<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE='testclass.class' height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Function function on page 181-107.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.
AREA Function

This function generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

Syntax

```sql
HTF.AREA ( ccoords IN VARCHAR2,
cshape IN VARCHAR2 DEFAULT NULL,
chref IN VARCHAR2 DEFAULT NULL,
cnohref IN VARCHAR2 DEFAULT NULL,
ctarget IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccoords</td>
<td>The the value for the COORDS attribute.</td>
</tr>
<tr>
<td>cshape</td>
<td>The value for the SHAPE attribute.</td>
</tr>
<tr>
<td>chref</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>cnohref</td>
<td>If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<AREA COORDS="ccoords" SHAPE='cshape' HREF='chref' NOHREF TARGET='ctarget' cattributes>
```
BASE Function

This function generates the `<BASE>` tag which records the URL of the document.

Syntax

```sql
HTF.BASE (    
    ctarget   IN   VARCHAR2   DEFAULT NULL,    
    cattributes   IN   VARCHAR2   DEFAULT NULL)    
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<Base href='current URL' target='ctarget' attributes/>
```
BASEFONT Function

This function generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

Syntax

```java
HTF.BASEFONT (nsize IN INTEGER) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<BaseFont size="nsize">
```
BGSOUND Function

This function generates the `<BGSOUND>` tag which includes audio for a Web page.

Syntax

```
HTF.BGSOUND (  
  csrc   IN VARCHAR2,  
  cloop  IN VARCHAR2 DEFAULT NULL,  
  cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cloop</td>
<td>The value for the LOOP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```
BIG Function

This function generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

Syntax

```sql
HTP.BIG (  
    ctext        IN     VARCHAR2,  
    cattributes  IN     VARCHAR2 DEFAULT NULL) 
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```
BLOCKQUOTECLOSE Function

This function generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Function.

Syntax

```sql
HTF.BLOCKQUOTECLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</BLOCKQUOTE>
```
BLOCKQUOTEOPEN Function

This function generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the BLOCKQUOTECLOSE Function.

Syntax

```sql
HTF.BLOCKQUOTEOPEN (  
  cnowrap IN VARCHAR2 DEFAULT NULL,  
  cclear IN VARCHAR2 DEFAULT NULL,  
  cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```
**BODYCLOSE Function**

This function generates the `</BODY>` tag which marks the end of a body section of an HTML document. You mark the beginning of a body section by means of the `BODYOPEN Function`.

**Syntax**

```sql
HTF.BODYCLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

```html
</BODY>
```
BODYOPEN Function

This function generates the `<BODY>` tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Function.

Syntax

```
HTF.BODYOPEN (  
cbackground IN VARCHAR2 DEFAULT NULL,  
cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbackground</td>
<td>The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<BODY background='cbackground' cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')
RETURN VARCHAR2;
```

generates:

```
<BODY background='/img/background.gif'>
BOLD Function

This function generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```sql
HTF.BOLD (ctext IN VARCHAR2,
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<B cattributes>ctext</B>
```
BR Function

This function generates the &lt;BR&gt; tag which begins a new line of text. It performs the same operation as the NL Function.

Syntax

```
HTF.BR(
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
&lt;BR CLEAR=“cclear’ cattributes&gt;
```
**CENTER Function**

This function generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

**Syntax**

```sql
HTF.CENTER (ctext IN VARCHAR2) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<CENTER>ctext</CENTER>
```
CENTERCLOSE Function

This function generates the </CENTER> tag which marks the end of a section of text to center. You mark the beginning of a section of text to center by means of the CENTEROPEN Function.

Syntax

```
HTF.CENTERCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

</CENTER>
**CENTEROPEN Function**

This function generates the `<CENTER>` tag which mark the beginning of a section of text to center. You mark the beginning of a section of text to center by means of the CENTERCLOSE Function.

**Syntax**

```
HTF.CENTEROPEN
   RETURN VARCHAR2;
```

**Examples**

This function generates

```<CENTER>```
CITE Function

This function generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as citation.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```
CODE Function

This function generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTF.CODE (   
  ctext IN VARCHAR2,  
  cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as code.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```
COMMENT Function

This function generates the comment tags.

Syntax

```sql
HTF.COMMENT ( 
    ctext    IN   VARCHAR2) 
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The comment.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```sql```
<-- ctext -->
```
DFN Function

This function generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTF.DFN (ctext IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

**Table 181–19  DFN Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<DFN>ctext</DFN>
DIRLISTCLOSE Function

This function generates the `<DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

Syntax

```
HTP.DIRLISTCLOSE
RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the LISTITEM Function so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

Examples

This function generates

```
</DIR>
```
DIRLISTOPEN Function

This function generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

Syntax

```sql
HTF.DIRLISTOPEN
    RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```html
<DIR>
```
DIV Function

This function generates the `<DIV>` tag which creates document divisions.

Syntax

```sql
HTF.DIV (calign IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<DIV ALIGN="calign" cattributes>
```
DLISTCLOSE Function

This function generates the \(</DL>\) tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```
HTF.DLISTCLOSE
    RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

\(</DL>\)
**DLISTDEF Function**

This function generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

**Syntax**

```sql
HTP.DLISTDEF (ctext IN VARCHAR2 DEFAULT NULL,
               cclear IN VARCHAR2 DEFAULT NULL,
               cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The definition of the term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the <code>CLEAR</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<DD CLEAR="cclear" cattributes>ctext
```
**DLISTOPEN Function**

This function generates the `<DL>` tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

**Syntax**

```sql
HTF.DLISTOPEN (  
  cclear IN VARCHAR2 DEFAULT NULL,  
  cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Usage Notes**

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

**Examples**

This function generates

```html
<DL CLEAR='cclear' cattributes>
```
DLISTTERM Function

This function generates the `<DT>` tag which defines a term in a definition list `<DL>`.

Syntax

```
HTP.DLISTTERM (  
  ctext IN VARCHAR2 DEFAULT NULL,  
  cclear IN VARCHAR2 DEFAULT NULL,  
  cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```
EM Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the EMPHASIS Function.

Syntax

```
HTF.EM(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<EM cattributes>ctext</EM>
```
EMPHASIS Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the EM Function.

Syntax

```sql
HTF.EMPHASIS(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<EM cattributes>ctext</EM>
```
ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;

This function performs the same operation as HTP. PRINTS Procedure and HTP. PS Procedure.

Syntax

```
HTF.ESCAPE_SC(
    ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text string to convert.</td>
</tr>
</tbody>
</table>
ESCAPE_URL Function

This function replaces characters that have special meaning in HTML and HTTP with their escape sequences. The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;
- % to &25

Syntax

```sql
HTF.ESCAPE_URL(
    p_url IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_url</td>
<td>The string to convert.</td>
</tr>
</tbody>
</table>
**FONTCLOSE Function**

This function generates the </FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Function.

**Syntax**

```
HTF.FONTCLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

</FONT>
FONTOPEN Function

This function generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Function.

Syntax

```sql
HTF.FONTOPEN(
    ccolor IN VARCHAR2 DEFAULT NULL,
    cface IN VARCHAR2 DEFAULT NULL,
    csize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccolor</td>
<td>The value for the COLOR attribute.</td>
</tr>
<tr>
<td>cface</td>
<td>The value for the FACE attribute</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```
FORMAT_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

```
HTF.FORMAT_CELL(
    columnValue IN VARCHAR2
    format_numbers IN VARCHAR2 DEFAULT NULL
)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columnValue</td>
<td>The value that needs to be formatted in an HTML table.</td>
</tr>
<tr>
<td>format_numbers</td>
<td>The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TD >columnValue</TD>
```
FORMCHECKBOX Function

This function generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTF.FORMCHECKBOX(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2 DEFAULT 'ON',
    cchecked IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the <code>CHECKED</code> attribute is</td>
</tr>
<tr>
<td></td>
<td>added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="checkbox" NAME='cname' VALUE='cvalue' CHECKED cattributes>
```
FORMCLOSE Function

This function generates the </FORM> tag which marks the end of a form section in an HTML document. You mark the beginning of the form section by means of the FORMOPEN Function.

Syntax

```sql
HTF.FORMCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</FORM>
```
FORMFILE Function

This function generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
    cname IN VARCHAR2,
    caccept IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>caccept</td>
<td>A comma-delimited list of MIME types for upload.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```
FORMHIDDEN Function

This function generates the `<INPUT>` tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTF.FORMHIDDEN(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```
FORMIMAGE Function

This function generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with `.x` appended, and the y coordinate with `.y` appended. Any `VALUE` attribute is ignored.

Syntax

```sql
HTF.FORMIMAGE(
    cname IN VARCHAR2,
    csrc IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td><code>csrc</code></td>
<td>The value for the SRC attribute that specifies the image file.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```xml
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```
FORMOPEN Function

This function generates the `<FORM>` tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Function.

Syntax

```
HTF.FORMOPEN(
    curl IN VARCHAR2,
    cmethod IN VARCHAR2 DEFAULT 'POST',
    ctarget IN VARCHAR2 DEFAULT NULL,
    cenctype IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.</td>
</tr>
<tr>
<td>cmethod</td>
<td>The value for the METHOD attribute. The value can be &quot;GET&quot; or &quot;POST&quot;.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cenctype</td>
<td>The value for the ENCTYPE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<FOR M ACTION='curl' METHOD='cmethod' TARGET='ctarget' ENCTYPE='cenctype' cattributes>
```
FORMPASSWORD Function

This function generates the `<INPUT>` tag with `TYPE="password"` which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTF.FORMPASSWORD(
    cname IN VARCHAR2,
    csize IN VARCHAR2,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the MAXLENGTH attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```
FORMRADIO Function

This function generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTF.FORMRADIO(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2,
    cchecked IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE='radio' NAME='cname' VALUE='cvalue' CHECKED cattributes>
```
FORMRESET Function

This function generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```plsql
HTP.FORMRESET(
    cvalue IN VARCHAR2 DEFAULT 'Reset',
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<input TYPE="reset" VALUE='cvalue' cattributes>
```
FORMSELECTCLOSE Function

This function generates the \(<\!\text{SELECT}\!\>) tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Function. The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Function.
FORMSELECTOPEN Function

This function generates the `<SELECT>` tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Function. The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTOPEN(
    cname IN VARCHAR2,
    cprompt IN VARCHAR2 DEFAULT NULL,
    nsize IN INTEGER DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cprompt</td>
<td>The string preceding the list box.</td>
</tr>
<tr>
<td>nsize</td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

Pick the greatest player:
```
<SELECT NAME="greatest_player">
    <OPTION>Messier
    <OPTION>Howe
    <OPTION>Gretzky
</SELECT>
```
FORMSELECTOPTION Function

This function generates the `<OPTION>` tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELECTOPTION(
   cvalue IN VARCHAR2,
   cselected IN VARCHAR2 DEFAULT NULL,
   cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The text for the option.</td>
</tr>
<tr>
<td>cvalue</td>
<td>If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Function.
FORMSUBMIT Function

This function generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTF.FORMSUBMIT(
    cname IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT 'Submit',
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<input TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```
FORMTEXT Function

This function generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT(
    cname IN VARCHAR2,
    csize IN VARCHAR2 DEFAULT NULL,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the <code>MAXLENGTH</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue" cattributes>
```
FORMTEXTAREA Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Function which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR DEFAULT NULL,
    cattributes IN VARCHAR DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes> </TEXTAREA>
```
FORMTEXTAREA2 Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA Function except that in that case you cannot specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA2(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the <code>WRAP</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes>"</TEXTAREA>
```
FORMTEXTAREACLOSE Function

This function generates the </TEXTAREA> tag which ends a text area form element. You open a text area element by means of either FORMTEXTAREAOPEN Function or FORMTEXTAREAOPEN2 Function.

Syntax

```
HTF.FORMTEXTAREACLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</TEXTAREA>
```
FORMTEXTAREAOPEN Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Function which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```sql
HTF.FORMTEXTAREAOPEN(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```
FORMTEXTAREAOPEN2 Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Function except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```sql
HTF.FORMTEXTAREAOPEN2 (
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```
FRAME Function

This function generates the `<FRAME>` tag which defines the characteristics of a frame created by a `<FRAMESET>` tag.

Syntax

```sql
HTF.FRAME(
    csrc IN VARCHAR2,
    cname IN VARCHAR2 DEFAULT NULL,
    cmarginwidth IN VARCHAR2 DEFAULT NULL,
    cmarginheight IN VARCHAR2 DEFAULT NULL,
    cscrolling IN VARCHAR2 DEFAULT NULL,
    cnoresize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

**Table 181–46 FRAME Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The URL to display in the frame.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cmarginwidth</td>
<td>The value for the MARGINWIDTH attribute.</td>
</tr>
<tr>
<td>cscrolling</td>
<td>The value for the SCROLLING attribute.</td>
</tr>
<tr>
<td>cnoresize</td>
<td>If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```
FRAMESETCLOSE Function

This function generates the `<FRAMESET>` tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Function.

Syntax

```
HTP.FRAMESETCLOSE
   RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```
FRAMESETOPEN Function

This function generates the `<FRAMESET>` tag which define a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Function.

Syntax

```sql
HTF.FRAMESETOPEN(
    crows IN VARCHAR2 DEFAULT NULL,
    ccols IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crows</td>
<td>The value for the ROWS attribute.</td>
</tr>
<tr>
<td>ccols</td>
<td>The value for the COLS attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```
HEADCLOSE Function

This function generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Function.

Syntax

```sql
HTP.HEADCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

```html
</HEAD>
```
HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (<H1> to </H6>).

Syntax

```sql
HTF.HEADER(
    nsize IN INTEGER,
    cheader IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The heading level. This is an integer between 1 and 6.</td>
</tr>
<tr>
<td>cheader</td>
<td>The text to display in the heading.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>The value for the NOWRAP attribute.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

```sql
HTF.header (1, 'Overview')
RETURN VARCHAR2;
```

produces:

```html
<H1>Overview</H1>
```
HEADOPEN Function

This function generates the `<HEAD>` tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Function.

Syntax

```sql
HTP.HEADOPEN
    RETURN VARCHAR2;
```

Examples

This function generates

```html
<HEAD>
```
HR Function

This function generates the `<HR>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the LINE Function.

Syntax

```
HTF.HR(
    cclear IN VARCHAR2 DEFAULT NULL,
    csrc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the</td>
</tr>
<tr>
<td></td>
<td>source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```
HTMLCLOSE Function

This function generates the </HTML> tag which marks the end of an HTML document. You use the HTMLOPEN Function to mark the beginning of an HTML document.

Syntax

```sql
HTP.HTMLCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

</HTML>
**HTMLOPEN Function**

This function generates the `<HTML>` tag which marks the beginning of an HTML document. You use the **HTMLCLOSE Function** to mark the end of the an HTML document.

**Syntax**

```
HTF.HTMLOPEN
    RETURN VARCHAR2;
```

**Examples**

This function generates

```
<HTML>
```
IMG Function

This function generates the `<IMG>` tag which directs the browser to load an image onto the HTML page. The IMG2 Function performs the same operation but additionally uses the cusemap parameter.

Syntax

```sql
HTF.IMG(
    curl IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    calt IN VARCHAR2 DEFAULT NULL,
    cismap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```
**IMG2 Function**

This function generates the `<IMG>` tag, which directs the browser to load an image onto the HTML page. The **IMG Function** performs the same operation but does not use the `cusemap` parameter.

**Syntax**

```sql
HTF.IMG2(
    curl IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    calt IN VARCHAR2 DEFAULT NULL,
    cismap IN VARCHAR2 DEFAULT NULL,
    cusemap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>curl</code></td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td><code>calt</code></td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td><code>cismap</code></td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td><code>cusemap</code></td>
<td>The value for the USEMAP attribute which specifies a client-side imagemap.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```
ISINDEX Function

This function creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX(
    cprompt IN VARCHAR2 DEFAULT NULL,
    curl IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cprompt</td>
<td>The value for the PROMPT attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```
ITALIC Function

This function generates
the <I> and
</I> tags which direct the browser to render the text in italics.

Syntax

```sql
HTF.ITALIC(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<I cattributes>ctext</I>
KBD Function

This function generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Function.

Syntax

```sql
HTF.KBD(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<KBD cattributes>ctext</KBD>
```
KEYBOARD Function

This function generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Function.

Syntax

```
HTF.KEYBOARD(
    ctext        IN    VARCHAR2,
    cattributes  IN    VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```
LINE Function

This function generates the `<HR>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Function.

Syntax

```sql
HTP.LINE(
    cclear IN VARCHAR2 DEFAULT NULL,
    csrc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<HR CLEAR="cclear" SRC="csrc" cattributes>
```
LINKREL Function

This function generates the `<LINK>` tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of LINKREV Function. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```sql
HTF.LINKREL(
    crel IN VARCHAR2,
    curl IN VARCHAR2,
    ctitle IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the REL attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<Link REL='crel' HREF='curl' TITLE='ctitle'>
```
LINKREV Function

This function generates the `<LINK>` tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Function. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```sql
HTF.LINKREV(
    crev IN VARCHAR2,
    curl IN VARCHAR2,
    ctitle IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crev</td>
<td>The value for the REV attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<Link REV="crev" HREF="curl" TITLE="ctitle">```

LISTHEADER Function

This function generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

Syntax

```
HTF.LISTHEADER ( 
  ctext IN VARCHAR2, 
  cattributes IN VARCHAR2 DEFAULT NULL) 
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code>.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<LH cattributes>ctext</LH>
```
LISTINGCLOSE Function

This function generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Function.

Syntax

```
HTF.LISTINGCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

```
</LISTING>
```
LISTINGOPEN Function

This function generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Function.

Syntax

```sql
HTF.LISTINGOPEN
    RETURN VARCHAR2;
```

Examples

This function generates

```html
<LISTING>
```
LISTITEM Function

This function generates the `<LI>` tag, which indicates a list item.

Syntax

```
HTF.LISTITEM(
    ctext    IN    VARCHAR2  DEFAULT NULL,
    cclear   IN    VARCHAR2  DEFAULT NULL,
    cdingbat IN    VARCHAR2  DEFAULT NULL,
    csrc     IN    VARCHAR2  DEFAULT NULL,
    cattributes IN   VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the list item.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```
MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```sql
HTF.MAILTO(
    caddress  IN VARCHAR2,
    ctext     IN VARCHAR2,
    cname     IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL
)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>caddress</td>
<td>The email address of the recipient.</td>
</tr>
<tr>
<td>ctext</td>
<td>The clickable portion of the link.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```sql
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```html
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```
MAPCLOSE Function

This function generates the */MAP* tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Function.

Syntax

```
HTF.MAPCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

```html
</MAP>
```
**MAOPEN Function**

This function generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Function.

**Syntax**

```
HTF.MAOPEN(
    cname IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<MAP NAME='cname' cattributes>
```
MENULISTCLOSE Function

This function generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```plaintext
HTF.MENULISTCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</MENU>
```
**MENULISTOPEN Function**

This function generates the `<MENU>` tag which creates a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

**Syntax**

```sql
HTF.MENULISTOPEN
    RETURN VARCHAR2;
```

**Examples**

This function generates

```html
<MENU>
```
META Function

This function generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(
    chttp_equiv IN VARCHAR2,
    cname IN VARCHAR2,
    ccontent IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chttp_equiv</td>
<td>The value for the <code>CHTTP_EQUIV</code> attribute.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>ccontent</td>
<td>The value for the <code>CONTENT</code> attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.
NL Function

This function generates the <br> tag which begins a new line of text. It performs the same operation as the BR Function.

Syntax

```sql
HTF.NL(
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<br CLEAR='cclear' cattributes>
```
NOBR Function

This function generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR(
  ctext        IN        VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that is to be rendered on one line.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<NOBR>ctext</NOBR>
```
NOFRAMESCLOSE Function

This function generates the </NOFRAMES> tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</NOFRAMES>
```
NOFRAMESOPEN Function

This function generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```sql
HTP.NOFRAMESOPEN
    RETURN VARCHAR2;
```

Examples

This function generates

`<NOFRAMES>`
OLISTCLOSE Function

This function generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Function. Numbered items are added using LISTITEM Function.

Syntax

```sql
HTF.OLISTCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

</OL>
OLISTOPEN Function

This function generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the OLISTCLOSE Function. Numbered items are added using LISTITEM Function.

Syntax

```sql
HTP.OLISTOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```
PARA Function

This function generates the \texttt{<P>} tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the \texttt{PARAGRAPH Function}.

Syntax

\begin{verbatim}
HTF.PARA
    RETURN VARCHAR2;
\end{verbatim}

Examples

This function generates

\texttt{<P>}

\texttt{</P>
PARAGRAPh Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

Syntax

```
HTF.PARAGRAPH(
  calign IN VARCHAR2 DEFAULT NULL,
  cnowrap IN VARCHAR2 DEFAULT NULL,
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```
PARAM Function

This function generates the `<PARAM>` tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Function to begin the invocation. Use one PARAM Function for each desired name-value pair, and use APPLETCLOSE Function to end the applet invocation.

**Syntax**

```sql
HTF.PARAM(
    cname IN VARCHAR2
    cvalue IN VARCHAR2)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<PARAM NAME=cname VALUE="cvalue">
```
PLAINTEXT Function

This function generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```sql
HTP.PLAINTEXT(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in fixed-width font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```
**PRECLOSE Function**

This function generates the ```</PRE>``` tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the **PREOPEN Function**.

**Syntax**

```sql
HTF.PRECLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

```html
</PRE>
```
PREOPEN Function

This function generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Function.

Syntax

```sql
HTF.PREOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwidth IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

```
PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character. The PRN Functions performs the same operation but does not terminate with a newline character.

Syntax

```
HTF.PRINT (   
    cbuf      IN       VARCHAR2) 
RETURN VARCHAR2;
```

```
HTF.PRINT (   
   dbuf      IN       DATE) 
RETURN VARCHAR2;
```

```
HTF.PRINT (   
    nbuf      IN       NUMBER) 
RETURN VARCHAR2;
```

Parameters

**Table 181–71 PRINT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
</tbody>
</table>

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These functions do not have function equivalents.
PRN Functions

These functions generate the specified parameter as a string. Unlike the PRINT Functions the string is not terminated with the \n newline character.

Syntax

HTF.PRN (  
cbuf    IN       VARCHAR2)  
RETURN VARCHAR2;

HTF.PRN (  
dbuf    IN       DATE)  
RETURN VARCHAR2;

HTF.PRN (  
nbuf    IN       NUMBER)  
RETURN VARCHAR2;

Parameters

Table 181–72 PRN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
</tbody>
</table>

Usage Notes

These functions do not have function equivalents.
S Function

This function generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Function.

Syntax

```
HTF.S (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<S cattributes>ctext</S>
```
SAMPLE Function

This function generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```sql
HTF.SAMPLE (  
    ctext    IN    VARCHAR2,  
    cattributes    IN    VARCHAR2     DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<SAMP cattributes>ctext</SAMP>
```
SCRIPT Function

This function generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (  
cscript IN VARCHAR2,  
clanguage IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cscript</td>
<td>The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.</td>
</tr>
<tr>
<td>clanguage</td>
<td>The language in which the script is written. If this parameter is omitted, the user’s browser determines the scripting language.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.
SMALL Function

This function generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTF.SMALL (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in small font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<SMALL cattributes>ctext</SMALL>
```
**STRIKE Function**

This function generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as S Function.

**Syntax**

```
STRIKE (  
    ctext    IN    VARCHAR2,  
    cattributes    IN    VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>attributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```
**STRONG Function**

This function generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold or however "strong" is defined.

**Syntax**

```
HTP.STRONG(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be emphasized.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<STRONG cattributes>ctext</STRONG>
```
STYLE Function

This function generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page. You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```sql
HTF.STYLE(
    cstyle IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cstyle</td>
<td>The style information to include.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<STYLE>cstyle</STYLE>
```
SUB Function

This function generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTF.SUB(
    ctext IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in subscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```
**SUP Function**

This function generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

**Syntax**

```
HTF.SUP(
 ctext IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in superscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<SUP ALIGN='calign' cattributes>ctext</SUP>
```
TABLECaption Function

This function generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```sql
HTF.TABLECAPTION(
    caption IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the caption.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```
TABLECLOSE Function

This function generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Function on page 181-126.

Syntax

```sql
HTF.TABLECLOSE
RETURN VARCHAR2;
```

Examples

This function generates

</TABLE>
TABLEDATA Function

This function generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

Syntax

```sql
HTF.TABLEDATA(
    cvalue IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    crowspan IN VARCHAR2 DEFAULT NULL,
    ccolspan IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>crowspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes>cvalue</TD>
```
TABLEHEADER Function

This function generates the \(<TH>\) and \(</TH>\) tags which insert a header cell in an HTML table. The \(<TH>\) tag is similar to the \(<TD>\) tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTF.TABLEHEADER(
    cvalue IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    crowspan IN VARCHAR2 DEFAULT NULL,
    ccolspan IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added</td>
</tr>
<tr>
<td>crowspan</td>
<td>To the tag.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes>cvalue</TH>
```
TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Function.

Syntax

```sql
HTP.TABLEOPEN(
    cborder IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>border</td>
<td>The value for the BORDER attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```
**TABLEROWCLOSE Function**

This function generates the `</TR>` tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Function.

**Syntax**

```
HTF.TABLEROWCLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

```html
</TABLE>
```
TABLEROWOPEN Function

This function generates the `<TR>` tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Function.

Syntax

```
HTP.TABLEROWOPEN(
    calign IN VARCHAR2 DEFAULT NULL,
    cvalign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cvalign</td>
<td>The value for the <code>VALIGN</code> attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the <code>DP</code> attribute.</td>
</tr>
<tr>
<td>cnwrap</td>
<td>If the value of this parameter is not NULL, the <code>NOWRAP</code> attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>>
```

TELETYPE Function

This function generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```sql
HTF.TELETYPE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in a fixed width typewriter font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TT cattributes>ctext</TT>
```
TITLE Function

This function generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTF.TITLE(  
ctitle IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 181–88 TITLE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctitle</td>
<td>The text to display in the titlebar of the browser window.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TITLE>ctitle</TITLE>
```
ULISTCLOSE Function

This function generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Function. Add list items with LISTITEM Function.

Syntax

HTF.ULISTCLOSE
RETURN VARCHAR2;

Examples

This function generates

</UL>
ULISTOPEN Function

This function generates the `<UL>` tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Function. Add list items with LISTITEM Function.

Syntax

```
HTP.ULISTOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cdingbat IN VARCHAR2 DEFAULT NULL,
    csrcc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrcc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrcc" cattributes>
```
UNDERLINE Function

This function generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTF.UNDERLINE(
  ctext   IN  VARCHAR2,
  cattributes   IN  VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render with an underline.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<U cattributes>ctext</U>
```
VARIABLE Function

This function generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTF.VARIABLE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```
WBR Function

This function generates the \(<\text{WBR}>\) tag, which inserts a soft line break within a section of NOBR text.

Syntax

```sql
HTF.WBR
    RETURN VARCHAR2;
```

Examples

This function generates

\(<\text{WBR}>\)
The HTP (hypertext procedures) and HTF (hypertext functions) packages generate HTML tags. For example, the HTP.ANCHOR procedure generates the HTML anchor tag, <A>.

**See Also:** For more information about implementation of this package:

  - Rules and Limits
  - Examples
- **Summary of Tags**
- **Summary of HTP Subprograms**
Using HTP

- Operational Notes
- Rules and Limits
- Examples
Operational Notes

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is an ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.

- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using the TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP.PROINT procedure. It then prints its parameters to the generated Web page.
If you use values of the LONG data type in procedures such as `HTP.PRINT`, `HTP.PRINT`, `HTP.PRINTS`, `HTP.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 data type in the procedure.
Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN; -- generates <HTML>
    HTP.HEADOPEN; -- generates <HEAD>
    HTP.TITLE('Hello'); -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE; -- generates </HEAD>
    HTP.BODYOPEN; -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE; -- generates </BODY>
    HTP.HTMLCLOSE; -- generates </HTML>
END;
```
Summary of Tags

**HTML, HEAD, and BODY Tags**

- **HTMLOPEN Procedure, HTMLCLOSE Procedure** - generate `<HTML>` and `</HTML>`
- **HEADOPEN Procedure, HEADCLOSE Procedure** - generate `<HEAD>` and `</HEAD>`
- **BODYOPEN Procedure, BODYCLOSE Procedure** - generate `<BODY>` and `</BODY>`

**Comment Tag**

- **COMMENT Procedure** - generates `<!--` and `-->`

**Tags in the <HEAD> Area**

- **BASE Procedure** - generates `<BASE>`
- **LINKREL Procedure** - generates `<LINK>` with the REL attribute
- **LINKREV Procedure** - generates `<LINK>` with the REV attribute
- **TITLE Procedure** - generates `<TITLE>`
- **META Procedure** - generates `<META>`
- **SCRIPT Procedure** - generates `<SCRIPT>`
- **STYLE Procedure** - generates `<STYLE>`
- **ISINDEX Procedure** - generates `<ISINDEX>`

**Applet Tags**

- **APPLETOPEN Procedure, APPLETCLOSE Procedure** - generate `<APPLET>` and `</APPLET>`
- **PARAM Procedure** - generates `<PARAM>`

**List Tags**

- **OLISTOPEN Procedure, OLISTCLOSE Procedure** - generate `<OL>` and `</OL>`
- **ULISTOPEN Procedure, ULISTCLOSE Procedure** - generate `<UL>` and `</UL>`
- **DLISTOPEN Procedure, DLISTCLOSE Procedure** - generate `<DL>` and `</DL>`
- **DLISTTERM Procedure** - generates `<DT>`
- **DLISTDEF Procedure** - generates `<DD>`
- **DIRLISTOPEN Procedure, DIRLISTCLOSE Procedure** - generate `<DIR>` and `</DIR>`
- **LISTHEADER Procedure** - generates `<LH>`
- **LISTINGOPEN Procedure, LISTINGCLOSE Procedure** - generate `<LISTING>` and `</LISTING>`
- **MENULISTOPEN Procedure** - generate `<MENU>` and `</MENU>`
- **LISTITEM Procedure** - generates `<LI>`

**Form Tags**

- **FORMOPEN Procedure, FORMCLOSE Procedure** - generate `<FORM>` and `</FORM>`
FORMCHECKBOX Procedure - generates <INPUT TYPE="CHECKBOX"/>
FORMHIDDEN Procedure - generates <INPUT TYPE="HIDDEN"/>
FORMIMAGE Procedure - generates <INPUT TYPE="IMAGE"/>
FORMPASSWORD Procedure - generates <INPUT TYPE="PASSWORD"/>
FORMRADIO Procedure - generates <INPUT TYPE="RADIO"/>
FORMSELECTOPEN Procedure, FORMSELECTCLOSE Procedure - generate <SELECT> and </SELECT>
FORMSELECTOPTION Procedure - generates <OPTION>
FORMTEXT Procedure - generates <INPUT TYPE="TEXT"/>
FORMTEXTAREA Procedure - generate <TEXTAREA>
FORMTEXTAREAOPEN Procedure, FORMTEXTAREACLOSE Procedure - generate <TEXTAREA> and </TEXTAREA>
FORMRESET Procedure - generates <INPUT TYPE="RESET"/>
FORMSUBMIT Procedure - generates <INPUT TYPE="SUBMIT"/>

Table Tags
TABLEOPEN Procedure, TABLECLOSE Procedure - generate <TABLE> and </TABLE>
TABLECAPTION Procedure - generates <CAPTION>
TABLEROWOPEN Procedure, TABLEROWCLOSE Procedure - generate <TR> and </TR>
TABLEHEADER Procedure - generates <TH>
TABLEDATA Procedure - generates <TD>

IMG, HR, and A Tags
HR Procedure, LINE Procedure - generate <HR>
IMG Procedure, IMG2 Procedure - generate <IMG>
ANCHOR Procedure, ANCHOR2 Procedure - generate <A>
MAPOPEN Procedure, MAPCLOSE Procedure - generate <MAP> and </MAP>

Paragraph Formatting Tags
HEADER Procedure - generates heading tags (<H1> to <H6>)
PARA Procedure, PARAGRAPH Procedure - generate <P>
PRN Procedures, PRINT Procedures - generate any text that is passed in
PRINTS Procedure, PS Procedure - generate any text that is passed in; special characters in HTML are escaped
PREOPEN Procedure, PRECLOSE Procedure - generate <PRE> and </PRE>
BLOCKQUOTEOPEN Procedure, BLOCKQUOTECLOSE Procedure - generate <BLOCKQUOTE> and </BLOCKQUOTE>
DIV Procedure - generates <DIV>
NL Procedure, BR Procedure - generate <BR>
NOBR Procedure - generates <NOBR>
WBR Procedure - generates <WBR>
PLAINTEXT Procedure - generates <PLAINTEXT>
ADDRESS Procedure - generates <ADDRESS>
MAILTO Procedure - generates <A> with the MAILTO attribute
AREA Procedure - generates <AREA>
BGSOUND Procedure - generates <BGSOUND>

Character Formatting Tags

BASEFONT Procedure - generates <BASEFONT>
BIG Procedure - generates <BIG>
BOLD Procedure - generates <B>
CENTER Procedure - generates <CENTER> and </CENTER>
CENTEROPEN Procedure, CENTERCLOSE Procedure - generate <CENTER> and </CENTER>
CITE Procedure - generates <CITE>
CODE Procedure - generates <CODE>
DFN Procedure - generates <DFN>
EM Procedure, EMPHASIS Procedure - generate <EM>
FONTOPEN Procedure, FONTCLOSE Procedure - generate <FONT> and </FONT>
ITALIC Procedure - generates <I>
KBD Procedure, KEYBOARD Procedure - generate <KBD> and </KBD>
S Procedure - generates <S>
SAMPLE Procedure - generates <SAMP>
SMALL Procedure - generates <SMALL>
STRIKE Procedure - generates <STRIKE>
STRONG Procedure - generates <STRONG>
SUB Procedure - generates <SUB>
SUP Procedure - generates <SUP>
TELETYPE Procedure - generates <TT>
UNDERLINE Procedure - generates <U>
VARIABLE Procedure - generates <VAR>

Frame Tags

FRAME Procedure - generates <FRAME>
FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate <FRAMESET> and </FRAMESET>
NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate <NOFRAMES> and </NOFRAMES>
### Summary of HTP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDRESS Procedure on page 182-15</td>
<td>Generate <code>s the </code>&lt;ADDRESS&gt; and <code>&lt;ADDRESS&gt;</code> tags which specify the address, author and signature of a document</td>
</tr>
<tr>
<td>ANCHOR Procedure on page 182-16</td>
<td>Generate <code>s the </code>&lt;A&gt; and <code>&lt;A&gt;</code> tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>ANCHOR2 Procedure on page 182-17</td>
<td>Generates the <code>&lt;A&gt;</code> and <code>&lt;A&gt;</code> tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>APPLETCLOSE Procedure on page 182-18</td>
<td>Closes the applet invocation with the <code>&lt;/APPLET&gt;</code> tag</td>
</tr>
<tr>
<td>APPLETOPEN Procedure on page 182-19</td>
<td>Generates the <code>&lt;APPLET&gt;</code> tag which begins the invocation of a Java applet</td>
</tr>
<tr>
<td>AREA Procedure on page 182-20</td>
<td>Generates the <code>&lt;AREA&gt;</code> tag, which defines a client-side image map</td>
</tr>
<tr>
<td>BASE Procedure on page 182-21</td>
<td>Generates the <code>&lt;BASE&gt;</code> tag which records the URL of the document</td>
</tr>
<tr>
<td>BASEFONT Procedure on page 182-22</td>
<td>Generates the <code>&lt;BASEFONT&gt;</code> tag which specifies the base font size for a Web page</td>
</tr>
<tr>
<td>BGSOUND Procedure on page 182-23</td>
<td>Generates the <code>&lt;BGSOUND&gt;</code> tag which includes audio for a Web page</td>
</tr>
<tr>
<td>BIG Procedure on page 182-24</td>
<td>Generates the <code>&lt;BIG&gt;</code> and <code>&lt;BIG&gt;</code> tags which direct the browser to render the text in a bigger font</td>
</tr>
<tr>
<td>BLOCKQUOTECLOSE Procedure on page 182-25</td>
<td>Generates the <code>&lt;/BLOCKQUOTE&gt;</code> tag which mark the end of a section of quoted text</td>
</tr>
<tr>
<td>BLOCKQUOTEOPEN Procedure on page 182-26</td>
<td>Generates the <code>&lt;BLOCKQUOTE&gt;</code> tag, which marks the beginning of a section of quoted text</td>
</tr>
<tr>
<td>BODYCLOSE Procedure on page 182-27</td>
<td>Generates the <code>&lt;/BODY&gt;</code> tag which marks the end of a body section of an HTML document</td>
</tr>
<tr>
<td>BODYOPEN Procedure on page 182-28</td>
<td>Generates the <code>&lt;BODY&gt;</code> tag which marks the beginning of the body section of an HTML document</td>
</tr>
<tr>
<td>BOLD Procedure on page 182-29</td>
<td>Generates the <code>&lt;B&gt;</code> and <code>&lt;B&gt;</code> tags which direct the browser to display the text in boldface</td>
</tr>
<tr>
<td>BR Procedure on page 182-30</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>CENTER Procedure on page 182-31</td>
<td>Generates the <code>&lt;CENTER&gt;</code> and <code>&lt;CENTER&gt;</code> tags which center a section of text within a Web page</td>
</tr>
<tr>
<td>CENTERCLOSE Procedure on page 182-32</td>
<td>Generates the <code>&lt;/CENTER&gt;</code> tag which marks the end of a section of text to center</td>
</tr>
</tbody>
</table>

<tr>
<td>CITE Procedure on page 182-34</td>
<td>Generates the <code>&lt;CITE&gt;</code> and <code>&lt;/CITE&gt;</code> tags which direct the browser to render the text as a citation</td>
</tr>
<tr>
<td>CODE Procedure on page 182-35</td>
<td>Generates the <code>&lt;CODE&gt;</code> and <code>&lt;/CODE&gt;</code> tags which direct the browser to render the text in monospace font or however &quot;code&quot; is defined stylistically</td>
</tr>
<tr>
<td>COMMENT Procedure on page 182-36</td>
<td>Generates This procedure generates the comment tags <code>&lt;!-- ctext --&gt;</code></td>
</tr>
<tr>
<td>DFN Procedure on page 182-37</td>
<td>Generates the <code>&lt;DFN&gt;</code> and <code>&lt;/DFN&gt;</code> tags which direct the browser to mark the text as italics or however &quot;definition&quot; is defined stylistically</td>
</tr>
<tr>
<td>DIRLISTCLOSE Procedure on page 182-38</td>
<td>Generates the <code>&lt;/DIR&gt;</code> tag which ends a directory list section</td>
</tr>
<tr>
<td>DIRLISTOPEN Procedure on page 182-39</td>
<td>Generates the <code>&lt;DIR&gt;</code> which starts a directory list section</td>
</tr>
<tr>
<td>DIV Procedure on page 182-40</td>
<td>Generates the <code>&lt;DIV&gt;</code> tag which creates document divisions</td>
</tr>
<tr>
<td>DLISTCLOSE Procedure on page 182-41</td>
<td>Generates the <code>&lt;/DL&gt;</code> tag which ends a definition list</td>
</tr>
<tr>
<td>DLISTDEF Procedure on page 182-42</td>
<td>Generates the <code>&lt;DD&gt;</code> tag, which inserts definitions of terms</td>
</tr>
<tr>
<td>DLISTOPEN Procedure on page 182-43</td>
<td>Generates the <code>&lt;DL&gt;</code> tag which starts a definition list</td>
</tr>
<tr>
<td>DLISTTERM Procedure on page 182-44</td>
<td>Generates the <code>&lt;DT&gt;</code> tag which defines a term in a definition list <code>&lt;DL&gt;</code></td>
</tr>
<tr>
<td>EM Procedure on page 182-45</td>
<td>Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized</td>
</tr>
<tr>
<td>EMPHASIS Procedure on page 182-46</td>
<td>Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized</td>
</tr>
<tr>
<td>ESCAPE_SC Procedure on page 182-47</td>
<td>Replaces characters that have special meaning in HTML with their escape sequences</td>
</tr>
<tr>
<td>FONTCLOSE Procedure on page 182-48</td>
<td>Generates the <code>&lt;/FONT&gt;</code> tag which marks the end of a section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FONTOPEN Procedure on page 182-49</td>
<td>Generates the <code>&lt;FONT&gt;</code> which marks the beginning of section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FORMCHECKBOX Procedure on page 182-50</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;checkbox&quot; which inserts a checkbox element in a form</td>
</tr>
<tr>
<td>FORMCLOSE Procedure on page 182-51</td>
<td>Generates the <code>&lt;/FORM&gt;</code> tag which marks the end of a form section in an HTML document</td>
</tr>
<tr>
<td>FORMOPEN Procedure on page 182-52</td>
<td>Generates the <code>&lt;FORM&gt;</code> tag which marks the beginning of a form section in an HTML document</td>
</tr>
<tr>
<td>FORMFILE Procedure on page 182-53</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;file&quot; which inserts a file form element, and is used for file uploading for a given page</td>
</tr>
<tr>
<td>FORMHIDDEN Procedure on page 182-54</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;hidden&quot; which inserts a hidden form element</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORMIMAGE Procedure on page 182-55</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;image&quot;</code> which creates an image field that the user clicks to submit the form immediately</td>
</tr>
<tr>
<td>FORMPASSWORD Procedure on page 182-56</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;password&quot;</code> which creates a single-line text entry field</td>
</tr>
<tr>
<td>FORMRADIO Procedure on page 182-57</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;radio&quot;</code>, which creates a radio button on the HTML form</td>
</tr>
<tr>
<td>FORMRESET Procedure on page 182-58</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;reset&quot;</code> which creates a button that, when selected, resets the form fields to their initial values</td>
</tr>
<tr>
<td>FORMSELECTCLOSE Procedure on page 182-59</td>
<td>Generates the <code>&lt;/SELECT&gt;</code> tag which marks the end of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPEN Procedure on page 182-60</td>
<td>Generates the <code>&lt;/SELECT&gt;</code> tag which marks the beginning of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPTION Procedure on page 182-61</td>
<td>Generates the <code>&lt;OPTION&gt;</code> tag which represents one choice in a Select element</td>
</tr>
<tr>
<td>FORMSUBMIT Procedure on page 182-62</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;submit&quot;</code> which creates a button that, when clicked, submits the form</td>
</tr>
<tr>
<td>FORMTEXT Procedure on page 182-63</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;text&quot;</code>, which creates a field for a single line of text</td>
</tr>
<tr>
<td>FORMTEXTAREA Procedure on page 182-64</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area</td>
</tr>
<tr>
<td>FORMTEXTAREA2 Procedure on page 182-65</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FORMTEXTAREACLOSE Procedure on page 182-66</td>
<td>Generates the <code>&lt;/TEXTAREA&gt;</code> tag which ends a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOOPEN Procedure on page 182-67</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> which marks the beginning of a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOOPEN2 Procedure on page 182-68</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> which marks the beginning of a text area form element with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FRAME Procedure on page 182-69</td>
<td>Generates the <code>&lt;FRAME&gt;</code> tag which defines the characteristics of a frame created by a <code>&lt;FRAMESET&gt;</code> tag</td>
</tr>
<tr>
<td>FRAMESETCLOSE Procedure on page 182-70</td>
<td>Generates the <code>&lt;/FRAMESET&gt;</code> tag which ends a frameset section</td>
</tr>
<tr>
<td>FRAMESETOPEN Procedure on page 182-71</td>
<td>Generates the <code>&lt;/FRAMESET&gt;</code> tag which begins a frameset section</td>
</tr>
<tr>
<td>HEADCLOSE Procedure on page 182-72</td>
<td>Generates the <code>&lt;/HEAD&gt;</code> tag which marks the end of an HTML document head section</td>
</tr>
<tr>
<td>HEADER Procedure on page 182-73</td>
<td>Generates opening heading tags (<code>&lt;H1&gt;</code> to <code>&lt;H6&gt;</code>) and their corresponding closing tags (<code>&lt;/H1&gt;</code> to <code>&lt;/H6&gt;</code>)</td>
</tr>
<tr>
<td>HEADOPEN Procedure on page 182-74</td>
<td>Generates the <code>&lt;HEAD&gt;</code> tag which marks the beginning of the HTML document head section</td>
</tr>
<tr>
<td>HR Procedure on page 182-75</td>
<td>Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HTMLCLOSE Procedure</td>
<td>Generates the <code>&lt;HTML&gt;</code> tag which marks the end of an HTML document</td>
</tr>
<tr>
<td>HTMLOPEN Procedure</td>
<td>Generates the <code>&lt;HTML&gt;</code> tag which marks the beginning of an HTML document</td>
</tr>
<tr>
<td>IMG Procedure</td>
<td>Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page</td>
</tr>
<tr>
<td>IMG2 Procedure</td>
<td>Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute</td>
</tr>
<tr>
<td>ISINDEX Procedure</td>
<td>Creates a single entry field with a prompting text, such as &quot;enter value,&quot; then sends that value to the URL of the page or program</td>
</tr>
<tr>
<td>ITALIC Procedure</td>
<td>Generates the <code>&lt;I&gt;</code> and <code>&lt;/I&gt;</code> tags which direct the browser to render the text in italics</td>
</tr>
<tr>
<td>KBD Procedure</td>
<td>Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>KEYBOARD Procedure</td>
<td>Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags, which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>LINE Procedure</td>
<td>Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>LINKREL Procedure</td>
<td>Generates the <code>&lt;LINK&gt;</code> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target</td>
</tr>
<tr>
<td>LINKREV Procedure</td>
<td>Generates the <code>&lt;LINK&gt;</code> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor</td>
</tr>
<tr>
<td>LISTHEADER Procedure</td>
<td>Generates the <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> tags which print an HTML tag at the beginning of the list</td>
</tr>
<tr>
<td>LISTINGCLOSE Procedure</td>
<td>Generates the <code>&lt;/LISTING&gt;</code> tags which marks the end of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTINGOPEN Procedure</td>
<td>Generates the <code>&lt;LISTING&gt;</code> tag which marks the beginning of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTITEM Procedure</td>
<td>Generates the <code>&lt;LI&gt;</code> tag, which indicates a list item</td>
</tr>
<tr>
<td>MAILTO Procedure</td>
<td>Generates the <code>&lt;A&gt;</code> tag with the HREF set to 'mailto' prepended to the mail address argument</td>
</tr>
<tr>
<td>MAPCLOSE Procedure</td>
<td>Generates the <code>&lt;MAP&gt;</code> tag which marks the end of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MAPOPEN Procedure</td>
<td>Generates the <code>&lt;MAP&gt;</code> tag which mark the beginning of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MENULISTCLOSE Procedure</td>
<td>Generates the <code>&lt;MENU&gt;</code> tag which ends a list that presents one line for each item</td>
</tr>
<tr>
<td>MENULISTOPEN Procedure</td>
<td>Generates the <code>&lt;MENU&gt;</code> tag which create a list that presents one line for each item</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>META Procedure on page 182-96</td>
<td>Generates the <code>&lt;META&gt;</code> tag, which embeds meta-information about the document and also specifies values for HTTP headers</td>
</tr>
<tr>
<td>NL Procedure on page 182-97</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>NOBR Procedure on page 182-98</td>
<td>Generates the <code>&lt;NOBR&gt;</code> and <code>&lt;/NOBR&gt;</code> tags which turn off line-breaking in a section of text</td>
</tr>
<tr>
<td>NOFRAMESCLOSE Procedure on page 182-99</td>
<td>Generates the <code>&lt;NOFRAMES&gt;</code> tag which marks the end of a no-frames section</td>
</tr>
<tr>
<td>NOFRAMESOPEN Procedure on page 182-100</td>
<td>Generates the <code>&lt;NOFRAMES&gt;</code> tag which mark the beginning of a no-frames section</td>
</tr>
<tr>
<td>OLISTCLOSE Procedure on page 182-101</td>
<td>Generates the <code>&lt;/OL&gt;</code> tag which defines the end of an ordered list</td>
</tr>
<tr>
<td>OLISTOPEN Procedure on page 182-102</td>
<td>Generates the <code>&lt;OL&gt;</code> tag which marks the beginning of an ordered list</td>
</tr>
<tr>
<td>PARA Procedure on page 182-103</td>
<td>Generates the <code>&lt;P&gt;</code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph</td>
</tr>
<tr>
<td>PARAGRAPH Procedure on page 182-104</td>
<td>Adds attributes to the <code>&lt;P&gt;</code> tag</td>
</tr>
<tr>
<td>PARAM Procedure on page 182-105</td>
<td>Generates the <code>&lt;PARAM&gt;</code> tag which specifies parameter values for Java applets</td>
</tr>
<tr>
<td>PLAINTEXT Procedure on page 182-106</td>
<td>Generates the <code>&lt;PLAINTEXT&gt;</code> and <code>&lt;/PLAINTEXT&gt;</code> tags which direct the browser to render the text they surround in fixed-width type</td>
</tr>
<tr>
<td>PRECLOSE Procedure on page 182-107</td>
<td>Generates the <code>&lt;PRE&gt;</code> tag which marks the end of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PREOPEN Procedure on page 182-108</td>
<td>Generates the <code>&lt;PRE&gt;</code> tag which marks the beginning of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PRINT Procedures on page 182-109</td>
<td>Generates the specified parameter as a string terminated with the <code>\n</code> newline character</td>
</tr>
<tr>
<td>PRINTS Procedure on page 182-110</td>
<td>Generates a string and replaces the following characters with the corresponding escape sequence</td>
</tr>
<tr>
<td>PRN Procedures on page 182-111</td>
<td>Generates the specified parameter as a string</td>
</tr>
<tr>
<td>PS Procedure on page 182-112</td>
<td>Generates a string and replaces the following characters with the corresponding escape sequence</td>
</tr>
<tr>
<td>S Procedure on page 182-113</td>
<td>Generates the <code>&lt;S&gt;</code> and <code>&lt;/S&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>SAMPLE Procedure on page 182-114</td>
<td>Generates the <code>&lt;SAMP&gt;</code> and <code>&lt;/SAMP&gt;</code> tags which direct the browser to render the text they surround in monospace font or however “sample” is defined stylistically</td>
</tr>
<tr>
<td>SCRIPT Procedure on page 182-115</td>
<td>Generates the <code>&lt;SCRIPT&gt;</code> and <code>&lt;/SCRIPT&gt;</code> tags which contain a script written in languages such as JavaScript and VBscript</td>
</tr>
<tr>
<td>SMALL Procedure on page 182-116</td>
<td>Generates the <code>&lt;SMALL&gt;</code> and <code>&lt;/SMALL&gt;</code> tags, which direct the browser to render the text they surround using a small font</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>STRIKE Procedure</td>
<td>Generates the <code>&lt;STRIKE&gt;</code> and <code>&lt;/STRIKE&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>STRONG Procedure</td>
<td>Generates the <code>&lt;STRONG&gt;</code> and <code>&lt;/STRONG&gt;</code> tags which direct the browser to render the text they surround in bold or however &quot;strong&quot; is defined stylistically</td>
</tr>
<tr>
<td>STYLE Procedure</td>
<td>Generates the <code>&lt;STYLE&gt;</code> and <code>&lt;/STYLE&gt;</code> tags which include a style sheet in a Web page</td>
</tr>
<tr>
<td>SUB Procedure</td>
<td>Generates the <code>&lt;SUB&gt;</code> and <code>&lt;/SUB&gt;</code> tags which direct the browser to render the text they surround as subscript</td>
</tr>
<tr>
<td>SUP Procedure</td>
<td>Generates the <code>&lt;SUP&gt;</code> and <code>&lt;/SUP&gt;</code> tags which direct the browser to render the text they surround as superscript</td>
</tr>
<tr>
<td>TABLECAPTION Procedure</td>
<td>Generates the <code>&lt;CAPTION&gt;</code> and <code>&lt;/CAPTION&gt;</code> tags which place a caption in an HTML table</td>
</tr>
<tr>
<td>TABLECLOSE Procedure</td>
<td>Generates the <code>&lt;/TABLE&gt;</code> tag which marks the end of an HTML table</td>
</tr>
<tr>
<td>TABLEDATA Procedure</td>
<td>Generates the <code>&lt;TD&gt;</code> and <code>&lt;/TD&gt;</code> tags which insert data into a cell of an HTML table</td>
</tr>
<tr>
<td>TABLEHEADER Procedure</td>
<td>Generates the <code>&lt;TH&gt;</code> and <code>&lt;/TH&gt;</code> tags which insert a header cell in an HTML table</td>
</tr>
<tr>
<td>TABLEOPEN Procedure</td>
<td>Generates the <code>&lt;TABLE&gt;</code> tag which marks the beginning of an HTML table</td>
</tr>
<tr>
<td>TABLEROWCLOSE Procedure</td>
<td>Generates the <code>&lt;/TR&gt;</code> tag which marks the end of a new row in an HTML table</td>
</tr>
<tr>
<td>TABLEROWOPEN Procedure</td>
<td>Generates the <code>&lt;TR&gt;</code> tag which marks the beginning of a new row in an HTML table</td>
</tr>
<tr>
<td>TELETYPETE Procedure</td>
<td>Generates the <code>&lt;TT&gt;</code> and <code>&lt;/TT&gt;</code> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font</td>
</tr>
<tr>
<td>TITLE Procedure</td>
<td>Generates the <code>&lt;TITLE&gt;</code> and <code>&lt;/TITLE&gt;</code> tags which specify the text to display in the titlebar of the browser window</td>
</tr>
<tr>
<td>ULISTCLOSE Procedure</td>
<td>Generates the <code>&lt;/UL&gt;</code> tag which marks the end of an unordered list</td>
</tr>
<tr>
<td>ULISTOPEN Procedure</td>
<td>Generates the <code>&lt;UL&gt;</code> tag which marks the beginning of an unordered list</td>
</tr>
<tr>
<td>UNDERLINE Procedure</td>
<td>Generates the <code>&lt;U&gt;</code> and <code>&lt;/U&gt;</code> tags, which direct the browser to render the text they surround with an underline</td>
</tr>
<tr>
<td>VARIABLE Procedure</td>
<td>Generates the <code>&lt;VAR&gt;</code> and <code>&lt;/VAR&gt;</code> tags which direct the browser to render the text they surround in italics or however &quot;variable&quot; is defined stylistically.</td>
</tr>
<tr>
<td>WBR Procedure</td>
<td>Generates the <code>&lt;WBR&gt;</code> tag, which inserts a soft line break within a section of NOBR text</td>
</tr>
</tbody>
</table>
ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTP.ADDRESS (  
cvalue IN VARCHAR2  
cnowrap IN VARCHAR2 DEFAULT NULL  
cclear IN VARCHAR2 DEFAULT NULL  
cattributes IN VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The string that goes between the &lt;ADDRESS&gt; and &lt;/ADDRESS&gt; tags.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```
ANCHOR Procedure

This procedure and the ANCHOR2 Procedure procedures generate the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR Procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR (
    curl IN VARCHAR2,
    ctext IN VARCHAR2,
    cname IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes="cname">ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.
ANCHOR2 Procedure

This procedure and the ANCHOR Procedure generate the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (curl IN VARCHAR2,
          ctext IN VARCHAR2,
          cname IN VARCHAR2 DEFAULT NULL,
          ctarget IN VARCHAR2 DEFAULT NULL,
          cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```
APPLETCLOSE Procedure

This procedure closes the applet invocation with the \(</APPLET>\) tag. You must first invoke the a Java applet using APPLETOPEN Procedure.

Syntax

HTP.APPLETCLOSE;
APPLETOPEN Procedure

This procedure generates the `<APPLET>` tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Procedure which generates the `</APPLET>` tag.

Syntax

```
HTP.APPLETOPEN (  
code IN VARCHAR2,  
cheight IN NUMBER,  
cwidth IN NUMBER,  
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccode</td>
<td>The value for the CODE attribute which specifies the name of the applet class.</td>
</tr>
<tr>
<td>cheight</td>
<td>The value for the HEIGHT attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE='testclass.class' height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Procedure procedure.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.
AREA Procedure

This procedure generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

Syntax

```
HTP.AREA ( 
  ccoords IN VARCHAR2,
  cshape IN VARCHAR2 DEFAULT NULL,
  chref IN VARCHAR2 DEFAULT NULL,
  cnohref IN VARCHAR2 DEFAULT NULL,
  ctarget IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccoords</td>
<td>The the value for the COORDS attribute.</td>
</tr>
<tr>
<td>cshape</td>
<td>The value for the SHAPE attribute.</td>
</tr>
<tr>
<td>chref</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>cnohref</td>
<td>If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes> 
```
BASE Procedure

This procedure generates the `<BASE>` tag which records the URL of the document.

Syntax

```
HTP.BASE (  
  ctarget IN VARCHAR2 DEFAULT NULL,  
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<Base HREF='<current URL>' TARGET='ctarget' cattributes>
```
BASEFONT Procedure

This procedure generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

Syntax

```
HTP.BASEFONT (
    nsize   IN   INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Table 182–8</th>
<th>BASEFONT Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<BaseFONT SIZE="nsize">
```
BGSOUND Procedure

This procedure generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTP.BGSOUND (    
csrc  IN      VARCHAR2,   
cloop IN      VARCHAR2 DEFAULT NULL,   
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cloop</td>
<td>The value for the LOOP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```
BIG Procedure

This procedure generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

Syntax

```sql
HTP.BIG (ctext IN VARCHAR2,
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```
**BLOCKQUOTECLOSE Procedure**

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the `BLOCKQUOTEOPEN` Procedure.

**Syntax**

```assembly
HTP.BLOCKQUOTECLOSE;
```

**Examples**

This procedure generates

`</BLOCKQUOTE>`
This procedure generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the `BLOCKQUOTECLOSE` Procedure.

### Syntax

```
HTP.BLOCKQUOTEOPEN (     
    cnowrap IN VARCHAR2 DEFAULT NULL, 
    cclear IN VARCHAR2 DEFAULT NULL, 
    cattributes IN VARCHAR2 DEFAULT NULL); 
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the <code>NOWRAP</code> attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the <code>CLEAR</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

### Examples

This procedure generates

```html
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```
BODYCLOSE Procedure

This procedure generates the </BODY> tag which marks the end of a body section of an HTML document. You mark the beginning of a body section by means of the BODYOPEN Procedure.

Syntax

HTPgetBodyCLOSE;

Examples

This procedure generates
</BODY>
BODYOPEN Procedure

This procedure generates the `<BODY>` tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Procedure.

Syntax

```sql
HTP.BODYOPEN (cbackground IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbackground</td>
<td>The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<BODY background="cbackground" cattributes>
```

so that

```sql
HTP.BODYOPEN('/img/background.gif');
```

generates:

```html
<BODY background="/img/background.gif">
```
**BOLD Procedure**

This procedure generates the `<B>` and `</B>` tags which direct the browser to display the text in boldface.

**Syntax**

```
HTP.BOLD (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

Table 182–13  BOLD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<B cattributes>ctext</B>
```
BR Procedure

This procedure generates the \texttt{<BR>} tag which begins a new line of text. It performs the same operation as the \texttt{NL Procedure}.

Syntax

\begin{verbatim}
HTP.BR(
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
\end{verbatim}

Parameters

\begin{table}[h]
\centering
\begin{tabular}{ll}
\hline
Parameter & Description \\
\hline
cclear & The value for the \texttt{CLEAR} attribute. \\
cattributes & The other attributes to be included as-is in the tag. \\
\hline
\end{tabular}
\caption{BR Procedure Parameters}
\end{table}

Examples

This procedure generates

\texttt{<BR CLEAR="cclear" cattributes>}

CENTER Procedure

This procedure generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```sql
HTP.CENTER (ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<CENTER>ctext</CENTER>
```
This procedure generates the </CENTER> tag which marks the end of a section of text to center. You mark the beginning of a section of text to center by means of the CENTEROPEN Procedure.

Syntax

HTP.CENTERCLOSE;

Examples

This procedure generates

</CENTER>
CENTEROPEN Procedure

This procedure generates the `<CENTER>` tag which mark the beginning of a section of text to center. You mark the beginning of a section of text to center by means of the CENTERCLOSE Procedure.

Syntax

```
HTP.CENTEROPEN;
```

Examples

This procedure generates

```
<CENTER>
```
CITE Procedure

This procedure generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```sql
HTP.CITE (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as citation.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

`<CITE cattributes>ctext</CITE>`
CODE Procedure

This procedure generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as code.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```
COMMENT Procedure

This procedure generates the comment tags.

Syntax

```sql
HTP.COMMENT (ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The comment.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```sql
<!-- ctext -->
```
DFN Procedure

This procedure generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<DFN>ctext</DFN>
```
DIRLISTCLOSE Procedure

This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

HTP.DIRLISTCLOSE;

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

</DIR>
**DIRLISTOPEN Procedure**

This procedure generates the `<DIR>` which starts a directory list section. You end a directory list section with the `DIRLISTCLOSE Procedure`.

**Syntax**

```
HTP.DIRLISTOPEN;
```

**Usage Notes**

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the `LISTITEM Procedure` so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

**Examples**

This procedure generates

```
<DIR>
```
DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```sql
HTP.DIV (  
calign IN VARCHAR2 DEFAULT NULL,  
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<DIV ALIGN="calign" cattributes>
```
**DLISTCLOSE Procedure**

This procedure generates the `<DL>` tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

**Syntax**

```
HTP.DLISTCLOSE;
```

**Usage Notes**

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

**Examples**

This procedure generates

```
</DL>
```
DLISTDEF Procedure

This procedure generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

Syntax

```
HTP.DLISTDEF (  
  ctext IN VARCHAR2 DEFAULT NULL,  
  cclear IN VARCHAR2 DEFAULT NULL,  
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The definition of the term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

```
This procedure generates

<DD CLEAR="cclear" cattributes>ctext
```
DLISTOPEN Procedure

This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

Syntax

```
HTP.DLISTOPEN (   
cclear        IN   VARCHAR2 DEFAULT NULL,   
cattributes   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 182–22 DLISTOPEN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
<DL CLEAR='cclear' cattributes>
```
DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTP.DLISTTERM (  
    ctext IN VARCHAR2 DEFAULT NULL,  
    cclear IN VARCHAR2 DEFAULT NULL,  
    cattributes IN VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```
EM Procedure

This procedure generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the EMPHASIS Procedure.

**Syntax**

```sql
HTP.EM(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<EM cattributes>ctext</EM>
```
EMPHASIS Procedure

This procedure generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the EM Procedure.

Syntax

```sql
HTP.EMPHASIS(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<EM cattributes>ctext</EM>
```
ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- `&` to `&amp;`
- `*` to `&quot;`
- `<` to `&lt;`
- `>` to `&gt;`

This procedure performs the same operation as PRINTS Procedures and PS Procedure.

Syntax

```plaintext
HTP.ESCAPE_SC(
    ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text string to convert.</td>
</tr>
</tbody>
</table>
This procedure generates the </FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Procedure.

Syntax

HTP.FONTCLOSE;

Examples

This procedure generates

</FONT>
**FONTOPEN Procedure**

This procedure generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Procedure.

**Syntax**

```
HTP.FONTOPEN(
    ccolor IN VARCHAR2 DEFAULT NULL,
    cface IN VARCHAR2 DEFAULT NULL,
    csize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccolor</td>
<td>The value for the COLOR attribute.</td>
</tr>
<tr>
<td>cface</td>
<td>The value for the FACE attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```
FORMCHECKBOX Procedure

This procedure generates the `<INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```sql
HTP.FORMCHECKBOX(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2 DEFAULT 'ON',
    cchecked IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```
FORMCLOSE Procedure

This procedure generates the </FORM> tag which marks the end of a form section in an HTML document. You mark the beginning of the form section by means of the FORMOPEN Procedure.

Syntax

HTP.FORMCLOSE;

Examples

This procedure generates

</FORM>
FORMOPEN Procedure

This procedure generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Procedure.

Syntax

HTP.FORMOPEN(
    curl IN VARCHAR2,
    cmethod IN VARCHAR2 DEFAULT 'POST',
    ctarget IN VARCHAR2 DEFAULT NULL,
    cenctype IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.</td>
</tr>
<tr>
<td>cmethod</td>
<td>The value for the METHOD attribute. The value can be &quot;GET&quot; or &quot;POST&quot;.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cenctype</td>
<td>The value for the ENCTYPE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<Form Action="curl" Method="cmethod" Target="ctarget" Enctype="cenctype"
Cattributes>```
FORMFILE Procedure

This procedure generates the `<INPUT>` tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
    c_name IN VARCHAR2,
    c_accept IN VARCHAR2 DEFAULT NULL,
    c_attributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c_name</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>c_accept</td>
<td>A comma-delimited list of MIME types for upload.</td>
</tr>
<tr>
<td>c_attributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="c_name" ACCEPT="c_accept" c_attributes>
```
FORMHIDDEN Procedure

This procedure generates the `<INPUT>` tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```
FORMIMAGE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any `VALUE` attribute is ignored.

Syntax

```
HTP.FORMIMAGE(
    cname IN VARCHAR2,
    csrc IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the <code>SRC</code> attribute that specifies the image file.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```
FORMPASSWORD Procedure

This procedure generates the `<INPUT>` tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD(
    cname IN VARCHAR2,
    csize IN VARCHAR2,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the MAXLENGTH attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```
FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

HTP.FORMRADIO(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2,
    cchecked IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the <code>CHECKED</code> attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE='radio' NAME='cname' VALUE='cvalue' CHECKED cattributes>
```
FORMRESET Procedure

This procedure generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```plsql
HTP.FORMRESET(
    cvalue IN VARCHAR2 DEFAULT 'Reset',
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE="reset" VALUE='cvalue' cattributes>
```
FORMSELECTCLOSE Procedure

This procedure generates the \(<\!/SELECT>\) tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Procedure. The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
HTP.FORMSELECTCLOSE;
```

Examples

This procedure generates

```
\(<\!/SELECT>\)
```

as shown under Examples of the FORMSELECTOPEN Procedure.
FORMSELECTOPEN Procedure

This procedure generates the `<SELECT>` tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Procedure. The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
FORMSELECTOPEN(cname IN VARCHAR2,
cprompt IN VARCHAR2 DEFAULT NULL,
nsize IN INTEGER DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cprompt</td>
<td>The string preceding the list box.</td>
</tr>
<tr>
<td>nsize</td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player');
   'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
 <OPTION>Messier
 <OPTION>Howe
 <OPTION>Gretzky
</SELECT>
```
FORMSELECTOPTION Procedure

This procedure generates the `<OPTION>` tag which represents one choice in a Select element.

Syntax

```
HTP.FORMSELECTOPTION(
    cvalue IN VARCHAR2,
    cselected IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cvalue</code></td>
<td>The text for the option.</td>
</tr>
<tr>
<td><code>cvalue</code></td>
<td>If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Procedure.
This procedure generates the `<INPUT>` tag with TYPE=submit which creates a button that, when clicked, submits the form. If the button has a NAME attribute, the button contributes a name/value pair to the submitted data.

**Syntax**

```sql
HTP.FORMSUBMIT(
    cname IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT 'Submit',
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```
**FORMTEXT Procedure**

This procedure generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

**Syntax**

```
HTP.FORMTEXT(
    cname IN VARCHAR2,
    csize IN VARCHAR2 DEFAULT NULL,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td><code>csize</code></td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td><code>cmaxlength</code></td>
<td>The value for the <code>MAXLENGTH</code> attribute.</td>
</tr>
<tr>
<td><code>cvalue</code></td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue" cattributes>
```
FORMTEXTAREA Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Procedure which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA(
  cname IN VARCHAR2,
  nrows IN INTEGER,
  ncolumns IN INTEGER,
  calign , IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes> </TEXTAREA>
```
FORMTEXTAREA2 Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA Procedure except that in that case you cannot specify a wrap style.

Syntax

```sql
HTP.FORMTEXTAREA2(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes"></TEXTAREA>
```
FORMTEXTAREACLOSE Procedure

This procedure generates the </TEXTAREA> tag which ends a text area form element. You open a text area element by means of either FORMTEXTAREAOPEN Procedure or FORMTEXTAREAOPEN2 Procedure.

Syntax

    HTP.FORMTEXTAREACLOSE;

Examples

This procedure generates

    </TEXTAREA>
FORMTEXTAREAOPEN Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Procedure which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td><code>nrows</code></td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td><code>ncolumns</code></td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
FORMTEXTAREAOPEN2 Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Procedure except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN2 (    
cname IN VARCHAR2,     
nrows IN INTEGER,     
ncolumns IN INTEGER,     
calign IN VARCHAR2 DEFAULT NULL,     
cwrap IN VARCHAR2 DEFAULT NULL,     
cattributes IN VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap" cattributes>
```
FRAME Procedure

This procedure generates the `<FRAME>` tag which defines the characteristics of a frame created by a `<FRAMESET>` tag.

Syntax

```sql
HTP.FRAME(
    csrc IN VARCHAR2,
    cname IN VARCHAR2 DEFAULT NULL,
    cmarginwidth IN VARCHAR2 DEFAULT NULL,
    cmarginheight IN VARCHAR2 DEFAULT NULL,
    cscrolling IN VARCHAR2 DEFAULT NULL,
    cnoresize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The URL to display in the frame.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cmarginwidth</td>
<td>The value for the MARGINWIDTH attribute.</td>
</tr>
<tr>
<td>cscrolling</td>
<td>The value for the SCROLLING attribute.</td>
</tr>
<tr>
<td>cnoresize</td>
<td>If the value for this parameter is not NULL, the NORESIZE attribute is</td>
</tr>
<tr>
<td></td>
<td>added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```
FRAMESETCLOSE Procedure

This procedure generates the </FRAMESET> tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Procedure.

Syntax

```
HTP.FRAMESETCLOSE;
```

Examples

This procedure generates

```
</FRAMESET>
```
FRAMESETOPEN Procedure

This procedure generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Procedure.

Syntax

```sql
HTP.FRAMESETOPEN(crows IN VARCHAR2 DEFAULT NULL, ccols IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crows</td>
<td>The value for the ROWS attribute.</td>
</tr>
<tr>
<td>ccols</td>
<td>The value for the COLS attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```
HEADCLOSE Procedure

This procedure generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Procedure.

Syntax

HTP.HEADCLOSE;

Examples

This procedure generates

</HEAD>
**HEADER Procedure**

This procedure generates opening heading tags (&lt;H1&gt; to &lt;H6&gt;) and their corresponding closing tags (&lt;/H1&gt; to &lt;/H6&gt;).

**Syntax**

```sql
HTP.HEADER(
    nsize IN INTEGER,
    cheader IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The the heading level. This is an integer between 1 and 6.</td>
</tr>
<tr>
<td>cheader</td>
<td>The text to display in the heading.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>The value for the NOWRAP attribute.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

```sql
HTP.header (1, 'Overview');
```

produces:

```html
&lt;H1&gt;Overview&lt;/H1&gt;
```
HEADOPEN Procedure

This procedure generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Procedure.

Syntax

```sql
HTP.HEADOPEN;
```

Examples

This procedure generates

```html
<HEAD>
```
HR Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the **LINE Procedure**.

Syntax

```
HTP.HR(
  cclear IN VARCHAR2 DEFAULT NULL,
  csrc IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 182–47**  HR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```
HTMLCLOSE Procedure

This procedure generates the </HTML> tag which marks the end of an HTML document. You use the HTMLOPEN Procedure to mark the beginning of an HTML document.

Syntax

```
HTP.HTMLCLOSE;
```

Examples

This procedure generates

`</HTML>`
HTMLOPEN Procedure

This procedure generates the <HTML> tag which marks the beginning of an HTML document. You use the HTMLCLOSE Procedure to mark the end of the an HTML document.

Syntax

HTP.HTMLOPEN;

Examples

This procedure generates

<HTML>
IMG Procedure

This procedure generates the `<IMG>` tag which directs the browser to load an image onto the HTML page. The IMG2 Procedure performs the same operation but additionally uses the `cusemap` parameter.

Syntax

```
HTP.IMG(
    curl IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    calt IN VARCHAR2 DEFAULT NULL,
    cismap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```
IMG2 Procedure

This procedure generates the `<IMG>` tag, which directs the browser to load an image onto the HTML page. The IMG Procedure performs the same operation but does not use the cusemap parameter.

Syntax

```
HTP.IMG2(
    curl IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    calt IN VARCHAR2 DEFAULT NULL,
    cismap IN VARCHAR2 DEFAULT NULL,
    cusemap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 182–49  IMG2 Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cusemap</td>
<td>The value for the USEMAP attribute which specifies a client-side image map.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```
ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX(
    cprompt IN VARCHAR2 DEFAULT NULL,
    curl IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cprompt</td>
<td>The value for the PROMPT attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl"> 
```
ITALIC Procedure

This procedure generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

Syntax

```sql
HTP.ITALIC(
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<i cattributes>ctext</i>
```
KBD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Procedure.

Syntax

```
HTP.KBD(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```
KEYBOARD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Procedure.

Syntax

```
HTP.KEYBOARD(
    ctext  IN   VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```
LINE Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Procedure.

Syntax

```sql
HTP.LINE(
  cclear IN VARCHAR2 DEFAULT NULL,
  csrc IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<HR CLEAR="cclear" SRC="csrc" cattributes>
```
LINKREL Procedure

This procedure generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of LINKREV Procedure. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREL(
    crel IN VARCHAR2,
    curl IN VARCHAR2,
    ctitle IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the REL attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<LINK REL='crel' HREF='curl' TITLE='ctitle'>
```
LINKREV Procedure

This procedure generates the `<LINK>` tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Procedure. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```sql
HTP.LINKREV(
    crev IN VARCHAR2,
    curl IN VARCHAR2,
    ctitle IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crev</td>
<td>The value for the REV attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```
LISTHEADER Procedure

This procedure generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code>.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```
LISTINGCLOSE Procedure

This procedure generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Procedure.

Syntax

HTP.LISTINGCLOSE;

Examples

This procedure generates

</LISTING>
LISTINGOPEN Procedure

This procedure generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Procedure.

Syntax

```
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```
<Listing>
```
LISTITEM Procedure

This procedure generates the `<LI>` tag, which indicates a list item.

Syntax

```sql
HTP.LISTITEM(
    ctext IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cdingbat IN VARCHAR2 DEFAULT NULL,
    csrc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the list item.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```
MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
  caddress  IN   VARCHAR2,
  ctext    IN    VARCHAR2,
  cname    IN    VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>caddress</td>
<td>The email address of the recipient.</td>
</tr>
<tr>
<td>ctext</td>
<td>The clickable portion of the link.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```
MAPCLOSE Procedure

This procedure generates the <\MAP> tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Procedure.

Syntax

HTP.MAPCLOSE;

Examples

This procedure generates

<\MAP>
MAPOPEN Procedure

This procedure generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Procedure.

Syntax

```
HTP.MAPOPEN(
    cname IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```
MENULISTCLOSE Procedure

This procedure generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

HTP.MENULISTCLOSE;

Examples

This procedure generates

</MENU>
MENULISTOPEN Procedure

This procedure generates the `<MENU>` tag which creates a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```vbscript
HTP.MENULISTOPEN;
```

Examples

This procedure generates

```html
<MENU>
```
META Procedure

This procedure generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

HTP.META (  
    chttp_equiv IN VARCHAR2,  
    cname IN VARCHAR2,  
    ccontent IN VARCHAR2);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chttp_equiv</td>
<td>The value for the CHTTP_EQUIV attribute.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>ccontent</td>
<td>The value for the CONTENT attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```sql
<META HTTP-EQUIV="chttp_equiv" NAME="cname" CONTENT="ccontent">
```

so that

```sql
HTP.meta ('Refresh', NULL, 120);
```

generates

```sql
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.
**NL Procedure**

This procedure generates the `<BR>` tag which begins a new line of text. It performs the same operation as the BR Procedure.

**Syntax**

```sql
HTP.NL(
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```
**NOBR Procedure**

This procedure generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

**Syntax**

```
HTP.NOBR(
  ctext        IN        VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that is to be rendered on one line.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<NOBR>ctext</NOBR>
```
NOFRAMESCLOSE Procedure

This procedure generates the <\!\!\!\!\!\!\!\!\!NOFRAMES> tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

HTP.NOFRAMESCLOSE;

Examples

This procedure generates

</NOFRAMES>
NOFRAMESOPEN Procedure

This procedure generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```plsql
HTP.NOFramesopen;
```

Examples

This procedure generates

```html
<NOFRAMES>
```
OLISTCLOSE Procedure

This procedure generates the </ol> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

HTP.OLISTCLOSE;

Examples

This procedure generates

</ol>
OLISTOPEN Procedure

This procedure generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the OLISTCLOSE Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```
PARA Procedure

This procedure generates the `<P>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the PARAGRAPH Procedure.

Syntax

```
HTP.PARA;
```

Examples

This procedure generates

```
<P>
```
PARAGRAPh Procedure

You can use this procedure to add attributes to the <p> tag created by the PARA Procedure.

Syntax

```sql
HTP.PARAGRAPH(
  calign IN VARCHAR2 DEFAULT NULL,
  cnowrap IN VARCHAR2 DEFAULT NULL,
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<p ALIGN="calign" NOWRAP CLEAR="cclear" cattributes/>
```
PARAM Procedure

This procedure generates the `<PARAM>` tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOOPEN Procedure to begin the invocation. Use one PARAM Procedure for each desired name-value pair, and use APPLETCLOSE Procedure to end the applet invocation.

Syntax

```
HTP.PARAM(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">  
```
PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in fixed-width font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```
PRECLOSE Procedure

This procedure generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Procedure.

Syntax

HTP.PRECLOSE;

Examples

This procedure generates

</PRE>
**PREOPEN Procedure**

This procedure generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Procedure.

**Syntax**

```
HTP.PREOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwidth IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```
PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character. The PRN Procedures performs the same operation but does not terminate with a newline character.

Syntax

```sql
HTP.PRINT (cbuf IN VARCHAR2);
HTP.PRINT (dbuf IN DATE);
HTP.PRINT (nbuf IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
</tbody>
</table>

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These procedures do not have function equivalents.
PRINTS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- `<` to `&lt;`
- `>` to `&gt;`
- `"` to `&quot;`
- `&` to `&amp;`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure an the PS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```sql
HTP.PRINTS (ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The string where to perform character substitution.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 182-3 for the HTF implementation).
PRN Procedures

These procedures generate the specified parameter as a string. Unlike the PRINT Procedures the string is not terminated with the \n newline character.

Syntax

```sql
HTP.PRN (  
cbuf IN VARCHAR2 );  
HTP.PRN (  
dbuf IN DATE );  
HTP.PRN (  
nbuf IN NUMBER );
```

Parameters

<table>
<thead>
<tr>
<th>Table 182–71  PRN Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>cbuf</td>
</tr>
<tr>
<td>dbuf</td>
</tr>
<tr>
<td>nbuf</td>
</tr>
</tbody>
</table>

Usage Notes

These procedures do not have function equivalents.
PS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- `<` to `&lt;`
- `>` to `&gt;`
- `"` to `&quot;`
- `&` to `&amp;`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PRINTS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PS (ctime IN VARCHAR2);
```

Parameters

**Table 182–72  PS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The string where to perform character substitution.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 182-3 for the HTF implementation).
S Procedure

This procedure generates the \(<S>\) and \(</S>\) tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Procedure.

Syntax

```
HTP.S (  
    ctext  IN  VARCHAR2,  
    cattributes  IN  VARCHAR2  DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

\(<S \ cattributes>c\text</S>\)
SAMPLE Procedure

This procedure generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTP.SAMPLE (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<SAMP cattributes>ctext</SAM>
```
**SCRIPT Procedure**

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

**Syntax**

```sql
HTP.SCRIPT (cscript IN VARCHAR2,
clanguage IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cscript</td>
<td>The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.</td>
</tr>
<tr>
<td>clanguage</td>
<td>The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```sql
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.
SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (  
    ctext  IN VARCHAR2,  
    cattributes  IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in small font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```
STRIKE Procedure

This procedure generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as S Procedure.

Syntax

```sql
HTP.STRIKE (ctext IN VARCHAR2,
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<STRIKE cattributes>ctext</STRIKE>
```
STRONG Procedure

This procedure generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold or however “strong” is defined.

Syntax

```
HTP.STRONG(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be emphasized.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<STRONG cattributes>ctext</STRONG>
```
STYLE Procedure

This procedure generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page. You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(
    cstyle    IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cstyle</td>
<td>The style information to include.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```
**SUB Procedure**

This procedure generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

**Syntax**

```
HTP.SUB(
    ctext IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in subscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```
**SUP Procedure**

This procedure generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

**Syntax**

```
HTP.SUP(
  ctext IN VARCHAR2,
  calign in VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in superscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```
TABLECAPTION Procedure

This procedure generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```sql
HTP.TABLECAPTION(
    ccaption IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the caption.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```
TABLECLOSE Procedure

This procedure generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Procedure.

Syntax

HTP.TABLECLOSE;

Examples

This procedure generates

</TABLE>
TABLEDATA Procedure

This procedure generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```sql
HTP.TABLEDATA(
    cvalue IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    crowspan IN VARCHAR2 DEFAULT NULL,
    ccolspan IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes>cvalue</TD>
```
TABLEHEADER Procedure

This procedure generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTP.TABLEHEADER(
    cvalue IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    crowspan IN VARCHAR2 DEFAULT NULL,
    ccolspan IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>crowspan</td>
<td>The value for the ROWSPAN attribute.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes>cvalue</TH>
```
TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Procedure.

Syntax

```
HTP.TABLEOPEN(
    cborder IN VARCHAR2 DEFAULT NULL,
    callign IN VARCHAR2 DEFAULT NULL,
    cnnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>border</td>
<td>The value for the BORDER attribute.</td>
</tr>
<tr>
<td>callign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="callign" CLEAR="cclear" cattributes>
```
TABLEROWCLOSE Procedure

This procedure generates the </TR> tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Procedure.

Syntax

HTP.TABLEROWCLOSE;

Examples

This procedure generates

</TABLE>
TABLEROWOPEN Procedure

This procedure generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Procedure.

Syntax

```
HTP.TABLEROWOPEN(
    calign IN VARCHAR2 DEFAULT NULL,
    cvalign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 182–86  TABLEROWOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cvalign</td>
<td>The value for the VALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```
TELETYPE Procedure

This procedure generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTP.TELETYPE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in a fixed width typewriter font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```
TITLE Procedure

This procedure generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```sql
HTP.TITLE(
    ctitle IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctitle</td>
<td>The text to display in the titlebar of the browser window.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TITLE>ctitle</TITLE>
```
**ULISTCLOSE Procedure**

This procedure generates the `<ul>` tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the **ULISTOPEN Procedure**. Add list items with **LISTITEM Procedure**.

**Syntax**

```plaintext
HTP.ULISTCLOSE;
```

**Examples**

This procedure generates

```html
</table>
```
ULISTOPEN Procedure

This procedure generates the `<UL>` tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Procedure. Add list items with LISTITEM Procedure.

Syntax

```sql
HTP.ULISTOPEN(
  cclear IN VARCHAR2 DEFAULT NULL,
  cwrap IN VARCHAR2 DEFAULT NULL,
  cdingbat IN VARCHAR2 DEFAULT NULL,
  csrc IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

UNDERLINE Procedure

This procedure generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```sql
HTP.UNDERLINE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render with an underline.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<U cattributes>ctext</U>
```
VARIABLE Procedure

This procedure generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTP.VARIABLE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
```

Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```
WBR Procedure

This procedure generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

HTP.WBR;

Examples

This procedure generates

<WBR>
This Oracle Multimedia package supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type. See Oracle Multimedia DICOM Developer's Guide for a complete description of the ORDDicom object type.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other content, such as single-frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

The Oracle Multimedia ORD_DICOM package provides functions and procedures in the DICOM relational interface to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM content. This Oracle Multimedia package also provides functions and procedures to check DICOM content for conformance based on a set of user-specified conformance rules, and to make DICOM content anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

The Oracle Multimedia ORD_DICOM package also provides functions and procedures in the DICOM data model utility interface to operate on the DICOM data model repository. See Oracle Multimedia DICOM Developer's Guide for a complete description of the DICOM data model utility interface.

- Documentation of ORD_DICOM
For a complete description of this package within the context of Oracle Multimedia, see ORD_DICOM in the Oracle Multimedia DICOM Developer’s Guide.
This Oracle Multimedia package is used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository.

The DICOM data model repository is a collection of documents. An initial set of documents is loaded during installation. After installation, DICOM administrators can use the procedures and functions provided in the data model repository API of the Oracle Multimedia ORD_DICOM_ADMIN package to obtain document content as well as to insert, edit, and delete documents in the data model repository.

- Documentation of ORD_DICOM_ADMIN
For a complete description of this package within the context of Oracle Multimedia, see ORD_DICOM_ADMIN in the Oracle Multimedia DICOM Developer’s Guide.
The OWA_CACHE package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications.

**See Also:** For more information about implementation of this package:

Summary of OWA_CACHE Subprograms

Table 185–1  OWA_CACHE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE Procedure on page 185-5</td>
<td>Disables the cache for this particular request</td>
</tr>
<tr>
<td>GET_ETAG Function on page 185-6</td>
<td>Returns the tag associated with the cached content (used in the Validation technique model only)</td>
</tr>
<tr>
<td>GET_LEVEL Function on page 185-7</td>
<td>Returns the caching level (used in the Validation technique model only)</td>
</tr>
<tr>
<td>SET_CACHE Procedure on page 185-8</td>
<td>Sets up the cache headers for validation model cache type</td>
</tr>
<tr>
<td>SET_EXPIRES Procedure on page 185-9</td>
<td>Sets up the cache headers for expires model cache type</td>
</tr>
<tr>
<td>SET_NOT_MODIFIED Procedure on page 185-10</td>
<td>Sets up the headers for a not modified cache hit (used in the Validation technique model only)</td>
</tr>
<tr>
<td>SET_SURROGATE_CONTROL Procedure on page 185-11</td>
<td>Sets up the headers for a surrogate-control header for Web cache</td>
</tr>
</tbody>
</table>
DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

```
OWA_CACHE.DISABLE;
```
GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```sql
OWA_CACHE.GET_ETAG
RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise NULL.
GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```sql
OWA_CACHE.GET_LEVEL
RETURN VARCHAR2;
```

Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.
SET_CACHE Procedure

This sets up the cache headers for validation model cache type.

Syntax

```sql
OWA_CACHE.SET_CACHE(
    p_etag        IN       VARCHAR2,
    p_level       IN       VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_etag</td>
<td>The etag associated with this content</td>
</tr>
<tr>
<td>p_level</td>
<td>The caching level ('USER' or 'SYSTEM').</td>
</tr>
</tbody>
</table>

Exceptions

VALUE_ERROR is thrown if
- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'
**SET_EXPIRES Procedure**

This procedure sets up the cache headers for expires model cache type.

**Syntax**

```sql
OWA_CACHE.SET_EXPIRES(
    p_expires    IN       NUMBER,
    p_level      IN       VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_expires</td>
<td>The number of minutes this content is valid.</td>
</tr>
<tr>
<td>p_level</td>
<td>The caching level ('USER' or 'SYSTEM').</td>
</tr>
</tbody>
</table>

**Exceptions**

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)
SET NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

OWA_CACHE.SET_NOT_MODIFIED;

Exceptions

VALUE_ERROR is thrown if the etag was not passed in
**SET_SURROGATE_CONTROL Procedure**

This procedure sets the headers for a surrogate-control header for Web cache.

**Syntax**

```sql
OWA_CACHE.SET_SURROGATE_CONTROL(
    p_value        IN       VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_value</td>
<td>The value to be passed as the Surrogate-Control header</td>
</tr>
</tbody>
</table>

**Exceptions**

`VALUE_ERROR` is thrown if `p_value` is greater than 55 in length.
The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client’s browser.

See Also: For more information about implementation of this package:

- Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server
- Oracle Fusion Middleware User’s Guide for mod_plsql

The chapter contains the following topics:

- Using OWA_COOKIE
  - Overview
  - Types
  - Rules and Limits
- Summary of OWA_COOKIE Subprograms
Using OWA_COOKIE

- Overview
- Types
- Rules and Limits
Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client’s sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.
This data type contains cookie name-value pairs. Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL RECORD holding all values associated with a given cookie name.

```plsql
type vc_arr is table of varchar2(4000) index by binary_integer.

type cookie is record (
  name      varchar2(4000),
  vals      vc_arr,
  num_vals  integer);
```
Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.
## Summary of OWA_COOKIE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET Function on page 186-7</td>
<td>Gets the value of the specified cookie</td>
</tr>
<tr>
<td>GET_ALL Procedure on page 186-8</td>
<td>Gets all cookie name-value pairs</td>
</tr>
<tr>
<td>REMOVE Procedure on page 186-9</td>
<td>Removes the specified cookie</td>
</tr>
<tr>
<td>SEND procedure on page 186-10</td>
<td>Generates a &quot;Set-Cookie&quot; line in the HTTP header</td>
</tr>
</tbody>
</table>
GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA_COOKIE.COOKIE DATA TYPE.

Syntax

OWA_COOKIE.GET(
   name           IN       VARCHAR2)
RETURN COOKIE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie.</td>
</tr>
</tbody>
</table>

Return Values

OWA_COOKIE.COOKIE DATA TYPE.
GET_ALL Procedure

This procedure returns all cookie names and their values from the client’s browser. The values appear in the order in which they were sent from the browser.

Syntax

```plsql
OWA_COOKIE.GET_ALL(
    names OUT vc_arr,
    vals OUT vc_arr,
    num_vals OUT INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>names</td>
<td>The names of the cookies.</td>
</tr>
<tr>
<td>vals</td>
<td>The values of the cookies.</td>
</tr>
<tr>
<td>num_vals</td>
<td>The number of cookie-value pairs.</td>
</tr>
</tbody>
</table>
REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990". This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE(
    name IN VARCHAR2,
    val IN VARCHAR2,
    path IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie to expire.</td>
</tr>
<tr>
<td>val</td>
<td>The value of the cookie.</td>
</tr>
<tr>
<td>path</td>
<td>[Currently unused]</td>
</tr>
</tbody>
</table>
SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client. This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.Send(
    name in varchar2,
    value in varchar2,
    expires in date DEFAULT NULL,
    path in varchar2 DEFAULT NULL,
    domain in varchar2 DEFAULT NULL,
    secure in varchar2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the cookie.</td>
</tr>
<tr>
<td>expires</td>
<td>The date at which the cookie will expire</td>
</tr>
<tr>
<td>path</td>
<td>The value for the path field.</td>
</tr>
<tr>
<td>domain</td>
<td>The value for the domain field.</td>
</tr>
<tr>
<td>secure</td>
<td>If the value of this parameter is not NULL, the &quot;secure&quot; field is added to the line.</td>
</tr>
</tbody>
</table>
The `OWA_CUSTOM` package provides a Global PLSQL Agent Authorization callback function. It is used when PLSQL Agent’s authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

**See Also:** For more information about implementation of this package:
- *Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server*

- **Summary of OWA_CUSTOM Subprograms**
Using OWA_CUSTOM

- Constants
Constants

- dbms_server_timezone CONSTANT VARCHAR2(3) := 'PST';
- dbms_server_gmtdiff CONSTANT NUMBER := NULL;
### Summary of OWA_CUSTOM Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTHORIZER Function on page 187-5</td>
<td>Provides a Global PLSQL Agent Authorization callback function</td>
</tr>
</tbody>
</table>
AUTHORIZE Function

This function is used when PLSQL Agent’s authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

Syntax

```sql
OWA_CUSTOM.AUTHORIZE
RETURN BOOLEAN;
```
The OWA_IMAGE package provides an interface to access the coordinates where a user clicked on an image.

See Also: For more information about implementation of this package:
- Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server
- Oracle Fusion Middleware User’s Guide for mod_plsql

The chapter contains the following topics:
- Summary of OWA_IMAGE Subprograms

- Summary of OWA_IMAGE Subprograms
Using OWA_IMAGE

- Overview
- Types
- Variables
- Examples
Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.
This data type (point) contain the X and Y values of a coordinate, and so provides the coordinates of a user's click on an imagemap. It is defined as:

```sql
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```
Variables

This package variable (null_point) of TYPE POINT is used to default point parameters. Both the X and the Y fields of this variable are NULL.
CREATE OR REPLACE PROCEDURE process_image
  (my_img IN OWA_IMAGE.POINT)
AS
  x INTEGER := OWA_IMAGE.GET_X(my_img);
  y INTEGER := OWA_IMAGE.GET_Y(my_img);
BEGIN
  /* process the coordinate */
END
# Summary of OWA_IMAGE Subprograms

</tr>
</tbody>
</table>

*Table 188–1  OWA_IMAGE Package Subprograms*
GET_X Function

This function returns the X coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_X(
    p   IN   point)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>The point where the user clicked.</td>
</tr>
</tbody>
</table>

Return Values

The X coordinate as an integer.
GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```lisp
OWA_IMAGE.GET_Y(
p   IN   point)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>The point where the user clicked.</td>
</tr>
</tbody>
</table>

Return Values

The Y coordinate as an integer.
The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

  - Overview
  - Types
- **Summary of OWA_OPT_LOCK Subprograms**
Using OWA_OPT_LOCK

- Overview
- Types
Overview

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The OWA_OPT_LOCK package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the owa_opt_lock.store_values procedure.

- The checksum method stores a checksum rather than the values themselves. To use this method, call the owa_opt_lock.checksum function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.
Types

This data type is a PL/SQL table intended to hold ROWIDs.

```sql
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC.ARR` DATA TYPE.
## Summary of OWA_OPT_LOCK Subprograms

**Table 189–1**  
**OWA_CACHE Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECKSUM Functions on page 189-6</td>
<td>Returns the checksum value</td>
</tr>
<tr>
<td>GET_ROWID Function on page 189-7</td>
<td>Returns the ROWID value</td>
</tr>
<tr>
<td>STORE_VALUES Procedure on page 189-8</td>
<td>Stores unmodified values in hidden fields for later verification</td>
</tr>
<tr>
<td>VERIFY_VALUES Function on page 189-9</td>
<td>Verifies the stored values against modified values</td>
</tr>
</tbody>
</table>
CHECKSUM Functions

This function returns a checksum value for a specified string, or for a row in a table. For a row in a table, the function calculates the checksum value based on the values of the columns in the row. This function comes in two versions.

The first version returns a checksum based on the specified string. This is a "pure" 32-bit checksum executed by the database and based on the Internet 1 protocol.

The second version returns a checksum based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

Syntax

```
OWA_OPT_LOCK.CHECKSUM(
    p_buff    IN    VARCHAR2)
  RETURN NUMBER;

OWA_OPT_LOCK.CHECKSUM(
    p_owner   IN    VARCHAR2,
    p_tname   IN    VARCHAR2,
    p_rowid   IN    ROWID)
  RETURN NUMBER;
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_buff</td>
<td>The nstring where you want to calculate the checksum.</td>
</tr>
<tr>
<td>p_owner</td>
<td>The owner of the table.</td>
</tr>
<tr>
<td>p_tname</td>
<td>The table name.</td>
</tr>
<tr>
<td>p_rowid</td>
<td>The row in p_tname where you want to calculate the checksum value. Use the GET_ROWID Function to convert VCARRAY values to proper rowids.</td>
</tr>
</tbody>
</table>
```
**GET_ROWID Function**

This function returns the ROWID data type from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

**Syntax**

```sql
OWA_OPT_LOCK.GET_ROWID(
    p_old_values IN vcarray)
RETURN ROWID;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_old_values</td>
<td>This parameter is usually passed in from an HTML form.</td>
</tr>
</tbody>
</table>
STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```sql
OWA_OPT_LOCK.STORE_VALUES(
p_owner IN VARCHAR2,
p_tname IN VARCHAR2,
p_rowid IN ROWID);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_owner</td>
<td>The owner of the table.</td>
</tr>
<tr>
<td>p_tname</td>
<td>The name of the table.</td>
</tr>
<tr>
<td>p_rowid</td>
<td>The row where you want to store values.</td>
</tr>
</tbody>
</table>

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the VERIFY_VALUES Function.
VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query. Use this function with the STORE_VALUES Procedure.

Syntax

```sql
OWA_OPT_LOCK.VERIFY_VALUES(
    p_old_values IN varray)
RETURN BOOLEAN;
```

Parameters

Table 189–5  VERIFY_VALUES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| p_old_values | A PL/SQL table containing the following information:  
  - p_old_values(1) specifies the owner of the table.  
  - p_old_values(2) specifies the table.  
  - p_old_values(3) specifies the rowid of the row to verify.  
  The remaining indexes contain values for the columns in the table.  
  Typically, this parameter is passed in from the HTML form,  
  where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements. |

Return Values

TRUE if no other update has been performed, otherwise FALSE.
The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User’s Guide for mod_plsql*

The chapter contains the following topics:

- **Using OWA_PATTERN**
  - Types
  - Operational Notes
- **Summary of OWA_PATTERN Subprograms**
Using OWA_PATTERN

- Types
- Operational Notes
Types

You can use a pattern as both an input and output parameter. Thus, you can pass the same regular expression to `OWA_PATTERN` function calls, and it only has to be parsed once.

- `OWA_PATTERN . PATTERN`
Operational Notes

The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of MATCH, and four each of AMATCH and CHANGE. The subprograms use the following parameters:

- **line** - This is the target to be examined for a match. It can be more than one line of text or a owa_text.multi_line data type.

- **pat** - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the owa_pattern.change function and procedure, this parameter is called from_str.

- **flags** - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- **Wildcards**

- **Quantifiers**

- **Flags**

**Wildcards**

Wildcard tokens match something other than themselves:

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Matches newline or the beginning of the target</td>
</tr>
<tr>
<td>$</td>
<td>Matches newline or the end of the target</td>
</tr>
<tr>
<td>\n</td>
<td>Matches newline</td>
</tr>
<tr>
<td>.</td>
<td>Matches any character except newline</td>
</tr>
<tr>
<td>\t</td>
<td>Matches tab</td>
</tr>
<tr>
<td>\d</td>
<td>Matches digits [0-9]</td>
</tr>
<tr>
<td>\D</td>
<td>Matches non-digits [not 0-9]</td>
</tr>
<tr>
<td>\w</td>
<td>Matches word characters (0-9, a-z, A-Z, or _)</td>
</tr>
<tr>
<td>\W</td>
<td>Matches non-word characters (not 0-9, a-z, A-Z, or _)</td>
</tr>
<tr>
<td>\s</td>
<td>Matches whitespace characters (blank, tab, or newline).</td>
</tr>
<tr>
<td>\S</td>
<td>Matches non-whitespace characters (not blank, tab, or newline)</td>
</tr>
<tr>
<td>\b</td>
<td>Matches &quot;word&quot; boundaries (between \w and \W)</td>
</tr>
<tr>
<td>\x&lt;HEX&gt;</td>
<td>Matches the value in the current character set of the two hexadecimal digits</td>
</tr>
<tr>
<td>&lt;OCT&gt;</td>
<td>Matches the value in the current character set of the two or three octal digits</td>
</tr>
<tr>
<td>\</td>
<td>Followed by any character not covered by another case matches that character</td>
</tr>
<tr>
<td>&amp;</td>
<td>Applies only to CHANGE. This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under CHANGE Functions and Procedures.</td>
</tr>
</tbody>
</table>
Quantifiers

Any tokens except & can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals:

<table>
<thead>
<tr>
<th>Quantifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>0 or 1 occurrence(s)</td>
</tr>
<tr>
<td>*</td>
<td>0 or more occurrences</td>
</tr>
<tr>
<td>+</td>
<td>1 or more occurrence(s)</td>
</tr>
<tr>
<td>{n}</td>
<td>Exactly n occurrences</td>
</tr>
<tr>
<td>(n,)</td>
<td>At least n occurrences</td>
</tr>
<tr>
<td>(n,m)</td>
<td>At least n, but not more than m, occurrences</td>
</tr>
</tbody>
</table>

Flags

In addition to targets and regular expressions, the OWA_PATTERN functions and procedures use flags to affect how they are interpreted.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>This indicates a case-insensitive search.</td>
</tr>
<tr>
<td>g</td>
<td>This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.</td>
</tr>
</tbody>
</table>
## Summary of OWA_PATTERN Subprograms

<table>
<thead>
<tr>
<th>Table 190–4</th>
<th>OWA_CACHE Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>AMATCH Function  on page 190-7</td>
<td>Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur</td>
</tr>
<tr>
<td>CHANGE Functions and Procedures on page 190-9</td>
<td>Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced</td>
</tr>
<tr>
<td>GETPAT Procedure on page 190-11</td>
<td>Generates a pattern data type from a VARCHAR2 type</td>
</tr>
<tr>
<td>MATCH Function on page 190-12</td>
<td>Determines if a string contains the specified pattern</td>
</tr>
</tbody>
</table>
AMATCH Function

This function specifies if a pattern occurs in a particular location in a string. There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the backrefs parameters in the third and fourth versions). The difference between the first and second versions is the pat parameter, which can be a VARCHAR2 or a pattern data type.
- The third and fourth versions of the function save the matched tokens in the backrefs parameter. The difference between the third and fourth versions is the pat parameter, which can be a VARCHAR2 or a pattern data type.

**Note:** If multiple overlapping strings match the regular expression, this function takes the longest match.

## Syntax

```sql
OWA_PATTERN.AMATCH(
    line IN VARCHAR2,
    from_loc IN INTEGER,
    pat IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```sql
OWA_PATTERN.AMATCH(
    line IN VARCHAR2,
    from_loc IN INTEGER,
    pat IN OUT PATTERN,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```sql
OWA_PATTERN.AMATCH(
    line IN VARCHAR2
    from_loc IN INTEGER
    pat in varchar2
    backrefs OUT owa_text.vc_arr
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```sql
OWA_PATTERN.AMATCH(
    line IN VARCHAR2
    from_loc IN INTEGER
    pat IN OUT PATTERN
    backrefs OUT owa_text.vc_arr
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

## Parameters

**Table 190–5 AMATCH Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>The text to search in.</td>
</tr>
</tbody>
</table>
AMATCH Function

Return Values

The index of the character after the end of the match, counting from the beginning of line. If there was no match, the function returns 0.

---

### Table 190–5 (Cont.) AMATCH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_loc</td>
<td>The location (in number of characters) in line where the search is to begin.</td>
</tr>
<tr>
<td>pat</td>
<td>The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.</td>
</tr>
<tr>
<td>backrefs</td>
<td>The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table.</td>
</tr>
<tr>
<td>flags</td>
<td>Whether or not the search is case-sensitive. If the value of this parameter is 'I', the search is case-insensitive. Otherwise the search is case-sensitive.</td>
</tr>
</tbody>
</table>
CHANGE Functions and Procedures

This function or procedure searches and replaces a string or multi_line data type. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```sql
OWA_PATTERN.CHANGE(
    line IN OUT VARCHAR2,
    from_str IN VARCHAR2,
    to_str IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```sql
OWA_PATTERN.CHANGE(
    line IN OUT VARCHAR2,
    from_str IN VARCHAR2,
    to_str IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL);
```

```sql
owa_pattern.change(
    mline IN OUT owa_text.multi_line,
    from_str IN VARCHAR2,
    to_str IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```sql
OWA_PATTERN.CHANGE(
    mline IN OUT owa_text.multi_line,
    from_str IN VARCHAR2,
    to_str IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>The text to search in. The output value of this parameter is the altered string.</td>
</tr>
<tr>
<td>mline</td>
<td>The text to search in. This is a owa_text.multi_line data type. The output value of this parameter is the altered string.</td>
</tr>
<tr>
<td>from_str</td>
<td>The regular expression to replace.</td>
</tr>
<tr>
<td>to_str</td>
<td>The substitution pattern.</td>
</tr>
<tr>
<td>flags</td>
<td>Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If &quot;i&quot; is specified, the search is case-insensitive. If &quot;g&quot; is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.</td>
</tr>
</tbody>
</table>

Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.
Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red". If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found     INTEGER;
BEGIN
  theline := 'what is the goal?';
  num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
  HTP.PRINT(num_found);      -- num_found is 1
  HTP.PRINT(theline);        -- theline is 'what is the idea?'
END;
/ 
SHOW ERRORS
```
GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA_PATTERN. PATTERN DATA TYPE.

Syntax

OWA_PATTERN.GETPAT(
    arg    IN       VARCHAR2,
    pat   IN OUT   pattern);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg</td>
<td>The string to convert.</td>
</tr>
<tr>
<td>pat</td>
<td>the OWA_PATTERN. PATTERN DATA TYPE initialized with arg.</td>
</tr>
</tbody>
</table>
MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

owa_pattern.match(
  line IN VARCHAR2,
  pat IN VARCHAR2,
  flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
  line IN VARCHAR2,
  pat IN OUT PATTERN,
  flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
  line IN VARCHAR2,
  pat IN VARCHAR2,
  backrefs OUT owa_text.vc_arr,
  flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

OWA_PATTERN.MATCH(
  line IN VARCHAR2,
  pat IN OUT PATTERN,
  backrefs OUT owa_text.vc_arr,
  flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
  mline IN owa_text.multi_line,
  pat IN VARCHAR2,
  rlist OUT owa_text.row_list,
  flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

OWA_PATTERN.MATCH(
  mline IN owa_text.multi_line,
  pat IN OUT pattern,
  rlist OUT owa_text.row_list,
  flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

Parameters

Table 190–8  CHANGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>The line to search in.</td>
</tr>
<tr>
<td>mline</td>
<td>The text to search in. This is a owa_text.multi_line data type.</td>
</tr>
</tbody>
</table>
Return Values

TRUE if a match was found, FALSE otherwise.

Examples

KAZOO is the target where it is searching for the zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

sometext VARCHAR2(256);
pat VARCHAR2(256);
sometext := 'what is the goal?'
pat := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
THEN
    HTP.PRINT('Match found');
ELSE
    HTP.PRINT('Match not found');
END IF;

Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create an OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.
- Create a MULTI_LINE DATA TYPE from a long string using the OWA_TEXT STREAM2MULTI procedure. If a multi_line is used, the rlist parameter specifies a list of chunks where matches were found.
If the line is a string and not a multi_line, you can add an optional output parameter called backrefs. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
The OWA_SEC package provides an interface for custom authentication.

Operational Notes

Parameters that have default values are optional.
### Summary of OWA SEC Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_CLIENT_HOSTNAME Function on page 191-5</td>
<td>Returns the client’s hostname</td>
</tr>
<tr>
<td>GET_CLIENT_IP Function on page 191-6</td>
<td>Returns the client’s IP address</td>
</tr>
<tr>
<td>GET_PASSWORD Function on page 191-7</td>
<td>Returns the password that the user entered</td>
</tr>
<tr>
<td>GET_USER_ID Function on page 191-8</td>
<td>Returns the username that the user entered</td>
</tr>
<tr>
<td>SET_AUTHORIZATION Procedure on page 191-9</td>
<td>Enables the PL/SQL application to use custom authentication</td>
</tr>
<tr>
<td>SET_PROTECTION_REALM Procedure on page 191-10</td>
<td>Defines the realm that the page is in</td>
</tr>
</tbody>
</table>
GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME
RETURN VARCHAR2;
```

Return Values

The hostname.
GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```plsql
OWA_SEC.GET_CLIENT_IP
    RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address` data type is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is 123.45.67.89 and the variable `ipaddr` is of the `owa_util.ip_address` data type, the variable would contain the following values:

```plaintext
ipaddr(1) = 123
ipaddr(2) = 45
ipaddr(3) = 67
ipaddr(4) = 89
```
GET PASSWORD Function

This function returns the password that the user used to log in.

Syntax

```sql
OWA_SEC.GET_PASSWORD
    RETURN VARCHAR2;
```

Return Values

The password.

Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.
GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```plsql
OWA_SEC.GET_USER_ID
RETURN VARCHAR2;
```

Return Values

The username.
**SET_AUTHORIZATION Procedure**

This procedure, called in the initialization portion of the OWA_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway. This implements your authorize function, which authorizes the user before his requested procedure is run. The placement of the authorize function depends on the scheme you select.

**Syntax**

```sql
OWA_SEC.SET_AUTHORIZATION(
    scheme IN INTEGER);
```

**Parameters**

**Table 191–2 SET_AUTHORIZATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheme</td>
<td>The authorization scheme. It is one of the following schemes for SET_AUTHORIZATION:</td>
</tr>
<tr>
<td></td>
<td>- OWA_SEC.NO_CHECK - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.</td>
</tr>
<tr>
<td></td>
<td>- OWA_SEC.GLOBAL - Defines an authorize function that is called for all users and all procedures. This is the OWA_CUSTOM.AUTHORIZE Function in the &quot;sys&quot; schema.</td>
</tr>
<tr>
<td></td>
<td>- OWA_SEC.PER_PACKAGE - Define an authorize function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package AUTHORIZE function in the user’s schema is called to authorize the user. If the procedures are not in a package, then the anonymous authorize function in the user’s schema is called.</td>
</tr>
<tr>
<td></td>
<td>- OWA_SEC.CUSTOM - Implements different authorize functions for each user. The function OWA_CUSTOM.AUTHORIZE Function in the user’s schema is called to authorize the user. If the user's schema does not contain an OWA_CUSTOM.AUTHORIZE Function, the PL/SQL Gateway looks for it in the &quot;sys&quot; schema. The custom authorize function has the following signature:</td>
</tr>
<tr>
<td></td>
<td>FUNCTION AUTHORIZE</td>
</tr>
<tr>
<td></td>
<td>RETURN BOOLEAN;</td>
</tr>
<tr>
<td></td>
<td>If the function returns TRUE, authentication succeeded. If it returns FALSE, authentication failed. If the authorize function is not defined, the Gateway returns an error and fails.</td>
</tr>
</tbody>
</table>
SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

OWA_SEC.SET_PROTECTION_REALM(
  realm IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>realm</td>
<td>The realm where the page belongs. This string is displayed to the user.</td>
</tr>
</tbody>
</table>
The OWA_TEXT package contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.

See Also: For more information about implementation of this package:
- Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server
- Oracle Fusion Middleware User’s Guide for mod_plsql

The chapter contains the following topics:
- Using OWA_TEXT
  - Types
- Summary of OWA_TEXT Subprograms
Using OWA_TEXT

- Types
Types

- MULTI_LINE DATA TYPE
- ROW_LIST DATA TYPE
- VC_ARR DATA TYPE

**MULTI_LINE DATA TYPE**

This data type is a PL/SQL record that holds large amounts of text. The rows field, of type OWA_TEXT.VC_ARR DATA TYPE, contains the text data in the record.

```plsql
TYPE multi_line IS RECORD (  
  rows vc_arr,  
  num_rows INTEGER,  
  partial_row BOOLEAN);
```

**ROW_LIST DATA TYPE**

This is the data type for holding data to be processed.

```plsql
TYPE row_list IS RECORD (  
  rows int_arr,  
  num_rows INTEGER);
```

`int_arr` IS DEFINED AS:

```plsql
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

**VC_ARR DATA TYPE**

This is a component of the **MULTI_LINE DATA TYPE** and is used for holding large amounts of text.

```plsql
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```
Summary of OWA_TEXT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD2MULTI Procedure on page 192-5</td>
<td>Adds text to an existing multi_line type</td>
</tr>
<tr>
<td>NEW_ROW_LIST Function and Procedure on page 192-6</td>
<td>Creates a new row_list</td>
</tr>
<tr>
<td>PRINT_MULTI Procedure on page 192-7</td>
<td>Prints out the contents of a multi_list</td>
</tr>
<tr>
<td>PRINT_ROW_LIST Procedure on page 192-8</td>
<td>Prints out the contents of a row_list</td>
</tr>
<tr>
<td>STREAM2MULTI Procedure on page 192-9</td>
<td>Converts a varchar2 to a multi_line type</td>
</tr>
</tbody>
</table>
ADD2MULTI Procedure

This procedure adds content to an existing MULTI_LINE DATA TYPE.

Syntax

```
OWA_TEXT.ADD2MULTI (  
    stream IN VARCHAR2,  
    mline IN OUT multi_line,  
    continue IN BOOLEAN DEFAULT TRUE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stream</td>
<td>The text to add.</td>
</tr>
<tr>
<td>mline</td>
<td>The OWA_TEXT.MULTI_LINE DATA TYPE. The output of this parameter contains <code>stream</code>.</td>
</tr>
<tr>
<td>continue</td>
<td>If TRUE, the procedure appends <code>stream</code> within the previous final row (assuming it is less than 32K). If FALSE, the procedure places <code>stream</code> in a new row.</td>
</tr>
</tbody>
</table>
NEW_ROW_LIST Function and Procedure

This function or procedure creates a new OWA_TEXT.ROW_LIST DATA TYPE. The function version uses no parameters and returns a new empty row_list. The procedure version creates the row_list data type as an output parameter.

Syntax

```sql
OWA_TEXT.NEW_ROW_LIST
  RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist    OUT     row_list);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rlist</td>
<td>This is an output parameter containing the new row_list data type</td>
</tr>
</tbody>
</table>

Return Values

The function version returns the new row_list data type.
PRINT_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA_TEXT.MULTI_LINE DATA TYPE.

Syntax

```plaintext
OWA_TEXT.PRINT_MULTI(
    mline       IN       multi_line);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mline</td>
<td>The multi_line data type to print.</td>
</tr>
</tbody>
</table>

Return Values

The contents of the multi_line.
PRINT_ROW_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA_TEXT.ROW_LIST DATA TYPE.

Syntax

```
OWA_TEXT.PRINT_ROW_LIST(
    rlist       IN       multi_line);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rlist</td>
<td>The row_list data type to print.</td>
</tr>
</tbody>
</table>

Return Values

The contents of the row_list.
STREAM2MULTI Procedure

This procedure converts a string to a multi_line data type.

Syntax

```
OWA_TEXT.STREAM2MULTI(
    stream  IN  VARCHAR2
    mline   OUT  multi_line);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stream</td>
<td>The string to convert.</td>
</tr>
<tr>
<td>mline</td>
<td>The stream in OWA_TEXT.MULTI_LINE DATA_TYPE format</td>
</tr>
</tbody>
</table>
The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User’s Guide for mod_plsql*

This chapter contains the following topics:

- **Using OWA_UTIL**
  - Overview
  - Types
- **Summary of OWA_UTIL Subprograms**
Using OWA_UTIL

- Overview
- Types
Overview

The OWA_UTIL package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a data type by the Oracle database.
Types

- DATETYPE Data Type
- IDENT_ARR Data Type
- IP_ADDRESS Data Type

DATETYPE Data Type

The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

```sql
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

IDENT_ARR Data Type

This data type is used for an array.

```sql
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

IP_ADDRESS Data Type

This data type is used by the GET_CLIENT_IP Function in the "OWA_SEC" package on page 191-1.

```sql
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```
## Summary of OWA_UTIL Subprograms

<td>Returns information on the caller of the procedure.</td>
</tr>
</tbody>
</table>
BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```sql
OWA_UTIL.BIND_VARIABLES(
    theQuery IN VARCHAR2 DEFAULT NULL,
    bv1Name IN VARCHAR2 DEFAULT NULL,
    bv1Value IN VARCHAR2 DEFAULT NULL,
    bv2Name IN VARCHAR2 DEFAULT NULL,
    bv2Value IN VARCHAR2 DEFAULT NULL,
    bv3Name IN VARCHAR2 DEFAULT NULL,
    bv3Value IN VARCHAR2 DEFAULT NULL,
    ...
    bv25Name IN VARCHAR2 DEFAULT NULL,
    bv25Value IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>theQuery</td>
<td>The SQL query statement which must be a SELECT statement</td>
</tr>
<tr>
<td>bv1Name</td>
<td>The name of the variable</td>
</tr>
<tr>
<td>bv1Value</td>
<td>The value of the variable</td>
</tr>
</tbody>
</table>

Return Values

An integer identifying the opened cursor.
CALENDARPRINT Procedures

These procedures create a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```sql
OWA_UTIL.CALENDARPRINT(
    p_query IN VARCHAR2,
    p_mf_only IN VARCHAR2 DEFAULT 'N');
```

```sql
OWA_UTIL.CALENDARPRINT(
    p_cursor IN INTEGER,
    p_mf_only IN VARCHAR2 DEFAULT 'N');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_query</td>
<td>A PL/SQL query.</td>
</tr>
<tr>
<td>p_cursor</td>
<td>A PL/SQL cursor containing the same format as p_query.</td>
</tr>
<tr>
<td>p_mf_only</td>
<td>If &quot;N&quot; (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.</td>
</tr>
</tbody>
</table>

Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.
CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table. There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the FORMAT_CELL Function in the "HTF" package on page 181-1.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```sql
OWA_UTIL.CELLSPRINT(
p_colCnt IN INTEGER,
p_resultTbl IN vc_arr,
p_format_numbers IN VARCHAR2 DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
p_theQuery IN VARCHAR2,
p_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
p_theCursor IN INTEGER,
p_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
p_theQuery IN VARCHAR2,
p_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL,
p_skip_rec IN NUMBER DEFAULT 0,
p_more_data OUT BOOLEAN);

OWA_UTIL.CELLSPRINT(
p_theCursor IN INTEGER,
p_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL,
p_skip_rec IN NUMBER DEFAULT 0,
p_more_data OUT BOOLEAN);

OWA_UTIL.CELLSPRINT(
p_theQuery IN VARCHAR2,
p_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL,
p_reccnt OUT NUMBER);

OWA_UTIL.CELLSPRINT(
```
p_theCursor IN INTEGER,
p_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL,
p_reccnt OUT NUMBER);

OWA_UTIL.CELLSPRINT(
  p_theQuery IN VARCHAR2,
P_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL,
p_skip_rec IN NUMBER DEFAULT 0,
p_more_data OUT BOOLEAN,
P_reccnt OUT NUMBER);

OWA_UTIL.CELLSPRINT(
  p_theCursor IN INTEGER,
P_max_rows IN NUMBER DEFAULT 100,
P_format_numbers IN VARCHAR2 DEFAULT NULL,
P_skip_rec IN NUMBER DEFAULT 0,
P_more_data OUT BOOLEAN,
P_reccnt OUT NUMBER);

Parameters

Table 193–4  CELLSPRINT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_query</td>
<td>A PL/SQL query.</td>
</tr>
<tr>
<td>p_colCnt</td>
<td>The number of columns in the table.</td>
</tr>
<tr>
<td>p_theQuery</td>
<td>A SQL SELECT statement.</td>
</tr>
<tr>
<td>p_theCursor</td>
<td>A cursor ID. This can be the return value from the BIND_VARIABLES Function.</td>
</tr>
<tr>
<td>p_max_rows</td>
<td>The maximum number of rows to print.</td>
</tr>
<tr>
<td>p_format_numbers</td>
<td>If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.</td>
</tr>
<tr>
<td>p_skip_rec</td>
<td>The number of rows to exclude from the HTML table.</td>
</tr>
<tr>
<td>p_more_data</td>
<td>TRUE if there are more rows in the query or cursor, FALSE otherwise.</td>
</tr>
<tr>
<td>p_reccnt</td>
<td>The number of rows that have been returned by the query. This value does not include skipped rows (if any).</td>
</tr>
<tr>
<td>p_resultTbl</td>
<td>The index table which will contain the result of the query. Each entry in the query will correspond to one column value.</td>
</tr>
</tbody>
</table>

Examples

This function generates

<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
CHOOSE_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

Syntax

```
OWA_UTIL.CHOOSE_DATE(
    p_name IN VARCHAR2,
    p_date IN DATE DEFAULT SYSDATE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_name</td>
<td>The name of the form elements.</td>
</tr>
<tr>
<td>p_date</td>
<td>The initial date that is selected when the HTML page is displayed.</td>
</tr>
</tbody>
</table>

Usage Notes

- The parameter in the procedure that receives the data from these elements must be a GET_CGI_ENV Function.
- Use the TODATE Function to convert the GET_CGI_ENV Function value to the standard Oracle DATE data type.

Examples

```
<SELECT NAME="p_name" SIZE="1">
    <OPTION value="01">1
    ...
    <OPTION value="31">31
</SELECT>
```
```
<SELECT NAME="p_name" SIZE="1">
    <OPTION value="01">JAN
    ...
    <OPTION value="12">DEC
</SELECT>
```
```
<SELECT NAME="p_name" SIZE="1">
    <OPTION value="1992">1992
    ...
    <OPTION value="2002">2002
</SELECT>
```
GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```
OWA_UTIL.GET_CGI_ENV(
    param_name       IN      VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>param_name</td>
<td>The name of the CGI environment variable. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns NULL.
GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

OWA_UTIL.GET_OWA_SERVICE_PATH
RETURN VARCHAR2;

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.
GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

    OWA_UTIL.GET_PROCEDURE
    RETURN VARCHAR2;

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.
HTTP_HEADER_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

Syntax

OWA_UTIL.HTTP_HEADER_CLOSE;

Return Values

A newline character, which closes the HTTP header.

Usage Notes

- Use this procedure if you have not closed the header by using the bclose_header parameter in calls such as MIME_HEADER Procedure, REDIRECT_URL Procedure, or STATUS_LINE Procedure
- The HTTP header must be closed before any HTP.PRINT or HTP.PRN calls.
LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query. There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.LISTPRINT(
    p_theQuery IN VARCHAR2,
    p_cname IN VARCHAR2,
    p_nsize IN NUMBER,
    p_multiple IN BOOLEAN DEFAULT FALSE);

OWA_UTIL.LISTPRINT(
    p_theCursor IN INTEGER,
    p_cname IN VARCHAR2,
    p_nsize IN NUMBER,
    p_multiple IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_theQuery</td>
<td>The SQL query.</td>
</tr>
<tr>
<td>p_theCursor</td>
<td>The cursor ID. This can be the return value from the BIND_VARIABLES Function.</td>
</tr>
<tr>
<td>p_cname</td>
<td>The name of the HTML form element.</td>
</tr>
<tr>
<td>p_nsize</td>
<td>The size of the form element (this controls how many items the user can see without scrolling).</td>
</tr>
<tr>
<td>p_multiple</td>
<td>Whether multiple selection is permitted.</td>
</tr>
</tbody>
</table>

Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
    <OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
    <OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
    ...
</SELECT>
```
MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any HTP.PRINT or HTP.PRN calls to direct the script not to use the default MIME header.

Syntax

```sql
OWA_UTIL.MIME_HEADER(
    ccontent_type   IN VARCHAR2 DEFAULT 'text/html',
    bclose_header   IN BOOLEAN DEFAULT TRUE,
    ccharset        IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccontent_type</td>
<td>The MIME type to generate</td>
</tr>
<tr>
<td>bclose_header</td>
<td>Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.</td>
</tr>
<tr>
<td>ccharset</td>
<td>The character set to use. The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.</td>
</tr>
</tbody>
</table>

Examples

```sql
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```sql
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```sql
Content-type: text/plain; charset=ISO-8859-4
```
PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

OWA_UTIL.PRINT_CGI_ENV;

Examples

This procedure generates a list in the following format:

cgi_env_var_name = value\n
**REDIRECT_URL Procedure**

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

**Syntax**

```sql
OWA_UTIL.REDIRECT_URL(
    curl IN VARCHAR2,
    bclose_header IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>curl</code></td>
<td>The URL to visit.</td>
</tr>
<tr>
<td><code>bclose_header</code></td>
<td>Whether or not to close the HTTP header. If <code>TRUE</code>, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure must come before any HTP procedure or HTF function call.

**Examples**

This procedure generates

```text
Location: <curl>
```

SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus. The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

OWA_UTIL.SHOWPAGE;

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the DBMS_OUTPUT package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.
SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

OWA_UTIL.SHOWSOURCE ( 
    cname IN VARCHAR2); 

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The function or procedure whose source you want to show.</td>
</tr>
</tbody>
</table>
**SIGNATURE procedure**

This procedure generates an HTML line followed by a signature line on the HTML document. If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the SHOWSOURCE Procedure.

**Syntax**

```
OWA_UTIL.SIGNATURE;
```

```
OWA_UTIL.SIGNATURE (cname IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The function or procedure whose source you want to show.</td>
</tr>
</tbody>
</table>

**Examples**

Without a parameter, the procedure generates a line that looks like the following:

This page was produced by the **PL/SQL Agent** on August 9, 2001 09:30.

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

This page was produced by the **PL/SQL Agent** on 8/09/01 09:30
View PL/SQL Source
STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client. This procedure must come before any `htp.print` or `htp.prn` calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```
OWA_UTIL.STATUS_LINE(
    nstatus IN INTEGER,
    creason IN VARCHAR2 DEFAULT NULL,
    bclose_header IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nstatus</td>
<td>The status code.</td>
</tr>
<tr>
<td>creason</td>
<td>The string for the status code.</td>
</tr>
<tr>
<td>bclose_header</td>
<td>Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
Status: <nstatus> <creason>
```

TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user’s browser) from database tables.

Syntax

```
OWA_UTIL.TABLEPRINT(
  ctable IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL,
  ntable_type IN INTEGER DEFAULT HTML_TABLE,
  ccolumns IN VARCHAR2 DEFAULT '*',
  cclauses IN VARCHAR2 DEFAULT NULL,
  ccol_aliases IN VARCHAR2 DEFAULT NULL,
  nrow_min IN NUMBER DEFAULT 0,
  nrow_max IN NUMBER DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctable</td>
<td>The database table.</td>
</tr>
<tr>
<td>cattributes</td>
<td>Other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
| ntable_type | How to generate the table. Specify HTML_TABLE to generate the table using `<TABLE>` tags or PRE_TABLE to generate the table using the `<PRE>` tags. These are constants:  
  - HTML_TABLE CONSTANT INTEGER := 1;  
  - PRE_TABLE CONSTANT INTEGER := 2; |
| ccolumns  | A comma-delimited list of columns from ctable to include in the generated table. |
| cclauses  | WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them. |
| ccol_aliases | A comma-delimited list of headings for the generated table. |
| nrow_min  | The first row, of those retrieved, to display. |
| nrow_max  | The last row, of those retrieved, to display. |

Return Values

Returns TRUE if there are more rows beyond the nrow_max requested, FALSE otherwise.

Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result ‘Not Printable’.
- Note that in this function, cattributes is the second rather than the last parameter.
Examples

For browsers that do not support HTML tables, create the following procedure:

```sql
CREATE OR REPLACE PROCEDURE showemps IS
    ignore_more BOOLEAN;
BEGIN
    ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

http://myhost:7777/pls/hr/showemps

returns to the following to the client:

```html
<PRE>
<table>
<thead>
<tr>
<th>EMPNO</th>
<th>ENAME</th>
<th>JOB</th>
<th>MGR</th>
<th>HIREDATE</th>
<th>SAL</th>
<th>COMM</th>
<th>DEPTNO</th>
</tr>
</thead>
<tbody>
<tr>
<td>7369</td>
<td>SMITH</td>
<td>CLERK</td>
<td>7902</td>
<td>17-DEC-80</td>
<td>800</td>
<td></td>
<td>20</td>

<td>CLERK</td>
<td>7782</td>
<td>23-JAN-82</td>
<td>1300</td>
<td></td>
<td>10</td>
</tr>
</tbody>
</table>
</PRE>
```

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```sql
CREATE OR REPLACE PROCEDURE showemps_10 IS
    ignore_more BOOLEAN;
BEGIN
    ignore_more := OWA_UTIL.TABLEPRINT ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE, 
        'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno', 
        'Employee Number, Name, Salary');
END;
```

A request for a URL like

http://myhost:7777/pls/hr/showemps_10

would return the following to the client:

```html
<PRE>
<table>
<thead>
<tr>
<th>Employee Number</th>
<th>Name</th>
<th>Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>7782</td>
<td>CLARK</td>
<td>2450</td>
</tr>
<tr>
<td>7839</td>
<td>KING</td>
<td>5000</td>
</tr>
<tr>
<td>7934</td>
<td>MILLER</td>
<td>1300</td>
</tr>
</tbody>
</table>
</PRE>
```
For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showdept
```

would return the following to the client:

```
<TABLE BORDER>
  <TR>
    <TH>DEPTNO</TH>
    <TH>DNAME</TH>
    <TH>LOC</TH>
  </TR>
  <TR>
    <TD ALIGN='LEFT'>10</TD>
    <TD ALIGN='LEFT'>ACCOUNTING</TD>
    <TD ALIGN='LEFT'>NEW YORK</TD>
  </TR>
  <TR>
    <TD ALIGN='LEFT'>20</TD>
    <TD ALIGN='LEFT'>RESEARCH</TD>
    <TD ALIGN='LEFT'>DALLAS</TD>
  </TR>
  <TR>
    <TD ALIGN='LEFT'>30</TD>
    <TD ALIGN='LEFT'>SALES</TD>
    <TD ALIGN='LEFT'>CHICAGO</TD>
  </TR>
  <TR>
    <TD ALIGN='LEFT'>40</TD>
    <TD ALIGN='LEFT'>OPERATIONS</TD>
    <TD ALIGN='LEFT'>BOSTON</TD>
  </TR>
</TABLE>
```

A Web browser would format this to look like the following table:

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
</tr>
<tr>
<td>20</td>
<td>RESEARCH</td>
<td>DALLAS</td>
</tr>
<tr>
<td>30</td>
<td>SALES</td>
<td>CHICAGO</td>
</tr>
</tbody>
</table>
TODATE Function

This function converts the DATETYPE Data Type to the standard Oracle DATE type.

Syntax

```sql
OWA_UTIL.TODATE(
    p_dateArray IN dateType)
RETURN DATE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_dateArray</td>
<td>The value to convert.</td>
</tr>
</tbody>
</table>
WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```
OWA_UTIL.WHO_CALLED_ME(
  owner OUT VARCHAR2,
  name OUT VARCHAR2,
  lineno OUT NUMBER,
  caller_t OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>The owner of the program unit.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.</td>
</tr>
<tr>
<td>lineno</td>
<td>The line number within the program unit where the call was made.</td>
</tr>
<tr>
<td>caller_t</td>
<td>The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.</td>
</tr>
</tbody>
</table>
The SDO_CS package contains functions and procedures for working with coordinate systems. You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

- Documentation of SDO_CS
For a complete description of this package within the context of Oracle Spatial, see SDO_CS in the Oracle Spatial Developer’s Guide.
The SDO_CSW_PROCESS package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

- Documentation of SDO_CSW_PROCESS
For a complete description of this package within the context of Oracle Spatial, see \texttt{SDO\_CSW\_PROCESS} in the \textit{Oracle Spatial Developer's Guide}. 
The **SDO_GCDR** package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

- Documentation of SDO_GCDR
For a complete description of this package within the context of Oracle Spatial, see SDO_GCDR in Oracle Spatial Developer’s Guide.
The SDO_GEOM package contains the geometry functions, which can be grouped into the following categories (with examples of each):

- Relationship (True/False) between two objects: RELATE, WITHIN_DISTANCE
- Validation: VALIDATE_GEOMETRY_WITH_CONTEXT, VALIDATE_LAYER_WITH_CONTEXT
- Single-object operations: SDO_ARC_DENSIFY, SDO_AREA, SDO_BUFFER, SDO_CENTROID, SDO_CONVEXHULL, SDO_LENGTH, SDO_MBR, SDO_POINTONSURFACE
- Two-object operations: SDO_DISTANCE, SDO_DIFFERENCE, SDO_INTERSECTION, SDO_UNION, SDO_XOR

This chapter contains the following topic:

- Documentation of SDO_GEOM
For a complete description of this package within the context of Oracle Spatial, see SDO_GEOM in the Oracle Spatial Developer’s Guide.
The SDO_GEOR package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

- Documentation of SDO_GEOR
Documentation of SDO_GEOR

For complete description of this package within the context of Oracle Spatial, see SDO_GEOR in the Oracle Spatial GeoRaster Developer’s Guide.
The **SDO_GEOR_ADMIN** package contains subprograms for administrative operations related to GeoRaster.

- Documentation of SDO_GEOR_ADMIN
For a complete description of this package within the context of Oracle Spatial, see SDO_GEOR_ADMIN in the Oracle Spatial GeoRaster Developer’s Guide.
The SDO_GEOR_UTL package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

- Documentation of SDO_GEOR_UTL
For complete description of this package within the context of Oracle Spatial, see SDO_GEOR_UTL in the *Oracle Spatial GeoRaster Developer’s Guide.*
The SDO_LRS package contains functions that create, modify, query, and convert linear referencing elements.

- Documentation of SDO_LRS
Documentation of SDO_LRS

For a complete description of this package within the context of Oracle Spatial, see SDO_LRS in the Oracle Spatial Developer’s Guide.
The SDO_MIGRATE package lets you upgrade geometry tables from previous releases of Oracle Spatial.

- Documentation of SDO_MIGRATE
For a complete description of this package within the context of Oracle Spatial, see \texttt{SDO_MIGRATE} in the \textit{Oracle Spatial Developer’s Guide}. 
The SDO_NET package contains functions and procedures for working with data modeled as nodes and links in a network.

- Documentation of SDO_NET
Documentation of SDO_NET

For a complete description of this package within the context of Oracle Spatial, see SDO_NET in the Oracle Spatial Topology and Network Data Models Developer’s Guide.
The SDO_NET_MEM package contains functions and procedures for performing editing and analysis operations on network data using a network memory object.

- Documentation of SDO_NET_MEM
For a complete description of this package within the context of Oracle Spatial, see SDO_NET_MEM in the Oracle Spatial Topology and Network Data Models Developer’s Guide.
The `SDO_OLS` package contains subprograms for Spatial OpenLS support.

- Documentation of `SDO_OLS`
For a complete description of this package within the context of Oracle Spatial, see SDO_OLS in the Oracle Spatial Developer’s Guide.
The SDO_PC_PKG package contains subprograms to support the use of point clouds in Spatial.

- Documentation of SDO_PC_PKG
For a complete description of this package within the context of Oracle Spatial, see SDO_PC_PKG in the Oracle Spatial Developer’s Guide.
The SDO_SAM package contains functions and procedures for spatial analysis and data mining.

- Documentation of SDO_SAM
Documentation of SDO_SAM

For a complete description of this package within the context of Oracle Spatial, see SDO_SAM in the Oracle Spatial Developer’s Guide.
The SDO_TIN_PKG package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

- Documentation of SDO_TIN_PKG
For a complete description of this package within the context of Oracle Spatial, see `SDO_TIN_PKG` in the *Oracle Spatial Developer’s Guide*. 
The SDO_TOPO package contains subprograms for creating and managing Oracle Spatial topologies.

- Documentation of SDO_TOPO
For a complete description of this package within the context of Oracle Spatial, see SDO_TOPO in the Oracle Spatial Topology and Network Data Models Developer’s Guide.
The `SDO_TOPO_MAP` package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

- **Documentation of SDO_TOPO_MAP**
Documentation of SDO_TOPO_MAP

For a complete description of this package within the context of Oracle Spatial, see SDO_TOPO_MAP in the *Oracle Spatial Topology and Network Data Models Developer’s Guide*.
The SDO_TUNE package contains Spatial tuning functions and procedures.

- Documentation of SDO_TUNE
For complete description of this package within the context of Oracle Spatial, see SDO_TUNE in the Oracle Spatial Developer’s Guide.
The SDO_UTIL package contains the utility functions and procedures for Oracle Spatial.

- Documentation of SDO_UTIL
Documentation of SDO_UTIL

For complete description of this package within the context of Oracle Spatial, see SDO_UTIL in the Oracle Spatial Developer’s Guide.
The `SDO_WFS_LOCK` package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

- Documentation of `SDO_WFS_LOCK`
For a complete description of this package within the context of Oracle Spatial, see SDO_WFS_LOCK in the Oracle Spatial Developer’s Guide.
The SDO_WFS_PROCESS package contains subprograms for various processing operations related to support for Web Feature Services.

- Documentation of SDO_WFS_PROCESS
For a complete description of this package within the context of Oracle Spatial, see SDO_WFS_PROCESS in the Oracle Spatial Developer’s Guide.
The SEM_APIS package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

- Documentation of SEM_APIS
Documentation of SEM_APIs

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_APIs in the Oracle Database Semantic Technologies Developer’s Guide.
The SEM_PERF package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

- Documentation of SEM_PERF
For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_PERF in the Oracle Database Semantic Technologies Developer's Guide.
The `SEM_RDFCTX` package contains subprograms for managing extractor policies and semantic indexes created for documents.

- Documentation of `SEM_RDFCTX`
Documentation of SEM_RDFCTX

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_RDFCTX in the Oracle Database Semantic Technologies Developer’s Guide.
The SEM_RDFSA package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

- Documentation of SEM_RDFSA
Documentation of SEM_RDFSA

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_RDFSA in the Oracle Database Semantic Technologies Developer’s Guide.
The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- Summary of UTL_COLL Subprograms
Summary of UTL_COLL Subprograms

Table 219–1  UTL_COLL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_LOCATOR Function on page 219-3</td>
<td>Determines whether a collection item is actually a locator or not</td>
</tr>
</tbody>
</table>
IS_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

Syntax

```sql
UTL_COLL.IS_LOCATOR (
    coln IN STANDARD)
RETURNS BOOLEAN;
```

Pragmas

Asserts WDNS, WNPS and RNPS pragmas

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coln</td>
<td>Nested table or varray item.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Collection item is indeed a locator.</td>
</tr>
<tr>
<td>0</td>
<td>Collection item is not a locator.</td>
</tr>
</tbody>
</table>

Examples

```sql
CREATE OR REPLACE TYPE list_t as TABLE OF VARCHAR2(20);
/
CREATE OR REPLACE TYPE phone_book_t AS OBJECT {
    pno  number,
    ph   list_t };
/
CREATE TABLE phone_book OF phone_book_t
    NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
    NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;
INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));
CREATE OR REPLACE PROCEDURE chk_coll IS
    plist list_t;
    plist1 list_t;
BEGIN
    SELECT ph INTO plist FROM phone_book WHERE pno=1;
    SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;
    IF (UTL_COLL.IS_LOCATOR(plist)) THEN
        DBMS_OUTPUT.PUT_LINE('plist is a locator');
    END IF;
```
ELSE
    DBMS_OUTPUT.PUT_LINE('plist is not a locator');
END IF;

IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
    DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
ELSE
    DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
The **UTL_COMPRESS** package provides a set of data compression utilities.

This chapter contains the following topics:

- **Using UTL_COMPRESS**
  - Constants
  - Exceptions
  - Operational Notes
- **Summary of UTL_COMPRESS Subprograms**
Using UTL_COMPRESS

- Constants
- Exceptions
- Operational Notes
Constants

Define max number of handles for piecewise operations:

```plsql
UTLCOMP_MAX_HANDLE CONSTANT PLS_INTEGER := 5;
```
### Table 220–1  UTL_COMPRESS Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER_TOO_SMALL</td>
<td>The compressed representation is too big.</td>
</tr>
<tr>
<td>DATA_ERROR</td>
<td>The input or output data stream was found to be an invalid format.</td>
</tr>
<tr>
<td>INVALID_ARGUMENT</td>
<td>One of the arguments was an invalid type or value.</td>
</tr>
<tr>
<td>INVALID_HANDLE</td>
<td>Invalid handle for piecewise compress or uncompress.</td>
</tr>
<tr>
<td>STREAM_ERROR</td>
<td>An error occurred during compression or uncompression of the data stream.</td>
</tr>
</tbody>
</table>
Operational Notes

- It is the caller's responsibility to free the temporary LOB returned by the LZ* functions with DBMS_LOB.FREETEMPORARY call.

- A BFILE passed into LZ_COMPRESS* or LZ_UNCOMPRESS* has to be opened by DBMS_LOB.FILEOPEN.

- Under special circumstances (especially if the input has already been compressed) the output produced by one of the UTL_COMPRESS subprograms may be the same size, or even slightly larger than, the input.

- The output of the UTL_COMPRESS compressed data is compatible with gzip(with -n option)/gunzip on a single file.
### Summary of UTL_COMPRESS Subprograms

**Table 220–2 UTL_COMPRESS Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISOPEN Function on page 220-7</td>
<td>Checks to see if the handle to a piecewise (un)compress context is open or closed</td>
</tr>
<tr>
<td>LZ_COMPRESS Functions and Procedures on page 220-8</td>
<td>Compresses data using Lempel-Ziv compression algorithm</td>
</tr>
<tr>
<td>LZ_COMPRESS_ADD Procedure on page 220-10</td>
<td>Adds a piece of compressed data</td>
</tr>
<tr>
<td>LZ_COMPRESS_CLOSE on page 220-11</td>
<td>Closes and finishes piecewise compress operation</td>
</tr>
<tr>
<td>LZ_COMPRESS_OPEN on page 220-12</td>
<td>Initializes a piecewise context that maintains the compress state and data</td>
</tr>
<tr>
<td>LZ_UNCOMPRESS Functions and Procedures on page 220-13</td>
<td>Accepts compressed input, verifies it to be a valid and uncompresses it</td>
</tr>
<tr>
<td>LZ_UNCOMPRESS_EXTRACT Procedure on page 220-14</td>
<td>Extracts a piece of uncompressed data</td>
</tr>
<tr>
<td>LZ_UNCOMPRESS_OPEN Function on page 220-15</td>
<td>Initializes a piecewise context that maintains the uncompress state and data</td>
</tr>
<tr>
<td>LZ_UNCOMPRESS_CLOSE Procedure on page 220-16</td>
<td>Closes and finishes the piecewise uncompress</td>
</tr>
</tbody>
</table>
ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

UTL_COMPRESS.ISOPEN(
    handle in binary_integer)
RETURN BOOLEAN;

Parameters

Table 220–3  ISOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise uncompress context.</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

Examples

IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
    UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;

Alternatively:

IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
    UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```sql
UTL_COMPRESS.LZ_COMPRESS (  
    src IN RAW,  
    quality IN BINARY_INTEGER DEFAULT 6)  
RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```sql
UTL_COMPRESS.LZ_COMPRESS (  
    src IN BLOB,  
    quality IN BINARY_INTEGER DEFAULT 6)  
RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```sql
UTL_COMPRESS.LZ_COMPRESS (  
    src IN BLOB,  
    dst IN OUT NOCOPY BLOB,  
    quality IN BINARY_INTEGER DEFAULT 6);  
```

This function returns a temporary BLOB for the compressed data:

```sql
UTL_COMPRESS.LZ_COMPRESS (  
    src IN BFILE,  
    quality IN BINARY_INTEGER DEFAULT 6)  
RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```sql
UTL_COMPRESS.LZ_COMPRESS (  
    src IN BFILE,  
    dst IN OUT NOCOPY BLOB,  
    quality IN BINARY_INTEGER DEFAULT 6);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>Data (RAW, BLOB or BFILE) to be compressed.</td>
</tr>
<tr>
<td>dst</td>
<td>Destination for compressed data</td>
</tr>
<tr>
<td>quality</td>
<td>An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6</td>
</tr>
</tbody>
</table>
Usage Notes

- quality is an optional compression tuning value. It allows the UTL_COMPRESS user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.
LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```sql
UTL_COMPRESS.LZ_COMPRESS_ADD (  
    handle IN             BINARY_INTEGER,  
    dst    IN OUT NOCOPY  BLOB,  
    src    IN             RAW);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise compress context.</td>
</tr>
<tr>
<td>dst</td>
<td>The opened LOB from LZ_COMPRESS_OPEN to store compressed data.</td>
</tr>
<tr>
<td>src</td>
<td>The input data to be compressed.</td>
</tr>
</tbody>
</table>

Exceptions

- `invalid_handle` - out of range invalid or unopened handle.
- `invalid_argument` - NULL handle, src, dst, or invalid dst.
LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
    handle IN BINARY_INTEGER,
    dst    IN OUT NOCOPY BLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise compress context.</td>
</tr>
<tr>
<td>dst</td>
<td>The opened LOB from LZ_COMPRESS_OPEN to store compressed data.</td>
</tr>
</tbody>
</table>

Exceptions

- `invalid_handle`: out of range invalid or uninitialized handle.
- `invalid_argument`: NULL handle, dst, or invalid dst.
LZ_COMPRESS_OPEN

This function initializes a piecewise context that maintains the compress state and data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (
    dst       IN OUT NOCOPY BLOB,
    quality   IN            BINARY_INTEGER DEFAULT 6)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>User supplied LOB to store compressed data.</td>
</tr>
<tr>
<td>quality</td>
<td>Speed versus efficiency of resulting compressed output.</td>
</tr>
<tr>
<td></td>
<td>■ Valid values are the range 1..9, with a default value of 6.</td>
</tr>
<tr>
<td></td>
<td>■ 1=fastest compression, 9=slowest compression and best compressed file size.</td>
</tr>
</tbody>
</table>

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL dst or invalid quality specified.

Usage Notes

Close the opened handle with LZ_COMPRESS_CLOSE
- once the piecewise compress is completed
- in the event of an exception in the middle of process
because lack of doing so will cause these handles to leak.
LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a RAW, BLOB or BFILE compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or BLOB result.

Syntax

This function returns uncompressed data as RAW:

```sql
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  RAW)
RETURN RAW;
```

This function returns uncompressed data as a temporary BLOB:

```sql
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BLOB)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst), which will be trimmed to the uncompressed data size:

```sql
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BLOB,
    dst  IN  OUT  NOCOPY  BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```sql
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BFILE)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst). The original dst data will be overwritten.

```sql
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BFILE,
    dst  IN  OUT  NOCOPY  BLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>Compressed data.</td>
</tr>
<tr>
<td>dst</td>
<td>Destination for uncompressed data.</td>
</tr>
</tbody>
</table>
LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```sql
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(
    handle  IN          BINARY_INTEGER,
    dst     OUT NOCOPY  RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise uncompress context.</td>
</tr>
<tr>
<td>dst</td>
<td>The uncompressed data.</td>
</tr>
</tbody>
</table>

Exceptions

- no_data_found - finished uncompress.
- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle.
LZ_UNCOMPRESS_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(
    src  IN  BLOB)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>The input data to be uncompressed.</td>
</tr>
</tbody>
</table>

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL src.

Usage Notes

Close the opened handle with LZ_UNCOMPRESS_CLOSE
- once the piecewise uncompress is completed
- in the event of an exception in the middle of process
because lack of doing so will cause these handles to leak.
LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```sql
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(
    handle  IN   BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise uncompress context.</td>
</tr>
</tbody>
</table>

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.
The UTL_ENCODE package provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts. You can use UTL_ENCODE functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- Summary of UTL_ENCODE Subprograms
Summary of UTL_ENCODE Subprograms

</tbody>
</table>
BASE64_DECODE Function

This function reads the base 64-encoded RAW input string and decodes it to its original RAW value.

Syntax

```sql
UTL_ENCODE.BASE64_DECODE (
    r  IN RAW)
RETURN RAW;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string containing base 64-encoded data. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the decoded string</td>
</tr>
</tbody>
</table>
BASE64_ENCODE Function

This function encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string.

Syntax

```
UTL_ENCODE.BASE64_ENCODE ( 
  r   IN RAW) 
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNSD, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW value to be encoded. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the encoded base 64 elements</td>
</tr>
</tbody>
</table>
MIMEHEADER_DECODE Function

This function accepts as input an "encoded word" of the form:

```plaintext
=?<charset>?<encoding>?<encoded text>?
=?ISO-8859-1?q?Here is some encoded text=q?
```

The `<encoded text>` is encapsulated in mime header tags which give the MIMEHEADER_DECODE function information about how to decode the string. The mime header metadata tags are stripped from the input string and the `<encoded text>` is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the `<encoding>` metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a VARCHAR2 string.

Syntax

```sql
UTL_ENCODE.MIMEHEADER_DECODE (.buf IN VARCHAR2 CHARACTER SET ANY_CS) RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The encoded text data with mime header format tags.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>The encoded text data with mime header format tags</td>
</tr>
</tbody>
</table>

Examples

```sql
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?q?Here is some encoded text=q?');
```
MIMEHEADER_ENCODE Function

This function returns as an output an "encoded word" of the form:

=?charset=?encoding=?encoded text=?
=?ISO-8859-1?Q?Here is some text=?

The buf input parameter is the text to be encoded and becomes the <encoded text>.

The <encoding> value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The ENCODING input parameter accepts as valid values UTL_ENCODE.QUOTED_PRINTABLE or UTL_ENCODE.BASE64 or NULL. If NULL, quoted-printable encoding is selected as a default value.

The <charset> value is specified as the input parameter encode_charset. If NULL, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the buf input string to the character set specified by the encode_charset parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
    buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN  VARCHAR2 DEFAULT NULL,
    encoding       IN  PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The text data.</td>
</tr>
<tr>
<td>encode_charset</td>
<td>The target character set.</td>
</tr>
<tr>
<td>encoding</td>
<td>The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A VARCHAR2 encoded string with mime header format tags.</td>
</tr>
</tbody>
</table>
QUOTED_PRINTABLE_DECODE Function

This function reads the varchar2 quoted printable format input string and decodes it to the corresponding RAW string.

Syntax

```sql
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (  
    r IN RAW)  
RETURN RAW;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string containing a quoted printable data string. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The decoded string</td>
</tr>
</tbody>
</table>
QUOTED_PRINTABLE_ENCODE Function

This function reads the RAW input string and encodes it to the corresponding quoted printable format string.

Syntax

```sql
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (  
    r  IN RAW)  
RETURN RAW;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS,WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the quoted printable string</td>
</tr>
</tbody>
</table>
TEXT_DECODE Function

This function converts the input text to the target character set as specified by the encode_charset parameter, if not NULL. The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each encoding parameter. If NULL, quoted-printable is selected as a default decoding format. If encode_charset is not NULL, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_DECODE(
    buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN  VARCHAR2 DEFAULT NULL,
    encoding       IN  PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The encoded text data.</td>
</tr>
<tr>
<td>encode_charset</td>
<td>The source character set.</td>
</tr>
<tr>
<td>encoding</td>
<td>The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A VARCHAR2 decoded text string.</td>
</tr>
</tbody>
</table>

Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
    'Here is some text',
    WE8ISO8859P1,
    UTL_ENCODE.BASE64);```

TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL. The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if `ENCODING` is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```sql
UTL_ENCODE.TEXT_ENCODE (
    buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN  VARCHAR2 DEFAULT NULL,
    encoding       IN  PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 221–16 TEXT_ENCODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The text data.</td>
</tr>
<tr>
<td>encode_charset</td>
<td>The target character set.</td>
</tr>
<tr>
<td>encoding</td>
<td>The encoding format. Valid values are</td>
</tr>
<tr>
<td></td>
<td><code>UTL_ENCODE.BASE64</code>,</td>
</tr>
<tr>
<td></td>
<td><code>UTL_ENCODE.QUOTED_PRINTABLE</code> and</td>
</tr>
<tr>
<td></td>
<td><code>NULL</code></td>
</tr>
</tbody>
</table>

Return Values

Table 221–17 TEXT_ENCODE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A VARCHAR2 encoded string with mime header format tags.</td>
</tr>
</tbody>
</table>

Examples

```sql
v2:=utl_encode.text_encode(
    'Here is some text',
    'WEBISO8859P1',
    UTL_ENCODE.BASE64);
```
UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string. See “UUENCODE Function” on page 221-12 for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

Syntax

```plaintext
UTL_ENCODE.UUDECODE (
    r  IN RAW)
RETURN RAW;
```

Pragmas

```plaintext
pragma RESTRICT_REFERENCES(uudecode, wNDS, RNDS, wNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string containing the uuencoded data string. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The decoded RAW string</td>
</tr>
</tbody>
</table>
UUENCODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string. The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

Syntax

```sql
UTL_ENCODE.UUENCODE (r          IN RAW,
type       IN PLS_INTEGER DEFAULT 1,
filename   IN VARCHAR2 DEFAULT NULL,
permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r</code></td>
<td>RAW string</td>
</tr>
<tr>
<td><code>type</code></td>
<td>Optional number parameter containing the type of uuencoded output. Options:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><code>filename</code></td>
<td>Optional varchar2 parameter containing the uuencode filename; the default is <code>uuencode.txt</code></td>
</tr>
<tr>
<td><code>permission</code></td>
<td>Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the uuencode format string</td>
</tr>
</tbody>
</table>
With the UTL_FILE package, PL/SQL programs can read and write operating system text files. UTL_FILE provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- Using UTL_FILE
  - Security Model
  - Operational Notes
  - Rules and Limits
  - Exceptions
  - Examples
- Data Structures
- Summary of UTL_FILE Subprograms
Using UTL_FILE

- Security Model
- Operational Notes
- Rules and Limits
- Exceptions
- Examples
Security Model

The set of files and directories that are accessible to the user through UTL_FILE is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user. The nature of directory objects is discussed in the Oracle Database SQL Language Reference.

Assuming the user has both READ and WRITE access to the directory object USER_DIR, the user can open a file located in the operating system directory described by USER_DIR, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

UTL_FILE provides file access both on the client side and on the server side. When run on the server, UTL_FILE provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, UTL_FILE provides access to operating system files that are accessible from the client.

In the past, accessible directories for the UTL_FILE functions were specified in the initialization file using the UTL_FILE_DIR parameter. However, UTL_FILE_DIR access is no longer recommended. Oracle recommends that you instead use the directory object feature, which replaces UTL_FILE_DIR. Directory objects offer more flexibility and granular control to the UTL_FILE application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. CREATE ANY DIRECTORY privilege is granted only to SYS and SYSTEM by default.

---

**Note:** Use the CREATE DIRECTORY feature instead of UTL_FILE_DIR for directory access verification.

---

On UNIX systems, the owner of a file created by the FOPEN function is the owner of the shadow process running the instance. Normally, this owner is ORACLE. Files created using FOPEN are always writable and readable using the UTL_FILE subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

---

**Caution:** The privileges needed to access files in a directory object are operating system specific. UTL_FILE directory object privileges give you read and write access to all files within the specified directory.
Operational Notes

The file location and file name parameters are supplied to the `FOPEN` function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an `ALL_DIRECTORIES` object.

`UTL_FILE` implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a `GET_LINE` call. For example, the `len` parameter of `UTL_FILE.GET_LINE` specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The `GET_LINE.len` parameter, or
- The number of bytes until the next line terminator character, or
- The `max_linesize` parameter specified by `UTL_FILE.FOPEN`

The `FOPEN.max_linesize` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The `GET_LINE.len` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of `max_linesize`. If `max_linesize` and `len` are defined to be different values, then the lesser value takes precedence.

`UTL_FILE.GET_RAW` ignores line terminators.

`UTL_FILE` expects that files opened by `UTL_FILE.FOPEN` in text mode are encoded in the database character set. It expects that files opened by `UTL_FILE.FOPEN_NCHAR` in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of `NLS_LANG`) that it is encoded in another character set, the result is indeterminate. If `NLS_LANG` is set, it should therefore be the same as the database character set.
Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

Note: The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.
Exceptions

Table 222-1  UTL_FILE Package Exceptions

<table>
<thead>
<tr>
<th>Exception Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_PATH</td>
<td>File location is invalid.</td>
</tr>
<tr>
<td>INVALID_MODE</td>
<td>The open_mode parameter in FOPEN is invalid.</td>
</tr>
<tr>
<td>INVALID_FILEHANDLE</td>
<td>File handle is invalid.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File could not be opened or operated on as requested.</td>
</tr>
<tr>
<td>READ_ERROR</td>
<td>Destination buffer too small, or operating system error occurred during the read operation</td>
</tr>
<tr>
<td>WRITE_ERROR</td>
<td>Operating system error occurred during the write operation.</td>
</tr>
<tr>
<td>INTERNAL_ERROR</td>
<td>Unspecified PL/SQL error</td>
</tr>
<tr>
<td>CHARSETMISMATCH</td>
<td>A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.</td>
</tr>
<tr>

<td>The requested operation failed because the file is open.</td>
</tr>
<tr>
<td>INVALID_MAXLINESIZE</td>
<td>The MAX_LINESIZE value for FOPEN() is invalid; it should be within the range 1 to 32767.</td>
</tr>
<tr>
<td>INVALID_FILENAME</td>
<td>The filename parameter is invalid.</td>
</tr>
<tr>
<td>ACCESS_DENIED</td>
<td>Permission to access to the file location is denied.</td>
</tr>
<tr>
<td>INVALID_OFFSET</td>
<td>Causes of the INVALID_OFFSET exception:</td>
</tr>
<tr>
<td></td>
<td>■  ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or</td>
</tr>
<tr>
<td></td>
<td>■  ABSOLUTE_OFFSET &lt; 0, or</td>
</tr>
<tr>
<td></td>
<td>■  Either offset caused a seek past the end of the file</td>
</tr>
<tr>
<td>DELETE_FAILED</td>
<td>The requested file delete operation failed.</td>
</tr>
<tr>
<td>RENAME_FAILED</td>
<td>The requested file rename operation failed.</td>
</tr>
</tbody>
</table>

Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.
Examples

Example 1

Note: The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

<table>
<thead>
<tr>
<th>File Location</th>
<th>Filename</th>
<th>READ and WRITE</th>
</tr>
</thead>
<tbody>
<tr>
<td>/appl/gl/log</td>
<td>L12345.log</td>
<td>Users with DBA privilege</td>
</tr>
<tr>
<td>/appl/gl/user</td>
<td>u12345.tmp</td>
<td>All users</td>
</tr>
</tbody>
</table>

The following file locations and filenames are invalid:

<table>
<thead>
<tr>
<th>File Location</th>
<th>Filename</th>
<th>Invalid Because</th>
</tr>
</thead>
<tbody>
<tr>
<td>/appl/gl/log/backup</td>
<td>L12345.log</td>
<td># subdirectories are not accessible</td>
</tr>
<tr>
<td>/APPL/gl/log</td>
<td>L12345.log</td>
<td># directory strings must follow case sensitivity rules as required by the O/S</td>
</tr>
<tr>
<td>/appl/gl/log</td>
<td>backup/L1234.log</td>
<td># filenames may not include portions of directory paths</td>
</tr>
<tr>
<td>/user/tmp</td>
<td>L12345.log</td>
<td># no corresponding CREATE DIRECTORY command has been issued</td>
</tr>
</tbody>
</table>

Example 2

```
DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R',256);
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
```

Note:

The examples are UNIX-specific.
UTL_FILE.GET_LINE(F1,V1,32767);
UTL_FILE.FCLOSE(F1);

-- In this example, GET_LINE doesn't specify a number of bytes, so it defaults to
-- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and
defaults to 1024.
-- So the number of bytes returned will be 1024 or less if a line terminator is
seen.
F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
UTL_FILE.GET_LINE(F1,V1);
UTL_FILE.FCLOSE(F1);
END;
Data Structures

The `UTL_FILE` package defines a RECORD type.

Record Types

- `FILETYPE` Record Type
FILETYPE Record Type

The contents of FILE_TYPE are private to the UTL_FILE package. You should not reference or change components of this record.

```sql
TYPE file_type IS RECORD (
    id       BINARY_INTEGER,
    datatype BINARY_INTEGER,
    byte_mode BOOLEAN);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>A numeric value indicating the internal file handle number</td>
</tr>
<tr>
<td>datatype</td>
<td>Indicates whether the file is a CHAR file, Nchar file or other (binary)</td>
</tr>
<tr>
<td>byte_mode</td>
<td>Indicates whether the file was open as a binary file, or as a text file</td>
</tr>
</tbody>
</table>

**Caution:** Oracle does not guarantee the persistence of FILE_TYPE values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have indeterminate outcomes.
# Summary of UTL_FILE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>

</table>
### Table 222–3  \textit{(Cont.) UTL\_FILE Subprograms}

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUTF_NCHAR Procedure * on page 222-36</td>
<td>A PUT_NCHAR procedure with formatting, and writes a Unicode string to a file, with formatting</td>
</tr>
<tr>
<td>PUT_RAW Procedure * on page 222-37</td>
<td>Accepts as input a RAW data value and writes the value to the output buffer</td>
</tr>
</tbody>
</table>
FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

```fortran
UTL_FILE.FCLOSE (  
    file IN OUT FILE_TYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN or FOPEN_NCHAR call</td>
</tr>
</tbody>
</table>

Usage Notes

If there is buffered data yet to be written when FCLOSE runs, then you may receive a WRITE_ERROR exception when closing a file.

Exceptions

- WRITE_ERROR
- INVALID_FILEHANDLE
FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

```sql
UTL_FILE.FCLOSE_ALL;
```

Usage Notes

**Note:** FCLOSE_ALL does not alter the state of the open file handles held by the user. This means that an `IS_OPEN` test on a file handle after an FCLOSE_ALL call still returns `TRUE`, even though the file has been closed. No further read or write operations can be performed on a file that was open before an FCLOSE_ALL.

Exceptions

- WRITE_ERROR
FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file. By default, the whole file is copied if the start_line and end_line parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

UTL_FILE.FCOPY(
    src_location    IN VARCHAR2,
    src_filename    IN VARCHAR2,
    dest_location   IN VARCHAR2,
    dest_filename   IN VARCHAR2,
    start_line      IN BINARY_INTEGER DEFAULT 1,
    end_line        IN BINARY_INTEGER DEFAULT NULL);

Parameters

Table 222–5  FCOPY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_location</td>
<td>Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)</td>
</tr>
<tr>
<td>src_filename</td>
<td>Source file to be copied</td>
</tr>
<tr>
<td>dest_location</td>
<td>Destination directory where the destination file is created</td>
</tr>
<tr>
<td>dest_filename</td>
<td>Destination file created from the source file</td>
</tr>
<tr>
<td>start_line</td>
<td>Line number at which to begin copying. The default is 1 for the first line</td>
</tr>
<tr>
<td>end_line</td>
<td>Line number at which to stop copying. The default is NULL, signifying end of file</td>
</tr>
</tbody>
</table>

Exceptions

INVALID_FILENAME
INVALID_PATH
INVALID_OPERATION
INVALID_OFFSET
READ_ERROR
WRITE_ERROR
FFLUSH Procedure

FFLUSH physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The FFLUSH procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

Syntax

UTL_FILE.FFLUSH (  
   file IN FILE_TYPE);  

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN or FOPEN_NCHAR call</td>
</tr>
</tbody>
</table>

Exceptions

INVALID_FILENAME
INVALID_MAXLINESIZE
INVALID_OPERATION
WRITE_ERROR
FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```sql
UTL_FILE.FGETATTR(
   location    IN VARCHAR2,
   filename    IN VARCHAR2,
   fexists     OUT BOOLEAN,
   file_length OUT NUMBER,
   blocksize   OUT BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)</td>
</tr>
<tr>
<td>filename</td>
<td>Name of the file to be examined</td>
</tr>
<tr>
<td>fexists</td>
<td>A BOOLEAN for whether or not the file exists</td>
</tr>
<tr>
<td>file_length</td>
<td>Length of the file in bytes. NULL if file does not exist.</td>
</tr>
<tr>
<td>blocksize</td>
<td>File system block size in bytes. NULL if the file does not exist.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_PATH
- INVALID_FILENAME
- INVALID_OPERATION
- READ_ERROR
- ACCESS_DENIED
FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```sql
UTL_FILE.FGETPOS (  
    file IN FILE_TYPE)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Directory location of the source file</td>
</tr>
</tbody>
</table>

Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- READ_ERROR

Usage Notes

If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously. See also FOPEN_NCHAR Function on page 222-21.

Syntax

```sql
UTL_FILE.FOPEN (
    location     IN VARCHAR2,
    filename     IN VARCHAR2,
    open_mode    IN VARCHAR2,
    max_linesize IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

Parameters

**Table 222–9  FOPEN Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of file. This string is a directory object name and is case sensitive. The default is uppercase. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.</td>
</tr>
<tr>
<td>filename</td>
<td>File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.</td>
</tr>
<tr>
<td>open_mode</td>
<td>Specifies how the file is opened. Modes include:</td>
</tr>
<tr>
<td></td>
<td>•  r -- read text</td>
</tr>
<tr>
<td></td>
<td>•  w -- write text</td>
</tr>
<tr>
<td></td>
<td>•  a -- append text</td>
</tr>
<tr>
<td></td>
<td>•  rb -- read byte mode</td>
</tr>
<tr>
<td></td>
<td>•  wb -- write byte mode</td>
</tr>
<tr>
<td></td>
<td>•  ab -- append byte mode</td>
</tr>
<tr>
<td>max_linesize</td>
<td>Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.</td>
</tr>
</tbody>
</table>

Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

**Table 222–10  FOPEN Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILE_TYPE</td>
<td>Handle to open file</td>
</tr>
</tbody>
</table>
Exceptions

- INVALID_MAXILINESIZE
- INVALID_MODE
- INVALID_OPERATION
- INVALID_PATH

Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects.
FOPEN_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. You can have a maximum of 50 files open simultaneously. With this function, you can read or write a text file in Unicode instead of in the database character set.

Even though the contents of an NVARCHAR2 buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. UTL_FILE converts between UTF8 and AL16UTF16 as necessary.

See also FOPEN Function on page 222-19.

Syntax

```
UTL_FILE.FOPEN_NCHAR (    
    location     IN VARCHAR2,    
    filename     IN VARCHAR2,    
    open_mode    IN VARCHAR2,    
    max_linesize IN BINARY_INTEGER DEFAULT 1024)    
RETURN FILE_TYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of file</td>
</tr>
<tr>
<td>filename</td>
<td>File name (including extension)</td>
</tr>
<tr>
<td>open_mode</td>
<td>Open mode (r,w,a,rb,wb,ab)</td>
</tr>
<tr>
<td>max_linesize</td>
<td>Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767)</td>
</tr>
</tbody>
</table>

Return Values

FOPEN_NCHAR returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILE_TYPE</td>
<td>Handle to open file</td>
</tr>
</tbody>
</table>

Exceptions

INVALID_MAXILINESIZE
INVALID_MODE
INVALID_OPERATION
INVALID_PATH
FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

```
UTL_FILE.FREMOVE (  
    location IN VARCHAR2,  
    filename IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive)</td>
</tr>
<tr>
<td>filename</td>
<td>Name of the file to be deleted</td>
</tr>
</tbody>
</table>

Exceptions

ACCESS_DENIED
DELETE_FAILED
INVALID_FILENAME
INVALID_OPERATION
INVALID_PATH

Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.
FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX mv function.

Syntax

```
UTL_FILE.FRENAME (
    src_location     IN   VARCHAR2,
    src_filename     IN   VARCHAR2,
    dest_location    IN   VARCHAR2,
    dest_filename    IN   VARCHAR2,
    overwrite        IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 222–14  FRENAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_location</td>
<td>Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)</td>
</tr>
<tr>
<td>src_filename</td>
<td>Source file to be renamed</td>
</tr>
<tr>
<td>dest_location</td>
<td>Destination directory of the destination file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)</td>
</tr>
<tr>
<td>dest_filename</td>
<td>New name of the file</td>
</tr>
<tr>
<td>overwrite</td>
<td>Default is FALSE. Permission on both the source and destination directories must be granted. You can use the overwrite parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is FALSE for no overwrite.</td>
</tr>
</tbody>
</table>

Exceptions

ACCESS_DENIED
INVALID_FILENAME
INVALID_PATH
RENAME_FAILED
FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

Syntax

```sql
UTL_FILE.FSEEK (
    file             IN OUT  UTL_FILE.FILE_TYPE,
    absolute_offset  IN      PL_INTEGER DEFAULT NULL,
    relative_offset  IN      PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File handle</td>
</tr>
<tr>
<td>absolute_offset</td>
<td>Absolute location to which to seek; default = NULL</td>
</tr>
<tr>
<td>relative_offset</td>
<td>Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OFFSET
- INVALID_OPERATION
- READ_ERROR

Usage Notes

- Using FSEEK, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If `relative_offset`, the procedure seeks forward. If `relative_offset > 0`, or backward, if `relative_offset < 0`, the procedure seeks through the file by the number of `relative_offset` bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an INVALID_OFFSET error is raised.
- If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the file, or up to the end of the len parameter. It cannot exceed the max_linesize specified in FOPEN.

Syntax

```
UTL_FILE.GET_LINE (  
    file        IN  FILE_TYPE,  
    buffer      OUT VARCHAR2,  
    len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN call. The file must be open for reading (mode r); otherwise an INVALID_OPERATION exception is raised.</td>
</tr>
<tr>
<td>buffer</td>
<td>Data buffer to receive the line read from the file</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.</td>
</tr>
</tbody>
</table>

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
NO_DATA_FOUND
READ_ERROR

Usage Notes

If the line does not fit in the buffer, a READ_ERROR exception is raised. If no text was read due to end of file, the NO_DATA_FOUND exception is raised. If the file is opened for byte mode operations, the INVALID_OPERATION exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN.

If unspecified, Oracle supplies a default value of 1024. See also "GET_LINE_NCHAR Procedure" on page 222-26.
GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype, such as NCHAR, NCLOB, or VARCHAR2 is specified, PL/SQL will perform standard implicit conversion from NVARCHAR2 after the text is read.

See also GET_LINE Procedure on page 222-25

Syntax

```sql
UTL_FILE.GET_LINE_NCHAR (  
    file        IN  FILE_TYPE,  
    buffer      OUT NVARCHAR2,  
    len         IN  PLS_INTEGER DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>file</code></td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.</td>
</tr>
<tr>
<td><code>buffer</code></td>
<td>Data buffer to receive the line read from the file</td>
</tr>
<tr>
<td><code>len</code></td>
<td>The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- NO_DATA_FOUND
- READ_ERROR
GET_RAW Procedure

This procedure reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL_FILE.GET_RAW ignores line terminators.

Syntax

```
UTL_FILE.GET_RAW (
    file IN            UTL_FILE.FILE_TYPE,
    buffer OUT NOCOPY RAW,
    len IN            PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File handle</td>
</tr>
<tr>
<td>buffer</td>
<td>RAW data</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- LENGTH_MISMATCH
- NO_DATA_FOUND
- READ_ERROR

Usage Notes

The subprogram will raise NO_DATA_FOUND when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```sql
PROCEDURE Sys.p (n IN VARCHAR2) IS
    h     UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
    Buf   RAW(32767);
    Amnt  CONSTANT PLS_INTEGER := 32767;
    BEGIN
        LOOP
            BEGIN
                Utl_File.Get_Raw(h, Buf, Amnt);
                -- Do something with this chunk
            EXCEPTION WHEN No_Data_Found THEN EXIT;
            END;
        END LOOP;
    UTL_FILE.FCLOSE (h);
END;
```
IS_OPEN Function

This function tests a file handle to see if it identifies an open file. IS_OPEN reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

UTL_FILE.IS_OPEN (  
    file  IN FILE_TYPE)  
RETURN BOOLEAN;

Parameters

Table 222–19 IS_OPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN or FOPEN_NCHAR call</td>
</tr>
</tbody>
</table>

Return Values

TRUE or FALSE

Exceptions

INVALID_FILEHANDLE
NEW_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle. This procedure is separate from PUT because the line terminator is a platform-specific character or sequence of characters.

Syntax

```
UTL_FILE.NEW_LINE (
    file   IN FILE_TYPE,
    lines IN BINARY_INTEGER := 1);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN or FOPEN_NCHAR call</td>
</tr>
<tr>
<td>lines</td>
<td>Number of line terminators to be written to the file</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- WRITE_ERROR
PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. No line terminator is appended by PUT; use NEW_LINE to terminate the line or use PUT_LINE to write a complete line with a line terminator. See also "PUT_NCHAR Procedure" on page 222-33.

Syntax

UTL_FILE.PUT (  
    file IN FILE_TYPE,  
    buffer IN VARCHAR2);  

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.</td>
</tr>
</tbody>
</table>

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. PUT_LINE terminates the line with the platform-specific line terminator character or characters. See also "PUT_LINE_NCHAR Procedure" on page 222-32.

Syntax

UTL_FILE.PUT_LINE (  
  file      IN FILE_TYPE,  
  buffer    IN VARCHAR2,  
  autoflush IN BOOLEAN DEFAULT FALSE);

Parameters

Table 222–22  PUT_LINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN call</td>
</tr>
<tr>
<td>buffer</td>
<td>Text buffer that contains the lines to be written to the file</td>
</tr>
<tr>
<td>autoflush</td>
<td>Flushes the buffer to disk after the WRITE</td>
</tr>
</tbody>
</table>

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set. This procedure is equivalent to the PUT_NCHAR Procedure, except that the line separator is appended to the written text. See also PUT_LINE Procedure on page 222-31.

Syntax

UTL_FILE.PUT_LINE_NCHAR (file IN FILE_TYPE, buffer IN NVARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.</td>
</tr>
<tr>
<td>buffer</td>
<td>Text buffer that contains the lines to be written to the file</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
PUT_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to NVARCHAR2 before writing the text.

See also PUT Procedure on page 222-30

Syntax

```
UTL_FILE.PUT_NCHAR (  
    file      IN FILE_TYPE,  
    buffer    IN NVARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- WRITE_ERROR

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
PUTF Procedure

This procedure is a formatted PUT procedure. It works like a limited printf(). See also PUTF_NCHAR Procedure on page 222-36.

Syntax

```sql
UTL_FILE.PUTF (    
    file    IN FILE_TYPE,    
    format  IN VARCHAR2,    
    [arg1   IN VARCHAR2  DEFAULT NULL,    
    . . .    
    arg5    IN VARCHAR2  DEFAULT NULL]);
```

Parameters

Table 222–25  PUTF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN call</td>
</tr>
<tr>
<td>format</td>
<td>Format string that can contain text as well as the formatting characters \n and %s</td>
</tr>
<tr>
<td>arg1..arg5</td>
<td>From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.</td>
</tr>
</tbody>
</table>

Usage Notes

- If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
- The format string can contain any text, but the character sequences %s and \n have special meaning.

<table>
<thead>
<tr>
<th>Character Sequence</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>%s</td>
<td>Substitute this sequence with the string value of the next argument in the argument list.</td>
</tr>
<tr>
<td>\n</td>
<td>Substitute with the appropriate platform-specific line terminator.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- WRITE_ERROR

Examples

The following example writes the lines:

```
Hello, world!
```
I come from Zork with greetings for all earthlings.

my_world  varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!
I come from %s with %s.
', my_world, 'greetings for all earthlings');

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.
PUTF_NCHAR Procedure

This procedure is a formatted version of a PUT_NCHAR Procedure. Using PUTF_NCHAR, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements \n and %s, and up to five arguments to be substituted for consecutive instances of %s in the format string. The expected datatype of the format string and the arguments is NVARCHAR2.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to NVARCHAR2 before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

Syntax

```sql
UTL_FILE.PUTF_NCHAR (    
    file    IN FILE_TYPE,    
    format  IN NVARCHAR2,    
    [arg1   IN NVARCHAR2  DEFAULT NULL,    
     . . .    
    arg5    IN NVARCHAR2  DEFAULT NULL]);
```

Parameters

**Table 222–26  PUTF_NCHAR Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.</td>
</tr>
<tr>
<td>format</td>
<td>Format string that can contain text as well as the formatting characters \n and %s</td>
</tr>
<tr>
<td>arg1..arg5</td>
<td>From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
PUT_RAW Procedure

This procedure accepts as input a RAW data value and writes the value to the output buffer.

Syntax

```plaintext
UTL_FILE.PUT_RAW (
  file          IN    UTL_FILE.FILE_TYPE,
  buffer        IN    RAW,
  autoflush     IN    BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File handle</td>
</tr>
<tr>
<td>buffer</td>
<td>The RAW data written to the buffer</td>
</tr>
<tr>
<td>autoflush</td>
<td>If TRUE, then performs a flush after writing the value to the output buffer; default is FALSE.</td>
</tr>
</tbody>
</table>

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to TRUE.

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
The **UTL_HTTP** package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager which can be created by either Oracle Wallet Manager or the `orapki` utility. Non-HTTPS fetches do not require an Oracle wallet.

Using UTL_HTTP

This section contains topics which relate to using the UTL_HTTP package.

- Overview
- Security Model
- Constants
- Datatypes
- Operational Notes
- Exceptions
- Examples
Overview

With the UTL_HTTP package, you can write PL/SQL programs that communicate with Web (HTTP) servers. And UTL_HTTP contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.
Security Model

This package is an invoker's rights package and the invoking user will need the `connect` privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the `use-client-certificates` or the `use-passwords` privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

**Note:** For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide
Constants

The UTL_HTTP package uses the constants shown in following tables.

- UTL_HTTP Constants - HTTP Versions
- UTL_HTTP Constants - Default Ports
- UTL_HTTP Constants - HTTP 1.1 Status Codes

Table 223–1  UTL_HTTP Constants - HTTP Versions

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP_VERSION_1_0</td>
<td>VARCHAR2(10)</td>
<td>'HTTP/1.0'</td>
<td>Denotes HTTP version 1.0 that can be used in the function BEGIN_REQUEST.</td>
</tr>
<tr>
<td>HTTP_VERSION_1_1</td>
<td>VARCHAR2(10)</td>
<td>'HTTP/1.1'</td>
<td>Denotes HTTP version 1.1 that can be used in the function BEGIN_REQUEST.</td>
</tr>
</tbody>
</table>

Table 223–2  UTL_HTTP Constants - Default Ports

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_HTTP_PORT</td>
<td>PLS_INTEGER</td>
<td>80</td>
<td>The default TCP/IP port (80) at which a Web server or proxy server listens</td>
</tr>
<tr>
<td>DEFAULT_HTTPS_PORT</td>
<td>PLS_INTEGER</td>
<td>443</td>
<td>The default TCP/IP port (443) at which an HTTPS Web server listens</td>
</tr>
</tbody>
</table>

Table 223–3  UTL_HTTP Constants - HTTP 1.1 Status Codes

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP_CONTINUE</td>
<td>PLS_INTEGER</td>
<td>100</td>
<td>The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.</td>
</tr>
<tr>
<td>HTTP_SWITCHING_</td>
<td>PLS_INTEGER</td>
<td>101</td>
<td>The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.</td>
</tr>
<tr>
<td>PROTOCOLS</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>HTTP_OK</td>
<td>PLS_INTEGER</td>
<td>200</td>
<td>The request has succeeded. The information returned with the response is dependent on the method used in the request.</td>
</tr>
<tr>
<td>HTTP_CREATED_CONSTANT</td>
<td>PLS_INTEGER</td>
<td>201</td>
<td>The request has been fulfilled and resulted in a new resource being created.</td>
</tr>
<tr>
<td>HTTP_ACCEPTED</td>
<td>PLS_INTEGER</td>
<td>202</td>
<td>The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.</td>
</tr>
</tbody>
</table>
### Table 223–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP_NON_AUTHORITATIVE_INFO</td>
<td>PLS_INTEGER</td>
<td>203</td>
<td>The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.</td>
</tr>
<tr>
<td>HTTP_NO_CONTENT</td>
<td>PLS_INTEGER</td>
<td>204</td>
<td>The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.</td>
</tr>
<tr>
<td>HTTP_RESET_CONTENT</td>
<td>PLS_INTEGER</td>
<td>205</td>
<td>The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.</td>
</tr>
<tr>
<td>HTTP_PARTIAL_CONTENT</td>
<td>PLS_INTEGER</td>
<td>206</td>
<td>The server has fulfilled the partial GET request for the resource.</td>
</tr>
<tr>
<td>HTTP_MULTIPLE_CHOICES</td>
<td>PLS_INTEGER</td>
<td>300</td>
<td>The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.</td>
</tr>
<tr>
<td>HTTP_MOVED_PERMANENTLY</td>
<td>PLS_INTEGER</td>
<td>301</td>
<td>The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.</td>
</tr>
<tr>
<td>HTTP_FOUND CONSTANT</td>
<td>PLS_INTEGER</td>
<td>302</td>
<td>The requested resource resides temporarily under a different URI.</td>
</tr>
<tr>
<td>HTTPSEE_OTHER</td>
<td>PLS_INTEGER</td>
<td>303</td>
<td>The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.</td>
</tr>
<tr>
<td>HTTP_NOT_MODIFIED</td>
<td>PLS_INTEGER</td>
<td>304</td>
<td>If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.</td>
</tr>
<tr>
<td>HTTPUSE_PROXY</td>
<td>PLS_INTEGER</td>
<td>305</td>
<td>The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.</td>
</tr>
<tr>
<td>HTTP_TEMPORARY_REDIRECT</td>
<td>PLS_INTEGER</td>
<td>307</td>
<td>The requested resource resides temporarily under a different URI.</td>
</tr>
<tr>
<td>HTTP_BAD_REQUEST</td>
<td>PLS_INTEGER</td>
<td>400</td>
<td>The request could not be understood by the server due to malformed syntax.</td>
</tr>
<tr>
<td>HTTP_UNAUTHORIZED</td>
<td>PLS_INTEGER</td>
<td>401</td>
<td>The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.</td>
</tr>
<tr>
<td>HTTP_PAYMENT_REQUIRED</td>
<td>PLS_INTEGER</td>
<td>402</td>
<td>This code is reserved for future use.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------</td>
<td>-------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HTTP_FORBIDDEN</td>
<td>PLS_INTEGER</td>
<td>403</td>
<td>The server understood the request, but is refusing to fulfill it.</td>
</tr>
<tr>
<td>HTTP_NOT_FOUND</td>
<td>PLS_INTEGER</td>
<td>404</td>
<td>The server has not found anything matching the Request-URI.</td>
</tr>
<tr>
<td>HTTP_NOT_ACCEPTABLE</td>
<td>PLS_INTEGER</td>
<td>406</td>
<td>The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.</td>
</tr>
<tr>
<td>HTTP_PROXY_AUTH_REQUIRED</td>
<td>PLS_INTEGER</td>
<td>407</td>
<td>This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.</td>
</tr>
<tr>
<td>HTTP_REQUEST_TIME_OUT</td>
<td>PLS_INTEGER</td>
<td>408</td>
<td>The client did not produce a request within the time that the server was prepared to wait.</td>
</tr>
<tr>
<td>HTTP_CONFLICT</td>
<td>PLS_INTEGER</td>
<td>409</td>
<td>The request could not be completed due to a conflict with the current state of the resource.</td>
</tr>
<tr>
<td>HTTP_GONE</td>
<td>PLS_INTEGER</td>
<td>410</td>
<td>The requested resource is no longer available at the server and no forwarding address is known.</td>
</tr>
<tr>
<td>HTTP_LENGTH_REQUIRED</td>
<td>PLS_INTEGER</td>
<td>411</td>
<td>The server refuses to accept the request without a defined Content-Length.</td>
</tr>
<tr>
<td>HTTP_PRECONDITION_FAILED</td>
<td>PLS_INTEGER</td>
<td>412</td>
<td>The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.</td>
</tr>
<tr>
<td>HTTP_REQUEST_ENTITY_TOO_LARGE</td>
<td>PLS_INTEGER</td>
<td>413</td>
<td>The server is refusing to process a request because the request entity is larger than the server is willing or able to process.</td>
</tr>
<tr>
<td>HTTP_REQUEST_URI_TOO_LARGE</td>
<td>PLS_INTEGER</td>
<td>414</td>
<td>The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.</td>
</tr>
<tr>
<td>HTTP_UNSUPPORTED_MEDIA_TYPE</td>
<td>PLS_INTEGER</td>
<td>415</td>
<td>The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.</td>
</tr>
<tr>
<td>HTTP_REQ_RANGE_NOT_SATISFIABLE</td>
<td>PLS_INTEGER</td>
<td>416</td>
<td>A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.</td>
</tr>
<tr>
<td>HTTP_EXPECTATION_FAILED</td>
<td>PLS_INTEGER</td>
<td>417</td>
<td>The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------</td>
<td>-------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HTTP_NOT_IMPLEMENTED</td>
<td>PLS_INTEGER</td>
<td>501</td>
<td>The server does not support the functionality required to fulfill the request.</td>
</tr>
<tr>
<td>HTTP_BAD_GATEWAY</td>
<td>PLS_INTEGER</td>
<td>502</td>
<td>The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request.</td>
</tr>
<tr>
<td>HTTP_SERVICE_UNAVAILABLE</td>
<td>PLS_INTEGER</td>
<td>503</td>
<td>The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.</td>
</tr>
<tr>
<td>HTTP_GATEWAY_TIME_OUT</td>
<td>PLS_INTEGER</td>
<td>504</td>
<td>The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.</td>
</tr>
<tr>
<td>HTTP_VERSION_NOT_SUPPORTED</td>
<td>PLS_INTEGER</td>
<td>505</td>
<td>The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.</td>
</tr>
</tbody>
</table>
Datatypes

- **REQ Type**
- **RESP Type**
- **COOKIE and COOKIE_TABLE Types**
- **CONNECTION Type**
- **REQUEST_CONTEXT_KEY Type**

**REQ Type**

Use this PL/SQL record type to represent an HTTP request.

**Syntax**

```sql
type req is record (  
  url      varchar2(32767),  
  method   varchar2(64),  
  http_version varchar2(64));
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>url</code></td>
<td>The URL of the HTTP request. It is set after the request is created by <code>BEGIN_REQUEST</code>.</td>
</tr>
<tr>
<td><code>method</code></td>
<td>The method to be performed on the resource identified by the URL. It is set after the request is created by <code>BEGIN_REQUEST</code>.</td>
</tr>
<tr>
<td><code>http_version</code></td>
<td>The HTTP protocol version used to send the request. It is set after the request is created by <code>BEGIN_REQUEST</code>.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

**REQUEST_CONTEXT_KEY Type**

This type is used to represent the key to a request context. A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

**Syntax**

```sql
subtype request_context_key is pls_integer;
```

**Usage Notes**

To provide enhanced security, `UTL_HTTP` allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when...
making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

**RESP Type**

This PL/SQL record type is used to represent an HTTP response.

**Syntax**

```sql
TYPE resp IS RECORD (
  status_code    PLS_INTEGER,
  reason_phrase  VARCHAR2(256),
  http_version   VARCHAR2(64));
```

**Parameters**

**Table 223–5  RESP Type Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status_code</td>
<td>The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.</td>
</tr>
<tr>
<td>reason_phrase</td>
<td>The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.</td>
</tr>
<tr>
<td>http_version</td>
<td>The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The information returned in RESP from the interface GET_RESPONSE is read-only. There are other fields in the RESP record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the UTL_HTTP package. You should not modify the fields.

**COOKIE and COOKIE_TABLE Types**

The COOKIE type is the PL/SQL record type that represents an HTTP cookie. The COOKIE_TABLE type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

**Syntax**

```sql
TYPE cookie IS RECORD (
  name  VARCHAR2(256),
  value VARCHAR2(1024),
  domain VARCHAR2(256),
  expire TIMESTAMP WITH TIME ZONE,
  path  VARCHAR2(1024),
  secure BOOLEAN,
  version PLS_INTEGER,
  comment VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```
Fields of COOKIE Record Type

Table 223–6 shows the fields for the COOKIE and COOKIE_TABLE record types.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the HTTP cookie</td>
</tr>
<tr>
<td>value</td>
<td>The value of the cookie</td>
</tr>
<tr>
<td>domain</td>
<td>The domain for which the cookie is valid</td>
</tr>
<tr>
<td>expire</td>
<td>The time by which the cookie will expire</td>
</tr>
<tr>
<td>path</td>
<td>The subset of URLs to which the cookie applies</td>
</tr>
<tr>
<td>secure</td>
<td>Should the cookie be returned to the Web server using secured means only.</td>
</tr>
<tr>
<td>version</td>
<td>The version of the HTTP cookie specification the cookie conforms. This field is NULL for Netscape cookies.</td>
</tr>
<tr>
<td>comment</td>
<td>The comment that describes the intended use of the cookie. This field is NULL for Netscape cookies.</td>
</tr>
</tbody>
</table>

Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the UTL_HTTP package. The cookies are maintained by the package transparently. They are maintained inside the UTL_HTTP package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using GET_COOKIES, store them persistently in a database table, and re-store the cookies back in the package using ADD_COOKIES in the next database session. All the fields in the cookie record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "Retrieving and Restoring Cookies" on page 223-22.

CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. connection_table is a PL/SQL table of connection.

For a direct HTTP persistent connection to a Web server, the host and port fields contain the host name and TCP/IP port number of the Web server. The proxy_host and proxy_port fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the proxy_host and proxy_port fields contain the host name and TCP/IP port number of the proxy server. The host and port fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The SSL field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the host and port fields contain the host name and TCP/IP port number of the target HTTPS Web server and
the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

**Syntax**

```plaintext
TYPE connection IS RECORD (  
    host  VARCHAR2(256),  
    port  PLS_INTEGER,  
    proxy_host  VARCHAR2(256),  
    proxy_port  PLS_INTEGER,  
    ssl  BOOLEAN);  

TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```
Operational Notes

- Operational Flow
- Simple HTTP Fetches
- HTTP Requests
- HTTP Responses
- HTTP Persistent Connections
- Error Conditions
- Session Settings
- Request Context
- External Password Store

Operational Flow

The UTL_HTTP package provides access to the HTTP protocol. The interfaces must be called in the order shown in Figure 223–1, or an exception will be raised.
This illustration describes execution flow in UTL_HTTP that has two phases: (1) beginning with "begin_request" and ending with "end_request", (2) beginning with "get_response" and ending with "end_response". Key to the symbols used:

- … -> denotes "continue to next step", for example, "begin_request" -> "get_response"
- … material enclosed in double quotation marks denotes an action, for example "PARSE"
- … material enclosed in single qutation marks denotes a choice point, for example, 'perform pre-response set operations': Yes/No
- … material unenclosed denotes a choice of direction, for example, Yes

PHASE #1.
Using UTL_HTTP

- "begin_request" -> 'perform pre-response set operations': Yes/No
  - 'perform set operations': Yes -> "set_cookie_support" (optional with option to repeat multiple times) -> "set_persistent_conn_support" (optional with option to repeat multiple times) -> "set_body_charset" (optional with option to repeat multiple times) -> "set_follow_redirect" (optional with option to repeat multiple times) -> "set_authentication" (optional with option to repeat multiple times) -> "set_header" (optional with option to repeat multiple times) -> 'perform pre-response write operations': Yes/No
  - 'perform set operations': No -> 'perform write operations': Yes/No
- 'perform pre-response write operations': Yes -> "write_raw" (optional with option to repeat multiple times) -> "write_line" (optional with option to repeat multiple times) -> "write_text" (optional with option to repeat multiple times) -> "end_request"
- 'perform pre-response write operations': No -> "end_request"

PHASE #2.
- "get_response" -> 'perform get operations': Yes/No
  - 'perform get operations': Yes -> "set_body_charset" (optional with option to repeat multiple times) -> "get_authentication" (optional with option to repeat multiple times) -> "get_header_count" (optional with option to repeat multiple times) -> "get_header_by_name" (optional with option to repeat multiple times) -> 'peform read operations': Yes/No
  - 'perform get operations': No -> 'peform read operations': Yes/No
- 'peform read operations': Yes -> "read_raw" (optional with option to repeat multiple times) -> "read_line" (optional with option to repeat multiple times) -> "read_text" (optional with option to repeat multiple times) -> end_response
- 'peform read operations': No -> end_response

***********************************************************************************************

The following can be called at any time:
- Non-protocol interfaces that manipulate cookies
  - GET_COOKIE_COUNT
  - GET_COOKIES
  - ADD_COOKIES
  - CLEAR.Cookies
- Persistent connections
  - GET_PERSISTENT_CONN_COUNT
  - GET_PERSISTENT_CONNS
  - CLOSE_PERSISTENT_CONN
  - CLOSE_PERSISTENT_CONNS
- Interfaces that manipulate attributes and configurations of the UTL_HTTP package in the current session
  - SET_PROXY
  - GET_PROXY
- SET_COOKIE_SUPPORT
- GET_COOKIE_SUPPORT
- SET_FOLLOW_REDIRECT
- GET_FOLLOW_REDIRECT
- SET_BODY_CHARSET
- GET_BODY_CHARSET
- SET_PERSISTENT_CONN_SUPPORT
- GET_PERSISTENT_CONN_SUPPORT
- SET_DETAILED_EXCP_SUPPORT
- GET_DETAILED_EXCP_SUPPORT
- SET_WALLET
- SET_TRANSFER_TIMEOUT
- GET_TRANSFER_TIMEOUT

- Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session
  - GET_DETAILED_SQLCODE
  - GET_DETAILED_SQLERRM

---

**NOTE:** Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

---

**Simple HTTP Fetches**

REQUEST and REQUEST_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect REQUEST or REQUEST_PIECES to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If REQUEST or REQUEST_PIECES fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each REQUEST or REQUEST_PIECES call using the optional proxy parameter.
HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

See Also: HTTP Requests Subprograms on page 223-28

HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET_RESPONSE and receive response information from the Web server. When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

See Also: HTTP Responses Subprograms on page 223-30

HTTP Cookies

The UTL_HTTP package provides subprograms to manipulate HTTP cookies.

See Also: HTTP Cookies Subprograms on page 223-31

HTTP Persistent Connections

The UTL_HTTP package provides subprograms to manipulate persistent connections.

See Also: HTTP Persistent Connections Subprograms on page 223-32

Error Conditions

The UTL_HTTP package provides subprograms to retrieve error information.

See Also: Error Conditions Subprograms on page 223-33

Session Settings

Session settings manipulate the configuration and default behavior of UTL_HTTP when HTTP requests are executed within a database user session. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect,
body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

**See Also:** [Session Settings Subprograms](#) on page 223-27

### Request Context

The **UTL_HTTP** package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

**See Also:** [HTTP Requests Subprograms](#) on page 223-28

### External Password Store

The **UTL_HTTP** package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage for passwords and frees the application developers from the need to maintain their own storage.

**See Also:** [SET_AUTHENTICATION_FROM_WALLET Procedure](#) on page 223-79
## Exceptions

Table 223–7 lists the exceptions that the UTL_HTTP package interface can raise. By default, UTL_HTTP raises the exception request_failed when a request fails to execute. If the package is set to raise a detailed exception by set_detailed_excp_support, the rest of the exceptions will be raised directly (except for the exception end_of_body, which will be raised by READ_TEXT, READ_LINE, and READ_RAW regardless of the setting).

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Reason</th>
<th>Where Raised</th>
</tr>

<td>29276</td>
<td>No data is read and a read</td>
<td>READ_TEXT and READ_LINE, when detailed_exception is enabled</td>
</tr>
<tr>
<td></td>
<td></td>
<td>timeout occurred</td>
<td></td>
</tr>
<tr>
<td>UNKNOWN_SCHEME</td>
<td>29264</td>
<td>The scheme of the requested URL</td>
<td>BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled</td>
</tr>
<tr>
<td></td>
<td></td>
<td>is unknown</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE:** The partial_multibyte_char and transfer_timeout exceptions are duplicates of the same exceptions defined in UTL_TCP. They are defined in this package so that the use of this package does not require the knowledge of the UTL_TCP. As those exceptions are duplicates, an exception handle that catches the partial_multibyte_char and transfer_timeout exceptions in this package also catch the exceptions in the UTL_TCP.

For REQUEST and REQUESTPieces, the request_failed exception is raised when any exception occurs and detailed_exception is disabled.
Examples

The following examples demonstrate how to use UTL_HTTP.

- General Usage
- Retrieving HTTP Response Headers
- Handling HTTP Authentication
- Retrieving and Restoring Cookies
- Making HTTP Request with Private Wallet and Cookie Table

General Usage

```sql
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req   UTL_HTTP.REQ;
    resp  UTL_HTTP.RESP;
    value VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    LOOP
        UTL_HTTP.READ_LINE(resp, value, TRUE);
        DBMS_OUTPUT.PUT_LINE(value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
    WHEN UTL_HTTP.END_OF_BODY THEN
        UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving HTTP Response Headers

```sql
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req   UTL_HTTP.REQ;
    resp  UTL_HTTP.RESP;
    name  VARCHAR2(256);
    value VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
    DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;
```
Handling HTTP Authentication

```sql
SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url IN VARCHAR2,
username IN VARCHAR2 DEFAULT NULL,
password IN VARCHAR2 DEFAULT NULL,
realm IN VARCHAR2 DEFAULT NULL) AS

req       UTL_HTTP.REQ;
resp      UTL_HTTP.RESP;
my_scheme VARCHAR2(256);
my_realm  VARCHAR2(256);
my_proxy  BOOLEAN;
BEGIN
    -- Turn off checking of status code. We will check it by ourselves.
    UTL_HTTP.HTTP_RESPONSE_ERROR_CHECK(FALSE);
    req := UTL_HTTP.BEGIN_REQUEST(url);
    IF (username IS NOT NULL) THEN
        UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic
    END IF;
    resp := UTL_HTTP.GET_RESPONSE(req);
    IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
        UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, my_proxy);
        IF (my_proxy) THEN
            DBMS_OUTPUT.PUT_LINE('Web proxy server is protected.');
            DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || ' authentication username/password for realm ' || my_realm || ' for the proxy server.);
        ELSE
            DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected.
            DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || ' authentication username/password for realm ' || my_realm || ' for the Web page.);
        END IF;
    END IF;
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
END IF;
FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
END LOOP;
UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving and Restoring Cookies

```sql
CREATE TABLE my_cookies (
    session_id  INTEGER,
    name        VARCHAR2(256),
    value       VARCHAR2(1024),
    domain      VARCHAR2(256),
    expire      DATE,
    path        VARCHAR2(256),
    secure      VARCHAR2(1),
    version     INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
Using UTL_HTTP

```sql
BEGIN
    /* assume that some cookies have been set in previous HTTP requests. */
    UTL_HTTP.GET_COOKIES(cookies);
    SELECT session_id.nextval INTO my_session_id FROM DUAL;
    FOR i IN 1..cookies.count LOOP
        IF (cookies(i).secure) THEN
            secure := 'Y';
        ELSE
            secure := 'N';
        END IF;
        INSERT INTO my_cookies
        VALUES (my_session_id, cookies(i).name, cookies(i).value,
                cookies(i).domain,
                cookies(i).expire, cookies(i).path, secure, cookies(i).version);
    END LOOP;
    RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER) AS
    cookies        UTL_HTTP.COOKIE_TABLE;
    cookie         UTL_HTTP.COOKIE;
    i              PLS_INTEGER := 0;
    CURSOR c (c_session_id PLS_INTEGER) IS
        SELECT * FROM my_cookies WHERE session_id = c_session_id;
    BEGIN
        FOR r IN c(this_session_id) LOOP
            i := i + 1;
            cookie.name     := r.name;
            cookie.value    := r.value;
            cookie.domain   := r.domain;
            cookie.expire   := r.expire;
            cookie.path     := r.path;
            IF (r.secure = 'Y') THEN
                cookie.secure := TRUE;
            ELSE
                cookie.secure := FALSE;
            END IF;
            cookies(i) := cookie;
        END LOOP;
        UTL_HTTP.CLEAR.Cookies;
        UTL_HTTP.ADD_COOKIES(cookies);
    END;
/

Making HTTP Request with Private Wallet and Cookie Table

SET SERVEROUTPUT ON SIZE 40000

CREATE OR REPLACE PROCEDURE DISPLAY_PAGE(url IN VARCHAR2) AS
    request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
    req             UTL_HTTP.REQ;
    resp            UTL_HTTP.RESP;
    data            VARCHAR2(1024);
```
BEGIN

-- Create a request context with its wallet and cookie table
request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
    wallet_path          => 'file:/oracle/wallets/test/wallet',
    wallet_password      => '******',
    enable_cookies       => TRUE,
    max_cookies          => 300,
    max_cookies_per_site => 20);

-- Make a HTTP request using the private wallet and cookie table in the request context
req := UTL_HTTP.BEGIN_REQUEST(
    url        => url,
    request_context => request_context);
resp := UTL_HTTP.GET_RESPONSE(req);

BEGIN
    LOOP
        UTL_HTTP.READ_TEXT(resp, data);
        DBMS_OUTPUT.PUT(data);
    END LOOP;
EXCEPTION
    WHEN UTL_HTTP.END_OF_BODY THEN
        UTL_HTTP.END_RESPONSE(resp);
END;

-- Destroy the request context
UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);

END;

BEGIN
    DISPLAY_PAGE('https://www.example.com/');
END;
/

Examples
UTL_HTTP subprograms are grouped by function:
- Simple HTTP Fetches in a Single Call Subprograms
- Session Settings Subprograms
- HTTP Requests Subprograms
- HTTP Request Contexts Subprograms
- HTTP Responses Subprograms
- HTTP Cookies Subprograms
- HTTP Persistent Connections Subprograms
- Error Conditions Subprograms
REQUEST and REQUEST_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQUEST Function on page 223-73</td>
<td>Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.</td>
</tr>
<tr>
<td>REQUEST_PIECES Function on page 223-75</td>
<td>Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.</td>
</tr>
</tbody>
</table>
### Session Settings Subprograms

**Table 223–9  UTL_HTTP Subprograms—Session Settings**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GET_BODY_CHARSET Procedure</strong> on page 223-51</td>
<td>Retrieves the default character set of the body of all future HTTP requests.</td>
</tr>
<tr>
<td><strong>GET_COOKIE_SUPPORT Procedure</strong> on page 223-53</td>
<td>Retrieves the current cookie support settings.</td>
</tr>
<tr>
<td><strong>GET_DETAILED_EXCP_SUPPORT Procedure</strong> on page 223-55</td>
<td>Checks if the UTL_HTTP package will raise a detailed exception or not.</td>
</tr>
<tr>
<td><strong>GET_FOLLOW_REDIRECT Procedure</strong> on page 223-58</td>
<td>Retrieves the follow-redirect setting in the current session.</td>
</tr>
<tr>
<td><strong>GET_PERSISTENT_CONN_SUPPORT Procedure</strong> on page 223-63</td>
<td>Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session.</td>
</tr>
<tr>
<td><strong>GET_PROXY Procedure</strong> on page 223-65</td>
<td>Retrieves the current proxy settings.</td>
</tr>
<tr>
<td><strong>GET_RESPONSE_ERROR_CHECK Procedure</strong> on page 223-67</td>
<td>Checks if the response error check is set or not.</td>
</tr>
<tr>
<td><strong>GET_TRANSFER_TIMEOUT Procedure</strong> on page 223-68</td>
<td>Retrieves the current network transfer timeout value.</td>
</tr>
<tr>
<td><strong>SET_TRANSFER_TIMEOUT Procedure</strong> on page 223-92</td>
<td>Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header.</td>
</tr>
<tr>
<td><strong>SET_COOKIE_SUPPORT Procedures</strong> on page 223-83</td>
<td>Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session.</td>
</tr>
<tr>
<td><strong>SET_DETAILED_EXCP_SUPPORT Procedure</strong> on page 223-85</td>
<td>Sets the UTL_HTTP package to raise a detailed exception.</td>
</tr>
<tr>
<td><strong>SET_FOLLOW_REDIRECT Procedures</strong> on page 223-86</td>
<td>Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function.</td>
</tr>
<tr>
<td><strong>SET_PERSISTENT_CONN_SUPPORT Procedure</strong> on page 223-88</td>
<td>Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session.</td>
</tr>
<tr>
<td><strong>SET_PROXY Procedure</strong> on page 223-90</td>
<td>Sets the proxy to be used for requests of HTTP or other protocols.</td>
</tr>
<tr>
<td><strong>SET_RESPONSE_ERROR_CHECK Procedure</strong> on page 223-91</td>
<td>Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges.</td>
</tr>
<tr>
<td><strong>SET_TRANSFER_TIMEOUT Procedure</strong> on page 223-92</td>
<td>Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server.</td>
</tr>
<tr>
<td><strong>SET_WALLET Procedure</strong> on page 223-93</td>
<td>Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS.</td>
</tr>
</tbody>
</table>
HTTP Requests Subprograms

Table 223–10  UTL_HTTP Subprograms—HTTP Requests

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN_REQUEST Function on page 223-39</td>
<td>Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.</td>
</tr>
<tr>
<td>SET_HEADER Procedure on page 223-87</td>
<td>Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.</td>
</tr>
<tr>
<td>SET_AUTHENTICATION Procedure on page 223-78</td>
<td>Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.</td>
</tr>
<tr>
<td>SET_AUTHENTICATION_FROM_WALLET Procedure on page 223-79</td>
<td>Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.</td>
</tr>
<tr>
<td>SET_BODY_CHARSET Procedures on page 223-81</td>
<td>Sets the character set of the request body when the media type is Text but the character set is not specified in the Content-Type header.</td>
</tr>
<tr>
<td>SET_COOKIE_SUPPORT Procedures on page 223-83</td>
<td>Enables or disables support for the HTTP cookies in the request.</td>
</tr>
<tr>
<td>SET_FOLLOW_REDIRECT Procedures on page 223-86</td>
<td>Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE Function on page 223-66</td>
</tr>
<tr>
<td>SET_PERSISTENT_CONN_SUPPORT Procedure on page 223-88</td>
<td>Enables or disables support for the HTTP 1.1 persistent-connection in the request.</td>
</tr>
<tr>
<td>SET_PROXY Procedure on page 223-90</td>
<td>Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP)</td>
</tr>
<tr>
<td>WRITE_RAW Procedure on page 223-96</td>
<td>Writes some binary data in the HTTP request body</td>
</tr>
<tr>
<td>WRITE_TEXT Procedure on page 223-97</td>
<td>Writes some text data in the HTTP request body</td>
</tr>
</tbody>
</table>
HTTP Request Contexts Subprograms

</table>
ADD_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL_HTTP package's session state.

See Also: HTTP Cookies on page 223-17 and HTTP Cookies Subprograms on page 223-31

Syntax

UTL_HTTP.ADD_COOKIES (  
cookies          IN  cookie_table,  
request_context  IN  request_context_key DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cookies</td>
<td>The cookies to be added</td>
</tr>
<tr>
<td>request_context</td>
<td>Request context to add the cookies. If NULL, the cookies will be added</td>
</tr>
<tr>
<td></td>
<td>to the UTL_HTTP package's session state instead.</td>
</tr>
</tbody>
</table>

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.
BEGIN_REQUEST Function

This function begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request. The URL may contain the username and password needed to authenticate the request to the server. The format is

scheme://[user[:password]@[]host[:port]/[...]

See Also: HTTP Requests on page 223-17 and HTTP Requests Subprograms on page 223-28

Syntax

UTL_HTTP.BEGIN_REQUEST (url IN VARCHAR2, method IN VARCHAR2 DEFAULT 'GET', http_version IN VARCHAR2 DEFAULT NULL, request_context IN request_context_key DEFAULT NULL) RETURN req;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL of the HTTP request</td>
</tr>
<tr>
<td>method</td>
<td>The method performed on the resource identified by the URL</td>
</tr>
<tr>
<td>http_version</td>
<td>The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.</td>
</tr>
<tr>
<td>request_context</td>
<td>Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is NULL, the wallet and cookie table shared in the current database session will be used instead.</td>
</tr>
</tbody>
</table>

Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the UTL_URL package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See Chapter 237, "UTL_URL" for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

- BEGIN_REQUEST can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a
subsequent invocation of the `GET_RESPONSE` Function will raise the `PROTOCOL_ERROR` exception.

A URL will be long when its `QUERY_STRING` (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the `POST` method.

```plaintext
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r => req,
    name => 'Content-Type',
    value => 'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r => req,
    name => 'Content-Length',
    value => '<length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r => req,
    data => 'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE (r => req);
...```

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the `SET_WALLET Procedure` procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the `use-client-certificates` privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the `Oracle Database Security Guide` to grant the privilege.

- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the `UTL_HTTP` must have the `connect ACL privilege to the remote Web server host or the proxy host respectively.`
CLEAR_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

See Also: HTTP Cookies on page 223-17 and HTTP Cookies Subprograms on page 223-31

Syntax

UTL_HTTP.CLEAR_COOKIES (request_context IN request_context_key DEFAULT NULL);

Parameters

Table 223–19  CLEAR_COOKIES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_context</td>
<td>Request context to clear the cookies. If NULL, the cookies maintained in the UTL_HTTP package's session state will be cleared instead.</td>
</tr>
</tbody>
</table>
CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session.

See Also: HTTP Persistent Connections on page 223-17 and HTTP Persistent Connections Subprograms on page 223-32

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (conn IN connection);
```

Parameters

Table 223–20 CLOSE_PERSISTENT_CONN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conn</td>
<td>The HTTP persistent connection to close</td>
</tr>
</tbody>
</table>
CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```sql
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the proxy www-proxy at TCP/IP port 80:

```sql
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                  proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```sql
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

See Also: HTTP Persistent Connections on page 223-17 and HTTP Persistent Connections Subprograms on page 223-32

Syntax

```sql
UTL_HTTP.CLOSE_PERSISTENT_CONNS (  
   host        IN VARCHAR2 DEFAULT NULL,
   port        IN PLS_INTEGER DEFAULT NULL,
   proxy_host  IN VARCHAR2 DEFAULT NULL,
   proxy_port  IN PLS_INTEGER DEFAULT NULL,
   ssl         IN BOOLEAN DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The host for which persistent connections are to be closed</td>
</tr>
<tr>
<td>port</td>
<td>The port number for which persistent connections are to be closed</td>
</tr>
<tr>
<td>proxy_host</td>
<td>The proxy host for which persistent connections are to be closed</td>
</tr>
<tr>
<td>proxy_port</td>
<td>The proxy port for which persistent connections are to be closed</td>
</tr>
<tr>
<td>ssl</td>
<td>Close persistent SSL connection</td>
</tr>
</tbody>
</table>

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL.
of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a NULL value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a NULL value in a parameter to match only a NULL value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the CLOSE_PERSISTENT_CONN procedure that closes a specific persistent connection.
CREATE_REQUEST_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

See Also: Request Context on page 223-18 and HTTP Request Contexts Subprograms on page 223-29

Syntax

```
UTL_HTTP.CREATE_REQUEST_CONTEXT (  
  wallet_path          IN VARCHAR2 DEFAULT NULL,  
  wallet_password      IN VARCHAR2 DEFAULT NULL,  
  enable_cookies       IN BOOLEAN  DEFAULT TRUE,  
  max_cookies          IN PLS_INTEGER DEFAULT 300,  
  max_cookies_per_site IN PLS_INTEGER DEFAULT 20)  
RETURN request_context_key;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wallet_path</td>
<td>Directory path that contains the Oracle wallet. The format is file:directory-path</td>
</tr>
<tr>
<td>wallet_password</td>
<td>The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See the Oracle Database Advanced Security Administrator’s Guide for detailed information about wallets.</td>
</tr>
<tr>
<td>enable_cookies</td>
<td>Sets whether HTTP requests using this request context should support HTTP cookies or not: TRUE to enable the support, FALSE to disable it.</td>
</tr>
<tr>
<td>max_cookies</td>
<td>Sets the maximum total number of cookies that will be maintained in this request context</td>
</tr>
<tr>
<td>max_cookies_per_site</td>
<td>Sets the maximum number of cookies per each Web site that will be maintained in this request context</td>
</tr>
</tbody>
</table>

Return Values

The request context created.

Examples

```sql
DECLARE
    request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
    req              utl_http.req;
BEGIN
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(  
        wallet_path          => 'file:/oracle/wallets/test_wallets',  
        wallet_password      => NULL,  
        enable_cookies       => TRUE,  
        max_cookies          => 300,  
        max_cookies_per_site => 20);  
    req := UTL_HTTP.BEGIN_REQUEST(  
        url                  => 'http://www.example.com/');
```

CREATE REQUEST CONTEXT Function

    request_context => request_context);
END;
DESTROY_REQUEST_CONTEXT Procedure

This procedure destroys a request context in UTL_HTTP. A request context cannot be destroyed when it is in use by a HTTP request or response.

See Also: Request Context on page 223-18 and HTTP Request Contexts Subprograms on page 223-29

Syntax

UTL_HTTP.DESTROY_REQUEST_CONTEXT (request_context request_context_key);

Parameters

Table 223–23 DESTROY_REQUEST_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_context</td>
<td>Request context to destroy</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
BEGIN
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(...);
    UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);
END;
END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

See Also: HTTP Requests on page 223-17 and HTTP Requests Subprograms on page 223-28

Syntax

```sql
UTL_HTTP.END_REQUEST (
    r  IN OUT NOCOPY req);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
</tbody>
</table>
**END_RESPONSE Procedure**

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

**See Also:** HTTP Responses on page 223-17 and HTTP Responses Subprograms on page 223-30

**Syntax**

```plaintext
UTL_HTTP.END_RESPONSE (r IN OUT NOCOPY resp);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
</tbody>
</table>
GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

See Also: HTTP Responses on page 223-17 and HTTP Responses Subprograms on page 223-30

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
    r          IN OUT NOCOPY resp,
    scheme     OUT VARCHAR2,
    realm      OUT VARCHAR2,
    for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>scheme</td>
<td>The scheme for the required HTTP authentication</td>
</tr>
<tr>
<td>realm</td>
<td>The realm for the required HTTP authentication</td>
</tr>
<tr>
<td>for_proxy</td>
<td>Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE</td>
</tr>
</tbody>
</table>

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling GET_AUTHENTICATION. The Web client makes the second request and supplies the required authentication information with SET_AUTHORIZATION. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.
GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

See Also: Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

UTL_HTTP.GET_BODY_CHARSET (  
    charset OUT NOCOPY VARCHAR2);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>The default character set of the body of all future HTTP requests</td>
</tr>
</tbody>
</table>
GET_COOKIE_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session state.

See Also:  HTTP Cookies on page 223-17 and HTTP Cookies Subprograms on page 223-31

Syntax

UTL_HTTP.GET_COOKIE_COUNT (    request_context  IN  request_context_key DEFAULT NULL)    RETURN PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_context</td>
<td>Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead.</td>
</tr>
</tbody>
</table>
GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

See Also: Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

```sql
UTL_HTTP.GET_COOKIE_SUPPORT (enable OUT BOOLEAN,
                             max_cookies OUT PLS_INTEGER,
                             max_cookies_per_site OUT PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE)</td>
</tr>
<tr>
<td>max_cookies</td>
<td>Indicates the maximum total number of cookies maintained in the current session</td>
</tr>
<tr>
<td>max_cookies_per_site</td>
<td>Indicates the maximum number of cookies maintained in the current session for each Web site</td>
</tr>
</tbody>
</table>
GET_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

**See Also:** HTTP Cookies on page 223-17 and HTTP Cookies Subprograms on page 223-31

**Syntax**

```
UTL_HTTP.GET_COOKIES (  
  cookies          IN  OUT NOCOPY cookie_table,  
  request_context  IN             request_context_key DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cookies</td>
<td>The cookies returned</td>
</tr>
<tr>
<td>request_context</td>
<td>Request context to return the cookies for. If NULL, the cookies maintained</td>
</tr>
<tr>
<td></td>
<td>in the UTL_HTTP package's session state will be returned instead.</td>
</tr>
</tbody>
</table>
GET_DETAILED_EXCP_SUPPORT Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

See Also: Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (enable OUT BOOLEAN);

Parameters

Table 223–31 GET_DETAILED_EXCP_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE</td>
</tr>
</tbody>
</table>
GET_DETAILED_SQLCODE Function

This function retrieves the detailed SQLCODE of the last exception raised.

See Also: Error Conditions on page 223-17 and Error Conditions Subprograms on page 223-33

Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;
```
GET_DETAILED_SQLERRM Function

This function retrieves the detailed SQLERRM of the last exception raised.

See Also: Error Conditions on page 223-17 and Error Conditions Subprograms on page 223-33

Syntax

UTL_HTTP.GET_DETAILED_SQLERRM
RETURN VARCHAR2,
GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

See Also:  Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

UTL_HTTP.GET_FOLLOW_REDIRECT {
    max_redirects OUT PLS_INTEGER};

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_redirects</td>
<td>The maximum number of redirections for all future HTTP requests</td>
</tr>
</tbody>
</table>
GET_HEADER Procedure

This procedure returns the n\textsuperscript{th} HTTP response header name and value returned in the response.

**See Also:** HTTP Responses on page 223-17 and HTTP Responses Subprograms on page 223-30

**Syntax**

```sql
UTL_HTTP.GET_HEADER (
    r      IN OUT NOCOPY resp,
    n      IN PLS_INTEGER,
    name   OUT NOCOPY VARCHAR2,
    value  OUT NOCOPY VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>n</td>
<td>The n\textsuperscript{th} header to return</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP response header</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP response header</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.
GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

**See Also:** [HTTP Responses](#) on page 223-17 and [HTTP Responses Subprograms](#) on page 223-30

### Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
    r IN OUT NOCOPY resp,
    name IN VARCHAR2,
    value OUT NOCOPY VARCHAR2,
    n IN PLS_INTEGER DEFAULT 1);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP response header for which the value is to return</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP response header</td>
</tr>
<tr>
<td>n</td>
<td>The n&lt;sup&gt;th&lt;/sup&gt; occurrence of an HTTP response header by the specified name to return. The default is 1.</td>
</tr>
</tbody>
</table>

### Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.
GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

See Also: HTTP Responses on page 223-17 and HTTP Responses Subprograms on page 223-30

Syntax

UTL_HTTP.GET_HEADER_COUNT (  
    r  IN OUT NOCOPY resp)  
RETURN PLS_INTEGER;

Parameters

Table 223–35 GET_HEADER_COUNT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
</tbody>
</table>

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.
GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also: HTTP Persistent Connections on page 223-17 and HTTP Persistent Connections Subprograms on page 223-32

Syntax

```sql
UTL_HTTP.GET_PERSISTENT_CONN_COUNT
RETURN PLS_INTEGER;
```

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.
GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks:

- If the persistent connection support is enabled
- Gets the maximum number of persistent connections in the current session

**See Also:** Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

```sql
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (  
    enable OUT BOOLEAN,  
    max_conns OUT PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if persistent connection support is enabled; otherwise FALSE</td>
</tr>
<tr>
<td>max_conns</td>
<td>the maximum number of persistent connections maintained in the current session</td>
</tr>
</tbody>
</table>
GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also: HTTP Persistent Connections on page 223-17 and HTTP Persistent Connections Subprograms on page 223-32

Syntax

```
UTL_HTTP.get_persistent_conns (  
    connections IN OUT NOCOPY connection_table);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connections</td>
<td>The network connections kept persistent</td>
</tr>
</tbody>
</table>

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.
GET_PROXY Procedure

This procedure retrieves the current proxy settings.

See Also:  Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

```sql
UTL_HTTP.GET_PROXY (  
    proxy OUT NOCOPY VARCHAR2,  
    no_proxy_domains OUT NOCOPY VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>The proxy (host and an optional port number) currently used by the UTL_HTTP package</td>
</tr>
<tr>
<td>no_proxy_domains</td>
<td>The list of hosts and domains for which no proxy is used for all requests</td>
</tr>
</tbody>
</table>
GET_RESPONSE Function

This function reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

See Also: HTTP Responses on page 223-17 and HTTP Responses Subprograms on page 223-30

Syntax

```sql
UTL_HTTP.GET_RESPONSE (r IN OUT NOCOPY req)
RETURN resp;
```

Parameters

<table>
<thead>
<tr>
<th>Table 223–39 GET_RESPONSE Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>r</td>
</tr>
</tbody>
</table>
GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

See Also: Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

UTL_HTTP.GET_RESPONSE_ERROR_CHECK (enable OUT BOOLEAN);

Parameters

Table 223–40 GET_RESPONSE_ERROR_CHECK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if the response error check is set; otherwise FALSE</td>
</tr>
</tbody>
</table>
GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

See Also: Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (  
    timeout  OUT PLS_INTEGER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The network transfer timeout value in seconds</td>
</tr>
</tbody>
</table>
READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer. The end of line is as defined in the function read_line of UTL_TCP. The end_of_body exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also: HTTP Responses on page 223-17 and HTTP Responses Subprograms on page 223-30

Syntax

UTL_HTTP.READ_LINE(
    r            IN OUT NOCOPY resp,
    data         OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
    remove_crlf  IN BOOLEAN DEFAULT FALSE);

Parameters

Table 223–42 READ_LINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>data</td>
<td>The HTTP response body in text form</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>Removes the newline characters if set to TRUE</td>
</tr>
</tbody>
</table>

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_line waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, read_line stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the read_raw procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

When the Content-Type response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the “ORA-01482: unsupported character set” exception is raised if you try to read the response body as text. You can either read the response body as binary using the READ_RAW procedure, or set the character set of the response body explicitly using the SET_BODY_CHARSET procedure and read the response body as text again.
READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer. The end_of_body exception will be raised if the end of the HTTP response body is reached.

See Also: HTTP Responses on page 223-17 and HTTP Responses Subprograms on page 223-30

Syntax

UTL_HTTP.READ_RAW(
    r IN OUT NOCOPY resp,
    data OUT NOCOPY RAW,
    len IN PLS_INTEGER DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>data</td>
<td>The HTTP response body in binary form</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL</td>
</tr>
</tbody>
</table>

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_raw waits for each data packet to be ready to read until timeout occurs. If it occurs, read_raw stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.
**READ_TEXT Procedure**

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer. The end_of_body exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

**See Also:** HTTP Responses on page 223-17 and HTTP Responses Subprograms on page 223-30

**Syntax**

```sql
UTL_HTTP.READ_TEXT(
    r    IN OUT NOCOPY resp,
    data OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
    len  IN PLS_INTEGER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>data</td>
<td>The HTTP response body in text form</td>
</tr>
<tr>
<td>len</td>
<td>The maximum number of characters of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_text waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, read_text stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the read_raw procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

When the Content-Type response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482:
unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the READ_RAW procedure, or set the character set of the response body explicitly using the SET_BODY_CHARSET procedure and read the response body as text again.
REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL. This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@[host[:port]]/[
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@[host[:port]]/
```

See Also: Simple HTTP Fetches on page 223-16 and Simple HTTP Fetches in a Single Call Subprograms on page 223-26

Syntax

```
UTL_HTTP.REQUEST ( IN VARCHAR2, 
    url              IN VARCHAR2, 
    proxy            IN VARCHAR2 DEFAULT NULL, 
    wallet_path      IN VARCHAR2 DEFAULT NULL, 
    wallet_password  IN VARCHAR2 DEFAULT NULL) 
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Uniform resource locator</td>
</tr>
<tr>
<td>proxy</td>
<td>(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.</td>
</tr>
<tr>
<td>wallet_path</td>
<td>(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</td>
</tr>
<tr>
<td>wallet_password</td>
<td>(Optional) Specifies the password required to open the wallet</td>
</tr>
</tbody>
</table>

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.
Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```html
<html>
<head>
<title>Error Message</title>
</head>
<body>
<H1>Fatal Error 500</H1>
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
</body>
</html>
```

Examples

```sql
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')

--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the proxy parameter. For example, from within the Oracle firewall, where there might be a proxy server named www-proxy.my-company.com:

```sql
```
REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL. You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

See Also: Simple HTTP Fetches on page 223-16 and Simple HTTP Fetches in a Single Call Subprograms on page 223-26

Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
  url             IN VARCHAR2,
  max_pieces      IN NATURAL DEFAULT 32767,
  proxy           IN VARCHAR2 DEFAULT NULL,
  wallet_path     IN VARCHAR2 DEFAULT NULL,
  wallet_password IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Uniform resource locator</td>
</tr>
<tr>
<td>max_pieces</td>
<td>(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.</td>
</tr>
<tr>
<td>proxy</td>
<td>(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.</td>
</tr>
<tr>
<td>wallet_path</td>
<td>(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code>, and in Unix is, for example, <code>file:/home/username/wallets</code>. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</td>
</tr>
</tbody>
</table>
| wallet_password| (Optional) Specifies the password required to open the wallet }
Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
</BODY>
</HTML>

Examples

SET SERVEROUTPUT ON

DECLARE
  x   UTL_HTTP.HTML_PIECES;
  len PLS_INTEGER;
BEGIN
  x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
  DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved. ');
  DBMS_OUTPUT.PUT_LINE('with total length ');
  IF x.count < 1 THEN
    DBMS_OUTPUT.PUT_LINE('0');
  END IF;
ELSE
    len := 0;
    FOR i in 1..x.count LOOP
        len := len + length(x(i));
    END LOOP;
    DBMS_OUTPUT.PUT_LINE(i);
END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687
SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

See Also: HTTP Requests on page 223-17 and HTTP Requests Subprograms on page 223-28

Syntax

UTL_HTTP.SET_AUTHENTICATION(
    r IN OUT NOCOPY req,
    username IN VARCHAR2,
    password IN VARCHAR2,
    scheme IN VARCHAR2 DEFAULT 'Basic',
    for_proxy IN BOOLEAN DEFAULT FALSE);

Parameters

Table 223-47 SET_AUTHENTICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>HTTP request</td>
</tr>
<tr>
<td>username</td>
<td>Username for the HTTP authentication</td>
</tr>
<tr>
<td>password</td>
<td>Password for the HTTP authentication</td>
</tr>
<tr>
<td>scheme</td>
<td>HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.</td>
</tr>
<tr>
<td>for_proxy</td>
<td>Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.
SET_AUTHENTICATION_FROM_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

See Also: External Password Store on page 223-18, and HTTP Requests Subprograms on page 223-28

Syntax

```sql
UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
    r IN OUT NOCOPY req,
    alias IN VARCHAR2,
    scheme IN VARCHAR2 DEFAULT 'Basic',
    for_proxy IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>alias</td>
<td>Alias to identify and retrieve the username and password credential stored in the Oracle wallet</td>
</tr>
<tr>
<td>scheme</td>
<td>HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.</td>
</tr>
<tr>
<td>for_proxy</td>
<td>Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

- To use the password credentials in a wallet, the UTL_HTTP user must have the use-passwords privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

Examples

Creating a wallet and entering username and password in the wallet

```bash
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: ******
Enter password again: ******
> mkstore -wrl /oracle/wallets/test_wallet -createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: ******
```

Granting the use-passwords privilege on the wallet to a user by the database administrator

```sql
BEGIN
    DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
```
acl => 'wallet-acl.xml',
description => 'Wallet ACL',
principal => 'SCOTT',
is_grant => TRUE,
privilege => 'use-passwords');
DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
  acl => 'wallet-acl.xml',
  wallet_path => 'file: /oracle/wallets/test_wallet');
END;

Using username and password from the wallet
DECLARE
  req UTL_HTTP.req;
BEGIN
  UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
  req := UTL_HTTP.BEGIN_REQUEST(...);
  UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
  ...
END;
SET_BODY_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

See Also:
- HTTP Responses on page 223-17 and HTTP Responses Subprograms on page 223-30
- Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is text and the character set is not specified in the Content-Type header. Following the HTTP protocol standard specification, if the media type of a request or a response is text, but the character set information is missing in the Content-Type header, the character set of the request or response body should default to ISO-8859-1. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is ISO-8859-1 in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other SET_BODY_CHARSET procedure that operates on a request:

```sql
UTL_HTTP.SET_BODY_CHARSET (charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is text but the character set is not specified in the Content-Type header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the Content-Type header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a request inherits from the session default setting:

```sql
UTL_HTTP.SET_BODY_CHARSET (r        IN OUT NOCOPY req, 
charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the Content-Type header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the Content-Type header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```sql
UTL_HTTP.SET_BODY_CHARSET (r        IN OUT NOCOPY resp, 
charset  IN VARCHAR2 DEFAULT NULL);
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r</code></td>
<td>The HTTP response.</td>
</tr>
<tr>
<td><code>charset</code></td>
<td>The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If <code>charset</code> is <code>NULL</code>, the database character set is assumed.</td>
</tr>
</tbody>
</table>
SET_COOKIE_SUPPORT Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

This procedure

See Also:

- HTTP Requests on page 223-17 and HTTP Requests Subprograms on page 223-28
- Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(
    r       IN OUT NOCOPY REQ,
    enable  IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (  
    enable       IN BOOLEAN,
    max_cookies  IN PLS_INTEGER DEFAULT 300,
    max_cookies_per_site  IN PLS_INTEGER DEFAULT 20);
```

Parameters

Table 223–50  SET_COOKIE_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>enable</td>
<td>Set enable to TRUE to enable HTTP cookie support; FALSE to disable</td>
</tr>
<tr>
<td>max_cookies</td>
<td>Sets the maximum total number of cookies maintained in the current session</td>
</tr>
<tr>
<td>max_cookies_per_site</td>
<td>Sets the maximum number of cookies maintained in the current session for each Web site</td>
</tr>
</tbody>
</table>

Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the Set-Cookie HTTP headers can still be retrieved from the response.
Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other SET_COOKIE_SUPPORT procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "Examples" on page 223-21 for how to use GET_COOKIES and ADD_COOKIES to retrieve, save, and restore cookies.
**SET_DETAILED_EXCP_SUPPORT Procedure**

This procedure sets the UTL_HTTP package to raise a detailed exception. By default, UTL_HTTP raises the request_failed exception when an HTTP request fails. Use GET_DETAILED_SQLE and GET_DETAILED_SQLEERM for more detailed information about the error.

**See Also:**  
Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

**Syntax**

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (enable IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE</td>
</tr>
</tbody>
</table>
This procedure sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET_RESPONSE function.

**See Also:**
- HTTP Requests on page 223-17 and HTTP Requests Subprograms on page 223-28
- Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

**Syntax**

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
    max_redirects  IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT(
    r              IN OUT NOCOPY req,
    max_redirects  IN PLS_INTEGER DEFAULT 3);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>max_redirects</td>
<td>The maximum number of redirects. Set to zero to disable redirects.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If `max_redirects` is set to a positive number, the **GET_RESPONSE Function** will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the **REQ** record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function **FOLLOW_REDIRECT** and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The **SET_FOLLOW_REDIRECT** procedure must be called before **GET_RESPONSE** for any redirection to take effect.
SET_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

See Also: HTTP Requests on page 223-17 and HTTP Requests Subprograms on page 223-28

Syntax

```sql
UTL_HTTP.SET_HEADER (
  r      IN OUT NOCOPY req,
  name   IN VARCHAR2,
  value  IN VARCHAR2);
```

Parameters

Table 223–53 SET_HEADER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP request header</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP request header</td>
</tr>
</tbody>
</table>

Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, UTL_HTTP sets the Host header automatically for you.

When you set the Content-Type header with this procedure, UTL_HTTP looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the SET_BODY_CHARSET procedure.

When you set the Transfer-Encoding header with the value chunked, UTL_HTTP automatically encodes the request body written by the WRITE_TEXT, WRITE_LINE and WRITE_RAW procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.
SET_PERSISTENT_CONN_SUPPORT Procedure

This procedure enables or disables support for the HTTP 1.1 persistent-connection in the request.

**See Also:** HTTP Requests on page 223-17 and HTTP Requests Subprograms on page 223-28

**Syntax**

```sql
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
    r       IN OUT NOCOPY req,
    enable  IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>enable</td>
<td>TRUE to keep the network connection persistent. FALSE otherwise.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in UTL_HTTP may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "Examples" on page 223-89.
The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Examples

Using SET_PERSISTENT_CONN_SUPPORT in HTTP Requests

```sql
DECLARE
    TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
    paths VC2_TABLE;

    UTL_HTTP.fetch_pages(paths IN vc2_table) AS
        url_prefix   VARCHAR2(256) := 'http://www.my-company.com/';
        req          UTL_HTTP.REQ;
        resp         UTL_HTTP.RESP;
        data  VARCHAR2(1024);
    BEGIN
        FOR i IN 1..paths.count LOOP
            req := UTL_HTTP.BEGIN_REQUEST(url_prefix || paths(i));
            -- Use persistent connection except for the last request
            IF (i < paths.count) THEN
                UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
            END IF;
            resp := UTL_HTTP.GET_RESPONSE(req);
            BEGIN
                LOOP
                    UTL_HTTP.READ_TEXT(resp, data);
                    -- do something with the data
                END LOOP;
            EXCEPTION
                WHEN UTL_HTTP.END_OF_BODY THEN
                    NULL;
            END;
            UTL_HTTP.END_RESPONSE(resp);
        END LOOP;
    END;

    BEGIN
        UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);
        paths(1) := '...';
        paths(2) := '...';
        ...
    fetch_pages(paths);
    END;
```
SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`. `no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

**See Also:** Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

**Syntax**

```sql
UTL_HTTP.SET_PROXY (proxy             IN VARCHAR2,
                     no_proxy_domains  IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>The proxy (host and an optional port number) to be used by the UTL_HTTP package</td>
</tr>
<tr>
<td>no_proxy_domains</td>
<td>The list of hosts and domains for which no proxy should be used for all requests</td>
</tr>
</tbody>
</table>

**Usage Notes**

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com`, `eng.my-company.com:80`. When `no_proxy_domains` is `NULL` and the proxy is set, all requests go through the proxy. When the proxy is not set, UTL_HTTP sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/`
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.
SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges. For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

See Also: Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (enable IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE to check for response errors; otherwise FALSE</td>
</tr>
</tbody>
</table>

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, GET_RESPONSE will raise the HTTP_CLIENT_ERROR or HTTP_SERVER_ERROR exception. If SET_RESPONSE_ERROR_CHECK is set to FALSE, GET_RESPONSE will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The GET_RESPONSE function can raise other exceptions when SET_RESPONSE_ERROR_CHECK is set to FALSE.
SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the UTL_HTTP package should attempt while reading the HTTP response from the Web server or proxy server. This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

**See Also:** Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

**Syntax**

```sql
UTL_HTTP.SET_TRANSFER_TIMEOUT (timeout IN PLS_INTEGER DEFAULT 60);
```

**Parameters**

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The network transfer timeout value in seconds.</td>
</tr>
</tbody>
</table>
```

**Usage Notes**

The default value of the time out is 60 seconds.
SET_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS. When the UTL_HTTP package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the UTL_HTTP package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the UTL_HTTP package. An Oracle wallet is required to make an HTTPS request.

See Also:
- Session Settings on page 223-17 and Session Settings Subprograms on page 223-27

Syntax

```sql
UTL_HTTP.SET_WALLET (
    path      IN VARCHAR2,
    password  IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The directory path that contains the Oracle wallet. The format is file:directory-path. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.</td>
</tr>
<tr>
<td>password</td>
<td>The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See &quot;Using Wallets with Automatic Login Enabled&quot; in the Oracle Database Advanced Security Administrator’s Guide for information about using Oracle Wallet Manager and the ORAPKI utility to create an auto-login wallet</td>
</tr>
</tbody>
</table>

Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager.
See Also: Oracle Database Advanced Security Administrator’s Guide
for more information on Wallet Manager
WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP). As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also: HTTP Requests on page 223-17 and HTTP Requests Subprograms on page 223-28

Syntax

```
UTL_HTTP.WRITE_LINE(
    r     IN OUT NOCOPY req,
    data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The text line to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The UTL_HTTP package performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the WRITE_RAW procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where UTL_HTTP handles the length of the chunks transparently.
WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

See Also: HTTP Requests on page 223-17 and HTTP Requests Subprograms on page 223-28

Syntax

UTL_HTTP.WRITE_RAW(
    r IN OUT NOCOPY REQ,
    data IN            RAW);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The binary data to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. UTL_HTTP performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding:chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.
WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also: HTTP Requests on page 223-17 and HTTP Requests Subprograms on page 223-28

Syntax

```
UTL_HTTP.WRITE_TEXT(
    r     IN OUT NOCOPY REQ,
    data  IN            VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request data</td>
</tr>
<tr>
<td>data</td>
<td>The text data to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. UTL_HTTP performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the WRITE_RAW procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where UTL_HTTP handles the length of the chunks transparently.
UTL_I18N is a set of services that provides additional globalization functionality for applications written in PL/SQL.

Using UTL_I18N

This section contains topics which relate to using the UTL_I18N package.

- Overview
- Security Model
- Constants
Overview

The UTL_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
- A function that returns a listing of the most commonly used time zones.
Security Model

The functions of the `UTL_I18N` package neither read database contents nor modify them. The functions operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to `PUBLIC` by default.
The **UTL_I18N** package uses the constants shown in Table 224–1.

**Table 224–1  **UTL_I18N Constants**

</tr>
<tr>
<td>UNESCAPE_REFERENCE Function on page 224-34</td>
<td>Converts an input string that contains character references to a text string.</td>
</tr>
</tbody>
</table>
ESCAPE_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document. Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document.

Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, &#xe5; is the numeric character reference for the small letter “a” with a ring above, whereas &aring; is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, &lt; represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

Syntax

```sql
UTL_I18N.ESCAPE_REFERENCE(
    str            IN VARCHAR2 CHARACTER SET ANY_CS,
    page_cs_name   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Specifies the input string</td>
</tr>
<tr>
<td>page_cs_name</td>
<td>Specifies the character set of the document. If page_cs_name is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid character set or a NULL string, then the function returns a NULL string.

Examples

```sql
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns 'hello &lt; å'.

GET_COMMON_TIME_ZONES Function

This function returns a listing of the most commonly used time zones. This list contains a subset of the time zones that are supported in the database.

Syntax

```sql
UTL_I18N.GET_COMMON_TIME_ZONES
RETURN STRING_ARRAY;
```

Examples

Returns the list of the most commonly used time zones.

```sql
DECLARE
    retval UTL_I18N.STRING_ARRAY;
BEGIN
    retval := UTL_I18N.GET_COMMON_TIME_ZONES;
END;
/
GET_DEFAULT_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

**See Also:** "MAP_CHARSET Function" on page 224-20 for an explanation of an e-mail safe character set

**Syntax**

```sql
UTL_I18N.GET_DEFAULT_CHARSET(
    language  IN VARCHAR2,
    context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    iswindows IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language</td>
</tr>
<tr>
<td>context</td>
<td>GENERIC_CONTEXT</td>
</tr>
<tr>
<td></td>
<td>GENERIC_CONTEXT: Returns the default character set for general cases</td>
</tr>
<tr>
<td></td>
<td>MAIL_CONTEXT: Returns the default e-mail safe character set name</td>
</tr>
<tr>
<td>iswindows</td>
<td>If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE.</td>
</tr>
<tr>
<td></td>
<td>iswindows has no effect if context is set as GENERIC_CONTEXT.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

**Examples**

**GENERIC_CONTEXT, iswindows=FALSE**

```sql
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

**MAILCONTEXT, iswindows=TRUE**

```sql
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

**MAIL_CONTEXT, iswindows=FALSE**

```sql
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

**Table 224–4 GET_DEFAULT_CHARSET Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language</td>
</tr>
<tr>
<td>context</td>
<td>GENERIC_CONTEXT</td>
</tr>
<tr>
<td></td>
<td>GENERIC_CONTEXT: Returns the default character set for general cases</td>
</tr>
<tr>
<td></td>
<td>MAIL_CONTEXT: Returns the default e-mail safe character set name</td>
</tr>
<tr>
<td>iswindows</td>
<td>If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE.</td>
</tr>
<tr>
<td></td>
<td>iswindows has no effect if context is set as GENERIC_CONTEXT.</td>
</tr>
</tbody>
</table>
GET_DEFAULT_ISO_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

Syntax

UTL_I18N.GET_DEFAULT_ISO_CURRENCY (  
    territory IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;

Parameters

Table 224–5  GET_DEFAULT_ISO_CURRENCY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>territory</td>
<td>Specifies a valid Oracle territory. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Displays the default ISO currency code for China.

DECLARE  
    retval VARCHAR2(50);  
BEGIN  
    retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');  
    DBMS_OUTPUT.PUT_LINE(retval);  
END;  
/
GET_DEFAULT_LINGUISTIC_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

Syntax

```sql
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (  
    language  IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```sql
DECLARE  
    retval VARCHAR2(50);  
BEGIN  
    SELECT value INTO retval FROM nls_session_parameters  
    WHERE parameter = 'NLS_LANGUAGE';  
    retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);  
    DBMS_OUTPUT.PUT_LINE(retval);  
END;  
/```
GET_LOCAL LANGUAGES Function

This function returns the local language names for the specified territory.

Syntax

```sql
UTL_I18N.GET_LOCAL_LANGUAGES (   territory    IN VARCHAR2 CHARACTER SET ANY_CS) RETURN STRING_ARRAY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>territory</td>
<td>Specifies a valid Oracle territory. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Returns the list of local languages used in Belgium.

```sql
DECLARE    retval UTL_I18N.STRING_ARRAY;
            cnt    INTEGER;
BEGIN    retval   :=  UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
            DBMS_OUTPUT.PUT('Count = ');
            DBMS_OUTPUT.PUT_LINE(retval.LAST);
            cnt := retval.FIRST;
            WHILE cnt IS NOT NULL LOOP  
                DBMS_OUTPUT.PUT_LINE(retval(cnt));
                cnt := retval.NEXT(cnt);
            END LOOP;
END;
/  
...  
Count = 2  
DUTCH  
FRENCH
```
GET_LOCAL_LINGUISTIC_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A BINARY sort is included for all languages.

Syntax

```sql
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (  
    language  IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN STRING_ARRAY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the local linguistic sort names for JAPANESE.

```sql
DECLARE  
    retval UTL_I18N.STRING_ARRAY;  
    cnt INTEGER;  
BEGIN  
    retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');  
    DBMS_OUTPUT.PUT('Count = ');  
    DBMS_OUTPUT.PUT_LINE(retval.COUNT);  
    cnt := retval.FIRST;  
    WHILE cnt IS NOT NULL LOOP  
        DBMS_OUTPUT.PUT_LINE(retval(cnt));  
        cnt := retval.NEXT(cnt);  
    END LOOP;  
END;  
/  
```

...  
Count = 2  
JAPANESE_M  
BINARY
GET_LOCAL_TERRITORIES Function

This function returns the local territory names for the specified language.

Syntax

UTL_I18N.GET_LOCAL_TERRITORIES (  
    language  IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN STRING_ARRAY;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the list of Oracle territories that use German as one of their local languages.

DECLARE  
    retval  UTL_I18N.STRING_ARRAY;  
    cnt     INTEGER;  
BEGIN  
    retval := UTL_I18N.GETLOCAL_TERRITORIES('GERMAN');  
    DBMS_OUTPUT.PUT('Count = ');  
    DBMS_OUTPUT.PUT_LINE(retval.LAST);  
    cnt := retval.FIRST;  
    WHILE cnt IS NOT NULL LOOP  
        DBMS_OUTPUT.PUT_LINE(retval(cnt));  
        cnt := retval.NEXT(cnt);  
    END LOOP;  
END;  
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
GET_LOCAL_TIME_ZONES Function

This function returns the local time zone IDs for the specified territory.

Syntax

```sql
UTL_I18N.GET_LOCAL_TIME_ZONES (    territory IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL) RETURN STRING_ARRAY;
```

Parameters

Table 224–10 GET_LOCAL_TIME_ZONES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>territory</td>
<td>Specifies a valid Oracle territory. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Creates a function that returns the list of time zones locally used in the territory AZERBAIJAN followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```sql
CREATE OR REPLACE FUNCTION get_time_zones(territory IN VARCHAR2 CHARACTER SET ANY_CS) RETURN utl_i18n.string_array IS    retval utl_i18n.string_array;    retval2 utl_i18n.string_array;    stpos INTEGER;
BEGIN    retval := utl_i18n.get_local_time_zones(    territory);    retval2 := utl_i18n.get_common_time_zones;    stpos := retval.LAST + 1;    retval(stpos) := '-----'; -- a separator
    FOR i IN retval2.FIRST..retval2.LAST LOOP
        stpos := stpos + 1;
        retval(stpos) := retval2(i);
    END LOOP;
    RETURN retval;
END;
/
```

Returns the list of local time zones for AZERBAIJAN followed by the common time zones with a separator string of five dashes (-----).

```sql
DECLARE    retval UTL_I18N.STRING_ARRAY;    cnt INTEGER;
BEGIN    DBMS_OUTPUT.ENABLE(100000);    retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');    cnt := retval.FIRST;
```

UTL_I18N  224-17
```
WHILE cnt IS NOT NULL LOOP
    DBMS_OUTPUT.PUT_LINE(retval(cnt));
    cnt := retval.NEXT(cnt);
END LOOP;
END;
/

Asia/Baku

...```
GET_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

Syntax

```
UTL_I18N.GET_TRANSLATION (  
    parameter        IN VARCHAR2 CHARACTER SET ANY_CS,  
    trans_language   IN VARCHAR2 'AMERICAN',  
    flag             IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)  
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Specifies a valid language name, territory name, or a combined string in the form of language_territory. It is case-insensitive.</td>
</tr>
<tr>
<td>trans_language</td>
<td>Specifies a translation language name. For example, ITALIAN is for the Italian language. The default is AMERICAN, which indicates American English.</td>
</tr>
</tbody>
</table>
| flag               | Specifies the translation type:  
  LANGUAGE_TRANS: The function returns the language translation.  
  TERRITORY_TRANS: The function returns the territory translation.  
  LANGUAGE_TERRITORY_TRANS: The function returns the language and territory translation.  
  The default translation type is LANGUAGE_TRANS. |

Usage Notes

If VARCHAR2 is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using NVARCHAR2 as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide GUJARATI translations, so the returned translation would be in American English.

Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
    CURSOR c1 IS
        SELECT value FROM V$NLS_VALID_VALUES
        WHERE parameter = 'LANGUAGE'
    ORDER BY value;
    retval NVARCHAR2(100);
BEGIN
    FOR item IN c1 LOOP
        retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
    END LOOP;
END;
```
MAP_CHARSET Function

This function maps the following:
- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

Syntax

```
UTL_I18N.MAP_CHARSET(
    charset   IN VARCHAR2,
    context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    flag      IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>Specifies the character set name to be mapped. The mapping is case-insensitive.</td>
</tr>
</tbody>
</table>
| context   | GENERIC_CONTEXT | MAIL_CONTEXT 
GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value. 
MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name. |
| flag      | ORACLE_TO_IANA | IANA_TO_ORACLE if GENERIC_CONTEXT is set 
ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default. 
IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name. 
MAIL_GENERIC | MAIL_WINDOWS if MAIL_CONTEXT is set 
MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform. 
MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform. |

Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the MAP_CHARSET function with the ORACLE_TO_IANA option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP_CHARSET function with the MAIL_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.
The steps in this example are as follows:

1. Call the MAP_CHARSET function with the MAIL_CONTEXT | MAIL_GENERIC option with the database character set name, WE8DEC. The result is WE8ISO8859P1.

2. Convert the contents stored in the database to WE8ISO8859P1.

3. Call the MAP_CHARSET function with the ORACLE_TO_IANA | GENERIC_CONTEXT option with the e-mail safe character set, WE8ISO8859P1. The result is ISO-8859-1.

4. Specify ISO-8859-1 in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns NULL.

---

**Note:** Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

---

**Examples**

**Generic Context**

UTL_I18N.MAP_CHARSET('iso-8859-1', UTL_I18N.GENERIC_CONTEXT, UTL_I18N.IANA_TO_ORACLE)

This returns 'WE8ISO8859P1'.

**Context**

UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context, utl_i18n.mail_generic)

This returns 'WE8ISO8859P1'.

**See Also:** Oracle Database Globalization Support Guide for a list of valid Oracle character sets
MAP_FROM_SHORT_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (  
    language           IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

Table 224–13  MAP_FROM_SHORT_LANGUAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid short language name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table customers is from the oe user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the GET_DEFAULT_LINGUISTIC_SORT procedure.

```
DECLARE  
    short_n VARCHAR2(10);  
    ling_n VARCHAR2(50);  
BEGIN  
    SELECT nls_language INTO short  
    FROM customers WHERE customer_id = 9000;  
    ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (  
        UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));  
    DBMS_OUTPUT.PUT_LINE(ling_n);  
END;  
/  
```
**MAP_LANGUAGE_FROM_ISO Function**

This function returns an Oracle language name from an ISO locale name.

**Syntax**

```sql
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
    isolocale IN VARCHAR2
) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isolocale</td>
<td>Specifies the ISO locale. The mapping is case-insensitive.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the language (for example, `en_` instead of `en_US`), then the function returns the default language name for the specified language (for example, American).

**Examples**

```sql
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

**See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle languages
MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name. A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (   
    ora_language   IN VARCHAR2,  
    ora_territory  IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ora_language</td>
<td>Specifies an Oracle language name. It is case-insensitive.</td>
</tr>
<tr>
<td>ora_territory</td>
<td>Specifies an Oracle territory name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid string, then the function returns a NULL string.

Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns ‘en_US’.

See Also: *Oracle Database Globalization Support Guide* for a list of valid Oracle languages and territories
MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```sql
UTL_I18N.MAP_TERRITORY_FROM_ISO (  
isolocale IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isolocale</td>
<td>Specifies the ISO locale. The mapping is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the territory (for example, _fr instead of fr_fr), then the function returns the default territory name for the specified territory (for example, France).

Examples

```sql
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

See Also: Oracle Database Globalization Support Guide for a list of valid Oracle territories
MAP_TO_SHORT_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (  
    language       IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

**Table 224–17  MAP_TO_SHORT_LANGUAGE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid full language name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the short language name for the language.

```
DECLARE
    retval VARCHAR2(100);
BEGIN
    retval := UTL_I18N.MAP_TO_SHORT_LANGUAGE('american');
    DBMS_OUTPUT.PUT_LINE(retval);
END;
/

US
```
RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR ( 
    data            IN RAW,
    src_charset     IN VARCHAR2 DEFAULT NULL,
    scanned_length  OUT PLS_INTEGER,
    shift_status    IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the RAW data to be converted to a VARCHAR2 string</td>
</tr>
<tr>
<td>src_charset</td>
<td>Specifies the character set that the RAW data was derived from. If src_</td>
</tr>
<tr>
<td></td>
<td>charset is NULL, then the database character set is used.</td>
</tr>
<tr>
<td>scanned_length</td>
<td>Specifies the number of bytes of source data scanned</td>
</tr>
<tr>
<td>shift_status</td>
<td>Specifies the shift status at the end of the scan. The user must set it to</td>
</tr>
<tr>
<td></td>
<td>SHIFT_IN the first time it is called in piecewise conversion.</td>
</tr>
</tbody>
</table>

**Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. *shift_status* cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

**Buffer Conversion**

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:
'abcde'||chr(170)

**Piecewise Conversion**

`UTL_I18N.RAW_TO_CHAR(hex2oraw('616263646566C2AA'),'utf8',shf,slen)`

This expression returns the following string in the database character set:

'abcde'||chr(170)

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the database character set.

```sql
rvalue RAW(1050);
nvalue VARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;
...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                               remote_port => 2000);
LOOP
  tlen := utl_tcp.read_raw(conn, rvalue, 1024);
rvalue := utl_raw.concat(rtemp, rvalue);
nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
  if (converted_len < utl_raw.length(rvalue) )
    then
      rtemp := utl_raw.substr(rvalue, converted_len+1);
    else
      rtemp := '';
    end if;
    /* do anything you want with nvalue */
    /* e.g htp.prn(nvalue); */
  END LOOP;
  utl_tcp.close_connection(conn);
EXCEPTION
  WHEN utl_tcp.end_of_input THEN
    utl_tcp.close_connection(conn);
END;
```
RAW_TO_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```sql
UTL_I18N.RAW_TO_NCHAR (  
    data         IN RAW,  
    src_charset  IN VARCHAR2 DEFAULT NULL)  
RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```sql
UTL_I18N.RAW_TO_NCHAR (  
    data            IN RAW,  
    src_charset      IN VARCHAR2 DEFAULT NULL,  
    scanned_length   OUT PLS_INTEGER,  
    shift_status     IN OUT PLS_INTEGER)  
RETURN NVARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the RAW data to be converted to an NVARCHAR2 string</td>
</tr>
<tr>
<td>src_charset</td>
<td>Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.</td>
</tr>
<tr>
<td>scanned_length</td>
<td>Specifies the number of bytes of source data scanned</td>
</tr>
<tr>
<td>shift_status</td>
<td>Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion.</td>
</tr>
</tbody>
</table>

**Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

**Buffer Conversion**

```sql
UTL_I18N.RAW_TO_NCHAR('hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:
'abcde'||chr(170)

### Piecewise Conversion

UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)

This expression returns the following string in the national character set:

'abcde'||chr(170)

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the national character set.

```plsql
rvalue RAW(1050); nvalue NVARCHAR2(1024); conversion_state PLS_INTEGER = 0; converted_len PLS_INTEGER; rtemp RAW(10) = ''; conn utl_tcp.connection; tlen PLS_INTEGER; ...

conn := utl_tcp.open_connection ( remote_host => 'localhost', remote_port => 2000); LOOP
  tlen := utl_tcp.read_raw(conn, rvalue, 1024); rvalue := utl_raw.concat(rtemp, rvalue); nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA165JIS', converted_len, conversion_stat);
  if (converted_len < utl_raw.length(rvalue) ) then
    rtemp := utl_raw.substr(rvalue, converted_len+1);
  else
    rtemp := '';
  end if;
  /* do anything you want with nvalue */
  /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
  WHEN utl_tcp.end_of_input THEN
    utl_tcp.close_connection(conn); END;
```
**STRING_TO_RAW Function**

This function converts a VARCHAR2 or NVARCHAR2 string to another valid Oracle character set and returns the result as RAW data.

**Syntax**

```sql
UTL_I18N.STRING_TO_RAW(
    data          IN VARCHAR2 CHARACTER SET ANY_CS,
    dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

**Parameters**

**Table 224–20 STRING_TO_RAW Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the VARCHAR2 or NVARCHAR2 string to convert.</td>
</tr>
<tr>
<td>dst_charset</td>
<td>Specifies the destination character set. If dst_charset is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the user specifies an invalid character set, a NULL string, or a string whose length is 0, then the function returns a NULL string.

**Examples**

```sql
DECLARE
    r raw(50);
    s varchar2(20);
BEGIN
    s:='abcdef'||chr(170);
    r:=utl_i18n.string_to_raw(s,'utf8');
    dbms_output.put_line(rawtohex(r));
END;
/
```

This returns a hex value of '616263646566C2AA'.
TRANSLITERATE Function

This function performs script transliteration. In this release, the TRANSLITERATE function only supports Japanese Kana conversion.

Syntax

```sql
UTL_I18N.TRANSLITERATE (  
    data IN VARCHAR2 CHARACTER SET ANY_CS,  
    name IN VARCHAR2)  
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the data to be converted. Either CHAR or NCHAR data type can be specified.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the transliteration name string. For a list of valid names, see Table 224–22.</td>
</tr>
</tbody>
</table>

Constants

These options specify Japanese Kana conversions.

<table>
<thead>
<tr>
<th>Constant Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KANA_FWKATAKANA</td>
<td>'kana_fwkatakana'</td>
<td>Converts any type of Kana character to a fullwidth Katakana character.</td>
</tr>
<tr>
<td>KANA_HWKATAKANA</td>
<td>'kana_hwkatakana'</td>
<td>Converts any type of Kana character to a halfwidth Katakana character.</td>
</tr>
<tr>
<td>KANA_HIRAGANA</td>
<td>'kana_hiragana'</td>
<td>Converts any type of Kana character to a fullwidth Hiragana character.</td>
</tr>
<tr>
<td>FWKATAKANA_</td>
<td>'fwkatakana_'</td>
<td>Converts only fullwidth Katakana characters to halfwidth Katakana characters.</td>
</tr>
<tr>
<td>HWKATAKANA_</td>
<td>'hwkatakana_'</td>
<td>Converts only halfwidth Katakana characters to fullwidth Hiragana characters.</td>
</tr>
<tr>
<td>FWKATAKANA_</td>
<td>'fwkatakana_'</td>
<td>Converts only fullwidth Katakana characters to fullwidth Hiragana characters.</td>
</tr>
<tr>
<td>HIRAGANA_</td>
<td>'hiragana_'</td>
<td>Converts only fullwidth Hiragana characters to fullwidth Katakana characters.</td>
</tr>
<tr>
<td>FWKATAKANA_</td>
<td>'fwkatakana_'</td>
<td>Converts only fullwidth Hiragana characters to halfwidth Katakana characters.</td>
</tr>
<tr>
<td>HIRAGANA_</td>
<td>'hiragana_'</td>
<td>Converts only fullwidth Hiragana characters to halfwidth Katakana characters.</td>
</tr>
</tbody>
</table>

Usage Notes

The function returns the converted string.
Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
    SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

Figure shows how this output might look.

**Figure 224–1  Loading Locale-Specific Data to the Database**

![kana_small_arrow.gif](image)

The image `kana_small_arrow.gif` is partially described in the preceding text. It shows how three versions of the word "Tanaka" can be standardized and converted into one form.

**********************************************************************************************

The following statement normalizes one kana name to hiragana:

```
DECLARE
    Name  japanese_emp.ename%TYPE;
    Eno   CONSTANT  NUMBER(4) := 1;
BEGIN
    SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
    name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
    UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
    WHEN UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
        DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/```
UNESCAPE_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

**See Also:** "ESCAPE_REFERENCE Function" on page 224-9 for more information about escape sequences

Syntax

```sql
UTL_I18N.UNESCAPE_REFERENCE (str IN VARCHAR2 CHARACTER SET ANY_CS) RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Specifies the input string</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies a `NULL` string or a string whose length is 0, then the function returns a `NULL` string. If the function fails, then it returns the original string.

Examples

```sql
UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &amp;#xe5;')

This returns 'hello <'||chr(229).
```
The UTL_INADDR package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- Using UTL_INADDR
  - Security Model
  - Exceptions
  - Examples
- Summary of UTL_INADDR Subprograms
Using UTL_INADDR

- Security Model
- Exceptions
- Examples
Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the `connect` privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

---

**Note:** For more information about managing fine-grained access, see *Oracle Database Security Guide*. 

---
### Exceptions

**Table 225–1  Exception - Internet Address Package**

<table>
<thead>
<tr>
<th>Number</th>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24247</td>
<td>NETWORK_ACCESS_DENIED</td>
<td>Access to network is denied.</td>
</tr>
<tr>
<td>ORA-29257</td>
<td>UNKNOWN_HOST</td>
<td>The host is unknown.</td>
</tr>
</tbody>
</table>
Examples

Retrieve the local host name and IP address.

```sql
SET serveroutput on
BEGIN
    DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME);  -- get local host name
    DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS);  -- get local IP addr
END;
/
```
## Summary of UTL_INADDR Subprograms

### Table 225–2  UTL_INADDR Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_HOST_ADDRESS</td>
<td>Retrieves the IP address of the local or remote host given its name</td>
</tr>
<tr>
<td>GET_HOST_NAME</td>
<td>Retrieves the name of the local or remote host given its IP address</td>
</tr>
</tbody>
</table>
GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (  
    host IN VARCHAR2 DEFAULT NULL)  
RETURN host_address VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The name of the host to retrieve the IP address.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host_address</td>
<td>The IP address of the specified host, or that of the local host if host is NULL.</td>
</tr>
</tbody>
</table>

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the resolve privilege on LOCALHOST.
GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```sql
UTL_INADDR.GET_HOST_NAME (  
  ip  IN VARCHAR2 DEFAULT NULL)
RETURN host_name VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>The IP address of the host used to determine its host name. If <code>ip</code> is not <code>NULL</code>, the official name of the host with its domain name is returned. If this is <code>NULL</code>, the name of the local host is returned and the name does not contain the domain to which the local host belongs.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host_name</td>
<td>The name of the local or remote host of the specified IP address.</td>
</tr>
</tbody>
</table>

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege granted through `DBMS_NETWORK_ACL_ADMIN` on `LOCALHOST`. 
The UTL_IDENT package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- Using UTL_IDENT
  - Overview
  - Security Model
  - Constants
Using UTL_IDENT

This section contains topics which relate to using the UTL_IDENT package.

- Overview
- Security Model
- Constants
Overview

The UTL_IDENT package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.
The `UTL_IDENT` package runs as the package owner `SYS`. The public synonym `UTL_IDENT`, and `EXECUTE` permission on this package is granted to `PUBLIC`. 
Constants

The `UTL_IDENT` package uses the constants shown in Table 226–1, "UTL_IDENT Constants".

## Summary of UTL_LMS Subprograms

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORMAT_MESSAGE</td>
<td>Formats a retrieved error message</td>
</tr>
<tr>
<td>GET_MESSAGE Function</td>
<td>Retrieves an error message based on error number, product, facility, language, and message specified</td>
</tr>
</tbody>
</table>

(*Table 227–1  UTL_LMS Package Subprograms*)
**FORMAT_MESSAGE Function**

This function formats a message retrieved by the `GET_MESSAGE` function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

<table>
<thead>
<tr>
<th>Special Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'%s'</td>
<td>Substitute the next string argument</td>
</tr>
<tr>
<td>'%d'</td>
<td>Substitute the next integer argument</td>
</tr>
<tr>
<td>'%%'</td>
<td>Represents the special character %</td>
</tr>
</tbody>
</table>

**Syntax**

```sql
UTL_LMS.FORMAT_MESSAGE (  
   format IN VARCHAR2 CHARACTER SET ANY_CS,  
   args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)  
RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Specifies the string to format</td>
</tr>
<tr>
<td>args</td>
<td>Specifies the list of arguments</td>
</tr>
</tbody>
</table>

**Examples**

```sql
DECLARE
   s varchar2(200);
   i  pls_integer;
BEGIN
   i:= utl_lms.get_messsage(26052, 'rdbms', 'ora', 'french', s);
   dbms_output.put_line('before format, message is: '||s);
   dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9, 'my_column_name'));
END;
/
```

The following is an unformatted message:

Type %d non pris en charge pour l'expression SQL sur la colonne %s.

The following is the formatted message:

Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the lmsgen utility.

It returns 0 when it is successful. It returns -1 when it fails.

See Also: Oracle Database Globalization Support Guide for more information about the lmsgen utility

Syntax

```
UTL_LMS.GET_MESSAGE (
  errnum    IN PLS_INTEGER,
  product   IN VARCHAR2,
  facility  IN VARCHAR2,
  language  IN VARCHAR2,
  message   OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errnum</td>
<td>Specifies the error number. Example: ‘972’ (for ORA-00972)</td>
</tr>
<tr>
<td>product</td>
<td>Specifies the product to which the error message applies. Example: ‘rdbms’</td>
</tr>
<tr>
<td>facility</td>
<td>Specifies the error message prefix. Example: ‘ora’</td>
</tr>
<tr>
<td>language</td>
<td>Specifies the language of the message. The parameter is case-insensitive. The default is NULL, which causes GET_MESSAGE to use the value of the NLS_LANGUAGE session parameter.</td>
</tr>
<tr>
<td>message</td>
<td>Specifies the output buffer for the retrieved message</td>
</tr>
</tbody>
</table>

Usage Notes

If the language parameter is set to NULL, then the value of the NLS_LANGUAGE session parameter is used as the default.

Examples

```
DECLARE
  s varchar2(200);
  i pls_integer;
BEGIN
  i := utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
  dbms_output.put_line('OCI--00601 is: ' || s);
END /
```

The following output results:

OCI--00601 is: Echec du processus de nettoyage.
The UTL_MAIL package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- Using UTL_MAIL
  - Security Model
  - Operational Notes
  - Rules and Limits
- Summary of UTL_MAIL Subprograms
Using UTL_MAIL

- Security Model
- Operational Notes
- Rules and Limits
Security Model

UTL_MAIL is not installed by default because of the SMTP_OUT_SERVER configuration requirement and the security exposure this involves. In installing UTL_MAIL, you should take steps to prevent the port defined by SMTP_OUT_SERVER being swamped by data transmissions.

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

---

**Note:** For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide
Operational Notes

You must both install `UTL_MAIL` and define the `SMTP_OUT_SERVER`.

- To install `UTL_MAIL`:

  sqlplus sys/<pwd>
  SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
  SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb

- You define the `SMTP_OUT_SERVER` parameter in the `init.ora rdbms` initialization file. However, if `SMTP_OUT_SERVER` is not defined, this invokes a default of `DB_DOMAIN` which is guaranteed to be defined to perform appropriately.
Rules and Limits

Use UTL_MAIL only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.
## Summary of UTL_MAIL Subprograms

</tr>
</tbody>
</table>
SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients. It hides the SMTP API and exposes a one-line email facility for ease of use.

Syntax

```
UTL_MAIL.SEND (  
   sender      IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients  IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message     IN    VARCHAR2 CHARACTER SET ANY_CS,
   mime_type   IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
   priority    IN    PLS_INTEGER DEFAULT 3,
   replyto     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>Email address of the sender</td>
</tr>
<tr>
<td>recipients</td>
<td>Email addresses of the recipient(s), separated by commas</td>
</tr>
<tr>
<td>cc</td>
<td>Email addresses of the CC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>bcc</td>
<td>Email addresses of the BCC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>subject</td>
<td>String to be included as email subject string, default is NULL</td>
</tr>
<tr>
<td>message</td>
<td>Text message body</td>
</tr>
<tr>
<td>mime_type</td>
<td>Mime type of the message, default is 'text/plain; charset=us-ascii'</td>
</tr>
<tr>
<td>priority</td>
<td>Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.</td>
</tr>
<tr>
<td>replyto</td>
<td>Defines to whom the reply email is to be sent</td>
</tr>
</tbody>
</table>
SEND_Attach_RAW Procedure

This procedure is the SEND Procedure overloaded for RAW attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_RAW (  
  sender           IN    VARCHAR2 CHARACTER SET ANY_CS,  
  recipients       IN    VARCHAR2 CHARACTER SET ANY_CS,  
  cc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  bcc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  subject          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  message          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  mime_type        IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT 'text/plain; charset=us-ascii',  
  priority         IN    PLS_INTEGER DEFAULT 3,  
  attachment       IN    RAW,  
  att_inline       IN    BOOLEAN DEFAULT TRUE,  
  att_mime_type    IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT 'text/plain; charset=us-ascii',  
  att_filename     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
  replyto          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>Email address of the sender</td>
</tr>
<tr>
<td>recipients</td>
<td>Email addresses of the recipient(s), separated by commas</td>
</tr>
<tr>
<td>cc</td>
<td>Email addresses of the CC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>bcc</td>
<td>Email addresses of the BCC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>subject</td>
<td>String to be included as email subject string, default is NULL</td>
</tr>
<tr>
<td>message</td>
<td>Text message body</td>
</tr>
<tr>
<td>mime_type</td>
<td>Mime type of the message, default is 'text/plain; charset=us-ascii'</td>
</tr>
<tr>
<td>priority</td>
<td>Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.</td>
</tr>
<tr>
<td>attachment</td>
<td>RAW attachment</td>
</tr>
<tr>
<td>att_inline</td>
<td>Specifies whether the attachment is viewable inline with the message body, default is TRUE</td>
</tr>
<tr>
<td>att_mime_type</td>
<td>Mime type of the attachment, default is 'application/octet'</td>
</tr>
<tr>
<td>att_filename</td>
<td>String specifying a filename containing the attachment, default is NULL</td>
</tr>
<tr>
<td>replyto</td>
<td>Defines to whom the reply email is to be sent</td>
</tr>
</tbody>
</table>
**SEND_ATTACHVARCHAR2 Procedure**

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

**Syntax**

```plsql
UTL_MAIL.SEND_ATTACHVARCHAR2 (
    sender            IN    VARCHAR2 CHARACTER SET ANY_CS,
    recipients        IN    VARCHAR2 CHARACTER SET ANY_CS,
    cc                IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    bcc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    subject           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    message           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    mime_type         IN    VARCHAR2 CHARACTER SET ANY_CS
        DEFAULT 'text/plain; charset=us-ascii',
    priority          IN    PLS_INTEGER DEFAULT 3,
    attachment        IN    VARCHAR2 CHARACTER SET ANY_CS,
    att_inline        IN    BOOLEAN DEFAULT TRUE,
    att_mime_type     IN    VARCHAR2 CHARACTER SET ANY_CS
        DEFAULT 'text/plain; charset=us-ascii',
    att_filename      IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    replyto           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>Email address of the sender</td>
</tr>
<tr>
<td>recipients</td>
<td>Email addresses of the recipient(s), separated by commas</td>

  - Security Model
- **Summary of UTL_MATCH Subprograms**
Using UTL_MATCH

- Overview
- Security Model
Overview

"Edit Distance" also known as "Levenshtein Distance "(named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of similarity between two strings, s1 and s2. The distance is the number of insertions, deletions or substitutions required to transform s1 to s2.

The Edit Distance between strings "shackelford" and "shackelford" = 2

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

Table 229–1 shows similarity values returned by Jaro-Winkler and Edit Distance

<table>

<td>Calculates the measure of agreement between string-1 and string-2, returning a value between 0 (no match) and 100 (perfect match)</td>
</tr>
</tbody>
</table>
EDIT_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

Syntax

```sql
UTL_MATCH.EDIT_DISTANCE ( s1  IN  VARCHAR2,
                        s2  IN  VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>The string to be transformed</td>
</tr>
<tr>
<td>s2</td>
<td>The string into which s1 is to be transformed</td>
</tr>
</tbody>
</table>

Examples

```sql
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;
-------------
returns 2
```
EDIT_DISTANCE_SIMILARITY Function

This function calculates the number of insertions, deletions or substations required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two Strings. The value is typically between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.EDIT_DISTANCE_SIMILARITY(
    s1  IN  VARCHAR2,
    s2  IN  VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>The string to be transformed</td>
</tr>
<tr>
<td>s2</td>
<td>The string into which s1 is to be transformed</td>
</tr>
</tbody>
</table>

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
--------------
returns 82
```
JARO_WINKLER Function

This function calculates the measure of agreement between two strings.

Syntax

```
UTL_MATCH.JARO_WINKLER (
    s1  IN  VARCHAR2,
    s2  IN  VARCHAR2)
RETURN BINARY_DOUBLE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>Input</td>
</tr>
<tr>
<td>s2</td>
<td>Input</td>
</tr>
</tbody>
</table>

Examples

```
SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;
--------------
returns 9.818E-001
```
JARO_WINKLER_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

Syntax

```sql
UTL_MATCH.JARO_WINKLER (
    s1  IN  VARCHAR2,
    s2  IN  VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>Input</td>
</tr>
<tr>
<td>s2</td>
<td>input</td>
</tr>
</tbody>
</table>

Examples

```sql
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
```

returns 98
The UTL_NLA package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs.

This chapter contains the following topics:

- **Using UTL_NLA**
  - Overview
  - Rules and Limits
  - Security Model

- **Subprogram Groups**
  - BLAS Level 1 (Vector-Vector Operations) Subprograms
  - BLAS Level 2 (Matrix-Vector Operations) Subprograms
  - BLAS Level 3 (Matrix-Matrix Operations) Subprograms
  - LAPACK Driver Routines (Linear Equations) Subprograms
  - LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

- **Summary of UTL_NLA Subprograms**
Using UTL_NLA

This section contains topics which relate to using the UTL_NLA package.

- Overview
- Rules and Limits
- Security Model
Overview

The UTL_NLA package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage ) (Version 3.0) operations on vectors and matrices represented as VARRAYs.

Standards
For more information on the BLAS and LAPACK standards see

http://www.netlib.org/blas/
http://www.netlib.org/lapack/

Required Expertise
Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

Implementation
The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the BLAS_ prefix (for example, the BLAS_ASUM Functions). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.

- All LAPACK functions have the LAPACK_ prefix (for example, the LAPACK_GBSV Procedures). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all /work/ arguments have been removed. The UTL_NLA package manages the allocation and de-allocation of all work areas required by the libraries.

- A new optional parameter, pack, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.
Vectors and matrices are stored in VARRAYs with a maximum size of one million entries. Given this restriction, UTL_NLA vectors can be up to one million entries but matrices need to be of size RxC <= 1,000,000.
Security Model

The UTL_NLA package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).
Subprogram Groups

- BLAS Level 1 (Vector-Vector Operations) Subprograms
- BLAS Level 2 (Matrix-Vector Operations) Subprograms
- BLAS Level 3 (Matrix-Matrix Operations) Subprograms
- LAPACK Driver Routines (Linear Equations) Subprograms
- LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

### Parameters

#### Table 230–11  BLAS_GBMV Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| trans     | Specifies the operation to be performed:  
  - trans = 'N' or 'n': \( \alpha A'x + \beta y \)  
  - trans = 'T' or 't': \( \alpha A'x + \beta y \)  
  - trans = 'C' or 'c': \( \alpha A'x + \beta y \)  
<p>| m         | Specifies the number of rows of the matrix A. ( m ) must be at least zero. |
| n         | Specifies the number of columns of the matrix A. ( n ) must be at least zero. |
| kl        | Specifies the number of sub-diagonals of the matrix A. ( kl ) must satisfy ( 0 \leq kl ). |
| ku        | Specifies the number of super-diagonals of the matrix A. ( ku ) must satisfy ( 0 \leq ku ). |
| alpha     | SCALAR_FLOAT/Double. Specifies the scalar alpha. |
| a         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading ( (kl+ku+1) ) by ( n ) part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row ( (ku+1) ) of the array, the first super-diagonal starting at position 2 in row ( ku ), the first sub-diagonal starting at position 1 in row ( (ku+2) ), and so on. Elements in the array A that do not correspond to elements in the band matrix (such as the top left ( ku ) by ( ku ) triangle) are not referenced. |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. ( lda ) must be at least ( (kl+ku+1) ). |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least ( (1 + (n - 1) \times \text{abs}(\text{incx})) ) when ( \text{trans} = 'N' ) or 'n' and at least ( (1 + (m - 1) \times \text{abs}(\text{incx})) ) otherwise. Before entry, the incremented array X must contain the vector x. |
| incx      | Specifies the increment for the elements of x. Must not be zero. |
| beta      | SCALAR_FLOAT/Double. Specifies the scalar beta. When beta is supplied as zero then ( y ) need not be set on input. |
| y         | UTL_NLA_ARRAY_FLT/DBL of dimension at least ( (1 + (m - 1) \times \text{abs}(\text{incy})) ) when ( \text{trans} = 'N' ) or 'n' and at least ( (1 + (n - 1) \times \text{abs}(\text{incy})) ) otherwise. Before entry with ( \text{beta} ) nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y. |
| incy      | Specifies the increment for the elements of y. Must not be zero. |</p>

| `uplo`    | Specifies the upper or lower triangular part of the matrix \( A \) is supplied in the packed array \( AP \):  
  - `uplo = 'U'` or `u`. The upper triangular part of \( A \) is supplied in \( AP \).  
  - `uplo = 'L'` or `l`. The lower triangular part of \( A \) is supplied in \( AP \).  |
| `n`       | Specifies the order of the matrix \( A \). \( n \) must be at least zero. |
| `alpha`   | SCALAR_FLOAT/Double. Specifies the scalar \( \alpha \). |
Summary of UTL_NLA Subprograms

**Parameter** | **Description**
--- | ---
**ap** | UTL_NLA_ARRAY_FLT/DBL of dimension at least 
\((n^2(n+1))/2\)

Before entry with uplo = 'U' or 'u', the array ap must 
contain the upper triangular part of the symmetric matrix 
packed sequentially, column by column, so that ap(1) 
contains a(1,1), ap(2) and ap(3) contain a(1, 2) and 
a(2, 2) respectively, and so on.

Before entry with uplo = 'L' or 'l', the array ap must 
contain the lower triangular part of the symmetric matrix 
packed sequentially, column by column, so that ap(1) 
contains, ap(2) and ap(3) contain a(2, 1) and a(3, 1) 
respectively, and so on.

**x** | UTL_NLA_ARRAY_FLT/DBL of dimension at least 
\((1+(n-1)*\text{abs}(\text{incx}))\)

Before entry, the incremented array \(X\) must contain the \(n\) 
element vector \(x\).

**incx** | Specifies the increment for the elements of \(x\). Must not be zero.

**beta** | SCALAR_FLOAT/DOPLE. Specifies the scalar beta. When 
\(\beta\) is supplied as zero then \(Y\) need not be set on input.

**y** | UTL_NLA_ARRAY_FLT/DBL of dimension at least 
\((1+(n-1)*\text{abs}(\text{incy}))\)

Before entry, the incremented array \(Y\) must contain the \(n\) 
element vector \(y\). On exit, \(Y\) is overwritten by the updated 
vector \(y\).

**incy** | Specifies the increment for the elements of \(y\). Must not be zero.

**pack** | (Optional) Flags the packing of the matrices:
| ■ 'C': column-major (default)
| ■ 'R': row-major

---

Table 230–20 (Cont.) BLAS_SPMV Procedure Parameters
BLAS_SPR Procedures

This procedure performs the rank 1 operation
\[ A := \alpha x^T x + A \]
where \( \alpha \) is a real scalar, \( x \) is an \( n \) element vector, and \( A \) is an \( n \) by \( n \) symmetric matrix, supplied in packed form.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 230-8 for other subprograms in this group

Syntax

```sql
UTL_NLA.BLAS_SPR (uplo IN flag, n IN POSITIVEN, alpha IN SCALAR_DBL, x IN OUT UTL_NLA_ARRAY_DBL, incx IN POSITIVEN, ap IN OUT UTL_NLA_ARRAY_DBL, pack IN flag DEFAULT 'C');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| uplo | Specifies whether the upper or lower triangular part of the matrix \( A \) is supplied in the packed array \( ap \):
  - \( \text{uplo} = 'U' \) or \( \text{'u'} \): The upper triangular part of \( A \) is supplied in \( ap \).
  - \( \text{uplo} = 'L' \) or \( \text{'l'} \): The lower triangular part of \( A \) is supplied in \( ap \). |
| n | Specifies the order of the matrix \( A \). \( n \) must be at least zero. |
| alpha | Specifies the scalar \( \alpha \). |
| x | UTL_NLA_ARRAY_FLT/DBL of dimension at least \((1+(n-1)\cdot\text{abs}(\text{incx}))\)
Before entry, the incremented array \( X \) must contain the \( m \) element vector \( x \). |
| incx | Specifies the increment for the elements of \( x \). \( \text{incx} \) must not be zero. |
Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. On exit, the array ap is overwritten by the upper triangular part of the updated matrix.

Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. On exit, the array ap is overwritten by the lower triangular part of the updated matrix.

(Optional) Flags the packing of the matrices:
- 'C': column-major (default)
- 'R': row-major
BLAS_SPR2 Procedures

This procedure performs the rank 2 operation

\[ A := \alpha x'y' + \alpha y'x' + A \]

where \( \alpha \) is a scalar, \( x \) and \( y \) are \( n \) element vectors, and \( A \) is an \( n \) by \( n \) symmetric matrix, supplied in packed form.

</tbody>
</table>
alpha SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.

a UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced.

Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced.

Unchanged on exit

lda Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).

x UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.

incx Specifies the increment for the elements of x. Must not be zero.

beta SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.

y UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.

incy Specifies the increment for the elements of y. Must not be zero.

pack (Optional) Flags the packing of the matrices:
  ■ 'C': column-major (default)
  ■ 'R': row-major

</tbody>
</table>
Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix.

Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.

ldc Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1, n).

pack (Optional) Flags the packing of the matrices:
- 'C': column-major (default)
- 'R': row-major
BLAS_SYRK Procedures

This procedure performs one of the symmetric rank k operations

\[ C := \alpha A^*A' + \beta C \]

or

\[ C := \alpha A'*A + \beta C \]

where \( \alpha \) and \( \beta \) are scalars, \( C \) is an \( n \) by \( n \) symmetric matrix and \( A \) is an \( n \) by \( k \) matrix in the first case and a \( k \) by \( n \) matrix in the second case.

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.
BLAS_TRMM Procedures

This procedure performs one of the matrix-matrix operations

\[ B := \alpha \cdot \text{op}(A) \cdot B \]

or

\[ B := \alpha \cdot B \cdot \text{op}(A) \]

where \( \alpha \) is a scalar, \( B \) is an \( m \) by \( n \) matrix, \( A \) is a unit, or non-unit, upper or lower triangular matrix and \( \text{op}(A) \) is one of

\[ \text{op}(A) = A \]

or

\[ \text{op}(A) = A' \]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>side</td>
<td>Specifies whether the symmetric matrix $A$ appears on the left or right in the operation:</td>
</tr>
<tr>
<td></td>
<td>- side = 'L' or 'l': $B := \alpha\cdot\text{op}(A)\cdot B$</td>
</tr>
<tr>
<td></td>
<td>- side = 'R' or 'r': $B := \alpha\cdot B\cdot\text{op}(A)$</td>
</tr>
<tr>
<td>uplo</td>
<td>Specifies whether the upper or lower triangular part of the array $A$ is to be referenced:</td>
</tr>
<tr>
<td></td>
<td>- uplo = 'U' or 'u': $A$ is an upper triangular matrix.</td>
</tr>
<tr>
<td></td>
<td>- uplo = 'L' or 'l': $A$ is a lower triangular matrix.</td>
</tr>
<tr>
<td>transa</td>
<td>Specifies the form of $\text{op}(A)$ to be used in the matrix multiplication as follows:</td>
</tr>
<tr>
<td></td>
<td>- transa = 'N' or 'n': $\text{op}(A) = A$</td>
</tr>
<tr>
<td></td>
<td>- transa = 'T' or 't': $\text{op}(A) = A'$</td>
</tr>
<tr>
<td></td>
<td>- transa = 'C' or 'c': $\text{op}(A) = A'$</td>
</tr>
<tr>
<td>diag</td>
<td>Specifies whether or not $A$ is unit triangular:</td>
</tr>
<tr>
<td></td>
<td>- diag = 'U' or 'u'. $A$ is assumed to be unit triangular.</td>
</tr>
<tr>
<td></td>
<td>- diag = 'N' or 'n'. $A$ is not assumed to be unit triangular.</td>
</tr>
<tr>
<td>m</td>
<td>Specifies the number of rows of the $B$. $m$ must be at least zero.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies the number of columns of $B$. $n$ must be at least zero.</td>
</tr>
<tr>
<td>alpha</td>
<td>SCALAR_FLOAT/DOUBLE. Specifies the scalar $\alpha$. When $\alpha$ is zero then $A$ is not referenced and $B$ need not be set before entry.</td>
</tr>

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `uplo`    | Specifies whether the matrix is an upper or lower triangular matrix:  
- `uplo = 'U'` or `u'. A is an upper triangular matrix.  
- `uplo = 'L'` or `l'. A is a lower triangular matrix.  
| `trans`   | Specifies the operation to be performed:  
- `trans = 'N'` or `n'A'x = b`  
- `trans = 'T'` or `t'A'*x = b`  
- `trans = 'C'` or `c'A'*x = b` |
Table 230–38 (Cont.) BLAS_TRSV Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| diag      | Specifies whether or not \( A \) is unit triangular:  
  - \( \text{diag} = 'U' \) or \( 'u' \). \( A \) is assumed to be unit triangular.  
  - \( \text{diag} = 'N' \) or \( 'n' \). \( A \) is not assumed to be unit triangular. |
| n         | Specifies the order of the matrix \( A \). \( n \) must be at least zero. |
| a         | UTL_NLA_ARRAY_FLT/DBL of dimension at least \( (\text{lda}, n) \). |

Before entry with \( \text{uplo} = 'U' \) or \( 'u' \), the leading \( n \) by \( n \) upper triangular part of the array \( A \) must contain the upper triangular matrix and the strictly lower triangular part of \( A \) is not referenced.

Before entry with \( \text{uplo} = 'L' \) or \( 'l' \), the leading \( n \) by \( n \) lower triangular part of the array \( A \) must contain the lower triangular matrix and the strictly upper triangular part of \( A \) is not referenced.

Note that when \( \text{diag} = 'U' \) or \( 'u' \), the diagonal elements of \( A \) are not referenced either, but are assumed to be unity.

| lda       | Specifies the first dimension of \( A \) as declared in the calling (sub) program. \( \text{lda} \) must be at least \( \text{max}(1, n) \). |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least \( (1 + (n - 1) \times \text{abs}(\text{incx})) \) |

Before entry, the incremented array \( X \) must contain the \( n \) element right-hand side vector \( b \). On exit, \( X \) is overwritten with the solution vector \( x \).

| incx      | Specifies the increment for the elements of \( x \). Must not be zero. |
| pack      | (Optional) Flags the packing of the matrices:  
  - \( 'C' \): column-major (default)  
  - \( 'R' \): row-major |

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.
LAPACK_GBSV Procedures

This procedure computes the solution to a real system of linear equations
\[ a \cdot x = b \]
where \( a \) is a band matrix of order \( n \) with \( kl \) sub diagonals and \( ku \) superdiagonals, and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.
The \( LU \) decomposition with partial pivoting and row interchanges is used to factor \( A \) as
\[ a = L \cdot U \]
where \( L \) is a product of permutation and unit lower triangular matrices with \( kl \) sub diagonals, and \( U \) is upper triangular with \( kl+ku \) superdiagonals. The factored form of \( a \) is then used to solve the system of equations
\[ a \cdot x = b \]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( n )</td>
<td>The number of linear equations, equivalent to the order of the matrix ( a ). ( n \geq 0 )</td>
</tr>
<tr>
<td>( kl )</td>
<td>The number of sub diagonals within the band of ( a ). ( kl \geq 0 ).</td>
</tr>
</tbody>
</table>
The number of superdiagonals within the band of \( a \). \( ku \geq 0 \).

The number of right-hand sides, which is the number of columns of the matrix \( b \). \( nrhs \geq 0 \).

On entry, the matrix \( a \) in band storage, in rows \( kl+1 \) to \( 2*kl+ku+1 \); rows 1 to \( kl \) of the array need not be set. The \( j \)-th column of \( A \) is stored in the \( j \)-th column of the array \( ab \):

\[
ab(kl+ku+1+i-j,j) = a(i,j) \quad \text{for} \quad \max(1,j-ku) \leq i \leq \min(n,j+kl)
\]

On exit, details of the factorization: \( U \) is stored as an upper triangular band matrix with \( kl+ku \) superdiagonals in rows 1 to \( KL+KU+1 \), and the multipliers used during the factorization are stored in rows:

\( kl+ku+2 \) to \( 2*kl+ku+1 \)

The leading dimension of the array \( ab \).

\( ldab \geq 2*kl+ku+1 \)

INTEGER array, DIMENSION (n).

The pivot indices that define the permutation matrix \( P \); row \( i \) of the matrix was interchanged with row \( ipiv(i) \).

On entry, the \( n \) by \( nrhs \) matrix of right hand side matrix \( b \). On exit, if \( info = 0 \), the \( n \) by \( nrhs \) solution matrix \( X \).

The leading dimension of the array \( b \).

\( ldb \geq \max(1,n) \)

\( info \)

- \( = 0 \) : successful exit
- \( < 0 \) : if \( info = -i \), the \( i \)-th argument had an illegal value
- \( > 0 \) : if \( info = i \), \( U(i,i) \) is exactly zero. The factorization has been completed, but the factor \( U \) is exactly singular, and the solution has not been computed

(Optional) Flags the packing of the matrices:

- \( 'C' \) : column-major (default)
- \( 'R' \) : row-major

</tbody>
</table>
This procedure computes for an $n$ by $n$ real nonsymmetric matrix $A$, the eigenvalues, the real Schur form $T$, and, optionally, the matrix of Schur vectors $Z$. This gives the Schur factorization $A = Z^*T(Z^*Z)$.

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

\[
\begin{bmatrix}
  a & b \\
  c & a \\
\end{bmatrix}
\]

where $b*c < 0$. The eigenvalues of such a block are $a \pm \sqrt{bc}$.

</table>
This procedure solves overdetermined or underdetermined real linear systems involving an \( m \) by \( n \) matrix \( A \), or its transpose, using a QR or \( LQ \) factorization of \( A \). It is assumed that \( A \) has full rank.

The following options are provided:

1. If \( \text{TRANS} = 'N' \) and \( m \geq n \): find the least squares solution of an overdetermined system, that is, solve the least squares problem.
   \[
   \text{minimize} \quad || B - A^T X ||
   \]

2. If \( \text{TRANS} = 'N' \) and \( m < n \): find the minimum norm solution of an underdetermined system \( A \times X = B \).

3. If \( \text{TRANS} = 'T' \) and \( m \geq n \): find the minimum norm solution of an underdetermined system \( A^T \times X = B \).

4. If \( \text{TRANS} = 'T' \) and \( m < n \): find the least squares solution of an overdetermined system, that is, solve the least squares problem \( \text{minimize} \quad || B - A^T \times X || \).

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| trans     | - CHARACTER = 'N': The linear system involves \( A \).  
            - CHARACTER = 'T': The linear system involves \( A^T \). |
The number of rows of the matrix \( a \). \( M \geq 0 \).

The number of columns of the matrix \( a \). \( N \geq 0 \).

The number of right-hand sides, which is the number of columns of the matrix \( b \). \( nrhs \geq 0 \).

\( a \) \( \text{UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n).} \)

On entry, the matrix \( b \) of right hand side vectors, stored columnwise; \( b \) is \( m \) by \( nrhs \) if \( \text{TRANS} = 'N' \), or \( n \) by \( nrhs \) if \( \text{TRANS} = 'T' \).

On exit, if \( m \geq n \), \( a \) is overwritten by details of its QR factorization as returned by \( \text{SGEQRF} \). If \( m < n \), \( a \) is overwritten by details of its LQ factorization as returned by \( \text{SGELQF} \).

\( \text{lda} \) The leading dimension of the array \( A \). \( \text{lda} \geq \max(1,m) \).

\( b \) \( \text{UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs).} \)

On entry, the matrix \( b \) of right hand side vectors, stored columnwise. \( b \) is \( m \) by \( nrhs \) if \( \text{TRANS} = 'N' \), or \( n \) by \( nrhs \) if \( \text{TRANS} = 'T' \).

On exit, \( b \) is overwritten by the solution vectors, stored columnwise:

- If \( \text{TRANS} = 'N' \) and \( m \geq n \), rows 1 to \( n \) of \( b \) contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of elements \( n+1 \) to \( m \) in that column.
- If \( \text{TRANS} = 'N' \) and \( m < n \), rows 1 to \( n \) of \( b \) contain the minimum norm solution vectors.
- If \( \text{TRANS} = 'T' \) and \( m \geq n \), rows 1 to \( m \) of \( b \) contain the minimum norm solution vectors.
- If \( \text{TRANS} = 'T' \) and \( m < n \), rows 1 to \( m \) of \( b \) contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of elements \( m+1 \) to \( n \) in that column.

\( \text{ldb} \) The leading dimension of the array \( b \).

\( \text{ldb} \geq \max(1,m,n) \)

\( \text{info} \)

- \( = 0 \) : successful exit
- \( < 0 \) : if \( \text{info} = -i \), the \( i \)-th argument had an illegal value

\( \text{pack} \) (Optional) Flags the packing of the matrices:

- \( 'C' \) : column-major (default)
- \( 'R' \) : row-major
LAPACK_GESDD Procedures

This procedure computes the singular value decomposition (SVD) of a real \( m \) by \( n \) matrix \( A \), optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

\[
A = U \times \text{SIGMA} \times \text{transpose}(V)
\]

where \( \text{SIGMA} \) is an \( m \) by \( n \) matrix which is zero except for its \( \min(m, n) \) diagonal elements, \( U \) is an \( m \) by \( m \) orthogonal matrix, and \( V \) is an \( n \) by \( n \) orthogonal matrix. The diagonal elements of \( \text{SIGMA} \) are the singular values of \( A \), they are real and non-negative, and are returned in descending order. The first \( \min(m, n) \) columns of \( U \) and \( V \) are the left and right singular vectors of \( A \).

Note that the routine returns \( V^T \), not \( V \).

LAPACK_GESV Procedures

This procedure computes the solution to a real system of linear equations
\[ a * x = b \]

where \( a \) is an \( n \) by \( n \) matrix and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.

The \( LU \) decomposition with partial pivoting and row interchanges is used to factor \( A \) as
\[ a = P * L * U \]

where \( P \) is a permutation matrix, \( L \) is unit lower triangular, and \( U \) is upper triangular. The factored form of \( a \) is then used to solve the system of equations
\[ a * x = b \]

</tbody>
</table>
This procedure computes for an \( n \) by \( n \) real nonsymmetric matrix \( A \), the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector \( v(j) \) of \( A \) satisfies \( A \cdot v(j) = \lambda(j) \cdot v(j) \) where \( \lambda(j) \) is its eigenvalue.
- The left eigenvector \( u(j) \) of \( A \) satisfies \( u(j)^{**H} \cdot A = \lambda(j) \cdot u(j)^{**H} \) where \( u(j)^{**H} \) denotes the conjugate transpose of \( u(j) \).

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

LAPACK_PBSV Procedures

This procedure computes the solution to a real system of linear equations

\[ a \cdot x = b \]

where \( a \) is an \( n \) by \( n \) symmetric positive definite band matrix and \( x \) and \( b \) are \( n \) by \( \text{nrhs} \) matrices.

The Cholesky decomposition is used to factor \( A \) as

\[ A = U^T \cdot U \quad \text{if} \quad \text{UPLO} = 'U' \]

or

\[ A = L \cdot L^T \quad \text{if} \quad \text{UPLO} = 'L' \]

where \( U \) is an upper triangular matrix and \( L \) is a lower triangular matrix. The factored form of \( A \) is then used to solve the system of equations \( A \cdot X = B \).

</thead>
</table>
| uplo      | - \( \text{uplo} = 'U' \). Upper triangular of \( A \) is stored.  
            - \( \text{uplo} = 'L' \). Lower triangular of \( A \) is stored. |
| n         | The number of linear equations, that is, the order of the matrix \( a \cdot n \geq 0 \) |
The number of superdiagonals of the matrix \( A \) if \( \text{uplo} = 'U' \), or the number of subdiagonals if \( \text{UPLO} = 'L' \). \( KD >= 0 \).

The number of right-hand sides, which is the number of columns of the matrix \( b \). \( nrhs >= 0 \).

\( \text{ab} \) UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n).
On entry, the upper or lower triangle of the symmetric band matrix \( A \), stored in the first \( KD+1 \) rows of the array. The \( j \)-th column of \( A \) is stored in the \( j \)-th column of the array \( \text{ab} \) as follows:

- if \( \text{uplo} = 'U' \), \( AB(KD+1+i-j,j) = A(i,j) \) for \( \max(1,j-KD)<=i<=j \);
- if \( \text{uplo} = 'L' \), \( AB(1+i-j,j) = A(i,j) \) for \( j<=i<=\min(N,j+KD) \).

See below for further details.
On exit, if \( \text{info} = 0 \), the triangular factor \( U \) or \( L \) from the Cholesky factorization \( A = U^*U \) or \( A = L*L^* \) of the band matrix \( A \), in the same storage format as \( A \).

The leading dimension of the array \( \text{ab} \).
\( ldb >= kd+1 \)

\( b \) UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs).
On entry, the \( n \) by \( nrhs \) matrix of right hand side matrix \( b \).
On exit, if \( \text{info} = 0 \), the \( n \) by \( nrhs \) solution matrix \( X \).

The leading dimension of the array \( b \).
\( ldb >= \max(1,n) \)

\( \text{info} \)

- \( = 0 \) : successful exit
- \( < 0 \) : if \( \text{info} = -i \), the \( i \)-th argument had an illegal value
- \( > 0 \) : if \( \text{info} = i \), the leading minor of order \( a \) of \( A \) is not positive definite, so the factorization could not be completed, and the solution has not been computed.

\( \text{pack} \) (Optional) Flags the packing of the matrices:
- \( 'C' \): column-major (default)
- \( 'R' \): row-major
LAPACK_POSV Procedures

This procedure computes the solution to a real system of linear equations
\[ a \times x = b \]
where \( a \) is an \( n \) by \( n \) symmetric positive definite matrix and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.

The Cholesky decomposition is used to factor \( A \) as
\[ A = U^{\ast}T \quad \text{if uplo = 'U'} \]
or
\[ A = L \ast L^{\ast}T \quad \text{if uplo = 'L'} \]
where \( U \) is an upper triangular matrix and \( L \) is a lower triangular matrix. The factored form of \( A \) is then used to solve the system of equations \( A \ast X = B \).

- \( = 0 \): successful exit
- \( < 0 \): if \( \text{info} = -i \), the \( i \)-th argument had an illegal value
- \( > 0 \): if \( \text{info} = i \), the leading minor of order \( i \) of \( a \) is not positive definite, so the factorization could not be completed, and the solution has not been computed.

**pack**

(Optional) Flags the packing of the matrices:

- \( 'C' \): column-major (default)
- \( 'R' \): row-major
LAPACK_PTSV Procedures

This procedure computes the solution to a real system of linear equations
\[ a \cdot x = b \]
where \(a\) is an \(n\) by \(n\) symmetric positive definite tridiagonal matrix, and \(x\) and \(b\) are \(n\) by \(nrhs\) matrices.

\(a\) is factored as \(A = L \cdot D \cdot L^T\), and the factored form of \(a\) is then used to solve the system of equations.

**LAPACK_SPSV Procedures**

This procedure computes the solution to a real system of linear equations

\[ a \ast x = b \]

where \(a\) is an \(n\) by \(n\) symmetric matrix stored in packed format, and \(x\) and \(b\) are \(n\) by \(nrhs\) matrices.

The diagonal pivoting method is used to factor \(A\) as

\[ A = U \ast D \ast U^\ast T, \text{if } UPLO = 'U' \]

or

\[ A = L \ast D \ast L^\ast T, \text{if } UPLO = 'L' \]

where \(U\) (or \(L\)) is a product of permutation and unit upper (lower) triangular matrices, and \(D\) is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of \(A\) is then used to solve the system of equations \(A \ast X = B\).

Table 230–55  (Cont.) LAPACK_SPSV Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| ap        | UTNL_ARRAYFLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix A, packed columnwise in a linear array. The j-th column of A is stored in the array ap as follows:  
  - uplo = 'U': AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j  
  - uplo = 'L': AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n  
See below for further details.  
On exit, the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSPTRF, stored as a packed triangular matrix in the same storage format as A.  
| ipiv      | INTEGER array, DIMENSION (n). Details of the interchanges and the block structure of d, as determined by SSPTRF.  
  - If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by 1 diagonal block.  
  - If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block.  
  - If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.  
| b         | UTNL_ARRAYFLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs right hand side matrix b. On exit, if info = 0, the n by nrhs solution matrix X.  
| ldb       | The leading dimension of the array b. ldb >= max(1,n)  
| info      |  
  - = 0 : successful exit  
  - < 0 : if info = -i, the i-th argument had an illegal value  
  - > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed.

LAPACK_SYSV Procedures

This procedure computes the solution to a real system of linear equations

\[ a \times x = b \]

where \( a \) is an \( n \) by \( n \) symmetric matrix, and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.

The diagonal pivoting method is used to factor \( A \) as

\[ A = U \times D \times U^{*^T}, \text{if } UPLO = 'U' \]

or

\[ A = L \times D \times L^{*^T}, \text{if } UPLO = 'L' \]

where \( U \) (or \( L \)) is a product of permutation and unit upper (lower) triangular matrices, and \( D \) is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of \( A \) is then used to solve the system of equations \( A \times X = B \).

| n         | The number of linear equations, which is the order of the matrix \( a \). \( N >= 0 \). |
```
nrhs

The number of right-hand sides, which is the number of columns of the matrix $b$. $nrhs \geq 0$.

$a$

$UTL_NLA_ARRAY_FLT/DBL$, $DIMENSION(n-1)$.

On entry, the symmetric matrix $a$. If $UPLO = 'U'$, the leading $n$ by $n$ upper triangular part of $a$ contains the upper triangular part of the matrix $a$, and the strictly lower triangular part of $a$ is not referenced. If $uplo = 'L'$, the leading $n$ by $n$ lower triangular part of $a$ contains the lower triangular part of the matrix $a$, and the strictly upper triangular part of $a$ is not referenced.

On exit, if $info = 0$, the block diagonal matrix $d$ and the multipliers used to obtain the factor $U$ or $L$ from the factorization $A = U*D*U^T$ or $A = L*D*L^T$ as computed by $S SYTRF$.

lda

The leading dimension of the array $a$.

$lda \geq max(1,n)$

ipiv

INTEGER array, $DIMENSION(ldb, nrhs)$.

Details of the interchanges and the block structure of $d$, as determined by $S SYTRF$.

- If $ipiv(k) > 0$, then rows and columns $k$ and $ipiv(k)$ were interchanged, and $d(k,k)$ is a 1 by 1 diagonal block.
- If $uplo = 'U'$ and $ipiv(k) = ipiv(k-1) < 0$, then rows and columns $k-1$ and $-ipiv(k)$ were interchanged and $d(k-1:k,k-1:k)$ is a 2 by 2 diagonal block.
- If $uplo = 'L'$ and $ipiv(k) = ipiv(k+1) < 0$, then rows and columns $k+1$ and $-ipiv(k)$ were interchanged and $d(k:k+1,k:k+1)$ is a 2 by 2 diagonal block.

$b$

$UTL_NLA_ARRAY_FLT/DBL$, $DIMENSION(ldb, nrhs)$.

On entry, the $n$ by $nrhs$ matrix of right hand side matrix $b$.

On exit, if $info = 0$, the $n$ by $nrhs$ solution matrix $X$.

ldb

The leading dimension of the array $b$.

$ldb \geq max(1,n)$

info

- $= 0$ : successful exit
- $< 0$ : if $info = -i$, the $i$-th argument had an illegal value
- $> 0$ : if $info = i$, $d(i,i)$ is exactly zero. The factorization has been completed, but the block diagonal matrix $d$ is exactly singular, so the solution could not be computed.

pack

(Optional) Flags the packing of the matrices:

- $'C'$: column-major (default)
- $'R'$: row-major
The UTL_RAW package provides SQL functions for manipulating RAW datatypes.

This chapter contains the following topics:

- Using UTL_RAW
  - Overview
  - Operational Notes
- Summary of UTL_RAW Subprograms
Using UTL_RAW

- Overview
- Operational Notes
Overview

This package is necessary because normal SQL functions do not operate on RAWs, and PL/SQL does not allow overloading between a RAW and a CHAR datatype. UTL_RAW also includes subprograms that convert various COBOL number formats to, and from, RAWs.

UTL_RAW is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix UTL has been given to the package, instead of DBMS.
**Operational Notes**

UTL_RAW allows a RAW "record" to be composed of many elements. By using the RAW datatype, character set conversion will not be performed, keeping the RAW in its original format when being transferred through remote procedure calls.

With the RAW functions, you can manipulate binary data that was previously limited to the hextoraw and rawtohex functions.

---

**Note:** Notes on data types:

- The PLS_INTEGER and BINARY_INTEGER data types are identical. This document uses BINARY_INTEGER to indicate data types in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.

- The INTEGER and NUMBER(38) data types are also identical. This document uses INTEGER throughout.
### Summary of UTL_RAW Subprograms

<tr>
<td>LENGTH Function on page 231-29</td>
<td>Returns the length in bytes of a RAW r</td>
</tr>
</tbody>
</table>
## Table 231–1  (Cont.) UTL_RAW Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OVERLAY Function</strong> on page 231-30</td>
<td>Overlays the specified portion of target RAW with overlay RAW, starting from byte position pos of target and proceeding for len bytes</td>
</tr>
<tr>
<td><strong>REVERSE Function</strong> on page 231-32</td>
<td>Reverses a byte sequence in RAW r from end to end</td>
</tr>
<tr>
<td><strong>SUBSTR Function</strong> on page 231-33</td>
<td>Returns len bytes, starting at pos from RAW r</td>
</tr>
<tr>
<td><strong>TRANSLATE Function</strong> on page 231-35</td>
<td>Translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set</td>
</tr>
<tr>
<td><strong>TRANSLITERATE Function</strong> on page 231-37</td>
<td>Converts the bytes in the input RAW r according to the bytes in the transliteration RAWs from_set and to_set</td>
</tr>
<tr>
<td><strong>X RANGE Function</strong> on page 231-39</td>
<td>Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value start_byte and ending with the value end_byte</td>
</tr>
</tbody>
</table>
**BIT_AND Function**

This function performs bitwise logical “and” of the values in RAW r1 with RAW r2 and returns the “anded” result RAW.

**Syntax**

```
UTL_RAW.BIT_AND ( 
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

**Pragmas**

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to “and” with r2</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to “and” with r1</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the “and” of r1 and r2</td>
</tr>
<tr>
<td>NULL</td>
<td>Either r1 or r2 input parameter was NULL</td>
</tr>
</tbody>
</table>

**Usage Notes**

If r1 and r2 differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.
BIT_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW r and returns the complement'ed result RAW. The result length equals the input RAW r length.

Syntax

```sql
UTL_RAW.BIT_COMPLEMENT (    
    r IN RAW
) RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW to perform &quot;complement&quot; operation</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The &quot;complement&quot; of r1</td>
</tr>
<tr>
<td>NULL</td>
<td>If r input parameter was NULL</td>
</tr>
</tbody>
</table>
BIT_OR Function

This function performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the or'd result RAW.

Syntax

```
UTL_RAW.BIT_OR ( 
    r1 IN RAW, 
    r2 IN RAW) 
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;or&quot; with r2</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;or&quot; with r1</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;or&quot; of r1 and r2</td>
</tr>
<tr>
<td>NULL</td>
<td>Either r1 or r2 input parameter was NULL</td>
</tr>
</tbody>
</table>

Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.
BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

Syntax

```sql
UTL_RAW.BIT_XOR (
  r1 IN RAW,
  r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;xor&quot; with r2</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;xor&quot; with r1</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;xor&quot; of r1 and r2</td>
</tr>
<tr>
<td>NULL</td>
<td>If either r1 or r2 input parameter was NULL</td>
</tr>
</tbody>
</table>

Usage Notes

If r1 and r2 differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.
CAST_FROM_BINARY_DOUBLE Function

This function returns the RAW binary representation of a BINARY_DOUBLE value.

Syntax

UTL_RAW.CAST_FROM_BINARY_DOUBLE(
    n          IN BINARY_DOUBLE,
    endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;

Pragmas

pragma restrict_references(cast_from_binary_double, WNDS, RDNS, WNPS, RNPS);

Parameters

Table 231–10    CAST_FROM_BINARY_DOUBLE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>BINARY_DOUBLE value</td>
</tr>
<tr>
<td>endianess</td>
<td>A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:
  
  byte 0: bit 63 ~ bit 56  
  byte 1: bit 55 ~ bit 48  
  byte 2: bit 47 ~ bit 40  
  byte 3: bit 39 ~ bit 32  
  byte 4: bit 31 ~ bit 24  
  byte 5: bit 23 ~ bit 16  
  byte 6: bit 15 ~ bit  8  
  byte 7: bit  7 ~ bit  0

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

<table>
<thead>
<tr>
<th></th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
<th>rb4</th>
<th>rb5</th>
<th>rb6</th>
<th>rb7</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>db0</td>
<td>db1</td>
<td>db2</td>
<td>db3</td>
<td>db4</td>
<td>db5</td>
<td>db6</td>
<td>db7</td>
</tr>
<tr>
<td>little_endian</td>
<td>db7</td>
<td>db6</td>
<td>db5</td>
<td>db4</td>
<td>db3</td>
<td>db2</td>
<td>db1</td>
<td>db0</td>
</tr>
</tbody>
</table>

- In case of machine-endian, the 8 bytes of the BINARY_DOUBLE argument are copied straight across into the RAW return value. The effect is the same if the user
has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_FROM_BINARY_FLOAT Function

This function returns the RAW binary representation of a BINARY_FLOAT value.

Syntax

\[
\text{UTL_RAW.CAST_FROM_BINARY_FLOAT(}
\text{ n \quad \text{IN BINARY_FLOAT,}}
\text{ endianess \text{IN PLS_INTEGER DEFAULT 1)}}
\text{RETURN RAW;}
\]

Pragmas

pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);

Parameters

**Table 231–11 CAST_FROM_BINARY_FLOAT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>BINARY_FLOAT value</td>
</tr>
<tr>
<td>endianess</td>
<td>A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation (RAW) of the BINARY_FLOAT value, or NULL if the input is NULL.

Usage Notes

- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:
  
  - byte 0: bit 31 ~ bit 24
  - byte 1: bit 23 ~ bit 16
  - byte 2: bit 15 ~ bit  8
  - byte 3: bit  7 ~ bit  0

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

<table>
<thead>
<tr>
<th></th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>fb0</td>
<td>fb1</td>
<td>fb2</td>
<td>fb3</td>
</tr>
<tr>
<td>little_endian</td>
<td>fb3</td>
<td>fb2</td>
<td>fb1</td>
<td>fb0</td>
</tr>
</tbody>
</table>

- In case of machine-endian, the 4 bytes of the BINARY_FLOAT argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_FROM_BINARY_INTEGER Function

This function returns the RAW binary representation of a BINARY_INTEGER value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (n          IN BINARY_INTEGER
   endianess IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_integer, WND, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>BINARY_INTEGER value.</td>
</tr>
<tr>
<td>endianess</td>
<td>A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the BINARY_INTEGER value.
CAST_FROM_NUMBER Function

This function returns the `RAW` binary representation of a `NUMBER` value.

Syntax

```sql
UTL_RAW.CAST_FROM_NUMBER (n  IN NUMBER)
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td><code>NUMBER</code> value</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the `NUMBER` value.
CAST_TO_BINARY_DOUBLE Function

This function casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE.

Syntax

```sql
UTL_RAW.CAST_TO_BINARY_DOUBLE (r IN RAW, endianess IN PLS_INTEGER DEFAULT 1) RETURN BINARY_DOUBLE;
```

Pragmas

```sql
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Binary representation of a BINARY_DOUBLE</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_DOUBLE value.

Usage Notes

- If the RAW argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_DOUBLE_NAN is returned.
- If the RAW argument is less than 8 bytes, a VALUE_ERROR exception is raised.
- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

  - byte 0: bit 63 ~ bit 56
  - byte 1: bit 55 ~ bit 48
  - byte 2: bit 47 ~ bit 40
  - byte 3: bit 39 ~ bit 32
  - byte 4: bit 31 ~ bit 24
  - byte 5: bit 23 ~ bit 16
  - byte 6: bit 15 ~ bit 8
  - byte 7: bit  7 ~ bit  0

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

<table>
<thead>
<tr>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
<th>rb4</th>
<th>rb5</th>
<th>rb6</th>
<th>rb7</th>
</tr>
</thead>
<tbody>
<tr>
<td>db0</td>
<td>db1</td>
<td>db2</td>
<td>db3</td>
<td>db4</td>
<td>db5</td>
<td>db6</td>
<td>db7</td>
</tr>
<tr>
<td>db7</td>
<td>db6</td>
<td>db5</td>
<td>db4</td>
<td>db3</td>
<td>db2</td>
<td>db1</td>
<td>db0</td>
</tr>
</tbody>
</table>
In case of machine-endian, the 8 bytes of the RAW argument are copied straight across into the BINARY_DOUBLE return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_TO_BINARY_FLOAT Function

This function casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT.

Syntax

```sql
UTL_RAW.CAST_TO_BINARY_FLOAT (  
    r          IN RAW  
    endianess  IN PLS_INTEGER DEFAULT 1)  
RETURN BINARY_FLOAT;
```

Pragmas

```sql
pragma restrict_references(cast_to_binary_float, WDNS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r</code></td>
<td>Binary representation of a BINARY_FLOAT</td>
</tr>
<tr>
<td><code>endianess</code></td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_FLOAT value.

Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_FLOAT_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE_ERROR exception is raised.
- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:
  - byte 0: bit 31 ~ bit 24
  - byte 1: bit 23 ~ bit 16
  - byte 2: bit 15 ~ bit  8
  - byte 3: bit  7 ~ bit  0

The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

<table>
<thead>
<tr>
<th></th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>fbo</td>
<td>fb1</td>
<td>fb2</td>
<td>fb3</td>
</tr>
<tr>
<td>little_endian</td>
<td>fb3</td>
<td>fb2</td>
<td>fb1</td>
<td>fb0</td>
</tr>
</tbody>
</table>

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY_FLOAT return value. The effect is the same if the user has
passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_TO_BINARY_INTEGER Function

This function casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER.

Syntax

```sql
UTL_RAW.CAST_TO_BINARY_INTEGER (  
    r          IN RAW  
    endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)  
RETURN BINARY_INTEGER;
```

Pragmas

```sql
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Binary representation of a BINARY_INTEGER</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_INTEGER value
CAST_TO_NUMBER Function

This function casts the RAW binary representation of a NUMBER into a NUMBER.

Syntax

```plaintext
UTL_RAW.CAST_TO_NUMBER (r IN RAW)
RETURN NUMBER;
```

Pragmas

```plaintext
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Binary representation of a NUMBER</td>
</tr>
</tbody>
</table>

Return Values

The NUMBER value.
CAST_TO_NVARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into an NVARCHAR2 value with that number of data bytes.

---

**Note:** When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2 value.

---

**Syntax**

```sql
UTL_RAW.CAST_TO_NVARCHAR2 (
    r IN RAW)
RETURN NVARCHAR2;
```

**Pragmas**

```sql
pragma restrict_references(cast_to_NVARCHAR2, WDNS, RNDS, WNPS, RNPS);
```

**Parameters**

**Table 231–18  CAST_TO_NVARCHAR2 Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW (without leading length field) to be changed to a NVARCHAR2</td>
</tr>
</tbody>
</table>

**Return Values**

**Table 231–19  CAST_TO_NVARCHAR2 Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NVARCHAR2</td>
<td>Containing having the same data as the input RAW</td>
</tr>
<tr>
<td>NULL</td>
<td>If r input parameter was NULL</td>
</tr>
</tbody>
</table>
CAST_TO_RAW Function

This function converts a VARCHAR2 value represented using some number of data bytes into a RAW value with that number of data bytes. The data itself is not modified in any way, but its data type is recast to a RAW data type.

Syntax

```
UTL_RAW.CAST_TO_RAW (c IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_to_raw, WDNS, RNDS, WNPS, RNPS);
```

Parameters

Table 231–20  CAST_TO_RAW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>VARCHAR2 to be changed to a RAW</td>
</tr>
</tbody>
</table>

Return Values

Table 231–21  CAST_TO_RAW Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field</td>
</tr>
<tr>
<td>NULL</td>
<td>If c input parameter was NULL</td>
</tr>
</tbody>
</table>
CAST_TO_VARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into a VARCHAR2 value with that number of data bytes.

**Note:** When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

Syntax

```sql
UTL_RAW.CAST_TO_VARCHAR2 ( r IN RAW)
RETURN VARCHAR2;
```

Pragmas

```sql
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Table 231–22</th>
<th>CAST_TO_VARCHAR2 Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>r</td>
<td>RAW (without leading length field) to be changed to a VARCHAR2</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Table 231–23</th>
<th>CAST_TO_VARCHAR2 Function Return Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Return</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>VARCHAR2</td>
<td>Containing having the same data as the input RAW</td>
</tr>
<tr>
<td>NULL</td>
<td>If r input parameter was NULL</td>
</tr>
</tbody>
</table>
COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional pad parameter.

Syntax

```
UTL_RAW.COMPARE (
    r1  IN RAW,
    r2  IN RAW,
    pad IN RAW DEFAULT NULL)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>1st RAW to be compared, may be NULL or 0 length</td>
</tr>
<tr>
<td>r2</td>
<td>2nd RAW to be compared, may be NULL or 0 length</td>
</tr>
<tr>
<td>pad</td>
<td>This is an optional parameter. Byte to extend whichever of r1 or r2 is shorter. The default: x'00'</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte</td>
</tr>
</tbody>
</table>
CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned.

Syntax

```
UTL_RAW.CONCAT (r1 IN RAW DEFAULT NULL,
                r2 IN RAW DEFAULT NULL,
                r3 IN RAW DEFAULT NULL,
                r4 IN RAW DEFAULT NULL,
                r5 IN RAW DEFAULT NULL,
                r6 IN RAW DEFAULT NULL,
                r7 IN RAW DEFAULT NULL,
                r8 IN RAW DEFAULT NULL,
                r9 IN RAW DEFAULT NULL,
                r10 IN RAW DEFAULT NULL,
                r11 IN RAW DEFAULT NULL,
                r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

Parameters

```
r1....r12 are the RAW items to concatenate.
```

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the items concatenated</td>
</tr>
</tbody>
</table>

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.
CONVERT Function

This function converts RAW \( r \) from character set \( \text{from} \_\text{charset} \) to character set \( \text{to} \_\text{charset} \) and returns the resulting RAW.

Both \( \text{from} \_\text{charset} \) and \( \text{to} \_\text{charset} \) must be supported character sets defined to the Oracle server.

Syntax

```sql
UTL_RAW.CONVERT (
    r            IN RAW,
    to_charset   IN VARCHAR2,
    from_charset IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Table 231–27 CONVERT Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>( r )</td>
</tr>
<tr>
<td>( \text{to} _\text{charset} )</td>
</tr>
<tr>
<td>( \text{from} _\text{charset} )</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Table 231–28 CONVERT Function Return Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
</tr>
<tr>
<td>--------</td>
</tr>
<tr>
<td>RAW</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Table 231–29 CONVERT Function Exceptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>VALUE_ERROR</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
COPIES Function

This function returns \( n \) copies of \( r \) concatenated together.

**Syntax**

```
UTL_RAW.COPIES (  
    r IN RAW,  
    n IN NUMBER)  
RETURN RAW;
```

**Pragmas**

```
pragma restrict_references(copies, WNDs, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r )</td>
<td>RAW to be copied</td>
</tr>
<tr>
<td>( n )</td>
<td>Number of times to copy the RAW (must be positive)</td>
</tr>
</tbody>
</table>

**Return Values**

This returns the RAW copied \( n \) times.

**Exceptions**

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- ( r ) is missing, NULL or 0 length</td>
</tr>
<tr>
<td></td>
<td>- ( n ) &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- Length of result exceeds maximum length of a RAW</td>
</tr>
</tbody>
</table>
LENGTH Function

This function returns the length in bytes of a RAW r.

Syntax

UTL_RAW.LENGTH (  
   r  IN RAW)  
RETURN NUMBER;

Pragmas

pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 231–32  LENGTH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW byte stream to be measured</td>
</tr>
</tbody>
</table>

Return Values

Table 231–33  LENGTH Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>Current length of the RAW</td>
</tr>
</tbody>
</table>
OVERLAY Function

This function overlays the specified portion of target RAW with overlay_str RAW, starting from byte position pos of target and proceeding for len bytes.

Syntax

```
UTL_RAW.OVERLAY (  
  overlay_str IN RAW,
  target      IN RAW,
  pos         IN BINARY_INTEGER DEFAULT 1,
  len         IN BINARY_INTEGER DEFAULT NULL,
  pad         IN RAW            DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>overlay_str</td>
<td>Byte-string used to overlay target</td>
</tr>
<tr>
<td>target</td>
<td>Byte-string which is to be overlaid</td>
</tr>
<tr>
<td>pos</td>
<td>Position in target (numbered from 1) to start overlay</td>
</tr>
<tr>
<td>len</td>
<td>The number of target bytes to overlay</td>
</tr>
<tr>
<td>pad</td>
<td>Pad byte used when overlay len exceeds overlay_str length or pos exceeds target length</td>
</tr>
</tbody>
</table>

Defaults and Optional Parameters

<table>
<thead>
<tr>
<th>Optional Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>1</td>
</tr>
<tr>
<td>len</td>
<td>To the length of overlay_str</td>
</tr>
<tr>
<td>pad</td>
<td>x'00'</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The target byte_string overlaid as specified.</td>
</tr>
</tbody>
</table>

Usage Notes

If overlay_str has less than len bytes, then it is extended to len bytes using the pad byte. If overlay_str exceeds len bytes, then the extra bytes in overlay_str are ignored. If len bytes beginning at position pos of target exceeds the length of target, then target is extended to contain the entire length of overlay_str.
If \( \text{len} \) is specified, it must be greater than or equal to 0. If \( \text{pos} \) is specified, it must be greater than or equal to 1. If \( \text{pos} \) exceeds the length of \( \text{target} \), then \( \text{target} \) is padded with pad bytes to position \( \text{pos} \), and \( \text{target} \) is further extended with overlay_str bytes.

Exceptions

**Table 231–37 OVERLAY Function Exceptions**

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- Overlay_str is NULL or has 0 length</td>
</tr>
<tr>
<td></td>
<td>- Target is missing or undefined</td>
</tr>
<tr>
<td></td>
<td>- Length of target exceeds maximum length of a RAW</td>
</tr>
<tr>
<td></td>
<td>- ( \text{len} &lt; 0 )</td>
</tr>
<tr>
<td></td>
<td>- ( \text{pos} &lt; 1 )</td>
</tr>
</tbody>
</table>
REVERSE Function

This function reverses a byte sequence in RAW \( r \) from end to end. For example, \( x'0102F3' \) would be reversed to \( x'F30201' \), and \( 'xyz' \) would be reversed to \( 'zyx' \). The result length is the same as the input RAW length.

Syntax

```
UTL_RAW.REVERSE (    r IN RAW)    RETURN RAW;
```

Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r )</td>
<td>RAW to reverse</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the “reverse” of ( r )</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>( r ) is NULL or has 0 length</td>
</tr>
</tbody>
</table>
SUBSTR Function

This function returns \( len \) bytes, starting at \( pos \) from RAW \( r \).

Syntax

```
UTL_RAW.SUBSTR (
    r   IN RAW,
    pos IN BINARY_INTEGER,
    len IN BINARY_INTEGER DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 231–41 SUBSTR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r )</td>
<td>The RAW byte-string from which a portion is extracted</td>
</tr>
<tr>
<td>( \text{pos} )</td>
<td>The byte position in ( r ) at which to begin extraction</td>
</tr>
<tr>
<td>( \text{len} )</td>
<td>The number of bytes from ( \text{pos} ) to extract from ( r ) (optional)</td>
</tr>
</tbody>
</table>

Defaults and Optional Parameters

Table 231–42 SUBSTR Function Exceptions

<table>
<thead>
<tr>
<th>Optional Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \text{len} )</td>
<td>Position ( \text{pos} ) through to the end of ( r )</td>
</tr>
</tbody>
</table>

Return Values

Table 231–43 SUBSTR Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>portion of ( r )</td>
<td>Beginning at ( \text{pos} ) for ( \text{len} ) bytes long</td>
</tr>
<tr>
<td>NULL</td>
<td>( r ) input parameter was NULL</td>
</tr>
</tbody>
</table>

Usage Notes

If \( \text{pos} \) is positive, then SUBSTR counts from the beginning of \( r \) to find the first byte. If \( \text{pos} \) is negative, then SUBSTR counts backward from the end of the \( r \). The value \( \text{pos} \) cannot be 0.

If \( \text{len} \) is omitted, then SUBSTR returns all bytes to the end of \( r \). The value \( \text{len} \) cannot be less than 1.
Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>VALUE_ERROR is returned if:</td>
</tr>
<tr>
<td></td>
<td>■ pos = 0 or &gt; length of x</td>
</tr>
<tr>
<td></td>
<td>■ len &lt; 1 or &gt; length of x - (pos-1)</td>
</tr>
</tbody>
</table>
TRANSLATE Function

This function translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set. If a byte in r has a matching byte in from_set, then it is replaced by the byte in the corresponding position in to_set, or deleted.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored.

Syntax

UTL_RAW.TRANSLATE (  
  r        IN RAW,  
  from_set IN RAW,  
  to_set   IN RAW)  
RETURN RAW;

Note: Be aware that to_set and from_set are reversed in the calling sequence compared to TRANSLITERATE.

Pragmas

pragma restrict_references(translate, WDNS, RNDS, WNPS, RNPS);

Parameters

<table>
<thead>
<tr>
<th>Table 231–45 TRANSLATE Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>r</td>
</tr>
<tr>
<td>from_set</td>
</tr>
<tr>
<td>to_set</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Table 231–46 TRANSLATE Function Return Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
</tr>
<tr>
<td>RAW</td>
</tr>
</tbody>
</table>

Usage Notes

- If to_set is shorter than from_set, the extra from_set bytes have no corresponding translation bytes. Bytes from the input RAW that match any such from_set bytes are not translated or included in the result. They are effectively translated to NULL.
- If to_set is longer than from_set, the extra to_set bytes are ignored.
- If a byte value is repeated in from_set, the repeated occurrence is ignored.
Note: Differences from the TRANSLITERATE Function:

- The from_set parameter comes before the to_set parameter in the calling sequence.
- Bytes from $r$ that appear in from_set but have no corresponding values in to_set are not translated or included in the result.
- The resulting RAW value may be shorter than the input RAW value.

Note that TRANSLATE and TRANSLITERATE only differ in functionality when to_set has fewer bytes than from_set.

### Exceptions

**Table 231–47 TRANSLATE Function Exceptions**

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- $r$ is NULL or has 0 length</td>
</tr>
<tr>
<td></td>
<td>- from_set is NULL or has 0 length</td>
</tr>
<tr>
<td></td>
<td>- to_set is NULL or has 0 length</td>
</tr>
</tbody>
</table>
**TRANSLITERATE Function**

This function converts the bytes in the input `RAW r` according to the bytes in the transliteration `RAWs from_set` and `to_set`. Successive bytes in `r` are looked up in the `from_set`, and, if not found, copied unaltered to the result `RAW`. If found, they are replaced in the result `RAW` by either corresponding bytes in the `to_set`, or the `pad` byte when no correspondence exists.

Bytes in `r`, but undefined in `from_set`, are copied to the result. Only the first (leftmost) occurrence of a byte in `from_set` is used. Subsequent duplicates are not scanned and are ignored. The result `RAW` is always the same length as `r`.

**Syntax**

```plaintext
UTL_RAW.TRANSLITERATE ( 
  r        IN RAW, 
  to_set   IN RAW DEFAULT NULL, 
  from_set IN RAW DEFAULT NULL, 
  pad      IN RAW DEFAULT NULL) 
RETURN RAW;
```

**Note:** Be aware that `to_set` and `from_set` are reversed in the calling sequence compared to `TRANSLATE`.

**Pragmas**

```plaintext
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Table 231–48 TRANSLITERATE Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>r</td>
</tr>
<tr>
<td>to_set</td>
</tr>
<tr>
<td>from_set</td>
</tr>
<tr>
<td>pad</td>
</tr>
</tbody>
</table>

**Defaults and Optional Parameters**

<table>
<thead>
<tr>
<th>Table 231–49 TRANSLITERATE Function Optional Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional Parameter</td>
</tr>
<tr>
<td>to_set</td>
</tr>
<tr>
<td>from_set</td>
</tr>
<tr>
<td>pad</td>
</tr>
</tbody>
</table>
Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Converted byte-string.</td>
</tr>
</tbody>
</table>

Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding conversion bytes. Bytes from the input RAW that match any such `from_set` bytes are converted in the result to the pad byte instead.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

Note: Differences from the TRANSLATE Function:

- The `to_set` parameter comes before the `from_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are replaced by pad in the result.
- The resulting RAW value always has the same length as the input RAW value.

Note that TRANSLATE and TRANSLITERATE only differ in functionality when `to_set` has fewer bytes than `from_set`.

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td><code>R</code> is NULL or has 0 length</td>
</tr>
</tbody>
</table>
XRANGE Function

This function returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte RAW values. If the start_byte value is greater than the end_byte value, then the succession of resulting bytes begins with start_byte, wraps through x'FF' back to x'00', then ends at end_byte.

Syntax

```
UTL_RAW.XRANGE (  
    start_byte IN RAW DEFAULT NULL,  
    end_byte   IN RAW DEFAULT NULL) 
RETURN RAW;
```

Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_byte</td>
<td>Beginning byte-code value of resulting sequence. The default is x'00'.</td>
</tr>
<tr>
<td>end_byte</td>
<td>Ending byte-code value of resulting sequence. The default is x'FF'.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing succession of 1-byte hexadecimal encodings</td>
</tr>
</tbody>
</table>
The UTL_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- **Using UTL_RECOMP**
  - Overview
  - Operational Notes
  - Examples
- **Summary of UTL_RECOMP Subprograms**
Using UTL_RECOMP

- Overview
- Operational Notes
- Examples
Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to RECOMP_PARALLEL Procedure.

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.
Operational Notes

- This package uses the job queue for parallel recompilation.
- This package must be run using SQL*PLUS.
- You must be connected AS SYSDBA to run this script.
- This package expects the following packages to have been created with VALID status:
  - STANDARD (standard.sql)
  - DBMS_STANDARD (dbmsstdx.sql)
  - DBMS_JOB (dbmsjob.sql)
  - DBMS_RANDOM (dbmsrand.sql)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.
Examples

Recompile all objects sequentially:
EXECUTE UTL_RECOMP.RECOMP_SERIAL();

Recompile objects in schema SCOTT sequentially:
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');

Recompile all objects using 4 parallel threads:
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);

Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE PROCESSES:
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
Summary of UTL_RECOMP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECOMP_PARALLEL Procedure</td>
<td>Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel</td>
</tr>
<tr>
<td>RECOMP_SERIAL Procedure</td>
<td>Recompiles invalid objects in a given schema or all invalid objects in the database</td>
</tr>
</tbody>
</table>
RECOMP_PARALLEL Procedure

This procedure uses the information exposed in the DBA_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(
    threads  IN   PLS_INTEGER DEFAULT NULL,
    schema   IN   VARCHAR2    DEFAULT NULL,
    flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threads</td>
<td>The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.</td>
</tr>
<tr>
<td>schema</td>
<td>The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.</td>
</tr>
<tr>
<td>flags</td>
<td>Flag values are intended for internal testing and diagnosability only.</td>
</tr>
</tbody>
</table>

Usage Notes

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.
RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```
UTL_RECOMP.RECOMP_SERIAL(
    schema IN VARCHAR2 DEFAULT NULL,
    flags IN PLS_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.</td>
</tr>
<tr>
<td>flags</td>
<td>Flag values are intended for internal testing and diagnosability only.</td>
</tr>
</tbody>
</table>
The `UTL_REF` package provides PL/SQL procedures to support reference-based operations. Unlike SQL, `UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- Using `UTL_REF`
  - Overview
  - Security Model
  - Types
  - Exceptions
- Summary of `UTL_REF` Subprograms
Using UTL_REF

- Overview
- Security Model
- Types
- Exceptions
Overview

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.
The procedural option is needed to use this package. This package must be created under SYS (connect/as sysdba). Operations provided by this package are performed under the current calling user, not under the package owner SYS.

You can use the UTL_REF package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, UTL_REF verifies that the invoker has the appropriate privileges to access the object pointed to by the REF.

---

**Note:** This is in contrast to PL/SQL packages/procedures on the server which operate with definer’s privileges, where the package owner must have the appropriate privileges to perform the desired operations.

---

Thus, if UTL_REF is defined under user SYS, and user A invokes UTL_REF.SELECT to select an object from a reference, then user A (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, UTL_REF operates with the privileges of the client session under which the PL/SQL execution is being done.
Types

An object type is a composite datatype defined by the user or supplied as a library type. You can create the object type `employee_type` using the following syntax:

```sql
CREATE TYPE employee_type AS OBJECT (
    name VARCHAR2(20),
    id NUMBER,

member function GET_ID
    (name VARCHAR2)
    RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID()`.

You can create an object table using the following SQL syntax:

```sql
CREATE TABLE employee_table OF employee_type;
```
Exceptions

Exceptions can be returned during execution of UTL_REF functions for various reasons. For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the UTL_REF subprogram must have the proper privilege on the object that is being selected or modified.

<table>
<thead>
<tr>
<th>Exceptions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errnum == 942</td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td>errnum == 1031</td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td>errnum == 8177</td>
<td>Unable to serialize, if in a serializable transaction.</td>
</tr>
<tr>
<td>errnum == 60</td>
<td>Deadlock detected.</td>
</tr>
<tr>
<td>errnum == 1403</td>
<td>No data found (if the REF is NULL, and so on.).</td>
</tr>
</tbody>
</table>

The UTL_REF package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.
## Summary of UTL_REF Subprograms

**Table 233–2 UTL_REF Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_OBJECT Procedure</td>
<td>Deletes an object given a reference</td>
</tr>
<tr>
<td>LOCK_OBJECT Procedure</td>
<td>Locks an object given a reference</td>
</tr>
<tr>
<td>SELECT_OBJECT Procedure</td>
<td>Selects an object given a reference</td>
</tr>
<tr>
<td>UPDATE_OBJECT Procedure</td>
<td>Updates an object given a reference</td>
</tr>
</tbody>
</table>
DELETE_OBJECT Procedure

This procedure deletes an object given a reference. The semantic of this subprogram is similar to the following SQL statement:

```sql
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```sql
UTL_REF.DELETE_OBJECT (reference IN REF '<typename>');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to delete.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.

Examples

The following example illustrates usage of the UTL_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

```sql
... declarations of Address_t and others...
CREATE OR REPLACE TYPE Person_t { 
    name VARCHAR2(64),
    gender CHAR(1),
    address Address_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t)
};

CREATE OR REPLACE TYPE BODY Person_t { 
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
    BEGIN
        address := addr;
    END;
};

CREATE OR REPLACE TYPE Employee_t { 
    Under Person_t: Simulate implementation of inheritance using a REF to Person_t 
    and delegation of setAddress to it.
    thePerson REF Person_t,
    empno NUMBER(5),
    deptREF Department_t,
    mgrREF Employee_t,
    reminders StringArray_t,
```
MEMBER PROCEDURE setAddress(addr IN Address_t),
MEMBER procedure addReminder(reminder VARCHAR2);
);

CREATE TYPE BODY Employee_t {
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
        myMgr Employee_t;
        meAsPerson Person_t;
    BEGIN

    Update the address by delegating the responsibility to thePerson. Lock the Person object from the reference, and also select it:

        UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
        meAsPerson.setAddress(addr);

    Delegate to thePerson:

        UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
        if mgr is NOT NULL THEN

    Give the manager a reminder:

        UTL_REF.LOCK_OBJECT(mgr);
        UTL_REF.SELECT_OBJECT(mgr, myMgr);
        myMgr.addReminder
            ('Update address in the employee directory for ' ||
             thePerson.name || ' , new address: ' || addr.asString);
        UTL_REF.UPDATE_OBJECT(mgr, myMgr);
        END IF;
    EXCEPTION
    WHEN OTHERS THEN
        errnum := SQLCODE;
        errmsg := SUBSTR(SQLERRM, 1, 200);
**LOCK_OBJECT Procedure**

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object. The semantic of this subprogram is similar to the following SQL statement:

```sql
SELECT VALUE(t)
  INTO object
FROM object_table t
WHERE REF(t) = reference
FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

**Syntax**

```sql
UTL_REF.LOCK_OBJECT (reference IN REF '<typename>');

UTL_REF.LOCK_OBJECT (reference IN REF '<typename>',
                     object    IN OUT '<typename>');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to lock.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.</td>
</tr>
</tbody>
</table>

**Exceptions**

May be raised.
**SELECT_OBJECT Procedure**

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```sql
SELECT VALUE(t) INTO object FROM object_table t WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

**Syntax**

```plsql
UTL_REF.SELECT_OBJECT (
    reference IN REF '<typename>',
    object    IN OUT '<typename>');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference to the object to select or retrieve.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.</td>
</tr>
</tbody>
</table>

**Exceptions**

May be raised.
UPDATE_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```sql
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```sql
UTL_REF.UPDATE_OBJECT ( 
    reference IN REF '<typename>',
    object    IN     '<typename>');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to update.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.
The **UTL_SMTP** package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

Using UTL_SMTP

- Overview
- Security Model
- Constants
- Types
- Reply Codes
- Exceptions
- Rules and Limits
- Examples
Overview

The UTL_SMTP protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The UTL_SMTP package provides interfaces to the SMTP commands. For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using UTL_SMTP, all text data (in other words, those in VARCHAR2) are converted to US7ASCII before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte VARCHAR2 data to RAW and use the WRITE_RAW_DATA subprogram to send multibyte data using 8-bit MIME encoding.

UTL_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, UTL_SMTP does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.
Security Model

This package is an invoker's rights package. The invoking user must have the 
connect privilege granted in the access control list assigned to the remote network 
host to which the user must connect.

---

**Note:** For more information, see Managing Fine-Grained Access in 
PL/SQL Packages and Types in *Oracle Database Security Guide*
Constants

Note: This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

The UTL_SMTP package uses the constants shown in Table 234–1, "UTL_SMTP Constants".

Table 234–1 UTL_SMTP Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL_SCHEMES</td>
<td>VARCHAR2</td>
<td>'CRAM-MD5'</td>
<td>List of all authentication schemes UTL_SMTP supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, PLAIN and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS).</td>
</tr>
<tr>
<td>NON_CLEARTEXT_PASSWORD_SCHEMES</td>
<td>VARCHAR2</td>
<td>'CRAM-MD5'</td>
<td>List of authentication schemes that UTL_SMTP supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection.</td>
</tr>
</tbody>
</table>
Types

- CONNECTION Record Type
- REPLY, REPLIES Record Types

CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

Syntax

```
TYPE connection IS RECORD (
  host          VARCHAR2(255),
  port          PLS_INTEGER,
  tx_timeout    PLS_INTEGER,
  private_tcp_con utl_tcp.connection,
  private_state PLS_INTEGER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Name of the remote host when connection is established. NULL when no connection is established.</td>
</tr>
<tr>
<td>port</td>
<td>Port number of the remote SMTP server connected. NULL when no connection is established.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
<tr>
<td>private_tcp_con</td>
<td>Private, for implementation use only. You should not modify this field.</td>
</tr>
<tr>
<td>private_state</td>
<td>Private, for implementation use only. You should not modify this field.</td>
</tr>
</tbody>
</table>

Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the OPEN_CONNECTION Functions. Changing the values of these fields has no effect on the connection. The fields `private_tcp_con` and `private_state` for implementation use only. You should not modify these fields.

REPLY, REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.
**Syntax**

```
TYPE reply IS RECORD (
    code   PLS_INTEGER,
    text   VARCHAR2(508));

TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;
```

**Fields**

*Table 234–3  REPLY, REPLIES Record Type Fields*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>code</td>
<td>3-digit reply code</td>
</tr>
<tr>
<td>text</td>
<td>Text message of the reply</td>
</tr>
</tbody>
</table>
# Reply Codes

The following is a list of the SMTP reply codes.

<table>
<thead>
<tr>
<th>Reply Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>211</td>
<td>System status, or system help reply</td>
</tr>
<tr>
<td>214</td>
<td>Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]</td>
</tr>
<tr>
<td>220</td>
<td>&lt;domain&gt; Service ready</td>
</tr>
<tr>
<td>221</td>
<td>&lt;domain&gt; Service closing transmission channel</td>
</tr>
<tr>
<td>250</td>
<td>Requested mail action okay, completed</td>
</tr>
<tr>
<td>251</td>
<td>User not local; forwards to &lt;forward-path&gt;</td>
</tr>
<tr>
<td>252</td>
<td>OK, pending messages for node &lt;node&gt; started. Cannot VRFY user (for example, info is not local), but takes message for this user and attempts delivery.</td>
</tr>
<tr>
<td>253</td>
<td>OK, &lt;messages&gt; pending messages for node &lt;node&gt; started</td>
</tr>
<tr>
<td>354</td>
<td>Start mail input; end with &lt;CRLF,CRLF&gt;</td>
</tr>
<tr>
<td>355</td>
<td>Octet-offset is the transaction offset</td>
</tr>
<tr>
<td>421</td>
<td>&lt;domain&gt; Service not available, closing transmission channel (This can be a reply to any command if the service knows it must shut down.)</td>
</tr>
<tr>
<td>450</td>
<td>Requested mail action not taken: mailbox unavailable [for example, mailbox busy]</td>
</tr>
<tr>
<td>451</td>
<td>Requested action terminated: local error in processing</td>
</tr>
<tr>
<td>452</td>
<td>Requested action not taken: insufficient system storage</td>
</tr>
<tr>
<td>453</td>
<td>You have no mail.</td>
</tr>
<tr>
<td>454</td>
<td>TLS not available due to temporary reason. Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>458</td>
<td>Unable to queue messages for node &lt;node&gt;</td>
</tr>
<tr>
<td>459</td>
<td>Node &lt;node&gt; not allowed: reason</td>
</tr>
<tr>
<td>500</td>
<td>Syntax error, command unrecognized (This may include errors such as command line too long,)</td>
</tr>
<tr>
<td>501</td>
<td>Syntax error in parameters or arguments</td>
</tr>
<tr>
<td>502</td>
<td>Command not implemented</td>
</tr>
<tr>
<td>503</td>
<td>Bad sequence of commands</td>

<td>&lt;Machine&gt; does not accept mail.</td>
</tr>
<tr>
<td>530</td>
<td>Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>534</td>
<td>Authentication mechanism is too weak.</td>
</tr>
<tr>
<td>538</td>
<td>Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>Reply Code</td>
<td>Meaning</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>550</td>
<td>Requested action not taken: mailbox unavailable [for, mailbox not found, no access]</td>
</tr>
<tr>
<td>551</td>
<td>User not local; please try &lt;forward-path&gt;</td>
</tr>
<tr>
<td>552</td>
<td>Requested mail action terminated: exceeded storage allocation</td>
</tr>
<tr>
<td>553</td>
<td>Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]</td>
</tr>
<tr>
<td>554</td>
<td>Transaction failed</td>
</tr>
</tbody>
</table>
Exceptions

The table lists the exceptions that can be raised by the interface of the UTL_SMTP package. The network error is transferred to a reply code of 421 - service not available.

Table 234–5  UTL_SMTP Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_OPERATION</td>
<td>Raised when an invalid operation is made. In other words, calling API other than the WRITE_DATA Procedure, the WRITE_RAW_DATA Procedure or the CLOSE_DATA Function and Procedure after the OPEN_DATA Function and Procedure is called, or calling WRITE_DATA, WRITE_RAW_DATA or CLOSE_DATA without first calling OPEN_DATA.</td>
</tr>
<tr>
<td>TRANSIENT_ERROR</td>
<td>Raised when receiving a reply code in 400 range</td>
</tr>
<tr>
<td>PERMANENT_ERROR</td>
<td>Raised when receiving a reply code in 500 range</td>
</tr>
</tbody>
</table>
Rules and Limits

No limitation or range-checking is imposed by the API. However, you must be aware of the following size limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

<table>
<thead>
<tr>
<th>Table 234–6</th>
<th>SMTP Size Limitation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element</td>
<td>Size Limitation</td>
</tr>
<tr>
<td>user</td>
<td>Maximum total length of a user name is 64 characters</td>
</tr>
<tr>
<td>domain</td>
<td>Maximum total length of a domain name or number is 64 characters</td>
</tr>
<tr>
<td>path</td>
<td>Maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators)</td>
</tr>
<tr>
<td>command line</td>
<td>Maximum total length of a command line including the command word and the &lt;CRLF&gt; is 512 characters</td>
</tr>
<tr>
<td>reply line</td>
<td>Maximum total length of a reply line including the reply code and the &lt;CRLF&gt; is 512 characters</td>
</tr>
<tr>
<td>text line</td>
<td>Maximum total length of a text line including the &lt;CRLF&gt; is 1000 characters (but not counting the leading dot duplicated for transparency)</td>
</tr>
<tr>
<td>recipients buffer</td>
<td>Maximum total number of recipients that must be buffered is 100 recipients</td>
</tr>
</tbody>
</table>
The following example illustrates how UTL_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```sql
DECLARE
    c UTL_SMTP.CONNECTION;
    PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
    BEGIN
        UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
    END;
BEGIN
    c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
    UTL_SMTP.HELO(c, 'foo.com');
    UTL_SMTP.MAIL(c, 'sender@foo.com');
    UTL_SMTP.RCPT(c, 'recipient@foo.com');
    UTL_SMTP.OPEN_DATA(c);
    send_header('From',    '"Sender" <sender@foo.com>');
    send_header('To',      '"Recipient" <recipient@foo.com>');
    send_header('Subject', 'Hello');
    UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
    UTL_SMTP.CLOSE_DATA(c);
    UTL_SMTP.QUIT(c);
EXCEPTION
    WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
        BEGIN
            UTL_SMTP.QUIT(c);
        EXCEPTION
            WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
                NULL; -- When the SMTP server is down or unavailable, we don't have
                -- a connection to the server. The QUIT call raises an
                -- exception that we can ignore.
        END;
        raise_application_error(-20000, 'Failed to send mail due to the following error: ' || sqlerrm);
END;
```

---
### Summary of UTL_SMTP Subprograms

<table>

<td>Writes a portion of the e-mail message with RAW data</td>
</tr>
</tbody>
</table>
AUTH Function and Procedure

This subprogram sends the AUTH command to authenticate to the SMTP server. The UTL_SMTP package goes through the user’s choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported. To determine the schemes the SMTP server supports from its EHLO reply, the user must call the EHLO Function and Procedure. Otherwise, UTL_SMTP uses the first scheme in the list.

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

**Syntax**

```sql
UTL_SMTP.AUTH ( 
    c          IN OUT NOCOPY connection, 
    username   IN            VARCHAR2, 
    password   IN            VARCHAR2, 
    schemes    IN            VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES) 
RETURN reply;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>username</td>
<td>Username</td>
</tr>
<tr>
<td>password</td>
<td>Password</td>
</tr>
<tr>
<td>schemes</td>
<td>Space-separated list of authentication schemes UTL_SMTP is allowed to use in the preferred order. See the ALL_SCHEMES and NON_CLEARTEXT_PASSWORD_SCHEMES constants for suggestions.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- Currently only PLAIN, LOGIN and CRAM-MD5 authentication schemes are supported by UTL_SMTP.
Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the STARTTLS command (for example, adding PLAIN and LOGIN), the caller must call the EHLO Function and Procedure again for UTL_SMTP to update the list after the STARTTLS Function and Procedure is called.

Examples

DECLARE
c utl_smtp.connection;
BEGIN
c := utl_smtp.open_connection(
  host => 'smtp.example.com',
  port => 25,
  wallet_path => 'file:/oracle/wallets/smtp_wallet',
  wallet_password => 'password',
  secure_connection_before_smtp => FALSE);
UTL_SMTP.STARTTLS(c);
UTL_SMTP.AUTH(
  c => c,
  username => 'scott',
  password => 'password'
  schemes => utl_smtp.all_schemes);
END;
CLOSE_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session. To end the SMTP connection properly, use the QUIT Function and Procedure.

Syntax

```
UTL_SMTP.CLOSE_CONNECTION (c IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>
CLOSE_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence \(<CR><LF>.<CR><LF>\) (a single period at the beginning of a line).

Syntax

```
UTL_SMTP.CLOSE_DATA (  
    c     IN OUT NOCOPY connection)  
RETURN reply;
```

```
UTL_SMTP.CLOSE_DATA (  
    c     IN OUT NOCOPY connection);
```

Parameters

Table 234–11 CLOSE_DATA Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

Table 234–12 CLOSE_DATA Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

CLOSE_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.
COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

Syntax

```sql
UTL_SMTP.COMMAND (
    c     IN OUT NOCOPY    connection,
    cmd   IN               VARCHAR2,
    arg   IN               VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.COMMAND (
    c     IN OUT NOCOPY    connection,
    cmd   IN               VARCHAR2,
    arg   IN               VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>cmd</td>
<td>SMTP command to send to the server</td>
</tr>
<tr>
<td>arg</td>
<td>Optional argument to the SMTP argument. A space is inserted between cmd and arg.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

This function is used to invoke generic SMTP commands. Use COMMAND if only a single reply line is expected. Use COMMAND_REPLIES if multiple reply lines are expected.

For COMMAND, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.
COMMAND_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

Syntax

```
UTL_SMTP.COMMAND_REPLIES (  
    c     IN OUT NOCOPY    connection,  
    cmd   IN               VARCHAR2,  
    arg   IN               VARCHAR2 DEFAULT NULL)  
RETURN replies;
```

Parameters

Table 234–15 COMMAND_REPLIES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>cmd</td>
<td>SMTP command to send to the server</td>
</tr>
<tr>
<td>arg</td>
<td>Optional argument to the SMTP argument. A space is inserted between cmd and arg.</td>
</tr>
</tbody>
</table>

Return Values

Table 234–16 COMMAND_REPLIES Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY, REPLIES Record Types)</td>
</tr>
</tbody>
</table>

Usage Notes

This function is used to invoke generic SMTP commands. Use COMMAND if only a single reply line is expected. Use COMMAND_REPLIES if multiple reply lines are expected.

For COMMAND, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.
DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

Syntax

```
UTL_SMTP.DATA (  
    c     IN OUT NOCOPY connection  
    body  IN VARCHAR2 CHARACTER SET ANY_CS) 
RETURN reply;
```

```
UTL_SMTP.DATA (  
    c     IN OUT NOCOPY connection  
    body  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP Connection</td>
</tr>
<tr>
<td>body</td>
<td>Text of the message to be sent, including headers, in [RFC822] format</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a `<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>` to `<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The DATA subprogram must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL and RCPT have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial DATA command is not returned to the caller.
EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the EHLO command.

Syntax

```plsql
UTL_SMTP.EHLO (
    c       IN OUT NOCOPY connection,
    domain  IN)
RETURN replies;
```

Parameters

```
Table 234–19 EHLO Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>domain</td>
<td>Domain name of the local (sending) host. Used for identification purposes.</td>
</tr>
</tbody>
</table>
```

Return Values

```
Table 234–20 EHLO Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY, REPLIES Record Types).</td>
</tr>
</tbody>
</table>
```

Usage Notes

The EHLO interface is identical to HELO except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with HELO, each line of text returned by the server begins with status code 250.

Related Functions

HELO Function and Procedure
HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the HELO command.

Syntax

```sql
UTL_SMTP.HELO (  
    c       IN OUT NOCOPY   connection,  
    domain IN              VARCHAR2)  
RETURN reply;

UTL_SMTP.HELO (  
    c       IN OUT NOCOPY   connection,  
    domain IN              VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>domain</td>
<td>Domain name of the local (sending) host. Used for identification purposes.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to OPEN_CONNECTION Functions before calling this routine.

The expected response from the server is a message beginning with status code 250.

Related Functions

EHLO Function and Procedure
HELP Function

This function sends the HELP command.

Syntax

```sql
UTL_SMTP.HELP (  
    c         IN OUT NOCOPY   connection,  
    command   IN              VARCHAR2 DEFAULT NULL)  
RETURN replies;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>command</td>
<td>Command to get the help message</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY, REPLIES Record Types)</td>
</tr>
</tbody>
</table>
MAIL Function and Procedure

This subprogram initiate a mail transaction with the server. The destination is a mailbox.

Syntax

```
UTL_SMTP.MAIL (   
    c           IN OUT NOCOPY   connection,  
    sender      IN              VARCHAR2,  
    parameters  IN              VARCHAR2 DEFAULT NULL)  
RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>sender</td>
<td>E-mail address of the user sending the message.</td>
</tr>
<tr>
<td>parameters</td>
<td>Additional parameters to mail command as defined in Section 6 of [RFC1869]. It must follow the format of &quot;XXX=XXX (XXX=XXX ...)&quot;.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to RCPT and DATA to complete the transaction. The connection to the SMTP server must be open and a HELO or EHLO command must have already been sent.

The expected response from the server is a message beginning with status code 250.
NOOP Function and Procedure

This subprogram issues the NULL command.

Syntax

UTL_SMTP.NOOP (
    c  IN OUT NOCOPY connection)
RETURN reply;

Parameter

Table 234–27 NOOP Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

Table 234–28 NOOP Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with OPEN_CONNECTION. The NOOP command can be used to verify that the server is still connected and is listening properly.
- This command replies with a single line beginning with status code 250.
OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

---

**Note:** This functionality associated with **wallet_path**, **wallet_password** and **secure_connection_before_smtp** is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

Syntax

```sql
UTL_SMTP.OPEN_CONNECTION (  
    host                            IN  VARCHAR2,  
    port                            IN  PLS_INTEGER DEFAULT 25,  
    c                               OUT connection,  
    tx_timeout                      IN  PLS_INTEGER DEFAULT NULL,  
    wallet_path                     IN  VARCHAR2 DEFAULT NULL,  
    wallet_password                 IN  VARCHAR2 DEFAULT NULL,  
    secure_connection_before_smtp   IN  BOOLEAN DEFAULT FALSE)  
RETURN reply;
```

```sql
UTL_SMTP.OPEN_CONNECTION (  
    host                           IN  VARCHAR2,  
    port                           IN  PLS_INTEGER DEFAULT 25,  
    tx_timeout                     IN  PLS_INTEGER DEFAULT NULL,  
    wallet_path                    IN  VARCHAR2 DEFAULT NULL,  
    wallet_password                IN  VARCHAR2 DEFAULT NULL,  
    secure_connection_before_smtp  IN  BOOLEAN DEFAULT FALSE)  
RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>host</strong></td>
<td>Name of the SMTP server host</td>
</tr>
<tr>
<td><strong>port</strong></td>
<td>Port number on which SMTP server is listening (usually 25)</td>
</tr>
<tr>
<td><strong>c</strong></td>
<td>SMTP connection</td>
</tr>
<tr>
<td><strong>tx_timeout</strong></td>
<td>Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
<tr>
<td><strong>wallet_path</strong></td>
<td>Directory path that contains the Oracle wallet for SSL/TLS. The format is file: <code>&lt;directory-path&gt;</code></td>
</tr>
<tr>
<td><strong>wallet_password</strong></td>
<td>Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL.</td>
</tr>
<tr>
<td><strong>secure_connection_before_smtp</strong></td>
<td>If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made.</td>
</tr>
</tbody>
</table>
Return Values

<table>
<thead>
<tr>
<th>Table 234–30 OPEN_CONNECTION Functions Return Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return Value</td>
</tr>
<tr>
<td>reply</td>
</tr>
</tbody>
</table>

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of OPEN_CONNECTION that returns UTL_SMTP.CONNECTION record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of OPEN_CONNECTION that returns REPLY.
- tx_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx_timeout from governing write operations in the current release.

Examples

```sql
DECLARE
    c utl_smtp.connection;
BEGIN
    c := UTL_SMTP.OPEN_CONNECTION(
        host => 'smtp.example.com',
        port => 465,
        wallet_path => 'file:/oracle/wallets/smtp_wallet',
        wallet_password => 'password',
        secure_connection_before_smtp => TRUE);
END;
```
OPEN_DATA Function and Procedure

This subprogram sends the DATA command after which you can use WRITE_DATA and WRITE_RAW_DATA to write a portion of the e-mail message.

Syntax

```sql
UTL_SMTP.OPEN_DATA (  
    c     IN OUT NOCOPY connection)  
RETURN reply;
```

```sql
UTL_SMTP.OPEN_DATA (  
    c     IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>data</td>
<td>Portion of the text of the message to be sent, including headers, in RFC822 format.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

- OPEN_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

Syntax

UTL_SMTP.QUIT (c IN OUT NOCOPY connection)
RETURN reply;

Parameter

<p>| Table 234–33 QUIT Function and Procedure Parameters |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

<p>| Table 234–34 QUIT Function and Procedure Function Return Values |</p>
<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The QUIT command informs the SMTP server of the client’s intent to terminate the session. It then closes the connection established by OPEN_CONNECTION which must have been called before executing this command. If a mail transaction is in progress when QUIT is issued, it is canceled in the same manner as RSET.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields REMOTE_HOST and REMOTE_PORT of c are reset.

Related Functions

RSET Function and Procedure
RCPT Function

This subprogram specifies the recipient of an e-mail message.

Syntax

```sql
UTL_SMTP.RCPT (  
    c           IN OUT NOCOPY     connection,  
    recipient   IN                VARCHAR2,  
    parameters  IN                VARCHAR2 DEFAULT NULL)  
RETURN reply;
```

Return Values

Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.
RSET Function and Procedure

This subprogram terminates the current mail transaction.

Syntax

```plaintext
UTL_SMTP.RSET (  
    c  IN OUT NOCOPY connection)  
RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call RSET at any time after the connection to the SMTP server has been opened by means of OPEN_CONNECTION until DATA or OPEN_DATA is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.
- The server responds to RSET with a message beginning with status code 250.

Related Functions

QUIT Function and Procedure
STARTTLS Function and Procedure

This subprogram sends the STARTTLS command to secure the SMTP connection using SSL/TLS. SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the OPEN_CONNECTION Functions.

Syntax

```
UTL_SMTP.STARTTLS (c IN OUT NOCOPY connection)
RETURN reply;
```

```
UTL_SMTP.STARTTLS (c IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>SMTP reply</td>
</tr>
</tbody>
</table>

Usage Notes

The STARTTLS command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the EHLO command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the OPEN_CONNECTION function.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection{
    host => 'smtp.example.com',
    port => 25,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => FALSE};
  utl_smtp.starttls(c);
END
```
VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```
UTL_SMTP.VRFY (
    c          IN OUT NOCOPY connection
    recipient  IN VARCHAR2)
RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>recipient</td>
<td>E-mail address to be verified</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The server attempts to resolve the destination address recipient. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of OPEN_CONNECTION and HELO or EHLO before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.
WRITE_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to WRITE_DATA appends data to the e-mail message.

Syntax

UTL_SMTP.WRITE_DATA (  
  c     IN OUT NOCOPY connection,  
  data  IN VARCHAR2 CHARACTER SET ANY_CS);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>data</td>
<td>Portion of the text of the message to be sent, including headers, in [RFC822] format</td>
</tr>
</tbody>
</table>

Usage Notes

- The calls to the OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be made in the correct order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of <CR><LF>.<CR><LF> (single period) in the body to <CR><LF>.<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

- The OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be called only after OPEN_CONNECTION Functions, HELO Function and Procedure, or EHLO Function and Procedure, MAIL Function and Procedure, and RCPT Function have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

- Note that there is no function form of the WRITE_DATA Procedure because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA Function and Procedure.

- Text (VARCHAR2) data sent using WRITE_DATA is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension is negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL_RAW package, and then sending the RAW data using WRITE_RAW_DATA.
**WRITE_RAW_DATA Procedure**

This procedure writes a portion of the e-mail message. A repeat call to WRITE_RAW_DATA appends data to the e-mail message.

**Syntax**

```sql
UTL_SMTP.WRITE_RAW_DATA (  
c     IN OUT NOCOPY connection  
data  IN RAW);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>data</td>
<td>Portion of the text of the message to be sent, including headers, in [RFC822] format</td>
</tr>
</tbody>
</table>

**Usage Notes**

- The calls to the OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be made in the correct order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a `<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>` (single period) in the body to `<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

- The OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be called only after OPEN_CONNECTION Functions, HELO Function and Procedure, or EHLO Function and Procedure, MAIL Function and Procedure, and RCPT Function have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

- Note that there is no function form of the WRITE_DATA Procedure because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA Function and Procedure.
The UTL_SPADV package, one of a set of Oracle Streams packages, provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment. This package uses the Oracle Streams Performance Advisor to gather statistics.

This chapter contains the following topic:

- **Using UTL_SPADV**
  - Overview
  - Security Model
  - Operational Notes
- **Summary of UTL_SPADV Subprograms**

See Also: *Oracle Streams Concepts and Administration* for more information about this package and the Oracle Streams Performance Advisor
Using UTL_SPADV

- Overview
- Security Model
- Operational Notes
Overview

This package enables you to collect and analyze statistics about the performance or Oracle Streams components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Streams performance.

When this package is used on an Oracle Database 11g Release 2 (11.2) database, it can monitor Oracle Database 10g Release 2 (10.2) and later databases. It cannot monitor databases prior to release 10.2.

See Also: Oracle Streams Concepts and Administration
Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

See Also: Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator
Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Streams administrator and run the `utlspadv.sql` script in the `rdbms/admin` directory in `ORACLE_HOME`.

The `utlspadv.sql` script creates the following tables:

- `STREAMS$_PA_COMPONENT` Table
- `STREAMS$_PA_COMPONENT_LINK` Table
- `STREAMS$_PA_COMPONENT_PROP` Table
- `STREAMS$_PA_COMPONENT_STAT` Table
- `STREAMS$_PA_CONTROL` Table
- `STREAMS$_PA_DATABASE` Table
- `STREAMS$_PA_DATABASE_PROP` Table
- `STREAMS$_PA_MONITORING` Table
- `STREAMS$_PA_PATH_BOTTLENECK` Table
- `STREAMS$_PA_PATH_STAT` Table
- `STREAMS$_PA_SHOW_COMP_STAT` Table
- `STREAMS$_PA_SHOW_PATH_STAT` Table

The Oracle Streams Performance Advisor populates these tables when it is run.

**See Also:** Oracle Streams Concepts and Administration

**STREAMS$_PA_COMPONENT** Table

The `STREAMS$_PA_COMPONENT` table displays information about the Oracle Streams components at each database.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPONENT_ID</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Identification number assigned to the component by the Oracle Streams Performance Advisor</td>
</tr>
<tr>
<td>COMPONENT_NAME</td>
<td>VARCHAR2(194)</td>
<td></td>
<td>Name of the component</td>
</tr>
<tr>
<td>COMPONENT_DB</td>
<td>VARCHAR2(128)</td>
<td></td>
<td>Name of the database that contains the component</td>
</tr>
</tbody>
</table>
STREAMS$_PA_COMPONENT_LINK Table

The STREAMS$_PA_COMPONENT_LINK table displays information about how information flows between Oracle Streams components.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPONENT_TYPE</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Type of the component</td>

</tbody>
</table>

**STREAMS$_PA_COMPONENT_PROP Table**

For a capture process, the component properties include the following:

- SOURCE_DATABASE - The source database for the changes captured by the capture process
- PARALLELISM - The setting for the parallelism capture process parameter
- OPTIMIZATION_MODE - Indicates whether the capture process uses combined capture and apply (greater than zero) or does not use combined capture and apply (0)

For an apply process, the component properties include the following:

- SOURCE_DATABASE - The source database for the messages applied by the apply process
- PARALLELISM - The setting for the parallelism apply process parameter
- APPLY_CAPTURED - Indicates whether the apply process applies captured messages (YES) persistent messages (NO)
- MESSAGE_DELIVERY_MODE - Either buffered or persistent

</tr>
<tr>
<td>START_MONITORING Procedure</td>
<td>Starts a monitoring job.</td>
</tr>
<tr>
<td>STOP_MONITORING Procedure</td>
<td>Stops a monitoring job.</td>
</tr>
</tbody>
</table>
**ALTER_MONITORING Procedure**

This procedure alters the monitoring job submitted by the current user.

**Syntax**

```sql
UTL_SPADV.ALTER_MONITORING(
    interval                      IN NUMBER  DEFAULT NULL,
    top_event_threshold           IN NUMBER  DEFAULT NULL,
    bottleneck_idle_threshold     IN NUMBER  DEFAULT NULL,
    bottleneck_flowctrl_threshold IN NUMBER  DEFAULT NULL,
    retention_time                IN NUMBER  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. If NULL, then the current value is not changed.</td>
</tr>
<tr>
<td>top_event_threshold</td>
<td>A percentage that determines whether or not a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected. If NULL, then the current value is not changed.</td>
</tr>
<tr>
<td>bottleneck_idle_threshold</td>
<td>A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed.</td>
</tr>
<tr>
<td>bottleneck_flowctrl_threshold</td>
<td>A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed.</td>
</tr>
<tr>
<td>retention_time</td>
<td>The number of hours to retain monitoring results. If NULL, then the current value is not changed.</td>
</tr>
</tbody>
</table>
### Exceptions

**Table 235–15  ALTER_MONITORING Procedure Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20113</td>
<td>no active monitoring job found</td>
</tr>
</tbody>
</table>
COLLECT_STATS Procedure

This procedure uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

Note: This procedure commits.

See Also: Oracle Streams Concepts and Administration for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.COLLECT_STATS(
  interval                      IN NUMBER  DEFAULT 60,
  num_runs                      IN NUMBER  DEFAULT 10,
  comp_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
  path_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
  top_event_threshold           IN NUMBER  DEFAULT 15,
  bottleneck_idle_threshold     IN NUMBER  DEFAULT 50,
  bottleneck_flowctrl_threshold IN NUMBER  DEFAULT 50);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.</td>
</tr>
<tr>
<td>num_runs</td>
<td>The number of times that the Oracle Streams Performance Advisor is run by the procedure.</td>
</tr>
<tr>
<td>comp_stat_table</td>
<td>The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as [schema_name.]object_name. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table STREAMS$_ADVISOR_COMP_STAT. See &quot;Usage Notes&quot; on page 235-19 for more information about this parameter.</td>
</tr>
<tr>
<td>path_stat_table</td>
<td>The name of the table that stores the statistics collected for stream paths. Specify the table name as [schema_name.]object_name. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table STREAMS$_ADVISOR_PATH_STAT. See &quot;Usage Notes&quot; on page 235-19 for more information about this parameter.</td>
</tr>
</tbody>
</table>
### Usage Notes

The table specified in the `path_stat_table` parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the `comp_stat_table` parameter. The `SHOW_STATS` procedure in this package shows only the statistics stored in the table specified in the `path_stat_table` parameter.

---

**Table 235–16 (Cont.) COLLECT_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>top_event_threshold</code></td>
<td>A percentage that determines whether or not a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.</td>
</tr>
<tr>
<td><code>bottleneck_idle_threshold</code></td>
<td>A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</td>

<tr>
<td><code>bottleneck_flowctrl_threshold</code></td>
<td>A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</td>
</tr>
</tbody>
</table>
IS_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns TRUE if a monitoring job is currently running or FALSE if a monitoring job is not currently running.

A monitoring job is submitted using the START_MONITORING procedure.

See Also: "START_MONITORING Procedure" on page 235-24

Syntax

```
UTL_SPADV.IS_MONITORING(
    job_name    IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
    client_name IN VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

```
Table 235–17  IS_MONITORING Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job for which to check.</td>
</tr>
<tr>
<td>client_name</td>
<td>The name of the client that submitted the job.</td>
</tr>
</tbody>
</table>
```
SHOW_STATS Procedure

This procedure generates output that includes the statistics gathered by the COLLECT_STATS and START_MONITORING procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

---

**Note:** This procedure does not commit.

---

**See Also:**
- "COLLECT_STATS Procedure" on page 235-18
- "START_MONITORING Procedure" on page 235-24
- Oracle Streams Concepts and Administration for more information about the Oracle Streams Performance Advisor

**Syntax**

```sql
UTL_SPADV.SHOW_STATS(
    path_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
    path_id           IN NUMBER    DEFAULT NULL,
    bgn_run_id        IN NUMBER    DEFAULT -1,
    end_run_id        IN NUMBER    DEFAULT -10,
    show_path_id      IN BOOLEAN   DEFAULT TRUE,
    show_run_id       IN BOOLEAN   DEFAULT TRUE,
    show_run_time     IN BOOLEAN   DEFAULT TRUE,
    show_optimization IN BOOLEAN   DEFAULT TRUE,
    show_setting      IN BOOLEAN   DEFAULT FALSE,
    show_stat         IN BOOLEAN   DEFAULT TRUE,
    show_sess         IN BOOLEAN   DEFAULT FALSE,
    show_legend       IN BOOLEAN   DEFAULT TRUE);
```

**Parameters**

**Table 235–18 SHOW_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path_stat_table</td>
<td>The name of the table that contains the stream path statistics. Specify the table name as <code>[schema_name.]object_name</code>. If the schema is not specified, then the current user is the default. When you gather statistics using the COLLECT_STATS procedure, this table is specified in the path_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS$_ADVISOR_PATH_STAT. When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS$_PA_MONITORING view. The default table for a monitoring job is STREAMS$_PA_SHOW_PATH_STAT.</td>
</tr>
<tr>
<td>path_id</td>
<td>A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.</td>
</tr>
</tbody>
</table>
**SHOW_STATS Procedure**

**Usage Notes**

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Streams Performance Advisor runs that you want to display. Positive numbers show
statistics from the an earlier run forward. Negative numbers show statistics from the a
later run backward.

For example, if \texttt{bgn\_run\_id} is set to 1 and \texttt{end\_run\_id} is set to 10, then the
procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.
However, if \texttt{bgn\_run\_id} is set to \texttt{-1} and \texttt{end\_run\_id} is set to \texttt{-10}, then the
procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

\textbf{See Also:} Oracle Streams Concepts and Administration for information
about the combined capture and apply optimization
START_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the COLLECT_STATS procedure to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

Note: This procedure commits.

See Also:
- "COLLECT_STATS Procedure" on page 235-18
- Oracle Streams Concepts and Administration for more information about the Oracle Streams Performance Advisor

Syntax

```sql
UTL_SPADV.START_MONITORING(
    job_name                      IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
    client_name                   IN VARCHAR2  DEFAULT NULL,
    query_user_name               IN VARCHAR2  DEFAULT NULL,
    interval                      IN NUMBER    DEFAULT 60,
    top_event_threshold           IN NUMBER    DEFAULT 15,
    bottleneck_idle_threshold     IN NUMBER    DEFAULT 50,
    bottleneck_flowctrl_threshold IN NUMBER    DEFAULT 50,
    retention_time                IN NUMBER    DEFAULT 24);
```

Exceptions

Table 235–20 START_MONITORING Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20111</td>
<td>cannot start monitoring due to active EM monitoring job</td>
</tr>
<tr>
<td></td>
<td>Stop the Enterprise Manager (EM) monitoring job, and run the START_MONITORING procedure again.</td>
</tr>
<tr>
<td>ORA-20112</td>
<td>cannot start monitoring due to active Streams monitoring job</td>
</tr>
<tr>
<td></td>
<td>Stop the Streams monitoring job, and run the START_MONITORING procedure again.</td>
</tr>
</tbody>
</table>

Usage Notes

The following are usage notes for the START_MONITORING procedure:

- **Requirements for the User Running the Procedure**
- **Full Monitoring Job Names**
- **Restrictions on Monitoring Jobs**

Requirements for the User Running the Procedure

The user who runs the START_MONITORING procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Streams components.
- The user must have been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure.
Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table shows examples of full monitoring job names:

<table>
<thead>
<tr>
<th>Setting for client_name Parameter</th>
<th>Setting for job_name parameter</th>
<th>Full Monitoring Job Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>STREAMS$$<em>MONITORING</em> JOB</td>
<td>STREAMS$$<em>MONITORING</em> JOB</td>
</tr>
<tr>
<td>EM</td>
<td>STREAMS$$<em>MONITORING</em> JOB</td>
<td>EMSTREAMS$$<em>MONITORING</em> JOB</td>
</tr>
<tr>
<td>strm</td>
<td>STREAMS$$<em>MONITORING</em> JOB</td>
<td>strmSTREAMS$$<em>MONITORING</em> JOB</td>
</tr>
<tr>
<td>strm</td>
<td>mjob1</td>
<td>strmjob1</td>
</tr>
</tbody>
</table>

Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$$_MONITORING_ JOB` and `STRMSTREAMS$$_MONITORING_ JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.
STOP_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

Syntax

```sql
UTL_SPADV.STOP_MONITORING(
    purge IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>purge</td>
<td>If TRUE, then the procedure purges information about the monitoring job from the result tables. If FALSE, then the procedure retains information about the monitoring job in the result tables.</td>
</tr>
</tbody>
</table>
With the UTL_TCP package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- Using UTL_TCP
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Rules and Limits
  - Examples
- Summary of UTL_TCP Subprograms
Using UTL_TCP

- Overview
- Security Model
- Types
- Exceptions
- Rules and Limits
- Examples
Overview

The UTL_TCP package provides TCP/IP client-side access functionality in PL/SQL.
Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information about managing fine-grained access, see Oracle Database Security Guide
Types

- CONNECTION Type
- CRLF

CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.

Syntax

```plsql
TYPE connection IS RECORD (
  remote_host    VARCHAR2(255),
  remote_port    PLS_INTEGER,
  local_host     VARCHAR2(255),
  local_port     PLS_INTEGER,
  charset        VARCHAR2(30),
  newline        VARCHAR2(2),
  tx_timeout     PLS_INTEGER,
  private_sd     PLS_INTEGER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_host</td>
<td>Name of the remote host when connection is established. NULL when no connection is established.</td>
</tr>
<tr>
<td>remote_port</td>
<td>Port number of the remote host connected. NULL when no connection is established.</td>
</tr>
<tr>
<td>local_host</td>
<td>Name of the local host used to establish the connection. NULL when no connection is established.</td>
</tr>
<tr>
<td>local_port</td>
<td>Port number of the local host used to establish the connection. NULL when no connection is established.</td>
</tr>
<tr>
<td>charset</td>
<td>The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network.</td>
</tr>
<tr>
<td>newline</td>
<td>Newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>

Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using OPEN_CONNECTION. Changing the values of those fields
has no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields are not set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the `UTL_TCP` package.

**CRLF**

The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

**Syntax**

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

**Usage Notes**

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.
Exceptions

The exceptions raised by the TCP/IP package are listed in Table 236–2.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER_TOO_SMALL</td>
<td>Buffer is too small for input that requires look-ahead</td>
</tr>
<tr>
<td>END_OF_INPUT</td>
<td>Raised when no more data is available to read from the connection</td>
</tr>
<tr>
<td>NETWORK_ERROR</td>
<td>Generic network error</td>
</tr>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument passed in an API call (for example, a negative buffer size)</td>
</tr>
<tr>
<td>TRANSFER_TIMEOUT</td>
<td>No data is read and a read time out occurred</td>
</tr>
<tr>
<td>PARTIAL_MULTIBYTE_CHAR</td>
<td>No complete character is read and a partial multibyte character is found at the end of the input</td>
</tr>
</tbody>
</table>
Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.
Examples

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```plsql
DECLARE
  c utl_tcp.connection;  -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                             remote_port => 80,
                             charset     => 'US7ASCII');  -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0');    -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  LOOP
    dbms_output.put_line(utl_tcp.get_line(c, TRUE));  -- read result
  END LOOP;
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      NULL; -- end of input
  END;
  utl_tcp.close_connection(c);
END;
```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```plsql
PROCEDURE send_mail (sender IN VARCHAR2,
                      recipient IN VARCHAR2,
                      message IN VARCHAR2)
IS
  mailhost   VARCHAR2(30) := 'mailhost.mydomain.com';
  smtp_error EXCEPTION;
  mail_conn   utl_tcp.connection;
  PROCEDURE smtp_command(command IN VARCHAR2,
                           ok      IN VARCHAR2 DEFAULT '250')
  IS
    response varchar2(3);
    len pls_integer;
  BEGIN
    len := utl_tcp.write_line(mail_conn, command);
    response := substr(utl_tcp.get_line(mail_conn), 1, 3);
    IF (response <> ok) THEN
      RAISE smtp_error;
    END IF;
  END;
BEGIN
  mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                        remote_port => 25,
                                        charset     => 'US7ASCII');
  smtp_command('HELO ' || mailhost);
  smtp_command('MAIL FROM: ' || sender);
  smtp_command('RCPT TO: ' || recipient);
  smtp_command('DATA', '354');  -- send body
  smtp_command(message);
END;
```

smtp_command('QUIT', '221');
utl_tcp.close_connection(mail_conn);
EXCEPTION
  WHEN OTHERS THEN
    -- Handle the error
END;
### Summary of UTL_TCP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>

<td>Transmits a text message to a service on an open connection</td>
</tr>
</tbody>
</table>
AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```
UTL_TCP.AVAILABLE (  
  c        IN OUT NOCOPY connection,  
  timeout  IN PLS_INTEGER DEFAULT 0)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to determine the amount of data that is available to be read</td>
</tr>
<tr>
<td>timeout</td>
<td>Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>

Return Values

The number of bytes available for reading without blocking

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the END_OF_INPUT exception.

The following example illustrates using this function in a portable manner:

```plaintext
DECLARE  
  c   utl_tcp.connection  
  data VARCHAR2(256);  
  len  PLS_INTEGER;  
BEGIN  
  c := utl_tcp.open_connection(...);  
  LOOP  
    IF (utl_tcp.available(c) > 0) THEN  
      len := utl_tcp.read_text(c, data, 256);  
    ELSE  
      ---do some other things  
      . . . .  
    END IF  
  END LOOP;
```
END LOOP;
END;
CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

Usage Notes

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.
CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

```
UTL_TCP.CLOSE_CONNECTION (
    c IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to close</td>
</tr>
</tbody>
</table>

Usage Notes

Connection must have been opened by a previous call to OPEN_CONNECTION. The fields `remote_host`, `remote_port`, `local_host`, `local_port` and `charset` of `c` are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.
FLUSH Procedure

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

Syntax

```sql
UTL_TCP.FLUSH (  
  c IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
</tbody>
</table>

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. 
**GET_LINE Function**

This function returns the line of data read.

**Syntax**

```sql
UTL_TCP.GET_LINE (  
c           IN OUT NOCOPY connection,  
remove_crlf IN            BOOLEAN DEFAULT FALSE,  
peek        IN            BOOLEAN DEFAULT FALSE)  
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one ore more trailing CRLF characters are removed from the received message.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

**Return Values**

The text line read

**Usage Notes**

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.
GET_LINE_NCHAR Function

This function returns the line of data read in NCHAR form.

Syntax

```sql
UTL_TCP.GET_LINE_NCHAR (  
  c           IN OUT NOCOPY connection,  
  remove_crlf IN            BOOLEAN DEFAULT FALSE,  
  peek        IN            BOOLEAN DEFAULT FALSE)  
RETURN NVARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one ore more trailing CRLF characters are removed from the received message.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.
GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```sql
UTL_TCP.GET_RAW ( 
  c     IN OUT NOCOPY connection, 
  len   IN            PLS_INTEGER DEFAULT 1, 
  peek  IN            BOOLEAN     DEFAULT FALSE) 
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one ore more trailing CRLF characters are removed from the received message.</td>
</tr>
</tbody>
</table>

Return Values

The binary data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.
GET_TEXT Function

This function returns the text data read.

Syntax

```
UTL_TCP.GET_TEXT (    
    c IN OUT NOCOPY connection,
    len IN     PLS_INTEGER DEFAULT 1,
    peek IN    BOOLEAN     DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>len</td>
<td>Number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

| remove_crlf | If TRUE, then one ore more trailing CRLF characters are removed from the received message. |

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.
GET_TEXT_NCHAR Function

This function returns the text data read in NCHAR form.

Syntax

```
UTL_TCP.GET_TEXT_NCHAR (  
    c    IN OUT NOCOPY connection,  
    len  IN            PLS_INTEGER DEFAULT 1,  
    peek IN            BOOLEAN     DEFAULT FALSE)  
RETURN NVARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one or more trailing CRLF characters are removed from the received message.</td>
</tr>
</tbody>
</table>

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.
OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

---

**Note:** The functionality associated with `wallet_path` and `wallet_password` is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

**Syntax**

```sql
UTL_TCP.OPEN_CONNECTION  (
  remote_host          IN VARCHAR2,
  remote_port          IN PLS_INTEGER,
  local_host           IN VARCHAR2 DEFAULT NULL,
  local_port           IN PLS_INTEGER DEFAULT NULL,
  in_buffer_size       IN PLS_INTEGER DEFAULT NULL,
  out_buffer_size      IN PLS_INTEGER DEFAULT NULL,
  charset              IN VARCHAR2 DEFAULT NULL,
  newline              IN VARCHAR2 DEFAULT CRLF,
  tx_timeout           IN PLS_INTEGER DEFAULT NULL,
  wallet_path          IN  VARCHAR2 DEFAULT NULL,
  wallet_password      IN  VARCHAR2 DEFAULT NULL,
RETURN connection;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_host</td>
<td>Name of the host providing the service. When <code>remote_host</code> is <code>NULL</code>, it connects to the local host.</td>
</tr>
<tr>
<td>remote_port</td>
<td>Port number on which the service is listening for connections.</td>
</tr>
<tr>
<td>local_host</td>
<td>Name of the host providing the service. <code>NULL</code> means does not care.</td>
</tr>
<tr>
<td>local_port</td>
<td>Port number on which the service is listening for connections. <code>NULL</code> means don’t care.</td>
</tr>
<tr>
<td>in_buffer_size</td>
<td>The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A <code>NULL</code> value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.</td>
</tr>
<tr>
<td>out_buffer_size</td>
<td>The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A <code>NULL</code> value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.</td>
</tr>
</tbody>
</table>
Return Values

A connection to the targeted TCP/IP service

Usage Notes

■ Note that connections opened by this UTL_TCP package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

■ In the current release of the UTL_TCP package, the parameters local_host and local_port are ignored when open_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local_host and local_port fields is not set in the connection record returned by the function.

■ tx_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx_timeout from governing write operations in the current release.

Examples

DECLARE
    c UTL_TCP.CONNECTION;
BEGIN
    c := UTL_TCP.OPEN_CONNECTION(
        host => 'www.example.com',
        port => 443,
        wallet_path => 'file:/oracle/wallets/smtp_wallet',
        wallet_password => '****');
UTL_TCP.SECURE_CONNECTION (c => c);
END;
**READ_LINE Function**

This function receives a text line from a service on an open connection. A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

**Syntax**

```
UTL_TCP.READ_LINE (  
  c           IN OUT NOCOPY connection,  
  data        IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,  
  peek        IN            BOOLEAN DEFAULT FALSE)  
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>data</td>
<td>Data received.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one ore more trailing CRLF characters are removed from the received message.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

**Return Values**

The number of characters of data received

**Usage Notes**

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of
the character have not arrived and read time out occurs, then the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.
READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```plsql
UTL_TCP.READ_RAW (  
c     IN OUT NOCOPY connection,  
data  IN OUT NOCOPY RAW,  
len   IN            PLS_INTEGER DEFAULT 1,  
peek  IN            BOOLEAN     DEFAULT FALSE)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>data</td>
<td>Data received</td>
</tr>
<tr>
<td>len</td>
<td>Number of bytes of data to receive</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The number of bytes of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.
**READ_TEXT Function**

This function receives text data from a service on an open connection.

**Syntax**

```
UTL_TCP.READ_TEXT (    
c    IN OUT NOCOPY connection,    
data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,    
len IN            PLS_INTEGER DEFAULT 1,    
peek IN            BOOLEAN     DEFAULT FALSE)    
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>data</td>
<td>Data received</td>
</tr>
<tr>
<td>len</td>
<td>Number of characters of data to receive</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

**Return Values**

The number of characters of data received

**Usage Notes**

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a VARCHAR2 buffer is specified in terms of bytes, while the parameter len refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the VARCHAR2 buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.
If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.
SECURE_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS. SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the OPEN_CONNECTION Function.

Syntax

```
UTL_TCP.SECURE_CONNECTION (
    c    IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
</tbody>
</table>
WRITE_LINE Function

This function transmits a text line to a service on an open connection. The newline character sequence is appended to the message before it is transmitted.

Syntax

```sql
UTL_TCP.WRITE_LINE (  
    c    IN OUT NOCOPY connection,  
    data IN            VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
<tr>
<td>data</td>
<td>Buffer containing the data to be sent</td>
</tr>
</tbody>
</table>

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.
WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```sql
UTL_TCP.WRITE_RAW (  
c    IN OUT NOCOPY connection,  
data IN            RAW,  
len  IN            PLS_INTEGER DEFAULT NULL)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
<tr>
<td>data</td>
<td>Buffer containing the data to be sent</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes of data to transmit. When <code>len</code> is <code>NULL</code>, the whole length of data is written.</td>
</tr>
</tbody>
</table>

Return Values

The number of bytes of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. 
WRITE_TEXT Function

This function transmits a text message to a service on an open connection.

Syntax

```
UTL_TCP.WRITE_TEXT (
  c    IN OUT NOCOPY connection,
  data IN VARCHAR2 CHARACTER SET ANY_CS,
  len  IN PLS_INTEGER DEFAULT NULL)
RETURN num_chars PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
<tr>
<td>data</td>
<td>Buffer containing the data to be sent</td>
</tr>
<tr>
<td>len</td>
<td>The number of characters of data to transmit. When len is NULL, the whole length of data is written. The actual amount of data written may be less because of network condition.</td>
</tr>
</tbody>
</table>

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.
The UTL_URL package has two functions: ESCAPE and UNESCAPE.

This chapter contains the following topics:

- Using UTL_URL
  - Overview
  - Exceptions
  - Examples
- Summary of UTL_URL Subprograms
Using UTL_URL

- Overview
- Exceptions
- Examples
Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP). For example, the URL for Oracle's Web site is:

http://www.oracle.com

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the unreserved characters. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign ($), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the reserved characters. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent (‘), left parenthesis ( ), right parenthesis ( )

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), percentage sign (%), and comma (,)

The UTL_URL package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used fetch a Web page by way of the UTL_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

http://www.w3.org/TR/html
Table 237–1 lists the exceptions that can be raised when the `UTL_URL` package API is invoked.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_URL</td>
<td>29262</td>
<td>The URL contains badly formed escape code sequences</td>
</tr>
<tr>
<td>BAD_FIXED_WIDTH_CHARSET</td>
<td>29274</td>
<td>Fixed-width multibyte character set is not allowed as a URL char</td>
</tr>
</tbody>
</table>

Examples

You can implement the x-www-form-urlencoded encoding using the UTL_URL.ESCAPE function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (   
data    IN VARCHAR2,   
charset IN VARCHAR2) RETURN VARCHAR2 AS   
BEGIN   
  RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE   
END;
```

For decoding data encoded with the form-URL-encode scheme, the following function implements the decoding scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode(   
data    IN VARCHAR2,   
charset IN VARCHAR2) RETURN VARCHAR2 AS   
BEGIN   
  RETURN utl_url.unescape(   
    replace(data, '+', ' '),   
    charset);   
END;
```
## Summary of UTL_URL Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ESCAPE Function</strong> on page 237-7</td>
<td>Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format</td>
</tr>
<tr>
<td><strong>UNESCAPE Function</strong> on page 237-9</td>
<td>Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters</td>
</tr>
</tbody>
</table>
ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

Syntax

```
UTL_URL.ESCAPE (  
    url                   IN VARCHAR2 CHARACTER SET ANY_CS,  
    escape_reserved_chars IN BOOLEAN  DEFAULT  FALSE,  
    url_charset           IN VARCHAR2 DEFAULT  utl_http.body_charset)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The original URL</td>
</tr>
<tr>
<td>escape_reserved_chars</td>
<td>Indicates whether the URL reserved characters should be escaped. If set to TRUE, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is FALSE.</td>
</tr>
<tr>
<td>url_charset</td>
<td>When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If url_charset is NULL, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the UTL_HTTP package, whose default value is ISO-8859-1. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tild (~), asterisk (*), accent (’), left parenthesis ( ( ), right parenthesis ( ) )

The reserved characters consist of:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using escape_url. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An escape_url cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair $logon=scott/tiger into the query string of a URL, escape the $ and / separately as %24logon=scott%2Ftiger and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:
utl_url.escape('http://www.acme.com/a url with space.html')

Returns:
http://foo.com/a%20url%20with%20space.html

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with escape_reserved_chars set to TRUE) and then concatenate it with the rest of the URL. For example:

url := 'http://www.acme.com/search?check=' || utl_url.escape('Is the use of the "$" sign okay?', TRUE);

This expression escapes the question mark (?), dollar sign ($), and space characters in 'Is the use of the "$" sign okay?' but not the ? after search in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using US7ASCII so that a space is escaped as %20 (hex code of a space in ASCII) instead of %40 (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.
UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the \%XX escape character sequences to the original characters.

Syntax

```
UTL_URL.UNESCAPE (
    url            IN VARCHAR2 CHARACTER SET ANY_CS,
    url_charset    IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

Parameters

Table 237–4  UNESCAPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL to unescape</td>
</tr>
<tr>
<td>url_charset</td>
<td>After a character is unescaped, the character is assumed to be in the source_charset character set and it will be converted from the source_charset to the database character set before the URL is returned. If source_charset is NULL, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the UTL_HTTP package, whose default value is &quot;ISO-8859-1&quot;. The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.</td>
</tr>
</tbody>
</table>

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using US7ASCII so that \%20 is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a ? (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.
The WPG_DOCLOAD package provides an interface to download files, BLOBs and BFILEs.

## Summary of WPG_DOCLOAD Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOWNLOAD_FILE Procedures</td>
<td>Downloads files, BLOBs and BFILES</td>
</tr>
<tr>
<td>on page 238-5</td>
<td></td>
</tr>
</tbody>
</table>
DOWNLOAD_FILE Procedures

There are three versions of this procedure:

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that p_filename is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that p_blob is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that p_bfile is to be downloaded to the client's browser.

Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE(
    p_filename      IN             VARCHAR2,
    p_bcaching      IN             BOOLEAN DEFAULT TRUE);

WPG_DOCLOAD.DOWNLOAD_FILE(
    p_blob          IN OUT NOCOPY  BLOB);

WPG_DOCLOAD.DOWNLOAD_FILE(
    p_bfile         IN OUT         BFILE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_filename</td>
<td>The file to download from the document table.</td>
</tr>
<tr>
<td>p_blob</td>
<td>The BLOB to download.</td>
</tr>
<tr>
<td>p_bfile</td>
<td>The BFILE to download (see Usage Notes).</td>
</tr>
<tr>
<td>p_bcaching</td>
<td>Whether browser caching is enabled (see Usage Notes).</td>
</tr>
</tbody>
</table>

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the p_bcaching parameter should be set to FALSE to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.
- p_bfile and p_blob are declared as IN OUT because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.
An ANYDATA TYPE contains an instance of a given type, plus a description of the type. In this sense, an ANYDATA is self-describing. An ANYDATA can be persistently stored in the database.

This chapter contains the following topics:

- Using ANYDATA TYPE
  - Restrictions
  - Operational Notes
- Summary of ANYDATA Subprograms
Using ANYDATA TYPE

- Restrictions
- Operational Notes
Restrictions

Persistent storage of ANYDATA instances whose type contains embedded LOBs other than BFILEs is not currently supported.
Operational Notes

- Construction
- Access

Construction

There are 2 ways to construct an ANYDATA. The CONVERT* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

```
STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBFile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(f1 IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(invIN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNChar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,
```

The second way to construct an ANYDATA is a piece by piece approach. The BEGINCREATE Static Procedure call begins the construction process and ENDCREATE Member Procedure call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET* calls. For piece by piece access of the attributes of objects and elements of collections, the PIECEWISE Member Procedure should be invoked prior to GET* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of
these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH TIMEZONE,
MEMBER FUNCTION AccessURowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
### Summary of ANYDATA Subprograms

<table>
<thead>
<tr>
<th>Table 239–1  ANYDATA Type Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
</tr>
<tr>
<td>BEGINCREATE Static Procedure on page 239-7</td>
</tr>
<tr>
<td>ENDCREATE Member Procedure on page 239-8</td>
</tr>
<tr>
<td>GET* Member Functions on page 239-9</td>
</tr>
<tr>
<td>GETTYPE Member Function on page 239-12</td>
</tr>
<tr>
<td>GETTYPENAME Member Function on page 239-13</td>
</tr>
<tr>
<td>PIECEWISE Member Procedure on page 239-14</td>
</tr>
<tr>
<td>SET* Member Procedures on page 239-15</td>
</tr>
</tbody>
</table>
BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```plaintext
STATIC PROCEDURE BeginCreate(
    dtype          IN OUT NOCOPY AnyType,
    adata          OUT NOCOPY ANYDATA);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtype</td>
<td>The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)</td>
</tr>
<tr>
<td>adata</td>
<td>ANYDATA being constructed.</td>
</tr>
</tbody>
</table>

Exception

DBMS_TYPES.INVALID_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call PIECEWISE immediately after this call. The construction process begins in a piece-wise manner automatically.
**ENDCREATE Member Procedure**

This procedure ends creation of an **ANYDATA**. Other creation functions cannot be called after this call.

**Syntax**

```plaintext
MEMBER PROCEDURE EndCreate(
    self    IN OUT NOCOPY ANYDATA);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An <strong>ANYDATA</strong>.</td>
</tr>
</tbody>
</table>
GET* Member Functions

These functions get the current data value (which should be of appropriate type). The type of the current data value depends on the MODE with which we are accessing (depending on whether we have invoked the PIECEWISE call).

If PIECEWISE has NOT been called, we are accessing the ANYDATA in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, we are accessing the ANYDATA piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

MEMBER FUNCTION GetBDouble(
    self    IN ANYDATA,
    dbl    OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBfile(
    self    IN ANYDATA,
    b       OUT NOCOPY BFILE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBFloat(
    self    IN ANYDATA,
    fl      OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBlob(
    self    IN ANYDATA,
    b       OUT NOCOPY BLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetChar(
    self    IN ANYDATA,
    c       OUT NOCOPY CHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetClob(
    self    IN ANYDATA,
    c       OUT NOCOPY CLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetCollection(
    self    IN ANYDATA,
    col     OUT NOCOPY "<collection_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GetDate(
    self    IN ANYDATA,
    dat     OUT NOCOPY DATE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
    self    IN ANYDATA,
    inv     OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN PLS_INTEGER;
MEMBER FUNCTION GetIntervalYM(
    self         IN ANYDATA,
    inv          OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNchar(
    self         IN ANYDATA,
    nc           OUT NOCOPY NCHAR)
RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNClob(
    self         IN ANYDATA,
    nc           OUT NOCOPY NCLOB)
RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNumber(
    self         IN ANYDATA,
    num          OUT NOCOPY NUMBER)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
    self         IN ANYDATA,
    nc           OUT NOCOPY NVARCHAR2)
RETURN         PLS_INTEGER;

MEMBER FUNCTION GetObject(
    self         IN ANYDATA,
    obj          OUT NOCOPY '<object_type>'
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRaw(
    self         IN ANYDATA,
    r            OUT NOCOPY RAW)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRef(
    self         IN ANYDATA,
    rf           OUT NOCOPY REF '<object_type>'
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetTimestamp(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
    self         IN ANYDATA,
    c            OUT NOCOPY VARCHAR)
RETURN       PLS_INTEGER;
MEMBER FUNCTION GetVarchar2{
    self IN ANYDATA,
    c OUT NOCOPY VARCHAR2)
RETURN PLS_INTEGER;

Parameters

Table 239–4 GET* Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>num</td>
<td>The number to be obtained.</td>
</tr>
</tbody>
</table>

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

MEMBER FUNCTION GETTYPE(
    self          IN ANYDATA,
    typ           OUT NOCOPY AnyType
) RETURN        PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>typ</td>
<td>The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.</td>
</tr>
</tbody>
</table>

Return Values

The typecode corresponding to the type of the ANYDATA.
GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return `schema_name.type_name`, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```sql
MEMBER FUNCTION GETTYPENAME(
    self         IN ANYDATA)
RETURN       VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
</tbody>
</table>

Return Values

Type name of the ANYDATA.
PIECEWISE Member Procedure

This procedure sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to SET* and GET* will sequentially obtain individual attributes or collection elements.

Syntax

MEMBER PROCEDURE PIECEWISE(
  self         IN OUT NOCOPY ANYDATA);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The current data value.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS
- DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an OBJECT or COLLECTION type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.
SET* Member Procedures

Sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

MEMBER PROCEDURE SETBDOUBLE(
    self        IN  OUT NOCOPY ANYDATA,
    dbl         IN  BINARY_DOUBLE,
    last_elem   IN  boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self        IN  OUT NOCOPY ANYDATA,
    b           IN  BFILE,
    last_elem   IN  boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
    self        IN  OUT NOCOPY ANYDATA,
    fl          IN  BINARY_FLOAT,
    last_elem   IN  boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self        IN  OUT NOCOPY ANYDATA,
    b           IN  BLOB,
    last_elem   IN  boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self        IN  OUT NOCOPY ANYDATA,
    c           IN  CHAR,
    last_elem   IN  boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
    self        IN  OUT NOCOPY ANYDATA,
    c           IN  CLOB,
    last_elem   IN  boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self        IN  OUT NOCOPY ANYDATA,
    col         IN  '<collection_type>',
    last_elem   IN  boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self        IN  OUT NOCOPY ANYDATA,
    dat         IN  DATE,
    last_elem   IN  boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self        IN  OUT NOCOPY ANYDATA,
    inv         IN  INTERVAL DAY TO SECOND,
    last_elem   IN  boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self        IN  OUT NOCOPY ANYDATA,
    inv         IN  INTERVAL YEAR TO MONTH,
    last_elem   IN  boolean DEFAULT FALSE);
MEMBER PROCEDURE SETNCHAR(
    self        IN OUT NOCOPY ANYDATA,
    nc          IN NCHAR,
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
    self        IN OUT NOCOPY ANYDATA,
    nc          IN Nclob,
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
    self        IN OUT NOCOPY ANYDATA,
    num         IN NUMBER,
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
    self        IN OUT NOCOPY ANYDATA,
    nc          IN NVarchar2,
    last_elem   IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETOBJECT(
    self        IN OUT NOCOPY ANYDATA,
    obj         IN "<object_type>'
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
    self        IN OUT NOCOPY ANYDATA,
    r           IN RAW,
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
    self        IN OUT NOCOPY ANYDATA,
    rf          IN REF '<object_type>',
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
    self       IN OUT NOCOPY ANYDATA,
    ts         IN TIMESTAMP,
    last_elem  IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(
    self IN OUT NOCOPY ANYDATA,
    ts          IN TIMESTAMP WITH TIME ZONE,
    last_elem   IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
    self IN OUT NOCOPY ANYDATA,
    ts IN TIMESTAMP WITH LOCAL TIME ZONE,
    last_elem IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETVARCHAR(
    self        IN OUT NOCOPY ANYDATA,
    c           IN VARCHAR,
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
    self        IN OUT NOCOPY ANYDATA,
    c           IN VARCHAR2,
    last_elem   IN boolean DEFAULT FALSE);
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information, that is to be set.</td>
</tr>
<tr>
<td>last_elem</td>
<td>Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.</td>
</tr>
</tbody>
</table>

Exceptions

- **DBMS_TYPES.INVALID_PARAMETERS**: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- **DBMS_TYPES.INCORRECT_USAGE**: Incorrect usage.
- **DBMS_TYPES.TYPE_MISMATCH**: When the expected type is different from the passed in type.

Usage Notes

When **BEGINCREATE** is called, construction has already begun in a piece-wise fashion. Subsequent calls to **SET*** will set the successive attribute values.

If the **ANYDATA** is a standalone collection, the **SET*** call will set the successive collection elements.
An ANYDATASET TYPE contains a description of a given type plus a set of data instances of that type. An ANYDATASET can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- Construction
- Summary of ANYDATASET TYPE Subprograms
Construction

The ANYDATASET needs to be constructed value by value, sequentially.

For each data instance (of the type of the ANYDATASET), the ADDINSTANCE function must be invoked. This adds a new data instance to the ANYDATASET. Subsequently, SET* can be called to set each value in its entirety.

The mode of construction/access can be changed to attribute/collection element wise by making calls to PIECEWISE.

- If the type of the ANYDATASET is TYPECODE_OBJECT, individual attributes will be set with subsequent SET* calls. Likewise on access.

- If the type of the current data value is a collection type individual collection elements will be set with subsequent SET* calls. Likewise on access. This call is very similar to ANYDATA.PIECEWISE call defined for the type ANYDATA.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

ENDCREATE should be called to finish the construction process (before which no access calls can be made).
Summary of ANYDATASET TYPE Subprograms

<table>
<thead>
<tr>
<th>Table 240–1</th>
<th>ANYDATASET Type Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>ADDINSTANCE Member Procedure on page 240-4</td>
<td>Adds a new data instance to an ANYDATASET.</td>
</tr>
<tr>
<td>BEGINCREATE Static Procedure on page 240-5</td>
<td>Creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.</td>
</tr>
<tr>
<td>ENDCREATE Member Procedure on page 240-6</td>
<td>Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.</td>
</tr>
<tr>
<td>GET* Member Functions on page 240-7</td>
<td>Gets the current data value (which should be of appropriate type).</td>
</tr>
<tr>

<td>Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).</td>
</tr>
<tr>
<td>SET* Member Procedures on page 240-15</td>
<td>Sets the current data value.</td>
</tr>
</tbody>
</table>
ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

MEMBER PROCEDURE AddInstance(
    self          IN OUT NOCOPY ANYDATASET);

Parameters

Table 240–2  ADDINSTANCE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

DBMS_TYPES.invalid_parameters: Invalid parameters.
DBMS_TYPES.incorrect_usage: On incorrect usage.

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call PIECEWISE if a piece-wise construction of the instance is intended.
BEGINcreate Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

Syntax

```plaintext
STATIC PROCEDURE BeginCreate(
    typecode     IN PLS_INTEGER,
    rtype        IN OUT NOCOPY AnyType,
    aset         OUT NOCOPY ANYDATASET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>typecode</td>
<td>The typecode for the type of the ANYDATASET.</td>
</tr>
<tr>
<td>dtype</td>
<td>The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.</td>
</tr>
<tr>
<td>aset</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

DBMS_TYPES.invalid_parameters: dtype is invalid (not fully constructed, and like errors.)
ENDCREATE Member Procedure

This procedure ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.

Syntax

MEMBER PROCEDURE ENDCREATE(
self IN OUT NOCOPY ANYDATASET);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>
GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE with which you are accessing it (depending on how we have invoked the PIECEWISE call). If PIECEWISE has not been called, we are accessing the instance in its entirety and the type of the data value should match the type of the ANYDATASET.

If PIECEWISE has been called, we are accessing the instance piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

MEMBER FUNCTION GETBDOUBLE(
    self        IN ANYDATASET,
    dbl         OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFLOAT(
    self        IN ANYDATASET,
    fl          OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFILE(
    self        IN ANYDATASET,
    b           OUT NOCOPY BFILE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBLOB(
    self        IN ANYDATASET,
    b           OUT NOCOPY BLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETCHAR(
    self        IN ANYDATASET,
    c           OUT NOCOPY CHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETCLOB(
    self        IN ANYDATASET,
    c           OUT NOCOPY CLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETCOLLECTION(
    self        IN ANYDATASET,
    col         OUT NOCOPY "<collection_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GETDATE(
    self        IN ANYDATASET,
    dat         OUT NOCOPY DATE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETINTERVALDS(
    self        IN ANYDATASET,
    inv         IN OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN PLS_INTEGER;
MEMBER FUNCTION GETINTERVALYM(
  self  IN ANYDATASET,
  inv  IN OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCHAR(
  self  IN ANYDATASET,
  nc   OUT NOCOPY NCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
  self  IN ANYDATASET,
  nc   OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
  self  IN ANYDATASET,
  num  OUT NOCOPY NUMBER)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
  self  IN ANYDATASET,
  nc   OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
  self  IN ANYDATASET,
  obj  OUT NOCOPY "<object_type>"
RETURN PLS_INTEGER;

MEMBER FUNCTION GETRAW(
  self  IN ANYDATASET,
  r    OUT NOCOPY RAW)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETREF(
  self  IN ANYDATASET,
  rf   OUT NOCOPY REF "<object_type>"
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
  self  IN ANYDATASET,
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP/TZ(
  self  IN ANYDATASET,
  ts   OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP/TZ(
  self  IN ANYDATASET,
  ts   OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETUROWID(
  self  IN ANYDATASET,
  rid  OUT NOCOPY UROWID)
RETURN PLS_INTEGER
MEMBER FUNCTION GETVARCHAR(
    self        IN ANYDATASET,
    c           OUT NOCOPY VARCHAR)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2(
    self        IN ANYDATASET,
    c           OUT NOCOPY VARCHAR2)
RETURN      PLS_INTEGER;

Parameters

Table 240–5  GET* Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information, that is to be obtained.</td>
</tr>
</tbody>
</table>

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMSTYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.
GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

MEMBER FUNCTION GetCount(
  self        IN ANYDATASET)
RETURN      PLS_INTEGER;

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
</tbody>
</table>

Return Values

The number of data instances.
GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed. After this function has been called, the GET* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

Syntax

MEMBER FUNCTION GETINSTANCE(
  self IN OUT NOCOPY ANYDATASET)
RETURN PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
</tbody>
</table>

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

DBMS_TYPES.NO_DATA signifies the end of the ANYDATASET (all instances have been accessed).

Usage Notes

This function should be called even before accessing the first instance.
GETTYPE Member Function

Gets the AnyType describing the type of the data instances in an ANYDATASET.

Syntax

MEMBER FUNCTION GETTYPE(
    self           IN ANYDATASET,
    typ            OUT NOCOPY AnyType)
RETURN         PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET.</td>
</tr>
<tr>
<td>typ</td>
<td>The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.</td>
</tr>
</tbody>
</table>

Return Values

The typecode corresponding to the type of the ANYDATA.
**GETTYPENAME Member Function**

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return `schema_name.type_name`. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

**Syntax**

```plsql
MEMBER FUNCTION GETTYPENAME(
    self           IN ANYDATASET)
RETURN         VARCHAR2;
```

**Parameter**

*Table 240–9  GETTYPENAME Function Parameter*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

**Return Values**

Type name of the ANYDATASET.
PIECEWISE Member Procedure

This procedure sets the mode of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the mode of construction, access of the data value to be a collection element at a time (if the data value is of a collection type). Once this call has been made, subsequent SET* and GET* calls will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
  self         IN OUT NOCOPY ANYDATASET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters.
- `DBMS_TYPES.INCORRECT_USAGE`: On incorrect usage.

Usage Notes

The current data value must be of an object or collectyon type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.
SET* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the mode with which we are constructing (depending on how we have invoked the PIECEWISE call). The type of the current data should be the type of the ANYDATASET if PIECEWISE has NOT been called. The type should be the type of the attribute at the current position if PIECEWISE has been called.

Syntax

```sql
MEMBER PROCEDURE SETBDOUBLE(
    self              IN OUT NOCOPY ANYDATASET,
    dbl               IN BINARY_DOUBLE,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
    self              IN OUT NOCOPY ANYDATASET,
    fl                IN BINARY_FLOAT,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self              IN OUT NOCOPY ANYDATASET,
    b                 IN BFILE,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self              IN OUT NOCOPY ANYDATASET,
    b                 IN BLOB,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self              IN OUT NOCOPY ANYDATASET,
    c                 IN CHAR,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
    self              IN OUT NOCOPY ANYDATASET,
    c                 IN CLOB,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self              IN OUT NOCOPY ANYDATASET,
    col               IN "<collection_type>",
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self              IN OUT NOCOPY ANYDATASET,
    dat               IN DATE,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self              IN OUT NOCOPY ANYDATASET,
    inv               IN INTERVAL DAY TO SECOND,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self              IN OUT NOCOPY ANYDATASET,
set* member procedures

member procedure setnchar(
  self            in out nocopy anydataset,
  nc              in nchar,
  last_elem       in boolean default false);

member procedure setnclob(
  self            in out nocopy anydataset,
  nc              in nClob,
  last_elem       in boolean default false);

member procedure setnumber(
  self            in out nocopy anydataset,
  num             in number,
  last_elem       in boolean default false);

member procedure setvarchar2(
  self            in out nocopy anydataset,
  nc              in NVarchar2,
  last_elem       in boolean default false);

member procedure setobject(
  self            in out nocopy anydataset,
  obj             in '<object_type>',
  last_elem       in boolean default false);

member procedure setraw(
  self            in out nocopy anydataset,
  r               in raw,
  last_elem       in boolean default false);

member procedure setref(
  self            in out nocopy anydataset,
  rf              in ref '<object_type>',
  last_elem       in boolean default false);

member procedure settimestamp(
  self            in out nocopy anydataset,
  ts              in timestamp,
  last_elem       in boolean default false);

member procedure settimestampLt2(
  self            in out nocopy anydataset,
  ts              in timestamp with local time zone,
  last_elem       in boolean default false);

member procedure settimestampPt2(
  self            in out nocopy anydataset,
  ts              in timestamp with time zone,
  last_elem       in boolean default false);

member procedure seturowid(
  self            in out nocopy anydataset,
  rid             in UROWID,
  last_elem       in boolean default false);
MEMBER PROCEDURE SETVARCHAR(
    self              IN OUT NOCOPY ANYDATASET,
    c                 IN VARCHAR,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
    self              IN OUT NOCOPY ANYDATASET,
    c                 IN VARCHAR2,
    last_elem BOOLEAN DEFAULT FALSE);

Parameters

Table 240–11  SET* Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information, that is to be set.</td>
</tr>
<tr>
<td>last_elem</td>
<td>Relevant only if PIECEWISE has been already called (for a collection). Set to TRUE if it is the last element of the collection, FALSE otherwise.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.
An ANYTYPE TYPE can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the CREATE TYPE statement. Only new transient types can be constructed using the ANYTYPE interfaces.

This chapter discusses the following:

- Summary of ANYTYPE Subprograms
### Summary of ANYTYPE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BEGINCREATE Static Procedure on page 241-3</strong></td>
<td>Creates a new instance of ANYTYPE which can be used to create a transient type description.</td>
</tr>
<tr>
<td><strong>SETINFO Member Procedure on page 241-4</strong></td>
<td>Sets any additional information required for constructing a COLLECTION or builtin type.</td>
</tr>
<tr>
<td><strong>ADDATTR Member Procedure on page 241-6</strong></td>
<td>Adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).</td>
</tr>
<tr>
<td><strong>ENDCREATE Member Procedure on page 241-7</strong></td>
<td>Ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.</td>
</tr>
<tr>
<td><strong>GETPERSISTENT Static Function on page 241-8</strong></td>
<td>Returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.</td>
</tr>
<tr>
<td><strong>GETINFO Member Function on page 241-9</strong></td>
<td>Gets the type information for the ANYTYPE.</td>
</tr>
<tr>
<td><strong>GETATTRELEMINFOMember Function on page 241-10</strong></td>
<td>Gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection’s element type if the self parameter is of a collection type.</td>
</tr>
</tbody>
</table>
BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```plaintext
STATIC PROCEDURE BEGINCREATE(
    typecode       IN          PLS_INTEGER,
    atype          OUT NOCOPY  ANYTYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>typecode</td>
<td>Use a constant from DBMS_TYPES package. Typecodes for user-defined type: DBMS_TYPES.TYPECODE_OBJECT, DBMS_TYPES.TYPECODE_VARRAY or DBMS_TYPES.TYPECODE_TABLE. Typecodes for built-in types: DBMS_TYPES.TYPECODE_NUMBER, and similar types.</td>
</tr>
<tr>
<td>atype</td>
<td>ANYTYPE for a transient type</td>
</tr>
</tbody>
</table>
SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

Syntax

MEMBER PROCEDURE SETINFO(
    self          IN OUT NOCOPY ANYTYPE,
    prec          IN PLS_INTEGER,
    scale         IN PLS_INTEGER,
    len           IN PLS_INTEGER,
    csid          IN PLS_INTEGER,
    csfrm         IN PLS_INTEGER,
    atype         IN ANYTYPE DEFAULT NULL,
    elem_tc       IN PLS_INTEGER DEFAULT NULL,
    elem_count    IN PLS_INTEGER DEFAULT 0);

Parameters

Table 241–3  SETINFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed.</td>
</tr>
<tr>
<td>prec</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid</td>
<td>Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>csfrm</td>
<td>Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>atype</td>
<td>Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.</td>
</tr>
</tbody>
</table>

The Following Parameters Are Required For Collection Types

Table 241–4  SETINFO Procedure Parameters - Collection Types

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem_tc</td>
<td>Must be of the collection element’s typecode (from DBMS_TYPES package).</td>
</tr>
<tr>
<td>elem_count</td>
<td>Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if self represents a VARRAY.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (typecode, typeinfo)
Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.
ADDAATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

MEMBER PROCEDURE ADDATTR (  
  self      IN OUT NOCOPY ANYTYPE,  
  aname     IN VARCHAR2,  
  typecode  IN PLS_INTEGER,  
  prec      IN PLS_INTEGER,  
  scale     IN PLS_INTEGER,  
  len       IN PLS_INTEGER,  
  csid      IN PLS_INTEGER,  
  csfrm     IN PLS_INTEGER,  
  attr_type IN ANYTYPE DEFAULT NULL);  

Parameters

Table 241–5 ADDATTR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.</td>
</tr>
<tr>
<td>aname</td>
<td>Optional. Attribute's name. Could be NULL.</td>
</tr>
<tr>
<td>typecode</td>
<td>Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).</td>
</tr>
<tr>
<td>prec</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.</td>
</tr>
<tr>
<td>csid</td>
<td>Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>csfrm</td>
<td>Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>attr_type</td>
<td>Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)
ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

Syntax

MEMBER PROCEDURE ENDCREATE(
    self IN OUT NOCOPY ANYTYPE);

Parameter

<table>
<thead>
<tr>
<th>Table 241–6</th>
<th>ENDCREATE Procedure Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed.</td>
</tr>
</tbody>
</table>
GETPERSISTENT Static Function

This procedure returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

Syntax

```sql
STATIC FUNCTION GETPERSISTENT(
    schema_name IN VARCHAR2,
    type_name IN VARCHAR2,
    version IN VARCHAR2 DEFAULT NULL)
RETURN ANYTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name of the type.</td>
</tr>
<tr>
<td>type_name</td>
<td>Type name.</td>
</tr>
<tr>
<td>version</td>
<td>Type version.</td>
</tr>
</tbody>
</table>

Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.
GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

```plaintext
MEMBER FUNCTION GETINFO (  
  self        IN ANYTYPE,  
  prec        OUT PLS_INTEGER,  
  scale       OUT PLS_INTEGER,  
  len         OUT PLS_INTEGER,  
  csid        OUT PLS_INTEGER,  
  csfrm       OUT PLS_INTEGER,  
  schema_name OUT VARCHAR2,  
  type_name   OUT VARCHAR2,  
  version     OUT varchar2,  
  count       OUT PLS_INTEGER)  
RETURN      PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYTYPE.</td>
</tr>
<tr>
<td>prec</td>
<td>If typecode represents a number. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>If typecode represents a number. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>csid</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Type's schema (if persistent).</td>
</tr>
<tr>
<td>type_name</td>
<td>Type's typename.</td>
</tr>
<tr>
<td>version</td>
<td>Type's version.</td>
</tr>
<tr>
<td>count</td>
<td>If <code>self</code> is a VARRAY, this gives the VARRAY count. If self is of TYPECODE_OBJECT, this gives the number of attributes.</td>
</tr>
</tbody>
</table>

Return Values

The typecode of `self`.

Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).
**GETTRELEMINFOMember Function**

This function gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection’s element type if the self parameter is of a collection type.

**Syntax**

```plaintext
MEMBER FUNCTION GETTRELEMINFOM ( 
    self           IN ANYTYPE,
    pos            IN PLS_INTEGER,
    prec           OUT PLS_INTEGER,
    scale          OUT PLS_INTEGER,
    len            OUT PLS_INTEGER,
    csid           OUT PLS_INTEGER,
    csfrm          OUT PLS_INTEGER,
    attr_elt_type  OUT ANYTYPE
    aname          OUT VARCHAR2)
RETURN         PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYTYPE.</td>
</tr>
<tr>
<td>pos</td>
<td>If self is of TYPECODE_OBJECT, this gives the attribute position (starting at 1). It is ignored otherwise.</td>
</tr>
<tr>
<td>prec</td>
<td>If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid, csfrm</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. Gives character set ID, character set form.</td>
</tr>
<tr>
<td>attr_elt_type</td>
<td>If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the attr_elt_type.</td>
</tr>
<tr>
<td>aname</td>
<td>Attribute name (if it is an attribute of an object type, NULL otherwise).</td>
</tr>
</tbody>
</table>

**Return Values**

The typecode of the attribute or collection element.

**Exceptions**

- **DBMS_TYPES.INVALID_PARAMETERS**: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).
This chapter describes the types used with Oracle Streams Advanced Queuing (AQ) packages for PL/SQL, DBMS_AQ, and DBMS_AQADM.

See Also: Oracle Streams Advanced Queuing User’s Guide for information about using Oracle Streams AQ.

This chapter contains the following topics:

- Summary of Types
Summary of Types

- AQ$_AGENT Type
- AQ$_AGENT_LIST_T Type
- AQ$_DESCRIPTOR Type
- AQ$_NTFN_DESCRIPTOR Type
- AQ$_POST_INFO Type
- AQ$_POST_INFO_LIST Type
- AQ$_PURGE_OPTIONS_T Type
- AQ$-_RECIPIENT_LIST_T Type
- AQ$_REG_INFO Type
- AQ$_REG_INFO_LIST Type
- AQ$_SUBSCRIBER_LIST_T Type
- DEQUEUE_OPTIONS_T Type
- ENQUEUE_OPTIONS_T Type
- SYS.MSG_PROP_T Type
- MESSAGE_PROPERTIES_T Type
- MESSAGE_PROPERTIES_ARRAY_T Type
- MSGID_ARRAY_T Type
AQ$_AGENT Type

This type identifies a producer or a consumer of a message.

Syntax

```sql
TYPE SYS.AQ$_AGENT IS OBJECT (    
    name       VARCHAR2(30),  
    address    VARCHAR2(1024),  
    protocol   NUMBER  DEFAULT 0);  
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of a producer or consumer of a message. The name must follow object name guidelines in the <em>Oracle Database SQL Language Reference</em> with regard to reserved characters.</td>
</tr>
<tr>
<td>address</td>
<td>Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form <code>schema.[queue[@dblink]]</code>. For example, a queue named <code>emp_messages</code> in the HR queue at the site <code>dbs1.net</code> has the address: <code>hr.emp_messages@dbs1.net</code></td>
</tr>
<tr>
<td>protocol</td>
<td>Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Streams AQ.</td>
</tr>
</tbody>
</table>
AQ$_AGENT_LIST_T Type

This type identifies the list of agents for which DBMS_AQ.LISTEN listens.

See Also: "AQ$_AGENT Type" on page 242-3

Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY INTEGER;
```
**AQ$_DESCRIPTOR Type**

This type specifies the Oracle Streams AQ descriptor received by the AQ PL/SQL callbacks upon notification.

*See Also:* "MESSAGE_PROPERTIES_T Type" on page 242-24

**Syntax**

```sql
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
  queue_name      VARCHAR2(61),
  consumer_name   VARCHAR2(30),
  msg_id          RAW(16),
  msg_prop        MSG_PROP_T,
  gen_desc        AQ$_NTFN_DESCRIPTOR,
  msgid_array     SYS.AQ$_NTFN_MSGID_ARRAY,
  ntfnsRecdInGrp  NUMBER);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queue_name</code></td>
<td>Name of the queue in which the message was enqueued which resulted in the notification</td>
</tr>
<tr>
<td><code>consumer_name</code></td>
<td>Name of the consumer for the multiconsumer queue</td>
</tr>
<tr>
<td><code>msg_id</code></td>
<td>Identification number of the message</td>
</tr>
<tr>
<td><code>msg_prop</code></td>
<td>Message properties specified by the MSG_PROP_T type</td>
</tr>
<tr>
<td><code>gen_desc</code></td>
<td>Indicates the timeout specifications</td>
</tr>
<tr>
<td><code>msgid_array</code></td>
<td>Group notification message ID list</td>
</tr>
<tr>
<td><code>ntfnsRecdInGrp</code></td>
<td>Notifications received in group</td>
</tr>
</tbody>
</table>
QA$_NTFN_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

Syntax

```plsql
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT(
    ntnf_flags NUMBER)
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ntnf_flags</td>
<td>Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.</td>
</tr>
</tbody>
</table>
**AQ$NTFN_MSGID_ARRAY Type**

This type is for storing grouping notification data for AQ namespace, value $2^{30}$ which is the max varray size.

**Syntax**

```sql
TYPE SYS.AQ$NTFN_MSGID_ARRAY
    AS VARRAY(1073741824)OF RAW(16);
```
AQ$_POST_INFO Type

Specifies anonymous subscriptions to which you want to post messages.

Syntax

```sql
TYPE SYS.AQ$_POST_INFO IS OBJECT {
    name        VARCHAR2(128),
    namespace   NUMBER,
    payload     RAW(2000) DEFAULT NULL;
}
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the anonymous subscription to which you want to post</td>
</tr>
<tr>
<td>namespace</td>
<td>To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQNAMESPACE_ANONYMOUS</td>
</tr>
<tr>
<td>payload</td>
<td>The payload to be posted to the anonymous subscription</td>
</tr>
</tbody>
</table>
**AQ$_POST_INFO_LIST Type**

Identifies the list of anonymous subscriptions to which you want to post messages.

**See Also:** [AQ$_POST_INFO Type](#) on page 242-8

**Syntax**

```sql
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```
AQ$_PURGE_OPTIONS_T Type

This type specifies the options available for purging a queue table.

See Also: PURGE_QUEUE_TABLE Procedure on page 23-42.

Syntax

TYPE AQ$_PURGE_OPTIONS_T is RECORD (
    block           BOOLEAN       DEFAULT FALSE,
    delivery_mode   PLS_INTEGER   DEFAULT PERSISTENT);

Table 242–5  AQ$_PURGE_OPTIONS_T Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>block</td>
<td>TRUE/FALSE.</td>
</tr>
<tr>
<td></td>
<td>• If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE.</td>
</tr>
<tr>
<td></td>
<td>• The default for block is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>Kind of messages to purge, either DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT</td>
</tr>
</tbody>
</table>
**AQ$-_RECIPIENT_LIST_T Type**

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

*See Also:* "AQ$-_AGENT Type" on page 242-3

**Syntax**

```sql
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY_INTEGER;
```
**AQ$_REG_INFO Type**

This type identifies a producer or a consumer of a message.

**Syntax**

```
TYPE SYS.AQ$_REG_INFO IS OBJECT {
   name                              VARCHAR2(128),
   namespace                         NUMBER,
   callback                          VARCHAR2(4000),
   context                           RAW(2000)  DEFAULT NULL,
   qosflags                          NUMBER,
   timeout                           NUMBER,
   ntfn_grouping_class               NUMBER,
   ntfn_grouping_value               NUMBER    DEFAULT 600,
   ntfn_grouping_type                NUMBER,
   ntfn_grouping_start_time          TIMESTAMP WITH TIME ZONE,
   ntfn_grouping_repeat_count   NUMBER);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the name of the subscription. The subscription name is of the form <code>schema.queue</code> if the registration is for a single consumer queue or <code>schema.queue:consumer_name</code> if the registration is for a multiconsumer queues.</td>
</tr>
<tr>
<td>namespace</td>
<td>Specifies the namespace of the subscription. To receive notification from Oracle Streams AQ queues, the namespace must be <code>DBMS_AQ.NAMESPACE_AQ</code>. To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code>, the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code>.</td>
</tr>
<tr>
<td>callback</td>
<td>Specifies the action to be performed on message notification. For HTTP notifications, use <code>http://www.company.com:8080</code>. For e-mail notifications, use <code>mailto://xyz@company.com</code>. For raw message payload for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=0</code>. For user-defined type message payload converted to XML for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=1</code>.</td>
</tr>
<tr>
<td>context</td>
<td>Specifies the context that is to be passed to the callback function.</td>
</tr>
<tr>
<td>qosflags</td>
<td>Can be set to one or more of the following values to specify the notification quality of service:</td>
</tr>
<tr>
<td></td>
<td>- NTFN_QOS_RELIABLE- This value specifies that reliable notification is required. Reliable notifications persist across instance and database restarts.</td>
</tr>
<tr>
<td></td>
<td>- NTFN_QOS_PAYLOAD - This value specifies that payload delivery is required. It is supported only for client notification and only for RAW queues.</td>
</tr>
<tr>
<td></td>
<td>- NTFN_QOS_PURGE_ON_NTFN - This value specifies that the registration is to be purged automatically when the first notification is delivered to this registration location.</td>
</tr>
</tbody>
</table>
**Table 242–6 (Cont.) AQ$_REG_INFO$ Type Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ntnf_grouping_class</td>
<td>Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If ntnf_grouping_class is 0, all other notification grouping attributes must be 0.</td>
</tr>
<tr>
<td></td>
<td>■ NTFN_GROUPING_CLASS_TIME - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.</td>
</tr>
<tr>
<td>ntnf_grouping_value</td>
<td>Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until ntnf_grouping_repeat_count is exhausted.</td>
</tr>
<tr>
<td>ntnf_grouping_type</td>
<td>■ NTFN_GROUPING_TYPE_SUMMARY - Summary of all notifications that occurred in the time interval. (Default)</td>
</tr>
<tr>
<td></td>
<td>■ NTFN_GROUPING_TYPE_LAST - Last notification that occurred in the interval.</td>
</tr>
<tr>
<td>ntnf_grouping_start_time</td>
<td>Notification grouping start time. Notification grouping can start from a user-specified time that should a valid timestamp with time zone. If ntnf_grouping_start_time is not specified when using grouping, the default is to current timestamp with time zone.</td>
</tr>
<tr>
<td>ntnf_grouping_repeat_count</td>
<td>Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The ntnf_grouping_repeat_count, if not specified, will default to</td>
</tr>
<tr>
<td></td>
<td>■ NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever.</td>
</tr>
</tbody>
</table>

**Usage Notes**

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

Table 242–7 shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. Table 242–8 shows the actions performed when XML presentation is specified.

</table>
AQ$_REG_INFO_LIST Type

Identifies the list of registrations to a queue.

See Also: "AQ$_REG_INFO Type" on page 242-12

Syntax

```sql
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```
AQ$$_SUBSCRIBER_LIST_T Type

Identifies the list of subscribers that subscribe to a queue.

**See Also:** "AQ$$_AGENT Type" on page 242-3

**Syntax**

```sql
TYPE SYS.AQ$$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$$_AGENT
   INDEX BY BINARY_INTEGER;
```
DEQUEUE_OPTIONS_T Type

Specifies the options available for the dequeue operation.

Syntax

```sql
TYPE DEQUEUE_OPTIONS_T IS RECORD (
  consumer_name VARCHAR2(30) DEFAULT NULL,
  dequeue_mode  BINARY_INTEGER DEFAULT REMOVE,
  navigation    BINARY_INTEGER DEFAULT NEXT_MESSAGE,
  visibility    BINARY_INTEGER DEFAULT ON_COMMIT,
  wait          BINARY_INTEGER DEFAULT FOREVER,
  msgid         RAW(16) DEFAULT NULL,
  correlation   VARCHAR2(128) DEFAULT NULL,
  deq_condition VARCHAR2(4000) DEFAULT NULL,
  signature     aq$_sig_prop DEFAULT NULL,
  transformation VARCHAR2(61) DEFAULT NULL,
  delivery_mode PLS_INTEGER DEFAULT PERSISTENT);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>consumer_name</td>
<td>Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL. For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through <code>dbms_aqadm.enable_db_access</code> procedure call.</td>
</tr>
<tr>
<td>dequeue_mode</td>
<td>Specifies the locking behavior associated with the dequeue. Possible settings are: BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement. LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.</td>
</tr>
</tbody>
</table>
Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are:

- **NEXT_MESSAGE**: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default.

- **NEXT_TRANSACTION**: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue.

- **FIRST_MESSAGE**: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.

- **FIRST_MESSAGE_MULTI_GROUP**: indicates that a call to `DBMS_AQ.DEQUEUE_ARRAY` will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the `ARRAY_SIZE` limit. Refer to the `TRANSACTION_GROUP` attribute for the message to distinguish between transaction groups.

- **NEXT_MESSAGE_MULTI_GROUP**: indicates that a call to `DBMS_AQ.DEQUEUE_ARRAY` will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the `ARRAY_SIZE` limit. Refer to the `TRANSACTION_GROUP` attribute for the message to distinguish between transaction groups.

Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the `BROWSE` dequeue mode. Possible settings are:

- **ON_COMMIT**: The dequeue will be part of the current transaction. This setting is the default.

- **IMMEDIATE**: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.

Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are:

- **FOREVER**: Wait forever. This setting is the default.

- **NO_WAIT**: Do not wait.

- **number**: Wait time in seconds.

Specifies the message identifier of the message to be dequeued.

Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.

---

<table>
<thead>
<tr>

<td>Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.</td>
</tr>
</tbody>
</table>
A conditional expression based on the message properties, the message data properties, and PL/SQL functions.

A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the WHERE clause of a SQL query). Message properties include priority, corr_id and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The deq_condition parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.

Currently not implemented

Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.

The deqer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be BUFFERED or PERSISTENT or PERSISTENT_OR_BUFFERED. The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of "1".

<td>The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the dequeue options. It can be <strong>BUFFERED</strong> or <strong>PERSISTENT</strong>. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of ‘1’.</td>
</tr>
</tbody>
</table>
SYS.MSG_PROP_T Type

This type is used in PL/SQL notification, as one field in aq$_descriptor, to pass message properties of an AQ message to the PL/SQL notification client callback.

Syntax

CREATE or replace TYPE sys.msg_prop_t AS OBJECT (  
  priority NUMBER,  
  delay NUMBER,  
  expiration NUMBER,  
  correlation VARCHAR2(128),  
  attempts NUMBER,  
  exception_queue VARCHAR2(51),  
  enqueue_time DATE,  
  state NUMBER,  
  sender_id aq$_agent,  
  original_msgid RAW(16),  
  delivery_mode NUMBER);

Parameters

Table 242–11  SYS.MSG_PROP_T Type Attributes

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.</td>
</tr>
<tr>
<td>delay</td>
<td>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by msgid overrides the delay specification. A message enqueued with delay set is in the WAITING state, and when the delay expires, the message goes to the READY state. DELAY processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: NO_DELAY: The message is available for immediate dequeuing number: The number of seconds to delay the message</td>
</tr>
<tr>
<td>expiration</td>
<td>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: NEVER: The message does not expire number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state.</td>
</tr>
<tr>
<td>correlation</td>
<td>Returns the identifier supplied by the producer of the message at enqueue time.</td>
</tr>
<tr>
<td>attempts</td>
<td>Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.</td>
</tr>
</tbody>
</table>
exception_queue

Specifies the name of the queue into which the message is moved if it cannot be processed successfully.

Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:

- RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation.

For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view.

If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.

- A message was not dequeued before the expiration time elapsed.

- Message propagation to the specified destination queue failed with one of the following errors:
  * There were no recipients for the multiconsumer destination queue.
  * Recipients were specified for a single-consumer destination queue.
  * Destination queue was an exception queue
  * There was an error when applying transformation.

The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.

enqueue_time

Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.

state

Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:

- DBMS_AQ.READY: The message is ready to be processed.
- DBMS_AQ.WAITING: The message delay has not yet been reached.
- DBMS_AQ.PROCESSED: The message has been processed and is retained.
- DBMSAQ.EXPIRED: The message has been moved to the exception queue.
### Table 242–11 (Cont.) SYS.MSG_PROP_T Type Attributes

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender_id</td>
<td>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [source_queue@source_database_name]</td>
</tr>
<tr>

<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| expiration   | Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed.  
The possible settings follow:  
NEVER: The message does not expire  
number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state. |
| correlation  | Returns the identifier supplied by the producer of the message at enqueue time.                                                                |
| attempts     | Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.                       |
| recipient_list| This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time.  
For type definition, see the "AQ$_AGENT Type" on page 242-3. |
exception_queue

Specifies the name of the queue into which the message is moved if it cannot be processed successfully.

Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:

- **RETRY_COUNT**, the number of unsuccessful dequeue attempts, has exceeded the specification for the **MAX_RETRIES** parameter in the `DBMS_AQADM.CREATE_QUEUE` procedure during queue creation.

For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the **MAX_RETRIES** parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than **MAX_RETRIES**. You can view **MAX_RETRIES** for a queue in the `ALL_QUEUES` data dictionary view.

If a dequeue transaction fails because the server process dies (including `ALTER SYSTEM KILL SESSION`) or `SHUTDOWN ABORT` on the instance, then **RETRY_COUNT** is not incremented.

- A message was not dequeued before the expiration time elapsed.

- Message propagation to the specified destination queue failed with one of the following errors:
  * There were no recipients for the multiconsumer destination queue.
  * Recipients were specified for a single-consumer destination queue.
  * Destination queue was an exception queue
  * There was an error when applying transformation.

The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a **NULL** value at dequeue time.

enqueue_time

Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.

state

Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:

- **DBMS_AQ.READY**: The message is ready to be processed.
- **DBMS_AQ.WAITING**: The message delay has not yet been reached.
- **DBMS_AQ.PROCESSED**: The message has been processed and is retained.
- **DBMSAQ.EXPIRED**: The message has been moved to the exception queue.

| sender_id         | The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent.  
Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified.  
The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name] |
| original_msgid    | This parameter is used by Oracle Streams AQ for propagating messages.  
| signature         | Currently not implemented  
| transaction_group | Specifies the transaction_group for the dequeued message.  
Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls.  
| user_property     | This optional attribute is used to store additional information about the payload.  
| delivery_mode     | The message publisher specifies the delivery mode in the message_properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'. |
MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by dbms_aq.enqueue_array and dbms_aq.dequeue_array calls to hold the set of message properties. Each element in the payload_array should have a corresponding element in the MESSAGE_PROPERTIES_ARRAY_T VARRAY.

See Also: "MESSAGE_PROPERTIES_T Type" on page 242-24

Syntax

TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647) OF MESSAGE_PROPERTIES_T;
MSGID_ARRAY_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```
This chapter describes public types defined to support the DBMS_DBFS_CONTENT interface.

This chapter contains the following topics:

- Using Content Types
  - Overview
  - Security Model
- Data Structures
Using Content Types

- Overview
- Security Model
Overview

The type definitions described in this chapter support the DBMS_DBFS_CONTENT interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.
The user can access the content operational and administrative interfaces (packages, types, tables, and so on) by way of the DBFS_ROLE. This role can be granted to users as needed.
Data Structures

Types that support the DBMS_DBFS_CONTENT interface include both Object and Table types.

Object Types
- DBMS_DBFS_CONTENT_CONTEXT_T Object Type
- DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type
- DBMS_DBFS_CONTENT_PROPERTY_T Object Type

Table Types
- DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type
- DBMS_DBFS_CONTENT_PROPERTIES_T Table Type
- DBMS_DBFS_CONTENT_RAW_T Table Type
DBMS_DBFS_CONTENT_CONTEXT_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing asof queries, and whether or not the item(s) are read_only. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

Syntax

CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
  AUTHID DEFINER
AS OBJECT (
  principal VARCHAR2(32),
  acl VARCHAR2(1024),
  owner VARCHAR2(32),
  asof TIMESTAMP,
  read_only INTEGER);

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>principal</td>
<td>File system user</td>
</tr>
<tr>
<td>acl</td>
<td>Access control list</td>
</tr>
<tr>
<td>owner</td>
<td>Path item owner</td>
</tr>
<tr>
<td>asof</td>
<td>Timestamp</td>
</tr>
<tr>
<td>read_only</td>
<td>Nonzero if the path item is read-only</td>
</tr>
</tbody>
</table>
DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type

This type describes a type to assist in listing the contents of a directory.

Syntax

CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
AUTHID DEFINER
AS OBJECT (
    path          VARCHAR2(1024),
    item_name     VARCHAR2(256),
    item_type     INTEGER);

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path to the path item</td>
</tr>
<tr>
<td>item_name</td>
<td>Name of the path item</td>
</tr>
<tr>
<td>item_type</td>
<td>Type of path item. (See DBMS_DBFS_CONTENT Constants - Path Name Types)</td>
</tr>
</tbody>
</table>
DBMS_DBFS_CONTENT_PROPERTY_T Object Type

This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```sql
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
  AUTHID DEFINER
AS OBJECT (
    propname     VARCHAR2(32),
    propvalue    VARCHAR2(1024),
    typecode     INTEGER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prop_name</td>
<td>Name of property</td>
</tr>
<tr>
<td>prop_value</td>
<td>Value of property</td>
</tr>
<tr>
<td>typecode</td>
<td>Property type (See Constants in DBMS_TYPES)</td>
</tr>
</tbody>
</table>
DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type

This type is a variable-sized array of DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS TABLE OF dbms_dbfs_content_list_item_t;
DBMS_DBFS_CONTENT_PROPERTIES_T Table Type

This type is a variable-sized array of property tuples of DBMS_DBFS_CONTENT_PROPERTY_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS
    TABLE OF dbms_dbfs_content_property_t;
```
DBMS_DBFS_CONTENT_RAW_T Table Type

This type is an array of RAW. It is to enable RAW data transport for batch interfaces in the DBMS_DBFS_CONTENT interface.

Syntax

CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS TABLE OF RAW(32767);
Oracle supports the UriType family of types that can be used to store and query Uri-refs inside the database. The UriType itself is an abstract object type and the HTTPURITYPE, XDBURITYPE and DBURITYPE are subtypes of it.

You can create a UriType column and store instances of the DBURITYPE, XDBURITYPE or the HTTPURITYPE inside of it. You can also define your own subtypes of the UriType to handle different URL protocols.

Oracle also provides a UriFactory package that can be used as a factory method to automatically generate various instances of these UriTypes by scanning the prefix, such as http:// or /oradb. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix gopher:// to be handled by your subtype. The UriFactory will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- Summary of URITYPE Supertype Subprograms
- Summary of HTTPURITYPE Subtype Subprograms
- Summary of DBURITYPE Subtype Subprograms
- Summary of XDBURITYPE Subtype Subprograms
- Summary of URIFACTORY Package Subprograms

See Also:

- Oracle XML DB Developer’s Guide
The UriType is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

**Table 244–1  URITYPE Type Subprograms**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETBLOB on page 244-3</td>
<td>Returns the BLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCLOB on page 244-4</td>
<td>Returns the CLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCONTENTTYPE on page 244-5</td>
<td>Returns the URL, in escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETEXTERNALURL on page 244-6</td>
<td>Returns the URL, in escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETURL on page 244-7</td>
<td>Returns the URL, in non-escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETXML on page 244-8</td>
<td>Returns the XMLType located at the address specified by the URL.</td>
</tr>
</tbody>
</table>
GETBLOB

This function returns the BLOB located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getBlob()</td>
<td>This function returns the BLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>RETURN BLOB;</td>
<td></td>
</tr>
<tr>
<td>MEMBER FUNCTION getBlob(content OUT VARCHAR2)</td>
<td>This function returns the BLOB located at the address specified by the URL and the content type.</td>
</tr>
<tr>
<td>RETURN BLOB;</td>
<td></td>
</tr>
<tr>
<td>FUNCTION getBlob(csid IN NUMBER)</td>
<td>This function returns the BLOB located at the address specified by the URL in the specified character set.</td>
</tr>
<tr>
<td>RETURN BLOB;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
This function returns the CLOB located at the address specified by the URL. This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getClob() RETURN clob;</td>
<td>This function returns the CLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;</td>
<td>This function returns the CLOB located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
**GETCONTENTTYPE**

This function returns the content type of the document pointed to by the URI. This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

**Syntax**

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```
GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the UriType instance. The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the getExternalUrl function or the getUrl function to get to the URL value instead of using the attribute present in the UriType instance.

Syntax

MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
GETURL

This function returns the URL, in non-escaped format, stored inside the UriType instance. The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the getExternalUrl function or the getUrl function to get to the URL value instead of using the attribute present in the UriType instance.

Syntax
MEMBER FUNCTION getUrl()
RETURN varchar2;
This function returns the `XMLType` located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getXML() RETURN XMLType;</td>
<td>This function returns the <code>XMLType</code> located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getXML( content OUT VARCHAR2) RETURN XMLType;</td>
<td>This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
The HTTPURITYPE is a subtype of the UriType that provides support for the HTTP protocol. This uses the UTL_HTTP package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

Table 244–2  HTTPURITYPE Type Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEURI</td>
<td>Creates an instance of HTTPURITYPE from the given URI.</td>
</tr>
<tr>
<td>GETBLOB</td>
<td>Returns the BLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCLOB</td>
<td>Returns the CLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCONTENTTYPE</td>
<td>Returns the content type of the document pointed to by the URI.</td>
</tr>
<tr>
<td>GETEXTERNALURL</td>
<td>Returns the URL, in escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETURL</td>
<td>Returns the URL, in non-escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETXML</td>
<td>Returns the XMLType located at the address specified by the URL.</td>
</tr>
<tr>
<td>HTTPURITYPE</td>
<td>Creates an instance of HTTPURITYPE from the given URI.</td>
</tr>
</tbody>
</table>
This static function constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

**Syntax**

```sql
STATIC FUNCTION createUri(
    url IN varchar2)
RETURN HTTPURITYPE;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string containing a valid HTTP URL; escaped format.</td>
</tr>
</tbody>
</table>
GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getBlob() RETURN blob;</td>
<td>This function returns the BLOB located at the address specified by the HTTP URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getBlob(    content OUT VARCHAR2) RETURN blob;</td>
<td>This function returns the BLOB located at the address specified by the HTTP URL and the content type.</td>
</tr>
<tr>
<td>FUNCTION getBlob(    csid IN NUMBER) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL in the specified character set.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
GETCLOB

This function returns the CLOB located by the HTTP URL address. If a temporary CLOB is returned, it must be freed.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getClob() RETURN clob;</td>
<td>Returns the CLOB located at the address specified by the HTTP URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getClob( content OUT VARCHAR2) RETURN clob;</td>
<td>Returns the CLOB located at the address specified by the HTTP URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE

Returns the content type of the document pointed to by the URI.

Syntax
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;}
This function returns the URL, in escaped format, stored inside the HTTPURLTYPE instance. The subtype instances override this member function. The HTTPURLTYPE function does not store the prefix http://, but generates it for the external URL.

**Syntax**

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```
GETURL

This function returns the URL, in non-escaped format, stored inside the HTTPURITYPE instance.

Syntax

MEMBER FUNCTION getUrl()
RETURN varchar2;
This function returns the XMLType located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getXML() RETURN XMLType;</td>
<td>This function returns the XMLType located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getXML( content OUT VARCHAR2) RETURN XMLType;</td>
<td>This function returns the XMLType located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
HTTPURITYPE

This constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax
CONSTRUCTOR FUNCTION HTTPURITYPE(
    url IN varchar2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.</td>
</tr>
</tbody>
</table>
Summary of DBURITYPE Subtype Subprograms

The DBURITYPE is a subtype of the UriType that provides support for DBUri-refs. A DBUri-ref is an intra-database URL that can be used to reference any row or row-column data in the database. The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and view further contain the rows and columns inside them.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEURI</td>
<td>Constructs a DBURITYPE instance.</td>
</tr>
<tr>
<td>DBURITYPE</td>
<td>Creates an instance of DBURITYPE from the given URI.</td>
</tr>
<tr>
<td>GETBLOB</td>
<td>Returns the BLOB located at the address specified by the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETCLOB</td>
<td>Returns the CLOB located at the address specified by the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETCONTENTTYPE</td>
<td>Returns the content type of the document pointed to by the URI.</td>
</tr>
<tr>
<td>GETEXTERNALURL</td>
<td>Returns the URL, in escaped format, stored inside the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETURL</td>
<td>Returns the URL, in non-escaped format, stored inside the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETXML</td>
<td>Returns the XMLType located at the address specified by the URL.</td>
</tr>
</tbody>
</table>
CREATEURI

This static function constructs a DBURITYPE instance. Parses the URL given and creates a DBURITYPE instance.

**Syntax**

```sql
STATIC FUNCTION createUri(
    url IN varchar2)
RETURN DBURITYPE;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string, in escaped format, containing a valid DBURITYPE.</td>
</tr>
</tbody>
</table>
This constructs a DBURITYPE instance.

**Syntax**

```plsql
CONSTRUCTOR FUNCTION DBURITYPE(
    url IN varchar2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string containing a valid DBURITYPE. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.</td>
</tr>
</tbody>
</table>
## GETBLOB

This function returns the **BLOB** located at the address specified by the URL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getBlob() RETURN blob;</td>
<td>This function returns the <strong>BLOB</strong> located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getBlob( content OUT VARCHAR2) RETURN blob;</td>
<td>This function returns the <strong>BLOB</strong> located at the address specified by the URL and the content type.</td>
</tr>
<tr>
<td>FUNCTION getBlob( csid IN NUMBER) RETURN BLOB;</td>
<td>This function returns the <strong>BLOB</strong> located at the address specified by the URL in the specified character set.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
This function returns the CLOB located at the address specified by the DBURITYPE instance. If a temporary CLOB is returned, it must be freed. The document returned may be an XML document or a text document. When the DBUri-ref identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getClob() RETURN clob;</td>
<td>Returns the CLOB located at the address specified by the DBURITYPE instance.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;</td>
<td>Returns the CLOB located at the address specified by the DBURITYPE instance and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```
This function returns the URL, in escaped format, stored inside the DBURITYPE instance. The DBUri servlet URL that processes the DBURITYPE has to be appended before using the escaped URL in Web pages.

**Syntax**

```plsql
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```
GETURL

This function returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

**Syntax**

MEMBER FUNCTION getUrl()
RETURN varchar2;
GETXML

This function returns the XMLType located at the address specified by the URL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getXML() RETURN XMLType;</td>
<td>This function returns the XMLType located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getXML( content OUT VARCHAR2) RETURN XMLType;</td>
<td>This function returns the XMLType located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
**Summary of XDBURITYPE Subtype Subprograms**

XDBURITYPE is a new subtype of URIType. It provides a way to expose documents in the Oracle XML DB hierarchy as URLs that can be embedded in any URIType column in a table. The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by ‘#’. The more general XPointer syntax for specifying a fragment is not currently supported.

<table>
<thead>
<tr>
<th>Table 244–4</th>

</table>
GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as VARCHAR2.

**Syntax**

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```
This function returns the URL, in escaped format, stored inside the `XDBUTYPE` instance.

**Syntax**

```plsql
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```
GETURL

This function returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.

Syntax

MEMBER FUNCTION getUrl()
RETURN varchar2;
GETXML

This function returns the XMLType located at the address specified by the URL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getXML() RETURN XMLType;</td>
<td>This function returns the XMLType located at the address specified by the URL.</td>

<td>■ 3 - Both flag bits (1, 2) are enabled</td>
</tr>
</tbody>
</table>
The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

### Table 244–5  **URIFACTORY Type Subprograms**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>GETURI</code> on page 244-37</td>
<td>Returns the correct URL handler for the given URL string.</td>
</tr>
<tr>
<td><code>ESCAPEURI</code> on page 244-38</td>
<td>Returns a URL in escaped format.</td>
</tr>
<tr>
<td><code>UNESCAPEURI</code> on page 244-39</td>
<td>Returns a URL in unescaped format.</td>
</tr>
<tr>
<td><code>REGISTERURLHANDLER</code> on page 244-40</td>
<td>Registers a particular type name for handling a particular URL.</td>
</tr>
<tr>
<td><code>UNREGISTERURLHANDLER</code> on page 244-41</td>
<td>Unregisters a URL handler.</td>
</tr>
</tbody>
</table>
GETURI

This factory method returns the correct URI handler for the given URI string. It returns a subtype instance of the UriType that can handle the protocol. By default, it always creates an XDBURITYPE instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the REGISTERURLHANDLER function. If the prefix matches, GETURI would then use that subtype.

Syntax

FUNCTION getUri(
    url IN Varchar2)
RETURN UriType;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>The URL string, in escaped format, containing a valid HTTP URL.</td>
</tr>
</tbody>
</table>
This function returns a URL in escaped format. The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the GETEXTERNALURL function or the GETURI function to get to the URL value instead of using the attribute present in the UriType.

**Syntax**

```sql
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string to be returned in escaped format.</td>
</tr>
</tbody>
</table>
**UNESCAPEURI**

This function returns a URL in unescaped format. This function is the reverse of the ESCAPEURI function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a VARCHAR2, the characters would be converted into the equivalent characters as defined by the database character set.

**Syntax**

FUNCTION unescapeUri()
RETURN varchar2;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string to be returned in unescaped format.</td>
</tr>
</tbody>
</table>
Registers a particular type name for handling a particular URL. The type specified must be valid and must be a subtype of the UriType or one of its subtypes. It must also implement the createUri static member function. This function is called by the GETURI function to generate an instance of the type. The stripprefix parameter indicates that the prefix must be stripped off before calling this function.

**Syntax**

```sql
PROCEDURE registerUrlHandler(
    prefix IN varchar2,
    schemaName IN varchar2,
    typename IN varchar2,
    ignoreCase IN boolean := true,
    stripprefix IN boolean := true);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>(IN)</td>
<td>The prefix to handle; for example, http://.</td>
</tr>
<tr>
<td>schemaName</td>
<td>(IN)</td>
<td>Name of the schema where the type resides; case sensitive.</td>
</tr>
<tr>
<td>typename</td>
<td>(IN)</td>
<td>The name of the type to handle the URL; case sensitive.</td>
</tr>
<tr>
<td>ignoreCase</td>
<td>(IN)</td>
<td>Ignore case when matching prefixes.</td>
</tr>
<tr>
<td>stripprefix</td>
<td>(IN)</td>
<td>Strip prefix before generating the instance of the type.</td>
</tr>
</tbody>
</table>
UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as http://.

Syntax

PROCEDURE unregisterUrlHandler(
    prefix IN varchar2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>(IN)</td>
<td>The prefix to be unregistered.</td>
</tr>
</tbody>
</table>
PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues. The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueuing or to interpret a dequeued JMS message.

This chapter contains these topics:

- **Using JMS Types**
  - Overview
  - Java Versus PL/SQL Data Types
  - More on Bytes, Stream and Map Messages
  - Upcasting and Downcasting Between General and Specific Messages
  - JMS Types Error Reporting
  - Oracle JMS Type Constants
  - `CONVERT_JMS_SELECTOR`

- **Summary of JMS Types**

Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Streams Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Streams AQ offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Streams AQ offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Streams AQ rules.
Java Versus PL/SQL Data Types

Data types do not map one-to-one between PL/SQL and Java. Some Java types, such as BYTE and SHORT, are not present in PL/SQL. PL/SQL type INT was chosen to represent these types. If a PL/SQL INT value intended to hold a Java BYTE or SHORT value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both VARCHAR2 and CLOB, but VARCHAR2 has a maximum limit of 4000 bytes. When retrieving TEXT data from map, stream, and bytes message types, a CLOB is always returned. When updating the map, stream and bytes message types, users can submit either a VARCHAR2 or CLOB.

Similarly, a Java BYTE ARRAY can be represented by both RAW and BLOB, with RAW having a maximum size of 32767. When retrieving BYTE ARRAY data from map, stream, and bytes message types, a BLOB is always returned. When updating the map, stream and bytes message types, users can submit either a RAW or BLOB.

New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new AQ$_JMS_VALUE ADT has been added in the SYS schema for OJMS PL/SQL users. It is specifically used to implement the read_object procedure of AQ$_JMS_STREAM_MESSAGE and get_object procedure of AQ$_JMS_MAP_MESSAGE, to mimic the Java general object class Object. AQ$_JMS_VALUE ADT can represent any data type that JMS StreamMessage and MapMessage can hold.

The collection ADT AQ$_JMS_NAMEARRAY was added for the getNames method of MapMessage. It holds an array of names.

In this release the ADT AQ$_JMS_EXCEPTION was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.
More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of \texttt{AQ$\_MAP\_MESSAGE}, \texttt{AQ$\_JMS\_STREAM\_MESSAGE}, and \texttt{AQ$\_JMS\_BYTES\_MESSAGE} types. These types have some common functionalities that are different from \texttt{AQ$\_JMS\_TEXT\_MESSAGE} type. This section discusses these common functionalities.

This section contains these topics:
- Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:
- \texttt{aq$\_jms\_bytes\_message}
- \texttt{aq$\_jms\_map\_message}
- \texttt{aq$\_jms\_stream\_message}

Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the \texttt{prepare} or \texttt{clear\_body} procedure. The \texttt{prepare} procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while \texttt{clear\_body} initializes the static variable to an empty payload (empty hashtable or stream).

\textbf{Note:} It is important to call the \texttt{prepare} or \texttt{clear\_body} procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the \texttt{flush} procedure wipes out all updates made to the messages.
Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$jms_bytes_message`, `aq$jms_map_message`, and `aq$jms_stream_message` clean up all static variables of their corresponding message stores.

Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages:

1. Call `prepare` for a message.
   
   This call also gives you an operation ID if you do not specify one.

2. Call multiple retrieving procedures with the provided operation ID.

3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.
   
   For `aq$jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.

2. Call multiple updating procedures with the provided operation ID.

3. Call the `flush` method with the provided operation ID.

4. Call the `clean` procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.
The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- **Map messages**
  
  The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- **Stream and bytes messages**
  
  The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

  Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the Jserv static variable.

  The `prepare` procedure, on the other hand, overwrites the message payload in the Jserv static variable with the payload in the PL/SQL ADT.

  Oracle provides member function `get_mode` for users to query the mode.

### Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using Java `ObjectOutputStream` and bytes messages are encoded using Java `DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support utf-8 encoding.

---

**Note:** All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation from JavaSoft.com for details on how the data is encoded into bytes.
Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either RAW or BLOB in the database. In this release Oracle Streams AQ provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```sql
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).
Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Streams AQ queue. Oracle Streams AQ supports retrieving and populating of `aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field.

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.
# JMS Types Error Reporting

Table 245–1 lists Oracle JMS types related errors.

<table>
<thead>
<tr>
<th>ORA error number</th>
<th>dbms_jms_plsql package constants</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24190</td>
<td>ERROR_DATA_OVERFLOW</td>
<td>The payload data exceeds the size that an out parameter can hold. For example, the get_text procedure with a VARCHAR2 parameter of aq$._jms_text_message or get_bytes procedure with a RAW parameter of aq$._jms_bytes_message.</td>
</tr>
<tr>
<td>ORA-24191</td>
<td>ERROR_PROP_NAME_EXIST</td>
<td>Setting a property that is previous set</td>
</tr>
<tr>
<td>ORA-24192</td>
<td>ERROR_PROP_NAME_NULL</td>
<td>Occurs when setting a property with null property name.</td>
</tr>
<tr>
<td>ORA-24193</td>
<td>ERROR_EXCEED_RANGE</td>
<td>PL/SQL number type exceeds the valid range of the respective Java type. For example set_byte_property, set_short_property of aq$._jms_head ADT; set_byte and set_short of aq$._jms_map_message ADT; write_byte and write_short of aq$._jms_stream_message and aq$._jms_bytes_message ADT.</td>
</tr>
<tr>
<td>ORA-24194</td>
<td>ERROR_TYPE_MISMATCH</td>
<td>The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.</td>
</tr>
<tr>
<td>ORA-24195</td>
<td>ERROR_MAP_TOO_LARGE</td>
<td>The size of the map exceeds the aq$._jms_namearray ADT capacity. The current size limit is 1024. You can use the get_names function with offset and length parameters to retrieve the name array in multiple small chunks.</td>
</tr>
<tr>
<td>ORA-24196</td>
<td>ERROR_WRONG_MODE</td>
<td>The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.</td>
</tr>
<tr>
<td>ORA-24197</td>
<td>ERROR_JAVA_EXCEPTION</td>
<td>ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the get_exception static procedure of aq$._jms_map_message, aq$._jms_bytes_message, and aq$._jms_stream_message to retrieve the exception information last thrown by the Java stored procedure.</td>
</tr>
<tr>
<td>ORA-24198</td>
<td>ERROR_INVALID_ID</td>
<td>An invalid operation ID is being provided to access a message.</td>
</tr>
<tr>
<td>ORA-24199</td>
<td>ERROR_STORE_OVERFLOW</td>
<td>The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the clean procedure after using one message. The clean procedure frees the message slot for use by other messages attempting access.</td>
</tr>
</tbody>
</table>
Oracle JMS Type Constants

This section lists some useful constants when dealing with message type functions.

**DBMS_AQ Package Constants**

DBMS_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

- JMS_TEXT_MESSAGE CONSTANT BINARY_INTEGER;
- JMS_BYTES_MESSAGE CONSTANT BINARY_INTEGER;
- JMS_STREAM_MESSAGE CONSTANT BINARY_INTEGER;
- JMS_MAP_MESSAGE CONSTANT BINARY_INTEGER;
- JMS_OBJECT_MESSAGE CONSTANT BINARY_INTEGER;

**SYS.DBMS_JMS_PLSQL Package Constants**

SYS.DBMS_JMS_PLSQL package constants are new in Oracle Database 10g. These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

- MESSAGE_ACCESS_READONLY CONSTANT PLS_INTEGER;
- MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;

These constants specify the ADT type of an Oracle Streams AQ queue. They are useful during the conversion of JMS selectors to Oracle Streams AQ rules:

- DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
- DESTPLOAD_USERADT CONSTANT PLS_INTEGER;
- DESTPLOAD_ANYDATA CONSTANT PLS_INTEGER;

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

- DATA_TYPE_BYTE CONSTANT PLS_INTEGER;
- DATA_TYPE_SHORT CONSTANT PLS_INTEGER;
- DATA_TYPE_INTEGER CONSTANT PLS_INTEGER;
- DATA_TYPE_LONG CONSTANT PLS_INTEGER;
- DATA_TYPE_FLOAT CONSTANT PLS_INTEGER;
- DATA_TYPE_DOUBLE CONSTANT PLS_INTEGER;
- DATA_TYPE_BOOLEAN CONSTANT PLS_INTEGER;
- DATA_TYPE_CHARACTER CONSTANT PLS_INTEGER;
- DATA_TYPE_STRING CONSTANT PLS_INTEGER;
- DATA_TYPE_BYTES CONSTANT PLS_INTEGER;
- DATA_TYPE_UNSIGNED_BYTE CONSTANT PLS_INTEGER;
- DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

- ERROR_DATA_OVERFLOW CONSTANT PLS_INTEGER := -24190;
- ERROR_PROP_NAME_EXIST CONSTANT PLS_INTEGER := -24191;
- ERROR_PROP_NAME_NULL CONSTANT PLS_INTEGER := -24192;
- ERROR_EXCEED_RANGE CONSTANT PLS_INTEGER := -24193;
- ERROR_TYPE_MISMATCH CONSTANT PLS_INTEGER := -24194;
- ERROR_MAP_TOO_LARGE CONSTANT PLS_INTEGER := -24195;
- ERROR_WRONG_MODE CONSTANT PLS_INTEGER := -24196;
ERROR_JAVA_EXCEPTION CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW CONSTANT PLS_INTEGER := -24199;
CONVERT_JMS_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Streams AQ rules. These rules can be used in ADD_SUBSCRIBER operations as subscriber rules or in DEQUEUE operations as dequeue conditions. These procedures are in the SYS.dbms_jms_plsql package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is dbms_jms_plsql.DESTPLOAD_JMSTYPE and also assumes that the J2EE compliant mode is true.

Syntax

Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: dest_pload_type. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if this parameter is SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE or SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA. The function returns exactly the same VARCHAR2 value as the selector parameter if the dest_pload_type parameter is SYS.dbms_jms_plsql.DESTPLOAD_USERADT. The function returns null if dest_pload_type parameter is none of these three constants. This function assumes that the J2EE compliant mode is true.

Syntax

Function convert_jms_selector(
    selector IN VARCHAR2,
    dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a dest_pload_type parameter and a compliant parameter. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if the dest_pload_type parameter is SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE or SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA. The function returns exactly the same VARCHAR2 value as the selector parameter if the dest_pload_type
The parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

**Syntax**

```sql
Function convert_jms_selector(
    selector         IN  VARCHAR2,
    dest_pload_type  IN  PLS_INTEGER,
    compliant        IN  BOOLEAN )

Returns
The converted Oracle Streams AQ rule or null if there is any conversion error.

**Exceptions**
ORA-24197 if the Java stored procedure throws an exception during execution.
Summary of JMS Types

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
- SYS.AQ$_JMS_NAMESARRAY Type
- SYS.AQ$_JMS_VALUE Type
- SYS.AQ$_JMS_EXCEPTION Type
SYS.AQ$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

- CONSTRUCT Static Functions
- Cast Methods
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```sql
TYPE AQ$_JMS_MESSAGE AS OBJECT(
    header    aq$_jms_header,
    senderid  varchar2(100),
    message_type  INT,
    text_len    INT,
    bytes_len   INT,
    text_vc     varchar2(4000),
    bytes_raw   raw(2000),
    text_lob    clob,
    bytes_lob   blob,

CONSTRUCT Static Functions

There are six CONSTRUCT static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq$_jms_message
Creates an instance of aq$_jms_message, which can hold a specific type of JMS message (TextMessage, BytesMessage, MapMessage, StreamMessage or ObjectMessage). The message type of the created aq$_jms_message instance depends on the mtype parameter passed to the construct method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The mtype parameter must be one of the following constants described in "Oracle JMS Type Constants" on page 245-11:

DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE

STATIC FUNCTION construct (text_msg IN aq$_jms_text_message) RETURN aq$_jms_message
Creates an aq$_jms_message from an aq$_jms_text_message.

STATIC FUNCTION construct (bytes_msg IN aq$_jms_bytes_message) RETURN
aq$.jms_message;
Creates an aq$._jms_message from an aq$._jms_bytes_message.

STATIC FUNCTION construct (stream_msg IN aq$._jms_stream_message) RETURN aq$._jms_message;
Creates an aq$._jms_message from an aq$._jms_stream_message.

STATIC FUNCTION construct (map_msg IN aq$._jms_map_message) RETURN aq$._jms_message;
Creates an aq$._jms_message from an aq$._jms_map_message.

STATIC FUNCTION construct (object_msg IN aq$._jms_object_message) RETURN aq$._jms_message;
Creates an aq$._jms_message from an aq$._jms_object_message.

Cast Methods

cast_to_bytes_msg RETURN aq$._jms_bytes_message
Casts an aq$._jms_message to an aq$._jms_bytes_message. Returns an aq$._jms_bytes_message or null if the message_type attribute of the aq$._jms_message is not DBMS_AQ.JMS_BYTES_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$._jms_message is not DBMS_AQJMS.JMS.GetBytes.MESSAGE.

cast_to_map_msg RETURN aq$._jms_map_message
Casts an aq$._jms_message to an aq$._jms_map_message. Returns an aq$._jms_map_message or null if the message_type attribute of the aq$._jms_message is not DBMS_AQ.JMS_MAP_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$._jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE.

cast_to_object_msg RETURN aq$._jms_object_message
Casts an aq$._jms_message to an aq$._jms_object_message. Returns an aq$._jms_object_message or null if the message_type attribute of the aq$._jms_message is not DBMS_AQ.JMS_OBJECT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$._jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE.

cast_to_stream_msg RETURN aq$._jms_stream_message
Casts an aq$._jms_message to an aq$._jms_stream_message. Returns an aq$._jms_stream_message or null if the message_type attribute of the aq$._jms_message is not DBMS_AQ.JMS_STREAM_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$._jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE.

cast_to_text_msg RETURN aq$._jms_text_message
Casts an aq$._jms_message to an aq$._jms_text_message. Returns an aq$._jms_text_message or null if the message_type attribute of the aq$._jms_message is not DBMS_AQ.JMS_TEXT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$._jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE.

JMS Header Methods

set_replyto (replyto IN sys.aq$._agent)
Sets the replyto parameter, which corresponds to JMSReplyTo.
get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text and corresponds to JMSType.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID.

set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN VARCHAR
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value in an internal representation (a NUMBER type). Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If it is not null, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the byte datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.
set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If it is not null, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because the INT datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If it is not null, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a Integer property, then this function returns the value of the property. Otherwise it returns a null.
get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a VARCHAR2 value, to an internal representation.

set_text (payload IN CLOB),
Sets the payload, a CLOB value, to an internal representation.

set_bytes (payload IN RAW)
Sets the payload, a RAW value, to an internal representation.

set_bytes (payload IN BLOB)
Sets the payload, a BLOB value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a VARCHAR2 variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a CLOB variable payload.

get_bytes (payload OUT RAW)
Puts the internal representation of the payload into a RAW variable payload.

get_bytes (payload OUT BLOB)
Puts the internal representation of the payload into a BLOB variable payload.
SYS.AQ$_JMS_TEXT_MESSAGE Type

This type is the ADT used to store a TextMessage in an Oracle Streams AQ queue.

This section contains these topics:

MEMBER FUNCTION get_long_property  (property_name IN VARCHAR) RETURN NUMBER,
MEMBER FUNCTION get_short_property  (property_name IN VARCHAR) RETURN INT,
```
CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_text_message
Creates an empty aq$_jms_text_message.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN INT
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.
set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.
get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a Integer property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR)
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a VARCHAR2 value, to an internal representation.

set_text (payload IN CLOB)
Sets the payload, a CLOB value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a VARCHAR2 variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a CLOB variable payload.
SYS.AQ$_JMS_BYTES_MESSAGE Type

This type is the ADT used to store a BytesMessage in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

**Syntax**

```plsql
TYPE AQ$_JMS_BYTES_MESSAGE AS OBJECT(

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_bytes_message
Creates an empty aq$_jms_bytes_message.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.
SYS.AQ$ JMS_BYTES_MESSAGE Type

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN NUMBER
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.
**set_int_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_long_property (property_name IN VARCHAR, property_value IN NUMBER)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_short_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN**
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

**get_byte_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

**get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION**
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

**get_float_property (property_name IN VARCHAR) RETURN FLOAT**
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

**get_int_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a Integer property, then this function returns the value of the property. Otherwise it returns a null.

**get_long_property (property_name IN VARCHAR) RETURN NUMBER**
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.
get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload in RAW)
Sets the payload, a RAW value, to an internal representation.

set_bytes (payload in BLOB)
Sets the payload, a BLOB value, to an internal representation.

get_bytes (payload out RAW)
Puts the internal representation of the payload into a RAW variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of RAW in PL/SQL).

get_bytes (payload out BLOB)
Puts the internal representation of the payload into a BLOB variable payload.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_bytes_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to MESSAGE_ACCESS_READONLY. Subsequent calls of write_XXX procedure raise an ORA-24196 error. Users can call the clear_body procedure to set the message access mode to MESSAGE_ACCESS_READONLY.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to the aq$_jms_bytes_message. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session
memory. If \texttt{id} is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to \texttt{MESSAGE\_ACCESS\_WRITEONLY}. Later calls of \texttt{read\_XXX} procedure raise ORA-24196 error. Users can call the \texttt{reset} or \texttt{prepare} procedures to set the message access mode to \texttt{MESSAGE\_ACCESS\_READONLY}.

Write-only and read-only modes affect only the payload functions of \texttt{AQ$_JMS$_BYTES\_MESSAGE}. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

\textbf{clean (id IN PLS\_INTEGER)}

Closes and cleans up the \texttt{DataInputStream} or \texttt{DataOutputStream} at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

\textbf{clean\_all}

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

\textbf{get\_mode (id IN PLS\_INTEGER) RETURN PLS\_INTEGER}

Returns the current mode of this message. The return value is either \texttt{SYS.dbms\_jms.plsql.MESSAGE\_ACCESS\_READONLY} or \texttt{SYS.dbms\_jms.plsql.MESSAGE\_ACCESS\_WRITEONLY}. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

\textbf{read\_boolean (id IN PLS\_INTEGER) RETURN BOOLEAN}

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter \texttt{id} is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

\textbf{read\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER}

Reads a \texttt{BYTE} value from the bytes message and returns the \texttt{BYTE} value read. Null is returned if the end of the stream has been reached. Because there is no \texttt{BYTE} type in PL/SQL, Oracle Database uses \texttt{PLS\_INTEGER} to represent a \texttt{BYTE}. Although PL/SQL users get a \texttt{PLS\_INTEGER}, they are guaranteed that the value is in the Java \texttt{BYTE} value range. If this value is issued with a \texttt{write\_byte} function, then there will not be an out of range error. Parameter \texttt{id} is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

\textbf{read\_bytes (id IN PLS\_INTEGER, value OUT NO COPY BLOB, length IN PLS\_INTEGER) RETURN PLS\_INTEGER}

Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
read_char (id IN PLS_INTEGER) RETURN CHAR
Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION
Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT
Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN INT
Reads an INT from the bytes message and returns the INT read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER
Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, PLS_INTEGER is used to represent a BYTE. Although PL/SQL users get a PLS_INTEGER, they are guaranteed that the value is in the Java short value range. If this value is issued with a write_short function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
Summary of JMS Types

**read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)**
Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)**
Writes a Boolean to the bytes message stream as a 1-byte value. The value true is written as the value (byte)1. The value false is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)**
Writes a byte to the bytes message. Because there is no BYTE type in PL/SQL, PLS_INTEGER is used to represent a BYTE. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN RAW)**
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN BLOB)**
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)**
Writes a portion of a byte array to the bytes message stream. Parameter offset is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)**
Writes a portion of a byte array to the bytes message stream. Parameter offset is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_char (id IN PLS_INTEGER, value IN CHAR)**
Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
**write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)**
 Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_float (id IN PLS_INTEGER, value IN FLOAT)**
 Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)**
 Writes an INT to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_long (id IN PLS_INTEGER, value IN NUMBER)**
 Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)**
 Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, INT is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_utf (id IN PLS_INTEGER, value IN VARCHAR2)**
 Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_utf (id IN PLS_INTEGER, value IN CLOB)**
 Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
SYS.AQ$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a MapMessage in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```sql
TYPE aq$_jms_map_message AS object(
  header     aq$_jms_header,
  bytes_len  int,
  bytes_raw  raw(2000),
  bytes_lob  blob,
  STATIC FUNCTION  construct   RETURN aq$_jms_map_message,
  MEMBER PROCEDURE set_replyto  (replyto IN sys.aq$_agent),
  MEMBER PROCEDURE set_type     (type    IN VARCHAR),
  MEMBER FUNCTION get_replyto  RETURN sys.aq$_agent,
  MEMBER FUNCTION get_type     RETURN VARCHAR,
  MEMBER PROCEDURE set_userid   (userid   IN VARCHAR),
  MEMBER PROCEDURE set_appid    (appid    IN VARCHAR),

    RETURN BOOLEAN);

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_map_message
Creates an empty aq$_jms_map_message object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN NUMBER
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.
set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.
get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is an Integer property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload IN RAW)
Sets the internal payload as a RAW variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function sets a payload as a RAW variable without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as a BLOB variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB without interpreting it.
prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in \texttt{aq$_jms\_map\_message} and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter \texttt{id} is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If \texttt{id} is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to \texttt{aq$_jms\_map\_message}. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter \texttt{id} is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If \texttt{id} is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)
Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the \texttt{BYTE} value with the specified name in the map. Because there is no \texttt{BYTE} type in PL/SQL, \texttt{PLS\_INTEGER} is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW)
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT,
**Summary of JMS Types**

**set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)**

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)**

Sets a portion of the byte array value with the specified name in the map. Parameter *offset* is the initial offset within the byte array, and parameter *length* is the number of bytes to use. If the range \[offset \ldots offset+length\] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)**

Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)**

Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)**

This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)**

Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)**

Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)**

Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN CLOB)
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the \texttt{BYTE} value with the specified name. If there is no item by this name, then null is returned. Because there is no \texttt{BYTE} type in PL/SQL, \texttt{PLS\_INTEGER} is used to represent a byte. Although the PL/SQL users get a \texttt{PLS\_INTEGER}, they are guaranteed that the value is in the Java \texttt{BYTE} value range. If this value is issued with a \texttt{set\_byte} function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)
Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL \texttt{RAW} type, a \texttt{BLOB} is always returned here. The \texttt{BLOB} returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR
Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION
Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT
Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the \texttt{INT} value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type
of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER**
Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER**
Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no short type in PL/SQL, INT is used to represent a short. Although the PL/SQL users get an PLS_INTEGER, they are guaranteed that the value is in the Java short value range. If this value is issued with a set_short function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)**
Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get_names (id IN PLS_INTEGER) RETURN aq$_jms_namearray**
Retrieves all the names within the map message and returns them in a varray. Because aq$_jms_namearray has a size as 1024 and each element is a VARCHAR(200), this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

**get_names (id IN PLS_INTEGER, names OUT aq$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER**
Retrieves a portion of the names within the map message. Because aq$_jms_namearray has a size as 1024 and each element is a VARCHAR(200), this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a length parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter offset is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval [offset, offset+length-1] and interval [0, size-1] where size is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ$_JMS_VALUE)**
Returns a general value ADT AQ$_JMS_VALUE. If there is no item by this name, then null is returned. Users can use the type attribute of this ADT to interpret the data. See
the map in the AQ$_JMS_VALUE ADT for the correspondence among dbms_jms_plsql package constants, Java data type and AQ$_JMS_VALUE attribute. Note this member procedure might bring additional overhead compared to other get member procedures or functions. It is used only if the user does not know the data type of the fields within a message before hand. Otherwise it is a good idea to use a specific get member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**
Indicates that an item exists in this map message by returning TRUE. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
SYS.AQ$_JMS_STREAM_MESSAGE Type

This type is the ADT used to store a StreamMessage in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE aq$_jms_stream_message AS object(
  header     aq$_jms_header,
  bytes_len  int,
  bytes_raw  raw(2000),
  bytes_lob  blob,
  STATIC FUNCTION  construct RETURN aq$_jms_stream_message,
  MEMBER PROCEDURE set_replyto  (replyto IN sys.aq$_agent),
  MEMBER PROCEDURE set_type     (type    IN VARCHAR),
  MEMBER FUNCTION  get_replyto  RETURN sys.aq$_agent,
  MEMBER FUNCTION  get_type     RETURN VARCHAR,
  MEMBER PROCEDURE set_userid   (userid   IN VARCHAR),
  MEMBER PROCEDURE set_appid    (appid    IN VARCHAR),
  MEMBER PROCEDURE set_groupid  (groupid  IN VARCHAR),
  MEMBER PROCEDURE set_groupseq (groupseq IN INT),
  MEMBER FUNCTION  get_userid   RETURN VARCHAR,
  MEMBER FUNCTION  get_appid    RETURN VARCHAR,
  MEMBER FUNCTION  get_groupid  RETURN VARCHAR,
  MEMBER FUNCTION  get_groupseq RETURN INT,
  MEMBER PROCEDURE clear_properties,
  MEMBER PROCEDURE set_boolean_property(property_name IN VARCHAR, property_value IN BOOLEAN),
  MEMBER PROCEDURE set_byte_property   (property_name IN VARCHAR, property_value IN INT),
  MEMBER PROCEDURE set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION),
  MEMBER PROCEDURE set_float_property  (property_name IN VARCHAR, property_value IN FLOAT),
  MEMBER PROCEDURE set_int_property    (property_name IN VARCHAR, property_value IN INT),
  MEMBER PROCEDURE set_long_property   (property_name IN VARCHAR, property_value IN NUMBER),
  MEMBER PROCEDURE set_short_property  (property_name IN VARCHAR, property_value IN INT),
  MEMBER PROCEDURE set_string_property (property_name IN VARCHAR, property_value IN VARCHAR),

 MEMBER PROCEDURE write_bytes (id IN PLS_INTEGER, value IN RAW),
 MEMBER PROCEDURE write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION),
 MEMBER PROCEDURE write_float (id IN PLS_INTEGER, value IN FLOAT),
 MEMBER PROCEDURE write_long (id IN PLS_INTEGER, value IN NUMBER),
 MEMBER PROCEDURE write_short (id IN PLS_INTEGER, value IN PLS_INTEGER),
 MEMBER PROCEDURE write_string (id IN PLS_INTEGER, value IN VARCHAR2),
 MEMBER PROCEDURE write_string (id IN PLS_INTEGER, value IN CLOB));

**CONSTRUCT Function**

**STATIC FUNCTION construct RETURN aq$_jms_stream_message**

Creates an empty aq$_jms_stream_message object.

**JMS Header Methods**

```sql
set_replyto (replyto IN sys.aq$_agent)
```

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

```sql
set_type (type IN VARCHAR)
```

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

```sql
get_replyto RETURN sys.aq$_agent
```

Returns replyto, which corresponds to JMSReplyTo.
**get_type RETURN VARCHAR**
Returns type, which corresponds to JMSType.

**System Properties Methods**

**set_userid (userid IN VARCHAR)**
Sets userid, which corresponds to JMSXUserID in JMS.

**set_appid (appid IN VARCHAR)**
Sets appid, which corresponds to JMSXAppID in JMS.

**set_groupid (groupid IN VARCHAR)**
Sets groupid, which corresponds to JMSXGroupID in JMS.

**set_groupseq (groupseq IN INT)**
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

**get_userid RETURN VARCHAR**
Returns userid, which corresponds to JMSXUserID.

**get_appid RETURN VARCHAR**
Returns appid, which corresponds to JMSXAppID.

**get_groupid RETURN VARCHAR**
Returns groupid, which corresponds to JMSXGroupID.

**get_groupseq RETURN NUMBER**
Returns groupseq, which corresponds to JMSXGroupSeq.

**User Properties Methods**

**clear_properties**
Clears all user properties. This procedure does not affect system properties.

**set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)**
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_byte_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_float_property (property_name IN VARCHAR, property_value IN FLOAT)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.
set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is an integer property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.
get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB variable without interpreting it.

set_bytes (payload IN RAW)
Sets the internal payload as the RAW variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as the BLOB variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_stream_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to MESSAGE_ACCESS_READONLY. Subsequent calls of write_XXX procedure raise an ORA-24196 error. Users can call the clear_body procedure to set the message access mode to MESSAGE_ACCESS_READONLY.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the stream message in MESSAGE_ACCESS_READONLY mode.
flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to aq$_jms_stream_message. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare procedures to set the message access mode to MESSAGE_ACCESS_READONLY.
Write-only and read-only modes affect only the payload functions of AQ$_JMS_BYTES_MESSAGE. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER
Returns the current mode of this message. The return value is either SYS.dbms_aqjms.READ_ONLY or SYS.dbms_aqjms.WRITE_ONLY. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN
Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no BYTE type in PL/SQL, INT is used to represent a byte. Although PL/SQL users get an INT, they are guaranteed that the value is in the Java BYTE value range. If this value is issued with a write_byte function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
**Summary of JMS Types**

**read_bytes (id IN PLS_INTEGER) RETURN BLOB**
Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)**
Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_char (id IN PLS_INTEGER) RETURN CHAR**
Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION**
Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_float (id IN PLS_INTEGER) RETURN FLOAT**
Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads and returns an INT from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_long (id IN PLS_INTEGER) RETURN NUMBER**
Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, INT is used to represent a byte. Although PL/SQL users get an INT, they are guaranteed that the value is in the Java short value range. If this value is issued with a write_short function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected
type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_string RETURN CLOB**
Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)**
Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ$_JMS_VALUE)**
Returns a general value ADT AQ$_JMS_VALUE. Users can use the type attribute of this ADT to interpret the data. See Table 245–2 on page 245-57 for the correspondence among dbms_jms_plsql package constants, Java data type and AQ$_JMS_VALUE attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the data type of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)**
Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_byte (id IN PLS_INTEGER, value IN INT)**
Writes a byte to the stream message. Because there is no BYTE type in PL/SQL, INT is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN RAW)**
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)**
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter offset is the initial offset within the byte array, and parameter length is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure. The index starts from 0.
Summary of JMS Types

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN BLOB)**
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)**
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_char (id IN PLS_INTEGER, value IN CHAR)**
Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)**
Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_float (id IN PLS_INTEGER, value IN FLOAT)**
Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)**
Writes an INT to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_long (id IN PLS_INTEGER, value IN NUMBER)**
Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)**
Writes a short to the stream message. Because there is no short type in PL/SQL, INT is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
**write_string (id IN PLS_INTEGER, value IN VARCHAR2)**
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_string (id IN PLS_INTEGER, value IN CLOB)**
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
**SYS.AQ$_JMS_OBJECT_MESSAGE Type**

This type is the ADT used to store an `ObjectMessage` in an Oracle Streams AQ queue.

**Syntax**

```sql
TYPE aq$_jms_object_message AS object(
    header      aq$_jms_header,
    bytes_len   int,
    bytes_raw   raw(2000),
    bytes_lob   blob);
```
SYS.AQ$_JMS_NAMESARRAY Type

This type represents the name array returned by the get_names procedure of aq$_jms_map_message. The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax

CREATE OR REPLACE TYPE AQ$_JMS_NAMESARRAY AS VARRAY(1024) OF VARCHAR(100);

Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,
    offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
SYS.AQ$_JMS_VALUE Type

This type represents the general data returned by the get_object procedure of aq$_jms_map_message and the read_object procedure of aq$_jms_stream_message. The type field in this ADT is used to decide which type of data this object is really holding. Table 245–2 lists the mapping between the sys.dbms_jms_plsql type constants, the corresponding Java type, and the data field of ADT aq$_jms_value which effectively holds the data.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(
  type      number(2),
  num_val   number,
  char_val  char(1),
  text_val  clob,
  bytes_val blob);
```

<table>
<thead>
<tr>
<th>Type</th>
<th>Java Type</th>
<th>aq$_jms_value Data Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_BYTE</td>
<td>byte</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_SHORT</td>
<td>short</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_INTEGER</td>
<td>int</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_LONG</td>
<td>long</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_FLOAT</td>
<td>float</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE</td>
<td>double</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN</td>
<td>boolean</td>
<td>num_val: 0 FALSE, 1 TRUE</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER</td>
<td>char</td>
<td>char_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_STRING</td>
<td>java.lang.String</td>
<td>text_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_BYTES</td>
<td>byte[]</td>
<td>bytes_val</td>
</tr>
</tbody>
</table>
SYS.AQ$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side. The id field is reserved for future use. The exp_name stores the Java exception name, the err_msg field stores the Java exception error message, and the stack field stores the stack trace of the Java exception.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
    id          number, -- Reserved and not used. Right now always return 0.
    exp_name    varchar(200),
    err_msg     varchar(500),
    stack       varchar(4000));
```
The Expression Filter feature provides a set of predefined types and public synonyms for these types. Most of these types are used for configuring index parameters with the Expression Filter procedural APIs. The `EXF$TABLE_ALIAS` type is used to support expressions defined on one or more database tables.

**See Also:** Oracle Database Rules Manager and Expression Filter Developer’s Guide for more information.

This chapter contains the following topics:

- Using Expression Filter Types
- Summary of Expression Filter Types
Using Expression Filter Types

This section contains topics that relate to using the Expression Filter Types.

- Security Model
Security Model

The Oracle Database installation runs the `catexf.sql` script to load the `DBMS_EXPR_FIL` package and create the required Expression Filter schema objects in the `EXFSYS` schema.
Summary of Expression Filter Types

Table 246–1 describes the Expression Filter object types.

All the values and names passed to the types defined in this chapter are not case sensitive. To preserve the case, enclose the values with double quotation marks.

Table 246–1  Expression Filter Object Types

<table>
<thead>
<tr>
<th>Object Type Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXP$ATTRIBUTE</td>
<td>Specifies the stored and indexed attributes for the Expression Filter indexes</td>
</tr>
<tr>
<td>EXP$ATTRIBUTE_LIST</td>
<td>Specifies a list of stored and indexed attributes when configuring index parameters</td>
</tr>
<tr>
<td>EXP$INDEXOPER</td>
<td>Specifies a list of common operators in predicates with a stored or an indexed attribute</td>
</tr>
<tr>
<td>EXP$TABLE_ALIAS</td>
<td>Indicates a special form of elementary attribute used to manage expressions defined on one or more database tables</td>
</tr>
<tr>
<td>EXP$TEXT</td>
<td>Associates preferences to a text attribute in an attribute set or an event structure</td>
</tr>
<tr>
<td>EXP$XPATH_TAG</td>
<td>Configures an XML element or an XML attribute for indexing a set of XPath predicates</td>
</tr>
<tr>
<td>EXP$XPATH_TAGS</td>
<td>Specifies a list of XML tags when configuring the Expression Filter index parameters</td>
</tr>
</tbody>
</table>
EXF$ATTRIBUTE

The EXF$ATTRIBUTE type is used to handle stored and indexed attributes for the Expression Filter indexes.

Syntax

CREATE or REPLACE TYPE EXF$ATTRIBUTE AS OBJECT attr_name VARCHAR2(350),
attr_oper EXF$INDEXOPER,
attr_indexed VARCHAR2(5);

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attr_name</td>
<td>The arithmetic expression that constitutes the stored or indexed attribute</td>
</tr>
<tr>
<td>attr_oper</td>
<td>The list of common operators in the predicates with the attribute. Default value: EXF$INDEXOPER('all')</td>
</tr>
<tr>
<td>attr_indexed</td>
<td>TRUE if the attribute is indexed, else FALSE. Default value: FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

- The EXF$ATTRIBUTE type is used to specify the stored and indexed attributes for an Expression Filter index using the DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS procedure. When values for attr_oper and attr_indexed fields are omitted during EXF$ATTRIBUTE instantiation, it is considered a stored attribute with a default value for common operators (EXF$INDEXOPER('all')).

Examples

A stored attribute with no preference on the list of common operators is represented as follows:

```sql
exf$attribute (attr_name => 'HorsePower(Model, Year)')
```

An indexed attribute is represented as follows:

```sql
exf$attribute (attr_name => 'HorsePower(Model, Year)',
               attr_indexed => 'TRUE')
```

An indexed attribute with a list of common operators is represented as follows:

```sql
exf$attribute (attr_name => 'HorsePower(Model, Year)',
               attr_oper => exf$indexoper('=','<','>','>=','<='),
               attr_indexed => 'TRUE')
```
The `EXF$ATTRIBUTE_LIST` type specifies a list of stored and indexed attributes while configuring the index parameters.

Syntax

```
CREATE or REPLACE TYPE EXF$ATTRIBUTE_LIST as VARRAY(490) of exf$attribute;
```

Attributes

None.

Usage Notes

- Also see the `DEFAULT_INDEX_PARAMETERS` Procedure for more information

Examples

A list of stored and indexed attributes can be represented as follows:

```sql
exf$attribute_list (
    exf$attribute {attr_name => 'Model',
                   attr_oper => exf$indexoper('='),
                   attr_indexed => 'TRUE'),
    exf$attribute {attr_name => 'Price',
                   attr_oper => exf$indexoper('all'),
                   attr_indexed => 'TRUE'),
    exf$attribute {attr_name => 'HorsePower(Model, Year)',
                   attr_oper => exf$indexoper('=','<','>','>=','<='),
                   attr_indexed => 'FALSE'}
)
```
EXF$INDEXOPER

The EXF$INDEXOPER type specifies the list of common operators in predicates with a stored or an indexed attribute.

Syntax

CREATE or REPLACE TYPE EXFSYS.EXF$INDEXOPER as VARRAY(20) of VARCHAR2(15);

The values for the EXF$INDEXOPER array are expected to be from the list in the following table:

<table>
<thead>
<tr>
<th>Value</th>
<th>Predicate Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>Equality predicates</td>
</tr>
<tr>
<td>&gt;</td>
<td>Greater than predicates</td>
</tr>
<tr>
<td>&lt;</td>
<td>Less than predicates</td>
</tr>
<tr>
<td>&gt;=</td>
<td>Greater than or equal to predicates</td>
</tr>
<tr>
<td>&lt;=</td>
<td>Less than or equal to predicates</td>
</tr>
<tr>
<td>!= or &lt;&gt; or ^=</td>
<td>Not equal to predicates</td>
</tr>
<tr>
<td>IS NULL</td>
<td>IS NULL predicates</td>
</tr>
<tr>
<td>IS NOT NULL</td>
<td>IS NOT NULL predicates</td>
</tr>
<tr>
<td>ALL</td>
<td>All the operators listed in this table starting with the equality predicate through the IS NOT NULL predicate</td>
</tr>
<tr>
<td>NVL</td>
<td>Predicates with NVL (equality) operator</td>
</tr>
<tr>
<td>LIKE</td>
<td>Predicates with LIKE operator</td>
</tr>
<tr>
<td>BETWEEN</td>
<td>BETWEEN predicates</td>
</tr>
</tbody>
</table>

Attributes

None.

Usage Notes

- A value of ALL for one of the EXF$INDEXOPER items implies that all the simple operators (=, >, <, >=, <=, !=, IS NULL, IS NOT NULL) are common in the predicates with an attribute. This value can be used along with one or more complex operators (NVL, LIKE and BETWEEN).

- A predicate with a BETWEEN operator is treated as two predicates with binary operators, one with ‘>=’ operator and another with ‘<=’ operator. By default, only one of these operators is indexed, and the other operator is evaluated by value substitution. However, if predicates with the BETWEEN operator are common for an attribute (stored or indexed), both the binary operators resulting from the BETWEEN operator can be indexed by specifying BETWEEN in the EXF$INDEXOPER VARRAY. However, because this uses additional space in the predicate table, this operator should be used only when majority of predicates with an attribute use the BETWEEN operator.

- When the LIKE operator is chosen as one of the common operators for an attribute, LIKE predicates on that attributes are indexed. Indexing a LIKE operator is beneficial only if the VARCHAR2 constant on the right-hand side of the
predicate does not lead with a wild-card character. For example, indexing a LIKE operator will filter the following predicates efficiently:

company LIKE 'General%'
company LIKE 'Proctor%'

But, the following predicates are evaluated as sparse predicates in the last stage:

company LIKE '%$Electric'
company LIKE '%$Gamble'

Examples

An attribute with a list of common operators is represented as follows:

```sql
exf$attribute (attr_name => 'HorsePower(Model, Year)',
               attr_oper => exf$indexoper('=', '<', '>', '>=', '<=', 'between'),
               attr_indexed => 'TRUE')
```
A \textit{EXF\$TABLE\_ALIAS} type is a special form of elementary attribute that can be included in the attribute set. These attributes manage expressions defined on one or more database tables.

### Syntax

```
CREATE or REPLACE TYPE EXF\$TABLE\_ALIAS AS OBJECT table_name VARCHAR2(70);
```

### Attributes

#### Table 246–3 \textit{EXF\$TABLE\_ALIAS} Attribute

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of the table with a possible schema extension</td>
</tr>
</tbody>
</table>

### Usage Notes

- The concept of a table alias attribute is captured in the Expression Filter dictionary and the corresponding attribute in the attribute set’s object type is created with a \texttt{VARCHAR2} data type. (Also see Oracle Database Rules Manager and Expression Filter Developer’s Guide and \texttt{ADD\_ELEMENTARY\_ATTRIBUTE} Procedures.)

### Examples

For a set of expressions defined on database tables, the corresponding table alias attributes are configured as follows:

```
BEGIN
    DBMS_EXPFIL.ADD\_ELEMENTARY\_ATTRIBUTE {
        attr_set => 'HRAttrSet',
        attr_name => 'EMP',
        tab_alias => exf\$table\_alias('SCOTT.EMP'));
    DBMS_EXPFIL.ADD\_ELEMENTARY\_ATTRIBUTE {
        attr_set => 'HRAttrSet',
        attr_name => 'DEPT',
        tab_alias => exf\$table\_alias('DEPT'));
END;
/
```

The Expression column using the previous attribute set can store expressions of form \texttt{EMP.JOB = 'Clerk' and EMP.NAME = 'Joe'}, where \texttt{JOB} and \texttt{NAME} are the names of the columns in the \texttt{SCOTT.EMP} table.
A EXF$TEXT type associates preferences to a text attribute in an attribute set or an event structure.

Syntax

```
CREATE or REPLACE TYPE EXFSYS.EXF$TEXT AS OBJECT(preferences VARCHAR2(1000));
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>preferences</td>
<td>Text preference specification, such as LEXER, CLASSIFIER, and WORDLIST</td>
</tr>
</tbody>
</table>

Usage Notes

- The EXF$TEXT attribute is used to specify the preferences for a text attribute at the time of creation. The preferences specified through the instance of EXF$TEXT type are used in creation of the CTXRULE index for the text predicates. The syntax for the text preference specification is similar to the PARAMETERS clause specified for a CTXRULE Indextype. [See CREATE INDEX syntax for CTXRULE Indextype in Oracle Text Reference, Release 10g Release 2.]

Examples

A text predicate with a LEXER and WORDLIST preferences can be created using the following instance of EXF$TEXT object as follows:

```sql
EXF$TEXT ('LEXER insrpt_lexer WORDLIST insrpt_wordlist');
```
EXF$XPATH_TAG

The EXF$XPATH_TAG type configures an XML element or an XML attribute for indexing a set of XPath predicates.

Syntax

CREATE or REPLACE TYPE EXF$XPATH_TAG AS OBJECT
tag_name VARCHAR2(350),
tag_indexed VARCHAR2(5),
tag_type VARCHAR2(30);

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag_name</td>
<td>Name of the XML element or attribute. The name for an XML attribute is formatted as: <code>&lt;ElementName&gt;@&lt;AttributeName&gt;</code>. Optionally, the element name can be prefixed with its namespace URL as in <code>&lt;Namespace URL&gt;:&lt;ElementName&gt;@&lt;AttributeName&gt;</code>.</td>
</tr>
<tr>
<td>tag_indexed</td>
<td>TRUE if XML tag is indexed; otherwise FALSE. Default: TRUE if the tag is a positional filter. FALSE if the tag is a value filter.</td>
</tr>
<tr>
<td>tag_type</td>
<td>Datatype for the value in the case of value filter. NULL for positional filters.</td>
</tr>
</tbody>
</table>

Usage Notes

- EXF$XPATH_TAG type configures an XML element or an attribute as a positional or a value filter for an Expression Filter index (see the section on index tuning for XPath predicates in Oracle Database Rules Manager and Expression Filter Developer’s Guide). An instance of the EXF$XPATH_TAG type with NULL value for tag_type configures the XML tag as a positional filter. In the current release, the only other possible values for the tag_type attribute are strings (CHAR or VARCHAR) and such tags are configured as value filters. By default, all positional filters are indexed and the value filters are not indexed. This behavior can be overridden by setting a TRUE or FALSE value for the tag_indexed attribute accordingly.

Examples

An XML element can be configured as a positional filter and be indexed using the following instance of the EXF$XPATH_TAG type.

```sql
exf$xpath_tag(tag_name    => 'stereo',       --- XML element
tag_indexed => 'TRUE',         --- indexed predicate group
tag_type    => null)           --- positional filter
```

An XML attribute can be configured as a value filter and be indexed using the following type instance.

```sql
exf$xpath_tag(tag_name    => 'stereo@make',  --- XML attribute
tag_indexed => 'TRUE',         --- indexed predicate group
tag_type    => 'VARCHAR(15)')  --- value filter
```

The following commands configure the two filters shown previously using the namespace URL for the corresponding elements.

```sql
exf$xpath_tag(tag_name => 'http://www.auto.com/car.xsd:stereo',
```

Table 246–5  EXF$XPATH_TAG Attributes
tag_indexed => 'TRUE', --- indexed predicate group
tag_type => null)       --- positional filter

exf$xpath_tag(tag_name => 'http://www.auto.com/car.xsd:stereo@make'
tag_indexed => 'TRUE',   --- indexed predicate group
tag_type => 'VARCHAR(15)')     --- value filter
**EXF$XPATH_TAGS**

The EXF$XPATH_TAGS type specifies a list of XML tags while configuring the Expression Filter index parameters.

**Syntax**

CREATE or REPLACE TYPE EXF$XPATH_TAGS as VARRAY(490) of EXF$XPATH_TAG;

**Attributes**

None.

**Usage Notes**

- **EXF$XPATH_TAGS** type specifies a list of XML tags while configuring the Expression Filter index parameters. (See DEFAULT_INDEX_PARAMETERS Procedure.)

**Examples**

A list of XML tags configured as positional and value filters can be represented as follows:

```sql
exf$xpath_tags(
  exf$xpath_tag(tag_name => 'stereo@make',  --- XML attribute
tag_indexed => 'TRUE',
tag_type => 'VARCHAR(15)'), --- value filter
exf$xpath_tag(tag_name => 'stereo',       --- XML element
tag_indexed => 'FALSE',
tag_type => null),          --- positional filter
exf$xpath_tag(tag_name => 'memory',       --- XML element
tag_indexed => 'TRUE',
tag_type => 'VARCHAR(10)')  --- value filter
)
```
This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

- **Using Logical Change Record Types**
  - Overview
  - Security Model

- **Summary of Logical Change Record Types**

- **Common Subprograms for LCR$\_DDL\_RECORD and LCR$\_ROW\_RECORD**
Using Logical Change Record Types

This section contains topics that relate to using the logical change record (LCR) types.

- Overview
- Security Model
Overview

In Oracle Streams, logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Oracle Streams, the capture process captures changes in the form of LCRs and enqueues them into a queue. These LCRs can be propagated from a queue in one database to a queue in another database. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueuing, and dequeuing LCRs manually.

See Also: Oracle Streams Concepts and Administration for more information about LCRs
Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.
Summary of Logical Change Record Types

Table 247–1  Logical Change Record (LCR) Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCR$_DDL_RECORD Type</td>
<td>Represents a data definition language (DDL) change to a</td>
</tr>
<tr>
<td></td>
<td>database object</td>
</tr>
<tr>
<td>LCR$_ROW_RECORD Type</td>
<td>Represents a data manipulation language (DML) change</td>
</tr>
<tr>
<td></td>
<td>to a database object</td>
</tr>
<tr>
<td>LCR$_ROW_LIST Type</td>
<td>Identifies a list of column values for a row in a table</td>
</tr>
<tr>
<td>LCR$_ROW_UNIT Type</td>
<td>Identifies the value for a column in a row</td>
</tr>
</tbody>
</table>

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS_APPLY_ADM
- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM
LCR$_DDL_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the ddl_text is consistent with the base_table_name, base_table_owner, object_type, object_owner, object_name, and command_type attributes.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- LCR$_DDL_RECORD Constructor
- Summary of LCR$_DDL_RECORD Subprograms, which also include the subprograms described in "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" on page 247-36

Note:
- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

LCR$_DDL_RECORD Constructor

Creates a SYS.LCR$_DDL_RECORD object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
  source_database_name  IN  VARCHAR2,
  command_type IN  VARCHAR2,
  object_owner IN  VARCHAR2,
  object_name           IN  VARCHAR2,
  object_type           IN  VARCHAR2,
  ddl_text              IN  CLOB,
  logon_user            IN  VARCHAR2,
  current_schema IN  VARCHAR2,
  base_table_owner IN  VARCHAR2,
  base_table_name      IN  VARCHAR2,
  tag                   IN  RAW       DEFAULT NULL,
  transaction_id        IN  VARCHAR2  DEFAULT NULL,
  scn                   IN  NUMBER    DEFAULT NULL,
  position              IN  RAW       DEFAULT NULL,
  edition_name          IN  VARCHAR2  DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;
```
**LCR$_DDL_RECORD Constructor Function Parameters**

<table>
<thead>

**Cont. Constructor Function Parameters for LCR$$_DDL$$ RECORD**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl_text</td>
<td>The text of the DDL statement</td>
</tr>
<tr>
<td></td>
<td>Set this parameter to a non-NULL value.</td>
</tr>
<tr>
<td>logon_user</td>
<td>The user whose session executed the DDL statement</td>
</tr>
<tr>
<td>current_schema</td>
<td>The schema that is used if no schema is specified explicitly for the modified database objects in <code>ddl_text</code>.</td>
</tr>
<tr>
<td></td>
<td>If a schema is specified in <code>ddl_text</code> that differs from the one specified for <code>current_schema</code>, then the function uses the schema specified in <code>ddl_text</code>.</td>
</tr>
<tr>
<td></td>
<td>Set this parameter to a non-NULL value.</td>
</tr>
<tr>
<td>base_table_owner</td>
<td>If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code>), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_owner</code> specifies the owner of the table involved. Otherwise, <code>base_table_owner</code> is NULL.</td>
</tr>
<tr>
<td>base_table_name</td>
<td>If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code>), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_name</code> specifies the name of the table involved. Otherwise, <code>base_table_name</code> is NULL.</td>
</tr>
<tr>
<td>tag</td>
<td>A binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used.</td>
</tr>
<tr>
<td>transaction_id</td>
<td>The identifier of the transaction</td>
</tr>
<tr>
<td>scn</td>
<td>The SCN at the time when the change record for a captured LCR was written to the redo log. The SCN value is meaningless for a user-created LCR.</td>
</tr>
<tr>
<td>position</td>
<td>The position of the LCR</td>
</tr>
<tr>
<td>edition_name</td>
<td>The name of the edition in which the DDL statement was executed</td>
</tr>
</tbody>
</table>
### EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

---

**Note:** The EXECUTE member procedure can be invoked only in an apply handler for an Oracle Streams apply process.

---

#### Syntax

```
MEMBER PROCEDURE EXECUTE;
```

### GET_BASE_TABLE_NAME Member Function

Gets the base (dependent) table name.

---

#### Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME()
RETURN VARCHAR2;
```
GET_BASE_TABLE_OWNER Member Function

Gets the base (dependent) table owner.

Syntax

MEMBER FUNCTION GET_BASE_TABLE_OWNER()
RETURN VARCHAR2;

GET_CURRENT_SCHEMA Member Function

Gets the current schema name.

Syntax

MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;

GET_DDL_TEXT Member Procedure

Gets the DDL text in a CLOB.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```plsql
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
    ddl_text CLOB;
BEGIN
    DBMS_OUTPUT.PUT_LINE('  -----------------------------------------' );
    DBMS_OUTPUT.PUT_LINE('  Displaying DDL text in a DDL LCR: ');
    DBMS_OUTPUT.PUT_LINE('  -----------------------------------------' );
    DBMS_LOB.CREATETEMPORARY(ddl_text, true);
    ddl_lcr.GET_DDL_TEXT(ddl_text);
    DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
    DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/
```

**Note:** GET_DDL_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

Syntax

MEMBER FUNCTION GET_DDL_TEXT(
    ddl_text IN/OUT CLOB);

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl_text</td>
<td>The DDL text in the DDL LCR</td>
</tr>
</tbody>
</table>
GET_EDITION_NAME Member Function

Gets the name of the edition in which the DDL statement was executed.

See Also: Oracle Database Advanced Application Developer’s Guide

Syntax

MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;

GET_LOGON_USER Member Function

Gets the logon user name.

Syntax

MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;

GET_OBJECT_TYPE Member Function

Gets the type of the object involved for the DDL.

Syntax

MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;

SET_BASE_TABLE_NAME Member Procedure

Sets the base (dependent) table name.

Syntax

MEMBER PROCEDURE SET_BASE_TABLE_NAME(
    base_table_name  IN  VARCHAR2);

Parameter

Table 247–5  SET_BASE_TABLE_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_table_name</td>
<td>The name of the base table</td>
</tr>
</tbody>
</table>

SET_BASE_TABLE_OWNER Member Procedure

Sets the base (dependent) table owner.

Syntax

MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
    base_table_owner  IN  VARCHAR2);
**SET_CURRENT_SCHEMA Member Procedure**

Sets the default schema (user) name.

**Syntax**

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(
    current_schema  IN  VARCHAR2);
```

**Parameter**

*Table 247–6  SET_BASE_TABLE_OWNER Procedure Parameter*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_table_owner</td>
<td>The name of the base owner</td>
</tr>
</tbody>
</table>

**SET_DDL_TEXT Member Procedure**

Sets the DDL text.

**Syntax**

```
MEMBER PROCEDURE SET_DDL_TEXT(
    ddl_text  IN  CLOB);
```

**Parameter**

*Table 247–7  SET_CURRENT_SCHEMA Procedure Parameter*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current_schema</td>
<td>The name of the schema to set as the current schema Set this parameter to a non-NULL value.</td>
</tr>
</tbody>
</table>

**SET_EDITION_NAME Member Procedure**

Sets the name of the edition in which the DDL statement was executed.

**See Also:** Oracle Database Advanced Application Developer’s Guide

**Syntax**

```
MEMBER PROCEDURE SET_EDITION_NAME(
    edition_name  IN  VARCHAR2);
```
Parameter

Table 247–9  SET_EDITION_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edition_name</td>
<td>Name of the edition</td>
</tr>
</tbody>
</table>

SET_LOGON_USER Member Procedure

Sets the logon user name.

Syntax

MEMBER PROCEDURE SET_LOGON_USER(
    logon_user  IN  VARCHAR2);

Parameter

Table 247–10  SET_LOGON_USER Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logon_user</td>
<td>The name of the schema to set as the logon user</td>
</tr>
</tbody>
</table>

SET_OBJECT_TYPE Member Procedure

Sets the object type.

Syntax

MEMBER PROCEDURE SET_OBJECT_TYPE(
    object_type  IN  VARCHAR2);
### Parameter

<table>

</tr>
</tbody>
</table>
LCR$_ROW_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the LCR$_ROW_LIST type.

If you create or modify a row logical change record (row LCR), then make sure the command_type attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- LCR$_ROW_RECORD Constructor
- Summary of LCR$_ROW_RECORD Subprograms, which also include the subprograms described in Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD on page 247-36

Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.

- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

See Also:  LCR$_ROW_LIST Type on page 247-47

LCR$_ROW_RECORD Constructor

Creates a SYS.LCR$_ROW_RECORD object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
    source_database_name  IN  VARCHAR2,
    command_type IN  VARCHAR2,
    object_owner IN  VARCHAR2,
    object_name           IN  VARCHAR2,
    tag                   IN  RAW                DEFAULT NULL,
    transaction_id        IN  VARCHAR2           DEFAULT NULL,
    scn                   IN  NUMBER             DEFAULT NULL,
    old_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
    new_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
    position              IN  RAW                DEFAULT NULL,
    statement             IN  VARCHAR2           DEFAULT NULL,
    bind_variables        IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
    bind_by_position      IN  VARCHAR2           DEFAULT 'N')
RETURN SYS.LCR$_ROW_RECORD;
```

</tr>
</tbody>
</table>
Summary of Logical Change Record Types

Table 247–12 (Cont.) Constructor Function Parameters for LCR$_ROW_RECORD

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_values</td>
<td>The column values for the row after the DML change. If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.</td>
</tr>
<tr>
<td>position</td>
<td>The position of the LCR. LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product.</td>
</tr>
<tr>
<td>statement</td>
<td>This parameter is reserved for internal use only.</td>
</tr>
<tr>
<td>bind_variables</td>
<td>This parameter is reserved for internal use only.</td>
</tr>
<tr>
<td>bind_by_position</td>
<td>This parameter is reserved for internal use only.</td>
</tr>
</tbody>
</table>

Note: Starting with Oracle Database 11g Release 2 (11.2.0.2), this constructor function includes the following new parameters: statement, bind_variables, and bind_by_position.

Summary of LCR$_ROW_RECORD Subprograms

Table 247–13 LCR$_ROW_RECORD Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_COLUMN Member Procedure on page 247-18</td>
<td>Adds the value as old or new, depending on the value type specified, for the column</td>
</tr>
<tr>
<td>CONVERT_LONG_TO_LOB_CHUNK Member Procedure on page 247-20</td>
<td>Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB</td>
</tr>
<tr>
<td>DELETE_COLUMN Member Procedure on page 247-20</td>
<td>Deletes the old value, the new value, or both, for the specified column, depending on the value type specified</td>

</tr>
<tr>
<td>GET_ROW_TEXT Member Procedure on page 247-24</td>
<td>Gets the SQL statement for the change that is encapsulated in the LCR</td>
</tr>
</tbody>
</table>
ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

**Note:** To set a column value that already exists, run `SET_VALUE`.

**See Also:** `SET_VALUE Member Procedure` on page 247-31

**Considerations for LOB Columns**

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lobs` is set to `FALSE` for
the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the column_value parameter in the member procedure. The ADD_COLUMN member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

---

**Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a LONG or LONG RAW column.

---

**Syntax**

```sql
MEMBER PROCEDURE ADD_COLUMN(
    value_type    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    column_value  IN  ANYDATA);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to add for the column</td>
</tr>
<tr>
<td></td>
<td>Specify old to add the old value of the column. Specify new to add the new value of the column.</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td></td>
<td>This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.</td>
</tr>
<tr>
<td>column_value</td>
<td>The value of the column</td>
</tr>
<tr>
<td></td>
<td>If NULL, then this procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified.</td>
</tr>
<tr>
<td></td>
<td>A NULL column value can be specified by encapsulating the NULL value in an ANYDATA wrapper.</td>
</tr>
</tbody>
</table>
CONVERT_LONG_TO_LOB_CHUNK Member Procedure

Converts LONG data in a row LCR into a CLOB, or converts LONG RAW data in a row LCR into a BLOB.

This procedure can change the operation code from LONG_WRITE to LOB_WRITE for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- LONG data can be sent as a part of a row LCR with one of the following operation codes: INSERT, UPDATE, or LONG_WRITE. Because LONG data can be sent in multiple pieces, make sure that this method is invoked on either none or all LONG pieces.
- LOB to LONG conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

See Also: Oracle Streams Replication Administrator’s Guide

Syntax

MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

Syntax

MEMBER PROCEDURE DELETE_COLUMN(
  column_name  IN  VARCHAR2,
  value_type   IN  VARCHAR2  DEFAULT '*');

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td></td>
<td>An error is raised if the column does not exist in the LCR.</td>
</tr>
<tr>
<td>value_type</td>
<td>The type of value to delete for the column</td>
</tr>
<tr>
<td></td>
<td>Specify old to delete the old value of the column. Specify new to delete</td>
</tr>
<tr>
<td></td>
<td>the new value of the column. If * is specified, then the procedure deletes</td>
</tr>
<tr>
<td></td>
<td>both the old and new values.</td>
</tr>
</tbody>
</table>

EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:
The LCR is being processed by an apply handler.

The LCR is in a queue and was last enqueued by a mechanism other than an Oracle Streams capture process, such as an Oracle Streams apply process or an application.

The LCR has been constructed using the `LCR$_ROW_RECORD` constructor function but has not been enqueued.

The LCR is in the error queue.

**Note:** Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

**Considerations for LOB Columns**

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lobs` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with `VARCHAR2` and `RAW` data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lobs` set to `FALSE` attempts to execute a row LCR that contains a LOB locator.

- A DML or error handler configured with `assemble_lobs` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

**Syntax**

```plaintext
MEMBER PROCEDURE EXECUTE(
    conflict_resolution  IN  BOOLEAN);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>conflict_resolution</code></td>
<td>If <code>TRUE</code>, then any conflict resolution defined for the table using the <code>SET_UPDATE_CONFLICT_HANDLER</code> procedure in the <code>DBMS_APPLY_ADM</code> package is used to resolve conflicts resulting from the execution of the LCR. If <code>FALSE</code>, then conflict resolution is not used. An error is raised if this parameter is not specified or is set to <code>NULL</code>.</td>
</tr>
</tbody>
</table>
GET_LOB_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

- DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1;
- DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2;
- DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3;
- DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4;
- DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5;
- DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

MEMBER FUNCTION GET_LOB_INFORMATION(
  value_type IN VARCHAR2,
  column_name IN VARCHAR2,
  use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;

Parameters

Table 247–17  GET_LOB_INFORMATION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column, either old or new</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td>use_old</td>
<td>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>

GET_LOB_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is DBMS_LCR.LAST_LOB_CHUNK or DBMS_LCR.LOB_CHUNK
- The command type is LOB_ERASE or LOB_WRITE

Otherwise, returns NULL.

Syntax

GET_LOB_OFFSET(
  value_type IN VARCHAR2,  
...
column_name  IN  VARCHAR2)  
RETURN NUMBER;

Parameters

**Table 247–18  GET_LOB_OFFSET Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column</td>
</tr>
<tr>
<td></td>
<td>Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
</tbody>
</table>

**GET_LOB_OPERATION_SIZE Member Function**

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE or LOB TRIM
- The information is DBMS_LCR.LAST_LOB_CHUNK

Otherwise, returns NULL.

**Syntax**

MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2)
RETURN NUMBER,

**Parameters**

**Table 247–19  GET_LOB_OPERATION_SIZE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column</td>
</tr>
<tr>
<td></td>
<td>Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
</tbody>
</table>

**GET_LONG_INFORMATION Member Function**

Gets the LONG information for the column.

The return value can be one of the following:

- `DBMS_LCR.NOT_A_LONG` CONSTANT NUMBER := 1;
- `DBMS_LCR.NULL_LONG` CONSTANT NUMBER := 2;
- `DBMS_LCR.INLINE_LONG` CONSTANT NUMBER := 3;
- `DBMS_LCR.LONG_CHUNK` CONSTANT NUMBER := 4;
- `DBMS_LCR.LAST_LONG_CHUNK` CONSTANT NUMBER := 5;

Returns NULL if the specified column does not exist.
If the command type of the row LCR is `UPDATE`, then specifying 'Y' for the `use_old` parameter is a convenient way to get the value of the columns.

**Syntax**

```
MEMBER FUNCTION GET_LONG_INFORMATION(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column, either <code>old</code> or <code>new</code></td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td>use_old</td>
<td>If 'Y' and <code>value_type</code> is <code>new</code>, and no new value exists, then the function returns the corresponding old value. If 'N' and <code>value_type</code> is <code>new</code>, then the function does not return the old value if no new value exists. If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not <code>UPDATE</code>, then the function ignores the value of the <code>use_old</code> parameter. NULL is not a valid specification for the <code>use_old</code> parameter.</td>
</tr>
</tbody>
</table>

**GET_ROW_TEXT Member Procedure**

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

**Syntax**

The following procedure returns the SQL statement in a `CLOB` data type.

```
MEMBER PROCEDURE GET_ROW_TEXT(
    row_text  IN/OUT  CLOB);
```

The following procedure returns the SQL statement with bind variables in a `CLOB` data type.

```
MEMBER PROCEDURE GET_ROW_TEXT(
    row_text   IN/OUT  CLOB,
    variable_list   IN/OUT  LCR$_ROW_LIST,
    bind_var_syntax   IN  VARCHAR2  DEFAULT ':');
```

**See Also:** 
[LCR$_ROW_LIST Type](#) on page 247-47
Parameters

Table 247–21  GET_ROW_TEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_text</td>
<td>The SQL statement for the change that is encapsulated in the LCR</td>
</tr>
<tr>
<td>variable_list</td>
<td>The values for the bind variables in the order of the bind variables</td>
</tr>
<tr>
<td>bind_var_syntax</td>
<td>The syntax for the bind variables</td>
</tr>
<tr>
<td></td>
<td>One of the following values is valid:</td>
</tr>
<tr>
<td></td>
<td>■ Specify :, the default, for bind values to be in the form :1, :2, and so</td>
</tr>
<tr>
<td></td>
<td>on.</td>
</tr>
<tr>
<td></td>
<td>■ Specify ? for bind values to be in the form ?.</td>
</tr>
</tbody>
</table>

GET_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of a column.

Syntax

```sql
MEMBER FUNCTION GET_VALUE(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN ANYDATA;
```

Parameters

Table 247–22  GET_VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column</td>
</tr>
<tr>
<td></td>
<td>Specify old to get the old value for the column. Specify new to get the new</td>
</tr>
<tr>
<td></td>
<td>value for the column.</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td></td>
<td>If the column is present and has a NULL value, then the function returns a</td>
</tr>
<tr>
<td></td>
<td>ANYDATA instance containing a NULL value. If the column value is absent,</td>
</tr>
<tr>
<td></td>
<td>then the function returns a NULL.</td>
</tr>
<tr>
<td>use_old</td>
<td>If Y and value_type is new, and no new value exists, then the function</td>
</tr>
<tr>
<td></td>
<td>returns the corresponding old value.</td>
</tr>
<tr>
<td></td>
<td>If N and value_type is new, then the function returns NULL if no new value</td>
</tr>
<tr>
<td></td>
<td>exists.</td>
</tr>
<tr>
<td></td>
<td>If value_type is old or if the command_type of the row LCR is not UPDATE,</td>
</tr>
<tr>
<td></td>
<td>then the function ignores the value of the use_old parameter.</td>
</tr>
<tr>
<td></td>
<td>NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>
GET_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the values of all columns.

Syntax

MEMBER FUNCTION GET_VALUES(
    value_type IN VARCHAR2,
    use_old     IN VARCHAR2 DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;

Parameters

Table 247–23  GET_VALUES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| value_type | The type of values to return
|            | Specify old to return a list of old values. Specify new to return a list of new values. |
| use_old    | If Y and value_type is new, then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and the old values where there are no new values. |
|            | If N and value_type is new, then the function returns a list of all new values in the LCR without returning any old values. |
|            | If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. |
|            | NULL is not a valid specification for the use_old parameter. |

GET_WHERE_CLAUSE Member Procedure

Gets a WHERE clause for the change that is encapsulated in the row LCR.

Use the WHERE clause returned by GET_WHERE_CLAUSE instead of using the ROWID, because the ROWID is not ANSI compatible. The generated WHERE clause might not match the WHERE clause in the original DML operation.

The ROWID of an INSERT statement is the ROWID of the new row created by the INSERT. The WHERE clause generated for an INSERT operation identifies the new row. Therefore, the generated WHERE clause includes all of the new values inserted.

For example, consider the following insert into the hr.departments table:

```sql
INSERT INTO hr.departments (
    department_id, department_name, manager_id, location_id)
VALUES (10, 'HR', 20, 40);
```

The generated WHERE clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated WHERE clause is the following:

```sql
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The ROWID of an UPDATE statement is the ROWID of the row that was updated. The WHERE clause generated for an UPDATE operation identifies the row after the UPDATE
executes. The generated WHERE clause is based on the old and new values of the UPDATE.

For example, consider the following update to the hr.departments table:

```sql
UPDATE hr.departments 
SET department_name='Management' 
WHERE department_name='Administration' AND location_id = 20 
AND manager_id = 30 AND department_id = 10;
```

The values of the row after the UPDATE are 10, 'Management', 30, and 20. Hence, the generated WHERE clause to identify the row is the following:

```sql
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND 
"MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for "DEPARTMENT_NAME", because the new value is the value of the column after the UPDATE. For the rest of the columns, the old values are used.

The ROWID of a DELETE operation is the row that existed before it was deleted. The generated WHERE clause consists of all the old column values present in the DELETE operation.

LOB columns do not appear in generated WHERE clauses. The generated WHERE clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

**Syntax**

The following procedure returns the WHERE clause of a SQL statement in a CLOB data type.

```sql
MEMBER PROCEDURE GET_WHERE_CLAUSE(
    where_clause  IN/OUT  CLOB);
```

The following procedure returns the WHERE clause of a SQL statement with bind variables in a CLOB data type.

```sql
MEMBER PROCEDURE GET_WHERE_CLAUSE(
    where_clause     IN/OUT  CLOB,
    variable_list    IN/OUT  LCR$_ROW_LIST,
    bind_var_syntax  IN      VARCHAR2  DEFAULT ':');
```

**See Also:**
- LCR$_ROW_LIST Type on page 247-47
- Oracle Streams Concepts and Administration

**Parameters**

<table>
<thead>
<tr>
<th><strong>Table 247–24</strong> GET_WHERE_CLAUSE Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>----------------</td>
</tr>
<tr>
<td>where_clause</td>
</tr>
<tr>
<td>variable_list</td>
</tr>
</tbody>
</table>
GET_XML_INFORMATION Member Function

This function is reserved for internal use only.

KEEP_COLUMNS Member Procedure

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.

Note: This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).
Parameters

Table 247–26  KEEP_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_list</td>
<td>The names of the columns kept for the row LCR</td>
</tr>
<tr>
<td></td>
<td>Specify a comma-delimited list of type VARCHAR2. This procedure removes columns that are not in the list from the current row LCR.</td>
</tr>
<tr>
<td>value_type</td>
<td>The type of value for which to keep the columns</td>
</tr>
<tr>
<td></td>
<td>Specify old to keep the old values of the columns. An error is raised if the old values do not exist in the LCR.</td>
</tr>
<tr>
<td></td>
<td>Specify new to keep the new values of the columns. An error is raised if the new values do not exist in the LCR.</td>
</tr>
<tr>
<td></td>
<td>If * is specified, then the procedure keeps both the old and the new columns.</td>
</tr>
</tbody>
</table>

RENAME_COLUMN Member Procedure

Renames a column in a row LCR.

Syntax

MEMBER PROCEDURE RENAME_COLUMN(
  from_column_name IN VARCHAR2,
  to_column_name IN VARCHAR2,
  value_type IN VARCHAR2 DEFAULT '*');

Parameters

Table 247–27  RENAME_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_column_name</td>
<td>The existing column name</td>
</tr>
<tr>
<td>to_column_name</td>
<td>The new column name</td>
</tr>
<tr>
<td></td>
<td>An error is raised if a column with the specified name already exists.</td>
</tr>
<tr>
<td>value_type</td>
<td>The type of value for which to rename the column</td>
</tr>
<tr>
<td></td>
<td>Specify old to rename the old value of the column. An error is raised if the old value does not exist in the LCR.</td>
</tr>
<tr>
<td></td>
<td>Specify new to rename the new value of the column. An error is raised if the new value does not exist in the LCR.</td>
</tr>
<tr>
<td></td>
<td>If * is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.</td>
</tr>
</tbody>
</table>

SET_LOB_INFORMATION Member Procedure

Sets LOB information for the column.

Note: When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.
Syntax

MEMBER PROCEDURE SET_LOB_INFORMATION(
    value_type       IN  VARCHAR2,
    column_name      IN  VARCHAR2,
    lob_information  IN  NUMBER);

Parameters

Table 247–28  SET_LOB_INFORMATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column, either old or new. Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column. An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.</td>
</tr>
<tr>
<td>lob_information</td>
<td>Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NOT_A_LOB       CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NULL_LOB        CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.INLINE_LOB      CONSTANT NUMBER := 3;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.EMPTY_LOB       CONSTANT NUMBER := 4;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LOB_CHUNK       CONSTANT NUMBER := 5;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LAST_LOB_CHUNK  CONSTANT NUMBER := 6;</td>
</tr>
</tbody>
</table>

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

**Note:** When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

MEMBER PROCEDURE SET_LOB_OFFSET(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    lob_offset   IN  NUMBER);

Parameters

Table 247–29  SET_LOB_OFFSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column. Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name. An error is raised if the column value does not exist in the LCR.</td>
</tr>
</tbody>
</table>
Table 247–29 (Cont.) SET_LOB_OPERATION_SIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
<tr>
<td>lob_operation_size</td>
<td>If lob_information for the LOB is or will be DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. Otherwise, set to NULL.</td>
</tr>
</tbody>
</table>

SET_ROW_TEXT Member Procedure

This procedure is reserved for internal use only.

Note: This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.
One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

---

**Note:** To add a column to a row LCR, run **ADD_COLUMN**.

---

**See Also:** [ADD_COLUMN Member Procedure](#) on page 247-18

### Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `SET_VALUE` member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

---

**Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a `LONG` or `LONG_RAW` column.

---

### Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value an XMLType column, specify the XMLType for the `column_value` parameter. The `SET_VALUE` member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
An attempt is made to set a XMLType column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType column is represented by the original (nonassembled) row LCRs.

---

**Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

---

**Syntax**

```sql
MEMBER PROCEDURE SET_VALUE(
    value_type    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    column_value  IN  ANYDATA);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set</td>
</tr>
<tr>
<td></td>
<td>Specify old to set the old value of the column. Specify new to set the new</td>
</tr>
<tr>
<td></td>
<td>value of the column.</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td></td>
<td>An error is raised if the specified column_value does not exist in the LCR</td>
</tr>
<tr>
<td></td>
<td>for the specified column_type.</td>
</tr>
<tr>
<td>column_value</td>
<td>The new value of the column</td>
</tr>
<tr>
<td></td>
<td>If NULL is specified, then this procedure raises an error. To set the</td>
</tr>
<tr>
<td></td>
<td>value to NULL, encapsulate the NULL in an ANYDATA instance.</td>
</tr>
<tr>
<td></td>
<td>If the member procedure is used in a procedure DML handler or error handler</td>
</tr>
<tr>
<td></td>
<td>that uses LOB assembly, then specify a LOB locator for LOB columns.</td>
</tr>
</tbody>
</table>

**SET_VALUES Member Procedure**

Replaces all old values or all new values for the LCR, depending on the value type specified.

**Considerations for LOB Columns**

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the assemble_lob parameter is set to TRUE for the handler), then you can use this member procedure in the handler procedure. If assemble_lob is set to FALSE for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated LOB locator
is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

---

**Considerations for XMLType Columns**

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value of one or more XMLType columns in a row LCR, specify an XMLType for each XMLType column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType columns are represented by the original (nonassembled) row LCRs.

---

**Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on LONG or LONG RAW columns.

---

**Considerations for XMLType Columns**

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value of one or more XMLType columns in a row LCR, specify an XMLType for each XMLType column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType columns are represented by the original (nonassembled) row LCRs.

---

**Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

---

**Syntax**

```sql
MEMBER PROCEDURE SET_VALUES ( 
```
value_type IN VARCHAR2,
value_list IN SYS.LCR$_.ROW_LIST);

Parameters

<table>
<thead>
<tr>
<th>Table 247–32 SET_VALUES Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>value_type</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>value_list</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

SET_XML_INFORMATION Member Procedure

Sets the XML information for the column.

Syntax

MEMBER PROCEDURE SET_XML_INFORMATION(
    column_name    IN  VARCHAR2,
    xml_information IN  NUMBER);

Parameters

<table>
<thead>
<tr>
<th>Table 247–33 SET_XML_INFORMATION Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>column_name</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>xml_information</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

DBMS_LCR.NOT_XML indicates that the column is not an XMLType column. DBMS_LCR.XML_DOC indicates that the column contains an XML document. DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.
The following functions and procedures are common to both the LCR$_DDL_RECORD and LCR$_ROW_RECORD type.

**See Also:** For descriptions of the subprograms for these types that are exclusive to each type:

</tbody>
</table>

**GET_COMMAND_TYPE Member Function**

Gets the command type of the LCR.

*See Also:* The "SQL Command Codes" table in the *Oracle Call Interface Programmer’s Guide* for a complete list of command types

**Syntax**

```plaintext
MEMBER FUNCTION GET_COMMAND_TYPE()
RETURN VARCHAR2;
```

**GET_COMMIT_SCN Member Function**

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns NULL.

**Syntax**

```plaintext
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

**GET_COMMIT_SCN_FROM_POSITION Static Function**

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

**Syntax**

```plaintext
STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
```
### Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

```plsql
member function get_commit_time()
return date;
```

### GET_COMMIT_TIME

**Description**

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns **NULL**.

### Syntax

```plsql
member function get_commit_time()
return date;
```

### GET_COMPATIBLE Member Function

**Description**

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the **COMPATIBLE** initialization parameter.

The return value for this function can be one of the following:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>COMPATIBLE Initialization Parameter Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_9_2</td>
<td>9.2.0</td>
</tr>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_10_1</td>
<td>10.1.0</td>
</tr>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_10_2</td>
<td>10.2.0</td>
</tr>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_11_1</td>
<td>11.1.0</td>
</tr>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_11_2</td>
<td>11.2.0</td>
</tr>
</tbody>
</table>

DDL LCRs always return `DBMS_STREAMS.COMpatible_9_2`.

You can use the following functions in the `DBMS_STREAMS` package for constant compatibility return values:

- The **COMPATIBLE_9_2** function returns the `DBMS_STREAMS.COMpatible_9_2` constant.
The COMPATIBLE_10_1 function returns DBMS_STREAMS.COMPATIBLE_10_1 constant.

The COMPATIBLE_10_2 function returns DBMS_STREAMS.COMPATIBLE_10_2 constant.

The COMPATIBLE_11_1 function returns DBMS_STREAMS.COMPATIBLE_11_1 constant.

The COMPATIBLE_11_2 function returns DBMS_STREAMS.COMPATIBLE_11_2 constant.

The MAX_COMPATIBLE function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the GET_COMPATIBLE member function for an LCR in rule conditions and apply handlers.

**Note:** You can determine which database objects in a database are not supported by Oracle Streams by querying the DBA_STREAMS_UNSUPPORTED data dictionary view.

See Also:
- Oracle Streams Concepts and Administration for examples of rules that discard changes that are not supported by Oracle Streams
- Chapter 142, "DBMS_STREAMS" and Chapter 143, "DBMS_STREAMS_ADM"
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter

**Syntax**

```
MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
```

**GET_EXTRA_ATTRIBUTE** Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an ANYDATA instance. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

See Also: INCLUDE_EXTRA_ATTRIBUTE Procedure on page 32-33

**Syntax**

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
    attribute_name  IN  VARCHAR2)
RETURN ANYDATA;
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name</td>
<td>The name of the extra attribute to return</td>
</tr>
<tr>
<td></td>
<td>Valid names are:</td>
</tr>
<tr>
<td></td>
<td>■ row_id</td>
</tr>
<tr>
<td></td>
<td>The rowid of the row changed in a row LCR. This attribute is not included in</td>
</tr>
<tr>
<td></td>
<td>DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID.</td>
</tr>
<tr>
<td></td>
<td>■ serial#</td>
</tr>
<tr>
<td></td>
<td>The serial number of the session that performed the change captured in the</td>
</tr>
<tr>
<td></td>
<td>LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ session#</td>
</tr>
<tr>
<td></td>
<td>The identifier of the session that performed the change captured in the LCR.</td>
</tr>
<tr>
<td></td>
<td>The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ thread#</td>
</tr>
<tr>
<td></td>
<td>The thread number of the instance in which the change captured in the LCR</td>
</tr>
<tr>
<td></td>
<td>was performed. Typically, the thread number is relevant only in an Oracle</td>
</tr>
<tr>
<td></td>
<td>Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ tx_name</td>
</tr>
<tr>
<td></td>
<td>The name of the transaction that includes the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>■ username</td>
</tr>
<tr>
<td></td>
<td>The name of the current user who performed the change captured in the LCR.</td>
</tr>
<tr>
<td></td>
<td>The type is VARCHAR2.</td>
</tr>
</tbody>
</table>

An error is raised if the specified attribute_name is not valid.

If no value exists for the specified extra attribute, then the function returns a NULL.

See Also: Oracle Database PL/SQL Language Reference for more information about the current user

GET_OBJECT_NAME Member Function

Gets the name of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME() RETURN VARCHAR2;
```

GET_OBJECT_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER() RETURN VARCHAR2;
```
GET_POSITION Member Function

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

Syntax

MEMBER FUNCTION GET_POSITION()
RETURN RAW;

---

GET_SCN Member Function

Gets the system change number (SCN) of the LCR.

Syntax

MEMBER FUNCTION GET_SCN()
RETURN NUMBER;

GET_SCN_FROM_POSITION Static Function

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.

Syntax

STATIC FUNCTION GET_SCN_FROM_POSITION(
    position  IN  RAW)
RETURN NUMBER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>position</td>
<td>The position</td>
</tr>
<tr>
<td></td>
<td>You can obtain the position by using the GET_POSITION member function or by</td>
</tr>
<tr>
<td></td>
<td>querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.</td>
</tr>
</tbody>
</table>

---

GET_SOURCE_DATABASE_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

Syntax

MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
GET_SOURCE_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME()
RETURN DATE;
```

GET_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

```
MEMBER FUNCTION GET_TAG()
RETURN RAW;
```

GET_THREAD_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

See Also: Oracle Real Application Clusters Administration and Deployment Guide

Syntax

```
MEMBER FUNCTION GET_THREAD_NUMBER()
RETURN NUMBER;
```

GET_TRANSACTION_ID Member Function

Gets the transaction identifier of the LCR.

Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()
RETURN VARCHAR2;
```

IS_NULL_TAG Member Function

Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

```
MEMBER FUNCTION IS_NULL_TAG()
RETURN VARCHAR2;
```
SET_COMMAND_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing INSERT to GRANT would raise an error.

See Also:

- The description of the command_type parameter in LCR$_DDL_RECORD Constructor Function Parameters on page 247-7
- The description of the command_type parameter in LCR$_ROW_RECORD Type on page 247-15
- The "SQL Command Codes" table in the Oracle Call Interface Programmer’s Guide for a complete list of command types

Syntax

MEMBER PROCEDURE SET_COMMAND_TYPE(
    command_type IN VARCHAR2);

Parameter

Table 247–38 SET_COMMAND_TYPE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>command_type</td>
<td>The command type</td>
</tr>
<tr>
<td></td>
<td>Set this parameter to a non-NULL value.</td>
</tr>
</tbody>
</table>

SET_EXTRA_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

See Also: INCLUDE_EXTRA_ATTRIBUTE Procedure on page 32-33

Syntax

MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
    attribute_name IN VARCHAR2,
    attribute_value IN ANYDATA);
Parameters

**Table 247–39 SET_EXTRA_ATTRIBUTE Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>

<tbody>
<tr>
<td></td>
<td>If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance.</td>
</tr>
</tbody>
</table>

**SET_OBJECT_NAME Member Procedure**

Sets the name of the object that is changed by the LCR.

**Syntax**

```plsql
MEMBER PROCEDURE SET_OBJECT_NAME(
    object_name  IN  VARCHAR2);
```

**Parameter**

**Table 247–40 SET_OBJECT_NAME Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the object</td>
</tr>
</tbody>
</table>
SET_OBJECT_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

Syntax

MEMBER PROCEDURE SET_OBJECT_OWNER(
    object_owner  IN  VARCHAR2);

Parameter

Table 247–41  SET_OBJECT_OWNER Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_owner</td>
<td>The schema that contains the object</td>
</tr>
</tbody>
</table>

SET_SOURCE_DATABASE_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

Syntax

MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
    source_database_name  IN  VARCHAR2);

Parameter

Table 247–42  SET_SOURCE_DATABASE_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database_name</td>
<td>The source database of the change</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.</td>
</tr>
</tbody>
</table>

SET_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

See Also:  Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

MEMBER PROCEDURE SET_TAG(
    tag IN  RAW);
# Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| tag       | The binary tag for the LCR  
The size limit for a tag value is two kilobytes. |
LCR$ _ROW _LIST Type

Identifies a list of column values for a row in a table.

This type uses the LCR$ _ROW _UNIT type and is used in the LCR$ _ROW _RECORD type.

See Also:
- LCR$ _ROW _UNIT Type on page 247-48
- LCR$ _ROW _RECORD Type on page 247-15

Syntax

CREATE TYPE SYS.LCR$ _ROW _LIST AS TABLE OF SYS.LCR$ _ROW _UNIT
/
LCR$_ROW_UNIT Type

Identifies the value for a column in a row.
This type is used in the LCR$_ROW_LIST type.

See Also: LCR$_ROW_LIST Type on page 247-47

Syntax

CREATE TYPE LCR$_ROW_UNIT AS OBJECT ( 
  column_name        VARCHAR2(4000),
  data                ANYDATA,
  lob_information     NUMBER,
  lob_offset          NUMBER,
  lob_operation_size  NUMBER,
  long_information    NUMBER);
/

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td>data</td>
<td>The data contained in the column</td>

The **Oracle Multimedia ORDAudio** object type supports the storage and management of audio data.

Audio data can have different formats, encoding types, compression types, numbers of channels, sampling rates, sample sizes, and playing times (duration) depending upon how the audio data is digitally recorded. **Oracle Multimedia ORDAudio** can store and retrieve audio data of any data format. **Oracle Multimedia ORDAudio** can extract metadata from audio data of a variety of popular audio formats. **Oracle Multimedia ORDAudio** can also extract application attributes and store them in the comments attribute of the object in XML form.

- Documentation of ORDAudio
For a complete description of this type within the context of Oracle Multimedia, see \texttt{ORDAudio} in the \textit{Oracle Multimedia Reference}. 
The Oracle Multimedia ORDDicom object type supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other objects. These include objects such as single frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

Oracle Multimedia ORDDicom provides methods to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM objects. Oracle Multimedia ORDDicom also provides methods to check DICOM objects for conformance based on a set of user-specified conformance rules, and to make DICOM objects anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

- Documentation of ORDDicom
Documentation of ORDDicom

For a complete description of this type within the context of Oracle Multimedia, see ORDDicom in the Oracle Multimedia DICOM Developer’s Guide.
The Oracle Multimedia ORDDoc object type supports the storage and management of heterogeneous media data including image, audio, and video.

Heterogeneous media data can have different formats depending upon the application generating the media data. Oracle Multimedia can store and retrieve media data of any data format. Oracle Multimedia ORDDoc data type can be used in applications that require you to store different types of heterogeneous media data in the same column so you can build a common metadata index on all the different types of media data. Using this index, you can search across all the different types of heterogeneous media data. However, you cannot use this same search technique if the different types of heterogeneous media data are stored in different types of objects in different columns of relational tables.

- Documentation of ORDDoc
For a complete description of this type within the context of Oracle Multimedia, see ORDDoc in the Oracle Multimedia Reference.
The Oracle Multimedia ORDImage object type supports the storage, management, and manipulation of image data.

Digitized images consist of the image data (digitized bits) and attributes that describe and characterize the image data.

The image data (pixels) can have varying depths (bits for each pixel) depending on how the image was captured, and can be organized in various ways. The organization of the image data is known as the data format. Oracle Multimedia ORDImage can store and retrieve image data of any data format. Oracle Multimedia ORDImage can process (cut, scale, and generate thumbnails) of images, convert the format of images, extract properties of images of a variety of popular data formats, and extract and embed application metadata in images.

- Documentation of ORDImage
Documentation of ORDImage

For a complete description of this type within the context of Oracle Multimedia, see ORDImage in the Oracle Multimedia Reference.
Oracle Multimedia provides support for the SQL/MM Still Image Standard, which supports the storage, retrieval, and modification of images in the database and the ability to locate images using visual predicates.

The following object relational types for images and image characteristics are included in this support:

- SI_StillImage
- SI_AverageColor
- SI_Color
- SI_ColorHistogram
- SI_FeatureList
- SI_PositionalColor
- SI_Texture

- Documentation of SQL/MM Still Image
Documentation of SQL/MM Still Image

For a complete description of this type within the context of Oracle Multimedia, see SQL/MM Still Image in the Oracle Multimedia Reference.
The Oracle Multimedia ORDVideo object type supports the storage and management of video data.

Digitized video consists of the video data (digitized bits) and the attributes that describe and characterize the video data. Video applications sometimes associate application-specific information, such as the description of the video training tape, date recorded, instructor's name, producer's name, and so on, within the video data.

The video data can have different formats, compression types, frame rates, frame sizes, frame resolutions, playing times, compression types, number of colors, and bit rates depending upon how the video data was digitally recorded. Oracle Multimedia ORDVideo can store and retrieve video data of any data format. Oracle Multimedia ORDVideo can extract metadata from video data of a variety of popular video formats. Oracle Multimedia ORDVideo can also extract application attributes and store them in the comments attribute of the object in XML form.

- Documentation of ORDVideo
For a complete description of this type within the context of Oracle Multimedia, see ORDVideo in the Oracle Multimedia Reference.
The `MGD_ID` package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The `MGD_ID` Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification). The `MGD_ID` package contains several predefined types.

**See Also:** *Oracle Database Advanced Application Developer’s Guide* for more information.

This chapter contains the following topics:

- Using `MGD_ID` Package Object Types
- Summary of Types
- Summary of `MGD_ID` Subprograms

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```
Using MGD_ID Package Object Types

This section contains topics that relate to using the MGD_ID package object types.

- Security Model
Security Model

You must run the catmgd.sql script to load the DBMS_MGD_ID_UTL package and create the required Identity Code Package schema objects in the MGDSYS schema.

MGD_ID is a MGDSYS-owned object type. Any MGD_ID subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the MGD_ID object type and its subprograms.

EXECUTE privilege is granted to PUBLIC for this ADT: MGD_ID.

A public synonym, by the same name, is created for this ADT: MGD_ID.
Summary of Types

Table 254–1 describes the MGD_ID Package object types.

<table>
<thead>
<tr>
<th>Object Type Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MGD_ID_COMPONENT Object Type</td>
<td>Datatype that specifies the name and value pair attributes that define a component</td>
</tr>
<tr>
<td>MGD_ID_COMPONENT_VARRAY Object Type</td>
<td>Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object</td>
</tr>
<tr>
<td>MGD_ID Object Type</td>
<td>Represents an MGD_ID object that specifies the category identifier for the code category for this identity code and its list of components</td>
</tr>
</tbody>
</table>
MGD_ID_COMPONENT Object Type

The MGD_ID_COMPONENT type is a datatype that specifies the name and value pair attributes that define a component.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID_COMPONENT as object (name VARCHAR2(256),
          value VARCHAR2(1024));
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of component</td>
</tr>
<tr>
<td>value</td>
<td>Value of the component as a character</td>
</tr>
</tbody>
</table>

Usage Notes

None.

Examples

See the MGD_ID Constructor Function for an example.
MGD_ID_COMPONENT_VARRAY Object Type

The MGD_ID_COMPONENT_VARRAY type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_COMPONENT;
```

Attributes

None.

Usage Notes

None.

Examples

See the MGD_ID Constructor Function for an example.
MGD_ID Object Type

The MGD_ID type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

Syntax

CREATE OR REPLACE TYPE MGD_ID as object (category_id VARCHAR2(256),
   components MGD_ID_COMPONENT_VARRAY);

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category identifier for the code category of this code</td>
</tr>
<tr>
<td>components</td>
<td>List of components as name-value attributes</td>

</tbody>
</table>
MGD_ID Constructor Function

This constructor function constructs an identity code type object, MGD_ID. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs an MGD_ID object type based on the category ID and a list of components.

```sql
constructor function MGD_ID (    category_id      IN VARCHAR2,
                                 components       IN MGD_ID_COMPONENT_VARRAY)    RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```sql
constructor function MGD_ID (    category_id        VARCHAR2,
                                 identifier         VARCHAR2,
                                 parameter_list      VARCHAR2)    RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, and a list of components.

```sql
constructor function MGD_ID (    category_name      VARCHAR2,
                                 category_version   VARCHAR2,
                                 components         MGD_ID_COMPONENT_VARRAY)    RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```sql
constructor function MGD_ID (    category_name      VARCHAR2,
                                 category_version   VARCHAR2,
                                 identifier         VARCHAR2,
                                 parameter_list      VARCHAR2)    RETURN SELF AS RESULT DETERMINISTIC;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category identifier</td>
</tr>
<tr>
<td>components</td>
<td>List of component name value pairs</td>
</tr>
<tr>
<td>category_name</td>
<td>Category name, such as EPC</td>
</tr>
<tr>
<td>category_version</td>
<td>Category version. If NULL, the latest version for the specified category name will be used.</td>
</tr>
</tbody>
</table>
Usage Notes

- Use `MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID` as `category_id`.
- If the category is not already registered, an error is raised.
- If the `bit_length` parameter is `NULL`, the `bit_length` is `8^` the length of `bit_encoding`.
- If the component list does not contain all required components, an exception `MGD_ID_UTL.e_LackComponent` will be thrown.

Examples

The following examples construct identity code type objects.

Construct an `MGD_ID` object (SGTIN-64) passing in the category ID and a list of components.

--Contents of constructor11.sql
    call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
    call DBMS_MGD_ID_UTL.refresh_category('1');
    select MGD_ID('1',
        MGD_ID_COMPONENT_VARRAY(
            MGD_ID_COMPONENT('companyprefix', '0037000'),
            MGD_ID_COMPONENT('itemref', '030241'),
            MGD_ID_COMPONENT('serial', '1041970'),
            MGD_ID_COMPONENT('schemes', 'SGTIN-64')
        )
    ) from dual;
    call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
        
        MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
             MGD_ID_COMPONENT('itemref', '030241'),
             MGD_ID_COMPONENT('serial', '1041970'),
             MGD_ID_COMPONENT('schemes', 'SGTIN-64'))

Table 254–6 (Cont.) MGD_ID Constructor Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>identifier</td>
<td>Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of BINARY, PURE_IDENTITY, TAG_ENCODING, or LEGACY. Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.</td>
</tr>
<tr>
<td>parameter_list</td>
<td>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: <code>filter=3;companyprefixlength=7;taglength=96</code></td>
</tr>
</tbody>
</table>

254-10  Oracle Database PL/SQL Packages and Types Reference
Constructs an MGD_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

```sql
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
    'urn:epc:id:sgtin:0037000.030241.1041970',
    'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

Constructs an MGD_ID object (SGTIN-64) passing in the category name, category version (if NULL, then the latest version will be used), and a list of components.

```sql
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
    MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix','0037000'),
    MGD_ID_COMPONENT('itemref','030241'),
    MGD_ID_COMPONENT('serial','1041970'),
    MGD_ID_COMPONENT('schemes','SGTIN-64'))
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

Constructs an MGD_ID object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.
Oracle Database PL/SQL Packages and Types Reference

--Contents of constructor.sql

call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
    'urn:epc:id:sgtin:0037000.030241.1041970',
    'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor.sql

MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
    MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
    MGD_ID_COMPONENT('companyprefixlength', '7'),
    MGD_ID_COMPONENT('companyprefix', '0037000'),
    MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
    MGD_ID_COMPONENT('serial', '1041970'),
    MGD_ID_COMPONENT('itemref', '030241')))
FORMAT Function

This function returns the string representation of the MGD_ID object in the specified format.

Syntax

```sql
function FORMAT (parameter_list  IN VARCHAR2,
output_format   IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter_list</td>
<td>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96</td>
</tr>
<tr>
<td>output_format</td>
<td>One of the supported output formats into which an MGD_ID component is formatted:</td>
</tr>
<tr>
<td></td>
<td>• BINARY</td>
</tr>
<tr>
<td></td>
<td>• LEGACY</td>
</tr>
<tr>
<td></td>
<td>• TAG_ENCODING</td>
</tr>
<tr>
<td></td>
<td>• PURE_IDENTITY</td>
</tr>
<tr>
<td></td>
<td>• ONS_HOSTNAME</td>
</tr>
</tbody>
</table>

Usage Notes

None.

Examples

See the example for the GET_COMPONENT Function.
GET_COMPONENT Function

This function returns the value of the specified \texttt{MGD\_ID} component.

\textbf{Syntax}

\begin{verbatim}
function GET\_COMPONENT (  
    component_name  IN  VARCHAR2)  
RETURN VARCHAR2 DETERMINISTIC;
\end{verbatim}

\textbf{Parameters}

\begin{table}[h]
\centering
\begin{tabular}{|c|c|}
\hline
Parameter & Description \\
\hline
component\_name & Name of component \\
\hline
\end{tabular}
\caption{GET\_COMPONENT Function Parameter}
\end{table}

\textbf{Usage Notes}

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, \texttt{NULL} is returned.

\textbf{Examples}

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```
--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80);
DECLARE
    id MGD\_ID;
BEGIN
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING\_LEVEL\_OFF);
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    
    --------------
    --PURE\_IDENTITY
    --------------
    dbms_output.put_line('..Testing constructor with pure identity');
    --PURE\_IDENTITY representation can be translated to BINARY and
    --TAG\_ENCODING ONLY when BOTH scheme and filer are provided.
    id := MGD\_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970',
                   'scheme=SGTIN-64;filter=3');
    dbms_output.put_line(id.to_string);
    dbms_output.put_line('filter         = ' || id.get_component('filter'));
    dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
    dbms_output.put_line('itemref        = ' || id.get_component('itemref'));
    dbms_output.put_line('serial         = ' || id.get_component('serial'));
    dbms_output.put_line('BINARY format  = ' || id.format(NULL, 'BINARY'));
    dbms_output.put_line('PURE\_IDENTITY format  = ' || id.format(NULL, 'PURE\_IDENTITY'));
    dbms_output.put_line('TAG\_ENCODING format   = ' || id.format(NULL, 'TAG\_ENCODING'));
END;
/
SHOW ERRORS;
```

```
call DBMS_MGD_ID_UTL.remove_proxy();
```
SQL> @get_component.sql
.
.
..Testing constructor with pure identity
category_id =1;filter = 3;schemes = SGTIN-64;companyprefixlength = 7;companyprefix = 0037000;scheme = SGTIN-64;serial = 1041970;itemref = 030241
filter       = 3
company prefix = 0037000

PL/SQL procedure successfully completed.
.
.
.
TO_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD_ID object.

Syntax

function TO_STRING
    RETURN VARCHAR2;

Parameters

None.

Usage Notes

None.

Examples

The following example converts the MGD_ID object into a string value:

```
-- Contents of tostring3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
    id          MGD_ID;
BEGIN
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    dbms_output.put_line('..Testing to_string');
    id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
    DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
    DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
connect / as sysdba;
drop user mgduser cascade;

SQL> @tostring3.sql
.
.
..Testing to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager = 0037000;scheme = GID-96;1 = 1;serial = 1041970
PL/SQL procedure successfully completed.
.
.
```
TRANSLATE Function

This static function translates between different representations directly without first constructing an MGD_ID object. This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```sql
function TRANSLATE (  
category_name    IN VARCHAR2,  
identifier       IN VARCHAR2,  
parameter_list   IN VARCHAR2,  
output_format    IN VARCHAR2)  
RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```sql
function TRANSLATE (  
category_name    IN VARCHAR2,  
category_version IN VARCHAR2,  
identifier       IN VARCHAR2,  
parameter_list   IN VARCHAR2,  
output_format    IN VARCHAR2)  
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_name</td>
<td>Name of category</td>
</tr>
<tr>
<td>category_version</td>
<td>Category version. If NULL, the latest version of the specified category name will be used.</td>
</tr>
<tr>
<td>identifier</td>
<td>EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for an SGTIN coding scheme.</td>
</tr>
<tr>
<td>parameter_list</td>
<td>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: <code>filter=3;companyprefixlength=7;taglength=96</code></td>
</tr>
</tbody>
</table>
**Usage Notes**

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the `parameter_list` parameter.

**Examples**

The following examples translates one GID-96 representation into another:

```sql
-- Contents of translate1.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
    id MGD_ID;
BEGIN
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTIL.get_category_id('EPC', NULL));
    DBMS_OUTPUT.PUT_LINE('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
    DBMS_OUTPUT.PUT_LINE( mgd_id.translate('EPC', NULL, '00110101000000000000000000000000000000000001111110011111111111111011000011010', NULL, 'BINARY'));
    DBMS_OUTPUT.PUT_LINE('Category ID is EPC, Identifier is BINARY, Output format is PURE_IDENTITY');
    DBMS_OUTPUT.PUT_LINE('Category ID is EPC, Identifier is TAG_ENCODING');
    DBMS_OUTPUT.PUT_LINE('Category ID is EPC, Identifier is TAG_ENCODING, Output format is BINARY');
    DBMS_OUTPUT.PUT_LINE( mgd_id.translate('EPC', 'urn:epc:tag:gid-96:0037000.30241.1041970', NULL, 'BINARY'));
    DBMS_OUTPUT.PUT_LINE('Category ID is EPC, Identifier is TAG_ENCODING, Output format is PURE_IDENTITY');
    DBMS_OUTPUT.PUT_LINE('Category ID is EPC, Identifier is TAG_ENCODING, Output format is TAG_ENCODING');
    DBMS_OUTPUT.PUT_LINE( mgd_id.translate('EPC', NULL, NULL, 'BINARY'));
END;
```

---

MGD_ID Package Types 254-19
This chapter describes the types used with rules, rule sets, and evaluation contexts. This chapter contains the following topics:

- Using Rule Types
  - Overview
  - Security Model
- Summary of Rule Types
Using Rule Types

This section contains topics that relate to using the types used with rules, rule sets, and evaluation contexts.

- Overview
- Security Model
Overview

This types in this chapter are used in rules and enable clients to evaluate rules with the rules engine.

See Also:

- Chapter 125, "DBMS_RULE"
- Chapter 126, "DBMS_RULE_ADM"
- Oracle Streams Extended Examples for examples that use rule types
Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

See Also: Oracle Database Security Guide for more information about user group PUBLIC
Summary of Rule Types

<td>RES_VARIABLE_VALUE_LIST Type</td>
<td>Identifies a list of variable values</td>
</tr>
</tbody>
</table>

Rule types are used with the following Oracle-supplied PL/SQL packages:

- DBMS_RULE
- DBMS_RULE_ADM

You can use the DBMS_RULE_ADM package to create and administer rules, rule sets, and evaluation contexts, and you can use the DBMS_RULE package to evaluate rules.
When you use Oracle Streams, rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Oracle Streams packages use rules:

- DBMS_APPLY_ADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS STREAMS
- DBMS_STREAMS_ADM
- DBMS_STREAMS_AUTH

See Also: Oracle Streams Concepts and Administration
**RE$ATTRIBUTE_VALUE** Type

Specifies the value of a variable attribute.

**Note:** Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

**Syntax**

```sql
TYPE SYS.RE$ATTRIBUTE_VALUE (
    variable_name   VARCHAR2(32),
    attribute_name  VARCHAR2(4000),
    attribute_value  ANYDATA);
```

**Attributes**

*Table 255–2  RE$ATTRIBUTE_VALUE Attributes*

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Specifies the variable used in a rule</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the attribute name. The attribute name can be a multi-component name, such as a1.b2.c3.</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Specifies the attribute value</td>
</tr>
</tbody>
</table>
RE$ATTRIBUTE_VALUE_LIST Type

Identifies a list of attribute values.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```
RE$COLUMN_VALUE Type

Specifies the value of a table column.

**Note:** Enclose the column name in double quotation marks (") if the name contains special characters.

**Syntax**

```sql
TYPE SYS.RE$COLUMN_VALUE (
    table_alias VARCHAR2(32),
    column_name VARCHAR2(4000),
    column_value ANYDATA);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>Specifies the alias used for the table in a rule</td>
</tr>
<tr>
<td>column_name</td>
<td>Specifies the column name</td>
</tr>
<tr>
<td>column_value</td>
<td>Specifies the column value</td>
</tr>
</tbody>
</table>
RE$COLUMN_VALUE_LIST Type

Identifies a list of column values.

Syntax

```sql
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```
RE$NAME_ARRAY Type

Identifies a list of names.

Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```
RE$NV_ARRAY Type

Identifies a list of name-value pairs.

Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```
RE$NV_LIST Type

Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
    actx_list  SYS.RE$NV_ARRAY);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>actx_list</td>
<td>The list of name-value pairs</td>
</tr>
</tbody>
</table>

RE$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE$NV_LIST type:

- ADD_PAIR Member Procedure
- GET_ALL_NAMES Member Function
- GET_VALUE Member Function
- REMOVE_PAIR Member Procedure

ADD_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

**Note:** Enclose the name in double quotation marks (""") if the name contains special characters.

```
MEMBER PROCEDURE ADD_PAIR(
    name   IN  VARCHAR2,
    value  IN  ANYDATA);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name in the name-value pair being added to the list. If the name already exists in the list, then this procedure raises an error.</td>
</tr>
<tr>
<td>value</td>
<td>The value in the name-value pair being added to the list</td>
</tr>
</tbody>
</table>

GET_ALL_NAMES Member Function

Returns a list of all the names in the name-value pair list.
Syntax

MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;

GET_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

---

Note: Enclose the name in double quotation marks (") if the name contains special characters.

---

Syntax

MEMBER FUNCTION GET_VALUE(
    name  IN  VARCHAR2)
RETURN ANYDATA;

Parameters

Table 255–6 GET_VALUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name whose value to return</td>
</tr>
</tbody>
</table>

REMOVE_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

---

Note: Enclose the name in double quotation marks (") if the name contains special characters.

---

Syntax

MEMBER PROCEDURE REMOVE_PAIR(
    name  IN  VARCHAR2);

Parameters

Table 255–7 REMOVE_PAIR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the pair to remove</td>
</tr>
</tbody>
</table>
RE$NV_NODE Type

Identifies a name-value pair.

---

**Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```sql
TYPE SYS.RE$NV_NODE (
    nvn_name VARCHAR2(30),
    nvn_value ANYDATA);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvn_name</td>
<td>Specifies the name in the name-value pair</td>
</tr>
<tr>
<td>nvn_value</td>
<td>Specifies the value in the name-value pair</td>
</tr>
</tbody>
</table>
RE$RULE_HIT Type

Specifies a rule found as a result of an evaluation.

See Also:
- CREATE_RULE Procedure on page 126-15
- ALTER_RULE Procedure on page 126-11

Syntax

```sql
TYPE SYS.RE$RULE_HIT (
    rule_name VARCHAR2(65),
    rule_action_context RE$NV_LIST);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The rule name in the form <code>schema_name.rule_name</code>. For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>&quot;hr&quot;.&quot;employee_rule&quot;</code>.</td>
</tr>
<tr>
<td>rule_action_context</td>
<td>The rule action context as specified in the CREATE_RULE or ALTER_RULE procedure of the DBMS_RULE_ADM package</td>
</tr>
</tbody>
</table>

Table 255–9 RE$RULE_HIT Attributes
RE$RULE_HIT_LIST Type

Identifies a list of rules found as a result of an evaluation.

Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```
RE$TABLE_ALIAS Type

Provides the table corresponding to an alias used in a rule evaluation context. A specified table name must satisfy the schema object naming rules.

**Note:** Enclose the table name in double quotation marks (" ") if the name contains special characters.

**See Also:** Oracle Database SQL Language Reference for information about schema object naming rules

**Syntax**

```sql
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
    table_alias  VARCHAR2(32),
    table_name   VARCHAR2(194));
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>The alias used for the table in a rule</td>
</tr>
<tr>
<td>table_name</td>
<td>The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following: schema_name.table_name table_name</td>
</tr>
</tbody>
</table>

For example, if the `schema_name` is `hr` and the `table_name` is `employees`, then enter the following: `hr.employees`
RE$TABLE_ALIAS_LIST Type

Identifies a list of table aliases used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```
RE$TABLE_VALUE Type

Specifies the value of a table row using a ROWID.

Syntax

```sql
TYPE SYS.RE$TABLE_VALUE{
    table_alias  VARCHAR2(32),
    table_rowid  VARCHAR2(18));
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table.alias</td>
<td>Specifies the alias used for the table in a rule</td>
</tr>
<tr>
<td>table.rowid</td>
<td>Specifies the rowid for the table row</td>
</tr>
</tbody>
</table>
RE$TABLE_VALUE_LIST Type

Identifies a list of table values.

Note: Each table alias in the list in the list must be unique.

Syntax

```sql
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```
RE$VARIABLE_TYPE Type

Provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

---

Note: Enclose the variable name in double quotation marks (") if the name contains special characters.

---

See Also: Oracle Database SQL Language Reference for information about schema object naming rules

Syntax

```sql
TYPE SYS.RE$VARIABLE_TYPE (  
    variable_name             VARCHAR2(32),  
    variable_type             VARCHAR2(4000),  
    variable_value_function   VARCHAR2(228),  
    variable_method_function  VARCHAR2(228));
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>The variable name used in a rule</td>
</tr>
<tr>
<td>variable_type</td>
<td>The type that is resolved in the evaluation context schema. Any valid Oracle built-in data type, user-defined type, or Oracle-supplied type can be specified. See the Oracle Database SQL Language Reference for more information about these types.</td>
</tr>
<tr>
<td>variable_value_function</td>
<td>A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the &quot;Usage Notes&quot; for more information.</td>
</tr>
<tr>
<td>variable_method_function</td>
<td>Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the &quot;Usage Notes&quot; for more information.</td>
</tr>
</tbody>
</table>

Usage Notes

The functions for both the variable_value_function parameter and variable_method_function parameter have the following format:

```sql
schema_name.package_name.function_name@dblink
```
Any of the following parts of the format can be omitted: `schema_name`, `package_name`, and `@dblink`.

For example, if the `schema_name` is `hr`, the `package_name` is `var_pac`, the `function_name` is `func_value`, and the `dblink` is `dbs1.net`, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

### Signature for variable_value_function

The function must have the following signature:

```sql
FUNCTION variable_value_function_name( 
    evaluation_context_schema  IN VARCHAR2,
    evaluation_context_name    IN VARCHAR2,
    variable_name              IN VARCHAR2,
    event_context              IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```

### Signature for variable_method_function

This function must have the following signature:

```sql
FUNCTION variable_method_function_name( 
    evaluation_context_schema  IN VARCHAR2,
    evaluation_context_name    IN VARCHAR2,
    variable_value             IN SYS.RE$VARIABLE_VALUE,
    method_name                IN VARCHAR2,
    event_context              IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```
RE$VARIABLE_TYPE_LIST Type

Identifies a list of variables and their types used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```
RE$VARIABLE_VALUE Type

Specifies the value of a variable.

**Note:** Enclose the variable name in double quotation marks (") if the name contains special characters.

Syntax

```sql
TYPE SYS.RE$VARIABLE_VALUE (
    variable_name VARCHAR2(32),
    variable_data ANYDATA);
```

Attributes

**Table 255–13  RE$VARIABLE_VALUE Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Specifies the variable name used in a rule</td>
</tr>
<tr>
<td>variable_data</td>
<td>Specifies the data for the variable value</td>
</tr>
</tbody>
</table>
RE$VARIABLE_VALUE_LIST Type

Identifies a list of variable values.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```
Rules Manager contains one predefined type and a public synonym for this type.

**See Also:** *Oracle Database Rules Manager and Expression Filter Developer’s Guide* for more information.

This chapter contains the following topics:

- Using Rules Manager Types
- Summary of Rule Manager Types
Using Rules Manager Types

This section contains topics that relate to using the Rules Manager Types.

- Security Model
Security Model

The Oracle Database installation runs the `catrul.sql` script to load the `DBMS_RLMGR` package and create the required Rules Manager schema objects in the `EXFSYS` schema.
Summary of Rule Manager Types

Table 256–1 describes the Rules Manager object type.

<table>
<thead>
<tr>
<th>Object Type Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RLM$EVENTIDS Object Type</td>
<td>Specifies a list of event identifiers to the CONSUME_PRIMEVENTS procedure</td>
</tr>
</tbody>
</table>
**RLM$EVENTIDS Object Type**

The `RLM$EVENTIDS` defines a table of `VARCHAR2` values.

**Syntax**

```
CREATE OR REPLACE TYPE RLM$EVENTIDS is table of VARCHAR2(38);
```

**Attributes**

None.

**Usage Notes**

- `RLM$EVENTIDS` type passes a list of event identifiers to the `CONSUME_PRIM_EVENTS` procedure. These event identifiers are `ROWID`s for the corresponding events in the database and their values are available through the arguments of the action callback procedure and rule class results view columns, when the rule class is configured for `RULE` consumption policy.

**Examples**

The following commands show the body of the action callback procedure for a rule class configured for `RULE` consumption policy. This demonstrates the use of `RLM$EVENTDIDS` type to consume the events before executing the action for the matched rules.

```
CREATE OR REPLACE TYPE RLM$EVENTIDS is table of VARCHAR2(38);

CREATE OR REPLACE PROCEDURE PromoAction (    
    Flt        AddFlight,      
    Flt_EvtId  ROWID,          
    Car        AddRentalCar,   
    Car_EvtId  ROWID,          
    rlm$rule   TravelPromotions%ROWTYPE) is
BEGIN
    evtcnsmd := dbms_rlmgr.consume_prim_events(
        rule_class => 'TravelPromotions',
        event_idents => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));

    IF (evtcnsmd = 1) THEN
        -- consume operation was successful; perform the action ---
        OfferPromotion (Flt.CustId, rlm$rule.PromoType, rlm$rule.OfferedBy);
    END IF;
END;
/
```
UTL Streams Types describes abstract types used with Oracle XML functionality. Four abstract PL/SQL streams are introduced and defined within the 'SYS' schema. The streams may be referenced by PUBLIC and are described in the following sections.

See Also: For more information, see A.

This chapter contains the following topics:

- Summary of UTL Binary Streams Types
Summary of UTL Binary Streams Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UTL_.BINARYINPUTSTREAM Type on page 257-3</td>
<td>Reads bytes and closes a stream.</td>
</tr>
<tr>
<td>UTL_.BINAR YOUTPUTSTREAM Type on page 257-4</td>
<td>Writes bytes and closes a stream.</td>
</tr>
<tr>
<td>UTL_.CHARACT ERINPUTSTREAM Type on page 257-5</td>
<td>Reads chars and closes a stream.</td>
</tr>
<tr>
<td>UTL_.CHARACT EROUTPUTSTREAM Type on page 257-6</td>
<td>Writes chars and closes a stream.</td>
</tr>
</tbody>
</table>
**UTL_BINARYINPUTSTREAM Type**

This type is similar to java.io.InputStream in that it can only read and close a stream.

**Syntax**

```sql
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (
    MEMBER FUNCTION available (self IN OUT NOCOPY Utl_BinaryInputStream) RETURN INTEGER,
    MEMBER FUNCTION read (self IN OUT NOCOPY Utl_BinaryInputStream, numBytes IN INTEGER DEFAULT 1) RETURN RAW,
    MEMBER PROCEDURE read (self IN OUT NOCOPY Utl_BinaryInputStream, bytes IN OUT NOCOPY RAW, numBytes IN OUT INTEGER),
    MEMBER PROCEDURE read (self IN OUT NOCOPY Utl_BinaryInputStream, bytes IN OUT NOCOPY RAW, offset IN INTEGER, numBytes IN OUT INTEGER),
    member function close (self IN Out Nocopy Utl_BinaryInputStream)
) NOT FINAL;
```

**Attributes**

<table>
<thead>
<tr>
<th>Member Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVAILABLE</td>
<td>Returns the number of bytes available to be read</td>
</tr>
<tr>
<td>READ</td>
<td></td>
</tr>
<tr>
<td>#1</td>
<td>Reads the number of bytes specified by numBytes (default is 1) and returns the bytes as a RAW. If there are no remaining bytes a value of NULL is returned.</td>
</tr>
<tr>
<td>#2</td>
<td>Reads the number of bytes specified in numBytes into the parameter bytes. Additionally, the actual number of bytes read is returned in parameter numBytes. If this parameter is set to 0 then there are no more bytes to be read.</td>
</tr>
<tr>
<td>#3</td>
<td>Reads the number of bytes specified in numBytes into the parameter bytes, beginning at the offset specified by parameter offset. The actual number of bytes read is returned in parameter numBytes. If this value is 0, then there are no additional bytes to be read.</td>
</tr>
<tr>
<td>CLOSE</td>
<td>Releases all resources held on the node to support the stream</td>
</tr>
</tbody>
</table>
UTL_BINARYOUTPUTSTREAM Type

This type is similar to java.io.OutputStream in that it can only write and close a stream.

Syntax

```sql
CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (
    MEMBER FUNCTION write (                                  -- #1
        self       IN OUT NOCOPY   sys.utl_BinaryOutputStream,
        bytes      IN              RAW,
        numBytes   IN              INTEGER DEFAULT 1)
    RETURN INTEGER,
    MEMBER PROCEDURE write (                                  -- #2
        self       IN OUT NOCOPY  sys.utl_BinaryOutputStream,
        bytes      IN NOCOPY      RAW,
        numBytes   IN OUT         INTEGER),
    MEMBER PROCEDURE write (                                  -- #3
        self       IN OUT NOCOPY  utl_BinaryOutputStream,
        bytes      IN NOCOPY      RAW,
        offset     IN             INTEGER,
        numBytes   IN OUT         INTEGER),
    MEMBER PROCEDURE flush (                                -- #4
        self       IN OUT NOCOPY  utl_BinaryOutputStream),
    MEMBER PROCEDURE close (                                 -- #5
        self       IN OUT NOCOPY utl_BinaryOutputStream)
) NOT FINAL;
```

Attributes

**Table 257–3**  | **UTL_BINARYOUTPUTSTREAM Type Member Subprograms**
---|---
**Member Subprogram** | **Description**
WRITE |  
  ■ #1 - Writes the number of bytes specified by `numBytes` (default is 1) from `RAW` into the stream. The actual number of bytes written is returned.  
  ■ #2 - Writes the number of bytes specified in parameter `numBytes` from parameter `bytes` to the stream. The actual number of bytes written is returned in parameter `numBytes`.  
  ■ #3 - Writes the number of bytes specified by `numBytes` to the stream, beginning at the offset specified by parameter `offset`. The actual number of bytes written is returned in parameter `numBytes`.  
FLUSH | Insures that any buffered bytes are copied to the node destination  
CLOSE | Frees all resources associated with the stream
UTL_CHARACTERINPUTSTREAM Type

This type is similar to java.io.Reader in that it can only read characters (chars) and close a stream.

Syntax

CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (  
MEMBER FUNCTION available (  
    self       IN OUT NOCOPY   utl_CharacterInputStream)  
RETURN INTEGER,  
MEMBER FUNCTION read ( -- #1  
    self       IN OUT NOCOPY   utl_CharacterInputStream,  
    numChars   IN              INTEGER DEFAULT 1,  
    lineFeed   IN              BOOLEAN DEFAULT FALSE)  
RETURN VARCHAR2,  
MEMBER PROCEDURE read ( -- #2  
    self      IN OUT NOCOPY    utl_CharacterInputStream,  
    chars     IN OUT NOCOPY    VARCHAR2,  
    numChars  IN OUT           INTEGER,  
    lineFeed  IN BOOLEAN DEFAULT FALSE),  
MEMBER PROCEDURE read ( -- #3  
    self      IN  OUT NOCOPY   utl_CharacterInputStream,  
    chars     IN OUT NOCOPY    VARCHAR2,  
    offset    IN               INTEGER,  
    numChars  IN OUT           INTEGER,  
    lineFeed  IN               BOOLEAN DEFAULT FALSE),  
MEMBER PROCEDURE close (  
    self       IN OUT NOCOPY    utl_CharacterInputStream)  
) NOT FINAL;

Attributes

Table 257–4  UTL_CHARACTERINPUTSTREAM Type Member Subprograms

<table>
<thead>
<tr>
<th>Member Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVAILABLE</td>
<td>Returns the number of bytes available to be read</td>
</tr>
<tr>
<td>READ</td>
<td></td>
</tr>
</tbody>
</table>
  - #1 - Returns the number of characters remaining to be read  
  - #2 - Reads the number of characters specified by numChars (default value is 1) and returns the characters as a VARCHAR2. If the value of lineFeed is true (default value is FALSE) then the reading stops if a linefeed character is found. If there are no remaining characters a value of NULL is returned.  
  - #3 - Reads the number of characters specified by parameter numChars into the parameter chars. Additionally, the actual number of characters read is returned in parameter numChars. If this value is 0, then there are no more characters to be read. If the value of lineFeed is TRUE (default is FALSE), then reading stops if a linefeed character is encountered. |
| CLOSE | Releases all resources held by the stream |
UTL_CHARACTEROUTPUTSTREAM Type

This type is similar to java.io.Reader in that it can only read characters (chars) and close a stream.

Syntax

CREATE OR REPLACE TYPE utl_CharacterOutputStream AS OBJECT {
    MEMBER FUNCTION write (                                  -- #1
        self      IN OUT NOCOPY   utl_CharacterOutputStream,

XMLType is a system-defined opaque type for handling XML data. It as predefined member functions on it to extract XML nodes and fragments.

You can create columns of XMLType and insert XML documents into it. You can also generate XML documents as XMLType instances dynamically using the SYS_XMLGEN and SYS_XMLAGG SQL functions.

This chapter contains the following topics:

- **Summary of XMLType Subprograms**

  **See Also:**

  - *Oracle XML DB Developer’s Guide*
Table 258–1 summarizes functions and procedures of the XMLType.

**Table 258–1  XMLTYPE Subprograms**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATENONSCHEMABASE</td>
<td>Creates a non schema based XML from the input schema based instance.</td>
</tr>
<tr>
<td>DXML on page 258-4</td>
<td></td>

</table>
CREATENONSCHEMABASEDXML

Member function. Creates a non-schema based XML document from a schema based instance.

**Syntax**

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```
CREATESCHEMABASEDXML

Member function. Creates a schema based XMLType instance from a non-schema based XMLType value. It uses either the supplied SCHEMA URL, or the SCHEMALLOCATION attribute of the instance.

Syntax

```
MEMBER FUNCTION createSchemaBasedXML(
    schema IN varchar2 := NULL)
return XMLType deterministic;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Optional XMLSchema URL used to convert the value to the specified schema.</td>
</tr>
</tbody>
</table>
CREATEXML

Static function for creating and returning an XMLType instance. The string and clob parameters used to pass in the date must contain well-formed and valid XML documents. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATIC FUNCTION createXML( xmlData IN varchar2) RETURN XMLType deterministic;</td>
<td>Creates the XMLType instance from a string.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML( xmlData IN clob) RETURN XMLType deterministic;</td>
<td>Creates the XMLType instance from a CLOB.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML ( xmlData IN clob, schema IN varchar2, validated IN number := 0, wellformed IN number := 0 ) RETURN XMLType deterministic;</td>
<td>This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML ( xmlData IN varchar2, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) RETURN XMLType deterministic;</td>
<td>This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML ( xmlData IN &quot;&lt;ADT_1&gt;&quot; , schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN NUMBER := 0) RETURN XMLType deterministic;</td>
<td>Creates an XML instance from an instance of an user-defined type.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML ( xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) RETURN XMLType deterministic;</td>
<td>Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.</td>
</tr>
</tbody>
</table>
### Syntax

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATIC FUNCTION createXML (</td>
<td>Creates an XML instance from ANYDATA.</td>
</tr>
<tr>
<td>xmlData IN AnyData,</td>
<td>If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is &quot;ANYDATA&quot; if it is not.</td>
</tr>
<tr>
<td>schema in varchar2 := NULL,</td>
<td></td>
</tr>
<tr>
<td>element in varchar2 := NULL,</td>
<td></td>
</tr>
<tr>
<td>validated in number := 0)</td>
<td></td>
</tr>
<tr>
<td>RETURN sys.XMLType deterministic</td>
<td></td>
</tr>
<tr>
<td>parallel_enable</td>
<td></td>
</tr>
<tr>
<td>STATIC FUNCTION createXML (</td>
<td>Creates an XML instance from a BLOB.</td>
</tr>
<tr>
<td>xmlData IN blob,</td>
<td></td>
</tr>
<tr>
<td>csid IN number,</td>
<td></td>
</tr>
<tr>
<td>schema IN varchar2,</td>
<td></td>
</tr>
<tr>
<td>validated IN number := 0,</td>
<td></td>
</tr>
<tr>
<td>wellformed IN number := 0)</td>
<td></td>
</tr>
<tr>
<td>return sys.XMLType deterministic</td>
<td></td>
</tr>
<tr>
<td>STATIC FUNCTION createXML (</td>
<td>Creates an XML instance from a BFILE.</td>
</tr>
<tr>
<td>xmlData IN bfile,</td>
<td></td>
</tr>
<tr>
<td>csid IN number,</td>
<td></td>

<tr>
<td>return sys.XMLType deterministic</td>
<td></td>
</tr>
</tbody>
</table>

### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlData</td>
<td>The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.</td>
</tr>
<tr>
<td>schema</td>
<td>Optional Schema URL to be used to make the input conform to the given schema.</td>
</tr>
<tr>
<td>validated</td>
<td>Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)</td>
</tr>
<tr>
<td>wellformed</td>
<td>Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)</td>
</tr>
<tr>
<td>element</td>
<td>Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL)</td>
</tr>
<tr>
<td>CSID</td>
<td>The character set id of input XML data.</td>
</tr>
</tbody>
</table>
Member function. Checks if the node exists. If the XPath string is NULL or the document is empty, then a value of 0 is returned, otherwise returns 1. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION existsNode(xpath IN varchar2) RETURN number deterministic;</td>
<td>Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.</td>
</tr>
<tr>
<td>MEMBER FUNCTION existsNode(xpath in varchar2, nsmap in varchar2) RETURN number deterministic;</td>
<td>This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xpath</td>
<td>The XPath expression to test.</td>
</tr>
<tr>
<td>nsmap</td>
<td>Optional namespace mapping.</td>
</tr>
</tbody>
</table>
**EXTRACT**

Member function. Extracts an XMLType fragment and returns an XMLType instance containing the result node(s). If the XPath does not result in any nodes, then returns **NULL**. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION extract( xpath IN varchar2) RETURN XMLType deterministic;</td>
<td>Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType.</td>
</tr>
<tr>
<td>MEMBER FUNCTION extract( xpath IN varchar2, nsmap IN varchar2) RETURN XMLType deterministic;</td>
<td>This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xpath</td>
<td>The XPath expression to apply.</td>
</tr>
<tr>
<td>nsmap</td>
<td>Optional prefix to namespace mapping information.</td>
</tr>
</tbody>
</table>
GETBLOBVAL

Member function. Returns a BLOB containing the serialized XML representation; if the returns is a temporary BLOB, then it must be freed after use.

Syntax
MEMBER FUNCTION getBlobVal()
RETURN Blob deterministic;
GETCLOBVAL

Member function. Returns a CLOB containing the serialized XML representation; if the returns is a temporary CLOB, then it must be freed after use.

Syntax

MEMBER FUNCTION getBlobVal()
RETURN clob deterministic;
GETNAMESPACE

Member function. Returns the namespace of the top level element in the instance. Returns NULL if the input is a fragment or is a non-schema based instance.

Syntax
MEMBER FUNCTION getNamespace
return varchar2 deterministic;
GETNUMBERVAL

Member function. Returns a numeric value, formatted from the text value pointed to by the XMLType instance. The XMLType must point to a valid text node that contains a numerical value. The options are described in the following table.

**Syntax**

```plaintext
MEMBER FUNCTION getNumberVal()
RETURN number deterministic;
```
Member function. Gets the root element of the XMLType instance. Returns NULL if the instance is a fragment.

Syntax

MEMBER FUNCTION getRootElement
return varchar2 deterministic;
GETSCHEMAURL

Member function. Returns the XML Schema URL corresponding to the XMLType instance, if the XMLType instance is a schema-based document. Otherwise returns NULL.

Syntax

MEMBER FUNCTION getSchemaURL
return varchar2 deterministic;
GETSTRINGVAL

Member function. Returns the document as a string. Returns a string containing the serialized XML representation, or in case of text nodes, the text itself. If the XML document is bigger than the maximum size of the VARCHAR2, which is 4000, then an error is raised at run time.

Syntax

MEMBER FUNCTION getStringVal()
RETURN varchar2 deterministic;
ISFRAGMENT

Determines if the XMLType instance corresponds to a well-formed document, or a fragment. Returns 1 or 0 indicating if the XMLType instance contains a fragment or a well-formed document.

Syntax

MEMBER FUNCTION isFragment()
RETURN number deterministic;
Member function. Determines whether the XMLType instance is schema-based or not. Returns 1 or 0 depending on whether the XMLType instance is schema-based.

Syntax

MEMBER FUNCTION isSchemaBased
return number deterministic;
ISSCHEMAVALID

Member function. Checks if the input instance is conformant to a specified schema. Does not change the validation status of the XML instance. If a XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance's own schema.

Syntax

member function isSchemaValid(
    schurl IN VARCHAR2 := NULL,
    elem IN VARCHAR2 := NULL)
return NUMBER deterministic;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schurl</td>
<td>(IN)</td>
<td>The URL of the XML Schema against which to check conformance.</td>
</tr>
<tr>
<td>elem</td>
<td>(IN)</td>
<td>Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.</td>
</tr>
</tbody>
</table>
Member function. Returns the validation status of the XMLType instance -- tells if a schema based instance has been actually validated against its schema. Returns 1 if the instance has been validated against the schema, 0 otherwise.

**Syntax**

```plsql
MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
```
SCHEMVALIDATE

Member procedure. Validates the XML instance against its schema if it hasn’t already been done. For non-schema based documents an error is raised. If validation fails an error is raised; else, the document’s status is changed to validated.

Syntax

```plaintext
MEMBER PROCEDURE schemaValidate(
    self IF OUT NOCOPY XMLType);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>(OUT)</td>
<td>XML instance being validated against the schema.</td>
</tr>
</tbody>
</table>
SETSCHEMAVALIDATED

Member function. Sets the VALIDATION state of the input XML instance.

Syntax
MEMBER PROCEDURE setSchemaValidated(
self IF OUT NOCOPY XMLType,
flag IN BINARY_INTEGER := 1);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>(OUT)</td>
<td>XML instance.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>0 - NOT VALIDATED; 1 - VALIDATED (Default)</td>
</tr>
</tbody>
</table>
TOOBJECT

Member procedure. Converts the XML value to an object type using the XMLSCHEMA mapping, if available. If a SCHEMA is not supplied or the input is a non-schema based XML, the procedure uses cannonical mapping between elements and object type attributes.

See Also:
- An in-depth discussion of this topic inside *Oracle XML DB Developer’s Guide*

Syntax

MEMBER PROCEDURE toObject(
    SELF in XMLType,
    object OUT '<ADT_1>',
    schema in varchar2 := NULL,
    element in varchar2 := NULL);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELF</td>
<td>(IN)</td>
<td>Instance to be converted. Implicit if used as a member procedure.</td>
</tr>
<tr>
<td>object</td>
<td>(IN)</td>
<td>Converted object. An object instance of the required type may be passed in to this function</td>
</tr>
<tr>
<td>schema</td>
<td>(IN)</td>
<td>Schema URL. The mapping of the XMLType instance to the converted object instance may be specified using a schema.</td>
</tr>
<tr>
<td>element</td>
<td>(IN)</td>
<td>Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter.</td>
</tr>
</tbody>
</table>
Member function. This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs. If any of the arguments other than the parammap is NULL, then a NULL is returned.

**Syntax**

```sql
MEMBER FUNCTION transform(
    xsl IN XMLType,
    parammap IN varchar2 := NULL)
RETURN XMLType deterministic;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xsl</td>
<td>(IN)</td>
<td>The XSL stylesheet describing the transformation</td>
</tr>
<tr>
<td>parammap</td>
<td>(IN)</td>
<td>Top level parameters to the XSL - string of name=value pairs</td>
</tr>
</tbody>
</table>
XMLType constructor. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>constructor function XMLType(xmlData IN clob, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic;</code></td>
<td>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td><code>constructor function XMLType(xmlData IN varchar2, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic;</code></td>
<td>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td><code>constructor function XMLType(xmlData IN &quot;w&lt;ADT_1&gt;&quot;, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic;</code></td>
<td>This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.</td>
</tr>
<tr>
<td><code>constructor function XMLType(xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) return self as result deterministic;</code></td>
<td>This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.</td>
</tr>
<tr>
<td><code>constructor function XMLType(xmlData IN AnyData, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic parallel_enable</code></td>
<td>This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is &quot;ANYDATA&quot; if it is not.</td>
</tr>
</tbody>
</table>
XMLTYPE

Syntax

```sql
constructor function XMLType(
    xmlData IN blob, csid IN number,
    schema IN varchar2 := NULL,
    validated IN number := 0,
    wellformed IN number := 0)
return self as result
```

This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.

```sql
constructor function XMLType(
    xmlData IN bfile,
    csid IN number,
    schema IN varchar2 := NULL,
    validated IN number := 0,
    wellformed IN number := 0)
return self as result
```

This constructor function creates an optionally schema-based XMLType instance from the specified BFILE parameter.

<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlData</td>
<td>The data in the form of a BFILE, BLOB, CLOB, REFs, VARCHAR2 or object type.</td>
</tr>
<tr>
<td>schema</td>
<td>Optional Schema URL to be used to make the input conform to the given schema.</td>
</tr>
<tr>
<td>validated</td>
<td>Indicates that the instance is valid to the given XML Schema.</td>
</tr>
<tr>
<td>wellformed</td>
<td>Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.</td>
</tr>
<tr>
<td>element</td>
<td>Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL)</td>
</tr>
<tr>
<td>CSID</td>
<td>The character set id of input XML data.</td>
</tr>
</tbody>
