURCE**
  - Overview
- **Summary of DBMS_XDBRESOURCE Subprograms**
Using DBMS_XDBRESOURCE

- Overview
Overview

The DBMS_XDBRESOURCE package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in DBMS_XMLDOM package, an XDBResource instance could be converted to a DOMDocument type by using DBMS_XDBRESOURCE.MAkedocument routine.
## Summary of DBMS_XDBRESOURCE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREERESOURCE Procedure on page 165-7</td>
<td>Frees any memory associated with an XDBResource</td>

Summary of DBMS_XDBRESOURCE Subprograms

Table 165–1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SETCOMMENT Procedure on page 165-53</td>
<td>Sets a comment associated with the given XDBResource</td>
</tr>
<tr>
<td>SETCONTENT Procedures on page 165-54</td>
<td>Replaces the contents of the given resource with the given CLOB</td>
</tr>
<tr>
<td>SETCONTENTTYPE Procedure on page 165-55</td>
<td>Sets the content-type of the given XDBResource</td>
</tr>
<tr>
<td>SETCUSTOMMETADATA Procedure on page 165-56</td>
<td>Sets the custom metadata specified by the XPath and namespace to new data</td>
</tr>
<tr>
<td>SETDISPLAYNAME Procedure on page 165-57</td>
<td>Sets the display name of the given XDBResource</td>
</tr>
<tr>
<td>SETLANGUAGE Procedure on page 165-58</td>
<td>Sets the language of the given XDBResource</td>
</tr>
<tr>
<td>SETOWNER Procedure on page 165-59</td>
<td>Sets the owner of the given XDBResource</td>
</tr>
</tbody>
</table>
FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```sql
DBMS_XDBRESOURCE.FREERESOURCE (  
    res IN    XDBResource)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource to free</td>
</tr>
</tbody>
</table>
GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```plsql
DBMS_XDBRESEROUCE.GETACL (  
    res  IN    XDBResource)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as XMLType.

Syntax

```sql
DBMS_XDBRESEROUCE.GETACLDOCFROMRES (res   IN    XDBResource)
RETURN SYS.XMLTYPE;
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
```

GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```sql
DBMS_XDBRESEROUCE.GETAUTHOR (  
    res IN XDBResource
)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCHARACTERSET Function

Given an XDBResource, this function returns its character set.

Syntax

```
DBMS_XDBRESOURCE.GETCHARACTERSET (
    res IN XDBResource) 
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```sql
DBMS_XDBRESEROUCE.GETCOMMENT (    res IN XDBResource) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTBLOB (  
    res IN XDBResource, 
    csid OUT PLS_INTEGER)  
RETURN BLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>csid</td>
<td>Character set ID of the BLOB returned</td>
</tr>
</tbody>
</table>
GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTCLOB (  
   res IN XDBResource)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCONTENTREF Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTREF (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
```
GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```sql
DBMS_XDBRESEROUCE.GETCONTENTTYPE (  
    res IN    XDBResource)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCONTENTXML Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTXML (
    res IN XDBResource)
RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Table 165–12 GETCONTENTXML Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>res</td>
</tr>
</tbody>
</table>
GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```sql
DBMS_XDBRESEROUC.GETCONTENTVARCHAR2 (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
**GETCREATIONDATE Function**

Given an XDBResource, this function returns its creation date.

**Syntax**

```plaintext
DBMS_XDBRESOURCE.GETCREATIONDATE (  
   res   IN    XDBResource)  
RETURN TIMESTAMP;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```sql
DBMS_XDBRESEROUCE.GETCREATOR (  
    res  IN    XDBResource)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```sql
DBMS_XDBRESEROUCE.GETCUSTOMMETADATA (
    res       IN    XDBResource,
    xpath     IN    VARCHAR2,
    namespace IN    VARCHAR2
) RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath for custom metadata</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

Usage Notes

The first component of the XPath expression must be "Resource".
GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```sql
DBMS_XDBRESOURCES.GETDISPLAYNAME (  
    res IN  XDBResource  
)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>

Table 165–17  GETDISPLAYNAME Function Parameters
**GETLANGUAGE Function**

Given an XDBResource, this function returns its language.

**Syntax**

```sql
DBMS_XDBRESOURCE.GETLANGUAGE (
    res IN XDBResource)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

DBMS_XDBRESEROUCE.GETLASTMODIFIER (  
    res IN XDBResource)  
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESOURCE.GETMODIFICATIONDATE (  
    res IN XDBResource)  
RETURN TIMESTAMP;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESEROUCE.GETOWNER (  
   res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```sql
DBMS_XDBRESOURCE.GETREFCOUNT (
    res IN XDBResource)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```plsql
DBMS_XDBRESEROUCE.GETVERSIONID (res IN XDBResource)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASACLCHANGED Function

This function returns TRUE if the ACL of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASACLCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Table 165–24 GETACL Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>res</td>
</tr>
</tbody>
</table>
HASAUTHORCHANGED Function

This function returns TRUE if the author of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASAUTHORCHANGED (  
   res  IN  XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```sql
DBMS_XDBRESEROUCE.HASCHANGED (
  res       IN    XDBResource,
  xpath     IN    VARCHAR2,
  namespace IN    VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath to check</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace to use</td>
</tr>
</tbody>
</table>
HASCHARACTERSETCHANGED Function

This function returns TRUE if the character set of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCHARACTERSETCHANGED (    res IN XDBResource)    RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCOMMENTCHANGED Function

This function returns TRUE if the comment of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCOMMENTCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCONTENTCHANGED Function

This function returns TRUE if the contents of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESEROUCE.HASCONTENTCHANGED (
    res  IN  XDBResource
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCONTENTTYPECHANGED Function

This function returns TRUE if the content-type of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTTYPECHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCREATIONDATECHANGED Function

This function returns TRUE if the creation date of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESEROUCE.HASCREATIONDATECHANGED (    res  IN  XDBResource)    RETURN  BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCREATORCHANGED Function

This function returns TRUE if the creator of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESEROUCE.HASCREATORCHANGED (    res IN XDBResource)    RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCUSTOMMETADATA_CHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```sql
DBMS_XDBRESEROUCE.HASCUSTOMMETADATA_CHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASDISPLAYNAMECHANGED Function

This function returns TRUE if the display name of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASDISPLAYNAMECHANGED (res IN XDBResource) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASLANGUAGECHANGED Function

This function returns TRUE if the language of the given resource has changed, FALSE otherwise.

Syntax

DBMS_XDBRESEROUCE.HASLANGUAGECHANGED {
    res IN XDBResource)
RETURN BOOLEAN;

Parameters

Table 165–35  HASLANGUAGECHANGED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASLASTMODIFIERCHANGED Function

This function returns TRUE if the last modifier of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESOURCE.HASLASTMODIFIERCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASMODIFICATIONDATECHANGED Function

This function returns TRUE if the modification date of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESEROUCE.HASMODIFICATIONDATECHANGED (
    res IN XDBResource
) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASOWNERCHANGED Function

This function returns TRUE if the owner of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESOURCE.HASOWNERCHANGED (    res   IN    XDBResource) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASREFCOUNTCHANGED Function

This function returns TRUE if the reference count of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESEROUCE.HASREFCOUNTCHANGED (   res IN XDBResource)   RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASVERSIONIDCHANGED Function

This function returns **TRUE** if the version ID of the given resource has changed, **FALSE** otherwise.

**Syntax**

```
DBMS_XDBRESEROUCE.HASVERSIONIDCHANGED(
    res IN XDBResource)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
ISFOLDER Function

This function returns TRUE if the given resource is a folder, FALSE otherwise.

Syntax

DBMS_XDBRESEROUCE.ISFOLDER (  
    res IN XDBResource)  
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
ISNULL Function

This function returns TRUE if input resource is NULL.

Syntax

```sql
DBMS_XDBRESOURCE.ISNULL (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>Input resource</td>
</tr>
</tbody>
</table>
MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

See Also: The DBMS_XMLDOM package

Syntax

```sql
DBMS_XDBRESEROUCE.MAKEDOCUMENT (
    res IN XDBResource)
RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
SAVE Procedure

This procedure updates the resource with any modifications.

Syntax

```
DBMS_XDBRESEROUCE.SAVE (  
   res IN    XDBResource);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

```sql
DBMS_XDBRESEROUCE.SETACL (  
    res      IN OUT  XDBResource,  
    ACLPath  IN      VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>ACLPath</td>
<td>Absolute path of the new ACL</td>
</tr>
</tbody>
</table>
SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESOURCE.SETAUTHOR (
    res    IN OUT  XDBResource,
    author IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>author</td>
<td>Author</td>
</tr>
</tbody>
</table>
SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```
DBMS_XDBRESEROUCE.SETCHARACTERSET (
    res   IN OUT XDBResource,
    charSet IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>charSet</td>
<td>New character set</td>
</tr>
</tbody>
</table>
SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```sql
DBMS_XDBRESEROUCE.SETCOMMENT (
    res     IN OUT  XDBResource,
    comment IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>comment</td>
<td>New comment</td>
</tr>
</tbody>
</table>
SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

Syntax

```sql
DBMS_XDBRESEROUCE.SETCONTENT (  
  res    IN OUT  XDBResource,  
  data   IN      BFILE,  
  csid   IN      NUMBER);

DBMS_XDBRESEROUCE.SETCONTENT (  
  res    IN OUT  XDBResource,  
  data   IN      BLOB,  
  csid   IN      PLS_INTEGER);

DBMS_XDBRESEROUCE.SETCONTENT (  
  res    IN OUT  XDBResource,  
  data   IN      CLOB);

DBMS_XDBRESEROUCE.SETCONTENT (  
  res    IN OUT  XDBResource,  
  data   IN      REF SYS.XMLType,  
  sticky IN      BOOLEAN := TRUE);

DBMS_XDBRESEROUCE.SETCONTENT (  
  res    IN OUT  XDBResource,  
  data   IN      VARCHAR2);

DBMS_XDBRESEROUCE.SETCONTENT (  
  res    IN OUT  XDBResource,  
  data   IN      SYS.XMLType);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>data</td>
<td>Data input as BFILE, BLOB, CLOB, string, XMLType</td>
</tr>
<tr>
<td>csid</td>
<td>Character set ID of the BFILE, BLOB</td>
</tr>
<tr>
<td>sticky</td>
<td>If TRUE creates a sticky REF, otherwise non-sticky</td>
</tr>
</tbody>
</table>
SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```
DBMS_XDB RESOURCE.SETCONTENTTYPE (
    res         IN OUT  XDBResource,
    conttype    IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>conttype</td>
<td>New content-type</td>
</tr>
</tbody>
</table>
SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```
DBMS_XDBRESEROUCE.SETCUSTOMMETADATA (  
    res     IN OUT  XDBResource,  
    xpath   IN      VARCHAR2,  
    namespace IN      VARCHAR2,  
    newMetadata IN      XMLType);
```

Parameters

Table 165–51  SETCUSTOMMETADATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath to change</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace to use</td>
</tr>
<tr>
<td>newMetadata</td>
<td>New data that should replace the metadata at the given XPath</td>
</tr>
</tbody>
</table>

Usage Notes

The first component of the XPath expression must be "Resource".
SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```sql
DBMS_XDBRESEROUCE.SETDISPLAYNAME (
    res IN OUT XDBResource,
    name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>name</td>
<td>New display name</td>
</tr>
</tbody>
</table>

Table 165–52  SETDISPLAYNAME Procedure Parameters
SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```sql
DBMS_XDBRESEROUCE.SETLANGUAGE (
    res      IN OUT  XDBResource,
    ACLPath  IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>ACLPath</td>
<td>New path</td>
</tr>
</tbody>
</table>
**SETOWNER Procedure**

This procedure sets the owner of the given XDBResource.

**Syntax**

```sql
DBMS_XDBRESOURCE.SETOWNER (  
  res      IN OUT  XDBResource,  
  owner    IN      VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>owner</td>
<td>New owner</td>
</tr>
</tbody>
</table>

**Usage Notes**

The user must have the XDBADMIN privilege to call this subprogram.
The DBMS_XDBT package provides a convenient mechanism for administrators to set up a CONTEXT index on the Oracle XML DB hierarchy. The package contains procedures to create default preferences, create the index and set up automatic synchronization of the CONTEXT index.

The DBMS_XDBT package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

See Also: Oracle XML DB Developer’s Guide

This chapter contains the following topics:

- Using DBMS_XDBT
  - Overview
  - Operational Notes
- Summary of DBMS_XDBT Subprograms
Using DBMS_XDBT

- Overview
- Operational Notes
Overview

The DBMS_XDBT package can be used in the following fashion:

- Customize the package to set up the appropriate configuration.
- Use the DROPPREFERENCES Procedure to drop any existing index preferences.
- Create new index preferences using the CREATEPREFERENCES Procedure.
- Create the CONTEXT index using the CREATEINDEX Procedure.
- Set up automatic synchronization of the index using the CONFIGUREAUTOSYNC Procedure.
The DBMS_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER_JOBS catalog views. This section describes the configuration settings, or package variables, available to customize the DBMS_XDBT package.

**Table 166–1 General Indexing Settings for Customizing DBMS_XDBT**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IndexName</td>
<td>XDB$CI</td>
<td>Name of the CONTEXT index.</td>
</tr>
<tr>
<td>IndexTablespace</td>
<td>XDB$RESINFO</td>
<td>Tablespace used by tables and indexes comprising the CONTEXT index.</td>
</tr>
<tr>
<td>IndexMemory</td>
<td>128M</td>
<td>Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).</td>
</tr>
<tr>
<td>LogFile</td>
<td>'XdbCtxLog'</td>
<td>The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging.</td>
</tr>
</tbody>
</table>

**Table 166–2 Filtering Settings for Customizing DBMS_XDBT**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SkipFilter_Types</td>
<td>image/%, audio/%, video/%, model/%</td>
<td>List of mime types that should not be indexed.</td>
</tr>
<tr>
<td>NullFilter_Types</td>
<td>text/plain, text/html, text/xml</td>
<td>List of mime types that do not need to use the INSO filter. Use this for text-based documents.</td>
</tr>
<tr>
<td>FilterPref</td>
<td>XDB$CI_FILTER</td>
<td>Name of the filter preference.</td>
</tr>
</tbody>
</table>

**Table 166–3 Stoplist Settings for Customizing DBMS_XDBT**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StoplistPref</td>
<td>XDB$CI_STOPLIST</td>
<td>Name of the stoplist.</td>
</tr>
<tr>
<td>StopWords</td>
<td>0..9; 'a'..'z'; 'A'..'Z'</td>
<td>List of stopwords, in excess of CTXSYS.DEFAULT_STOPLIST.</td>
</tr>
</tbody>
</table>

**Table 166–4 Sectioning and Section Group Settings for Customizing DBMS_XDBT**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SectionGroup</td>
<td>HTML_SECTION_GROUP</td>
<td>Default sectioner. Use PATH_SECTION_GROUP or AUTO_SECTION_GROUP if repository contains mainly XML documents.</td>
</tr>
<tr>
<td>SectionGroupPref</td>
<td>XDB$CI_SECTIONGROUP</td>
<td>Name of the section group.</td>
</tr>
</tbody>
</table>
### Table 166–5  Other Index Preference Settings for Customizing DBMS_XDBT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DatastorePref</td>
<td>XDB$CI_DATASTORE</td>
<td>Name of the datastore preference.</td>
</tr>
<tr>
<td>StoragePref</td>
<td>XDB$CI_STORAGE</td>
<td>Name of the storage preference.</td>
</tr>
<tr>
<td>WordlistPref</td>
<td>XDB$CI_WORDLIST</td>
<td>Name of the wordlist preference.</td>
</tr>
<tr>
<td>DefaultLexerPref</td>
<td>XDB$CI_DEFAULT_LEXER</td>
<td>Name of the default lexer preference.</td>
</tr>
</tbody>
</table>

### Table 166–6  SYNC (CONTEXT Synchronization) Settings for Customizing DBMS_XDBT

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AutoSyncPolicy</td>
<td>SYNC_BY_PENDING_COUNT</td>
<td>Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>MaxPendingCount</td>
<td>2</td>
<td>Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>CheckPendingCount</td>
<td>10 minutes</td>
<td>How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>SyncInterval</td>
<td>60 minutes</td>
<td>Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
</tbody>
</table>
## Summary of DBMS_XDBT Subprograms

### Table 166–7  DBMS_XDBT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIGUREAUTOSYNC Procedure</td>
<td>Configures the CONTEXT index for automatic maintenance, SYNC</td>
</tr>
<tr>
<td>CREATEDATASTOREPREF Procedure</td>
<td>Creates a USER datastore preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATENPREFERENCE Procedure</td>
<td>Creates a filter preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEINDEX Procedure on page 166-10</td>
<td>Creates the CONTEXT index on the XML DB hierarchy</td>
</tr>
<tr>
<td>CREATELEXERPREF Procedure on page 166-11</td>
<td>Creates a lexer preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEPREFERENCES Procedure on page 166-12</td>
<td>Creates preferences required for the CONTEXT index on the XML DB hierarchy</td>
</tr>
<tr>
<td>CREATESECTIONGROUPPREF Procedure on page 166-13</td>
<td>Creates a storage preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATESTOPLISTPREF Procedure on page 166-14</td>
<td>Creates a section group for the CONTEXT index</td>
</tr>
<tr>
<td>CREATESTORAGEPREF Procedure on page 166-15</td>
<td>Creates a wordlist preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEWORLDLISTPREF Procedure on page 166-16</td>
<td>Creates a stoplist for the CONTEXT index</td>
</tr>
<tr>
<td>DROPREFERENCES Procedure on page 166-17</td>
<td>Drops any existing preferences</td>
</tr>
</tbody>
</table>
CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the CONTEXT index.

Syntax

DBMS_XDBT CONFIGUREAUTOSYNC;

Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the USER_JOBS catalog views.
- The configuration parameter AutoSyncPolicy can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

<table>
<thead>
<tr>
<th>Sync Basis</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYNC_BY_PENDING_COUNT</td>
<td>The SYNC is triggered when the number of documents in the pending queue is greater than a threshold. (See the MaxPendingCount configuration setting on page 166-5). The pending queue is polled at regular intervals (See the CheckPendingCountInterval configuration parameter on page 166-5) to determine if the number of documents exceeds the threshold.</td>
</tr>
<tr>
<td>SYNC_BY_TIME</td>
<td>The SYNC is triggered at regular intervals. (See the SyncInterval configuration parameter on page 166-5).</td>
</tr>
<tr>
<td>SYNC_BY_PENDING_COUNT_AND_TIME</td>
<td>A combination of both of the preceding options.</td>
</tr>
</tbody>
</table>
CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEDATASTOREPREF;

Usage Notes

- The name of the datastore preference can be modified; see the DatastorePref configuration setting.
- The default USER datastore procedure also filters the incoming document. The DBMS_XDBT package provides a set of configuration settings that control the filtering process.
- The SkipFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.
- The NullFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
- All other documents use the INSO filter through the IFILTER API.
CREATEFILTERPREF Procedure

This procedure creates a NULL filter preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEFILTERPREF;

Usage Notes

- The name of the filter preference can be modified; see FilterPref configuration setting.
- The USER datastore procedure filters the incoming document; see CREATEDATASTOREPREF Procedure for more details.
CREATEINDEX Procedure

This procedure creates the CONTEXT index on the XML DB hierarchy.

Syntax

```plsql
DBMS_XDBT.CREATEINDEX;
```

Usage Notes

- The name of the index can be changed; see the `IndexName` configuration setting.
- Set the `LogFile` configuration parameter to enable ROWID logging during index creation.
- Set the `IndexMemory` configuration parameter to determine the amount of memory that index creation, and later SYNCs, will use.
CREATELEXERPREF Procedure

This procedure creates a BASIC lexer preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATELEXERPREF;

Usage Notes

- The name of the lexer preference can be modified; see LexerPref configuration setting. No other configuration settings are provided.
- MultiLexer preferences are not supported.
- Base letter translation is turned on by default.
CREATEPREFERENCES Procedure

This procedure creates a set of default preferences based on the configuration settings.

Syntax

```
DBMS_XDBT.CREATEPREFERENCES;
```
CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATESECTIONGROUPPREF;

Usage Notes

- The name of the section group can be changed; see the SectiongroupPref configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the AUTO_SECTION_GROUP or the PATH_SECTION_GROUP; see the SectionGroup configuration setting.
CREATESTOPLISTPREF Procedure

This procedure creates a stoplist for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTOPLISTPREF;
```

Usage Notes

- The name of the stoplist can be modified; see the StoplistPref configuration setting.
- Numbers are not indexed.
- The StopWords array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in CTXSYS.DEFAULT_STOPLIST.
CREATESTORAGEPREF Procedure

This procedure creates a BASIC_STORAGE preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATESTORAGEPREF;

Usage Notes

- The name of the storage preference can be modified; see the StoragePref configuration setting.
- A tablespace can be specified for the tables and indexes comprising the CONTEXT index; see the IndexTablespace configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The I_INDEX_CLAUSE uses key compression.
CREATEWORLDLISTPREF Procedure

This procedure creates a word list preference for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEWORLDLISTPREF;
```

Usage Notes

- The name of the word list preference can be modified; see the WordlistPref configuration setting. No other configuration settings are provided.
- FUZZY_MATCH and STEMMER attributes are set to AUTO (auto-language detection)
DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.DROPPREFERENCES;
The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- **Using DBMS_XDBZ**
  - Constants
- **Summary of DBMS_XDBZ Subprograms**

See Also: Oracle XML DB Developer’s Guide
Using DBMS_XDBZ

This section contains topics which relate to using the DBMS_XDBZ package.

- Constants on page 167-3
### Constants

The DBMS_XDBZ package uses the constants shown in following tables.

- DBMS_XDBZ Constants - Name Format on page 167-3
- DBMS_XDBZ Constants - Enable Option on page 167-3
- DBMS_XDBZ Constants - Enable Option Exercised on page 167-3

#### Table 167–1 DBMS_XDBZ Constants - Name Format

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME_FORMAT_SHORT</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>DB user name or LDAP nickname</td>
</tr>
<tr>
<td>NAME_FORMAT_DISTINGUISHED</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>LDAP distinguished name</td>
</tr>
</tbody>
</table>

#### Table 167–2 DBMS_XDBZ Constants - Enable Option

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENABLE_CONTENTS</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>Enables hierarchy for contents and is used by users when calling the ENABLE_HIERARCHY Procedure</td>
</tr>
<tr>
<td>ENABLE_RESMETADATA</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources</td>
</tr>
</tbody>
</table>

#### Table 167–3 DBMS_XDBZ Constants - Enable Option Exercised

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_ENABLED_CONTENTS</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>If hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE CONTENTS</td>
</tr>
<tr>
<td>IS_ENABLED_RESMETADATA</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>If hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA</td>
</tr>
</tbody>
</table>
### Summary of DBMS_XDBZ Subprograms

<table>
<thead>
<tr>
<th>Table 167–4  DBMS_XDBZ Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Method</strong></td>
</tr>
<tr>
<td>DISABLE_HIERARCHY Procedure on page 167-5</td>
</tr>
<tr>
<td>ENABLE_HIERARCHY Procedure on page 167-6</td>
</tr>
<tr>
<td>GET_ACLOID Function on page 167-7</td>
</tr>
<tr>
<td>GET_USERID Function on page 167-8</td>
</tr>
<tr>
<td>IS_HIERARCHY_ENABLED Function on page 167-9</td>
</tr>
<tr>
<td>PURGELDAPCACHE Function on page 167-10</td>
</tr>
</tbody>
</table>
DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

Syntax

```sql
DBMS_XDBZ.DISABLE_HIERARCHY(
    object_schema IN VARCHAR2,
    object_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema name of the XMLType table or view</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the XMLType table or view</td>
</tr>
</tbody>
</table>
ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

See Also: Oracle XML DB Developer’s Guide for more information about

Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(
  object_schema   IN   VARCHAR2,
  object_name     IN   VARCHAR2,
  hierarchy_type  IN   PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema name of the XMLType table or view</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the XMLType table or view</td>
</tr>
<tr>
<td>hierarchy_type</td>
<td>How to enable the hierarchy.</td>
</tr>
<tr>
<td></td>
<td>■ ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository</td>
</tr>
<tr>
<td></td>
<td>■ ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources</td>
</tr>
</tbody>
</table>

If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.
GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```sql
DBMS_XDBZ.GET_ACLOID(
    aclpath   IN   VARCHAR2,
    acloid    OUT  RAW)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aclpath</td>
<td>ACL resource path for the repository</td>
</tr>
<tr>
<td>acloid</td>
<td>The returned Object ID</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if successful.
GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the USERID is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the USERID is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(
    username IN  VARCHAR2,
    userid   OUT RAW,
    format   IN  BINARY_INTEGER := NAME_FORMAT_SHORT)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Name of the database or LDAP user.</td>
</tr>
<tr>
<td>userid</td>
<td>Return parameter for the matching user id.</td>
</tr>
<tr>
<td>format</td>
<td>Format of the specified user name; valid options are:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDBZ.NAME_FORMAT_DISTRIBUTED -- LDAP distinguished name.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if successful.
**IS_HIERARCHY_ENABLED Function**

This function determines if repository support for the specified XMLType table or view is enabled.

**Syntax**

```sql
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
    object_schema   IN  VARCHAR2,
    object_name     IN  VARCHAR2,
    hierarchy_type  IN  PLS_INTEGER := IS_ENABLED_CONTENTS)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema name of the XMLType table or view</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the XMLType table or view</td>
</tr>
<tr>
<td>hierarchy_type</td>
<td>The type of hierarchy to check for.</td>
</tr>
<tr>
<td></td>
<td>- IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_CONTENTS</td>
</tr>
<tr>
<td></td>
<td>- IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA</td>
</tr>
</tbody>
</table>

**Return Values**

Returns **TRUE** if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.
PURGELDAPCACHE Function

This function purges the LDAP nickname cache. Returns TRUE if successful.

Syntax

```
DBMS_XDBZ.PURGELDAPCACHE
RETURN BOOLEAN;
```
The DBMS_XEVENT package provides event-related types and supporting subprograms.

Using DBMS_XEVENT

- Constants
## Constants

The `DBMS_XEVENT` package uses the constants shown in Table 168–1:

### Table 168–1 DBMS_XEVENT Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENDER_EVENT</td>
<td>PLS_INTEGER</td>
<td>1</td>

Subprogram Groups

- XDBEvent Type Subprograms
- XDBRepositoryEvent Type Subprograms
- XDBHandlerList Type Subprograms
- XDBHandler Type Subprograms
- XDBPath Type Subprograms
- XDBLink Type Subprograms
XDBEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBEvent type.

Table 168–2  XDBEvent Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETCURRENTUSER Function on page 168-17</td>
<td>Returns the name of the user executing the operation that triggers the event</td>
</tr>
<tr>
<td>GETEVENT Function on page 168-18</td>
<td>Returns a value identifying the triggering event</td>
</tr>
<tr>
<td>ISNULL Functions on page 168-45</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.
XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

**Table 168–3  XDBRepositoryEvent Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETAPPLICATIONDATA Function on page 168-15</td>
<td>Returns the &lt;applicationData&gt; element extracted from the resource configuration that defines the invoking handler</td>
</tr>
<tr>
<td>GETHANDLERLIST Function on page 168-20</td>
<td>Returns an XDBHandlerList object containing the list of handlers that will be executed after the currently executing handler</td>
</tr>
<tr>
<td>GETINTERFACE Function on page 168-21</td>
<td>Returns the top-level interface used to initiate the operation that triggered the event</td>
</tr>
<tr>
<td>GETLINK Function on page 168-23</td>
<td>Returns an XDBLink object for the target resource</td>
</tr>
<tr>
<td>GETLOCK Function on page 168-25</td>
<td>Returns the lock object corresponding to the current operation</td>
</tr>
<tr>
<td>GETOLDRESOURCE Function on page 168-29</td>
<td>Returns the original XDBResource object before the operation was executed</td>
</tr>
<tr>
<td>GETOPENACCESSMODE Function on page 168-30</td>
<td>Returns the access mode for the open operation</td>
</tr>
<tr>
<td>GETOPENDENYMODE Function on page 168-31</td>
<td>Returns the deny mode for the open operation</td>
</tr>
<tr>
<td>GETOUTPUTSTREAM Function on page 168-32</td>
<td>Returns the output BLOB in which the handler can write the rendered data</td>
</tr>
<tr>
<td>GETPARAMETER Function on page 168-33</td>
<td>Returns the value of a request or session-specific parameter</td>
</tr>
<tr>
<td>GETPARENT Function on page 168-34</td>
<td>Returns the resource object corresponding to a parent folder of the target resource</td>
</tr>
<tr>
<td>GETPATH Function on page 168-38</td>
<td>Returns the XDBPath object representing the path of the resource for which the event was fired</td>
</tr>
<tr>
<td>GETRESOURCE Function on page 168-39</td>
<td>Returns an XDBResource object that provides methods to access and modify the contents and metadata of the target resource</td>
</tr>
<tr>
<td>GETUPDATEBYTECOUNT Function on page 168-42</td>
<td>If the current operation is a byte-range write, returns the byte count</td>
</tr>
<tr>
<td>GETUPDATEBYTEOFFSET Function on page 168-43</td>
<td>If the current operation is a byte-range write, function returns the byte offset at which the range begins</td>
</tr>
<tr>
<td>GETXDBEVENT Function on page 168-44</td>
<td>Converts an XDBRepositoryEvent object to an XDBEvent type</td>
</tr>
<tr>
<td>ISNULL Functions on page 168-45</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
<tr>
<td>SETRENDERPATH Procedure on page 168-48</td>
<td>Specifies the path of the resource that contains the rendered contents</td>
</tr>
<tr>
<td>SETRENDERSTREAM Procedure on page 168-49</td>
<td>Sets the BLOB from which the rendered contents can be read</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.
XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandlerList type.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR Procedure on page 168-14</td>
<td>Clears the handler list</td>
</tr>
<tr>
<td>GETFIRST Function on page 168-19</td>
<td>Returns the first handler in the list</td>
</tr>
<tr>
<td>GETNAME Function on page 168-27</td>
<td>Returns the next handler in the list</td>
</tr>
<tr>
<td>ISNULL Functions on page 168-45</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
<tr>
<td>REMOVE Procedure on page 168-47</td>
<td>Removes the specified handler from the handler list</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.
XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandler type.

Table 168–5  XDBHandler Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETLANGUAGE Function on page 168-22</td>
<td>Returns the implementation language of the handler</td>
</tr>
<tr>
<td>GETSCHEMA Function on page 168-40</td>
<td>Returns the schema of the handler’s source</td>
</tr>
<tr>
<td>GETSOURCE Function on page 168-41</td>
<td>Returns the name of the Java class, PL/SQL package or</td>
</tr>
<tr>
<td></td>
<td>object type implementing the handler</td>
</tr>
<tr>
<td>ISNULL Functions on page 168-45</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.
XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 168–6 XDBPath Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETNAME Function on page 168-27</td>
<td>Returns the string representation of the path</td>
</tr>
<tr>
<td>GETPARENTPATH Function on page 168-37</td>
<td>Returns the parent’s path</td>
</tr>
<tr>
<td>ISNULL Functions on page 168-45</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.
XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

Table 168–7  XDBLink Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETCHILDOID Function on page 168-16</td>
<td>Returns the OID of the resource to which the link is pointing</td>
</tr>
<tr>
<td>GETPARENTNAME Function on page 168-35</td>
<td>Returns the link’s parent folder’s name</td>
</tr>
<tr>
<td>GETPARENTOID Function on page 168-36</td>
<td>Returns the link’s parent folder’s OID</td>
</tr>
<tr>
<td>ISNULL Functions on page 168-45</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

<td>sets the BLOB from which the rendered contents can be read</td>
<td>XDBRepositoryEvent Type Subprograms on page 168-5</td>
</tr>
</tbody>
</table>
CLEAR Procedure

this procedure clears the handler list.

**See Also:** XDBHandlerList Type Subprograms on page 168-6 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.CLEAR (    
   hl    IN OUT   XDBHandlerList);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
</tbody>
</table>
GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

DBMS_XEVENT.GETAPPLICATIONDATA (ev IN XDBRepositoryEvent)
RETURN XMLType;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETCHILDOID Function

This function returns the OID of the resource to which the link is pointing.

**See Also:** [XDBLink Type Subprograms](#) on page 168-10 for other subprograms in this group

**Syntax**

```sql
DBMS_XEVENT.GETCHILDOID (  
    link   IN   XDBLink)  
RETURN RAW;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>
GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

See Also: XDBEvent Type Subprograms on page 168-5 for other subprograms in this group

Syntax

DBMS_XEVENT.GETCURRENTUSER (ev IN XDBEvent) RETURN VARCHAR2;

Parameters

Table 168–12 GETCURRENTUSER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBEvent type</td>
</tr>
</tbody>
</table>
GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

See Also: XDBEvent Type Subprograms on page 168-5 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETEVENT (  
  ev   IN   XDBEvent)  
RETURN XDBEventID;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ev</code></td>
<td>Event of XDBEvent type</td>
</tr>
</tbody>
</table>
GETFIRST Function

This function returns the first handler in the list.

See Also: XDBHandlerList Type Subprograms on page 168-6 for other subprograms in this group

Syntax

DBMS_XEVENT.GETFIRST (hl IN XDBHandlerList)
RETURN XDBHandler;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
</tbody>
</table>
GETHANDLERLIST Function

This function returns an XDBHandlerList object containing the list of handlers that will be executed after the currently executing handler. The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

DBMS_XEVENT.GETHANDLERLIST (  
   ev   IN   XDBRepositoryEvent)  
RETURN XDBHandlerList;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 168-6 for other subprograms in this group

**Syntax**

```
DBMS_XEVENT.GETINTERFACE (
    ev IN XDBRepositoryEvent)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETLANGUAGE Function

This function returns the implementation language of the handler.

See Also: XDBHandler Type Subprograms on page 168-8 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>
GETLINK Function

This function returns an XDBLink object for the target resource. For a link* or unlink* event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, ParentName, ParentOID, ChildOID and LinkName.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

DBMS_XEVENT.GETLINK (  
  ev   IN   XDBRepositoryEvent)  
RETURN XDBLink;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETLINKNAME Function

This function returns the name of the link.

**See Also:** XDBLink Type Subprograms on page 168-10 for other subprograms in this group

### Syntax

```sql
DBMS_XEVENT.GETLINKNAME (  
  link   IN   XDBLink)  
RETURN VARCHAR2;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>
**GETLOCK Function**

This function returns the lock object corresponding to the current operation. It is only valid for lock and unlock events.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 168-6 for other subprograms in this group

**Syntax**

```sql
DBMS_XEVENT.GETLOCK  (  
    ev  IN  XDBRepositoryEvent)  
RETURN XDBLock;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
**GETLANGUAGE Function**

This function returns the implementation language of the handler.

**See Also:** [XDBHandler Type Subprograms](#) on page 168-8 for other subprograms in this group

**Syntax**

```sql
DBMS_XEVENT.GETLANGUAGE (  
    handler   IN   XDBHandler)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>
GETNAME Function

This function returns the string representation of the path.

See Also: XDBPath Type Subprograms on page 168-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (
    path   IN   XDBPath)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path</td>
</tr>
</tbody>
</table>
GETNEXT Function

This function returns the next handler in the list.

See Also: XDBHandlerList Type Subprograms on page 168-6 for other subprograms in this group

Syntax

```plsql
DBMS_XEVENT.GETNEXT (    hl IN   XDBHandlerList)    RETURN XDBHandler;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
</tbody>
</table>
GETOLDRESOURCE Function

This function returns the original XDBResource object before the operation was executed. This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
   ev   IN   XDBRepositoryEvent)
RETURN XDBResource;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (  
    ev IN XDBRepositoryEvent)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

Return Values

- XDBRepositoryEvent.OPEN_ACCESS_READ (value 1)
- XDBRepositoryEvent.OPEN_ACCESS_WRITE (value 2)
- XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE (value 3)
GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

```plsql
DBMS_XEVENT.GETOPENDENYMODE (
   ev IN XDBRepositoryEvent
) RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)
GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6
for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (   ev IN XDBRepositoryEvent)   RETURN BLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the key parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

**See Also:** XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETPARAMETER (
    ev   IN   XDBRepositoryEvent,
    key  IN   VARCHAR2)
RETURN VARCHAR2;
```

Parameters

**Table 168–28  GETPARAMETER Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
<tr>
<td>key</td>
<td>Supported parameters:</td>
</tr>
<tr>
<td></td>
<td>■ ACCEPT</td>
</tr>
<tr>
<td></td>
<td>■ ACCEPT-LANGUAGE</td>
</tr>
<tr>
<td></td>
<td>■ ACCEPT-CHARSET</td>
</tr>
<tr>
<td></td>
<td>■ ACCEPT_ENCODING</td>
</tr>
</tbody>
</table>
GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link* or unlink* event, this method returns the link’s parent folder.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENT (ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETPARENTNAME Function

This function returns the link's parent folder's name.

**See Also:** [XDBLink Type Subprograms](#) on page 168-10 for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARENTNAME (
    link   IN   XDBLink)
RETURN VARCHAR2;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>
GETPARENTOID Function

This function returns the link's parent folder's OID.

See Also:  XDBLink Type Subprograms on page 168-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (
    link   IN   XDBLink)
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>
GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a NULL is returned.

See Also: XDBPath Type Subprograms on page 168-9 for other subprograms in this group

Syntax

DBMS_XEVENT.GETPARENTPATH (  
    path   IN   XDBPath,  
    level   IN   INTEGER)  
RETURN XDBPath;

Parameters

Table 168–32 GETPARENTPATH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path</td>
</tr>
<tr>
<td>level</td>
<td>Number of levels up the hierarchy</td>
</tr>
</tbody>
</table>
GETPATH Function

This function returns the XDBPath object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 168-6 for other subprograms in this group

**Syntax**

```
DBMS_XEVE NT.GETPATH (    ev IN XDBRepositoryEvent)    RETURN XDBPath;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETRESOURCE Function

This function returns an XDBResource object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a link* or unlink* event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETRESOURCE (    ev IN XDBRepositoryEvent)    RETURN XDBResource;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETSCHEMA Function

This function returns the schema of the handler's source.

See Also: XDBHandler Type Subprograms on page 168-8 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSCHEMA (handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>
GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

See Also: XDBHandler Type Subprograms on page 168-8 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETSOURCE (
    handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>
GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the function returns the byte count. It is only valid for the inconsistent-update event.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (  
   ev IN XDBRepositoryEvent)  
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6
for other subprograms in this group

Syntax

DBMS_XEVENT.GETUPDATEBYTEOFFSET (ev IN XDBRepositoryEvent) RETURN NUMBER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETXDBEVENT Function

This function converts an XDBRepositoryEvent object to an XDBEvent type.

See Also: XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETXDBEVENT (  
    ev IN XDBRepositoryEvent)  
RETURN XDBEvent;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

ISNULL Functions

This function returns TRUE if input argument is NULL.

See Also:
- XDBEvent Type Subprograms on page 168-5 for other subprograms in this group
- XDBRepositoryEvent Type Subprograms on page 168-6 for other subprograms in this group

- XDBPath Type Subprograms on page 168-9 for other subprograms in this group
- XDBLink Type Subprograms on page 168-10 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.ISNULL (ev IN XDBEvent) RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (ev IN XDBRepositoryEvent) RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (hl IN XDBHandlerList) RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (handler IN XDBHandler) RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (path IN XDBPath) RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (link IN XDBLink) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of specified type</td>
</tr>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path</td>
</tr>
</tbody>
</table>
REMOVE Procedure

This procedure removes the specified handler from the handler list.

**See Also:** [XDBHandlerList Type Subprograms](#) on page 168-6 for other subprograms in this group

### Syntax

```sql
DBMS_XEVENT.REMOVE (
  hl       IN OUT   XDBHandlerList,
  handler  IN       XDBHandler);
```

### Parameters

**Table 168–41 REMOVE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>
SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents. This should not be called after the stream returned by GETOUTPUTSTREAM Function is written to or after the SETRENDERSTREAM Procedure is called; doing so will result in an error. This is only valid for the render event.

Syntax

DBMS_XEVENT.SETRENDERPATH (
  ev     IN   XDBRepositoryEvent,
  path   IN   VARCHAR2);

Parameters

Table 168–42  SETRENDERPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>XDB Repository Event object</td>
</tr>
<tr>
<td>path</td>
<td>Path of the resource containing the rendered contents</td>
</tr>
</tbody>
</table>
SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read. This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```sql
DBMS_XEVENT.SETRENDERSTREAM (
    ev IN XDBRepositoryEvent, 
    istr IN BLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>XDBRepositoryEvent object</td>
</tr>
<tr>
<td>istr</td>
<td>Input stream from which to get the rendered contents</td>
</tr>
</tbody>
</table>
The DBMS_XMLDOM package is used to access XMLType objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

Using DBMS_XMLDOM

- Overview
- Constants
- Types
- Exceptions
- Subprogram Groups
Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated. In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally seen as "data"; nevertheless, XML presents this data as documents, and the DBMS_XMLDOM package allows you access to both schema-based and non schema-based documents.

Note:

- Before database startup, the read-from and write-to directories in the init.ora file must be specified; for example: UTL_FILE_DIR=/mypath/insidemypath.
- Read-from and write-to files must be on the server file system.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as Node, Element, and others have equivalent PL/SQL types DOMNode, DOMElement, respectively.
- Various DOMException codes such as WRONG_DOCUMENT_ERR, HIERARCHY_REQUEST_ERR, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as ELEMENT_NODE, ATTRIBUTE_NODE, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform APPENDCHILD Function on a DOMNode n, the APPENDCHILD FunctionPL/SQL function on page 169-41 is provided.
- To perform setAttribute on a DOMElement elem SETATTRIBUTE Procedures, use PL/SQL procedure on page 169-141.

DOM defines an inheritance hierarchy. For example, Document, Element, and Attr are defined to be subtypes of Node (see Figure 169–1). Thus, a method defined in the Node interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the MAKENODE function. Calling MAKENODE on various DOM types converts these types into a DOMNode. The appropriate functions or procedures that accept DOMNodes can then be called to operate on these types. If, subsequently, type specific functionality is desired, the DOMNode can be converted back into the original type by the makeXXX functions, where DOMXXX is the desired DOM type.

Note:

- Before database startup, the read-from and write-to directories in the init.ora file must be specified; for example: UTL_FILE_DIR=/mypath/insidemypath.
- Read-from and write-to files must be on the server file system.
This is a text description of arpls010.gif. This figure provides a graphical representation of inheritance-type relationship between DOM types; methods defined on the supertype should be available on the subtype. Description of the inheritance structure follows:

1. Attr, CharacterData, Document, DocumentFragment, DocumentType, Element, Entity, EntityReference, Notation, and ProcessingInstruction are all subtypes of Node
2. Text is a subtype of CharacterData
3. CDATASection and Comment are subtypes of Text

***********************************************************************************************

The implementation of this interface follows the REC-DOM-Level-1-19981001.
## Constants

Defined constants of DBMS_XMLDOM are listed in Table 169–1.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ELEMENT_NODE</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>The Node is an Element.</td>
</tr>
<tr>
<td>ATTRIBUTE_NODE</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>The Node is an Attribute.</td>
</tr>
<tr>
<td>TEXT_NODE</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>The Node is a Text node.</td>
</tr>
<tr>
<td>CDATA_SECTION_NODE</td>
<td>PLS_INTEGER</td>
<td>4</td>
<td>The Node is a CDataSection.</td>
</tr>
<tr>
<td>ENTITY_REFERENCE_NODE</td>
<td>PLS_INTEGER</td>
<td>5</td>
<td>The Node is an Entity Reference.</td>
</tr>
<tr>
<td>ENTITY_NODE</td>
<td>PLS_INTEGER</td>
<td>6</td>
<td>The Node is an Entity.</td>
</tr>
<tr>
<td>PROCESSING_INSTRUCTION_NODE</td>
<td>PLS_INTEGER</td>
<td>7</td>
<td>The Node is a Processing Instruction.</td>
</tr>
<tr>
<td>COMMENT_NODE</td>
<td>PLS_INTEGER</td>
<td>8</td>
<td>The Node is a Comment.</td>
</tr>
<tr>
<td>DOCUMENT_NODE</td>
<td>PLS_INTEGER</td>
<td>9</td>
<td>The Node is a Document.</td>
</tr>
<tr>
<td>DOCUMENT_TYPE_NODE</td>
<td>PLS_INTEGER</td>
<td>10</td>
<td>The Node is a Document Type Definition.</td>
</tr>
<tr>
<td>DOCUMENT_FRAGMENT_NODE</td>
<td>PLS_INTEGER</td>
<td>11</td>
<td>The Node is a Document fragment.</td>
</tr>
<tr>
<td>NOTATION_NODE</td>
<td>PLS_INTEGER</td>
<td>12</td>
<td>The Node is a Notation.</td>
</tr>
</tbody>
</table>
Types

The following types for DBMS_XMLDOM.DOMTYPE are defined in Table 169–2:

Table 169–2 XDB_XMLDOM Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMATTR</td>
<td>Implements the DOM Attribute interface.</td>
</tr>
<tr>
<td>DOMCDATASECTION</td>
<td>Implements the DOM CDataSection interface.</td>
</tr>
<tr>
<td>DOMCHARACTERDATA</td>
<td>Implements the DOM Character Data interface.</td>
</tr>
<tr>
<td>DOMCOMMENT</td>
<td>Implements the DOM Comment interface.</td>
</tr>
<tr>
<td>DOMDOCUMENT</td>
<td>Implements the DOM Document interface.</td>
</tr>
<tr>
<td>DOMDOCUMENTFRAGMENT</td>
<td>Implements the DOM DocumentFragment interface.</td>
</tr>
<tr>
<td>DOMDOCUMENTTYPE</td>
<td>Implements the DOM Document Type interface.</td>
</tr>
<tr>
<td>DOMELEMENT</td>
<td>Implements the DOM Element interface.</td>
</tr>
<tr>
<td>DOMENTITY</td>
<td>Implements the DOM Entity interface.</td>
</tr>
<tr>
<td>DOMENTITYREFERENCE</td>
<td>Implements the DOM EntityReference interface.</td>
</tr>
<tr>
<td>DOMIMPLEMENTATION</td>
<td>Implements the DOM Implementation interface.</td>
</tr>
<tr>
<td>DOMNAMEDNODENMAP</td>
<td>Implements the DOM Named Node Map interface.</td>
</tr>
<tr>
<td>DOMNODE</td>
<td>Implements the DOM Node interface.</td>
</tr>
<tr>
<td>DOMNODELIST</td>
<td>Implements the DOM NodeList interface.</td>
</tr>
<tr>
<td>DOMNOTATION</td>
<td>Implements the DOM Notation interface.</td>
</tr>
<tr>
<td>DOMPROCESSINGINSTRUCTION</td>
<td>Implements the DOM Processing instruction interface.</td>
</tr>
<tr>
<td>DOMTEXT</td>
<td>Implements the DOM Text interface.</td>
</tr>
</tbody>
</table>
Exceptions

The exceptions listed in Table 169–3 are defined for DBMS_XMLDOM:

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMSTRING_SIZE_ERR</td>
<td>If the specified range of text does not fit into a DOMString.</td>
</tr>
<tr>
<td>HIERARCHY_REQUEST_ERR</td>
<td>If any node is inserted somewhere it doesn’t belong.</td>
</tr>
<tr>
<td>INDEX_SIZE_ERR</td>
<td>If index or size is negative, or greater than the allowed value.</td>
</tr>
<tr>
<td>INUSE_ATTRIBUTE_ERR</td>
<td>If an attempt is made to add an attribute that is already in use elsewhere.</td>
</tr>
<tr>
<td>INVALID_CHARACTER_ERR</td>
<td>If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.</td>
</tr>
<tr>
<td>NO_DATA_ALLOWED_ERROR</td>
<td>If data is specified for a node that does not support data.</td>
</tr>
<tr>
<td>NOT_FOUND_ERR</td>
<td>If an attempt is made to reference a node in a context where it does not exist.</td>
</tr>
<tr>
<td>NO_MODIFICATION_ALLOWED_ERR</td>
<td>If an attempt is made to modify an object where modifications are not allowed.</td>
</tr>
<tr>
<td>NOT_SUPPORTED_ERR</td>
<td>If the implementation does not support the requested type of object or operation.</td>
</tr>
<tr>
<td>WRONG_DOCUMENT_ERR</td>
<td>If a node is used in a different document than the one that created it (that doesn’t support it).</td>
</tr>
</tbody>
</table>
DBMS/XMLDOM subprograms are divided into groups according to W3C Interfaces.

- DOMNode Subprograms on page 169-10
- DOMAttr Subprograms on page 169-12
- DOMCDataSection Subprograms on page 169-13
- DOMCharacterData Subprograms on page 169-14
- DOMComment Subprograms on page 169-15
- DOMDocument Subprograms on page 169-16
- DOMDocumentFragment Subprograms on page 169-18
- DOMDocumentType Subprograms on page 169-19
- DOMElement Subprograms on page 169-20
- DOMEntity Subprograms on page 169-21
- DOMEntityReference Subprograms on page 169-22
- DOMImplementation Subprograms on page 169-23
- DOMNamedNodeMap Subprograms on page 169-24
- DOMNodeList Subprograms on page 169-25
- DOMNotation Subprograms on page 169-26
- DOMProcessingInstruction Subprograms on page 169-27
- DOMText Subprograms on page 169-28
## DOMNode Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADOPTNODE Function</strong> on page 169-40</td>
<td>Adopts a node from another document</td>

<td></td>
</tr>
</tbody>
</table>
ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

See Also: DOMNode Subprograms on page 169-10 for other subprograms in this group

Syntax

```sql
DBMS_XMLDOM.ADOPTNODE(
    doc            IN   DOMDocument,
    importedNode   IN   DOMNode)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>Document that is adopting the node</td>
</tr>
<tr>
<td>importedNode</td>
<td>Node to adopt</td>
</tr>
</tbody>
</table>

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.
**APPENDCHILD Function**

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

**See Also:** [DOMNode Subprograms](#) on page 169-10

**Syntax**

```sql
DBMS_XMLDOM.APPENDCHILD(
    n          IN    DOMNode,
    newchild   IN    DOMNode)
RETURN DOMNODE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>newchild</td>
<td>The child to be appended to the list of children of node n</td>
</tr>
</tbody>
</table>
APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

See Also: DOMCharacterData Subprograms on page 169-14

Syntax

```
DBMS_XMLDOM.APPENDDATA(
    cd      IN    DOMCHARACTERDATA,
    arg     IN    VARCHAR2);
```

Parameters

```
Table 169–24 APPENDDATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>arg</td>
<td>The data to append to the existing data</td>
</tr>
</tbody>
</table>
```
CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is NULL.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.CLONENODE(
    n       IN    DOMNODE,
    deep    IN    BOOLEAN)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>deep</td>
<td>Determines if children are to be cloned</td>
</tr>
</tbody>
</table>

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE).
- Cloning any other type of node simply returns a copy of this node.
CREATEATTRIBUTE Functions

This function creates a DOMATTR node.

See Also: DOMDocument Subprograms on page 169-16

Syntax

Creates a DOMATTR with the specified name:

```sql
DBMS_XMLDOM.CREATEATTRIBUTE(
    doc IN DOMDOCUMENT,
    name IN VARCHAR2)
RETURN DOMATTR;
```

Creates a DOMATTR with the specified name and namespace URI:

```sql
DBMS_XMLDOM.CREATEATTRIBUTE(
    doc IN DOMDOCUMENT,
    qname IN VARCHAR2,
    ns IN VARCHAR2)
RETURN DOMATTR;
```

Parameters

<table>
<thead>
<tr>
<th>Table 169–26 CREATEATTRIBUTE Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>------------</td>
</tr>
<tr>
<td>doc</td>
</tr>
<tr>
<td>qname</td>
</tr>
<tr>
<td>ns</td>
</tr>
</tbody>
</table>
CREATECDATASECTION Function

This function creates a DOMCDATASECTION node.

See Also: DOMDocument Subprograms on page 169-16

Syntax

```sql
DBMS_XMLDOM.CREATECDATASECTION(
    doc   IN   DOMDOCUMENT,
    data  IN   VARCHAR2)
RETURN DOMCDATASECTION;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>data</td>
<td>Content of the DOMCDATASECTION node</td>
</tr>
</tbody>
</table>
CREATECOMMENT Function

This function creates a DOMCOMMENT node.

See Also: DOMDocument Subprograms on page 169-16

Syntax

```sql
DBMS_XMLDOM.CREATECOMMENT (  
doc      IN      DOMDOCUMENT,  
data     IN      VARCHAR2)  
RETURN DOMCOMMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>data</td>
<td>Content of the DOMComment node</td>
</tr>
</tbody>
</table>
**CREATEDOCUMENT Function**

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

*See Also:* DOMDocument Subprograms on page 169-16

**Syntax**

```sql
DBMS_XMLDOM.CREATEDOCUMENT(
    namespaceURI IN VARCHAR2,
    qualifiedName IN VARCHAR2,
    doctype IN DOMTYPE := NULL)
RETURN DOMDOCUMENT;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespaceURI</td>
<td>Namespace URI</td>
</tr>
<tr>
<td>qualifiedName</td>
<td>Root element name</td>
</tr>
<tr>
<td>doctype</td>
<td>Document type</td>
</tr>
</tbody>
</table>
CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

See Also: DOMDocument Subprograms on page 169-16

Syntax

DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT (doc IN DOMDOCUMENT) RETURN DOMDOCUMENTFRAGMENT;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument</td>
</tr>
</tbody>
</table>
CREATEELEMENT Functions

This function creates a DOMELEMENT.

See Also: DOMDocument Subprograms on page 169-16

Syntax

Creates a DOMElement with specified name:

```sql
DBMS_XMLDOM.CREATEELEMENT(
    doc IN DOMDOCUMENT,
    tagName IN VARCHAR2)
RETURN DOMELEMENT;
```

Creates a DOMElement with specified name and namespace URI:

```sql
DBMS_XMLDOM.CREATEELEMENT(
    doc IN DOMDOCUMENT,
    tagName IN VARCHAR2,
    ns IN VARCHAR2)
RETURN DOMELEMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>tagName</td>
<td>Tagname for new DOMELEMENT</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

Table 169–31: CREATEELEMENT Function Parameters
CREATEENTITYREFERENCE Function

This function creates a DOMENTITYREFERENCE node.

See Also: DOMDocument Subprograms on page 169-16

Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE(
    doc IN DOMDOCUMENT,
    name IN VARCHAR2)
RETURN DOMENTITYREFERENCE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>name</td>
<td>New entity reference name</td>
</tr>
</tbody>
</table>

Table 169–32 CREATEENTITYREFERENCE Function Parameters
CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

See Also: DOMDocument Subprograms on page 169-16

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
    doc      IN      DOMDocument,
    target   IN      VARCHAR2,
    data     IN      VARCHAR2)
RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>target</td>
<td>Target of the new processing instruction</td>
</tr>
<tr>
<td>data</td>
<td>Content data of the new processing instruction</td>
</tr>
</tbody>
</table>
CREATETEXTNODE Function

This function creates a DOMTEXT node.

See Also: DOMDocument Subprograms on page 169-16

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE(
    doc    IN    DOMDocument,
    data   IN    VARCHAR2)
RETURN DOMTEXT;
```

Parameters

Table 169–34 CREATETEXTNODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>data</td>
<td>Content of the DOMText node</td>
</tr>
</tbody>
</table>
DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

**See Also:** [DOMCharacterData Subprograms](#) on page 169-14

**Syntax**

```sql
DBMS_XMLDOM.DELETEDATA(
    cd IN DOMCHARACTERDATA,
    offset IN NUMBER,
    cnt IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The offset from which to delete the data</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters (starting from offset) to delete</td>
</tr>
</tbody>
</table>
FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

See Also: DOMDocumentType Subprograms on page 169-19

Syntax

```sql
DBMS_XMLDOM.FINDENTITY(
    dt IN DOMDOCTYPE,
    name IN VARCHAR2,
    par IN BOOLEAN)
RETURN DOMENTITY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD</td>
</tr>
<tr>
<td>name</td>
<td>Entity to find</td>
</tr>
<tr>
<td>par</td>
<td>Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity</td>
</tr>
</tbody>
</table>
FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

See Also: DOMDocumentType Subprograms on page 169-19

Syntax

```sql
DBMS_XMLDOM.FINDNOTATION(
    dt        IN     DOMDocumentType,
    name      IN     VARCHAR2)
RETURN DOMNOTATION;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD</td>
</tr>
<tr>
<td>name</td>
<td>The notation to find</td>
</tr>
</tbody>
</table>
FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

See Also: DOMDocument Subprograms on page 169-16 and DOMDocumentFragment Subprograms on page 169-18

Syntax

```sql
DBMS_XMLDOM.FREEDOCFRAG(
    df IN   DOMDOCUMENTFRAGMENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>df</td>
<td>DOM document fragment</td>
</tr>
</tbody>
</table>
FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

See Also: DOMDocument Subprograms on page 169-16

Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(
    doc     IN     DOMDOCUMENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
This procedure frees memory allocated to a DOMElement handle.

See Also: DOMElement Subprograms on page 169-20

Syntax

```
DBMS_XMLDOM.FREENODE(
   elem     IN     DOMELEMENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>Of type DOMELEMENT</td>
</tr>
</tbody>
</table>
FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

See Also: DOMNode Subprograms on page 169-10

Syntax

```
DBMS_XMLDOM.FREENODE(
    n    IN    DOMNODE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
FREENODELIST Procedure

This procedure frees all resources associated with a nodelist.

See Also: DOMNodeList Subprograms on page 169-25

Syntax

```plsql
DBMS_XMLDOM.FREENODE(
    nl    IN    DOMNodeList);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nl</td>
<td>Of type DOMNODELIST</td>
</tr>
</tbody>
</table>
**GETATTRIBUTE Functions**

This function returns the value of an attribute of a DOMElement by name.

*See Also:* [DOMElement Subprograms](#) on page 169-20

**Syntax**

Returns the value of a DOMElement’s attribute by name:

```sql
DBMS_XMLDOM.GETATTRIBUTE(
  elem    IN     DOMElement,
  name    IN     VARCHAR2)
RETURN VARCHAR2;
```

Returns the value of a DOMElement’s attribute by name and namespace URI:

```sql
DBMS_XMLDOM.GETATTRIBUTE(
  elem    IN     DOMElement,
  name    IN     VARCHAR2,
  ns      IN     VARCHAR2)
RETURN VARCHAR2;
```

**Parameters**

*Table 169–43 GETATTRIBUTE Function Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
GETATTRIBUTENODE Functions

This function returns an attribute node from the DOMELEMENT by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

See Also: DOMElement Subprograms on page 169-20

Syntax

Returns an attribute node from the DOMELEMENT by name:

```plsql
DBMS_XMLDOM.GETATTRIBUTENODE(
    elem      IN     DOMElement,
    name      IN     VARCHAR2)
RETURN DOMATTR;
```

Returns an attribute node from the DOMELEMENT by name and namespace URI:

```plsql
DBMS_XMLDOM.GETATTRIBUTENODE(
    elem      IN     DOMElement,
    name      IN     VARCHAR2,
    ns        IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name; * matches any attribute</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
**GETATTRIBUTES Function**

This function retrieves a NAMEDNODEMAP containing the attributes of this node (if it is an Element) or NULL otherwise.

**See Also:** DOMNode Subprograms on page 169-10

**Syntax**

\[
\text{DBMS.XMLDOM.GETATTRIBUTES}(\text{n IN DOMNode})\text{ RETURN DOMNAMEDNODEMAP;}
\]

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETCHARSET Function

This function retrieves the character set of the DOM document.

See Also: DOMDocument Subprograms on page 169-16

Syntax

DBMS_XMLDOM.GETCHARSET(
    doc IN DOMDocument
) RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOM document</td>
</tr>
</tbody>
</table>

Usage Notes

For a newly parsed document, we return the database character set. Once the SETCHARSET Procedure is called with a non-NULL value for charset, that charset is returned.
**GETCHILDNODES Function**

This function retrieves a DOMNODELIST that contains all children of this node. If there are no children, this is a DOMNODELIST containing no nodes.

*See Also:* DOMNode Subprograms on page 169-10

**Syntax**

```sql
DBMS_XMLDOM.GETCHILDNODES(
    n    IN    DOMNode)
RETURN DOMNodeList;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
This function returns the children of the DOMELEMENT.

See Also: DOMElement Subprograms on page 169-20

Syntax

Returns children of the DOMELEMENT given the tag name:

```sql
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
    elem IN DOMElement,
    name IN VARCHAR2)
RETURN DOMNODELIST;
```

Returns children of the DOMELEMENT given the tag name and namespace:

```sql
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
    elem IN DOMElement,
    name IN VARCHAR2,
    ns IN VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Tag name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 169-14):

```sql
DBMS_XMLDOM.GETDATA(
    cd IN DOMCHARACTERDATA)
RETURN VARCHAR2;
```

Returns the content data of the DOMProcessingInstruction (See Also: DOMProcessingInstruction Subprograms on page 169-27):

```sql
DBMS_XMLDOM.GETDATA(
    pi IN DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>pi</td>
<td>The DOMPROCESSINGINSTRUCTION</td>
</tr>
</tbody>
</table>
GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 169-16

Syntax

```
DBMS_XMLDOM.GETDOCTYPE(
  doc      IN     DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 169-16

Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT(
    doc      IN      DOMDOCUMENT)
RETURN DOMELEMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a DOMNODELIST of all the elements with a specified tagname (See Also: DOMDocument Subprograms on page 169-16):

```sql
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   doc IN DOMDOCUMENT,
   tagname IN VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name (See Also: DOMElement Subprograms on page 169-20):

```sql
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem IN DOMELEMENT,
   name IN VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name and namespace (See Also: DOMElement Subprograms on page 169-20):

```sql
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem IN DOMELEMENT,
   name IN VARCHAR2,
   ns IN VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>tagname</td>
<td>Name of the tag to match on</td>
</tr>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Tag name; using a wildcard(*) would match any tag</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
GETENTITIES Function

This function retrieves a DOMNAMEDNODEMAP containing the general entities, both external and internal, declared in the DTD.

See Also: DOMDocumentType Subprograms on page 169-19

Syntax

DBMS_XMLDOM.GETENTITIES(
    dt IN DOMDocumentType)
RETURN DOMNAMEDNODEMAP;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE</td>
</tr>
</tbody>
</table>
GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the Node if is in an Element or Attribute type; otherwise, returns NULL (See Also: DOMNode Subprograms on page 169-10):

```sql
DBMS_XMLDOM.GETEXPANDEDNAME(
    n IN DOMNODE
    data OUT VARCHAR);
```

Returns the expanded name of the DOMAttr (See Also: DOMAttr Subprograms on page 169-12):

```sql
DBMS_XMLDOM.GETEXPANDEDNAME(
    a IN DOMAttr
RETURN VARCHAR2;
```

Returns the expanded name of the DOMElement (See Also: DOMElement Subprograms on page 169-20):

```sql
DBMS_XMLDOM.GETEXPANDEDNAME(
    elem IN DOMELEMENT
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>data</td>
<td>Returned expanded name of the Node</td>
</tr>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
</tbody>
</table>
GETFIRSTCHILDFunction

This function retrieves the first child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.GETFIRSTCHILDF(
  n IN DOMNODE
) RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETIMPLEMENTATION Function

This function returns the DOMIMPLEMENTATION object that handles this DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 169-16

Syntax

DBMS_XMLDOM.GETIMPLEMENTATION(
    doc IN DOMDOCUMENT)
RETURN DOMIMPLEMENTATION;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.GETLASTCHILD(
    n IN DOMNODE)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: DOMCharacterData Subprograms on page 169-14):

```sql
DBMS_XMLDOM.GETLENGTH(
    cd IN DOMCHARACTERDATA)
RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to length-1, inclusive (See Also: DOMNamedNodeMap Subprograms on page 169-24):

```sql
DBMS_XMLDOM.GETLENGTH(
    nnm IN DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to length-1, inclusive (See Also: DOMNodeList Subprograms on page 169-25):

```sql
DBMS_XMLDOM.GETLENGTH(
    nl IN DOMNODELIST)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>nnn</td>
<td>DOMNAMEDNODEMAP</td>
</tr>
<tr>
<td>nl</td>
<td>DOMNODELIST</td>
</tr>
</tbody>
</table>
GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: DOMNode Subprograms on page 169-10):

```
DBMS_XMLDOM.GETLOCALNAME(
    n       IN     DOMNODE,
    data    OUT    VARCHAR2);
```

Returns the local name of the DOMAttr (See Also: DOMAttr Subprograms on page 169-12):

```
DBMS_XMLDOM.GETLOCALNAME(
    a       IN     DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the DOMElement (See Also: DOMElement Subprograms on page 169-20)

```
DBMS_XMLDOM.GETLOCALNAME(
    elem    IN     DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>data</td>
<td>Returned local name.</td>
</tr>
<tr>
<td>a</td>
<td>DOMAttr.</td>
</tr>
<tr>
<td>elem</td>
<td>DOMElemnt.</td>
</tr>
</tbody>
</table>
GETNAME Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns the name of this attribute (See Also: DOMAttr Subprograms on page 169-12):

```
DBMS_XMLDOM.GETNAME(
    a       IN     DOMATTR
) RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the DOCTYPE keyword (See Also: DOMDocumentType Subprograms on page 169-19):

```
DBMS_XMLDOM.GETNAME(
    dt       IN     DOMDOCUMENTTYPE
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE</td>
</tr>
</tbody>
</table>
**GETNAMEDITEM Function**

This function retrieves a node specified by name.

**See Also:** [DOMNamedNodeMap Subprograms on page 169-24](#)

**Syntax**

Retrieves a node specified by name:

```sql
DBMS_XMLDOM.GETNAMEDITEM(
    nnm  IN  DOMNAMEDNODEMAP,
    name IN  VARCHAR2)
RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```sql
DBMS_XMLDOM.GETNAMEDITEM(
    nnm  IN  DOMNAMEDNODEMAP,
    name IN  VARCHAR2,
    ns   IN  VARCHAR2)
RETURN DOMNODE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnm</td>
<td>DOMNAMEDNODEMAP</td>
</tr>
<tr>
<td>name</td>
<td>Name of the item to be retrieved</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: DOMNode Subprograms on page 169-10):

```sql
DBMS_XMLDOM.GETNAMESPACE(
    n IN DOMNODE,
    data OUT VARCHAR2);
```

Retrieves the namespace of the DOMATTTR (See Also: DOMAttr Subprograms on page 169-12):

```sql
DBMS_XMLDOM.GETNAMESPACE(
    a IN DOMATTTR)
RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: DOMElement Subprograms on page 169-20):

```sql
DBMS_XMLDOM.GETNAMESPACE(
    elem IN DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>data</td>
<td>Returned namespace URI</td>
</tr>
<tr>
<td>a</td>
<td>DOMATTTR</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
</tbody>
</table>
**GETNEXTSIBLING Function**

This function retrieves the node immediately following this node. If there is no such node, this returns `NULL`.

**See Also:** [DOMNode Subprograms on page 169-10](#)

**Syntax**

```sql
DBMS_XMLDOM.GETNEXTSIBLING(
    n       IN     DOMNODE)
RETURN DOMNode;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

---

---
GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.GETNODETYPE(
    n IN DOMNODE)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETNODENAME Function

This function gets the name of the node depending on its type.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.GETNODENAME(
    n       IN     DOMNODE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>n</code></td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

Table 169–65 GETNODENAME Function Parameters
GETNODEVALUE Function

This function gets the value of this node, depending on its type.

See Also: DOMNode Subprograms on page 169-10

Syntax

```
DBMS_XMLDOM.GETNODEVALUE(
    n IN DOMNODE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

Table 169–66 GETNODEVALUE Function Parameters
GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 169-10

Syntax

This function returns an instance of the PL/SQL XMLBinaryInputStream. The node data type must be RAW or BLOB – if not an exception is raised.

DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (n IN DOMNODE) RETURN SYS.UTL_BINARYINPUTSTREAM;

Using this procedure, the application passes an implementation of SYS.UTL_BINARYOUTPUTSTREAM into which XDB writes the contents of the node. The data type of the node must be RAW or CLOB – if not an exception is raised.

DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (n in DOMNODE, value in SYS.UTL_BINARYOUTPUTSTREAM);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>BINARYOUTPUTSTREAM</td>
</tr>
</tbody>
</table>
GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 169-10

Syntax

This function returns an instance of the PL/SQL XMLCharacterInputStream. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
    n        IN     DOMNODE)
RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the SYS.UTL_CHARACTEROUTPUTSTREAM.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
    n        IN   DOMNODE,
    value    IN   SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>CHARACTEROUTPUTSTREAM</td>
</tr>
</tbody>
</table>
GETNOTATIONNAME Function

This function returns the notation name of the DOMENTITY.

**See Also:** DOMEntity Subprograms on page 169-21

**Syntax**

```sql
DBMS_XMLDOM.GETNOTATIONNAME(
    ent       IN     DOMENTITY)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ent</td>
<td>DOMENTITY</td>
</tr>
</tbody>
</table>
GETNOTATIONS Function

This function retrieves a DOMNAMEDNODEMAP containing the notations declared in the DTD.

See Also: DOMDocumentType Subprograms on page 169-19

Syntax

DBMS_XMLDOM.GETNOTATIONS(
   dt       IN     DOMDOCUMENTTYPE)
RETURN DOMNAMEDNODEMAP;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE</td>
</tr>
</tbody>
</table>
GETTARGET Function

This function returns the target of the DOMPROCESSINGINSTRUCTION.

**See Also:** [DOMProcessingInstruction Subprograms](#) on page 169-27

**Syntax**

```sql
DBMS_XMLDOM.GETTARGET(
    pi IN DOMPROCESSINGINSTRUCTION
) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pi</td>
<td>DOMPROCESSINGINSTRUCTION</td>
</tr>
</tbody>
</table>
GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is NULL.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.GETOWNERDOCUMENT(
    n IN DOMNODE)
RETURN DOMDOCUMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.GETOWNERDOCUMENT(
    n IN DOMNODE)
RETURN DOMDOCUMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

See Also: DOMAttr Subprograms on page 169-12

Syntax

DBMS_XMLDOM.GETOWNERELEMENT(
    a IN DOMATT
) RETURN DOMElement;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Attribute</td>
</tr>
</tbody>
</table>
GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except Attr, Document, DocumentFragment, Entity, and Notation may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is NULL.

See Also: DOMNode Subprograms on page 169-10

Syntax

```
DBMS_XMLDOM.GETPARENTNODE(n IN DOMNODE)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETPREFIX Function

This function retrieves the namespace prefix of the node.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.GETPREFIX(
  n       IN     DOMNODE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Table 169–75</th>
<th>GETPREFIX Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETPREVIOUSBROTHER Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.GETPREVIOUSBROTHER(
    n       IN     DOMNODE)
RETURN DOMNODE;
```

Parameters

Table 169–76  GETPREVIOUSBROTHER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the specified DTD (See Also: DOMDocumentType Subprograms on page 169-19):

```
DBMS_XMLDOM.GETPUBLICID(
    dt       IN     DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the public identifier of the DOMENTITY (See Also: DOMEntity Subprograms on page 169-21):

```
DBMS_XMLDOM.GETPUBLICID(
    ent      IN     DOMENTITY)
RETURN VARCHAR2;
```

Returns the public identifier of the DOMNOTATION (See Also: DOMNotation Subprograms on page 169-26):

```
DBMS_XMLDOM.GETPUBLICID(
    n        IN     DOMNOTATION)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Table 169–77 GETPUBLICID Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>----------</td>
</tr>
<tr>
<td>dt</td>
</tr>
<tr>
<td>ent</td>
</tr>
<tr>
<td>n</td>
</tr>
</tbody>
</table>
GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the qualified name of the DOMATTR (See Also: DOMAttr Subprograms on page 169-12):

```sql
DBMS_XMLDOM.GETQUALIFIEDNAME(
    a        IN     DOMATTR)
RETURN VARCHAR2;
```

Returns the qualified name of the DOMElement (See Also: DOMElement Subprograms on page 169-20):

```sql
DBMS_XMLDOM.GETQUALIFIEDNAME(
    elem     IN     DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
</tbody>
</table>
GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

See Also: DOMNode Subprograms on page 169-10

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE(
   n        IN     DOMNODE)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

See Also: DOMAttr Subprograms on page 169-12

Syntax

DBMS_XMLDOM.GETSPECIFIED(  
a       IN     DOMATTR)  
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
</tbody>
</table>
GETSTANDALONE Function

This function returns the standalone property associated with the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 169-16

Syntax

DBMS_XMLDOM.GETSTANDALONE(
        doc       IN     DOMDOCUMENT)
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT.</td>
</tr>
</tbody>
</table>
GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the specified DTD (See Also: DOMDocumentType Subprograms on page 169-19):

```sql
DBMS_XMLDOM.GETSYSTEMID(
    dt       IN     DOMDOCUMENTTYPE
) RETURN VARCHAR2;
```

Returns the system identifier of the DOMENTITY (See Also: DOMEntity Subprograms on page 169-21):

```sql
DBMS_XMLDOM.GETSYSTEMID(
    ent      IN     DOMENTITY
) RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: DOMNotation Subprograms on page 169-26):

```sql
DBMS_XMLDOM.GETSYSTEMID(
    n        IN     DOMNOTATION
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD.</td>
</tr>
<tr>
<td>ent</td>
<td>DOMEntity.</td>
</tr>
<tr>
<td>n</td>
<td>DOMNotation.</td>
</tr>
</tbody>
</table>
GETTAGNAME Function

This function returns the name of the DOMELEMENT.

See Also: DOMElement Subprograms on page 169-20

Syntax

```
DBMS_XMLDOM.GETTAGNAME(
    elem       IN     DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

```
Table 169–83    GETTAGNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
</tbody>
</table>
```
GETVALUE Function

This function retrieves the value of the attribute.

See Also:  DOMAttr Subprograms on page 169-12

Syntax

```
DBMS_XMLDOM.GETVALUE(
    a       IN     DOMATTR)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
</tbody>
</table>

Table 169–84   GETVALUE Function Parameters
GETVERSION Function

This function returns the version of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 169-16

Syntax

DBMS_XMLDOM.GETVERSION (doc IN DOMDOCUMENT) RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
GETXMLTYPE Function

This function returns the XMLType associated with the DOMDOCUMENT.

**See Also:** DOMDocument Subprograms on page 169-16

**Syntax**

```
DBMS_XMLDOM.GETXMLTYPE(
    doc IN DOMDOCUMENT)
RETURN SYS.XMLTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
HASATTRIBUTE Functions

Verifies whether an attribute has been defined for DOMElement, or has a default value.

See Also: DOMElement Subprograms on page 169-20

Syntax

Verifies whether an attribute with the specified name has been defined for DOMElement:

DBMS_XMLDOM.HASATTRIBUTE(
    elem IN DOMElement,
    name IN VARCHAR2)
RETURN VARCHAR2;

Verifies whether an attribute with specified name and namespace URI has been defined for DOMElement; namespace enabled:

DBMS_XMLDOM.HASATTRIBUTE(
    elem IN DOMElement,
    name IN VARCHAR2,
    ns IN VARCHAR2)
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name; * matches any attribute</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
HASATTRIBUTES Function

This function returns whether this node has any attributes.

See Also: DOMNode Subprograms on page 169-10

Syntax

```plaintext
DBMS_XMLDOM.HASATTRIBUTES (
    n       IN     DOMNODE)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

Table 169–88 HASATTRIBUTES Function Parameters
HASCHILDNODES Function

This function determines whether this node has any children.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.HASCHILDNODES(
  n       IN     DOMNODE)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
HASFEATURE Function

This function tests if the DOMIMPLEMENTATION implements a specific feature.

See Also: DOMImplementation Subprograms on page 169-23

Syntax

DBMS_XMLDOM.HASFEATURE(
    di IN DOMIMPLEMENTATION,
    feature IN VARCHAR2,
    version IN VARCHAR2)
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>di</td>
<td>DOMIMPLEMENTATION</td>
</tr>
<tr>
<td>feature</td>
<td>The feature to check for</td>
</tr>
<tr>
<td>version</td>
<td>The version of the DOM to check in</td>
</tr>
</tbody>
</table>
IMPORTNODE Function

This function imports a node from an external document and returns this new node.

See Also: DOMNode Subprograms on page 169-10

Syntax

DBMS_XMLDOM.IMPORTNODE(
    doc IN DOMDOCUMENT,
    importedNode IN DOMNODE,
    deep IN BOOLEAN)
RETURN DOMNODE;

Parameters

Table 169–91 IMPORTNODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>Document from which the node is imported</td>
</tr>
<tr>
<td>importedNode</td>
<td>Node to import</td>
</tr>
<tr>
<td>deep</td>
<td>Setting for recursive import.</td>
</tr>
<tr>
<td></td>
<td>■ If this value is TRUE, the entire subtree of the node will be imported with the node.</td>
</tr>
<tr>
<td></td>
<td>■ If this value is FALSE, only the node itself will be imported.</td>
</tr>
</tbody>
</table>

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.
INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is NULL, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.INSERTBEFORE(
    n          IN     DOMNODE,
    newchild   IN     DOMNODE,
    refchild   IN     DOMNODE)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>newChild</td>
<td>The child to be inserted in the DOMNODE</td>
</tr>
<tr>
<td>refChild</td>
<td>The reference node before which the <code>newchild</code> is to be inserted</td>
</tr>
</tbody>
</table>
INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also: DOMCharacterData Subprograms on page 169-14

Syntax

```
DBMS_XMLDOM.INSERTDATA (  
    cd IN DOMCHARACTERDATA,  
    offset IN NUMBER,  
    arg IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The offset at which to insert the data</td>
</tr>
<tr>
<td>arg</td>
<td>The value to be inserted</td>
</tr>
</tbody>
</table>
ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the specified DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNode Subprograms on page 169-10):

```sql
DBMS_XMLDOM.ISNULL(
    n        IN     DOMNODE)
RETURN BOOLEAN;
```

Checks that the specified DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMAttr Subprograms on page 169-12):

```sql
DBMS_XMLDOM.ISNULL(
    a       IN     DOMATTR)
RETURN BOOLEAN;
```

Checks that the specified DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDataSection Subprograms on page 169-13):

```sql
DBMS_XMLDOM.ISNULL(
    cds      IN     DOMCDATASECTION)
RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCharacterData Subprograms on page 169-14):

```sql
DBMS_XMLDOM.ISNULL(
    cd       IN     DOMCHARACTERDATA)
RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMComment Subprograms on page 169-15):

```sql
DBMS_XMLDOM.ISNULL(
    com      IN     DOMCOMMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocument Subprograms on page 169-16):

```sql
DBMS_XMLDOM.ISNULL(
    doc      IN     DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentFragment Subprograms on page 169-18):

```sql
DBMS_XMLDOM.ISNULL(
    df       IN     DOMDOCUMENTFRAGMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentType Subprograms on page 169-19):

```sql
DBMS_XMLDOM.ISNULL(
    dt       IN     DOMDOCUMENTTYPE)
```
Checks that the specified DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMElement Subprograms on page 169-20):

```sql
DBMS_XMLDOM.ISNULL(
    elem IN DOMELEMENT
) RETURN BOOLEAN;
```

Checks that the specified DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntity Subprograms on page 169-21):

```sql
DBMS_XMLDOM.ISNULL(
    ent IN DOMENTITY
) RETURN BOOLEAN;
```

Checks that the specified DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntityReference Subprograms on page 169-22):

```sql
DBMS_XMLDOM.ISNULL(
    EREF IN DOMENTITYREFERENCE
) RETURN BOOLEAN;
```

Checks that the specified DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: DOMImplementation Subprograms on page 169-23):

```sql
DBMS_XMLDOM.ISNULL(
    di IN DOMIMPLEMENTATION
) RETURN BOOLEAN;
```

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNodeList Subprograms on page 169-25):

```sql
DBMS_XMLDOM.ISNULL(
    nl IN DOMNODELIST
) RETURN BOOLEAN;
```

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNotation Subprograms on page 169-26):

```sql
DBMS_XMLDOM.ISNULL(
    n IN DOMNOTATION
) RETURN BOOLEAN;
```

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMProcessingInstruction Subprograms on page 169-27):

```sql
DBMS_XMLDOM.ISNULL(
    pi IN DOMPROCESSINGINSTRUCTION
) RETURN BOOLEAN;
```

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMText Subprograms on page 169-28):

```sql
DBMS_XMLDOM.ISNULL(
```
Parameters

Table 169–94  ISNULL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to check</td>
</tr>
<tr>
<td>a</td>
<td>DOMATTR to check</td>

</tr>
</tbody>
</table>
ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the INDEX parameter. If INDEX is greater than or equal to the number of nodes in this map, this returns NULL (See Also: DOMNamedNodeMap Subprograms on page 169-24):

```sql
DBMS_XMLDOM.ITEM(
    nnm       IN     DOMNAMEDNODEMAP,
    index     IN     NUMBER)
RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the INDEX parameter. If index is greater than or equal to the number of nodes in the list, this returns NULL (See Also: DOMNodeList Subprograms on page 169-25):

```sql
DBMS_XMLDOM.ITEM(
    nl       IN     DOMNODELIST,
    index    IN     NUMBER)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Table 169–95 ITEM Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>nnnm</td>
</tr>
<tr>
<td>index</td>
</tr>
<tr>
<td>nl</td>
</tr>
<tr>
<td>index</td>
</tr>
</tbody>
</table>
MAKEATTR Function

This function casts a specified DOMNODE to a DOMATTR, and returns the DOMATTR.

See Also: DOMNode Subprograms on page 169-10

Syntax

```
DBMS_XMLDOM.MAKEATTR (    
   n       IN     DOMNODE)  
RETURN DOMATTR;
```

Parameters

<table>
<thead>
<tr>
<th>Table 169–96 MAKEATTR Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>n</td>
</tr>
</tbody>
</table>
MAKECDATASECTION Function

This function casts a specified DOMNODE to a DOMCDATASECTION.

See Also: DOMNode Subprograms on page 169-10

Syntax

DBMS_XMLDOM.MAKECDATASECTION (  
    n       IN     DOMNODE) 
RETURN DOMCDATASECTION;

Parameters

Table 169–97  MAKECDATASECTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKECHARACTERDATA Function

This function casts a specified DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

See Also: DOMNode Subprograms on page 169-10

Syntax

DBMS_XMLDOM.MAKECHARACTERDATA(
   n       IN     DOMNode)
RETURN DOMCharacterData;

Parameters

Table 169–98 MAKECHARACTERDATA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKECOMMENT Function

This function casts a specified DOMNode to a DOMCOMMENT, and returns the DOMCOMMENT.

**See Also:** DOMNode Subprograms on page 169-10

**Syntax**

```sql
DBMS_XMLDOM.MAKECOMMENT(
    n       IN     DOMNODE)
RETURN DOMCOMMENT;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEDOCUMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENT, and returns the DOMDOCUMENT.

See Also: DOMNode Subprograms on page 169-10

Syntax

```plsql
DBMS_XMLDOM.MAKEDOCUMENT(
    n       IN     DOMNODE)
RETURN DOMDocument;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEDOCUMENTFRAGMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENTFRAGMENT, and returns the DOMDOCUMENTFRAGMENT.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT(
    n       IN     DOMNODE)
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEDOCUMENTTYPE Function

This function casts a specified DOMNODE to a DOMDOCUMENTTYPE and returns the DOMDOCUMENTTYPE.

See Also: DOMNode Subprograms on page 169-10

Syntax

DBMS_XMLDOM.MAKEDOCUMENTTYPE (
    n       IN     DOMNODE)
RETURN DOMDOCUMENTTYPE;

Parameters

Table 169–102  MAKEDOCUMENTTYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast.</td>
</tr>
</tbody>
</table>
MAKEELEMENT Function

This function casts a specified DOMNODE to a DOMELEMENT, and returns the DOMELEMENT.

See Also: DOMNode Subprograms on page 169-10

Syntax

DBMS_XMLDOM.MAKEELEMENT (n IN DOMNODE) RETURN DOMELEMENT;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEENTITY Function

This function casts a specified DOMNODE to a DOMENTITY, and returns the DOMENTITY.

See Also: DOMNode Subprograms on page 169-10

Syntax

```
DBMS_XMLDOM.MAKEENTITY(
   n IN DOMNODE)
RETURN DOMENTITY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEENTITYREFERENCE Function

This function casts a specified DOMNODE to a DOMENTITYREFERENCE, and returns the DOMENTITYREFERENCE.

See Also: DOMNode Subprograms on page 169-10

Syntax

DBMS_XMLDOM.MAKEENTITYREFERENCE (  
  n    IN    DOMNODE)  
RETURN DOMENTITYREFERENCE;

Parameters

Table 169–105  MAKEENTITYREFERENCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts specified DOMAttr to a DOMNODE, and returns the DOMNODE (See Also: DOMAttr Subprograms on page 169-12):

```sql
DBMS_XMLDOM.MAKENODE(
    a IN DOMATTR)
RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: DOMCDataSection Subprograms on page 169-13):

```sql
DBMS_XMLDOM.MAKENODE(
    cds IN DOMCDATASECTION)
RETURN DOMNODE;
```

Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: DOMCharacterData Subprograms on page 169-14):

```sql
DBMS_XMLDOM.MAKENODE(
    cd IN DOMCHARACTERDATA)
RETURN DOMNODE;
```

Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMComment Subprograms on page 169-15):

```sql
DBMS_XMLDOM.MAKENODE(
    com IN DOMCOMMENT)
RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocument Subprograms on page 169-16):

```sql
DBMS_XMLDOM.MAKENODE(
    doc IN DOMDOCUMENT)
RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentFragment Subprograms on page 169-18):

```sql
DBMS_XMLDOM.MAKENODE(
    df IN DOMDOCUMENTFRAGMENT)
RETURN DOMNode;
```

Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentType Subprograms on page 169-19):

```sql
DBMS_XMLDOM.MAKENODE(
    dt IN DOMDOCUMENTTYPE)
RETURN DOMNODE;
```

Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMElement Subprograms on page 169-20):

```sql
DBMS_XMLDOM.MAKENODE(
    elem IN DOMELEMENT)
```
Casts specified DOMENTITY to a DOMNODE, and returns that DOMNODE (See Also: DOMEntity Subprograms on page 169-21):

DBMS_XMLDOM.MAKENODE(
    ent IN   DOMENTITY)
RETURN DOMNODE;

Casts the DOMENTITYREFERENCE to a DOMNODE, and returns that DOMNODE (See Also: DOMEntityReference Subprograms on page 169-22):

DBMS_XMLDOM.MAKENODE(
    eref IN   DOMENTITYREFERENCE)
RETURN DOMNODE;

Casts the DOMNOTATION to a DOMNODE, and returns that DOMNODE (See Also: DOMNotation Subprograms on page 169-26):

DBMS_XMLDOM.MAKENODE(
    n IN   DOMNOTATION)
RETURN DOMNODE;

Casts the DOMPROCESSINGINSTRUCTION to a DOMNODE, and returns the DOMNODE (See Also: DOMProcessingInstruction Subprograms on page 169-27):

DBMS_XMLDOM.MAKENODE(
    pi IN   DOMPROCESSINGINSTRUCTION)
RETURN DOMNODE;

Casts the DOMTEXT to a DOMNODE, and returns that DOMNODE (See Also: DOMText Subprograms on page 169-28):

DBMS_XMLDOM.MAKENODE(
    t IN   DOMTEXT)
RETURN DOMNODE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR to cast</td>
</tr>
<tr>
<td>cds</td>
<td>DOMCDATASECTION to cast</td>
</tr>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA to cast</td>
</tr>
<tr>
<td>com</td>
<td>DOMCOMMENT to cast</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT to cast</td>
</tr>
<tr>
<td>df</td>
<td>DOMDOCUMENTFRAGMENT to cast</td>
</tr>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE to cast</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT to cast</td>
</tr>
<tr>
<td>ent</td>
<td>DOMENTITY to cast</td>
</tr>
<tr>
<td>eref</td>
<td>DOMENTITYREFERENCE to cast</td>
</tr>
<tr>
<td>n</td>
<td>DOMNOTATION to cast</td>
</tr>
<tr>
<td>pi</td>
<td>DOMPROCESSINGINSTRUCTION to cast</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>t</td>
<td>DOMTEXT to cast</td>
</tr>
</tbody>
</table>
MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

**See Also:** DOMNode Subprograms on page 169-10

**Syntax**

```sql
DBMS_XMLDOM.MAKENOTATION(
    n       IN     DOMNODE)
RETURN DOMNOTATION;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

See Also: DOMNode Subprograms on page 169-10

Syntax

DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
   n IN DOMNODE)
RETURN DOMPROCESSINGINSTRUCTION;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>

See Also: DOMNode Subprograms on page 169-10
MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

See Also: DOMNode Subprograms on page 169-10

Syntax

```
DBMS_XMLDOM.MAKETEXT(
    n           IN     DOMNODE)
RETURN DOMTEXT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

See Also: DOMDocument Subprograms on page 169-16

Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
    xmldoc    IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
    cl        IN CLOB)
RETURN DOMDOCUMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmldoc</td>
<td>XMLType source for the DOMDOCUMENT</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB source for the DOMDOCUMENT</td>
</tr>
</tbody>
</table>
NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

See Also: DOMEElement Subprograms on page 169-20

Syntax

DBMS_XMLDOM.NORMALIZE(
    elem   IN   DOMELEMENT);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
</tbody>
</table>
REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

See Also: DOMEElement Subprograms on page 169-20

Syntax

Removes the value of a DOMELEMENT's attribute by name:

```sql
DBMS_XMLDOM.REMOVEATTRIBUTE(
    elem     IN    DOMELEMENT,
    name     IN    VARCHAR2);
```

Removes the value of a DOMELEMENT's attribute by name and namespace URI.

```sql
DBMS_XMLDOM.REMOVEATTRIBUTE(
    elem     IN    DOMELEMENT,
    name     IN    VARCHAR2,
    ns       IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
REMOVATTRIBUTENODE Function

This function removes the specified attribute node from the DOMELEMENT. The method returns the removed node.

See Also: DOMElement Subprograms on page 169-20

Syntax

DBMS_XMLDOM.REMOVATTRIBUTENODE(
    elem       IN     DOMELEMENT,
    oldAttr    IN     DOMATTR)
RETURN DOMAttr;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT.</td>
</tr>
<tr>
<td>oldAttr</td>
<td>The old DOMATTR.</td>
</tr>
</tbody>
</table>
REMOVECHILD Function

This function removes the child node indicated by \texttt{oldchild} from the list of children, and returns it.

\textbf{See Also:} \texttt{DOMNode Subprograms} on page 169-10

\textbf{Syntax}

\begin{verbatim}
DBMS_XMLDOM.REMOVECHILD(
    n          IN     DOMNode,
    oldchild   IN     DOMNode)
RETURN DOMNODE;
\end{verbatim}

\textbf{Parameters}

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
Parameter & Description \\
\hline
n & DOMNODE \\
oldchild & The child of the node \texttt{n} to be removed \\
\hline
\end{tabular}
\caption{Table 169–114 REMOVECHILD Function Parameters}
\end{table}
REMOVENAMEDITEM Function

This function removes from the map a node specified by name, and returns this node. When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

See Also: DOMNamedNodeMap Subprograms on page 169-24

Syntax

Removes a node specified by name:

```sql
DBMS_XMLDOM.REMOVENAMEDITEM(
    nnm IN DOMNamedNodeMap,
    name IN VARCHAR2)
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```sql
DBMS_XMLDOM.REMOVENAMEDITEM(
    nnm IN DOMNamedNodeMap,
    name IN VARCHAR2,
    ns IN VARCHAR2)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnm</td>
<td>DOMNamedNodeMap</td>
</tr>
<tr>
<td>name</td>
<td>The name of the item to be removed from the map</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

Table 169–115  REMOVENAMEDITEM Function Parameters
REPLACECHILD Function

This function replaces the child node oldchild with newchild in the list of children, and returns the oldchild node. If newchild is a DocumentFragment object, oldchild is replaced by all of the DocumentFragment children, which are inserted in the same order. If the newchild is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.REPLACECHILD(
    n           IN     DOMNode,
    newchild    IN     DOMNode,
    oldchild    IN     DOMNode)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>newchild</td>
<td>The new child which is to replace the old child</td>
</tr>
<tr>
<td>oldchild</td>
<td>The child of the node n which is to be replaced</td>
</tr>
</tbody>
</table>
REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

See Also: DOMCharacterData Subprograms on page 169-14

Syntax

DBMS_XMLDOM.REPLACEDATA(
    cd        IN     DOMCHARACTERDATA,
    offset    IN     NUMBER,
    cnt       IN     NUMBER,
    arg       IN     VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The offset at which to replace</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters to replace</td>
</tr>
<tr>
<td>arg</td>
<td>The value to replace with</td>
</tr>
</tbody>
</table>
RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

See Also: DOMElement Subprograms on page 169-20

Syntax

```sql
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(
    elem       IN     DOMELEMENT,
    prefix     IN     VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>prefix</td>
<td>Namespace prefix</td>
</tr>
</tbody>
</table>

Table 169–118 RESOLVENAMESPACEPREFIX Function Parameters
SETATTRIBUTE Procedures

Sets the value of a DOMELEMENT's attribute by name.

See Also:  DOMElement Subprograms on page 169-20

Syntax

Sets the value of a DOMELEMENT's attribute by name:

DBMS_XMLDOM.SETATTRIBUTE(
    elem       IN  DOMELEMENT,
    name       IN  VARCHAR2,
    newvalue   IN  VARCHAR2);

Sets the value of a DOMElement's attribute by name and namespace URI:

DBMS_XMLDOM.SETATTRIBUTE(
    elem       IN  DOMELEMENT,
    name       IN  VARCHAR2,
    newvalue   IN  VARCHAR2,
    ns         IN  VARCHAR2);

Parameters

Table 169–119  SETATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name</td>
</tr>
<tr>
<td>newvalue</td>
<td>Attribute value</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
SETATTRIBUTENODE Functions

Adds a new attribute node to the DOMELEMENT.

See Also: DOMElement Subprograms on page 169-20

Syntax

Adds a new attribute node to the DOMELEMENT:

DBMS_XMLDOM.SETATTRIBUTENODE(
    elem IN DOMELEMENT,
    newAttr IN DOMATTR)
RETURN DOMATTR;

Adds a new attribute node to the DOMElement; namespace enabled:

DBMS_XMLDOM.SETATTRIBUTENODE(
    elem IN DOMELEMENT,
    newAttr IN DOMATTR,
    ns IN VARCHAR2)
RETURN DOMATTR;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>newAttr</td>
<td>The new DOMATTR</td>
</tr>
<tr>
<td>ns</td>
<td>The namespace</td>
</tr>
</tbody>
</table>
SETCHARSET Procedure

This function sets the characterset of the DOM document.

See Also: DOMDocument Subprograms on page 169-16

Syntax

```sql
DBMS_XMLDOM.SETCHARSET(
  doc      IN    DOMDocument,
  charset  IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOM document</td>
</tr>
<tr>
<td>charset</td>
<td>Characterset</td>
</tr>
</tbody>
</table>

Usage Notes

This is used for WRITETOF ILE Procedures if not explicitly specified at that time.
SETDATA Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 169-14):

```sql
DBMS_XMLDOM.SETDATA(
    cd IN DOMCHARACTERDATA,
    data IN VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: DOMProcessingInstruction Subprograms on page 169-14):

```sql
DBMS_XMLDOM.SETDATA(
    pi IN DOMPROCESSINGINSTRUCTION,
    data IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>data</td>
<td>The data to which the node is set</td>
</tr>
<tr>
<td>pi</td>
<td>DOMPROCESSINGINSTRUCTION</td>
</tr>
<tr>
<td>data</td>
<td>New processing instruction content data</td>
</tr>
</tbody>
</table>
**SETDOCTYPE Procedure**

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document. This DTD can later be retrieved using the GETDOCTYPE Function.

**Syntax**

```sql
DBMS_XMLDOM.SETDOCTYPE(
  doc     IN   DOMDocument,
  name    IN   VARCHAR2,
  sysid   IN   VARCHAR2,
  pubid   IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>The document whose DTD has to be set</td>
</tr>
<tr>
<td>name</td>
<td>The name that the doctype needs to be initialized with</td>
</tr>
<tr>
<td>sysid</td>
<td>The system ID that the doctype needs to be initialized with</td>
</tr>
<tr>
<td>pubid</td>
<td>The public ID that the doctype needs to be initialized with</td>
</tr>
</tbody>
</table>
SETNAMEDITEM Function

This function adds a node using its NodeName attribute. If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, NULL is returned.

As the NodeName attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

See Also: DOMNamedNodeMap Subprograms on page 169-24

Syntax

Adds a node using its NodeName attribute:

```
DBMS_XMLODM.SETNAMEDITEM(
    nnm   IN    DOMNAMEDNODEMAP,
    arg   IN    DOMNODE)
RETURN DOMNode;
```

Adds a node using its NodeName attribute and namespace URI:

```
DBMS_XMLODM.SETNAMEDITEM(
    nnm   IN    DOMNAMEDNODEMAP,
    arg   IN    DOMNODE,
    ns    IN    VARCHAR2)
RETURN DOMNode;
```

Parameters

Table 169–124  SETNAMEDITEM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnm</td>
<td>DOMNAMEDNODEMAP</td>
</tr>
<tr>
<td>arg</td>
<td>The Node to be added using its NodeName attribute</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
**SETNODEVALUE Procedure**

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

*See Also:*  [DOMNode Subprograms on page 169-10](#)

**Syntax**

```sql
DBMS_XMLDOM.SETNODEVALUE(
    n IN DOMNODE,
    nodeValue IN VARCHAR2);
```

**Parameters**

*Table 169–125  SETNODEVALUE Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>nodeValue</td>
<td>The value to which node is set</td>
</tr>
</tbody>
</table>
The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 169-10

Syntax

This function returns an instance of the PL/SQL XMLBINARYOUTPUTSTREAM into which the caller can write the node value. The data type of the node must be RAW or BLOB – if not, an exception is raised.

```sql
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (n      IN     DOMNODE) RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl.BinaryInputStream` from which XDB reads data to populate the node. The data type of the node must be RAW or BLOB – if not an exception is raised.

```sql
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (n        in   DOMNODE, value    in   SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

Table 169–126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>BINARYINPUTSTREAM</td>
</tr>
</tbody>
</table>
SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 169-10

Syntax

This function returns an instance of the PL/SQL XMLCHARACTEROUTPUTSTREAM type into which the caller can write the node value. The data type of the node can be any valid XDB data type. If the type is not character or CLOB, the character data written to the stream is converted to the node data type. If the data type of the node is character or CLOB, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
    n        IN     DOMNODE)
RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;

Using this procedure, the application passes in an implementation of SYS.UTL_CHARACTERINPUTSTREAM from which XDB reads to populate the node. The data type of the node may be any valid type supported by XDB. If a non-character data type, the character data read from the stream is converted to the data type of the node. If the data type of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
    n        IN   DOMNODE,
    value    IN   SYS.UTL_CHARACTERINPUTSTREAM);

Parameters

Table 169–127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>CHARACTERINPUTSTREAM</td>
</tr>
</tbody>
</table>
SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

See Also: DOMNode Subprograms on page 169-10

Syntax

```
DBMS_XMLDOM.SETPREFIX(
    n       IN     DOMNODE,
    prefix  IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>prefix</td>
<td>The value for the namespace prefix of the node</td>
</tr>
</tbody>
</table>
SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 169-16

Syntax

DBMS_XMLDOM.SETSTANDALONE(
    doc IN DOMDOCUMENT,
    newvalue IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>newvalue</td>
<td>Value of the standalone property of the document</td>
</tr>
</tbody>
</table>
SETVALUE Procedure

This procedure sets the value of the attribute.

See Also: DOMAttr Subprograms on page 169-12

Syntax

```sql
DBMS_XMLDOM.SETVALUE(
    a IN DOMATTR,
    value IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>value</td>
<td>The value to which to set the attribute</td>
</tr>
</tbody>
</table>
SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 169–16

Syntax

DBMS_XMLDOM.SETVERSION(
    doc IN DOMDOCUMENT,
    version IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>version</td>
<td>The version of the document</td>
</tr>
</tbody>
</table>
SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

See Also: DOMText Subprograms on page 169-28

Syntax

DBMS_XMLDOM.SPLITTEXT(
    t        IN     DOMTEXT,
    offset   IN     NUMBER)
RETURN DOMText;

Parameters

Table 169–132 SPLITTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>DOMTEXT</td>
</tr>
<tr>
<td>offset</td>
<td>Offset at which to split</td>
</tr>
</tbody>
</table>
SUBSTRINGDATA Function

This function extracts a range of data from the node.

See Also: DOMCharacterData Subprograms on page 169-14

Syntax

```sql
DBMS_XMLDOM.SUBSTRINGDATA(
    cd        IN     DOMCHARACTERDATA,
    offset    IN     NUMBER,
    cnt       IN     NUMBER)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The starting offset of the data from which to get the data</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters (from the offset) of the data to get</td>
</tr>
</tbody>
</table>
USEBINARYSTREAM Function

This function returns TRUE if the data type of the node is RAW or BLOB so that the node value may be read or written using an UTL_BINARYINPUTSTREAM or UTL_BINARYOUTPUTSTREAM. If a value of FALSE is returned, the node value may only be accessed through an UTL_CHARACTERINPUTSTREAM or UTL_CHARACTEROUTPUTSTREAM.

See Also: DOMNode Subprograms on page 169-10

Syntax

```sql
DBMS_XMLDOM.USEBINARYSTREAM (n        IN     DOMNODE)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
WRITETOBUFFER Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: DOMNode Subprograms on page 169-10):

```sql
DBMS_XMLDOM.WRITETOBUFFER(
    n        IN      DOMNODE,
    buffer   IN OUT  VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: DOMDocument Subprograms on page 169-16):

```sql
DBMS_XMLDOM.WRITETOBUFFER(
    doc       IN      DOMDOCUMENT,
    buffer    IN OUT  VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: DOMDocumentFragment Subprograms on page 169-18):

```sql
DBMS_XMLDOM.WRITETOBUFFER(
    df        IN      DOMDOCUMENTFRAGMENT,
    buffer    IN OUT  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer to which to write</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>df</td>
<td>DOM document fragment</td>
</tr>
</tbody>
</table>
WRITETOCLOB Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified CLOB using the database character set (See Also: DOMNode Subprograms on page 169-10):

```sql
DBMS_XMLDOM.WRITETOCLOB(
    n IN DOMNODE,
    cl IN OUT CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: DOMDocument Subprograms on page 169-16):

```sql
DBMS_XMLDOM.WRITETOCLOB(
    doc IN DOMDOCUMENT,
    cl IN OUT CLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB to which to write</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
**WRITETOFILE Procedures**

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

**Syntax**

**Writes XML node to specified file using the database character set (See Also: DOMNode Subprograms):**

```
DBMS_XMLDOM.WRITETOFILE(
    n          IN      DOMNODE,
    fileName   IN      VARCHAR2);
```

**Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: DOMNode Subprograms):**

```
DBMS_XMLDOM.WRITETOFILE(
    n          IN      DOMNODE,
    fileName   IN      VARCHAR2,
    charset    IN      VARCHAR2);
```

**Writes an XML document to a specified file using database character set (See Also: DOMDocument Subprograms):**

```
DBMS_XMLDOM.WRITETOFILE(
    doc        IN   DOMDOCUMENT,
    filename   IN   VARCHAR2);
```

**Writes an XML document to a specified file using specified character set (See Also: DOMDocument Subprograms):**

```
DBMS_XMLDOM.WRITETOFILE(
    doc        IN   DOMDOCUMENT,
    fileName   IN   VARCHAR2,
    charset    IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>fileName</td>
<td>File to which to write</td>
</tr>
<tr>
<td>charset</td>
<td>specified character set</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>charset</td>
<td>Character set</td>
</tr>
</tbody>
</table>
The DBMS_XMLGEN package converts the results of a SQL query to a canonical XML format. The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a CLOB. This package is similar to the DBMS_XMLQUERY package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- Summary of DBMS_XMLGEN Subprograms

See Also: Oracle XML DB Developer's Guide, for more information on XML support and on examples of using DBMS_XMLGEN
### Summary of DBMS_XMLGEN Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>

<td>Sets the number of rows to skip every time before generating the XML</td>
</tr>
<tr>
<td>USEITEMTAGSFORCOLL Procedure on page 170-16</td>
<td>Forces the use of the collection column name appended with the tag _ITEM for collection elements</td>
</tr>
<tr>
<td>USENULLATTRIBUTEINDICATOR Procedure on page 170-17</td>
<td>Specified weather to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document</td>
</tr>
</tbody>
</table>
CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (
    ctx IN ctxHandle);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle to close.</td>
</tr>
</tbody>
</table>
CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (
    xmlData IN VARCHAR2,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
    xmlData IN CLOB,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlData</td>
<td>The XML CLOB data to be encoded or decoded.</td>
</tr>
<tr>
<td>flag</td>
<td>The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.</td>
</tr>
</tbody>
</table>

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character < is &lt;. Unescaping is the reverse transformation.
GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML. Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (  
    ctx  IN    ctxHandle)  
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the NEWCONTEXT Functions call on page 170-8.</td>
</tr>
</tbody>
</table>

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.
GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It
appends the XML document to the CLOB passed in. Use this version of GETXML
Functions to avoid any extra CLOB copies and to reuse the same CLOB for subsequent
calls. Because of the CLOB reuse, this GETXML Functions call is potentially more
efficient:

```sql
DBMS_XMLGEN.GETXML (  
    ctx          IN ctxHandle,  
    tmpclob      IN OUT NCOPY CLOB,  
    dtdOrSchema  IN number := NONE)  
RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary
CLOB obtained from this function must be freed using the DBMS_LOB.FREETEMPORARY call:

```sql
DBMS_XMLGEN.GETXML (  
    ctx          IN ctxHandle,  
    dtdOrSchema  IN number := NONE)  
RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML
as a temporary CLOB, which must be subsequently freed using the DBMS_LOB.FREETEMPORARY call:

```sql
DBMS_XMLGEN.GETXML (  
    sqlQuery     IN VARCHAR2,  
    dtdOrSchema  IN number := NONE)  
RETURN CLOB;
```

Parameters

Table 170–5  GETXML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the newContext call.</td>
</tr>
<tr>
<td>tmpclob</td>
<td>The CLOB to which the XML document is appended.</td>
</tr>
<tr>
<td>sqlQuery</td>
<td>The SQL query string.</td>
</tr>
<tr>
<td>dtdOrSchema</td>
<td>Generate a DTD or a schema? Only NONE is supported.</td>
</tr>
</tbody>
</table>

Usage Notes

When the rows indicated by the SETSKIPROWS Procedure call are skipped, the
maximum number of rows as specified by the SETMAXROWS Procedure call (or the
entire result if not specified) is fetched and converted to XML. Use the
GETNUMROWSPROCESSED Function to check if any rows were retrieved.
GETXMLTYPE Functions

This function gets the XML document and returns it as an XMLTYPE. XMLTYPE operations can be performed on the results.

This function is overloaded.

Syntax

Generates the XML document and returns it as a sys.XMLType:

```sql
DBMS_XMLGEN.GETXMLTYPE (  
    ctx           IN ctxhandle,  
    dtdOrSchema   IN number := NONE)  
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a sys.XMLType:

```sql
DBMS_XMLGEN.GETXMLTYPE (  
    sqlQuery     IN VARCHAR2,  
    dtdOrSchema  IN number := NONE)  
RETURN sys.XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the newContext call.</td>
</tr>
<tr>
<td>sqlQuery</td>
<td>The SQL query string.</td>
</tr>
<tr>
<td>dtdOrSchema</td>
<td>Generate a DTD or a schema? Only NONE is supported.</td>
</tr>
</tbody>
</table>
NEWCONTEXT Functions

This function generates and returns a new context handle. This context handle is used in GETXML Functions and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (
    query     IN VARCHAR2)
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (
    queryString  IN SYS_REFCURSOR)
RETURN ctxHandle;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>The query, in the form of a VARCHAR, the result of which must be converted to XML.</td>
</tr>
<tr>
<td>queryString</td>
<td>The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.</td>
</tr>
</tbody>
</table>
**RESTARTQUERY Procedure**

This procedure restarts the query and generates the XML from the first row. It can be used to start executing the query again, without having to create a new context.

**Syntax**

```sql
DBMS_XMLGEN.RESTARTQUERY (
   ctx  IN ctxHandle);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the current query.</td>
</tr>
</tbody>
</table>
SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to &lt;. The default is to perform conversions. This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, ", ’, which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS(
  ctx IN ctxHandle,
  conv IN BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from one of the NEWCONTEXT Functions call on page 170-8.</td>
</tr>
<tr>
<td>conv</td>
<td>TRUE indicates that conversion is needed.</td>
</tr>
</tbody>
</table>
SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call. It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the maxrows parameter.

Syntax

```sql
DBMS_XMLGEN.SETMAXROWS (  
ctx IN ctxHandle,  
maxRows IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>maxRows</td>
<td>The maximum number of rows to get for each call to GETXML Functions</td>
</tr>
</tbody>
</table>
SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the flag parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(
    ctx  IN ctx,
    flag IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>flag</td>
<td>The NULL handling option set.</td>
</tr>
<tr>
<td></td>
<td>■ DROP_NULLS CONSTANT NUMBER:= 0; (Default)</td>
</tr>
<tr>
<td></td>
<td>Leaves out the tag for NULL elements.</td>
</tr>
<tr>
<td></td>
<td>■ NULL_ATTR CONSTANT NUMBER:= 1; Sets</td>
</tr>
<tr>
<td></td>
<td>xsi:nil=&quot;true&quot;.</td>
</tr>
<tr>
<td></td>
<td>■ EMPTY_TAG CONSTANT NUMBER:= 2; Sets, for</td>
</tr>
<tr>
<td></td>
<td>example, &lt;foo/&gt;.</td>
</tr>
</tbody>
</table>
**SETROWSETTAG Procedure**

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

**Syntax**

```sql
DBMS_XMLGEN.SETROWSETTAG (ctx IN ctxHandle,
rowSetTagName IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the NEWCONTEXT Functions call on page 170-8.</td>
</tr>
<tr>
<td>rowSetTagName</td>
<td>The name of the document element. Passing NULL indicates that you do not want the ROWSET element present.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The user can set the `rowSetTag` to NULL to suppress the printing of this element. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.
SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is ROW.

Syntax

```sql
DBMS_XMLGEN.SETROWTAG (
    ctx         IN ctxHandle,
    rowTagName  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the NEWCONTEXT Functions call on page 170-8.</td>
</tr>
<tr>
<td>rowTagName</td>
<td>The name of the ROW element. Passing NULL indicates that you do not want the ROW element present.</td>
</tr>
</tbody>
</table>

Usage Notes

The user can set the name of the element to NULL to suppress the ROW element itself. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.
SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility. For example, when generating the first page of XML or HTML data, set skiprows to zero. For the next set, set the skiprows to the number of rows obtained in the first case. See GETNUMROWSPROCESSED Function on page 170-5.

Syntax

DBMS_XMLGEN.SETSKIPROWS {
    ctx IN ctxHandle,
    skipRows IN NUMBER};

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>skipRows</td>
<td>The number of rows to skip for each call to getXML.</td>
</tr>
</tbody>
</table>
USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```sql
DBMS_XMLGEN.USEITEMTAGSFORCOLL (  
   ctx  IN ctxHandle);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle.</td>
</tr>
</tbody>
</table>

Usage Notes

Using this procedure, you can override the default to use the name of the column with the _ITEM tag appended to it. If there is a collection of NUMBER, the default tag name for the collection elements is NUMBER.
USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document. It is used as a shortcut for the SETNULLHANDLING Procedure.

Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(
ctx IN ctxType,
attrind IN BOOLEAN := TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>Context handle.</td>
</tr>
<tr>
<td>attrind</td>
<td>Use attribute to indicate NULL?</td>
</tr>
</tbody>
</table>
The DBMS_XMLINDEX package provides an interface to implement asynchronous indexing.

**See Also:** *Oracle XML DB Developer’s Guide* for more information about "XMLIndex"

This chapter contains the following topics:

- Using DBMS_XMLINDEX
  - Overview
- Summary of DBMS_XMLINDEX Subprograms
Using DBMS_XMLINDEX

- Overview
Overview

Asynchronous Index Maintenance
The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a convenient time, for example to a time when the load on the database is low. Thus a mechanism for asynchronous index maintenance is provided.
Summary of DBMS_XMLINDEX Subprograms

This table list the package subprograms in alphabetical order.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEDATEINDEX Procedure on page 171-5</td>
<td>Creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex</td>
</tr>
<tr>
<td>CREATENUMBERINDEX Procedure on page 171-6</td>
<td>Creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex</td>
</tr>
<tr>
<td>DROPPARAMETER Procedure on page 171-7</td>
<td>Drops the XMLIndex parameter string that is associated with a given parameter identifier.</td>
</tr>
<tr>
<td>MODIFYPARAMETER Procedure on page 171-8</td>
<td>Modifies the XMLIndex parameter string that is associated with a given parameter name.</td>
</tr>
<tr>
<td>REGISTERPARAMETER Procedure on page 171-9</td>
<td>Registers a parameter string and XMLIndex parameter string pair in XDB.</td>
</tr>
<tr>
<td>SYNCINDEX Procedure on page 171-10</td>
<td>Synchronizes the index manually.</td>
</tr>
</tbody>
</table>
CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date_index_clause to be set to an empty string.

Syntax

```sql
DBMS_XMLINDEX.CREATEDATEINDEX  (
    xml_index_schema   IN   VARCHAR2,
    xml_index_name     IN   VARCHAR2,
    date_index_name    IN   VARCHAR2,
    xmltypename        IN   VARCHAR2,
    date_index_clause  IN   VARCHAR2);

DBMS_XMLINDEX.CREATEDATEINDEX  (
    xml_index_schema   IN   VARCHAR2
    xml_index_name     IN   VARCHAR2,
    date_index_name    IN   VARCHAR2,
    xmltypename        IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_index_name</td>
<td>Name of the XMLIndex</td>
</tr>
<tr>
<td>date_index_name</td>
<td>Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema</td>
</tr>
<tr>
<td>xmltypename</td>
<td>The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.</td>
</tr>
<tr>
<td>date_index_clause</td>
<td>Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index</td>
</tr>
</tbody>
</table>
CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the \texttt{VALUE} column of a \texttt{PATH TABLE} which is the storage table of an XMLIndex.

Syntax

```sql
DBMS_XMLINDEX.CREATENUMBERINDEX (  
  xml_index_schema   IN   VARCHAR2,
  xml_index_name     IN   VARCHAR2,
  num_index_name     IN   VARCHAR2,
  num_index_clause   IN   VARCHAR2,
  xmltypename        IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_index_name</td>
<td>Name of the XMLIndex</td>
</tr>
<tr>
<td>num_index_name</td>
<td>Name of the secondary index to be created for number values in the \texttt{VALUE} column of the \texttt{PATH TABLE} of XMLIndex named \texttt{xml_index_name} and owned by \texttt{xml_index_schema}</td>
</tr>
<tr>
<td>num_index_clause</td>
<td>Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index.</td>
</tr>
<tr>
<td>xmltypename</td>
<td>The type to which values in the \texttt{VALUE} column of the path table are to be cast. Acceptable values are the following strings: \texttt{FLOAT}, \texttt{DOUBLE}, \texttt{DECIMAL}, \texttt{INTEGER}, \texttt{NONPOSITIVEINTEGER}, \texttt{NEGATIVEINTEGER}, \texttt{LONG}, \texttt{INT}, \texttt{SHORT}, \texttt{BYTE}, \texttt{NONNEGATIVEINTEGER}, \texttt{UNSIGNEDLONG}, \texttt{UNSIGNEDINT}, \texttt{UNSIGNEDSHORT}, \texttt{UNSIGNEDBYTE}, \texttt{POSITIVEINTEGER}.</td>
</tr>
</tbody>
</table>
DROPPARAMETER Procedure

This procedure drops the XMLIndex parameter string that is associated with a given parameter identifier.

Syntax

DBMS_XMLINDEX.DROPPARAMETER (  
    name        IN      VARCHAR2);

Parameters

Table 171–4  DROPPARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Identifier for parameter string</td>
</tr>
</tbody>
</table>

Examples

DBMS_XMLINDEX.DROPPARAMETER (  
    'myIndexParam');
MODIFYPARAMETER Procedure

This procedure modifies the XMLIndex parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (  
    name        IN      VARCHAR2,  
    parameter   IN      CLOB);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Identifier for parameter string</td>
</tr>
<tr>
<td>parameter</td>
<td>XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement</td>
</tr>
</tbody>
</table>

Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (  
    'myIndexParam',  
    'PATH TABLE po_ptab  
        PATH ID INDEX po_pidx  
        PATH ID INDEX po_pidx  
        ORDER KEY INDEX po_oidx  
        VALUE INDEX po_vidx');  
```
REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

Syntax

`DBMS_XMLINDEX.REGISTERPARAMETER (    name        IN      VARCHAR2,    parameter   IN      CLOB);`

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Identifier for parameter string</td>
</tr>
<tr>
<td>parameter</td>
<td>XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement</td>
</tr>
</tbody>
</table>

Examples

SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex. It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

Syntax

```sql
DBMS_XMLINDEX.SYNCINDEX (
    xml_index_schema      IN VARCHAR2,
    xml_index_name        IN VARCHAR2,
    partition_name        IN VARCHAR2 DEFAULT NULL,
    reindex               IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_schema_name</td>
<td>Name of the XMLIndex</td>
</tr>
<tr>
<td>partition_name</td>
<td>[Currently not supported]</td>
</tr>
<tr>
<td>reindex</td>
<td>Default is FALSE. If set to TRUE, this drops the secondary indexes and recreates them later so that they can be bulkloaded.</td>
</tr>
</tbody>
</table>

Examples

```sql
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```
Using `DBMS_XMLPARSER`, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- Summary of `DBMS_XMLPARSER` Subprograms

### Summary of DBMS_XMLPARSER Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREEPARSER on page 172-3</td>
<td>Frees a parser object.</td>
</tr>
<tr>
<td>GETDOCTYPE on page 172-4</td>
<td>Gets parsed DTD.</td>
</tr>
<tr>
<td>GETDOCUMENT on page 172-5</td>
<td>Gets DOM document.</td>
</tr>
<tr>
<td>GETRELEASEVERSION on page 172-5</td>
<td>Returns the release version of Oracle XML Parser for PL/SQL.</td>
</tr>
<tr>
<td>GETVALIDATIONMODE on page 172-7</td>
<td>Returns validation mode.</td>
</tr>
<tr>
<td>NEWPARSER on page 172-8</td>
<td>Returns a new parser instance</td>
</tr>
<tr>
<td>PARSE on page 172-9</td>
<td>Parses XML stored in the given url/file.</td>
</tr>
<tr>
<td>PARSEBUFFER on page 172-10</td>
<td>Parses XML stored in the given buffer</td>
</tr>
<tr>
<td>PARSECLOB on page 172-10</td>
<td>Parses XML stored in the given clob</td>
</tr>
<tr>
<td>PARSEDTD on page 172-12</td>
<td>Parses DTD stored in the given url/file</td>
</tr>
<tr>
<td>PARSEDTDDBUFFER on page 172-13</td>
<td>Parses DTD stored in the given buffer</td>
</tr>
<tr>
<td>PARSEDTDTCLOB on page 172-14</td>
<td>Parses DTD stored in the given clob</td>
</tr>
<tr>
<td>SETBASEDIR on page 172-15</td>
<td>Sets base directory used to resolve relative URLs.</td>
</tr>
<tr>
<td>SETDOCTYPE on page 172-16</td>
<td>Sets DTD.</td>
</tr>
<tr>
<td>SETERRORLOG on page 172-17</td>
<td>Sets errors to be sent to the specified file</td>
</tr>
<tr>
<td>SETPRESERVEWHITESPACE on page 172-18</td>
<td>Sets white space preserve mode</td>
</tr>
<tr>
<td>SETVALIDATIONMODE on page 172-19</td>
<td>Sets validation mode.</td>
</tr>
<tr>
<td>SHOWWARNINGS on page 172-20</td>
<td>Turns warnings on or off.</td>
</tr>
</tbody>
</table>
FREEPARSER

Frees a parser object.

Syntax

PROCEDURE freeParser(
   p Parser);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>
Returns the parsed DTD; this function must be called only after a DTD is parsed.

**Syntax**

```sql
FUNCTION getDoctype(
p  Parser)
RETURN DOMDocumentType;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>
GETDOCUMENT

Returns the document node of a DOM tree document built by the parser; this function must be called only after a document is parsed.

Syntax

FUNCTION GETDOCUMENT(
p Parser)
RETURN DOMDocument;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>
GETRELEASEVERSION

Returns the release version of the Oracle XML parser for PL/SQL.

Syntax

FUNCTION getReleaseVersion
RETURN VARCHAR2;
GETVALIDATIONMODE

Retrieves validation mode; TRUE for validating, FALSE otherwise.

Syntax

FUNCTION GETVALIDATIONMODE(
p Parser)
RETURN BOOLEAN;

Parameter | IN / OUT | Description
----------|---------|------------
p         | (IN)    | Parser instance.
NEWPARSER

Returns a new parser instance. This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

**Syntax**

```plaintext
FUNCTION newParser
RETURN Parser;
```
PARSE

Parses XML stored in the given URL or file. An application error is raised if parsing fails. There are several versions of this method.

**Syntax Description**

**FUNCTION parse(url VARCHAR2)**

*Returns the built DOM Document.*

This is meant to be used when the default parser behavior is acceptable and just a url/file needs to be parsed.

**PROCEDURE parse(p Parser, url VARCHAR2);**

Any changes to the default parser behavior should be effected before calling this procedure.

**Parameter** | **IN / OUT** | **Description**
---|---|---
url | (IN) | Complete path of the url/file to be parsed.
p | (IN) | Parser instance.
PARSEBUFFER

Parses XML stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSEBUFFER(
  p  Parser,
  doc VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>doc</td>
<td>(IN)</td>
<td>XML document buffer to parse.</td>
</tr>
</tbody>
</table>

PARSECLOB

Parses XML stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSECLOB(
    p   Parser,
    doc CLOB);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>doc</td>
<td>(IN)</td>
<td>XML document buffer to parse.</td>
</tr>
</tbody>
</table>
PARSEDDTD

PARSEDDTD

Parses the DTD stored in the given URL or file. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSEDTD(
p   Parser,
url  VARCHAR2,
root VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>url</td>
<td>(IN)</td>
<td>Complete path of the URL or file to be parsed.</td>
</tr>
<tr>
<td>root</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>
PARSEDTDDBUFFER

Parses the DTD stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

**Syntax**

```
PROCEDURE PARSEDTDDBUFFER(
  p    Parser,
  dtd  VARCHAR2,
  root VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dtd</td>
<td>(IN)</td>
<td>DTD buffer to parse.</td>
</tr>
<tr>
<td>root</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>
PARSEDTDCL0B

Parses the DTD stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSEDTDCL0B(
    p    Parser,
    dtd  CLOB,
    root VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dtd</td>
<td>(IN)</td>
<td>DTD Clob to parse.</td>
</tr>
<tr>
<td>root</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>
SETBASEDIR

Sets base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

```sql
PROCEDURE setBaseDir(
  p Parser,
  dir VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dir</td>
<td>(IN)</td>
<td>Directory used as a base directory.</td>
</tr>
</tbody>
</table>
Sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

**Syntax**

```plsql
PROCEDURE setDoctype(
  p   Parser,
  dtd DOMDocumentType);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dtd</td>
<td>(IN)</td>
<td>DTD to set.</td>
</tr>
</tbody>
</table>
SETErrorLog

Sets errors to be sent to the specified file.

Syntax
PROCEDURE setErrorLog(
p    Parser,
fileName VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>fileName</td>
<td>(IN)</td>
<td>Complete path of the file to use as the error log.</td>
</tr>
</tbody>
</table>
Sets whitespace preserving mode.

**Syntax**

```lisp
PROCEDURE setPreserveWhitespace(
p  Parser,
yes BOOLEAN);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>yes</td>
<td>(IN)</td>
<td>Mode to set: TRUE - preserve, FALSE - don’t preserve.</td>
</tr>
</tbody>
</table>
SETVALIDATIONMODE

Sets validation mode.

Syntax
PROCEDURE setValidationMode{
p    Parser,
yes BOOLEAN};

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>yes</td>
<td>(IN)</td>
<td>Mode to set: TRUE - validate, FALSE - don’t validate.</td>
</tr>
</tbody>
</table>
SHOWWARNINGS

Turns warnings on or off.

Syntax
PROCEDURE showWarnings(
p    Parser,
yes BOOLEAN);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>yes</td>
<td>(IN)</td>
<td>Mode to set: TRUE - show warnings, FALSE - don't show warnings.</td>
</tr>
</tbody>
</table>
DBMS_XMLQUERY provides database-to-XMLType functionality. Whenever possible, use DBMS_XMLGEN, a built-in package in C, instead of DBMS_XMLQUERY.

## Constants

**Table 173–1 Constants of DBMS_XMLQUERY**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB_ENCODING</td>
<td>Used to signal that the DB character encoding is to be used.</td>
</tr>
<tr>
<td>DEFAULT_ROWSETTAG</td>
<td>The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET.</td>
</tr>
<tr>
<td>DEFAULT_ERRORTAG</td>
<td>The default tag to enclose raised errors -- ERROR.</td>
</tr>
<tr>
<td>DEFAULT_ROWIDATTR</td>
<td>The default name for the cardinality attribute of XML elements corresponding to <code>db.records</code> -- NUM.</td>
</tr>
<tr>
<td>DEFAULT_ROWTAG</td>
<td>The default tag name for the element corresponding to <code>db.records</code> -- ROW.</td>
</tr>
<tr>
<td>DEFAULT_DATE_FORMAT</td>
<td>Default date mask -- 'MM/dd/yyyy HH:mm:ss'.</td>
</tr>
<tr>
<td>ALL_ROWS</td>
<td>Indicates that all rows are needed in the output.</td>
</tr>
<tr>
<td>NONE</td>
<td>Used to specifies that the output should not contain any XML metadata (for example, no DTD).</td>
</tr>
<tr>
<td>DTD</td>
<td>Used to specify that the generation of the DTD is desired.</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>Used to specify that the generation of the XML Schema is desired.</td>
</tr>
<tr>
<td>LOWER_CASE</td>
<td>Use lower case tag names.</td>
</tr>
<tr>
<td>UPPER_CASE</td>
<td>Use upper case tag names.</td>
</tr>
</tbody>
</table>
## Types

**Table 173–2  Types of DBMS_XMLQUERY**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxType</td>
<td>The type of the query context handle. This is the return type of NEWCONTEXT</td>
</tr>
</tbody>
</table>
### Summary of DBMS_XMLQUERY Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOSECONTEXT</td>
<td>Closes or deallocates a particular query context.</td>
</tr>
<tr>
<td>GETDTD</td>
<td>Generates the DTD.</td>
</tr>
<tr>
<td>GETEXCEPTIONCONTENT</td>
<td>Returns the thrown exception’s error code and error message.</td>
</tr>
<tr>
<td>GETNUMROWSPROCESSED</td>
<td>Returns the number of rows processed for the query.</td>
</tr>
<tr>
<td>GETVERSION</td>
<td>Prints the version of the XSU in use.</td>
</tr>
<tr>
<td>GETXML</td>
<td>Generates the XML document.</td>
</tr>
<tr>
<td>NEWCONTEXT</td>
<td>Creates a query context and it returns the context handle.</td>
</tr>
<tr>
<td>PROPAGATEORIGINALEXCEPTION</td>
<td>Tells the XSU that if an exception is raised, and is being thrown, the XSU</td>
</tr>
<tr>
<td></td>
<td>should throw the very exception raised; rather then, wrapping it with an</td>
</tr>
<tr>
<td></td>
<td>OracleXMLSQLException.</td>
</tr>
<tr>
<td>REMOVEXSLTPARAM</td>
<td>Removes a particular top-level stylesheet parameter.</td>
</tr>
<tr>
<td>SETBINDVALUE</td>
<td>Sets a value for a particular bind name.</td>
</tr>
<tr>
<td>SETCOLLIDATTRNAME</td>
<td>Sets the name of the id attribute of the collection element’s separator tag.</td>
</tr>
<tr>
<td>SETDATAHEADER</td>
<td>Sets the XML data header.</td>
</tr>
<tr>
<td>SETDATEFORMAT</td>
<td>Sets the format of the generated dates in the XML document.</td>
</tr>
<tr>
<td>SETENCODINGTAG</td>
<td>Sets the encoding processing instruction in the XML document.</td>
</tr>
<tr>
<td>SETERRORORTAG</td>
<td>Sets the tag to be used to enclose the XML error documents.</td>
</tr>
<tr>
<td>SETMAXROWS</td>
<td>Sets the maximum number of rows to be converted to XML.</td>
</tr>
<tr>
<td>SETMETAHEADER</td>
<td>Sets the XML meta header.</td>
</tr>
<tr>
<td>SETRAISEEXCEPTION</td>
<td>Tells the XSU to throw the raised exceptions.</td>
</tr>
<tr>
<td>SETRAISENOROWSEXCEPTION</td>
<td>Tells the XSU to throw or not to throw an OracleXMLNoRowsException in the</td>
</tr>
<tr>
<td></td>
<td>case when for one reason or another, the XML document generated is empty.</td>
</tr>
<tr>
<td>SETROWIDATTRNAME</td>
<td>Sets the name of the id attribute of the row enclosing tag.</td>
</tr>
<tr>
<td>SETROWIDATTRVALUE</td>
<td>Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.</td>
</tr>
<tr>
<td>SETROWSETTAG</td>
<td>Sets the tag to be used to enclose the XML dataset.</td>
</tr>
<tr>
<td>SETROWTAG</td>
<td>Sets the tag to be used to enclose the XML element.</td>
</tr>
</tbody>
</table>
### Table 173–3  (Cont.) DBMS_XMLQUERY Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SETSKIPROWS on page 173-30</td>
<td>Sets the number of rows to skip.</td>
</tr>
<tr>
<td>SETSQLTOXMLNAMEESCAPING on page 173-31</td>
<td>This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.</td>
</tr>
<tr>
<td>SETSTYLESCHEETHEADER on page 173-32</td>
<td>Sets the stylesheet header.</td>
</tr>
<tr>
<td>SETTAGCASE on page 173-33</td>
<td>Specified the case of the generated XML tags.</td>
</tr>
<tr>
<td>SETXSLT on page 173-34</td>
<td>Registers a stylesheet to be applied to generated XML.</td>
</tr>
<tr>
<td>SETXSLTPARAM on page 173-35</td>
<td>Sets the value of a top-level stylesheet parameter.</td>
</tr>
<tr>
<td>USENULLATTRIBUTEINDICATOR on page 173-36</td>
<td>Specifies weather to use an XML attribute to indicate NULLness.</td>
</tr>
<tr>
<td>USETYPEFORCOLLELEMTAG on page 173-37</td>
<td>Tells the XSU to use the collection element's type name as the collection element tag name.</td>
</tr>
</tbody>
</table>
CLOSECONTEXT

Closes or deallocates a particular query context

Syntax

PROCEDURE CLOSECONTEXT(
ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

**Syntax**

<table>
<thead>
<tr>
<th>FUNCTION GETDTD(</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl IN ctxType,</td>
<td>Function that generates the DTD based on the SQL query used to initialize the context.</td>
</tr>
<tr>
<td>withVer IN BOOLEAN := false)</td>
<td></td>
</tr>
<tr>
<td>RETURN CLOB;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>PROCEDURE GETDTD(</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl IN ctxType,</td>
<td>Procedure that generates the DTD based on the SQL query used to initialize the context; specifies the output CLOB for XML document result.</td>
</tr>
<tr>
<td>xDoc IN CLOB,</td>
<td></td>
</tr>
<tr>
<td>withVer IN BOOLEAN := false);</td>
<td></td>
</tr>
</tbody>
</table>

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>withVer</td>
<td>(IN)</td>
<td>Generate the version information? TRUE for yes.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>CLOB into which to write the generated XML document.</td>
</tr>
</tbody>
</table>
GETEXCEPTIONCONTENT

Returns the thrown exception's SQL error code and error message through the procedure's OUT parameters. This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

**Syntax**

```sql
PROCEDURE GETEXCEPTIONCONTENT(
    ctxHdl IN ctxType,
    errNo OUT NUMBER,
    errMsg OUT VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>errNo</td>
<td>(OUT)</td>
<td>Error number.</td>
</tr>
<tr>
<td>errMsg</td>
<td>(OUT)</td>
<td>Error message.</td>
</tr>
</tbody>
</table>
GETNUMROWSPROCESSED

Return the number of rows processed for the query.

Syntax

FUNCTION GETNUMROWSPROCESSED(
ctxHdl IN ctxType)
RETURN NUMBER;

Parameter IN / OUT Description
ctxHdl (IN) Context handle.
GETVERSION

Prints the version of the XSU in use.

**Syntax**

PROCEDURE GETVERSION();
**GETXML**

Creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context doesn’t have to be explicitly opened or closed. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| FUNCTION GETXML(  
  sqlQuery IN VARCHAR2,  
  metaType IN NUMBER := NONE)  
RETURN CLOB; | This function uses a SQL query in string form. |
| FUNCTION GETXML(  
  sqlQuery IN CLOB,  
  metaType IN NUMBER := NONE)  
RETURN CLOB; | This function uses a SQL query in CLOB form. |
| FUNCTION GETXML(  
  ctxHdl IN ctxType,  
  metaType IN NUMBER := NONE)  
RETURN CLOB; | This function generates the XML document based on a SQL query used to initialize the context. |
| PROCEDURE GETXML(  
  ctxHdl IN ctxType,  
  xDoc IN CLOB,  
  metaType IN NUMBER := NONE); | This procedure generates the XML document based on the SQL query used to initialize the context. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>metaType</td>
<td>(IN)</td>
<td>XML metadata type (NONE, DTD, or SCHEMA).</td>
</tr>
<tr>
<td>sqlQuery</td>
<td>(IN)</td>
<td>SQL query.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>CLOB into which to write the generated XML document.</td>
</tr>
</tbody>
</table>
NEWCONTEXT

Creates a query context and it returns the context handle. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION NEWCONTEXT (sqlQuery IN VARCHAR2) RETURN ctxType;</td>
<td>Creates a query context from a string.</td>
</tr>
<tr>
<td>FUNCTION NEWCONTEXT (sqlQuery IN CLOB) RETURN ctxType;</td>
<td>Creates a query context from a CLOB.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlQuery</td>
<td>(IN)</td>
<td>SQL query, the results of which to convert to XML.</td>
</tr>
</tbody>
</table>
PROPAGATEORIGINALEXCEPTION

Specifies whether to throw every original exception raised or to wrap it in an OracleXMLSQLException.

Syntax

PROCEDURE PROPAGATEORIGINALEXCEPTION(
    ctxHdl IN ctxType,
    flag IN BOOLEAN);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>TRUE if want to propagate original exception, FALSE to wrap in OracleXMLException.</td>
</tr>
</tbody>
</table>
REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

Syntax

PROCEDURE REMOVEXSLTPARAM(
  ctxHdl IN ctxType,
  name IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Name of the top level stylesheet parameter.</td>
</tr>
</tbody>
</table>
Sets a value for a particular bind name.

**Syntax**

```plsql
PROCEDURE SETBINDVALUE(
  ctxHdl IN ctxType,
  bindName IN VARCHAR2,
  bindValue IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>bindName</td>
<td>(IN)</td>
<td>Bind name.</td>
</tr>
<tr>
<td>bindValue</td>
<td>(IN)</td>
<td>Bind value.</td>
</tr>
</tbody>
</table>
**SETCOLLIDATTRNAME**

Sets the name of the id attribute of the collection element's separator tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

**Syntax**

```sql
PROCEDURE SETCOLLIDATTRNAME(
  ctxHdl IN ctxType,
  attrName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>attrName</td>
<td>(IN)</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>
Sets the XML data header. The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the rowset. The two entities are enclosed by the docTag argument. The last data header specified is used. Passing in NULL for the header parameter unsets the data header.

**Syntax**

```plsql
PROCEDURE SETDATAHEADER(
  ctxHdl IN ctxType,
  header IN CLOB := null,
  tag IN VARCHAR2 := null);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>header</td>
<td>(IN)</td>
<td>Header.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag used to enclose the data header and the rowset.</td>
</tr>
</tbody>
</table>
SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the java.text.SimpleDateFormat class. Setting the mask to NULL or an empty string sets the default mask -- DEFAULT_DATE_FORMAT.

**Syntax**

PROCEDURE SETDATEFORMAT(
  ctxHdl IN ctxType,
  mask IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>mask</td>
<td>(IN)</td>
<td>The date mask.</td>
</tr>
</tbody>
</table>
SETS the encoding processing instruction in the XML document.

**Syntax**

```sql
PROCEDURE SETENCODINGTAG(
    ctxHdl IN ctxType,
    enc IN VARCHAR2 := DB_ENCODING);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>enc</td>
<td>(IN)</td>
<td>The encoding to use.</td>
</tr>
</tbody>
</table>
SETERRORTAG

Sets the tag to be used to enclose the XML error documents.

Syntax
PROCEDURE SETERRORTAG(
ctxHdl IN ctxType,
tag IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
SETMAXROWS

Sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

Syntax
PROCEDURE SETMAXROWS (  
ctxHdl IN ctxType,  
rows IN NUMBER);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>rows</td>
<td>(IN)</td>
<td>Maximum number of rows to generate.</td>
</tr>
</tbody>
</table>
SEMTMETAHEADER

Sets the XML meta header. When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in NULL for the header parameter unsets the meta header.

Syntax

PROCEDURE SETMETAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>Header</td>
<td>(IN)</td>
<td>Header.</td>
</tr>
</tbody>
</table>
SETRAISEEXCEPTION

Specifies whether to throw raised exceptions. If this call isn’t made or if FALSE is passed to the flag argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

Syntax

```
PROCEDURE SETRAISEEXCEPTION(
  ctxHdl IN ctxType,
  flag IN BOOLEAN:=true);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Throw raised exceptions? TRUE for yes, otherwise FALSE.</td>
</tr>
</tbody>
</table>
SETRAISENOROWSEXCEPTION

Specifies whether to throw an OracleXMLNoRowsException when the generated XML document is empty. By default, the exception is not thrown.

Syntax

PROCEDURE SETRAISENOROWSEXCEPTION(
  ctxHdl IN ctxType,
  flag IN BOOLEAN := false);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Throws an OracleXMLNoRowsException if set to TRUE.</td>
</tr>
</tbody>
</table>
SETS the name of the id attribute of the row enclosing tag. Passing NULL or an empty string for the tag causes the row id attribute to be omitted.

**Syntax**

```sql
PROCEDURE SETROWIDATTRNAME(
    ctxHdl IN ctxType,
    attrName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>attrName</td>
<td>(IN)</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>
SETROWIDATTRVALUE

Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag. Passing NULL or an empty string for the colName assigns the row count value (0, 1, 2 and so on) to the row id attribute.

Syntax
PROCEDURE SETROWIDATTRVALUE(
ctxHdl IN ctxType,
colName IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column whose value is to be assigned to the row id attribute.</td>
</tr>
</tbody>
</table>
Sets the tag to be used to enclose the XML dataset.

**Syntax**

```plsql
PROCEDURE SETROWSETTAG(
    ctxHdl IN ctxType,
    tag IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
SETROWTAG

Sets the tag to be used to enclose the XML element corresponding to a db.record.

Syntax

PROCEDURE SETROWTAG(
  ctxHdl IN ctxType,
  tag IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
SETSIPROWS

Sets the number of rows to skip. By default, 0 rows are skipped.

Syntax
PROCEDURE SETSKIPROWS(
  ctxHdl IN ctxType,
  rows IN NUMBER);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>rows</td>
<td>(IN)</td>
<td>Maximum number of rows to skip.</td>
</tr>
</tbody>
</table>
SETSQLTOXMLNAMEESCAPING

This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

**Syntax**

PROCEDURE SETSQLTOXMLNAMEESCAPING(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Turn on escaping? TRUE for yes, otherwise FALSE.</td>
</tr>
</tbody>
</table>
SETSTYLESHEETHEADER

Sets the stylesheet header (the stylesheet processing instructions) in the generated XML document. Passing NULL for the uri argument will unset the stylesheet header and the stylesheet type.

Syntax

PROCEDURE SETSTYLESHEETHEADER(
  ctxHdl IN ctxType,
  uri IN VARCHAR2,
  type IN VARCHAR2 := 'text/xsl');

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>Stylesheet URI.</td>
</tr>
<tr>
<td>type</td>
<td>(IN)</td>
<td>Stylesheet type; defaults to &quot;text/xsl&quot;.</td>
</tr>
</tbody>
</table>
SETTAGCASE

Sets the case of the generated XML tags.

**Syntax**

```plaintext
PROCEDURE SETTAGCASE(
    ctxHdl IN ctxType,
    tCase IN NUMBER);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tCase</td>
<td>(IN)</td>
<td>The tag's case:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 0 for as are</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 1 for lower case</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- 2 for upper case</td>
</tr>
</tbody>
</table>
Registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. The options are described in the following table. Passing `NULL` for the `uri` argument or an empty string for the `stylesheet` argument will unset the stylesheet header and type.

**Syntax**

```
PROCEDURE SETXSLT(
    ctxHdl IN ctxType,
    uri IN VARCHAR2,
    ref IN VARCHAR2 := null);
```

To un-register the stylesheet pass in a null for the `uri`.

```
PROCEDURE SETXSLT(
    ctxHdl IN ctxType,
    stylesheet CLOB,
    ref IN VARCHAR2 := null);
```

To un-register the stylesheet pass in a null or an empty string for the `stylesheet`.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ctxHdl</code></td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td><code>uri</code></td>
<td>(IN)</td>
<td>Stylesheet URI.</td>
</tr>
<tr>
<td><code>stylesheet</code></td>
<td>(IN)</td>
<td>Stylesheet.</td>
</tr>
<tr>
<td><code>ref</code></td>
<td>(IN)</td>
<td>URL to include, imported and external entities.</td>
</tr>
</tbody>
</table>
SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

Syntax

PROCEDURE SETXSLTPARAM(
  ctxHdl IN ctxType,
  name IN VARCHAR2,
  value IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Name of the top level stylesheet parameter.</td>
</tr>
<tr>
<td>value</td>
<td>(IN)</td>
<td>Value to be assigned to the stylesheet parameter.</td>
</tr>
</tbody>
</table>
USENULLATTRIBUTEINDICATOR

Specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

Syntax

PROCEDURE SETNULLATTRIBUTEINDICATOR(
  ctxHdl IN ctxType,
  flag IN BOOLEAN);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Sets attribute to NULL if TRUE, omits from XML document if FALSE.</td>
</tr>
</tbody>
</table>
USETYPEFORCOLLELEMTAG

Specifies whether to use the collection element's type name as its element tag name. By default, the tag name for elements of a collection is the collection's tag name followed by _item.

Syntax
PROCEDURE USETYPEFORCOLLELEMTAG(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Turn on use of the type name?</td>
</tr>
</tbody>
</table>
DBMS_XMLSAVE provides XML to database-type functionality.

## Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_ROWTAG</td>
<td>The default tag name for the element corresponding to database records -- ROW</td>
</tr>
<tr>
<td>DEFAULT_DATE_FORMAT</td>
<td>Default date mask: 'MM/dd/yyyy HH:mm:ss'</td>
</tr>
<tr>
<td>MATCH_CASE</td>
<td>Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.</td>
</tr>
<tr>
<td>IGNORE_CASE</td>
<td>Used to specify that when mapping XML elements to database entities the XSU should be case insensitive.</td>
</tr>
</tbody>
</table>
### Types

**Table 174–2** Types of DBMS_XMLSAVE

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxType</td>
<td>The type of the query context handle. This the return type of <strong>NEWCONTEXT</strong>.</td>
</tr>
</tbody>
</table>
## Summary of DBMS_XMLSAVE Subprograms

<table>
<thead>
<tr>
<th>Method</th>

<tr>
<td>SETXSLTPARAM on page 174-25</td>
<td>Sets the value of a top-level stylesheet parameter.</td>
</tr>
<tr>
<td>UPDATEXML on page 174-26</td>
<td>Updates the table given the XML document.</td>
</tr>
</tbody>
</table>
CLEARKEYCOLUMNLIST

Clears the key column list.

**Syntax**

```plsql
PROCEDURE clearKeyColumnList(
    ctxHdl IN ctxType);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
CLEARUPDATECOLUMNLIST

Clears the update column list.

**Syntax**

PROCEDURE clearUpdateColumnList(
    ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

PROCEDURE closeContext(
    ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted. The options are described in the following table.

### Syntax

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deleteXML(</td>
<td></td>
</tr>
<tr>
<td>ctxHdl IN ctxPType,</td>
<td></td>
</tr>
<tr>
<td>xDoc IN VARCHAR2)</td>
<td></td>
</tr>
<tr>
<td>RETURN NUMBER;</td>
<td></td>
</tr>
<tr>
<td>deleteXML(</td>
<td></td>
</tr>
<tr>
<td>ctxHdl IN ctxType,</td>
<td></td>
</tr>
<tr>
<td>xDoc IN CLOB)</td>
<td></td>
</tr>
<tr>
<td>RETURN NUMBER;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
Through its arguments, this method returns the thrown exception’s error code and error message, SQL error code. This is to get around the fact that the JVM throws an exception on top of whatever exception was raised; thus, rendering PL/SQL unable to access the original exception.

**Syntax**

```sql
PROCEDURE getExceptionContent(
    ctxHdl IN ctxType,
    errNo OUT NUMBER,
    errMsg OUT VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>errNo</td>
<td>(IN)</td>
<td>Error number.</td>
</tr>
<tr>
<td>errMsg</td>
<td>(IN)</td>
<td>Error message.</td>
</tr>
</tbody>
</table>
**INSERTXML**

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a VARCHAR2.</td>
</tr>
<tr>
<td>FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a CLOB.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
NEWCONTEXT

Creates a save context, and returns the context handle.

**Syntax**

```
FUNCTION newContext(
    targetTable IN VARCHAR2)
RETURN ctxType;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetTable</td>
<td>(IN)</td>
<td>The target table into which to load the XML document.</td>
</tr>
</tbody>
</table>
PROPAGATEORIGINALEXCEPTION

Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an `OracleXMLSQLException`.

Syntax

```
PROCEDURE propagateOriginalException(
    ctxHdl IN ctxType,
    flag IN BOOLEAN);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Propagate the original exception? 0=FALSE, 1=TRUE.</td>
</tr>
</tbody>
</table>
Removes the value of a top-level stylesheet parameter.

**Syntax**

```plsql
PROCEDURE removeXSLTParam(
    ctxHdl IN ctxType,
    name IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Parameter name.</td>
</tr>
</tbody>
</table>
SETBATCHSIZE

Changes the batch size used during DML operations. When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

Syntax

PROCEDURE setBatchSize(
    ctxHdl IN ctxType,
    batchSize IN NUMBER);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>batchSize</td>
<td>(IN)</td>
<td>Batch size.</td>
</tr>
</tbody>
</table>
Sets the commit batch size. The commit batch size refers to the number or records inserted after which a commit should follow. If `batchSize` is less than 1 or the session is in “auto-commit” mode, using the XSU does not make any explicit commits. By default, `commitBatch` is 0.

**Syntax**

```plsql
PROCEDURE setCommitBatch(
    ctxHdl IN ctxType,
    batchSize IN NUMBER);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>batchSize</td>
<td>(IN)</td>
<td>Commit batch size.</td>
</tr>
</tbody>
</table>
SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the class java.text.SimpleDateFormat. Setting the mask to <code>null</code> or an empty string unsets the date mask.

Syntax

```sql
PROCEDURE setDateFormat(
    ctxHdl IN ctxType,
    mask IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>mask</td>
<td>(IN)</td>
<td>Syntax of the date format pattern.</td>
</tr>
</tbody>
</table>
SETIGNORECASE

The XSU does mapping of XML elements to db columns/attributes based on the element names (XML tags). This function tells the XSU to do this match case insensitive.

Syntax

PROCEDURE setIgnoreCase(
    ctxHdl IN ctxType,
    flag IN NUMBER);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.</td>
</tr>
</tbody>
</table>
SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

Syntax

PROCEDURE setKeyColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the key column list; cannot be NULL.</td>
</tr>
</tbody>
</table>
SETPRESERVEWHITESPACE

Tells the XSU whether or not to preserve whitespace.

**Syntax**

PROCEDURE setPreserveWhitespace(
    ctxHdl IN ctxType,
    flag IN BOOLEAN := true);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Should XSU preserve whitespace?</td>
</tr>
</tbody>
</table>
SETROWTAG

Names the tag used in the XML document to enclose the XML elements corresponding to db. records.

Syntax

PROCEDURE setRowTag(
  ctxHd1 IN ctxType,
  tag IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHd1</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
SETSQLTOXMLNAMEESCAPING

Turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

PROCEDURE setSQLToXMLNameEscaping(
    ctxHdl IN ctxType,
    flag IN BOOLEAN := true);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Turn on escaping?</td>
</tr>
</tbody>
</table>
### SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

**Syntax**

```sql
PROCEDURE setUpdateColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the update column list.</td>
</tr>
</tbody>
</table>
Registers an XSL transform to be applied to the XML to be saved. If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| PROCEDURE setXSLT(  
  ctxHdl IN ctxType,  
  uri IN VARCHAR2,  
  ref IN VARCHAR2 := null);  
PROCEDURE setXSLT(  
  ctxHdl IN ctxType,  
  stylesheet IN CLOB,  
  ref IN VARCHAR2 := null); | Passes in the stylesheet through a URI. Passes in the stylesheet through a CLOB. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>URI to the stylesheet to register.</td>
</tr>
<tr>
<td>ref</td>
<td>(IN)</td>
<td>URL for include, import, and external entities.</td>
</tr>
<tr>
<td>stylesheet</td>
<td>(IN)</td>
<td>CLOB containing the stylesheet to register.</td>
</tr>
</tbody>
</table>
**SETXSLTParam**

Sets the value of a top-level stylesheet parameter. The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

**Syntax**

```sql
PROCEDURE setXSLTParam(
    ctxHdl IN ctxType,
    name IN VARCHAR2,
    value IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Parameter name.</td>
</tr>
<tr>
<td>value</td>
<td>(IN)</td>
<td>Parameter value as an XPath expression</td>
</tr>
</tbody>
</table>
Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a VARCHAR2.</td>
</tr>
<tr>
<td>FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a CLOB.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
DBMS_XMLSCHEMA package provides procedures to manage XML schemas. It is created by script `dbmsxsch.sql` during Oracle database installation.

Using DBMS_XMLSCHEMA

This section contains topics which relate to using the DBMS_XMLSCHEMA package.

- Overview
- Constants
- Views
- Operational Notes
Overview

This package provides subprograms to

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema
The `DBMS_XMLSCHEMA` package uses the constants shown in following tables.

- **DBMS_XMLSCHEMA Constants - Delete Option**
- **DBMS_XMLSCHEMA Constants - Enable Hierarchy**
- **DBMS_XMLSCHEMA Constants - Register CSID**

**Table 175–1 DBMS_XMLSCHEMA Constants - Delete Option**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_RESTRICT</td>
<td>NUMBER</td>
<td>1</td>
<td>Deletion of an XML schema fails if there are any tables or XML schemas that depend on it</td>
</tr>
<tr>
<td>DELETE_INVALIDATE</td>
<td>NUMBER</td>
<td>2</td>
<td>Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.</td>
</tr>
<tr>
<td>DELETE_CASCADE</td>
<td>NUMBER</td>
<td>3</td>
<td>Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if <code>gentypes</code> argument was set to <code>TRUE</code> during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.</td>
</tr>
<tr>
<td>DELETE_CASCADE_FORCE</td>
<td>NUMBER</td>
<td>4</td>
<td>This option is similar to <code>DELETE_CASCADE</code> except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.</td>
</tr>
</tbody>
</table>

**Table 175–2 DBMS_XMLSCHEMA Constants - Enable Hierarchy**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENABLE_HIERARCHY_NONE</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will not be called on any tables created while registering that schema</td>
</tr>
<tr>
<td>ENABLE_HIERARCHY_CONTENTS</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will be called for all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_CONTENTS</code></td>
</tr>
</tbody>
</table>
The `ENABLE_HIERARCHY_RESMETADATA` procedure of the `DBMS_XDBZ` package will be called on all tables created during schema registration with `hierarchy_type` as `DBMS_XDBZ.ENABLE_RESMETADATA`. Users should pass in `DBMS_XMLSCHEMA.ENABLE_RESMETADATA` for schemas they intend to use as resource metadata tables.

### Table 175–3  DBMS_XMLSCHEMA Constants - Register CSID

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REGISTER_NODOCID</td>
<td>NUMBER</td>
<td>1</td>
<td>If a schema is registered for metadata use (using the value <code>ENABLE_HIERARCHY_RESMETADATA</code> for parameter <code>enablehierarchy</code> during registration), a column named <code>DOCID</code> is added to all tables created during schema registration. This constant can be used in the options argument of <code>REGISTERSCHEMA</code> to prevent the creation of this column if the user wishes to optimize on storage</td>
</tr>
<tr>
<td>REGISTER_CSID_NULL</td>
<td>NUMBER</td>
<td>-1</td>
<td>If user wishes to not specify the character set of the input schema document when invoking <code>REGISTERSCHEMA</code>, this value can be used for the <code>csid</code> parameter</td>
</tr>
</tbody>
</table>
The DBMS_XMLSCHEMA package uses the views shown in Table 175–4. The columns of these views are described in detail in the Oracle Database Reference.

Table 175–4  Summary of Views used by DBMS_XMLSCHEMA

<table>
<thead>
<tr>
<th>Schema</th>
<th>Description</th>
</tr>

</tbody>
</table>
Operational Notes

Guidelines for Using In-Place XML Schema Evolution

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.

2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only \texttt{INPLACE_TRACE}. Do not also use \texttt{INPLACE_EVOLVE}. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.
### Summary of DBMS_XMLSCHEMA Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPILESCHEMA Procedure on page 175-9</td>
<td>Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.</td>
</tr>
<tr>
<td>COPYEVOLVE Procedure on page 175-10</td>
<td>Evolves registered schemas so that existing XML instances remain valid.</td>
</tr>
<tr>
<td>DELETESCHEMMA Procedure on page 175-12</td>
<td>Removes the schema from the database.</td>
</tr>
<tr>
<td>GENERATESCHEMMA Function on page 175-13</td>
<td>Generates an XML schema from an oracle type name.</td>
</tr>
<tr>
<td>GENERATESCHEMAS Function on page 175-14</td>
<td>Generates several XML schemas from an oracle type name.</td>
</tr>
<tr>
<td>INPLACEEVOLVE Procedure on page 175-15</td>
<td>Evolves registered schemas by propagating schema changes to object types and tables.</td>
</tr>
<tr>
<td>PURGESCHEMA Procedure on page 175-17</td>
<td>Removes the XML schema.</td>
</tr>
<tr>
<td>REGISTERSCHEMA Procedures on page 175-18</td>
<td>Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.</td>
</tr>
<tr>
<td>REGISTERURI Procedure on page 175-22</td>
<td>Registers an XML schema specified by a URI name.</td>
</tr>
</tbody>
</table>
COMPILESHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in an ORA-31001 exception: invalid resource handle or path name.

Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(
    schemaurl IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurl</td>
<td>URL identifying the schema</td>
</tr>
</tbody>
</table>
COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based XMLType tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new XMLType tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

See Also:

- "Schema Evolution" chapter of the Oracle XML DB Developer’s Guide for examples on how to evolve existing schemas
- Oracle Database Error Messages for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```sql
DBMS_XMLSCHEMA.COPYEVOLVE(
    schemaurls       IN  XDB$STRUBG_LIST_T,
    newschemas       IN  XMLSequenceType,
    transforms       IN  XMLSequenceType := NULL,
    preserveolddocs IN  BOOLEAN := FALSE,
    maptablename     IN  VARCHAR2 := NULL,
    generatetables   IN  BOOLEAN := TRUE,
    force            IN  BOOLEAN := FALSE,
    schemaowners     IN  XDB$STRING_LIST_T := NULL,
    parallelDegree   IN  PLS_INTEGER := 0,
    options          IN  PLS_INTEGER := 0)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurls</td>
<td>VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the FORCE parameter is TRUE, URLs should be in the order of dependency.</td>
</tr>
<tr>
<td>newschemas</td>
<td>VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.</td>
</tr>
<tr>
<td>transforms</td>
<td>VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.</td>
</tr>
</tbody>
</table>
Usage Notes

You should back up all schemas and documents prior to invocation because `COPYEVOLVE Procedure` deletes all conforming documents prior to implementing the schema evolution.
DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```sql
DBMS_XMLSCHEMA.DELETESCHEMA(
  schemaurl      IN  VARCHAR2,
  delete_option  IN  PLS_INTEGER := DELETE_RESTRICT);
```

See Also: "XMLSCHEMA Storage and Query: Basic" chapter of the Oracle XML DB Developer's Guide

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurl</td>
<td>URL identifying the schema to be deleted</td>
</tr>
<tr>
<td>delete_option</td>
<td>Delete options:</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects.</td>
</tr>
<tr>
<td></td>
<td>■ DELETECASCADE - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema.</td>
</tr>
<tr>
<td></td>
<td>■ DELETECASCADE_FORCE - Similar to DELETECASCADE except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31001</td>
<td>Invalid resource handle or path name</td>
</tr>
</tbody>
</table>
GENERATESCHEMA Function

This function generates XML schema(s) from an Oracle type name. It inlines all in one schema (XMLType).

See Also: "XMLSCHEMA Storage and Query: Advanced" chapter of the Oracle XML DB Developer's Guide

Syntax

```sql
DBMS_XMLSCHEMA.GENERATESCHEMA(
    schemaname    IN  VARCHAR2,
    typename      IN  VARCHAR2,
    elementname   IN  VARCHAR2 := NULL,
    recurse       IN  BOOLEAN  := TRUE,
    annotate      IN  BOOLEAN  := TRUE,
    embedcoll     IN  BOOLEAN  := TRUE)
RETURN SYS.XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaname</td>
<td>Name of the database schema containing the type</td>
</tr>
<tr>
<td>typename</td>
<td>Name of the Oracle type</td>
</tr>
<tr>
<td>elementname</td>
<td>The name of the top level element in the XML Schema. Defaults to typename.</td>
</tr>
<tr>
<td>recurse</td>
<td>Whether or not to also generate schema for all types referred to by the type specified</td>
</tr>
<tr>
<td>annotate</td>
<td>Whether or not to put the SQL annotations in the XML Schema</td>
</tr>
<tr>
<td>embedcoll</td>
<td>Determines whether the collections should be embedded in the type which refers to them, or create a complextype. Cannot be FALSE if annotations are turned on</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31001</td>
<td>Invalid resource handle or path name</td>
</tr>
</tbody>
</table>
GENERATESCHEMAS Function

This function generates XML schema(s) from an Oracle type name. It returns a collection of XMLTypes, one XML Schema document for each database schema.

See Also: "XMLSCHEMA Storage and Query: Advanced" chapter of the Oracle XML DB Developer’s Guide

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMAS(
    schemaname   IN  VARCHAR2,
    typename     IN  VARCHAR2,
    elementname  IN  VARCHAR2 := NULL,
    schemaurl    IN  VARCHAR2 := NULL,
    annotate     IN  BOOLEAN := TRUE,
    embedcoll    IN  BOOLEAN := TRUE
) RETURN SYS.XMLTYPE;
```

Parameters

Table 175–12 GENERATESCHEMAS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaname</td>
<td>Name of the database schema containing the type</td>
</tr>
<tr>
<td>typename</td>
<td>Name of the Oracle type</td>
</tr>
<tr>
<td>elementname</td>
<td>The name of the top level element in the XML Schema defaults to typeName</td>
</tr>
<tr>
<td>schemaurl</td>
<td>Specifies base URL where schemas will be stored, needed by top level schema for import statement</td>
</tr>
<tr>
<td>annotate</td>
<td>Whether or not to put the SQL annotations in the XML Schema</td>
</tr>
<tr>
<td>embedcoll</td>
<td>Determines whether the collections be embedded in the type which refers to them, or create a complextype. Cannot be FALSE if annotations are turned on</td>
</tr>
</tbody>
</table>

Exceptions

Table 175–13 GENERATESCHEMAS Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31001</td>
<td>Invalid resource handle or path name</td>
</tr>
</tbody>
</table>
INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```sql
DBMS_XMLSCHEMA.INPLACEEVOLVE(
    schemaURL    IN   VARCHAR2,
    diffXML      IN   XMLType,
    flags        IN   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaURL</td>
<td>URL of the schema to evolve</td>
</tr>
<tr>
<td>diffXML</td>
<td>Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.</td>
</tr>
<tr>
<td>flags</td>
<td>The following bits may be set in this parameter to control the behavior of this procedure:</td>
</tr>
<tr>
<td></td>
<td>• INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new.</td>
</tr>
<tr>
<td></td>
<td>• INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file.</td>
</tr>
</tbody>
</table>

That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition:

|           | • Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new. |
|           | • Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps) |

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPath expressions and for XDIFF documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.
Any errors resulting from CREATE TYPE, ALTER TYPE and like commands will generate error messages.

Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the REGISTERSCHEMA Procedures and the REGISTERURI Procedure at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.
PURGESCALA Procedure

This procedure removes the XML schema.

See Also: "XMLSCHEMA Storage and Query: Advanced" chapter of the Oracle XML DB Developer’s Guide

Syntax

DBMS_XMLSCHEMA.PURGESCALA(
    schemaid  IN  RAW);

Parameters

Table 175–15  PURGESCALA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaid</td>
<td>ID of the schema to be purged</td>
</tr>
</tbody>
</table>

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the HIDE mode.
- Once a schema has been deleted in HIDE mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.
This procedure registers the specified schema for use by the database. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

**Note:** As of release 11.2.0.2 the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

**See Also:** "XMLSCHEMA Storage and Query: Basic" chapter of the Oracle XML DB Developer’s Guide

**Syntax**

Registers a schema specified as a `VARCHAR2`:

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN VARCHAR2,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    gentables IN BOOLEAN := TRUE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE`. The contents of the schema document must be in the database character set:

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN BFILE,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    gentables IN BOOLEAN := TRUE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE` and identifies the character set id of the schema document:

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN BFILE,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := TRUE,
    gentables IN BOOLEAN := TRUE,
    force IN BOOLEAN := TRUE,
    owner IN VARCHAR2 := '',
    csid IN NUMBER,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```
Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```plsql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN BLOB,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB and identifies the character set id of the schema document:

```plsql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN BLOB,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := TRUE,
    gentables IN BOOLEAN := TRUE,
    force IN BOOLEAN := TRUE,
    owner IN VARCHAR2 := '',
    csid IN NUMBER,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```

Registers the schema specified as a CLOB:

```plsql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN CLOB,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    options IN PLS_INTEGER := 0);
```

Registers the schema specified as an XMLTYPE:

```plsql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN SYSDML.XMLTYPE,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```plsql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl IN VARCHAR2,
    schemadoc IN BLOB,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```
schemadoc IN SYS.URIType,
local IN BOOLEAN := TRUE,
gentypes IN BOOLEAN := TRUE,
genbean IN BOOLEAN := FALSE,
force IN BOOLEAN := FALSE,
owner IN VARCHAR2 := NULL,
enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
options IN PLS_INTEGER := 0);

Parameters

Table 175–16 REGISTERSHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurl</td>
<td>URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside schemalocation attribute of XML Schema import element.</td>
</tr>
<tr>
<td>schemadoc</td>
<td>A valid XML schema document</td>
</tr>
<tr>
<td>local</td>
<td>Is this a local or global schema?</td>
</tr>
<tr>
<td></td>
<td>■ By default, all schemas are registered as local schemas, under /sys/schemas/&lt;username&gt;/...</td>
</tr>
<tr>
<td></td>
<td>■ If a schema is registered as global, it is added under /sys/schemas/PUBLIC/...</td>
</tr>
<tr>
<td></td>
<td>You need write privileges on the directory to be able to register a schema as global.</td>
</tr>
<tr>
<td>gentypes</td>
<td>Determines whether the schema compiler generates object types. By default, TRUE. If you use binary XML, you must be set gentypes to FALSE.</td>
</tr>
<tr>
<td>genbean</td>
<td>Determines whether the schema compiler generates Java beans. By default, FALSE. Oracle recommends that this parameter always be set to FALSE.</td>
</tr>
<tr>
<td>gentables</td>
<td>Determines whether the schema compiler generates default tables. By default, TRUE</td>
</tr>
<tr>
<td>force</td>
<td>If this parameter is set to TRUE, the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.</td>
</tr>
<tr>
<td>owner</td>
<td>This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.</td>
</tr>
<tr>
<td>csid</td>
<td>Identifies the character set of the input schema document. If this value is 0, the schema document’s encoding is determined by the current rule for “text/xml” MIME type.</td>
</tr>
</tbody>
</table>
enable hierarchy
- ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema
- ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default.
- ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

options
Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:
- REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)
- REGISTER_BINARYXML - Register the schema for Binary XML
- REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables
REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

Note: As of release 11.2.0.2 the genbean parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

Syntax

```
DBMS_XMLSCHEMA.REGISTERURI(
  schemaurl IN VARCHAR2,
  schemadocuri IN VARCHAR2,
  local IN BOOLEAN := TRUE,
  gentypes IN BOOLEAN := TRUE,
  genbean IN BOOLEAN := FALSE,
  gentables IN BOOLEAN := TRUE,
  force IN BOOLEAN := FALSE,
  owner IN VARCHAR2 := NULL,
  options IN PLS_INTEGER := 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurl</td>
<td>Uniquely identifies the schema document. Can be used inside schemaLocation attribute of XML Schema import element.</td>
</tr>
<tr>
<td>schemadocuri</td>
<td>Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a URIType instance using the urifactory, and invokes the REGISTERSCHEMA Procedures.</td>
</tr>
<tr>
<td>local</td>
<td>Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under /sys/schemas/ &lt;username&gt;/... If a schema is registered as global, it is added under /sys/schemas/PUBLIC/... The user needs write privileges on the directory to register a global schema.</td>
</tr>
<tr>
<td>gentypes</td>
<td>Determines whether the compiler generate object types. By default, TRUE.</td>
</tr>
<tr>
<td>genbean</td>
<td>Determines whether the compiler generate Java beans. By default, FALSE.</td>
</tr>
<tr>
<td>gentables</td>
<td>Determines whether the compiler generate default tables. TRUE by default.</td>
</tr>
<tr>
<td>force</td>
<td>TRUE: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.</td>
</tr>
<tr>
<td>owner</td>
<td>This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.</td>
</tr>
</tbody>
</table>
options

Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:

- REGISTER_NODCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)

<td>SETROWTAG</td>
<td>Names the tag used in the XML document, to enclose the XML elements corresponding to the database.</td>
</tr>
<tr>
<td>SETUPDATECOLUMN</td>
<td>Adds a column to the &quot;update column list&quot;.</td>
</tr>
<tr>
<td>UPDATEXML</td>
<td>Updates the table given the XML document.</td>
</tr>
</tbody>
</table>
CLEARKEYCOLUMNLIST

Clears the key column list.

Syntax

PROCEDURE clearKeyColumnList(
  ctxHd1 IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHd1</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
CLEARUPDATECOLUMNLIST

Clears the update column list.

**Syntax**

```sql
PROCEDURE clearUpdateColumnList(
    ctxHdl IN ctxType);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

PROCEDURE closeContext(
    ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
DELETEXML

DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION deleteXML( ctxHdl IN ctxPType, xDoc IN VARCHAR2) RETURN NUMBER;</td>
<td></td>
</tr>
<tr>
<td>Uses a VARCHAR2 type for the xDoc parameter.</td>
<td></td>
</tr>
<tr>
<td>FUNCTION deleteXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</td>
<td></td>
</tr>
<tr>
<td>Uses a CLOB type for the xDoc parameter.</td>
<td></td>
</tr>
<tr>
<td>FUNCTION deleteXML( ctxHdl IN ctxType, xDoc IN XMLType) RETURN NUMBER;</td>
<td></td>
</tr>
<tr>
<td>Uses an XMLType type for the xDoc parameter.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
**INSERTXML**

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for `insertXML` to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless `SETUPDATECOLUMN` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>FUNCTION insertXML(ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;</code></td>
<td>Passes in the <code>xDoc</code> parameter as a VARCHAR2.</td>
</tr>
<tr>
<td><code>FUNCTION insertXML(ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</code></td>
<td>Passes in the <code>xDoc</code> parameter as a CLOB.</td>
</tr>
<tr>
<td><code>FUNCTION insertXML(ctxHdl IN ctxType, xDoc IN XMLType) RETURN NUMBER;</code></td>
<td>Passes in the <code>xDoc</code> parameter as an XMLType.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
NEWCONTEXT

Creates a save context, and returns the context handle.

**Syntax**

FUNCTION newContext(
   targetTable IN VARCHAR2)
RETURN ctxType;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetTable</td>
<td>(IN)</td>
<td>The target table into which to load the XML document.</td>
</tr>
</tbody>
</table>
SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

Syntax

```sql
PROCEDURE setKeyColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the key column list; cannot be NULL.</td>
</tr>
</tbody>
</table>
Names the tag used in the XML document, to enclose the XML elements corresponding to database records.

**Syntax**

```sql
PROCEDURE setRowTag(
    ctxHdl IN ctxType,
    tag IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for `INSERTXML` to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless `setUpdateColumn` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

**Syntax**

```
PROCEDURE setUpdateColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the update column list.</td>
</tr>
</tbody>
</table>
**UPDATEXML**

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a VARCHAR2.</td>
</tr>
<tr>
<td>FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a CLOB.</td>
</tr>
<tr>
<td>FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN XMLType) RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a XMLType.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
The DBMS_XMLTRANSLATIONS package provides an interface to perform translations so that strings can be searched or displayed in various languages.

<td>UPDATETRANSLATION Function</td>
<td>Updates the translation in a particular language at the specified XPATH</td>
</tr>
</tbody>
</table>
DISABLETRANSLATION Procedure

This procedure disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values.

Syntax

DBMS_XMLTRANSLATIONS.DISABLETRANSLATION;
ENABLETRANSLATION Procedure

This procedure enables translations in the current session. This is the default behavior.

Syntax

DBMS_XMLTRANSLATIONS.ENABLETRANSLATION;
EXTRACTXLIFF Function & Procedure

This function and procedure extracts the translations in XLIFF format from either an XMLTYPE or a resource in the XDB Repository.

Syntax

```sql
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
   doc       IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
RETURN XMLTYPE;

DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
   abspath   IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>XMLTYPE from which the XLIFF is to be extracted</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath at which specifies the location of the element that needs to be translated. If no XPath is specified, the entire document is processed.</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
<tr>
<td>abspath</td>
<td>Absolute path of the resource from which the XLIFF is to be extracted</td>
</tr>
</tbody>
</table>

Return Values

The translations in the XLIFF format

Examples

Extracting the Translation from an XMLTYPE

Let `doc =` 

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
   xmlns:is="xmlns.oracle.com/iStore"
   xmlns:oa="xmlns.oracle.com/OracleApps"
   targetNamespace="xmlns.oracle.com/example">
   <name>
      securityClassExample
   </name>
   <title xml:lang="en" xdb:srclang="true">
      Security Class Example
   </title>
   <title xml:lang="fr">
      Security Class Example - FR
   </title>
   <title xml:lang="es">
      Security Class Example - ES
   </title>
</securityClass>
```

---

**Table 177–2**  EXTRACTXLIFF Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>XMLTYPE from which the XLIFF is to be extracted</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath at which specifies the location of the element that needs to be translated. If no XPath is specified, the entire document is processed.</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
<tr>
<td>abspath</td>
<td>Absolute path of the resource from which the XLIFF is to be extracted</td>
</tr>
</tbody>
</table>
Let the xpath = '/securityClass/title'. The output of EXTRACTXLIFF will be as follows:

```xml
<xliff version='1.1'>
<file original='' source-language='en' datatype='xml'>
<body>
<trans-unit id='/securityClass/title'>
<source>Security Class Example</source>
<alt-trans>
<target xml:lang='fr'>Security Class Example - FR</target>
<target xml:lang='es'>Security Class Example - ES</target>
</alt-trans>
</trans-unit>
</body>
</file>
</xliff>
```

**Extracting the Translation from a Resource**

Let the resource '/public/security.xml' =

```xml
<securityClass xmlns='http://xmlns.oracle.com/xdb/security.xsd'
    xmlns:is='xmlns.oracle.com/iStore'
    xmlns:oa='xmlns.oracle.com/OracleApps'
    targetNamespace='xmlns.oracle.com/example'>

    <name>
        securityClassExample
    </name>
    <title xml:lang='en' xdb:srcLang='true'>Security Class Example</title>
    <title xml:lang='es'>Security Class Example - ES</title>
    <title xml:lang='fr'>Security Class Example - FR</title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
    <privlist>
        <privilege name='privilege1'/>
        <aggregatePrivilege name='iStorePOApprover'>
            <title>iStore Purchase Order Approver</title>
            <privilegeRef name='is:privilege1'/>
            <privilegeRef name='oa:submitPO'/>
            <privilegeRef name='oa:privilege3'/>
        </aggregatePrivilege>
        <privilege name='privilege2'>
            <title xml:lang='en'>secondary privilege</title>
            <title xml:lang='fr' xdb:srcLang='true'>secondary privilege - FR</title>
        </privilege>
        <columnRef schema='APPS' table='PurchaseOrder' column='POId'/>
        <columnRef schema='APPS' table='PurchaseOrder' column='Amount'/>
    </privlist>
</securityClass>
```
And let XPATH = ", then the extracted XLIFF is

```xml
<xliff version='1.1'>
<file original='/public/security.xml' source-language='en' datatype='xml'>
  <body>
    <trans-unit id='/securityClass/title'>
      <source>Security Class Example</source>
      <alt-trans>
        <target xml:lang='fr'>Security Class Example - FR</target>
        <target xml:lang='es'>Security Class Example - ES</target>
      </alt-trans>
    </trans-unit>
  </body>
</file>

<file original='/public/security.xml' source-language='fr' datatype='xml'>
  <body>
    <trans-unit id='/securityClass/privilege[@name="privilege2"/title'>
      <source>secondary privilege - FR</source>
      <alt-trans>
        <target xml:lang='en'>secondary privilege</target>
      </alt-trans>
    </trans-unit>
  </body>
</file>
</xliff>
```
**GETBASEDOCUMENT Function**

This function returns the base document with all the translations.

**Syntax**

```sql
DBMS_XMLTRANSLATIONS.GETBASEDOCUMENT(
    doc    IN  XMLTYPE)
RETURN XMLTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>Input XMLTYPE</td>
</tr>
</tbody>
</table>

**Return Values**

The `XMLTYPE` which contains the base document with all the translations.

**Examples**

For example, for `doc` =

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">
  <name>securityClassExample</name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

For the above document, this subprogram will return:

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">
  <name>securityClassExample</name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```
MERGEXLIFF Functions

This function merges the translations in XLIFF format into either an XMLTYPE or a resource in the XDB Repository.

Syntax

```
DBMS_XMLTRANSLATIONS.MERGEXLIFF(
    doc       IN  XMLTYPE,
    xliff     IN  XMLTYPE)
RETURN XMLTYPE;
```

```
DBMS_XMLTRANSLATIONS.MERGEXLIFF(
    xliff     IN  XMLTYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>XMLTYPE from which the XLIFF is to be merged</td>
</tr>
<tr>
<td>xliff</td>
<td>Translations in the XLIFF format</td>
</tr>
</tbody>
</table>

Return Values

The result of merging 'xliff' into 'doc' at 'xpath'

Examples

Merge Translations into an XMLTYPE
Consider the following input XMLTYPE:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="es">
    Security Class Example - ES
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
  <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
      <title>
        iStore Purchase Order Approver
      </title>
      <privilegeRef name="is:privilege1"/>
      <privilegeRef name="oa:submitPO"/>
    </aggregatePrivilege>
  </privlist>
</securityClass>
```
Let the input XLIFF be as follows:

```xml
<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example Modified</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example Mod - FR</target>
          <target xml:lang='es'>Security Class Example Mod - ES</target>
        </alt-trans>
      </trans-unit>
      <trans-unit id='/securityClass/privilege[@name="privilege2"]'>
        <source>secondary privilege modified</source>
        <alt-trans>
          <target xml:lang='fr'>secondary privilege mod - FR</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
```

The output of merge will be as follows:

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:i="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>securityClassExample</name>
  <title xml:lang="en" xdb:srclang="true">Security Class Example Modified</title>
  <title xml:lang="es">Security Class Example Mod - ES</title>
  <title xml:lang="fr">Security Class Example Mod - FR</title>
  <inherits-from>i:iStorePurchaseOrder</inherits-from>
  <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
      <title>iStore Purchase Order Approver</title>
    </aggregatePrivilege>
  </privlist>
</securityClass>
```
<privilegeRef name="is:privilege1"/>
<privilegeRef name="oa:submitPO"/>
<privilegeRef name="oa:privilege3"/>
</aggregatePrivilege>

<privilege name="privilege2">
  <title xml:lang="en" xdb:srclang="true">
    secondary privilege modified
  </title>
  <title xml:lang="fr">
    secondary privilege mod - FR
  </title>
  <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
  <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
</privilege>
</privlist>
</securityClass>

**Merge XLIFF Translations into a Resource**

If the input document in the above example were to be stored in the repository at 'public/security.xml', then merging the above XLIFF will have the same effect.
SETSOURCELANG Function

This function sets the source language to a particular language at the specified XPath.

Syntax

```
DBMS_XMLTRANSLATIONS.SETSOURCELANG (  
  doc IN XMLTYPE,  
  xpath IN VARCHAR2,  
  lang IN VARCHAR2,  
  namespace IN VARCHAR2 := NULL)  
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>XMLTYPE for which the source language is to be set</td>
</tr>
<tr>
<td>xpath</td>
<td>XPATH at which the source language is to be set</td>
</tr>
<tr>
<td>lang</td>
<td>Source language</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

Return Values

The updated document

Examples

For example, if doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"  
xmlns:is="xmlns.oracle.com/iStore"  
xmlns:oa="xmlns.oracle.com/OracleApps"  
targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

the statement

```
setSourceLang ( doc, '/securityClass/title', 'fr' )
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"  
xmlns:is="xmlns.oracle.com/iStore"  
xmlns:oa="xmlns.oracle.com/OracleApps"  
xml:lang="fr" xdb:srclang="true">
  Security Class Example - FR
</securityClass>
```
targetNamespace="xmlns.oracle.com/example">
  <name>securityClassExample</name>
  <title xml:lang="en">Security Class Example</title>
  <title xml:lang="fr" xdb:srclang="true">Security Class Example - FR</title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
TRANSLATEXML Function

This function returns the document in the specified language.

Syntax

```
DBMS_XMLTRANSLATIONS.TRANSLATEXML(
    doc    IN  XMLTYPE,
    lang   IN  VARCHAR2)
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>Input XMLTYPE</td>
</tr>
<tr>
<td>lang</td>
<td>Language</td>
</tr>
</tbody>
</table>

Return Values

The XMLTYPE which contains the document in the specified language

Examples

For example, for `doc` =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"  
    xmlns:is="xmlns.oracle.com/iStore"  
    xmlns:oa="xmlns.oracle.com/OracleApps"  
    targetNamespace="xmlns.oracle.com/example">  
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true"> 
        Security Class Example
    </title>
    <title xml:lang="fr"> 
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

`TRANSLATEXML(doc, 'fr')` will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"  
    xmlns:is="xmlns.oracle.com/iStore"  
    xmlns:oa="xmlns.oracle.com/OracleApps"  
    targetNamespace="xmlns.oracle.com/example">  
    <name>
        securityClassExample
    </name>
    <title xml:lang="fr"> 
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```
**UPDATETRANSLATION Function**

This function updates the translation in a particular language at the specified XPATH.

**Syntax**

```sql
DBMS_XMLTRANSLATIONS.UPDATETRANSLATION(
    doc       IN  XMLTYPE,
    xpath     IN  VARCHAR2,
    lang      IN  VARCHAR2,
    value     IN  VARCHAR2,
    namespace IN  VARCHAR2 := NULL
)
RETURN XMLTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>XMLTYPE for which the translation is to be updated</td>
</tr>
<tr>
<td>xpath</td>
<td>XPATH at which the translation is to be updated</td>
</tr>
<tr>
<td>lang</td>
<td>Language for which the translation is to be updated</td>
</tr>
<tr>
<td>value</td>
<td>New translation</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

**Return Values**

The updated document

**Examples**

For example,

```sql
updateTranslation ( doc, '/securityClass/title/text()', 'fr', 'Oracle' );
```

produces

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespaces="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Oracle
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```
The DBMS_XPLAN package provides an easy way to display the output of the EXPLAIN PLAN command in several, predefined formats. You can also use the DBMS_XPLAN package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the V$SQL_PLAN and V$SQL_PLAN_STATISTICS_ALL fixed views. Finally, it displays plans from a SQL plan baseline.

See Also:

- For more information on the EXPLAIN PLAN command, the AWR, and SQL tuning set, see Oracle Database Performance Tuning Guide.
- For more information on the V$SQL_PLAN and V$SQL_PLAN_STATISTICS fixed views, see Oracle Database Reference.

This chapter contains the following topics:

- Summary of DBMS_XPLAN Subprograms
Using DBMS_XPLAN

- Overview
- Security Model
- Examples
Overview

The `DBMS_XPLAN` package supplies five table functions:

- **DISPLAY** - to format and display the contents of a plan table.
- **DISPLAY_AWR** - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- **DISPLAY_CURSOR** - to format and display the contents of the execution plan of any loaded cursor.
- **DISPLAY_SQL_PLAN_BASELINE** - to display one or more execution plans for the SQL statement identified by SQL handle.
- **DISPLAY_SQLSET** - to format and display the contents of the execution plan of statements stored in a SQL tuning set.
Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function `DISPLAY_CURSOR` requires to have select privileges on the following fixed views: `V$SQL_PLAN`, `V$SESSION` and `V$SQL_PLAN_STATISTICS_ALL`.

Using the `DISPLAY_AWR Function` requires the user to have `SELECT` privileges on `DBA_HIST_SQL_PLAN`, `DBA_HIST_SQLTEXT`, and `V$DATABASE`.

Using the `DISPLAY_SQLSET Function` requires the user to have the `SELECT` privilege on `ALL_SQLSET_STATEMENTS` and `ALL_SQLSET_PLANS`.

Using `DISPLAY_SQL_PLAN_BASELINE Function` the user requires the user to have the `SELECT` privilege on `DBA_SQL_PLAN_BASELINES`.

All these privileges are automatically granted as part of the `SELECT_CATALOG` role.
Examples

**Displaying a Plan Table Using DBMS_XPLAN.DISPLAY**

Execute an explain plan command on a `SELECT` statement:

```sql
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
    WHERE e.deptno = d.deptno
    AND e.ename='benoit';
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```sql
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

```
Plan hash value: 3693697075
---------------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU) | Time     |
---------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  1 |  HASH JOIN         |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    37 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    80 |     3  (34)| 00:00:01 |
---------------------------------------------------------------------------
Predicate Information (identified by operation id):
---------------------------------------------------
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."ENAME"='benoit')
```

15 rows selected.

**Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR**

By default, the table function `DISPLAY_CURSOR` formats the execution plan for the last SQL statement executed by the session. For example:

```sql
SELECT ename FROM emp e, dept d
    WHERE e.deptno = d.deptno
    AND e.empno=7369;
```

```
ENAME
----------
SMITH
```

To display the execution plan of the last executed statement for that session:

```sql
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR);
```

This query produces the following output:

```
Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0
------------------------------------------------------------------
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369
------------------------------------------------------------------
```

Predicate Information (identified by operation id):
---------------------------------------------------------------
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."ENAME"='benoit')

15 rows selected.
<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>* 1</td>
<td>HASH JOIN</td>
<td></td>
<td>1</td>
<td>16</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>* 2</td>
<td>TABLE ACCESS FULL</td>
<td>EMP</td>
<td>1</td>
<td>13</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>3</td>
<td>TABLE ACCESS FULL</td>
<td>DEPT</td>
<td>4</td>
<td>12</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
</tbody>
</table>

Predicate Information (identified by operation id):
---------------------------------------------------
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."EMPNO"=7369)

You can also use the table function DISPLAY_CURSOR to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);

Get sql_id and child_number for the preceding statement:

SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE 'TOTO%';

SQL_ID       CHILD_NUMBER
----------     -----------------------------
gwp663cqh5qbf 0

Display the execution plan for the cursor:

SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR(('gwp663cqh5qbf',0));

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0

SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);

<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
<td>4</td>
<td>64</td>
<td>7 (100)</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>SORT GROUP BY</td>
<td></td>
<td>4</td>
<td>64</td>
<td>7 (43)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>* 2</td>
<td>HASH JOIN</td>
<td></td>
<td>14</td>
<td>224</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>3</td>
<td>TABLE ACCESS FULL</td>
<td>DEPT</td>
<td>4</td>
<td>44</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>4</td>
<td>TABLE ACCESS FULL</td>
<td>EMP</td>
<td>14</td>
<td>70</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
</tbody>
</table>

Predicate Information (identified by operation id):
---------------------------------------------------
2 - access("E"."DEPTNO"="D"."DEPTNO")

Instead of issuing two queries, one to the get the sql_id and child_number pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
<td>4</td>
<td>64</td>
<td>7 (100)</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>SORT GROUP BY</td>
<td></td>
<td>4</td>
<td>64</td>
<td>7 (43)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>* 2</td>
<td>HASH JOIN</td>
<td></td>
<td>14</td>
<td>224</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>3</td>
<td>TABLE ACCESS FULL</td>
<td>DEPT</td>
<td>4</td>
<td>44</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>4</td>
<td>TABLE ACCESS FULL</td>
<td>EMP</td>
<td>14</td>
<td>70</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
</tbody>
</table>

Predicate Information (identified by operation id):
---------------------------------------------------
2 - access("E"."DEPTNO"="D"."DEPTNO")

Instead of issuing two queries, one to the get the sql_id and child_number pair and one to display the plan, you can combine these in a single query:
### Using DBMS_XPLAN

```sql
SELECT t.*
FROM v$sql s, table(DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number)) t WHERE sql_text LIKE '%TOTO%';
```

#### Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and `display_cursor` table functions. In Displaying a Plan Table Using DBMS_XPLAN.DISPLAY on page 178-5, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```sql
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
    WHERE e.deptno = d.deptno
    AND e.ename = 'hermann'
    ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```sql
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
Plan hash value: 3693697345
```

<table>
<thead>
<tr>
<th>Id</th>

<td>4</td>
<td>120</td>
<td>3 (34)</td>
<td>00:00:01</td>
<td>Q1.01</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Predicate Information (identified by operation id):

```
6 - access('E'. 'DEPTNO'= 'D'. 'DEPTNO')
10 - filter('E'. 'ENAME'= 'hermann')
```

When the query is parallel, information related to parallelism is reported: table queue number (TQ column), table queue type (INOUT) and table queue distribution method (PQ Distrib).

By default, if several plans in the plan table match the `statement_id` parameter passed to the display table function (default value is NULL), only the plan corresponding to the last `EXPLAIN PLAN` command is displayed. Hence, there is no need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for individual users and preserves its content throughout the
lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the EXPLAIN PLAN command:

**Using a View to Display Last Explain Plan**

```sql
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```
**Summary of DBMS_XPLAN Subprograms**

<table>

</tbody>
</table>
DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or \texttt{V$SQL\_PLAN\_STATISTICS\_ALL} if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

Syntax

\begin{verbatim}
DBMS_XPLAN.DISPLAY(
    table_name    IN  VARCHAR2  DEFAULT 'PLAN_TABLE',
    statement_id  IN  VARCHAR2  DEFAULT  NULL,
    format        IN  VARCHAR2  DEFAULT 'TYPICAL',
    filter_preds  IN  VARCHAR2 DEFAULT NULL);
\end{verbatim}

Parameters

\begin{center}
\begin{tabular}{ll}
\hline
Parameter & Description \\
\hline
\texttt{table\_name} & Specifies the table name where the plan is stored. This parameter defaults to \texttt{PLAN\_TABLE}, which is the default plan table for the \texttt{EXPLAIN PLAN} command. If \texttt{NULL} is specified it also defaults to \texttt{PLAN\_TABLE}. \\
\texttt{statement\_id} & Specifies the \texttt{statement\_id} of the plan to be displayed. This parameter defaults to \texttt{NULL}, which is the default when the \texttt{EXPLAIN PLAN} command is executed without a \texttt{set statement\_id} clause. If no \texttt{statement\_id} is specified, the function shows you the plan of the most recent explained statement. \\
\end{tabular}
\end{center}
DBMS_XPLAN Subprograms

### Summary of DBMS_XPLAN Subprograms

**format**

Controls the level of details for the plan. It accepts four values:

- **BASIC**: Displays the minimum information in the plan—the operation ID, the operation name and its option.
- **TYPICAL**: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).
- **SERIAL**: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.
- **ALL**: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).

For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:

- **ROWS** - if relevant, shows the number of rows estimated by the optimizer
- **BYTES** - if relevant, shows the number of bytes estimated by the optimizer
- **COST** - if relevant, shows optimizer cost information
- **PARTITION** - if relevant, shows partition pruning information
- **PARALLEL** - if relevant, shows PX information (distribution method and table queue information)
- **PREDICATE** - if relevant, shows the predicate section
- **PROJECTION** - if relevant, shows the projection section
- **ALIAS** - if relevant, shows the "Query Block Name / Object Alias" section
- **REMOTE** - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)
- **NOTE** - if relevant, shows the note section of the explain plan

Format keywords can be prefixed by the sign `'-'` to exclude the specified information. For example, `'--PROJECTION'` excludes projection information.

If the target plan table (see `table_name` parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view `V$SQL_PLAN_STATISTICS_ALL`), additional format keywords can be used to specify which class of statistics to display when using the `DISPLAY Function`. These additional format keywords are `IOSTATS`, `MEMSTATS`, `ALLSTATS` and `LAST` (see the `DISPLAY_CURSOR Function` or the `DISPLAY_SQLSET Function` for a full description of these four keywords).
Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

**WARNING:** Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

### Examples

To display the result of the last `EXPLAIN PLAN` command stored in the plan table:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my_plan_table":

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as `statement_id='foo'`:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'foo'));
```
DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in the AWR.

Syntax

```sql
DBMS_XPLAN.DISPLAY_AWR(
    sql_id            IN      VARCHAR2,
    plan_hash_value   IN      NUMBER DEFAULT NULL,
    db_id             IN      NUMBER DEFAULT NULL,
    format            IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given SQL_ID.</td>
</tr>
<tr>
<td>db_id</td>
<td>Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database is used, as shown in V$DATABASE.</td>
</tr>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts four values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>BASIC</strong>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>TYPICAL</strong>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and information about REMOTE SQL (see below).</td>
</tr>
<tr>
<td></td>
<td>- <strong>SERIAL</strong>: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>- <strong>ALL</strong>: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</td>
</tr>
</tbody>
</table>
DISPLAY_AWR Function

Usage Notes

- To use the DISPLAY_AWR functionality, the calling user must have SELECT privilege on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE, otherwise it shows an appropriate error message.

- Here are some ways you might use variations on the format parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
  - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```
To display all execution plans of all stored SQL statements containing the string 'TOTO':

```sql
SELECT tf.* FROM DBA_HIST_SQLTEXT ht, table
       (DBMS_XPLAN.DISPLAY_AWR(ht.sql_id, null, null, 'ALL')) tf
WHERE ht.sql_text like '%TOTO%';
```
DISPLAY_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as I/O, memory and timing) can be reported (based on the `V$SQL_PLAN_STATISTICS_ALL` views).

Syntax

```sql
DBMS_XPLAN.DISPLAY_CURSOR(
    sql_id        IN  VARCHAR2  DEFAULT  NULL,
    child_number  IN  NUMBER    DEFAULT  NULL,
    format        IN  VARCHAR2  DEFAULT  'TYPICAL');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Specifies the <code>SQL_ID</code> of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column <code>SQL_ID</code> in <code>V$SQL</code> or <code>V$SQLAREA</code>. Alternatively, you could choose the column <code>PREV_SQL_ID</code> for a specific session out of <code>V$SESSION</code>. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed.</td>
</tr>
<tr>
<td>child_number</td>
<td>Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied <code>sql_id</code> parameter are displayed. The <code>child_number</code> can be specified only if <code>sql_id</code> is specified.</td>
</tr>
</tbody>
</table>
| format      | Controls the level of details for the plan. It accepts four values:

  - **BASIC**: Displays the minimum information in the plan—the operation ID, the operation name and its option.
  - **TYPICAL**: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only `PROJECTION`, `ALIAS` and `REMOTE SQL` information (see below).
  - **SERIAL**: Like **TYPICAL** except that the parallel information is not displayed, even if the plan executes in parallel.
  - **ALL**: Maximum user level. Includes information displayed with the **TYPICAL** level with additional information (projection, alias and information about remote SQL if the operation is distributed).

For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as `PARTITION`) or logical additions to the base plan table output (such as `PREDICATE`).
### Usage Notes

- To use the **DISPLAY_CURSOR** functionality, the calling user must have **SELECT** privilege on the fixed views **V$SQL_PLAN_STATISTICS_ALL**, **V$SQL** and **V$SQL_PLAN**, otherwise it shows an appropriate error message.

- Here are some ways you might use variations on the **format** parameter:

<table>
<thead>
<tr>
<th>Format Keywords</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ROWS</strong></td>
<td>if relevant, shows the number of rows estimated by the optimizer</td>
</tr>
<tr>
<td><strong>BYTES</strong></td>
<td>if relevant, shows the number of bytes estimated by the optimizer</td>
</tr>
<tr>
<td><strong>COST</strong></td>
<td>if relevant, shows optimizer cost information</td>
</tr>
<tr>
<td><strong>PARTITION</strong></td>
<td>if relevant, shows partition pruning information</td>
</tr>
<tr>
<td><strong>PARALLEL</strong></td>
<td>if relevant, shows PX information (distribution method and table queue information)</td>
</tr>
<tr>
<td><strong>PREDICATE</strong></td>
<td>if relevant, shows the predicate section</td>
</tr>
<tr>
<td><strong>PROJECTION</strong></td>
<td>if relevant, shows the projection section</td>
</tr>
<tr>
<td><strong>ALIAS</strong></td>
<td>if relevant, shows the &quot;Query Block Name / Object Alias&quot; section</td>
</tr>
<tr>
<td><strong>REMOTE</strong></td>
<td>if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</td>
</tr>
<tr>
<td><strong>NOTE</strong></td>
<td>if relevant, shows the note section of the explain plan</td>
</tr>
<tr>
<td><strong>IOSTATS</strong></td>
<td>assuming that basic plan statistics are collected when SQL statements are executed (either by using the <code>gather_plan_statistics</code> hint or by setting the parameter <code>statistics_level</code> to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor</td>
</tr>
<tr>
<td><strong>MEMSTATS</strong></td>
<td>Assuming that PGA memory management is enabled (that is, <code>pga_aggregate_target</code> parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators</td>
</tr>
<tr>
<td><strong>ALLSTATS</strong></td>
<td>A shortcut for &quot;<strong>IOSTATS MEMSTATS</strong>&quot;</td>
</tr>
</tbody>
</table>

The following two formats are deprecated but supported for backward compatibility:

- **RUNSTATS_TOT** - Same as **IOSTATS**, that is, displays IO statistics for all executions of the specified cursor.
- **RUNSTATS_LAST** - Same as **IOSTATS LAST**, that is, displays the runtime statistics for the last execution of the cursor.

Format keywords can be prefixed by the sign ‘-’ to exclude the specified information. For example, ‘-PROJECTION’ excludes projection information.

---

**Table 178–4 (Cont.) DISPLAY_CURSOR Function Parameters**

<tr>
<td><strong>MEMSTATS</strong></td>
<td>Assuming that PGA memory management is enabled (that is, <code>pga_aggregate_target</code> parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators</td>
</tr>
<tr>
<td><strong>ALLSTATS</strong></td>
<td>A shortcut for &quot;<strong>IOSTATS MEMSTATS</strong>&quot;</td>
</tr>
<tr>
<td><strong>LAST</strong></td>
<td>By default, plan statistics are shown for all executions of the cursor. The keyword <strong>LAST</strong> can be specified to see only the statistics for the last execution.</td>
</tr>
</tbody>
</table>

The following two formats are deprecated but supported for backward compatibility:

- **RUNSTATS_TOT** - Same as **IOSTATS**, that is, displays IO statistics for all executions of the specified cursor.
- **RUNSTATS_LAST** - Same as **IOSTATS LAST**, that is, displays the runtime statistics for the last execution of the cursor.

Format keywords can be prefixed by the sign ‘-’ to exclude the specified information. For example, ‘-PROJECTION’ excludes projection information.
- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan of the last SQL statement executed by the current session:

```sql
SELECT * FROM table {
    DBMS_XPLAN.DISPLAY_CURSOR;
}
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```sql
SELECT * FROM table {
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp');
}
```

To display runtime statistics for the cursor included in the preceding statement:

```sql
SELECT * FROM table {
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST');
}
DISPLAY_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

Syntax

```sql
DBMS_XPLAN.DISPLAY_PLAN (  
    table_name       IN    VARCHAR2   DEFAULT 'PLAN_TABLE',  
    statement_id     IN    VARCHAR2   DEFAULT NULL,  
    format           IN    VARCHAR2   DEFAULT 'TYPICAL',  
    filter_preds     IN    VARCHAR2   DEFAULT NULL,  
    type             IN    VARCHAR2   DEFAULT 'TEXT')  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.</td>
</tr>
<tr>
<td>statement_id</td>
<td>Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause. If no statement_id is specified, the function shows you the plan of the most recent explained statement.</td>
</tr>
<tr>
<td>filter_preds</td>
<td>SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=&gt;'plan_id = 10'</td>
</tr>
<tr>
<td>type</td>
<td></td>
</tr>
</tbody>
</table>

Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see WARNING under Usage Notes).
### Table 178–5 (Cont.) DISPLAY_PLAN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts four values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>BASIC</strong>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>TYPICAL</strong>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</td>
</tr>
<tr>
<td></td>
<td>- <strong>SERIAL</strong>: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>- <strong>ALL</strong>: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</td>
</tr>
<tr>
<td></td>
<td>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</td>
</tr>
<tr>
<td></td>
<td>- <strong>ROWS</strong> - if relevant, shows the number of rows estimated by the optimizer</td>
</tr>
<tr>
<td></td>
<td>- <strong>BYTES</strong> - if relevant, shows the number of bytes estimated by the optimizer</td>
</tr>
<tr>
<td></td>
<td>- <strong>COST</strong> - if relevant, shows optimizer cost information</td>
</tr>
<tr>
<td></td>
<td>- <strong>PARTITION</strong> - if relevant, shows partition pruning information</td>
</tr>
<tr>
<td></td>
<td>- <strong>PARALLEL</strong> - if relevant, shows PX information (distribution method and table queue information)</td>
</tr>
<tr>
<td></td>
<td>- <strong>PREDICATE</strong> - if relevant, shows the predicate section</td>
</tr>
<tr>
<td></td>
<td>- <strong>PROJECTION</strong> - if relevant, shows the projection section</td>
</tr>
<tr>
<td></td>
<td>- <strong>ALIAS</strong> - if relevant, shows the &quot;Query Block Name / Object Alias&quot; section</td>
</tr>
<tr>
<td></td>
<td>- <strong>REMOTE</strong> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</td>
</tr>
<tr>
<td></td>
<td>- <strong>NOTE</strong> - if relevant, shows the note section of the explain plan</td>
</tr>
<tr>
<td></td>
<td>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</td>
</tr>
<tr>
<td></td>
<td>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).</td>
</tr>
<tr>
<td>type</td>
<td>Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE).</td>
</tr>
</tbody>
</table>
Return Values

Returns the requested report as CLOB

Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

WARNING: Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.
DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```sql
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (  sql_handle      IN VARCHAR2 := NULL,  plan_name       IN VARCHAR2 := NULL,  format          IN VARCHAR2 := 'TYPICAL')
RETURN dbms_xplan_type_table;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement handle. It identifies a SQL statement whose plan(s) are to be displayed.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.</td>
</tr>
<tr>
<td>format</td>
<td>Format string determines what information stored in the plan displayed. One of three format values ('BASIC', 'TYPICAL', 'ALL') can be used, each representing a common use case.</td>
</tr>
</tbody>
</table>

Return Values

A PL/SQL type table

Usage Notes

This procedure uses plan information stored in the plan baseline to explain and display the plans. It is possible that the plan_id stored in the SQL management base may not match with the plan_id of the generated plan. A mismatch between stored plan_id and generated plan_id means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

Examples

**Display all plans of a SQL statement identified by the SQL handle 'SYS_SQL_b1d49f6074ab95af' using TYPICAL format**

```sql
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE('SYS_SQL_b1d49f6074ab95af')) t;
```

**Display all plans of one or more SQL statements containing the string 'HR2' using BASIC format**

```sql
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines
  WHERE sql_handle LIKE '%HR2%') t;
```
WHERE sql_text like 'HR2') pb,
TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
    'BASIC')) t;
**DISPLAY_SQLSET Function**

This table function displays the execution plan of a given statement stored in a SQL tuning set.

**Syntax**

```
DBMS_XPLAN.DISPLAY_SQLSET(
    sqlset_name  IN  VARCHAR2,
    sql_id       IN  VARCHAR2,
    plan_hash_value IN NUMBER := NULL,
    format       IN  VARCHAR2  := 'TYPICAL',
    sqlset_owner IN  VARCHAR2  := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Name of the SQL Tuning Set</td>
</tr>
<tr>
<td>sql_id</td>
<td>Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function DBMS_SQLTUNE.SELECT_SQLSET.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.</td>
</tr>
</tbody>
</table>
| format             | Controls the level of details for the plan. It accepts four values:  
  - **BASIC**: Displays the minimum information in the plan—the operation ID, the operation name and its option.  
  - **TYPICAL**: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).  
  - **SERIAL**: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.  
  - **ALL**: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). |

---

178-24  Oracle Database PL/SQL Packages and Types Reference
For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:

- **ROWS** - if relevant, shows the number of rows estimated by the optimizer
- **BYTES** - if relevant, shows the number of bytes estimated by the optimizer
- **COST** - if relevant, shows optimizer cost information
- **PARTITION** - if relevant, shows partition pruning information
- **PARALLEL** - if relevant, shows PX information (distribution method and table queue information)
- **PREDICATE** - if relevant, shows the predicate section
- **PROJECTION** - if relevant, shows the projection section
- **ALIAS** - if relevant, shows the "Query Block Name / Object Alias" section
- **REMOTE** - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)
- **NOTE** - if relevant, shows the note section of the explain plan
- **IOSTATS** - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter statistics_level to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor.
- **MEMSTATS** - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.
- **ALLSTATS** - A shortcut for 'IOSTATS MEMSTATS'
- **LAST** - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution.

The following two formats are deprecated but supported for backward compatibility:

- **RUNSTATS_TOT** - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor.
- **RUNSTATS_LAST** - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor

Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-'-PREDICATE' excludes projection information.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set. The default is the current user.</td>
</tr>
</tbody>
</table>
Usage Notes

Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID 'gwp663cqh5qbf' and PLAN HASH 3693697075 in the SQL Tuning Set called 'OLTP_optimization_0405':

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf', 3693697075));
```

To display all execution plans of the SQL ID 'atfwcg8anrykp' stored in the SQL tuning set:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST'));
```
The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- **Using DBMS_XSLPROCESSOR**
  - Overview

- **Summary of DBMS_XSLPROCESSOR Subprograms**

  **See Also:**

  - *Oracle XML DB Developer’s Guide*
This section contains topics which relate to using the DBMS_XSLPROCESSOR package.

- Overview on page 179-3
Overview

The **DBMS_XSLPROCESSOR** package provides an interface to manage the contents and structure of XML documents.

**Standards**

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

**Concepts**

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

**Implementation**

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails
## Summary of DBMS_XSLPROCESSOR Subprograms

</tr>
</tbody>
</table>
CLOB2FILE Procedure

This procedure writes content of a CLOB into a file.

Syntax

```sql
DBMS_XSLPROCESSOR.CLOB2FILE(
    cl          IN  CLOB;
    flocation   IN  VARCHAR2,
    fname       IN  VARCHAR2,
    csid        IN  NUMBER:=0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOB</td>
<td>File directory</td>
</tr>
<tr>
<td>flocation</td>
<td>File directory</td>
</tr>
<tr>
<td>fname</td>
<td>File name</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the file</td>
</tr>
<tr>
<td></td>
<td>• Must be a valid Oracle id; otherwise returns an error</td>
</tr>
<tr>
<td></td>
<td>• If 0, content of the output file will be in the database character set</td>
</tr>
</tbody>
</table>
FREEPROCESSOR Procedure

This procedure Frees a Processor object.

Syntax

DBMS_XSLPROCESSOR.FREEPROCESSOR (  
   p  IN  Processor);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Processor</td>
</tr>
</tbody>
</table>
FREESTYLESHEET Procedure

This procedure frees a Stylesheet object.

Syntax

```sql
DBMS_XSLPROCESSOR.FREESTYLESHEET(
    ss  IN  Stylesheet);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet</td>
</tr>
</tbody>
</table>

Table 179–4 FREESTYLESHEET Procedure Parameters
NEWPROCESSOR Function

This function returns a new Processor instance. The function must be called before the default behavior of Processor can be changed and if other processor methods need to be used.

Syntax

```sql
DBMS_XSLPROCESSOR.NEWPROCESSOR
RETURN Processor;
```
NEWSTYLESHEET Functions

This function creates and returns a new Stylesheet instance. The options are described in the following table.

Syntax

Creates and returns a new stylesheet instance using the given DOMDOCUMENT and reference URLs:

```sql
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
    xmldoc IN DOMDOCUMENT,
    ref IN VARCHAR2)
RETURN Stylesheet;
```

Creates and returns a new Stylesheet instance using the given input and reference URLs:

```sql
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
    inp IN VARCHAR2,
    ref IN VARCHAR2)
RETURN Stylesheet;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmldoc</td>
<td>DOMDocument to use for construction</td>
</tr>
<tr>
<td>inp</td>
<td>Input URL to use for construction</td>
</tr>
<tr>
<td>ref</td>
<td>Reference URL</td>
</tr>
</tbody>
</table>
This function transforms input XMLDocument. Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

Syntax

Transforms input XMLDocument using given DOMDocument and stylesheet, and returns the resultant document fragment:

```sql
DBMS_XSLPROCESSOR.PROCESSXSL(
  p IN Processor,
  ss IN Stylesheet,
  xmldoc IN DOMDOCUMENT),
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as URL and the Stylesheet, and returns the resultant document fragment:

```sql
DBMS_XSLPROCESSOR.PROCESSXSL(
  p IN Processor,
  ss IN Stylesheet,
  url IN VARCHAR2,
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as CLOB and the Stylesheet, and returns the resultant document fragment:

```sql
DBMS_XSLPROCESSOR.PROCESSXSL(
  p IN Processor,
  ss IN Stylesheet,
  clb IN CLOB)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given DOMDocument and the stylesheet, and writes the output to the specified file:

```sql
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
  p IN Processor,
  ss IN Stylesheet,
  xmldoc IN DOMDOCUMENT,
  dir IN VARCHAR2,
  fileName IN VARCHAR2);
```

Transforms input XMLDocument using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```sql
DBMS_XSLPROCESSOR.PROCESSXSL(
  p IN Processor,
  ss IN Stylesheet,
  url IN VARCHAR2,
  dir IN VARCHAR2,
  fileName IN VARCHAR2);
```

Transforms input XMLDocument using given DOMDocument and the stylesheet, and writes the output to a CLOB:

```sql
DBMS_XSLPROCESSOR.PROCESSXSL(
  p IN Processor,
  ss IN Stylesheet,
  xmldoc IN DOMDOCUMENT,
  clb IN CLOB);
```
ss IN Stylesheet,
xmldoc IN DOMDOCUMENT,
cl IN OUT CLOB);

Transforms input XMLDocument using given DOMDOCUMENTFRAGMENT and the stylesheet, and returns the resultant document fragment:

DBMS_XSLPROCESSOR.PROCESSXSL(
p IN Processor,
ss IN Stylesheet,
xmldf IN DOMDOCUMENTFRAGMENT)
RETURN DOMDOCUMENTFRAGMENT;

Transforms input XMLDocumentFragment using given DOMDocumentFragment and the stylesheet, and writes the output to the specified file in a specified directory:

DBMS_XSLPROCESSOR.PROCESSXSL(
p IN Processor,
ss IN Stylesheet,
xmldf IN DOMDOCUMENTFRAGMENT,
dir IN VARCHAR2,
filename IN VARCHAR2);

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a buffer:

DBMS_XSLPROCESSOR.PROCESSXSL(
p IN Processor,
ss IN Stylesheet,
xmldf IN DOMDOCUMENTFRAGMENT,
buf IN OUT VARCHAR2);

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a CLOB:

DBMS_XSLPROCESSOR.PROCESSXSL(
p IN Processor,
ss IN Stylesheet,
xmldf IN DOMDOCUMENTFRAGMENT,
cl IN OUT CLOB);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Processor instance</td>
</tr>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
<tr>
<td>xmldoc</td>
<td>XML document being transformed</td>
</tr>
<tr>
<td>url</td>
<td>URL for the information being transformed</td>
</tr>
<tr>
<td>clb</td>
<td>CLOB containing information to be transformed</td>
</tr>
<tr>
<td>dir</td>
<td>Directory where processing output file is saved</td>
</tr>
<tr>
<td>filename</td>
<td>Processing output file</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB to which the processing output is saved</td>
</tr>
<tr>
<td>xmldf</td>
<td>XMLDocumentFragment being transformed</td>
</tr>
</tbody>
</table>
READ2CLOB Function

This function reads content of a file into a CLOB.

Syntax

```sql
DBMS_XSLPROCESSOR.READ2CLOB(
    flocation     IN   VARCHAR2,
    fname         IN   VARCHAR2,
    csid          IN   NUMBER:=0)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flocation</td>
<td>File directory</td>
</tr>
<tr>
<td>fname</td>
<td>File name</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the file</td>
</tr>
<tr>
<td></td>
<td>Must be a valid Oracle id; otherwise returns an error</td>
</tr>
<tr>
<td></td>
<td>If 0, input file is assumed to be in the database character set</td>
</tr>
</tbody>
</table>
REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```sql
DBMS_XSLPROCESSOR.REMOVEPARAM(
    ss IN Stylesheet,
    name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
<tr>
<td>name</td>
<td>Name of the parameter</td>
</tr>
</tbody>
</table>
RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

DBMS_XSLPROCESSOR.RESETPARAMS(
    ss  IN  Stylesheet);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
</tbody>
</table>
**SELECTNODES Function**

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

**Syntax**

```plsql
DBMS_XSLPROCESSOR.SELECTNODES(
    n           IN   DBMS_XMLDOM.DOMNODE,
    pattern     IN   VARCHAR2,
    namespace   IN VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODELIST;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Root DOMNode of the tree</td>
</tr>
<tr>
<td>pattern</td>
<td>Pattern to use</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace declared</td>
</tr>
</tbody>
</table>
**SELECTSINGLENODE Function**

This function selects the first node from the tree that match the supplied path expression, and returns that node.

**Syntax**

```sql
DBMS_XSLPROCESSOR.SELECTSINGLENODE(
  n           IN   DBMS_XMLDOM.DOMNODE,
  pattern     IN   VARCHAR2,
  namespace   IN   VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Root DOMNode of the tree</td>
</tr>
<tr>
<td>pattern</td>
<td>Pattern to use</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace declared</td>
</tr>
</tbody>
</table>
**SETERRORLOG Procedure**

This procedure sets errors to be sent to the specified file.

---

**Note:** This subprogram has been deprecated, and is included only for reasons of backward compatibility.

---

**Syntax**

```sql
DBMS_XSLPROCESSOR.SETERRORLOG(
    p IN Processor,
    fileName IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>p</code></td>
<td>Processor instance</td>
</tr>
<tr>
<td><code>fileName</code></td>
<td>Complete path of the file to use as the error log</td>
</tr>
</tbody>
</table>
SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet. The parameter value must be a valid XPath expression. Literal string values must be quoted.

Syntax

```sql
DBMS_XSLPROCESSOR.SETPARAM(
    ss      IN   Stylesheet,
    name    IN   VARCHAR2,
    value   IN   VARCHAR2);
```

Parameters

Table 179–13  SETPARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
<tr>
<td>name</td>
<td>Name of the parameter</td>
</tr>
<tr>
<td>value</td>
<td>Value of the parameter</td>
</tr>
</tbody>
</table>
SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS(
    p     IN   Processor,
    yes   IN   BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Processor instance</td>
</tr>
<tr>
<td>yes</td>
<td>Mode to set: TRUE to show warnings, FALSE otherwise</td>
</tr>
</tbody>
</table>
TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a DOMDocumentFragment.

Syntax

```sql
DBMS_XSLPROCESSOR.TRANSFORMNODE(
    n IN DOMNODE,
    ss IN Stylesheet)
RETURN DOMDocumentFragment;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode to transform</td>
</tr>
<tr>
<td>ss</td>
<td>Stylesheet to use</td>
</tr>
</tbody>
</table>

179-20   Oracle Database PL/SQL Packages and Types Reference
VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

```
DBMS_XSLPROCESSOR.VALUEOF(
   n           IN    DBMS_XMLDOM.DOMNODE,
   pattern     IN    VARCHAR2,
   namespace   IN    VARCHAR2 := NULL)
RETURN VARCHAR2;
```

```
DBMS_XSLPROCESSOR.VALUEOF(
   n           IN    DBMS_XMLDOM.DOMNODE,
   pattern     IN    VARCHAR2,
   val         OUT   VARCHAR2,
   namespace   IN    VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Node whose value is being retrieved</td>
</tr>
<tr>
<td>pattern</td>
<td>Pattern to use</td>
</tr>
<tr>
<td>val</td>
<td>Retrieved value</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace to use</td>
</tr>
</tbody>
</table>
The DEBUG_EXTPROC package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- **Using DEBUG_EXTPROC**
  - Security Model
  - Operational Notes
  - Rules and Limits
- **Summary of DEBUG_EXTPROC Subprograms**
Using DEBUG_EXTPROC

- Security Model
- Operational Notes
- Rules and Limits
Security Model

Your Oracle account must have EXECUTE privileges on the package and CREATE LIBRARY privileges.
To install the package, run the script `DBGEXTP.SQL`.

- Install/load this package in the Oracle USER where you want to debug the ‘extproc’ process.
- Ensure that you have execute privileges on package `DEBUG_EXTPROC`:
  ```sql
  SELECT SUBSTR(OBJECT_NAME, 1, 20)
  FROM USER_OBJECTS
  WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
  ```
- You can install this package as any other user, as long as you have EXECUTE privileges on the package.

**Note:** These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL*Plus or OCI program by connecting to ORACLE.
- Execute procedure `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT` to startup the extproc agent in this session; for example, execute `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function ‘pextproc’ and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`.
- Your debugger should now break in function ‘pextproc’. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, ‘share’ in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.
Rules and Limits

**Note:** DEBUG_EXTPROC works only on platforms with debuggers that can attach to a running process.
## Summary of DEBUG_EXTPROC Subprograms

<table>
<thead>
<tr>
<th>Table 180–1  DEBUG_EXTPROC Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
</tr>
<tr>
<td>STARTUP_EXTPROC_AGENT Procedure on page 180-7</td>
</tr>
</tbody>
</table>
STARTUP_EXTPROC_AGENT Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
The HTF (hypertext functions) and HTP (hypertext procedures) packages generate HTML tags. For example, the \texttt{HTF.ANCHOR} function generates the HTML anchor tag, \texttt{<A>}. 

**See Also:** For more information about implementation of this package:
- \textit{Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server}
- \textit{Oracle Fusion Middleware User’s Guide for mod_plsql}

This chapter contains the following topics:

- **Using HTF**
  - Operational Notes
  - Rules and Limits
  - Examples
- **Summary of Tags**
- **Summary of HTF Subprograms**
Using HTF

- Operational Notes
- Rules and Limits
- Examples
Operational Notes

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is an ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.

- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function, which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.PRINT function. It then prints its parameters to the generated Web page.
Rules and Limits

If you use values of the LONG data type in functions such as HTF.PRINT, HTF.PRN, HTF.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 data type in the function.
Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
  HTP.P (HTF.HTMLOPEN); -- generates <HTML>
  HTP.P (HTF.HEADOPEN); -- generates <HEAD>
  HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
  HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
  HTP.P (HTF.BODYOPEN); -- generates <BODY>
  HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
  HTP.P (HTF.BODYCLOSE); -- generates </BODY>
  HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```
Summary of Tags

HTML, HEAD, and BODY Tags

HTMLOPEN Function, HTMLCLOSE Function - generate <HTML> and </HTML>
HEADOPEN Function, HEADCLOSE Function - generate <HEAD> and </HEAD>
BODYOPEN Function, BODYCLOSE Function - generate <BODY> and </BODY>

Comment Tag

COMMENT Function - generates <!-- and -->
http://www.w3.org.BASE Function - generates <BASE>
LINKREL Function - generates <LINK> with the REL attribute
LINKREV Function - generates <LINK> with the REV attribute
TITLE Function - generates <TITLE>
META Function - generates <META>
SCRIPT Function - generates <SCRIPT>
STYLE Function - generates <STYLE>
ISINDEX Function - generates <ISINDEX>

Applet Tags

APPLETOPEN Function, APPLETCLOSE Function - generate <APPLET> and </APPLET>
PARAM Function - generates <PARAM>

List Tags

OLISTOPEN Function, OLISTCLOSE Function - generate <OL> and </OL>
ULISTOPEN Function, ULISTCLOSE Function - generate <UL> and </UL>
DLISTOPEN Function, DLISTCLOSE Function - generate <DL> and </DL>
DLISTTERM Function - generates <DT>
DLISTDEF Function - generates <DD>
DIRLISTOPEN Function, DIRLISTCLOSE Function - generate <DIR> and </DIR>
LISTHEADER Function - generates <LH>
LISTINGOPEN Function, LISTINGCLOSE Function - generate <LISTING> and </LISTING>
MENULISTOPEN Function - generate <MENU> and </MENU>
LISTITEM Function - generates <LI>

Form Tags

FORMOPEN Function, FORMCLOSE Function - generate <FORM> and </FORM>
FORMCHECKBOX Function - generates <INPUT TYPE="CHECKBOX">
FORMHIDDEN Function - generates <INPUT TYPE="HIDDEN">
FORMIMAGE Function - generates `<INPUT TYPE="IMAGE">
FORMPASSWORD Function - generates `<INPUT TYPE="PASSWORD">
FORMRADIO Function - generates `<INPUT TYPE="RADIO">
FORMSELECTOPEN Function, FORMSELECTCLOSE Function - generate `<SELECT>
    and `</SELECT>
FORMSELECTOPTION Function - generates `<OPTION>
FORMTEXT Function - generates `<INPUT TYPE="TEXT">
FORMTEXTAREA Function - generate `<TEXTAREA`
FORMTEXTAREAOPEN Function, FORMTEXTAREACLOSE Function - generate `<TEXTAREA>` and `</TEXTAREA>`
FORMRESET Function - generates `<INPUT TYPE="RESET">
FORMSUBMIT Function - generates `<INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Function, TABLECLOSE Function - generate `<TABLE>` and `</TABLE>`
TABLECAPTION Function - generates `<CAPTION>`
TABLEROWOPEN Function, TABLEROWCLOSE Function - generate `<TR>` and `</TR>`
TABLEHEADER Function - generates `<TH>`
TABLEDATA Function - generates `<TD>`

IMG, HR, and A Tags

HR Function, LINE Function - generate `<HR>`
IMG Function, IMG2 Function - generate `<IMG>`
ANCHOR Function, ANCHOR2 Function - generate `<A>`
MAPOPEN Function, MAPCLOSE Function - generate `<MAP>` and `</MAP>`

Paragraph Formatting Tags

HEADER Function - generates heading tags (`<H1>` to `<H6>`) PARA Function, PARAGRAPH Function - generate `<P>`
PRN Functions, PRINT Functions - generate any text that is passed in
PRN Functions, S Function - generate any text that is passed in; special characters in HTML are escaped
PREOPEN Function, PRECLOSE Function - generate `<PRE>` and `</PRE>`
BLOCKQUOTEOPEN Function, BLOCKQUOTECLOSE Function - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`
DIV Function - generates `<DIV>`
NL Function, BR Function - generate `<BR>`
NOBR Function - generates `<NOBR>`
WBR Function - generates `<WBR>`
PLAINTEXT Function - generates <PLAINTEXT>
ADDRESS Function - generates <ADDRESS>
MAILTO Function - generates <A> with the MAILTO attribute
AREA Function - generates <AREA>
BGSOUND Function - generates <BGSOUND>

Character Formatting Tags
BASEFONT Function - generates <BASEFONT>
BIG Function - generates <BIG>
BOLD Function - generates <B>
CENTER Function - generates <CENTER> and </CENTER>
CENTEROPEN Function, CENTERCLOSE Function - generate <CENTER> and </CENTER>
CITE Function - generates <CITE>
CODE Function - generates <CODE>
DFN Function - generates <DFN>
EM Function, EMPHASIS Function - generate <EM>
FONTOPEN Function, FONTCLOSE Function - generate <FONT> and </FONT>
ITALIC Function - generates <I>
KBD Function, KEYBOARD Function - generate <KBD> and </KBD>
S Function - generates <S>
SAMPLE Function - generates <SAMP>
SMALL Function - generates <SMALL>
STRIKE Function - generates <STRIKE>
STRONG Function - generates <STRONG>
SUB Function - generates <SUB>
SUP Function - generates <SUP>
TELETYPE Function - generates <TT>
UNDERLINE Function - generates <U>
VARIABLE Function - generates <VAR>

Frame Tags
FRAME Function - generates <FRAME>
FRAMESETOPEN Function, FRAMESETCLOSE Function - generate <FRAMESET> and </FRAMESET>
NOFRAMESOPEN Function, NOFRAMESCLOSE Function - generate <NOFRAMES> and </NOFRAMES>
# Summary of HTF Subprograms

<table>
<thead>
<tr>

<td>Generates the <code>&lt;APPLET&gt;</code> tag which begins the invocation of a Java applet</td>
</tr>
<tr>
<td>AREA Function on page 181-20</td>
<td>Generates the <code>&lt;AREA&gt;</code> tag, which defines a client-side image map</td>
</tr>
<tr>
<td>BASE Function on page 181-21</td>
<td>Generates the <code>&lt;BASE&gt;</code> tag which records the URL of the document</td>
</tr>
<tr>
<td>BASEFONT Function on page 181-22</td>
<td>Generates the <code>&lt;BASEFONT&gt;</code> tag which specifies the base font size for a Web page</td>
</tr>
<tr>
<td>BGSOUND Function on page 181-23</td>
<td>Generates the <code>&lt;BGSOUND&gt;</code> tag which includes audio for a Web page</td>
</tr>
<tr>
<td>BIG Function on page 181-24</td>
<td>Generates the <code>&lt;BIG&gt;</code> and <code>&lt;/BIG&gt;</code> tags which direct the browser to render the text in a bigger font</td>
</tr>
<tr>
<td>BLOCKQUOTECLOSE Function on page 181-25</td>
<td>Generates the <code>&lt;/BLOCKQUOTE&gt;</code> tag which mark the end of a section of quoted text</td>
</tr>
<tr>
<td>BLOCKQUOTEOPEN Function on page 181-26</td>
<td>Generates the <code>&lt;BLOCKQUOTE&gt;</code> tag, which marks the beginning of a section of quoted text</td>
</tr>
<tr>
<td>BODYCLOSE Function on page 181-27</td>
<td>Generates the <code>&lt;/BODY&gt;</code> tag which marks the end of a body section of an HTML document</td>
</tr>
<tr>
<td>BODYOPEN Function on page 181-28</td>
<td>Generates the <code>&lt;BODY&gt;</code> tag which marks the beginning of the body section of an HTML document</td>
</tr>
<tr>
<td>BOLD Function on page 181-29</td>
<td>Generates the <code>&lt;B&gt;</code> and <code>&lt;/B&gt;</code> tags which direct the browser to display the text in boldface</td>
</tr>
<tr>
<td>BR Function on page 181-30</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>CENTER Function on page 181-31</td>
<td>Generates the <code>&lt;CENTER&gt;</code> and <code>&lt;/CENTER&gt;</code> tags which center a section of text within a Web page</td>
</tr>
<tr>
<td>CENTERCLOSE Function on page 181-32</td>
<td>Generates the <code>&lt;/CENTER&gt;</code> tag which marks the end of a section of text to center</td>
</tr>
<tr>
<td>CENTEROPEN Function on page 181-33</td>
<td>Generates the <code>&lt;CENTER&gt;</code> tag which mark the beginning of a section of text to center</td>
</tr>
<tr>

<tr>
<td>DFN Function on page 181-37</td>
<td>Generates the &lt;DFN&gt; and &lt;/DFN&gt; tags which direct the browser to mark the text as italics or however “definition” is defined stylistically</td>
</tr>
<tr>
<td>DIRLISTCLOSE Function on page 181-38</td>
<td>Generates the &lt;/DIR&gt; tag which ends a directory list section</td>
</tr>
<tr>
<td>DIRLISTOPEN Function on page 181-39</td>
<td>Generates the &lt;DIR&gt; which starts a directory list section</td>
</tr>
<tr>
<td>DIV Function on page 181-40</td>
<td>Generates the &lt;DIV&gt; tag which creates document divisions</td>
</tr>
<tr>
<td>DLISTCLOSE Function on page 181-41</td>
<td>Generates the &lt;/DL&gt; tag which ends a definition list</td>
</tr>
<tr>
<td>DLISTDEF Function on page 181-42</td>
<td>Generates the &lt;DD&gt; tag, which inserts definitions of terms</td>
</tr>
<tr>
<td>DLISTOPEN Function on page 181-43</td>
<td>Generates the &lt;DL&gt; tag which starts a definition list</td>
</tr>
<tr>
<td>DLISTTERM Function on page 181-44</td>
<td>Generates the &lt;DT&gt; tag which defines a term in a definition list &lt;DL&gt;</td>
</tr>
<tr>
<td>EM Function on page 181-45</td>
<td>Generates the &lt;EM&gt; and &lt;/EM&gt; tags, which define text to be emphasized</td>
</tr>
<tr>
<td>EMPHASIS Function on page 181-46</td>
<td>Generates the &lt;EM&gt; and &lt;/EM&gt; tags, which define text to be emphasized</td>
</tr>
<tr>
<td>ESCAPE_SC Function on page 181-47</td>
<td>Replaces characters that have special meaning in HTML with their escape sequences</td>
</tr>
<tr>
<td>ESCAPE_URL Function on page 181-48</td>
<td>Replaces characters that have special meaning in HTML and HTTP with their escape sequences</td>
</tr>
<tr>
<td>FONTCLOSE Function on page 181-50</td>
<td>Generates the &lt;/FONT&gt; tag which marks the end of a section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FONTOOPEN Function on page 181-50</td>
<td>Generates the &lt;FONT&gt; which marks the beginning of a section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FORMCHECKBOX Function on page 181-52</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;checkbox&quot; which inserts a checkbox element in a form</td>
</tr>
<tr>
<td>FORMCLOSE Function on page 181-53</td>
<td>Generates the &lt;/FORM&gt; tag which marks the end of a form section in an HTML document</td>
</tr>
<tr>
<td>FORMFILE Function on page 181-54</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;file&quot; which inserts a file form element, and is used for file uploading for a given page</td>
</tr>
<tr>
<td>FORMHIDDEN Function on page 181-55</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;hidden&quot; which inserts a hidden form element</td>
</tr>
<tr>
<td>FORMIMAGE Function on page 181-56</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;image&quot; which creates an image field that the user clicks to submit the form immediately</td>
</tr>
<tr>
<td>FORMOPEN Function on page 181-57</td>
<td>Generates the &lt;FORM&gt; tag which marks the beginning of a form section in an HTML document</td>
</tr>
</tbody>
</table>
### Table 181–1 (Cont.) HTF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORMPASSWORD Function on page 181-58</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;password&quot;</code> which creates a single-line text entry field</td>
</tr>
<tr>
<td>FORMRADIO Function on page 181-59</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;radio&quot;</code>, which creates a radio button on the HTML form</td>
</tr>
<tr>
<td>FORMRESET Function on page 181-60</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;reset&quot;</code> which creates a button that, when selected, resets the form fields to their initial values</td>
</tr>
<tr>
<td>FORMSELECTCLOSE Function on page 181-61</td>
<td>Generates the <code>&lt;/SELECT&gt;</code> tag which marks the end of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPEN Function on page 181-62</td>
<td>Generates the <code>&lt;/SELECT&gt;</code> tag which marks the beginning of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPTION Function on page 181-63</td>
<td>Generates the <code>&lt;OPTION&gt;</code> tag which represents one choice in a Select element</td>
</tr>
<tr>
<td>FORMSUBMIT Function on page 181-64</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;submit&quot;</code> which creates a button that, when clicked, submits the form</td>
</tr>
<tr>
<td>FORMTEXT Function on page 181-65</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;text&quot;</code>, which creates a field for a single line of text</td>
</tr>
<tr>
<td>FORMTEXTAREA Function on page 181-66</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area</td>
</tr>
<tr>
<td>FORMTEXTAREA2 Function on page 181-67</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FORMTEXTAREACLOSE Function on page 181-68</td>
<td>Generates the <code>&lt;/TEXTAREA&gt;</code> tag which ends a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOOPEN Function on page 181-69</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> which marks the beginning of a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOOPEN2 Function on page 181-70</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> which marks the beginning of a text area form element with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FRAME Function on page 181-71</td>
<td>Generates the <code>&lt;FRAME&gt;</code> tag which defines the characteristics of a frame created by a <code>&lt;FRAMESET&gt;</code> tag</td>
</tr>
<tr>
<td>FRAMESETCLOSE Function on page 181-72</td>
<td>Generates the <code>&lt;/FRAMESET&gt;</code> tag which ends a frameset section</td>
</tr>
<tr>
<td>FRAMESETOPEN Function on page 181-73</td>
<td>Generates the <code>&lt;/FRAMESET&gt;</code> tag which begins a frameset section</td>
</tr>
<tr>
<td>HEADCLOSE Function on page 181-74</td>
<td>Generates the <code>&lt;/HEAD&gt;</code> tag which marks the end of an HTML document head section</td>
</tr>
<tr>
<td>HEADER Function on page 181-75</td>
<td>Generates opening heading tags (<code>&lt;H1&gt;</code> to <code>&lt;H6&gt;</code>) and their corresponding closing tags (<code>&lt;/H1&gt;</code> to <code>/&lt;/H6&gt;</code>)</td>
</tr>
<tr>
<td>HEADOPEN Function on page 181-76</td>
<td>Generates the <code>&lt;HEAD&gt;</code> tag which marks the beginning of the HTML document head section</td>
</tr>
<tr>
<td>HR Function on page 181-77</td>
<td>Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>HTMLCLOSE Function on page 181-79</td>
<td>Generates the <code>&lt;/HTML&gt;</code> tag which marks the end of an HTML document</td>

<tr>
<td>on page 181-97</td>
<td></td>
</tr>
<tr>
<td>META Function</td>
<td>Generates the <code>&lt;META&gt;</code> tag, which embeds meta-information about the document and also specifies values for HTTP headers</td>
</tr>
<tr>
<td>on page 181-98</td>
<td></td>
</tr>
</tbody>
</table>
## Table 181–1 (Cont.) HTF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NL Function on page 181-86</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>NOBR Function on page 181-100</td>
<td>Generates the <code>&lt;NOBR&gt;</code> and <code>&lt;/NOBR&gt;</code> tags which turn off line-breaking in a section of text</td>
</tr>
<tr>
<td>NOFRAMESCLOSE Function on page 181-101</td>
<td>Generates the <code>&lt;NOFRAMES&gt;</code> tag which marks the end of a no-frames section</td>
</tr>
<tr>
<td>NOFRAMESOPEN Function on page 181-102</td>
<td>Generates the <code>&lt;NOFRAMES&gt;</code> tag which mark the beginning of a no-frames section</td>
</tr>
<tr>
<td>OLISTCLOSE Function on page 181-103</td>
<td>Generates the <code>&lt;/OL&gt;</code> tag which defines the end of an ordered list</td>
</tr>
<tr>
<td>OLISTOPEN Function on page 181-104</td>
<td>Generates the <code>&lt;OL&gt;</code> tag which marks the beginning of an ordered list</td>
</tr>
<tr>
<td>PARA Function on page 181-105</td>
<td>Generates the <code>&lt;P&gt;</code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph</td>
</tr>
<tr>
<td>PARAGRAPH Function on page 181-106</td>
<td>Adds attributes to the <code>&lt;P&gt;</code> tag</td>
</tr>
<tr>
<td>PARAM Function on page 181-107</td>
<td>Generates the <code>&lt;PARAM&gt;</code> tag which specifies parameter values for Java applets</td>
</tr>
<tr>
<td>PLAINTEXT Function on page 181-108</td>
<td>Generates the <code>&lt;PLAINTEXT&gt;</code> and <code>&lt;/PLAINTEXT&gt;</code> tags which direct the browser to render the text they surround in fixed-width type</td>
</tr>
<tr>
<td>PRECLOSE Function on page 181-109</td>
<td>Generates the <code>&lt;/PRE&gt;</code> tag which marks the end of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PREOPEN Function on page 181-110</td>
<td>Generates the <code>&lt;PRE&gt;</code> tag which marks the beginning of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PRINT Functions on page 181-111</td>
<td>Generates the specified parameter as a string terminated with the <code>\n</code> newline character</td>
</tr>
<tr>
<td>PRN Functions on page 181-112</td>
<td>Generates the specified parameter as a string</td>
</tr>
<tr>
<td>S Function on page 181-113</td>
<td>Generates the <code>&lt;S&gt;</code> and <code>&lt;/S&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>SAMPLE Function on page 181-114</td>
<td>Generates the <code>&lt;SAMP&gt;</code> and <code>&lt;/SAMP&gt;</code> tags which direct the browser to render the text they surround in monospace font or however “sample” is defined stylistically</td>
</tr>
<tr>
<td>SCRIPT Function on page 181-115</td>
<td>Generates the <code>&lt;SCRIPT&gt;</code> and <code>&lt;/SCRIPT&gt;</code> tags which contain a script written in languages such as JavaScript and VBscript</td>
</tr>
<tr>
<td>SMALL Function on page 181-116</td>
<td>Generates the <code>&lt;SMALL&gt;</code> and <code>&lt;/SMALL&gt;</code> tags, which direct the browser to render the text they surround using a small font</td>
</tr>
<tr>
<td>STRIKE Function on page 181-117</td>
<td>Generates the <code>&lt;STRIKE&gt;</code> and <code>&lt;/STRIKE&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>STRONG Function on page 181-118</td>
<td>Generates the <code>&lt;STRONG&gt;</code> and <code>&lt;/STRONG&gt;</code> tags which direct the browser to render the text they surround in bold or however “strong” is defined stylistically</td>
</tr>
<tr>
<td>STYLE Function on page 181-119</td>
<td>Generates the <code>&lt;STYLE&gt;</code> and <code>&lt;/STYLE&gt;</code> tags which include a style sheet in a Web page</td>
</tr>
</tbody>
</table>
## Table 181–1 (Cont.) HTF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUB Function</td>
<td>Generates the <code>&lt;SUB&gt;</code> and <code>&lt;/SUB&gt;</code> tags which direct the browser to render the text they surround as subscript</td>
</tr>
<tr>
<td>SUP Function</td>
<td>Generates the <code>&lt;SUP&gt;</code> and <code>&lt;/SUP&gt;</code> tags which direct the browser to render the text they surround as superscript</td>
</tr>
<tr>
<td>TABLECAPTION Function</td>
<td>Generates the <code>&lt;CAPTION&gt;</code> and <code>&lt;/CAPTION&gt;</code> tags which place a caption in an HTML table</td>
</tr>
<tr>
<td>TABLECLOSE Function</td>
<td>Generates the <code>&lt;/TABLE&gt;</code> tag which marks the end of an HTML table</td>
</tr>
<tr>
<td>TABLEDATA Function</td>
<td>Generates the <code>&lt;TD&gt;</code> and <code>&lt;/TD&gt;</code> tags which insert data into a cell of an HTML table</td>
</tr>
<tr>
<td>TABLEHEADER Function</td>
<td>Generates the <code>&lt;TH&gt;</code> and <code>&lt;/TH&gt;</code> tags which insert a header cell in an HTML table</td>
</tr>
<tr>
<td>TABLEOPEN Function</td>
<td>Generates the <code>&lt;TABLE&gt;</code> tag which marks the beginning of an HTML table</td>
</tr>
<tr>
<td>TABLEROWCLOSE Function</td>
<td>Generates the <code>&lt;/TR&gt;</code> tag which marks the end of a new row in an HTML table</td>
</tr>
<tr>
<td>TABLEROWOPEN Function</td>
<td>Generates the <code>&lt;TR&gt;</code> tag which marks the beginning of a new row in an HTML table</td>
</tr>
<tr>
<td>TELETYPE Function</td>
<td>Generates the <code>&lt;TT&gt;</code> and <code>&lt;/TT&gt;</code> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font</td>
</tr>
<tr>
<td>TITLE Function</td>
<td>Generates the <code>&lt;TITLE&gt;</code> and <code>&lt;/TITLE&gt;</code> tags which specify the text to display in the titlebar of the browser window</td>
</tr>
<tr>
<td>ULISTCLOSE Function</td>
<td>Generates the <code>&lt;/UL&gt;</code> tag which marks the end of an unordered list</td>
</tr>
<tr>
<td>ULISTOPEN Function</td>
<td>Generates the <code>&lt;UL&gt;</code> tag which marks the beginning of an unordered list</td>
</tr>
<tr>
<td>UNDERLINE Function</td>
<td>Generates the <code>&lt;U&gt;</code> and <code>&lt;/U&gt;</code> tags, which direct the browser to render the text they surround with an underline</td>
</tr>
<tr>
<td>VARIABLE Function</td>
<td>Generates the <code>&lt;VAR&gt;</code> and <code>&lt;/VAR&gt;</code> tags which direct the browser to render the text they surround in italics or however &quot;variable&quot; is defined stylistically</td>
</tr>
<tr>
<td>WBR Function</td>
<td>Generates the <code>&lt;WBR&gt;</code> tag, which inserts a soft line break within a section of <code>&lt;NOBR</code> text</td>
</tr>
</tbody>
</table>
ADDRESS Function

This function generates the `<ADDRESS>` and `</ADDRESS>` tags which specify the address, author and signature of a document.

Syntax

```
HTF.ADDRESS (    
cvalue IN VARCHAR2 
cnowrap IN VARCHAR2 DEFAULT NULL
cclear IN VARCHAR2 DEFAULT NULL
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The string that goes between the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<ADDRESS CLEAR='cclear' NOWRAP cattributes>cvalue</ADDRESS>
```
ANCHOR Function

This function and the ANCHOR2 Function functions generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR Function provides a target and therefore can be used for a frame.

Syntax

```sql
HTP.ANCHOR (curl IN VARCHAR2,
            ctext IN VARCHAR2,
            cname IN VARCHAR2 DEFAULT NULL,
            cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the &lt;A&gt; and &lt;/A&gt; tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.
ANCHOR2 Function

This function and the ANCHOR Function generate the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (  
curl    IN VARCHAR2,  
ctext    IN VARCHAR2,  
cname    IN VARCHAR2  DEFAULT NULL,  
ctarget  IN VARCHAR2  DEFAULT NULL,  
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<A HREF='curl' NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```
APPLETCLOSE Function

This function closes the applet invocation with the </APPLET> tag. You must first invoke the a Java applet using APPLETPROEN Function on page 181-19

Syntax

HTP.APPLETCLOSE
RETURN VARCHAR2;
APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Function on page 181-18 which generates the </APPLET> tag.

Syntax

```
HTF.APPLETOPEN (  
    ccode         IN     VARCHAR2,  
    cheight       IN     NUMBER,  
    cwidth        IN     NUMBER,  
    cattributes   IN     VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccode</td>
<td>The value for the CODE attribute which specifies the name of the applet class.</td>
</tr>
<tr>
<td>cheight</td>
<td>The value for the HEIGHT attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
