License Restrictions Warranty/Consequential Damages Disclaimer

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

Warranty Disclaimer

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

Restricted Rights Notice

If this software or related documentation is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS

Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, duplication, disclosure, modification, and adaptation shall be subject to the restrictions and license terms set forth in the applicable Government contract, and, to the extent applicable by the terms of the Government contract, the additional rights set forth in FAR 52.227-19, Commercial Computer Software License (December 2007). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

Hazardous Applications Notice

This software is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications which may create a risk of personal injury. If you use this software in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of this software. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software in dangerous applications.

Third Party Content, Products, and Services Disclaimer

This software and documentation may provide access to or information on content, products and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third party content, products and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third party content, products or services.

Contents

Preface

PeopleCode API Reference Preface	cxvii
PeopleCode API Reference	cxvii
PeopleCode Typographical Conventions	cxvii
PeopleBooks and the PeopleSoft Online Library	cxviii

Chapter 1

AESession Class	1
Understanding AESession Class	1
How an AESession is Accessed	2
AESession Example	3
Data Type of an AESession Object	5
Scope of an AESession Object	5
AESession Class Built-in Function	5
AESession Class Methods	5
AddStep	5
Close	6
Open	7
Save	8
SetSQL	9
SetTemplate	10
AESession Class Property	11
IsOpen	11

Chapter 2

Analytic Calculation Engine Classes	13
Understanding the Analytic Calculation Engine Classes	13
Using the Analytic Calculation Engine Classes with Application Engine	14
Running Synchronously	14
Using Trees	14
Error Handling	15
Data Types for Analytic Calculation Engine Classes	16
Scope of Analytic Calculation Engine Classes	16

Analytic Calculation Engine Classes Built-in Functions	16
AnalyticInstance Class Methods	16
CheckAsyncStatus	16
CheckStatus	17
Copy	18
Delete	19
GetAnalyticModel	20
Load	21
RunAsync	22
RunSync	23
Terminate	23
Unload	24
AnalyticInstance Class Properties	25
AnalyticType	25
ID	25
Messages	25
AnalyticModel Class Methods	26
AddMember	26
AttachTree	27
CalculateCube	28
DetachTree	29
GetCubeCollection	30
GetCellProperties	30

Chapter 6

Application Classes	189
Understanding Application Classes	189
When Would You Use Application Classes?	190
Application Classes General Structure	190
Class Name	191
Class Extension	192
Declaration of Public External Interface	193

Access Control and the Declaration of Protected Properties and Methods	194
Declaration of Private Instance Variables and Methods	198
Definition of Methods	199
Declaration of Abstract Methods and Properties	202
Interfaces	203
Constructors	204
External Function Declarations	206
Naming Standards	208
Naming Packages	208
Naming Classes	208
Naming Methods	208
Naming Properties	209
Import Declarations	209
Self-Reference	210
Using %This with Constructors	211
Properties and Constants	212
Differentiating Between Properties and Methods	213
Overriding Properties	214
Using Get and Set with Properties	215
Using Read-Only Properties	215
Using Methods and Properties for Collections	216
Declaring Constants	216
Using Variables in Application Classes	217
Placement of Variable Declarations	217
Declaring Private Instance Variables	217
Global Variables	217
Overriding Variables and Properties	218
Superclass Reference	218
Downcasting	219
Exception Handling	220
Commenting and Documenting Application Classes	221
Understanding Comments and Documentation	221
Method Header Comments	221
Class Header Comments	222
Designing Base Classes	223
Base Classes	223
Abstract Base Classes	223
Generic Base Classes	223
Utility Classes	224
Declaration of Application Classes	224
Declaring Application Classes	224
Importing Class Names	224
Referencing Superclasses	225
Declaring Private Methods	225
Scope of an Application Class	225

Application Classes Built-in Functions and Language Constructs	225
Class	225

PeopleCode API Reference Preface

This preface introduces the PeopleCode Reference PeopleBook.

PeopleCode API Reference

PeopleCode is the proprietary language used in the development of Oracle's PeopleSoft applications. This PeopleBook provides a reference for the PeopleCode application programming interface (API)—that is, the classes delivered with PeopleCode. The chapters of this PeopleBook describe the syntax and fundamental elements of this part of the PeopleCode language—for example, all of the methods and properties of the Rowset class, the Field class, and so on.

There are two accompanying PeopleBooks about PeopleCode: the *PeopleCode Language Reference* and the *PeopleCode Developer's Guide*. The language reference covers the language elements of PeopleCode, such as the built-in functions, meta-SQL, system variables, and so on. Its chapters contain reference material for the PeopleCode language. The *PeopleCode Developer's Guide* contains conceptual information about developing programs with the PeopleCode language, the PeopleCode API, the component processor, and so on.

PeopleBooks and the Online PeopleSoft Library contains general information about Oracle's PeopleTools product line, such as related documentation, common page elements, and typographical conventions.

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide

PeopleCode Typographical Conventions

Throughout this book, we use typographical conventions to distinguish between different elements of the PeopleCode language, such as bold to indicate function names, italics for arguments, and so on.

Please take a moment to review the following typographical cues:

<i>Font Type</i>	<i>Description</i>
monospace font	Indicates a PeopleCode program or other example
Keyword	In PeopleCode syntax, items in keyword font indicate function names, method names, language constructs, and PeopleCode reserved words that must be included literally in the function call.

Font Type	Description
<i>Variable</i>	In PeopleCode syntax, items in <i>variable</i> font are placeholders for arguments that your program must supply.
...	In PeopleCode syntax, ellipses indicate that the preceding item or series can be repeated any number of times.
{ <i>Option1</i> <i>Option2</i> }	In PeopleCode syntax, when there is a choice between two options, the options are enclosed in curly braces and separated by a pipe.
[]	In PeopleCode syntax optional items are enclosed in square brackets.
&Parameter	In PeopleCode syntax an ampersand before a parameter indicates that the parameter is an already instantiated object.

PeopleBooks and the PeopleSoft Online Library

A companion PeopleBook called *PeopleBooks and the PeopleSoft Online Library* contains general information, including:

- Understanding the PeopleSoft online library and related documentation.
- How to send PeopleSoft documentation comments and suggestions to Oracle.
- How to access hosted PeopleBooks, downloadable HTML PeopleBooks, and downloadable PDF PeopleBooks as well as documentation updates.
- Understanding PeopleBook structure.
- Typographical conventions and visual cues used in PeopleBooks.
- ISO country codes and currency codes.
- PeopleBooks that are common across multiple applications.
- Common elements used in PeopleBooks.
- Navigating the PeopleBooks interface and searching the PeopleSoft online library.
- Displaying and printing screen shots and graphics in PeopleBooks.
- How to manage the locally installed PeopleSoft online library, including web site folders.

- Understanding documentation integration and how to integrate customized documentation into the library.
- Application abbreviations found in application fields.

You can find this companion PeopleBook in your PeopleSoft online library.

Chapter 1

AESession Class

This chapter provides an overview of AESession class and discusses the following topics:

- How an AESession is accessed.
- AESession example.
- Data type of an AESession object.
- Scope of an AESession object.
- AESession Class built-in function.
- AESession Class reference.

Understanding AESession Class

Before PeopleTools 8, users could perform SQL directly on the Application Engine tables, thereby changing their SQL and Application Engine "flow" in a dynamic manner, prior to running their applications. Some applications, for example, let the user input their "rules" in a user-friendly application, then convert these rules, at save time, into Application Engine constructs.

With PeopleTools 8, Application Engine programs should not perform SQL directly on the Application Engine tables, as they are system tables, and are cached. SQL on the Application Engine tables may not be accurately reflected when the applications are executed, because of the caching mechanism.

To overcome this problem, developers have two basic operations that let them modify their Application Engine programs from their online pages:

- Ability to modify SQL definitions, which are referenced within Application Engine SQL using the PeopleCode SQL class and the meta-SQL function %SQL.
- Ability to dynamically change the execution flow of a given Application Engine section.

Use the AESession class to do the latter. This section object is used to modify the steps and SQL associated with a given section by using PeopleCode.

Before describing the specifics of the AESession class, the following are some general terms to understand:

- *base* section

The *base* section represents the Application Engine section you are working on. This is the section that you are changing in PeopleCode. In other words, it's the target section.

- *template* section

The *template* section represents the Application Engine section that is the source, or "model" for the section you're building. You copy *from* the template section *to* the base section.

The template must exist in the database before you can use it.

If the base section you specify doesn't exist, a *new* base section is created. This enables you to dynamically create sections as needed.

You can copy steps (and their attributes) from the template to the base. The only attribute of the step you can modify is the SQL statement that gets executed.

Warning! When you open or get an AERSection object, (that is, the base section) any existing steps in the section are deleted. You must add a new step to the section before you can modify it.

The main assumption for this class is that your rules are dynamic primarily in the SQL that they execute, but that the structure of the rules are static, or at least defined well enough that a standard template can be applied.

Note that you can't update the Application Engine *actions* that are not SQL-related (that is, PeopleCode, Call Section, or Log Message). In other words, you can't change the PeopleCode associated with a PeopleCode action within a step. You can add a step containing a PeopleCode action to your new section, but you can't change the PeopleCode dynamically.

How an AERSection is Accessed

When an AERSection is opened (or accessed), the system first checks if it exists with the given input parameters.

If the base section you specify doesn't exist, a *new* base section is created. This enables you to dynamically create sections as needed. In addition, if the target section doesn't exist, all section-level attributes are copied from the template to the target section. If the target exists, it retains its attribute settings.

If an effective date is specified (with EffDt), but there is no match using that effective date, the AERSection is opened using the base effective date of '1900-01-01'.

The market defined for the current component is used for the section to be open. If no section with this market exists, the default GBL is used.

If you open an AERSection object from within a running Application Engine program, the market value is set to the value of the current process.

The database platform you're currently running is used as the database platform for the section to be opened. If no section with this database platform exists, the default "none" is used.

To find the correct section to open, the precedence is:

1. Market
2. Database platform
3. Effective date

When a section is closed and its changes are saved, the market and database platform from the system that performed the changes is used as the market and database platform for the modified section.

Let's take an example. Assume that you're running on DB2 UDB for OS/390 and z/OS, and your current market is set to 'MKT'. Assume that you want to open a section called Sect1 in an Application Engine program called TestAppl, and that your data looks something like this:

<i>Number</i>	<i>Application Engine Program</i>	<i>Application Engine Section</i>	<i>Market</i>	<i>Platform</i>	<i>Effective Date</i>
1	TestAppl	Sect1	USA	DB2	1990-01-01
2	TestAppl	Sect1	USA	None	1900-01-01
3	TestAppl	Sect1	GBL	None	1900-01-01

If you use:

```
&SECTION.Open("TestAppl", "Sect1", "1998-12-14");
```

Then the third section in the previous list is used, because the market takes highest precedence. When the section is saved, the values for market and platform are updated to the current system values.

Warning! When you open or get an AERSection object, (that is, any base section) any existing steps in the section are deleted. You must add a new step to the section before you can modify it.

The other attributes of the section, however, are retained, with the exceptions noted previously.

AERSection Example

Assume that you have a template section called TEMPLATE in the Application Engine program called MY_APPL. The template looks like this:

Steps	Actions
NewStep1	DO When DO Select SQL
NewStep2	DO Select CallSection

Also, assume that you have a base section called DYN_SECT in the Application Engine program called RULES. When you start, this section looks like this:

Steps	Actions
Step1	DO Select Call Section DO Unit
Step2	Call Section

Here's the PeopleCode:

```
Local AERSection &Section;
&Section = GetAERSection("RULES", "DYN_SECT");
/* Open the base section */
&Section.SetTemplate("MY_APPL", "TEMPLATE");
/* Set the template section */
&Section.AddStep("NewStep2");
/* Insert NewStep2 */
/* Do some SQL stuff here */
&Section.SetSQL("DO_SELECT", &MySql);
/* Modify the SQL in the added step */
&Section.Save();
&Section.Close();
/* Save and close */
```

The base section looks like this after execution:

Steps	Actions
NewStep2	DO Select Call Section

Note. The existing steps in the base section have been *overwritten* by the new step from the template section.

Data Type of an AERSection Object

You should declare an AERSection object as type AERSection. For example:

```
Local AERSection &SECTION;
```

Scope of an AERSection Object

An AERSection object can only be instantiated from PeopleCode.

The AERSection Object is designed for use within online pages. Typically, dynamic sections should be constructed in response to an end-user action.

Note. Do not call an AERSection object from an Application Engine PeopleCode Action. If you need to access another section, use CallSection Actions instead.

AERSection Class Built-in Function

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetAERSection

AERSection Class Methods

In this section, we discuss each AERSection class method, in alphabetical order.

AddStep

Syntax

```
AddStep(ae_step_name [, NewStepName])
```

Description

The given step name from the template section is added as the next step into the base section, and named the existing step name.

Note. When you open or get a section, all the existing steps are deleted. The first time you execute `AddStep`, you add the first step. The second time you execute `AddStep`, you add the second step, and so on.

All attributes of the step are copied, including all of its actions. The only changeable attribute of a step are its SQL statements, which can be modified using the `SetSQL` method. `SetSQL` is run on the *current* step, that is, the step most recently added.

You can also change the name of the step by using the optional parameter *NewStepName*.

If the step named does not exist in the template, an error occurs. Likewise, if you have not opened or set the template for the section, you receive an error.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ae_step_name</i>	Specify the step name from the template to be added as the <i>next</i> step in the base section. This parameter takes a string value.
<i>NewStepName</i>	Specify a new name for the step to be added. This parameter is optional, and takes a string value.

Returns

None.

Example

See [Chapter 1, "AERSection Class," AERSection Example, page 3](#).

See Also

[Chapter 1, "AERSection Class," SetSQL, page 9](#)

Close

Syntax

`close()`

Description

Close closes the AERSection object. Any unsaved changes to the section are discarded.

Parameters

None.

Returns

None.

Example

See [Chapter 1, "AERSection Class," AERSection Example, page 3.](#)

See Also

[Chapter 1, "AERSection Class," Save, page 8](#) and [Chapter 1, "AERSection Class," Open, page 7](#)

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," [GetAERSection](#)

Open

Syntax

```
open(ae_applid, ae_section, [effdt])
```

Description

The Open method associates the AERSection object with the given Application Engine section, based on the *ae_applid* and *ae_section*. If the *effdt* is specified, this is also used to get the section object. In other words, the Open method sets the base section.

Warning! When you open or get an AERSection object, (that is, the base section) any existing steps in the section are deleted.

Note. If the base section you specify doesn't exist, a *new* base section is created. This enables you to dynamically create sections as needed. In addition, if the target section doesn't exist, all section-level attributes are copied from the template to the target section. If the target exists, it retains its attribute settings.

If the AERSection is still open when you issue the Open method, the previously opened object is discarded and none of the changes saved. To prevent accidentally discarding your changes, you can use the IsOpen property to verify if a section is already open.

The AERSection is open based on the Market and database type of your current system.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ae_applid</i>	Specify the application ID of the section you want to access. This parameter takes a string value.
<i>ae_section</i>	Specify the section name of the section you want to access. This parameter takes a string value.
<i>effdt</i>	Specify the effective date of the section you want to access (optional). This parameter takes a string value.

Returns

An AERSection object.

Example

```
Local AERSection &SECTION;
&SECTION = GetAERSection("RULES1", "DYN_SECT");
/* do some processing */
&SECTION.Close();
&SECTION.Open("RULES2", "DYN_SECT");
/* do additional processing */
```

See Also

[Chapter 1, "AERSection Class," IsOpen, page 11](#)

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetAERSection

Save

Syntax

Save()

Description

The Save method saves the section to the database. The AERSection object remains open after you use this method. To close the object, you must use the Close method.

You must commit all database changes prior to using this method. This is to avoid locking critical Tools tables and hence freezing all other users. You receive a runtime error message if you try to use this method when there are pending database updates, and your PeopleCode program terminates. You need to commit any database updates prior to using this method. Use the CommitWork function to commit database updates.

Parameters

None.

Returns

None.

Example

See [Chapter 1, "AERSection Class," AERSection Example, page 3.](#)

See Also

[Chapter 1, "AERSection Class," Close, page 6](#) and [Chapter 1, "AERSection Class," Open, page 7](#)

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," CommitWork

SetSQL

Syntax

SetSQL(*action_type_string*, *string*)

Description

The SetSQL method replaces the SQL associated with the given action type in the current step in the base section with the SQL in *string*. The *current* step is the latest step that was added using AddStep. The action types are:

- DO_WHEN
- DO_WHILE
- DO_SELECT

- SQL
- DO_UNTIL

Note. All action types must be passed in as strings with quotation marks.

If the action specified does not exist in the current step, an error occurs.

You can use a SQL object as *string*.

```
&SECTION.SetSQL("SQL", &SQL);
```

Parameters

<i>Parameter</i>	<i>Description</i>
<i>action_type</i>	Specifies the action type of the current step that should be changed. This parameter takes a string value.
<i>string</i>	Specifies the SQL to be used to replace the SQL in the current step.

Returns

None.

Example

See [Chapter 1, "AERSection Class," AERSection Example, page 3.](#)

See Also

[Chapter 1, "AERSection Class," AddStep, page 5](#)

[Chapter 40, "SQL Class," page 2227](#)

SetTemplate

Syntax

```
SetTemplate(ae_applid, ae_section)
```

Description

The SetTemplate method sets the template to be used with an AERSection object, as identified by *ae_applid* and *ae_section*.

The rules for assigning a template section are similar to the rules for selecting a base section. The selection of market and database platform are done exactly the same. However, the effective date of the template is always set based on the effective date of '1900-01-01'.

You must set the template before you can use any of the other methods.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ae_applid</i>	Specify the name of the Application Engine program that contains the section to be used as the template.
<i>ae_section</i>	Specify the name of the Application Engine section in the program to be used as the section template.

Returns

None.

Example

See [Chapter 1, "AERSection Class," AERSection Example, page 3.](#)

See Also

[Chapter 1, "AERSection Class," Open, page 7](#)

[Chapter 1, "AERSection Class," How an AERSection is Accessed, page 2](#)

GetAERSection

AERSection Class Property

In this section, we discuss the IsOpen AERSection property.

IsOpen

Description

If this property is True, the section object is already open. If you try to open a section object that is already open, the open section object is closed and all the changes that haven't been saved are discarded before the object is re-opened.

Example

```
If Not(&MYSECTION.IsOpen) Then  
    &MYSECTION.Open(MYAPPLID, SECTION2);  
End-If;
```

Chapter 2

Analytic Calculation Engine Classes

This chapter provides an overview of the Analytic Calculation Engine classes, and discusses:

- Using the Analytic Calculation Engine classes with Application Engine
- Running synchronously
- Error handling
- Data types for the Analytic Calculation Engine classes
- Scope of the Analytic Calculation Engine class objects
- Analytic Calculation Engine reference

Important! The Analytic Calculation Engine classes are not supported on IBM z/OS and Linux for IBM System z platforms.

Understanding the Analytic Calculation Engine Classes

PeopleSoft Analytic Calculation Engine comprises a calculation engine plus several PeopleTools features which enable application developers to define both the calculation rules and the display of calculated data within PeopleSoft applications for the purposes of multi-dimensional reporting, data editing and analysis.

More specifically, developers create *analytic models* in order to define the rules which are used to calculate data. Developers also create PeopleSoft Pure Internet Architecture pages with *analytic grids* in order to display the data within PeopleSoft applications. End users view, analyze and make changes to this data. When end users save their changes, PeopleSoft Analytic Calculation Engine recalculates the data and saves the calculated data to the database.

PeopleCode enables developers to manipulate analytic calculation data as follows:

- Use the Analytic Calculation Engine classes to either retrieve or specify data in an instance of an analytic model loaded into the system, and also to calculate (or recalculate) cube values.
- Use the Analytic Calculation Engine metadata classes to manipulate an analytic model definition. For example, you can add cubes to a cube collection or rename an existing user function for a model.
- Use the Analytic Grid classes to manipulate the display of analytic calculation data on a page.
- Use the Analytic Type classes to manipulate an analytic type definition. For example, you can specify a new analytic model for an analytic type definition.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," page 53](#)

[Chapter 4, "Analytic Grid Classes," page 159](#)

[Chapter 5, "Analytic Type Classes," page 169](#)

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine

Using the Analytic Calculation Engine Classes with Application Engine

All Application Engine programs run on the application engine server. This means your program runs on the application engine server, not the analytic server.

PeopleSoft recommends that you put each of the following methods into its own step when you're creating an analytic calculation using a Application Engine program:

- AnalyticInstance Load method
- AnalyticInstance Unload method
- AnalyticInstance Copy method
- AnalyticInstance Delete method (in case of any readable/writable records in the analytic type)
- AnalyticModel Recalculate method
- CubeCollection SetData method

Also, with the Recalculate method, you should use the Commit after step option.

Running Synchronously

Some of the methods and functions associated with these classes have the option of being run asynchronously. When you run these asynchronously, and not from a Application Engine program, these methods and functions have additional functionality, that is, if the RenServer is configured, a window displays the PeopleSoft Analytic Calculation Engine execution status.

Using Trees

PeopleSoft Analytic Calculation Engine uses trees to establish hierarchies of a dimension's parent-child relationships. PeopleSoft Analytic Calculation Engine uses these hierarchies to:

- Calculate and display aggregated data to end users.
- Enable end users to navigate through data by performing such actions as expanding and collapsing nodes.

- Enable end users to drill down and drill up through data.

It is important to understand that PeopleSoft trees and hierarchies differ in the following manner: You create one tree for each dimension that requires a hierarchy. The analytic model uses that tree to create one hierarchy for one dimension.

Use the `AttachTree` method to attach a tree to a dimension, and use the `DetachTree` method to detach the tree from the dimension.

You should be aware of the following restrictions:

- Because the `AttachTree` method attaches a specific tree to an analytic instance, the system throws an error if the tree's name, setID or effective date is incorrect.
- You can attach only one tree to one dimension at a time.
- If the analytic instance is already loaded into the analytic server, the tree isn't attached until the analytic model is loaded.
- No aggregate data is displayed to the user after you use the `DetachTree` method.
- If your application loads the analytic model after the tree has been detached, the analytic model doesn't create a hierarchy for the dimension.
- If the analytic instance is already loaded into the analytic server, the `DetachTree` method isn't applied to the tree until the next time your application loads the analytic instance.

You can only attach a tree to an analytic model before the analytic instance

No aggregate data displayed to user after detach tree.

See Also

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine, "Creating Hierarchies"

Error Handling

All the Analytic Calculation Engine classes throw `PeopleCode` exceptions for any fatal error that occurs in the execution of the operation. PeopleSoft recommends enclosing your analytic model programs in try-catch statements. This way, if your program catches the exception, the message set and message number that are associated with the exception object indicate the error.

Using the Messages Property

Use the `Messages` property to determine whether any errors occurred. The `Messages` property returns a multi-dimensional array. You can use the `Len` property of the array class to determine the length of the array. If the array has a length of 0, there are no errors.

Data Types for Analytic Calculation Engine Classes

Every PeopleSoft Analytic Calculation Engine object is declared as its own data type, that is, `AnalyticModel` objects are declared as type `AnalyticModel`, `CubeCollection` objects are declared as type `CubeCollection`, and so on.

The following are the data types for the PeopleSoft Analytic Calculation Engine classes:

- `AnalyticInstance`
- `AnalyticModel`
- `CubeCollection`

Scope of Analytic Calculation Engine Classes

The Analytic Calculation Engine objects can only be instantiated from `PeopleCode`.

These objects can be used anywhere you have `PeopleCode`, that is, in a `Application Engine` program, an application class, record field `PeopleCode`, and so on.

Analytic Calculation Engine objects can be of scope `Local`, `Component`, or `Global`.

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions,"
`GetAnalyticInstance`

AnalyticInstance Class Methods

In this section, we discuss the `AnalyticInstance` methods. The methods are discussed in alphabetical order.

CheckAsyncStatus

Syntax

`CheckAsyncStatus(OperationID)`

Description

Use the CheckAsyncStatus method to determine the current state of the asynchronous methods, as well as the Load method when executed asynchronously.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>OperationID</i>	Specify the operation ID of the asynchronous operation. This operation ID is returned when one of the asynchronous operations is executed.

Returns

This method returns one of the following values:

<i>Value</i>	<i>Description</i>
Less than 0	The operation completed with errors.
0	The operation has not completed yet.
Greater than 0	The operation completed successfully.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," CheckStatus, page 17](#); [Chapter 2, "Analytic Calculation Engine Classes," Load, page 21](#) and [Chapter 2, "Analytic Calculation Engine Classes," Unload, page 24](#)

CheckStatus

Syntax

CheckStatus()

Description

Use the CheckStatus method to determine the current state of the analytic calculation engine.

Parameters

None.

Returns

This method returns one of the following values:

<i>Value</i>	<i>Description</i>
%AnalyticInstance_NotLoaded	The analytic instance has not been loaded into the application server.
%AnalyticInstance_Loading	The analytic instance is being loaded.
%AnalyticInstance_Idle	The analytic instance is idle, that is, not currently running.
%AnalyticInstance_Busy	The analytic instance is currently running.
%AnalyticInstance_Inaccessible	The analytic instance is currently inaccessible.
%AnalyticInstance_Terminating	The analytic instance is currently ending.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," Load, page 21](#) and [Chapter 2, "Analytic Calculation Engine Classes," Unload, page 24](#)

Copy

Syntax

Copy(*NewID*, *ForceDelete*&*Record*)

Description

Use the Copy method to copy all the data and metadata to a new analytic instance from the current analytic instance.

If the specified *NewID* exists, or any data for *NewID* exists, the data is not copied unless *ForceDelete* has been specified as true.

If a tree is attached to the existing analytic instance, all tree data is also copied to the new analytic instance.

In addition, the analytic instance and the tree information are not copied unless the record specified with the &*Record* parameter is populated with the existing analytic instance ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NewID</i>	Specify the new analytic instance ID as a string.
<i>ForceDelete</i>	If the specified <i>NewID</i> exists, and <i>ForceDelete</i> is specified as false, the copy is cancelled. If the specified <i>NewID</i> exists, and <i>ForceDelete</i> is specified as true, the analytic instance specified by <i>NewID</i> is deleted, and a new analytic instance is created from the current ID.
<i>&Record</i>	Specify an already instantiated record object to pass in values to the Copy application package method that's defined with the specified analytic type definition.

Returns

None.

Example

```
&ai.Copy("MYTESTCOPY", True, &MyRecord);
```

See Also

[Chapter 2, "Analytic Calculation Engine Classes," Delete, page 19](#); [Chapter 2, "Analytic Calculation Engine Classes," Load, page 21](#) and [Chapter 2, "Analytic Calculation Engine Classes," Unload, page 24](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework, "Designing Analytic Type Definitions"

Delete

Syntax

```
Delete(ForceUnload, &RecordRef)
```

Description

Use the Delete method to remove all the metadata related to the given analytic instance.

Every analytic type definition is defined with an application package that contains three methods: Create, Delete, and Copy. The values in &*RecordRef* are passed to the Delete method.

This method does not delete the analytic instance if the analytic instance is currently loaded. Specify *ForceUnload* as true to unload the analytic instance before deleting it.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ForceUnload</i>	Specify whether to force the deletion of the analytic instance. This parameter takes a Boolean value. If the analytic instance is currently loaded, specifying true for this parameter forces the analytic instance to be unloaded before it is deleted.
<i>&RecordRef</i>	Specify a record to pass in values to the application package Delete class that's associated with the analytic type definition.

Returns

None.

Example

```
&ai.Delete(TRUE, &Record);
```

See Also

[Chapter 2, "Analytic Calculation Engine Classes," Unload, page 24](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework, "Designing Analytic Type Definitions"

GetAnalyticModel

Syntax

```
GetAnalyticModel(Model.ModelName)
```

Description

Use the GetAnalyticModel method to return a reference to an AnalyticModel object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ModelName</i>	Specify the name of the analytic model for which you want to return a reference. The model definition must already exist in Application Designer.

Returns

A reference to an `AnalyticModel` object or `Null`.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," AnalyticModel Class Methods, page 26](#)

Load

Syntax

Load(*Sync*, *IdleTimeOut*, **Message**.*messagename*)

Description

Use the Load method to load the `AnalyticInstance` object executing the method into the analytic server.

If this analytic instance is already loaded, this method fails.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Sync</i>	Specify whether the analytic instance should be run synchronously or asynchronously. This parameter takes a Boolean value: true if it should be run synchronously, false otherwise. See Chapter 2, "Analytic Calculation Engine Classes," Running Synchronously, page 14 .
<i>IdleTimeOut</i>	Specify, in minutes, the idle time out value. A value of 0 is an infinite time out. A value of -1 indicates that it should use the value specified in the default configuration for the analytic server. Note. When loading an analytic grid, you should always specify a value of -1. See <i>PeopleTools 8.51 PeopleBook: Analytic Calculation Engine</i> , "Managing Analytic Servers," Loading and Unloading Analytic Instances.
Message . <i>MessageName</i>	Specify an application message that should be sent if the analytic server crashes while the analytic instance is loaded. Note. The message is sent when the analytic server process restarts itself after crashing.

Returns

A string. For asynchronous loads, this string is passed to the CheckAsyncStatus method.

This method returns one of the following values:

<i>Value</i>	<i>Description</i>
%AnalyticInstance_NotLoaded	The analytic instance has not been loaded into the analytic server.
%AnalyticInstance_Loading	The analytic instance is being loaded.
%AnalyticInstance_Idle	The analytic instance is idle, that is, not currently running.
%AnalyticInstance_Busy	The analytic instance is currently running.
%AnalyticInstance_Inaccessible	The analytic instance is currently inaccessible.
%AnalyticInstance_Terminating	The analytic instance is currently terminating.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," CheckAsyncStatus, page 16](#) and [Chapter 2, "Analytic Calculation Engine Classes," Unload, page 24](#)

RunAsync

Syntax

RunAsync()

Description

Use the RunAsync method to specify if the analytic instance executing the method should be run in an asynchronous manner.

This method is used only to define the transaction in the analytic type definition in optimization. PeopleSoft Analytic Calculation Engine programs uses the Load method for defining synchronous or asynchronous operation.

Parameters

None.

Returns

None.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework, "Designing Analytic Type Definitions,"
Configuring Analytic Type Transactions

RunSync

Syntax

RunSync ()

Description

Use the RunSync method to specify if the analytic instance executing the method should be run in a synchronous manner.

This method is used only to define the transaction in the analytic type definition in optimization. PeopleSoft Analytic Calculation Engine programs uses the Load method for defining synchronous or asynchronous operation.

Parameters

None.

Returns

None.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework, "Designing Analytic Type Definitions,"
Configuring Analytic Type Transactions

Terminate

Syntax

Terminate ()

Description

Use the Terminate method to force the termination of an analytic instance loaded in an analytic server.

This method should only be used from PeopleCode running in a Application Engine program to cause an analytic instance loaded in an analytic server to be terminated.

Attempting to terminate an analytic instance that is not loaded or is loaded in a Application Engine process results in a PeopleCode exception.

Although the Terminate method returns instantly, it may take up to a minute before the analytic instance is actually terminated.

Parameters

None.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," Load, page 21](#) and [Chapter 2, "Analytic Calculation Engine Classes," Unload, page 24](#)

Unload

Syntax

`Unload()`

Description

Use the Unload method to unload the analytic instance executing the method from the analytic server. After unloading the analytic instance, the analytic server process is restarted.

Parameters

None.

Returns

None.

Example

```
&ai.UnLoad();
```

See Also

[Chapter 2, "Analytic Calculation Engine Classes," Load, page 21](#)

AnalyticInstance Class Properties

In this section, we discuss the AnalyticInstance properties. The properties are discussed in alphabetical order.

AnalyticType

Description

This property returns the name of the analytic type definition for this AnalyticInstance object as a string.

This property is read-only.

ID

Description

This property returns the analytic instance ID of this AnalyticInstance object as an integer.

This property is read-only.

Messages

Description

This property returns a multi-dimensional array of any, containing the messages that occurred.

The first dimension contains the message set number. The second dimension contains the message number. The third dimension contains the number of parameters in that message. The subsequent dimensions contain the values for the parameters. The maximum number of possible dimensions is 8.

After you access this property, only new messages are returned, that is, messages are only returned once.

This property is read-only.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," RunSync, page 23](#)

AnalyticModel Class Methods

In this section, we discuss the AnalyticModel methods. The methods are discussed in alphabetical order.

AddMember

Syntax

AddMember (*DimName*, *MemberName*)

Description

Use the AddMember method to add the specified dimension member to the specified dimension.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the dimension to which you want to add the member.
<i>MemberName</i>	Specify the name of the member that you want to add to the specified dimension.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," GetMembers, page 31](#) and [Chapter 2, "Analytic Calculation Engine Classes," RenameMember, page 35](#)

AttachTree

Syntax

AttachTree(*DimName*, *TreeName*, *SetID*, *UserKeyVa lue*, *EffDt*, *NodeName*, *OverrideRecord*, *DetailStartLvl*, *TreeDiscardLvl*)

Description

Use the AttachTree method to attach a tree to a dimension. Only one tree can be attached to a dimension at a time. You can only attach a tree before the analytic instance is loaded.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that you want to attach a tree to.
<i>TreeName</i>	Specify the name of the tree that you want to attach to the dimension.
<i>SetId</i>	Specify the table indirection key for the tree. This parameter takes a string value. If the tree structure the tree is based on has its IndirectionMethod specified as "S", you must specify a SetID. If the tree structure doesn't have its IndirectionMethod specified as "S", you must enter a Null string (that is, two quotation marks with no blank space between them ("")) for this parameter.
<i>UserKeyValue</i>	Specify the User Key Value for the tree. This parameter takes a string value. If the tree structure the tree is based on has its IndirectionMethod specified as "U" or "B", you must specify a User Key Value. If the tree structure doesn't have its IndirectionMethod specified as "U" or "B", you must enter a Null string (that is, two quotation marks with no blank space between them ("")) for this parameter
<i>EffDt</i>	Specify an effective date for this tree. This parameter takes a string value.
<i>NodeName</i>	Specify the tree node used as the dimension hierarchy root. This can be different from the tree root, that is, you can pick a subtree.
<i>OverrideRecord</i>	Specify the name of a record to be used for overriding the aggregate. See <i>PeopleTools 8.51 PeopleBook: Analytic Calculation Engine</i> , "Creating Hierarchies," Working with Overrides.

Parameter	Description
<i>DetailStartLvl</i>	Specify the tree level number (such as 1 for the node hierarchy root specified by the <i>NodeName</i> parameter) at which detail nodes start. If you specify a value other than 0, any nodes at this level or greater than this level are considered details node, and any nodes with levels less than the start level are considered aggregate nodes If you specify 0, detail nodes are nodes that don't have parents (a node can be a parent either by having children or by having child ranges).
<i>TreeDiscardLvl</i>	Specify the tree level number (such as 1 for the node hierarchy root specified by the <i>NodeName</i> parameter) at which to stop loading the tree. Nodes at this level or at levels greater are discarded. This parameter is only used if it has a value other than 0, and if it has a value greater than <i>DetailStartLvl</i> .

Returns

None.

See Also

[Chapter 43, "Tree Classes," page 2279](#)

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine, "Creating Hierarchies," Understanding the Relationship of PeopleSoft Trees to Analytic Models

CalculateCube

Syntax

calculateCube(*CubeName*[, *Sync*])

Description

Use the CalculateCube method to calculate the named cube in synchronous mode.

Parameters

Parameter	Description
<i>CubeName</i>	Specify the name of the cube that you want to calculate.

<i>Parameter</i>	<i>Description</i>
<i>Sync</i>	This parameter is optional and is not used. It is only being included for previous releases. This parameter takes a Boolean value. The value of this parameter is ignored. The cube is always calculated in synchronous mode.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," Running Synchronously, page 14](#) and [Chapter 2, "Analytic Calculation Engine Classes," Recalculate, page 34](#)

DetachTree

Syntax

DetachTree(*DimName*)

Description

Use the DetachTree method to detach a tree from the specified dimension.

You can only attach a tree when the analytic instance is not loaded. This method fails if you try to detach a tree while the analytic instance is loaded.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension from which you want to detach a tree.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," AttachTree, page 27](#) and [Chapter 2, "Analytic Calculation Engine Classes," GetTree, page 33](#)

[Chapter 43, "Tree Classes," page 2279](#)

GetCubeCollection

Syntax

GetCubeCollection(*CubeCollName*)

Description

Use the GetCubeCollection method to return a reference to a CubeCollection object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeCollName</i>	Specify the name of the cube collection to which you want a reference.

Returns

A CubeCollection object if successful.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," CubeCollection Class, page 36](#)

GetCellProperties

Syntax

GetCellProperties(*CubeName*, &*Node*)

Description

Use the GetCellProperties method to get information about a cell.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeName</i>	Specify the name of the cube that contains the cell you want information about.
<i>&Node</i>	Specify an already instantiated array of array of string (a two-dimensional array of string) containing name-value pairs of the node name and the node detail.

Returns

An array of string.

The four strings returned in the array are:

1. Cell type. Values are "Aggregate" or "Detail"
2. User function.
3. Dimension for aggregation, the dimension name.
4. Aggregation reason. Values are: "Dimension Level Override", "Member Level Override", "Cube Dimension Level Override", "None."

See Also

[Chapter 8, "Array Class," page 257](#)

GetMembers

Syntax

GetMembers(*DimName*, *DimFilter*)

Description

Use the GetMembers method to return the names of the members in the specified dimension. You can specify a user function to be used as a filter for the dimension using *DimFilter*.

When filtering hierarchy nodes, if the parent member is filtered, all the child nodes are also filtered.

In order to filter the parent member if all of its children are filtered, the user function should be written such that for the parent node, apply the condition on all of its children, using the FORCHILDREN built-in function. If none of the children satisfy the condition, return zero from the user function, which filters the parent node.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension from which you want to get the members.
<i>DimFilter</i>	Specify a user function that you want to use to filter the dimension.

Returns

A two-dimensional array of any.

The first dimension contains the member names. The second dimension contains the parent of the member. The members are sorted in the hierarchy order.

If the dimension does not have a hierarchy, all members are returned as level one.

For example, if the dimension has the following members:

```
ALLREGIONS
  NORTH AMERICA
    USA
    CANADA
    MEXICO
  EUROPE
    FRANCE
    GERMANY
    ENGLAND
  ASIA
    JAPAN
    CHINA
```

The GetMembers method returns the following:

<i>Member Name</i>	<i>Level</i>
ALLREGIONS	Null
NORTHAMERICA	ALLREGIONS
USA	NORTHAMERICA
CANADA	NORTHAMERICA
MEXICO	NORTHAMERICA
EUROPE	ALLREGIONS
FRANCE	EUROPE
ENGLAND	EUROPE

<i>Member Name</i>	<i>Level</i>
GERMANY	EUROPE
ASIA	ALLREGIONS
JAPAN	ASIA
CHINA	ASIA

If the total member is present in the metadata, it is returned as level zero.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," AddMember, page 26](#) and [Chapter 2, "Analytic Calculation Engine Classes," RenameMember, page 35](#)

GetTree

Syntax

GetTree(*DimName*)

Description

Use the GetTree method to return an array of string that contains information about the tree that is attached to the specified dimension.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension to which a tree is attached.

Returns

An array of string.

The array items have the following format:

1. TreeName
2. SetID
3. UserKeyValue

4. EffDt
5. BranchName
6. Override record name
7. DetailStartLvl
8. TreeDiscardLvl

[Chapter 43, "Tree Classes," page 2279](#)

Recalculate

Syntax

Recalculate(*Sync*)

Description

Use the Recalculate method to recalculate the loaded analytic model. If *Sync* is true, the transaction is synchronous, else it is performed asynchronously.

The Recalculate method always writes any changes to readable, readable and writable, as well as writable records to the database as specified by the analytic type definition.

If you are running in asynchronous mode, this method returns an optional string that contains the operation ID to be used with the CheckAsyncStatus property.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Sync</i>	Specify whether the recalculation should be run synchronously or asynchronously. This parameter takes a Boolean value: true if it should be run synchronously, false otherwise.

Returns

A string.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," CalculateCube, page 28](#) and [Chapter 2, "Analytic Calculation Engine Classes," CheckAsyncStatus, page 16](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AnalyticModelDefn, page 58](#)

RenameMember**Syntax**

RenameMember (*DimName*, *OrigMemberName*, *NewMemberName*)

Description

Use the RenameMember method to rename a member in the specified dimension.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the dimension that contains the member you want to rename.
<i>OrigMemberName</i>	Specify the name of the member that you want to rename.
<i>NewMemberName</i>	Specify the new name for the member specified by <i>OrigMemberName</i> .

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," AddMember, page 26](#) and [Chapter 2, "Analytic Calculation Engine Classes," GetMembers, page 31](#)

AnalyticModel Class Property

In this section, we discuss the AnalyticModel class property.

Messages

Description

This property returns a multi-dimensional array of any containing the messages that occurred during execution of the Recalculate method.

The first dimension contains the message set number. The second dimension contains the message number. The third dimension contains the number of parameters in that message. The subsequent dimensions contain the values for the parameters. The maximum number of possible dimensions is 8.

After you access this property, only new messages are returned, that is, messages are only returned once.

This property is read only.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," Recalculate, page 34](#)

CubeCollection Class

Instantiate a CubeCollection object using the AnalyticModel class GetCubeCollection method.

In cube collections, the total member behaves just as the root of the hierarchy. If it's present, it's displayed first in the list.

Filtering of members in a dimension in the cube collection is similar to filtering members using the AnalyticModel class GetMembers method. If you filter the parent node, the children of that node are filtered as well.

See [Chapter 2, "Analytic Calculation Engine Classes," GetCubeCollection, page 30](#).

CubeCollection Class Methods

In this section we discuss the CubeCollection class methods. The methods are described in alphabetical order.

CollapseNode

Syntax

CollapseNode(*DimName*, &*Node*)

Description

Use the CollapseNode method to collapse a node in the dimension specified by *DimName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that contains the node you want to collapse.
<i>&Node</i>	Specify an already instantiated array of array of string (a two-dimensional array of string) containing name-value pairs of the node name and the node detail. For example: PRODUCTS Fax Modem REGION East

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," ExpandNode, page 39](#)

DrillIntoNode

Syntax

DrillIntoNode(*DimName*, *&Node*)

Description

Use the DrillIntoNode method to display more data for the specified node and dimension. This is very similar to expanding, except that when you expand a node, the top level (node) is still present. When you drill into a node, the top level or levels are no longer displayed.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that contains the node that you want to drill into.

<i>Parameter</i>	<i>Description</i>
<i>&Node</i>	Specify an already instantiated array of array of string (a two-dimensional array of string) containing name-value pairs of the node name and the node detail. For example: PRODUCTS Fax Modem REGION East

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," DrillOutOfNode, page 38](#)

DrillOutOfNode

Syntax

DrillOutOfNode(*DimName*, *&Node*)

Description

Use the DrillOutOfNode method to collapse the data that you just expanded.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that contains the node you want to drill out of.
<i>&Node</i>	Specify an already instantiated array of array of string (a two-dimensional array of string) containing name-value pairs of the node name and the node detail. For example: PRODUCTS Fax Modem REGION East

Returns

None.

See Also

Chapter 2, "Analytic Calculation Engine Classes," DrillIntoNode, page 37

ExpandNode

Syntax

```
ExpandNode(DimName, &Nodes, ExpandAll)
```

Description

Use the ExpandNode method to expand the nodes in the specified dimension.

Parameters

Parameter	Description
<i>DimName</i>	Specify the name of the dimension contains the node that you want to expand.
& <i>Nodes</i>	Specify an already instantiated array of array of string (a two-dimensional array of string) containing name-value pairs of the node name and the node detail.
<i>ExpandAll</i>	Specify whether to expand the sub-nodes or not. This parameter takes a Boolean value; true to expand the nodes, false to not expand the nodes.

Returns

None.

Example

In the following example, both the Accounts and Dept dimensions have hierarchies.

When the data is displayed, it will be as follows:

```

All Accounts
    All Depts
    100
        All Depts
    200
        All Depts
    300
        All Depts

```

When you want to expand All Depts under Account 100 , use the following PeopleSoft Analytic Calculation Engine code:

```

BAMCoordinate coord;
coord.SetValue( "Account", "100");
coord.SetValue("Dept" , "All Depts")
ExpandNode("Dept", coord, false)

```

The result of this will have the following:

```

All Accounts
    All Depts
    100
        All Depts
            A
            B
    200
        All Depts
    300
        All Depts

```

See Also

[Chapter 2, "Analytic Calculation Engine Classes," CollapseNode, page 36](#)

GetData

Syntax

```
GetData(&DataRowset, StartRow, EndRow[, NetChanges])
```

Description

Use the GetData method to populate a rowset with data from the cube collection.

DataRowset is the rowset into which is put the data. If you specify an already instantiated rowset, the given rowset is populated with the data. If you specify a rowset that has not been instantiated, a new rowset is created, with the record field definition of the desired cube collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&DataRowset</i>	Specify the rowset into which to put the data. If you specify an already instantiated rowset, the given rowset is populated with the data. If you specify a rowset that has not been instantiated, a new rowset is created, with the record field definition of the desired cube collection.
<i>StartRow</i>	Specify the first row of data to be retrieved, as an integer.
<i>EndRow</i>	Specify the last row of data to be retrieved, as an integer. If you specify a zero for this parameter, all rows are retrieved.
<i>NetChanges</i>	Specify whether all values within the range are returned, or whether just values changed since the last time the Recalculate method was used. This parameter takes a Boolean value: true, return all values, false, return just the changed values. The default value is false.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," SetData, page 45](#) and [Chapter 2, "Analytic Calculation Engine Classes," Messages, page 52](#)

[Chapter 36, "Rowset Class," page 2115](#)

GetDimFilter

Syntax

GetDimFilter(*DimName*)

Description

Use the GetDimFilter method to return the name of the current user function (filter) used with the specified dimension.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension for which you want the associated user function (filter).

Returns

A string containing the name of the user function. If there is no filter applied to the dimension, this method returns an empty string.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," SetDimFilter, page 46](#)

GetDimSort

Syntax

GetDimSort(*DimName*)

Description

Use the GetDimSort to return the current sort settings on the specified dimension.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension for which you'd like the sort settings.

Returns

An array of any. The array contains the same structure as the signature for the SetDimSort method.

<i>Value</i>	<i>Description</i>
Array index 1	IsAscending as Boolean
Array index 2	Key1 as string

Value	Description
Array index 3	IsAscending2 as Boolean
Array index 4	Key2 as string
Array index 5	IsAscending3 as Boolean
Array index 6	Key3 as string

See Also

[Chapter 2, "Analytic Calculation Engine Classes," SetDimSort, page 47](#)

GetLayout

Syntax

GetLayout(*&SlicerArray*, *&RowAxisArray*, *&ColumnAxisArray*)

Description

Use the GetLayout method to return the current layout for the three axes, (slice, row, and column) on the specified dimension.

Parameters

Parameter	Description
<i>&SlicerArray</i>	Specify an already instantiated array of string containing the list of fields used on the slice axis.
<i>&RowAxisArray</i>	Specify an already instantiated array of string containing the list of fields used on the row axis.
<i>&ColumnAxisArray</i>	Specify an already instantiated array of string containing the list of fields used on the column axis.

Returns

None.

GetRowCount

Syntax

GetRowCount ()

Description

Use the GetRowCount method to return the total number of rows in the cube collection.

The number of rows is a function of the hierarchy, that is, what is shown or not shown, and filtered values.

Parameters

None.

Returns

An integer.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimension, page 77](#)

GetSlice

Syntax

GetSlice(*&SliceRecord*)

Description

Use the GetSlice method to return the current slice values of all the dimensions.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&SliceRecord</i>	Specify an already instantiated record object to hold the values of the slicer record.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," SetSlice, page 48](#)

SetData

Syntax

SetData(*&DataRowset*)

Description

Use the SetData method to populate the data in the cube collection with the data in the specified rowset.

The system extracts only changed values from the rowset, that is, values marked as updated. .

SetData method also writes the changes to the database for any record marked as writable or readable and writable in the analytic type definition, and mapped to the specified cube collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&DataRowset</i>	Specify the rowset object that contains the data you want to use to populate the cube collection.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," GetData, page 40](#)

[Chapter 35, "Row Class," IsChanged, page 2108](#)

[Chapter 36, "Rowset Class," page 2115](#)

SetDimensionOrder

Syntax

SetDimensionOrder(*&FieldNames*)

Description

Use the SetDimensionOrder method to specify the order of dimensions for this cube collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&FieldNames</i>	Specify an already instantiated array of string containing the field names that are the dimensions in the cube collection, in the order you want the dimensions.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," SetDimSort, page 116](#)

SetDimFilter

Syntax

SetDimFilter(*DimName*, *DimFilter*)

Description

Use the SetDimFilter method to set a dimension filter for the specified dimension in the cube collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension for which you want to specify a dimension filter.

<i>Parameter</i>	<i>Description</i>
<i>DimFilter</i>	Specify the name of the dimension filter (user function) that you want to use the dimension.

Returns

None.

See Also

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine, "Creating Dimensions," Understanding Dimensions

SetDimSort

Syntax

SetDimSort(*DimName*, *IsAscending* [, *Key1*, *IsAscending2*, *Key2*, *IsAscending3*, *Key3*])

Description

Use the SetDimSort method to specify the sorting order for the cube collection.

Key1, *Key2* and *Key3* are optional parameters. If they are not specified, the sorting works as a name sort, that is, it sorts by the name of members in the given dimension, either in ascending or descending order.

If keys are specified, the keys values refer to the names of the cubes to be used as they key. The method orders the members of the dimension based on the value of the cubes for each member. The Boolean parameter *IsAscending* defines whether sorting should be in ascending or descending order. Up to three sort keys may be specified. *Key1* is the primary sort key. *Key2* is used to sub-sort any members that have the same key value under *Key1*, and so on.

The scope of this method is the same as the scope of the AnalyticModel object created in PeopleCode, that is, if the AnalyticModel object was declared with scope Global, this method would have a global scope as well, if it was declared as Local, it would have Local, and so on.

Specifying a null string for *DimName* or for keys one through three removes the current value as a sort value.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the dimension name that you would like sorted.

<i>Parameter</i>	<i>Description</i>
<i>IsAscending</i>	Specify if the sort order is ascending or descending. This parameter takes a Boolean value: true if the sort is ascending, false if it's descending.
<i>Key1</i>	Specify the name of a key field by which the sort should be ordered. If you do not specify keys, the sort is ordered by the names of the members in the given dimensions. If you do specify keys, the sort is order by the keys.
<i>IsAscending2</i>	Specify if the sort order for <i>Key1</i> is ascending or descending. This parameter takes a Boolean value: true if the sort is ascending, false if it's descending.
<i>Key2</i>	Specify the name of a key field to be used to sub-sort the primary key field <i>Key1</i> .
<i>IsAscending3</i>	Specify if the sort order for <i>Key2</i> is ascending or descending. This parameter takes a Boolean value: true if the sort is ascending, false if it's descending.
<i>Key3</i>	Specify the name of a key field to be used to sub-sort the primary key field <i>Key2</i> .

Returns

None.

SetSlice

Syntax

SetSlice(&*SliceRecord*)

Description

Use the SetSlice method to specify a slice record for this cube collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&SliceRecord</i>	Specify an already instantiated record as the record to be used for the slice for the cube collection.

Returns

None.

See Also

Chapter 2, "Analytic Calculation Engine Classes," GetSlice, page 44

ShowHierarchy

Syntax

ShowHierarchy(*DimName*, *Show*, *ExpandToLevel*)

Description

Use the ShowHierarchy method to either hide or display the cube collection hierarchy.

If there is a tree attached to the dimension, and *Show* is false, only the detail level members are shown in the Analytic grid. If *Show* is true, all members including nodes are shown.

When the hierarchy is hidden, the GetData method returns only leaf values. When the hierarchy is displayed, GetData returns node values and leaf values.

The *ExpandToLevel* parameter expands the hierarchy to the level specified. Level indexes start from 0 , the root level.

For example, if you specify *ExpandToLevel* as 1, the grid displays the total (root member) and all the detail members in a dimension with no tree attached.

In the following example, if you specify *ExandToLevel* as 2, the hierarchy would be displayed only to the quarter level, and not to the month level.

```
ALL_TIME
  2003
    Q1      Jan
           Feb
           Mar
    Q2      Apr
           May
           Jun
    Q3      . . .
           . . .
    Q4
  2004
    Q1
    Q2
    Q3
    Q4
```

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension for which you want to either display or hide the hierarchy.
<i>Show</i>	Specify whether to display or hide the hierarchy. This parameter takes a Boolean value; true to display the hierarchy, false to hide it.
<i>ExpandToLevel</i>	Specify to what level to expand the hierarchy, as a number.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," CollapseNode, page 36](#); [Chapter 2, "Analytic Calculation Engine Classes," ExpandNode, page 39](#) and [Chapter 2, "Analytic Calculation Engine Classes," GetData, page 40](#)

UnsetDimFilter

Syntax

UnsetDimFilter(*DimName*)

Description

Use the UnsetDimFilter method to remove the filter on the specified dimension for the cube collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension from which you want to remove the filter.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," SetDimFilter, page 46](#)

UnsetDimSort

Syntax

UnsetDimSort(*DimName*)

Description

Use the UnsetDimSort method to remove the sorting on the specified dimension for a cube collection. After using this method, the members are returned in the global member order as specified in the analytic model definition.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension from which you want to remove sorting.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," SetDimSort, page 47](#)

CubeCollection Class Property

In this section we discuss the CubeCollection class property.

Messages

Description

This property returns a multi-dimensional array of any containing the messages that occurred during execution of the GetData, SetData, and CalculateCube methods.

The first dimension contains the message set number. The second dimension contains the message number. The third dimension contains the number of parameters in that message. The subsequent dimensions contain the values for the parameters. The maximum number of possible dimensions is 8.

After you access this property, only new messages are returned, that is, messages are only returned once.

This property is read-only.

Chapter 3

Analytic Calculation Engine Metadata Classes

This chapter provides an overview of the Analytic Calculation Engine Metadata classes, and discusses:

- Using the Analytic Calculation Engine Metadata classes
- Error handling
- Data types of the Analytic Calculation Engine Metadata objects
- Scope of Analytic Calculation Engine Metadata objects
- How to import the Analytic Calculation Engine Metadata classes
- How to create an Analytic Calculation Engine Metadata class object
- Analytic Calculation Engine Metadata classes reference

Important! The Analytic Calculation Engine Metadata classes are not supported on IBM z/OS and Linux for IBM System z platforms.

Understanding the PeopleSoft Analytic Calculation Engine Metadata Classes

PeopleSoft Analytic Calculation Engine comprises a calculation engine plus several PeopleTools features which enable application developers to define both the calculation rules and the display of calculated data within PeopleSoft applications for the purposes of multi-dimensional reporting, data editing and analysis.

More specifically, developers create *analytic models* in order to define the rules which are used to calculate data. Developers also create PeopleSoft Pure Internet Architecture pages with *analytic grids* in order to display the data within PeopleSoft applications. End users view, analyze and make changes to this data. When end users save their changes, PeopleSoft Analytic Calculation Engine recalculates the data and saves the calculated data to the database.

PeopleCode enables developers to manipulate analytic calculation data as follows:

- Use the Analytic Calculation Engine classes to either retrieve or specify data in an instance of an analytic model loaded into the system, and also to calculate (or recalculate) cube values.
- Use the Analytic Calculation Engine metadata classes to manipulate an analytic model definition. For example, you can add cubes to a cube collection or rename an existing user function for a model.

- Use the Analytic Grid classes to manipulate the display of analytic calculation data on a page.
- Use the Analytic Type classes to manipulate an analytic type definition. For example, you can specify a new analytic model for an analytic type definition.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," page 13](#)

[Chapter 4, "Analytic Grid Classes," page 159](#)

[Chapter 5, "Analytic Type Classes," page 169](#)

Using the Analytic Calculation Engine Metadata Classes

You can create analytic model definitions using Application Designer. PeopleSoft provides the Analytic Calculation Engine Metadata classes for accessing these definitions at runtime.

You can also create an analytic model definition in PeopleCode, using the Create method, then saving it to the database using the Save method. After you save the definition, you can access it using Application Designer.

All of the primary objects (dimensions, cube collections, cubes, and so on) are instantiated from an analytic model object, so you only need to create an instance of the analytic model. You can also build a rule as an object instead of as a string.

Inserting and Deleting Objects

If you insert or delete an object from a group of objects, any existing object references are no longer valid. For example, if you use the DeleteCube method, any existing references to cube objects are no longer valid. You need to create any object references after using any insert or delete method.

Building a Rule as an Object

The RuleExpressions sub-package contains several classes. Each of these classes represents the different parts of the analytic calculation engine rule grammar. These objects are created using the Create built-in function and the constructor for that class, then added to the RuleDefn object with the AddRuleExpression method.

The following example creates a cube that uses the Analytic Calculation Engine built-in function AT.

```

Function AT_Cube
  /** AT Cube Rule */
  &Expected = "AT(GENERAL2, [GENERAL2:4], LOOKUPVALUES)";
  &CubeName = "AT";

  &Funcall = create PT_ANALYTICMODELDEFN:RuleExpressions:FunctionCall⇒
(&Constants.Funcall_Type_Builtin, &Constants.Funcall_Builtin_AT);

  &Constant = create PT_ANALYTICMODELDEFN:RuleExpressions:Constant⇒
(&Constants.Constant_Type_Literal, "GENERAL2");
  &Funcall.AddArgument(&Constant);

  &MemberRefArgument = create PT_ANALYTICMODELDEFN:RuleExpressions:⇒
MemberReference("GENERAL2", "4");
  &Funcall.AddArgument(&MemberRefArgument);

  &CubeArgument = create PT_ANALYTICMODELDEFN:RuleExpressions:Cube("LOOKUPVALUES");
  &Funcall.AddArgument(&CubeArgument);

  &RuleDefn = create PT_ANALYTICMODELDEFN:RuleDefn("");
  &CubeDefn = &Model.GetCube(&CubeName);
  &RuleDefn.AddRuleExpression(&Funcall);
  &RuleDefn.GenerateRule();
  &CubeDefn.SetRule(&RuleDefn);
  If ( Not (Exact(&RuleDefn.RuleString, &Expected))) Then
    &Model.Save();
    Error ("Rule Expression API Failed [Cube " | &CubeName | " Rule]");
  End-If;
End-Function;

```

Error Handling

All the Analytic Calculation Engine Metadata classes throw PeopleCode exceptions for any fatal error that occurs in the execution of the operation. PeopleSoft recommends enclosing your analytic model programs in try-catch statements. This way, if your program catches the exception, the message set and message number that are associated with the exception object indicate the error.

See Also

Chapter 16, "Exception Class," Try-Catch Sections, page 764

Data Types of the Analytic Calculation Engine Metadata Objects

Every PeopleSoft Analytic Calculation Engine metadata object is declared as its own data type, that is, AnalyticModelDefn objects are declared as type AnalyticModelDefn, CubeDefn objects are declared as type CubeDefn, and so on.

Scope of Analytic Calculation Engine Metadata Objects

The Analytic Calculation Engine Metadata objects can only be instantiated from PeopleCode.

These objects can be used anywhere you have PeopleCode, that is, in a Application Engine program, an application class, record field PeopleCode, and so on.

Analytic Calculation Engine Metadata objects can be of scope Local, Component or Global.

How to Import the Analytic Calculation Engine Metadata Classes

The Analytic Calculation Engine metadata classes are *not* built-in classes, like Rowset, Field, Record, and so on. They are application classes. Before you can use these classes in your PeopleCode program, you must import them to your program.

An import statement names either all the classes in a package or one particular application class. For importing the Analytic Calculation Engine metadata classes, PeopleSoft recommends that you import all the classes in the application package.

The application package PT_ANALYTICMODELDEFN contains the following subclasses:

- AnalyticModelDefn
- CubeCollectionDefn
- CubeDefn
- DimensionDefn
- ExplicitDimSet
- OrganizerDefn
- RuleDefn
- UserFunctionDefn

Additionally, there is a sub-application package, RuleExpressions, that contains classes used to build a rule as object instead of as a simple string. This package contains the following classes:

- Assignment
- Comparison
- Constant
- Constants
- Cube
- ExpressionBlock

- FunctionCall
- MemberReference
- Operation
- RuleExpression
- Variable

The import statements that you should use should be as follows:

```
import PT_ANALYTICMODELDEFN:*;  
import PT_ANALYTICMODELDEFN:RuleExpressions:*;
```

Using the asterisks after the package name makes all the application classes directly contained in the named package available.

See Also

[Chapter 6, "Application Classes," page 189](#)

How to Create an Analytic Calculation Engine Metadata Class Object

After you've imported the Analytic Calculation Engine metadata classes, you need to instantiate an instance of the AnalyticModelDefn class, using the constructor for that class and the Create function. After you create the object, you must populate it using either the Get or Create method.

The following example creates an AnalyticModelDefn object from the QE_ALLFUNCTION analytic model definition.

```
import PT_ANALYTICMODELDEFN:*;  
  
Local AnalyticModelDefn &Model;  
  
&Model = create AnalyticModelDefn("QE_ALLFUNCTION");
```

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," Analytic Calculation Engine Metadata Classes Constructor, page 57](#)

Analytic Calculation Engine Metadata Classes Constructor

You must use the constructor for the AnalyticModelDefn class to instantiate an instance of that class. All other metadata objects are instantiated from this class.

AnalyticModelDefn

Syntax

AnalyticModelDefn(*ModelName*)

Description

Use the AnalyticModelDefn constructor to create an AnalyticModelDefn object.

Once the AnalyticModelDefn object is created, you can then execute either the Get or Create methods to 'instantiate' the model.

Note. The Delete and Rename methods can only be executed before a model is 'instantiated'.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ModelName</i>	Specify the name of an analytic model definition.

Returns

An AnalyticModelDefn object.

Example

```
&Model = create AnalyticModelDefn("QE_ALLFUNCTION");
```

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AnalyticModelDefn Class, page 58](#)

AnalyticModelDefn Class

Use the AnalyticModelDefn class to view or manipulate an analytic model definition that's already been created in Application Designer, or to create a new definition.

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine

AnalyticModelDefn Class Methods

The following section discusses the AnalyticModelDefn class methods. The methods are discussed in alphabetical order.

AddCube

Syntax

AddCube(*CubeName*)

Description

Use the AddCube method to add a new cube to the analytic model definition. This method fails if the cube specified by *CubeName* already exists.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeName</i>	Specify the name of a new cube that you want to add to the analytic model.

Returns

A CubeDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyCube, page 63](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteCube, page 69](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCube, page 74](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeNames, page 77](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCube, page 84](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeDefn Class, page 97](#)

AddCubeCollection

Syntax

AddCubeCollection(*CubeCollectionName*)

Description

Use the `AddCubeCollection` method to add a new cube collection to the analytic model definition. This method fails if *CubeCollectionName* already exists.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeCollectionName</i>	Specify the name of a new cube collection that you want to add to the analytic model definition.

Returns

A `CubeCollectionDefn` object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyCubeCollection, page 64](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteCubeCollection, page 70](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollection, page 75](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCubeCollection, page 85](#)

AddDimension

Syntax

AddDimension(*DimName*)

Description

Use the `AddDimension` method to add a new dimension to the analytic model. This method fails if the specified dimension already exists.

When you add a dimension to a cube, the dimension is also automatically added to any cube collections that already contain the cube.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension you want to add. This must be a new dimension.

Returns

A DimensionDef object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyDimension, page 65](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteDimension, page 71](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimension, page 77](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DimensionDefn Class, page 93](#)

AddExplicitDimensionSet

Syntax

AddExplicitDimensionSet(*ExplicitDimSetName*)

Description

Use the AddExplicitDimensionSet method to add a new explicit dimension set to the analytic model. This method fails if the specified explicit dimension set already exists.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ExplicitDimSetName</i>	Specify the name of the explicit dimension you want to add. This must be a new explicit dimension.

Returns

An ExplicitDimensionSet object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetExplicitDimensionSet, page 79](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteExplicitDimensionSet, page 71](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyExplicitDimensionSet, page 65](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetExplicitDimensionSetNames, page 80](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameExplicitDimensionSet, page 86](#)

AddOrganizer

Syntax

AddOrganizer(*OrganizerName*)

Description

Use the AddOrganizer method to add a new organizer to the analytic model. This method fails if the organizer specified by *OrganizerName* already exists.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>OrganizerName</i>	Specify the name of the organizer you want to add.

Returns

An OrganizerDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteOrganizer, page 72](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetOrganizer, page 80](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetOrganizerNames, page 81](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameOrganizer, page 87](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," OrganizerDefn Class, page 125](#)

AddUserFunction

Syntax

AddUserFunction(*UserFunctionName*)

Description

Use the AddUserFunction method to add a new user function to the analytic model. This method fails if the user function specified by *UserFunction* already exists.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>UserFunctionName</i>	Specify the name of the new user function that you want to add.

Returns

A UserFunction object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyUserFunction, page 67](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteUserFunction, page 73](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunction, page 82](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunctionNames, page 82](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameUserFunction, page 88](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," UserFunctionDefn Class, page 123](#)

CopyCube

Syntax

CopyCube(*CubeName*, *NewCubeName*)

Description

Use the CopyCube method to copy the specified cube to the new cube. This method fails if the cube specified by *CubeName* already exists.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeName</i>	Specify the name of the cube that you want to copy.
<i>NewCubeName</i>	Specify the name of the new cube that you want to create.

Returns

A CubeDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCube, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCube, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCube, page 74](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeNames, page 77](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCube, page 84](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeDefn Class, page 97](#)

CopyCubeCollection

Syntax

copyCubeCollection(*CubeCollectionName*, *NewCubeCollectionName*)

Description

Use the CopyCubeCollection method to copy the specified cube collection to a new collection. If the new cube collection specified by *NewCubeCollectionName* already exists, this method fails.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeCollectionName</i>	Specify the name of the cube collection that you want to copy.
<i>NewCubeCollectionName</i>	Specify the name you want for the new cube collection.

Returns

A CubeCollectionDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCubeCollection, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteCubeCollection, page 70](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollection, page 75](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollectionNames, page 76](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCubeCollection, page 85](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeCollectionDefn Class, page 108](#)

CopyDimension

Syntax

CopyDimension(*DimName*, *NewDimName*)

Description

Use the CopyDimension method to copy the dimension specified by *DimName* to a new dimension. If the dimension specified by *NewDimName* already exists, this method fails.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that you want to copy.
<i>NewDimName</i>	Specify the name of the new dimension that you want the data copied to.

Returns

A DimensionDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddDimension, page 60](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteDimension, page 71](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameDimension, page 85](#)

CopyExplicitDimensionSet

Syntax

CopyExplicitDimensionSet(*ExplicitDimSetName*, *NewExplicitDimSetName*)

Description

Use the CopyExplicitDimensionSet method to copy the explicit dimension set specified by *ExplicitDimSetName* to a new explicit dimension set. If the explicit dimension set specified by *NewExplicitDimSetName* already exists, this method fails.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ExplicitDimSetName</i>	Specify the name of the explicit dimension set that you want to copy.
<i>NewExplicitDimSetName</i>	Specify the name of the new explicit dimension set that you want the data copied to.

Returns

An ExplicitDimensionSet object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameExplicitDimensionSet, page 86](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," AddExplicitDimensionSet, page 61](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteExplicitDimensionSet, page 71](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetExplicitDimensionSet, page 79](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetExplicitDimensionSetNames, page 80](#)

CopyTo

Syntax

CopyTo (*NewModelName*)

Description

Use the CopyTo method to copy the AnalyticModelDefn object to a new analytic model specified by *NewModelName*. If the model set specified by *NewModelName* already exists, this method fails.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NewModelName</i>	Specify the name of a new analytic model definition that you want to create.

Returns

An AnalyticModelDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," Create, page 68](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Delete, page 68](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Get, page 74](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Rename, page 83](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," Save, page 89](#)

CopyUserFunction

Syntax

CopyUserFunction(*UserFunctionName*, *NewUserFunctionName*)

Description

Use the CopyUserFunction method to copy the user function specified by *UserFunctionName* to a new user function. If the user function specified by *NewUserFunctionName* already exists, this method fails.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>UserFunctionName</i>	Specify the name of the user function that you want to copy.
<i>NewUserFunctionName</i>	Specify the name of the new user function that you want to add.

Returns

A UserFunctionDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddUserFunction, page 62](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteUserFunction, page 73](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunction, page 82](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunctionNames, page 82](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameUserFunction, page 88](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," UserFunctionDefn Class, page 123](#)

Create

Syntax

Create()

Description

Use the Create method to create, and instantiate, a new model. If you save the new model after you create it, you can then access it in Application Designer as an analytic model definition.

If the model already exists, an exception is thrown.

Parameters

None.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyTo, page 66](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Delete, page 68](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Get, page 74](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," Rename, page 83](#)

Delete

Syntax

Delete()

Description

Use the Delete method to delete the analytic model executing the method.

You can only use this method on a *closed* analytic model definition, that is, before you use a Get or Create method.

Warning! The delete occurs immediately, that is, the analytic model definition is removed from the database. Only use this method if you're certain you want to delete the definition.

If this model is used by any existing analytic type definition, this method fails.

Parameters

None.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyTo, page 66](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Create, page 68](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Get, page 74](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Rename, page 83](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," Save, page 89](#)

DeleteCube

Syntax

DeleteCube(*CubeName*, *ForceDelete*)

Description

Use the DeleteCube method to delete the cube specified by *CubeName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeName</i>	Specify the name of the cube you want to delete from the analytic model.
<i>ForceDelete</i>	Specify if the cube should always be deleted. This parameter takes a Boolean value. If you specify <i>ForceDelete</i> as false, and the cube is used by another part (such as a cube collection) this method fails. If you specify <i>ForceDelete</i> as true, and the cube is used by another part, the cube is still deleted.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCube, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCube, page 74](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeNames, page 77](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCube, page 84](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeCollectionDefn Class, page 108](#)

DeleteCubeCollection**Syntax**

DeleteCubeCollection(*CubeCollectionName*, *ForceDelete*)

Description

Use the DeleteCubeCollection method to delete the cube collection specified by *CubeCollectionName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeCollectionName</i>	Specify the name of the cube collection that you want to delete from the analytic model.
<i>ForceDelete</i>	Specify if the cube collection should always be deleted. This parameter takes a Boolean value. If you specify <i>ForceDelete</i> as false, and the cube collection is used by another part (such as an Organizer), this method fails. If you specify <i>ForceDelete</i> as true, and the cube collection is used by another part, the cube collection is still deleted.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCubeCollection, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollection, page 75](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollectionNames, page 76](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCubeCollection, page 85](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeCollectionDefn Class, page 108](#)

DeleteDimension

Syntax

DeleteDimension(*DimensionName*, *ForceDelete*)

Description

Use the DeleteDimension method to delete the dimension specified by *DimensionName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimensionName</i>	Specify the name of the dimension you want to delete.
<i>ForceDelete</i>	Specify if the dimension should always be deleted. This parameter takes a Boolean value. If you specify <i>ForceDelete</i> as false, and the dimension is used by another part (such as a cube), this method fails. If you specify <i>ForceDelete</i> as true, and the dimension is used by another part, the dimension is still deleted.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddDimension, page 60](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyDimension, page 65](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimension, page 77](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimensionNames, page 78](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameDimension, page 85](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DimensionDefn Class, page 93](#)

DeleteExplicitDimensionSet

Syntax

DeleteExplicitDimensionSet(*ExplicitDimensionSetName*, *ForceDelete*)

Description

Use the `DeleteExplicitDimensionSet` method to delete the explicit dimension set specified by *ExplicitDimensionSetName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ExplicitDimensionSetName</i>	Specify the name of the explicit dimension set you want to delete.
<i>ForceDelete</i>	The value of this parameter is ignored in the current release.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddExplicitDimensionSet, page 61](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyExplicitDimensionSet, page 65](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetExplicitDimensionSet, page 79](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetExplicitDimensionSetNames, page 80](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameExplicitDimensionSet, page 86](#)

DeleteOrganizer

Syntax

`DeleteOrganizer(OrganizerName, ForceDelete)`

Description

Use the `DeleteOrganizer` method to delete the organizer specified by *OrganizerName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>OrganizerName</i>	Specify the name of the organizer you want to delete.
<i>ForceDelete</i>	This value is ignored in the current release.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddOrganizer, page 62](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetOrganizer, page 80](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetOrganizerNames, page 81](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameOrganizer, page 87](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," OrganizerDefn Class, page 125](#)

DeleteUserFunction

Syntax

DeleteUserFunction(*UserFunctionName*, *ForceDelete*)

Description

Use the DeleteUserFunction method to delete the user function specified by *UserFunctionName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>UserFunctionName</i>	Specify the name of the user function you want to delete.
<i>ForceDelete</i>	Specify if the user function should always be deleted. This parameter takes a Boolean value. If you specify <i>ForceDelete</i> as false, and the user function is used by another part, this method fails. If you specify <i>ForceDelete</i> as true, and the user function is used by another part, the user function is still deleted.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddUserFunction, page 62](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyUserFunction, page 67](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunction, page 82](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunctionNames, page 82](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameUserFunction, page 88](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," UserFunctionDefn Class, page 123](#)

Get

Syntax

Get ()

Description

Use the Get method to instantiate an instance of the analytic model.

If the model doesn't exist, an exception is thrown.

Parameters

None.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyTo, page 66](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Create, page 68](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Delete, page 68](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Rename, page 83](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," Save, page 89](#)

GetCube

Syntax

GetCube(*CubeName*)

Description

Use the `GetCube` method to return a reference to the cube specified by *CubeName*. This method fails if the cube specified by *CubeName* doesn't exist.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeName</i>	Specify the name of the cube that you want a reference to.

Returns

A `CubeDefn` object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCube, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyCube, page 63](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteCube, page 69](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeNames, page 77](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCube, page 84](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeCollectionDefn Class, page 108](#)

GetCubeCollection

Syntax

`GetCubeCollection(CubeCollectionName)`

Description

Use the `GetCubeCollection` method to return a reference to a cube collection. This method fails if the cube collection specified by *CubeCollectionName* doesn't exist.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeCollection</i>	Specify the name of the cube collection you want a reference to.

Returns

A CubeCollectionDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCubeCollection, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyCubeCollection, page 64](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteCubeCollection, page 70](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollection, page 75](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollectionNames, page 76](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCubeCollection, page 85](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeCollectionDefn Class, page 108](#)

GetCubeCollectionNames

Syntax

GetCubeCollectionNames()

Description

Use the GetCubeCollectionNames method to return an array of strings containing all the names of the cube collections associated with this analytic model.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCubeCollection, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyCubeCollection, page 64](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteCubeCollection, page 70](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollection, page 75](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCubeCollection, page 85](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeCollectionDefn Class, page 108](#)

[Chapter 8, "Array Class," page 257](#)

GetCubeNames

Syntax

GetCubeNames()

Description

Use the GetCubeNames method to return an array of strings containing all the names of the cubes associated with this analytic model.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCube, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyCube, page 63](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteCube, page 69](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCube, page 74](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCube, page 84](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeCollectionDefn Class, page 108](#)

[Chapter 8, "Array Class," page 257](#)

GetDimension

Syntax

GetDimension(*DimName*)

Description

Use the GetDimension method to return a reference to the dimension specified by *DimName*. This method fails if the dimension specified by *DimName* doesn't exist.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that you want a reference to.

Returns

A DimensionDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddDimension, page 60](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyDimension, page 65](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteDimension, page 71](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimensionNames, page 78](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameDimension, page 85](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DimensionDefn Class, page 93](#)

GetDimensionNames

Syntax

GetDimensionNames()

Description

Use the GetDimensionNames method to return an array of string containing the names of all the dimensions associated with the analytic model.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddDimension, page 60](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyDimension, page 65](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteDimension, page 71](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimension, page 77](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameDimension, page 85](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DimensionDefn Class, page 93](#)

[Chapter 8, "Array Class," page 257](#)

GetExplicitDimensionSet**Syntax**

GetExplicitDimensionSet(*ExplicitDimSetName*)

Description

Use the GetExplicitDimensionSet method to return a reference to the explicit dimension set specified by *ExplicitDimSetName*. This method fails if the explicit dimension set specified by *ExplicitDimSetName* doesn't exist.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ExplicitDimSetName</i>	Specify the name of the explicit dimension set that you want a reference to.

Returns

An ExplicitDimensionSet object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddExplicitDimensionSet, page 61](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyExplicitDimensionSet, page 65](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteExplicitDimensionSet, page 71](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetExplicitDimensionSetNames, page 80](#)

GetExplicitDimensionSetNames

Syntax

GetExplicitDimensionSetNames()

Description

Use the GetExplicitDimensionSetNames method to return an array of string containing the names of all the explicit dimension sets associated with the analytic model.

Parameters

None.

Returns

An array of strings.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," ExplicitDimensionSet Class, page 95](#)

GetOrganizer

Syntax

GetOrganizer(*OrganizerName*)

Description

Use the GetOrganizer method to return a reference to the organizer specified by *OrganizerName*. This method fails if the organizer specified by *OrganizerName* doesn't exist.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>OrganizerName</i>	Specify the name of the organizer you want a reference to.

Returns

An OrganizerDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddOrganizer, page 62](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteOrganizer, page 72](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetOrganizerNames, page 81](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameOrganizer, page 87](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," OrganizerDefn Class, page 125](#)

GetOrganizerNames

Syntax

```
GetOrganizerNames()
```

Description

Use the GetOrganizerNames method to return an array of string containing the names of all the organizers associated with the analytic model.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddOrganizer, page 62](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteOrganizer, page 72](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetOrganizer, page 80](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameOrganizer, page 87](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," OrganizerDefn Class, page 125](#)

[Chapter 8, "Array Class," page 257](#)

GetUserFunction

Syntax

GetUserFunction(*UserFunctionName*)

Description

Use the GetUserFunction method to return a reference to the user function specified by *UserFunctionName*. This method fails if the user function specified by *UserFunctionName* doesn't exist.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>UserFunctionName</i>	Specify the name of a user function that you want a reference to.

Returns

A UserFunctionDefn object

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddUserFunction, page 62](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyUserFunction, page 67](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteUserFunction, page 73](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunctionNames, page 82](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameUserFunction, page 88](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," UserFunctionDefn Class, page 123](#)

GetUserFunctionNames

Syntax

GetUserFunctionNames()

Description

Use the GetUserFunctionNames method to return an array of string containing the names of all the user functions associated with the analytic model.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddUserFunction, page 62](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyUserFunction, page 67](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteUserFunction, page 73](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunction, page 82](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameUserFunction, page 88](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," UserFunctionDefn Class, page 123](#)

[Chapter 8, "Array Class," page 257](#)

Rename

Syntax

Rename (*NewModelName*)

Description

Use the Rename method to rename the analytic model.

You can only use this method on a *closed* analytic model definition, that is, before you use a Get or Create method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NewModelName</i>	Specify the new name of the model.

Returns

None.

See Also

RenameCube**Syntax**

RenameCube(*CubeName*, *NewCubeName*, *ForceRename*)

Description

Use the RenameCube method to rename the cube specified by *CubeName* to *NewCubeName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeName</i>	Specify the name of the cube you want to rename.
<i>NewCubeName</i>	Specify the new name for the cube.
<i>ForceRename</i>	Specify if the cube should always be renamed. This parameter takes a Boolean value. If you specify <i>ForceRename</i> as false, and the cube is used by another part (such as a cube collection) this method fails. If you specify <i>ForceRename</i> as true, and the cube is used by another part, the cube is still renamed.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCube, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyCube, page 63](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteCube, page 69](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCube, page 74](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeNames, page 77](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeDefn Class, page 97](#)

RenameCubeCollection

Syntax

RenameCubeCollection(*CubeCollectionName*, *NewCubeCollectionName*, *ForceRename*

Description

Use the `RenameCubeCollection` method to rename the cube collection specified by *CubeCollectionName* to the new name *NewCubeCollectionName*

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeCollectionName</i>	Specify the name of the cube collection that you want to rename.
<i>NewCubeCollectionName</i>	Specify the new name of the cube collection.
<i>ForceRename</i>	Specify if the cube collection should always be renamed. This parameter takes a Boolean value. If you specify <i>ForceRename</i> as false, and the cube collection is used by another part (such as an organizer) this method fails. If you specify <i>ForceRename</i> as true, and the cube collection is used by another part, the cube collection is still renamed.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCubeCollection, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyCubeCollection, page 64](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteCubeCollection, page 70](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollection, page 75](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollectionNames, page 76](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeCollectionNames, page 76](#)

RenameDimension

Syntax

RenameDimension(*DimName*, *NewDimName*, *ForceRename*)

Description

Use the `RenameDimension` method to rename the dimension specified by *DimName* to the new name *NewDimName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension you want to rename.
<i>NewDimName</i>	Specify the new name of the dimension.
<i>ForceRename</i>	Specify if the dimension should always be renamed. This parameter takes a Boolean value. If you specify <i>ForceRename</i> as false, and the dimension is used by another part (such as a cube) this method fails. If you specify <i>ForceRename</i> as true, and the dimension is used by another part, the dimension is still renamed.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DimensionDefn Class, page 93](#)

RenameExplicitDimensionSet

Syntax

```
RenameExplicitDimensionSet(ExplicitDimSetName, NewExplicitDimSetName, ForceRename)
```

Description

Use the `RenameExplicitDimensionSet` method to rename the explicit dimension set specified by *ExplicitDimSetName* to the new name *NewExplicitDimSetName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ExplicitDimSetName</i>	Specify the name of the explicit dimension set you want to rename.
<i>NewExplicitDimSetName</i>	Specify the new name of the explicit dimension set.
<i>ForceRename</i>	The value for this parameter is ignored in the current release.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddExplicitDimensionSet, page 61](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyExplicitDimensionSet, page 65](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteExplicitDimensionSet, page 71](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetExplicitDimensionSet, page 79](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameExplicitDimensionSet, page 86](#)

RenameOrganizer

Syntax

RenameOrganizer(*OrganizerName*, *NewOrganizerName*, *ForceRename*)

Description

Use the RenameOrganizer method to rename the organizer specified by *OrganizerName* to the new name *NewOrganizerName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>OrganizerName</i>	Specify the name of the organizer you want to rename.
<i>NewOrganizerName</i>	Specify the new name for the organizer.
<i>ForceRename</i>	The value for this parameter is ignored in the current release.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddOrganizer, page 62](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteOrganizer, page 72](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetOrganizer, page 80](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetOrganizerNames, page 81](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," OrganizerDefn Class, page 125](#)

RenameUserFunction

Syntax

RenameUserFunction(*UserFunctionName*, *NewUserFunctionName*, *ForceRename*)

Description

Use the `RenameUserFunction` method to rename the user function specified by *UserFunctionName* to the new name *NewUserFunctionName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>UserFunctionName</i>	Specify the name of the user function you want to rename.
<i>NewUserFunctionName</i>	Specify the new name for the user function.
<i>ForceRename</i>	Specify if the user function should always be renamed. This parameter takes a Boolean value. If you specify <i>ForceRename</i> as false, and the user function is used by another part this method fails. If you specify <i>ForceRename</i> as true, and the user function is used by another part, the user function is still renamed.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddUserFunction, page 62](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyUserFunction, page 67](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteUserFunction, page 73](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunction, page 82](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunctionNames, page 82](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," UserFunctionDefn Class, page 123](#)

Save

Syntax

Save ()

Description

Use the Save method to save any changes to the analytic model definition to the database. If the saved model is valid, the value of the IsValid property is set to true, if it is not valid, it is set to false.

The Messages property is populated with messages from the validation that occurs with the save.

Parameters

None.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," Create, page 68](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," Validate, page 89](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," IsValid, page 91](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," Messages, page 92](#)

Validate

Syntax

Validate ()

Description

Use the Validate method to validate the analytic model definition. This method returns true if the model successfully validates. If this method returns false, the detailed error messages are available through the Messages property.

The IsValid property is not set with this method. The Save method sets the IsValid property.

Parameters

None.

Returns

A Boolean value: true if the analytic model definition validates successfully, false otherwise.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," Create, page 68](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Save, page 89](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," Messages, page 92](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," IsValid, page 91](#)

AnalyticModelDefn Properties

The following section discusses the AnalyticModelDefn class properties. The properties are discussed in alphabetical order.

CircularFormulaWarn

Description

Use this property to specify whether warnings occur when there are circular dependencies as rules are added. This property takes a Boolean value: true if warnings should occur, false otherwise. The default value for this property is false.

This property is read-write.

Description

Description

Use this property to specify the description of the analytic model. This property takes a string value.

This property is read-write.

IsValid

Description

This property indicates if the analytic model is valid, that is, if it would successfully load.

This property is read-only.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," Validate, page 89](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," Save, page 89](#)

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine, "Creating Analytic Model Definitions," Validating Analytic Models

LongDescription

Description

Use this property to specify the long description of the analytic model definition. This property takes a string value.

This property is read-write.

MaxDelta

Description

This property specifies the maximum number of value changes for the analytic model

This property takes a float value. The default value is 0.

This property is read-write.

See Also

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine, "Creating Analytic Model Definitions"

MaxIterations

Description

Use this property to specify the maximum number of iterations for the analytic model.

This property take an integer value. The default value is 100.

This property is read-write.

See Also

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine, "Designing and Editing Analytic Models"

Messages

Description

This property returns a multi-dimensional array of any that contains the messages that occurred during execution of the Validate or Save methods. This array is only populated after the Validate or Save method has completed successfully.

The first dimension contains the message set number. The second dimension contains the message number. The third dimension contains the number of parameters in that message. The subsequent dimensions contain the values for the parameters. The maximum number of possible dimensions is 8.

This property is read-only.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," Validate, page 89](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," Save, page 89](#)

Name

Description

This property indicates the name of the analytic model.

This property is read-only.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," Rename, page 83](#)

ResolveCircularDeps

Description

Use this property to specify if the analytic model should resolve circular dependencies through iteration. This property takes a Boolean value: true if the dependencies should be resolved, false otherwise. The default value is false.

This property is read-write.

DimensionDefn Class

Use the DimensionDefn class to access a dimension that's associated with an analytic model. You instantiate an object of this class using the following AnalyticModelDefn methods:

- AddDimension
- CopyDimension
- GetDimension

DimensionDefn Class Properties

The following section discusses the DimensionDefn class properties. The properties are discussed in alphabetical order.

AggregateSequence

Description

This property indicates the sequence number of this dimension used during aggregation of the analytic model

This property is read-only..

AggregationUserFunction

Description

Use this property to specify the name of a user function that can be used to override the default aggregation for this dimension.

This property is read-write.

Comments

Description

Use this property to specify additional notes about the dimension.

This property is read-write.

Name

Description

This property indicates the name of the dimension.

This property is read-only.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimensionNames, page 78](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameDimension, page 85](#)

TotalMemberName

Description

Use this property to specify a field value that is used at runtime to host the total value for this dimension. If a total isn't applicable, this property has no value.

This property is read-write.

ExplicitDimensionSet Class

Use the `ExplicitDimensionSet` class to access an explicit dimension set associated with an analytic model. You instantiate an object of this class using one of the following `AnalyticModelDefn` methods:

- `AddExplicitDimensionSet`
- `CopyExplicitDimensionSet`
- `GetExplicitDimensionSet`

You can also use the `GetExplicitDimensionSetNames` to return an array containing the names of all the explicit dimension sets associated with the analytic model.

ExplicitDimensionSet Methods

The following section discusses the `ExplicitDimensionSet` class methods. The methods are discussed in alphabetical order.

AttachDimension

Syntax

`AttachDimension`(*DimName*)

Description

Use the `AttachDimension` method to attach a dimension to an explicit dimension set.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension you want to attach.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachDimension, page 96](#)

DetachDimension

Syntax

DetachDimension(*DimName*)

Description

Use the DetachDimension method to detach a dimension from an explicit dimension set.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that you want to detach.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AttachDimension, page 95](#)

GetDimensionNames

Syntax

GetDimensionNames()

Description

Use the GetDimensionNames method to return an array of string that contains the names of all the dimensions associated with the ExplicitDimensionSet.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AttachDimension, page 95](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachDimension, page 96](#)

ExplicitDimensionSet Properties

The following section discusses the ExplicitDimensionSet class properties. The properties are discussed in alphabetical order.

Name

Description

The Name property returns the name of the explicit dimension set as a string.

This property is read-only.

SequenceNumber

Description

This property returns the sequence number of the explicit dimension set.

This property is read-only.

CubeDefn Class

Use the CubeDefn class to access a cube associated with an analytic model. You instantiate an object of this class using the following AnalyticModelDefn methods:

- AddCubeDefn

- `CopyCubeDefn`
- `GetCubeDefn`

CubeDefn Class Methods

The following section discusses the `CubeDefn` class methods. The methods are discussed in alphabetical order.

AttachDimension

Syntax

AttachDimension(*DimName*)

Description

Use the `AttachDimension` method to attach an existing dimension specified by *DimName* to the cube.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that you want to add.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachDimension, page 99](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimensionNames, page 103](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," UsesDimension, page 105](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddDimension, page 60](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DimensionDefn Class, page 93](#)

DetachDimension

Syntax

DetachDimension(*DimName*)

Description

Use the DetachDimension method to detach the dimension specified by *DimName* from the cube.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that you want to detach from the cube.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AttachDimension, page 98](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimensionNames, page 103](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," UsesDimension, page 105](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddDimension, page 60](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DimensionDefn Class, page 93](#)

GetCauses

Syntax

GetCauses(*CauseType*)

Description

Any cube that affects another cube is a *cause* of that cube. Use the GetCauses method to return a list of all the other cubes that are the causes for this cube.

The cube names are returned in an array of string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CauseType</i>	Specify the type of causes you want returned.

<i>Value</i>	<i>Description</i>
AnalyticModel_DirectCauses	Only return direct causes.
AnalyticModel_AllCauses	Return all cubes that are causes for this cube, both direct and indirect.
AnalyticModel_AllInputs	Return all cubes that have input to this cube.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetEffects, page 102](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCircularDeps, page 100](#)

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine, "Creating Data Cubes," Understanding Causes and Inputs

GetCircularDeps

Syntax

GetCircularDeps(*DimName*)

Description

Use the GetCircularDeps method to return all cubes that have circular dependencies based on the dimension specified by *DimName*.

The cube names are returned in an array of string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that you want to find circular dependencies for.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCauses, page 99](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetEffects, page 102](#)

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine

GetDimensionAggregate

Syntax

GetDimensionAggregate(*DimName*)

Description

Use the GetDimensionAggregate method to return the name of the user function used for the aggregate for the dimension specified by *DimName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that you want the aggregate user function.

Returns

A string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," SetDimensionAggregate, page 104](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetUserFunctionNames, page 82](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," UserFunctionDefn Class, page 123](#)

GetEffects**Syntax**

GetEffects(*EffectType*)

Description

Any cube that is affected by another cube is an *effect* of that cube. Use the GetEffects method to return a list of all the cubes affected by this cube.

The list of cubes is returned as an array of string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>EffectType</i>	Specify the type of effects you want returned.

<i>Value</i>	<i>Description</i>
AnalyticModel_DirectEffects	Only return cubes that are a direct effect on this cube.
AnalyticModel_AllEffects	Return all cubes that are an effect on this cube.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCauses, page 99](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCircularDeps, page 100](#)

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine

GetDimensionNames

Syntax

GetDimensionNames()

Description

Use the GetDimensionNames method to return an array of string containing the names of all the dimensions associated with the cube.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AttachDimension, page 98](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachDimension, page 99](#)

[Chapter 8, "Array Class," page 257](#)

GetRule

Syntax

GetRule()

Description

Use the GetRule method to get a reference to a RuleDefn object that represents the rule for this cube.

Parameters

None.

Returns

A RuleDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," RuleDefn Class, page 129](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," SetRule, page 105](#)

SetDimensionAggregate

Syntax

SetDimensionAggregate(*DimName*, *UserFunctionName*)

Description

Use the SetDimensionAggregate method to specify the user function to be used for the aggregate for the dimension *DimName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension for which you want to set the aggregate.
<i>UserFunctionName</i>	Specify the name of the user function to be used as the aggregate function.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimensionAggregate, page 101](#)

SetRule

Syntax

SetRule(*&RuleDefn*)

Description

Use the SetRule method to specify a RuleDefn object to be used as the rule for this cube.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&RuleDefn</i>	Specify an already instantiated RuleDefn object that you want to associate with this cube.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetRule, page 103](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," RuleDefn Class, page 129](#)

UsesDimension

Syntax

UsesDimension(*DimName*)

Description

Use the UsesDimension method to determine if the dimension specified by *DimName* is used by this cube.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimName</i>	Specify the name of the dimension that you want to check for.

Returns

A Boolean value: true if the dimension is used, false otherwise.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AttachDimension, page 98](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachDimension, page 99](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetDimensionNames, page 103](#)

CubeDefn Class Properties

The following section discusses the CubeDefn class properties. The properties are discussed in alphabetical order.

CalcAggregates

Description

Use this property to specify if the aggregate is calculated for this cube. This property takes a Boolean value: true if the aggregate is calculated, false otherwise.

This property is read-write.

Comments

Description

Use this property to specify additional notes about the cube.

This property is read-write.

DimensionCount

Description

This property indicates the number of dimensions associated with this cube.

This property is read-only.

FormatType

Description

Use this property to specify the format of the cube. The values are:

<i>Value</i>	<i>Description</i>
AnalyticModel_Format_Number	The format is of type number.
AnalyticModel_Format_Date	The format is of type date.
AnalyticModel_Format_Member	The format is of type member.
AnalyticModel_Format_Text	The format is of type text.

This property is read-write.

IsVirtual

Description

Use this property to specify if the cube is a virtual cube, that is, if it doesn't store data. This property takes a Boolean value: true if the cube is a virtual cube, false otherwise.

This property is read-write.

Name

Description

This property specifies the name of the cube.

This property is read-only.

ValueDimensionName

Description

Use this property to specify the dimension name for cubes that have a format of member.

This property is only valid when a cube has a format of member.

This property is read-write.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," FormatType, page 107](#)

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine

CubeCollectionDefn Class

Use the CubeCollectionDefn class to access cube collections associated with an analytic model. You instantiate an object of this class using the following AnalyticModelDefn class methods:

- AddCubeCollection
- CopyCubeCollection
- GetCubeCollection

CubeCollectionDefn Class Methods

The following section discusses the CubeCollectionDefn class methods. The methods are discussed in alphabetical order.

AttachCube

Syntax

AttachCube(*CubeName*)

Description

Use the AttachCube method to attach the existing cube specified by *CubeName* to the cube collection.

You should only specify cube collections comprised of derived/work records as the main record for a presentation cube collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeName</i>	Specify the name of the cube you want to attach.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachCube, page 109](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeNames, page 111](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeDefn Class, page 97](#)

DetachCube

Syntax

DetachCube(*CubeName*)

Description

Use the DetachCube to detach the cube specified by *CubeName* from the cube collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeName</i>	Specify the name of the cube that you want to detach.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeDefn Class, page 97](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeNames, page 111](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeDefn Class, page 97](#)

GetAggregateMapping

Syntax

GetAggregateMapping(*PartName*, *IsCube*)

Description

Use the GetAggregateMapping method to return the aggregate mapping field specified by the part *PartName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartName</i>	Specify the part name for which you want the aggregate mapping field name.
<i>IsCube</i>	Specify whether the part is a cube or not. This parameter takes a Boolean value, true if the part is a cube, false otherwise.

Returns

A string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetFieldMapping, page 113](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetPersistAggregate, page 114](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," SetAggregateMapping, page 115](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," SetFieldMapping, page 117](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," SetPersistAggregate, page 119](#)

GetCubeNames

Syntax

GetCubeNames()

Description

Use the GetCubeNames method to return an array of strings containing all the names of the cubes associated with this cube collection.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddCube, page 59](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," CopyCube, page 63](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DeleteCube, page 69](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCube, page 74](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," RenameCube, page 84](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeDefn Class, page 97](#)

[Chapter 8, "Array Class," page 257](#)

GetDimensionNames

Syntax

GetDimensionNames()

Description

Use the GetDimensionNames method to return an array of string containing the names of all the dimensions associated with the cube collection.

The dimension names are returned in an array of string.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AttachDimension, page 98](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachDimension, page 99](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DimensionDefn Class, page 93](#)

GetDimSort

Syntax

GetDimSort(*DimensionName*)

Description

Use the GetDimSort method return the sorting keys used for the dimension.

The sorting keys are returned as an array of any.

The first string is either true or false. If the first string is true it indicates that the dimension is sorted by the names of the members in the dimension.

The second string then is either true or false, indicating whether the sort is ascending (or descending). If the first string is false it indicates that the dimension is sorted by keys, which are the specified by the other strings in the array. The keys are names of cubes. The strings are as follows:

- Ascend1
- CubeName1
- Ascend2
- CubeName2
- Ascend3
- CubeName3

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimensionName</i>	Specify the name of the dimension for which you want the sorting keys.

Returns

An array of any.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," SetDimSort, page 116](#)

[Chapter 2, "Analytic Calculation Engine Classes," GetDimSort, page 42](#) and [Chapter 2, "Analytic Calculation Engine Classes," SetDimSort, page 47](#)

GetFieldMapping

Syntax

GetFieldMapping(*PartName*, *IsCube*)

Description

Use the GetFieldMapping method to return the name of the mapped field name for the part specified by *PartName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartName</i>	Specify the name of the part for which you want the mapped field name.
<i>IsCube</i>	Specify whether this part is a cube or not. This parameter takes a Boolean value: true if the part is a cube, false otherwise.

Returns

A string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetAggregateMapping, page 110](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," SetFieldMapping, page 117](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," SetAggregateMapping, page 115](#)

GetFilter**Syntax**

GetFilter(*DimensionName*)

Description

Use the GetFilter method to return the name of the user function used as a filter for the dimension specified by *DimensionName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimensionName</i>	Specify the name of the dimension for which you want the filter name.

Returns

A string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," SetAggregateMapping, page 115](#)

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine, "Creating Rules, Formulas, and User Functions," Filter User Functions

GetPersistAggregate**Syntax**

GetPersistAggregate(*DimensionName*)

Description

Use the `GetPersistAggregate` method to return the value for the persist aggregate for the dimension specified by *DimensionName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimensionName</i>	Specify the name of the dimension for which you want to find the persist aggregate value.

Returns

An integer, which is one of the following values:

<i>Value</i>	<i>Description</i>
<code>AnalyticModel_AggrType_Root</code>	The persist aggregate type is <i>Root</i> , that is, only the root node's data is saved to the database.
<code>AnalyticModel_AggrType_All</code>	The persist aggregate type is <i>All</i> , that is, save all of the dimension's aggregate data to the database.
<code>AnalyticModel_AggrType_None</code>	The persist aggregate type is <i>None</i> , that is, do not save any of the dimension's aggregate data to the database.

SetAggregateMapping

Syntax

```
SetAggregateMapping(PartName, IsCube, AggregateFieldName)
```

Description

Use the `SetAggregateMapping` method to specify an aggregate field for the part specified by *PartName*.

You can map a field to only one data cube or dimension within one cube collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartName</i>	Specify the name of the part for which you want to add an aggregate field.
<i>IsCube</i>	Specify whether the part is a cube. This parameter takes a Boolean value, true if the part is a cube, false otherwise.
<i>AggregateFieldName</i>	Specify the name of the field to be used to hold the aggregate value.

Returns

A string containing the name of the field that contains the aggregate value.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," SetPersistAggregate, page 119](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetFieldMapping, page 113](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetPersistAggregate, page 114](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," SetFieldMapping, page 117](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," SetPersistAggregate, page 119](#)

SetDimSort

Syntax

```
SetDimSort(DimName, IsAscending [, CubeName1, IsAscending2, CubeName2, IsAscending3, CubeName3])
```

Description

Use the SetDimSort method to specify the sorting order for the dimension.

If *CubeName1* is an empty string, the dimension is sorted by the names of the members of the dimension, and the other parameters are not used.

If *CubeName1* is not an empty string, the dimension is sorted by cubes, as specified by the other parameters.

The Boolean parameter *IsAscending* defines whether sorting should be in ascending or descending order. Up to three sort keys may be specified. *CubeName1* is the primary sort key. *CubeName2* is used to sub-sort any members that have the same key value under *CubeName1*, and so on.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimensionName</i>	Specify the name of the dimension that you would like to specify a sort order for.
<i>IsAscending</i>	Specify if the dimension should be sorted in ascending or descending order. This parameter takes a Boolean value: true if the sort should be ascending, false if it should be descending.
<i>CubeName1</i>	Specify whether the dimension is to be sorted by members or by cubes. If the dimension is to be sorted by members, specify a null string for this parameter. If the dimension is to be sorted by cubes, specify a cube name.
<i>IsAscending2</i>	Specify if the sort for <i>CubeName1</i> is in ascending or descending order. This parameter takes a Boolean value: true if the sort is ascending, false if its descending.
<i>CubeName2</i>	Specify the name of a cube to be used to sub-sort the primary sort specified by <i>CubeName1</i> .
<i>IsAscending3</i>	Specify if the sort for <i>CubeName2</i> is in ascending or descending order. This parameter takes a Boolean value: true if the sort is ascending, false if its descending.
<i>CubeName3</i>	Specify the name of a cube to be used to sub-sort the primary sort specified by <i>CubeName2</i> .

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," SetPersistAggregate, page 119](#)

[Chapter 2, "Analytic Calculation Engine Classes," GetDimSort, page 42](#)

SetFieldMapping

Syntax

SetFieldMapping(*PartName*, *FieldName*, *IsCube*)

Description

Use the `SetFieldMapping` method to specify the name of the main field used for mapping the part specified by *PartName*.

You can map a field to only one data cube or dimension within one cube collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartName</i>	Specify the name of the part for which you want to assign a mapping field.
<i>FieldName</i>	Specify the name of the field to be used for the field mapping.
<i>IsCube</i>	Specify whether or not the part is a cube. This parameter takes a Boolean value: true if the part is a cube, false otherwise.

Returns

None.

SetFilter

Syntax

SetFilter(*DimensionName*,*UserFunctionName*)

Description

Use the `SetFilter` method to specify the user function to be used as a filter for the dimension specified by *DimensionName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimensionName</i>	Specify the name of the dimension for which you want to set a filter.
<i>UserFunctionName</i>	Specify the name of a user function to be used as a filter for this dimension.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," GetFilter, page 114](#)

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine, "Creating Rules, Formulas, and User Functions," Filter User Functions

SetPersistAggregate

Syntax

SetPersistAggregate(*DimensionName*, *AggregateType*)

Description

Use the SetPersistAggregate to specify the value for the persist aggregate for the dimension specified by *DimensionName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimensionName</i>	Specify the name of the dimension for which you want to set the persist aggregate.
<i>AggregateType</i>	Specify the aggregate type. Values are:

<i>Value</i>	<i>Description</i>
AnalyticModel_AggrType_Root	The persist aggregate type is <i>Root</i> , that is, only the root node's data is saved to the database.

<i>Value</i>	<i>Description</i>
AnalyticModel_AggrType_All	The persist aggregate type is <i>All</i> , that is, save all of the dimension's aggregate data to the database.
AnalyticModel_AggrType_None	The persist aggregate type is <i>None</i> , that is, do not save any of the dimension's aggregate data to the database.

Returns

None.

UsesCube

Syntax

UsesCube(*CubeName*)

Description

Use the UsesCube method to determine if the cube collection uses the cube specified by *CubeName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CubeName</i>	Specify the name of the cube that you want to verify.

Returns

A Boolean value, true if the specified cube is part of the cube collection, false otherwise.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AttachCube, page 108](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachCube, page 109](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetCubeNames, page 111](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," CubeDefn Class, page 97](#)

UsesDimension

Syntax

UsesDimension(*DimensionName*)

Description

Use the UsesDimension method to determine if the cube collection uses the dimension specified by *DimensionName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DimensionName</i>	Specify the name of the dimension that you want to verify.

Returns

A Boolean value: true if the dimension is part of the cube collection, false otherwise.

CubeCollectionDefn Class Properties

The following section discusses the CubeCollectionDefn class properties. The properties are discussed in alphabetical order.

AggregateRecName

Description

Use this property to specify the name of the aggregate record associated with this cube collection. This property takes a string value.

This property is read-write.

Comments

Description

Use this property to specify additional notes about the cube collection.

This property is read-write.

CubeCount

Description

This property returns the number of cubes in the cube collection.

This property is read-only.

DimensionCount

Description

This property returns the number of dimensions associated with this cube collection.

This property is read-only.

Name

Description

This property returns the name of the cube collection as a string.

This property is read-only.

RecordName

Description

Use this property to specify the name of the main record associated with the cube collection. This property takes a string value.

This property is read-write.

UserFunctionDefn Class

Use the UserFunctionDefn class to access the user functions that are associated with an analytic model. You instantiate an object of this class using the following AnalyticModelDefn class methods:

- AddUserFunction
- CopyUserFunction
- GetUserFunction

UserFunctionDefn Class Methods

In this section we discuss the UserFunctionDefn class methods. They are described in alphabetical order.

GetRule

Syntax

GetRule()

Description

Use the GetRule method to return a RuleDefn object that represents the rule associated with this user function.

Parameters

None.

Returns

A RuleDefn object.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," RuleDefn Class, page 129](#)

SetRule

Syntax

SetRule(*&Rule*)

Description

Use the SetRule method to specify a rule defined by a RuleDefn object to be the rule for this user function.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Rule</i>	Specify an already instantiated RuleDefn object that you want to use as the rule for this user function.

Returns

None.

UserFunctionDefn Class Properties

The following section discusses the UserFunctionDefn class properties. The properties are discussed in alphabetical order.

Comments

Description

Use this property to specify additional notes about the user function.

This property is read-write.

Name

Description

This property specifies the name of the user function.

This property is read-only.

OrganizerDefn Class

Use the OrganizerDefn class to access the organizers that are associated with an analytic model. You instantiate an object of this class using the following AnalyticModelDefn class methods:

- AddOrganizer
- CopyOrganizer
- GetOrganizer

OrganizerDefn Class Methods

The following section discusses the OrganizerDefn class methods. The methods are discussed in alphabetical order.

AttachPart

Syntax

AttachPart(*PartName*, *PartType*)

Description

Use the AttachPart method to attach the part specified by *PartName* to the organizer. The part must exist in the analytic model.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartName</i>	Specify the name of the part that you want to attach.
<i>PartType</i>	Specify the type of part that you want to attach. Values are:

<i>Value</i>	<i>Description</i>
AnalyticModel_Dimension	Attach a dimension.
AnalyticModel_Cube	Attach a cube.
AnalyticModel_CubeCollection	Attach a cube collection.
AnalyticModel_UserFunction	Attach a user function.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachPart, page 126](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetPartNames, page 127](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," UsesPart, page 128](#)

DetachPart

Syntax

DetachPart(*PartName*, *PartType*)

Description

Use the DetachPart method to detach the part specified by *PartName* from the organizer.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartName</i>	Specify the name of the part that you want to detach.

<i>Parameter</i>	<i>Description</i>
<i>PartType</i>	Specify the type of the part that you want to detach. Valid values are:

<i>Value</i>	<i>Description</i>
AnalyticModel_Dimension	Detach a dimension.
AnalyticModel_Cube	Detach a cube.
AnalyticModel_CubeCollection	Detach a cube collection.
AnalyticModel_UserFunction	Detach a user function.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AttachPart, page 125](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetPartNames, page 127](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," UsesPart, page 128](#)

GetPartNames

Syntax

GetPartNames()

Description

Use the GetPartNames method to return a list of the names of the parts used by the organizer. The names are returned as an array of string.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AttachPart, page 125](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachPart, page 126](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," UsesPart, page 128](#)

UsesPart

Syntax

UsesPart(*PartName*, *PartType*)

Description

Use the UsesPart method to determine if the organizer uses the part specified by *PartName*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartName</i>	Specify the name of the part that you want to verify.
<i>PartType</i>	Specify the type of the part that you want to verify. Valid values are:

<i>Value</i>	<i>Description</i>
AnalyticModel_Dimension	A dimension.
AnalyticModel_Cube	A cube.
AnalyticModel_CubeCollection	A cube collection.
AnalyticModel_UserFunction	A user function.

Returns

A Boolean value: true if the part is associated with the organizer, false otherwise.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AttachPart, page 125](#); [Chapter 3, "Analytic Calculation Engine Metadata Classes," DetachPart, page 126](#) and [Chapter 3, "Analytic Calculation Engine Metadata Classes," GetPartNames, page 127](#)

OrganizerDefn Class Properties

The following section discusses the OrganizerDefn class properties. The properties are discussed in alphabetical order.

Comments

Description

Use this property to specify additional notes about the organizer.

This property is read-write.

Name

Description

This property specifies the name of the organizer.

This property is read-only.

RuleDefn Class

Use the RuleDefn class to access a rule that is associated with an analytic model. You instantiate an object of this class using the GetRule method for both the CubeDefn and UserFunctionDefn classes.

RuleDefn Class Methods

In this section, we discuss the RuleDefn class methods. The methods are described in alphabetical order.

AddRuleExpression

Syntax

AddRuleExpression(*&Expr*)

Description

Use the `AddRuleExpression` method to add a rule expression to the rule. Use the classes in the `RuleExpression` subpackage to create the expression specified by *&Expr*.

After you have finished adding rule expressions to the rule, you need to use the `GenerateRule` method to generate the rule.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Expr</i>	Specify the rule expression that you want added to the rule definition.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," `GenerateRule`, page 130](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," `RuleExpressions` Classes, page 131](#)

GenerateRule

Syntax

`GenerateRule()`

Description

Use the `GenerateRule` method to create the rule string for the rule that represents the current rule expressions that have been added using `AddRuleExpression`.

Parameters

None.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddRuleExpression, page 129](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," RuleExpressions Classes, page 131](#)

RuleDefn Class Property

The following describes the RuleDefn class property.

RuleString

Description

This property specifies a string representation of the rule.

After the rule is returned using the GetRule method, this string represents the existing rule cube or user function.

After AddRuleExpression and GenerateRule are called, this is the string representation of the rule.

This property is read-only.

RuleExpressions Classes

The RuleExpressions classes represents the different parts of the analytic calculation engine rule grammar. These objects are created using the Create built-in function and the constructor for that class, then added to the RuleDefn object with the AddRuleExpression method.

The following are the RuleExpressions classes:

- Assignment
- Comparison
- Constant
- Constants
- Cube
- ExpressionBlock
- FunctionCall
- MemberReference

- Operation
- RuleExpression
- Variable

Note. The RuleExpression object is the object that the other objects are derived from. You should not create or use this object directly.

Using the Constants Class

All of the constants used with the RuleExpression classes, such as FunctionCall, comparison, operation, and so on, are actually properties of the constants class. You must always instantiate an object of the constants class to use any constants in your program.

For example, the comparison class uses a constant to test whether two operands are equal. Use the following code to create a comparison testing this:

```
&Comparison = create Comparison(&Constants.Comparison_Type_Equal);
```

All of the properties for the constants class are listed with the classes that use them.

Assignment Class

An assignment object represents an assignment statement in an analytic calculation rule.

Use the following to create an assignment object:

```
&Assignment = create Assignment();
```

Assignment Class Method

The following is the method for the assignment class.

GenerateRule

Syntax

```
GenerateRule()
```

Description

Use the GenerateRule method to return a string that contains the rule for this object.

Generally you wouldn't use this method on the individual RuleExpression objects, but instead would use the GenerateRule method on the RuleDefn object.

Parameters

None.

Returns

A string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddRuleExpression, page 129](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," RuleExpressions Classes, page 131](#)

Assignment Class Properties

In this section we discuss the assignment class properties. The properties are described in alphabetical order.

Expression

Description

Use the Expression property to specify the right-hand side of the assignment statement.

This property is read-write.

Variable

Description

Use the Variable property to specify the left-hand side of the assignment statement.

This property is read-write.

Comparison Class

A comparison object represents a comparison statement in an analytic calculation rule.

Use the following to create a comparison class object:

```
&Comparison = create Comparison(&Constants.Comparison_Type);
```

Where *Comparison_Type* is one of the following:

Value	Description
Comparison_Type_Equal	Compare if the value of Operand1 equals Operand2.
Comparison_Type_Greater	Compare if the value of Operand1 is greater than the value of Operand2.
Comparison_Type_Less	Compare if the value of Operand1 is less than the value of Operand2.
Comparison_Type_GreaterEq	Compare if the value of Operand1 is greater or equal to the value of Operand2.
Comparison_Type_LessEq	Compare if the value of Operand1 is less than or equal to the value of Operand2.
Comparison_Type_NotEq	Compare if the value of Operand1 is not equal to the value of Operand2.

Specify Operand1 and Operand2 with the Operand1 and Operand2 comparison class properties.

The following code example creates a rule that compares if the first operand is greater than or equal to the second operand, then adds the rule using the AddArgument method.

```
&Comparison = create Comparison(&Constants.Comparison_Type_GreaterEq);
&Constant = create Constant(&Constants.Constant_Type_Literal, "1000");
&Comparison.Operand1 = &Constant;
&Constant = create Constant(&Constants.Constant_Type_Literal, "100");
&Comparison.Operand2 = &Constant;
&FunCall.AddArgument(&Comparison);
```

Comparison Class Method

The following is the comparison class method.

GenerateRule

Syntax

```
GenerateRule()
```

Description

Use the `GenerateRule` method to return a string that contains the rule for this object.

Generally you wouldn't use this method on the individual `RuleExpression` objects, but instead would use the `GenerateRule` method on the `RuleDefn` object.

Parameters

None.

Returns

A string.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddRuleExpression, page 129](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," RuleExpressions Classes, page 131](#)

Comparison Class Properties

In this section we discuss the comparison class properties. The properties are described in alphabetical order.

Operand1

Description

Use this property to specify the `RuleExpression` object that is the first operand to be used in the comparison.

This property is read-write.

Operand2

Description

Use this property to specify the `RuleExpression` object that is the second operand to be used in the comparison.

This property is read-write.

Type

Description

This property returns the type of the comparison that was used to instantiate the comparison object.

The values are:

<i>Value</i>	<i>Description</i>
Comparison_Type_Equal	Compare if the value of Operand1 equals Operand2.
Comparison_Type_Greater	Compare if the value of Operand1 is greater than the value of Operand2.
Comparison_Type_Less	Compare if the value of Operand1 is less than the value of Operand2.
Comparison_Type_GreaterEq	Compare if the value of Operand1 is greater than or equal to the value of Operand2.
Comparison_Type_LessEq	Compare if the value of Operand1 is less than or equal to the value of Operand2.
Comparison_Type_NotEq	Compare if the value of Operand1 is not equal to the value of Operand1.

This property is read-only.

Constant Class

A constant object represents a constant statement in an analytic calculation rule.

Note. This is not the same as the constants class.

A constant object exposes all the constants that are passed to the constructors of the various RuleExpression objects.

Use the following to create a constant class object:

```
&Constant = create Constant(&Constants.Constant_Type, [&Constants.]Constant_Value);
```

where *Constant_Type* is one of the following:

<i>Value</i>	<i>Description</i>
Constant_Type_Builtin	The <i>Constant_Value</i> is an analytic calculation engine built-in function. In this instance, the constant value must be prefaced with an already instantiated constants object. For possible values, see below.
Constant_Type_Number	The <i>Constant_Value</i> is a number.

Value	Description
Constant_Type_Literal	The <i>Constant_Value</i> is a string.

When the *Constant_Type* is Constant_Type_Builtin, the *Constant_Value* is one of the following:

- Constant_Builtin_ALL
- Constant_Builtin_BASE_E
- Constant_Builtin_DEFAULT
- Constant_Builtin_DETAILS
- Constant_Builtin_DIRECT
- Constant_Builtin_FALSE
- Constant_Builtin_FORWARD
- Constant_Builtin_PI
- Constant_Builtin_REVERSE
- Constant_Builtin_TRUE

The following code creates a PeopleSoft Analytic Calculation Engine built-in function to be used as a constant:

```
&Constant = create Constant(&Constants.Constant_Type_Builtin,⇒
&Constants.Constant_Builtin_REVERSE);
```

The following code creates a literal (string) constant:

```
&Constant = create Constant(&Constants.Constant_Type_Literal, "GENERAL");
```

The following code creates a number constant:

```
&Constant = create Constant(&Constants.Constant_Type_Number, "-1");
```

Constant Class Method

The following is the constant class method.

GenerateRule

Syntax

GenerateRule()

Description

Use the `GenerateRule` method to return a string that contains the rule for this object.

Generally you wouldn't use this method on the individual `RuleExpression` objects, but instead would use the `GenerateRule` method on the `RuleDefn` object.

Parameters

None.

Returns

A string.

Constant Class Properties

In this section we discuss the constant class properties. The properties are described in alphabetical order.

Type

Description

This property returns the value of the *Constant Type* that was used to instantiate the constant class object.

This property is read-only.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," Constant Class, page 136](#)

Value

Description

This property returns the value of the *Constant Value* that was used to instantiate the constant class object.

This property is read-only.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," Constant Class, page 136](#)

Constants Class

All of the constants used with the RuleExpression classes, such as FunctionCall, comparison, operation, and so on, are actually properties of the constants class. You must always instantiate an object of the constants class to use any constants in your program.

For example, the comparison class uses a constant to test whether two operands are equal. Use the following code to create a comparison testing this:

```
&Comparison = create Comparison(&Constants.Comparison_Type_Equal);
```

All of the properties for the constants class are listed with the classes that use them.

Cube Class

A cube object represents a cube statement in an analytic calculate engine rule.

Use the following to create a cube object.

```
&Assignment = create Cube("CubeName");
```

Cube Class Methods

In the following section, we discuss the cube class methods. The methods are described in alphabetical order.

AddIndex

Syntax

```
AddIndex(&MemberReference)
```

Description

Use the AddIndex method to add a MemberReference object to the cube.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&MemberReference</i>	Specify an already instantiated MemberReference object to be added to the cube.

Returns

None.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," MemberReference Class, page 149](#)

GenerateRule

Syntax

GenerateRule()

Description

Use the GenerateRule method to return a string that contains the rule for this object.

Generally you wouldn't use this method on the individual RuleExpression objects, but instead would use the GenerateRule method on the RuleDefn object.

Parameters

None.

Returns

A string.

GetIndexes

Syntax

GetIndexes()

Description

Use the `GetIndexes` method to return an array of `MemberReference`'s (indexes) for this cube. These `MemberReferences` are the `MemberReferences` that were added with the `AddIndex` method.

Parameters

None.

Returns

An array of `MemberReference` objects.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," MemberReference Class, page 149](#)

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddIndex, page 139](#)

Cube Class Property

The following is the cube class property.

Name

Description

This property indicates the name of the cube that was used to instantiate the cube object.

This property is read-only.

ExpressionBlock Class

For some function, you need multi-statement nested expressions. You need to use the `ExpressionBlock` class to group these expressions. For example, all the statements inside of a `FOR` statement should be included in an expression block.

```
FOR(&Index, 1, PERIOD,  
    SET(&Value, &Value + 1);  
    SET(&countPl4, &countPl4 + 4);  
);
```

Use the following code to create an `ExpressionBlock` object:

```
&ExpressionBlock = create ExpressionBlock();
```

ExpressionBlock Methods

In the following section we discuss the ExpressionBlock class methods. The methods are described in alphabetical order.

AddRuleExpression

Syntax

```
AddRuleExpression(&Expr)
```

Description

Use the AddRuleExpression method to add an expression to the expression block and the rule. Use the classes in the RuleExpression subpackage to create the expression specified by *&Expr*.

Note. As the rule string is generated, the system adds a ";" after each RuleExpression, except the last.

Parameters

Parameter	Description
<i>&Expr</i>	Specify the rule expression that you want added to the expression block.

Returns

None.

GetRuleExpressions

Syntax

```
GetRuleExpressions()
```

Description

Use the GetRuleExpressions to return an array of rule expression objects that have been added using the AddRuleExpression method.

Parameters

None.

Returns

An array of RuleExpression objects.

FunctionCall Class

A FunctionCall object represents a function call statement in an analytic calculation engine rule.

Use the following code to create a FunctionCall object:

```
&Assignment = create FunctionCall(&Constants.Function_Call_Type, [&Constants.]⇒  
Function_Call_Name);
```

Where *Function_Call_Type* can be one of the following:

Value	Description
FunctionCall_Type_Builtin	Specifies that the function call is a PeopleSoft Analytic Calculation Engine built-in functions. In this instance, the function name must be prefaced with an already instantiated constants object. For the built-in function values used with <i>Function_Call_Name</i> , see below.
FunctionCall_Type_UserFunc	Specifies that the function call is a user function. The value specified for <i>Function_Call_Name</i> must be an already created user function defined in this analytic model. Specify this value as a string.

When the *Function_Call_Type* is specified as Function_Call_Type_Builtin, the *Function_Call_Name* must be one of the following:

- FunctionCall_Builtin_ABS
- FunctionCall_Builtin_ACOS
- FunctionCall_Builtin_ARGUMENTS
- FunctionCall_Builtin_ASC
- FunctionCall_Builtin_ASIN
- FunctionCall_Builtin_AT
- FunctionCall_Builtin_ATAN
- FunctionCall_Builtin_BREAK
- FunctionCall_Builtin_CASE

- FunctionCall_Builtin_CHANGE
- FunctionCall_Builtin_CHILDCOUNT
- FunctionCall_Builtin_CHR
- FunctionCall_Builtin_CONSOL
- FunctionCall_Builtin_COS
- FunctionCall_Builtin_CUBEID
- FunctionCall_Builtin_CUBSUM
- FunctionCall_Builtin_CUMAVG
- FunctionCall_Builtin_DAVG
- FunctionCall_Builtin_DAY
- FunctionCall_Builtin_DCOUNT
- FunctionCall_Builtin_DDB
- FunctionCall_Builtin_DEC
- FunctionCall_Builtin_DLOOKUP
- FunctionCall_Builtin_DMAX
- FunctionCall_Builtin_DMIN
- FunctionCall_Builtin_DSUM
- FunctionCall_Builtin_E
- FunctionCall_Builtin_FIRST
- FunctionCall_Builtin_FOR
- FunctionCall_Builtin_FORCHILDREN
- FunctionCall_Builtin_FORMEMBERS
- FunctionCall_Builtin_FV
- FunctionCall_Builtin_GROUPAVG
- FunctionCall_Builtin_GROUPBY
- FunctionCall_Builtin_GROUPMAX
- FunctionCall_Builtin_GROUPMIN
- FunctionCall_Builtin_GROUPSUM
- FunctionCall_Builtin_GROW
- FunctionCall_Builtin_IF

- FunctionCall_Builtin_IFNPV
- FunctionCall_Builtin_INC
- FunctionCall_Builtin_INDICATE
- FunctionCall_Builtin_INPUT
- FunctionCall_Builtin_INSUBTREE
- FunctionCall_Builtin_INTERCEPT

FunctionCall Class Methods

In this section we discuss the FunctionCall class methods. The methods are described in alphabetical order.

AddArgument

Syntax

AddArgument(*&RuleExpression*)

Description

Use the AddArgument method to add an argument to this function call.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&RuleExpression</i>	Specify an already instantiated rule expression object, such as a cube object.

Returns

None.

GenerateRule

Syntax

GenerateRule()

Description

Use the `GenerateRule` method to return a string that contains the rule for this object.

Generally you wouldn't use this method on the individual `RuleExpression` objects, but instead would use the `GenerateRule` method on the `RuleDefn` object.

Parameters

None.

Returns

A string.

GetArguments

Syntax

`GetArguments()`

Description

Use the `GetArguments` method to return an array of `RuleExpression` objects associated with this `FunctionCall`. These are the `RuleExpression` objects that were added using the `AddArgument` method.

Parameters

None.

Returns

An array of `RuleExpression` objects.

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," AddArgument, page 147](#)

FunctionCall Class Properties

In this section we discuss the FunctionCall class properties. The properties are described in alphabetical order.

Name

Description

This property specifies the name of the function call used to instantiate the FunctionCall object.

This property is read-only.

Type

Description

This property specifies the type of the function call used to instantiate the FunctionCall object.

This property is read-only.

MemberReference Class

A MemberReference object represents a member in an analytic calculation engine rule.

Use the following code to create a MemberReference object:

```
&Member = create MemberReference(DimensionName, MemberName);
```

MemberReference Class Method

This section discusses the MemberReference class method.

GenerateRule

Syntax

GenerateRule()

Description

Use the `GenerateRule` method to return a string that contains the rule for this object.

Generally you wouldn't use this method on the individual `RuleExpression` objects, but instead would use the `GenerateRule` method on the `RuleDefn` object.

Parameters

None.

Returns

A string.

MemberReference Class Properties

In this section we discuss `MemberReference` class properties. The properties are described in alphabetical order.

Dimension

Description

This property specifies the name of the dimension used to create the `MemberReference` object.

This property is read-only.

Member

Description

This property specifies the name of the member used to create the `MemberReference` object.

This property is read-only.

Operation Class

An operation object represents an operation in an analytic calculation engine rule. The operation is generally some type of mathematical function performed between two operands. Specify the operands for the operation using the `Operand1` and `Operand2` operation class properties.

Use the following code to create an operation object:

```
&Comparison = create Operation(&Constants.Operation_Type);
```

Where *Operation_Type* has a value of one of the following:

Value	Description
Operation_Type_Plus	The operation is addition.
Operation_Type_Minus	The operation is subtraction.
Operation_Type_Mult	The operation is multiplication.
Operation_Type_Div	The operation is division.
Operation_Type_And	Use a logical AND with the operation.
Operation_Type_Or	Use a logical OR with the operation.
Operation_Type_Not	Use a logical NOT with the operation.
Operation_Type_Neg	Use a mathematical negate with the operation.
Operation_Type_Exp	Use a mathematical exponent with the operation.

The following code creates an operations that is a multiplication between two operands.

```
&operation = create Operation(&Constants.Operation_Type_Mult);
&Constant = create Constant(&Constants.Constant_Type_Literal, "PI");
&operation.Operand1 = &Constant;
&Constant = create Constant(&Constants.Constant_Type_Literal, "SLOPE");
&operation.Operand2 = &Constant;
&FunCall.AddArgument(&operation);
```

Operation Class Method

The following is the operation class method.

GenerateRule

Syntax

```
GenerateRule()
```

Description

Use the GenerateRule method to return a string that contains the rule for this object.

Generally you wouldn't use this method on the individual RuleExpression objects, but instead would use the GenerateRule method on the RuleDefn object.

Parameters

None.

Returns

A string.

Operation Class Properties

In this section we discuss the operation class properties. The properties are described in alphabetical order.

Operand1

Description

Use this property to specify the RuleExpression object that is the first operand to be used in the operation.

This property is read-write.

Operand2

Description

Use this property to specify the RuleExpression object that is the second operand to be used in the operation.

This property is read-write.

Type

Description

This property returns the type of the operation used to instantiate the operation object.

The values for this property are:

Value	Description
Operation_Type_Plus	The operation is addition.
Operation_Type_Minus	The operation is subtraction.
Operation_Type_Mult	The operation is multiplication.
Operation_Type_Div	The operation is division.
Operation_Type_And	Use a logical AND for the operation.
Operation_Type_OR	Use a logical OR for the operation.
Operation_Type_Not	Use a logical NOT for the operation.
Operation_Type_Neg	Use a mathematical negate for the operation.
Operation_Type_Exp	Use a mathematical exponent for the operation.

Variable Class

A variable object represents a variable in an analytic calculation engine rule.

Use the following code to create a variable object:

```
&Variable = create Variable(&Constants.Variable_Type, "Variable_Name");
```

Where *Variable_Type* is one of the following:

Value	Description
Variable_Type_Auto	Use a local variable.
Variable_Type_Expression	The variable is in an expression. Specify an already instantiated rule expression object for the <i>Variable_Name</i> .
Variable_Type_Dimension	The variable is a dimension name. Specify a dimension name for the <i>Variable_Name</i> .

The following code example creates a variable, then adds it to the rule.

```
&Variable = create Variable(&Constants.Variable_Type_Auto, "StartVal");
&FunCall.AddArgument(&Variable);
```

Variable Class Method

The following is the variable class method.

GenerateRule

Syntax

GenerateRule()

Description

Use the GenerateRule method to return a string that contains the rule for this object.

Generally you wouldn't use this method on the individual RuleExpression objects, but instead would use the GenerateRule method on the RuleDefn object.

Parameters

None.

Returns

A string.

Variable Class Properties

In this section we discuss the variable class properties. The properties are described in alphabetical order.

Name

Description

This property specifies the name of the variable that was used to create the variable object, passed in the constructor.

This property is read-only.

Type

Description

This property specifies the type of the variable, passed in the constructor. The possible values are:

<i>Value</i>	<i>Description</i>
Variable_Type_Auto	A local variable.
Variable_Type_Expression	The variable is an expression. Specify an already instantiated rule expression object for the <i>Variable_Name</i> .
Variable_Type_Dimension	The variable is a dimension name. Specify a dimension name for the <i>Variable_Name</i> .

This property is read-only.

Analytic Model Metadata Classes Examples

The following are some examples of the most general cases of using the Analytic Model Metadata classes.

Creating an Analytic Model Code Example

The following code creates an analytic model definition "from scratch" without retrieving an existing definition from the Application Designer, adds parts such as dimensions, cubes, and cube collections, then saves the definition.

```

import PT_ANALYTICMODELDEFN:*;

Function CreateGENXModel

    Local PT_ANALYTICMODELDEFN:AnalyticModelDefn &Model;
    Local PT_ANALYTICMODELDEFN:UserFunctionDefn &UserFunc;
    Local PT_ANALYTICMODELDEFN:DimensionDefn &Dim;
    Local PT_ANALYTICMODELDEFN:CubeDefn &Cube;
    Local PT_ANALYTICMODELDEFN:CubeCollectionDefn &CubeColl;
    Local array of string &arr;

    &ACEMODELID = QE_ACE_META_WK.QE_ACE_MODELID.Value;

    &Model = create PT_ANALYTICMODELDEFN:AnalyticModelDefn(&ACEMODELID);

    &Model.Create();

    /* Model Properties */

    &Model.Description = QE_ACE_META_WK.DESCR;
    &Model.LongDescription = QE_ACE_META_WK.DESCR200;
    &Model.MaxDelta = QE_ACE_META_WK.QE_ACE_MAXDELTA_FL;
    &Model.MaxIterations = QE_ACE_META_WK.QE_ACE_MAXITER_FLD;

    If (QE_ACE_META_WK.QE_ACE_CIRCWARN_FL.Value = 0) Then
        &Circ = True;
    Else
        &Circ = False;
    End-If;

    If (QE_ACE_META_WK.QE_ACE_RESOLVE_FLD.Value = 0) Then
        &Resolve = True;
    Else
        &Resolve = False;
    End-If;

    &Model.ResolveCircularDeps = &Resolve;
    &Model.CircularFormulaWarn = &Circ;

    /* Add User Functions */

    &UserFunction = &Model.AddUserFunction("FILTERPRODUCTS");
    &Rule = &UserFunction.GetRule();
    &Rule.RuleString = "IF( ((UNIT_COST = 0) .AND. (UNITS_SOLD = 0) .AND. (PROD_⇒
SALES =0 )) , RETURN(0), RETURN(1))";
    &UserFunction.SetRule(&Rule);

    /* Add the Dimensions */
    &Dim = &Model.AddDimension("MONTH");

    &Dim = &Model.AddDimension("PRODUCTS");
    &Dim.TotalMemberName = "TOTAL";

    &Dim = &Model.AddDimension("PROD_CAT");

    &Dim = &Model.AddDimension("REGION");

    /* Add the cubes */
    &Cube = &Model.AddCube("PROD_SALES");
    &Cube.FormatType = &Cube.AnalyticModel_Format_Number;
    &Cube.IsVirtual = False;

```

```

&Cube.CalcAggregates = False;
&Cube.Rule = "UNIT_COST * UNITS_SOLD";
&Cube.AttachDimension("MONTH");
&Cube.AttachDimension("PRODUCTS");
&Cube.AttachDimension("REGION");

&Cube = &Model.AddCube("SALES");
&Cube.FormatType = &Cube.AnalyticModel_Format_Number;
&Cube.IsVirtual = False;
&Cube.CalcAggregates = False;

&Cube = &Model.AddCube("TGT_COST");
&Cube.FormatType = &Cube.AnalyticModel_Format_Number;
&Cube.IsVirtual = False;
&Cube.CalcAggregates = False;
&Cube.AttachDimension("PRODUCTS");

&Cube = &Model.AddCube("UNITS_SOLD");
&Cube.FormatType = &Cube.AnalyticModel_Format_Number;
&Cube.IsVirtual = False;
&Cube.CalcAggregates = False;
&Cube.AttachDimension("MONTH");
&Cube.AttachDimension("PRODUCTS");
&Cube.AttachDimension("REGION");

&Cube = &Model.AddCube("UNIT_COST");
&Cube.FormatType = &Cube.AnalyticModel_Format_Number;
&Cube.IsVirtual = False;
&Cube.CalcAggregates = False;
&Cube.AttachDimension("MONTH");
&Cube.AttachDimension("PRODUCTS");
&Cube.AttachDimension("REGION");

/* Add Cube Collections */
&CubeColl = &Model.AddCubeCollection("REG_SALES_IN");
&CubeColl.RecordName = "QE_BAM_FACT_TBL";
&CubeColl.AttachCube("PROD_SALES");
&CubeColl.AttachCube("UNITS_SOLD");
&CubeColl.AttachCube("UNIT_COST");
&CubeColl.SetFieldMapping("MONTH", "QE_BAM_MONTH_FLD", False);
&CubeColl.SetPersistAggregate("MONTH", &CubeColl.AnalyticModel_AggrType_None);
&CubeColl.SetDimSort("MONTH", False, "", False, "", False, "");
&CubeColl.SetFieldMapping("PRODUCTS", "QE_BAM_PRODUCT_FLD", False);
&CubeColl.SetPersistAggregate("PRODUCTS", &CubeColl.AnalyticModel_AggrType_⇒
None);
&CubeColl.SetDimSort("PRODUCTS", False, "", False, "", False, "");
&CubeColl.SetFieldMapping("REGION", "QE_BAM_REGION_FLD", False);
&CubeColl.SetPersistAggregate("REGION", &CubeColl.AnalyticModel_AggrType_None);
&CubeColl.SetDimSort("REGION", False, "", False, "", False, "");
&CubeColl.SetFieldMapping("PROD_SALES", "QE_BAM_PRDSALES_FL", True);
&CubeColl.SetFieldMapping("UNITS_SOLD", "QE_BAM_SALES_FLD", True);
&CubeColl.SetFieldMapping("UNIT_COST", "QE_BAM_UNIT_FLD", True);

&CubeColl = &Model.AddCubeCollection("REG_SALES_PROD");
&CubeColl.RecordName = "QE_BAM_CCSMOKE";
&CubeColl.AttachCube("PROD_SALES");
&CubeColl.AttachCube("UNITS_SOLD");
&CubeColl.AttachCube("UNIT_COST");
&CubeColl.SetFieldMapping("MONTH", "QE_BAM_MONTH_FLD", False);
&CubeColl.SetPersistAggregate("MONTH", &CubeColl.AnalyticModel_AggrType_None);
&CubeColl.SetDimSort("MONTH", False, "", False, "", False, "");
&CubeColl.SetFieldMapping("PRODUCTS", "QE_BAM_PRODUCT_FLD", False);
&CubeColl.SetPersistAggregate("PRODUCTS", &CubeColl.AnalyticModel_AggrType_⇒

```

```

None);
    &CubeColl.SetFilter("PRODUCTS", "FILTERPRODUCTS");
    &CubeColl.SetDimSort("PRODUCTS", False, "", False, "", False, "");
    &CubeColl.SetFieldMapping("REGION", "QE_BAM_REGION_FLD", False);
    &CubeColl.SetPersistAggregate("REGION", &CubeColl.AnalyticModel_AggrType_None);
    &CubeColl.SetDimSort("REGION", False, "", False, "", False, "");
    &CubeColl.SetFieldMapping("PROD_SALES", "QE_BAM_PRDSALES_FL", True);
    &CubeColl.SetFieldMapping("UNITS_SOLD", "QE_BAM_SALES_FLD", True);
    &CubeColl.SetFieldMapping("UNIT_COST", "QE_BAM_UNIT_FLD", True);

    &CubeColl = &Model.AddCubeCollection("TGT_COST_PROD");
    &CubeColl.RecordName = "QE_BAM_CC_TRGT";
    &CubeColl.AttachCube("TGT_COST");
    &CubeColl.SetFieldMapping("PRODUCTS", "QE_BAM_PRODUCT_FLD", False);
    &CubeColl.SetPersistAggregate("PRODUCTS", &CubeColl.AnalyticModel_AggrType_⇒
None);
    &CubeColl.SetDimSort("PRODUCTS", False, "", False, "", False, "");
    &CubeColl.SetFieldMapping("TGT_COST", "QE_BAM_TARGET_FLD", True);

    &Model.Save();
    /* &Valid = &Model.Validate(); */

    QE_ACE_META_WK.QE_BAM_PCSTATUS = "The Model " | &ACEMODELID | " was created and⇒
saved.";

End-Function;

```

Chapter 4

Analytic Grid Classes

This chapter provides an overview of Analytic Calculation Engine classes, and discusses:

- The analytic grid in PeopleCode.
- Using freeze column mode.
- Error handling.
- Data types of analytic grid objects.
- Scope of analytic grid objects.
- AnalyticGrid class reference.

Important! The analytic grid classes are not supported on IBM z/OS and Linux for IBM System z platforms.

Understanding the Analytic Calculation Engine Classes

PeopleSoft Analytic Calculation Engine comprises a calculation engine plus several PeopleTools features which enable application developers to define both the calculation rules and the display of calculated data within PeopleSoft applications for the purposes of multi-dimensional reporting, data editing, and analysis.

More specifically, developers create *analytic models* in order to define the rules which are used to calculate data. Developers also create PeopleSoft Pure Internet Architecture pages with *analytic grids* in order to display the data within PeopleSoft applications. End users view, analyze, and make changes to this data. When end users save their changes, PeopleSoft Analytic Calculation Engine recalculates the data and saves the calculated data to the database.

PeopleCode enables developers to manipulate analytic calculation data as follows:

- Use the Analytic Calculation Engine classes to either retrieve or specify data in an instance of an analytic model loaded into the system, and also to calculate (or recalculate) cube values.
- Use the Analytic Calculation Engine metadata classes to manipulate an analytic model definition. For example, you can add cubes to a cube collection or rename an existing user function for a model.
- Use the Analytic Grid classes to manipulate the display of analytic calculation data on a page.
- Use the Analytic Type classes to manipulate an analytic type definition. For example, you can specify a new analytic model for an analytic type definition.

[Chapter 2, "Analytic Calculation Engine Classes," page 13](#)

Using the Analytic Grid in PeopleCode

The PeopleCode `AnalyticGrid` object is a reference to a page runtime object for the analytic grid. These particular page runtime objects aren't present until the component is started.

Note. PeopleSoft builds a page grid one row at a time. Because the `AnalyticGrid` class applies to a complete grid, you can't attach PeopleCode that uses the `AnalyticGrid` class to events that occur before the grid is built; the earliest event you can use is the page `Activate` Event.

If you're using the analytic grid within a secondary page, the runtime object for the grid isn't created until the secondary page is run. The grid object can't be obtained until then, which means that the earliest PeopleCode event you can use to activate a grid that's on a secondary page is the `Activate` event for the secondary page.

The attributes you set for displaying an analytic grid remain in effect only while the page is active. When you switch between pages in a component, you have to reapply those changes *every time* the page is displayed.

In addition, the `Activate` event associated with a page fires every time the page is displayed. Any PeopleCode associated with that `Activate` event runs, which may undo the changes you made when the page was last active. For example, if you hide a grid column in the `Activate` event, then display it as part of a user action, when the user tabs to another page in the component, then tabs back, the `Activate` event runs again, hiding the grid column again.

If a user at runtime hides a column of a grid, tabs to another page in the component, then tabs back to the first page, the page is refreshed and the grid column is displayed again.

You can use the rowset class methods and properties on analytic grid data. You can access the data loaded by the analytic grid by accessing a rowset object after the grid is populated.

Use the analytic grid classes to manipulate the display of an analytic grid—that is, one associated with PeopleSoft Analytic Calculation Engine data. If you want to manipulate a grid control, use the grid classes.

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetRowset

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "PeopleCode and the Component Processor," Activate Event

Using Freeze Column Mode

If you specify Freeze Column Mode for an analytic grid in Application Designer, the analytic grid isn't populated from the component buffer by default. It is your responsibility to write your application code so that it populates the rowset bound to the analytic grid.

Note. You should not be adding and deleting data from the analytic grid when you are not in Freeze Column Mode; this is an unsupported feature and might cause unexpected behavior.

In addition, no layout information is available, and there is no slicer, row, or column axis.

The following is an example of populating the analytic grid with data from a normal grid in Freeze Column Mode.

```
Local Rowset &RSAGRID;
Local Rowset &RSGRID;

/* Get the rowset associated with normal grid whose primary record is */
/* QE_BAM_FACTTBL */
&RSGRID = GetLevel0()(1).GetRowset(Scroll.QE_BAM_FACTTBL);

/* Get the rowset associated with Analytic grid whose primary record is */
/* QE_BAM_CCSSMOKE */
&RSAGRID = GetLevel0()(1).GetRowset(Scroll.QE_BAM_CCSSMOKE);

/* Flush out existing Data from the Analytic Grid */
&RSAGRID.Flush();

/* Copy data from Normal Grid to Analytic Grid in Freeze Column Mode*/
&RSGRID.CopyTo(&RSAGRID, Record.QE_BAM_FACTTBL, Record.QE_BAM_CCSSMOKE);
```

Do not use the following methods with an analytic grid that is in Freeze Column Mode:

- Analytic grid GetCubeCollection method
- Analytic grid LoadData method

- Analytic grid SetAnalyticInstance method
- Analytic grid SetLayout method
- Analytic grid SlicerVisible property

Error Handling

All the analytic type classes throw PeopleCode exceptions for any fatal error that occurs in the execution of the operation. PeopleSoft recommends enclosing your analytic model programs in try-catch statements. This way, if your program catches the exception, the message set and message number that are associated with the exception object indicate the error.

See Also

[Chapter 16, "Exception Class," Try-Catch Sections, page 764](#)

Data Types of the Analytic Grid Objects

Analytic grids are declared using the AnalyticGrid data type. For example,

```
Local AnalyticGrid &MyAnalyticGrid;
```

Analytic grid columns are declared using the AnalyticGridColumn data type. For example:

```
Local AnalyticGridColumn &MYGRIDCOL;
```

Scope of Analytic Grid Objects

Both the AnalyticGrid and AnalyticGridColumn objects can be instantiated from PeopleCode only.

An AnalyticGrid is a control on a page. You generally use these objects only in PeopleCode programs that are associated with an online process, not in an Application Engine program, a message notification, a Component Interface, and so on.

AnalyticGrid objects can be of scope local, component or global.

AnalyticGrid Class Reference

This reference for the AnalyticGrid class includes:

- AnalyticGrid class built-in function.
- AnalyticGrid class methods.

- AnalyticGrid class properties.

AnalyticGrid Class Built-in Function

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions,"
GetAnalyticGrid

AnalyticGrid Class Methods

In this section, we discuss the AnalyticGrid class methods. The methods are described in alphabetic order.

GetColumn

Syntax

GetColumn(*ColumnName*)

Description

Use the GetColumn method to instantiate an AnalyticGridColumn object.

Note. The properties for an AnalyticGridColumn and a GridColumn are the same. Any differences are indicated in the description for the GridColumn property.

Specify the grid column name in the page field properties for that field, consisting of any combination of uppercase letters, digits and "#", "\$", "@", and "_".

To specify a grid column name:

1. Open the page in Application Designer, select the analytic grid and access the Analytic Grid control properties.
2. On the General tab, type the new grid name in Page Field Name.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ColumnName</i>	Specify the name of the column that you want to access.

Returns

An AnalyticGridColumn object.

Note. The properties for an AnalyticGridColumn and a GridColumn are the same. Any differences are indicated in the description for the GridColumn property.

See Also

[Chapter 20, "Grid Classes," GridColumn Class, page 1045](#)

GetCubeCollection

Syntax

GetCubeCollection()

Description

Use the GetCubeCollection method to return a reference to the cube collection associated with the analytic grid.

Note. Do not use this method with an analytic grid that is in Freeze Column Mode.

Parameters

None.

Returns

A CubeCollection object.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," page 13](#)

[Chapter 2, "Analytic Calculation Engine Classes," CubeCollection Class, page 36](#)

LoadData

Syntax

LoadData()

Description

Use the LoadData method to cause the system to get fresh data for the grid from the analytic calculation engine. Generally, you would use this method after you perform some operation, such as SetLayout, that might change the value or layout of the data.

Note. Do not use this method with an analytic grid that is in Freeze Column Mode.

Parameters

None.

Returns

None.

SetAnalyticInstance

Syntax

SetAnalyticInstance(*ID*)

Description

Use the SetAnalyticInstance method to specify the analytic instance to be associated with this analytic grid.

An AnalyticGrid object can be bound only once to an analytic instance. If the SetAnalyticInstance method is called after the analytic grid is bound to an instance, the method call has no effect.

Note. Do not use this method with an analytic grid that is in Freeze Column Mode.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ID</i>	Specify the analytic instance ID as a string.

Returns

None.

See Also

[Chapter 2, "Analytic Calculation Engine Classes," AnalyticInstance Class Methods, page 16](#)

[Chapter 2, "Analytic Calculation Engine Classes," page 13](#)

SetLayout

Syntax

```
SetLayout(&SlicerArray, &RowAxisArray, &ColumnAxisArray)
```

Description

Use the SetLayout method to set the layout for the three axes, slice, row, and column.

Note. Do not use this method with an analytic grid that is in Freeze Column Mode.

If you specify No Drag drop mode for an analytic grid in Application Designer, the analytic grid has the column axis, row axis and slicer axis, but the end user isn't allowed to change the layout by dragging and dropping elements between axes. However, you can still change the layout using the SetLayout method.

Note. You can specify a null value ("") for all the required parameters for this method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&SlicerArray</i>	Specify an already instantiated array of string containing the list of fields to be put on the slice axis.
<i>&RowAxisArray</i>	Specify an already instantiated array of string containing the list of fields to be put on the row axis.
<i>&ColumnAxisArray</i>	Specify an already instantiated array of string containing the list of fields to be put on the column axis. Note. The maximum number of columns that can be displayed in an analytic grid is four.

Returns

None.

AnalyticGrid Class Properties

In this section we discuss the AnalyticGrid properties. The properties are described in alphabetic order.

Inactive

Description

Use this property to specify whether the analytic grid is inactive or active. This property takes a Boolean value, true if the grid is inactive, false otherwise.

If you specify this property as true, the analytic grid is not displayed to the user and no data is fetched from the database.

This property is read-write.

Label

Description

Use this property to specify the label that appears as the title of the grid.

Note. You can't use this property to set labels longer than 100 characters. If you try to set a label of more than 100 characters, the label is truncated to 100 characters. Always put any changes to labels in the Activate event for the page. This way the label is set every time the page is accessed.

This property is read-write.

ShowGridLines

Description

Use this property to specify whether grid lines are displayed with the analytic grid. This property takes a Boolean value, true to show the lines, false otherwise.

This property is read-write.

SlicerVisible

Description

Use this property to specify whether the slicer is displayed with the analytic grid. This property takes a Boolean value, true to show the slicer, false otherwise.

Note. Do not use this method with an analytic grid that is in Freeze Column Mode.

This property is read-write.

SummaryText

Description

Use this property to set or return a string representing the summary text for the analytic grid.

Summary text enables you to provide a brief description of the functionality and content of the grid area. This property is pertinent for users who access the application in accessibility mode using screen readers.

This property is read-write.

Example

```
&MyAnGrid = GetAnalyticGrid(Page.PSMYPAGE, "PSMYPAGE");  
&MyAnGrid.SummaryText = "This is the new summary text through PeopleCode";
```

Analytic Type Classes

This chapter provides an overview of Analytic Calculation Engine classes and discusses:

- Using the analytic type classes.
- Error handling.
- Data types of the analytic type objects.
- Scope of analytic type objects.
- How to import the analytic type classes.
- How to create an analytic type class object.
- Analytic type classes reference.

Important! The analytic type classes are not supported on IBM z/OS and Linux for IBM System z platforms.

Understanding the Analytic Calculation Engine Classes

PeopleSoft Analytic Calculation Engine comprises a calculation engine plus several PeopleTools features which enable application developers to define both the calculation rules and the display of calculated data within PeopleSoft applications for the purposes of multi-dimensional reporting, data editing, and analysis.

More specifically, developers create *analytic models* in order to define the rules which are used to calculate data. Developers also create PeopleSoft Pure Internet Architecture pages with *analytic grids* in order to display the data within PeopleSoft applications. End users view, analyze and make changes to this data. When end users save their changes, PeopleSoft Analytic Calculation Engine recalculates the data and saves the calculated data to the database.

PeopleCode enables developers to manipulate analytic calculation data as follows:

- Use the Analytic Calculation Engine classes to either retrieve or specify data in an instance of an analytic model loaded into the system, and also to calculate (or recalculate) cube values.
- Use the Analytic Calculation Engine metadata classes to manipulate an analytic model definition. For example, you can add cubes to a cube collection or rename an existing user function for a model.
- Use the analytic grid classes to manipulate the display of analytic calculation data on a page.
- Use the analytic type metadata classes to manipulate an analytic type definition. For example, you can specify a new analytic model for an analytic type definition.

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine

Using the Analytic Type Classes

You can create analytic type definitions using Application Designer. PeopleSoft provides the analytic type classes for accessing these definitions at runtime.

You can also create an analytic type definition in PeopleCode, using the Create method, then saving it to the database using the Save method. After you save the definition, you can access it using Application Designer.

You only need to create an instance of the analytic type. All other objects are instantiated from the analytic type object.

Once the AnalyticTypeDefn object is created, you can then execute either the Get or Create methods to "instantiate" the analytic type object.

Error Handling

All the analytic type classes throw PeopleCode exceptions for any fatal error that occurs in the execution of the operation. PeopleSoft recommends enclosing your analytic model programs in try-catch statements. This way, if your program catches the exception, the message set and message number that are associated with the exception object indicate the error.

See Also

[Chapter 16, "Exception Class," Try-Catch Sections, page 764](#)

Data Types of the Analytic Type Objects

Every PeopleSoft analytic type object is declared as its own data type, that is, AnalyticTypeDefn objects are declared as type AnalyticTypeDefn, AnalyticTypeModelDefn objects are declared as type AnalyticTypeModelDefn, and so on.

The following are the data types for the PeopleSoft analytic type classes:

- AnalyticTypeDefn
- AnalyticTypeModelDefn

- `AnalyticTypeRecordDefn`

Scope of Analytic Type Objects

The analytic type objects can only be instantiated from PeopleCode.

These objects can be used anywhere you have PeopleCode, that is, in a Application Engine program, an application class, record field PeopleCode, and so on.

Analytic type objects can be of scope Local, Component or Global.

How to Import the Analytic Type Classes

The analytic type classes are *not* built-in classes, like Rowset, Field, Record, and so on. They are application classes. Before you can use these classes in your PeopleCode program, you must import them to your program.

An import statement names either all the classes in a package or one particular application class. For importing the analytic type classes, PeopleSoft recommends that you import all the classes in the application package.

The application package `PT_ANALYTICTYPEDEFN` contains the following subclasses:

- `AnalyticTypeDefn`
- `AnalyticTypeModelDefn`
- `AnalyticTypeRecordDefn`

The import statement you should use should be as follows:

```
import PT_ANALYTICTYPEDEFN: *;
```

Using the asterisks after the package name makes all the application classes directly contained in the named package available.

See Also

[Chapter 6, "Application Classes," page 189](#)

How to Create an Analytic Type Class Object

After you've imported the analytic type classes, you need to instantiate an instance of the `AnalyticTypeDefn` class, using the constructor for that class and the `Create` function. After you create the object, you must populate it using either the `Get` or `Create` method.

The following example creates an AnalyticTypeDefn object from the QE_ACE_ALLFUNCTION analytic type definition.

```
Local PT_ANALYTICTYPEDEFN:AnalyticTypeDefn &AnalyticType;  
  
&AnalyticType = create PT_ ANALYTICTYPEDEFN:AnalyticTypeDefn("QE_ACE_ALLFUNCTION");
```

See Also

[Chapter 3, "Analytic Calculation Engine Metadata Classes," Analytic Calculation Engine Metadata Classes Constructor, page 57](#)

Analytic Type Classes Constructor

You must use the constructor for the AnalyticTypeDefn class to instantiate an instance of that class. All other objects are instantiated from this class.

AnalyticTypeDefn

Syntax

AnalyticTypeDefn(*TypeName*)

Description

Use the AnalyticTypeDefn constructor to create an AnalyticTypeDefn.

Once the AnalyticTypeDefn object is created, you can then execute either the Get or Create methods to instantiate the model.

Note. The Delete and Rename methods can only be executed before a model is instantiated.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TypeName</i>	Specify the name of an analytic type definition.

Returns

An AnalyticTypeDefn object.

Example

```
&Model = create AnalyticTypeDefn("QE_ACE_ALLFUNCTION");
```

See Also

[Chapter 5, "Analytic Type Classes," AnalyticTypeDefn, page 172](#)

AnalyticTypeDefn Class Methods

This section describes the analytic type definition class methods. The methods are discussed in alphabetical order.

AddModel

Syntax

```
AddModel(ModelName, ModelType)
```

Description

Use the AddModel method to add either an analytic model or optimization model to the analytic type definition. If the model doesn't exist, this method fails.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ModelName</i>	Specify the name of an existing model.
<i>ModelType</i>	Specify the model type. Values are:

<i>Value</i>	<i>Description</i>
%ModelType_ACE	The model is an Analytic Calculation Engine.
%ModelType_OPT	The model is an optimization.

Returns

The new AnalyticTypeModelDefn object.

See Also

[Chapter 5, "Analytic Type Classes," DeleteModel, page 176](#) and [Chapter 5, "Analytic Type Classes," GetModelNames, page 179](#)

[Chapter 5, "Analytic Type Classes," AnalyticTypeModelDefn Class Properties, page 183](#)

AddRecord

Syntax

AddRecord(*RecordName*)

Description

Use the AddRecord method to add a record to the analytic type definition. If the record definition doesn't exist in Application Designer, or if the record already exists in this analytic type definition, this method fails.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName</i>	Specify the name of the record that you want to add.

Returns

An AnalyticTypeRecordDefn object that represents the record.

See Also

[Chapter 5, "Analytic Type Classes," DeleteRecord, page 177](#) and [Chapter 5, "Analytic Type Classes," GetRecordNames, page 180](#)

[Chapter 5, "Analytic Type Classes," AnalyticTypeRecordDefn Class Methods, page 184](#)

Create

Syntax

Create()

Description

Use the Create method to create, and instantiate, a new analytic type. If the analytic type already exists, an exception is thrown.

Parameters

None.

Returns

None.

See Also

[Chapter 5, "Analytic Type Classes," Save, page 182](#)

[Chapter 16, "Exception Class," Try-Catch Sections, page 764](#)

CopyTo

Syntax

CopyTo(*NewAnalyticTypeName*)

Description

Use the CopyTo method to copy the current AnalyticTypeDefn object to the AnalyticTypeDefn object with the specified name. This method fails if the analytic type specified with *NewAnalyticTypeName* already exists.

Parameters

Parameter	Description
<i>NewAnalyticTypeName</i>	Specify the name of the new analytic type definition that you want to create.

Returns

The new AnalyticTypeDefn object.

See Also

[Chapter 5, "Analytic Type Classes," Create, page 174](#) and [Chapter 5, "Analytic Type Classes," Save, page 182](#)

Delete**Syntax**

Delete()

Description

Use the Delete method to delete the analytic type definition. You must use this method immediately after you create the AnalyticType object, before you instantiate it, that is, before you use either the Get or Create method.

Note. This method executes immediately, and deletes the definition from Application Designer.

Parameters

None.

Returns

None.

See Also

[Chapter 5, "Analytic Type Classes," Create, page 174](#); [Chapter 5, "Analytic Type Classes," Get, page 178](#) and [Chapter 5, "Analytic Type Classes," Save, page 182](#)

DeleteModel**Syntax**

DeleteModel(*ModelName*)

Description

Use the DeleteModel method to delete the specified model from the analytic type definition.

Note. The model is not deleted from the analytic type definition until you use the Save method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ModelName</i>	Specify the name of a model that exists in the analytic type definition.

Returns

None.

See Also

[Chapter 5, "Analytic Type Classes," AddModel, page 173](#) and [Chapter 5, "Analytic Type Classes," GetModelNames, page 179](#)

[Chapter 5, "Analytic Type Classes," AnalyticTypeModelDefn Class Properties, page 183](#)

DeleteRecord

Syntax

DeleteRecord(*RecordName*)

Description

Use the DeleteRecord method to delete a record from the analytic type definition.

Note. The record deleted from the analytic type definition until you use the Save method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName</i>	Specify the name of the record that you want to remove from the analytic type definition.

Returns

None.

See Also

[Chapter 5, "Analytic Type Classes," AddRecord, page 174](#) and [Chapter 5, "Analytic Type Classes," GetRecordNames, page 180](#)

[Chapter 5, "Analytic Type Classes," AnalyticTypeRecordDefn Class Methods, page 184](#)

Get

Syntax

Get ()

Description

Use the Get method to instantiate an existing analytic type definition as an AnalyticTypeDefn object. If the analytic type doesn't exist, this method throws an exception.

Parameters

None.

Returns

None.

See Also

[Chapter 5, "Analytic Type Classes," Create, page 174](#) and [Chapter 5, "Analytic Type Classes," Save, page 182](#)

GetModel

Syntax

GetModel(*ModelName*)

Description

Use the GetModel method to return a reference to an AnalyticTypeModelDefn object.

This method fails if the model specified by *ModelName* doesn't exist.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ModelName</i>	Specify the name of the analytic type model definition that you want to access.

Returns

An `AnalyticTypeModelDefn` object.

See Also

[Chapter 5, "Analytic Type Classes," AnalyticTypeModelDefn Class Properties, page 183](#)

GetModelNames

Syntax

`GetModelNames()`

Description

Use the `GetModelNames` method to return an array of string containing all the model names in this analytic type definition.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 5, "Analytic Type Classes," AddModel, page 173](#) and [Chapter 5, "Analytic Type Classes," DeleteModel, page 176](#)

[Chapter 5, "Analytic Type Classes," AnalyticTypeModelDefn Class Properties, page 183](#)

GetRecord

Syntax

GetRecord(*RecordName*)

Description

Use the GetRecord method to return a reference to an `AnalyticTypeRecordDefn` object.

This method fails if the record specified by *RecordName* doesn't exist.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName</i>	Specify the name of the record that you want to access.

Returns

An `AnalyticTypeRecordDefn` object.

See Also

[Chapter 5, "Analytic Type Classes," AnalyticTypeRecordDefn Class Methods, page 184](#)

GetRecordNames

Syntax

GetRecordNames()

Description

Use the GetRecordNames method to return an array of string containing the names of all the records associated with the analytic type definition.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 5, "Analytic Type Classes," AddRecord, page 174](#) and [Chapter 5, "Analytic Type Classes," DeleteRecord, page 177](#)

[Chapter 5, "Analytic Type Classes," AnalyticTypeRecordDefn Class Methods, page 184](#)

Rename

Syntax

Rename(*NewAnalyticTypeName*)

Description

Use the Rename method to rename an existing analytic type definition to a new name. You must use this method immediately after you create the AnalyticType object, before you instantiate it, that is, before you use either the Get or Create method. The new name is not saved to the database until you use the Save method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NewAnalyticTypeName</i>	Specify the new name for the analytic type definition.

Returns

None.

See Also

[Chapter 5, "Analytic Type Classes," Save, page 182](#)

Save

Syntax

Save()

Description

Use the Save method to save any changes that were made to the AnalyticTypeDefn object to the database.

Parameters

None.

Returns

None.

AnalyticTypeDefn Class Properties

In this section we discuss the AnalyticTypeDefn class properties. The properties are described in alphabetic order.

AppClassPath

Description

Use this property to specify the full name of the application package that contains the Create, Copy and Delete methods used with this analytic type definition.

This property is read-write.

Comments

Description

Use this property to specify comments for the analytic type.

This property is read-write.

Description

Description

Use this property to specify a description for the analytic type.

This property is read-write.

Name

Description

This property specifies the name of the `AnalyticTypeDefn`.

This property is read-only.

OwnerID

Description

This property specifies the owner ID for this `AnalyticTypeDefn`.

This property is read-write.

AnalyticTypeModelDefn Class Properties

In this section we discuss the `AnalyticTypeModelDefn` class properties. The properties are described in alphabetic order.

Name

Description

This property specifies the name of the analytic type model.

This property is read-only.

Type

Description

This property specifies the type of the analytic type model. Values are:

<i>Value</i>	<i>Description</i>
%ModelType_ACE	The model is an Analytic Calculation Engine.
%ModelType_OPT	The model is an optimization.

This property is read-only.

AnalyticTypeRecordDefn Class Methods

In this section we describe the AnalyticTypeRecordDefn class methods. The methods are discussed in alphabetic order.

GetSelectedField

Syntax

GetSelectedField()

Description

Use the GetSelectedField to return an array of string containing the names of the fields that are selected for this record.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 5, "Analytic Type Classes," SetSelectedField, page 185](#)

SetSelectedField

Syntax

SetSelectedField(*FieldName*)

Description

Use the SetSelectedField method to specify the name of the field that is selected for this record.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>FieldName</i>	Specify the name of the field that you want to select.

Returns

None.

See Also

[Chapter 5, "Analytic Type Classes," GetSelectedField, page 184](#)

UnsetSelectedField

Syntax

UnsetSelectedField(*FieldName*)

Description

Use the UnsetSelectedField method to unselect the selected field.

This method throws an exception if the field specified by *FieldName* isn't selected.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>FieldName</i>	Specify the name of the field that you want to deselect.

Returns

None.

AnalyticTypeRecordDefn Class Properties

In this section we discuss the `AnalyticTypeRecordDefn` class properties. The properties are described in alphabetic order.

All of the properties listed here can also be set for the analytic type definition using Application Designer.

See Also

PeopleTools 8.51 PeopleBook: Analytic Calculation Engine, "Viewing and Debugging Analytic Models," Understanding Analytic Model Properties

Callback

Description

Use this property to specify whether this record has a callback. This property takes a Boolean value, true if the record has a callback, false otherwise.

This property is read-write.

Description

Description

Use this property to specify a description for the record.

This property is read-write.

Name

Description

This property specifies the name of the record.

This property is read-only.

Readable

Description

Use this property to specify whether this record is readable. This property takes a Boolean value, true if the record is readable, false otherwise.

This record is read-write.

ReadOnce

Description

Use this property to specify whether this record is specified as read once. This property takes a Boolean value, true if the record is only read once, false otherwise.

This property is read-write.

ScenarioManaged

Description

Use this property to specify if the record is specified as scenario managed. This property takes a Boolean value, true if the record is scenario managed, false otherwise.

This property is read-write.

SyncOrder

Description

This property specifies the synchronization order for the record. It returns an integer value.

This property is read-write.

Writeable

Description

Use this property to specify if a record is specified as writeable. This property takes a Boolean value, true if the record is writeable, false otherwise.

This property is read-write.

AnalyticType Classes Example

The following is a typical example of using the AnalyticType classes.

```
import PT_ANALYTICTYPEDEFN:*;  
  
Local PT_ANALYTICTYPEDEFN:AnalyticTypeDefn &AnalyticType;  
  
Local PT_ANALYTICTYPEDEFN:AnalyticTypeRecordDefn &AnalyticTypeRecordDefn;  
  
&AnalyticType = create PT_ ANALYTICTYPEDEFN:AnalyticTypeDefn("BB_TEST");  
  
&AnalyticType.Create();  
  
&AnalyticType.AddModel("QE_BAM_GENX", %ModelType_ACE);  
  
&AnalyticTypeRecordDefn = &AnalyticType.AddRecordl("QE_BAM_CCSSMOKE");  
  
&AnalyticTypeRecordDefn = &AnalyticType.AddRecordl("QE_BAM_FACTTBL");  
  
&AnalyticType.Save();
```

Chapter 6

Application Classes

This chapter provides an overview of application classes and discusses the following topics:

- Application classes general structure.
- Import declarations.
- Self-reference.
- Property overrides.
- Superclass reference.
- Downcasting.
- Exception handling.
- Design of base classes.
- Declaration of application classes.
- Scope of an application class.
- Application classes built-in functions and language constructs.

Understanding Application Classes

You can create Application Packages in Application Designer. These *packages* contain application classes (and may contain other packages also). An application class, at its base level, is just a PeopleCode program. However, using the Application Packages, you can create your own classes, and extend the functionality of the existing PeopleCode classes.

The application classes provide capability beyond that offered by the existing PeopleCode classes. Unlike the existing classes, a subclass can inherit all the properties and methods of the class it extends. This provides all the advantages of true object-oriented programming:

- easier to debug because all the pieces are separate
- easier to maintain because functionality is gathered into a single place
- extensible by subclass

In addition, the application classes provide more structure. Using the Application Packages, you have a clear definition of each class, as well as its listed properties and methods. This makes it easier to create a complex program that uses many functions.

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Creating Application Packages and Classes"

When Would You Use Application Classes?

Use Application classes to help structure your existing PeopleCode functions. For example, prior to Application classes, most PeopleCode functions were put into FUNCLIB records. However, in larger, more complex programs, it is sometimes difficult to find (let alone maintain) a function. You could make every function a class in a package with very little reworking of your PeopleCode (as well as making the different fields in a record a package, and combining them into a single larger package.) This provides a better visual interface for grouping your functions.

In addition, use Application classes when you have to do generic processing, and just the details are different. For example, suppose one of the processes for your application is reading a file object and doing bulk insert. The process could all be contained in a single package, with the classes and subclasses providing all the details, different kinds of reading for different types of files, different inserts based on the record, and so on.

One of the main differences between a class and a function call is that the call to the class is dynamic, like a function variable, but more closely controlled. All the calls to the class (methods) must have the same signature.

For example, suppose you want to provide a more generic sort, with comparison function at the end of it. You want to use the array class Sort method, but your process has to be generic: you aren't certain if you're comparing two records or two strings. You could define a class that had as its main method a comparison, and return a -1, 0, or 1. Then write your personalized sort, extending the array class method Sort.

Another use is for business processing. Think in terms of core functionality, with vertical product solutions that extend the basic processing by providing specifics, in other words, by extending the general classes with subclasses. This could be appropriate for sales force automation or order entry.

Generally, use application classes where you can extract the common functionality.

Note. Do not extend a SOAPDoc with an application class. This is currently not supported.

Application Classes General Structure

All application classes are contained in a package. All application classes are composed of PeopleCode. In this section, we discuss the general form of an application class, which is:

- Class name
- Class extensions
- Declaration of public external interface
- Declaration of protected instance variables and methods
- Declaration of private instance variables and methods

- Definition of methods
- Constructors

This division enables a separation of the following:

- what the class provides to other classes
- what is applicable to the entire class
- what is applicable to the definition of a method

The data types used in an application class (for methods parameters, return values, and so on) can be any PeopleCode types, including application classes. Likewise, application classes can be used anywhere in a PeopleCode program where a general data type can be used.

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Understanding the PeopleCode Language," Data Types

Class Name

Application classes have a fully qualified name that is formed hierarchically by the name of the top-level package that contains them, the package that contains that package, and so on down to the short class name, that is, the one specified when the class was created in Application Designer, using a colon for the separator between names.

The fully qualified name of the class must be unique, as this is what identifies the class. The short name of the class does not have to be unique.

For example, suppose package CRM contains the application classes Address and Customer as well as the package Utilities, which in turn contains the application classes Address and Incident:

Application classes example

There are four distinct application classes in this example:

- CRM:Address
- CRM:Customer
- CRM:Utilities:Address
- CRM:Utilities:Incident

Note. If you change the name of a package or an application class, that name change is *not* automatically propagated through all your PeopleCode programs. You must make the change manually in your programs. If you specify an incorrect name for a package or application class, you receive a warning when you try to save the PeopleCode.

Class Extension

Extension represents the "is-a" relationship. When a class extends another class, it's called a *subclass* of that class. Conversely, the class being extended is called a *superclass* of that subclass.

A subclass inherits all of the public methods and properties (collectively called *members*) of the class it extends. These members can be overridden by declarations of methods and properties in the subclass.

Note. Application classes have no multiple inheritance (that is, being able to extend more than one class.)

Type checking in PeopleCode (both at design time and runtime) does strong type checking of application classes, tracking each application class as a separate type. A subclass can be used as the class it extends, because it implements the public interfaces of its superclass. This is called *subtyping*.

In the following example, the class `Banana` extends the class `Fruit`. `Banana` is the *subclass* of `Fruit`. From `Fruit`, you can extend to `Bananas`. However, from `Bananas` you can't extend to `Fruit`. Another way to think about this is you can only extend from the general to the specific, not the other way around.

```
class Fruit
  method DoFruit();
  property number FruitNum instance;
end-class;

class Banana extends Fruit
  method DoBanana();
  property number BananaNum instance;
end-class;
```

The following code shows a correct way to assign a class object, because `Banana` is a *subtype* of `Fruit`.

```
local Fruit &Bref = Create Banana();
```

The following is *not* correct. `Banana` is a subtype of `Fruit`. `Fruit` is *not* a subtype of `Banana`. This assignment causes an error at design time.

```
local Banana &Fref = Create Fruit();
```

Before you can extend a class, you must first import it. You must import all class names you use in a PeopleCode program before you use them.

See Also

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

Declaration of Public External Interface

The names of the members (that is, all the methods and properties of a class) must be unique only within that class. Different classes can have members with the same name. As members are used only with objects, and each object knows its class, the member that's accessed is the one associated with that class.

For example, more than one class has the property `Name` which returns the name of the object executing the property. There isn't any confusion, because the field `Name` property returns the name of a field, while the record name property returns the name of a record. No class has more than one property called `Name`.

Note. Within a class, each member name *must* be unique.

The public part of a class declaration specifies the methods and properties that the class provides to other PeopleCode programs. These methods and properties are *dynamically bound*, that is, the actual method that is called depends on the actual class of the object, as it might be an overridden method or property from a subclass.

In the following code example, the text in bold indicates the public part of the class declaration.

```
/* generic building class */
class BuildingAsset
  method Acquire ();
  method DisasterPrep();
end-class;
```

Access Control and the Declaration of Protected Properties and Methods

Application class objects have private and public access control. Properties or methods that are declared outside the "private" declaration section have public access control. This means that they can be referenced and used by any PeopleCode. This access is of course subject to access controls such as "readonly". Private properties and methods are private to the class, not instance, and can only be referenced by objects of this application class.

Between these two access control schemes of public and private, lies the concept of protected methods and properties. Protected methods and properties can be accessed only by objects of this application class and those derived from this application class. Use protected methods or properties when you want to hide them from outside use, but allow the flexibility of using them in derived classes.

The declarations of protected variables and methods are done within the class declaration, before the declaration of private variables and methods. You can use protected instance variables in interface classes. Protected methods and properties can be overridden by subclasses.

Most of the time your design can be implemented through the use of private methods and properties without resorting to the use of protected methods and properties. The following examples demonstrates the rules and some of the subtleties about when to use protected methods and properties.

```

class A;
    method A();
    property string Q;
protected
    method MP() Returns string;
    property string p;
end-class;

method A;
    &p = "Class A: property p";
end-method;

method MP
    /+ Returns String +/
    Return "Class A: method MP";
end-method;

=====

class B extends A;
    method B();
    method M(&X As C);
    method m2(&Aobj As A);
    /* property string P; */
protected
    property string Q;
    method MP() Returns string;
end-class;

method B;
    %Super = (create A());
    &Q = "Class B: property Q";
    /* &P = "Class B: property P"; */
end-method;

method M
    /+ &X as FOXTEST:C +/;

    MessageBox(0, "", 0, 0, "In B:M %This.P=" | %This.p);
    /* %This.p is class A property P */
    MessageBox(0, "", 0, 0, "In B:M %This.Q=" | %This.Q);
    /* %This.q is class B property Q */
    MessageBox(0, "", 0, 0, %This.MP());
    /* %This.MP() calls class B method MP */

    if &X.p = "Error" then
    end-if;
    /* error: cannot reference &X.p since class B is
    not involved in the implementation of class C */
end-method;

method m2
    /+ &Aobj as FOXTEST:A +/
    /* MessageBox(0, "", 0, 0, "In B:M2 &Aobj.P=" | &Aobj.p);
    /* Error: cannot reference &Aobj.p from class B
    since class B is not involved in its implementation */

End-method;

method MP
    /+ Returns String +/
    Return "Class B: method MP";
end-method;

```

```

=====

class C extends A;
    method C();
protected
    property string P;
end-class;

method C;
    %Super = (create A());
    &P = "Class C: property P";
end-method;
=====

/* AE program */
import FOXTEST:*;

Local A &A = (create A());

Local object &obj = &A;
MessageBox(0, "", 0, 0, "In AEMINITEST: &obj.p=" | &obj.P);
/* run time error: anonymous access through type
object not allowed*/

```

The following example also illustrates some of the rules surrounding protected access control.

```

import FOXTEST:Point3d;

class Point
  method Point(&X1 As integer, &Y1 As integer);
  method Warp(&A As Point3d);
protected
  property integer x;
  property integer y;
end-class;

method Point
  /+ &X1 as Integer, +/
  /+ &Y1 as Integer +/;

  %This.x = &X1;
  %This.y = &Y1;
end-method;

method Warp
  /+ &A as FOXTEST:Point3d +/
  /* Local Integer &temp = &A.Z; ERROR cannot access &A.Z */
end-method;
=====
import FOXTEST:Point;

class Point3d extends Point
  method Point3d(&X1 As integer, &Y1 As integer, &Z1 As integer);
  method Delta(&P As Point);
  method Delta3d(&Q As Point3d);
protected
  property integer z;
end-class;

method Point3d
  /+ &X1 as Integer, +/
  /+ &Y1 as Integer, +/
  /+ &Z1 as Integer +/;
  %Super = (create Point(&X1, &Y1));
  %This.z = &Z1;
end-method;

method Delta
  /+ &P as FOXTEST:Point +/
  /* &P.x = %This.x;
  ERROR cannot access &P.x since while Point3d
  (the class in which references to fields x and y occur)
  is a subclass of Point (the class in which x and y are declared),
  it is not involved in the implementation of Point (the type of parameter p)*/
  /* &P.y = %This.y;
  ERROR cannot access &P.y. Same reason as above */
end-method;

method Delta3d
  /+ &Q as FOXTEST:Point3d +/
  /* The protected members of Q can be accessed because the class point3d is a⇒
  subclass of Point and is involved in the implementation of Point3d */
  &Q.x = %This.x;
  &Q.y = %This.y;
  &Q.z = %This.z;

end-method;

```

Declaration of Private Instance Variables and Methods

The private part of a class declaration gives the declaration of any private methods, instance variables, and private class constants. Private methods *cannot* be overridden by subclasses, because they are completely private to the declaring class. Likewise, the instance variables can't be overridden.

The declarations of private variables and methods are done within the class declaration.

Note. You cannot have private methods or instance variables in an interface type of class.

In the following example, there are both public as well as private methods and properties. Any method that is declared before the keyword `Private` in the initial class declaration is public. Any method declared after the keyword `Private` is private. Properties are only declared in `Public`. Instances and Constants are only declared in `Private`

In the following example, the class `Example` extends the class `ExampleBase`. It has both public as well as private methods and properties. It also defines the private method in the definition of methods section of the code (the private definitions are marked **like this**.)

```

import PWWPACK:ExampleBase;

class Example extends ExampleBase
    method Example();
    method NumToStr(&Num As number) Returns string;
    method AppendSlash();
    property number SlashCount get;
    property number ImportantDayOfWeek get set;
    property string SlashString readonly;
    property date ImportantDate;
private
    method NextDayOfWeek(&Dow As number) Returns date;
    Constant &Sunday = 1;
    instance string &BaseString;
end-class;

Global string &CurrentBaseString;

/* Method declarations */
method NumToStr
    return String(&num);
end-method;

method AppendSlash
    &SlashString = &SlashString | "/";
end-method;

get SlashCount
    Return Len(&SlashString) - Len(&BaseString);
end-get;

get ImportantDayOfWeek
    Return Weekday(&ImportantDate);
end-get;

set ImportantDayOfWeek
    &importantdate = %This.nextdayofweek(&newvalue);
end-set;

/* Private method. */
method nextdayofweek
    Return &ImportantDate + (&dow - Weekday(&ImportantDate));
end-method;

/* Constructor. */
method Example
    &BaseString = &CurrentBaseString;
    &SlashString = &BaseString;
    &ImportantDate = Date(19970322);
end-method;

```

Definition of Methods

After the declaration of any global or component variables and external functions needed by the methods, comes the actual definition of the methods. This section discusses some of the differences in how application programs are processed by the system, and how application class method parameters are processed.

- The system *never* skips to the next top-level statement.
- Application programs generally pass parameters by value, which is not the same as for existing functions.

- Parameter passing with object data types is by reference.
- Application programs use the `out` specifier to pass a parameter by reference.

Not Skipping to The Next Top-Level Statement

For existing functions and programs, the system skips to the next top-level statement in some circumstances, such as a field not found error. This never happens in an application class program. The code is always executed or an error is produced.

Passing Parameters in Application Class Methods

The parameters to a method are passed by value in the absence of an *out* specification in the parameter list. However, if a parameter list has an *out* specification, that argument (when used in the call of a method) must be a value that can be assigned something, and is passed by *reference*. In particular this means you cannot pass an object property to a method which requires the parameter to be an "out" parameter. Application class properties are always passed by value.

For example:

```
/* argument passed by reference */
method increment(&value as number out);
```

```
/* argument passed by value */
method increment(&value as number);
```

This is in contrast with existing PeopleCode functions that pass *all* parameters by reference when they can be assigned something. This means the method signature is a specification of which parameters can be updated by the method. This makes the code easier to debug and maintain because it's easy to see what can be updated and what can't.

The following is an example of code that increments a variable by one.

```
local Number &Mine;

&Mine = 1;

&obj.Increment(&Mine);
```

&Mine now has the value 2.

You cannot pass properties by reference. For example, supposed `MyProp` is a property of class `Xan`, a statement that requires a reference doesn't work if you supply the property. The following code will always fail because `&Xan.MyProp` is always passed by value and the `MySqlExec` method requires it to be passed by reference (so a value can be returned.)

```
MySqlExec("select from bar", &Xan.MyProp)
```

This makes sense because the semantics of an object require that you can only change a property with standard property references, not as a side affect of some other action.

Passing Parameters with Object Data Types

Parameters with object data types are always passed by reference:

```
/* argument passed by reference */
method storeInfo(&f as File);
```

If you specify the out modifier for a method parameter with an object data type, it becomes a *reference parameter*. This means that the parameter variable is passed by reference instead of the object that it is pointing at when passed.

For example, if you pass an object parameter with the out modifier:

```
method myMethod(&arg as MyObjectClass);

Local MyObjectClass &o1 = create MyObjectClass("A");
Local MyOtherObjectClass &o2 = create MyOtherObjectClass();

&o2.myMethod(&o1);
```

And inside myMethod this occurs:

```
Method myMethod
    &arg = create MyObjectClass("B");
end-method;
```

Since the method argument is reassigned within the body of myMethod, &o1 does not point at the new instance of MyObjectClass (initialized with "B") after the method call completes. This is because &o1 still references the original instance of MyObjectClass.

However, if &o1 had been passed with the out modifier, after the method call completes, &o1 points at whatever the parameter was last assigned to; in this case, the new instance of MyObjectClass. The parameter, rather than the object, is passed by reference.

Using the Out Specification for a Parameter

In the following example, a class, AddStuff, has a single public method, DoAdd. This adds two numbers together, then assigns them as different numbers. In the signature of the method declaration, the first parameter is *not* declared with an out statement, while the second one is.

```
class AddStuff
    method DoAdd(&P1 as number, &P2 as number out);
end-class;

method DoAdd
    &X = &P1 + &P2;
    &P1 = 1;
    &P2 = 2;
end-method;
```

In the following PeopleCode example, an object named &Aref is instantiated from the class AddStuff. Two parameters, &I and &J are also defined.

```
local AddStuff &Aref = Create AddStuff();
local number &I = 10;
local number &J = 20;
```

The following code example is correct. &J is changed, because of the *out* statement in the method signature, and because the value is being passed by reference. The value of &I is *not* updated.

```
&Aref.DoAdd(&I, &J); /* changes &J but not &I */
```

The following code example causes a design time error. The second parameter must be passed *by reference*, not by value.

```
&Aref.DoAdd(10, 20); /* error - second argument not variable */
```

Declaration of Abstract Methods and Properties

You can declare methods and properties as abstract, that is, a method or property that has a signature which specifies the parameters and results, but has no implementation in the class that defines it. The implementation may occur in one of the classes that extend the class where the method or property is initially defined.

Abstract methods and properties could be used, for example, when your application wants to provide a means for in-field customization. Your application might deliver a base class specifying the abstract methods and properties and you would allow the customization to complete those methods and properties by using a class that would extend the base class and provide implementations for some or all of the abstract methods and properties.

For a class that only contains abstract methods and properties, that is, a pure interface class, you would define a PeopleCode interface, instead of a class. You define a PeopleCode interface by using the keyword `Interface` instead of `Class`. In an interface, all the methods and properties are abstract by default.

The following example illustrates the use of abstract methods and properties. Class `MyInterface` is the base class which has mostly abstract methods and properties. However it is fully specified by the class `MyImplementation` which provides an implementation for all the methods and properties.

```

class MyInterface
    method MyMethod1() abstract;
method MyMethod2() Returns string abstract;
method MyMethod3();
    property string myproperty1 abstract readonly;
    property number myproperty2 abstract;
property number myproperty3 abstract;
end-class;
method MyMethod3
end-method;
-----
import FOXTEST:MyInterface;

class MyImplementation extends MyInterface;
    method MyImplementation();
    method MyMethod1();
    method MyMethod2() Returns string;
    property string myproperty1 readonly;
    property number myproperty2;
    property number myproperty3;
end-class;

method MyImplementation
    %Super = Create MyInterface();[Ugh.]
end-method;

method MyMethod1
    /* dummy */
end-method;

method MyMethod2
    /* Returns String */
    Return "MyMethod2's implementation is this";
end-method;

```

Considerations Using Abstract Methods and Properties

Be aware of the following considerations when using abstract methods or properties.

- You cannot have private abstract methods.
- You will receive an error if you try to provide a method body for an abstract method.
- The method signatures must be identical between the abstract method definition and the method implementation in the derived subclass.
- You will receive an error if you try to provide a Get or Set body with an abstract property.
- You will receive an error and your PeopleCode program will be terminated if you try to call an abstract method or property at runtime, unless caught in a try-catch statement.
- The class that implements an interface must still assign %Super in its constructor.

Interfaces

The concept of an interface class is purely a syntactic assist when you are defining an application class which is totally composed of abstract methods and properties. In this case by simply specify the keyword **interface** you are indicating that all the methods and properties are abstract. The following two definitions are semantically equivalent.

```

class MyInterface
    method MyMethod1() abstract;
method MyMethod2() Returns string abstract;
    property string myproperty1 abstract readonly;
    property number myproperty2 abstract;
property number myproperty3 abstract;
end-class;

Interface MyInterface
    method MyMethod1();
method MyMethod2() Returns string;
    property string myproperty1 readonly;
    property number myproperty2;
property number myproperty3;
end-class;

```

When you provide an implementation for an Interface you can also use the keyword **Implements** instead of **Extends**. While this is not mandatory, specifying **Implements** describes more accurately what your application class is doing.

If your class implements an interface, you don't need to create a super object interface since the system does that automatically for you.

In addition if your constructor takes no parameters and simply exists to assign to the created instance to %super (that is, there is only one statement such as %Super = create mySuper(); then you don't need to use a constructor at all.

Constructors

The constructor for a class is the public method with the same name as the (short name of the) class. The statements contained in this method (if any) provide the initialization of the class.

This constructor is *always* executed when an object of the class is instantiated.

Note. Before a constructor runs, the instance variables for the class are set by default based on their declared types.

Instantiate new objects of an application class by using the Create function. This function takes the name of the class, and any parameters needed for the constructor method.

If the short class name is unambiguous, that is, only one class by that short name has been imported, you can use just the short class name.

The following code instantiates an object of the class Fruit:

```
&Fref = Create Fruit();
```

If there's a possibility that the name is ambiguous, you can use the full class name to instantiate the object.

The following code instantiates an object of the Invoice class:

```
&InvObj = Create pt:examples:Invoice();
```

If the Create function is used in the context of further object expressions, that is, with a reference to members by a dot operation, the function call must be enclosed in parentheses. This is to emphasize that the creation happens before the member reference. For example:

```
&InvCust = (Create Invoice()).Cust();
```

If necessary, the constructor is supplied its parameters by the call-list after the class name in the create statement. For example:

```
&Example = create Example(&ConstructorParameter1, 2, "Third");
```

A class that does not extend some other class does not need any constructor.

A class that extends another class must have a constructor, and in the constructor, it must initialize its super class. This restriction is relaxed if the super class constructor takes no parameters, and all the constructor does is assign it to %Super. In this case, the runtime creates the super object and runs its constructor automatically. The benefit of this is two-fold: at design time you do not need to provide a constructor since the runtime automatically does the equivalent of `%Super = Create MySuperObject();` Also, at runtime, you may notice a performance increase since the super class object creation and construction are done without any PeopleCode. This latter benefit can be compounded in the case where there are multiple levels of inheritance.

To the general case, to initialize a superobject, an instance of the superclass is assigned to the keyword %Super in the constructor for the subclass. This assignment is allowed only in the constructor for the subclass.

The following example shows this type of assignment:

```
class Example extends ExampleBase
    method Example();
    ...
end-class;

Global string &CurrentBaseString;

method Example
    %Super = create ExampleBase();
    &BaseString = &CurrentBaseString;
    &SlashString = &BaseString;
    &ImportantDate = Date(19970322);
end-method
```

If your subclass' constructor only exists to create the superclass object and assign that to your %Super, you can dispense with providing a constructor completely as the following example illustrates.

```
class A
    ...
end-class;

Class B extends A
    ...
end-class;

Class C extends B
    ...
end-class;

...
Local C &c = Create C();
...
```

Classes A, B and C have no constructors and the one call to `Create C` creates objects of class C, B and A and run their constructors. PeopleSoft recommends that unless your constructors take parameters and need to do more than be assigned to their %Super, that you do not provide constructors since that simplifies design time as well as may improve runtime performance significantly.

The above example is semantically equivalent to the following, except that it may run much faster, since it does not have to run `PeopleCode` at each step of the construction process.

```
class A
...
end-class;

Class B extends A
    Method B();
...
end-class;

method B
%Super = Create A();
end-method;

Class C extends B
    Method C();
...
end-class;

method C
%Super = Create B();
end-method;
```

Note. Application classes don't have destructors, that is, a method called just before an object is destroyed. The `PeopleCode` runtime environment generally cleans up any held resources, so they're not as necessary as they are in other languages.

[Chapter 6, "Application Classes," Superclass Reference, page 218](#)

External Function Declarations

External function declarations are allowed in application classes, in the global and component variable declarations, after the class declaration (after the `end-class` statement), and before the method definitions. For example:

```

import SP:Record;

class Person extends SP:Record
    method Person(&pid As string);

    method getPerson() Returns Record;
    method getUsername() Returns string;

private
    instance Record &recPerson;

end-class;

Declare Function getUsername PeopleCode FUNCLIB_PP.STRING_FUNCTIONS FieldFormula;

method Person
    /+ &pid as String +/

    %Super = create SP:Record(Record.SPB_PERSON_TBL);
    &recPerson = %Super.getRecord();
    &recPerson.PERSON_ID.Value = &pid;

end-method;

method getPerson
    /+ Returns Record +/

    Return &recPerson;

end-method;

method getUsername
    /+ Returns String +/
    Local string &formattedName;

    &formattedName = getUsername(&recPerson.PERSON_ID);
    Return &formattedName;
end-method;

```

When application class properties and instance variables are used as the argument to functions or methods, they are always passed by value, never by reference. This means that the called function or method cannot change the value of the property or instance variable. If you want a function call to change a property or instance variable, use a local variable in the call and then assign the property or instance variable after the call.

Suppose you have the following class and you want to call Meth2 in the body of Meth1, passing it MyProp:

```

class MyClass
    property number MyProp;
    method Meth1();
    method Meth2(&i as number out);
end-class;

```

The following PeopleCode *fails* with a compile-time error:

```

method Meth1
    Meth2(%This.MyProp); /* error - field or temp name required. */
    Meth2(&MyProp); /* error - field or temp name required. */
end-method;

```

The following PeopleCode is valid:

```
method Meth1
/* Assignment needed if &i is input as well as output in Meth2. */
    local number &Var = %This.MyProp;
    Meth2(&Var);
    %This.MyProp = &Var;
end-method;
```

Note. You call a Java program from an Application Class the same way you do using any other PeopleCode program, that is, by using one of the existing Java class built-in functions.

See [Chapter 22, "Java Class," From Java to PeopleCode, page 1090.](#)

Naming Standards

This section describes the naming standards for:

- Packages.
- Classes.
- Methods.
- Properties.

Naming Packages

The naming standard for application packages is in the following format.

CC_XXX[_YYY]

Where CC is the company name (for example, PS is PeopleSoft), XXX is the product line, and YYY is the product code.

Examples are PS_CRM and PS_CRM_RB.

Naming Classes

Use a constructor to be the same name as the short name for the class. PeopleSoft recommends that you do not name classes to be GetXxx.

Naming Methods

Make method names simple verb or verb object words, spelled out, first letter of each word capitalized.

Examples: GetField, Save, SetDefault, WriteRecord

Naming Properties

Make property names nouns, likewise spelled out, first letter of each word capitalized. Examples: Dimension, HTTPMethod, PathInfo, SubscriptionProcessId.

For Boolean read-only properties, sometimes IsXxx is appropriate. Examples: IsOpen, IsNewFieldID, IsChanged, IsDeleted

State Boolean properties positively, that is, IsChanged, as opposed to negatively, IsUnChanged. This avoids double negatives when testing (If Not &MyField.IsUnChanged Then. . .)

Import Declarations

Before you can use a class name in a PeopleCode program (either a class definition program or an ordinary PeopleCode program), you must first import it using an import statement at the beginning of your program.

An import statement names either all the classes in a package or one particular application class.

If you're importing all the classes in a package, the syntax for the import statement ends with the following:

```
: *
```

This makes all the application classes directly contained in the named package available. Application classes contained in subpackages of the named package are *not* made available.

If you're importing one particular application class, the syntax of the import statement ends with the short name of the class. Only that class is made available.

For example, the following imports all the classes of the package named Fruit:

```
Import Fruit: *;
```

The following imports only the application classes Banana and Kiwi. If the package named Fruit contains other classes, those are not made available to the PeopleCode program:

```
Import Fruit: Banana;
```

```
Import Fruit: Kiwi;
```

If you had a subpackage in Fruit named Drinks, you could access all the classes in that subpackage like this:

```
Import Fruit: Drinks: *;
```

A PeopleCode program (either a separate program or one contained within a class definition) can use only application class names that have been imported. However, a class definition can use its own name without having to import it.

It's possible to import two packages which contain application classes with the same short name. For example, suppose my package Fruit contained classes Apple and Banana. Suppose a second package, Drinks, contained Apple and Cherry.

```
Import Fruit: *;
```

```
Import Drinks: *;
```

You could refer to the Banana and Cherry classes using just the short name of the class. However, you couldn't refer to the Apple class by the short name. You must always use the full name reference (that is, the name of the package and the name of the class) when referring to Apple.

```
Global Banana &MyBanana;
```

```
Local Cherry &CherryTree;
```

```
Component Fruit:Apple &GreenApple;
```

The following line produces an error, because the program doesn't know which Apple class you're referring to:

```
Component Apple &GreenApple;
```

Note. Single class imports (such as, Import Fruit:Banana) are checked for existence when you save your PeopleCode.

Self-Reference

A method can refer to the current object using the %This system variable.

Due to subtyping, %This is an object of either the method's class or a subclass of the method's class.

In PeopleCode, the methods and properties of the class *cannot* be used without an object qualification.

In the following code example, the line in bold indicates an error. You can't call the class this way: you must use %This.

```
class FactorialClass
  method factorial(&I as number) returns number;
end-class;

method factorial
  if &I <= 1 then
    return 1;
  end-if;

  return &I * factorial(&I - 1); /* error - factorial undefined */

  return &I * %This.factorial(&I - 1); /* okay */
end-method;
```

One of the implications of this is that when you're writing a method, there isn't any way to guarantee you'll access your own class' version of a public method (rather than a subclass') as it might be overridden by a subclass. The only way to make sure that you can access your own method is to make it private.

If you have some action that you also want to make public, and you want guaranteed access to it, you can make the action a private method, then define a public method for it that calls the private one.

In the following example, factorial is the public method that can be used by other classes. myFactorial is the private action.

```

class FactorialClass
    method factorial(&I as number) returns number;
private
    method myFactorial(&I as number) returns number;
end-class;

method factorial
    return myFactorial(&I);
end-method;

method myFactorial
    if &I <= 1 then
        return 1;
    end-if;

    return &I * %This.myFactorial(&I - 1);
end-method;

```

If you declare an instance variable as private you can still access it as a private property in another instance of the same class. For example, given the following declaration:

```

class Example
    private
        instance number &Num;
end-class;

```

A method of Example could reference another Example instance's &Num instance variable as follows:

```
&X = &SomeOtherExample.Num;
```

Using %This with Constructors

%This when used in application class constructor code refers to the object currently being constructed. It does not refer to the dynamic this pointer of some object under construction. Given these two application classes, the PeopleCode %This.Test() in the Base constructor *always* refers to the Test method in the Base class.

```

class Base
    method Base();
    method Test();
    method CallTest();
    property string sTestResult;
end-class;

method Base
    %This.Test();
end-method;

method Test
    &sTestResult = "BASE_METHOD_CALLED";
end-method;

method CallTest
    %This.Test();
end-method;

import PACKAGE:Base;

class Extend extends PACKAGE:Base;
    method Extend();

    method Test();
end-class;

method Extend
    %Super = create PACKAGE:Base();
end-method;

method Test
    /* Extends/implements PACKAGE:Base.Test */
    %This.sTestResult = "EXTENSION_METHOD_CALLED";
end-method;

```

Even though the Extend class method provides its own Test method which overrides Base's Test method, in PeopleCode create Extend() which ultimately runs Base's constructor, the %This.Test() call in Base's constructor still references Base's Test method, not Extend's Test method, because %This always refers to the object under construction

Properties and Constants

This section discusses the following ways to use properties and constants with application classes:

- Differentiating between properties and methods.
- Overriding properties.
- Using the Get and Set keywords.
- Using read-only properties.
- Using methods and properties for collections.
- Declaring constants.

Differentiating Between Properties and Methods

A method is a procedure or routine, associated with one or more classes, that acts on an object.

A property is an attribute of an object.

PeopleSoft recommends that you use read-write or read-only properties instead of creating methods named GetXxx and SetXxx. For example, instead of creating a method GetName, that takes no parameter, just to return the name of an object, create a read-only property Name.

If your properties simply set or return the value of an instance variable, it is far more efficient to declare the property that way than have a get and set method. The overhead of having a get and set method means that each time the property is reference some PeopleCode has to be run.

Application classes can have read-only properties, but no indexed properties.

Considerations Creating Public Properties

There are two implementations of (public) properties:

- as instance variables.
- as get-set methods.

From outside the class, you cannot tell the difference between them (for example, both are dynamically bound). However, if you just want to expose an instance variable to users of the class, you can declare a property of that name and type, which declares the instance variable too:

```
class xxx
    property string StringProp;
end-class
```

If you want the property to be read-only outside the class, use the following code:

```
class xxx
    property string StringProp readonly;
end-class
```

Both of these code examples declare an instance variable called &StringProp and provide its value for getting and change its value for setting (if not readonly). You can think of this as shorthand for the usual implementation of get-set methods.

If you want to implement the same with code (perhaps deriving the property from other instance variables or other data), use the following sort of PeopleCode program:

```
class xxx
    property string StringProp get set;
end-class;

get StringProp
    return "string"; /* Get the value from somewhere. */
end-get;

set StringProp
    /* Do something with &NewValue. */
end-set;
```

To specify a read-only property, omit the set portions of the code example.

Overriding Properties

A property of a superclass can be overridden by a subclass by providing a different implementation.

The properties of a class are implemented by the keywords `Get` and `Set`, or by access to an otherwise private instance variable.

To access the property, you do not have to specify `Get` or `Set`: the context tells the processor which task you're doing. To create read-only properties, specify only a `Get` method, with no `Set` method, or for instance variable properties, specify `Readonly`.

For an instance variable property, there are two different ways for method code in the class itself to refer to the property:

- `%This.PropertyName`
- `&PropertyName`

The first way is dynamically bound, as it uses whatever (possibly overridden by a subclass) implementation of *PropertyName* that the current object provides.

The second way always accesses the private instance variable of the class that the method is declared in.

The following example returns strings, by converting the property. It also demonstrates overriding.

```

class A
    property number Anum;
    property string Astring get;
    property string Astring2 get;
end-class;

/* The following is a dynamic reference to the Anum property of the current⇒
object, which might be a subclass of A, so this might not access the A⇒
class's implementation of Anum as an instance variable. */
Get Astring
    return String(%This.Anum);
end-get;

/* The following is a static reference to our &Anum instance variable. Since it⇒
does not use %This, it will not be overridden even if the current object is a⇒
subclass of A. */
Get Astring2
    return String(&Anum);
end-get;

/* The following overrides the Anum property of our superclass,
in this case by providing another instance variable implementation.
This gives us our own &Anum instance variable. */
class B extends A
    property number Anum;
end-class;

...
/* Set the Anum property in B. Because of the above definitions, this sets
the &Anum instance variable in the B object, but not the &Anum instance
variable in its superobject. In the absence of other setting, the latter will
be defaulted to 0. */

local B &B = Create B();
&B.Anum = 2;

&MyValue = &B.Astring; /* &MyValue is "2" */
&MyValue = &B.Astring2; /* &MyValue is now "0" */

```

Using Get and Set with Properties

PeopleSoft recommends against using read-only properties that are public and mutable in application classes (similar to public instance variables) because this allows external code to read and change the internal state of the object without any controls. Instead, modify the property declarations with the Get and Set keywords.

There is a slight performance advantage, and you write less code, if you use the Get and Set keywords over using get and set methods.

If you define a property with the Get and Set keywords, you also must define a get or set block in the same part of the code that contains the method bodies.

Using Read-Only Properties

PeopleCode read-only properties are functionally similar to static variables, as long as the class that defines the properties initializes them and does not change them. The difference is that you need an instance of the class to access them.

For example, consider a `Category` object that has a `CategoryType` member that can have one of the following values:

- 'R' for Regular
- 'B' for Browse
- 'N' for News

You can define three read-only properties corresponding to each of these values, `REGULAR`, `BROWSE`, and `NEWS`, then initialize them to the appropriate values in the constructor of the class.

When you write code to evaluate the `CategoryType` of the `Category` object, perform a test like this:

```
If (&category.getCategoryType() = &constants.NEWS) then...
```

PeopleSoft recommends referring to the read-only properties, rather than their literal values, for the following reasons:

- If you spell a literal value incorrectly, the PeopleCode editor does not catch it; if you spell a read-only property wrong, it does.
- If you ever need to change the value of a read-only property, you only have to do it in one place.
- It makes the code more maintainable and reusable (because `NEWS` is more intelligible than 'N').

Using Methods and Properties for Collections

Application classes can contain collections. Collections of objects generally have at least the following methods and properties.

- `First()`
- `Item(Index)`
- `Next()`
- `Count` (as a property)

All numeric indexes in PeopleCode are one-origin, that is, start all indexes at 1, not 0.

Declaring Constants

PeopleSoft recommends that if constants are inextricably linked to a class, you should define them within that class. If the constants are more general, potentially used by multiple classes, consolidate the constants into a constants class at application-level or package-level.

Message catalog set and message numbers are good candidates to centralize into a single constants class. It can improve the readability of code and make it easier to maintain these values.

For example, you can define a constant `MSG_SET_NBR`, and then define constant values for each message that explain a little about what the message represents (like `REQUIRED_VALUE_MISSING`, `UNIMPLEMENTED_METHOD`, or `INSUFFICIENT_PRIVILEGES`).

Using Variables in Application Classes

This section discusses how to use the following variables in application classes:

- Instance variables.
- Global variables.
- Overriding variables and properties.

Placement of Variable Declarations

Variables are declared after the class definition (the end-class statement) before anything else. After you have declared a variable, you can use it anywhere in your program.

```
class Example
  method Example_M1(&par As string);
end-class;
```

Global boolean &b;

```
method Example_M1
  /+ &par as String +/
  &b = False;
end-method;
```

Declaring Private Instance Variables

A private instance variable is private to the class, not just to the object instance. For example, consider a linked-list class where one instance needs to update the pointer in another instance. Another example is the following class declaration:

```
class Example private instance number &Num; end-class;
```

A method of Example could reference another instance of the Example &Num instance variable as:

```
&X = &SomeOtherExample.Num;
```

Avoid making every instance-scoped variable a public property. You should consider each variable individually and decide if it belongs in the public interface or not. If it does, decide if the variable warrants get or set modifiers and therefore should be a public property. If the variable only serves internal purposes to the class, it should be declared as a private instance variable.

Global Variables

PeopleSoft recommends avoiding global variables in application classes unless there is a situation where no other code works. Generally, an application class should not know about anything scoped outside of its instance. There are exceptions, since not all application classes should be standalone. For example, an application class that interacts with the Component Buffer must know about the Component Buffer objects.

Overriding Variables and Properties

PeopleSoft recommends against overriding of variables and of properties.

Since instance variables are private in scope, you cannot access them in subclasses, but you can redeclare them in subclasses. The same is true of public properties; you can even explicitly access the overridden or overriding property. However, overriding is not recommended.

Superclass Reference

A method can refer to a member of its superclass by using the %Super system variable. This construction is needed only to access superclass members that are hidden by overriding members in the current class.

In the following example, the classes that extend the general BuildingAsset class each have their own method DisasterPrep, that does the specific processing, then calls the superclass (generic) version of DisasterPrep.

```
/* generic building class */
class BuildingAsset
    method Acquire();
    method DisasterPrep();
end-class;

method Acquire
    %This.DisasterPrep();
end-method;

method DisasterPrep
    PrepareForFire();
end-method;

/* building in Vancouver */
class VancouverBuilding extends BuildingAsset
    method DisasterPrep();
end-class;

method DisasterPrep
    PrepareForEarthquake();
    %Super.DisasterPrep(); /* call superclass method */
end-method;

/* building in Edmonton */
class EdmontonBuilding extends BuildingAsset
    method DisasterPrep();
end-class;

method DisasterPrep
    PrepareForFreezing();
    %Super.DisasterPrep(); /* call superclass method */
end-method;

local BuildingAsset &Building = Create VancouverBuilding();

&Building.Acquire(); /* calls PrepareForEarthquake then PrepareForFire */

&Building = Create EdmontonBuilding();

&Building.Acquire(); /* calls PrepareForFreezing then PrepareForFire */
```

Downcasting

Downcasting is the process of determining if an object is of a particular subclass type. If the object has that subtype (either the object is of that subtype, or is a subtype of it), a reference to the subobject is returned, otherwise Null is returned. In either case, the type of the resulting value is compatible with the named subclass type.

This downcast inquiry into the actual type of an object can be used when the object has been passed to some general facility, then passed back to more specific code. For example, the general facility might be a dispatch mechanism, or a new storage structure such as a binary balanced tree. These general facilities won't know about specific types, but it might be necessary for the specific program using the general facility to recover the actual type of an object that is returned to it by the general facility.

A downcast should *not* be used when you could add members to a common base class to provide the same functionality. In other words, if you find yourself using the downcast to test whether the object is one or another of several related types, you should add members to the common base class to provide the operations or properties that you are trying to access, then provide separate implementations of those actions or properties in each specific class.

If the downcast operator is to be used in the context of further object expressions (such as references to other members using dot notation) then the downcast must be enclosed in parentheses to emphasize that the downcast happens before the member reference.

```
class Fruit
    property number FruitCount;
end-class;

class Banana extends Fruit
    property number BananaCount;
end-class;
```

In the following code example, first the variables are assigned. All the variable assignments are legal, for Banana is a subtype of Fruit.

```
local Banana &MyBanana = Create Banana();
local Fruit &MyFruit = &MyBanana; /* okay, Banana is a subtype of Fruit */
local number &Num = &MyBanana.BananaCount;
```

The next two lines of code don't produce an error, as &MyFruit is currently a Banana at runtime.

```
&MyBanana = &MyFruit as Banana;

&Num = (&MyFruit as Banana).BananaCount; /* same as &MyBanana.BananaCount */
```

In the next lines of code, we're reassigning &MyFruit to be of type Fruit, that is, of the superclass Fruit. When you try to reassign &MyFruit as Banana, &MyBanana is assigned as Null, because &MyFruit is no longer of type Banana.

```
&MyFruit = Create Fruit();

&MyBanana = &MyFruit as Banana; /* assigns Null - &MyFruit isn't a Banana */
```

Exception Handling

Use the Exception class to do exception handling in your PeopleCode. This class provides a try, catch, and throw mechanism so you don't need to check after each operation for errors. Instead, by the structure of the try-catch statements, you can declare when you are interested in handling exceptions, and how you want to handle them.

Exceptions are instances or subclasses of the PeopleCode Exception class. PeopleSoft recommends that when applicable, application class methods should throw exceptions instead of communicating back to the calling code with return values. You can create exceptions by:

- Creating an Exception base class that encapsulates the built-in function call and handles its function parameters consistently. This is the preferred way.
- Calling the built-in function CreateException.

Since a method can throw exceptions for several different reasons, PeopleSoft recommends that you:

- Create Exception subclasses often.
- Throw strongly typed exceptions.

This allows the calling code to make decisions based on the exception type.

For example, a method that retrieves customer data from a database might throw an exception named SQLException if a database error occurs, or an exception named PrivilegeException if the current user doesn't have the appropriate permissions to perform the operation. There could be different errors causing either of these exception types to be thrown in this method; if necessary, you can write the calling code to examine the specific message numbers and react accordingly.

PeopleSoft recommends that you always catch an exception; if it is not caught, it causes a runtime error. Use a try-catch block.

Not catching an exception causes a runtime error and can cause PeopleTools to display a dialog box with the message catalog entry and information about the technical context of the exception. The reasons for avoiding this by using try-catch blocks are:

- Application code often continues some form of processing even in the event of an exception; you should not assume that the script stops all processing if an exception occurs.
- The error message that PeopleTools displays might not be appropriate for end-users because of its technical information.

Commenting and Documenting Application Classes

This section contains guidelines for writing method header comments, class header comments, and tags inside the comments. It discusses:

- Comments and documentation
- Method header comments
- Class header comments

Understanding Comments and Documentation

Documentation is important in all code, but even more so in application class code, which aims at, and incurs certain overhead in the name of, higher levels of reuse.

There are two types of inline comments:

- Internal comments, which start with `/*` and end with `*/`.
- Comments which can potentially be used to generate API documentation, which start with `/*` and end with `*/`. You can write method header and class header comments for application classes, and you can use the comment tags, with this type of comment.

Warning! In application classes you will see the use of `/+ +/` style comments. *Do not use these in your PeopleCode.* These annotations are generated by the compiler. If you use them, they will be removed the next time you validate, compile, or save your PeopleCode. They are used to provide signature information on application class methods and properties, and are regenerated each time the compiler compiles your application class PeopleCode. Instead, use the standard commenting mechanisms listed above.

PeopleSoft recommends keeping a running line of asterisks along one side of an extensive comment to help the readability of the code by making the entire comment stand out from the surrounding code.

Method Header Comments

The following is an example of documentation conventions for method header comments, which are also suitable for PeopleCode. It contains comment tags, which are explained below the example.

```
/**
 * Description of what method does
 *
 * @param a optional description of param a
 * @param b optional descriptions of param b
 * @exception PrivilegeException thrown if etc, etc
 * @exception SQLException thrown if etc., etc.
 * @return String - description of potential values
 */
Method myMethod
...
End-method;
```

Method Comment Tags

The following are the suggested tags for commenting methods.

Tag	Description
<code>@param N</code>	Specify a description for each method parameter. The name of the parameter is specified after the keyword <code>@param</code> .
<code>@exception name</code>	Specify a description of each exception class. The name of the exception is specified after the keyword <code>@exception</code> . For example, the descriptions can explain what causes certain exceptions to be thrown.
<code>@return Type</code>	Specify a description of the return value. The type of data that is returned is specified after the keyword <code>@return</code> . For example, explain the potential values a method may return, whether it returns null in some circumstances, and so on.

Not all methods require documentation. For example, some simple set or get methods have method signatures that are descriptive enough. In other cases, it may suffice to include a brief sentence in the header explaining what the method does.

As with methods, PeopleCode get or set blocks should also carry method header comments.

Class Header Comments

Header comments for the class should provide descriptive information about the class, and may optionally include additional tags, indicating version and author:

```
/**
 * class description
 *
 * @version 1.0
 * @author amachado
 */
```

Class Header Comment Tags

The following are the suggested tags for commenting class headers.

Tag	Description
<code>@version number</code>	Specify a version number for a class.
<code>@author name</code>	Specify an author for a class.

Designing Base Classes

This section discusses some ways you can design application classes.

- Base data classes
- Abstract base classes
- Generic base classes
- Utility classes

Base Classes

Base classes contain a representation of data elements, such as documents, categories, users, and miscellaneous security-related entities.

To design the document data element to be integration-friendly, PeopleSoft recommends you start with a relatively basic base class. Then use more specialized types of documents to create a subclass from that base class, adding the necessary specialized attributes.

Even if you think of ways to use data to drive the business rules, PeopleSoft recommends that you do not place them into your data objects. Replicating business rules for every instance of a data element can be detrimental to performance.

Abstract Base Classes

Abstract base classes contain reusable logic for PeopleCode classes; you do not instantiate them directly. Instead, you instantiate classes that are subclasses of the abstract base class. Abstract base classes use placeholder methods for specialized logic, and its subclasses override those methods to provide the specialized logic.

An example of a candidate for an abstract base class is a class that is used for administering a data entity, such as an invoice. Such a class has a Save method. A Save method can use normal methods to call generic validation routines, talk to the database, and handle errors; it can use the placeholder methods for specialized logic, such as mapping a given data class to a particular database table.

PeopleSoft recommends that you program an active validation check into your placeholder method that causes a runtime error, such as throwing an `UnimplementedMethodException`, if an abstract base class placeholder method hasn't been overridden.

Generic Base Classes

Generic base classes contain reusable logic for PeopleCode classes; you write them to be self-contained, fully implemented, and capable of being instantiated directly. This differs from abstract base classes, which are not instantiated directly and need subclasses that override methods to provide specialized logic.

Some examples of classes that are good candidates for creating generic base classes are:

- Service classes, which typically extend a class that provides infrastructure services, such as configurable application logging.
- Data classes, which typically extend a class that enables you to plug in adapters to support sorting their instances with custom sort algorithms.

Even when a class does not seem generic because it only has a couple of subclasses, you can still define it in your design as a generic base class rather than cloning common code across different classes. The main reason is maintainability: it's easier to maintain a single class than trying to keep track of the same code scattered across your database.

Utility Classes

Some reusable code is the kind you typically don't want to inherit, but you just want to use here and there. Utility classes can serve this purpose.

String parsing, data type conversion, and formatting routines are all good candidates for utility classes. PeopleSoft recommends that anytime you code something that's more than just a line or two, and that seems to be reusable, write it as a utility class.

Declaration of Application Classes

This section discusses instructions for declaring application classes, such as:

- Declaring application classes.
- Importing class names.
- Referencing Superclasses.
- Declaring private methods.

Declaring Application Classes

Application object references are declared in your PeopleCode programs by either the short name of the class (if the short name is unambiguous amongst all the imported classes), or by the full name of the class. Like all uses of class names, to use the name in a variable declaration, you must have imported the class. Application objects can be of Local, Global, or Component scope.

Every application class is a definition of a new data type in PeopleCode, like the record, rowset, or field data types. The application class includes both the definition of its external interface, its data (properties and instance variables), and its actions (methods), just like the PeopleSoft delivered classes.

Importing Class Names

When you import a class name, fully-qualifying it is optional. The syntax is:

```
<package>:<subpackage>:<...>:<classname or wildcard>
```

PeopleSoft recommends that you individually import each class when you import multiple classes from the same package, instead of using wildcards.

Referencing Superclasses

PeopleSoft recommends that you do not set %Super to a new instance of the current class you are defining because this would start an infinite loop.

```
/* Do not do this! */
%Super = %This;
```

Declaring Private Methods

PeopleSoft recommends that you use private methods for succinct operations, even if they aren't reused, to improve the readability and maintainability of the code. You can also do this by using many inline comments.

Scope of an Application Class

Application classes can be instantiated only from PeopleCode. These classes can be used anywhere you have PeopleCode, that is, in message notification PeopleCode, Component Interface PeopleCode, record field PeopleCode, and so on.

Application Classes Built-in Functions and Language Constructs

In this section, we discuss the Application classes built-in functions and language constructs, in alphabetical order.

Class

Syntax

```
Class classname [{Extends | Implements} Classname]
    [Method_declarations]
    [Property_declarations]
[Protected
    [Method_declarations]
    [Instance_declarations]
    [Constant_declaration]]
[Private
    [Method_declarations]
    [Instance_declarations]
    [Constant_declaration]]
End-Class
```

Where Method_declarations are of the form:

Method*methodname*([*MethodParam1* [, *MethodParam2*. . .] [**ReturnsDatatype**]] [**abstract**])

Where *Property_declarations* are of the form:

Property*DataTypePropertyName* {[**Get**] | [**Set**]} | [**abstract**] | [**readonly**]

Where *Instance_declarations* are of the form:

Instance*DataType&Variable1* [, &*Variable2*. . .]

Where *Constant_declarations* are of the form:

Constant&*Constant* = {*Number* | *String* | **True** | **False** | **Null** }

Description

Use the Class language construct to build application classes in an application package. All classes within a package must be uniquely named, however, classes contained in different packages do not have to be named uniquely.

External function declarations are allowed in application classes, in the global and component variable declarations, after the class declaration (after the end-class statement), and before the method definitions.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>classname</i>	Specify the name of the class that you are creating. All classes within a package must be uniquely named, however, classes contained in different packages do not have to be named uniquely.
Extends Implements <i>classname</i>	For a regular class, specify the name of the class that this class extends. If the class is an interface type of class, specify the name of the interface that this class implements. You must import the class to extend it.
<i>Method_declarations</i>	Specify the methods (and their signature) as used in this class.
<i>Property_declarations</i>	Specify the properties, and their usage, in this class.
Protected	Use this keyword to declare any methods, constants, or instance variables as protected to the class, that is, are only visible to the declaring class and subclasses.
Private	Use this keyword to declare any methods, constants, or instance variables as private to the class, that is, they can't be accessed by any other classes.
<i>Instance_declarations</i>	Specify any variables that should be in any instance (object) of the class.
<i>Constant_declarations</i>	Specify any constants that should be used with this class.

Returns

None.

Example

```
class Example extends ExampleBase
  method NumToStr(&Num as number) returns string;
  method AppendSlash();
  property number SlashCount get;
  property number ImportantDayOfWeek get set;
  property string SlashString readonly;
  property date ImportantDate;
private
  method NextDayOfWeek(&DoW as number) returns date;
  constant &Sunday = 1;
  instance number &BaseString;
end-class;
```

See Also

[Chapter 6, "Application Classes," Method, page 230](#); [Chapter 6, "Application Classes," Get, page 227](#) and [Chapter 6, "Application Classes," Set, page 231](#)

Get

Syntax

```
GetPropertyStatementList
End-Get
```

Description

Use the Get language construct when defining properties in an application class that are implemented by methods rather than an instance variable. All properties within an application class must be uniquely named.

Parameters

Parameter	Description
Get <i>PropertyName</i>	Specify the name of the property that you're implementing.
<i>StatementList</i>	Returns the value of the property. In other words, this is a method which has no parameters and must return the value of the property.

Returns

Depends on the assignment within *StatementList*

Example

```
Get FruitCount
    Return &MyFruit.Number();
End-Get;
```

[Chapter 6, "Application Classes," Method, page 230](#) and [Chapter 6, "Application Classes," Set, page 231](#)
PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," Return

Import

Syntax

```
ImportPackageName:[PackageName. . .:]{Classname | *}
```

Description

Before you can use a class name, you must first import it using an import declaration statement at the beginning of your program.

An import declaration statement names either all the classes in a package or a single application class.

Parameters

Parameter	Description
ImportPackageName	Specify the name of the package that you want to import.
*	Import all the classes of the specified package.
Classname	Import only this class of the specified package. You won't have access to any other classes in the specified package, only this one.

Returns

None.

Example

The following gives you access to all the classes in the package Fruit:

```
Import Fruit:*
```

The following only gives you access to the class Banana in the package Fruit:

```
Import Fruit:Banana;
```

The following gives you access to the class Apple, in the package Drinks, which contains the package Fruit:

```
Import Drinks:Fruit:Apple;
```

See Also

[Chapter 6, "Application Classes," Class, page 225](#)

Interface

Syntax

```
Interface classname [{Extends | Implements} Classname]
    [Method_declarations]
    [Property_declarations]
[Protected
    [Method_declarations]
    [Instance_declarations]
    [Constant_declaration]]
]
End-Interface
```

Where *Method_declarations* are of the form:

```
MethodmethodName( [MethodParam1 [, MethodParam2. . .] [ReturnsDatatype] [abstract])
```

Where *Property_declarations* are of the form:

```
PropertyDataTypePropertyName {[Get] | [Set]} | [abstract] | [readonly]
```

Where *Instance_declarations* are of the form:

```
InstanceDataType&Variable1 [, &Variable2. . .]
```

Where *Constant_declarations* are of the form:

```
Constant&Constant = {Number | String | True | False | Null }
```

Description

Use the Interface language construct to create classes of type interface in an application package. An interface class is a purely abstract class.

Parameters

An interface does not have Private methods or properties, but all the other parameters are identical to the Class language construct.

See [Chapter 6, "Application Classes," Class, page 225](#).

Returns

None.

See Also

[Chapter 6, "Application Classes," Class, page 225](#)

Method

Syntax

Method *MethodNameStatementList***End-Method**

Description

Use the Method statement to define the methods of your application class.

Parameters

<i>Parameter</i>	<i>Description</i>
Method <i>methodname</i>	Specify the name of the method that you are creating.
<i>StatementList</i>	Specify the program of the method, what it does.

Returns

Depends on the method.

Example

```
method NumToStr
    return String(&Num);
end-method;

method AppendSlash
    &SlashString = &SlashString | "/";
end-method;
```

[Chapter 6, "Application Classes," Get, page 227](#) and [Chapter 6, "Application Classes," Set, page 231](#)
PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," Return

Set

Syntax

```
SetPropertyNameStatementListEnd-Set
```

Description

Use the Set language construct when implementing properties in an application class. All properties within an application class must be uniquely named. The new value for the property is available in the &NewValue parameter of the Set method.

Note. You cannot create a set-only property. You can create only get-set properties.

Parameters

Parameter	Description
Set <i>PropertyName</i>	Specify the name of the property that you're implementing.
<i>StatementList</i>	Change the value of the property to be &NewValue.

Returns

None.

Example

```
Set FruitCount
```

```
&Fruitcount = &MyFruit[&NewValue].ActiveRowCount();  
End-Set;
```

API Repository

This chapter provides an overview of the PeopleSoft API Repository and discusses:

- Repository properties.
- Bindings collection properties.
- Bindings collection methods.
- Bindings properties.
- Bindings methods.
- Namespaces collection properties.
- Namespaces collection methods.
- Namespaces properties.
- Namespaces methods.
- ClassInfo collection properties.
- ClassInfo collection methods.
- ClassInfo properties.
- MethodInfo collection properties.
- MethodInfo collection methods.
- MethodInfo properties.
- PropertyInfo collection properties.
- PropertyInfo collection methods.
- PropertyInfo properties.
- Summary of repository methods and properties.

Understanding the PeopleSoft API Repository

This section discusses:

- The PeopleSoft API Repository.

- Accessing the repository by using PeopleCode.
- Accessing the repository by using Visual Basic.

The PeopleSoft API Repository

The PeopleSoft API Repository enables PeopleCode and third-party integrators to discover the internally available classes, methods, and properties that are provided by PeopleSoft for integration. The repository is useful to third-party integrators who integrate in a generic fashion: middleware providers, testing tool providers, and automated documentation providers.

The PeopleSoft API Repository is *nota* necessary interface for integrators who integrate at the business-rule level, such as integration with an expense report, and so on. Those integrators should use component interfaces.

The repository describes available PeopleSoft APIs and provides mechanisms to determine the classes that are available in the API, the properties of each class, the methods of a class (along with the required parameters), and information concerning which group a class belongs to (known as a namespace).

The process of determining information about the API is known as *discovery*. Third-party integrators use information found through discovery to drive generic integration tools.

The repository is divided into namespaces. Each namespace contains a collection of related classes. Example namespaces include "PeopleSoft," "ComponentInterface," "Trees," and "BusinessInterlinks".

A *class* defines a related set of methods and properties. Using the repository, you can determine the methods and properties that are available and that can be used on any object returned by a call to the PeopleSoft API. An instance of a class is known as an object.

A *property* is a data item of an object that has both a name and type (string, number, Boolean, and so on are examples of types). Some properties are used for inputting data to a class, some are used for getting data from a class, and some are used for both. Whether a property is used for input or output or both is known as usage.

A *method* is a function that you can call on an object. Methods have a name and a return type (string, number, Boolean, and so on). Methods also have a collection of arguments that must be set prior to invoking the method. Methods arguments have identical attributes to properties.

This diagram shows the different types of objects and collections instantiated from the repository:

Repository class hierarchy

Example of Accessing the Repository Using PeopleCode

This example gets information for the class `ABS_HIST` from the `Namespace` component interface and writes it to the file `BC.TXT`:

This is the complete code sample, followed by the flat file. The next section presents steps that explain each line.

```

Local ApiObject &MYSESSION;
Local ApiObject &MYCI;
Local string &OutTEXT;
Local File &MYFILE;

&MYSESSION = %Session;

&MYFILE = GetFile("CI.txt", "A");

&NAMESPACES = &MYSESSION.Repository.Namespaces;
&NAMESPACE = &NAMESPACES.ItemByName("CompIntfc");

&OutTEXT = "Namespace = " | &NAMESPACE.Name;
&MYFILE.WriteLine(&OutTEXT);

&CLASSES = &NAMESPACE.classes;
&CLASS = &CLASSES.ItemByName("ABS_HIST");

&OutTEXT = "  Class: " | &CLASS.Name;
&MYFILE.WriteLine(&OutTEXT);

&OutTEXT = "      Methods";
&MYFILE.WriteLine(&OutTEXT);

&METHODS = &CLASS.methods;
For &K = 0 To &METHODS.Count - 1
    &METHOD = &METHODS.item(&K);
    &OutTEXT = "          " | &METHOD.name | ": " | &METHOD.Type

    &MYFILE.WriteLine(&OutTEXT);
    &ARGUMENTS = &METHOD.arguments;
    For &M = 0 To &ARGUMENTS.count - 1
        &ARGUMENT = &ARGUMENTS.item(&M);
        &OutTEXT = "              " | &ARGUMENT.name | ": " | &ARGUMENT.type;
        &MYFILE.WriteLine(&OutTEXT);
    End-For;
End-For;

&OutTEXT = "      Properties";
&MYFILE.WriteLine(&OutTEXT);

&PROPERTIES = &CLASS.properties;
For &I = 0 To &PROPERTIES.count - 1
    &PROPERTY = &PROPERTIES.item(&I);
    &OutTEXT = "          " | &PROPERTY.name | ": " | &PROPERTY.type;
    &MYFILE.WriteLine(&OutTEXT);
End-For;
&MYFILE.Close();

```

The previous code produces the following flat file:

```

Namespace = CompIntfc
Class: ABS_HIST
Methods
    Get: Boolean
    Save: Boolean
    Cancel: Boolean
    Find: ABS_HIST
    GetPropertyByName: Variant
    Name: String
    SetPropertyByName: Number
    Name: String

    propertyInfoCollection: CompIntfcPropertyInfoCollection
    createKeyInfoCollection: CompIntfcPropertyInfoCollection
    getKeyInfoCollection: CompIntfcPropertyInfoCollection
    findKeyInfoCollection: CompIntfcPropertyInfoCollection

```

The PeopleCode Example Explanation

This procedure goes through the PeopleCode example line by line.

To retrieve information from the API Repository:

1. Get a session object.

Before you can access the PeopleSoft API Repository, you have to get a session object. The session controls access to PeopleSoft, provides error tracing, enables you to set the runtime environment, and so on.

```
&MYSESSION = %Session;
```

2. Open the file.

As this text will be written to a flat file, the next step is to open the file. If the file is already created, the new text is appended to the end of it. If the file hasn't been created, the GetFile built-in function creates the file.

```
&MYFILE = GetFile("CI.txt", "A");
```

3. Get the namespace you want.

Use the Namespaces property on the repository object to get a collection of available namespaces. We want to discover information about a component interface, so we specify CompIntfc in the ItemByName method to get that namespace. With ItemByName, you must specify a namespace that already exists. You'll receive a runtime error if you specify one that doesn't exist.

```
&NAMESPACES = &MYSESSION.Repository.Namespaces;
&NAMESPACE = &NAMESPACES.ItemByName("CompIntfc");
```

4. Write the text to the file.

Because all of the information discovered is being written to a file, the next step is to write text to the file. This code writes the string "Namespace", followed by the name of the namespace, to the file.

```
&OutTEXT = "Namespace = " | &NAMESPACE.Name;
&MYFILE.WriteLine(&OutTEXT);
```

5. Get the class that you want and write text to the file.

Use the Classes property on the Namespace object to get a collection of all the available classes. We want to discover information about the component interface named ABS_HIST, so we specify that using ItemByName. Then we write that information to the file.

```
&CLASSES = &NAMESPACE.classes;
&CLASS = &CLASSES.ItemByName("ABS_HIST");

&OutTEXT = "  Class: " | &CLASS.Name;
&MYFILE.WriteLine(&OutTEXT);
```

6. Get the methods and arguments, and write the information to the file.

Use the Methods property on the Class object to get a collection of all the available methods. After you get each method and write the information to the file, loop through and find all of the arguments for the method, then write that information to the file.

```
&OutTEXT = "      Methods";
&MYFILE.WriteLine(&OutTEXT);

&METHODS = &CLASS.methods;
For &K = 0 To &METHODS.Count - 1
  &METHOD = &METHODS.item(&K);
  &OutTEXT = "      " | &METHOD.name | ": " | &METHOD.Type;
  &MYFILE.WriteLine(&OutTEXT);
  &ARGUMENTS = &METHOD.arguments;
  For &M = 0 To &ARGUMENTS.count - 1
    &ARGUMENT = &ARGUMENTS.item(&M);
    &OutTEXT = "      " | &ARGUMENT.name | ": " | &ARGUMENT.type;
    &MYFILE.WriteLine(&OutTEXT);
  End-For;
End-For;
```

7. Get the properties and write the information to the file.

Use the Properties property on the Class object to get a collection of all the available properties. Write each property, with its type, to the file. At the end of the program, close the file.

```
&OutTEXT = "      Properties";
&MYFILE.WriteLine(&OutTEXT);

&PROPERTIES = &CLASS.properties;
For &I = 0 To &PROPERTIES.count - 1
  &PROPERTY = &PROPERTIES.item(&I);
  &OutTEXT = "      " | &PROPERTY.name | ": " | &PROPERTY.type;
  &MYFILE.WriteLine(&OutTEXT);
End-For;
&MYFILE.Close();
```

Example of Accessing the Repository by Using Visual Basic

This example gets information for the class `ABS_HIST` from the Namespace component interface.

```

Repository Properties

This section discusses the Repository properties in alphabetical order.

Bindings

Description

The Bindings property returns a reference to a Bindings collection.

This property is read-only.

Namespaces

Description

The Namespaces property returns a reference to a Namespaces collection.

This property is read-only.

Bindings Collection Properties

This section discusses the Bindings collection properties in alphabetical order.

Count

Description

This property returns the number of Bindings Properties objects in the Bindings collection object.

Note. All repository counts begin at zero, not one.

This property is read-only.

Example

```
&COUNT = &BINDINGS.Count ;
```

See Also

[Chapter 7, "API Repository," Bindings Properties, page 243](#)

Bindings Collection Methods

This section discusses the Bindings collection methods in alphabetical order.

Item

Syntax

Item(*number*)

Description

The Item method returns a Bindings object that exists at the number position in the Bindings collection executing the method

Parameters

<i>Parameter</i>	<i>Description</i>
<i>number</i>	Specify the position number in the collection of the Bindings object that you want returned.

Returns

A reference to a Bindings object or NULL.

Example

```
For &N = 0 to &BINDINGS.Count - 1
    &BINDING = &BINDINGS.Item(&N);
    /* do processing */
End-For;
```

Bindings Properties

This section discusses the Bindings properties in alphabetical order.

Name

Description

This property returns the name of the object as a string.

This property is read-only.

Bindings Methods

This section discusses the Bindings methods in alphabetical order.

Generate

Syntax

Generate()

Description

This method is a reserved internal function and shouldn't be used at this time.

Namespaces Collection Properties

This section discusses the Namespaces collection properties in alphabetical order.

Count

Description

This property returns the number of Namespaces Properties objects in the Namespaces collection object.

Note. All repository counts begin at zero, not one.

This property is read-only.

Example

```
&COUNT = &NameC.Count ;
```

See Also

[Chapter 7, "API Repository," Namespaces Properties, page 246](#)

Namespaces Collection Methods

This section discusses the Namespaces collection methods in alphabetical order.

Item

Syntax

Item(*number*)

Description

The Item method returns a Namespaces object that exists at the *number* position in the Namespaces collection executing the method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>number</i>	Specify the position number in the collection of the Namespaces object that you want returned.

Returns

A reference to a Namespaces object or NULL.

Example

```
For &N = 0 to &NAMESPACES.Count - 1
    &NAMESPACE = &NAMESPACES.Item(&N);
    /* do processing */
End-For;
```

ItemByName

Syntax

ItemByName(*name*)

Description

The ItemByName method returns the item specified by *name*. *Name* is not case-sensitive.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>name</i>	Specify the name of the Namespaces object that you want returned. This parameter takes a string value.

Returns

A reference to a Namespaces object or NULL.

Example

```
&NAMESPACE = &NAMESPACES.ItemByName("BusinessComponent");
```

Namespaces Properties

This section discusses the Namespaces properties in alphabetical order.

Classes

Description

This property returns a reference to a `ClassInfo` collection object.

This property is read-only.

Example

```
&CLASSC = &NAME.Classes;
```

See Also

[Chapter 7, "API Repository," ClassInfo Collection Properties, page 247](#)

Name

Description

This property returns the name of the object as a string.

This property is read-only.

Namespaces Methods

This section discusses the Namespaces methods in alphabetical order.

CreateObject

Syntax

```
CreateObject(classname)
```

Description

This method is a reserved internal function and shouldn't be used at this time.

ClassInfo Collection Properties

This section discusses the ClassInfo collection properties in alphabetical order.

Count

Description

This property returns the number of ClassInfo Properties objects in the ClassInfo collection object.

Note. All repository counts begin at zero, not one.

This property is read-only.

Example

```
&COUNT = &InfoC.Count;
```

See Also

[Chapter 7, "API Repository," ClassInfo Properties, page 249](#)

ClassInfo Collection Methods

This section discusses the ClassInfo collection methods in alphabetical order.

Item

Syntax

Item(*number*)

Description

The Item method returns a ClassInfo object that exists at the *number* position in the ClassInfo collection executing the method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>number</i>	Specify the position number in the collection of the ClassInfo object that you want returned.

Returns

A reference to a ClassInfo object or NULL.

Example

```
For &N = 0 to &CLASSES.Count - 1
    &CLASS = &CLASSES.Item(&N);
    /* do processing */
End-For;
```

ItemByName

Syntax

ItemByName(*name*)

Description

The ItemByName method returns the item specified by *name*. *Name* is not case-sensitive.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>name</i>	Specify the name of the ClassInfo object that you want returned. This parameter takes a string value.

Returns

A reference to a ClassInfo object or NULL.

Example

```
&CLASS = &CLASSES.ItemByName("ABS_HIST");
```

ClassInfo Properties

This section discusses the ClassInfo properties in alphabetical order.

Documentation

Description

This property doesn't actually return all the documentation for the class, just a brief description of the class as a string.

This property is read-only.

Methods

Description

This property returns a reference to a MethodInfo collection object.

This property is read-only.

See Also

[Chapter 7, "API Repository," MethodInfo Collection Methods, page 250](#)

Name

Description

This property returns the name of the object as a string.

This property is read-only.

Properties

Description

This property returns a reference to a PropertyInfo collection object.

This property is read-only.

See Also

[Chapter 7, "API Repository," PropertyInfo Collection Methods, page 253](#)

MethodInfo Collection Properties

This section discusses the MethodInfo collection properties in alphabetical order.

Count

Description

This property returns the number of MethodInfo Properties objects in the MethodInfo collection object.

Note. All repository counts begin at zero, not one.

This property is read-only.

Example

```
&COUNT = &MethC.Count;
```

See Also

[Chapter 7, "API Repository," MethodInfo Properties, page 252](#)

MethodInfo Collection Methods

This section discusses the MethodInfo collection methods in alphabetical order.

Item

Syntax

Item(*number*)

Description

The Item method returns a MethodInfo object that exists at the *number* position in the MethodInfo collection executing the method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>number</i>	Specify the position number in the collection of the MethodInfo object that you want returned.

Returns

A reference to a MethodInfo object or NULL.

Example

```
For &K = 0 To &METHODS.Count - 1
    &METHOD = &METHODS.item(&K);
    &OutTEXT = "          " | &METHOD.name | ":  " | &METHOD.Type;
    &MYFILE.WriteLine(&OutTEXT);
End-For;
```

ItemByName

Syntax

ItemByName(*name*)

Description

The ItemByName method returns the item specified by *name*. *Name* is not case-sensitive.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>name</i>	Specify the name of the MethodInfo object that you want returned. This parameter takes a string value.

Returns

A reference to a MethodInfo object or NULL.

Example

```
&METHOD = &METHODS.ItemByName("Save");
```

MethodInfo Properties

This section discusses the MethodInfo properties in alphabetical order.

Arguments

Description

This property returns a reference to a PropertyInfo collection object.

This property is read-only.

See Also

Documentation

Description

This property doesn't actually return all the documentation for the class, just a brief description of the class, as a string.

This property is read-only.

Name

Description

This property returns the name of the object as a string.

This property is read-only.

Type

Description

This property returns the type of the method. Values include:

- Bool (Boolean).

- Number.
- Float.
- String.
- Variant.
- Blob (binary large object).
- Any API class name.

This property is read-only.

PropertyInfo Collection Properties

This section discusses the PropertyInfo collection properties in alphabetical order.

Count

Description

This property returns the number of PropertyInfo Properties objects in the PropertyInfo collection object.

Note. All repository counts begin at zero, not one.

This property is read-only.

Example

```
&COUNT = &PropC.Count;
```

See Also

[Chapter 7, "API Repository," PropertyInfo Properties, page 255](#)

PropertyInfo Collection Methods

This section discusses the PropertyInfo collection methods in alphabetical order.

Item

Syntax

Item(*number*)

Description

The Item method returns a PropertyInfo object that exists at the *number* position in the PropertyInfo collection executing the method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>number</i>	Specify the position number in the collection of the PropertyInfo object that you want returned.

Returns

A reference to a PropertyInfo object or NULL.

Example

```
For &K = 0 To &PROPERTIES.Count - 1
    &PROPERTY = &PROPERTIES.item(&K);
    &OutTEXT = "          " | &PROPERTY.name | ": " | &PROPERTY.Type;
    &MYFILE.WriteLine(&OutTEXT);
End-For;
```

ItemByName

Syntax

ItemByName(*name*)

Description

The ItemByName method returns the item specified by *name*. *Name* is not case-sensitive.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>name</i>	Specify the name of the PropertyInfo object that you want returned. This parameter takes a string value.

Returns

A reference to a PropertyInfo object or NULL.

Example

```
&PROPERTY = &PROPERTIES.ItemByName(&ldquo;GetHistoryItems&rdquo;);
```

PropertyInfo Properties

This section discusses the PropertyInfo properties in alphabetical order.

Documentation

Description

This property doesn't actually return all the documentation for the class, just a brief description of the class, as a string. This property is read-only.

Name

Description

This property returns the name of the object as a string.

This property is read-only.

Type

Description

This property returns the data type. Values are:

- Bool (Boolean).
- Number.
- Float.
- String.
- Variant.
- Blob (binary large object).
- Any API class name.

This property is read-only.

Usage

Description

This property returns a number that describes in which direction the specified property (or argument) can be passed. The following table describes the valid values.

<i>Value</i>	<i>Description</i>
0	Can be passed into PeopleSoft API.
1	Can be passed out of PeopleSoft API.
2	Can be passed either into or out of PeopleSoft API.

This property is read-only.

Chapter 8

Array Class

This chapter provides an overview of arrays and discusses how to:

- Create arrays.
- Populate an array.
- Remove items from an array.
- Create empty arrays.
- Create and populate multi-dimensional arrays.
- Use flattening and promotion.
- Declare array objects.
- Understand the scope of an array object.
- Use array class built-in functions.
- Use array class methods
- Use array class properties

Understanding Arrays

An array is a collection of data storage locations, each of which holds the same type of data. Each storage location is called an element of the array. When you create an array, you don't have to declare the size of the array at declaration time. Arrays grow and shrink dynamically as you add (or remove) data. The size of an array is limited by the available memory. You can't access past the end of an array, but you can assign outside the existing boundaries, thereby growing the array.

Creating Arrays

Arrays are declared by using the Array type name, optionally followed by "of" and the type of the elements. If the element type is omitted, it is set by default to ANY.

```
Local Array of Number &MYARRAY;  
Local Array &ARRAYANY;
```

Arrays can be composed of any valid PeopleCode data type, such as string, record, number, date, and so on.

PeopleSoft recommends you declare every object you use in PeopleCode. This provides some syntax checking when you save PeopleCode. It's better to find out that you misspelled the name of a method or property at design time, rather than at runtime!

Arrays can be declared as Local, Global, or Component, just like any other PeopleTools object.

Arrays can be created with one or more dimensions. An array with more than one dimension is called an array of arrays. The *dimension* of an array is the number of Array type names in the declaration. This is also called the *depth* of an array. The maximum depth of a PeopleCode array is 15 dimensions.

In the following example, &MYARRAY has three dimensions, and &MYA2 has two dimensions.

```
Local Array of Array of Array of Number &MYARRAY;
Local Array of Array &MYA2;
```

An array must always have a consistent dimension. This means that in a one-dimensional array *none* of the elements can be an array, in a two-dimensional array *all* of the elements must be one-dimensional arrays, and so on.

After you declare an array, use one of the built-in array functions to instantiate it and return an object reference to it. For example, the following creates an array containing one element of type &TEMP, whatever data type &TEMP may be.

```
&MYARRAY = CreateArray(&TEMP);
```

Or you can use the CreateArrayRept function to instantiate an array. The Rept stands for *repeat*. CreateArrayRept creates an array that contains the number of copies you specify of a particular value. The following code creates an array with three copies of the string &MYSTRING. This does *not* create a three-dimensional array, but rather creates an array that's already populated with three elements of data (`Len = 3`), each of which contain the same string (&MYSTRING).

```
&MYARRAY = CreateArrayRept(&MYSTRING, 3);
```

An array *object* can be assigned to an array *variable*. Array objects can be passed from and returned to any kind of PeopleCode function:

```
ANewFunc (&myarray);
MyFunc (&myarray);
&MyArray = YourFunc("something");
```

For example, the ReturnToServer function returns an array of nodes to which a message can be published.

Elements in an array are specified by providing a bracketed subscript after the array object reference:

```
&MyArray[1] = 123;
&temp = &memory[1][2][3];
&temp = &memory[1, 2, 3]; /* Same as preceding line. */
MyFunc(&MyArray[7]);
MyFunc(10)[15] = "a string";
```

To access data in a two-dimensional array, you must specify both indexes. The following accesses the second item in the first subarray:

```
&VALUE = &DOUBLE[1][2];
```

You receive an error if you use a zero or negative index in an array. Accessing an array element whose index is larger than the last array element is also an error, but storing to such an index extends the array. Any intervening elements between the former last element and the new last element are assigned a value based on the element type of the array. This is the same value as an unassigned variable of that type.

An array is an object, which means that assignments to an array are the same as for any other object. An array variable can be assigned the distinguished value NULL, which indicates the absence of any array value.

Array variables are supported for all scopes. This means that you can have local, global, and Component array variables.

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Understanding Objects and Classes in PeopleCode," Assigning Objects

Populating an Array

There are several ways to populate an array. The example code following each of these methods creates the exact same array, with the same elements:

- Use CreateArray when you initially create the array:

```
Local Array of Number &MyArray;

&MyArray = CreateArray(100, 200, 300);
```

- Assign values to the elements of the array:

```
Local Array of Any &MYARRAY;

&MYARRAY = CreateArray();
&MYARRAY[1] = 100;
&MYARRAY[2] = 200;
&MYARRAY[3] = 300;
```

Note. Using CreateArray without any parameters creates an array of Any.

- Use the Push method to add items to the end of the array:

```
Local Array of Number &MYARRAY;
Local Number &MYNUM;

&MYARRAY = CreateArrayRept(&MYNUM, 0);
/* this creates an empty array of number */
&MYARRAY.Push(100);
&MYARRAY.Push(200);
&MYARRAY.Push(300);
```

- Use the Unshift method to add items to the beginning of the array:

```
Local Array of Number &MYARRAY;
Local Number &MYNUM;

&MYARRAY = CreateArrayRept(&MYNUM, 0);
/* this creates an empty array of number */
&MYARRAY.Unshift(300);
&MYARRAY.Unshift(200);
&MYARRAY.Unshift(100);
```

You can also use CreateArrayRept (repeat) when you initially create the array. The following example creates an array with three elements: all three elements have the same data, that is, 100:

```
Local Array of Number &MYARRAY;

&MYARRAY = CreateArrayRept(100, 3);
```

Removing Items From an Array

You can remove elements from either the start or the end of the array:

- Use the POP method to select and remove an element from the end of an array

```
Local Array of Number &MYARRAY;

&MYARRAY = CreateArray();
&MYARRAY[1] = 100;
&MYARRAY[2] = 200;
&MYARRAY[3] = 300;

&ANSWER = &MYARRAY.Pop();

&ANSWER will equal 300.
```

- Use the SHIFT method to select and remove an element from the beginning of an array

```
Local Array of Number &MYARRAY;

&MYARRAY = CreateArray();
&MYARRAY[1] = 100;
&MYARRAY[2] = 200;
&MYARRAY[3] = 300;

&ANSWER = &MYARRAY.Shift();

&ANSWER equals 100.
```

Creating Empty Arrays

If you create an array using CreateArray of any data type other than ANY, the new array is *not* empty: it contains one item. If you need to create a completely empty array that contains 0 elements, use one of the following:

```

Local Array of Number &AN;
Local Array of String &AS;
Local Array of Record &AR;
Local Array of Array of Number &AAN;
Local Record &REC;

&AN = CreateArrayRept(0,0); /* creates an empty array of number */
&AS = CreateArrayRept("", 0); /* creates an empty array of string */
&AR = CreateArrayRept(&REC, 0); /*create empty array of records */
&AAN = CreateArrayRept(&AN, 0); /*creates empty array of array of number */
&BOTH = CreateArray(CreateArrayRept("", 0), CreateArrayRept("", 0)); /* creates an⇒
empty array of array of string */

```

Creating and Populating Multi-Dimensional Arrays

You can create arrays with more than one dimension. Each element in a multi-dimensional array is itself an array. For example, a two-dimensional array is really an array of arrays. Each subarray has to be created and populated as an array.

Each subarray in a multi-dimensional array must be of the same type. For example, you can't create a two dimensional array that has one subarray of type string and a second subarray of type number.

The following example creates an array of array of string, then reads two files, one into each "column" of the array. The `CreateArrayRept` function call creates an empty array of string (that is, the `Len` property is 0) but with two dimensions (that is, with two subarrays, `Dimension` is 2). The first `Push` method adds elements into the first subarray, so at the end of that `WHILE` loop in the example, `&BOTH` has `Len` larger than 0. The other `Push` methods add elements to the second subarray.

```

Local array of array of string &BOTH;
Local File &MYFILE;
Local string &HOLDER;

/* Create empty &BOTH array */
&BOTH = CreateArrayRept(CreateArrayRept("", 0), 0);

/* Read first file into first column */

&MYFILE = GetFile("names.txt", "R");
While &MYFILE.ReadLine(&HOLDER);
    &BOTH.Push(&HOLDER);
End-While;

/* read second file into second column */

&MYFILE = GetFile("numbers.txt", "R");
&LINENO = 1;
While &MYFILE.ReadLine(&HOLDER);
    If &LINENO > &BOTH.Len Then
        /* more number lines than names, use a null name */
        &BOTH.Push(CreateArray("", &HOLDER));
    Else
        &BOTH[&LINENO].Push(&HOLDER);
    End-If;
    &LINENO = &LINENO + 1;
End-While;

/* if more names than numbers, add null numbers */
for &LINENO = &LINENO to &BOTH.Len
    &BOTH[&LINENO].Push("");
End-For;

```

Local Name	Local Value
&BOTH	Array
└ Dimension	2
└ Len	3
[1]	
└ Dimension	1
└ Len	2
└ [1]	Pete
└ [2]	100
[2]

&BOTH array expanded in PeopleCode debugger at program end

The following code reads from a two-dimensional array and writes the data from the each subarray into a separate file.

```

Local File &MYFILE1, &MYFILE2;
Local string &STRING1, &STRING2;
Local array of array of string &BOTH;

/* code to load data into array would be here */

/* open files to be written to */

&MYFILE1 = GetFile("names.txt", "A");
&MYFILE2 = GetFile("numbers.txt", "A");

/* loop through array and write to files */

For &I = 1 To &BOTH.Len
    &J = 1;
    &STRING1 = &BOTH[&I][&J];
    &MYFILE1.writeline(&STRING1);
    &J = &J + 1;
    &STRING2 = &BOTH[&I][&J];
    &MYFILE2.writeline(&STRING2);
End-For;

&MYFILE1.Close();
&MYFILE2.Close();

```

The following example populates a multi-dimensional string array using SQL. This could be used for reading small tables.

```

Component array of array of string &ArrRunStatus;

&ArrRunStatus = CreateArrayRept(CreateArrayRept("", 0), 0);
&ArrRunStatusDescr = CreateArrayRept("", 0);

&SQL = CreateSQL("SELECT FIELDVALUE, XLATSHORTNAME FROM XLATTABLE WHERE FIELDNAME =>
= 'RUNSTATUS'");

&LineNo = 1;
While &SQL.Fetch(&FieldValue, &XlatShortName)
    &ArrRunStatus.Push(&FieldValue);
    &ArrRunStatus[&LineNo].Push(&XlatShortName);
    &LineNo = &LineNo + 1;
End-While;

```

To search for a particular element in this array, use the following:

```

&iIndex = &ArrRunStatus.Find(&RunStatusToGet);

&RunStatusDescr = &ArrRunStatus[&iIndex][2];

```

The following example shows how to create a two-dimension array using CreateArrayRept and Push. In addition, it shows how to randomly assigns values to the cells in a two-dimension array.

```

Local array of array of string &ValueArray;

&Dim1 = 10;
&Dim2 = 5;
&ValueArray = CreateArrayRept(CreateArrayRept("", 0), 0);
For &I = 1 To &Dim1
    &ValueArray.Push(CreateArrayRept("", &Dim2));
End-For;

&ValueArray[1][1] = "V11";
&ValueArray[2][1] = "V21";

WinMessage("&ValueArray[1][1] = " | &ValueArray[1][1] | " " | "&ValueArray[2][1] =>
" | &ValueArray[2][1], 0);

```

Using Flattening and Promotion

Several of the functions and methods that support arrays in PeopleCode use flattening and promotion to convert their operands to the correct dimension for the array.

Flattening converts an array into its elements. For example, the `CreateArray` built-in function constructs an array from its parameters. If it is constructing a one-dimensional array and is given an array as a parameter, then it flattens that array into its elements and adds each of them to the array that it is building, rather than adding a reference to the array (which would be a dimension error) or reporting an error.

Likewise, for functions that operate on multiple-dimension arrays, if they are given a non-array parameter, they use *promotion* to convert it into an array of suitable dimension. For example, the `Push` method appends elements onto the end of an array. If it is operating with a two-dimensional array of Array of Number, and is given a numeric argument, it will convert the argument into a one-dimensional array of Number with the given number as its only element, and then append that to the two-dimensional array.

An array value can only be assigned to an array variable if the value and variable have both the same dimension and base type. This means you cannot assign an Array of Any to an Array of Number variable or vice-versa. You can, however, assign an Array of Number to an Any variable, as long as you do not break the rule that the base element of an array cannot be an array reference value.

Declaring Array Objects

Arrays are declared by using the Array type name, optionally followed by "of" and the type of the elements. If the element type is omitted, it is set by default to ANY.

```

Local Array of Number &MYARRAY;
Local Array &ARRAYANY;

```

Arrays can be composed of any valid PeopleCode data type, such as string, record, number, date, and so on.

Understanding the Scope of an Array Object

An array object can only be instantiated from PeopleCode. This object can be used anywhere you have PeopleCode, that is, in an application class, Component Interface PeopleCode, record field PeopleCode, and so on.

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," Split

Array Class Methods

In this section, we discuss the array class methods.

Clone

Syntax

`clone( )`

Description

The Clone method returns a reference to a new array, which is a copy of the given array. It copies all levels of the array, meaning, if the array contains elements which are themselves arrays (actually references to arrays), then the copy contains references to copies of the subarrays. Furthermore, if the array contains elements that are references to the same subarray, then the copy contains references to *different* subarrays (which of course have the same value).

Parameters

None. The array object that the clone method is executed against is the array to be cloned. Assigning the result of this method assigns a reference to the new array.

Returns

An array object copied from the original.

Example

In the following example, &AAN2 contains the three elements like &AAN, but they are distinct arrays. The last line changes only &AAN2[1][1], *not* &AAN[1][1].

```
Local Array of Array of String &AAN, &AAN2;
```

```
&AAN = CreateArray(CreateArray("A", "B"), CreateArray("C", "D"), "E");
&AAN2 = &AAN.Clone();
&AAN2[1][1] = "Z";
```

After the following example, &AAN contains three elements: two references to the subarray that was &AAN[2] (with elements C and D), and a reference to a subarray with element E.

```
&AAN[1] = &AAN[2];
```

After the following example, &AAN2 contains three elements: references to two different subarrays both with elements C and D, and a subarray with element E.

```
&AAN2 = &AAN.Clone();
```

[Chapter 8, "Array Class," Subarray, page 282](#)

Find

Syntax

Find(*value*)

Description

For a one-dimensional array, the Find method returns the lowest index of an element in the array that is equal to the given value. If the value is not found in the array, it returns zero.

For a two-dimensional array, the Find method returns the lowest index of a subarray which has its first element equal to the given value. If such a subarray is not found in the array, it returns zero.

Note. This method works with arrays that have only one or two dimensions. You receive a runtime error if you try to use this method with an array that has more than two dimensions.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>value</i>	The string or subarray to search for.

Returns

An index of an element or zero.

Example

Given an array &AS containing (A, B, C, D, E), the following code sets &IND to the index of D, that is, &IND has the value 4:

Local array of string &AS;

```
&AS = CreateArrayRept("", 0);
&AS.Push("A");
&AS.Push("B");
&AS.Push("C");
&AS.Push("D");
&AS.Push("E");
&IND = &AS.Find("D");
```

Given an array of array of string &AABYNAME containing (("John", "July"), ("Jane", "June"), ("Norm", "November")), the following code sets &IND to the index of the subarray starting with "Jane", that is, &IND has the value 2:

```
&NAME = "Jane";
&IND = &AABYNAME.Find(&NAME);
```

See Also

[Chapter 8, "Array Class," Replace, page 275](#) and [Chapter 8, "Array Class," Substitute, page 282](#)

Get

Syntax

Get(*index*)

Description

Use the Get method to return the *index* element of an array. This method is used with the Java PeopleCode functions, instead of using subscripts (which aren't available in Java.)

Using this method is the same as using a subscript to return an item of an array. In the following example, the two lines of code are identical:

```
&Value = &MyArray[8];  
&value = &MyArray.Get(8);
```

Parameters

Parameter	Description
<i>index</i>	The array element to be accessed.

Returns

An element in an array.

See Also

[Chapter 8, "Array Class," Set, page 278](#)

[Chapter 22, "Java Class," page 1085](#)

Join

Syntax

```
Join([separator [, arraystart,arrayend [,stringsizehint]])
```

Description

The Join method *converts* the array that is executing the method into a string by converting each element into a string and *joining* these strings together, separated by *separator*.

Note. Join does *not* join two arrays together.

Each array or subarray to be joined is preceded by the string given by *arraystart* and followed by the string given by *arrayend*. If the given array is multi-dimensional, then (logically) each subarray is first joined, then the resulting strings are joined together.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>separator</i>	Specifies what the elements in the resulting string should be separated with in the resulting string. <i>Separator</i> is set by default to a comma (",").
<i>arraystart</i>	Specifies what each array or subarray to be joined should be preceded with in the resulting string. <i>arraystart</i> is set by default to a left parenthesis ("(").
<i>arrayend</i>	Specifies what each array or subarray to be joined should be followed by in the resulting string. <i>arrayend</i> is set by default to a right parenthesis (")").
<i>stringsizehint</i>	Specify a hint to the Join method about the resulting size of the string. This can improve performance if your application is concatenating a large number of string. See the Example section below.

Returns

A string containing the converted elements of the array.

Example

The following example:

```
Local array of array of number &AAN;
```

```
&AAN = CreateArray(CreateArray(1, 2), CreateArray(3, 4), 5);  
&STR = &AAN.Join(", ");
```

produces in &STR the string:

```
((1, 2), (3, 4), 5)
```

The following example makes use of the *stringsizehint* parameter. The following application class passes the resulting string size hint in the Value property.

```

class StringBuffer
  method StringBuffer(&InitialValue As string, &MaxSize As integer);
  method Append(&New As string);
  method Reset();
  property string Value get set;
  property integer Length readonly;
private
  instance array of string &Pieces;
  instance integer &MaxLength;
end-class;

method StringBuffer
  /+ &InitialValue as String, +/
  /+ &MaxSize as Integer +/
  &Pieces = CreateArray(&InitialValue);
  &MaxLength = &MaxSize;
  &Length = 0;
end-method;

method Reset
  &Pieces = CreateArrayRept("", 0);
  &Length = 0;
end-method;

method Append
  /+ &New as String +/
  Local integer &TempLength = &Length + Len(&New);
  If &Length > &MaxLength Then
    throw CreateException(0, 0, "Maximum size of StringBuffer exceeded(" | &Max⇒
Length | ")");
  End-If;
  &Length = &TempLength;
  &Pieces.Push(&New);
end-method;

get Value
  /+ Returns String +/
  Local string &Temp = &Pieces.Join("", "", "", &Length);
  /* collapse array now */
  &Pieces = CreateArrayRept("", 0);
  &Pieces.Push(&Temp); /* start out with this combo string */
  Return &Temp;
end-get;

set Value
  /+ &NewValue as String +/
  /* Ditch our current value */
  %This.Reset();
  &Pieces.Push(&NewValue);
end-set;

```

The following code concatenates strings.

```

While &file.ReadLine(&line)
  &S.Append(&line);
  &S.Append(&separator);

```

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," Split

Next

Syntax

`Next(&index)`

Description

The Next method increments the given index variable. It returns true if and only if the resulting index variable refers to an existing element of the array. Next is typically used in the condition of a WHILE clause to process a series of array elements up to the end of the array.

&index must be a variable of type integer, or of type Any initialized to an integer, as Next attempts to update it.

If you want to start from the first element of the array, start Next with an index variable with the value zero. The first thing Next does is to increment the value by one.

Parameters

Parameter	Description
<i>&index</i>	The array element where processing should start. <i>&index</i> must be a variable of type integer, or of type Any initialized to an integer, as Next attempts to update it.

Returns

True if the resulting index refers to an existing element of the array, False otherwise.

Example

Next can be used in a While loop to iterate through an array in the following manner:

```
&INDEX = 0;
While &A.Next(&INDEX)
    /* Process &A[&INDEX] */
End-While;
```

In the following code example, &BOTH is a two-dimensional array. This example writes the data from each subarray in &BOTH into a different file.

```

&I = 0;
While &BOTH.Next(&I)
    &J = 1;
    &STRING1 = &BOTH[&I][&J];
    &MYFILE1.writeline(&STRING1);
    &J = &J + 1;
    &STRING2 = &BOTH[&I][&J];
    &MYFILE2.writeline(&STRING2);
End-While;

```

See Also

[Chapter 8, "Array Class," Len, page 285](#)

Pop

Syntax

Pop()

Description

The Pop method removes the last element from the array and returns its value.

Parameters

None.

Returns

The value of the last element of the array. If the last element is a subarray, the subarray is returned.

Example

The Pop method can be used with the Push method to use an array as a stack. To put values on the end of the array, use Push. To take the values back off the end of the array, use Pop.

Suppose we have a two-dimensional array &SUBPARTS which gives the subparts of each part of some assemblies. Each row (subarray) of &SUBPARTS starts with the name of the part, and then has the names of the subparts. Assuming there are no "loops" in this data, the following code puts all the subparts, subsubparts, and so on, of the part given by &PNAME into the array &ALLSUBPARTS, in "depth first order" (that is, subpart1, subparts of subpart1, ..., subpart2, subparts of subpart2, ...). We stack the indexes into &SUBPARTS when we want to go down to the subsubparts of the current subpart.

```

Local array of array of string &SUBPARTS;
Local array of string &ALLSUBPARTS;
Local array of array of number &STACK;
Local array of number &CUR;
Local string &SUBNAME;

/* Set the ALLSUBPARTS array to an empty array of string. */
&ALLSUBPARTS = CreateArrayRept("dummy", 0);

/* Start with the part name. */

&STACK = CreateArray(CreateArray(&SUBPARTS.Find(&PNAME), 2));
While &STACK.Len > 0
    &CUR = &STACK.Pop();
    If &CUR[1] <> 0 And
        &CUR[2] <= &SUBPARTS[&CUR[1]].Len Then

        /* There is a subpart here. Add it. */
        &SUBNAME = &SUBPARTS[&CUR[1], &CUR[2]];
        &ALLSUBPARTS.Push(&SUBNAME);

        /* Tour its fellow subparts later. */
        &STACK.Push(CreateArray(&CUR[1], &CUR[2] + 1));

        /* Now tour its subsubparts. */
        &STACK.Push(CreateArray(&SUBPARTS.Find(&SUBNAME), 2));

    End-If;
End-While;

```

Push

Syntax

Push(*paramlist*)

Where *paramlist* is an arbitrary-length list of values in the form:

value1 [, *value2*] ...

Description

The Push method adds the values in *paramlist* onto the end of the array executing the method. If a value is not the correct dimension, it is flattened or promoted to the correct dimension first, then the resulting values are added to the end of the array.

Considerations Using Arrays With Object References

This method only adds an element to the end of an array. It does not clone or otherwise deep-copy the parameters. For example, if you are adding a reference to an object, Push just adds a reference to the object at the end of the array. This is similar to an assignment. It is *not* making a copy of the object. The following code snippet only puts a reference to the same record onto the end of the array.

```
While &SQL.Fetch(&Rec);
&MYARRAY.Push(&Rec);
...
End-While;
```

Even though the array is growing, all the elements point to the same record. You have only as many standalone record objects as you create. The following code snippet creates new standalone records, so each element in the array points to a new object:

```
local Record &FetchedRec = CreateRecord(Record.PERSONAL_DATA);

While &SQL.Fetch(&FetchedRec)
    &MYARRAY.Push(&FetchedRec);
    &FetchedRec = CreateRecord(Record.PERSONAL_DATA);
End-While;
```

Parameters

Parameter	Description
<i>paramlist</i>	An arbitrary-length list of values, separated by commas.

Returns

None.

Example

The following example loads an array with data from a database table.

```
Local array of record &MYARRAY;
Local SQL &SQL;

&I = 1;
&SQL = CreateSQL("Select(:1) from %Table(:1) where EMPLID like &lsquo;8%’;", =>
    &REC);
While &SQL.Fetch(&REC);
    &MYARRAY.Push(CreateRecord(RECORD.PERSONAL_DATA));
    &I = &I + 1;
    &REC.CopyFieldsTo(&MYARRAY[&I]);
End-While;
```

[Chapter 8, "Array Class," Pop, page 272](#); [Chapter 8, "Array Class," Replace, page 275](#); [Chapter 8, "Array Class," Shift, page 278](#) and [Chapter 8, "Array Class," Unshift, page 284](#)

[Chapter 8, "Array Class," Using Flattening and Promotion, page 264](#)

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Understanding Objects and Classes in PeopleCode," Assigning Objects

Replace**Syntax**

Replace(*start*, *length*[, *paramlist*])

Where *paramlist* is an arbitrary-length list of values in the form:

value1 [, *value2*] ...

Description

Replace replaces the *length* elements starting at *start* with the given values, if any. If *length* is zero, the insertion takes place *before* the element indicated by *start*. Otherwise, the replacement starts with *start* and continues up to and including *length*, replacing the existing values with *paramlist*.

If a negative number is used for *start*, it indicates the starting position relative to the last element in the array, such that -1 indicates the position just *after* the end of the array. To insert at the end of the array (equivalent to the Push method), use a *start* of -1 and a *length* of 0.

If a negative number is used for *length*, it indicates a length measuring downward to lower indexes. Both flattening and promotion can be applied to change the dimension of the supplied parameters to match the elements of the given array.

Similar to how the built-in function Replace is used to update a string, the Replace method is a general way to update an array, and can cause the array to grow or shrink.

See [Chapter 8, "Array Class," Using Flattening and Promotion, page 264](#).

Using Replace to Remove an Element

You can use the Replace method to remove an element from an array. Just specify the item you want replaces, with *length* equal to one.

The following example removes the item from &Index:

```
&Array.Replace(&Index, 1);
```

Parameters

Parameter	Description
start	Specifies where to start replacing the given elements in the array. If a negative number is used for <i>start</i> , it indicates the starting position relative to the last element in the array.
length	Specifies the number of elements in the array to be replaced.
paramlist	Specifies values to be used to replace existing values in the array. This parameter is optional.

Returns

None.

Example

For example, given the following array:

```
Local array of string &AS;  
&AS = CreateArray("AA", "BB", "CC");
```

After executing the next code, the array &AN will contain four elements, ZZ, YY, BB, CC:

```
&AS.Replace(1, 1, "ZZ", "YY");
```

After executing the next code, the array &AN will contain three elements, ZZ, MM, CC:

```
&AS.Replace(2, 2, "MM");
```

After executing the next code, the array &AN will contain three elements, ZZ, OO, CC.

```
&AS.Replace( - 2, - 1, "OO");
```

Local Name	Local Value
 &AS	Array
 Dimension	1
 Len	3
 [1]	ZZ
 [2]	OO
 [3]	CC

&AS expanded in PeopleCode debugger

See Also

[Chapter 8, "Array Class," Substitute, page 282](#) and [Chapter 8, "Array Class," Find, page 266](#)

Reverse

Syntax

Reverse()

Description

The Reverse method reverses the order of the elements in the array.

If the array is composed of subarrays, the Reverse method reverses only the elements in the super-array, it doesn't reverse all the elements in the subarrays. For example, the following:

```
&AN = CreateArray(CreateArray(1, 2), CreateArray(3, 4), CreateArray(5, 6)).reverse⇒  
();
```

results in &AN containing:

```
((5, 6), (3, 4), (1, 2))
```

Parameters

None.

Returns

None.

Example

Suppose you had the following array.

```
Local Array of Sting &AS;
```

```
&AS = CreateArray("R", "O", "S", "E");
```

If you executed the Reverse method on this array, the elements would be ESOR.

See Also

[Chapter 8, "Array Class," Sort, page 279](#)

Set

Syntax

Set(*index*)

Description

Use the Set method to set the value of the *index* element of an array. This method is used with the Java PeopleCode functions, instead of using subscripts (which aren't available in Java.)

Using this method is the same as using a subscript to reference an item of an array. In the following example, the two lines of code are identical:

```
&MyArray[8] = &MyValue;
```

```
&MyArray.Set(8) = &MyValue;
```

Parameters

<i>Parameter</i>	<i>Description</i>
<i>index</i>	The array element to be accessed.

Returns

None.

See Also

[Chapter 8, "Array Class," Get, page 267](#)

[Chapter 22, "Java Class," page 1085](#)

Shift

Syntax

Shift()

Description

Use the Shift method to remove the first element from the array and return it. Any following elements are "shifted" to an index of one less than they had.

Parameters

None.

Returns

Returns the value of the first element of the array. If the first element is a subarray, the subarray is returned.

Example

```
For &I = 1 to &ARRAY.Len;
    &ITEM = &ARRAY.Shift;
    /* do processing */
End-For;
```

See Also

[Chapter 8, "Array Class," Pop, page 272](#); [Chapter 8, "Array Class," Push, page 273](#); [Chapter 8, "Array Class," Replace, page 275](#) and [Chapter 8, "Array Class," Unshift, page 284](#)

Sort

Syntax

Sort(*order*)

Description

The Sort method rearranges the elements of the array executing the method into an order.

The type of sort done by this function, that is, whether it is a linguistic or binary sort, is determined by the Sort Order Option on the PeopleTools Options page.

If the array is one-dimensional, the elements are arranged in either ascending or descending order.

The type of the first element is used to determine the kind of comparison to be made. Any attempt to sort an array whose elements are not all of the same type results in an error.

If *order* is "A", the order is ascending; if it is "D", the order is descending. The comparison between elements is the same one as if done using the PeopleCode comparison operators (<, >, =, and so on.)

Note. If you execute this method on a server, the string sorting order is determined by the character set and localization of the server.

If the array is two-dimensional, the subarrays are arranged in order by the first element of each subarray. Sorting an array whose subarrays have different types of first elements will result in an error. The comparison is done by using the PeopleCode comparison operators (<, >, =, and so on.)

Note. This method works with arrays that have only one or two dimensions. You receive a runtime error if you try to use this method with an array that has more than two dimensions.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>order</i>	Specifies whether the array should be sorted in ascending or descending order. Values for <i>order</i> are:

<i>Value</i>	<i>Description</i>
A	Ascending
D	Descending

Returns

None.

Example

The following example changes the order of the elements in array &A to be ("Frank", "Harry", "John").

```
&A = CreateArray("John", "Frank", "Harry");
```

```
&A.Sort();
```

The following example changes the order of the elements in array &A to be (("Frank", 1957), ("Harry", 1928), ("John", 1952)).

```
&A = CreateArray(CreateArray("John", 1952), CreateArray("Frank", 1957), Create⇒  
Array("Harry", 1928));
```

Local Name	Local Value

PeopleTools 8.51 PeopleBook: System and Server Administration, "Using PeopleTools Utilities,"
PeopleTools Options

Subarray

Syntax

Subarray(*start*, *length*)

Description

The Subarray method creates a new array from an existing one, taking the elements from *start* for a total of *length*. If *length* is omitted, all elements from *start* to the end of the array are used.

If the array is multi-dimensional, the subarrays of the created array are *references* to the same subarrays from the existing array. This means if you make changes to the original subarrays, the referenced subarrays are also changed. To make distinct subarrays, use the Clone method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>start</i>	Specifies where in the array to begin the subarray.
<i>length</i>	Specifies the number of elements in the array to be part of the subarray.

Returns

An array object.

Example

To make a distinct array from a multi-dimensional array, use the following:

```
&A = &AAN.Subarray(1, 2).Clone();
```

See Also

[Chapter 8, "Array Class," Clone, page 265](#)

Substitute

Syntax

Substitute(*old_val*, *new_val*)

Description

The Substitute method replaces every occurrence of a value found in an array with a new value. To replace an element that occurs in a specific location in an array, use Replace.

If the array is one-dimensional, Substitute replaces every occurrence of the *old_val* in the array with *new_val*.

If the array is two-dimensional, Substitute replaces every subarray whose first element is equal to *old_val*, with the subarray given by *new_val*.

Note. This method works with arrays that have only one or two dimensions. You receive a runtime error if you try to use this method with an array that has more than two dimensions.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>old_val</i>	Specifies the existing value in the array to be replaced.
<i>new_val</i>	Specifies the value with which to replace occurrences of <i>old_val</i> .

Returns

None

Example

The following example changes the array &A to be ("John", "Jane", "Hamilton").

```
&A = CreateArray();
&A[1] = "John";
&A[2] = "Jane";
&A[3] = "Henry";
&A.Substitute("Henry", "Hamilton");
```

The following example changes the array &A to be (("John", 1952), ("Jane", 1957), ("Hamilton", 1971), ("Frank", 1961)).

```
&A = CreateArray(CreateArray("John", 1952), CreateArray("Jane", 1957), CreateArray("Henry", 1928), CreateArray("Frank", 1961));
&A.Substitute("Henry", CreateArray("Hamilton", 1971));
```

See Also

[Chapter 8, "Array Class," Find, page 266](#) and [Chapter 8, "Array Class," Replace, page 275](#)

Unshift

Syntax

Unshift(*paramlist*)

Where *paramlist* is an arbitrary-length list of values in the form:

value1 [, *value2*] ...

Description

The Unshift method adds the given elements to the *start* of the array. Any following elements are moved up to indexes that are larger by the number of values moved. Flattening and Promotion are used to change the dimension of the supplied parameters to be one less than that of the given array.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>paramlist</i>	Specifies values to be added to the start of the array.

Returns

None.

Example

The following code changes &A to be ("x", "Y", "a", "B", "c").

```
&A = CreateArray("a", "B", "c");
```

```
&A.Unshift("x", "Y");
```

Array Class Properties

In this section, we discuss the array class properties.

Dimension

Description

The Dimension property is the number of "Array" type names from the declaration of the array, also called subarrays. This property returns a number.

This property is read-only.

Example

The following example sets &DIM to 2.

```
Local Array of Array of Number &AAN;  
&DIM = &AAN.Dimension;
```

Len

Description

The Len property is the current number of elements in the array. This property can be updated. Setting it to a negative value results in an error.

If this property is set to a smaller (nonnegative) number than its current value, the array is truncated to that length, discarding any elements whose indexes are larger than the given new length.

If this property is set to a number larger than its current value, the array is extended to the new length. Any new elements are set to a default value based on the element type of the array.

This property is read-write.

Example

The following is a test of whether an array is empty:

```
If &ARR.Len = 0 then  
/* &ARR is empty. */  
End-If;
```

Chapter 9

BPEL Classes

This chapter discusses the BPEL classes, as well as describes:

- Scope of the BPEL classes
- Data types of the BPEL classes
- How to import the BPEL classes
- How to create a BPEL object
- BPEL reference material

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Integrating with BPEL Process-Based Services"

Understanding the BPEL Classes

Use the Business Process Execution Language (BPEL) classes for launching, as well as controlling, a BPEL process instance. A BPEL process instance is associated with a service operation, that is, a message transaction, such as an outbound asynchronous message. You must have first created the service operation using PeopleSoft Pure Internet Architecture pages. When you define the service operation you specify the node used for connecting to the third-party system, as well as the routings used by the messages, and so on.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Integrating with BPEL Process-Based Services"

Scope of the BPEL Classes

The BPEL classes can be instantiated only from PeopleCode.

The BPEL classes can be called from a component, an internet script, Integration Broker, or an Application Engine program.

BPEL classes can be of Local, Global, or Component scope.

Data Types of the BPEL Classes

Every BPEL class is its own data type. That is, the class of BPELUtil is declared as type BPELUtil, and so on.

The following are the data types of the BPEL classes:

- AsyncFFSend
- BPELUtil
- IBUtil

How to Import the BPEL Classes

The BPEL classes are *not* built-in classes, like rowset, field, record, and so on. They are application classes. Before you can use these classes in your PeopleCode program, you must import them to your program.

An import statement names either all the classes in a package or one particular application class. For importing the BPEL classes, PeopleSoft recommends that you import all the classes in the application package.

The application package PT_BPEL contains the BPEL classes that you will use:

- AsyncFFSend
- BPELUtil
- IBUtil

The import statement you should use is as follows:

```
import PT_BPEL: *;
```

Using the asterisks after the package name makes all the application classes directly contained in the named package available. Application classes contained in subpackages of the named package are *not* made available.

See Also

[Chapter 6, "Application Classes," page 189](#)

How to Create a BPEL Object

After you've imported the BPEL classes, you instantiate an object of one of those classes using the constructor for the class and the Create function.

The following example creates a new instance of the BPELUtil class, as the variable &MyBU, with local scope:

```
import PT_BPEL: *;  
  
Local BPELUtil &MyBU = Create BPELUtil();
```

See Also

[Chapter 9, "BPEL Classes," BPEL Classes Constructors, page 289](#)

BPEL Classes Constructors

You must use the constructor for each class to instantiate an instance of that class. The following are the constructors for the BPEL classes.

AsyncFFSend

Syntax

AsyncFFSend()

Description

Use the AsyncFFSend constructor to instantiate an AsyncFFSend object.

Parameters

None.

Returns

A reference to an AsyncFFSend object.

See Also

[Chapter 9, "BPEL Classes," AsyncFFSend Class, page 291](#)

BPELUtil

Syntax

BPELUtil()

Description

Use the BPELUtil constructor to instantiate a BPELUtil object.

Parameters

None.

Returns

A reference to a BPELUtil object.

See Also

[Chapter 9, "BPEL Classes," BPELUtil Class, page 292](#)

IBUtil

Syntax

IBUtil()

Description

Use the IBUtil constructor to instantiate an IBUtil object.

Parameters

None.

Returns

A reference to an IBUtil object.

See Also

[Chapter 9, "BPEL Classes," IBUtil Class, page 298](#)

AsyncFFSend Class

This class provides the application handler used when an asynchronous one way operation is called from the local system. This class extends the integration broker ISend class OnRequestSend method.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages"

AsyncFFSend Class Method

This section describes the AsyncFFSend class method OnRequestSend.

OnRequestSend

Syntax

OnRequestSend(&Msg)

Description

Use the OnRequestSend method to implement the integration broker ISend class OnRequestSend method.

This method is generally used to associate the WSA_MessageID when making an asynchronous one way request to the BPEL process so that it can be tracked.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Msg</i>	Specify an already populated and instantiated message object.

Returns

A message object.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages," Understanding Sending and Receiving Messages

BPELUtil Class

This class provides the utility methods to interact with BPEL processes.

BPELUtil Class Methods

This section discusses the BPELUtil class methods, in alphabetical order.

GetASyncBPELProcessInstanceIdUrl

Syntax

GetASyncBPELProcessInstanceIdUrl(*TransactionID*)

Description

Use the GetASyncBPELProcessInstanceIdUrl method to return the complete URL that can be used to monitor an asynchronous BPEL process instance. The URL can be used to access the BPEL monitor for this particular BPEL process instance.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionID</i>	Specify the transaction ID for the asynchronous BPEL process instance that you want to monitor.

Returns

A string containing a complete URL if successful, a Null or invalid string otherwise.

See Also

[Chapter 9, "BPEL Classes," GetSyncBPELProcessInstanceIdUrl, page 294](#)

GetBPELProcessBrowserUrl

Syntax

GetBPELProcessBrowserUrl(*NodeName*)

Description

Use the GetBPELProcessBrowserUrl to return a complete URL of the WSIL process browser. It can be used to discover all the web services that are being hosted by the given BPEL domain.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NodeName</i>	Specify the name of the node associated with the BPEL process that you want to access, as a string.

Returns

A string containing the complete URL if successful, an invalid URL string otherwise.

GetOperationType

Syntax

GetOperationType(*OperationName*)

Description

Use the GetOperationType method to return the type of the specified operation.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>OperationName</i>	Specify the name of the operation for which you want to determine the type, as a string.

Returns

A string containing the operation type. Valid values are:

<i>Value</i>	<i>Description</i>
S	The operation type is synchronous.
A	The operation type is asynchronous.
Null	There is an error in the method execution.

GetSyncBPELProcessInstanceIdUrl

Syntax

GetSyncBPELProcessInstanceIdUrl(*NodeName*, *MessageID*)

Description

Use the GetSyncBPELProcessInstanceIdUrl method to return the complete URL that can be used to monitor the specified synchronous BPEL process instance.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NodeName</i>	Specify the node name associated with the synchronous BPEL process instance, as a string.
<i>MessageID</i>	Specify the message ID associated with the external system for this BPEL process instance, as a string.

Returns

A string containing a complete URL if successful, an invalid URL otherwise.

See Also

[Chapter 9, "BPEL Classes," GetAsyncBPELProcessInstanceIdUrl, page 292](#)

LaunchASyncBPELProcess

Syntax

LaunchASyncBPELProcess(*operationName*, &*Msg*, *Username*, *Password*)

Description

Use the LaunchASyncBPELProcess method to invoke an asynchronous BPEL process.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>OperationName</i>	Specify the name of the operation associated with the asynchronous BPEL process that you want to start, as a string.
& <i>Msg</i>	Specify an already instantiated and populated message object that is created from the message definition that is associated with the asynchronous BPEL process.
<i>Username</i>	<i>Username</i> and <i>Password</i> are used to override the security credentials that are sent by default by Integration Broker when invoking a secure BPEL process (a web service.) If you specify an empty string, the Integration Broker credentials are used. If you specify a value, it's sent as part of the security credentials of the BPEL process.
<i>Password</i>	<i>Username</i> and <i>Password</i> are used to override the security credentials that are sent by default by Integration Broker when invoking a secure BPEL process (a web service.) If you specify an empty string, the Integration Broker credentials are used. If you specify a value, it's sent as part of the security credentials of the BPEL process.

Returns

A string that contains the transaction ID of the published message if successful, a Null string otherwise.

See Also

[Chapter 9, "BPEL Classes," LaunchSyncBPELProcess, page 296](#)

LaunchSyncBPELProcess

Syntax

LaunchSyncBPELProcess(*operationName*, &*Msg*, *Username*, *Password*)

Description

Use the LaunchSyncBPELProcess method to invoke a synchronous BPEL process.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>OperationName</i>	Specify the name of the operation associated with the synchronous BPEL process that you want to start, as a string.
& <i>Msg</i>	Specify an already instantiated and populated message object that is created from the message definition that is associated with the synchronous BPEL process.
<i>Username</i>	<i>Username</i> and <i>Password</i> are used to override the security credentials that are sent by default by Integration Broker when invoking a secure BPEL process (a web service.) If you specify an empty string, the Integration Broker credentials are used. If you specify a value, it's sent as part of the security credentials of the BPEL process.
<i>Password</i>	<i>Username</i> and <i>Password</i> are used to override the security credentials that are sent by default by Integration Broker when invoking a secure BPEL process (a web service.) If you specify an empty string, the Integration Broker credentials are used. If you specify a value, it's sent as part of the security credentials of the BPEL process.

Returns

A message object populated with the reply message if successful, a Null object otherwise.

See Also

[Chapter 9, "BPEL Classes," LaunchASyncBPELProcess, page 295](#)

UpdateConnectorResponseProperties

Syntax

UpdateConnectorResponseProperties(&Msg)

Description

Prior to sending the response message, use this method to update the connector properties for an asynchronous PeopleSoft request/response web service that is consumed by a BPEL process. Among several connector property changes that it makes, this method adds a "content-type" connector property of "text/xml."

Note. The UpdateConnectorResponseProperties method is not required with Oracle BPEL Process Manager 10.1.2 or earlier supported versions of Oracle BPEL Process Manager; however, it can be used with those versions.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Msg</i>	The message object to be sent to the BPEL process as the response of an asynchronous PeopleSoft request/response web service.

Returns

None

Example

The following sample handler PeopleCode program processes requests for an asynchronous PeopleSoft request/response web service. A call is made to UpdateConnectorResponseProperties just before sending the response.

```

import PS_PT:Integration:INotificationHandler;
import PT_BPEL:BPELUtil;

class InboundASyncResponseHandler implements PS_PT:Integration:INotificationHandler
  method OnNotify(&MSG As Message);
end-class;

method OnNotify
  /+ &MSG as Message +/
  /+ Extends/implements PS_PT:Integration:INotificationHandler.OnNotify +/
  Local PT_BPEL:BPELUtil &bpeL;
  Local Message &response;
  Local string &payload;
  Local XmlDocument &xml;
  Local File &MYFILE;
  &bpeL = create PT_BPEL:BPELUtil();
  &payload = "<?xml version='1.0'?><PSFTCalcResponseMessage xmlns='http:⇒
//xmlns.oracle.com/Enterprise/Tools/schemas/PSFTCALCRESPONSEMESSAGE.V1'><result⇒
xmlns='1'>9</result></PSFTCalcResponseMessage>";
  &xml = CreateXmlDoc(&payload);
  &response = CreateMessage(Operation.PSFTASYNCCALCULATE, %IntBroker_Response);
  &response.SetXmlDoc(&xml);
  &response.IBInfo.WSA_MessageID = &MSG.IBInfo.WSA_MessageID;
  &response.IBInfo.WSA_ReplyTo = &MSG.IBInfo.WSA_ReplyTo;
  &bpeL.UpdateConnectorResponseProperties(&response);
  %IntBroker.Publish(&response);
end-method;

```

IBUtil Class

The IBUtil class provides the utility methods to access integration broker metadata.

IBUtil Class Methods

This section discusses the BPELUtil class methods, in alphabetical order.

GetBPELConsoleUrl

Syntax

```
GetBPELConsoleUrl(NodeName)
```

Description

Use the GetBPELConsoleUrl method to return the BPEL console URL.

A transaction ID is an internal identifier for the message that is published. A message ID is the external ID that is used by the external system for identifying the transaction. The transaction ID is appended to the URL generated by this method. This concatenated URL is used to monitor the BPEL process instance.

Use the GetMessageId method to return the message ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NodeName</i>	Specify the name of the node associated with the BPEL process that you want to monitor.

Returns

A string containing a complete URL if successful, Null otherwise.

See Also

[Chapter 9, "BPEL Classes," GetMessageId, page 300](#)

GetBPELDomain

Syntax

GetBPELDomain(*Nodename*)

Description

Use the GetBPELDomain method to determine the name of the domain of the specified node. This is used to construct the URL for accessing a BPEL process instance.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Nodename</i>	Specify the name of the node that you want to determine the domain for, as a string.

Returns

A string containing the domain if successful, Null otherwise.

GetMessageId

Syntax

GetMessageId(*TransactionId*)

Description

Use the GetMessageId method to return the message ID used to monitor a BPEL process instance.

A transaction ID is an internal identifier for the message that is published. A message ID is the external ID that is used by the external system for identifying the transaction.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionId</i>	Specify the transaction ID associated with the BPEL process instance that you want to monitor, as a string.

Returns

A string containing the message ID, Null otherwise.

See Also

[Chapter 9, "BPEL Classes," GetBPELConsoleUrl, page 298](#)

GetNode

Syntax

GetNode(*MessageId*)

Description

Use the GetNode method to return the node name of the node involved in processing of the message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>MessageId</i>	Specify the message ID associated with the BPEL process instance that you want to get the node for, as a string.

Returns

A string containing the node name if successful, Null otherwise.

GetNumberOfRoutings

Syntax

GetNumberOfRoutings(*ServiceOperationName*)

Description

Use the GetNumberOfRoutings method to return the number of routings for the specified service operation.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ServiceOperationName</i>	Specify the name of the service operation that you want to discover the number of routings for, as a string.

Returns

A number.

GetStatus

Syntax

GetStatus(*TransactionId*)

Description

Use the GetStatus method to return the status of the Integration Broker process specified by the transaction Id.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionId</i>	Specify the transaction ID for the BPEL process instance that you want to check the status of, as a string.

Returns

A string containing the status, Null otherwise.

GetTransactionId

Syntax

GetTransactionId(*MessageID*)

Description

Use the GetTransactionId method to return the transaction ID from the message. You must use the Publish or SyncRequest method on the message before you use this method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>MessageID</i>	Specify the message ID associated with the BPEL process instance, as a string.

Returns

A string containing the transaction ID associated with the published message, Null otherwise.

Chapter 10

Business Interlink Class

This chapter provides an overview of Business Interlink class and discusses the following topics:

- Using the Interlink object
- Deciding which methods to use
- Using the incoming Business Interlink methods and properties
- Understanding the state of an Interlink object
- Using Business Interlink with Application Engine
- Using the Data Type of a Business Interlink object
- Understanding the scope of a Business Interlink object
- Business Interlink class built-in function
- Business Interlink class reference
- Configuration parameters

Note. PeopleSoft Business Interlinks is a deprecated product. The Business Interlinks class currently exists for backward compatibility only. For new integrations, use Integration Broker instead.

See Also

Chapter 25, "Message Classes," page 1241

Understanding Business Interlink Class

The PeopleSoft Business Interlink framework provides a gateway for PeopleSoft applications to the services of any external system. This framework enables any PeopleSoft component (that is, a page, an Application Engine program, and so on) to integrate with any external system in near real-time and batch modes.

This framework enables a PeopleCode program to map the input and outputs of a Business Interlink definition to PeopleCode variables and record fields, then, using an Interlink object, call the Interlink plug-in, which in turn calls the external system, passes the information to the external system, and returns values to the PeopleCode program.

This documentation describes only the Interlink object portion of the PeopleSoft Business Interlink framework.

Each Interlink object is based on a Business Interlink definition, which is created in Application Designer. An Interlink object can be based on only a single Business Interlink definition.

See Also

See additional Business Interlink documentation available on PeopleSoft Customer Connection.

Using the Interlink Object

After you instantiate an Interlink object, use the Interlink object to:

- Populate the input buffer
- Send the data to the Interlink plug-in (by using the Execute method)
- Fetch the outputs from the buffer
- Check for status and error messages

After the Business Interlink object is instantiated, you can assign values from constants, PeopleSoft variables, or record fields to the inputs of that Business Interlink object.

When you execute the Business Interlink object, it loads the appropriate Business Interlink Plug-in and passes itself to that Business Interlink Plug-in. The Business Interlink Plug-in processes the input data, passing the input values of the Business Interlink object to the external system and then fills the output values of the Business Interlink object (if there are outputs).

Deciding Which Methods to Use

After you create your Business Interlink definition, you must use PeopleCode to instantiate an Interlink object and execute the Business Interlink plug-in. This PeopleCode can be long and complex. Rather than write it directly, you can drag and drop the Business Interlink definition from the Application Designer Project View into an open PeopleCode edit pane. Application Designer analyzes the definition and generates initial PeopleCode as a template, which you can modify.

In this section, we discuss how to:

- Execute the Business Interlink object.
- Support batch input and output.
- Support rowsets.
- Use the flat table methods.
- Support dynamic output.
- Use hierarchical data (BIDocs).

See Also

See additional Business Interlink documentation available on PeopleSoft Customer Connection.

Executing the Business Interlink Object

In most cases, you must use the `Execute` method to execute the Business Interlink object. However, for bulk input, you can use the `BulkExecute` method instead.

The `Execute` and `BulkExecute` methods return a value you can use for status and error checking.

Supporting Batch Input and Output

The methods discussed in this section, except for `BulkExecute`, add input values to the Business Interlink object one set, or row, at a time. The call to the Business Interlink Plug-in occurs only once. All the input data is passed with the single `Execute`. All output is returned as batch as well. The methods then get the output values one set, or row, at a time.

If you're sending a large amount of data to the input buffers, instead of adding one input row at a time, you might write the data to a staging table, then use the `BulkExecute` method. This method automatically executes; that is, you don't have to use the `Execute` method. It also automatically fills the output record specified with the method with all the output values in every row in the output buffer if you've specified an output record.

Supporting Rowsets

If your data is mapped into rowsets, you may want to use the `InputRowset` method. This method takes a standard rowset object to populate the inputs for the Business Interlink object. You can use the `FetchIntoRowset` method to repopulate the rowset with new data.

Using the Flat Table Methods

If your data is in a flat table structure, you can use the flat table methods. `AddInputRow` adds rows of input to the Business Interlink object; `FetchNextRow` fetches rows of output from the Business Interlink object.

Supporting Dynamic Output

A Business Interlink can have dynamic output, meaning that the outputs for a Business Interlink object are changeable in data type or number of outputs.

Business Interlinks supplies a set of methods to support dynamic output. These methods enable you to interrogate the output buffer programmatically to determine the number of fields (columns), their types, and their values.

The following methods support dynamic output:

- `GetFieldCount`

- `GetFieldType`
- `GetFieldValue`
- `MoveFirst`
- `MoveNext`

Use the `MoveFirst` method to move to the first column, first row of the output buffer, and within a loop, use the `MoveNext` method to move to each row on the output buffer.

Within a `MoveFirst` (or `MoveNext`) loop, use the `GetFieldCount` method to get the number of columns in the output buffer, which is also the number of outputs for this Business Interlink object. Then you can extract the outputs from the buffer in a loop.

Within the `GetFieldCount` loop, use `GetFieldName` to get the name of the output, `GetFieldValue` to get the value of the output (which will be returned as a string), and `GetFieldType` to get the type of the output (if the output is not a string type, you will convert it to this type).

See [Chapter 10, "Business Interlink Class," `GetFieldCount`, page 338](#); [Chapter 10, "Business Interlink Class," `GetFieldType`, page 339](#); [Chapter 10, "Business Interlink Class," `GetFieldValue`, page 340](#); [Chapter 10, "Business Interlink Class," `MoveFirst`, page 352](#) and [Chapter 10, "Business Interlink Class," `MoveNext`, page 353](#).

Using Hierarchical Data (BIDocs)

A Business Interlink can have hierarchical data. Think of the structure as a tree, with a root doc, node docs, and values. The hierarchical data methods and objects are also referred to as BIDocs.

Input Structures

The following shows an example of an input structure:

Example input structure

The *root doc* is `Calculate Cost(Domestic)`. A root doc can contain both values and node docs.

The *node docs* are `From`, `To`, `Package_Info` and `Account_Info_List`. Each node can contain both values and child nodes. Node docs can be further described as either:

- *Simple node docs* have only one set of values for a single instance of a root doc. From, To, Package_Info are all simple node docs.
- *List node docs* can contain more than one set of values for a single instance of a root doc. Account_Info_List is a list node doc.

The values in the From node are OriginCountry, OriginPostal_Code, and Ship_Date. The value within the root node is input_param1. Notice that there are values both within the root doc and within node docs.

Business Interlinks support hierarchical input structures with the following methods:

- GetInputDocs
- AddDoc
- AddValue
- AddNextDoc

The GetInputDocs method returns a reference to the root doc of an input structure. From the previous example, it returns a reference to Calculate Cost(Domestic).

Use the AddDoc method to access the node docs. From the previous example, you would use AddDoc to access the From, To, Package_Info, and Account_Info_List node docs. If any of these nodes contained nodes, you could use AddDoc to access those as well.

Use the AddValue method to set values. From the previous example, you would use AddValue to set the value for input_param1, OriginCountry, OriginPostal_Code, and Ship_date. You must call AddDoc on a node before you can call AddValue for its values.

Use the AddNextDoc method to access the following:

- If a node doc is a list, that is, it can contain more than one set of values, use AddNextDoc to reference the next set of values.
- To add another copy of the entire input structure, use AddNextDoc to return a reference to the next root doc.

The following code example sets values for the node doc From, which is a simple node doc. It also sets the values for Account_Info_List, which is a list node doc.

```
&Calc_Input = &QE_COST.GetInputDocs("");

&FromDoc = &Calc_Input.AddDoc("From");
&ret = &FromDoc.AddValue("OriginCountry", "United States");
&ret = &FromDoc.AddValue("OriginPostal_Code", &ORIGIN);
&ret = &FromDoc.AddValue("Ship_Date", &SHIPDATE);

&Account_Doc = &Calc_Input.AddDoc("Account_Info_List");
&ret = &Account_Doc.AddValue("Account_Number", "CT-8001");
&ret = &Account_Doc.AddValue("Meter_Number", &METER);
&ret = &Account_Doc.AddValue("Service_Type", &MODE);

/* add next set of values in list */

&ret = &Calc_Input.AddNextDoc();
&ret = &Account_Doc.AddValue("Account_Number", "CT-8002");
&ret = &Account_Doc.AddValue("Meter_Number", &METER);
&ret = &Account_Doc.AddValue("Service_Type", &MODE);
```

Output Structures

The following shows an example of an output structure:

Example output structure

The *root doc* is Calculate Cost(Domestic).

The *node docs* are Service_Rate and output_param2_List. Each node can contain both values and child nodes. Node docs can be further be described as either:

- *Simple node docs* have only one set of values for a single instance of a root doc. Service_Rate is a simple node doc.
- *List node docs* can contain more than one set of values for a single instance of a root doc. output_param2_List is a list node doc.

The values in the Service_Rate node are Service_Type, Rate, and in the output_param2_List node, output_member1 and output_member2, and within the root node, output_param1.

Business Interlinks support hierarchical output structures with the following methods:

- GetOutputDocs
- GetDoc
- GetNextDoc
- GetPreviousDoc
- GetStatus
- GetValue
- GetCount
- MoveToDoc

The GetOutputDocs method returns a reference to the root doc of an output structure. From the previous example, it returns a reference to Calculate Cost(Domestic).

Use the GetDoc method to access node docs. From the previous example, you would use GetDoc to access the Service_Rate or output_param2_List node docs. If any of these nodes contain nodes, you use GetDoc to access those as well.

Use the `GetValue` method to retrieve the values. From the previous example, you would use `GetValue` to retrieve the values for `output_param1`, and for the `Service_Rate` node, to get the values `Service_Type`, `Rate`, `output_member1`, and `output_member2`. You must call `GetDoc` on a node before you can call `GetValue` for its values.

Use the `GetNextDoc` (or `GetPreviousDoc`) method to access the following:

- A reference to the next (or previous, respectively) root doc.
- If a node doc is a list, that is, can contain more than one set of values, use `GetNextDoc` to reference the next node doc in the list (or `GetPreviousDoc` to access the previous node doc in the list.)

Use the `GetCount` method to return either the number of docs in a list node doc, or the number of root docs. In the example, you can count the number of `Calculate Cost(Domestic)` nodes or the number of `output_param2_list` nodes.

Use the `MoveToDoc` method to move to a particular doc at the root level or to a list node doc. In the example, you can move to a `Calculate Cost(Domestic)` node or to an `output_param2_list_node`.

The following code example gets values for the node docs `Service Rate`, which is a simple node doc. It also sets the values for `output_param2_List`, which is a list node doc.

```
&Calc_Input = &QE_COST.GetOutputDocs("");

&Service_Rate_Doc = &Calc_Input.GetDoc("Service_Rate");
&ret = &Service_Rate_Doc.GetValue("Service_Type", "Overnight");
&ret = &Service_Rate_Doc.GetValue("Rate", "50.00");

&Out_Param_Doc = &Calc_Input.GetDoc("output_param2_List");
&ret = &Out_Param_Doc.GetValue("output_member1", "value1");
&ret = &Out_Param_Doc.GetValue("output_member2", "value2");

/* get next set of values in list */

&Account_Doc = &Out_Param_Doc.AddNextDoc();
&ret = &Out_Param_Doc.GetValue("output_member1", "value3");
&ret = &Out_Param_Doc.GetValue("output_member2", "value4");
```

Using the Incoming Business Interlink Methods and Properties

The incoming Business Interlink methods enable you to parse an XML request and build an XML response.

The incoming Business Interlink uses a set of methods and functions.

The `GetContentBody Request` object method converts the request content into an XML string. You can then use this string with the `GetBiDoc` function to create a `BiDocs` structure from it that is the same shape and contains the same data as the XML document contained in the XML string.

After you have the `BiDocs` structure containing the XML request, you can:

- Use the `GetNode` method to get one of the XML elements.
- Use the `NodeType` method to get the type of the node (element, processing instruction, comment).
- Use the `NodeName` property to get the name of the element.

- Use the `NodeValue` property to get the value of the element.

You can also use the standard BiDocs methods (such as `GetDoc`, `GetValue`) to retrieve information from this BiDocs object.

When an XML element contains attributes, the `AttributeCount` property gets the number of attributes, the `GetAttributeName` method gets the name of an attribute, and the `GetAttributeValue` method gets the value of an attribute.

To build an XML response, you can use the `GetBiDocs` function to create a blank BiDocs structure. To create the XML structure within that BiDocs, use `CreateElement` to create an XML tag, `AddComment` to add an XML comment, `AddAttribute` to add an attribute to an XML tag, and `AddProcessInstruction` to add a processing instruction (the first tag of the XML response).

Use the `GenXMLString` method to create an XML string from the BiDocs structure. Then you can use the `Write Response` method to write the response to the HTTP response string.

Understanding the State of an Interlink Object

PeopleSoft Business Interlink API that are run on the application server should be stateless, that is, if you want to save information from one call of the Interlink object to the next, you have to do it yourself by writing the relevant information to the database. If you use the `Execute` method more than once within a single PeopleCode event (that is, if you have the `Execute` method in some sort of loop) the state is preserved. After you leave the event, any state associated with the Interlink object is lost.

You should create only one Business Interlink object, that is, you should only use the `GetInterlink` function once. After that, you can load it with data, pass the data to the Interlink plug-in (using `Execute`) and fetch output data as many times as you need.

Using Business Interlink with Application Engine

In a regular PeopleCode program, you can only declare a Business Interlink object as local. However, in an Application Engine program, you can declare a Business Interlink object as global. Instantiating a Business Interlink object once as a global saves on the significant overhead of reinstantiating a local object for every iteration of PeopleCode called in a loop.

- Global Business Interlink objects can only be used in Application Engine PeopleCode programs because PeopleCode that runs on an application server must be stateless.
- When a restartable Application Engine program abends, global Business Interlink objects that were instantiated before the last checkpoint are automatically reinstantiated at restart. So the object will be available, even though no call has been made to `GetInterlink` in the restarted process. However, the associated Business Interlink data buffers are *not* recovered, so the Application Engine program must be written such that these buffers are empty whenever a checkpoint is taken.

- Business Interlink objects should *not* be declared as global unless they are used in several PeopleCode actions, or in a PeopleCode action that is called in a loop. Only in these instances is the overhead of doing a checkpoint worthwhile.

Using the Data Type of a Business Interlink Object

You should declare a Business Interlink object using the data type Interlink. For example,

```
Local Interlink &MYBI;
```

Declare hierarchical data as type BIDocs. For example:

```
Local BIDocs &OutlistDoc;
```

Note. BIDocs and Interlink objects used in PeopleCode programs run on the application server can be declared only as type Local. You can declare Interlinks as Global only in an Application Engine program.

Understanding the Scope of a Business Interlink Object

A Business Interlink object can be instantiated from PeopleCode.

This object can be used anywhere you have PeopleCode, that is, in an application class, Application Engine PeopleCode, record field PeopleCode, and so on.

GetInterlink

Business Interlink Class Methods

In this section, we discuss the Business Interlink class methods. The methods are discussed in alphabetical order.

AddDoc

Syntax

AddDoc(*docname*)

Description

The AddDoc method adds a document to an input structure. The added document is an input parameter for a Business Interlink object that is not of simple type (such as integer or string). You must add the document to the input structure before you can add values to its members with AddValue.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>docname</i>	The name of the document that AddDoc adds to the structure.

Returns

The document added to the BIDocs input document.

Example

In the following example, the input structure for Calculate Cost, or the root level document, is created with the GetInputDocs method. (To create, or add, more input structures, use AddNextDoc.) The Calculate Cost input parameter From is a document, so the AddDoc method adds it to the input document.

```
Local Interlink &QE_COST;
Local BIDocs &CalcCostIn;
Local BIDocs &FromDoc, &ToDoc, &PackageDoc, &AccountDoc;
Local number &ret, &retinput;

&QE_COST = GetInterlink(Interlink.QE_COST_EX);

&CalcCostIn = &QE_COST.GetInputDocs("");

&ret = &CalcCostIn.AddValue("input_param1", "value");
&FromDoc = &CalcCostIn.AddDoc("From");
&ret = &FromDoc.AddValue("OriginCountry", "United States");
&ret = &FromDoc.AddValue("OriginPostal_Code", &ORIGIN);
&ret = &FromDoc.AddValue("Ship_Date", &SHIPDATE);

/* Call AddDoc and AddValue for To, Package_Info, and Account_Info_List (code not⇒
shown) */
```

The following shows the input structure for this example. It contains five input parameters: input_param1, From, To, Package_Info, and Account_Info_List. This is a version of the Federal Express plug-in that was modified for this example (input_param1 was added, Account_Info was modified to be a list).

Example input structure

See Also

[Chapter 10, "Business Interlink Class," GetInputDocs, page 341](#); [Chapter 10, "Business Interlink Class," AddValue, page 317](#) and [Chapter 10, "Business Interlink Class," AddNextDoc, page 314](#)

AddInputRow

Syntax

AddInputRow(*inputname*, *value*)

where *inputname* and *value* are in matched pairs, in the form:

inputname1,value1 [, *inputname2, value2*] . . .

Description

The AddInputRow method adds a row of input data (*value*) from PeopleCode variables or record fields for the Business Interlink object executing the method. These must be entered in matched pairs, that is, every input name must be followed by its matching value.

Note. The input *name*, not the input path, of the interface definition is used for this method.

There must be an input name for every input parameter defined in the interface definition used to instantiate the Business Interlink object.

If you specify a record field that is not part of the record the PeopleCode program is associated with, you must use *recname..fieldname* for that value.

You can specify default values for every input name in the interface definition (created in Application Designer.) These values are used if you create a PeopleCode "template" by dragging the interface definition from the Project window in Application Designer to an open PeopleCode editor window.

Parameters

<i>Parameter</i>	<i>Description</i>
inputname	Specify the input name. There must be one <i>inputname</i> for every input name defined in the interface definition used to instantiate the Business Interlink object.
value	Specify the value for the input name. This can be a constant, a variable, or a record field. Each <i>value</i> must be paired with an <i>inputname</i> .

Returns

A Boolean value: True if the input values were successfully added. Otherwise, it returns False.

Example

In the following example, the Business Interlink object name is SRA_ALL_1, and the input name, such as ship_site_name, are being bound to record fields, such as QE_RP_SITENAME or VENDOR_INFO.QE_RP_PROMISEDATE, to variables like &PARTNAME, or to literals, like 10 for quantity.

```
&SRA_ALL_1.AddInputRow("ship_site_name", QE_RP_SITENAME,  
    "promise_date", VENDOR_INFO.QE_RP_PROMISEDATE,  
    "request_date", QE_RP_ORDERREQDATE,  
    "subline_site_name", QE_RP_SITENAME,  
    "quantity", 10,  
    "part_name", &PARTNAME,  
    "site_name", INV_LOCATIONS.QE_RP_SITENAME);
```

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetInterlink

AddNextDoc

Syntax

AddNextDoc()

Description

The AddNextDoc method adds a document to one of the following levels:

- The root level of the input structure for a Business Interlink object. You create a reference to this level with the `GetInputDocs` method.
- When a document within the input structure is a list, `AddNextDoc` adds another document to the list. If you use `AddNextDoc` on a document that is not a list, `AddNextDoc` fails and returns an error.

Parameters

None.

Returns

This method returns an integer. The values are:

<i>Value</i>	<i>Description</i>
0	eNoError. The method succeeded.
1	eNO_DOCUMENT. The document referenced by this method does not exist.
2	eDOCLIST_OUT_RANGE. You tried to access a document in a list, but the document list is out of range. For example, if a document list contains five documents, and then you call <code>GetDoc/GetOutputDocs</code> once, you can call <code>GetNextDoc</code> four times; the fifth time results in this error.
3	eDOCUMENT_UNINITIALIZED. Internal error.
4	eNOT_DOCUMENTTYPE. You tried to perform an operation upon a parameter that is not a document type.
5	eNOT_LISTTYPE. You tried to perform a <code>GetNextDoc</code> or <code>AddNextDoc</code> upon a document that is not a list.
7	eNOT_BASICTYPE. You tried to perform a <code>GetValue</code> or <code>AddValue</code> upon a parameter that is not of basic type: integer, float, string, time, date, datetime.
8	eNO_DATA. You tried to retrieve data from a document that contained no data.

Example

In this example, the input structure for Calculate Cost, or the root level document, is accessed with the `GetInputDocs` method. The `AddNextDoc` method adds another `BIDocs` input document. The Calculate Cost input parameter `Account_Info_List` is a document, so the `AddDoc` method adds it to the `BIDocs` input document. `Account_Info_List` is also a document list, so `AddNextDoc` method adds another `Account_Info_List` document.

```

Local Interlink &QE_COST;
Local BIDocs &CalcCostIn;
Local BIDocs &FromDoc, &ToDoc, &PackageDoc, &AccountDoc;
Local number &ret, &retinput;

&QE_COST = GetInterlink(Interlink.QE_COST_EX);

&CalcCostIn = &QE_COST.GetInputDocs("");

For &n = 1 to &number_of_input_sets
/* Get values for inputs, such as &ORIGIN (code not shown) */

    &ret = &CalcCostIn.AddValue("input_param1", "value");
    &FromDoc = &CalcCostIn.AddDoc("From");
    &ret = &FromDoc.AddValue("OriginCountry", "United States");
    &ret = &FromDoc.AddValue("OriginPostal_Code", &ORIGIN);
    &ret = &FromDoc.AddValue("Ship_Date", &SHIPDATE);

    /* Call AddDoc and AddValue for To and Package_Info
       (code not shown) */

    /* Call AddDoc and AddNextDoc for the AccountDoc document list */
    &AccountDoc = &CalcCostIn.AddDoc("Account_Info_List");
    For &m = 1 to &number_of_AccountDocs
        &ret = &AccountDoc.AddValue("Account_Number", &ACCOUNT);
        &ret = &AccountDoc.AddValue("Meter_Number", &METER);
        &ret = &AccountDoc.AddValue("Service_Type", &SVCTYPE);
        &retinput = &AccountDoc.AddNextDoc();
    End-For;

    &retinput = &CalcCostIn.AddNextDoc();

End-For;

```

The following shows the input structure for this example. It contains five input parameters: input_param1, From, To, Package_Info, and Account_Info_List.

From, To, and Package_Info are not lists, so if you try to use AddNextDoc with these parameters, such as the following line of code, AddNextDoc will fail and return an error message.

```
&retinput = &To.AddNextDoc();
```

Example input structure

AddValue**Syntax**

AddValue(*paramname*, *value*)

Description

The AddValue method adds a value to a member of a document within the input structure for a Business Interlink object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>paramname</i>	The name of the member of the document that is having a value added to it.
<i>value</i>	The value that is added. This can be a constant, a variable, or a record field. The data type can be string, integer, double, float, time, date, or datetime.

Returns

This method returns an integer. The values are:

<i>Value</i>	<i>Description</i>
0	eNoError. The method succeeded.
1	eNO_DOCUMENT. The document referenced by this method does not exist.
2	eDOCLIST_OUT_RANGE. You tried to access a document in a list, but the document list is out of range. For example, if a document list contains five documents, and then you call GetDoc/GetOutputDocs once, you can call GetNextDoc four times; the fifth time results in this error.
3	eDOCUMENT_UNINITIALIZED. Internal error.
4	eNOT_DOCUMENTTYPE. You tried to perform an operation upon a parameter that is not a document type.

Value	Description
5	eNOT_LISTTYPE. You tried to perform a GetNextDoc or AddNextDoc upon a document that is not a list.
7	eNOT_BASICTYPE. You tried to perform a GetValue or AddValue upon a parameter that is not of basic type: integer, float, string, time, date, datetime.
8	eNO_DATA. You tried to retrieve data from a document that contained no data.

Example

In the following example, the Business Interlink object name is QE_COST.

In the following example, the input structure for Calculate Cost, or the root level document, is accessed with the GetInputDocs method. (To create, or add, more input structures, use AddNextDoc.) The Calculate Cost input parameter From is a document, so the AddDoc method adds it to the input structure. Then the AddValue method adds values to each of the From document members.

```
Local Interlink &QE_COST;
Local BIDocs &CalcCostIn;
Local BIDocs &FromDoc, &ToDoc, &PackageDoc, &AccountDoc;
Local number &ret;

&QE_COST = GetInterlink(Interlink.QE_COST_EX);

/* Get some values for input, such as &ORIGIN (code not shown) */

&CalcCostIn = &QE_COST.GetInputDocs("");
&ret = &CalcCostIn.AddValue("input_param1", "value");

&FromDoc = &CalcCostIn.AddDoc("From");
&ret = &FromDoc.AddValue("OriginCountry", "United States");
&ret = &FromDoc.AddValue("OriginPostal_Code", &ORIGIN);
&ret = &FromDoc.AddValue("Ship_Date", &SHIPDATE);

/* Call AddDoc, AddValue for Package, Account_Info_List, and also call AddNextDoc⇒
for Account_Info_List (code not shown) */
```

The following shows the input structure for this example. It contains five input parameters: input_param1, From, To, Package_Info, and Account_Info_List.

Example input structure

BulkExecute**Syntax**

```
BulkExecute(RECORD.inputrecname [, RECORD.outputrecname] [, {user_process_inst | user_operid}])
```

Description

The BulkExecute method uses the data in the specified record to populate the input buffer, copying like-named fields. Then the method executes, and, optionally, fills the record specified by outputrecname with data from the Business Interlink output buffer. BulkExecute results in significantly faster performance for transactions that process large amounts of data. Instead of adding one input row at a time, then fetching the values one at a time, you might write the data to a staging table, use the BulkExecute method and then read the data from the output table. This would be especially effective in Application Engine programs that process sets of data rather than individual rows.

This method assumes that the names of the fields in the record match the names of the inputs (or outputs) defined in the Business Interlink Definition. If there is no field in the *inputrecname* for a Business Interlink input parameter, the parameter's default value is used. If no default is specified, an empty string is passed. You must ensure that this default value is legitimate.

Fields in the output buffer are matched against the fields specified in the output record. You do not have to specify an output record. If you don't specify an output record, the output buffers are not be populated.

If you specify an output record, and if you have fields in the output record that are not specified as output parameters, they aren't populated with the BulkExecute method. In addition, they shouldn't be set as NOT NULL, otherwise inserts fail.

Note. Before you use this method, you should flush the record used for output and remove any residual data that might exist in it.

If you specify an output record, and you want to use the output record for error checking, you must add the following fields to your output record:

- RETURN_STATUS
 - RETURN_STATUS_MSG
-

Note. The field names in the output record must match these names exactly.

Then you must mark one or more input parameters as "key fields" in the Business Interlink definition (using the BulkExecute ID check box.) The value of these key fields are copied to the output record, and you can use these fields to match error messages with input (or output) rows.

To order your input (and output) rows, you must add the following column to both the input and output table:

- BI_SEQ_NUM
 -
-

Note. The field name in your input and output records must match this name exactly.

The input rows are read in the order of numbers in BI_SEQ_NUM, and the output rows are generated using the same order number.

This method automatically executes, so you don't need to use the Execute method with this method.

Whether this method halts on execution depends on the setting of the StopAtError configuration parameter. The default value is True, that is, stop if the error number returned is something other than a 1 or 2. This configuration parameter must be set before using the BulkExecute method.

Parameters

<i>Parameter</i>	<i>Description</i>
RECORD .inputrecname	Specify a record (SQL table) that contains the data to populate the input buffer of the Business Interlink.
RECORD .outputrecname	Specify a record (SQL table) that will hold the data that populates the output buffer of the Business Interlink. This is optional; it is often used to error check the input.
user_process_inst user_operid	This is an optional parameter that allows either different Application Engine programs or different clients to populate the same RECORD .outputrecname at the same time.
	For user_process_inst, the parameter takes an integer. RECORD .outputrecname must have a PROCESS_INSTANCE field. The PROCESS_INSTANCE field is used to identify the Application Engine program that is using this Business Interlink. You can use the %PROCESS_INSTANCE variable to populate user_process_inst.

<i>Parameter</i>	<i>Description</i>
	For <i>user_operid</i> , the parameter takes a string. RECORD.outputrecname must have an OPERID field. The OPERID field is used to identify the client who is using this Business Interlink. You can use the %OPERID variable to populate <i>user_operid</i> .

Returns

The following are the valid returns:

<i>Value</i>	<i>Description</i>
1	The Business Interlink object executes successfully
2	The Business Interlink object failed to execute
3	Transaction failed
4	Query failed
5	Missing criteria
6	Input mismatch
7	Output mismatch
8	No response from server
9	Missing parameter
10	Invalid username
11	Invalid password
12	Invalid server name
13	Connection error
14	Connection refused
15	Timeout reached
16	Unequal lists
17	No data for output
18	Output parameters empty
19	Driver not found

<i>Value</i>	<i>Description</i>
20	Internet connect error
21	XML parser error
22	XML deserialize

Example

Here are two PeopleSoft records that could be used as input and output records for BulkExecute. The key fields in the input record, which need to have the BulkExecute ID check box checked in Application Designer, are QE_RP_PO_NUMBER and QE_RP_SITENAME. These key fields are used both for input and output.

Num	Field Name	Type	Len	Format	H	Short Name	Long Name
1	QE_RP_PO_NUMBER	Char	40	Mixed		QE_RP_PONUMBER	QE_RP_PONUMBER
2	QE_RP_PODATE	DtTm	26			QE_RP_PODATE	QE_RP_PODATE
3	QE_RP_SITENAME	Char	15	Mixed		SITE_NAME	SITE_NAME
4	QE_RP_VENDORNAME	Char	30	Mixed		QE_RP_VENDORNAM	QE_RP_VENDORNAME

Example input record for BulkExecute

Num	Field Name	Type	Len	Format	H	Short Name	Long Name
1	QE_RP_PO_NUMBER	Char	40	Mixed		QE_RP_PONUMBER	QE_RP_PONUMBER
2	QE_RP_SITENAME	Char	15	Mixed		SITE_NAME	SITE_NAME
3	RETURN_STATUS	Sign	3			RETURN_STATUS	RETURN_STATUS
4	RETURN_STATUS_MSG	Char	254	Mixed		RETURN_STAT_MSG	RETURN_STATUS_MSG

Example output record for BulkExecute

Here are the corresponding inputs and outputs for a Business Interlink that has had its inputs and outputs renamed to match the field names in the records. The inputs and outputs have been renamed where necessary to match the record field names.

Example Business Interlink inputs for BulkExecute

Example Business Interlink inputs for BulkExecute

The PeopleCode program using these records could contain the following code to run BulkExecute.

```

Local Interlink &CREATE_PO;
Local number &EXECRLT;

&CREATE_PO = GetInterlink(INTERLINK.QE_RP_CREATEP01);

/* The next three lines set configuration parameters, which are not shown in the⇒
previous examples. */
&CREATE_PO.SERVER_NAME = "bc1";
&CREATE_PO.RSERVER_HOST = "4.3.4.3";
&CREATE_PO.RSERVER_PORT = "2200";

&EXECRLT = &CREATE_PO.BulkExecute(RECORD.QE_RP_PO, RECORD.QE_RP_PO_OUT1);

```

See Also

[Chapter 10, "Business Interlink Class," StopAtError, page 372](#)

Clear

Syntax

```
clear()
```

Description

The Clear method clears the input and output buffers. If you're using Business Interlinks in a batch program, every time after you use the Execute method, use the Clear method to flush out the input and output buffers.

Parameters

None.

Returns

None.

Example

```

For &n = 1 to x
    &myinterlink.AddInputRow("input1", value1, "input2", value2);
    &myinterlink.Execute();
    &myinterlink.FetchNextRow("output1", value1, "output2", value2);
    /* do processing on data */
    &myinterlink.clear();
    &n = &n + 1;
End-for;

```

See Also

[Chapter 10, "Business Interlink Class," Execute, page 325](#) and [Chapter 10, "Business Interlink Class," BulkExecute, page 319](#)

Execute

Syntax

Execute()

Description

When an Interlink object executes the Execute method, the transaction associated with the Interlink object is executed.

If there is only one row, after appropriate substitution is made, the transaction is executed only once. Otherwise, the data is "batched up" and sent once. You have to call Execute only once to execute all the rows of the input buffer.

Generally, you would only use the Execute method after using the AddInputRow method. If you create a PeopleCode "template" by dragging the Business Interlink definition from the Project window in Application Designer to an open PeopleCode editor window, the usual order of the execution of methods is shown in the template.

If you're using Business Interlinks in a batch program, every time after you use the Execute method, use the Clear method to flush out the input and output buffers.

Whether this method halts on execution depends on the setting of the StopAtError configuration parameter. The default value is True, that is, stop if the error number returned is something other than a 1 or 2. This configuration parameter must be set *before* using the Execute method.

Parameters

None.

Returns

The following are the valid returns:

<i>Value</i>	<i>Description</i>
1	The Business Interlink object executes successfully
2	The Business Interlink object failed to execute
3	Transaction failed

Value	Description
4	Query failed
5	Missing criteria
6	Input mismatch
7	Output mismatch
8	No response from server
9	Missing parameter
10	Invalid username
11	Invalid password
12	Invalid server name
13	Connection error
14	Connection refused
15	Timeout reached
16	Unequal lists
17	No data for output
18	Output parameters empty
19	Driver not found
20	Internet connect error
21	XML parser error
22	XML deserialize

Example

```

Local number &EXECRESLT;
&EXECRESLT = &SRA_ALL_1.Execute();
If (&EXECRESLT <> 1) Then
/* The instance failed to execute */
/* Do Error Processing */
End-If;

```

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," [GetInterlink](#)

FetchIntoRecord

Syntax

```
FetchIntoRecord(RECORD.recname, [, {user_process_inst | user_operid}])
```

Description

The `FetchIntoRecord` method copies the data from the output buffer into the specified record (SQL table) copying *like-named* fields. This method assumes that the names of the fields in the record match the names of the outputs defined in the Business Interlink definition.

You can use the `FetchIntoRecord` method to perform a transaction on a large amount of data that you want to receive from your system. Instead of executing your Business Interlink and then fetching one output row at a time, you might execute your Business Interlink, then use the `FetchIntoRecord` method to write the data returned from the Business Interlink to a staging table.

Note. Before you use this method, you should flush the record used for output and remove any residual data that might exist in it.

If your data is hierarchical, that is, in a rowset, and you want to preserve the hierarchy, use `FetchIntoRowset` instead of this method.

To order your output rows, you must add the `BI_SEQ_NUM` column to the record.

This column is populated with a sequence number that corresponds to the order in which each row of the record was written to by the method.

Parameters

Parameter	Description
RECORD .recname	Specify a record (SQL table) that you want to populate with data from the output buffers.

<i>Parameter</i>	<i>Description</i>
<i>user_process_inst</i> <i>user_operid</i>	This is an optional parameter that enables either different Application Engine programs or different clients to populate the same RECORD.outputrecname at the same time. For <i>user_process_inst</i>, the parameter takes an integer. RECORD.outputrecname must have a PROCESS_INSTANCE field. The PROCESS_INSTANCE field is used to identify the Application Engine program that is using this Business Interlink. You can use the %PROCESS_INSTANCE variable to populate <i>user_process_inst</i>. For <i>user_operid</i>, the parameter takes a string. RECORD.outputrecname must have an OPERID field. The OPERID field is used to identify the client who is using this Business Interlink. You can use the %OPERID variable to populate <i>user_operid</i>.

Returns

Number of rows fetched if one or more non-empty rows are returned.

If an empty row is returned, that is, every if field is empty except the return_status and return_status_msg fields, this method returns one of the following error messages:

<i>Number</i>	<i>Meaning</i>
0	No error
1	NoInterfaceObject
2	ParamCountError
3	IncorrectParameterType
4	NoColumnForOutputParm
5	NoColumnForInputParm
6	BulkInsertStartFailed
7	BulkInsertStopFailed
8	CouldNotCreateSelectCursor
9	CouldNotCreateInsertCursor

Number	Meaning
10	CouldNotDestroySelectCursor
11	CouldNotDestroyInsertCursor
12	InputRecordDoesNotExist
13	OutputRecordDoesNotExist
14	ContainEmptyRow
15	SQLExecError
201	FieldTooLarge
202	IgnoreSignNumber
203	ConvertFloatToInt

Example

```
&RSLT = &QE_SM_CONCAT.FetchIntoRecord(RECORD.PERSONAL__VENDR_DATA);
```

```
If &RSLT = 0 Then
/* no rows fetched */
Else
/* do processing */
End-If;
```

See Also

[Chapter 10, "Business Interlink Class," BulkExecute, page 319](#)

FetchIntoRowset

Syntax

```
FetchIntoRowset(&Rowset)
```

Description

The `FetchIntoRowset` method copies the data from the output buffer into the specified rowset, copying *like-named* fields. This method assumes that the names of the fields in the rowset match the names of the outputs defined in the Business Interlink definition, and that the structure is the same.

Note. Before you use this method, you should flush the rowset used for output and remove any residual data that might exist in it.

Use this method only if you have a hierarchical data structure and you want to preserve the hierarchy. Otherwise, use `BulkExecute` or `FetchIntoRecord`.

Parameters

Parameter	Description
<code>&Rowset</code>	Specify rowset object that you want to populate with data from the output buffers. This must be an existing, instantiated rowset.

Returns

Number of rows fetched if one or more non-empty rows are returned.

If an empty row is returned, that is, every if field is empty except the `return_status` and `return_status_msg` fields, this method returns one of the following error messages:

Value	Description
0	No error
1	NoInterfaceObject
2	ParamCountError
3	IncorrectParameterType
4	NoColumnForOutputParm
5	NoColumnForInputParm
6	BulkInsertStartFailed
7	BulkInsertStopFailed
8	CouldNotCreateSelectCursor
9	CouldNotCreateInsertCursor

Value	Description
10	CouldNotDestroySelectCursor
11	CouldNotDestroyInsertCursor
12	InputRecordDoesNotExist
13	OutputRecordDoesNotExist
14	ContainEmptyRow
15	SQLExecError
201	FieldTooLarge
202	IgnoreSignNumber
203	ConvertFloatToInt

Example

The example uses the rowset on level one from the EMPLOYEE_CHECKLIST page. A PeopleCode program running in a field on level zero in that page can access the level one (child rowset).

	Lvl	Label	Type	Field	Record	Display Control	Related Display	Related Control
1	0	Frame	Frame			☒	☒	
2	0	Frame	Frame			☐	☐	
3	0	Frame	Frame			☐	☐

EMPLOYEE_CHECKLIST Page order

EMPL_CHECKLIST is the primary database record for the level one scrollbar on the EMPLOYEE_CHECKLIST page. The following PeopleCode accesses the level one rowset using EMPL_CHECKLIST. The Business Interlink object name is QE_BI_EMPL_CHECKLIST. This Business Interlink object uses the level one rowset as its input and its output.

The InputRowset method uses this rowset as input for QE_BI_EMPL_CHECKLIST. Then a blank duplicate of the rowset is created with CreateRowset, and then the output of QE_BI_EMPL_CHECKLIST is fetched into the blank rowset with FetchIntoRowset.

```
&MYROWSET = GetRowset(SCROLL.EMPL_CHECKLIST);
&ROWCOUNT = &QE_BI_EMPL_CHECKLIST.InputRowset(&MYROWSET);
&RSLT = &QE_BI_EMPL_CHECKLIST.Execute();
/* do some error processing */
&WorkRowset = CreateRowset(&MYROWSET);
&ROWCOUNT = &QE_BI_EMPL_CHECKLIST.FetchIntoRowset(&WorkRowset);

If &ROWCOUNT = 0 Then
/* do some error processing */
Else
/* Process the rowset from QE_BI_EMPL_CHECKLIST. Check it for errors. */
For &I = 1 to &WorkRowset.RowCount
For &K = 1 to &WorkRowset(&I).RecordCount
&REC = &WorkRowset(&I).GetRecord(&K);
&REC.ExecuteEdits();
For &M = 1 to &REC.FieldCount
If &REC.GetField(&M).EditError Then
/* there are errors */
/* do other processing */
End-If;
End-For;
End-For;
End-for;
End-if;
```

FetchNextRow

Syntax

FetchNextRow(*outputname, value*)

where *outputname* and *value* are in matched pairs, in the form:

outputname1, value1 [, *outputname2, value2*] . . .

Description

After the Business Interlink object executes the method `Execute`, the `FetchNextRow` method can be used to retrieve a row of output and store the values of the output name (*outputname*) to PeopleCode variables or record fields (*value*). These must be entered in matched pairs, that is, every output name must be followed by its matching value.

Note. The output *name*, not the output path of the interface definition is used for this method.

There must be an *outputname* for every output name defined in the interface definition used to instantiate the Business Interlink object.

If you specify a record field that is not part of the record the PeopleCode program is associated with, you must use *recname.fieldname* for that *value*.

You can specify default values for every output name in the interface definition (created in Application Designer.) These values are used if you create a PeopleCode "template" by dragging the interface definition from the Project window in Application Designer to an open PeopleCode Editor window.

Parameters

Parameter	Description
<i>outputname</i>	Specify the output name. There must be one <i>outputname</i> for every output name defined in the interface definition used to instantiate the Business Interlink object.
<i>value</i>	Specify the value for the output name. This can be a constant, a variable, or a record field. Each <i>value</i> must be paired with an <i>outputname</i> .

Returns

A Boolean value: True if the row of output parameters was fetched. Otherwise, it returns False.

Example

In the following example, the Business Interlink object name is `SRA_ALL_1`, and the output names, such as costs, are being bound to record fields, such as `STR_COST`.

```
&RSLT = &SRA_ALL_1.FetchNextRow("costs", &STR_COST,
    "unit_costs", &STR_UNIT_COST,
    "customer_ship_dates", &STR_SHIP_DATE,
    "quantities", &STR_QUANTITY,
    "so_numbers", &STR_SO_NUM,
    "so_names", &STR_SO_NAME,
    "line_numbers", &STR_LINE_NUM,
    "ship_sets", &STR_SHIP_SET,
    "customer_receipt_dates", &STR_RECPT_DATE);
```

GetCount

Syntax

GetCount(*docname*)

Description

The GetCount method returns the number of documents within a document list contained within an output structure for a Business Interlink object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>docname</i>	The name of the document list.

Returns

The number of documents in the list.

Example

In the following example, the output structure for Calculate Cost, or the root level document, is accessed with the GetOutputDocs method. The Calculate Cost output parameter output_param2_List is a document, so the GetDoc method gets it from the output structure. Because output_param2_List is a document list, GetCount gets the number of documents in the list.

```

Local Interlink &QE_COST;
Local number &count;
Local BIDocs &CalcCostOut;
Local BIDocs &OutlistDoc;
Local number &ret;

&QE_COST = GetInterlink(Interlink.QE_COST_EX);
/* Get inputs, execute. (code not shown) */

&CalcCostOut = &QE_COST.GetOutputDocs("");

/* Call GetValue for output_param1, call GetDoc, GetValue for
Service_Rate (code not shown) */

&OutlistDoc = &CalcCostOut.GetDoc("output_param2_List");
&count = &CalcCostOut.GetCount("output_param2_List");

&I = 0;
While (&I < &count)
    &ret = &OutlistDoc.GetValue("output_member1", &VALUE1);
    &ret = &OutlistDoc.GetValue("output_member2", &VALUE2);
    If &ret = 0 Then
        /* Process output values */
        &I = &I + 1;
        &retoutput = &OutlistDoc.GetNextDoc();
    End-If;
End-While;

```

The following shows the output structure for this example. It contains three output parameters: output_param1, Service_Rate, and output_param2_List.

Example output structure

GetDoc

Syntax

GetDoc(*docname*)

Description

The GetDoc method gets a document from an output structure. The document is an output parameter for a Business Interlink object that is not of simple type (such as integer or string). You must get the document from the output structure before you can get values from its members with GetValue.

You can call `GetDoc` using dot notation, to access documents that are "nested" within other documents. For example, the following accesses a document nested three levels deep:

```
&Docs3 = &CalcCostOut.GetDoc("Doc1.Doc2.Doc3");
```

Parameters

<i>Parameter</i>	<i>Description</i>
<i>docname</i>	The name of the document that <code>GetDoc</code> should get from the output structure.

Returns

A reference to the document received from the output structure.

Example

In the following example, the Output structure for `Calculate Cost(Domestic)`, or the root level document, is created with the `GetOutputDocs` method. (To create, or get, more Output structures, call `GetNextDoc`.) The `Calculate Cost` output parameter `Service_Rate` is a document, so the `GetDoc` method gets it from the Output structure.

```
Local Interlink &QE_COST;
Local number &count;
Local BIDocs &CalcCostOut;
Local BIDocs &ServiceRateDoc;
Local number &ret;

&QE_COST = GetInterlink(Interlink.QE_COST_EX);
// Get inputs, execute. (code not shown)

&CalcCostOut = &QE_COST.GetOutputDocs("");
&ret = &CalcCostOut.GetValue("output_param1",&VALUE);
&ServiceRateDoc = &CalcCostOut.GetDoc("Service_Rate");
&ret = &ServiceRateDoc.GetValue("Service_Type", &SERVICE_TYPE);
&ret = &ServiceRateDoc.GetValue("Rate", &RATE);
/* Call GetDoc, GetValue, GetNextDoc for output_param2_List (code not shown) */
If &ret = 0 Then
    /* Process output values */
End-If;
```

The following illustration shows the Output structure for this example. It contains three output parameters: `output_param1`, `Service_Rate`, and `output_param2_List`. This is a version of the Federal Express plug-in that was modified for this example (`output_param1` and `output_param2_List` were added).

Example output structure

In the following example, GetDoc is used to access a document that is nested more deeply. To access a document that is more deeply nested, you can either call GetDoc for each nesting, or you can call GetDoc once using the nesting feature.

Calling GetDoc with the nesting feature:

```

Local Interlink &QE_4GETDOC;
Local BIDocs &CalcCostOut, &Docs3;
Local number &ret;

&QE_4GETDOC = GetInterlink(Interlink.QE_4GETDOC_EX);
// Get inputs, execute. (code not shown)

&CalcCostOut = &QE_4GETDOC.GetOutputDocs("");
&Docs3 = &CalcCostOut.GetDoc("Doc1.Doc2.Doc3");
&ret = &Docs3.GetValue("output_member3", &VALUE);
  
```

Calling GetDoc without the nesting feature:

```

Local Interlink &QE_4GETDOC;
Local BIDocs &CalcCostOut, &Docs1, &Docs2, &Docs3;
Local number &ret;

&QE_4GETDOC = GetInterlink(Interlink.QE_4GETDOC_EX);
// Get inputs, execute. (code not shown)

&CalcCostOut = &QE_4GETDOC.GetOutputDocs("");
&Docs1 = &CalcCostOut.GetDoc("Doc1");
&Docs2 = &Docs1.GetDoc("Doc2");
&Docs3 = &Docs2.GetDoc("Doc3");
&ret = &Docs3.GetValue("output_member3", &VALUE);
  
```

Example output structure with nested documents

GetFieldCount

Syntax

GetFieldCount()

Description

Use the GetFieldCount method to support dynamic output. It returns the number of columns in the output buffer, which is the same as the number of outputs in each row of the output buffer.

Note. This method can also be used with hierarchical doc data.

Parameters

None.

Returns

The number of columns in the output buffer, which is the same as the number of outputs in each row of the output buffer.

Example

The following example moves to the first column, first field of the output buffer. The Repeat loop goes through every row in the output buffer. The For loop processes every field in every row.

```
If (&MYBI.MoveFirst()) Then
  Repeat
    For &I = 1 to &MYBI.GetFieldCount
      &TYPE = &MYBI.GetFieldType(&I);
      Evaluate &TYPE
      Where = 1
      /* do processing */
    End-Evaluate;
  End-For;
  Until Not (&MYBI.MoveNext());
Else
  /* do error processing - output buffer not returned */
End-If;
```

[Chapter 10, "Business Interlink Class," GetFieldType, page 339](#); [Chapter 10, "Business Interlink Class," GetFieldValue, page 340](#); [Chapter 10, "Business Interlink Class," MoveFirst, page 352](#); [Chapter 10, "Business Interlink Class," MoveNext, page 353](#) and [Chapter 10, "Business Interlink Class," Using Hierarchical Data \(BIDocs\), page 306](#)

GetFieldType

Syntax

GetFieldType(*index*)

Description

Use the GetFieldType method to support dynamic output. It returns the type of field specified by *index*. You can use this method only after you have used the MoveFirst method; otherwise the system doesn't know where to start.

Note. This method can also be used with hierarchical doc data.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>index</i>	Specify the number of the field you want to find the type of.

Returns

A number indicating the type of the field. The values are:

<i>Value</i>	<i>Description</i>
1	String
2	Integer
3	Float
4	Boolean
5	Date
6	Time
7	DateTime
8	Binary
9	Object

Example

In the following example, the Business Interlink object name is &MYBI. The example uses MoveFirst to move to the first row of the output buffer, and to the first column, or first field, in that row. The Repeat loop uses MoveNext to go through every row in the output buffer. The For loop processes every field in every row, using the GetFieldCount method to get the number of fields, or outputs, in the row. Within the For loop, GetFieldType gets the type of the field data (string, integer, and so on.)

```
/* Add inputs to the Business Interlink object, then call Execute
to execute the Business Interlink object.
You are then ready to get the outputs using the following code. */
```

```
If (&MYBI.MoveFirst()) Then
  Repeat
    For &I = 1 to &MYBI.GetFieldCount
      &TYPE = &MYBI.GetFieldType(&I);
      Evaluate &TYPE
      Where = 1
      &STRING_VARIABLE = &MYBI.GetFieldValue(&I);
      /* test for and process other field types */
      End-Evaluate;
    End-For;
  Until Not(&MYBI.MoveNext());
Else
  /* Process error - no output buffer */
End-If;
```

GetFieldValue

Syntax

GetFieldValue(*index*)

Description

Use the GetFieldValue method to support dynamic output. It returns the value of the field specified by index. You can use this method only after you have used the MoveFirst method: otherwise the system doesn't know where to start.

Note. This method can also be used with hierarchical doc data.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>index</i>	Specify the number of the field you want to find the value of.

Returns

A string containing the value of the field.

Example

In the following example, the Business Interlink object name is &MYBI. The example uses MoveFirst to move to the first row of the output buffer, and to the first column, or first field, in that row. The Repeat loop uses MoveNext to go through every row in the output buffer. The For loop processes every field in every row, using the GetFieldCount method to get the number of fields, or outputs, in the row. Within the For loop, GetFieldValue gets the value of the field data.

```
/* Add inputs to the Business Interlink object, then call Execute to execute
the Business Interlink object. You are then ready to get the
outputs using the following code. */
```

```
If (&MYBI.MoveFirst()) Then
  Repeat
    For &I = 1 to &MYBI.GetFieldCount
      &TYPE = &MYBI.GetFieldType(&I);
      Evaluate &TYPE
      Where = 1
      &STRING_VARIABLE = &MYBI.GetFieldValue(&I);
      /* test for and process other field types */
      End-Evaluate;
    End-For;
  Until Not(&MYBI.MoveNext());
Else
  /* Process error - no output buffer */
End-If;
```

See Also

[Chapter 10, "Business Interlink Class," GetFieldCount, page 338](#); [Chapter 10, "Business Interlink Class," GetFieldType, page 339](#); [Chapter 10, "Business Interlink Class," MoveFirst, page 352](#) and [Chapter 10, "Business Interlink Class," MoveNext, page 353](#)

GetInputDocs

Syntax

```
GetInputDocs("")
```

Description

The `GetInputDocs` method gets the top input document at the root level for a Business Interlink object. This is a hierarchical structure that contains the values for the inputs for this Business Interlink object. The methods that you use to put the input values into this document are the hierarchical data methods.

Parameters

A null string.

Returns

An input document. This is the document at the top of the root level of the input document for a Business Interlink object.

Example

```
Local Interlink &QE_COST;  
Local BIDocs &CalcCostOut, &CalcCostIn;  
  
&QE_COST = GetInterlink(Interlink.QE_COST_EX);  
&CalcCostIn = &QE_COST.GetInputDocs("");  
  
/* You can now insert the input values and execute the BI object */
```

See Also

[Chapter 10, "Business Interlink Class," Using Hierarchical Data \(BIDocs\), page 306](#)

GetNextDoc

Syntax

GetNextDoc()

Description

The `GetNextDoc` method gets a document from one of the following levels:

- The root level of the Output structure for a Business Interlink object. This level was accessed with the `GetOutputDocs` method.
- When a document within the Output structure is a list, `GetNextDoc` gets another document from the list. If you use `GetNextDoc` on a document that is not a list, `GetNextDoc` fails and returns an error.

Parameters

None.

Returns

The following are the valid returns:

<i>Number</i>	<i>Enum Value</i>	<i>Description</i>
0	eNoError	The method succeeded.
1	eNO_DOCUMENT	The document referenced by this method does not exist.
2	eDOCLIST_OUT_RANGE	You tried to access a document in a list, but the document list is out of range. For example, if a document list contains five documents, and then you call GetDoc/GetOutputDocs once, you can call GetNextDoc four times; the fifth time results in this error.
3	eDOCUMENT_UNINITIALIZED	Internal error
4	eNOT_DOCUMENTTYPE	You tried to perform an operation upon a parameter that is not a document type.
5	eNOT_LISTTYPE	You tried to perform a GetNextDoc or AddNextDoc upon a document that is not a list.
7	eNOT_BASICTYPE	You tried to perform a GetValue or AddValue upon a parameter that is not of basic type: integer, float, string, time, date, datetime.
8	eNO_DATA	You tried to retrieve data from a document that contained no data.

Example

In this example, the Output structure for Calculate Cost, or the root level document, is accessed with the GetOutputDocs method. The GetNextDoc method gets another Output structure, assuming that there is more than one of them. The Calculate Cost output parameter output_param2_List is a document, so the GetDoc method gets it to the Output structure. output_param2_List is also a document list, so GetNextDoc method gets the next output_param2_List document.

```

Local Interlink &QE_COST;
Local number &count1, &count2;
Local BIDocs &CalcCostOut;
Local BIDocs &OutlistDoc;
Local number &ret1, &ret2;

&QE_COST = GetInterlink(Interlink.QE_COST_EX);
// Get inputs, execute. (code not shown)

&CalcCostOut = &QE_COST.GetOutputDocs("");

&ret1 = 0;
While (&ret1)
    &ret1 = &CalcCostOut.GetValue("output_param1",&VALUE);
    &ServiceRateDoc = &CalcCostOut.GetDoc("Service_Rate");
    &ret1 = &ServiceRateDoc.GetValue("Service_Type", &SERVICE_TYPE);
    &ret1 = &ServiceRateDoc.GetValue("Rate", &RATE);
    /* Process output values */

    &OutlistDoc = &CalcCostOut.GetDoc("output_param2_List");
    &count2 = &CalcCostOut.GetCount("output_param2_List");
    While (&I < &count2)
        &ret2 = &OutlistDoc.GetValue("output_member1", &VALUE1);
        &ret2 = &OutlistDoc.GetValue("output_member2", &VALUE2);
        If &ret2 = 0 Then
            /* Process output values */
            &I = &I + 1;
            &ret2 = &OutlistDoc.GetNextDoc();
        End-If;
    &ret1 = &CalcCostOut.GetNextDoc();
End-While;

```

The following shows the Output structure for this example. It contains three output parameters: output_param1, Service_Rate, and output_param2_List.

Example output structure

GetOutputDocs

Syntax

```
GetOutputDocs("")
```

Description

The `GetOutputDocs` method gets the top output document at the root level for a Business Interlink object. This is a hierarchical structure that contains the values for the outputs for this Business Interlink object. The methods that you use to get output values from this document are the hierarchical data methods.

Parameters

A null string.

Returns

An output document. This is the document at the top of the root level of the output document for a Business Interlink object.

Example

```
Local Interlink &QE_COST;  
Local BIDocs &CalcCostIn, &CalcCostOut;  
  
&QE_COST = GetInterlink(Interlink.QE_COST_EX);  
&CalcCostOut = &QE_COST.GetOutputDocs("");  
  
/* You can now execute the Business Interlink object and get the output values. */
```

See Also

[Chapter 10, "Business Interlink Class," Using Hierarchical Data \(BIDocs\), page 306](#)

GetPreviousDoc

Syntax

GetPreviousDoc()

Description

The `GetPreviousDoc` method gets the previous document from either the root level of the Output structure for a Business Interlink object, or from a document within the Output structure. When these documents are in a list, `GetPreviousDoc` gets the previous document in the list. You must get the document before you can get its values with `GetValue`.

Parameters

None.

Returns

The following are the possible returns:

<i>Number</i>	<i>Enum Value</i>	<i>Description</i>
0	eNoError	The method succeeded
1	eNO_DOCUMENT	The document referenced by this method does not exist.
2	eDOCLIST_OUT_RANGE	You tried to access a document in a list, but the document list is out of range. For example, if a document list contains five documents, and then you call GetDoc/GetOutputDocs once, you can call GetNextDoc four times; the fifth time results in this error.
3	eDOCUMENT_UNINITIALIZED	Internal error
4	eNOT_DOCUMENTTYPE	You tried to perform an operation upon a parameter that is not a document type.
5	eNOT_LISTTYPE	You tried to perform a GetNextDoc or AddNextDoc upon a document that is not a list.
7	eNOT_BASICTYPE	You tried to perform a GetValue or AddValue upon a parameter that is not of basic type: integer, float, string, time, date, datetime.
8	eNO_DATA	You tried to retrieve data from a document that contained no data.

Example

In this example, the Output structure for Calculate Cost, or the root level document, is accessed with the GetOutputDocs method. It contains one output parameter, output_param2_List, which is also a list. The GetCount and MoveToDoc methods point to the last output_param2_List document in the list. The GetPreviousDoc method is used in a loop to cycle through the output_param2_List list, starting with the last and ending with the first in the list, and get each output_param2_List document and its values.

```

Local Interlink &QE_COST;
Local number &count;
Local BIDocs &CalcCostOut;
Local BIDocs &OutlistDoc;
Local number &ret;

&QE_COST = GetInterlink(Interlink.QE_COST_EX);
// Get inputs, execute. (code not shown)

&CalcCostOut = &QE_COST.GetOutputDocs("");

/* Call GetValue for output_param1, call GetDoc, GetValue for Service_Rate (code⇒
not shown) */

&OutlistDoc = &CalcCostOut.GetDoc("output_param2_List");
&count = &CalcCostOut.GetCount("output_param2_List");
&ret = &OutlistDoc.MoveToDoc(&count-1);
&I = &count;
While (&I > 0)
    &ret = &OutlistDoc.GetValue("output_member1", &VALUE1);
    &ret = &OutlistDoc.GetValue("output_member2", &VALUE2);
    If &ret = 0 Then
        /* Process output values */
        &I = &I - 1;
        &retoutput = &OutlistDoc.GetPreviousDoc("");
    End-If;
End-While;

```

The following shows the Output structure for this example. It contains three output parameters: output_param1, Service_Rate, and output_param2_List.

Example output structure

GetStatus

Syntax

GetStatus()

Description

The GetStatus method tests the BIDocs document. To find the status for any BIDocs method that does not return a status value, call GetStatus just after you call that BIDocs method.

Parameters

None.

Returns

The following are the possible returns:

<i>Number</i>	<i>Enum Value</i>	<i>Description</i>
0	NoError	The method succeeded.
1	NO_DOCUMENT	The document referenced by this method does not exist.
2	LIST_OUT_RANGE	You tried to access a document in a list, but the document list is out of range. For example, if a document list contains five documents, and then you call GetDoc/GetOutputDocs once, you can call GetNextDoc four times; the fifth time results in this error.
3	DOCUMENT_UNINITIALIZED	Internal error.
4	NOT_DOCUMENTTYPE	You tried to perform an operation upon a parameter that is not a document type.
5	NOT_DOCUMENTLISTTYPE	You tried to perform a GetNextDoc or AddNextDoc upon a document that is not a list.
6	NOT_LISTTYPE	You tried to perform a list operation using GetValue, AddValue, on a non-list.
7	NOT_SINGLEBASICTYPE	You tried to perform a GetValue or AddValue upon a list that does not use a single basic type: integer, float, string, time, date, datetime.
9	NO_DATA	You tried to retrieve data from a document that contained no data.
10	GENERIC_ERROR	There was an error with the transaction.

GetValue

Syntax

```
GetValue(paramname, value)
```

Description

The GetValue method gets a value from an output parameter within a document of the Output structure for a Business Interlink object.

Parameters

Parameter	Description
Paramname	The name of the member of the document that is having a value retrieved from it.
Value	The value that is retrieved. This can be a variable or a record field. The data type can be string, integer, double, float, time, date, or datetime.

Returns

The following are the possible return values:

Return Status for Integer

Number	Enum value and Meaning
0	NoError. The method succeeded.
1	NO_DOCUMENT. The document referenced by this method does not exist.
9	NO_DATA. You tried to retrieve data from a document that contained no data.
10	GENERIC_ERROR. There was an error with the transaction.

Example

In the following example, the Business Interlink object name is QE_COST.

In the following example, the Output structure for Calculate Cost, or the root level document, is created with the GetOutputDocs method. (If you wanted to create, or get, more Output structures, you would call GetNextDoc.) The Calculate Cost output parameter Service_Rate is a document, so the GetDoc method gets it from the Output structure. Then the GetValue method gets values from each of the Service_Rate document members.

```
Local Interlink &QE_COST;
Local BIDocs &CalcCostOut;
Local BIDocs &ServiceRateDoc;
Local number &ret;

&QE_COST = GetInterlink(Interlink.QE_COST_EX);

// Get inputs, execute. (code not shown)

&CalcCostOut = &QE_COST.GetOutputDocs("");
&ret = &CalcCostOut.GetValue("output_param1", &PARAM1);

&ServiceRateDoc = &CalcCostOut.GetDoc("Service_Rate");
&ret = &ServiceRateDoc.GetValue("Service_Type", &SERVICE_TYPE);
&ret = &ServiceRateDoc.GetValue("Rate", &RATE);

/* Call GetDoc, GetValue, GetNextDoc for output_param2_List (code not shown) */
```

The following illustration shows the Output structure for this example. It contains three output parameters: output_param1, Service_Rate, and output_param2_List. This is a version of the Federal Express plug-in that was modified for this example (output_param1 and output_param2_List were added).

Example output structure

InputRowset

Syntax

InputRowset(&Rowset)

Description

The InputRowset method uses the data in the specified rowset to populate the input buffer, copying *like-named* fields in the appropriate structure. This method assumes that the names of the fields in the rowset match the names of the inputs defined in the Business Interlink definition, and that the structure of both rowsets are the same.

Use this method only if you have a hierarchical data structure and you want to preserve the hierarchy. Otherwise, use BulkExecute or AddInputRow.

Parameters

Parameter	Description
&Rowset	Specify an existing, instantiated rowset object.

Returns

An optional value: the number of rows inserted into the output buffer.

Example

The example uses the rowset on level one from the EMPLOYEE_CHECKLIST page. A PeopleCode program running in a field on level zero in that panel can access the child rowset (level one), shown below from Scroll Bar 1 to Scroll Bar 2.

	Lvl	Label	Type	Field	Record	Display Control	Related Display	Related Control
1	0	Frame	Frame			☒	☒	
2	0	Frame	Frame			☐	☐	
3	0	Frame	Frame			☐	☐	
4	0	Employee Name	Edit Box	NAME	PERSONAL_DATA	☐	☐	
5	0	ID	Edit Box	EMPLID	PERSONAL_DATA	☐	☐	
6	1	Checklist Item Tbl	Scroll Bar			☒	☒	
7	1	Checklist Sequen	Edit Box	CHECKLIST_SEQ	CHECKLIST_ITEM	☐	☐	
8	1	Scroll Bar 1	Scroll Bar			☒	☒	
9	1	Checklist Date	Edit Box	CHECKLIST_DT	EMPL_CHECKLIST	☐	☐	
10	1	derived_hr_effdt	Edit Box	EFFDT	DERIVED_HR	☐	☐	
11	1	Checklist	Edit Box	CHECKLIST_CD	EMPL_CHECKLIST	☒	☐	
12	1	Checklist Descript	Edit Box	DESCR	CHECKLIST_TBL	☐	☒	11
13	1	Responsible ID	Edit Box	RESPONSIBLE_ID	EMPL_CHECKLIST	☒	☐	
14	1	Responsible Nam	Edit Box	NAME	PERSONAL_DATA	☐	☒	13
15	1	Comment	Long Edit Box	COMMENTS	EMPL_CHECKLIST	☐	☐	
16	2	Scroll Bar 2	Scroll Bar			☒	☒	
17	2	Chklist Seq	Edit Box	CHECKLIST_SEQ	EMPL_CHKLIST_ITM	☐	☐	
18	2	Chklist Itm	Edit Box	CHKLIST_ITEM_CD	EMPL_CHKLIST_ITM	☒	☐	
19	2	Briefing Descripti	Edit Box	DESCR	CHKLIST_ITEM_TBL	☐	☒	18
20	2	Briefing Status	Drop Down List	BRIEFING_STATUS	EMPL_CHKLIST_ITM	☐	☐	
21	2	Status Date	Edit Box	STATUS_DT	EMPL_CHKLIST_ITM	☐	☐	

EMPLOYEE_CHECKLIST Page structure

EMPL_CHECKLIST is the primary database record for the level one scrollbar on the EMPLOYEE_CHECKLIST page. The following PeopleCode access the level one rowset using EMPL_CHECKLIST. The Business Interlink object name is QE_BI_EMPL_CHECKLIST. This Business Interlink object uses the level one rowset as its input and its output.

The InputRowset method uses this rowset as input for QE_BI_EMPL_CHECKLIST. Then a blank duplicate of the rowset is created with CreateRowset, and then the output of QE_BI_EMPL_CHECKLIST is fetched into the blank rowset with FetchIntoRowset.

```
&MYROWSET = GetRowset(SCROLL.EMPL_CHECKLIST);
&ROWCOUNT = &QE_BI_EMPL_CHECKLIST.InputRowset(&MYROWSET);
&RSLT = &QE_BI_EMPL_CHECKLIST.Execute();
/* do some error processing */
&WorkRowset = CreateRowset(&MYROWSET);
&ROWCOUNT = &QE_BI_EMPL_CHECKLIST.FetchIntoRowset(&WorkRowset);

If &ROWCOUNT = 0 Then
/* do some error processing */
Else
/* Process the rowset from QE_BI_EMPL_CHECKLIST. Check it for errors. */
For &I = 1 to &WorkRowset.RowCount
For &K = 1 to &WorkRowset(&I).RecordCount
&REC = &WorkRowset(&I).GetRecord(&K);
&REC.ExecuteEdits();
For &M = 1 to &REC.FieldCount
If &REC.GetField(&M).EditError Then
/* there are errors */
/* do other processing */
End-If;
End-For;
End-For;
End-for;
End-if;
```

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Accessing the Data Buffer"

MoveFirst

Syntax

MoveFirst()

Description

Use the MoveFirst method to support dynamic output. This method moves your cursor to the first column, first row of the output buffer. You must use this method before you try to access any data.

Parameters

None.

Returns

Boolean: True if successfully positioned cursor at the first column, first row of the output buffer, False otherwise.

Example

In the following example, the Business Interlink object name is &MYBI. The example uses MoveFirst to move to the first row of the output buffer, and to the first column, or first field, in that row. The Repeat loop uses MoveNext to go through every row in the output buffer. The For loop processes every field in every row, using the GetFieldCount method to get the number of fields, or outputs, in the row.

```
/* Add inputs to the Business Interlink object, then call Execute to execute the⇒
Business Interlink object. You are then ready to get the outputs using the⇒
following code. */
```

```
If (&MYBI.MoveFirst()) Then
  Repeat
    For &I = 1 to &MYBI.GetFieldCount
      &TYPE = &MYBI.GetFieldType(&I);
      Evaluate &TYPE
      Where = 1
      &STRING_VARIABLE = &MYBI.GetFieldValue(&I);
      /* test for and process other field types */
      End-Evaluate;
    End-For;
  Until Not(&MYBI.MoveNext());
Else
  /* Process error - no output buffer */
End-If;
```

MoveNext

Syntax

MoveNext ()

Description

Use the MoveNext method to support dynamic output. This method moves your cursor to the first column of the next row of the output buffer. You can use this method only after you have used the MoveFirst method; otherwise, the system doesn't know where to start.

Parameters

None.

Returns

Boolean: True if successfully positioned cursor at the next row of the output buffer, False otherwise.

Example

In the following example, the Business Interlink object name is &MYBI. The example uses MoveFirst to move to the first row of the output buffer, and to the first column, or first field, in that row. The Repeat loop uses MoveNext to go through every row in the output buffer. The For loop processes every field in every row, using the GetFieldCount method to get the number of fields, or outputs, in the row.

```
/* Add inputs to the Business Interlink object, then call Execute to execute the⇒
Business Interlink object. You are then ready to get the outputs using the⇒
following code. */
```

```
If (&MYBI.MoveFirst()) Then
  Repeat
    For &I = 1 to &MYBI.GetFieldCount
      &TYPE = &MYBI.GetFieldType(&I);
      Evaluate &TYPE
      Where = 1
      &STRING_VARIABLE = &MYBI.GetFieldValue(&I);
      /* test for and process other field types */
      End-Evaluate;
    End-For;
  Until Not(&MYBI.MoveNext());
Else
  /* Process error - no output buffer */
End-If;
```

MoveToDoc

Syntax

MoveToDoc(*list_number*)

Description

Within a list of documents in the Output structure, the MoveToDoc method moves to the documents given by the parameter *list_number*. After using MoveToDoc, the GetValue method gets the values of the document that is in the *list_number+1* location in the list.

Parameters

<i>Parameter</i>	<i>Description</i>
list_number	The number indicating the document that MoveToDoc moves to. After using MoveToDoc, the GetValue method gets the values of the document that is in the <i>list_number+1</i> location in the list. For example, if <i>list_number</i> is zero, then MoveToDoc moves to the first document in the list.

Returns

This method returns an integer. The values are:

<i>Value</i>	<i>Description</i>
0	eNoError. The method succeeded.
1	eNO_DOCUMENT. The document referenced by this method does not exist.
2	eDOCLIST_OUT_RANGE. You tried to access a document in a list, but the document list is out of range. For example, if a document list contains five documents, and then you call GetDoc/GetOutputDocs once, you can call GetNextDoc four times; the fifth time results in this error.
3	eDOCUMENT_UNINITIALIZED. Internal error.
4	eNOT_DOCUMENTTYPE. You tried to perform an operation upon a parameter that is not a document type.
5	eNOT_LISTTYPE. You tried to perform a GetNextDoc or AddNextDoc upon a document that is not a list.
7	eNOT_BASICTYPE. You tried to perform a GetValue or AddValue upon a parameter that is not of basic type: integer, float, string, time, date, datetime.
8	eNO_DATA. You tried to retrieve data from a document that contained no data.

Example

The following example gets the values of the last document in the output_param2_List list. It uses GetCount to get the number of documents in the list, and then uses MoveToDoc to move to the last document in the list.

```

Local Interlink &QE_COST;
Local number &count;
Local BIDocs &CalcCostOut;
Local BIDocs &OutlistDoc;
Local number &ret;

&QE_COST = GetInterlink(Interlink.QE_COST_EX);
// Get inputs, execute. (code not shown)

&CalcCostOut = &QE_COST.GetOutputDocs("");
&OutlistDoc = &CalcCostOut.GetDoc("output_param2_List");
&count = &CalcCostOut.GetCount("output_param2_List");
&ret = &OutlistDoc.MoveToDoc(&count-1);
&ret = &OutlistDoc.GetValue("output_member1", &VALUE1);
&ret = &OutlistDoc.GetValue("output_member2", &VALUE2);

```

The following illustration shows the Output structure for this example. It contains three output parameters: output_param1, Service_Rate, and output_param2_List. This is a version of the Federal Express plug-in that was modified for this example (output_param1 and output_param2_List were added).

Example output structure

ResetCursor

Syntax

ResetCursor()

Description

The ResetCursor method resets the cursor in the Output structure for a Business Interlink object to the top. After you call this method, the next time you call GetValue, you get an output value from the first document of the Output structures for a Business Interlink object.

Parameters

None.

Returns

None.

Example

The following code uses `ResetCursor` to reset the cursor in the Output structure to the top.

```
Local Interlink &QE_COST;  
Local BiDocs &CalcCostOut;  
  
&QE_COST = GetInterlink(Interlink.QE_COST_EX);  
// Get inputs, execute. (code not shown)  
&CalcCostOut = &QE_COST.GetOutputDocs("");  
// Perform actions on the output documents (code not shown)  
&CalcCostOut.ResetCursor();
```

Incoming Business Interlink Methods

This section describes the PeopleCode methods you use with Incoming Business Interlinks.

AddAttribute

Syntax

AddAttribute(*attributename*, *attributevalue*)

Description

The `AddAttribute` method adds an attribute name and its value to an XML element referenced by a `BiDocs` object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>attributename</i>	String. The name of the attribute.
<i>attributevalue</i>	String. The value of the attribute.

Returns

Number. The return status. NoError, or 0, means the method succeeded.

Example

Here is a set of XML response code.

```
<?xml version="1.0"?>
  <postreqresponse>
    <candidate>
      <user>
        <location scenery="great" density="low" blank="eh?">
        </location>
      </user>
    </candidate>
  </postreqresponse>
```

Here is the PeopleCode that builds it.

```
Local BIDocs &rootDoc, &postreqresponse;
Local BIDocs &candidates, &location, &user;
Local number &ret;

&rootDoc = GetBiDoc("");
&ret = &rootDoc.AddProcessInstruction("<?xml version=""1.0""?>");
&postreqresponse = &rootDoc.CreateElement("postreqresponse");
&candidates = &postreqresponse.CreateElement("candidates");
&user = &candidates.CreateElement("user");
&location = &user.CreateElement("location");
&ret = &location.AddAttribute("scenery", "great");
&ret = &location.AddAttribute("density", "low");
&ret = &location.AddAttribute("blank", "eh?");
```

See Also

[Chapter 10, "Business Interlink Class," GetStatus, page 347](#)

AddComment

Syntax

AddComment(*comment*)

Description

The AddComment method adds an XML comment after the beginning tag of an XML element referenced by a BiDoc object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>comment</i>	String. The comment.

Returns

Number. The return status. NoError, or 0, means the method succeeded.

Example

Here is a set of XML response code.

```
<?xml version="1.0"?>
  <postreqresponse>
    <error>
      <!--this is a comment line-->
      <errorcode>1</errorcode>
      <errortext></errortext>
    </error>
  </postreqresponse>
```

Here is the PeopleCode that builds it.

```
Local BIDocs &rootDoc, &postreqresponse, &error, &errorcode, &errortext;
Local string &blob;
Local number &ret;
&rootDoc = GetBiDoc("");

/* add a processing instruction*/
&ret = &rootDoc.AddProcessInstruction("<?xml version='\"1.0\"'?>");
/* create an element and add text*/
&postreqresponse = &rootDoc.CreateElement("postreqresponse");
&error = &postreqresponse.CreateElement("error");
&ret = &error.AddComment("this is a comment line");
&errorcode = &error.CreateElement("errorcode");
&ret = &errorcode.AddText("1");
&errortext = &error.CreateElement("errortext");
```

See Also

[Chapter 10, "Business Interlink Class," GetStatus, page 347](#)

AddProcessInstruction

Syntax

AddProcessInstruction(*instruction*)

Description

The `AddProcessInstruction` method adds an XML processing instruction to a `BiDocs` object. Use this method at the root level of the `BiDocs` object for Incoming Business Interlinks before you add anything else to the `BiDocs` object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>instruction</i>	String. The processing instruction.

Returns

Number. The return status. `NoError`, or 0, means the method succeeded.

Example

Here is a set of XML response code.

```
<?xml version="1.0"?>
  <postreqresponse>
    <error>
      <!--this is a comment line-->
      <errorcode>1</errorcode>
      <errortext></errortext>
    </error>
  </postreqresponse>
```

Here is the PeopleCode that builds it.

```
Local BiDocs &rootDoc, &postreqresponse;
Local BiDocs &error, &errorcode, &errortext;
Local number &ret;
&rootDoc = GetBiDoc("");

/* add a processing instruction*/
&ret = &rootDoc.AddProcessInstruction("<?xml version=""1.0""?>");
/* create an element and add text*/
&postreqresponse = &rootDoc.CreateElement("postreqresponse");
&error = &postreqresponse.CreateElement("error");
&ret = &error.AddComment("this is a comment line");
&errorcode = &error.CreateElement("errorcode");
&ret = &errorcode.AddText("1");
&errortext = &error.CreateElement("errortext");
```

See Also

[Chapter 10, "Business Interlink Class," GetStatus, page 347](#)

AddText

Syntax

AddText(*text*)

Description

The AddText method adds text to an XML element referenced by a BiDocs object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>text</i>	String. The text.

Returns

Number. The return status. NoError, or 0, means the method succeeded.

Example

Here is a set of XML response code.

```
<?xml version="1.0"?>
  <postreqresponse>
    <error>
      <!--this is a comment line-->
      <errorcode>1</errorcode>
      <errortext></errortext>
    </error>
  </postreqresponse>
```

Here is the PeopleCode that builds it.

```
Local BiDocs &rootDoc, &postreqresponse;
Local BiDocs &error, &errorcode, &errortext;
Local number &ret;
&rootDoc = GetBiDoc("");

/* add a processing instruction*/
&ret = &rootDoc.AddProcessInstruction("<?xml version='\"1.0\"'?>");
/* create an element and add text*/
&postreqresponse = &rootDoc.CreateElement("postreqresponse");
&error = &postreqresponse.CreateElement("error");
&ret = &error.AddComment("this is a comment line");
&errorcode = &error.CreateElement("errorcode");
&ret = &errorcode.AddText("1");
&errortext = &error.CreateElement("errortext");
```

See Also

[Chapter 10, "Business Interlink Class," GetStatus, page 347](#)

CreateElement

Syntax

CreateElement(*elementname*)

Description

The CreateElement method creates an XML element with the given name within a BiDoc object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>elementname</i>	String. The XML element name.

Returns

BiDocs. The reference to the created element.

Example

Here is a set of XML response code.

```
<?xml version="1.0"?>
  <postreqresponse>
    <error>
      <errorcode>1</errorcode>
      <errortext></errortext>
    </error>
  </postreqresponse>
```

Here is the PeopleCode that builds it.

```

Local BiDocs &rootDoc, &postreqresponse;
Local BiDocs &error, &errorcode, &errortext;
Local number &ret;

&rootDoc = GetBiDoc("");

/* add a processing instruction*/
&ret = &rootDoc.AddProcessInstruction("<?xml version=""1.0""?>");
/* create an element and add text*/
&postreqresponse = &rootDoc.CreateElement("postreqresponse");
&error = &postreqresponse.CreateElement("error");
&errorcode = &error.CreateElement("errorcode");
&ret = &errorcode.AddText("1");
&errortext = &error.CreateElement("errortext");

```

GenXMLString

Syntax

GenXMLString()

Description

The GenXMLString method creates an XML string from a BiDocs object. The BiDocs object must contain the shape and data needed for an XML string. This is part of the Incoming Business Interlink functionality, which enables PeopleCode to receive an XML request and return an XML response.

Parameters

None.

Returns

String. The XML string containing the shape and data of the BiDocs object. For example, you can use this method to create an XML string containing an XML response.

Example

The following example takes a BiDocs structure that contains an XML response and puts that into a text string. After this is done, the %Response.Write function can send this as an XML response.

```

Local BiDocs &rootDoc;
Local string &xmlString;

/* Create a BiDoc structure containing the data and shape of your XML response =>
(code not shown) */

/* Generate the XML string containing the data and shape of your XML response from=>
the BiDoc structure */
&xmlString = &rootDoc.GenXMLString();
%Response.Write(&xmlString);

```

GetAttributeName

Syntax

GetAttributeName(*attributenum*)

Description

The GetAttributeName method gets the name of an attribute within an XML element referenced by a BiDocs object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>attributenum</i>	Number. The index number of the attribute.

Returns

String. The name of the attribute.

Example

Here is a set of XML request code.

```
<?xml version="1.0"?>
  <postreq>
    <email>joe_blow@peoplesoft.com</email>
    <location scenery="great" density="low" blank="eh?">
      <city>San Rafael</city>
      <state>CA</state>
      <zip>94522</zip>
      <country>US</country>
    </location>
  </postreq>
```

Here is the PeopleCode that gets the name of the second attribute in the location node. &attrName is density.

```
Local BiDocs &rootInDoc, &postreqDoc, &locationDoc;
Local string &blob, &attrName;
&blob = %Request.GetContentBody();

&rootInDoc = GetBiDoc(&blob);
&postreqDoc = &rootInDoc.GetNode("postreq");
&locationDoc = &postreqDoc.GetNode("location");
&attrName = &locationDoc.GetAttributeName(2);
```

GetAttributeValue

Syntax

```
GetAttributeValue({attributename | attributenumbers})
```

Description

The GetAttributeValue method gets the value of an attribute within an XML element referenced by a BiDocs object.

Parameters

Parameter	Description
<i>attributenumbers attributename</i>	Specify the attribute that you want to get the value for. You can specify either the attribute number (1 for the first attribute, 2 for the second, and so on) or the attribute name (an XML tag.)

Returns

String. The value of the attribute.

Example

Here is a set of XML request code.

```
<?xml version="1.0"?>
  <postreq>
    <email>joe_blow@peoplesoft.com</email>
    <location scenery="great" density="low" blank="eh?">
      <city>San Rafael</city>
      <state>CA</state>
      <zip>94522</zip>
      <country>US</country>
    </location>
  </postreq>
```

Here is the PeopleCode that gets the value of the second attribute in the location node. &attrValue is low.

```
Local BiDocs &rootInDoc, &postreqDoc, &locationDoc;
Local string &blob, &attrValue;
&blob = %Request.GetContentBody();

&rootInDoc = GetBiDoc(&blob);
&postreqDoc = &rootInDoc.GetNode("postreq");
&locationDoc = &postreqDoc.GetNode("location");
&attrValue = &locationDoc.GetAttributeValue(2);
```

GetNode

Syntax

```
GetNode({nodename | nodenumber})
```

Description

The GetNode method returns a BiDocs reference to a child XML node (element or comment). Use the GetNode method upon a BiDocs reference to an XML element to access the child nodes for that element.

Parameters

Parameter	Description
<i>nodenumber nodename</i>	Specify the node that you want to reference. You can specify either a node number (the first node is 1, the second 2, and so on) or a node name (that is, the XML tag.)

Returns

BiDocs. The returned XML element within a BiDocs object.

Example

Here is a set of XML request code.

```
<?xml version="1.0"?>
  <postreq>
    <email>joe_blow@peoplesoft.com</email>
    <projtitle>
      <projsubtitle>first_subtitle</projsubtitle>
      <projsubtitle>second_subtitle</projsubtitle>
      <projsubtitle>third_subtitle</projsubtitle>
    </projtitle>
  </postreq>
```

Here is the PeopleCode that gets the postreqDoc element and the projtitle element.

```
Local BiDocs &rootInDoc, &postreqDoc, &projtitleDoc;
Local string &name, &blob;
&blob = %Request.GetContentBody();

&rootInDoc = GetBiDoc(&blob);
&postreqDoc = &rootInDoc.GetNode("postreq");
&projtitleDoc = &postreqDoc.GetNode("projtitle");
```

Here is the PeopleCode that gets the postreqDoc element, the projtitle element, and the third projsubtitle element.

```

Local BiDocs &rootInDoc, &postreqDoc, &projtitleDoc, &projsubtitleDoc;
Local string &name, &blob;
&blob = %Request.GetContentBody();

&rootInDoc = GetBiDoc(&blob);
&postreqDoc = &rootInDoc.GetNode(1);
&projtitleDoc = &postreqDoc.GetNode(2);
&projsubtitleDoc = &projtitleDoc.GetNode(3);

```

To parse a list of elements like <projsubtitle>, where elements have the same name, you must call `GetNode` using an index number rather than the element name.

ParseXMLString

Syntax

```
ParseXMLString(XMLstring [, DTDValidation])
```

Description

The `ParseXMLString` methods fills an existing `BiDocs` object with the data and shape from an XML string. This is part of the Incoming Business Interlink functionality, which enables `PeopleCode` to receive an XML request and return an XML response.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>XMLstring</i>	A string containing an XML document.
<i>DTDValidation</i>	Specify whether to validate a document type definition (DTD.) This parameter takes a Boolean value. If you specify true, the DTD validation occurs if a DTD is provided. If you specify false, and if a DTD is provided, it is ignored and the XML isn't validated against the DTD. The default value for this parameter is false. In the case of application messaging, if a DTD is provided, it's always ignored and the XML isn't validated against the DTD. If the XML cannot be validated against a DTD, an error is thrown saying that there was an XML parse error.

Returns

Number. The return status. `NoError`, or 0, means the method succeeded.

Example

The following example gets an XML request, creates an empty `BiDoc`, and then fills the `BiDoc` with the data and shape contained in the XML string. After this is done, the `GetDoc` method and the `GetValue` method can get the value of the skills XML element, which is contained within the `postreq` element in the XML request.

```

Local BIDs &rootInDoc, &postreqDoc;
Local string &blob;
Local number &ret;

&blob = %Request.GetContentBody();
/* process the incoming xml(request)- Create a BiDoc and fill with the request*/
&rootInDoc = GetBiDoc("");
&ret = &rootInDoc.ParseXMLString(&blob);
&postreqDoc = &rootInDoc.GetDoc("postreq");
&ret = &postreqDoc.GetValue("skills", &skills);

```

Incoming Business Interlink Properties

This section describes the PeopleCode properties you use with Incoming Business Interlinks.

AttributeCount

Description

The AttributeCount property gets the number of attributes within an XML element referenced by a BiDocs object.

This property is read-only.

Example

Here is a set of XML request code.

```

<?xml version="1.0"?>
  <postreq>
    <email>joe_blow@peoplesoft.com</email>
    <location scenery="great" density="low" blank="eh?">
      <city>San Rafael</city>
      <state>CA</state>
      <zip>94522</zip>
      <country>US</country>
    </location>
  </postreq>

```

Here is the PeopleCode that gets the number of attributes in the location XML element. &count should be 3, for scenery, density, and blank.

```

Local BIDocs &rootInDoc, &postreqDoc, &locationDoc;
Local string &blob;
Local number &count;
&blob = %Request.GetContentBody();

&rootInDoc = GetBiDoc(&blob);
&postreqDoc = &rootInDoc.GetNode("postreq");
&locationDoc = &postreqDoc.GetNode("location");
&count = &locationDoc.AttributeCount;

```

ChildNodeCount

Description

The ChildNodeCount property returns the number of XML child nodes within the element referenced by the BiDocs object. Child nodes include XML elements, comments, and processing instructions.

This property is read-only.

Example

Here is a set of XML request code.

```

<?xml version="1.0"?>
  <postreq>
    <email>joe_blow@peoplesoft.com</email>
    <projtitle>
      <!--this is a comment line-->
      <projsubtitle>first_subtitle</projsubtitle>
      <projsubtitle>second_subtitle</projsubtitle>
      <projsubtitle>third_subtitle</projsubtitle>
    </projtitle>
  </postreq>

```

Here is the XML code that gets the number of nodes within <postreq> and <projtitle>. &count1 is 2, for <email> and <projtitle>, and &count2 is 4, for the three <projsubtitle> nodes and the comment node.

```

Local BIDocs &rootInDoc, &projtitleDoc;
Local string &blob;
Local number &count1, &count2;
&blob = %Request.GetContentBody();

&rootInDoc = GetBiDoc(&blob);
&postreqDoc = &rootInDoc.GetNode("postreq");
&count1 = &postreqDoc.ChildNodeCount;
&projtitleDoc = &postreqDoc.GetNode("projtitle");
&count2 = &projtitleDoc.ChildNodeCount;

```

NodeName

Description

The NodeName property gets the name of an XML element referenced by a BiDocs object. Use this to get the name of an XML element when you used GetNode with an index number to retrieve it (meaning that you did not have the name of the XML element when you used GetNode).

This property is read-only.

Example

Here is a set of XML request code.

```
<?xml version="1.0"?>
  <postreq>
    <email>joe_blow@peoplesoft.com</email>
    <projtitle>
      <projsubtitle>first_subtitle</projsubtitle>
      <projsubtitle>second_subtitle</projsubtitle>
      <projsubtitle>third_subtitle</projsubtitle>
    </projtitle>
  </postreq>
```

Here is the PeopleCode that gets the name of the <email> element, email.

```
Local BiDocs &rootInDoc, &postreqDoc, &emailDoc;
Local string &emailName, &blob;
&blob = %Request.GetContentBody();

&rootInDoc = GetBiDoc(&blob);
&postreqDoc = &rootInDoc.GetNode(1);
&emailDoc = &postreqDoc.GetNode(1);
&emailName = &emailDoc.NodeName;
```

NodeType

Description

The NodeType property returns the type of an XML tag within a BiDocs object as an integer. The values are:

Value	Description
1	Element (a normal XML tag)
7	Processing instruction
8	Comment

This property is read-only.

Example

Here is a set of XML request code.

```
<?xml version="1.0"?>
  <postreq>
    <email>joe_blow@peoplesoft.com</email>
    <!--this is a comment-->
    <projtitle>
      <projsubtitle>first_subtitle</projsubtitle>
      <projsubtitle>second_subtitle</projsubtitle>
      <projsubtitle>third_subtitle</projsubtitle>
    </projtitle>
  </postreq>
```

Here is the PeopleCode that gets types: &xmlprocType is 7 for processing instruction, postreqDoc is 1 for element, and commentType is 8 for comment.

```
Local BIDocs &rootInDoc, &postreqDoc, &commentDoc;
Local number &xmlprocType, &postreqType, &commentDoc;
Local string &blob;
&blob = %Request.GetContentBody();

/* <?xml version="1.0"?> */
&rootInDoc = GetBiDoc(&blob);
&xmlprocType = &rootInDoc.NodeType;

/* <postreq> */
&postreqDoc = &rootInDoc.GetNode(1);
&postreqType = &postreqDoc.NodeType;

/* <!--this is a comment--> */
&commentDoc = &postreqDoc.GetNode(2);
&commentType = &commentDoc.NodeType;
```

NodeValue

Description

The NodeValue property returns the value of a node within an XML document as a string.

This property is read-only.

Example

Here is a set of XML request code.

```
<?xml version="1.0"?>
  <postreq>
    <email>joe_blow@peoplesoft.com</email>
    <projtitle>
      <projsubtitle>first_subtitle</projsubtitle>
      <projsubtitle>second_subtitle</projsubtitle>
      <projsubtitle>third_subtitle</projsubtitle>
    </projtitle>
  </postreq>
```

Here is the PeopleCode that gets the value of the third <projsubtitle> element, third_subtitle.

```
Local BIDocs &rootInDoc, &postreqDoc, &projtitleDoc, &projsubtitleDoc;
Local string &name, &blob;
&blob = %Request.GetContentBody();

&rootInDoc = GetBiDoc(&blob);
&postreqDoc = &rootInDoc.GetNode(1);
&projtitleDoc = &postreqDoc.GetNode(2);
&projsubtitleDoc = &projtitleDoc.GetNode(3);
&projsubtitleName = &projsubtitleDoc.NodeValue;
```

Business Interlink Class Property

This section explains the StopAtError property.

StopAtError

Description

The StopAtError property specifies whether the execution of the PeopleCode program stops when there's an error, or if the PeopleCode program tries to capture the errors.

This property takes a Boolean value: True to halt execution of your PeopleCode program at an error, False to continue executing. The default value is True.

This property is read-write.

Example

```
&QE_RP_SRAALL_1.StopAtError = False;
```

Configuration Parameters

There are two types of configuration parameters: the ones defined by the Interlink plug-in the Business Interlink definition is based on, and the ones that are standard, that is, defined for every Business Interlink object.

All configuration parameters must be set before you add any data to the input buffers.

In this section, we discuss the following parameters:

- Interlink plug-in configuration parameters
- URL configuration parameter
- BIDocValidate configuration parameter

Interlink Plug-in Configuration Parameters

The configuration parameters defined by the Interlink plug-in are accessed as if they were properties on the Business Interlink object. That is, in PeopleCode, you assign the value of a configuration parameter by using the Business Interlink object followed by a dot and the configuration parameter, in this format:

```
&MYINTERLINK.parameter = value;
```

You can also return the value of a configuration parameter:

```
&MYVALUE = &MYINTERLINK.parameter;
```

Each Business Interlink plug-in has its own set of configuration parameters. For example, the email project uses configuration parameters of SMTP_MAIL_SERVER, POP3MAIL_SERVER, LOGIN_NAME, PASSWORD, SENDERS_EMAIL_ADDRESS and REPLY_EMAIL_ADDRESS, while the Red Pepper transaction driver uses SERVER_NAME, RSERVER_HOST, RSERVER_PORT, and TIMEOUT.

You can specify default values for every configuration parameter in the Business Interlink definition (created in Application Designer.) These values are used if you create a PeopleCode "template" by dragging the Business Interlink definition from the Project window in Application Designer to an open PeopleCode editor window.

In the following example, the Interlink object name is QE_RP_SRAALL_1, and the driver is the Red Pepper driver:

```
&QE_RP_SRAALL_1.SERVER_NAME = "server";
&QE_RP_SRAALL_1.RSERVER_HOST = "pt-sun02.peoplesoft.com";
&QE_RP_SRAALL_1.RSERVER_PORT = "9884";
&QE_RP_SRAALL_1.TIMEOUT = 999;
&QE_RP_SRAALL_1.URL = "HTTP://www.PeopleSoft.com";
&QE_RP_SRAALL_1.StopAtError = False;
```

URL Configuration Parameter

Specifies the location and name of the Business Interlink plug-in to be used to connect to the external system. This configuration parameter takes a string value.

If the plug-in is located on a web server, you have to specify the name of the web server.

If you specify a file, you can specify either a relative or an absolute path:

- If you specify an absolute path, you must specify the drive letter:

```
&MYBI.URL = "File://D:\TEMP.MYDLL";
```

- If you specify a relative path, just use the file name:

```
&MYBI.URL = "File://TEMP.MYDLL";
```

If you specify a relative path, the system firsts looks for the file in the Location directory (specified by the user when the Business Interlink was first created), then it looks in the directory where PeopleTools is installed, in the PSTOOLS/Interface Drivers directory.

BIDocValidate Configuration Parameter

Specifies whether the system should verify whether the hierarchical data object (BIDoc) exists before adding or getting values from it. This configuration parameter takes a Boolean value: True if the system should verify before accessing the object, False otherwise.

The default value is True.

If this configuration parameter is specified as True, and the object specified doesn't exist, the PeopleCode program halts execution and an error is displayed.

Chapter 11

Charting Classes

This chapter provides an overview of the PeopleSoft charting classes and discusses:

- Creating PeopleSoft charts.
- Using the Chart class.
- Using the Gantt class.
- Using the OrgChart class.
- Using the RatingBoxChart class.
- Using the Charting Classes Reference.
- Charting classes built-in functions.

Understanding the Charting Classes

PeopleTools delivers four charting classes. One general charting class supports a range of standard chart types, and three specialized charting classes address specific charting needs. Each charting class is discussed in detail in following sections.

The charting classes are:

- **Chart**
Use the Chart class to visually display data series in common formats, including bar charts, line charts, pie charts, and bubble charts.
- **Gantt**
Use the Gantt class to create interactive Gantt charts that enable you to display and edit project and task information.
- **OrgChart**
Use the OrgChart class to create interactive organization charts that enable you to visually represent a hierarchy of information as a series of connected nodes.
- **RatingBoxChart**
Use the RatingBoxChart class to create rating box charts that enable you to display and manipulate points of information in two-dimensional bins.

The following examples show each of the four chart classes:

This chart was created from the Chart class with a chart type of 2D Bar:

Two-dimensional bar chart

This example shows a Gantt chart:

Gantt chart

This example shows an organization chart:

Organization chart

This example shows a rating box chart:

Rating box chart

Creating PeopleSoft Charts

This section discusses the process of creating charts using any of the PeopleSoft charting classes. Further details can be found in the specific section for each chart class.

These topics relate to all of the charting classes:

- Creating a chart on a page

- Creating a chart using an iScript
- Font considerations
- Component Processor considerations
- Translation considerations
- Label considerations
- Style sheets
- Using style sheets with RevertToPre850
- Using style sheets with PeopleTools Version 8.50 charts
- Chart colors

Creating a Chart on a Page

This section summarizes the basic steps to create a chart. The basic steps are essentially the same for all four charting classes.

At the end of this chapter are examples of charts with step-by-step instructions and complete PeopleCode programs.

The Chart class section has fundamental, detailed instructions for creating a chart using the Chart class. Each specialized class – Gantt class, OrgChart class, and RatingBoxChart class – has detailed instructions that build on the Chart class instructions.

See [Chapter 11, "Charting Classes," Creating a Chart Using the Chart Class, page 557](#); [Chapter 11, "Charting Classes," Using the Chart Class, page 394](#); [Chapter 11, "Charting Classes," Using the Gantt Class, page 399](#); [Chapter 11, "Charting Classes," Using the OrgChart Class, page 407](#) and [Chapter 11, "Charting Classes," Using the RatingBoxChart Class, page 425](#).

Note. The following steps are for creating a chart on a PeopleSoft Pure Internet Architecture page. You can also create a chart for a web page using an iScript. Only Chart class charts or Gantt class charts can be created using an iScript.

See [Chapter 11, "Charting Classes," Creating a Chart Using an iScript, page 596](#).

To create a chart on a page:

1. In Application Designer, place a chart control on a page and associate the chart with a record field.
2. Create a record to hold your chart data.

For charts made using the OrgChart class and the RatingBoxChart class, you also create a record that controls the appearance of the chart. Place each record on a level-1 grid on the page so the chart records are present in the component buffer at runtime. You can optionally hide the grid. You can also optionally place the grid on another page on the same component.

Place the page on a component and register the component.

3. Add PeopleCode, probably on the page Activate event, to instantiate the chart object and associate it with the page control.

For example, this is the minimum PeopleCode to create a bar chart using the Chart class.

```
/* Declare a chart object */  
  
Component Chart &cChart;  
  
/* Instantiate the chart object and associate the chart  
** with the chart page control */  
  
&cChart = GetChart(SC_CHART_DUMREC.QE_CHART_FIELD);  
  
/* Specify the chart data record and specify the record  
** fields for the X-Axis data and Y-Axis data*/  
  
&cChart.SetData(Record.SC_CHART_RECORD);  
&cChart.SetDataXAxis(SC_CHART_RECORD.SC_PRODUCT);  
&cChart.SetDataYAxis(SC_CHART_RECORD.SC_SALES);
```

4. View the chart in the browser.

Suppose you have this data in SC_CHART_RECORD:

Region	Sales
Arizona	62
California	50
Oregon	42
Washington	30

This is the bar chart generated by the example code and data. The default chart type for the Chart class is a bar chart. Since no colors are specified, the chart uses the default colors.

Default Chart class bar chart

5. Add PeopleCode to control the behavior of the chart or to modify its appearance at runtime. For example, for a bar chart you might add FieldChange PeopleCode to the Y-axis field on your data record to display information when a user clicks a data point.

See [Chapter 11, "Charting Classes," Adding Drilldown, page 584.](#)

You can also add FieldChange PeopleCode to a Gantt chart, organization chart, or rating box chart to enable the user to interact with the chart.

See Also

[Chapter 11, "Charting Classes," Creating a Chart Using the Chart Class, page 557](#)

[Chapter 11, "Charting Classes," Using the Chart Class, page 394](#)

[Chapter 11, "Charting Classes," Using the Gantt Class, page 399](#)

[Chapter 11, "Charting Classes," Using the OrgChart Class, page 407](#)

[Chapter 11, "Charting Classes," Using the RatingBoxChart Class, page 425](#)

Creating a Chart Using an iScript

If possible, you should put a chart on a page definition. If not possible, then you can build a chart at runtime using an iScript and call the chart using a URL. Use the CreateObject function in the iScript instead of the GetChart function. You can then use the GetChartURL Response class method to use the URL in your application.

Note. You can create only Chart class and Gantt class charts using an iScript. OrgChart class and RatingBoxChart class charts cannot be created with an iScript.

For example, this PeopleCode would build a chart using a standalone rowset:

```
Function IScript_GetChartURL()
local object &MYCHART;
local string &MYURL;

&MYCHART = CreateObject("Chart");
&MYCHART.SetData(xx);

/* xx will be a data row set */

&MYURL = %Response.GetChartURL(&MYCHART);

/* use &MYURL in your application */
...
End-Function;
```

See Also

[Chapter 11, "Charting Classes," Creating a Chart Using an iScript, page 596](#)

Font Considerations

For Chart class charts and Gantt class charts, the environment variable JAVA_FONTS must be set correctly so the fonts that are used in charting can be picked up by the application server's Java Virtual Machine. It must be set to include the paths to any TrueType fonts that are used to support extended languages. You can set this variable at the system level or in psconfig.sh.

The following is an example of this variable being set:

```
JAVA_FONTS=$PS_HOME/jre/lib/fonts:/usr/share/fonts/default/TrueType:/usr/share
/fonts/ja/TrueType:/usr/share/fonts/zh_CN/TrueType:/usr/share/fonts/zh_TW/TrueType
:/usr/share/fonts/ko/TrueType;export JAVA_FONTS
```

Component Processor Considerations

Sometimes, records at level zero on a page are considered *work* records, even when they are not specified as such in PeopleSoft Application Designer. Work records are not updated by the database and are skipped when the component is run.

A level-zero record is marked as a work record when any of these conditions is true:

- The record is designated as a work record in Application Designer.
- All fields for the record are used as read-only fields.
- All values for these fields can be read from the input keys.

When a chart field is attached to a level-zero record field of a record considered to be a work record, it is also skipped when the system determines that record's 'work' status.

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Referencing Data in the Component Buffer"

Translation Considerations

If you hard code a value for a label, a title, a data hint, and so on, then that value is *not* translated. Be sure to specify field values as message catalog entries that will be translated.

Label Considerations

The appearance of Chart class chart labels is based on the size of the axis, fonts, and charts on the page. If all the labels for your chart do not appear, then you should either make the chart larger or the font smaller.

Pie chart labels are staggered, so that, in most cases, both labels can be read. However, if one or both of the labels are very long, they could be truncated or completely missing from the chart.

For Gantt charts, use double quotes to correctly display the use of single quotes in your label, if applicable.

Style Sheets

A style sheet is a definition, like a record definition or field definition, that you create in PeopleSoft Application Designer. It contains a collection of formatting styles, called style classes, each of which can be applied to either the entire chart or to specific elements within a chart.

The following style sheet properties are supported for PeopleSoft charting:

- Font family

- Font foreground color
- Font size
- Font style (only Normal and Italic are supported)
- Font weight (only Normal and Bold are supported)

You can use a style sheet, and the style classes in a style sheet, for the different parts of a chart. You can specify a style sheet for the entire chart (using either the chart `Style` or `StyleSheet` property) and for an element (using that element's `style` property.)

Using Style Sheets with RevertToPre850

How your chart uses style sheets is very different depending on whether you want your chart to use the PeopleTools Version 8.50 appearance or the pre-8.50 appearance.

The overall look of charts changed with the introduction of new style sheets and colors in PeopleTools Version 8.50. The way style sheets are applied to charts changed at the same time.

If you want your chart to use the pre-8.50 look, set the `RevertToPre850` Chart class or Gantt class property to *True*. If the `RevertToPre850` property is not set or is set to *False*, then your chart will use the PeopleTools Version 8.50 look. By default, the property is *False*.

Warning! By default, all charts use the new 8.50 chart style classes, including charts that were created before PeopleTools Version 8.50.

Any custom Chart class properties or Gantt class properties that were set in PeopleCode for existing charts that use the new 8.50 chart style classes will be ignored if those properties are defined in the 8.50 chart style classes.

A new property, `RevertToPre850`, enables you to maintain the pre-8.50 visual style of an existing chart. If you want an existing chart to use pre-8.50 style classes, you must set the chart property `RevertToPre850` to *True*.

`RevertToPre850` is not available for charts created using the `OrgChart` class or the `RatingBox` class. These chart classes were introduced in PeopleTools Version 8.50.

See [Chapter 11, "Charting Classes," RevertToPre850, page 463](#) and *PeopleTools 8.51 PeopleBook: System and Server Administration*, "Using PeopleTools Utilities," PeopleTools Options.

PTSTYLEDEF Style Sheet

The default style sheet associated with a Chart class chart or Gantt class chart with `RevertToPre850` set to *True* is `PTSTYLEDEF`.

PTSTYLEDEF style sheet showing the chart style sheets

The chart style classes associated with the PTSTYLEDEF style sheet include:

<i>Chart Element</i>	<i>Style Class Name</i>
Style XAxisStyle YAxisStyle LegendStyle Also controls the chart section of the Gantt chart	PSCHARTDEFAULT
MainTitleStyle	PSCHARTTITLE
XAxisTitleStyle YAxisTitleStyle	PSCHARTAXISTITLE
Controls the table section of the Gantt chart	PSCHARTGANTTGRID

RevertToPre850 Override Rules

The application style sheet, which is specified on the PeopleTools Options page, controls the formatting of all charts in an application unless it is overridden.

The override rules are:

1. If you specify the style property for any element (XAxisStyle, XAxisTitleStyle, YAxisStyle, YAxisTitleStyle, LegendStyle, MainTitleStyle, and so on), then the style is used.
2. If you do not specify the style property for any element of a chart object but you specify the StyleSheet property for the chart object itself, then that style sheet is used for the unspecified elements.

3. If you do not specify styles for any elements of a chart object and you do not specify a style sheet for the chart object itself, then a default style sheet is used.

Note. Oracle recommends not using your own style classes or style sheets unless absolutely necessary. If you modify styles you must test changes in all supported browsers. Some changes can have different effects in different browsers.

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Creating Style Sheet Definitions"

[Chapter 11, "Charting Classes," Considerations for Gantt Charts, page 391](#)

Using Style Sheets with PeopleTools Version 8.50 Charts

This section describes how to use style sheets if you have not set the `RevertToPre850` property or have set the property to `False`.

The application style sheet, which is specified on the PeopleTools Options page, controls the formatting of all charts in an application unless it is overridden.

The override rules are:

1. If a style sheet is specified for the Chart object or Gantt object using the `StyleSheet` property, then use this style sheet. (The `StyleSheet` property only applies to Chart class and Gantt class charts. OrgChart class and RatingBoxChart class charts do not use the `StyleSheet` property.)
2. If no style sheet is specified for the chart object but the style sheet is specified for the page in Application Designer, then use the style sheet on the page as the style sheet of the chart.
3. If no page style sheet is specified, then use the style sheet specified on the PeopleTools Options page.
4. If no style sheet is specified on the PeopleTools Options page, use the default style sheet, `PTSTYLEDEF`.

Modifying Style Classes

You modify the appearance of a chart by modifying the style classes that control the appearance. The steps you follow to modify styles depends on the extent of your modification. You can, for instance, modify every style in every chart in your application, or you can modify just one style for a single chart.

The following table summarizes the changes to style sheets and style classes depending on the extent of the modification you intend to make.

Note. Do not change the delivered style sheets. Oracle recommends that you use the default styles wherever possible.

Extent of Modification	Steps
All charts in the application	1. Clone a style sheet, probably the default style sheet. For example, in Application Designer open the style sheet PTSTYLEDEF and save it as MySTYLEDEF. 2. Modify the style classes in the new style sheet. 3. Specify the new style sheet on the PeopleTools Options page. See <i>PeopleTools 8.51 PeopleBook: System and Server Administration</i>, "Using PeopleTools Utilities," PeopleTools Options.
All charts on a page (This method only applies to PeopleTools Version 8.50 charts.)	1. Clone a style sheet, probably the default style sheet. 2. Modify the style classes in the new style sheet. 3. Specify the new style sheet on the chart page using the page properties dialog. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide</i>, "Creating Style Sheet Definitions," Overriding the Default Page Style Sheet.
One chart (This method uses the StyleSheet property, which is only used by the Chart class and the Gantt class.)	1. Clone a style sheet, probably the default style sheet. 2. Modify the style classes in the new style sheet. 3. Specify the new style sheet using the Chart class or Gantt class StyleSheet property. See Chapter 11, "Charting Classes," StyleSheet, page 464.

Extent of Modification	Steps
One style attribute on one chart	1. Clone a style sheet, probably the default style sheet. 2. Copy and paste and rename a style class. For example, copy the style class PSCHARTTITLE. Paste and name the new class MYCHARTTITLE. 3. Modify the new style class. 4. Specify the new style sheet on the chart page using the page properties dialog. or Specify the new style sheet using the Chart class or Gantt class StyleSheet property (Chart class or Gantt class only). For example: <code>&cChart.StyleSheet = STYLESHEET.&MyStyleDef;</code> 5. Assign the new style class to the corresponding style property. For example: <code>&cChart.&cMyChart.MainTitleStyle = STYLESHEET.MYChartTitle;</code>

Note. Oracle recommends not using your own styles or style sheets unless absolutely necessary.

See *PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide*, "Creating Style Sheet Definitions" and *PeopleTools 8.51 PeopleBook: System and Server Administration*, "Using PeopleTools Utilities," PeopleTools Options.

PSCHARTSTYLE

The style classes in PSCHARTSTYLE are used by the Chart class and the Gantt class.

PSCHARTSTYLE style sheet

Chart Colors

The following table lists all the colors that are defined in the PSCHARTSTYLE style sheet.

You assign colors to your chart using the Chart class and Gantt class color methods. You can use either the numeric or constant value.

Charts that have RevertToPre850 set to True use solid colors. Beginning with 8.50, charts use gradients.

Numeric Value	Constant Value	Description
–1	%ChartColor_Series_Default	Default series color. When a data point is set to this value, the default series color or the color set by the user for that series is used instead. This value works only with the SetColorArray method.
0	%ChartColor_Black	Black
1	%ChartColor_Blue	Blue
2	%ChartColor_Cyan	Cyan
3	%ChartColor_DarkGray	DarkGray
4	%ChartColor_Gray	Gray
5	%ChartColor_Green	Green
6	%ChartColor_LightGray	LightGray
7	%ChartColor_Magenta	Magenta
8	%ChartColor_Orange	Orange
9	%ChartColor_Pink	Pink
10	%ChartColor_Red	Red
11	%ChartColor_White	White

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
12	%ChartColor_Yellow	Yellow
13	%ChartColor_Red_Orange	Red_Orange
14	%ChartColor_Yellow_Green	Yellow_Green
15	%ChartColor_Blue_Violet	Blue_Violet
16	%ChartColor_Purple	Purple
17	%ChartColor_Yellow_Orange	Yellow_Orange

See [Chapter 11, "Charting Classes," SetColorArray, page 433](#) and [Chapter 11, "Charting Classes," SetDataColor, page 438](#).

See [Chapter 11, "Charting Classes," SetActualTaskBarColor, page 480](#) and [Chapter 11, "Charting Classes," SetPlannedTaskBarColor, page 487](#).

Considerations for Gantt Charts

In Gantt charts, the PSCHARTDEFAULT style class uses an 8-point font with a normal weight. This style class affects all text in the chart area, such as task labels, DateTime X-axis labels, and hints. The PSCHARTGANTTGRID style class uses a 10-point font with a normal weight, and it affects all text in the table area. For the font size between the table and chart areas to be the same, the point size in the PSCHARTGANTTGRID style class should be 1.25 times the point size of the font defined in PSCHARTDEFAULT. Note, however, that the font size for PSCHARTGANTTGRID should not exceed 13; otherwise, column text may bleed into another column.

OrgChart Class and RatingBoxChart Class Style Sheets

OrgChart class and RatingBoxChart class chart appearance attributes are controlled entirely using style classes.

To modify a style class you can either create a new style sheet or set style properties to new style classes.

To create a new style sheet:

1. Clone the style sheet.

For example, in Application Designer, open the PSORGCHART style sheet and save as MYORGCHART.

2. Double-click a style class name and modify the values in the Class properties dialog.

3. Assign the new style sheet to the page on which the chart is placed.

In Application Designer, open the page and select File, Definition Properties.

On the Use tab, in the Page Style Sheet field, select the new style sheet.

To set style properties to new style classes:

1. Copy and paste to create a new style class within the style sheet that is associated with the chart.

For example, copy and paste the PT_ORGCHART_TITLE style class and name it MY_ORGCHART_TITLE.

2. Modify the new style class.
3. Set the style property of the chart class to the new style class.

For example:

```
&ocMyOrgChart.MainTitleStyle = MY_ORGCHART_TITLE;
```

The PSORGCHART style sheet controls the appearance of organization charts.

PSORGCHART style sheet

The PSRATEBOX style sheet controls the appearance of rating box charts.

PSRATEBOX style sheet

Using the Chart Class

Use the Chart class to create charts that display data series in several common formats, including bar charts, line charts, pie charts, and bubble charts.

This section discusses:

- Chart terms.
- Creating charts using the Chart class.
- Chart class chart types.
- Data type of a Chart object.
- Scope of a Chart object.
- Error handling.
- Chart class methods and properties by category.

Chart Terms

The following is a list of Chart class terms and their descriptions:

Label	Text that identifies the data on one of the axes.
Legend	Text that identifies the different series in the chart.
Series	A grouping of related information. For example, if you were tracking sales for several divisions over many years, each division could be a series. Generally, every series in a chart has a distinct color. You can have more than one series in a chart for comparison. Each line in a line chart represents one series.
Overlay	Related data represented by a line drawn over the background chart. You can also specify data series, with different line types for each overlay.
Title	The three titles are Main, X axis, and Y axis. Each title identifies a portion of the chart.
TrueXY	A type of line chart that uses a numeric X axis instead of a categorical X axis. The numeric X axis supports non-uniform X data, that is, each series need not have the same number of points, and those points along the X axis need not match up across the series.
X axis	The axis that data is measured against.
Y axis	The axis that contains the data. In most charts, this is the vertical axis. In a horizontal bar chart, this is the horizontal axis.

Creating Charts Using the Chart Class

You can specify a rowset and have it graphed using a chart object with minimal PeopleCode. Within this rowset, one column must contain data for the X axis and another column must contain data for the Y axis. If more than one series of data is used, an additional column is required for each series. You can also set color and pop-up text for each point in this rowset using additional columns.

The following distinguishable types of data can be included in a chart:

- Primary data.
- Secondary or overlay data.

Overlay data may be quite different from primary data, so an additional rowset is needed.

The only object used with the Chart class is a chart object. Sub-objects do not exist. All methods and properties are used with the Chart object.

For a conceptual overview, a chart is easier to view in pieces; however, these pieces do *not* represent sub-objects.

A chart contains the following major parts:

- X axis
- Y axis
- Overlay
- Legend
- Data
- Title

The X, Y, and Overlay axes have access to titles and labels associated with their data.

Chart Class Chart Types

The following chart types are available for the Chart class:

- 2D Bar
- 3D Bar
- 2D Histogram
- 2D Percent Bar
- 3D Percent Bar
- 2D Stacked Bar
- 3D Stacked Bar
- 2D Horizontal Bar
- 2D Horizontal Percent Bar
- 2D Horizontal Stacked Bar
- 2D Line
- 2D Scatter
- 2D Pie
- 3D Pie

See Also

[Chapter 11, "Charting Classes," Creating a Chart Using the Chart Class, page 557](#)

Data Type of a Chart Object

Chart objects are declared using the Chart data type. For example,

```
Local Chart &MyChart;

Component Chart &Abs_Hist_Chart;
```

Scope of a Chart Object

A chart object can be instantiated only from PeopleCode.

You can use this object only in PeopleCode programs that are associated with an online process, not in an Application Engine program, a message notification, a Component Interface, and so on.

Error Handling

The PeopleCode program is terminated if a field or record is missing at runtime.

If a valid record is specified but no data is found, or for any other error, the chart is replaced by the message "Image creation failed."

If the Java Runtime Environment (JRE) is missing, an error appears and is logged.

Chart Class Methods and Properties by Category

The following topics subdivide the Chart class methods and properties by functional category.

The categories are divided among the different parts of a chart. However, all methods and properties are used with the chart object; a chart has no sub-objects.

Chart Data Methods and Properties

Use chart data methods and properties to set X and Y axes data.

See [Chapter 11, "Charting Classes," Reset, page 433](#); [Chapter 11, "Charting Classes," SetData, page 435](#); [Chapter 11, "Charting Classes," SetDataHints, page 439](#); [Chapter 11, "Charting Classes," SetDataSeries, page 443](#); [Chapter 11, "Charting Classes," SetDataURLs, page 443](#); [Chapter 11, "Charting Classes," SetDataXAxis, page 444](#); [Chapter 11, "Charting Classes," SetDataYAxis, page 446](#); [Chapter 11, "Charting Classes," DataStartRow, page 454](#); [Chapter 11, "Charting Classes," DataWidth, page 454](#); [Chapter 11, "Charting Classes," ImageMap, page 457](#) and [Chapter 11, "Charting Classes," IsTrueXY, page 458](#).

Chart Appearance Properties

Use chart appearance properties to set the type of graph, the line style, and so on.

See [Chapter 11, "Charting Classes," GridLines, page 455](#); [Chapter 11, "Charting Classes," GridLineType, page 455](#); [Chapter 11, "Charting Classes," Height, page 456](#); [Chapter 11, "Charting Classes," IsDrillable, page 457](#); [Chapter 11, "Charting Classes," IsPlainImage, page 458](#); [Chapter 11, "Charting Classes," LineType, page 460](#); [Chapter 11, "Charting Classes," RevertToPre850, page 463](#); [Chapter 11, "Charting Classes," Style, page 464](#); [Chapter 11, "Charting Classes," StyleSheet, page 464](#); [Chapter 11, "Charting Classes," Type, page 465](#); [Chapter 11, "Charting Classes," Width, page 466](#); [Chapter 11, "Charting Classes," XRotationAngle, page 471](#); [Chapter 11, "Charting Classes," YRotationAngle, page 476](#) and [Chapter 11, "Charting Classes," ZRotationAngle, page 476](#).

Note. A new property, `RevertToPre850`, enables you to maintain the pre-8.50 visual style of an existing chart. If you want an existing chart to use pre-8.50 style classes, you must set the chart property `RevertToPre850` to `True`.

See [Chapter 11, "Charting Classes," Using Style Sheets with `RevertToPre850`, page 384](#).

Chart Color Methods

Use chart color methods to set and manipulate colors for either a series or for each point.

See [Chapter 11, "Charting Classes," `SetColorArray`, page 433](#) and [Chapter 11, "Charting Classes," `SetDataColor`, page 438](#).

Note. A new property, `RevertToPre850`, enables you to maintain the pre-8.50 visual style of an existing chart. If you want an existing chart to use pre-8.50 style classes, you must set the chart property `RevertToPre850` to `True`.

See [Chapter 11, "Charting Classes," Using Style Sheets with `RevertToPre850`, page 384](#).

Chart Axis Methods and Properties

Use chart axis methods and properties to further control the appearance of axes.

See [Chapter 11, "Charting Classes," `SetXAxisLabels`, page 452](#); [Chapter 11, "Charting Classes," `SetYAxisLabels`, page 452](#); [Chapter 11, "Charting Classes," `XAxisCross`, page 466](#); [Chapter 11, "Charting Classes," `XAxisLabelOrient`, page 468](#); [Chapter 11, "Charting Classes," `XAxisStyle`, page 470](#); [Chapter 11, "Charting Classes," `XAxisTicks`, page 470](#); [Chapter 11, "Charting Classes," `YAxisLabelOrient`, page 472](#); [Chapter 11, "Charting Classes," `YAxisMax`, page 473](#); [Chapter 11, "Charting Classes," `YAxisMin`, page 473](#); [Chapter 11, "Charting Classes," `YAxisStyle`, page 474](#) and [Chapter 11, "Charting Classes," `YAxisTicks`, page 475](#).

Chart Title Properties

Use chart title properties to set the text and style of titles for the graph and the axes.

See [Chapter 11, "Charting Classes," `MainTitle`, page 461](#); [Chapter 11, "Charting Classes," `MainTitleOrient`, page 461](#); [Chapter 11, "Charting Classes," `MainTitleStyle`, page 461](#); [Chapter 11, "Charting Classes," `XAxisTitle`, page 470](#); [Chapter 11, "Charting Classes," `XAxisTitleOrient`, page 471](#); [Chapter 11, "Charting Classes," `XAxisTitleStyle`, page 471](#); [Chapter 11, "Charting Classes," `YAxisTitle`, page 475](#); [Chapter 11, "Charting Classes," `YAxisTitleOrient`, page 475](#) and [Chapter 11, "Charting Classes," `YAxisTitleStyle`, page 476](#).

Chart Legend Methods and Properties

Use chart legend methods and properties for each series legend.

See [Chapter 11, "Charting Classes," `SetLegend`, page 446](#); [Chapter 11, "Charting Classes," `HasLegend`, page 456](#); [Chapter 11, "Charting Classes," `LegendMaxEntries`, page 459](#); [Chapter 11, "Charting Classes," `LegendPosition`, page 459](#) and [Chapter 11, "Charting Classes," `LegendStyle`, page 460](#).

Chart Overlay Methods and Properties

Use chart overlay methods and properties to set and manipulate overlay data.

See [Chapter 11, "Charting Classes," SetOldData, page 447](#); [Chapter 11, "Charting Classes," SetOldDataSeries, page 450](#); [Chapter 11, "Charting Classes," SetOldDataXAxis, page 450](#); [Chapter 11, "Charting Classes," SetOldDataYAxis, page 451](#); [Chapter 11, "Charting Classes," OLLineType, page 462](#) and [Chapter 11, "Charting Classes," OLType, page 462](#).

Scatter Chart Methods and Properties

Use scatter chart methods and properties to set and manipulate scatter charts and bubble charts.

See [Chapter 11, "Charting Classes," SetDataAnnotations, page 437](#); [Chapter 11, "Charting Classes," SetDataGlyphScale, page 438](#); [Chapter 11, "Charting Classes," SetOldDataAnnotations, page 448](#); [Chapter 11, "Charting Classes," SetOldDataGlyphScale, page 449](#) and [Chapter 11, "Charting Classes," ShowCrossHair, page 464](#).

TrueXY Line Chart Properties

Use trueXY line chart properties to set and manipulate trueXY line charts.

See [Chapter 11, "Charting Classes," XAxisCrossPoint, page 467](#); [Chapter 11, "Charting Classes," XAxisMax, page 468](#); [Chapter 11, "Charting Classes," XAxisMin, page 468](#); [Chapter 11, "Charting Classes," XAxisPrecision, page 469](#); [Chapter 11, "Charting Classes," XAxisScaleResolution, page 469](#); [Chapter 11, "Charting Classes," YAxisCrossPoint, page 472](#); [Chapter 11, "Charting Classes," YAxisMax, page 473](#); [Chapter 11, "Charting Classes," YAxisMin, page 473](#); [Chapter 11, "Charting Classes," YAxisPrecision, page 473](#) and [Chapter 11, "Charting Classes," YAxisScaleResolution, page 474](#).

Using the Gantt Class

Use the Gantt class to create Gantt charts. A Gantt chart displays tasks along a time line. Gantt charts are frequently used in project management because they provide a graphical illustration of a schedule, which helps in planning, coordinating, and tracking project tasks.

This section provides an overview of Gantt chart terminology and discusses how to:

- Use Gantt charts in PeopleSoft Pure Internet Architecture.
- Create Gantt charts.
- Specify DateTime axis formats.
- Work with start and end dates.
- Use Gantt glyphs.
- Use style sheets with Gantt charts.

Understanding Gantt Chart Terms

Gantt charts can be composed of many different elements, such as a title, a label, and so on. The following terms apply specifically to Gantt charts:

Activity or Task	See Task.
Baseline	A point-in-time snapshot of the project plan that allows the user to identify how the project plan has changed since that point in time.
Data area	The part of the chart that graphically shows the span of dates that each task (or activity) covers. (This area is the right side of the displayed chart.)
Dependencies	A relationship between one task and other tasks that drives when tasks can begin and end. A dependent task cannot start before the task it is dependent on is either started or completed (depending on business rules defined in the application).
Milestone	A specialized mark on the chart that names a meaningful point in time.
Resource	A source of supply or support that is assigned to work on an activity or task.
Task or Activity	In a Gantt chart, each row (task or activity), is represented in the Y axis of the chart, and the span of dates for each row is displayed on the X axis.
X axis	The X axis displays dates that are spanned by items in the Y axis.
X-axis labels	The part of the chart that lists the time scale. The X-axis labels support multiple levels of granularity: second, minute, hour, day, week, month, year.
Y axis	The Y axis is the display of tasks or activities, and is displayed as rows.
Y-axis labels	The part of the chart that lists activities and their attributes. Activities are shown hierarchically, and subtasks can be hidden or displayed by expanding or collapsing higher level tasks.

Using Gantt Charts in PeopleSoft Pure Internet Architecture

The Gantt chart consists of two sections: a table section and a chart section.

Example Gantt chart

The left side of the chart, where you see the table, is the table section. The other side, where you see the bars, is the chart section.

Horizontal scrollbars below the table section support scrolling through the task-related columns; below the task section, they support scrolling through the task bars.

The amount that a section scrolls depends on the value set for the `SetTableXScrollbar` method. Each click on the arrow scrollbar scrolls the task either left or right by the amount set with the `SetTableXScrollbar` method (or 10 percent of the section area if a value is not set).

See [Chapter 11, "Charting Classes," SetTableXScrollbar, page 489](#).

Vertical scrollbars support scrolling through the task hierarchy.

Table Section

The table section contains all of the tasks and associated subtasks, and displays them in a hierarchy. Tasks that contain subtasks are called *parent tasks*, and subtasks are called *child tasks*. You can click on the expand (collapse) image to the left of the task name (Baby, above) to expand or collapse the subtask hierarchy. Note that subtasks may also act as parent tasks to other subtasks.

Each task has a name (Born, Baby, Childhood, and so on). It also has a level. Parent tasks have a higher level than child tasks.

Chart Section

The chart section displays the tasks, task dependencies, and milestones graphically.

In the previous example, each horizontal bar represents a single task. The progress bar (that is, the percentage complete for a particular task) is indicated with a bar of a different color above the task bar. The milestone date (Graduate in the previous example) is represented with a circle.

You can also have dependencies between tasks. These are represented as lines connecting the task bars.

You can execute custom FieldChange PeopleCode when a user clicks a task bar or a task dependency line.

X-Axis Range

Click the X-Axis Range link on the Gantt toolbar to change the Begin and End dates for the X axis.

Example of X-Axis range dialog

User Interaction

A user can interact directly with a chart to change the underlying chart data.

These user actions are supported:

- Resize the task bar.
- Reposition the task bar.
- Reposition a milestone glyph.
- Move the separator between the table section and the chart section.
- Update task details, task start time and end time, and the progress bar.

When a user changes values in the chart section by dragging and dropping bars, the Planned Start, Planned End, and Progress values in the grid column will also be updated if the grid and the chart section use the same record and fields.

You can control the level the user is able to interact with the chart using the Gantt class properties InteractiveStart, InteractiveEnd, InteractiveProgress, and InteractiveMove.

See [Chapter 11, "Charting Classes," InteractiveStart, page 511](#); [Chapter 11, "Charting Classes," InteractiveEnd, page 510](#); [Chapter 11, "Charting Classes," InteractiveProgress, page 511](#) and [Chapter 11, "Charting Classes," InteractiveMove, page 511](#).

Creating Gantt Charts Using the Gantt Class

Every Gantt chart has at least one data set used to define the tasks and the information related to each task, such as start date, end date, milestones, percent finished, and so on.

A second data set can be used to describe dependencies between tasks.

The following methods are required for using the Gantt chart:

- `SetTaskData`

Use this method to specify where most of the information for the Gantt chart is stored. You can specify either a rowset or a record.

- `SetTaskID`

Use this method to specify the task ID, or name, of the task. Every task must have a unique task identifier. The task ID is used to support task linking and dependencies.

- `SetPlannedStartDate`

Use this method to specify the planned starting date of the task. Each task must have its own planned starting date.

- `SetPlannedEndDate`

Use this method to specify the planned ending date of the task. Each task must have its own planned ending date.

Though not required, Oracle recommends using the `SetTaskName` method to display meaningful information in the table section of the Gantt chart.

If you only use the required methods and do not use the `SetTaskAppData` method, Oracle recommends that you also use the `SetChartArea` method and dedicate most, if not all, of the entire area to the chart, and not the table.

If you specify one actual date, either for start or end, then you must specify the other (`SetActualStartDate`, `SetActualEndDate`).

In addition, if you want to use dependency data, the following methods are required:

- `SetTaskDependencyData`

Use this method to specify where most of the information for the dependency data is stored. You can specify either a rowset or a record.

- `SetTaskDependencyParentID`

In a dependency, one task depends on another. Use this method to specify the parent task, that is, the one that the other (child) task depends upon.

- `SetTaskDependencyChildID`

In a dependency, one task depends on another. Use this method to specify the child task, that is, the one that depends on another.

Specifying DateTime Axis Formats

You can control the display of the label format that describes the DateTime axis in up to six different time increments, from seconds to years, or any combination thereof simultaneously for a given time period. Each time increment, if enabled through the DateTimeAxis specific methods, occupies a single level within the X-axis hierarchy. Smaller time increments display closer to the axis, while larger time increments display farther from the axis.

The following example shows the levels of the labels for the DateTime axis. The first level, in seconds, is the closest level to the chart edge; next are minutes, at the second level; and then hours, at the third level, and so on. Generally, the smallest unit should be on the lowest level. Therefore, if months and years appear, then months appear at the first level and years appear at the second level.

Example of levels of DateTime axis labels

In the following example, days, months, and years are defined at levels 1, 2, and 3, respectively. Therefore, the days of the month (1, 10, 20) appear closest to the chart area, the months appear below them, and the years appear below that.

DateTime format example

By default, the DateTime axis displays both the year and the months, with the major tick mark marking the months.

Note. The charting algorithm may or may not display a given time increment, even if it is enabled. The resolution of the given time increments may be too great, depending on the length of the time period defined in the chart section.

Working with Start and End Dates

You must set the end date to be after the start date, for both the planned as well as actual dates, or else you will receive an error.

Both the start and end dates you specify for a task must fall within the axis dates, that is, the dates specified by the AxisEndDateTime and AxisStartDateTime properties. If you specify task dates that fall outside of the axis dates, the task appears in the table section of the Gantt chart, but no bar appears in the chart section of the Gantt chart, even if one of the dates falls *inside* the axis dates.

Using Gantt Glyphs

You can use all of the following glyphs with a Gantt chart. You can use either the numeric or constant value.

	Constant: %ChartGlyph_Axe Numeric value: 1
	Constant: %ChartGlyph_Bar Numeric value: 2
	Constant: %ChartGlyph_Box Numeric value: 3
	Constant: %ChartGlyph_Circle Numeric value: 4
	Constant: %ChartGlyph_Cross Numeric value: 5
	Constant: %ChartGlyph_Diamond Numeric value: 6
	Constant: %ChartGlyph_Dodecahedron Numeric value: 7
	Constant: %ChartGlyph_Icosahedron Numeric value: 8
	Constant: %ChartGlyph_Sphere Numeric value: 9

Constant: %ChartGlyph_Square

Numeric value: 10

Constant: %ChartGlyph_Star

Numeric value: 11

Constant: %ChartGlyph_Triangle

Numeric value: 12

Using Style Sheets with Gantt Charts

In Gantt charts, the PSCHARTDEFAULT style class uses an 8-point font with a normal weight. This style class affects all text in the chart area, such as task labels, DateTime X-axis labels, and hints. The PSCHARTGANTTGRID style class uses a 10-point font, also with a normal weight, and affects all text in the table area. For the font size between the table and chart areas to be the same, the point size in the PSCHARTGANTTGRID style class should be 1.25 times the point size of the font defined in PSCHARTDEFAULT. Note, however, that the font size for PSCHARTGANTTGRID should not exceed 13; otherwise, column text may bleed into another column.

Data Type of a Gantt Object

Gantt objects are declared using the Gantt data type. For example,

```
Local Gantt &MyGantt;
```

Scope of a Gantt Object

A Gantt object can be instantiated only from PeopleCode.

You can use this object only in PeopleCode programs that are associated with an online process, not in an Application Engine program, a message notification, a Component Interface, and so on.

Error Handling

The PeopleCode program is terminated if a field or record is missing at runtime.

If a valid record is specified but no data is found, or for any other error, the chart is replaced by the message "Image creation failed."

If the Java Runtime Environment (JRE) is missing, an error appears and is logged.

Using the OrgChart Class

Use the OrgChart class to create organization charts. An organization chart represents hierarchical data as boxes arrayed in levels, which can be oriented top to bottom, with horizontal rows, or left to right, with vertical rows. Connectors show parent and child relationships between boxes on adjacent levels.

You can use this chart type to display many different types of hierarchical relationships, including, but not limited to:

- People in organizations
- Positions in organizations
- Departments in organizations
- Components in bills of materials

This section provides an overview of organization chart terminology and discusses how to:

- Use organization charts in PeopleSoft Pure Internet Architecture.
- Create organization charts.
- Organization chart actions and events.
- Organization chart subrecord definitions.
- Minimum methods.

Understanding Organization Chart Terms

Organization charts can be composed of many different elements, such as the main chart, nodes, connectors, pop-up nodes, and so on. These terms apply specifically to organization charts:

Breadcrumbs	You can configure an organization chart to optionally display links at the top of an organization chart. Typically, these are the names of people in an organization hierarchy.
Button	See Drop-down list box.
Child node	A node that is one level below its parent node (except for the top-level node). Every node except the top-level node has one parent node.
Connector	Lines that link the boxes in an organization chart. Connectors denote parent and child relationships. A connector also shows the relationship between a pop-up node and the predecessor node of the pop-up.

Descriptor	A text string that conveys information about a node. A main chart node has up to seven descriptors, and a pop-up node has up to eight descriptors. Each descriptor can have an image associated with it and can be configured as a link. On the main chart, a descriptor can also be configured as a button that is associated with a drop-down list box. FieldChange PeopleCode associated with a descriptor can invoke a pop-up, change the display characteristics of the chart, and perform other processing logic.
Drop-down list box	You can configure a descriptor as a button associated with a drop-down list box. A drop-down list box can be linkable or read-only. If the drop-down list box is linkable, PeopleCode related to the descriptor executes when a user clicks a list item.
Header	Information that appears at the top of a pop-up.
Level	An organization chart is made up of boxes, representing nodes, at different levels. The position of a node in a chart is determined by its parent node (PTPARENT_CHART_ND) and display order (PTND_DISPLAY_ORDER).
Main chart	The primary chart in an organization chart showing individual entities, such as employees, in boxes related to one another hierarchically. A user can invoke PeopleCode that displays a pop-up node by clicking a link in a box, or node, of the main chart or by clicking a link in a pop-up node.
Node	A representation of a single entity, an individual instance of data, in an organization chart. A node is represented as a box with vertical lines connecting it to its parent node and to its child nodes, if any.
Node record	A derived/work record that contains the properties and data values for each node on the main chart. The node record is created using a clone of the PTORGNODE_SBR subrecord.
Parent node	A node that has one or more subordinate nodes, or child nodes, one level below it. Each node can be a parent for other nodes.
Pop-up	A new window that displays information specifically related to a node on the main chart or another pop-up. A pop-up can be invoked from a link on a main chart node or from a link on a pop-up node. FieldChange PeopleCode controls the appearance and content of a pop-up.
Pop-up node	A single instance of data on a pop-up. A pop-up can have one or more nodes, all related to one node of the main chart or one node of another pop-up.
Pop-up node record	A derived/work record that contains the properties and data values for each pop-up node on the main chart. The node record is created using a clone of the PTORGPOPUPNODE_SBR subrecord.

Using Organization Charts in PeopleSoft Pure Internet Architecture

A PeopleSoft organization chart consists of two parts: the main hierarchical chart and pop-ups that enable the user to access additional related data for each node.

An organization chart can be oriented vertically or horizontally.

The following example shows a vertical organization chart:

Vertically oriented organization chart

The following example shows a horizontally oriented organization chart with a pop-up:

Horizontally oriented organization chart with a pop-up chart

The underlying chart is the main organization chart. The chart overlaying the nodes on the right is a pop-up chart.

Main Chart

The main chart can have multiple levels. Each level consists of one or more nodes. Each node represents an individual entity, such as an employee, in the organization. A node has one parent node (except the top-level node, which does not have a parent node) and zero, one, or more child nodes. Each node in the main chart has up to seven descriptors and each descriptor can be configured as a link or as a button associated with a drop-down list box. Application developers can associate FieldChange PeopleCode with each descriptor link or button associated with a linkable drop-down list box.

Internet Explorer 8 Considerations

In Microsoft Internet Explorer 8, organization charts may not display correctly when the browser Document mode is set to Standards mode. Only the Quirks mode is supported for PeopleSoft charts.

See the Troubleshooting Browser Limitations document on Oracle's MyOracleSupport website.

Pop-up

A pop-up displays a pop-up node with information specifically related to the node from which it was invoked. A connector line visually links the pop-up chart to the predecessor node, the node in the chart from which the pop-up was invoked.

If the pop-up contains more nodes than can be displayed (that is, if `MaxPopupDisplayNode` is set to a number that is less than the total number of nodes) then a scroll bar appears in the pop-up. In some circumstances when a pop-up has a scroll bar and has more than one level, when a user clicks a link on a level other than the top level the new pop-up may not appear in the display area. If this occurs, the user can scroll down using the scroll bar in the initial pop-up to view the new pop-up node.

Note. The amount of time it takes for a pop-up to appear is proportional to the number of nodes in the pop-up. A pop-up with hundreds of nodes may take a long time to appear. An hourglass appears to let the user know the system is working to retrieve the nodes.

A pop-up is invoked through `PeopleCode` associated with the `FieldChange` event for a descriptor link on a main chart node or another pop-up node.

A pop-up consists of a header and one or more nodes with each node having up to eight descriptors. Each descriptor can be configured as a link.

The user can drag-and-drop a pop-up node to reposition it but the new position will not be retained after any action that requires a server trip that reloads the chart.

Creating Organization Charts Using the `OrgChart` Class

You can populate the organization node information using rowsets linked to existing record data, or you can populate the rowset from PeopleSoft trees using the `Tree` class APIs.

When you add an organization chart to a page in PeopleSoft Application Designer, you use the chart properties to associate the chart control with a chart record field. You will use this field name to identify the chart in `PeopleCode`.

You will need to create two records that will be the organization chart node records. The org node record holds the values for the properties and data for each of the nodes of the main chart. The pop-up node record holds the values for the properties and data for each of the pop-up nodes.

The organization chart node records must be in the component buffer at runtime. This means that you will have to place them on a page at level one in the component. You can hide them.

The maximum number of nodes you can create is limited according to browser, as shown in the following table:

<i>Browser</i>	<i>Maximum Nodes</i>
Microsoft Internet Explorer	250
Mozilla Firefox	1000
Apple Safari	600

The records can have any name, but they must include clones of the PeopleTools-delivered subrecords `PTORGNODE_SBR` and `PTORGPOPUPNODE_SBR`. Since the subrecords will carry the `FieldChange` `PeopleCode` for the chart, in most cases you should create unique subrecords for each chart.

Your `PeopleCode` will create and populate two rowsets. These must be component rowsets, linked to the node records of the chart, not standalone rowsets. The org node rowset has one row for each node in the organization chart, and the pop-up node rowset has one row for each pop-up node.

You place FieldChange PeopleCode on the fields of the node records to invoke pop-up charts, update displayed data, process application logic, and refresh the chart.

Using Images with Organization Charts

If your organization chart uses images, such as photographs, then the scroll area or grid with the fields that contain the images must have unlimited occurs count enabled. That is, the Unlimited Occurs Count check box must be selected on any scroll area or grid that includes a record with the fields from PTORGNODE_SBR or PTORGPOPUPNODE_SBR, but only when images are used.

Using Breadcrumbs with Organization Charts

You can configure an organization chart to display breadcrumbs. Typically, breadcrumbs display the names of people in an organization hierarchy. The following example shows an organization chart with breadcrumbs:

Organization chart with breadcrumbs

An organization chart can have only one set of breadcrumbs. The breadcrumbs appear horizontally at the top of an organization chart, above the chart legend if the legend is set. The breadcrumbs string wraps automatically if it is wider than the organization chart. If a breadcrumb contains a space, the breadcrumb string may wrap at the space, causing the breadcrumb to appear on two lines.

Style classes control the formatting of breadcrumbs. The default style classes are PT_ORGCHART_BRDCRM and PT_ORGCHART_UNLINK_BRDCRM. You can specify your own style classes using the CrumbDescrStyle and UnlinkCrumbDescrStyle properties.

You can specify an image to separate breadcrumb entries. If an image is not specified, the breadcrumbs are separated by three spaces. Each breadcrumb entry can be configured to be linkable. This configuration is similar to linkable text on organization chart nodes.

To implement breadcrumbs in an organization chart, you:

- Clone the breadcrumb subrecord PTORGCRMB_SBR.
- Add the clone of PTORGCRMB_SBR to a work record.
- Add the work record to a page such that it is available in the component buffer so that PeopleCode can be invoked from the record fields.

One way to accomplish this is to include the record in a level 1 grid on the same page as the organization chart, and hide the grid.

- To make a breadcrumb linkable, set the corresponding PTORGCRMBLINKABLE field to "Y", in much the same way as you make a descriptor linkable in an organization chart node.
- Add PeopleCode to provide application-specific processing when a linkable breadcrumb is selected.

When a user clicks a linkable breadcrumb, any FieldEdit and FieldChange PeopleCode in the PTORGCRMBID field executes.

At runtime, your PeopleCode will add rows to the work record that holds the information for each breadcrumb (person).

Each breadcrumb in a chart is defined by a row in the record.

See [Chapter 11, "Charting Classes," Organization Chart Subrecord Definitions, page 417](#) and [Chapter 11, "Charting Classes," CrumbDescrStyle, page 528](#).

Breadcrumb Methods and Properties

The following OrgChart class methods and properties control the appearance of breadcrumbs:

- SetCrumbData
- SetCrumbRecord
- UnlinkCrumbDescrStyle
- CrumbDescrStyle
- CrumbMaxDisplayLength
- CrumbSeparatorImage

Using Drop-Down List Boxes

You can configure an organization chart to include buttons associated with drop-down list boxes for any of the node descriptors, enabling you to present related tasks for a node.

A drop-down list box can be linkable or read-only. If the drop-down list box is linkable, field change PeopleCode associated with the descriptor field, PTNODE_DESCR n , executes when a user clicks on a list item. If the drop-down list box is read-only, field change PeopleCode does not execute.

Example of an organization chart with buttons

The width of a drop-down list box is the width of the widest list item that the box contains.

The height of the list item box is defined dynamically. An up-and-down arrow vertical scroll appears when the number of list items is greater than the value specified for the `MaxDropDownDisplayItem` property. The default value is 7.

A scroll appears if the list extends beyond the visible chart area.

To implement drop-down list boxes:

- Include the subrecord `PTORGBOXFLD_SBR` at the end of the chart node record.
- Set the `PTNDDESCnLINKABLE` field to "D" for the descriptor that is to have the linkable drop-down list box. Set the field to "R" if the field is to be read-only.
- Populate the `PTDESCRn_DROPDOWN` field value in the updated rowset to provide the dropdown box ID for the descriptor that has the `PTNDDESCnLINKABLE` field set to "D" or "R".
- Create a derived/work record that contains the subrecord `PTORGBOXLIST_SBR`, and populate the corresponding rowset with the list information for each of the dropdown box IDs.
- Place `FieldChange PeopleCode` on the `PTNODE_DESCRn` field to perform corresponding logic when a list item is selected in the linkable drop-down list box.

Use the `DropDownBoxStyle` property to specify the style to specify the button position in the node.

Specifying Scroll Type

If an organization chart is larger than the viewable area, the user needs to scroll to view other areas of the chart. You can specify whether the organization chart will use scroll bars or alternative scrolling.

Example of an organization chart using alternative scrolling

If you specify alternative scrolling, a scroll navigator and a hand cursor appear instead of vertical and horizontal scroll bars.

The arrows on the scroll navigator enable the user to quickly position the right, left, top, or bottom of the chart in the viewable area.

If the user scrolls the chart, the center button of the scroll navigator returns the chart to its initial display position. If the user changes focus by selecting a different node, the chart centers on that node. The center button then returns the chart to display centered on the focus node.

Note. If the breadcrumbs and chart legend are so large that there is not sufficient room to display the scroll navigator in the upper left portion of the chart, it will appear in the lower left corner.

The hand cursor enables the user to grab the background of the chart and move it within the viewable area.

Note. When using the hand cursor to scroll, you must position the hand cursor in the chart area outside the chart nodes and popup nodes. Scrolling does not work if the hand cursor is positioned within a chart node or pop-up node.

Use the `ChartScrollType` property to specify which type of scrolling to use. The default is scroll bars.

Organization Chart Actions and Events

An organization chart can execute FieldEdit or FieldChange PeopleCode in response to these user actions:

- Select an expand/collapse icon.
- Select a descriptor link or linkable drop-down list item.
- Close a pop-up node.
- Select a breadcrumb.
- Click on a node image.
- Click on a node.

Selecting Expand/Collapse Icons

When the user clicks an expand/collapse icon, the system toggles the EXPANDED_FLAG field value from "Y" to "N" or from "N" to "Y" and changes the icon on the node to collapsed or expanded, correspondingly. This action triggers field change processing (FieldEdit and FieldChange events) on EXPANDED_FLAG. Typically, FieldChange PeopleCode checks the EXPANDED_FLAG and PARENT_FLAG of the node and performs these actions:

- If EXPANDED_FLAG="Y" and PARENT_FLAG="X", loads the child rows into the rowset and sets PARENT_FLAG="Y". The updates appear when the chart is refreshed.
- If EXPANDED_FLAG="N" (collapse action), it does nothing.
- If EXPANDED_FLAG="Y" (expand action) and PARENT_FLAG="Y" (child data is already in rowset), it does nothing.

Note. If your PeopleCode doesn't populate the CollapsedImage and ExpandedImage properties of the organization chart, then no expand/collapse icon appears on any nodes in the chart, and the expand/collapse action is disabled for the chart.

Selecting a Descriptor Link or Linkable Drop-Down List Item

When the user clicks a descriptor link or linkable drop-down list item, field change processing is triggered on the PTNODE_DESCR n field in the node record.

For instance, suppose descriptor 2 is linked to a pop-up chart. When the user clicks the descriptor 2 link, FieldChange PeopleCode on the PTNODE_DESCR2 field in the node record performs the following actions:

1. Sets the node's PTPOPUP_EXPAND_FLAG = "Y".
2. Sets the node's PTPOPUP_HDRMAINDESC.
3. Sets the node's PTPOPUP_HDRMAINICON.
4. If the node's PTHASPOPUP_FLAG = "X", then populates the pop-up node rowset and sets PTHASPOPUP_FLAG = "Y" to indicate that the node's descriptor was clicked for the first time.
5. Refresh the chart with the pop-up displayed.

Closing a Pop-up Node

When the user closes a pop-up node it triggers field change processing on the PTPOPUPEXPAND_FLAG field.

FieldChange PeopleCode on the PTPOPUPEXPAND_FLAG field would need to restore any changes that were made to the originating node's display characteristics and reset the node's PTPOPUPEXPAND_FLAG = "N" .

Selecting a Breadcrumb

When a user clicks on a linkable breadcrumb, any FieldEdit and FieldChange PeopleCode in the PTORGCRMBID field executes. Typically PeopleCode is used to redraw the organization giving focus to the node that was clicked.

Clicking on a Photograph

When a user clicks on a node image, field change PeopleCode on the PTNDMAINICON_IMAGE field executes.

Clicking on a Node

When a user clicks on the body of a node -- not on a link, linkable drop-down list, or image -- field change PeopleCode on the PTCHART_NODE field executes.

Organization Chart Subrecord Definitions

This table describes the fields in PTORGNODE_SBR:

<i>Field</i>	<i>Description</i>
PTCHART_NODE	Specifies the node name. PTCHART_NODE and PTPARENT_CHART_ND are key fields of the PTORGNODE record.
PTPARENT_CHART_ND	Specifies the parent of the current chart node. If a node does not have a parent node defined, then the node is placed on the first level.
PTND_DISPLAY_ORDER	Specifies the display order of the sibling nodes for the same parent node. Nodes display left to right according to display order. By default, the nodes are ordered as they appear in the rowset.
PTCONNECTLINESTYLE	Specifies the style class name for connection line style. The default style class is PT_ORGCHART_CONNECT1.
PTNDMAINICON_IMAGE	Specifies the main icon image name for the node.

Field	Description
PTNODESTYLENAME	Indicates the style class name for the node to control node background color, border, style, and so on. The default style class is PT_ORGNODE.
PTFOCUS_FLAG	Indicates a focused node (that is, the node that has focus). Y – Focused node. N – Not a focused node. If more than one node is set to focused, only the first focused node in the rowset will be recognized as the focused node. The default is "N".
PARENT_FLAG	Indicates whether a node is a parent. Y – The node is a parent and its direct children are already loaded into the rowset. X – The node is a parent and its direct children are not loaded in the rowset (that is, they will be loaded on demand). N – The node is not a parent. The default value is "N".
EXPANDED_FLAG	Indicates whether the node is expanded or collapsed. Y – The chart shows the node expanded with the expanded image icon and its immediate children displayed. N – The chart shows the node collapsed with the collapsed image icon.
DISPLAYED_FLAG	Indicates whether the node displays in the chart. Y – The node displays if the parent node's <code>EXPANDED_FLAG = "Y"</code> (the parent node is not collapsed). N – This node and its child nodes do not display in the chart's display area. The default is "Y".

<i>Field</i>	<i>Description</i>
PTHASPOPUP_FLAG	Indicates whether the node has a pop-up. Y – This node has a link that invokes a pop-up and the data for the pop-up is already loaded into the pop-up node rowset. X – This node has a link that invokes a pop-up and the data for the pop-up is not loaded in the rowset. The data will be loaded on demand. N – This node does not have a link to invoke a pop-up chart. The default value is "N".
PTPOPUEXPAND_FLAG	Indicates whether a node's pop-up nodes display. Y – Pop-up nodes display. N – No pop-up nodes display. If the user clicks the close icon in the pop-up node, the FieldChange event for PTPOPUEXPAND_FLAG executes. The application sets the value of PTPOPUEXPAND_FLAG to "N" when the pop-up node is closed.
PTNODE_DESCR n	Specifies the descriptor n of the node, where n is an integer from 1 to 7; for example, PTNODE_DESCR2. Maximum length is 50 characters.
PTNDDESC n LINKABLE	Specifies whether the descriptor n is linkable, a button with a linkable drop-down list box, or a button with a read-only drop down list box, where n is an integer from 1 to 8; for example, PTNDDESC2LINKABLE. Y – Linkable N – Not linkable D – Linkable drop down list box R – Read-only down list box The default value is "N". Note. If PTDESCRn_ICON_IMG is set to a valid image and PTNDDESCnLINKABLE is set to "D" or "R", drop down list box, the image is not displayed.
PTDESCR n _ICON_IMG	Specifies the name of the image associated with descriptor n, where n is an integer from 1 to 7; for example, PTDESCR2_ICON_IMG. Note. If PTDESCRn_ICON_IMG is set to a valid image and PTNDDESCnLINKABLE is set to "D" or "R", drop down list box, the image is not displayed.

<i>Field</i>	<i>Description</i>
PTDESCR n _ICON_POS	Indicates the position of the icon relative to descriptor n, where n is an integer from 1 to 7; for example, PTDESCR2_ICON_POS. L – To the left of the description. R – To the right of the description. The default value is based on user language. For instance, "L" for English and "R" for Hebrew.
PTADJUSTFORNULLS	Indicate whether to collapse empty attributes to conserve vertical space within the nodes. Y – Collapse. N – Do not collapse. The default value is "N".
PTPOPUPHDRMAINDESC	Specifies the main descriptor of the pop-up chart header for this node
PTPOPUPHDRMAINICON	Specifies the name of the image to place on the top left of the pop-up chart header.
PTORGCHRTIMG	Specifies the node image. The maximum image size depends on your database platform. Note. If this field is placed on a grid and the column is hidden (Visible = False), the node images do not appear on the chart.
PSIMAGEVER	A unique number that is assigned to each image. This is a system-maintained value.
PTDESCR_UNDER_IMG	Determines whether descriptors appear to the side of the image or below it. Specify an integer from 1 to 7. The corresponding descriptor and all following descriptors appear below the image. All descriptors prior to the one specified appear to the side of the image. If no value is specified, or any value other than 1-7, the descriptors all appear to the side. If no image is displayed, this field is ignored.

This table describes the fields in PTORGPOPUP_SBR.

Field	Description
PTCHART_NODE	Specifies the name of the node that invoked this pop-up chart. PTCHART_NODE and PT_POP_UP_ID are keys for PTORGPOPUP_SBR.
PT_POP_UP_ID	The unique id for the pop-up . PTCHART_NODE and PT_POP_UP_ID are keys for PTORGPOPUP_SBR.
PTPREDECESSOR_NODE	Specifies the name of the predecessor node to the current chart node. The predecessor node is the node that invoked this node. Your application PeopleCode must set this value when the link is clicked on the predecessor node.
PTND_DISPLAY_ORDER	Sets the display order of the nodes within the same pop-up. By default the nodes are ordered as they appear in the rowset.
PTNDMAINICON_IMAGE	Specifies the main icon image name for the node.
PTNODESTYLENAME	Specifies the style class name for the node to control node background color, border, style, and so on. If no style class name is specified the PeopleTools default style class is used.
PT_POPUP_PARENT_ID	Set to the ID of the parent pop-up chart to which the PT_POP_UP_ID is attached. If the chart ID PT_POP_UP_ID is connected from the organization node, then its corresponding PT_POPUP_PARENT_ID value is NULL.
PTHASPOPUP_FLAG	Indicates whether the node has a pop-up. Y – This node has a link that invokes a pop-up and the data for the pop-up is already loaded into the pop-up node rowset. X – This node has a link that invokes a pop-up and the data for the pop-up is not loaded in the rowset. The data will be loaded on demand. N – This node does not have a link to invoke a pop-up chart. The default value is "N".

Field	Description
PTPOPUEXPAND_FLAG	Indicates whether a node's pop-up nodes display. Y – Pop-up nodes display. N – No pop-up nodes display. If the user clicks the close icon in the pop-up node, the FieldChange event for PTPOPUEXPAND_FLAG executes. The application sets the value of PTPOPUEXPAND_FLAG to "N" when the pop-up node is closed.
DISPLAYED_FLAG	Indicates whether the node will appear in the pop-up chart. Y = The node appears in the pop-up chart. N = The node never appears in the pop-up chart, including its pop-up nodes. Default is "Y".
PTNODE_DESCR n	Specifies the descriptor n of the node, where n is an integer from 1 to 8; for example, PTNODE_DESCR2. Maximum length is 50 characters.
PTNDDESC n LINKABLE	Specifies whether the descriptor n is linkable, where n is an integer from 1 to 8; for example, PTNDDESC2LINKABLE. Y – Linkable N – Not linkable
PTDESCR n _ICON_IMG	Specifies the name of the image associated with descriptor n, where n is an integer from 1 to 8; for example, PTDESCR2_ICON_IMG.
PTDESCR n _ICON_POS	Indicates the position of the icon relative to descriptor n, where n is an integer from 1 to 8; for example, PTDESCR2_ICON_POS. L – To the left of the description. R – To the right of the description. The default value is based on user language. For instance, "L" for English and "R" for Hebrew.
PTADJUSTFORNULLS	Indicates whether to collapse empty attributes to conserve vertical space within the nodes. Y – Collapse N – Do not collapse

Field	Description
PTPOPUPHDRMAINDESC	Specifies the main descriptor of the pop-up chart header for this node. To force a line break in the header add a <code>
</code> html tag. Example: 'PLAN ID 23 EFF DATE 1/1/09' Note. <code>
</code> does not produce a line break. The html tag must be <code>
</code> .
PTPOPUPHDRMAINICON	Specifies the name of the image to place on the top left of the pop-up chart header.

This table describes the fields in PTORGBOXFLD_SBR:

Field	Description
PTDESCR n _DROPDOWN	The drop down list ID for descriptor n , where n is an integer from 1 to 7; for example, PTDESCR2_DROPDOWN.
PTDES n _SLCT_ITM_ID	The selected list Item ID in the drop-down box for descriptor n , where n is an integer from 1 to 7; for example, PTDES2_SLCT_ITM_ID. The system sets this field to the value of the list item ID when the user clicks on a list item in the drop-down list box for descriptor n . You can add PeopleCode to the PTNODE_DESCR n field that performs business logic using the value in this field.

This table describes the fields in PTORGBOXLIST_SBR:

Field	Description
PTDESCR_DRPDWN_ID	Specifies the node description drop-down list box ID. PTDESCR_DRPDWN_ID is a key field.
PTORGDRPLSTITM_ID	The drop down list item ID for the specified drop down list. PTORGDRPLSTITM_ID is a key field.
PTND_DISPLAY_ORDER	Set the display order of the list item within the same dropdown box. By default, the list will display in the order the list items appear in the rowset.
PTNODELISTDESCR	The text that will appear for the drop down list item. The maximum length is 60 characters.

Field	Description
PTORGLISTDESCSTYLE	Specify the style class for the list item. The default is PT_ACTION_LIST_ITEM.

This table describes the fields in PTORGCRMB_SBR:

Field	Description
PTORGCRMBID	Assigns the breadcrumb ID. PTORGCRMBID is a key field.
PTPARENT_ORGCRMBID	Specifies the breadcrumb ID of Parent node. Only one row, which will be the first breadcrumb, can have this field blank or there will be a runtime error.
PTORGCRMBDESCR	Sets the breadcrumb description. In an organization chart this is generally a name.
DISPLAYED_FLAG	The displayed flag, Y = Displayed. N = Not displayed. The default is "N".
PTORGCRMBLINKABLE	The linkable flag. Y = Linkable N = Not linkable The default is "Y".

Minimum Methods

At a minimum, these methods are needed to create an organization chart:

- SetNodeData
- SetNodeRecord

These methods are required if your organization chart uses pop-ups:

- SetPopUpNodeData
- SetPopUpNodeRecord

These methods are required if your organization chart uses breadcrumbs:

- SetCrumbData
- SetCrumbRecord

These methods are required if your organization chart uses drop-down list boxes:

- `SetDropdownData`
- `SetDropdownRecord`

Data Type of an OrgChart Object

Chart objects are declared using the `Chart` data type. For example,

```
Local OrgChart &MyOrgChart;
```

Scope of an OrgChart Object

A chart object can be instantiated only from `PeopleCode`.

You can use this object only in `PeopleCode` programs that are associated with an online process, not in an Application Engine program, a message notification, a Component Interface, and so on.

Using the RatingBoxChart Class

A rating box chart is an interactive chart that displays nodes on a two-dimensional grid. A user can move the nodes from one box to another on the grid. When the user moves a node the underlying data updates automatically.

The rating box chart in this example displays ratings on the dimensions of potential and performance:

Rating box chart used to graph performance and potential

This section provides an overview of rating box chart terminology and discusses how to:

- Use rating box charts in PeopleSoft Pure Internet Architecture.
- Create rating box charts using the RatingBoxChart class.
- Rating box chart subrecords.
- Minimum methods.
- Minimum properties.

Understanding Rating Box Chart Terms

The following is a list of terms that apply specifically to rating box charts.

Box A rating box chart is an array of boxes arranged in a grid along the X and Y axes. Each box represents a pair of ratings, one for the X value and one for the Y value.

Description	A text string that is associated with a node. The node description optionally displays with the node icon.
Icon	An image associated with a node that displays in a box on the rating box chart.
Node	A single data point on a rating box chart. A node represents an individual entity, such as an employee, customer, or product. A user can drag and drop a node to other boxes in the rating box chart grid.
Node Record	A record that contains the properties and data values for each node on the rating box chart. The node record must include a copy of the subrecord PTRATINGBIX_SBR.
Rating	A text string that is assigned to each box in the rating chart. Each box has an X rating, based on its position on the horizontal axis, and a Y rating, based on its position on the vertical axis.
Title	There are three titles: Main title, X-Axis title, and Y-Axis title. A title is text that identifies that portion of the chart.

Using Rating Box Charts in PeopleSoft Pure Internet Architecture

A rating box chart displays nodes on a chart that is divided into two or more boxes arrayed in a grid.

An application can correlate nodes, represented by icons, with various entities, such as employees, customers, or products, and various attribute pairs, such as potential/performance, cost/benefit, or opportunity/risk.

A user interacts with the rating box by dragging nodes to different boxes. When a node is moved, its underlying X (horizontal) and Y (vertical) values are updated. A user can also interact with the rating box by changing the node X/Y values in the grid that contains the rating box values if the application makes the grid visible and editable.

If a box contains more nodes than the number set in the RatingBoxChart property BoxMaxDisplayItems, the user can click a link at the bottom of the box to launch a pop-up that contains all the nodes. The box border changes color to indicate that the box has a pop-up open. A vertical scrollbar enables the user to scroll through all the nodes in the list.

The View all pop-up automatically closes if the user moves a node to another quadrant.

Using PeopleCode, you can associate each node with an image, or icon, and a description. You can configure a rating box to display nodes with icons and descriptions or with only icons.

Rating box chart with a pop-up displaying all nodes for a rating box

See Also

Chapter 11, "Charting Classes," `BoxMaxDisplayItems`, page 547

Creating Rating Box Charts Using the `RatingBoxChart` Class

When you add a rating box chart to a page in PeopleSoft Application Designer, you use the chart properties to associate the chart with a record field. You will use this field name to identify the chart in PeopleCode.

You will need to create a record that will be the rating box chart node record. The record can be a standard database record or a derived/work record. The node record holds the values for the properties and data for each of the rating box chart nodes.

The record can have any name, but it must include a clone of the PeopleTools-delivered subrecord `PTRATINGBOX_SBR`. Since the subrecord will carry the `FieldChange` PeopleCode for the chart, in most cases you should create a unique subrecord for each chart. The node record must be placed on a page at level one on the component so that its PeopleCode will be loaded into the component buffer. It can be hidden.

In your chart PeopleCode, typically in the Activate event, you will create and populate a rowset linked to the chart's node record. This must be a component rowset, linked to the chart's node record, not a standalone rowset. The rowset has one row for each node in the chart.

Actions and Events

When user drags the node from one box to another, PeopleSoft Charting updates the values for the node's PTXAXISRATINGS and PTYAXISRATINGS values, changing the box's X and Y values to the new values. This change invokes field change processing on the PTXAXISRATINGS and PTYAXISRATINGS fields on the rating box node record. Typically, FieldChange PeopleCode performs business logic and refreshes the chart display.

Text Orientation

The orientation of the main title in a rating box chart is always horizontal.

The orientation of the X-axis title and X-axis labels is always horizontal.

The orientation of the Y-axis title and Y-axis labels is always vertical.

Rating Box Chart Subrecord Definition

These are the fields in PTRATINGBOX_SBR:

Field	Description
PTCHART_NODE	Specifies the node name. This is the key to the record.
PTND_DISPLAY_ORDER	Specifies the display order of the nodes within the chart. By default nodes will display in the same order as in the rowset. You must provide a unique value for display order for each node in the rating box rowset so that the nodes will display in the correct order in the rating box. A runtime error message is thrown when the display order is not unique for each node in the rating box rowset.
PTNODE_DESCR1	Specifies the main description for the node.
PTNODEDESCRSTYLE	Specifies the style class that defines the description's text font, type, color, size, and so on.
PTNDDESC1LINKABLE	Reserved for future use.
PTDESCR1_ICON_IMG	Specifies the image name for the main description.
PTDESCR1_ICON_POS	Indicates where to place the icon relative to the description. L – Left of the description R – Right of the description

<i>Field</i>	<i>Description</i>
PTXAXISRATINGS	Specifies the X-axis rating for the current node.
PTYAXISRATINGS	Specifies the Y-axis rating for the current node.
DISPLAYED_FLAG	Indicates whether the node will display in the chart area. Y – The node will display in the chart area. N – The node will not display in the chart area. The default value is "Y".

Minimum Methods

At a minimum these methods are needed to create a rating box chart.

- SetRBNodeData
- SetRBNodeRecord
- SetXAxisLabels
- SetYAxisLabels

Minimum Properties

At a minimum, these properties are needed to create a rating box chart.

- XAxisBoxNum
- YAxisBoxNum

These properties are required if the chart includes a view all pop-up:

- PopUpWidth
- PopUpHeight

Data Type of a RatingBoxChart Object

Chart objects are declared using the Chart data type. For example,

```
Local RatingBoxChart &RatingBoxChart;
```

Scope of a RatingBoxChart Object

A chart object can be instantiated only from PeopleCode.

You can use this object only in PeopleCode programs that are associated with an online process, not in an Application Engine program, a message notification, a Component Interface, and so on.

Chart Class Methods

These methods are used by the Chart class. The methods are listed in alphabetical order.

Refresh

Syntax

Refresh()

Description

Note.

This method has been deprecated and remains for backward compatibility only. Use the `SetData` method or `SetOldData` method instead.

If you make a change to the underlying data of a chart, call the `SetData` method again to update the chart.

You don't need to refresh after setting a property or method of the chart itself, such as setting the starting point or changing colors. When a method or property is used, the chart is automatically refreshed.

Parameters

None.

Returns

None.

Example

```
&MyChart.Refresh();
```

See Also

[Chapter 11, "Charting Classes," SetData, page 435](#) and [Chapter 11, "Charting Classes," SetOldData, page 447](#)

Reset

Syntax

Reset ()

Description

Use the Reset method to clear all existing chart settings and data.

Parameters

None.

Returns

None.

See Also

[Chapter 11, "Charting Classes," Refresh, page 432](#)

SetColorArray

Syntax

SetColorArray(*&Array_of_Color*)

Description

Use the SetColorArray method to set the colors for a series. You can specify only a one-dimensional array for the parameter. This method applies only to base chart data, not to the overlay data.

The type of array can be any of the following:

- String
- Number
- Integer
- Decimal

Use the `SetColorArray` method for line charts instead of `SetDataColor` because `SetDataColor` does not work with line charts. Individual line segments cannot be colored because there are fewer line segments than points. Use `SetColorArray` instead to color each complete line (series).

Parameters

Parameter	Description
<i>&Array_of_Color</i>	Specify an already instantiated array that contains the color values that you want for the series. You can specify either a constant or a number.

The following lists all the values you can use with the chart color methods. You can use either the numeric or constant value.

Numeric Value	Constant Value	Description
-1	%ChartColor_Series_Default	Default series color. When a data point is set to this, the default series color or the color that has been set by the user for that series is used instead. This value works only with the <code>SetColorArray</code> method.
0	%ChartColor_Black	Black
1	%ChartColor_Blue	Blue
2	%ChartColor_Cyan	Cyan
3	%ChartColor_DarkGray	DarkGray
4	%ChartColor_Gray	Gray
5	%ChartColor_Green	Green
6	%ChartColor_LightGray	LightGray
7	%ChartColor_Magenta	Magenta
8	%ChartColor_Orange	Orange
9	%ChartColor_Pink	Pink

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
10	%ChartColor_Red	Red
11	%ChartColor_White	White
12	%ChartColor_Yellow	Yellow
13	%ChartColor_Red_Orange	Red_Orange
14	%ChartColor_Yellow_Green	Yellow_Green
15	%ChartColor_Blue_Violet	Blue_Violet
16	%ChartColor_Purple	Purple
17	%ChartColor_Yellow_Orange	Yellow_Orange

Returns

None.

Example

The following example sets the four series in the chart:

```
&NumArray = CreateArray(1, 3, 6, 9);
&oChart.SetColorArray(&NumArray);
```

See Also

[Chapter 8, "Array Class," page 257](#)

SetData

Syntax

```
SetData({Record_Name | &Rowset})
```

Description

Use the `SetData` method to specify where the data from the chart is coming from.

You can use either a record name or an already instantiated, populated rowset. In general, specify a record when building a chart from page data and a rowset when building a chart from a standalone rowset.

If you make a change to the underlying data of a chart, call the `SetData` method again to update the chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record_Name</i>	Specify the name of a record to be used to populate the chart with data.
<i>&Rowset</i>	Specify the name of an already instantiated rowset to populate the chart with data. This is generally a standalone rowset.

Returns

None.

Example

The following is the minimum code you need to create a PeopleSoft chart.

```
Local Chart &MyChart;  
  
&MyChart = GetChart(ABS_HIST.CHART);  
&MyChart.SetData(ABS_HIST);  
&MyChart.SetDataYAxis(ABS_HIST.Reason);  
&MyChart.SetDataXAxis(ABS_HIST.Duration);
```

The following example creates a chart using a standalone rowset.

```

Function IScript_GetChartURL()
local object &MYCHART;
local string &MYURL;
local rowset &MYROWSET;

&MYCHART = CreateObject("Chart");

&MYROWSET = CreateRowset(Record.ABS_HIST);

&EmplID = %Emplid;

&MYROWSET.Fill("Where EMPLID :=1", &EmplID);

&MYCHART.SetData(&MYROWSET);
&MYCHART.SetDataXAxis(ABS_HIST.ABSENCE_TYPE);
&MYCHART.SetDataYAxis(ABS_HIST.DURATION_DAYS);

&MYURL = %Response.GetChartURL(&MYCHART);

/* use &MYURL in your application */
...
End-Function;

```

See Also

[Chapter 11, "Charting Classes," SetDataXAxis, page 444](#) and [Chapter 11, "Charting Classes," SetDataYAxis, page 446](#)

SetDataAnnotations

Syntax

SetDataAnnotations(*Record_Name.Field_Name*)

Description

Use the SetDataAnnotations method to specify an optional text label that can be associated with each point in the chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Recordname.Fieldname</i>	Specify the field name (and the record it's associated with) that contains the text for the optional label.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetOLDataAnnotations, page 448](#)

SetDataColor**Syntax**

SetDataColor(*Record_Name.Field_Name*)

Description

Use the SetDataColor method to specify a field that contains the color for each data point. Each field for each data point must contain either a number or a constant that specifies the color you want to use.

Use the SetColorArray method for line charts instead of SetDataColor because SetDataColor does not work with line charts. Individual line segments cannot be colored because fewer line segments exist than points. Use SetColorArray instead to color each complete line (series).

Note. This method has no effect when used with an overlay.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record_Name.Field_Name</i>	Specify the name of the record, and the field on that record, that contains the colors for each data point. You can specify either a constant or a number.

See [Chapter 11, "Charting Classes," SetColorArray, page 433](#).

Returns

None.

SetDataGlyphScale**Syntax**

SetDataGlyphScale(*Record_Name.Field_Name*)

Description

Use the `SetDataGlyphScale` method to specify a field that contains numerical data defining the size of each glyph for bubble charts (scatter charts). These values are mapped to a range of size values between a predefined minimum and maximum.

This method only affects scatter charts (`%ChartType_2DScatter`)

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Recordname.Fieldname</i>	Specify the field (and the record associated with it) that contains numerical data used to define the size of each glyph.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetOldDataGlyphScale, page 449](#)

SetDataHints

Syntax

`SetDataHints(Record_Name.Field_Name)`

Description

Use the `SetDataHints` method to specify the field that contains the text that displays as a data hint.

What displays for a data hint depends on the value specified for the data hints method, as well as the value specified for the series and the data method.

Series Data but No Data Hints

If you do not specify data hints, but you *do* specify both the data series and data methods, the hints appear as follows:

Value *value* for point *x* position of series *series*

Where:

- *value* is the Y data value

- *x position* is the X-axis label
- *series* is the series value

The following example shows this type of data hints. The tooltips pop-up appears when the cursor hovers over any data value.

Data hints with multiple series example

Data Hints, Data, and Series

If you specify data hints, then that value appears. In the following example, the data hints are set to the same value as the series is set, that is, the product:

Data hints set to the product value

Data and Series, but no Data Hints

If you do not specify `SetDataHints` and do not specify `SetDataSeries`, then the value of the Y axis appears in the data hint:

Data hints from default data

Parameters

Parameter	Description
Record_Name.Field_Name	Specify the name of the record, and the field on that record, that contains the data hints for the chart.

Returns

None.

Example

The following PeopleCode example:

```
&oChart.SetDataHints(QE_CHART_RECORD.QE_CHART_REGION);
```

Could produce data hints as follows:

Data hints set to the product value

See Also

[Chapter 11, "Charting Classes," SetDataXAxis, page 444](#) and [Chapter 11, "Charting Classes," SetDataSeries, page 443](#)

SetDataSeries

Syntax

SetDataSeries(*Record_Name.Field_Name*)

Description

Use the SetDataSeries method to specify the name of the field containing the series values. Every distinct value in this field is considered a unique series.

The series is plotted in the order given by the record.

By default, the legend is populated by the value of this field.

If this value is Null, the system assumes there is only one series to plot.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record_Name.Field_Name</i>	Specify the name of the record, and the field on that record, that contains the series values for the chart.

Returns

None.

Example

```
&MYCHART.SetDataSeries(MYRECORD.MYSERIES);
```

See Also

[Chapter 11, "Charting Classes," SetDataXAxis, page 444](#) and [Chapter 11, "Charting Classes," SetDataYAxis, page 446](#)

SetDataURLs

Syntax

SetDataURLs(*FieldName*)

Description

Use the `SetDataURLs` method to specify a URL to be launched when a data point is clicked in the chart. The URL for each point must be given as a string, that is, enclosed in quotation marks. You can also specify *recordname.fieldname*. Use this method for charts created from a chart control or a standalone rowset.

You could use this method to launch a JavaScript that generates a pop-up menu.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>FieldName</i>	Specify a field name to be used to populate the URL for each data point.

Returns

None.

Example

```
&MyChart.SetDataURLs(MyRecord.URL);
```

SetDataXAxis

Syntax

```
SetDataXAxis(Record_Name.Field_Name)
```

Description

Use the `SetDataXAxis` method to specify the groups along the X axis.

If this value is not set or Null, the Y values are plotted along the X axis in groups labeled by their order number.

The order of the data is plotted in the order of the data in the record.

By default, the labels along the X axis are populated by the value of this field.

Parameters

Parameter	Description
Record_Name.Field_Name	Specify the name of the record, and the field on that record, that contains the data for the X axis for the chart.

Returns

None.

Example

In the following example, the Y axis is set to a numeric amount, while the X axis is set to the region.

```
&cChart = GetChart(PB_CHART_DUMREC.PB_CHART_FIELD);

&cChart.SetData(Record.PB_CHART_RECORD);
&cChart.SetDataSeries(PB_CHART_RECORD.PB_CHART_PRODUCT);
&cChart.SetDataXAxis(PB_CHART_RECORD.PB_CHART_REGION);
&cChart.SetDataYAxis(PB_CHART_RECORD.PB_CHART_SALES);
```

X axis set with region data

See Also

[Chapter 11, "Charting Classes," SetDataYAxis, page 446](#) and [Chapter 11, "Charting Classes," SetData, page 435](#)

SetDataYAxis

Syntax

SetDataYAxis(*Record_Name.Field_Name*)

Description

Use the SetDataYAxis to specify the data to plot in the chart.

The Y axis is always considered the data axis.

The Y axis must always be numeric. If the greatest Y-axis value is less than 10, the Y-axis labels are given a decimal place. If the greatest Y-axis value is greater than or equal to 10, the Y-axis labels appear as integers.

Note. If you have specified negative numbers in the Y axis, then the X axis is drawn according to the XAxisCross property.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record_Name.Field_Name</i>	Specify the name of the record, and the field on that record, that contains the data for the Y axis for the chart.

Returns

None.

Example

```
&oChart.SetDataYAxis(QE_CHART_RECORD.QE_CHART_SALES);
```

See Also

[Chapter 11, "Charting Classes," SetDataXAxis, page 444](#) and [Chapter 11, "Charting Classes," SetData, page 435](#)

SetLegend

Syntax

SetLegend(&*Array_of_String*)

Description

Use the `SetLegend` method to specify alternative legends. By default, the legends are populated from the record field specified with `SetDataSeries`.

This method is used to write both the overlay legend and the series legend. The labels are overwritten in the order of elements in the array, that is, the first element overwrites the first series, the second overwrites the second, and so on, with the last element in the array overwriting the overlay legend. There can be more than one series in an overlay.

If you do not specify an element for an array (that is, a blank or a null) then no legend is listed for that series.

Note. Default label text is not automatically translated. If you set your own labels, be sure to use translated text, such as message catalog entries.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array_of_String</i>	Specify an already instantiated array of string, containing the text that you want to use for the legend.

Returns

None.

Example

The following example displays a legend containing only the overlay.

```
&LegendArray = CreateArray("", "", "Revenue");  
&MyChart.SetLegend(&LegendArray);
```

See Also

[Chapter 11, "Charting Classes," SetDataSeries, page 443](#)

[Chapter 8, "Array Class," page 257](#)

SetOldData

Syntax

```
SetOldData ({Record_Name | &Rowset})
```

Description

Use the `SetOldData` method to specify where the data for the overlay is coming from.

If you make a change to the underlying data of a chart, call the `SetOldData` method again to update the chart.

There are no default values for the overlay data. You must specify the data.

You can specify two different Y-axis fields, but you must make certain that different data plotted against the same axis makes sense. For example, while plotting two currency amounts would work technically—plotting currency amounts against number of units sold and sharing the same axis— would not look correct.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record_Name</i>	Specify the name of a record to be used to populate the overlay of the chart with data.
<i>&Rowset</i>	Specify the name of an already instantiated rowset to populate the overlay of the chart with data.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetDataXAxis, page 444](#); [Chapter 11, "Charting Classes," SetDataYAxis, page 446](#) and [Chapter 11, "Charting Classes," SetData, page 435](#)

SetOldDataAnnotations

Syntax

`SetOldDataAnnotation(Record_Name.Field_Name)`

Description

Use the `SetOldDataAnnotations` method to specify an optional text label that can be associated with each point in the overlay of the chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Recordname.Fieldname</i>	Specify the field name (and the record it's associated with) that contains the text for the optional label.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetDataAnnotations, page 437](#)

SetOldDataGlyphScale

Syntax

SetOldDataGlyphScale(*Record_Name.Field_Name*)

Description

Use the SetOldDataGlyphScale method to specify a field that contains numerical data defining the size of each glyph in the overlay chart. These values are mapped to a range of size values between a predefined minimum and maximum.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Recordname.Fieldname</i>	Specify the field (and the record associated with it) that contains numerical data used to define the size of each glyph.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetDataGlyphScale, page 438](#)

SetOLDataSeries

Syntax

SetOLDataSeries(*Record_Name.Field_Name*)

Description

Use the SetOLDataSeries method to specify the name of the field containing the overlay series values. Every distinct value in this field is considered a unique series.

The series is plotted in the order given by the rows in the record.

If this value is Null, the system assumes there is only one series to plot.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record_Name.Field_Name</i>	Specify the name of the record, and the field on that record, that contains the series values of the overlay for the chart.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetDataSeries, page 443](#)

SetOLDataXAxis

Syntax

SetOLDataXAxis(*Record_Name.Field_Name*)

Description

Use the SetOLDataXAxis method to specify the groups along the X axis if the axis is non-numeric for the overlay.

If the X axis is numeric, this method is used to give the position of the points along the axis. Only discrete values are supported for the X axis.

If this value is Null, the Y values are plotted along the X axis in groups labeled by their order number.

The order of the data is plotted in the order of rows in the record.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record_Name.Field_Name</i>	Specify the name of the record, and the field on that record, that contains the data for the X axis for the overlay of the chart.

Returns

None.

SetOldDataYAxis

Syntax

SetOldDataYAxis(*Record_Name.Field_Name*)

Description

Use the SetOldDataYAxis to specify the data to plot for the overlay of the chart.

This value must always be numeric.

This method has no default value.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record_Name.Field_Name</i>	Specify the name of the record, and the field on that record, that contains the data for the overlay of the chart.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetDataXAxis, page 444](#) and [Chapter 11, "Charting Classes," SetDataYAxis, page 446](#)

SetXAxisLabels

Syntax

SetXAxisLabels(&Array_of_Any)

Description

Use the SetXAxisLabels method to specify an array of labels for the X axis. By default, the labels are populated from the record field specified by SetDataXAxis. Labels specified with SetXAxisLabels overwrite the default labels.

Note. Default label text is not automatically translated. If you set your own labels, be sure to use translated text, such as message catalog entries.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array_of_Any</i>	Specify an already instantiated array of any that contain the labels that you want to use for the X Axis.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetDataXAxis, page 444](#)

[Chapter 8, "Array Class," page 257](#)

[Chapter 11, "Charting Classes," Tick Mark Considerations, page 584](#)

SetYAxisLabels

Syntax

SetYAxisLabels(&Array_of_Any)

Description

Use the `SetYAxisLabels` method to specify an array of labels for the Y axis. Labels specified with `SetYAxisLabels` overwrite the default labels.

If the greatest Y-axis value is less than ten, the default Y-axis labels are given a decimal place. If the greatest Y-axis value is greater than or equal to ten, the default Y-axis labels are displayed as integers.

Note. Default label text is not automatically translated. If you set your own labels, be sure to use translated text, such as message catalog entries.

If you set the labels yourself, you may need to set the `YAxisTicks` and `YAxisMax` because you no longer have numbers that correlate to the data points.

Parameters

<i>Parameter</i>	<i>Description</i>
<code>&Array_of_Any</code>	Specify an already instantiated array of any that contain the labels that you want to use for the Y Axis.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetDataXAxis, page 444](#); [Chapter 11, "Charting Classes," YAxisTicks, page 475](#) and [Chapter 11, "Charting Classes," YAxisMax, page 473](#)

[Chapter 8, "Array Class," page 257](#)

[Chapter 11, "Charting Classes," Tick Mark Considerations, page 584](#)

Chart Class Properties

These properties are used by the `Chart` class. The properties are described in alphabetic order.

DataStartRow

Description

This property sets or returns the row number (after any preprocessing) at which to start plotting. This is useful when you have many rows of data in a rowset, and you want to start at a particular row. This can also be useful for creating your own 'scrolling' effect, by specifying both the start row and how many rows to be displayed (by using the `DataWidth` property).

If this property is not set, then the value is 1.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," DataWidth, page 454](#)

DataWidth

Description

This property returns or sets the number of rows to plot for a series. The starting point for the number of rows is set with the `DataStartRow` property. If the `DataWidth` property value is not set, then the width is from the `DataStartRow` to the last element in the rowset. If the property value is less than zero, then it will automatically be set to one.

This property is read-write.

Example

Suppose your rowset returned 400 rows. You wouldn't want all 400 to display in your chart. Instead, you'd pick a subset of those rows. The row to start with is set with `DataStartRow`, while how many rows to display is set with `DataWidth`.

The following code could be used with a push button connected with a chart. The push button enables the next set of data to appear with the chart.

You do not need to refresh after setting this property. When a method or property is used, the chart is automatically refreshed.

```
Local Chart &MyChart;  
  
&MyChart = GetChart(ChartRec.DisplayField);  
&Start = &MyChart.DataStartRow;  
/* display the next 20 rows of data */  
&MyChart.DataStartRow = &Start + 20;  
&MyChart.DataWidth = 20;
```

See Also

[Chapter 11, "Charting Classes," DataStartRow, page 454](#)

GridLines

Description

Use this property to specify whether to show grid lines with the chart.

Note. This property is ignored unless you have set `RevertToPre850` to `True` for the chart.

If you do not specify a value, both horizontal and vertical grid lines are shown.

This property controls only the display of grid lines. If you want to specify the style of the grid lines, use the `GridLineType` property.

The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	<code>%ChartGrid_None</code>	Don't show grid lines
1	<code>%ChartGrid_Horizontal</code>	Show horizontal grid lines (default)
2	<code>%ChartGrid_Vertical</code>	Show vertical grid lines
3	<code>%ChartGrid_Both</code>	Show both vertical and horizontal grid lines

This property is read-write.

See Also

[Chapter 11, "Charting Classes," GridLineType, page 455](#)

GridLineType

Description

Use this property to specify the style of the grid lines when either or both vertical or horizontal grid lines are turned on.

Note. This property is ignored unless you have set `RevertToPre850` to `True` for the chart.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

The default value is %ChartLine_Solid. The possible values are:

<i>Value</i>	<i>Description</i>
%ChartLine_Solid	Draw grid lines with solid lines.
%ChartLine_Dash	Draw grid lines with lines composed of dashes.
%ChartLine_Dot	Draw grid lines with lines composed of dots.
%ChartLine_DashedDot	Draw grid lines with lines composed of both dashes and dots.

This property is read-write.

HasLegend

Description

Use this property to specify if a legend is displayed with the chart. This property takes a Boolean value: True, if the legend is displayed with the chart, False otherwise.

The default value is False.

This property is read-write.

Height

Description

Use this property to specify the height of the chart. This property takes a numeric value. The unit of measurement is pixels.

Generally this property is used with charts created for iScripts, to specify the height of the image, before generating the image map. You can also use it to overwrite the height set in PeopleSoft Application Designer.

If you try to read this property before setting it, the value returned is zero.

Note. The Height and Width properties must be set to the same value to change the size of a 2D Scatter chart, that is, a chart with the Type property set to %ChartType_2DScatter.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Height, page 456](#)

ImageMap

Description

This property returns the HTML client-side image map. The image map is what makes the chart interactive.

This property is read-only.

See Also

[Chapter 11, "Charting Classes," Creating a Chart Using an iScript, page 596](#)

IsDrillable

Description

Use this property to specify whether the end-user can click on the chart and trigger a PeopleCode program in the FieldChange event for that row.

By default, when the chart data comes from a record, a PeopleCode program in the FieldChange event for the Y-Data field of the clicked row is executed.

Note. The record that contains the PeopleCode must be in the component buffer at runtime.

See [Chapter 11, "Charting Classes," Creating a Chart Using the Chart Class, page 557](#).

This property takes a Boolean value: True if the end-user can click on the chart to initiate an action, False otherwise.

Note. Setting this property has no effect if the IsPlainImage property is set as True.

Note. When using a chart in an iScript, this property must be used in conjunction with the SetDataURLs method. The SetDataURLs method must point to a field that is populated with the URLs to be triggered for each data point in the chart.

The default value for this property is False.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," IsPlainImage, page 458](#)

IsPlainImage

Description

Use this property to specify whether the chart is built without any extra HTML, such as SRC or MAP tags.

If this property is specified as True, the end-user will not be able to click on the chart to trigger an event. In addition, the pop-up data hints will not appear when the end-user passes a mouse over the chart. However, you may see a performance improvement if your chart has an extremely complicated image map and you specify this property as True.

This property takes a Boolean value: True if the chart is built without extra HTML, False otherwise.

The default value of this property is False.

This property is read-write.

IsTrueXY

Description

Use this property to enable a TrueXY, or numeric, axis. This causes the X-axis data to be loaded as continuous linear numeric data, rather than discrete data, as is used in bar charts for example.

This property is only applicable to scatter, line or histogram charts where the X axis can be numeric.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," True XY Line Chart, page 578](#)

IsYAxisInteger

Description

Specify whether the Y axis will display integers. Set IsYAxisInteger to True if the Y axis represents integer data, such as number of people or number of tasks.

IsYAxisInteger is not used with pie charts and percentage bar charts.

This property takes a Boolean value.

The default value of this property is False.

This property is read-write.

LegendMaxEntries

Description

Use this property to specify the number of legend entries before a new column (or row) is created.

When the legend position is specified as left or right, the legend is drawn vertically so a new column is created when this property is exceeded.

When the legend position is specified as top or bottom, the legend is drawn horizontally and a new row is created when this property is exceeded.

The default value of this property is five.

This property is read-write.

LegendPosition

Description

Use this property to specify where the legend should appear, in relationship to the chart. You can specify either a numeric or constant value for this property.

Note. ChartLegend_Separate generates a legend without a chart. The legend takes over the entire charting area. The legend appears in the center of the chart.

The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartLegend_Left	Display legend to the left of the chart.
1	%ChartLegend_Right	Display legend to the right of the chart.
2	%ChartLegend_Top	Display legend on top of the chart.
3	%ChartLegend_Bottom	Display legend below the chart.
4	%ChartLegend_Separate	Generate a legend without a chart.

This property is read-write.

LegendStyle

Description

Use this property to specify the style of the legend. The values for this property are the style classes contained in the style sheet associated with the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

LineType

Description

Use the LineType property to specify the style of series that are plotted as lines. This is for a regular series only. To specify the style of line for overlay data, use the OLLineType property.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

This property takes either a numeric or constant value. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
1	%ChartLine_Solid	Draw series with a solid line.
2	%ChartLine_Dash	Draw series with a line composed of dashes.
3	%ChartLine_Dot	Draw series with a line composed of dots.
4	%ChartLine_DashedDot	Draw series with a line composed of both dashes and dots.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," OLLineType, page 462](#)

MainTitle

Description

Use this property to specify the text for the main title of the chart.

This property takes a string value.

This property is read-write.

MainTitleOrient

Description

Use this property to specify the orientation of the text for the main title.

The default value is horizontal.

You can specify either a number or a constant for this property. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartText_Horizontal	Title text is displayed horizontally.
90	%ChartText_Vertical	Title text is displayed vertically.

This property is read-write.

MainTitleStyle

Description

Use this property to specify the style of the main title. The values for this property are the style classes contained in the style sheet associated with the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

OLLineType

Description

Use the OLLineType property to specify the style of an overlay line.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

This property takes either a numeric or constant value. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
1	%ChartLine_Solid	Draw series with a solid line.
2	%ChartLine_Dash	Draw series with a line composed of dashes.
3	%ChartLine_Dot	Draw series with a line composed of dots.
4	%ChartLine_DashedDot	Draw series with a line composed of both dashes and dots.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," LineType, page 460](#)

OLType

Description

Use this property to specify the style of the overlay line.

You can specify either a numeric or a constant value for this property. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
4	%ChartType_2DLine	Overlay is drawn as a 2D line.
5	%ChartType_2DHistogram	Overlay is drawn as a 2D histogram.

This property is read-write.

RevertToPre850

Description

PeopleTools Version 8.50 implements new chart style classes that bring a consistent look and feel to charts.

Use this property to specify whether the chart will revert to the pre-PeopleTools 8.50 chart style classes.

Warning! By default RevertToPre850 is set to False, which means that charts that were created prior to PeopleTools 8.50 will use the new 8.50 chart style classes.

Any custom Chart class properties that were set in PeopleCode for existing charts that use the new 8.50 chart style classes will be ignored if those properties are defined in the 8.50 chart style classes.

Oracle strongly recommends that you review existing charts to verify that they display correctly.

This property takes a Boolean value:

<i>Parameter</i>	<i>Description</i>
True	Do not use the PeopleTools 8.50 style classes for this chart so that the chart will maintain its original appearance.
False	Use the PeopleTools 8.50 style classes for this chart. Any chart properties that are set in application PeopleCode may be overridden by the 8.50 style classes.

The default is False.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," OLLineType, page 462](#)

RotationAngle

Description

Note. This property has been deprecated and remains for backward compatibility only. Use the XRotationAngle, YRotationAngle, and ZRotationAngle properties instead.

Use this property to specify the rotation angle of the chart. This property is valid only with 3D style charts, that is, charts that have Type set as %ChartType_3DBar, %ChartType_3DStackedBar, and so on.

Note. This property has no effect on the 3D pie chart.

You don't need to refresh after setting this property. When a method or property is used, the chart is automatically refreshed.

This property takes a numeric value from 1 to 360.

This property does not take negative numbers.

The chart is rotated in a clockwise direction.

This property is read-write.

ShowCrossHair

Description

Use the ShowCrossHair property to specify whether the chart should be split into quadrants.

This property takes a boolean value. If you specify true, two lines are drawn, one from the middle of the X axis and one from the middle of the Y axis.

This property is read-write.

Style

Description

A *style sheet* is a definition, like a record or field definition, that you create in PeopleSoft Application Designer. It contains a collection of formatting styles, called *classes*, each of which can be applied to either the entire chart or to specific elements within a chart.

Use this property to specify the overall style of the chart by specifying a style class. The value must be a valid class within the style sheet specified for the chart.

Individual style properties (such as SetXAxisStyle, MainTitleStyle, and so on) can be used to override this value for individual elements of the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

StyleSheet

Description

Use this property to associate a style sheet with a chart.

The PTSTYLEDEF style sheet is the default style sheet associated with a chart.

Both the Style property for the chart, and individual style properties (such as SetXAxisStyle, MainTitleStyle, and so on) can be used to override this value for individual elements of the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

Type

Description

Use this property to specify the type of chart that you want. You can specify either a numeric or constant value for this property. The valid values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartType_2DBar	Two-dimensional bar chart
1	%ChartType_2DStackedBar	Two-dimensional stacked bar chart
2	%ChartType_2DPercentBar	Two-dimensional percent bar chart
3	%ChartType_2DHorizStackedBar	Two-dimensional stacked horizontal bar chart
4	%ChartType_2DLine	Two-dimensional line chart
5	%ChartType_2DHistogram	Two-dimensional histogram chart
6	%ChartType_2DPie	Two-dimensional pie chart
7	%ChartType_3DBar	Three-dimensional bar chart
8	%ChartType_3DStackedBar	Three-dimensional stacked bar chart
9	%ChartType_3DPie	Three-dimensional pie chart
10	%ChartType_2DHorizPercentBar	Two-dimensional horizontal percent chart
11	%ChartType_3DPercentBar	Three-dimensional percent bar chart
13	%ChartType_2DHorizBar	Two-dimensional horizontal bar chart
14	%ChartType_Scatter	Scatter chart.

This property is read-write.

See Also

Chapter 11, "Charting Classes," Chart Class Chart Types, page 396

Width**Description**

Use this property to specify the width of the chart. This property takes a numeric value. The unit of measurement is pixels.

Generally this property is used with charts created for iScripts, to specify the width of the image, before generating the image map. You can also use it to overwrite the width set in PeopleSoft Application Designer.

If you try to read this property before setting it, the value returned is zero.

Note. The Height and Width properties must be set to the same value to change the size of a 2D Scatter chart, that is, a chart with the Type property set to %ChartType_2DScatter.

This property is read-write.

XAxisCross**Description**

Use this property to specify the appearance of the X-axis data when there are both negative and positive values.

You can specify either a numeric value or a constant for this property. Values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartXAxisCross_Zero	The X axis extrudes from the zero point on the Y axis. X-axis labels are located below the X axis.
-1	%ChartXAxisCross_Bottom	The X axis extrudes from the Y minimum on the Y axis.
-2	%ChartXAxisCross_ZeroLineBttm	The X axis extrudes from the Y minimum on the Y axis, and a line is drawn from the zero point on the Y axis.
-3	%ChartXAxisCross_ZeroLbIsBttm	The X axis extrudes from the zero point on the Y axis. X-axis labels are located at the bottom of the chart.

This property is read-write.

Example

The following code:

```
&MyChart.XAxisCross = %ChartXAxisCross_ZeroLineBtm;
```

produces a chart similar to this:

Example of %ChartXAxisCross_ZeroLineBtm

XAxisCrossPoint

Description

Use the XAxisCrossPoint property to specify the point at which the X axis intersects a numeric Y axis. The value is in the coordinate system of the Y-axis scale.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," YAxisCrossPoint, page 472](#)

XAxisLabelOrient

Description

Use this property to specify whether the X-axis label is displayed horizontally or vertically.

The default value is horizontal.

You can specify either a numeric value or a constant for this property. Values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartText_Horizontal	The X-axis label is displayed horizontally.
90	%ChartText_Vertical	The X-axis label is displayed vertically

This property is read-write.

XAxisMax

Description

The maximum value of the X axis.

This property is only applicable to scatter, line or histogram charts where the X axis is numeric, that is, the `IsTrueXY` property has been set to true.

This property is read-write.

XAxisMin

Description

The minimum value of the X axis.

This property is only applicable to scatter, line or histogram charts where the X axis is numeric, that is, the `IsTrueXY` property has been set to true.

This property is read-write.

XAxisPrecision

Description

Use the `XAxisPrecision` property to control the number of decimal places displayed in the labels of a numeric X axis.

This property is only applicable to scatter, line or histogram charts where the X axis is numeric, that is, the `IsTrueXY` property has been set to true.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," YAxisPrecision, page 473](#)

XAxisScaleResolution

Description

Use the `XAxisScaleResolution` property to control the level of detail displayed on a numeric axis. Use this property to increase or reduce the number of major tick marks and labels on the X axis.

This property is only applicable to scatter, line, bubble, or histogram charts where the X axis is numeric, that is, the `IsTrueXY` property has been set to true.

The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	<code>%ChartAxisResolution_Fine</code>	Specify fine resolution for the chart, that is, increase the number of major ticks and labels on the X axis. The fine scale resolution uses extra tick marks to give a more detailed division of the axis. This means that there may not be a one-to-one relationship between the axis labels and the tick marks.
1	<code>%ChartAxisResolution_Coarse</code>	Specify coarse resolution for the chart, that is, reduce the number of major ticks and labels on the X axis. The coarse scale value maintains a one-to-one relationship between the axis labels and the tick marks.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," YAxisScaleResolution, page 474](#)

XAxisStyle

Description

Use this property to specify the style of the X axis. The values for this property are the style classes contained in the style sheet associated with the chart.

Note. Pie chart labels take their style from this property.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

XAxisTicks

Description

Use this property to specify the number of minor tick marks along the X axis. This property takes a numeric value. To control the major tick marks use the XAxisScaleResolution method.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," XAxisScaleResolution, page 469](#)

[Chapter 11, "Charting Classes," Tick Mark Considerations, page 584](#)

XAxisTitle

Description

Use this property to specify the text for the X-axis title.

This property is read-write.

XAxisTitleOrient

Description

Use this property to specify the orientation of the text for the X-axis title.

You can specify either a number or a constant for this property. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartText_Horizontal	Title text is displayed horizontally.
90	%ChartText_Vertical	Title text is displayed vertically. This property is read-write.

XAxisTitleStyle

Description

Use this property to specify the style of the X-axis title. The values for this property are the style classes contained in the style sheet associated with the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

XRotationAngle

Description

Use this property to specify the angle of rotation about the X axis in degrees.

This property is valid only with 3D-style charts, that is, charts that have the Type property set as %ChartType_3DBar, %ChartType_3DStackedBar, %ChartType_3DPercentBar, or %ChartType_3DPie.

You do not need to refresh after setting this property. When a method or property is used, the chart is automatically refreshed.

This property takes a string value from "0" to "360".

The chart is rotated in a clockwise direction.

If a negative value is specified the chart is rotated counter-clockwise.

This property is read-write.

YAxisCrossPoint

Description

Use the YAxisCrossPoint property to specify the point at which the Y axis intersects a numeric X axis. The value is in the coordinate system of the X-axis scale.

This property is only applicable to scatter, line or histogram charts where the X axis is numeric, that is, the IsTrueXY property has been set to true.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," XAxisCrossPoint, page 467](#)

YAxisLabelOrient

Description

Use this property to specify whether the Y-axis label is displayed horizontally or vertically.

The default value is horizontal.

You can specify either a numeric value or a constant for this property. Valid values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartText_Horizontal	The Y-axis label is displayed horizontally.
90	%ChartText_Vertical	The Y-axis label is displayed vertically

This property is read-write.

YAxisMax

Description

Use this property to specify the maximum value of the Y (data) axis. This property takes a numeric value.

The maximum value sets the largest value that is displayed on the axis.

Note. If the YAxisMax and YAxisMin properties are not set, or are set to too narrow a range, ticks may not appear on the Y axis.

This property is only applicable to scatter, line, or histogram charts.

This property is read-write.

YAxisMin

Description

Use this property to specify the minimum value of the Y axis. This property takes a numeric value.

The minimum value sets the point at which the chart plots in positive and negative directions.

The default minimum value is the default value of the Y axis.

Note. If the YAxisMax and YAxisMin properties are not set, or are set to too narrow a range, ticks may not appear on the Y axis.

This property is only applicable to scatter, line, or histogram charts.

This property is read-write.

YAxisPrecision

Description

Use the YAxisPrecision property to control the number of decimal places displayed in the labels of a numeric Y axis.

This property is only applicable to scatter, line or histogram charts.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," XAxisPrecision, page 469](#)

YAxisScaleResolution**Description**

Use the YAxisScaleResolution property to control the level of detail displayed on a numeric axis. Use this property to increase or reduce the number of major ticks and labels on the Y axis.

This property is only applicable to scatter, line, or histogram charts.

The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartAxisResolution_Fine	Specify fine resolution for the chart, that is, increase the number of major ticks and labels on the Y axis. The fine scale resolution uses extra tick marks to give a more detailed division of the axis. This means that there may not be a one-to-one relationship between the axis labels and the tick marks.
1	%ChartAxisResolution_Coarse	Specify coarse resolution for the chart, that is, reduce the number of major ticks and labels on the Y axis. The coarse scale value maintains a one-to-one relationship between the axis labels and the tick marks.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," XAxisScaleResolution, page 469](#)

YAxisStyle**Description**

Use this property to specify the style of the Y axis. The values for this property are the style classes contained in the style sheet associated with the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

YAxisTicks

Description

Use this property to specify the number of minor tick marks along the Y (data) axis. This property takes a numeric value. To control the major tick marks use the YAxisScaleResolution method.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," YAxisScaleResolution, page 474](#)

[Chapter 11, "Charting Classes," Tick Mark Considerations, page 584](#)

YAxisTitle

Description

Use this property to specify text of the title for the Y axis.

This property is read-write.

YAxisTitleOrient

Description

Use this property to specify the orientation of the text for the Y-axis title.

You can specify either a number or a constant for this property. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartText_Horizontal	Title text is displayed horizontally.
90	%ChartText_Vertical	Title text is displayed vertically. This property is read-write.

YAxisTitleStyle

Description

Use this property to specify the style of the Y-axis title. The values for this property are the style classes contained in the style sheet associated with the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

YRotationAngle

Description

Use this property to specify the angle of rotation about the Y axis in degrees.

This property is valid only with 3D-style charts, that is, charts that have the Type property set as %ChartType_3DBar, %ChartType_3DStackedBar, %ChartType_3DPercentBar, or %ChartType_3DPie.

You do not need to refresh after setting this property. When a method or property is used, the chart is automatically refreshed.

This property takes a string value from "0" to "360".

This property is read-write.

ZRotationAngle

Description

Use this property to specify the angle of rotation about the Z axis in degrees.

This property is valid only with 3D-style charts, that is, charts that have the Type property set as %ChartType_3DBar, %ChartType_3DStackedBar, %ChartType_3DPercentBar, or %ChartType_3DPie.

You do not need to refresh after setting this property. When a method or property is used, the chart is automatically refreshed.

This property takes a string value from "0" to "360".

This property is read-write.

Gantt Class Methods

These methods are used by the Gantt class. The methods are described in alphabetic order.

Refresh

Syntax

Refresh()

Description

Use the Refresh method if the underlying data of the chart has changed, and you want to update the chart.

Note. This method has been deprecated and remains for backward compatibility only. Use the `SetTaskAppData` method or `SetTaskData` method instead.

You don't need to refresh after setting a property or method of the chart itself, such as setting the starting point or changing colors. When a method or property is used, the chart is automatically refreshed.

Parameters

None.

Returns

None.

Example

```
&MyChart.Refresh();
```

See Also

[Chapter 11, "Charting Classes," SetTaskAppData, page 489](#) and [Chapter 11, "Charting Classes," SetTaskData, page 492](#)

Reset

Syntax

Reset ()

Description

Use the Reset method to clear all existing chart settings and data.

Parameters

None.

Returns

None.

See Also

[Chapter 11, "Charting Classes," Refresh, page 432](#)

SetActualEndDate

Syntax

SetActualEndDate(*RecordName.FieldName*)

Description

Use the SetActualEndDate method to specify the field in the record that defines the actual end date. This is an optional method, and is used in conjunction with the SetPlannedEndDate method. If an actual end date is specified, then an actual start date must also be specified. When defined, the actual or baseline tasks are visually shown as a separate task bar and are layered beneath the planned task if the two overlap.

Note. The Gantt chart logs a warning to the file PSJChart.log for any task that has a bad date format in this method or the SetActualStartDate method, but it continues with its normal processing. For these tasks, the overlaid baseline information is not displayed in the chart section.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field and its associated record that contains the value used to define the actual end date. This field must be of DateTime or Date type.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetActualStartDate, page 479](#); [Chapter 11, "Charting Classes," SetPlannedEndDate, page 486](#) and [Chapter 11, "Charting Classes," SetPlannedStartDate, page 486](#)

SetActualStartDate

Syntax

SetActualStartDate(*RecordName.FieldName*)

Description

Use the SetActualStartDate method to specify the field in the record that defines the actual start date. This is an optional method, and is used in conjunction with the SetPlannedStartDate method. If an actual start date is specified, then an actual end date must also be specified. When defined, the actual or baseline tasks are visually shown as a separate task bar and are layered beneath the planned task if the two overlap.

Note. The Gantt chart logs a warning to the file PSJChart.log for any task that has a bad date format in this method and the SetActualEndDate method, but continues with its normal processing. For these tasks, the overlaid baseline information is displayed in the chart section.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field and its associated record that contains the value used to define the actual start date. This field must be of DateTime or Date type.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetActualEndDate, page 478](#); [Chapter 11, "Charting Classes," SetPlannedEndDate, page 486](#) and [Chapter 11, "Charting Classes," SetPlannedStartDate, page 486](#)

SetActualTaskBarColor

Syntax

SetActualTaskBarColor(*RecordName.FieldName*)

Description

Use the SetActualTaskBarColor method to specify the field in the record that defines the colors for either the actual task bar or the actual milestone glyph.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that defines the task bar color. This field must be of type number, which means you can only use the numeric value for the color.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetPlannedTaskBarColor, page 487](#) and [Chapter 11, "Charting Classes," TaskMilestoneGlyph, page 517](#)

SetChartArea

Syntax

SetChartArea(*Percentage*)

Description

Use the `SetChartArea` method to specify what percentage of the Gantt chart is allocated to displaying the chart section. By default, both the task and chart sections are allocated 50% of the available space provided by the Gantt chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Percentage</i>	Specify the percentage of the page space for a Gantt chart that is allocated for displaying the chart area. Oracle recommends setting this value above .20 or 20%. Any point below .20 may cause the task bars and task dependency lines to become compressed and hard to read. If the percentage is set less than or equal to .10 or 10%, this parameter automatically takes a value of 0, enabling the table area to occupy the entire Gantt chart area. This parameter takes a float value.

Returns

None.

SetDayFormat

Syntax

SetDayFormat(*Format*)

Description

Use the `SetDayFormat` method to specify the format of the day on a `DateTime` axis.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Format</i>	Specify the format the day should display in. The values are:

<i>Value</i>	<i>Description</i>
<code>%Chart_DayFormat</code>	Display the day in a one- or two-digit format.
<code>%Chart_DayFormat_2Digit</code>	Display the day in a two-digit format.

<i>Value</i>	<i>Description</i>
%Chart_DayFormat_Name	Display the day using the full name, such as Monday, Tuesday, and so on.
%Chart_DayFormat_DOY	Display the day of the year in a numeric format, that is 1 — 366.
%Chart_DayFormat_DOY_2Digit	Display the day of the year in a two-digit numeric format, that is 01–366.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetHourFormat, page 482](#); [Chapter 11, "Charting Classes," SetMinuteFormat, page 484](#); [Chapter 11, "Charting Classes," SetMonthFormat, page 485](#) and [Chapter 11, "Charting Classes," SetSecondFormat, page 488](#)

SetHourFormat

Syntax

SetHourFormat(*Format*)

Description

Use the SetHourFormat method to specify how the hour displays on a DateTime axis.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Format</i>	Specify the format the hours should be displayed in. The values are:

<i>Value</i>	<i>Description</i>
%Chart_HourFormat_24	Display the hour using one or two digits in a 24 hour clock, that is 0–24.
%Chart_HourFormat_24_2Digit	Display the hour using two digits for a 24 hour clock, that is 00–24.
%Chart_HourFormat_12	Display the hour using one or two digits using a 12-hour clock. A.M. or P.M. appears next to the value.

<i>Value</i>	<i>Description</i>
%Chart_HourFormat_12_2Digit	Display the hour using one or two digits using a 12-hour clock. A.M. or P.M. appears next to the value.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetDayFormat, page 481](#); [Chapter 11, "Charting Classes," SetMinuteFormat, page 484](#) and [Chapter 11, "Charting Classes," SetSecondFormat, page 488](#)

SetLegend

Syntax

SetLegend(&Array_of_String)

Description

Use the SetLegend method to specify alternative legends. By default, the legends are populated from the record field specified with SetDataSeries.

This method is used to write both the overlay legend and the series legend. The labels are overwritten in the order of elements in the array, that is, the first element overwrites the first series, the second overwrites the second, and so on, with the last element in the array overwriting the overlay legend. There can be more than one series in an overlay.

If you do not specify an element for an array (that is, a blank or a null) then no legend is listed for that series.

Note. Default label text is not automatically translated. If you set your own labels, be sure to use translated text, such as message catalog entries.

Parameters

<i>Parameter</i>	<i>Description</i>
&Array_of_String	Specify an already instantiated array of string, containing the text that you want to use for the legend.

Returns

None.

Example

The following example displays a legend containing only the overlay.

```
&LegendArray = CreateArray("", "", "Revenue");
&MyChart.SetLegend(&LegendArray);
```

See Also

[Chapter 11, "Charting Classes," SetDataSeries, page 443](#)

[Chapter 8, "Array Class," page 257](#)

SetMinuteFormat

Syntax

SetMinuteFormat(*Format*)

Description

Use the SetMinuteFormat method to specify how minutes are displayed on the DateTime axis.

Locale-specific time separators are used to format the time.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Format</i>	Specify how the minutes should be displayed:

<i>Value</i>	<i>Description</i>
%Chart_MinuteFormat	Displays the minutes using a one- or two-digit number.
%Chart_MinuteFormat_2Digit	Displays the minutes using a two-digit number.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetHourFormat, page 482](#) and [Chapter 11, "Charting Classes," SetSecondFormat, page 488](#)

SetMonthFormat

Syntax

SetMonthFormat(*Format*)

Description

Use the SetMonthFormat method to specify the format of months on a DateTime axis.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Format</i>	Specify the format of how the month should be displayed. Values are:

<i>Value</i>	<i>Description</i>
%Chart_MonthFormat	Display the month using a one- or two-digit number.
%Chart_MonthFormat_2Digit	Display the month using a two-digit number.
%Chart_MonthFormat_FullName	Display the month using the full name.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetDayFormat, page 481](#) and [Chapter 11, "Charting Classes," SetYearFormat, page 505](#)

SetPlannedEndDate

Syntax

SetPlannedEndDate(*RecordName.FieldName*)

Description

Use the SetPlannedEndDate method to specify the field in the record that defines the planned end date. If planned versus actual dates are not used, this method specifies the end date of the task.

This method is required when creating a Gantt chart.

Note. The Gantt chart logs an error to the file PSJChart.log and stops its normal processing if it finds a bad date format in any of the rows in the field associated with this method and the SetPlannedStartDate method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field and its associated record that contains the value used to define the planned end date. This field must be of DateTime or Date type.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetActualEndDate, page 478](#); [Chapter 11, "Charting Classes," SetActualStartDate, page 479](#) and [Chapter 11, "Charting Classes," SetPlannedStartDate, page 486](#)

SetPlannedStartDate

Syntax

SetPlannedStartDate(*RecordName.FieldName*)

Description

Use the SetPlannedStartDate method to specify the field in the record that defines the planned start date. If planned versus actual dates are not used, this method specifies the start date of the task.

This method is required when creating a Gantt chart.

Note. The Gantt chart logs an error to the file PSJChart.log and stops its normal processing if it finds a bad date format in any of the rows in the field associated with this method and the SetPlannedEndDate method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field and its associated record that contains the value used to define the planned start date. This field must be of DateTime or Date type.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetActualEndDate, page 478](#); [Chapter 11, "Charting Classes," SetPlannedEndDate, page 486](#) and [Chapter 11, "Charting Classes," SetPlannedStartDate, page 486](#)

SetPlannedTaskBarColor

Syntax

SetPlannedTaskBarColor(*RecordName.FieldName*)

Description

Use the SetPlannedTaskBarColor method to specify the field in the record that defines the colors for either the planned task bar or the planned milestone glyph.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that defines the task bar color. This field must be of type number, which mean you can only use the numeric values for specifying color.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetActualTaskBarColor, page 480](#) and [Chapter 11, "Charting Classes," TaskMilestoneGlyph, page 517](#)

SetSecondFormat**Syntax**

SetSecondFormat(*Format*)

Description

Use the SetSecondFormat method to specify how seconds display on a DateTime axis.

Locale-specific time separators are used to format the time.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Format</i>	Specify the format for how the seconds should be displayed:

<i>Value</i>	<i>Description</i>
%Chart_SecondFormat	Displays the seconds using a one- or two-digit number.
%Chart_SecondFormat_2Digit	Displays seconds using a two-digit number.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetHourFormat, page 482](#) and [Chapter 11, "Charting Classes," SetMinuteFormat, page 484](#)

SetTableXScrollbar

Syntax

SetTableXScrollbar(*Scroll_ArrowAmount*)

Description

Use the SetTableXScrollbar method to specify the amount that the scroll bar in the table section of the Gantt chart scroll data when the user clicks on the arrows or scrollbar.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Scroll_ArrowAmount</i>	Specify the amount to scroll in the table section of the Gantt chart when the user clicks on the horizontal scrollbar arrow. The scroll amount must be a value between zero and one. The default value is 0.10. The amount specified indicates the percentage of the table section that is scrolled when the user clicks the scrollbar.

Returns

None.

SetTaskAppData

Syntax

SetTaskAppData(*RecordName.FieldName1* [, *RecordName.FieldName2* [, *RecordName.FieldName3*. . .]])

Description

Use the SetTaskAppData method to specify the fields in the record that define the application data to be viewed in the table section.

In the table section, column one (or the left-most column) always displays the work breakdown structure (WBS) numbering (if given) and name of the task (or task ID if the name is not given). This method allows applications to define additional task data columns to be displayed in the right-most columns of the table section.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldNames</i>	Specify the fields and their associated record that defines one or more application specific fields to be displayed as a column in the table section. The order in which the fields are given as parameters defines their column order in the table section. Because the task name (or task ID if the name is not given) is always shown in column one, the first record field value is displayed in column two.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskAppDataTitles, page 490](#); [Chapter 11, "Charting Classes," SetTaskData, page 492](#) and [Chapter 11, "Charting Classes," SetTaskDependencyData, page 493](#)

SetTaskAppDataTitles

Syntax

SetTaskAppDataTitles(&TitleArray)

Description

Use the SetTaskAppDataTitles method to specify the column titles to be displayed in the table section, starting with column two. The title for column one (that is, the left-most column) in the table section is set using the SetTaskTitle method.

The length of the array should match the number of application data fields specified with the SetTaskAppData method. Additional strings beyond the number of application data fields are not displayed. If the number of strings in the array specified by this method is less than the number of application data fields, the blanks are displayed in these title columns.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&TitleArray</i>	Specify an array of strings containing the column titles to be displayed in the table section.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskAppData, page 489](#) and [Chapter 11, "Charting Classes," TaskTitle, page 517](#)

SetTaskBarURL

Syntax

SetTaskBarURL(*RecordName.FieldName*)

Description

Use the SetTaskBarURL method to specify the field in the record which defines the URL the browser redirects to when the user clicks on a task bar.

By default, the FieldChange event on the planned end date field of the Gantt task data record is triggered if the image map based interactivity is turned on (using the IsDrillable property). This can be overridden by specifying a URL that is triggered when the task bar is clicked.

Use the SetTaskDependencyURL method to specify the URL to be used when the user clicks on a dependency line in the chart section.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record.FieldName</i>	Specify the field, and its associated record, that defines the URL the browser is redirected to when the task bar is clicked. This field must be of type character. The URL must be an absolute URL.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskDependencyURL, page 496](#)

[Chapter 11, "Charting Classes," IsDrillable, page 457](#)

SetTaskData

Syntax

```
SetTaskData({Record.RecordName | &Rowset})
```

Description

Use the SetTaskData method to specify from where the task data is to be populated, either from a record or an already instantiated rowset.

Note. If you specify a rowset, the data in the rowset must be provided in the correct display order.

This method is required when you're creating a Gantt chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName &Rowset</i>	Specify the record or rowset that contains the task data. If you specify a record, you must prefix the record name with the keyword Record .

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskDependencyData, page 493](#)

SetTaskDependencyChildID

Syntax

```
SetTaskDependencyChildID(RecordName.FieldName)
```

Description

The *dependent* task is the task where the dependency arrow ends. Use the SetTaskDependencyChildID method to specify the field in the record that defines the task ID for the dependent task.

The ID must match up to an ID in the Task data set.

This method is required if you specify dependency data.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that defines the task ID for the dependant task. This field must be of type number.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskDependencyData, page 493](#); [Chapter 11, "Charting Classes," SetTaskDependencyURL, page 496](#) and [Chapter 11, "Charting Classes," SetTaskDependencyParentID, page 494](#)

SetTaskDependencyData

Syntax

SetTaskDependencyData(*{RecordName | &Rowset}*)

Description

Use the SetTaskDependencyData method to specify either a record, or an already instantiated rowset, that contains the dependency data.

Note. If you specify a rowset, the data in the rowset must be provided in the correct display order.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName &Rowset</i>	Specify the record or rowset that contains the task data. If you specify a record, you must prefix the record name with the keyword Record .

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskData, page 492](#); [Chapter 11, "Charting Classes," SetTaskDependencyChildID, page 492](#); [Chapter 11, "Charting Classes," SetTaskDependencyURL, page 496](#) and [Chapter 11, "Charting Classes," SetTaskDependencyParentID, page 494](#)

SetTaskDependencyParentID**Syntax**

SetTaskDependencyParentID(*RecordName.FieldName*)

Description

The *depender* task is the task where the dependency arrow originates. Use the SetTaskDependencyParentID method to specify the field in the record that defines the task ID for the depender task.

The ID must match up to an ID in the Task data set.

This method is required if you specify dependency data.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field and its associated record that defines the task ID for the depender task. This field must be of type number.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskDependencyChildID, page 492](#) and [Chapter 11, "Charting Classes," SetTaskDependencyData, page 493](#)

SetTaskDependencyType**Syntax**

SetTaskDependencyType(*RecordName.FieldName*)

Description

Use the `SetTaskDependencyType` method to specify the type of dependency relationship between predecessor and successor tasks.

The values for type are as follows:

<i>Type</i>	<i>Description</i>
Finish-to-Start	The arrow starts at the end of the predecessor task bar and ends at the start of the successor task bar. This is the default value
Finish-to-Finish	The arrow starts at the end of the predecessor task bar and ends at the end of the successor task bar.
Start-to-Start	The arrow starts at the start of the predecessor task bar and ends at the start of the successor task bar.
Start-to-Finish	The arrow starts at the start of the predecessor task bar and ends at the end of the successor task bar.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that defines the type of dependencies between predecessor and successor tasks. This field must be of type integer, and one of the following values:

<i>Value</i>	<i>Description</i>
0 or any value greater than 3	Finish-to-Start
1	Finish-to-Finish
2	Start-to-Start
3	Start-to-Finish

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskDependencyChildID, page 492](#); [Chapter 11, "Charting Classes," SetTaskDependencyData, page 493](#) and [Chapter 11, "Charting Classes," SetTaskDependencyParentID, page 494](#)

SetTaskDependencyURL**Syntax**

SetTaskDependencyURL(*RecordName.FieldName*)

Description

Use the SetTaskDependencyURL method to specify the field in the record that defines the URL the browser redirects to when the user clicks on a task bar.

By default, the FieldChange event on the child ID field of the task dependency record is triggered if the image map based interactivity is turned on (using the IsDrillable property). This can be overridden by specifying a URL that is triggered when the task bar is clicked.

Use the SetTaskBarURL method to specify the URL to be used when the user clicks on a task bar in the chart section.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that defines the URL the browser is redirected to when the dependency arrow is clicked. This field must be of type character. The URL must be an absolute URL.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskBarURL, page 491](#); [Chapter 11, "Charting Classes," SetTaskDependencyChildID, page 492](#); [Chapter 11, "Charting Classes," SetTaskDependencyData, page 493](#) and [Chapter 11, "Charting Classes," SetTaskDependencyParentID, page 494](#)

SetTaskDrill

Syntax

SetTaskDrill(*Recordname.FieldName*)

Description

Use the SetTaskDrill method to specify for which field PeopleCode FieldEdit and FieldChange events will execute when the user clicks the task bar.

The field can be any field that is loaded in the component buffer.

The system does not change the value in the field when the user clicks the field. Any changes or other processing for the field must be done within the PeopleCode program.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the record name and the field name of the field to be used for field change processing. The field must be available in the component buffer.

Returns

None.

SetTaskExpanded

Syntax

SetTaskExpanded((*RecordName.FieldName*)

Description

Use the SetTaskExpanded method to specify the field in the record that defines the expanded state of parent tasks.

Whenever an end user changes the expanded state by clicking on the expand (collapse) icon in the table section, the expanded state in the rowset is updated. In addition, a field change event occurs to allow applications to synchronize expanded state changes with other parts of their application.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that defines the text in the task hint pop-up. This field must be of type character, that is, Y or N.

Returns

None.

SetTaskHints

Syntax

SetTaskHints(*RecordName.FieldName*)

Description

Use the SetTaskHints method to specify the field in the record which defines the task hint pop-up text. The description is displayed in a pop-up bubble when a cursor hovers over the task bar or milestone glyph.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that defines the text in the task hint pop-up. This field must be of type character.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskID, page 499](#) and [Chapter 11, "Charting Classes," SetTaskName, page 502](#)

SetTaskID

Syntax

SetTaskID(*RecordName.FieldName*)

Description

Use the SetTaskID method to specify the field that defines the unique task identifier. The task ID is used to support task linking and dependencies.

This method is required when you're creating a Gantt chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the record name and the field name of the field that defines the unique task identifier. The field must be of type number.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskName, page 502](#)

SetTaskLabel

Syntax

SetTaskLabel(*RecordName.FieldName*)

Description

Use the SetTaskLabel method to specify the field in the record that defines the task label. The label is displayed alongside its corresponding task bar in the chart area. If a task label is not provided, the task name is used instead. If a task name is not provided, the task id is used.

Parameters

Parameter	Description
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that contains the task label. This field must be of type character.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskID, page 499](#) and [Chapter 11, "Charting Classes," SetTaskName, page 502](#)

SetTaskLevel

Syntax

SetTaskLevel(*RecordName.FieldName*)

Description

Use the SetTaskLevel method to specify the field in the record that defines the level for the task. The outermost summary tasks are always defined as task level one. Tasks with task levels greater than one are subtasks. Subtasks may also contain other subtasks.

If a field is not provided to define the level, all tasks are defined at level 1. A maximum of 32 levels are supported.

The following table shows an example of the different levels that could be used, as well as what the parent task level is.

Note. The parent task is not actually part of the data.

Task Name	Task Level	Parent Level
Phase I	1	None
Evaluation	2	Phase I
Research	3	Evaluation
Report Findings	3	Evaluation

Task Name	Task Level	Parent Level
Create Budget	2	Phase I
Approve Budget	3	Create Budget
Phase II	1	None
Code and Test	2	Phase II
Phase III	1	None
Training	2	Phase III

Parameters

Parameter	Description
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that contains the information about the task level. This field must be of type number. Up to 32 levels are supported.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskID, page 499](#)

SetTaskMilestone

Syntax

SetTaskMilestone(*RecordName.FieldName*)

Description

Use the SetTaskMilestone method to specify the field in the record that defines whether the task should be treated as a milestone.

The fields specified by the SetPlannedStartDate and SetActualStartDate methods are used for determining the dates for the planned and actual milestones. The other date fields in the rowset are ignored

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field and its associated record that defines whether the task should be treated as a milestone. The field must be of type Character, and be one character long. The possible values for this field are Y, used to specify that this task is a milestone, or N, if not.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetActualStartDate, page 479](#); [Chapter 11, "Charting Classes," SetTaskMilestone, page 501](#) and [Chapter 11, "Charting Classes," SetPlannedStartDate, page 486](#)

SetTaskName

Syntax

SetTaskName(*RecordName.FieldName*)

Description

Use the SetTaskName method to specify the field in the record that defines the task name. If you do not specify a task name, the task ID is used in the table section of the Gantt chart.

Although this method is not required, Oracle recommends using it to display meaningful information in the table section of the Gantt chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field name and its associated record that defines the task name. The field must be of type character.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskID, page 499](#)

SetTaskProgress

Syntax

SetTaskProgress(*RecordName.FieldName*)

Description

Use the SetTaskProgress method to specify the field in the record that defines the length of the progress bar for this task as shown in the chart area of the Gantt chart.

The value in the field must be between 0 and 100, inclusive. Zero indicates no progress bar is shown, 100 indicates that the progress bar should cover the entire length of the task bar. Values greater than 100 are automatically converted to 100.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that defines the length of the progress bar for this task. This field must be of type number. The value in the field must be between 0 and 100, inclusive. You must not specify a value greater than 100.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetTaskProgressBarColor, page 503](#)

SetTaskProgressBarColor

Syntax

SetTaskProgressBarColor(*RecordName.FieldName*)

Description

Use the `SetTaskProgressBarColor` method to specify the field in the record that defines the color for the progress bar.

For the progress bar to be visible, its color must contrast with the task bar color. No borders are drawn around the progress bar.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RecordName.FieldName</i>	Specify the field, and its associated record, that defines the task progress bar color. This field must be of type numeric, which means that you can only use the numeric value for the chart colors, not the constant.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetActualTaskBarColor, page 480](#) and [Chapter 11, "Charting Classes," SetTaskProgress, page 503](#)

SetWBSNumbering

Syntax

SetWBSNumbering(*RecordName.FieldName*)

Description

Use the `SetWBSNumbering` method to specify the field in the record that defines the WBS numbering to be displayed for each task row in the table section of the Gantt chart.

A WBS is very similar in structure and layout to a document outline. Each item at a specific level of a WBS is numbered consecutively (that is, 10, 20, 30, 40, 50). Each item at the next level is numbered within the number of its parent item (that is, 10.1, 10.2, 10.3, 10.4). For example:

```
1.
  1.1
    1.1.1
    1.1.2
    1.1.3
  1.2
    1.2.1
    1.2.2
2.
. . .
```

If no field name is provided, WBS numbering is not displayed along with the tasks.

Regardless if WBS numbering is provided, child tasks are indented to the right of their parent task.

Parameters

Parameter	Description
RecordName.FieldName	Specify the field name and its associated record that defines the WBS numbering to be displayed. The field must be of type character.

Returns

None.

SetYearFormat

Syntax

```
SetYearFormat(Format)
```

Description

Use the SetYearFormat method to specify the format of years on the DateTime axis.

Parameters

Parameter	Description
Format	Specify the format of how the year should be displayed. Values are:

Value	Description
%Chart_YearFormat	Display the year in a numeric one- or two-digit format.

<i>Value</i>	<i>Description</i>
%Chart_YearFormat_2Digit	Display the year in a numeric two-digit format.
%Chart_YearFormat_4Digit	Display the year in a numeric four-digit format.

Returns

None.

See Also

[Chapter 11, "Charting Classes," SetDayFormat, page 481](#) and [Chapter 11, "Charting Classes," SetMonthFormat, page 485](#)

Gantt Class Properties

These properties are used by the Gantt class. The properties are described in alphabetic order.

AxisEndTime

Description

Use this property to specify the date and time where the chart axis should end. The value must be of type Date or DateTime.

This property is read-write.

AxisStartTime

Description

Use this property to specify the date and time where the chart axis should begin. The value must be of type Date or DateTime.

This property is read-write.

DataEndDateTime

Description

Use this property to specify where the chart should stop displaying data. The value must be of type `DateTime`.

This property is read-write.

DataStartDateTime

Description

Use this property to specify where the chart should start displaying data. The value must be of type `DateTime`.

This property is read-write.

DataStartRow

Description

This property sets or returns the row number (after any preprocessing) at which to start plotting. This is useful when you have many rows of data in a rowset, and you want to start at a particular row. This can also be useful for creating your own 'scrolling' effect, by specifying both the start row and how many rows to be displayed (by using the `DataWidth` property).

If this property is not set, then the value is 1.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," DataWidth, page 454](#)

DataWidth

Description

This property returns or sets the number of rows to plot for a series. The starting point for the number of rows is set with the `DataStartRow` property. If the `DataWidth` property value is not set, then the width is from the `DataStartRow` to the last element in the rowset. If the property value is less than zero, then it will automatically be set to one.

This property is read-write.

Example

Suppose your rowset returned 400 rows. You wouldn't want all 400 to display in your chart. Instead, you'd pick a subset of those rows. The row to start with is set with `DataStartRow`, while how many rows to display is set with `DataWidth`.

The following code could be used with a push button connected with a chart. The push button enables the next set of data to be displayed with the chart. You don't need to refresh after setting this property. When a method or property is used, the chart is automatically refreshed.

```
Local Chart &MyChart;  
  
&MyChart = GetChart(ChartRec.DisplayField);  
&Start = &MyChart.DataStartRow;  
/* display the next 20 rows of data */  
&MyChart.DataStartRow = &Start + 20;  
&MyChart.DataWidth = 20;
```

See Also

[Chapter 11, "Charting Classes," DataStartRow, page 454](#)

GridLines

Description

Use this property to specify whether to show grid lines with the chart.

Note. This property is ignored unless you have set `RevertToPre850` to `True` for the chart.

Gantt charts only support the `%ChartGrid_Vertical` and `%ChartGrid_None` values.

Grid lines are shown within the chart section of the Gantt chart, if enabled, and are tied to the major tick mark. The major tick mark is associated with the smallest time increment displayed on the `DateTime` axis using the `SetFormat` functions such as the `SetMonthFormat`, `SetDayFormat`, and so on. For example, if you choose to display both years and months on the `DateTime` axis, the major tick marks denote the months.

If you do not specify a value, no grid lines are shown.

This property controls only the display of grid lines. If you want to specify the style of the grid lines, use the `GridLineType` property.

The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	<code>%ChartGrid_None</code>	Don't show grid lines (default)
2	<code>%ChartGrid_Vertical</code>	Show vertical grid lines

This property is read-write.

See Also

[Chapter 11, "Charting Classes," GridLineType, page 455](#)

GridLineType

Description

Use this property to specify the style of the grid lines when either or both vertical or horizontal grid lines are turned on.

Note. This property is ignored unless you have set `RevertToPre850` to `True` for the chart.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

The default value is `%ChartLine_Solid`. The possible values are:

<i>Value</i>	<i>Description</i>
<code>%ChartLine_Solid</code>	Draw grid lines with solid lines.
<code>%ChartLine_Dash</code>	Draw grid lines with lines composed of dashes.
<code>%ChartLine_Dot</code>	Draw grid lines with lines composed of dots.
<code>%ChartLine_DashedDot</code>	Draw grid lines with lines composed of both dashes and dots.

This property is read-write.

HasLegend

Description

Use this property to specify if a legend is displayed with the chart. This property takes a Boolean value: `True`, if the legend is displayed with the chart, `False` otherwise.

The default value is `False`.

This property is read-write.

Height

Description

Use this property to specify the height of the chart. This property takes a numeric value. The unit of measurement is pixels.

Generally this property is used with charts created for iScripts, to specify the height of the image, before generating the image map. You can also use it to overwrite the height set in PeopleSoft Application Designer.

If you try to read this property before setting it, the value returned is zero.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Height, page 456](#)

ImageMap

Description

This property returns the HTML client-side image map. The image map is what makes the chart interactive.

This property is read-only.

See Also

[Chapter 11, "Charting Classes," Creating a Chart Using an iScript, page 596](#)

InteractiveEnd

Description

Use this property to specify whether the user can change the end date of a task by dragging and dropping.

This property takes a Boolean value: True if the user can change the end date, False otherwise.

The default value of this property is False.

This property is read-write.

InteractiveMove

Description

Use this property to specify whether the user can move a task bar by dragging and dropping.

This property takes a Boolean value: True if the user can move the bar, False otherwise.

The default value of this property is True.

This property is read-write.

InteractiveProgress

Description

Use this property to specify whether the user can change the progress value of a task by dragging and dropping.

This property takes a Boolean value: True if the user can change the progress value, False otherwise.

The default value of this property is True.

This property is read-write.

InteractiveStart

Description

Use this property to specify whether the user can change the start date of a task by dragging and dropping.

This property takes a Boolean value: True if the user can change the start date, False otherwise.

The default value of this property is False.

This property is read-write.

IsDrillable

Description

The IsDrillable property is used with the task bars as well as the task dependency lines in the chart section of a Gantt chart. Where the user is directed depends on whether a URL is provided or not, as detailed in this table:

User Action	If URL is not provided:	If URL is provided:
Clicks a task bar.	FieldChange event is associated with the Planned End Date field in the Task table.	Redirects to URL provided by field identified using the SetTaskBarURL method.
Clicks a task dependency line.	FieldChange event is associated with the Child ID field in the Task Dependency table.	Redirects to URL provided by field identified using the SetTaskDependencyURL method.
Clicks an expand/collapse icon.	FieldChange event is associated with the task data.	Redirects to URL provided by field identified using the SetTaskBarURL method.

This property takes a Boolean value: True if the end-user can click the chart to initiate an action, and False otherwise.

Note. Setting this property has no effect if the IsPlainImage property is set as True.

Note. When using a chart in an iScript, this property must be used in conjunction with the SetDataURLs method. The SetDataURLs method must point to a field that is populated with the URLs to be triggered for each data point in the chart.

The default value for this property is False.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," IsPlainImage, page 512](#)

IsPlainImage

Description

Use this property to specify whether the chart is built without any extra HTML, such as SRC or MAP tags.

If this property is specified as True, the end-user will not be able to click on the chart to trigger an event. In addition, the pop-up data hints will not appear when the end-user passes a mouse over the chart. However, you may see a performance improvement if your chart has an extremely complicated image map and you specify this property as True.

This property takes a Boolean value: True if the chart is built without extra HTML, False otherwise.

The default value of this property is False.

This property is read-write.

LegendPosition

Description

Use this property to specify where the legend should appear, in relationship to the chart. You can specify either a numeric or constant value for this property.

Note. ChartLegend_Separate generates a legend without a chart. The legend takes over the entire charting area. The legend appears in the center of the chart.

The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartLegend_Left	Display legend to the left of the chart.
1	%ChartLegend_Right	Display legend to the right of the chart.
2	%ChartLegend_Top	Display legend on top of the chart.
3	%ChartLegend_Bottom	Display legend below the chart.
4	%ChartLegend_Separate	Generate a legend without a chart. This property is read-write.

LegendStyle

Description

Use this property to specify the style of the legend. The values for this property are the style classes contained in the style sheet associated with the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

MainTitle

Description

Use this property to specify the text for the main title of the chart.

This property takes a string value.

This property is read-write.

MainTitleStyle

Description

Use this property to specify the style of the main title. The values for this property are the style classes contained in the style sheet associated with the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

PixelsPerRow

Description

This property returns an integer value of the row height (in pixels) for each row in the table section. Use this property to properly size the height of the table section of your Gantt chart so that all rows in the table are displayed. You can do so by multiplying the value for the PixelsPerRow property by the number of visible rows in the rowset.

The system calculates the value of the PixelsPerRow property at runtime after the Gantt image is rendered. To do so, this property must be read after the PeopleCode Activate event. This can be done by reading in the PixelPerRow value during a FieldChange event on a refresh button on the page.

This property is read-only.

RevertToPre850

Description

PeopleTools Version 8.50 implements new chart style classes that bring a consistent look and feel to charts.

Use this property to specify whether the chart will revert to the pre-PeopleTools 8.50 chart style classes.

Warning! By default RevertToPre850 is set to False, which means that charts that were created prior to PeopleTools 8.50 will use the new 8.50 chart style classes.

Any custom Chart class properties that were set in PeopleCode for existing charts that use the new 8.50 chart style classes will be ignored if those properties are defined in the 8.50 chart style classes.

Oracle strongly recommends that you review existing charts to verify that they display correctly.

This property takes a Boolean value:

<i>Parameter</i>	<i>Description</i>
True	Do not use the PeopleTools 8.50 style classes for this chart so that the chart will maintain its original appearance.
False	Use the PeopleTools 8.50 style classes for this chart. Any chart properties that are set in application PeopleCode may be overridden by the 8.50 style classes.

The default is False.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," OLLineType, page 462](#)

ShowTaskLabels

Description

Use this property to specify whether or not task labels are displayed alongside the corresponding task bar in the chart area. This property takes a boolean value; true to display the labels, false to not display the labels. The default is to display the labels.

This property is read-write.

Style

Description

A *style sheet* is a definition, like a record or field definition, that you create in PeopleSoft Application Designer. It contains a collection of formatting styles, called *classes*, each of which can be applied to either the entire chart or to specific elements within a chart.

Use this property to specify the overall style of the chart by specifying a style class. The value must be a valid class within the style sheet specified for the chart.

Individual style properties (such as `SetXAxisStyle`, `MainTitleStyle`, and so on) can be used to override this value for individual elements of the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

StyleSheet

Description

Use this property to associate a style sheet with a chart.

The `PTSTYLEDEF` style sheet is the default style sheet associated with a chart.

Both the `Style` property for the chart, and individual style properties (such as `SetXAxisStyle`, `MainTitleStyle`, and so on) can be used to override this value for individual elements of the chart.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

TaskDependencyLineType

Description

Use this property to specify an integer value that specifies the line type of the line connecting dependent tasks. This value affects all the dependency lines for the entire Gantt chart, not just for a specific set of tasks.

This property is read-write.

See [Chapter 11, "Charting Classes," Using Style Sheets with PeopleTools Version 8.50 Charts, page 386](#) and [Chapter 11, "Charting Classes," RevertToPre850, page 463](#).

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ChartLine_Solid	Solid line
1	%ChartLine_Dashed	Dashed line
2	%ChartLine_Dotted	Dotted line
3	%ChartLine_Mixed	Mixture of dashes and dots

TaskMilestoneGlyph

Description

Use this property of type integer to specify which field in the record defines the glyph to represent a task milestone (for both planned and actual milestones). This glyph is used for the entire chart, not just for a specific task.

By default a diamond shaped glyph will be used.

Milestones associated with planned dates use colors defined by the SetPlannedTaskBarColor method. Milestones associated with actual dates use colors defined by the SetActualTaskBarColor method.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Using Gantt Glyphs, page 405](#)

TaskTitle

Description

Use this property to specify the column title to be displayed in column one (that is, the left-most column) in the table section of the Gantt chart. Use the SetTaskAppDataTitles method to specify the column titles for the application specific data fields (that is, column two and beyond).

This property is read-write.

See Also

[Chapter 11, "Charting Classes," SetTaskAppDataTitles, page 490](#)

Width

Description

Use this property to specify the width of the chart. This property takes a numeric value. The unit of measurement is pixels.

Generally this property is used with charts created for iScripts, to specify the width of the image, before generating the image map. You can also use it to overwrite the width set in PeopleSoft Application Designer.

If you try to read this property before setting it, the value returned is zero.

This property is read-write.

XAxisPosition

Description

Use this property to specify the position of the X axis relative to the Y axis.

Note. This property is not supported in Gantt charts.

You can use either a constant or a numeric value for this property. Valid values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
1	%ChartAxis_ZeroPosition	Positions the axis in line with the 0 on the opposite axis. Default position for the axis.
2	%ChartAxis_LowPosition	Positions the axis in line with the lowest value on the opposite axis.
3	%ChartAxis_HighPosition	Positions the axis in line with the highest value on the opposite axis.

This property is read-write.

YAxisPosition

Description

Use this property to specify the position of the Y axis relative to the X axis.

Note. This property is not supported in Gantt charts.

You can use either a constant or a numeric value for this property. Valid values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
1	%ChartAxis_ZeroPosition	Positions the axis in line with the 0 on the opposite axis. Default position for the axis.
2	%ChartAxis_LowPosition	Positions the axis in line with the lowest value on the opposite axis.
3	%ChartAxis_HighPosition	Positions the axis in line with the highest value on the opposite axis.

This property is read-write.

OrgChart Class Methods

These methods are used by the OrgChart class. The methods are described in alphabetic order.

SetCrumbData

Syntax

SetCrumbData(*&Rowset*)

Description

Use the SetCrumbData method to specify the source for the data for the organization chart breadcrumbs. Use an already instantiated and populated level-1 component rowset that contains the breadcrumb data.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Rowset</i>	A level-1 rowset populated with the breadcrumbs data.

Returns

None.

SetCrumbRecord

Syntax

SetCrumbRecord(**Record**.*Record_Name*)

Description

Use the SetCrumbRecord method to specify the derived/working record name that contains the information about the breadcrumbs.

The breadcrumb record is an application-specific derived/work record created using a clone of the PTORGCRMB_SBR subrecord definition.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record.Record_Name</i>	Specify the name of the derived/work record that contains the data for the breadcrumbs. You must include the Record keyword.

Returns

None.

SetDropdownData

Syntax

SetDropdownData (&*Rowset*)

Description

Use the SetDropdownData method to specify the source for the data for the organization chart drop-down list boxes. Use an already instantiated and populated level-1 component rowset that contains the drop-down list data.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Rowset</i>	A level-1 rowset populated with the drop-down list data.

Returns

None

SetDropDownRecord

Syntax

SetDropDownRecord(**Record**.RecordName)

Description

Use the SetDropDownRecord method to specify the derived/working record name that contains the information about the dropdown lists.

The dropdown record is an application-specific derived/work record created using a clone of the PTORGBOXLIST_SBR subrecord definition.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record_Name</i>	Specify the name of the derived/work record that contains the data for the drop down lists. You must include the Record keyword.

Returns

None

SetLegend

Syntax

SetLegend(&Array_of_String)

Description

Use the `SetLegend` method to specify legend text. Legend text labels the images set using `SetLegendImg`.

If you do not specify an element for an array (that is, a blank or a null) then no legend is listed for that node.

Note. Legend text is not automatically translated. If you set your own labels, be sure to use translated text, such as message catalog entries.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array_of_String</i>	Specify an already instantiated array of string, containing the text that you want to use for the legend.

Returns

None.

Example

```
&LegendArray = CreateArray("A", "B", "C", "D ");  
&ocOrgChart.SetLegend (&LegendArray);
```

See Also

[Chapter 11, "Charting Classes," SetDataSeries, page 443](#)

[Chapter 8, "Array Class," page 257](#)

SetLegendImg

Syntax

```
SetLegendImg(&Array_of_String)
```

Description

Use the `SetLegendImg` method to specify the legend image names.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array_of_String</i>	An already instantiated array containing the names of the images that you want to use with the legend.

Returns

None.

SetNodeData

Syntax

SetNodeData(*&Rowset*)

Description

Use the SetNodeData method to specify the source for the node data for the organization chart. Use an already instantiated and populated level-1 component rowset that contains the node data.

This is a required method to build an organization chart.

If you make a change to the underlying data of a chart, call the SetNodeData method again to update the chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Rowset</i>	A level-1 component rowset populated with the node data. This rowset references the node record of the chart.

Returns

None.

SetNodeRecord

Syntax

SetNodeRecord(**Record**.*Record_Name*)

Description

Use the SetNodeRecord method to specify the organization node record.

The node record is an application-specific derived/work record created using a clone of the PTORGNODE_SBR subrecord definition.

This method is required to build an organization chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record.Record_Name</i>	Specify the name of the derived/work record that contains the data for the organization node. You must include the Record keyword.

Returns

None.

SetPopUpNodeData

Syntax

SetPopUpNodeData(&*Rowset*)

Description

Use the SetPopUpNodeData method to specify the source for the pop-up node data for the organization chart. Use an already instantiated and populated level-1 component rowset that contains the pop-up node data.

This method is not required if no pop-up chart is available to be displayed in the organization chart.

If you make a change to the underlying data of a pop-up chart, call the SetPopUpNodeData method again to update the chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Rowset</i>	A level-1 rowset populated with the pop-up node data. This rowset references the pop-up node record of the chart.

Returns

None.

SetPopUpNodeRecord

Syntax

SetPopUpNodeRecord(**Record**.*Record_Name*)

Description

Use the SetNodeRecord method to specify the pop-up node record.

The node record is an application-specific derived/work record created using a clone of the PTORGPOPUP_SBR subrecord definition.

This method is not required if no pop-up chart is available to be displayed in the organization chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record.Record_Name</i>	Specify the name of the derived/work record that contains the data for the pop-up node. You must include the Record keyword.

Returns

None.

OrgChart Class Properties

These properties are used by the OrgChart class. The properties are described in alphabetic order.

CenterFocusNode

Description

Specify whether the node with focus displays centered in the chart area.

<i>Value</i>	<i>Direction</i>
0	Center the focus node
2	Do not center the focus node

The focus node is not centered if the chart fits in the chart area without a horizontal scroll, even if CenterFocusNode = 0.

The focus node is not centered if any pop-ups are opened. The display of pop-ups in the visible chart area takes priority over focus node centering.

Note. If multiple pop-ups are opened, the last popup opened is not necessarily set to the visible area. This is determined by the position of the pop-up in the rowset.

The default is 0.

This property is read-write.

ChartScrollType

Description

Specify whether to use scroll bars or alternative scrolling to move the chart within the visible chart area.

<i>Value</i>	<i>Direction</i>
0	Use scroll bars
1	Use alternative scrolling. This allows the user to use the scroll navigator or to grab the surface of the organization chart background to move the chart in any direction.

Note. To use the mouse hand feature, the chart background color must be specified in the PSORGCHART style sheet. By default, the background color is white.

This property takes an integer value.

The default is 0.

This property is read-write.

Collapsed_Msg

Description

Specify the mouseover text message for the collapsed icon image.

An error message is issued if Collapsed_Msg is set but CollapsedImage is not set.

The default is "Expand".

This property is read-write.

CollapsedImage

Description

Specify the name of the collapsed node image.

If the CollapsedImage and ExpandedImage properties are not specified, then no expanded/collapsed icon appears on the node and the expand/collapse actions are disabled.

This property is read-write.

CollapseMainIconSpace

Description

Specify whether to reduce the space at the top of the node reserved for the main icon..

<i>Value</i>	<i>Direction</i>
0	Reserve space at the top of the node for the main icon.
1	Reduce the space at the top of the node reserved for the main icon.

This property takes an integer value.

The default is 0.

This property is read-write.

CrumbDescrStyle

Description

Use this property to specify the style class name that will be used to control the style of linkable breadcrumbs.

The default style class is PT_ORGCHART_BRDCRM.

Oracle recommends that you use the default breadcrumb style.

This property is read-write.

CrumbMaxDisplayLength

Description

Use this property to set the maximum description length that will appear for the breadcrumb.

A breadcrumb description has a maximum of 50 characters in length. If CrumbMaxDisplayLength is set to 30, then only the first 30 characters of the description appear and an ellipsis ("...") is appended.

On mouseover, the whole text of the breadcrumb appears.

The default is to show the full description.

This property takes a number value.

This property is read-write.

CrumbSeparatorImage

Description

Use this property to specify the image name for the image that appears between breadcrumb entries.

If this property is not set, then no image appears between breadcrumb entries. Instead, breadcrumb entries are separated by three spaces.

This property takes a string value.

This property is read-write.

DefaultImage

Description

Use this property to set the default image name for the image that will appear if ImageLocation is not 0 and no image is set in the work record.

This property is read-write.

Direction

Description

Use this property to specify chart node direction.

<i>Value</i>	<i>Direction</i>
0	Left to Right
2	Up to Down

For an organization chart, the only valid values are 0 (Left to Right) and 2 (Up to Down).

The default is 2 (Up to Down).

This property is read-write.

DropDownBoxStyle

Description

Specify the style for the drop-down list box header for the organization chart.

<i>Value</i>	<i>Description</i>
PT_ACTION_POSITION	The button appears to left, aligned with the other descriptors.
PT_ACTION_POSITION_RIGHT	The button appears to right.
PT_ACTION_POSITION_CENTER	The button appears in the center of the node.

The default style class is PT_ACTION_POSITION.

This property is read-write.

Expanded_Msg

Description

Specify the mouseover text message for the expanded icon image.

An error message is issued if Expanded_Msg is set but ExpandedImage is not set.

The default is "Collapse".

This property is read-write.

ExpandedImage

Description

Specify the name of the expanded node image.

If the CollapsedImage and ExpandedImage properties are not specified, then no expanded/collapsed icon appears on the node and the expand/collapse actions are disabled.

This property is read-write.

HasLegend

Description

Use this property to specify if a legend appears with the chart. This property takes a Boolean value: True if the legend appears with the chart, and False otherwise.

The default value is False.

This property is read-write.

Height

Description

Use this property to specify the height of the chart. This property takes a numeric value. The unit of measurement is pixels.

If you try to read this property before setting it, the value returned is 0.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Height, page 456](#)

ImageHeight**Description**

Use this property to specify the height of the node image. This property takes a numeric value. The unit of measurement is pixels.

Note. If ImageHeight is very large relative to the chart, tooltips may not have room to display properly. If this occurs, you need to reduce ImageHeight or increase chart size.

The default is 0.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Height, page 456](#)

ImageLocation**Description**

Use this property to specify chart node image location:

<i>Value</i>	<i>Direction</i>
0	No image
1	Image on the left
2	Image on the right

The default is 0 (No image).

This property is read-write.

ImageMouseoverMagnificationFactor

Description

Use this property to specify the mouseover magnification factor on the node image. This property takes a numeric value. A value of 100 produces a mouseover image the same size as the node image. If the value is set to 0 or 100, no image magnification will occur.

Valid values are 0 to 1000.

The default is 0.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Height, page 456](#)

LegendPosition

Description

The OrgChart class only supports %ChartLegend_Top, which is to display the legend on top of the chart.

This property is read-write.

LegendStyle

Description

Use this property to specify the style of the legend. The values for this property are the style classes contained in the style sheet associated with the chart.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_ORGCHART_LEGEND.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

LegendTopSpace

Description

Use this property to set the space between the breadcrumb and legend.

The default is no space between the legend and the breadcrumbs.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

MainTitle

Description

Use this property to specify the text for the main title of the chart.

This property takes a string value.

This property is read-write.

MainTitleStyle

Description

Use this property to specify the style of the main title. The values for this property are the style classes contained in the style sheet associated with the chart.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default value is "PT_ORGCHART_TITLE".

This property is read-write.

MaxDropdownDisplayItem

Description

Specify the maximum number of list items that will appear in the drop down box before the up-and-down arrow vertical scrolling is implemented.

This property takes an integer value.

The default value is 7.

This property is read-write.

MaxPopupDisplayNode

Description

The maximum number of nodes to be displayed in the pop-up before a vertical scrollbar appears in the pop-up.

For instance, if MaxPopupDisplayNode is set to 3 and the pop-up has more than 3 nodes, then the pop-up will only display the first 3 nodes with a scrollbar in the pop-up so the user can scroll down to see the other nodes.

The default value is 3.

This property is read-write.

NodeDescr1Style

Description

The style class name that will be used to control the style of the main chart node descriptor number 1.

Each node can have up to seven descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_ORGNODE_DESC1.

This property is read-write.

NodeDescr2Style

Description

The style class name that will be used to control the style of the main chart node descriptor number 2.

Each node can have up to seven descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_ORGNODE_DESC2.

This property is read-write.

NodeDescr3Style

Description

The style class name that will be used to control the style of the main chart node descriptor number 3.

Each node can have up to seven descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_ORGNODE_DESC3.

This property is read-write.

NodeDescr4Style

Description

The style class name that will be used to control the style of the main chart node descriptor number 4.

Each node can have up to seven descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_ORGNODE_DESC4.

This property is read-write.

NodeDescr5Style

Description

The style class name that will be used to control the style of the main chart node descriptor number 5.

Each node can have up to seven descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_ORGNODE_DESC5.

This property is read-write.

NodeDescr6Style

Description

The style class name that will be used to control the style of the main chart node descriptor number 6.

Each node can have up to seven descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_ORGNODE_DESC6.

This property is read-write.

NodeDescr7Style

Description

The style class name that will be used to control the style of the main chart node descriptor number 7.

Each node can have up to seven descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_ORGNODE_DESC7.

This property is read-write.

NodeMaxDisplayDescLength

Description

Set the maximum descriptor length that will appear in the node.

If the full descriptor text is longer than NodeMaxDisplayDescLength, then an ellipsis ("...") is appended to the displayed text. The entire text appears in a mouseover.

The default value is 50 characters.

This property is read-write.

OptimizeHorizontalSpace

Description

Set this property to automatically maximize or minimize the chart area horizontally.

<i>Value</i>	<i>Direction</i>
0	Use the specified size.
1	Expand horizontally to the right edge of the browser page. This option should only be used when there is only blank space to the right of the chart. Otherwise, any objects in that area will be pushed off the viewable area.
2	Contract horizontally to just to the right of the node furthest to the right.
3	Fit the chart area to the chart horizontally.

This property takes an integer value.

The default is 0.

This property is read-write.

OptimizeVerticalSpace

Description

Set this property to automatically maximize or minimize the chart area vertically.

<i>Value</i>	<i>Direction</i>
0	Use the specified size.
1	Expand vertically to the right edge of the browser page. This option should only be used when there is only blank space at the bottom of the chart. Otherwise, any objects in that area will be pushed off the viewable area.
2	Contract vertically to just below the bottom of the last visible chart node.
3	Fit the chart area to the chart vertically.

This property takes an integer value.

The default is 0.

This property is read-write.

PopupHeaderStyle

Description

The style class that will be used to control the style of the pop-up header and the header descriptor.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_POPUPNODE_HEADER.

This property is read-write.

PopupNodeDescr1Style

Description

The style class name that will be used to control the style of the pop-up node descriptor number 1.

Each node can have up to eight descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_POPUPNODE_DESC1.

This property is read-write.

PopupNodeDescr2Style

Description

The style class name that will be used to control the style of the pop-up node descriptor number 2.

Each node can have up to eight descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_POPUPNODE_DESC2.

This property is read-write.

PopupNodeDescr3Style

Description

The style class name that will be used to control the style of the pop-up node descriptor number 3.

Each node can have up to eight descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_POPUPNODE_DESC3.

This property is read-write.

PopupNodeDescr4Style

Description

The style class name that will be used to control the style of the pop-up node descriptor number 4.

Each node can have up to eight descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_POPUPNODE_DESC4.

This property is read-write.

PopupNodeDescr5Style

Description

The style class name that will be used to control the style of the pop-up node descriptor number 5.

Each node can have up to eight descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_POPUPNODE_DESC5.

This property is read-write.

PopupNodeDescr6Style

Description

The style class name that will be used to control the style of the pop-up node descriptor number 6.

Each node can have up to eight descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_POPUPNODE_DESC6.

This property is read-write.

PopupNodeDescr7Style

Description

The style class name that will be used to control the style of the pop-up node descriptor number 7.

Each node can have up to eight descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_POPUPNODE_DESC7.

This property is read-write.

PopupNodeDescr8Style

Description

The style class name that will be used to control the style of the pop-up node descriptor number 8.

Each node can have up to eight descriptors, each with its own style.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_POPUPNODE_DESC8.

This property is read-write.

Style

Description

A *style sheet* is a definition, like a record or field definition, that you create in PeopleSoft Application Designer. It contains a collection of formatting styles, called *classes*, each of which can be applied to either the entire chart or to specific elements within a chart.

Use this property to specify the overall style of the chart by specifying a style class. The value must be a valid class within the style sheet specified for the chart.

Individual style properties (such as Legend Style, MainTitleStyle, and so on) can be used to override this value for individual elements of the chart.

The default style class is PT_ORGCHART.

This property is read-write.

SuppressPeopleCodeOnNode

Description

Specify whether to suppress processing, such as re-centering the chart, when a user clicks on a chart node if no PeopleCode is associated with the node.

This property takes a Boolean value: True to suppress a click on a chart node, and False otherwise.

The default value is False.

This property is read-write.

SuppressPeopleCodeOnImage

Description

Specify whether to suppress a processing, such as re-centering the chart, when a user clicks on a chart image if no PeopleCode is associated with the image.

This property takes a Boolean value: True to suppress a click on a chart image, and False otherwise.

The default value is False.

This property is read-write.

UnlinkCrumbDescrStyle

Description

Use this property to specify the style class name that will be used to control the style of the unlinkable breadcrumb.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_ORGCHART_UNLINK_BRDCRM.

Oracle recommends that you use the default breadcrumb unlinkable style.

This property is read-write.

VerticalSpace

Description

Use this property to specify the amount of space above the first level of nodes in an organization chart. If the chart has a legend, the vertical space is measured as the distance from the top of the first level of nodes to the bottom of the legend. If the chart has no legend, the vertical space is the distance from the top of the first level of nodes to the top of the chart area.

This property only applies to charts with a vertical orientation (Direction = 2).

This property takes a numeric value. The unit of measurement is pixels.

The default value is 10 pixels.

This property is read-write.

Width

Description

Use this property to specify the width of the chart. This property takes a numeric value. The unit of measurement is pixels.

If you try to read this property before setting it, the value returned is 0.

This property is read-write.

RatingBoxChart Class Methods

These methods are used by the RatingBoxChart class. The methods are described in alphabetic order.

SetLegend

Syntax

SetLegend(&Array_of_String)

Description

Use the SetLegend method to specify legend text. Legend text labels the images set in the RatingBoxChart class method SetLegendImg.

Note. Legend text is not automatically translated. Be sure to use translated text, such as message catalog entries.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array_of_String</i>	Specify an already instantiated array of string, containing the text that you want to use for the legend.

Returns

None.

Example

```
&LegendArray = CreateArray("A", "B", "C", "D");  
&oRatingBoxChart.SetLegend(&LegendArray);
```

See Also

[Chapter 11, "Charting Classes," SetDataSeries, page 443](#)

[Chapter 8, "Array Class," page 257](#)

[Chapter 11, "Charting Classes," SetLegendImg, page 544](#)

SetLegendImg

Syntax

SetLegendImg(*&Array_of_String*)

Description

Use the SetLegendImg method to specify the legend image names.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array_of_String</i>	An already instantiated array containing the names of the images that you want to use with the legend.

Returns

None.

SetRBNodeData

Syntax

SetRBNodeData(*&Rowset*)

Description

Use the SetRBNodeData method to specify the level 1 component rowset that is the source for the node data for the rating box chart.

If you make a change to the underlying data of a chart, call the SetRBNodeData method again to update the chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Rowset</i>	An already instantiated and populated component rowset object that references the rating chart node record.

Returns

None.

SetRBNodeRecord

Syntax

SetRBNodeRecord(**Record**.*RecordName*)

Description

Use the SetRBNodeRecord method to specify the record that is to contain the node data for the rating box chart.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Record.RecordName</i>	Specify the name of the record to be used as the node record.

Returns

None.

SetXAxisLabels

Syntax

SetXAxisLabels(&*Array_of_Any*)

Description

Use the SetXAxisLabels method to specify an array of labels for the X axis.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array_of_Any</i>	Specify an already instantiated array of any that contain the labels that you want to use for the X Axis. The array size must match the value in the XAxisBoxNum property. If they do not match, the system throws a runtime error.

Returns

None.

See Also

[Chapter 8, "Array Class," page 257](#)

SetYAxisLabels

Syntax

SetYAxisLabels(*&Array_of_Any*)

Description

Use the SetYAxisLabels method to specify an array of labels for the Y axis.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array_of_Any</i>	Specify an already instantiated array of any that contain the labels that you want to use for the Y Axis. The array size must match the value in the YAxisBoxNum property. If they do not match, the system throws a runtime error.

Returns

None.

See Also

[Chapter 8, "Array Class," page 257](#)

RatingBoxChart Class Properties

These properties are used by the RatingBoxChart class. The properties are described in alphabetic order.

BoxMaxDisplayItems

Description

Specify how many nodes are to be shown in the displayable area of the box. When the number of nodes to be shown exceeds BoxMaxDisplayItems, a link labeled "View all (N)" appears at the bottom right of the box, where *N* is the total number of nodes in the box. The user can click the link to launch a pop-up that contains all the nodes. A scrollbar enables the user to scroll through all the nodes in the list.

Only one pop-up window will appear in the rating box chart, so when the user clicks another "View all (*N*)" link in another box, the previous pop-up window closes and the new pop-up window opens at the center of the rating box.

If an invalid (negative) value is specified, an error will be thrown at runtime.

The default value is 1.

This property is read-write.

DraggedNodeStyle

Description

Use this property to specify the style class that controls the appearance of a node as it is being dragged.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_RATBOX_DRAGGED_NODE.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

GridLineType

Description

Use this property to specify the style of the grid lines.

The default value is %ChartLine_Solid. The possible values are:

<i>Value</i>	<i>Description</i>
%ChartLine_Solid	Draw grid lines with solid lines.
%ChartLine_Dash	Draw grid lines with lines composed of dashes.
%ChartLine_Dot	Draw grid lines with lines composed of dots.

This property is read-write.

HasLegend

Description

Use this property to specify if a legend appears with the chart. This property takes a Boolean value: True if the legend appears with the chart, and False otherwise.

The default value is False.

This property is read-write.

Height

Description

Use this property to specify the height of the chart. This property takes a numeric value. The unit of measurement is pixels.

The default value is the height of the chart control on the page definition.

If you set a chart height value that cannot fit the X axis and label areas of the chart, a runtime error is thrown and the chart is not rendered.

If you set a negative value, a runtime error is thrown and the chart is not rendered.

If you try to read this property before setting it, the value returned is 0.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Height, page 456](#)

IconOnlySelectedQuadrantStyle

Description

Use this property to specify the style class that controls the appearance of border properties of the selected quadrant of an icon-only rating box chart when the system displays the view all pop-up.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default is PT_RATBOX_ICONONLY_BOX.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

IsDragable

Description

Specify whether the node in the rating box can be dragged and dropped. If the property is specified as *True*, then user will be able to drag the node in the rating box and drop it to another quadrant. If the property is *False*, then the drag and drop action is disabled.

The default value is *True*.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Height, page 456](#)

LegendPosition

Description

Use this property to specify where the legend should appear in relationship to the chart. You can specify either a numeric or constant value for this property.

The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
2	%ChartLegend_Top	Display legend at the top of the chart.
3	%ChartLegend_Bottom	Display legend below the chart.

If you set a value other than 2 or 3, a runtime error is thrown and the chart is not rendered.

This property is read-write.

MainTitle

Description

Use this property to specify the text for the main title of the chart.

This property takes a string value.

This property is read-write.

MainTitleStyle

Description

Use this property to specify the style of the main title. The values for this property are the style classes contained in the style sheet associated with the chart.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_RATBOX_TITLE.

This property is read-write.

NDMaxDisplayDescLength

Description

Specify the maximum number of characters that will display for the description.

When the ShowNodeDescription chart property is set to True, then both the icon and the description of the node will appear in the quadrant.

If the description is larger than NDMaxDisplayDescLength then the node displays the number of characters specified in NDMaxDisplayDescLength, followed by an ellipsis.

If the full node description or the number of characters specified in `NMaxDisplayDescLength` cannot fit in a box at runtime the description is automatically truncated. An ellipsis (...) follows the truncated text.

You only need to set this property if you want the truncated text to be less than the automatically truncated text.

When the user mouses over the truncated node description, the whole text displays in a tool tip.

If an invalid (negative) value is specified, an error will be thrown at runtime.

The default value is 50.

This property is read-write.

PopUpHeaderStyle

Description

Use this property to specify the style class that controls the appearance of the pop-up header.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is `PT_RATBOX_POPUP_HEADER`.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

PopUpHeight

Description

Specify the height of the pop-up chart in pixels.

This parameter takes a number value.

The recommended value is half of the rating box chart height.

If you set a pop-up chart height value that cannot fit the X axis area of the popup chart, a runtime error is thrown.

The default value is 0. If a negative value is specified, an error will be thrown at runtime.

This property is read-write.

PopUpStyle

Description

Use this property to specify the style class that controls the appearance of the pop-up.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_RATBOX_POPUP.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

PopUpWidth

Description

Specify the width of the pop-up chart in pixels.

This parameter takes a number value.

The recommended value is half of the rating box chart width.

If you set a pop-up chart width value that cannot fit the Y axis area of the popup chart, a runtime error is thrown.

The default value is 0. If a negative value is specified, an error will be thrown at runtime.

This property is read-write.

SelectedQuadrantStyle

Description

Use this property to specify the style class that controls the appearance of the quadrant when it is selected.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_RATBOX_SELECTED_BOX.

This property is read-write.

See Also

Chapter 11, "Charting Classes," Style Sheets, page 383

ShowNodeDescription

Description

Specify whether the chart should show the node description. This property takes a Boolean value.

<i>Value</i>	<i>Description</i>
True	Both the icon and description for the node appear.
False	Only the icon for the node appears.

The default value is True.

This property is read-write.

Style

Description

Use this property to specify the overall style for the chart by specifying a style class. The value must be a valid class within the style sheet specified for the chart.

The default style class is PT_RATBOX_CHART.

This property is read-write.

ViewAllStyle

Description

Use this property to specify the style class that controls the appearance of the View All link.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_RATBOX_VIEWALL_DESCR.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

Width

Description

Use this property to specify the width of the chart. This property takes a numeric value. The unit of measurement is pixels.

The default value is the width of the chart control on the page definition.

If you set a chart width value that cannot fit the Y axis and label areas of the chart, a runtime error is thrown.

If a negative value is specified, an error will be thrown at runtime and the chart will not be rendered.

If you try to read this property before setting it, the value returned is 0.

This property is read-write.

XAxisBoxNum

Description

Specify the number of boxes in the X axis.

This property is required. The value must be equal to or greater than 1.

If a value less than 1 is specified, an error will be thrown at runtime.

This property is read-write.

XAxisLabelStyle

Description

Use this property to specify the style of the X-axis label. The values for this property are the style classes contained in the style sheet associated with the chart.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_RATBOX_XAXIS.

This property is read-write.

See Also

Chapter 11, "Charting Classes," Style Sheets, page 383

XAxisTitle

Description

Use this property to specify the text for the X-axis title.

This property is read-write.

XAxisTitleStyle

Description

Use this property to specify the style of the X-axis title. The values for this property are the style classes contained in the style sheet associated with the chart.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_RATBOX_XTTL.

This property is read-write.

See Also

Chapter 11, "Charting Classes," Style Sheets, page 383

YAxisBoxNum

Description

Specify the number of boxes in the Y axis.

This property is required. The value must be equal to or greater than 1.

If a value less than 1 is specified, an error will be thrown at runtime.

This property is read-write.

YAxisLabelStyle

Description

Use this property to specify the style of the Y-axis label. The values for this property are the style classes contained in the style sheet associated with the chart.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_RATBOX_YAXS.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

YAxisTitle

Description

Use this property to specify text of the title for the Y axis.

This property is read-write.

YAxisTitleStyle

Description

Use this property to specify the style of the Y-axis title. The values for this property are the style classes contained in the style sheet associated with the chart.

The values for this property are controlled by the specified style class in the style sheet associated with the chart.

The default style class is PT_RATBOX_YTITL.

This property is read-write.

See Also

[Chapter 11, "Charting Classes," Style Sheets, page 383](#)

Charting Examples

The following are some example of charts, with the PeopleCode used to create them.

Creating a Chart Using the Chart Class

This section demonstrates how to create a simple chart based on the Chart class. This chart is meant to be used to demonstrate basic principles of creating charts and give an opportunity to experiment with different chart types. It is not typical of how a chart is used in PeopleSoft applications.

The first six steps also apply to creating charts using the Gantt class, the OrgChart class, and the RatingBoxChart class.

The steps to create a chart are:

1. Place a chart control on a page.
2. Associate the chart control with a record field.
3. Create the chart data record.
4. Add PeopleCode to instantiate a chart object.
5. Set the data source.
6. View the page in the browser.
7. Add data for the chart.
8. Specify the series data.
9. Specify chart colors.
10. Add text elements.
11. Review the complete program.

Placing a Chart Control on a Page

In Application Designer, create a new page.

Select Insert, Chart and draw a rectangle to represent the area the chart will occupy. The chart can be any size, and you can have more than one chart on a page.

Place the page on a component and register the component.

Associating the Chart Control with a Record Field

Each chart on a component must be associated with a unique field. Double-click the chart control to access the Chart Properties and enter a record name and field name.

Chart properties dialog

The chart field has no special requirements. Its only purpose is to provide a reference to the field in PeopleCode.

This sample chart uses a derived/work record named SC_CHART_DUMREC that is dedicated to this purpose.

Creating the Chart Data Record

The chart needs either a record or a rowset to serve as the data source. This sample chart uses a record. See the Chart class SetData method for details about using a rowset.

See [Chapter 11, "Charting Classes," SetData, page 435.](#)

At a minimum, the record must have fields for the X-axis data and the Y-axis data. Optionally, the record can have fields for series data, chart color, and glyph size.

The screenshot shows a window titled "PB_CHART_RECORD (Record)" with two tabs: "Record Fields" and "Record Type". The "Record Fields" tab is active, displaying a table with 14 columns: Num, Field Name, Type, Key, Ord, Dir, CurC, Srch, List, Sys, Audt, InTy, EnTypA, and Default. The table contains 7 rows of data.

Num	Field Name	Type	Key	Ord	Dir	CurC	Srch	List	Sys	Audt	InTy	EnTypA	Default
1	PB_CHART_PRODUCT	Char	Key	1	Asc		No	No	No		No	No	
2	PB_CHART_REGION	Char	Key	2	Asc		No	No	No		No	No	
3	PB_CHART_SALES	Sign					No	No	No		No	No	
4	PB_CHART_DESC	Char					No	No	No		No	No	
5	PB_CHART_COLOR	Nbr					No	No	No		No	No	
6	PB_CHART_X_NUMERIC	Sign					No	No	No		No	No	
7	PB_CHART_GLYPHSCLE	Sign					No	No	No		No	No	

Example of a chart data record

The record must be available in the component buffer at runtime. You can use a database record that is already part of your application or you can use a derived/work record or a component rowset that you populate at runtime. For greatest control, you will normally populate your record or rowset at runtime.

For the sample chart, place the record on a grid on a second page on the sample component. This placement gives you the opportunity to experiment with the data.

Your chart data record must be placed at level 1 on the same component as the chart so that the data is available in the component buffer at runtime. In your application, you can hide the grids or scroll areas that hold the records. For the sample chart, you will keep the grid visible so you can enter sample data.

The screenshot shows a window titled "PB_CHART_DATA (Page)" with two tabs: "Layout" and "Order". The "Layout" tab is active, displaying a data grid with 5 columns: Product, Region, Sales, and Chart Color. The grid has 7 rows, numbered 1 through 7. The grid is set against a dotted background.

	Product	Region	Sales	Chart Color
1				
2				
3				
4				
5				
6				
7				

Example of a page definition with chart data grid

Adding PeopleCode to Instantiate a Chart Object

This example instantiates a chart object using the Chart class, so it can be used to create bar charts, line charts, pie charts, and so on. Other examples in this section demonstrate how to create charts based on the Gantt class, OrgChart class, and RatingBoxChart class.

See [Chapter 11, "Charting Classes," Creating a Gantt Chart, page 585](#); [Chapter 11, "Charting Classes," Creating an Organization Chart, page 588](#) and [Chapter 11, "Charting Classes," Creating a Rating Box Chart, page 592](#).

Add this PeopleCode to the Activate event on the page:

```
/* Declare and instantiate a chart object */
Component Chart &cChart;

&cChart = GetChart(SC_CHART_DUMREC.SC_CHART_FIELD);
```

Chart PeopleCode is commonly placed on the Activate event, but it can be placed on any appropriate event. You could, for instance, execute the chart PeopleCode from a FieldChange event associated with a push button.

Setting the Data Source

The SetData method takes either a record or a rowset as an argument. In general, specify a record or component rowset when building a chart from page data and a standalone rowset when building a chart using an iScript.

In this example, the PeopleCode sets Product as the series data and sets Region to the X axis, so that in a bar chart products will be grouped along the X axis by region. In a line chart, each series is represented by a line. Sales figures are charted on the Y axis.

Note. SetData, SetDataXAxis, and SetDataYAxis are Chart class methods. The other charting classes provide equivalent methods to specify data sources.

```
/* Set the chart data record and specify X-axis, Y-axis, and series data */

&cChart.SetData(Record.SC_CHART_RECORD);
&cChart.SetDataXAxis(SC_CHART_RECORD.SC_REGION);
&cChart.SetDataYAxis(SC_CHART_RECORD.SC_SALES);
```

See [Chapter 11, "Charting Classes," SetData, page 435](#); [Chapter 11, "Charting Classes," SetDataSeries, page 443](#); [Chapter 11, "Charting Classes," SetDataXAxis, page 444](#); [Chapter 11, "Charting Classes," SetDataYAxis, page 446](#) and [Chapter 11, "Charting Classes," Creating a Chart Using an iScript, page 596](#).

Viewing the Page in the Browser

This is the most basic PeopleSoft Chart class chart. It has no data and only the default Y axis.

Chart class chart with no data

Adding Data for the Chart

Add the following data to the chart:

<i>Region</i>	<i>Sales</i>
Arizona	60
California	50
Oregon	42
Washington	30

This bar chart is generated by the example code and data:

Default Chart class bar chart

This chart graphs sales on the Y axis (the vertical axis) and regions on the X axis (the horizontal axis).

When the data for the chart is grouped according to values, a set of data representing a single value is called a *series*. For instance, if a chart shows sales for different products in each region, then the set of data for each product is a series.

At this point, the chart has only one series, so you do not need to set the series record field.

Specify the Series Data

If you want to graph more than one product on your chart, you need to specify the source of the series data.

For example, add the products shown in this table to your data:

<i>Product</i>	<i>Region</i>	<i>Sales</i>
Footballs	Arizona	60
Rackets	Arizona	50
Shoes	Arizona	42
Tents	Arizona	35
Footballs	California	55
Rackets	California	46
Shoes	California	30

Product	Region	Sales
Tents	California	35
Footballs	Oregon	50
Rackets	Oregon	40
Shoes	Oregon	30
Tents	Oregon	25
Footballs	Washington	45
Rackets	Washington	30
Shoes	Washington	20
Tents	Washington	15

Add this PeopleCode to set the series record field:

```
&cChart.SetDataSeries(SC_CHART_RECORD.SC_PRODUCT);
```

The resulting chart is a default 2D bar chart with bars for each region grouped by series:

Default 2D bar chart with products as series

The chart has four series:

- Footballs

- Rackets
- Shoes
- Tents

Each series shows four regions along the X axis:

- Arizona
- California
- Oregon
- Washington

Sales values appear against the Y axis as bar height.

The chart uses the default colors.

Specifying Chart Colors

If you do not want to use the default colors, you need a column containing the colors for each bar. Typically, the bars in a series are colored alike.

<i>Product</i>	<i>Region</i>	<i>Sales</i>	<i>Chart Color</i>
Footballs	Arizona	60	1
Rackets	Arizona	50	13
Shoes	Arizona	42	5
Tents	Arizona	35	15
Footballs	California	55	1
Rackets	California	46	13
Shoes	California	30	5
Tents	California	35	15
Footballs	Oregon	50	1
Rackets	Oregon	40	13
Shoes	Oregon	30	5
Tents	Oregon	25	15
Footballs	Washington	45	1

<i>Product</i>	<i>Region</i>	<i>Sales</i>	<i>Chart Color</i>
Rackets	Washington	30	13
Shoes	Washington	20	5
Tents	Washington	15	15

Add the following PeopleCode to your program to set the colors for your chart:

```
/* Associate color field with chart */
&cChart.SetDataColor(SC_CHART_RECORD.QE_CHART_COLOR);
```

Adding Text Elements

The following PeopleCode adds these elements to your chart:

- Title
- Legend
- Y-axis title
- X-axis title

```
/* Set title and legend properties */
&cChart.MainTitle = "Recreational Product Sales by Region";
&cChart.HasLegend = True;
&cChart.LegendPosition = %ChartLegend_Right;

/* Set axis text properties */
&cChart.XAxisLabelOrient = %ChartText_Horizontal;
&cChart.XAxisTitle = "Region";
&cChart.YAxisTitle = "Sales";
```

This is the resulting chart:

Sample bar chart with custom colors, a main title, axis titles, and a legend

Reviewing the Complete Program

The PeopleCode for this bar chart has been presented in snippets. Here is the complete program that produced the chart:

```
/* Declare a chart object */
Component Chart &cChart;

/* Instantiate the chart object and associate the chart
** with the chart page control */

&cChart = GetChart(SC_CHART_DUMREC.QE_CHART_FIELD);

/* Set the chart data record and specify X-axis, Y-axis,
** and series data */
&cChart.SetData(Record.SC_CHART_RECORD);
&cChart.SetDataSeries(SC_CHART_RECORD.SC_PRODUCT);
&cChart.SetDataXAxis(SC_CHART_RECORD.SC_REGION);
&cChart.SetDataYAxis(SC_CHART_RECORD.SC_SALES);

/* Associate color field with chart */
&cChart.SetDataColor(SC_CHART_RECORD.QE_CHART_COLOR);

/* Set title and legend properties */
&cChart.MainTitle = "Recreational Product Sales by Region";
&cChart.HasLegend = True;
&cChart.LegendPosition = %ChartLegend_Right;
/* Set axis text properties */
&cChart.XAxisLabelOrient = %ChartText_Horizontal;
&cChart.XAxisTitle = "Region";
&cChart.YAxisTitle = "Sales ";
```

Other Modifications

The remainder of this section shows the effects of modifying other aspects of your chart.

Changing X-Axis and Series Values

To group sales by product instead of by region, switch the series and the X axis. You will also need to reorder colors to correspond to regions instead of products.

```
&cChart.SetDataSeries(SC_CHART_RECORD.SC_REGION);
&cChart.SetDataXAxis(SC_CHART_RECORD.SC_PRODUCT );

&cChart.XAxisTitle = "Region";
&cChart.MainTitle = "Recreational Product Sales by Product";
```

Bar chart with series set to region

Axis Properties

If your chart has negative values, the bars automatically extend below the X axis:

Bar chart with negative values

If you want to remove the tick marks from the X or Y axis, you need to specify an empty array for the `SetXAxisLabels` or `SetYAxisLabels` methods.

The following example removes the tick marks from the Y axis:

```
&Arr = CreateArray("");
&Chart.SetYAxisLabel(&Arr);
```

If you set the X-axis labels to an empty array to remove the ticks, you must be plotting a single series on the chart because labels are automatically generated for each series if you do not provide them.

See [Chapter 11, "Charting Classes," SetXAxisLabels, page 452](#) and [Chapter 11, "Charting Classes," SetYAxisLabels, page 452](#).

You can also use the `XAxisCross`, `XAxisMin`, `XAxisMax`, `YAxisMin`, `YAxisMax`, and other axis properties to control the appearance of the axes.

See [Chapter 11, "Charting Classes," XAxisCross, page 466](#); [Chapter 11, "Charting Classes," XAxisLabelOrient, page 468](#); [Chapter 11, "Charting Classes," XAxisStyle, page 470](#); [Chapter 11, "Charting Classes," XAxisTicks, page 470](#); [Chapter 11, "Charting Classes," YAxisLabelOrient, page 472](#); [Chapter 11, "Charting Classes," YAxisMax, page 473](#); [Chapter 11, "Charting Classes," YAxisMin, page 473](#); [Chapter 11, "Charting Classes," YAxisStyle, page 474](#) and [Chapter 11, "Charting Classes," YAxisTicks, page 475](#).

Chart Class Chart Types

Use the `Type` property to set the chart type.

2D Bar Chart

The default Chart class chart type is a bar chart.

```
&cChart.Type=%ChartType_2DBar;
```

2D bar chart

The following examples show the various chart types using the same data. Each example gives the PeopleCode snippet that creates that chart type.

For a complete list of all Chart class chart types, see Chart class Type property.

See [Chapter 11, "Charting Classes," Type, page 465](#).

The Charting Examples section provides other examples of PeopleCode for charts using Gantt class, OrgChart class, and RatingBoxChart class at the end of the chapter.

See [Chapter 11, "Charting Classes," Creating a Gantt Chart, page 585](#); [Chapter 11, "Charting Classes," Creating an Organization Chart, page 588](#) and [Chapter 11, "Charting Classes," Creating a Rating Box Chart, page 592](#).

3D Bar Chart

A visual 3D effect can add interest to a chart.

Add this code to make your bar chart a 3D bar chart:

```
&cChart.Type = %ChartType_3DBar;  
&cChart.XAxisLabelOrient = 90;
```

This PeopleCode also turns the X-axis labels 90 degrees for better readability. Valid values for XAxisLabelOrient are 0 and 90.

Use the XRotationAngle, YRotationAngle, and ZRotationAngle properties to rotate the bar chart. This example shows the default values for rotation.

The default values are:

Property	Value
XRotationAngle	330
YRotationAngle	345
ZRotationAngle	0

3D bar with default rotation angles

The following 3D bar chart uses these rotation angles:

```
&cChart.XRotationAngle = "340";  
&cChart.YRotationAngle = "10";  
&cChart.ZRotationAngle = "10";
```

3D Bar chart with modified-axis rotation angles

See [Chapter 11, "Charting Classes," XRotationAngle, page 471](#); [Chapter 11, "Charting Classes," YRotationAngle, page 476](#); [Chapter 11, "Charting Classes," ZRotationAngle, page 476](#) and [Chapter 11, "Charting Classes," XAxisLabelOrient, page 468](#).

Horizontal Bar Chart

Use this line of code to specify a horizontal bar chart:

```
&cChart.Type = %ChartType_2DHorizBar;
```

Horizontal bar chart

Stacked Bar Chart

With a the stacked bar chart, you can place a different emphasis on the same data. The stacked column shows total sales per region as well as the product segments that contribute to the total.

Use this line of code to specify a stacked bar chart:

```
&cChart.Type = %ChartType_2DStackedBar;
```

Stacked bar chart

3D Stacked Bar Chart

Use this line of code to specify a 3D stacked bar chart:

```
&cChart.Type = %ChartType_3DStackedBar;
```

3D stacked bar chart

Horizontal Stacked Bar Chart

Use this line of code to specify a horizontal stacked bar chart:

```
&cChart.Type = %ChartType_2DHorizStackedBar;
```

Horizontal stacked bar chart

Percent Bar Chart

A percent bar is similar to a stacked bar, but the segments of each bar add up to 100. The segments show the proportional contribution of each product to total sales.

Use this line of code to specify a horizontal stacked bar chart:

```
&cChart.Type = %ChartType_2DPercentBar;
```

Percent bar chart

3D Percent Bar Chart

Use this line of code to specify a horizontal stacked bar chart:

```
&cChart.Type = %ChartType_3DPercentBar;
```

3D percent bar chart

Horizontal Percent Bar Chart

Use this line of code to specify a horizontal stacked bar chart:

```
&cChart.Type = %ChartType_2DHorizPercentBar;
```

Horizontal percent bar chart

Line Chart

A line chart is useful for showing changes and trends over time or across categories.

Use this line of code to specify a horizontal stacked bar chart:

```
&cChart.Type = %ChartType_2DLine;
```

Line Chart

Overlay Chart

You can overlay one chart on top of another to compare two different but related sets of data. The following chart uses a second set of data, showing average temperature for each region.

Use the OLType property to specify whether the overlay is a line chart or a histogram.

Add this PeopleCode to the PeopleCode for your bar chart to create 2D line chart overlay:

```
/* Create OL chart */
&cChart.SetOLDData(Record.SC_OLCHART_REC);
&cChart.SetOLDDataSeries(SC_OLCHART_REC.SC_CHART_SERIES);
&cChart.SetOLDDataXAxis(SC_OLCHART_REC.SC_CHART_XAXISDATA);
&cChart.SetOLDDataYAxis(SC_OLCHART_REC.SC_YAXISDATA);
&cChart.OLType = %ChartType_2DLine;
```

Overlay chart

True XY Line Chart

Use the `IsTrueXY` property to create a true XY line chart.

A true XY chart has a numeric X axis. That is, the numeric XY pairs can be plotted correctly.

By default, `IsTrueXY` is `False`. A default line chart plots X-axis values as discrete labels, ordered by record position.

For example, you have the following data:

X Axis	Y Axis
11	88000
12.2	96200
4.6	101300
6.6	83000
14	111200
8.5	11800

The following example shows a default line chart using the previous data:

Line chart with IsTrueXY = False

A line chart with IsTrueXY = True orders the X-axis values numerically on a continuous scale. The following chart is a true XY line chart plotted with the same data.

Line chart with IsTrueXY = True

Scatter Chart

Use this line of code to specify a scatter chart:

```
&cChart.Type = %ChartType_2DHorizStackedBar;
```

A scatter chart compares number pairs. Each pair is plotted against the horizontal X axis and the vertical Y axis. The data values are scattered across the chart. XY scatter charts are good for showing comparisons of numbers, such as scientific or statistical data, where several measurements need to be plotted on a single chart.

A scatter chart is a true XY chart, meaning that the X axis is numeric. The `IsTrueXY` property is automatically set to `True`.

For example, this sample data could be used to make an XY scatter chart:

<i>Tenure</i>	<i>Salary</i>
11	88000
12.2	96200
4.6	101300
6.6	83000
14	111200
8.5	11800

You use this code snippet to make a scatter chart:

```
&cChart.SetDataXAxis(SC_CHART_RECORD.SC_REGION);
&cChart.SetDataYAxis(SC_CHART_RECORD.SC_SALES);
&cChart.Type = %ChartType_2DScatter;
```

Scatter chart

You can set the color for each point, or glyph, on a scatter chart, and you can make each point drillable.

Note. If you have only one point of data, that is, only one X and Y pair, use a scatter chart. You may have unexpected results if you use a line chart with only one point.

Bubble Chart

A bubble chart is a special type of scatter chart.

If you add a third data set, glyph size, to a scatter chart, you can create a bubble chart, which uses the size of the markers to represent a third dimension of numeric data.

You can also set annotations for scatter charts and bubble charts.

This chart example uses Age to determine the size of the bubble markers, on the chart and Name to set the annotations:

Tenure	Salary	Age	Name
11	88000	39	Dickens
12.2	96200	55	Tolstoy
4.6	101300	32	Hemingway
6.6	83000	48	Tolkien
14	111200	59	Joyce

<i>Tenure</i>	<i>Salary</i>	<i>Age</i>	<i>Name</i>
8.5	11800	49	Shelley

```

&cChart.SetDataAnnotations(SC_CHART_RECORD.SC_NAME);
&cChart.SetDataGlyphScale(SC_CHART_RECORD.SC_AGE);
&cChart.Type = %ChartType_2DScatter;

```

Bubble chart

Pie Chart

A pie chart shows comparisons within a single set of values, and it shows how parts contribute to a whole. It is an ideal chart type to display the contribution of each region to an annual sales total.

A pie chart ignores the series and only plots X-axis data against Y-axis values. Our original bar chart has four regions times four products, resulting in 16 XY pairs. A pie chart with all of those slices would be confusing and not helpful. Instead, suppose you want to show just the data for tents, which are in rows 13–16. You can use a combination of the `DataWidth` and `DataStartRow` properties to select which rows to display.

You can make a pie chart showing only rows 13–16 by adding this snippet of code:

```

&cChart.DataWidth = 4;
&cChart.DataStartRow = 13;
&cChart.Type = %ChartType_2DPie;

```

2D pie chart

3D Pie Chart

Use this line of code to specify a horizontal stacked bar chart:

```
&cChart.Type = %ChartType_3DPie;
```

3D pie chart

Tick Mark Considerations

If you want to remove the tick marks from the X or Y axis, you need to specify an empty array for the `SetXAxisLabels` or `SetYAxisLabels` methods.

The following example removes the tick marks from the Y axis:

```
&Arr = CreateArray("");
&Chart.SetYAxisLabel(&Arr);
```

If you set the X-axis labels to an empty array to remove the ticks, you must be plotting a single series on the chart because labels are automatically generated for each series if you do not provide them.

See [Chapter 11, "Charting Classes," SetXAxisLabels, page 452](#) and [Chapter 11, "Charting Classes," SetYAxisLabels, page 452](#).

Adding Drilldown

If you set the property `IsDrillable` to `True` and add `FieldChange PeopleCode` to your chart, your user can get more information by clicking a chart data element—a bar, line segment, data point, or pie slice.

For a simple example, add this `PeopleCode` to the `FieldChange` event on the Y-axis field:

```
MessageBox(0, "", 0, 0, " Sales for " | SC_CHART_RECORD.SC_PRODUCT | " in "
| SC_CHART_RECORD.SC_REGION | " = " | SC_CHART_RECORD.SC_SALES);
```

And add this code to the page `Activate` event for your pie chart:

```
&cChart.IsDrillable = True;
```

When the user clicks the Oregon slice of the pie chart, this message appears:

Example of drilldown triggering `PeopleCode` with `MessageBox`

Current context provides the values for fields in the current row in the component buffer. You can use drilldown with your chart data fields along with any other data in the component buffer to accomplish anything FieldChange PeopleCode is capable of.

If the bars on a bar chart are too narrow, a user may not be able to click them. Sometimes, a few bars on a chart are affected, sometimes all of the bars cannot be clicked. The workaround is to put fewer bars on your chart or to make your chart bigger so that each bar is wider.

See [Chapter 11, "Charting Classes," IsDrillable, page 457](#).

Using the Other Charting Classes

In addition to the all the charts you can create with the Chart class, you can create specialized charts using the Gantt class, the OrgChart class, and the RatingBoxChart class.

You follow the same initial steps to create these specialized charts as you do for the Chart class chart types. The PeopleCode programs to set the data and properties are similar as well, but Gantt charts, organization charts, and rating box charts use data differently and interact with the user in different ways than do the Chart class charts.

See [Chapter 11, "Charting Classes," Creating a Gantt Chart, page 585](#); [Chapter 11, "Charting Classes," Creating an Organization Chart, page 588](#) and [Chapter 11, "Charting Classes," Creating a Rating Box Chart, page 592](#).

Creating a Gantt Chart

The PeopleCode and data used in this example create the following Gantt chart:

Example of a Gantt chart

This example uses the following data in the record QE_GANTT_TASK:

Customize Find   First 1-10 of 10 Last					
	*Task ID	TASK NAME	*PLANNED START DATE	*PLANNED END DATE	
1	1	Born	01/01/1963 12:00AM	01/01/63 12:00AM	+ -
2	2	Baby	01/01/1963 12:00AM	06/30/64 12:00AM	+ -
3	3	Toddler	07/01/1964 12:00AM	07/01/66 12:00AM	+ -
4	4	Childhood	07/01/1966 12:00AM	09/01/80 12:00AM	+ -
5	5	Elementary School	09/01/1968 12:00AM	06/01/73 12:00AM	+ -
6	6	Middle School	09/01/1973 12:00AM	06/01/76 12:00AM	+ -
7	7	High School	09/01/1976 12:00AM	06/01/80 12:00AM	+ -
8	8	Graduate	06/20/1980 12:00AM	06/20/80 12:00AM	+ -
9	9	Adult	09/02/1980 12:00AM	12/31/83 12:00AM	+ -
10	10	End of Life	01/01/1987 12:00AM	01/01/87 12:00AM	+ -

Example of Gantt task data

The chart also uses the following dependency data in the record QE_GANTT_TASKD:

Task ID	Parent Task ID	URL		
2	1	http://www.oracle.com	+	-
5	3	http://www.oracle.com	+	-
6	5	http://www.oracle.com	+	-
7	6	http://www.oracle.com	+	-
8	7	http://www.oracle.com	+	-
9	8	http://www.oracle.com	+	-

Example of Gantt dependency data

To create a Gantt chart:

1. In Application Designer, add a chart control to a page and associate the chart control with a record name and a field name.

See [Chapter 11, "Charting Classes," Creating a Chart Using the Chart Class, page 557.](#)

2. Initialize a Gantt chart object.

Initialize the chart using the GetGanttChart function. The arguments of the function are the record and field name specified for the chart definition in Application Designer.

```
Local Gantt &gGantt;  
&gGantt = GetGanttChart(QE_CHART_DUMREC.QE_CHART_FIELD);
```

3. Specify values for the required methods.

At a minimum, specify the source of the task data and which fields contain task ID, start date, and end date.

```
&gGantt.SetTaskData(Record.QE_GANTT_TASK);
&gGantt.SetTaskID(QE_GANTT_TASK.QE_TASK_ID);
&gGantt.SetPlannedStartDate(QE_GANTT_TASK.QE_PLANNED_START);
&gGantt.SetPlannedEndDate(QE_GANTT_TASK.QE_PLANNED_END);
```

4. Specify values for the additional methods controlling the appearance of the data.

After setting the required methods, you can set additional methods to control the appearance of the chart. The following code specifies the amount that the scroll bars scroll when clicked, the percentage of the entire chart that is taken up by the chart area, the width and height of the chart, on what row the chart should begin displaying data, the width of the data, if the user can click the chart area of the Gantt chart and either execute a function or a URL, and whether labels should appear with the tasks in the task section.

```
&gGantt.SetTableXScrollbar(0.20);
&gGantt.SetChartArea(50);
&gGantt.Width = 700;
&gGantt.Height = 380;
&gGantt.DataStartRow = 1;
&gGantt.DataWidth = 11;
&gGantt.IsDrillable = True;
&gGantt.ShowTaskLabels = True;
```

5. Specify the appearance of grid lines.

Depending on the type of data that you are using, you can specify the type of grid lines that should appear in the chart section of the Gantt chart.

```
&gGantt.GridLineType = %ChartLine_Solid;
&gGantt.GridLines = %ChartGrid_Vertical;
```

6. Specify the appearance of data.

The following methods control the appearance of the different parts of the task data, such as the label, which hints appear when you pass the mouse over the task data, and so on.

```
&gGantt.SetTaskName(QE_GANTT_TASK.QE_TASK_NAME);
&gGantt.SetWBSNumbering(QE_GANTT_TASK.QE_HINTS);
&gGantt.SetTaskLevel(QE_GANTT_TASK.QE_LEVEL);
&gGantt.SetTaskLabel(QE_GANTT_TASK.QE_TASK_LABEL);
&gGantt.SetTaskProgress(QE_GANTT_TASK.QE_TASK_PROGRESS);
&gGantt.SetTaskHints(QE_GANTT_TASK.QE_HINTS);
&gGantt.SetTaskBarURL(QE_GANTT_TASK.QE_URL);
&gGantt.SetTaskMilestone(QE_GANTT_TASK.QE_TASK_MILESTONE);
&gGantt.TaskMilestoneGlyph = QE_GANTT_PROJ.QE_MILESTONE_GLYPH;
&gGantt.SetTaskExpanded(QE_GANTT_TASK.QE_EXPANDED);

&gGantt.SetPlannedTaskBarColor(QE_GANTT_TASK.QE_PLANNED_COLOR);
&gGantt.SetActualTaskBarColor(QE_GANTT_TASK.QE_ACTUAL_COLOR);
&gGantt.SetTaskProgressBarColor(QE_GANTT_TASK.QE_PROGRESS_COLOR);
```

7. Specify the additional fields that will appear in the table section.

You can also specify application data that will appear with the task data.

```
&gGantt.SetTaskAppData(QE_GANTT_TASK.QE_PLANNED_START,
    QE_GANTT_TASK.QE_PLANNED_END, QE_GANTT_TASK.QE_TASK_PROGRESS,
    QE_GANTT_TASK.QE_TASK_NAME, QE_GANTT_TASK.QE_EXPANDED);
```

8. Specify titles for the task bars.

```
&gGantt.TaskTitle = "Tasks";
    &appDataArray = CreateArray("Start", "End", "Progress", "Name", "Expanded");
    &gGantt.SetTaskAppDataTitles(&appDataArray);
```

9. Specify the fields for task dependency data.

You do not need to specify dependency data. However, if you do, you must also specify the parent ID and the child ID (where the dependency data starts and ends). You can also specify the type of line used between dependencies and a URL that the browser will open to if the user clicks a dependency line.

```
&gGantt.SetTaskDependencyData(Record.QE_GANTT_TASKD);
    &gGantt.SetTaskDependencyParentID(QE_GANTT_TASKD.QE_PARENT_TASK_ID);
    &gGantt.SetTaskDependencyChildID(QE_GANTT_TASKD.QE_TASK_ID);
    &gGantt.TaskDependencyLineType = %ChartLine_Solid;
    &gGantt.SetTaskDependencyURL(QE_GANTT_TASKD.URL);
```

10. Specify the actual dates for the project.

If you know the actual start and end dates, in addition to the planned date, you can add those to your chart.

```
&gGantt.SetActualStartDate(QE_GANTT_TASK.QE_ACTUAL_START);
    &gGantt.SetActualEndDate(QE_GANTT_TASK.QE_ACTUAL_END);
```

11. Specify the DateTime axis values.

You can specify values for where the DateTime axis starts and ends.

```
&gGantt.AxisStartDateTime = DateTimeValue("01/01/1963 8:00:00");
    &gGantt.AxisEndDateTime = DateTimeValue("01/01/1987 8:00:00");
```

12. Specify the format of the DateTime axis values.

You can specify the format of the DateTime elements, such as the appearance of the days of the week, whether as a number or using the full name, and so on.

```
&gGantt.SetMonthFormat(%Chart_MonthFormat_FullName);
    &gGantt.SetDayFormat(%Chart_DayFormat_2Digit);
```

Creating an Organization Chart

The PeopleCode used in this example creates the following organization chart:

Example organization chart

To create an organization chart:

1. Add a chart control to a page in PeopleSoft Application Designer.

Associate the chart control with a record name and field name.

See [Chapter 11, "Charting Classes," Creating a Chart Using the Chart Class, page 557.](#)

2. Add the organization node record and the pop-up node record to the component.

These records are derived/work records that contain clones of the subrecords PTORGNODE_SBR and PTPOPUPNODE_SBR. These records must be in the component buffer. You can add them to a hidden grid on the page, or you can place them on another page in the same component.

3. If the chart will have breadcrumbs, add the breadcrumb node record to the component.

This derived/work record contains a clone of the subrecord PTORGCRMB_SBR. The record must be in the component buffer.

4. Prepare the organization chart data.

In an event such as PreBuild, instantiate two rowset objects and populate them with the organization node data and the pop-up node data.

This example shows one possible way. How you do it depends on how your data is stored and how you intend to present it.

```
Component Rowset &rs, &rsP, &rsBC, &rsOrgNode, &rsOrgPopupND, &rsBreadCrumbs;
Component OrgChart &ocOrgChart;
```

```
Local Rowset &RSGridDR;
Local Rowset &RSAGRID;
```

```
/* The record QE_ORG_NODEDATA has the data for the org chart **
** You will probably fill the rowset with some subset of the data**
** in the database. This example uses all the rows. */
&rs = CreateRowset(Record.QE_ORG_NODEDATA);
&rs.Fill();
```

```
/* Get the grid on the page for the node data and initialize to nulls */
&rsOrgNode = GetLevel0()(1).GetRowset(Scroll.QE_ORG_NODE);
&rsOrgNode.Flush();
```

```
/* Copy data from database table, QE_ORG_NODEDATA to the derived/work
** record QE_ORG_NODE_DR */
&rs.CopyTo(&rsOrgNode, Record.QE_ORG_NODEDATA, Record.QE_ORG_NODE_DR);
```

```
/* The record QE_ORG_POPDATA has the data for the popup chart */
&rsP = CreateRowset(Record.QE_ORG_POPDATA);
&rsP.Fill();
```

```
/* Get the grid on the page for the popup data and initialize to nulls */
&rsOrgPopupND = GetLevel0()(1).GetRowset(Scroll.QE_ORG_POPUP);
&rsOrgPopupND.Flush();
```

```
/* Copy data from database table, QE_ORG_POPDATA to the derived/work
** record QE_ORG_POP_DR */
&rsP.CopyTo(&rsOrgPopupND, Record.QE_ORG_POPDATA, Record.QE_ORG_POP_DR);
```

```
/* Fill in the breadcrumb information for this chart if the chart **
** uses breadcrumbs. */
&rsBC = CreateRowset(Record.QE_ORG_CRMB);
&rsBC.Fill();
```

```
/* Get the grid on the page for the pop data and initialize to nulls */
&rsBreadCrumbs = GetLevel0()(1).GetRowset(Scroll.QE_ORG_BCRMB);
&rsBreadCrumbs.Flush();
```

```
/* Copy data from database table, QE_ORG_CRMB to the derived/work
** record QE_ORG_CRMB_DR */
&rsBC.CopyTo(&rsBreadCrumbs, Record.QE_ORG_CRMB, Record.QE_ORG_CRMB_DR);
```

5. Instantiate an OrgChart object.

In an event such as Activate, add PeopleCode to instantiate and define your organization chart.

Get the chart using the GetOrgChart function. The argument for this function is the record name and field name specified on the Records tab of the Chart Properties dialog box in Application Designer.

```
Component Rowset &rsOrgNode, &rsOrgPopupND, &rsBreadCrumbs;
Component OrgChart &ocOrgChart;
&ocOrgChart= GetOrgChart(QE_CHART_DUMREC.QE_CHART_FIELD);
```

6. Specify the organization node record and the pop-up node record.

These records contain the clones of the subrecords PTORGNODE_SBR and PTORGPOPUP_SBR, respectively.

```
&ocOrgChart.SetNodeRecord (Record.QE_ORG_NODE_DR);
&ocOrgChart.SetPopUpNodeRecord (Record.QE_ORG_POP_DR);
```

7. Specify the node data and pop-up node data rowset objects.

/*&RSORGND and &RSORGPOPUPND are level 1 component rowsets that contain the
** organization node data and pop-up node data respectively.*/

```
&ocOrgChart.SetNodeData (&rsOrgNode);
&ocOrgChart.SetPopUpNodeData (&RSORGPOPUPND);
```

8. (Optional) Specify values for the chart display properties.

```
&ocOrgChart.MainTitle = "Application Development";
&ocOrgChart.MainTitleStyle = "PT_ORGCHART_TITLE";
&ocOrgChart.Direction = 2;
&ocOrgChart.Height = 380;
&ocOrgChart.Width = 700;
&ocOrgChart.VerticalSpace = 15;
&ocOrgChart.ImageLocation = 1;
&ocOrgChart.Style= "PTORGCHART";
&ocOrgChart.HasLegend = True;
&ocOrgChart.NodeMaxDisplayDescLength =30;
&ocOrgChart.CollapsedImage ="PT_COLLAPSED_CHART";
&ocOrgChart.ExpandedImage ="PT_EXPANDED_CHART";
&Expanded_Msg=MsgGetText(110, 100);
&Collapsed_Msg=MsgGetText(110, 101);
&ocOrgChart.Expanded_Msg =&Expanded_Msg
&ocOrgChart.Collapsed_Msg =&Collapsed_Msg
```

9. Specify values for the legend. This is required only if the chart has a legend.

```
&ocOrgChart.LegendStyle = PT_ORGCHART_LEGEND;
&LegendArray = CreateArray("Main", "1-2yrs", "3-5yrs", "Emergency",
"Retirement", "Key", "Successors");
&LegendImgArray = CreateArray("QE_NOWORGCHART", "QE_12ORGCHART",
"QE_34ORGCHART", "QE_EMRORGCHART", "QE_RETIRORG", "QE_KPERSON",
"QE_SUCCSORGCHART");

&ocOrgChart.SetLegend(&LegendArray);
&ocOrgChart.SetLegendImg(&LegendImgArray);
&ocOrgChart.LegendPosition = %ChartLegend_Top;
&ocOrgChart.LegendStyle = "PT_ORGCHART_LEGEND";
```

10. (Optional) Specify image values.

```
&ocOrgChart.ImageLocation =1;
&ocOrgChart.ImageHeight =150;
&ocOrgChart.ImageMouseoverMagnificationFactor =150;
&ocOrgChart.DefaultImage=PT_CHART_DEFAULTIMG;
```

11. Specify the breadcrumb data and the rowset and display properties. These are required only if your chart uses breadcrumbs.

```
&ocOrgChart.SetCrumbRecord(Record.QE_ORG_CRMB_DR);
&ocOrgChart.SetCrumbData(&rsBreadCrumbs);
&ocOrgChart.CrumbMaxDisplayLength = 24;
&ocOrgChart.CrumbSeparatorImage = "PT_ORG_BRCRM_SEP";
&ocOrgChart.CrumbDescrStyle = "PT_ORGCHART_BRDCRM";
```

12. (Optional) Specify the maximum number of nodes that will appear in the pop-up without a vertical scroll bar.

```
&ocOrgChart.MaxPopUpDisplayNode = 2;
```

13. (Optional) Assign style class names to control the styles of each node descriptor.

If you do not specify a style class name, then the PeopleTools default style class is used.

This example uses the default style class names, so this segment of code could be omitted. It is shown for demonstration purposes only.

```
&ocOrgChart.NodeDescr1Style = "PT_ORGNODE_DESC1";
&ocOrgChart.NodeDescr2Style = "PT_ORGNODE_DESC2";
&ocOrgChart.NodeDescr3Style = "PT_ORGNODE_DESC3";
&ocOrgChart.NodeDescr4Style = "PT_ORGNODE_DESC4";
&ocOrgChart.NodeDescr5Style = "PT_ORGNODE_DESC5";
&ocOrgChart.NodeDescr6Style = "PT_ORGNODE_DESC6";
&ocOrgChart.NodeDescr7Style = "PT_ORGNODE_DESC7";
```

14. (Optional) Assign style class names to control the styles of each pop-up node descriptor.

If you do not specify a style class name, then the PeopleTools default style sheet is used.

This example uses the default style class names, so this segment of code could be omitted. It is shown for demonstration purposes only.

```
&ocOrgChart.PopupNodeDescr1Style = "PT_POPNODE_DESC1";
&ocOrgChart.PopupNodeDescr2Style = "PT_POPNODE_DESC2";
&ocOrgChart.PopupNodeDescr3Style = "PT_POPNODE_DESC3";
&ocOrgChart.PopupNodeDescr4Style = "PT_POPNODE_DESC4";
&ocOrgChart.PopupNodeDescr5Style = "PT_POPNODE_DESC5";
&ocOrgChart.PopupNodeDescr6Style = "PT_POPNODE_DESC6";
&ocOrgChart.PopupNodeDescr7Style = "PT_POPNODE_DESC7";
&ocOrgChart.PopupNodeDescr8Style = "PT_POPNODE_DESC8";
&ocOrgChart.PopupHeaderStyle = "PT_POPNODE_HEADER";
```

Creating a Rating Box Chart

The PeopleCode used in the following example creates this rating box chart:

Example rating box chart

Follow these steps to create a rating box chart.

1. Create the rating box chart node record.
 - a. Clone the PTRATINGBOX_SBR subrecord to create an application-specific subrecord.
 - b. Create a new application-specific record and insert the new subrecord.

2. Add a chart control to a page in Application Designer.

See [Chapter 11, "Charting Classes," Creating a Chart Using the Chart Class, page 557.](#)

3. Add the rating box chart node record to the component.

This record must be in the component buffer. If you do not want to give the user access to the data you can add the record to a hidden grid on the page. Alternatively, you can place it on another page in the same component.

4. Add PeopleCode.

- In an event such as PreBuild, add PeopleCode to create a component buffer rowset that references the rating box chart node record.
- Add PeopleCode, probably in the page Activate event, to populate the rowset and define the chart.
- Add FieldChange PeopleCode that will execute when drag-and-drop events occur.

PeopleCode for the Rating Box Chart Example

Complete these steps to create a rating box chart:

1. Prepare the data for the chart.

Typically, write PeopleCode in an event such as PreBuild to populate a rowset with the data you want to display in the rating box chart.

```
Component Rowset &rs, &&rsRatingBox;
Component RatingBoxChart &rbRatingBoxChart;

/* the record QE_RATEBOX_DATA has the data for the RATING BOX chart */
&rs = CreateRowset(Record.QE_RATEBOX_DATA);
&rs.Fill("Where QE_RATEBOX_TC=:1", QE_RATEBOX_TC.QE_RATEBOX_TC.Value);

/* Get the grid on the page for the node data and initialize to nulls */
&rsGrid = GetLevel0()(1).GetRowset(Scroll.QE_RATEBOX_TC);
&rsGrid.Flush();

/* Copy data from database table, QE_RATEBOX_DATA, to the
level 1 component rowset associated with the component derived working
record QE_RATEBOX_DR */

&rs.CopyTo(&rsGrid, Record.QE_RATEBOX_DATA, Record.QE_RATEBOX_DR);
```

2. Define the RatingBoxChart.

Add PeopleCode in an event such as Activate.

Instantiate a RatingBoxChart object using the GetRatingBoxChart built-in function to reference the page control field of the chart.

```
Component Rowset &rs, &rsGrid;
Component RatingBoxChart &rbRatingBoxChart;

&rbRatingBoxChart = GetRatingBoxChart(QE_CHART_DUMREC.QE_CHART_FIELD);
```

3. Set the required display properties for the chart.

```
&rbRatingBoxChart.XaxisBoxNum = 3;
&rbRatingBoxChart.YaxisBoxNum = 3;
&rbRatingBoxChart.PopUpWidth = 200;
&rbRatingBoxChart.PopUpHeight = 200;
&XAxisArray = CreateArray("Low", "Medium", "High");
&YAxisArray = CreateArray("Low", "Medium", "High");

&rbRatingBoxChart.SetXAxisLabels(&XAxisArray);
&rbRatingBoxChart.SetYAxisLabels(&YAxisArray);
```

4. (Optional) Specify other values for the chart display properties.

If you do not specify these properties, the following default value will be used:

```
&rbRatingBoxChart.IsDragable = True;
&rbRatingBoxChart.BoxMaxDisplayItems = 3;
&rbRatingBoxChart.NDMaxDisplayDescLength = 25;
&rbRatingBoxChart.ShowNodeDescription = True;
&rbRatingBoxChart.GridLineType = %ChartLine_Solid;
&rbRatingBoxChart.XAxisTitle = "Performance";
&rbRatingBoxChart.YAxisTitle = "Potential";
&rbRatingBoxChart.NDMaxDisplayDescLength = 15;
&rbRatingBoxChart.BoxMaxDisplayItems = 5;

&rbRatingBoxChart.Height = 400;
&rbRatingBoxChart.Width = 400;
&rbRatingBoxChart.ShowNodeDescription = true;
&rbRatingBoxChart.GridLineType=%ChartLine_Solid;
&rbRatingBoxChart.IsDragable = True;
&rbRatingBoxChart.BoxMaxDisplayItems= 1;
&rbRatingBoxChart.NDMaxDisplayDescLength = 50;
```

5. (Optional) Assign style class names for the chart and X/Y Axis title and labels.

If you do not specify a style class name, the PeopleTools default style sheet is used.

```
&rbRatingBoxChart.Style = "PSCHARTDEFAULT";
&rbRatingBoxChart.XAxisTitleStyle = "PT_RATBOX_XTTL";
&rbRatingBoxChart.YAxisTitleStyle = "PT_RATBOY_YTTL";
&rbRatingBoxChart.XAxisLabelStyle = "PT_RATBOX_XAXIS";
&rbRatingBoxChart.YAxisLabelStyle = "PT_RATBOX_YAXIS";
```

6. (Optional) Specify title and legend properties.

```
&rbRatingBoxChart.MainTitle = "Development Division";
&rbRatingBoxChart.MainTitleStyle="PT_RATBOX_TITLE"
&rbRatingBoxChart.HasLegend = True;
&rbRatingBoxChart.LegendPosition = %ChartLegend_Bottom;
&LegendArray = CreateArray("Architect", "Engineer", "Director", "Manager",
    "Senior Director", "Vice-President");
&LegendImgArray = CreateArray("PT_ACECUBE", "PT_WF_PERSON", "PT_STATUS_ALERT_ICN",
    "PT_STATUS_ASSIGNED_ICN", "QE_SUCCSORGCHART", "QE_KPERSON");
&rbRatingBoxChart.SetLegend(&LegendArray);
&rbRatingBoxChart.SetLegendImg(&LegendImgArray);
```

7. Set the node data rowset and record.

The chart refreshes when the SetRBNodeData method is called.

```
/* Set the node data rowset and the node record. */
&rbRatingBoxChart.SetRBNodeData(&rsGrid);
&rbRatingBoxChart.SetRBNodeRecord(Record.Record. QE_RATEBOX_DR);
```

8. Add FieldChange PeopleCode on the fields PTXAXISRATINGS and PTYAXISRATINGS if you want to perform other logic after the drag and drop operation.

This example shows a call to the SetRBNodeData function to redraw the chart the user changes the values in either of these two fields in the component:

```
/* FieldChange PeopleCode for fields PTXAXISRATINGS and PTYAXISRATINGS*/
&rbRatingBoxChart.SetRBNodeData(&rsGrid);
```

Creating a Chart Using an iScript

You can also create a Chart class chart or a Gantt class chart using an iScript. The following example creates a chart, populates it, and then sends the chart URL to a response object. The complete code sample is shown.

Note. You cannot create a chart from OrgChart or RatingBoxChart using an iScript.

```
Function IScript_GetChartURL()

    Local Chart &cChart;
    Local Rowset &rsRowset;
    Local string &sMap;
    Local string &sURL;

    &cChart = CreateObject("Chart");

    &rsRowset = CreateRowset(Record.QE_CHART_RECORD);
    &rsRowset.Fill("where QE_CHART_REGION= :1", "MIDWEST");
    &cChart.SetData(&rsRowset);

    &cChart.Width = 400;
    &cChart.Height = 300;

    &cChart.SetDataYAxis(QE_CHART_RECORD.QE_CHART_SALES);
    &cChart.SetDataXAxis(QE_CHART_RECORD.QE_CHART_PRODUCT);
    &cChart.SetDataSeries(QE_CHART_RECORD.QE_CHART_REGION);

    &cChart.HasLegend = True;
    &cChart.LegendPosition = %ChartLegend_Right;

    &sURL = %Response.GetChartURL(&cChart);
    &sMap = &cChart.ImageMap;

    %Response.Write("<HTML><IMG SRC=");
    %Response.Write(&sURL);
    %Response.Write(" USEMAP=#THEMAP></IMG><MAP NAME=THEMAP>");
    %Response.Write(&sMap);
    %Response.Write("</MAP></HTML>");

End-Function;
```

See *PeopleTools 8.51 PeopleBook: PeopleCode Language Reference*, "PeopleCode Built-in Functions," CreateObject.

Complete these steps to create a chart using an iScript:

1. Create the chart object.

For this example, no chart control is available on a page to be referenced. To create the chart object, use the CreateObject function. The string passed in to the function must be the name of the class you are instantiating. For instance, to instantiate a chart from the Chart class, pass the string "Chart".

```
&cChart = CreateObject("Chart");
```

2. Create a rowset for the chart data and set the chart data.

The `CreateRowset` function creates a standalone rowset data structure. Use the `Fill` method to populate the empty rowset with data. The `SetData` method associates the rowset data with the chart.

```
&rsRowset = CreateRowset(Record.QE_CHART_RECORD);
&rsRowset.Fill("where QE_CHART_REGION= :1", "MIDWEST");
&cChart.SetData(&rsRowset);
```

3. Set the height and width of the chart.

Because the chart is not associated with a chart control on a page, you have to specify the size of the chart image to be generated using the `Height` and `Width` properties. The unit of measurement for both of these properties is pixels.

```
&cChart.Width = 400;
&cChart.Height = 300;
```

4. Set the data axes, series, and legend for the chart.

As with all charts, you must set the data axes. If necessary for your data, also set the data series and the legend.

```
&cChart.SetDataYAxis(QE_CHART_RECORD.QE_CHART_SALES);
&cChart.SetDataXAxis(QE_CHART_RECORD.QE_CHART_PRODUCT);
&cChart.SetDataSeries(QE_CHART_RECORD.QE_CHART_REGION);

&cChart.HasLegend = True;
&cChart.LegendPosition = %ChartLegend_Right;
```

5. Generate the URL for the chart.

Use the `GetChartURL` method of the `Response` class to generate the URL that will reference the chart data.

```
&sURL = %Response.GetChartURL(&cChart);
```

6. Generate the image map.

Use the `ImageMap` property to generate the image map for the chart. The `Response` object uses this value to draw the map.

```
&sMap = &cChart.ImageMap;
```

7. Create the response chart.

Use the `Write` `Response` class method to generate the chart. Note that first, the data is set using the URL generated with `GetChartURL`, and then the image map is used.

```
%Response.Write("<HTML><IMG SRC=");
%Response.Write(&sURL);
%Response.Write(" USEMAP=#THEMAP></IMG><MAP NAME=THEMAP>");
%Response.Write(&sMap);
%Response.Write("</MAP></HTML>");
```

Note. If one or more labels does not render in the chart, increase the width of the chart, use shorter label text, or reduce the data set being charted.

Chapter 12

Component Interface Classes

This chapter provides an overview of Component Interface class and discusses the following topics:

- Life cycle of a Component Interface.
- Declaring a Component Interface object.
- Scope of a Component Interface object.
- Implementing a Component Interface object.
- Component Interface methods and timeouts.
- Traversing a Component Interface and using data collections.
- Working with effective-dated data.
- Reusing existing code.
- Component Interface Reference.

Understanding Component Interface Class

Component Interfaces are the focal points for externalizing access to existing PeopleSoft components. They provide realtime synchronous access to the PeopleSoft business rules and data associated with a component outside the PeopleSoft online system. Component Interfaces can be viewed as "black boxes" that encapsulate PeopleSoft data and business processes, and hide the details of the structure and implementation of the underlying page and data.

Component Interfaces are one of the many APIs that PeopleSoft provides for enabling integration with other systems.

A Component Interface maps to one, and only one, PeopleSoft component. The *Component Interface object*, instantiated from a session object, is created at runtime to access the data specified by the Component Interface.

When you instantiate a Component Interface object:

- All the PeopleCode programs associated with the record fields, pages, component, and so on, and
- The runtime component processor still perform all of the work that they do in the online environment.

The exceptions are any GUI manipulation found in a PeopleCode program, and search dialog specific processing.

Component Interfaces are programmable through a C interface, an OLE/COM or C/C++ interface, and through PeopleCode. Application Engine programs, message notification programs, or any other PeopleCode programs are able to use Component Interfaces.

Like a component, you create the structure of a Component Interface in Application Designer, then at runtime, you populate the structure with data. This document is concerned with the runtime portion of a Component Interface.

When you populate a Component Interface with data, the first thing you fill out are its keys, as you would in a component. These can be keys for getting an existing instance of the data or for creating a new instance of the data.

In addition to keys, a Component Interface is composed of *properties* and *methods*.

- Component Interface *properties* provide access to the data in a component buffer.
- Component Interface *methods* are functions that can be called to perform operations on a Component Interface.

There are two types of both methods and properties: standard and user-defined. Standard properties and methods are provided automatically when you create a Component Interface. They perform operations common to all Component Interfaces, such as indicating what mode to operate the Component Interface, saving, or creating a Component Interface. User-defined properties are the specific record fields that an application developer has chosen to expose to an external system with the Component Interface. User-defined methods are PeopleCode programs that an application developer can write to perform operations on a Component Interface. Each is specific to that Component Interface.

You can instantiate a Component Interface object only from a session object. Through the session object you can control access to the Component Interface, check for errors, control the runtime environment, and so on.

PeopleTools 8.51 PeopleBook: PeopleSoft Component Interfaces

Life Cycle of a Component Interface

At runtime, there are certain things you want to do with a Component Interface, such as getting an instance of it, populating it with data, and so on. The following is an overview of this process. These steps are expanded in other sections.

1. Execute the `GetCompIntfc` method on the PeopleSoft session object to get a Component Interface.
2. Set the key values for the Component Interface object. If the keys you specify don't uniquely describe a component (partial keys), proceed to step 3. If the keys uniquely describe a component, skip to step 4.

3. Do *one* of the following:
 - Execute the Find standard method on the Component Interface. This returns a collection of Component Interfaces with their key values filled out. The user can then select the unique Component Interface they want.
 - Execute either the Get or Create standard method to instantiate the Component Interface (populate it with data.)
4. Get property values, set property values, or execute user-defined methods. Setting a property value will fire the standard PeopleSoft business rules for the field associated with the property (any PeopleCode program associated with FieldChange, RowInsert, and so on.)
5. Execute the Save standard method to fire the standard PeopleSoft save business rules (any PeopleCode programs associated with SavePreChange, WorkFlow, and so on.) and commit any changes to the database.
6. At any point, the standard method Cancel can be executed to reset the Component Interface to its state in step 1.

Component interface life cycle

Setting Component Interface Keys

The keys for a Component Interface are based on the key fields of the underlying component. There can be different types of keys for a Component Interface.

- **CREATEKEYS:** A list of the primary key fields of the search record specified to be used in Add mode for the component. This list is automatically generated.
- **GETKEYS:** A list of the primary (required) key fields on the search record. This list is automatically generated.

- **FINDKEYS:** A list of primary and alternate key fields on the primary search record for the component.

If the Component Interface has **CREATEKEYS**, these are the keys you must set before you execute the **Create()** method to create a new instance of the data. If the Component Interface doesn't have **CREATEKEYS**, use the **GETKEYS** to specify a new instance of the data.

Use either the **GETKEYS** or **FINDKEYS** to specify an existing instance of the data.

To set key values, use the field names listed under **GETKEYS**, **CREATEKEYS** or **FINDKEYS** like properties on the Component Interface object. The following example sets the **CREATEKEYS** values to create a new instance of the data.

```
&MYCI = GetCompIntfc(CompIntfc.EXPRESS_ISSUE);
&MYCI.BUSINESS_UNIT = "H01B";
&MYCI.INTERNAL_FLG = "Y";
&MYCI.ORDER_NO = "NEXT";
&MYCI.Create();
```

Standard and User-Defined Component Interface Methods

Every Component Interface comes with a standard set of methods:

- **Cancel()**
- **Create()**
- **Find()**
- **Get()**
- **Save()**

Use these methods during runtime to affect the data of the Component Interface.

The application developer can, at design time, disable any of these methods for the Component Interface.

In addition, an application developer can write their own methods. These methods are written as Functions using Component Interface PeopleCode. For example, suppose you wanted to be able to copy an instance of Component Interface data. You might write your own **Clone** method.

Note. User-defined method names must *not* be named *GetPropertyName*. The C header for Component Interfaces creates functions with that name so you can access each property. If you create your own *GetPropertyName* functions, you receive errors at runtime. User-defined methods can take only simple types of arguments (such as number, character, and so on) because user-defined methods can be called from C/C++ or COM as well as from PeopleCode. PeopleCode can use more complex types (like rowset, array, record, and so on), but these types of arguments are unknown to C/C++ or COM.

PeopleTools 8.51 PeopleBook: PeopleSoft Component Interfaces

PeopleTools 8.51 PeopleBook: PeopleSoft Component Interfaces, "Developing Component Interfaces," Creating User-Defined Methods

Accessing Component Interface Standard Properties

Every Component Interface comes with a standard set of properties. These properties can be divided as follows:

Properties that affect how the Component Interface is executed

The following properties affect how a component interface is executed:

- EditHistoryItems
- GetHistoryItems
- InteractiveMode

These properties must be set before the Component Interface is populated with data. That is, you must set these properties before you use the Get or Create methods.

EditHistoryItems and GetHistoryItems work together to determine how data is accessed:

- If EditHistoryItems is False (the default) and GetHistoryItems is True, you access the data in the Component Interface in a similar manner as if you were accessing a component in update/display All mode. This means all history rows are returned, however, you can edit rows only with a date set in the future.
- If EditHistoryItems is True and GetHistoryItems is True, you access the data in the Component Interface in a similar manner as if you were accessing a component in correction mode. This means all history rows are returned, and you can edit them.
- If GetHistoryItems is False, you access the data in the Component Interface in a similar manner as if you were accessing a component in update mode. The EditHistoryItems has no effect when GetHistoryItems is False.

InteractiveMode causes the Component Interface to emulate an online component. For example, if you set a value for a field in a Component Interface and you have set InteractiveMode to True, then any FieldChange PeopleCode programs associated with that field fire as soon as you set that value.

Properties that return information about the structure of the Component Interface

The following properties return information about the structure of the Component Interface:

- CreateKeyInfoCollection
- FindKeyInfoCollection

- GetKeyInfoCollection
- PropertyInfoCollection

See Also

Chapter 12, "Component Interface Classes," Component Interface Class Properties, page 632

Accessing User-Defined Component Interface Properties

Every user-defined property in a Component Interface *definition* can be used like a property on the *object* instantiated from that Component Interface at runtime.

For example, the following Component Interface definition has RETURN_DT defined as one of its properties.

RETURN_DT Component Interface property highlighted

At runtime, you can use PeopleCode to assign a value to that property (field), or to access the value of that field.

```
&MYCI.RETURN_DT = "05/05/2000";

/* OR */

&DATE = &MYCI.RETURN_DT;
```

Data Type of a Component Interface Object

Component Interfaces are declared as type ApiObject. For example,

```
Local ApiObject &MYCI;
```

Note. Component Interface objects can be declared only as Local.

Scope of a Component Interface Object

A Component Interface can be instantiated from PeopleCode, from a Visual Basic program, from Java, COM and C/C++.

This object can be used anywhere you have PeopleCode, that is, in an application class, Application Engine PeopleCode, record field PeopleCode, and so on.

If you're instantiating a Component Interface from an online page, after you finish working with the component, you may want to refresh your page. The Refresh method, on a rowset object, reloads the rowset (scroll) using the current page keys. This causes the page to be redrawn. GetLevel0().Refresh() refreshes the entire page. If you want a particular scroll only to be redrawn, you can refresh just that part.

Considerations Using Component Interfaces and Related Languages

If you update a field using a Component Interface through an external program (such as Java, VB, and so on) the Related Language Table gets updated, even if they are using a base language of ENG.

Considerations Using Component Variables With Component Interfaces

A component variable is scoped locally to its component or its Component Interface. This means that you cannot use a component variable to share data between a component and a Component Interface. In order to share information between components, use global variables.

If your page (component) calls a Component Interface (using the existing session), that in turn initializes a component variable, that component variable is shared with the calling component. When the Component Interface is closed, the component variable is no longer in scope.

When the calling component is closed, any component scoped variables created by it or by the Component Interface go out of scope.

PeopleTools 8.51 PeopleBook: PeopleSoft Component Interfaces

Implementing a Component Interface

After you create your Component Interface definition, you can use PeopleCode to access it. This PeopleCode can be long and complex. Rather than write it directly, you can drag and drop the Component Interface definition from Application Designer Project View into an open PeopleCode edit pane. Application Designer analyzes the definition and generates initial PeopleCode as a template, which you can modify.

You can also access your Component Interface using COM. You can automatically generate a Visual Basic or a C template, similar to the PeopleCode template, to get you started.

The following are the usual actions that you perform with a Component Interface:

- Create a new instance of data
- Get an existing instance of data
- Retrieve a list of instances of data

The following procedures cover each of these actions in more detail.

Another standard action is inserting or deleting a row of data (an item). This involves traversing a Component Interface (going from level zero to level one, from level one to level two, and so on) and accessing data collections.

You may want to work with effective-dated information. There are several properties you can set to allow you to do this.

In addition to these standard actions, you can also look at the structure of a Component Interface.

Component Interface Methods and Timeouts

The file `pstools.properties` controls when a Component Interface method times out. If you're having problems with methods timing out, you may want to change the values in this file. This file is located in the default directory for the application you're running. If this file isn't in this directory, copy it into the directory before you make your changes to it.

Traversing a Component Interface and Using Data Collections

The data in a Component Interface can be contained in a hierarchy: like the page it's built on, there may be data at level zero, level one, level two, and so on.

Each level of data in a Component Interface is known as a collection, such as:

level zero

```
-- level one (Collection)
```

```
-- Level 2 (Collection)
```

A *collection* is a set of similar things, like a group of already existing Component Interfaces. Most collections have the same standard properties and methods, with some additional ones specific to that collection. For example, all collections have the property *Count*, which indicates how many items are in that collection, but only a data collection has the method *ItemByKey*.

A *data collection* is the collection of data, available at runtime or during test mode, associated with a particular scroll (or record.) The data collection object returns information about every *row of data* (item) that is returned for that record at runtime.

To access the level two collection, in general, you could use the following:

```
&Level_1 = &CI.Level_1;  
&Level_1_Item = &Level_1.Item(ItemNumber);  
  
&Level_2 = &Level_1_Item.Level_2;
```

Sample Component Interface with collection highlighted

This example shows a Component Interface with a two-level hierarchy, that is, two data collections: EMPL_CHECKLIST and EMPL_CHKLIST_ITM. To get a data collection for the first level, use the following code:

```
&Level1 = &MYCI.EMPL_CHECKLIST;
```

To access the secondary scroll (EMPL_CHKLIST_ITM) you have to get the appropriate row (item) of the upper level scroll first:

```
&Level1 = &MYCI.EMPL_CHECKLIST;  
&Item = &Level1.Item(1);  
&Level2 = &Item.EMPL_CHKLIST_ITM;
```

Note. Scrolls represent a hierarchical order. You must get the first level row that contains the secondary scroll *before* you can access the secondary scroll.

Every data collection has a set of methods and standard properties.

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Accessing the Data Buffer"

Working With Effective-Dated Data

When you work with effective-dated data, use some combination of the following methods:

- CurrentItem
- GetEffectiveItem

Both these methods return an item, however, there are some differences:

- The CurrentItem method takes no parameters, so it bases the item it returns on the *current system date*.
- The GetEffectiveItem method bases the item it returns on a *user-provided date*. They all perform the same logic, they just use a different date.

Note. To show all history for an effective-dated collection, you must set GetHistoryItems to True before you populate the Component Interface.

See Also

[Chapter 12, "Component Interface Classes," CurrentItem, page 636](#)

[Chapter 12, "Component Interface Classes," GetEffectiveItem, page 638](#)

[Chapter 12, "Component Interface Classes," GetHistoryItems, page 634](#)

[Chapter 12, "Component Interface Classes," Inserting Effective-Dated Data Example, page 661](#)

[Chapter 12, "Component Interface Classes," Inserting Effective-Dated Data Example Using Visual Basic, page 664](#)

How a Developer Uses GetEffectiveItem

If a user is making an update to an effective-dated record, they don't always want to insert a row at the end.

Suppose the database contained the following data:

<i>EMPLID</i>	<i>EFFDT</i>	<i>SEQNO</i>
8000	3/1/99	0
8000	7/1/99	0
8000	9/1/99	0
8000	12/1/99	0

Now suppose the user wants to enter info with EFFDT of 11/1/99. If they were looking at a PeopleSoft component, they would visually scan to see where that date falls and then press ALT+7 and ENTER at the row that they want to insert after.

GetEffectiveItem enables you to pass in the correct effective date, instead of having to loop through every item in the collection doing a comparison, looking for the correct item.

Why Can't it Just Go at the End?

The InsertItem method simulates pressing ALT+7 and ENTER online to insert a row in a scroll. Part of the logic that occurs in the Component Processor is that if the scroll is effective-dated, the ALT+7 and ENTER carries the values forward from the previous row. This functionality is still there if you use InsertItem at the end of the collection, but the values may be incorrect.

Reusing Existing Code

One of the advantages of using a Component Interface is that it enables you to reuse existing PeopleCode and business logic. However, a Component Interface isn't exactly equivalent to a component, which means there are a few key areas in which you should expect differences in behavior between a Component Interface and the component it's based on. This section discusses the differences in:

- Search dialog processing
- Event and function behavior

Differences in Search Dialog Processing

When you run a Component Interface, the *SearchInit*, *SearchSave*, and *RowSelect* events don't fire. This means that any PeopleCode associated with these events won't run. The first event to run is *RowInit*.

Differences in PeopleCode Event and Function Behavior

PeopleCode events and functions that relate exclusively to the page interface (the GUI) and online processing can't be used by Component Interfaces. These include:

- Menu PeopleCode and pop-up menus.

The *ItemSelected* and *PrePopup* PeopleCode events are not supported. In addition, the *DisableMenuItem*, *EnableMenuItem*, and *HideMenuItem* functions aren't supported.

- Transfers between components, including modal transfers.

The *DoModal*, *EndModal*, *IsModal*, *Transfer*, *TransferPage*, *DoModalComponent*, *TransferNode*, *TransferPortal*, and *IsModalComponent* functions cannot be used.

- Cursor position.

SetControlValue cannot be used.

- *WinMessage* cannot be used.
- Save in the middle of a transaction.

DoSave cannot be used.

- The page *Activate* event cannot be used.

When executed using a component interface, these functions do nothing and return a default value. In addition, using the *Transfer* function terminates the current PeopleCode program.

For the unsupported functions, you should put a condition around them, testing whether there's an existing Component Interface.

```

If %ComponentName Then
    /* process is being called from a Component Interface */
    /* do CI specific processing */
Else
    /* do regular processing */
End-if;

```

Using %Menu Conditions

If you associate a Component Interface definition with a menu in Application Designer, a PeopleCode program that conditionally checks for that menu runs when the Component Interface is executed. For example, suppose you associate a Component Interface with the MP_HR_MENU. The following PeopleCode program, if called from that Component Interface, executes:

```

If %Menu = MP_HR_MENU Then

```

Session Class Methods

Component Interfaces don't have any built-in functions. They are instantiated from the Session class.

This section discusses the Session class methods used to instantiate Component Interfaces. The methods are discussed in alphabetical order.

FindCompIntfcs

Syntax

```
FindCompIntfcs([ComponentName])
```

Description

The FindCompIntfcs method, used with the session object, returns a reference to a Component Interface collection, filled with zero or more Component Interfaces. The *ComponentName* parameter takes a string value. You can use a partial value to limit the set of Component Interfaces returned. You can also specify a null value, that is, two quotation marks with no space between them, (""), to return the entire list of Component Interfaces available.

Using the FindCompIntfcs method is equivalent to using File, Open, and selecting Component Interface in Application Designer.

Example

In the following example, a partial key was used to open all components starting with "APP".

```
Local ApiObject &MYSESSION;  
Local ApiObject &MYCI;  
  
&MYSESSION = %Session;  
&MYCICOLL = &MYSESSION.FindCompIntfcs("APP");  
&MYCI = &MYCICOLL.First();
```

GetCompIntfc

Syntax

```
GetCompIntfc( [COMPINTFC.] ComponentName )
```

Description

The `GetCompIntfc` method, used with the session object, returns a reference to a Component Interface. *ComponentName* when used by itself takes a string value. If you use `COMPINTFC.componentname` it isn't a string value: it's a constant that automatically is renamed in your code if the Component Interface definition is ever renamed. You must specify an existing Component Interface, otherwise you receive a runtime error.

Example

```
Local ApiObject &MYSESSION;  
Local ApiObject &MYCI;  
  
&MYSESSION = %Session;  
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.PERSONAL_DATA_BC);
```

The following example uses the '@' operator to dynamically call a Component Interface from PeopleCode.

```
&MYCI = &MYSESSION.GetCompIntfc(@"CompIntfc." | &CIname));
```

Component Interface Collection Methods

A Component Interface collection is a list of the available Component Interfaces. An equivalent list is generated by starting Application Designer, selecting File, Open, Component Interface.

You get a Component Interface collection by using the `FindCompIntfcs` method with a session object.

First

Syntax

First()

Description

The First method returns the first Component Interface in the Component Interface collection object executing the method. This returns the structure of the Component Interface with only the key fields filled in. The rest of the data is not present. To populate the Component Interface with data, you must set the key values and use the Get method.

Example

```
&MYCI = &CICOLLECTION.First();
```

Item

Syntax

Item(*number*)

Description

The Item returns the Component Interface that exists at the number position in the Component Interface collection executing the method. This returns the structure of the Component Interface with only the key fields filled in. The rest of the data is not present. To populate the Component Interface with data, you must set the key values and use the Get method. *number* takes a number value.

Example

```
For &I = 1 to &COLLECTION.Count;  
&MYCI = &COLLECTION.Item(&I);  
/* do processing */  
End-For;
```

Next

Syntax

Next()

Description

The Next method returns the next Component Interface in the Component Interface collection object executing the method. You can use this method only after you have used either the First or Item methods; otherwise the system doesn't know where to start. This returns the structure of the Component Interface with only the key fields filled in. To populate the Component Interface with data, you must set the key values and use the Get method.

Example

```
&MYCI = &COLLECTION.Next();
```

Component Interface Collection Property

This section discusses the Count property.

Count

Description

This property returns the number of Component Interfaces in the Component Interface collection, as a number.

This property is read-only.

Example

```
&COUNT = &MYCI_COLLECTION.Count;
```

Component Interface Class Methods

This section discusses the Component Interface class methods. The methods are discussed in alphabetical order.

Cancel

Syntax

cancel()

Description

The Cancel method cancels the instance of the Component Interface object executing the method, rolling back any changes that were made. This sets the Component Interface state to the same state it was in immediately after it was created by GetCompIntfc. This closes the Component Interface.

Parameters

None.

Returns

A Boolean value: True if component was successfully cancelled, False otherwise.

CopyRowset

Syntax

```
CopyRowset(&Rowset [, InitialRow] [, record_list]);
```

Where *record_list* is a list of record names in the form:

```
[RECORD.source_recname1, RECORD.target_recname1  
[, RECORD.source_recname2, RECORD.target_recname2]]. . .
```

Description

The CopyRowset method copies the specified rowset object to the Component Interface executing the method, copying like-named record fields and data collections (child rowsets) at corresponding levels. If pairs of source and destination record names are given, these are used to pair up the records and data collections *before* checking for like-named record fields.

CopyRowset uses the Page Field order when copying properties. This helps ensure that dependent fields are set in the required order.

Note. This method works in PeopleCode only. This method uses the names of the records in the collection, *not* the name you may give the collection when you create the Component Interface.

If there are blanks in *source* rowset or record, they are copied over to the Component Interface only if the field's IsChanged property is set to True. Otherwise blanks are *not* copied.

Use this method when you are using a Component Interface to verify the data in your application message.

Note. The structure of the rowset you're copying data from must exactly match the existing rowset structure, with the same records at level zero, 1, 2, and so on. CopyRowset is intended to be used with a notification process, that is, with message data. As all notifications work only in two-tier mode, CopyRowset works only in two-tier mode.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Rowset</i>	Specify an existing, instantiated rowset object that contains data.
<i>InitialRow</i>	Specify the initial transaction row to begin with. This parameter provides a quick way to loop through a rowset that has multiple level zero rows. The default value for this parameter is 1.
<i>record_list</i>	Specify a list of source and target record names. All <i>source_recnames</i> are records being copied <i>from</i> , in the rowset object being copied from. All <i>target_recnames</i> are records being copied <i>to</i> , in the Component Interface being copied to.

Returns

None.

Example

The following example would be in your notification PeopleCode. The Exit(1) causes all changes to be rolled back, and the message is marked with the status ERROR so you can correct it.

```

Local message &MSG;
Local ApiObject &SESSION;
Local ApiObject &PO;
Local rowset &ROWSET;

&MSG = %IntBroker.GetMessage();
&ROWSET = &MSG.GetRowset();

&SESSION = %Session;

If &SESSION <> NULL Then
/* Session connected correctly */
/* Set key values to create component */
&PO = &SESSION.GetCompIntfc(COMPINTFC.PO);
&PO.BU = &MSG(&I).PO_HDR.BU.Value;
&PO.PO_ID = &MSG(&I).PO_HDR.PO_ID.Value;
&PO.Create();

&PO.CopyRowset(&ROWSET);
If NOT (&PO.Save()) Then
    Exit(1);
End-if;
Else
/* do error processing */
End-If;

```

The following example loops through all the transactions of a message rowset.

```

Local message &MSG;
Local ApiObject &SESSION;
Local ApiObject &CI;
Local rowset &ROWSET;

&MSG = %IntBroker.GetMessage();
&ROWSET = &MSG.GetRowset();

&SESSION = %Session;
If &SESSION <> Null Then)
    &CI = &SESSION.GetCompIntfc(CompIntfc.VOL_ORG);
    &I = 0;
    While (&I < &ROWSET.RowCount)
        &I = &I + 1;
        &CI.VOLUNTEER_ORG = &ROWSET.GetRow(&I).VOLNTER_ORG_2. VOLUNTEER_ORG.Value;
        If &CI.Create() Then
            If &CI.CopyRowset(&ROWSET, &I, Record.VOLNTER_ORG_TBL, Record.⇒
VOLNTER_ORG_TBL) Then

                /* App specific processing */

                If Not &CI.Save() Then
                    Winmessage("Save Failed");
                    /* Other app specific processing */
                End-If;
            End-If;
        End-If;
        &CI.Cancel();
    End-While;
End-If;

```

CopyRowsetDelta

Syntax

CopyRowsetDelta(&Rowset [, InitialRow] [, record_list]);

Where *record_list* is a list of record names in the form:

```
[RECORD.source_rename1, RECORD.target_rename1
[, RECORD.source_rename2, RECORD.target_rename2]]. . .
```

Description

The CopyRowsetDelta method copies the changed rows in the specified rowset object to the Component Interface executing the method, copying like-named record fields and data collections (child rowsets) at corresponding levels. If pairs of source and destination record names are given, these are used to pair up the records and data collections *before* checking for like-named record fields.

Note. This method works in PeopleCode only. This method uses the names of the records in the collection, *not* the name you give the collection when you create the Component Interface.

If there are blanks in *source* rowset or record, they are copied over to the Component Interface only if the field's IsChanged property is set to True. Otherwise blanks are *not* copied.

You will generally use this method with a Component Interface to verify data from a message.

Note. CopyRowsetDelta is intended for a notification process, that is, with message data. As all notifications work only in two-tier mode, CopyRowsetDelta works only in two-tier mode.

If the rowset you're copying from is a message rowset, the CopyRowsetDelta method uses the AUDIT_ACTN field in the PSCAMA table in the message to know whether the row is to be inserted, updated, or deleted inside the Component Interface.

If the rowset you're copying from *is not* a message rowset, that rowset must have the same structure as a message, that is, it must have a PSCAMA record with an AUDIT_ACTN field on every level of the rowset.

Warning! CopyRowsetDelta uses a record's keys to locate the target row to change for all audit actions other than Add. CopyRowsetDelta actions (other than Add) therefore work only on rowsets that have keys *that uniquely identify all rows in the rowset*. Rowsets that do *not* distinguish between rows using a key field will be updated in an unpredictable fashion.

Considerations Using CopyRowsetDelta with Effective-Dated Rowsets

If a message data row inserted using a PSCAMA Audit action of "A" belongs to an effective dated scroll containing child scrolls, the insertion of the parent row causes child rows of the previous effective-dated row to be copied over, and their effective date is updated with that of the inserted parent.

If the message also contains a child row being inserted with a PSCAMA Audit action of "A", the component interface being populated will end up having two child rows: the one inserted as part of the Effective-dated processing and the one inserted using the PSCAMA Audit action "A" in the message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Rowset</i>	Specify an existing, instantiated rowset object that contains data.
<i>InitialRow</i>	Specify the initial transaction row to begin with. This parameter provides a quick way to loop through a rowset that has multiple level zero rows. The default value for this parameter is 1.
<i>record_list</i>	Specify a list of source and target record names. All <i>source_recnames</i> are records being copied <i>from</i> , in the rowset object being copied from. All <i>target_recnames</i> are records being copied <i>to</i> , in the Component Interface being copied to.

Returns

None.

Example

The following PeopleCode would exist in your notification process. The Exit(1) causes all changes to be rolled back, and the message is marked with the status ERROR so you can correct it.

```

Local Message &MSG;
Local ApiObject &SESSION;
Local ApiObject &PO;
Local Rowset &ROWSET;

&MSG = %IntBroker.GetMessage();
&ROWSET = &MSG.GetRowset();

&SESSION = %Session;

If &SESSION <> Null Then
/* Session connected correctly */
/* Set key values to get component */
&PO = &SESSION.GetCompIntfc(COMPINTFC.PO);
&PO.BU = &MSG(&I).PO_HDR.BU.Value;
&PO.PO_ID = &MSG(&I).PO_HDR.PO_ID.Value;
&PO.Get();

&PO.CopyRowsetDelta(&ROWSET);
If NOT (&PO.Save()) Then
    Exit(1);
End-if;
Else
    /* do error processing */
End-If;

```

CopySetupRowset

Syntax

```
CopySetupRowset(&Rowset [, InitialRow] [, record_list]);
```

Where *record_list* is a list of record names in the form:

```
RECORD.source_recname, RECORD.target_recname
```

Description

The CopySetupRowset method is used to copy a setup table application message to a Component Interface. A setup table has the same record at level zero and level one, while a Component Interface has only a single copy of a record. This method copies the contents of the message (at level zero) to the first level collection (level one) of the Component Interface.

The CopySetupRowset method copies *like-named* record fields. If a pair of source and destination record names are given, these are used to pair up the records and data collections *before* checking for like-named record fields.

Note. This method works in PeopleCode only. This method uses the names of the records in the collection, *not* the name you may give the collection when you create the Component Interface.

If there are blanks in *source* rowset or record, they are copied over to the Component Interface only if the field's `IsChanged` property is set to `True`. Otherwise blanks are *not* copied.

Note. `CopySetupRowset` is for a notification process, that is, with message data. As all notifications work only in two-tier mode, `CopySetupRowset` works only in two-tier mode.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Rowset</i>	Specify an existing, instantiated rowset object that contains data.
<i>InitialRow</i>	Specify the initial transaction row to begin with. This parameter provides a quick way to loop through a rowset that has multiple level zero rows. The default value for this parameter is 1.
<i>record_list</i>	Specify source and target record names. The <i>source_recname</i> is the record being copied <i>from</i> , in the rowset object being copied from. The <i>target_recname</i> is the record being copied <i>to</i> , in the Component Interface being copied to.

Returns

None.

Example

The following example would be in your Notification PeopleCode.

```

Local ApiObject &SESSION;
Local ApiObject &PSMESSAGES;

Local ApiObject &CI;

Local Message &MSG;
Local Rowset &RS;

&SESSION = %Session;
&PSMESSAGES = &SESSION.psmessages;

&MSG = %IntBroker.GetMessage();
&RS = &MSG.GetRowset();

&CI = &SESSION.getcomponent(Component.VOL);

/** Set Business Component Properties */
&CI.gethistoryitems = True;
/*&CI.InteractiveMode = True;*/
/*&CI.stoponfirsterror = True;*/

For &TRANSACTION = 1 To &RS.RowCount

    &CI.VOLUNTEER_ORG = &RS(&TRANSACTION).VOLNTER_ORG_TBL.VOLUNTEER_ORG.Value;

    /* note: You can achieve better performance if you add code here to check if⇒
the keys are the same LO keys as the last time through the loop and, if so, skip⇒
the Get/Create section. */

    If Not &CI.create() Then
        &PSMESSAGES.DeleteAll();
        If Not &CI.get() Then
            /** Check Error Messages */
            For &I = 1 To &PSMESSAGES.count
                &TYPE = &PSMESSAGES.item(&I).type;
                &TEXT = &PSMESSAGES.item(&I).text;
            End-For;
            Exit(1);
        End-If;
    End-If;

    If Not &CI.CopySetupRowset(&RS, &TRANSACTION) Then
        /** Check Error Messages */
        For &I = 1 To &PSMESSAGES.count
            &TYPE = &PSMESSAGES.item(&I).type;
            &TEXT = &PSMESSAGES.item(&I).text;
        End-For;
        Exit(1);
    End-If;

    If Not &CI.Save() Then
        /** Check Error Messages */
        For &I = 1 To &PSMESSAGES.count
            &TYPE = &PSMESSAGES.item(&I).type;
            &TEXT = &PSMESSAGES.item(&I).text;
        End-For;
        Exit(1);
    End-If;

    &CI.Cancel();
End-For;

```

CopySetupRowsetDelta**Syntax**

```
CopySetupRowsetDelta(&Rowset [, InitialRow] [, record_list]);
```

Where *record_list* is a list of record names in the form:

```
RECORD.source_recname, RECORD.target_recname
```

Description

The CopySetupRowsetDelta method is used to copy a setup table with *changed* rows in an application message to a Component Interface. A setup table has the same record at level zero and level one, while a Component Interface has only a single copy of a record. This method copies the contents of the message (at level zero) to the first level collection (level one) of the Component Interface.

Note. This method works in PeopleCode only. CopySetupRowsetDelta copies all the like-named fields from the changed row into the message. It is *not* copying only the changed fields.

The CopySetupRowsetDelta method copies *like-named* record fields, in those rows where the IsChanged property is True. If a pair of source and destination record names are given, these are used to pair up the records and data collections *before* checking for like-named record fields.

Note. This method uses the names of the records in the collection, *not* the name you may give the collection when you create the Component Interface.

If there are blanks in *source* rowset or record, they are copied over to the Component Interface only if the field's IsChanged property is set to True. Otherwise blanks are *not* copied.

Note. CopySetupRowsetDelta is for a notification process, that is, with message data. As all notifications work only in two-tier mode, CopySetupRowsetDelta works only in two-tier mode.

Warning! CopySetupRowsetDelta uses a record's keys to locate the target row to change for all audit actions other than Add. CopySetupRowsetDelta actions (other than Add) therefore work only on rowsets that have keys that *uniquely identify all rows in the rowset*. Rowsets that do *not* distinguish between rows using a key field will be updated in an unpredictable fashion.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Rowset</i>	Specify an existing, instantiated rowset object that contains data.
<i>InitialRow</i>	Specify the initial transaction row to begin with. This parameter provides a quick way to loop through a rowset that has multiple level zero rows. The default value for this parameter is 1.
<i>record_list</i>	Specify source and target record names. The <i>source_recname</i> is the record being copied <i>from</i> , in the rowset object being copied from. The <i>target_recname</i> is the record being copied <i>to</i> , in the Component Interface being copied to.

Returns

None.

Example

```

Local ApiObject &SESSION;
Local ApiObject &PSMESSAGES;

Local ApiObject &CI;

Local Message &MSG;
Local Rowset &RS;

&SESSION = %Session;
&PSMESSAGES = &SESSION.psmessages;

&MSG = %IntBroker.GetMessage();
&RS = &MSG.GetRowset();

&CI = &SESSION.getcomponent(Component.VOL);

/** Set Business Component Properties */
&CI.gethistoryitems = True;
/*&CI.InteractiveMode = True;*/
/*&CI.stoponfirsterror = True;*/

For &TRANSACTION = 1 To &RS.RowCount

    &CI.VOLUNTEER_ORG = &RS(&TRANSACTION).VOLNTER_ORG_TBL.VOLUNTEER_ORG.Value;

    /* note: You can achieve much better performance if you add code here to check =>
    if the keys are the same L0 keys as the last time through the loop and, if so,=>
    skip the Get/Create section. */

    If Not &CI.create() Then
        &PSMESSAGES.DeleteAll();
        If Not &CI.get() Then
            /** Check Error Messages */
            For &I = 1 To &PSMESSAGES.count
                &TYPE = &PSMESSAGES.item(&I).type;
                &TEXT = &PSMESSAGES.item(&I).text;
            End-For;
            Exit(1);
        End-If;
    End-If;

    If Not &CI.CopySetupRowsetDelta(&RS, &TRANSACTION) Then
        /** Check Error Messages */
        For &I = 1 To &PSMESSAGES.count
            &TYPE = &PSMESSAGES.item(&I).type;
            &TEXT = &PSMESSAGES.item(&I).text;
        End-For;
        Exit(1);
    End-If;

    If Not &CI.Save() Then
        /** Check Error Messages */
        For &I = 1 To &PSMESSAGES.count
            &TYPE = &PSMESSAGES.item(&I).type;
            &TEXT = &PSMESSAGES.item(&I).text;
        End-For;
        Exit(1);
    End-If;

```

```
&CI.Cancel();
```

See Also

[Chapter 12, "Component Interface Classes," CopySetupRowset, page 620](#) and [Chapter 12, "Component Interface Classes," CopyRowsetDelta, page 618](#)

Create

Syntax

```
Create()
```

Description

The Create method associates the Component Interface object executing the method with a new, open Component Interface that matches the key values that were set prior to using the Create method. If there are CREATEKEYS values associated with the Component Interface, these are the values you must set. If there are no CREATEKEYS values, you must set the required GETKEYS values instead. All keys required for creating a new Component Interface must be set before using the Create method, otherwise you receive a runtime error. If you do not use unique key values, (that is, you try to set the keys to values that already exist in the database) you receive a runtime error.

Setting the key values prior to using the Create method is analogous to filling in the key values in the Add dialog for a component when you access it in add mode.

Parameters

None.

Returns

A Boolean value: True if component was successfully created, False otherwise.

Example

```
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.ACTION_REASON);  
&MYCI.ACTION = "Additional Job";  
&MYCI.ACTION_REASON = "0001";  
&MYCI.Create();
```

Find

Syntax

Find()

Description

Note. Find can be used only at level zero within the Component Interface.

You do not have to set values for all the key values. You can use the same wildcards in your Find that you can use in the search dialog, that is, % for one or more characters in a search pattern, and _ (underscore) for exactly one character. In addition, you can use partial values. For example, the following code finds all the data items where the employee ID starts with an "8":

```
&MYCI.Emplid = "8";  
&MYDC = &MYCI.Find();
```

This is analogous to using a partial key from the search dialog, opening a component.

After you have a data collection, you can use one of the data collection methods to open the Component Interface.

Parameters

None.

Returns

A collection of Component Interfaces.

See Also

[Chapter 12, "Component Interface Classes," Data Collection Methods, page 636](#)

Get

Syntax

Get()

Description

The Get method associates the Component Interface object executing the method with an open Component Interface that matches the key values that were set prior to using the Get method. The key values you must set are the required GETKEYS values for the Component Interface.

Note. To retrieve all the history data for a Component Interface, you must specify the GetHistoryItems property as True *before* you use the Get method. If you want any PeopleCode programs associated with the fields to fire immediately after a value is changed, you must set the InteractiveMode property as True *before* you use the Get method.

After any execution of Get, you should check if there are any errors pending on the session object. In some special circumstances (involving failure of previously cached operations failing after the Get has executed) Get returns True even though the component wasn't retrieved.

Parameters

None.

Returns

A Boolean value: True if component was successfully retrieved, False otherwise.

Example

```
&MYCI.EMPLID = "8001";
&MYCI.Get();
If %Session.ErrorPending Then
    /* Get Unsuccessful, do error processing */
Else
    /* do regular processing */
End-if;
```

GetPropertyByName

Syntax

GetPropertyByName(*string*)

Description

The GetPropertyByName method returns the value of the property specified by *string*. For a collection, it returns a reference to the collection. Generally this function is used only in applications that cannot get the names of the component interface properties until runtime.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>string</i>	The name of the property.

Returns

String. The value of the property.

ApiObject. For a collection. The value of the property.

Example

```

Local ApiObject &oSession, &oCI;
Local array of string &Keys_Arr, &Temp_Arr, &Prop_Arr;
Local string &strCIName, &PropertyValue;
Local number &I, &J, &K;

Function getPropertyValue(&oDataColl As ApiObject, &PropertyName As string)=>
    Returns string
    rem ***** Return property value
        Return &oDataColl.GetPropertyByName(&PropertyName);
End-Function;

Function getCollection1(&collectionName As string)
    Local ApiObject &oL1_DataColl, &oL1_DataItem;
    rem ***** Return collection
        &oL1_DataColl = &oCI.GetPropertyByName(&collectionName);
        For &J = 1 To &oL1_DataColl.Count
            &oL1_DataItem = &oL1_DataColl.Item(&J);
            For &K = 1 To &Prop_Arr.Len
                &Temp_Arr = Split(&Prop_Arr [&K], "|");
                If &Temp_Arr [1] = "1" Then
                    If &Temp_Arr [3] = "Property" Then
                        &PropertyValue = getPropertyValue(&oL1_DataItem,
                            &Temp_Arr [2]);
                    Else
                        rem ***** Code to Get Collection 2 goes here *****;
                    End-If;
                End-If;
            End-For;
        End-For;
    End-Function;

```

Save

Syntax

Save()

Description

Saves any changes that have been made to the data of the Component Interface executing the method. You must save any new Component Interfaces you create before they are added to the database.

The standard PeopleSoft save business rules (that is, any PeopleCode programs associated with SaveEdit, SavePreChange, WorkFlow, and so on.) is executed after you execute this method. If you didn't specify the Component Interface to run in interactive mode, FieldEdit, FieldChange, and so on, also run at this time.

If there are multiple errors, all errors are logged to the PSMessages collection, not just the first occurrence of an error. As you correct each error, you may want to delete it from the PSMessages collection.

Note. If you're running a Component Interface from an Application Engine program, the data won't actually be committed to the database until the Application Engine program performs a COMMIT.

Parameters

None.

Returns

A Boolean value: True if component was successfully saved, False otherwise.

Example

```
&MYCI.Emplid = "8001";  
&MYCI.Get();  
&MYCI.CHECKLIST_CD = "00001";  
&MYCI.Save;
```

See Also

[Chapter 38, "Session Class," ErrorPending, page 2176](#)

SetPropertyByName

Syntax

SetPropertyByName(*string*, *value*)

Description

The SetPropertyByName method sets the value of the property specified by *string*. Generally this function is used only in applications that cannot set the names of the component interface properties until runtime.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>string</i>	The name of the property.
<i>value</i>	The value to which the property is to be set.

Returns

None.

Example

```
Local ApiObject &oSession, &oCI;  
Local array of string &Keys_Arr, &Temp_Arr, &Prop_Arr;  
Local string &strCIName, &PropertyValue;  
Local number &I, &J, &K;  
  
&strCIName = "SDK_BUS_EXP";  
&Keys_Arr = CreateArrayRept("", 0);  
&Keys_Arr.Push("SDK_EMPLID|" | "8001");  
  
&oSession = %Session;  
&oCI = &oSession.GetCompIntfc(@"CompIntfc." | &strCIName));  
  
For &I = 1 To &Keys_Arr.Len  
    &Temp_Arr = Split(&Keys_Arr [1], "|");  
    &oCI.SetPropertyByName(&Temp_Arr [1], &Temp_Arr [2]);  
End-For;
```

Component Interface Class Properties

In this section, we discuss the Component Interface class properties. The properties are discussed in alphabetical order.

ComponentName

Description

This property returns the name of the Component Interface, as defined in Application Designer, as a string.

This property is read-only.

CreateKeyInfoCollection

Description

This property returns a `CompIntfPropInfoCollection` collection that contains a `CompIntfPropInfoCollection` object for every key in `CREATEKEYS`.

This property is read-only.

Example

```
&CREATEKEYS = &CI.CreateKeyInfoCollection;
```

See Also

[Chapter 12, "Component Interface Classes," Accessing the Structure of a Component Interface, page 644](#)

EditHistoryItems

Description

This property works with the `GetHistoryItems` property to specify what data is accessed, and whether you can edit that data:

- If `EditHistoryItems` is `False` (the default) and `GetHistoryItems` is `True`, you access the data in the Component Interface in a similar manner as if you were accessing a component in `Update/Display All` mode. This means all history rows are returned, however, you can edit only rows with a date set in the future.

- If `EditHistoryItems` is `True` and `GetHistoryItems` is `True`, you access the data in the Component Interface in a similar manner as if you were accessing a component in Correction mode. This means all history rows are returned, and you can edit them.
- If `GetHistoryItems` is `False`, you access the data in the Component Interface in a similar manner as if you were accessing a component in Update mode. The `EditHistoryItems` has no effect when `GetHistoryItems` is `False`.

You must set this property to `True` *before* you execute the `Get` method.

This property is read-write.

See Also

[Chapter 12, "Component Interface Classes," `GetHistoryItems`, page 634](#)

FindKeyInfoCollection

Description

This property returns a `CompIntfPropInfoCollection` collection that contains a `CompIntfPropInfoCollection` object for every key in `FINDKEYS`.

This property is read-only.

See Also

[Chapter 12, "Component Interface Classes," `Accessing the Structure of a Component Interface`, page 644](#)

GetDummyRows

Description

When a new scroll is inserted on a page, that scroll is displayed even though it has no underlying data. Any scroll that is empty has one dummy row displayed with only the defaults set.

This property is `True` if the dummy row is to be displayed, `False` if you do not want to display the dummy row. The default value for this property is `True`.

This property is read-write.

Example

```
&MyCI.GetDummyRows = False;
```

GetHistoryItems

Description

This property works with the EditHistoryItems property to specify what data is accessed, and whether you can edit that data:

- If EditHistoryItems is False (the default) and GetHistoryItems is True, you access the data in the Component Interface in a similar manner as if you were accessing a component in Update/Display All mode. This means all history rows are returned, however, you can edit only rows with a date set in the future.
- If EditHistoryItems is True and GetHistoryItems is True, you access the data in the Component Interface in a similar manner as if you were accessing a component in Correction mode. This means all history rows are returned, and you can edit them.
- If GetHistoryItems is False, you access the data in the Component Interface in a similar manner as if you were accessing a component in Update mode. The EditHistoryItems has no effect when GetHistoryItems is False.

You must set this property to True *before* you execute the Get method.

This property is read-write.

Example

The following example checks the current status of the mode, then sets the GetHistoryItems and EditHistoryItems properties to True if the mode is Correction mode.

```
If %Mode = "C" Then
    &CI.EditHistoryItems = True;
    &CI.GetHistoryItems = True;
End-if;
```

See Also

[Chapter 12, "Component Interface Classes," EditHistoryItems, page 632](#)

GetKeyInfoCollection

Description

This property returns a CompIntfPropInfoCollection collection that contains a CompIntfPropInfoCollection object for every key in GETKEYS.

This property is read-only.

See Also

[Chapter 12, "Component Interface Classes," Accessing the Structure of a Component Interface, page 644](#)

InteractiveMode

Description

When this property is set as True, the Component Interface runs the same as a component: that is, any PeopleCode programs associated with FieldChange, RowInsert, and so on, run immediately after you make a change. If this property is set to False, these programs won't run until you execute the Save method.

This property is read-write.

See Also

[Chapter 38, "Session Class," ErrorPending, page 2176](#)

PropertyInfoCollection

Description

This property returns a CompIntfPropInfoCollection object for every property that isn't a collection (that is, a scroll.) If the property is a collection (scroll), use the PropertyInfoCollection property to get another collection.

This property is read-only.

See Also

[Chapter 12, "Component Interface Classes," Accessing the Structure of a Component Interface, page 644](#)

StopOnFirstError

Description

When this property is set as True, the CopyRowset (or CopyRowsetDelta) method currently executing halts its processing at the first error generated by the Component Interface.

When this property is set as True and InteractiveMode is set as False, processing of queued operations at save time is halted at the first error.

The default value is False.

This property is read-write.

Data Collection Methods

A *data collection* is the collection of data, available at runtime or during test mode, associated with a particular scroll (or record.) The data collection object returns information about every *row of data* (item) that is returned for that record at runtime.

To access a data collection, use the name of the record (scroll) as a property on a Component Interface.

See Also

[Chapter 12, "Component Interface Classes," Traversing a Component Interface and Using Data Collections, page 608](#)

CurrentItem

Syntax

CurrentItem()

Description

If the component associated with the Component Interface is effective-dated, CurrentItem returns a reference to the current effective-dated item (row of data). To get a specific item based on a date, use GetEffectiveItem.

If there is no current item, a Null is returned.

Example

```
&MYCD = &MYCI.EMPL_CHKLIST_ITM;  
&ITEM = &MYDC.CurrentItem();
```

DeleteItem

Syntax

DeleteItem(*number*)

Description

The DeleteItem method deletes the item (row of data) at the position specified by *number*. This parameter takes a number value.

When the `DeleteItem` method is executed, if there are any `RowDelete` PeopleCode programs associated with any of the fields, they fire as well, as if the user pressed ALT+8 and ENTER or clicked the `DeleteRow` icon. However, the programs are executed as if turbo mode was selected. (In turbo mode default processing is performed *only* for the row being deleted.)

If you set the `InteractiveMode` property to `True`, any `RowDelete` PeopleCode runs immediately after you execute `DeleteItem`. If this property is set to `False`, any `RowDelete` PeopleCode runs after you execute the `Save` method.

The deleted item is not actually deleted from the database until after you use the `Save` method.

Example

For example, suppose your Component Interface had two scrolls: `EMPL_CHECKLIST` and `EMPL_CHKLIST_ITM`. The data collection `EMPL_CHECKLIST` has four items (rows of data.) The data collection `EMPL_CHKLIST_ITM` (under the third item) has five items (rows of data.) If you run this component in the Component Interface Tester, it would look as follows:

EMPL_CHK_BC in Component Interface Tester

To delete the third row in the third item, use the following:

```
Local ApiObject &MYSESSION;  
Local ApiObject &MYCI;  
  
&MYSESSION = %Session;  
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.EMPL_CHK_BC);  
&MYLVL1 = &MYCI.EMPL_CHECKLIST;  
&ITEM2 = &MYLVL1.Item(3);  
&MYLVL2 = &ITEM2.EMPL_CHKLST_ITM;  
&MYLVL2.DeleteItem(3);  
&MYCI.Save();
```

GetEffectiveItem

Syntax

```
GetEffectiveItem(DateString, SeqNo)
```

Description

If the component associated with the Component Interface is effective-dated, GetEffectiveItem returns a reference to the closest effective-dated item (row of data) that is less than or equal to the date specified by the *DateString*. To get an item based on the current effective date, use CurrentItem.

Note. *DateString* takes only a string value. You must convert a date variable into a string before you can use it for *DateString*. You can use the String function to do this.

Parameters

Parameter	Description
<i>DateString</i>	Specify the year, month, and day of the effective date that you want to look for. This parameter takes a string value. You can specify the date either as YYYY-MM-DD or MM/DD/YY.
<i>SeqNo</i>	Specify the sequence number of the effective date that you want to look for. This parameter takes a number value.

Returns

A reference to an effective-dated item.

Example

```
&MYCD = &MYCI.EMPL_CHKLST_ITM;  
&DSTRING = String(&MYDATE);  
&ITEM = &MYDC.GetEffectiveItem(&DSTRING, 1);
```

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," String

GetEffectiveItemNum**Syntax**

```
GetEffectiveItemNum(DateString, SeqNo)
```

Description

If the component associated with the Component Interface is effective-dated, **GetEffectiveItemNum** returns a reference to the number of the closest effective-dated item (row of data) that is less than or equal to the date specified by the *DateString*. To get an item number based on the current effective date, use **CurrentItemNum**.

Note. *DateString* takes only a string value. You must convert a date variable into a string before you can use it for *DateString*. You can use the **String** function to do this.

Considerations for Returning Rows

GetEffectiveItemNum returns a valid row number only when EFFDT is less than or equal to *DateString*. If the value you use for *DateString* pre-dates all the rows in the data collection, this method returns a zero and logs a message in the **PSMessages** collection.

For example, if 12/01/1990 was the earliest date in the collection, the following would return zero:

```
&NUM = &MYDC.GetEffectiveItemNum("01/01/1900", 1);
```

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DateString</i>	Specify the year, month, and day of the effective date that you want to look for. This parameter takes a string value. You can specify the date either as YYYY-MM-DD or MM/DD/YYYY.
<i>SeqNo</i>	Specify the sequence number of the effective date that you want to look for. This parameter takes a number value.

Returns

A number. This method returns 0 if no row matching the criteria is found.

Example

```
&MYCD = &MYCI.EMPL_CHKLIST_ITM;
&DSTRING = String(&MYDATE);
&ITEMNUM = &MYDC.GetEffectiveItemNum(&DSTRING, 1);
```

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," String

InsertItem

Syntax

```
InsertItem(number)
```

Description

The InsertItem method inserts the item (row of data) at the position specified by *number*. This parameter takes a number value. You can insert items below only the zero level scroll. If you need to add a new data item, use the Create method instead.

InsertItem adds the new row *after* the current row. If the row has an effective date (EFFDT) or an effective sequence (EFFSEQ), these values are copied into the new row.

If you specify -1 for *number*, InsertItem inserts a new item (row) after the *last* row.

The InsertItem method returns a reference to the newly created item (row of data).

When the InsertItem method is executed, if there are any RowInsert PeopleCode programs associated with any of the fields, they fire also, as if the user pressed ALT+7 and ENTER or clicked the InsertRow icon. However, the programs are executed as if turbo mode was selected. (In turbo mode default processing is performed *only* for the row being inserted.)

If you set the InteractiveMode property to True, any RowInsert PeopleCode runs immediately after you execute InsertItem. If this property is set to False, any RowInsert PeopleCode runs after you execute the Save method.

The inserted item is not added to the database until after you use the Save method.

Example

In the following example a new item (row of data) is added at the *end* of the current collection.

```
&MYDC = &MYCI.EMPL_CHECKLIST;
&COUNT = &MYDC.Count;
&ITEM = &MYDC.InsertItem(&COUNT);
&ITEM.CHECKLIST_CD = "00001";
&ITEM.RESPONSIBLE_ID = "6609";
&RSLT = &MYCI.Save();
```

Item

Syntax

Item(*number*)

Description

The **Item** returns the item (row of data) that exists at the *number* position in the data collection executing the method. The parameter takes a number value.

ItemByKeys

Syntax

ItemByKeys(­*key_values*)

Description

The **ItemByKeys** method returns the item specified by the parameters. The number and type of keys are unique to each specific collection. Each key must be separated by a comma.

The collection reference must be the name of the Component Interface, followed by the record name. This method won't work on a collection reference (that is, &CI.RECNAME.ItemByKeys, not &MYCOLLECTION.ItemByKeys).

After you've returned an item, use the **ItemNum** property to determine the number of the item.

The keys must be in the *exact* order as in the Component Interface. A second level data collection also contains the keys of the parent data collection.

An easy way to determine the keys and their order in PeopleCode is to open the Component Interface in Application Designer, and use the Test Component. To determine the keys in Visual Basic, use the Object Browser.

See [Chapter 12, "Component Interface Classes," ItemNum, page 643](#).

To see the signature for **ItemByKeys**:

1. Open the Component Interface in Application Designer.
2. Start the Component Interface Tester.

Select the open Component Interface, then right-click, and select Test Component Interface from the pop-up menu.

3. Instantiate an object.

Add data to the Get or Create keys and click Get Existing or Create New, respectively.

4. Expand the instantiated component until you find the collection in which you're interested.
5. Right-click on the collection and select ItemByKey from the resulting pop-up menu.
6. The dialog that follows shows you the specific parameters, types, and order in which you should call ItemByKey.

Returns

An item (row) of data from a data collection.

Example

```
Local ApiObject &MYSESSION;  
Local ApiObject &CI;  
Local ApiObject &CI_COLLECTION;  
Local ApiObject &CI_ITEM;  
  
&MYSESSION = %Session;  
&CI = &MYSESSION.GetCompIntfc(COMPINTFC.CM_EVAL);  
&CI.EMPLID = "8001";  
If &CI.Get() <> 1 Then  
    Exit;  
End-If;  
  
&CI_COLLECTION = &CI.CM_EVALUATIONS;  
&COUNT = &CI_COLLECTION.Count;  
  
&CI_ITEM = &CI.CM_EVALUATIONS.itembykeys("01");  
&CI_ITEM.DESCR50 = "TEST";  
If &CI.Save() <> 1 Then  
    Exit;  
End-If;
```

Testing Component Interfaces

Data Collection Properties

This section explains the following Data Collection properties:

- Count
- CurrentItemNumber

Count

Description

This property returns the number of data items (rows of data) in the data collection.

This property is read-only.

Example

```
&CI = &MYSESSION.GetCompIntfc(COMPINTFC.CM_EVAL_BC);  
&CI.EMPLID = "8001";  
&CI.Get()  
  
&CI_COLLECTION = &CI.CM_EVALUATIONS;  
&COUNT = &CI_COLLECTION.Count;
```

CurrentItemNumber

Description

If the component associated with the Component Interface is effective-dated, this property returns the item number for the current effective-dated item (row of data).

This property is read-only.

Data Item Class Property

This section discusses the ItemNum property.

ItemNum

Description

This property returns the number of the data item (row) in the collection. For example, many of the data collection methods takes a number as a parameter. Use this property to determine the item number (row number) of an item in a collection, then use that number in another method.

This property is read-only.

Example

Evaluate USER_ACTION

```
. . .
When = "D"
  &CI_ITEM = &CI_LVL1_NAMES.ItemByKey(&NAME_TYPE, &NAME_PART);
  If &CI_ITEM <> Null then
    &I = &CI_LVL1_NAMES.ItemNum;
    &CI_LVL1_NAMES.DeleteItem(&I);
  End-if;
. . .
End-Evaluate;
```

Accessing the Structure of a Component Interface

The structure of a Component Interface can be accessed using a `CompIntfPropInfoCollection` object. You access a `CompIntfPropInfoCollection` object from a `CompIntfPropInfoCollection` collection. There is more than one way to instantiate a `CompIntfPropInfoCollection` collection.

Note. You don't have to populate a Component Interface with data before you access the structure. You can access the structure of a Component Interface immediately after you use the `GetCompIntfc` method with a session object. Accessing the structure of a Component Interface before you populate it with data may increase your performance.

See [Chapter 12, "Component Interface Classes," GetCompIntfc, page 613.](#)

CompIntfPropInfoCollection Collection

There are two types of `CompIntfPropInfoCollection` object properties: *field* properties and *collection* properties.

A *field* property maps to a specific record field. You can access structural information about the field using a `CompIntfPropInfoCollection` object. This information includes the name of the field, whether it's required, is it based on a prompt table, and so on.

A *collection* property is just that, a collection of properties. And before you can access a `CompIntfPropInfoCollection` object, you must first get a `CompIntfPropInfoCollection` *collection*. The following are the valid types of `CompIntfPropInfoCollection` collections:

- CREATEKEYS, GETKEYS and FINDKEYS

When you create a component, you must specify the search record to be used with that component. You can also specify an alternate search record to be used when the component is accessed in Add mode. The key fields from those records make up the GETKEYS, FINDKEYS, and CREATEKEYS collections.

Note.

In order for a component interface to validate a key against a prompt table, both the Search Edit and List Box Item options must be selected in the record field properties for the key.

- **CREATEKEYS:** A collection containing the key fields of the search record specified to be used in Add mode. Use the `CreateKeyInfoCollection` property to instantiate the `CompIntfPropInfoCollection` collection.
 - **GETKEYS:** A collection containing the primary required key fields from the primary search record. Use the `GetKeyInfoCollection` property to instantiate the `CompIntfPropInfo` collection.
 - **FINDKEYS:** A collection containing the key fields and the alternate key fields from the primary search record. Use the `FindKeyInfoCollection` property to instantiate the `CompIntfPropInfo` collection.
- A page scroll

The fields associated with a page scroll are in this type of collection. This may or may not be all the fields associated with the record. Use the `PropertyInfoCollection` property to instantiate this kind of collection.

If the page the Component Interface is based on contains a secondary scroll, you can check the `Type` property to determine if the object is a `CompIntfPropInfoCollection` object (that is, a field), or a scroll. Then, to get the properties of the fields associated with that secondary scroll, you can use the `PropertyInfoCollection` property on the `CompIntfPropInfoCollection` object.

For example, the following Component Interface has a level zero and level one scroll.

Component Interface with secondary scroll

The level zero scroll is made up of three fields: CHECKLIST_CD, RESPONSIBLE_ID, COMMENTS, and a level one scroll, EMPL_CHKLIST_ITM. The `CompIntfPropInfoCollection` collection for this Component Interface would have four items in it. Three would be `CompIntfPropInfoCollection` objects (the three fields.) The last item, EMPL_CHKLIST_ITM would *not* be a valid `CompIntfPropInfoCollection` object. You can use the `IsCollection` property to verify if an item in a collection is itself a collection or a valid `CompIntfPropInfoCollection` object.

To access the fields in a lower level scroll, you must use the `PropertyInfoCollection` property first, to return a collection of those fields.

The following example loops through a Component Interface. It pulls out the names of the properties in the first three levels of a Component Interface. If the property is a nested collection, it prefixes the ancestor collection name to the property name.

```

&MYSESSION = %Session;
&CI = &MYSESSION.GetCompIntfc(COMPINTFC.VOLNEW);
&PROPINFO_0 = &CI.PropertyInfoCollection;
For &I = 1 To &PROPINFO_0.Count;
    &PROPITEM_0 = &PROPINFO_0.Item(&I);
    Warning (&PROPITEM_0.Name);
    If (&PROPITEM_0.IsCollection) Then
        &PROPINFO_1 = &PROPITEM_0.PropertyInfoCollection;
        For &J = 1 To &PROPINFO_1.Count;
            &PROPITEM_1 = &PROPINFO_1.Item(&J);
            &S1 = &PROPITEM_0.Name | "." | &PROPITEM_1.Name;
            Warning (&S1);
            If (&PROPITEM_1.IsCollection) Then
                &PROPINFO_2 = &PROPITEM_1.PropertyInfoCollection;
                For &K = 1 To &PROPINFO_2.Count;
                    &PROPITEM_2 = &PROPINFO_2.Item(&K);
                    &S1 = &PROPITEM_0.Name | "." | &PROPITEM_1.Name | "." | =>
&PROPITEM_2.Name;
                    Warning (&S1);
                End-For;
            End-If;
        End-For;
    End-If;
End-For;

```

CompIntfPropInfoCollection Collection Methods

This section explains the CompIntfPropInfoCollection collection methods.

First

Syntax

First()

Description

The First method returns the first CompIntfPropInfoCollection object in the CompIntfPropInfoCollection collection object executing the method.

Example

```
&CIINFO = &CIPROPCOLL.First();
```

Item

Syntax

Item(*number*)

Description

The Item method returns a `CompIntfPropInfoCollection` object that exists at the *number* position in the `CompIntfPropInfoCollection` collection executing the method

If the specified item is *itself* a collection, the `CompIntfPropInfoCollection` object that gets returned is invalid (set to NULL). You can use the `PropertyInfoCollection` property to return a collection of `CompIntfPropInfoCollection` objects for the collection.

Example

```
&SCROLL1 = &MYCI.PropertyInfoCollection;
For &I = 1 to &SCROLL1.Count;
&PROPERTY = &SCROLL1.Item(&I);
If &PROPERTY.IsCollection Then
&SCROLL2 = &PROPERTY.PropertyInfoCollection;
/*do scroll 2 processing */
Else
/* do scroll 1 processing */
End-If;
End-For;
```

Next

Syntax

Next()

Description

The Next method returns the next `CompIntfPropInfoCollection` object in the `CompIntfPropInfoCollection` collection object executing the method. You can use this method only after you have used either the First or Item methods; otherwise the system doesn't know where to start.

CompIntfPropInfoCollection Collection Properties

This section explains the Count property.

Count

Description

This property returns the number of `CompIntfPropInfoCollection` objects in the `CompIntfPropInfoCollection` collection object executing the method.

This property is read-only.

Example

```
&COUNT = &MYCIPROPINFOC.Count;
```

CompIntfPropInfoCollection Object Properties

This section explains the `CompIntfPropInfoCollection` Object properties.

Format

Description

This property returns the field format for the object executing the property (that is, name, phone, zip, SSN, and so on) as a number. The values are:

<i>Value</i>	<i>Description</i>
0	No Format
1	Name
2	Phone
3	Zip
4	SSN
5	Routine
6	Mixed Case
7	Raw Binary
8	Number only

<i>Value</i>	<i>Description</i>
9	SIN
10	Phone International
11	Zip International
12	Seconds
13	Microseconds
14	Custom

This property is read-only.

IsCollection

Description

This property returns True if the object executing the property is a data collection, False otherwise. If IsCollection is True, other field-oriented properties like Required, Type, Xlat, YesNo, Prompt and Format are undefined. If IsCollection is False, the object represents a field and all the previous properties are defined as described.

This property is read-only.

IsReadOnly

Description

This property returns True if the property marked Read Only in the Component Interface Definition; False otherwise.

This property is read-only.

Key

Description

This property returns True if the object executing the property is a key, False otherwise.

This property is read-only.

LabelLong

Description

This property returns the record field LongName value as a string. If there is a component override for this value, it is *not* included.

This property is read-only.

LabelShort

Description

This property returns the record field ShortName value as a string. If there is a component override for this value, it is *not* included.

This property is read-only.

Length

Description

This property returns the length of the field property as a number. If the property is a collection, this property returns a zero.

The length of the field is calculated by converting it to a string then getting the length of the string. This means that *everything* in the field is counted as a character, including spaces, date time separation characters, decimal points, sign indicators, and so on.

For example, the following string has 10 characters:

01/01/2001

The following string has five characters:

10.10

The following string has six characters:

-10.10

This property is read-only.

Name

Description

This property returns the name of the object executing the property as a string.

This property is read-only.

Prompt

Description

This property returns True if the object executing the property is associated with a prompt table, False otherwise.

This property is read-only.

PropertyInfoCollection

Description

This property returns another CompIntfPropInfoCollection collection if the object executing the property is a collection.

This property is read-only.

Example

```
&SCROLL1 = &MYCI.PropertyInfoCollection;  
For &I = 1 to &SCROLL1.Count;  
    &PROPERTY = &SCROLL1.Item(&I);  
    If &PROPERTY.IsCollection Then  
        &SCROLL2 = &PROPERTY.PropertyInfoCollection;  
        /*do scroll 2 processing */  
    Else  
        /* do scroll 1 processing */  
    End-If;  
End-For;
```

Required

Description

This property returns True if the object executing the property is a required property, False otherwise.

This property is read-only.

Type

Description

This property returns the field type, as a number, of the object. The values are:

<i>Value</i>	<i>Description</i>
0	Character
1	Long Character
2	Number
3	Signed Number
4	Date
5	Time
6	DateTime
7	SubRecord (Not supported with Component Interfaces)
8	Image (Limited support with Component Interfaces)
9	ImageReference (Not supported with Component Interfaces)

This property is read-only.

Xlat

Description

This property returns True if the object executing the property is associated with an XLAT table, False otherwise.

This property is read-only.

YesNo

Description

This property returns True if the object executing the property is associated with the Yes/No table, False otherwise.

This property is read-only.

Component Interface Examples

The following are examples of some of the most usual actions you're likely to perform using a Component Interface.

Create a New Instance of Data Example

The following is an example of how to create a new instance of a Component Interface.

To create a new instance of data:

In this example, you are creating a new instance of data for the EXPRESS Component Interface, which is based on the EXPRESS_ISSUE_INV component. The following is the complete code sample: the steps explain each line.

```
Local ApiObject &MYSESSION;
Local ApiObject &MYCI;

&MYSESSION = %Session;
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.EXPRESS);
&MYCI.BUSINESS_UNIT = "H01B";
&MYCI.INTERNAL_FLG = "Y";
&MYCI.ORDER_NO = "NEXT";
&MYCI.Create();
&MYCI.CUSTOMER = "John's Chicken Shack";
&MYCI.LOCATION = "H10B6987";
.
.
.
If NOT(&MYCI.Save()) Then
    /* save didn't complete */
    &COLL = &MYSESSION.PSMessages;
    For &I = 1 to &COLL.Count
        &ERROR = &COLL.Item(&I);
        &TEXT = &ERROR.Text;
        /* do error processing */
    End-For;
    &COLL.DeleteAll();
End-if;
```

1. Get a session object.

Before you can get a Component Interface, you have to get a session object. The session controls access to the Component Interface, provides error tracing, enables you to set the runtime environment, and so on.

```
&MYSESSION = %Session;
```

2. Get a Component Interface.

Use the `GetCompIntfc` method with a session object to get the Component Interface. You must specify a Component Interface definition that has already been created. You receive a runtime error if you specify a Component Interface that doesn't exist.

```
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.EXPRESS);
```

After you execute the `GetCompIntfc` method, you have only the *structure* of the Component Interface. You haven't populated the Component Interface with data yet.

3. Set the CREATEKEYS.

These key values are required to open a new instance of the data. If the values you specify aren't unique, that is, if an instance of the data already exists in the database with those key values, you receive a runtime error.

```
&MYCI.BUSINESS_UNIT = "H01B";
&MYCI.INTERNAL_FLG = "Y";
&MYCI.ORDER_NO = "NEXT&rsquo;;
```

4. Create the instance of data for the Component Interface.

After you set the key values, you must use the `Create` method to populate the Component Interface with the key values you set.

```
&MYCI.Create();
```

This creates an instance of this data. However, it hasn't been saved to the database. You must use the `Save` method before the instance of data is committed to the database.

5. Set the rest of the fields.

Assign values to the other fields.

```
&MYCI.CUSTOMER = "John&rsquo;s Chicken Shack";
&MYCI.LOCATION = "H10B6987";
.
.
.
```

If you have specified `InteractiveMode` as `True`, every time you assign a value or use the `InsertItem` or `DeleteItem` methods, any PeopleCode programs associated with that field (either with record field or the component record field) fires (`FieldEdit`, `FieldChange`, `RowInsert`, and so on.)

6. Save the data.

When you execute the Save method, the new instance of the data is saved to the database.

```
If NOT(&MYCI.Save()) Then
```

The Save method returns a Boolean value: True if the save was successful, False otherwise. You can use this value to do error checking.

The standard PeopleSoft save business rules (that is, any PeopleCode programs associated with SaveEdit, SavePreChange, WorkFlow, and so on.) are executed. If you didn't specify the Component Interface to run in interactive mode, FieldEdit, FieldChange, and so on, also run at this time for all fields that had values set.

Note. If you're running a Component Interface from an Application Engine program, the data won't actually be committed to the database until the Application Engine program performs a COMMIT.

7. Check Errors.

You can check if there were any errors using the PSMessages property on the session object.

```
If NOT(&MYCI.Save()) Then
  /* save didn't complete */
  &COLL = &MYSESSION.PSMessages;
  For &I = 1 to &COLL.Count
    &ERROR = &COLL.Item(&I);
    &TEXT = &ERROR.Text;
    /* do error processing */
  End-For;
  &COLL.DeleteAll();
End-if;
```

If there are multiple errors, all errors are logged to the PSMessages collection, not just the first occurrence of an error. As you correct each error, delete it from the PSMessages collection.

The Text property of the PSMessages returns the text of the error message. At the end of this text is a contextual string that contains the name of the field that generated the error. The contextual string has the following syntax:

```
{BusinessComponentName.[CollectionName(Row).[CollectionName(Row).[CollectionName=>
(Row)]].PropertyName}
```

For example, if you specified the incorrect format for a date field of the Component Interface named ABS_HIST, the Text property would contain the following string:

```
Invalid Date {ABS_HIST.BEGIN_DT} (90), (1)
```

The contextual string (by itself) is available using the Source property of the PSMessages.

Note. If you've called your Component Interface from an Application Engine program, all errors are also logged in the Application Engine error log tables.

See [Chapter 38, "Session Class," Error Handling, page 2168](#) and [Chapter 38, "Session Class," Source, page 2184](#).

Getting an Existing Instance of Data Example

The following is an example of how to get an existing instance of a Component Interface.

In this example, you are getting an existing instance of data for the EMPL_CHKLIST_BC Component Interface, which is based on the EMPLOYEE_CHECKLIST component. The following is the complete code sample: the steps explain each line.

```
Local ApiObject &MYSESSION;
Local ApiObject &MYCI;

&MYSESSION = %Session;
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.EMPL_CHKLIST_BC);
&MYCI.EMPLID= "8001";
&MYCI.Get();

/* Get checklist Code */

&CHECKLIST_CD = &MYCI.CHECKLIST_CD;

/* Set Effective date */

&MYCI.EFFDT = "05-01-1990";
.
.
.
If NOT(&MYCI.Save()) Then
  /* save didn't complete */
  &COLL = &MYSESSION.PSMessages;
  For &I = 1 to &COLL.Count
    &ERROR = &COLL.Item(&I);
    &TEXT = &ERROR.Text;
    /* do error processing */
  End-For;
  &COLL.DeleteAll();
End-if;
```

1. Get a session object.

Before you can get a Component Interface, you have to get a session object. The session controls access to the Component Interface, provides error tracing, enables you to set the runtime environment, and so on.

```
&MYSESSION = %Session;
```

2. Get a Component Interface.

Use the GetCompIntfc method with a session object to get the Component Interface. You must specify a Component Interface definition that has already been created. You receive a runtime error if you specify a Component Interface that doesn't exist.

```
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.EMPL_CHKLIST_BC);
```

After you execute the GetCompIntfc method, you have only the *structure* of the Component Interface. You haven't populated the Component Interface with data yet.

3. Set the GETKEYS.

These are the key values required to return a unique instance of existing data. If the keys you specify allow for more than one instance of the data to be returned, or if no instance of the data matching the key values is found, you receive a runtime error.

```
&MYCI.EMPLID = "8001";
```

4. Get the instance of data for the Component Interface.

After you set the key values, you have to use the Get method.

```
&MYCI.Get();
```

This populates the Component Interface with data, based on the key values you set.

5. Get field values or set field values.

At this point, you can either get values or set values.

```
&CHECKLIST_CD = &MYCI.CHECKLIST_CD;
```

```
/* OR */
```

```
&MYCI.EFFDT = "05-01-1990";
```

If you have specified InteractiveMode as True, every time you assign a value, any PeopleCode programs associated with that field (either with record field or the component record field) fires (FieldEdit, FieldChange, and so on.)

6. Save or Cancel the Component Interface, as appropriate.

If you've changed values and you want to save your changes to the database, you must use the Save method.

```
If NOT(&MYCI.Save()) Then
```

The Save method returns a Boolean value: True if the save was successful, False otherwise. Use this value to do error checking.

The standard PeopleSoft save business rules (that is, any PeopleCode programs associated with SaveEdit, SavePreChange, WorkFlow, and so on.) are executed. If you didn't specify the Component Interface to run in interactive mode, FieldEdit, FieldChange, and so on, also run at this time.

Note. If you're running a Component Interface from an Application Engine program, the data won't actually be committed to the database until the Application Engine program performs a COMMIT.

If you don't want to save any changes to the data, use the Cancel method. The Component Interface is reset to the state it was in just after you used the GetCompIntfc method.

```
&MYCI.Cancel();
```

This is similar to a user pressing ESC while in a component, and choosing to not save any of their changes.

7. Check Errors.

You can check if there were any errors using the PSMessages property on the session object.

```
If NOT(&MYCI.Save()) Then
  /* save didn't complete */
  &COLL = &MYSESSION.PSMessages;
  For &I = 1 to &COLL.Count
    &ERROR = &COLL.Item(&I);
    &TEXT = &ERROR.Text;
    /* do error processing */
  End-For;
  &COLL.DeleteAll();
End-if;
```

If there are multiple errors, all errors are logged to the PSMessages collection, not just the first occurrence of an error. As you correct each error, delete it from the PSMessages collection.

The Text property of the PSMessage returns the text of the error message. At the end of this text is a contextual string that contains the name of the field that generated the error. The contextual string has the following syntax:

```
{ComponentInterfaceName.[CollectionName(Row).[CollectionName(Row).[CollectionName=>
(Row)]].PropertyName}
```

For example, if you specified the incorrect format for a date field of the Component Interface named ABS_HIST, the Text property would contain the following string:

```
Invalid Date {ABS_HIST.BEGIN_DT} (90), (1)
```

The contextual string (by itself) is available using the Source property of the PSMessage.

Note. If you've called your Component Interface from an Application Engine program, all errors are also logged in the Application Engine error log tables.

See [Chapter 38, "Session Class," Error Handling, page 2168](#) and [Chapter 38, "Session Class," Source, page 2184](#).

Retrieving a List of Instance of Data Example

The following is an example of how to retrieve a list of instances of data.

To retrieve a list of instances of data:

In this example, you are getting a list of existing instances of data for the EMPL_CHKLIST_CI Component Interface, which is based on the EMPLOYEE_CHECKLIST component. The following is the complete code sample: the steps break it up and explain each line.

```

Local ApiObject &MYSESSION;
Local ApiObject &MYCI;
Local ApiObject &MYNEWCI;

&MYSESSION = %Session;
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.EMPL_CHKLIST_CI);
&MYCI.EMPLID= "8";
&MYCI.LAST_NAME_SRCH = "S";
&MYLIST = &MYCI.Find();
For &I = 1 to &MYLIST.Count;

    /* note: do not reuse the CI used to create the list, or the list will be⇒
    destroyed */

&MYNEWCI = &MYLIST.Item(&I);

/* CI from list still must be instantiated to use it */

&MYNEWCI.Get();

/* do some processing */

End-For;

```

1. Get a session object.

Before you can get a Component Interface, you have to get a session object. The session controls access to the Component Interface, provides error tracing, enables you to set the runtime environment, and so on.

```
&MYSESSION = %Session;
```

2. Get a Component Interface.

Use the `GetCompIntfc` method with a session object to get the Component Interface. You must specify a Component Interface definition that has already been created. You receive a runtime error if you specify a Component Interface that doesn't exist.

```
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.EMPL_CHKLIST_CI);
```

After you execute the `GetCompIntfc` method, you have only the *structure* of the Component Interface. You haven't populated the Component Interface with data yet.

3. Set the FINDKEYS values.

These can be alternate key values or partial key values. If no instance of the data matching the key values is found, you receive a runtime error.

```
&MYCI.EMPLID = "8";
&MYCI.LAST_NAME_SRCH = "S";
```

4. Get a list of data instances for the Component Interface.

After you set the alternate or partial key values, use the `Find` method to return a list of data instances for the Component Interface.

```
&MYLIST = &MYCI.Find();
```

Note. The `Find` method can be executed only at level zero in a Component Interface.

5. Select an instance of the data.

To select an instance of the data, you can use any of the following standard data collection methods:

- First
- Item
- Next

For example, you could loop through every instance of the data to do some processing:

```
For &I = 1 to &MYLIST.Count;  
    /* note: do not reuse the Component Interface used to */  
    /* create the list here, or the list will be destroyed */  
    &MYNEWCI = &MYLIST.Item(&I);  
    /* CI from list must still be instantiated to use it */  
    &MYNEWCI.Get();  
    /* do some processing */  
End-For;
```

After you have a specific instance of the data, you can get values, set values, and so on.

See [Chapter 12, "Component Interface Classes," Data Collection Methods, page 636](#).

Inserting Effective-Dated Data Example

You can rename a collection in a Component Interface. For example, suppose you had the same record at level zero and at level one. You may want to rename the level one data collection to reflect this. The data in a data collection is associated with the primary database record of a scroll, *not* with the name you supply.

Here is an example of using a Component Interface that has the same record at level zero and level one. The Component Interface is based on the CURRENCY_CD_TBL component.

Example of CI with same record at level zero and level one

The following code example is based on this Component Interface and does the following:

1. Gets an existing Component Interface.
2. Finds the current effective-dated item index.

3. Inserts a new row before the current effective-dated item using the InsertItem method.

```

Local ApiObject &Session;
Local ApiObject &CURRENCY_CD;
Local ApiObject &CURRENCY_CD_TBLCol;
Local ApiObject &CURRENCY_CD_TBLItm;
Local ApiObject &PSMessages;
Local string &ErrorText, &ErrorType;
Local number &ErrorCount;
Local Boolean &Error;

Function CheckErrorCodes()

    &PSMessages = &Session.PSMessages;
    &ErrorCount = &PSMessages.Count;
    For &i = 1 To &ErrorCount
        &ErrorText = &PSMessages.Item(&i).Text;
        &ErrorType = &PSMessages.Item(&i).Type;
    End-For;

End-Function;

/* Initialize Flags */
&Error = False;

&Session = %Session;

If &Session <> Null Then

    CheckErrorCodes();
    /* Application Specific Error Processing */

Else

    &CURRENCY_CD = &Session.GetCompIntfc(CompIntfc.CURRENCY_CD);

    If &CURRENCY_CD = Null Then

        CheckErrorCodes();
        /* Application Specific Error Processing */

    Else

        /* Set Component Interface Get Keys */
        &CURRENCY_CD.CURRENCY_CD = "USD";

        If Not &CURRENCY_CD.Get() Then

            CheckErrorCodes();
            /* Application Specific Error Processing */
            &Error = True;

        End-If;

        If Not &Error Then

            &CURRENCY_CD_TBLCol = &CURRENCY_CD.CURRENCY_CD_TBL;
            &CURRENCY_CD_TBLItm = &CURRENCY_CD_TBLCol.InsertItem(&CURRENCY_CD =>
TBLCol.CurrentItemNum());
            &CURRENCY_CD_TBLItm.EFFDT = %Date;
            &CURRENCY_CD_TBLItm.EFF_STATUS = "A";
            &CURRENCY_CD_TBLItm.DESCR = "NewCurrencyCode";
            &CURRENCY_CD_TBLItm.DESCRSHORT = "New";

```

```

&CURRENCY_CD_TBLItm.COUNTRY = "USA";
&CURRENCY_CD_TBLItm.CUR_SYMBOL = "?";
&CURRENCY_CD_TBLItm.DECIMAL_POSITIONS = 4;
&CURRENCY_CD_TBLItm.SCALE_POSITIONS = 0;

/* Save Instance of Component Interface */
If Not &CURRENCY_CD.Save() Then

    CheckErrorCodes();
    /* Application Specific Error Processing */

End-If;

End-If;
/* End: Set Component Interface Properties */

/* Cancel Instance of Component Interface */
&CURRENCY_CD.Cancel();

End-If;

End-If;

```

Inserting Effective-Dated Data Example Using Visual Basic

Here's a code example in Visual Basic that does the same thing as the previous code example.

```

Private Sub CURRENCY_CD()

    On Error GoTo eMessage

    '***** Set Object References *****
    Dim oCISession As Object
    Dim oCURRENCY_CD As Object
    Dim oCURRENCY_CD_TBL As Object
    Dim oCURRENCY_CD_TBItem As Object

    '***** Set Connect Parameters *****
    strAppSeverPath = "//PSOFT101999:9000"
    strOperatorID = "PTDM0"
    strPassword = "PTDM0"

    '***** Create PeopleSoft Session Object *****
    Set oCISession = CreateObject("PeopleSoft.Session")

    '***** Connect to the App Sever *****
    oCISession.Connect 1, strAppSeverPath, strOperatorID, strPassword, 0

    '***** Get the Component *****
    Set oCURRENCY_CD = oCISession.GetCompIntfc("CURRENCY_CD")

    '***** Set the Component Interface Mode *****
    oCURRENCY_CD.InteractiveMode = False
    oCURRENCY_CD.GetHistoryItems = True

    '***** Set Component Get/Create Keys *****
    oCURRENCY_CD.CURRENCY_CD = "USD"

    '***** Execute Create *****
    oCURRENCY_CD.Get

    'Set CURRENCY_CD_TBL Collection Field Properties --
    'Parent: PS_ROOT Collection
    Set oCURRENCY_CD_TBL = oCURRENCY_CD.CURRENCY_CD_TBL
    Set oCURRENCY_CD_TBItem = oCURRENCY_CD_TBL.InsertItem(oCURRENCY_CD_⇒
TBL.CurrentItemNum())

    oCURRENCY_CD_TBItem.EFFDT = Date
    oCURRENCY_CD_TBItem.EFF_STATUS = "A"
    oCURRENCY_CD_TBItem.DESCR = "NewCurrencyCode"
    oCURRENCY_CD_TBItem.DESCRSHORT = "New"
    oCURRENCY_CD_TBItem.COUNTRY = "USA"
    oCURRENCY_CD_TBItem.CUR_SYMBOL = "?"
    oCURRENCY_CD_TBItem.DECIMAL_POSITIONS = 4
    oCURRENCY_CD_TBItem.SCALE_POSITIONS = 0

    '***** Save Component Interface *****
    oCURRENCY_CD.Save
    oCURRENCY_CD.Cancel

    Exit Sub

eMessage:
    '***** Display VB Runtime Errors *****
    MsgBox Err.Description

    '***** Display PeopleSoft Error Messages *****
    If oCISession.PSMessages.Count > 0 Then
        For i = 1 To oCISession.PSMessages.Count
            MsgBox oCISession.PSMessages.Item(i).Text
        Next i
    End If

```

```

        End If

    End Sub

Sub MAIN( )
    CURRENCY_CD
End Sub

```

Inserting or Deleting a Row of Data Example

The CopyRowset and CopyRowsetDelta methods use the primary database name of a scroll, not the name you may give a collection.

A data collection represents a row of data. You often insert or delete a row of data.

To insert or delete a row of data:

In this example, you are getting an existing instance of data for the BUS_EXP Component Interface, which is based on the BUSINESS_EXPENSES component, then inserting (or deleting) a row of data in the second level scroll.

BUS_EXP Component Interface definition

The following is the complete code sample: the steps explain each line.

```

Local ApiObject &MYSESSION;
Local ApiObject &MYCI;

&MYSESSION = %Session;
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.BUS_EXP);
&MYCI.EMPLID= "8001";
&MYCI.Get();
&MYLEVEL1 = &MYCI.BUS_EXPENSE_PER;
/* get appropriate item in lvl1 collection */
For &I = 1 to &MYLEVEL1.Count
&ITEM = &MYLEVEL1.Item(&I);
&MYLEVEL2 = &ITEM.BUS_EXPENSE_DTL;
&COUNT = &MYLEVEL2.Count
/* get appropriate item in lvl2 collection */
For &J = 1 to &COUNT
&LVL2ITEM = &MYLEVEL2.Item(&J);
&CIDATE = &LVL2ITEM.CHARGE_DT;
If &CIDATE <> %Date Then
/* insert row */
&NEWITEM = &MYLEVEL2.InsertItem(&COUNT);
/* set values for &NEWITEM */
Else
/* delete last row */
&MYLEVEL2.DeleteItem(&COUNT);
End-If;
End-For;
End-For;

If NOT(&MYCI.Save()) Then
/* save didn't complete */
&COLL = &MYSESSION.PSMessages;
For &I = 1 to &COLL.Count
&ERROR = &COLL.Item(&I);
&TEXT = &ERROR.Text;
/* do error processing */
End-For;
&COLL.DeleteAll();
End-if;

```

1. Get a session object.

Before you can get a Component Interface, you have to get a session object. The session controls access to the Component Interface, provides error tracing, enables you to set the runtime environment, and so on.

```
&MYSESSION = %Session;
```

2. Get a Component Interface.

Use the `GetCompIntfc` method with a session object to get the Component Interface. You must specify a Component Interface definition that has already been created. You receive a runtime error if you specify a Component Interface that doesn't exist.

```
&MYCI = &MYSESSION.GetCompIntfc(COMPINTFC.BUS_EXP);
```

After you execute the `GetCompIntfc` method, you have only the *structure* of the Component Interface. You haven't populated the Component Interface with data yet.

3. Set the GETKEYS.

These are the key values required to return a unique instance of existing data. If the keys you specify allow for more than one instance of the data to be returned, or if no instance of the data matching the key values is found, you receive a runtime error.

```
&MYCI.EMPLID = "8001";
```

4. Get the instance of data for the Component Interface.

After you set the key values, you must use the Get method.

```
&MYCI.Get();
```

This populates the Component Interface with data, based on the key values you set.

5. Get the level one scroll.

The name of the scroll can be treated like a property. It returns a data collection that contains all the level one data.

```
&MYLEVEL1 = &MYCI.BUS_EXPENSE_PER
```

6. Get the appropriate item in the level one data collection.

Remember, scroll data is hierarchical. You must get the appropriate level one row before you can access the level two data.

```
For &I = 1 to &MYLEVEL1.Count
  &ITEM = &MYLEVEL1.Item(&I);
```

7. Get the level two scroll.

This is done the same way as you accessed the level one scroll, by using the scroll name as a property.

```
&MYLEVEL2 = &ITEM.BUS_EXPENSE_DTL;
```

8. Get the appropriate item in the level two data collection.

A data collection is made up of a series of items (rows of data.) You have to access the appropriate item (row) in this level also.

```
&COUNT = &MYLEVEL2.Count
/* get appropriate item in lvl2 collection */
For &J = 1 to &COUNT
  &LVL2ITEM = &MYLEVEL2.Item(&J);
```

9. Insert or delete a row of data.

You can insert or delete a row of data from a data collection. The following example finds the last item (row of data) in the second level scroll. If it matches the value of %Date, the last item is deleted. If it doesn't match, a new row is inserted.

```
&CIDATE = &LVL2ITEM.CHARGE_DT;
If &CIDATE <> %Date Then
    /* insert row */
    &NEWITEM = &MYLEVEL2.InsertItem(&COUNT);
    /* set values for &NEWITEM */
Else
    /* delete last row */
    &MYLEVEL2.DeleteItem(&COUNT);
End-If;
```

10. Save the data.

When you execute the Save method, the new instance of the data is saved to the database.

```
If NOT(&MYCI.Save()) Then
```

The Save method returns a Boolean value: True if the save was successful, False otherwise. Use this value to do error checking.

The standard PeopleSoft save business rules (that is, any PeopleCode programs associated with SaveEdit, SavePreChange, WorkFlow, and so on) are executed. If you did not specify the Component Interface to run in interactive mode, FieldEdit, FieldChange, and so on, also run at this time.

Note. If you're running a Component Interface from an Application Engine program, the data won't actually be committed to the database until the Application Engine program performs a COMMIT.

11. Check Errors.

You can check if there were any errors using the PSMessages property on the session object.

```
If NOT(&MYCI.Save()) Then
  /* save didn't complete */
  &COLL = &SESSION.PSMessages;
  For &I = 1 to &COLL.Count
    &ERROR = &COLL.Item(&I);
    &TEXT = &ERROR.Text;
    /* do error processing */
  End-For;
  &COLL.DeleteAll();
End-if;
```

If there are multiple errors, all errors are logged to the PSMessages collection, not just the first occurrence of an error. As you correct each error, delete it from the PSMessages collection.

The Text property of the PSMessage returns the text of the error message. At the end of this text is a contextual string that contains the name of the field that generated the error. The contextual string has the following syntax:

```
{BusinessComponentName.[CollectionName(Row).[CollectionName(Row).[CollectionName=>
(Row)]].PropertyName}
```

For example, if you specified the incorrect format for a date field of the Component Interface named ABS_HIST, the Text property contains the following string:

```
Invalid Date {ABS_HIST.BEGIN_DT} (90), (1)
```

The contextual string (by itself) is available using the Source property of the PSMessage.

Note. If you've called the Component Interface from an Application Engine program, all errors are also logged in the Application Engine error log tables.

See [Chapter 38, "Session Class," Error Handling, page 2168](#) and [Chapter 38, "Session Class," Source, page 2184](#).

Chapter 13

Connected Query Classes

This chapter provides an overview of the connected query classes and discusses:

- Importing connected query classes.
- CONQRSMGR class.
- CONQRSPROPERTY class.
- CONQRS_CONST class.
- QUERYITEMPROMPT class.
- SCHED_INFO class.
- SEC_PROFILE class.
- UTILITY class.

Understanding the Connected Query Classes

Connected query is a PeopleTools managed object that supports typical managed object functionality such as:

- Creating a new object.
- Editing an existing object.
- Deleting an object.
- Copying an object.
- Renaming an object.¹
- Caching an object.
- Adding an object to a project.
- Using project compare functionality.
- Copying to or restoring from a file.
- Upgrading to the database.

¹ Renaming a connected query object is supported on a managed object level, but is not exposed as a function in PeopleCode.

A connected query object is exposed to the report developer through the public methods and properties of the PT_CONQRS application package. The remainder of this chapter provides reference on those classes, methods, and properties.

Connected queries are described in more detail in the PeopleSoft Query PeopleBook.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Query, "Using Connected Query"

Importing Connected Query Classes

The connected query classes are application classes, not built-in classes, like Rowset, Field, Record, and so on. Before you can use these classes in your PeopleCode program, you must import them into your program.

An import statement either names a particular application class or imports all the classes in a package.

Using the asterisks after the package name makes all the application classes directly contained in the named package available. Application classes contained in subpackages of the named package are not made available.

CONQRSMGR Class

This section provides an overview of the CONQRSMGR class and discusses:

- CONQRSMGR class constructor.
- CONQRSMGR class methods.
- CONQRSMGR class properties.

CONQRSMGR Class Constructor

This section presents the constructor for the CONQRSMGR class.

CONQRSMGR

Example

```
import PT_CONQRS:CONQRSMGR;
```

```
Local PT_CONQRS:CONQRSMGR &objConQrsInst = create PT_CONQRS:CONQRSMGR(&sOprId, =>  
&sCONQRSNAME);
```

Note. The first parameter is not required; an empty string can be specified instead.

[Chapter 6, "Application Classes," Constructors, page 204](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

CONQRSMGR Class Methods

In this section, the CONQRSMGR class methods are presented in alphabetical order.

CleanOutputFile

Syntax

CleanOutputFile()

Description

Use this method to delete the connected query output file.

Note. This method is valid only for a connected query scheduled for running to a file—that is, when the run mode is equal to RunMode_Sched_File.

Parameters

None.

Returns

None.

Close

Syntax

close()

Description

Use this method to clean up connected query resources.

Parameters

None.

Returns

None.

CopyDefn

Syntax

CopyDefn(*target_UserID*, *target_ID*)

Description

Use this method to copy the connected query definition to a new ID. The user's query access security is checked prior to the copy.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>target_UserID</i>	Specifies the user ID of the owner of the new connected query as a string. An empty string indicates that the new connected query is public.
<i>target_ID</i>	Specifies the ID for the new connected query as a string.

Returns

A Boolean value: True if the copy is successful, False otherwise.

DeleteDefn

Syntax

DeleteDefn()

Description

Use this method to delete the current connected query definition.

Parameters

None.

Returns

A Boolean value: True if the delete was successful, False otherwise.

ExistsByName

Syntax

ExistsByName(*ObjName*)

Description

Use this method to for the existence of a connected query definition based on the specified definition name.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ObjName</i>	Specifies the connected query definition name as a string.

Returns

A Boolean value: True if connected query definition exists, False otherwise.

GetSampleXMLString

Syntax

GetSampleXMLString(*RowNum*)

Description

Use this method to generate and return a sample XML string. Use this string with XML Publisher data sources based on a connected query.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RowNum</i>	Sets number of rows of sample data to generate for each member query.

Returns

A string representing the sample XML data.

Open

Syntax

open(*IsNew*)

Description

Use this method to open a new or existing connected query definition.

This method should be called after a connected query object constructor. It initializes a new or existed connected query object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>IsNew</i>	Specifies as a Boolean value whether the connected query object represents a new connected query definition (True), or an existing definition (False).

Returns

A Boolean value: True if the open was successful, False otherwise.

ResetQueriesPrompt

Syntax

ResetQueriesPrompt()

Description

Use this method after a user clicks Cancel in a query prompt dialog.

Parameters

None.

Returns

None.

Run

Syntax

Run(*Prompts*, *runProcessInfo*)

Description

Use this method to run the connected query. The Run method is valid for the following run modes only:

- RunMode_Prev — Referred to as *preview mode*.
- RunMode_Sched_Web or RunMode_Sched_File — Referred to as *scheduled mode*.

If an error results, the Run method populates an error string with error details.

Preview Mode

In preview mode, the connected query is run immediately on the application sever. The output data is displayed in a separate browser window. In preview mode, the *Prompts* parameter is required; the *runProcessInfo* parameter *must* be set to Null. The *Prompts* parameter should be retrieved using the QueriesPromptsArray property. If this array length is greater than 0, this array must be populated.

Note. If both parameters are not null, the scheduling information is used to run the connected query by Process Scheduler.

Scheduled Mode

In scheduled mode, the connected query is run by Process Scheduler. In the case of `RunMode_Sched_File`, the output data is written to an XML file. In the case of `RunMode_Sched_Web`, the output data is accessible via a hyperlink in Process Monitor. In scheduled mode, the `runProcessInfo` parameter is required; the `Prompts` parameter should be set to Null.

Note. If both parameters are not null, the scheduling information is used to run the connected query by Process Scheduler.

Parameters

Parameter	Description
<i>Prompts</i>	Specifies the prompts for execution of the queries as an array of <code>QUERYITEMPROMPT</code> objects. This parameter should be set to null when running in scheduled mode.
<i>runProcessInfo</i>	Specifies the scheduling information for running the queries as a <code>SCHED_INFO</code> object. This parameter <i>must</i> be null when running in preview mode.

Returns

A Boolean value: True if the connected query was run successfully, False otherwise.

See Also

[Chapter 13, "Connected Query Classes," RunToWindow, page 678](#); [Chapter 13, "Connected Query Classes," RunToXMLFormattedString, page 679](#); [Chapter 13, "Connected Query Classes," QueriesPromptsArray, page 691](#); [Chapter 13, "Connected Query Classes," RunMode, page 693](#); [Chapter 13, "Connected Query Classes," QUERYITEMPROMPT Class, page 705](#); [Chapter 13, "Connected Query Classes," SCHED_INFO Class, page 706](#); [Chapter 13, "Connected Query Classes," Running a Connected Query in Scheduled Mode, page 713](#) and [Chapter 13, "Connected Query Classes," Running a Connected Query in Preview Mode or Background Mode, page 715](#)

RunToWindow

Syntax

`RunToWindow( )`

Description

Use this method to run a connected query in *background mode*. Similar to preview mode, running a connected query in background mode results in the output data being displayed in a separate browser window. However, in background mode, the connected query is run through Process Scheduler with a REN server. Running a connected query in this manner prevents blocking on the application server. While the report file is generated, the user can continue working with the PeopleSoft application and the application server environment.

To specify the scheduling information, prior to invoking the RunToWindow method, you must invoke the SetRunControlData method as follows:

```
&res = &objConQrsInst.SetRunControlData(&objConQrsInst.Const.⇒  
RunCntlId_Auto, False);
```

The RunToWindow method is valid for the RunMode_Window run mode only.

Parameters

None.

Returns

The process ID as a number.

See Also

[Chapter 13, "Connected Query Classes," Run, page 677](#); [Chapter 13, "Connected Query Classes," RunToXMLFormattedString, page 679](#); [Chapter 13, "Connected Query Classes," RunMode, page 693](#) and [Chapter 13, "Connected Query Classes," Running a Connected Query in Preview Mode or Background Mode, page 715](#)

RunToXMLFormattedString

Syntax

RunToXMLFormattedString(Prompts)

Description

Use this method to run the connected query immediately on the application server with output to an XML formatted string instead of an XML file.

The RunToXMLFormattedString method is valid for the RunMode_XMLFormattedString run mode only.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Prompts</i>	Specifies the prompts for execution of the queries as an array of QUERYITEMPROMPT objects. This parameter should be retrieved using the QueriesPromptsArray property. If this array length is greater than 0, this array must be populated.

Returns

The formatted XML as a string.

See Also

[Chapter 13, "Connected Query Classes," Run, page 677](#); [Chapter 13, "Connected Query Classes," RunToWindow, page 678](#); [Chapter 13, "Connected Query Classes," QueriesPromptsArray, page 691](#); [Chapter 13, "Connected Query Classes," RunMode, page 693](#) and [Chapter 13, "Connected Query Classes," QUERYITEMPROMPT Class, page 705](#)

Save

Syntax

Save()

Description

Use this method to save the connected query object to the database as a connected query definition. If the connected query does not pass validation, it is saved with an inactive status.

Parameters

None.

Returns

A Boolean value: True if the save was successful, False otherwise.

SaveRunControlParms

Syntax

SaveRunControlParms(*runCntlID*)

Description

Use this method to save the in-memory process request parameter array to the database. This method is also called internally from the SetRunControlData method when *IsChangeDB* is true.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>runCntlID</i>	Specifies the run control ID as a string.

Returns

A Boolean value: True if the save was successful, False otherwise.

See Also

[Chapter 13, "Connected Query Classes," SetRunControlData, page 681](#)

SetRunControlData

Syntax

SetRunControlData(*runCntlID*, *IsNewCtrl*, *IsChangeDB*)

Description

Use this as an interactive method to prompt the user if member queries have prompts. This method saves prompt data to the database using the PSCONQRSRUNPRM or PSCONQRSRUNPRMX records if the *IsChangeDB* parameter is passed as true. Call this method prior to scheduling a connected query to run in scheduled mode.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>runCntlID</i>	Specifies the run control ID as a string.
<i>IsNewCtrl</i>	Specifies as a Boolean value whether the run control is new.
<i>IsChangeDB</i>	Specifies as a Boolean value whether to write the run control information to the database.

Returns

A Boolean value: True if the run control parameters were set successfully, False otherwise.

Validate

Syntax

Validate()

Description

Use this method to validate the following:

- The existence of each query used in the connected query.
- Whether mapped fields used in the connected query object are still part of the QueryOutputFields collection for each query.
- The user security access for each query.

If validation fails, Validate populates an error string with the error details.

Parameters

None.

Returns

A Boolean value: True if the connected query passes all the validation checks, False otherwise.

See Also

Chapter 33, "Query Classes," QueryOutputFields, page 1959

ValidateIfFieldsMapped

Syntax

```
ValidateIfFieldsMapped( )
```

Description

Use this method to check whether all queries have mapped fields. Use this method to confirm that it is the report developer's intention to have unmapped fields in the queries.

If validation fails, `ValidateIfFieldsMapped` populates an error string with the names of the unlinked queries.

Parameters

None.

Returns

A Boolean value: True if all the queries have mapped fields, False otherwise.

ValidateRunControlParms

Syntax

```
ValidateRunControlParms(runCntLID)
```

Description

Use this method to determine whether sufficient populated records exist in the or PSCONQSRUNPRMX tables for the specified run control ID. `ValidateRunControlParms` compares the number of entries in the parameter tables with the number of prompts required for the connected query.

If validation fails, `ValidateRunControlParms` populates an error string with the error details.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>runCntlID</i>	Specifies the run control ID as a string.

Returns

A Boolean value: True if the validation is successful, False otherwise.

CONQRSMGR Class Properties

In this section, the CONQRSMGR class properties are presented in alphabetical order.

Const

Description

This property returns a CONQRS_CONST object.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," CONQRS_CONST Class, page 699](#)

Description

Description

Use this property to set or return a description for the connected query as a string.

This property is read-write.

Details

Description

Use this property to set or return a long description for the connected query as a string.

This property is read-write.

ErrString

Description

This property returns the error message as a string if an error occurs during processing.

This property is read-only.

ExecutionLog

Description

Use this property to return a Boolean value indicating whether to perform execution logging while executing the connected query.

This property is read-only.

Note. While this property is read-only, it can be set through the PropertyArray property.

The default value is False.

See Also

[Chapter 13, "Connected Query Classes," IsDebugMode, page 686](#) and [Chapter 13, "Connected Query Classes," PropertyArray, page 689](#)

IgnoreRelFldOutput

Description

Use this property to return a Boolean value indicating whether to create XML output without related field nodes.

This property is read-only.

Note. While this property is read-only, it can be set through the PropertyArray property.

The default value is False.

See Also

[Chapter 13, "Connected Query Classes," PropertyArray, page 689](#)

IsChanged

Description

This property returns a Boolean value indicating whether the connected query has been changed.

Note. When an existing connected query is opened, IsChanged is initialized to False.

This property is read-only.

IsDebugMode

Description

Use this property to return a Boolean value indicating whether to perform logging while executing the connected query. In addition, in debug mode, temporary files generated during execution of the connected query are not deleted after execution is complete. The log also contains SQL statements generated by each member query as well as values for the related fields used to link the parent query to its children.

This property is read-only.

Note. While this property is read-only, it can be set through the PropertyArray property.

The default value is False.

See Also

[Chapter 13, "Connected Query Classes," ExecutionLog, page 685](#) and [Chapter 13, "Connected Query Classes," PropertyArray, page 689](#)

IsInit

Description

This property returns a Boolean value indicating whether the connected query object has been initialized (opened) after object instance was created.

This property is read-only.

IsPublic

Description

This property returns a Boolean value indicating whether the connected query is public.

This property is read-only.

LastUpdatedBy

Description

This property returns the user ID of the user to have last updated the connected query, as a string.

This property is read-only.

LastUpdateDTTM

Description

This property returns the last update date and time for the connected query, as a datetime value.

This property is read-only.

MaxRowsPerQuery

Description

Use this property to set or return a number representing the maximum number of rows returned by each query in preview mode. If set to 0, no maximum is set.

This property is read-write.

Name

Description

This property returns the name of the connected query as a string.

This property is read-only.

ObjectRowset

Description

Use this property to set or return a Rowset object. The parent record for this rowset is PSCONQRSMAPVW; its child record is PSCONQRSFLDRLVW. Use of the ObjectRowset property and its associated rowset prevents the report developer from directly manipulating the managed object itself.

Getting the ObjectRowset property returns a Rowset object with the following structure, populated with Connected Query Manager data:

```
ObjectRowset = CreateRowset(Record.PSCONQRSMAPVW, CreateRowset⇒  
(Record.PSCONQRSFLDRLVW));
```

Setting the ObjectRowset property returns the rowset data back to the Connected Query Manager.

This property is read-write.

See Also

[Chapter 13, "Connected Query Classes," Iterating Through a Connected Query Opened for Editing, page 717](#)

OprID

Description

This property returns a string representing the user ID to which the connected query belongs to for private queries. For public queries, an empty string is returned.

This property is read-only.

OutProcessFileName

Description

This property returns a string representing the output file name as an absolute path.

Note. This property is valid only for a connected query scheduled for running to a file—that is, when the run mode is equal to RunMode_Sched_File.

This property is read-only.

PropertyArray

Description

Use this property to set or return an array of CONQRSPROPERTY objects (properties) for the connected query. If no properties exist, this array returns the default set of properties.

This property is read-write.

The following read-only properties of the CONQRSMGR class are dynamically synchronized whenever the PropertyArray property is set or returned:

- ExecutionLog
- IgnoreRelFldOutput
- IsDebugMode
- ShowFormattedXML

Example

The first example retrieves a set of properties from the database and populates the page grid using the Page Activate event:

```

import PT_CONQRS:CONQRSMGR;
import PT_CONQRS:CONQRSPROPERTY;

Component PT_CONQRS:CONQRSMGR &cConQrsInst;

Local array of PT_CONQRS:CONQRSPROPERTY &propArr;
Local Rowset &rsProp;
Local number &i, &j;

&propArr = &cConQrsInst.PropertyArray;
If &propArr.Len = 0 Then
    Return;
End-If;
Local Record &recProp, &recWrk;
&rsProp = GetLevel0()(1).GetRowset(Scroll.PSCONQRSPROP);
&rsProp.Flush();
For &i = 1 To &propArr.Len
    If &i > 1 Then
        &rsProp.InsertRow(&i - 1);
    End-If;
    &recProp = &rsProp(&i).PSCONQRSPROP;
    &recProp.PROPVALUEOPTION.ClearDropDownList();
    For &j = 1 To &propArr [&i].PROPVALUEARRAY.Len
        &recProp.PROPVALUEOPTION.AddDropDownItem(&propArr [&i].PROPVALUEARRAY [&j], =>
&propArr [&i].PROPVALUEARRAYDESC [&j]);
    End-For;
    &recProp.PROPNAME.Value = &propArr [&i].PROPNAME;
    &recProp.PROPVALUEOPTION.Value = &propArr [&i].PROPVALUE;
    &recProp.OPRID.Value = &cConQrsInst.OprID;
    &recProp.CONQRSNAME.Value = &cConQrsInst.Name;

    &recWrk = &rsProp(&i).PSCONQRS_WRK;
    &recWrk.PROPVALUEOPTION.Value = &propArr [&i].PROPDEFAULT;
End-For;

```

The second example populates a property array from a page grid. This program is executed when a user hits the OK button on a secondary page, PSCONQRSPROPS:

```

import PT_CONQRS:CONQRSMGR;
import PT_CONQRS:CONQRSPROPERTY;

Component PT_CONQRS:CONQRSMGR &cConQrsInst;

If %Page = Page.PSCONQRSPROPS Then
    Local array of PT_CONQRS:CONQRSPROPERTY &propArr;
    Local Rowset &rsProp;
    Local number &i;
    Local Record &recProp, &recWrk;

    /* Get the property array from the database. */
    &propArr = &cConQrsInst.PropertyArray;
    If &propArr.Len = 0 Then
        Return;
    End-If;

    &rsProp = GetLevel0()(1).GetRowset(Scroll.PSCONQRSPROP);
    If &propArr.Len <> &rsProp.ActiveRowCount Then
        Return;
    End-If;

    For &i = 1 To &rsProp.ActiveRowCount
        &recProp = &rsProp(&i).PSCONQRSPROP;
        &recWrk = &rsProp(&i).PSCONQRS_WRK;
        If None(&recProp.PROPNAMe.Value) Then
            &recProp.PROPNAMe.Value = &recWrk.PROPVALUEOPTION.Value;
        End-If;
        &propArr [&i].PROPNAMe = &recProp.PROPNAMe.Value;
        &propArr [&i].PROPVALUE = &recProp.PROPVALUEOPTION.Value;
        &propArr [&i].PROPDEFAULT = &recWrk.PROPVALUEOPTION.Value;
    End-For;

    /* Return the modified property array to the database. */
    &cConQrsInst.PropertyArray = &propArr;
End-If;

```

[Chapter 13, "Connected Query Classes," CONQRSPROPERTY Class, page 698](#)

QueriesPromptsArray

Description

This property returns an array of QUERYITEMPROMPT objects. This array is used by the connected query object as a parameter to the Run method in preview mode.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," QUERYITEMPROMPT Class, page 705](#)

QueryArray

Description

This property returns an array of string representing the query names that constitute the connected query object.

This property is read-only.

RegisteredBy

Description

This property returns a string representing the user ID of the user who created the connected query object.

This property is read-only.

RegisteredDTTM

Description

This property returns the creation date and time for the connected query, as a datetime value.

This property is read-only.

RunCntlId

Description

This property returns a string representing the run control ID for scheduling the connected query.

This property is read-only.

RunControlParArray

Description

This property returns an array of PSCONQRSRUNPRM records to be used for displaying and updating the set of scheduling parameters for the queries.

This property is read-only.

RunMode

Description

This property returns a number representing the run mode for a connected query instance. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
1	RunMode_Window	Run the connected query in background mode with output to a separate browser window. The connected query runs via Process Scheduler and uses a REN server for delivering the output XML to the user. The XML result file is delivered to both the REN server window and the Report Manager.
2	RunMode_Sched_Web	Run the connected query at a scheduled time with output to web. The connected query is scheduled to output the XML result file to the Report Manager. It can be accessed by the user via a Report Manager link.
3	RunMode_Sched_File	Run the connected query at a scheduled time with output to a file name and location specified by the user.

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
4	RunMode_Prev	Run the connected query immediately in preview mode with output to a separate browser window. The connected query is executed immediately on the application server with output to a separate browser window. The output XML is not formatted internally; the only formatting that occurs is performed by the browser. Because results only exist for the browser session and are not preserved, this mode should be used during connected query creation, debugging, and tuning only. Important! When using the preview mode, set a limit on the number of rows returned from each query. See Chapter 13, "Connected Query Classes," MaxRowsPerQuery, page 687 and Chapter 13, "Connected Query Classes," RunMode_Prev DefRowNumber, page 701.
5	RunMode_Sample	Run the connected query immediately with output to a file that is suitable as an XML Publisher data source.

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
6	RunMode_XMLFormattedString	Run the connected query immediately with output to a formatted XML string. This formatted XML string is larger than the unformatted XML of the RunMode_Prev mode. The connected query is executed immediately on the application server with output to a formatted XML string. This string is formatted according to the XML DOM object and is suitable for displaying in a long edit box. This mode is used by the Connected Query Quick Start wizard in which XML results are previewed on the application page in a long edit box. Important! When using the formatted XML string preview mode, set a limit on the number of rows returned from each query. See Chapter 13, "Connected Query Classes," MaxRowsPerQuery, page 687 and Chapter 13, "Connected Query Classes," RunMode_Prev DefRowNumber, page 701.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," Run, page 677](#); [Chapter 13, "Connected Query Classes," RunToWindow, page 678](#) and [Chapter 13, "Connected Query Classes," RunToXMLFormattedString, page 679](#)

[Chapter 13, "Connected Query Classes," RunMode_Prev, page 701](#); [Chapter 13, "Connected Query Classes," RunMode_Sample, page 702](#); [Chapter 13, "Connected Query Classes," RunMode_Sched_File, page 702](#); [Chapter 13, "Connected Query Classes," RunMode_Sched_Web, page 702](#); [Chapter 13, "Connected Query Classes," RunMode_Window, page 703](#) and [Chapter 13, "Connected Query Classes," RunMode_XMLFormattedString, page 703](#)

SchedInfo

Description

Use this property to set or return a SCHED_INFO object to be populated with scheduling details. Use the property as a parameter to the Run method for scheduling connected query execution when the run mode is RunMode_Window, RunMode_Sched_Web, or RunMode_Sched_File.

This property is read-write.

See Also

[Chapter 13, "Connected Query Classes," SCHED_INFO Class, page 706](#)

SchedRequestType

Description

Use this property to set or return a string indicating which application scheduled the connected query process. The values are:

<i>Value</i>	<i>Description</i>
CQR	Connected Query Manager
XMLP	XML Publisher

Separate run control parameter records (PSCONQRSRUNPRM or PSCONQRSRUNPRMX) are used for different values of this property.

This property is read-write.

SecProfile

Description

This property returns a SEC_PROFILE object, which shows the user's query access level as defined for the query.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," SEC_PROFILE Class, page 708](#)

ShowFormattedXML

Description

Use this property to return a Boolean value indicating whether to retain indentation when generating XML output.

This property is read-only.

Note. While this property is read-only, it can be set through the PropertyArray property.

The default value is False.

See Also

Chapter 13, "Connected Query Classes," PropertyArray, page 689

Status

Description

Use this property to set or return a string representing the status of the connected query. The values are:

<i>Value</i>	<i>Description</i>
A	Active
I	Inactive

<i>Value</i>	<i>Description</i>
P	In progress.

This property is read-write.

XMLDataFileName

Description

This property returns the short name for the XML data file as a string.

This property is read-only.

XMLDataFullName

Description

This property returns the long name for the XML data file as a string.

This property is read-only.

CONQRSPROPERTY Class

The CONQRSPROPERTY class is a data structure that exposes connected query properties. Individual members of the CONQRSPROPERTY class should be retrieved and set through the CONQRSMGR class, PropertyArray property, which is an array of CONQRSPROPERTY objects.

See Also

Chapter 13, "Connected Query Classes," PropertyArray, page 689

CONQRSPROPERTY Class Properties

In this section, the CONQRSPROPERTY class properties are presented in alphabetical order.

PROPDEFAULT

Description

Use this property to set or return the default property value as a string.

This property is read-write.

PROPNAME

Description

Use this property to set or return the property name as a string.

This property returns a Boolean value indicating that the specified connected query already exists. The value is False.

This property is read-write.

PROPVALUE

Description

Use this property to set or return the current property value as a string.

This property is read-write.

PROPVALUEARRAY

Description

Use this property to set or return an array of string representing the valid property values.

This property is read-write.

PROPVALUEARRAYDESC

Description

Use this property to set or return an array of string representing the descriptions for the valid property values.

This property is read-write.

CONQRS_CONST Class

This section provides an overview of the CONQRS_CONST class and discusses CONQRS_CONST class properties.

The CONQRS_CONST class is a data structure that exposes read-only properties representing constant values. An instance of the CONQRS_CONST class is created through the Const property of the CONQRSMR class.

See Also

[Chapter 13, "Connected Query Classes," Const, page 684](#)

CONQRS_CONST Class Properties

In this section, the CONQRS_CONST class properties are presented in alphabetical order.

InitExisting

Description

This property returns a Boolean value indicating that the specified connected query already exists. The value is False.

Use InitExisting as an argument to the Open method.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," Open, page 676](#)

InitNew

Description

This property returns a Boolean value indicating that the specified connected query is new. The value is True.

Use InitNew as an argument to the Open method.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," Open, page 676](#)

MsgSet

Description

This property returns the number 241 as the message set number for connected query.

This property is read-only.

RunCntlId_Auto

Description

This property returns the string PSCONQRS_AUTORUN.

Use this property with the SetRunControlData method for the RunMode_Window mode. It indicates that the run control ID for the connected query process should be generated automatically.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," SetRunControlData, page 681](#) and [Chapter 13, "Connected Query Classes," RunMode Window, page 703](#)

RunMode_Prev

Description

This property returns the number 4, which represents the preview run mode with output to a separate browser window.

The connected query is executed immediately on the application server with output to a separate browser window. The output XML is not formatted internally; the only formatting that occurs is performed by the browser. Because results only exist for the browser session and are not preserved, this mode should be used during connected query creation, debugging, and tuning only.

Note. When using the preview mode, set a limit on the number of rows returned from each query.

This property is read-only.

[Chapter 13, "Connected Query Classes," MaxRowsPerQuery, page 687](#) and [Chapter 13, "Connected Query Classes," RunMode_Prev DefRowNumber, page 701](#)

RunMode_Prev_DefRowNumber

Description

This property returns the number 6, which represents the default number of rows returned for connected queries running in the RunMode_Prev or RunMode_XMLFormattedString modes.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," MaxRowsPerQuery, page 687](#) and [Chapter 13, "Connected Query Classes," RunMode_Prev, page 701](#)

[Chapter 13, "Connected Query Classes," RunMode_XMLFormattedString, page 703](#)

RunMode_Sample

Description

This property returns the number 5, which represents a run mode that produces a sample XML string that can be used by an XML Publisher data source as a sample XML string.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," RunMode, page 693](#)

RunMode_Sched_File

Description

This property returns the number 3, which represents the scheduled run mode with output to a file name and location specified by the user.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," Run, page 677](#) and [Chapter 13, "Connected Query Classes," RunMode, page 693](#)

RunMode_Sched_Web

Description

This property returns the number 2, which represents the scheduled run mode with output to the web (that is, Report Manager).

The output can be accessed by the user via a Report Manager link.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," Run, page 677](#) and [Chapter 13, "Connected Query Classes," RunMode, page 693](#)

RunMode_Window

Description

This property returns the number 1, which represents the background run mode with output to a separate browser window.

The connected query runs via Process Scheduler and uses a REN server for delivering the output XML to the user. The XML result file is delivered to both the REN server window and the Report Manager.

This property is read-only.

See Also

[Chapter 13, "Connected Query Classes," RunToWindow, page 678](#) and [Chapter 13, "Connected Query Classes," RunMode, page 693](#)

RunMode_XMLFormattedString

Description

This property returns the number 6, which represents the run mode that produces an formatted XML string. This formatted XML string is larger than the unformatted XML of the RunMode_Prev mode.

The connected query is executed immediately on the application server with output to a formatted XML string. This string is formatted according to the XML DOM object and is suitable for displaying in a long edit box. This mode is used by the Connected Query Quick Start wizard in which XML results are shown on the application page in a long edit box.

Note. When using the preview mode, set a limit on the number of rows returned from each query.

This property is read-only.

[Chapter 13, "Connected Query Classes," RunToXMLFormattedString, page 679](#) and [Chapter 13, "Connected Query Classes," RunMode, page 693](#)

[Chapter 13, "Connected Query Classes," MaxRowsPerQuery, page 687](#) and [Chapter 13, "Connected Query Classes," RunMode_Prev DefRowNumber, page 701](#)

SchedRequest_CQR

Description

This property returns the string CQR representing that connected query execution was invoked by the Connected Query Manager. The value of this property is used as a part of the SCHED_INFO data structure.

This property is read-only.

SchedRequest_XMLP

Description

This property returns the string XMLP, representing that connected query execution was invoked by XML Publisher. The value of this property is used as a part of the SCHED_INFO data structure.

This property is read-only.

Stat_Active

Description

This property returns the string A indicating that the connected query definition is active.

This property is read-only.

Stat_InActive

Description

This property returns the string I indicating that the connected query definition is inactive. A connected query can be set to inactive if it did not pass a validation.

This property is read-only.

Stat_InProgress

Description

This property returns the string P indicating that the connected query definition is in progress. A connected query that is "in process" be run in preview mode only. It cannot be scheduled, and it is not be visible to XML Publisher.

This property is read-only.

QUERYITEMPROMPT Class

This section provides an overview of the QUERYITEMPROMPT class and discusses QUERYITEMPROMPT class properties.

The QUERYITEMPROMPT class is a data structure that exposes read-only properties representing query prompts. An array of instances of this class is exposed via the QueriesPromptsArray property of the CONQRSMR class. Therefore, only an import statement is required, and no constructor:

```
import PT_CONQRS:QUERYITEMPROMPT;
```

See Also

[Chapter 13, "Connected Query Classes," QueriesPromptsArray, page 691](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

QUERYITEMPROMPT Class Properties

In this section, the QUERYITEMPROMPT class properties are presented in alphabetical order.

QueryName

Description

This property returns as string representing the name of a query that participates in the connected query.

This property is read-only.

QueryPromptRecord

Description

This property returns a Record object with the runtime prompts for the query.

This property is read-only.

SCHED_INFO Class

This section provides an overview of the SCHED_INFO class and discusses SCHED_INFO class properties.

The SCHED_INFO class is a data structure that exposes the class constructor and read-write properties representing run controls and scheduling information. An instance of this class is exposed via the SchedInfo property of the CONQRSMR class. Therefore, only an import statement is required, and no constructor:

```
import PT_CONQRS:SCHED_INFO;
```

See Also

[Chapter 13, "Connected Query Classes," SchedInfo, page 695](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

SCHED_INFO Class Properties

In this section, the SCHED_INFO class properties are presented in alphabetical order.

AE_ID

Description

Use this property to set or return a string indicating which application scheduled execution of the connected query. The values are:

<i>Value</i>	<i>Description</i>
CQR (the default)	Connected Query Manager
XMLP	XML Publisher

This property is read-write.

DIRLOCATION

Description

Use this property to set or return a string representing the directory location for temporary files generated during processing of a scheduled connected query. This directory should be the same as the log/output directory specified in the psprcs.cfg file, allowing the connected query to use the distribution features of Process Scheduler.

This property is read-write.

OPRID

Description

Use this property to set or return a string representing the ID of the user who initiated the process.

This property is read-write.

OUTDESTTYPE

Description

Use this property to set or return the Process Scheduler output destination type as a number. The values are:

<i>Value</i>	<i>Description</i>
2	File
4	Window
6	Web

This property is read-write.

PRCSFILENAME

Description

Use this property to set or return the output file name as a string. This property is required when OUTDESTTYPE equals 2 (file). Specify an absolute path and file name that is accessible by the Process Scheduler server.

This property is read-write.

PROCESS_INSTANCE

Description

Use this property to set or return the process instance as a string.

This property is read-write.

RUN_CNTL_ID

Description

Use this property to set or return the run control ID as a string.

This property is read-write.

SEC_PROFILE Class

This section provides an overview of the SEC_PROFILE class and discusses:

- SEC_PROFILE class constructor.
- SEC_PROFILE class properties.

The SEC_PROFILE class is a data structure that exposes the class constructor and read-only properties representing the security access to the connected query for this user's session.

See Also

[Chapter 13, "Connected Query Classes," SecProfile, page 696](#)

SEC_PROFILE Class Constructor

This section presents the constructor for the SEC_PROFILE class.

SEC_PROFILE

Example

```
import PT_CONQRS:SEC_PROFILE;  
  
Local PT_CONQRS:SEC_PROFILE &SecProfile = create PT_CONQRS:SEC_PROFILE();
```

See Also

[Chapter 6, "Application Classes," Constructors, page 204](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

SEC_PROFILE Class Properties

In this section, the SEC_PROFILE class properties are presented in alphabetical order.

CanCreatePublic

Description

This property returns a Boolean value indicating whether the user can create a public connected query.

This property is read-only.

CanModify

Description

This property returns a Boolean value indicating whether the user can modify the connected query.

This property is read-only.

CanRunQuery

Description

This property returns a Boolean value indicating whether the user can run the connected query.

This property is read-only.

UTILITY Class

This section provides an overview of the UTILITY class and discusses:

- UTILITY class constructor.
- UTILITY class methods.

The UTILITY class is a data structure that exposes the class constructor and utility methods used for validation. The UTILITY class does not require that a connected query be opened first.

UTILITY Class Constructor

This section presents the constructor for the UTILITY class.

UTILITY

Example

```
import PT_CONQRS:UTILITY;  
Local PT_CONQRS:UTILITY &Utility = create PT_CONQRS:UTILITY();
```

See Also

[Chapter 6, "Application Classes," Constructors, page 204](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

UTILITY Class Methods

In this section, the UTILITY class methods are presented in alphabetical order.

CheckQryForTreePrompt

Syntax

```
CheckQryForTreePrompt(QryName, scope)
```

Description

Use this method to check if a specific query uses tree prompts.

Important! Connected query does not support queries with tree prompts.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>QryName</i>	Specifies the query name as a string.
<i>scope</i>	Specifies the query scope as a string. If a valid value is not specified, CheckQryForTreePrompt searches to determine the scope. The values are: • R — Private • U — Public

Returns

The empty string if the query does not use tree prompts; otherwise, an error string.

CheckQrySecurity

Syntax

CheckQrySecurity(*QryName*, *IsPublicObject*)

Description

Use this method to check user access security for a single query. CheckQrySecurity performs the following checks:

- Whether the query is public for public connected queries (*IsPublicObject* is True).
- Whether the query is disabled.
- Whether the query has tree prompts by invoking CheckQryForTreePrompt.
- Whether there are query prompt security violations.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>QryName</i>	Specifies the query name as a string.
<i>IsPublicObject</i>	Specifies a Boolean value indicating whether the connected query is public.

Returns

A Boolean value: True if the security validation was successful, False otherwise.

GetQueryScopeByName

Syntax

GetQueryScopeByName(*QryName*)

Description

Use this method to check whether the specified query has a public or private scope.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>QryName</i>	Specifies the query name as a string.

Returns

A number:

- 0 — Private query.
- 1 — Public query.
- 2 — Query not found.

ValidateObjectID

Syntax

ValidateObjectID(*ID*)

Description

Use this method to check whether the specified ID (connected query ID or run control ID) contains special characters. Valid characters for IDs include A-Z, 0–9, and _.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ID</i>	Specifies the ID to be validated as a string.

Returns

An empty string if the validation was successful; otherwise, an error string.

Connected Query Classes Examples

This section includes examples of:

- Running a connected query in scheduled mode.
- Running a connected query in preview mode or background mode.
- Iterating through a connected query opened for editing.

Running a Connected Query in Scheduled Mode

In scheduled mode, the connected query is run by Process Scheduler. In the case of RunMode_Sched_File, the output data is written to an XML file. In the case of RunMode_Sched_Web, the output data is accessible via a hyperlink in Process Monitor. In scheduled mode, the *runProcessInfo* parameter is required; the *Prompts* parameter should be set to Null.

The following example represents a PeopleCode step to be run via Application Engine:

```

import PT_CONQRS:CONQRSMGR;
import PT_CONQRS:SCHED_INFO;

Local PT_CONQRS:CONQRSMGR &cConQrsInst;
Local boolean &result;
Local string &PRCSFILENAME;
Local string &sPrCsName = "PSCONQRS";
Local string &sPrCsType = "Application Engine";
Local number &nOrigPSMessagesMode = %Session.PSMessagesMode;
%Session.PSMessagesMode = 1;

/* While working with connected queries, it is recommended to use a try- */
/* catch block */

try

    /* Create and open an object. System tries to find a connected query */
    /* with private ownership first for current user. If not found, it */
    /* uses a public ownership */
    &ConQrsInst = create PT_CONQRS:CONQRSMGR("", PSCONQRS_AET.CONQRSNAME);

    &result = &ConQrsInst.Open(&ConQrsInst.Const.InitExisting);

    &str = &ConQrsInst.ErrString;
    If &str <> "" Then
        WriteToLog(%ApplicationLogFence_Error, &ConQrsInst.ErrString);
        %Session.PSMessagesMode = &nOrigPSMessagesMode;
        Exit (1);
    End-If;

    If &result Then

        /* Get an empty SCHEDINFO structure and populate it. */
        &schedInfo = &ConQrsInst.SchedInfo;
        &schedInfo.DIRLOCATION = %FilePath;
        &schedInfo.OUTDESTTYPE = String(%OutDestType);
        &schedInfo.RUN_CNTL_ID = PSCONQRS_AET.RUN_CNTL_ID;
        &schedInfo.PROCESS_INSTANCE = PSCONQRS_AET.PROCESS_INSTANCE;
        &schedInfo.OPRID = PSCONQRS_AET.OPRID;
        If %OutDestType = 2 Then /* FILE */
            Local string &sqlFile = "SELECT OUTDEST FROM PS_PRCSRUNCNTLDTL =>
WHERE OPRID=:1 and RUNCNTLID=:2 and PRCSTYPE=:3 and PRCSNAME=:4";
            SQLExec(&sqlFile, PSCONQRS_AET.OPRID, PSCONQRS_AET.RUN_CNTL_ID, =>
&sPrCsType, &sPrCsName, &PRCSFILENAME);
            End-If;
            &schedInfo.PRCSTYPE = &PRCSFILENAME;

            /* Indicate the source of the scheduled request as CQR. */
            &schedInfo.AE_ID = &ConQrsInst.Const.SchedRequest_CQR;

            /* Schedule the query to run. Note that for scheduled connected */
            /* queries, the Prompts parameter is Null. */
            &result = &ConQrsInst.Run( Null, &schedInfo);
        End-If;
        If &result Then
            %Session.PSMessagesMode = &nOrigPSMessagesMode;
            Exit (0);
        Else

            /* Check for errors */
            &str = &ConQrsInst.ErrString;

```

```

If &str <> "" Then
    WriteToLog(%ApplicationLogFence_Error, &ConQrsInst.ErrString);
End-If;
/* check session message for errors */
If %Session.PSMessages.Count > 0 Then
    &PSMessages = %Session.PSMessages;
    For &i = 1 To &PSMessages.Count
        If (&PSMessages.Item(&i).MessageType <= 1) Then
            &MsgSetNbr = &PSMessages.Item(&i).MessageSetNumber;
            &MsgNbr = &PSMessages.Item(&i).MessageNumber;
            WriteToLog(%ApplicationLogFence_Error, MsgGet(&MsgSetNbr, =>
&MsgNbr, "Message Not Found : " | &MsgSetNbr | ", " | &MsgNbr));
        End-If;
    End-For;
End-If;
End-If;

%Session.PSMessagesMode = &nOrigPSMessagesMode;

catch Exception &Err
    WriteToLog(%ApplicationLogFence_Error, &Err.ToString());
end-try;

```

Running a Connected Query in Preview Mode or Background Mode

In preview mode, the connected query is run immediately on the application sever. The output data is displayed in a separate browser window. In preview mode, the *Prompts* parameter is required; the *runProcessInfo* parameter *must* be set to Null. The *Prompts* parameter should be retrieved using the *QueriesPromptsArray* property. If this array length is greater than 0, this array must be populated.

Similar to preview mode, running a connected query in background mode results in the output data being displayed in a separate browser window. However, in background mode, the connected query is run through Process Scheduler with a REN server. Running a connected query in this manner prevents blocking on the application server. While the report file is generated, the user can continue working with the PeopleSoft application.

In the following example, assume that an application calls the *RunConnectedQuery* function with all required parameters. The function returns an error string if any error occurs.

```

import PT_CONQRS:CONQRSMGR;
import PT_CONQRS:QUERYITEMPROMPT;

Function ShowException(&errString As Exception);

    /* Perform exception processing */

End-Function;

Function RunConnectedQuery(&sOprId As string, &sCONQRSNAME As string, &RunMode =>
As number) Returns string

    Local boolean &result;
    Local array of PT_CONQRS:QUERYITEMPROMPT &aPrompts;
    Local string &str;
    Local number &processID;
    Local boolean &IsChangeDB, &IsNewCnt;
    Local PT_CONQRS:CONQRSMGR &cConQrsInst;

    /* While working with connected queries, it is recommended to use a try- */
    /* catch block */

    try

        /* Create and open an object. System tries to find a connected query */
        /* with private ownership first for current user. If not found, it */
        /* uses a public ownership */

        &cConQrsInst = create PT_CONQRS:CONQRSMGR("", &sCONQRSNAME);
        &result = &cConQrsInst.Open(&cConQrsInst.Const.InitExisting);

        /* Check for errors */
        &str = &cConQrsInst.ErrString;
        If &str <> "" Then
            Error &cConQrsInst.ErrString;
        End-If;

        /* Validate the previously opened connected query object */
        If Not &cConQrsInst.Validate() Then
            &str = &cConQrsInst.ErrString;
            If &str <> "" Then
                Error &cConQrsInst.ErrString;
            End-If;
        End-If;

        /* Preview Mode- AppServer execution */
        /* Populate prompts. NOTE: It is required for 'interactive' execution */
        /* using an application server. In the case of scheduled execution, */
        /* prompts are read from the database */
        If &RunMode = &cConQrsInst.Const.RunMode_Prev Then
            &aPrompts = FillQueriesPrompts();
            If None(&aPrompts) Then
                /* User hit Cancel on a Prompt dialog */
                &cConQrsInst.ResetQueriesPrompt();
                Return &cErrIndicator;
            End-If;

            /* Restrict number of rows being displayed for each member query. */
            /* If user does not set this value, the default number is used */
            If All(PSCONQRS_WRK.QRY_MAX_FETCH) Then
                &cConQrsInst.MaxRowsPerQuery = &numRows;
            Else
                &cConQrsInst.MaxRowsPerQuery = &cConQrsInst.Const.=>

```

```

RunMode_Prev_DefRowNumber;
End-If;

/* Run the connected query. NOTE: The runProcessInfo parameter is Null */
&result = &cConQrsInst.Run(&aPrompts, Null);

End-If; /* end of Mode selection */

/* 'Run to Window' mode */
If &RunMode = &cConQrsInst.Const.RunMode_Window Then
  &IsChangeDB = True;
  &IsNewCnt = False;

  /* You are required to set run control parameters for immediate */
  /* execution using Process Scheduler */
  &result = &cConQrsInst.SetRunControlData(&cConQrsInst.Const.⇒
RunCntlId_Auto, &IsNewCnt, &IsChangeDB);
  If &result Then
    &processID = &cConQrsInst.RunToWindow();
    If All(&processID) Then
      &result = True;;
    End-If;
  End-If;
End-If; /* end of Mode selection */

/* Check for errors */
&str = &cConQrsInst.ErrString;
If &str <> "" Then
  Error &cConQrsInst.ErrString;
End-If;
Return &str;

catch Exception &Err
  ShowException(&Err);
end-try;

End-Function;

```

Iterating Through a Connected Query Opened for Editing

This example demonstrates usage of the connected query `ObjectRowset` property. The program opens an instance from an existing connected query definition. The program retrieves the rowset from the `ObjectRowset` property, and changes some of its properties. It saves the rowset back to `ObjectRowset` property, and then saves the modified connected query definition back to the database.

```

import PT_CONQRS:CONQRSMGR;

Local PT_CONQRS:CONQRSMGR &cConQrsInst;
Local string &sOprId, &sCONQRSNAME, &str, &sQryParentName, &sQryChildName, =>
&sFldNamePar, &sFldNameChild;
Local Rowset &rsObjectRowset, &rsObjectFields;
Local Record &rMapObjRec, &rFldObjRec;
Local number &i, &j, &seqNum, &fldNum;

Function ShowException(&errString As Exception);

End-Function;

/* While working with connected queries, it is recommended to use a try- */
/* catch block */

try

    /* Create and open an object. System tries to find a connected query */
    /* with private ownership first for current user. If not found, it */
    /* uses a public ownership */
    &sCONQRSNAME = "MyConQuery";
    &cConQrsInst = create PT_CONQRS:CONQRSMGR("", &sCONQRSNAME);

    &res = &cConQrsInst.Open(&cConQrsInst.Const.InitExisting);
    &str = &cConQrsInst.ErrString;

    If &str <> "" Then
        Error &cConQrsInst.ErrString;
    End-If;

    /* Validate the previously opened connected query object */
    If Not &cConQrsInst.Validate() Then
        &str = &cConQrsInst.ErrString;
        If &str <> "" Then
            Error &cConQrsInst.ErrString;
        End-If;
    End-If;

    /* Rowset retrieved from a connected query has the following */
    /* structure: ObjectRowset = CreateRowset(Record.PSCONQRSMAPVW, */
    /* CreateRowset(Record.PSCONQRSFLDRLVW)); */

    &rsObjectRowset = &cConQrsInst.ObjectRowset;

    /* The rowset contains the internal connected query structure. The */
    /* user can iterate the rowset, retrieve and modify member query */
    /* names, list the related fields, list object properties, etc. */

    For &i = 1 To &rsObjectRowset.ActiveRowCount
        &rMapObjRec = &rsObjectRowset(&i).PSCONQRSMAPVW;
        &sQryParentName = &rMapRec.GetField(Field.QRYNAMEPARENT).Value;
        &sQryChildName = &rMapRec.GetField(Field.QRYNAMECHILD).Value;
        &seqNum = &rsObjectRowset(&i).PSCONQRSMAPVW.SEQNUM.Value;

        &rsObjectFields = &rsObjectRowset(&i).GetRowset(Scroll.PSCONQRSFLDRLVW);
        For &j = 1 To &rsObjectFields.ActiveRowCount
            &rFldObjRec = &rsObjectFields(&j).PSCONQRSFLDRLVW;
            &fldNum = &rFldObjRec.SELCOUNT.Value;
            &sFldNamePar = &rFldObjRec.QRYFLDNAMEPAR.Value;
            &sFldNameChild = &rFldObjRec.QRYFLDNAMECHILD.Value;;
        End-For;
    End-For;

```

```

/* The preceding for loop shows how to navigate a connected query's */
/* internal structure. It allows a report developer to change a */
/* connected query definition by modifying existing query members or */
/* by adding new ones -- queries or related fields. */

/* Need to set the connected query's rowset to the retrieved rowset */
/* after any changes are made to the retrieved rowset. */

&cConQrsInst.ObjectRowset = &rsObjectRowset;

&Errstr = &cConQrsInst.ErrString;
If &Errstr <> "" Then
    Error &cConQrsInst.ErrString;
End-If;

/* Set the connected query properties. Set the object's status to */
/* active, so it will be available for reporting use */

&cConQrsInst.Description = "My Connected Query";
&cConQrsInst.Details = "Includes QryA, QryA1, and QryC";
&cConQrsInst.Status = "A";

/* Save the connected query instance */
If Not &cConQrsInst.Save() Then
    If &cConQrsInst.ErrString <> "" Then
        Error &cConQrsInst.ErrString;
    End-If;
End-If;

catch Exception &Err
    ShowException(&Err);
end-try;

```

Chapter 14

Crypt Class

This chapter provides an overview of the crypt class and discusses:

- Create a crypt object
- Error handling
- Data type of a crypt object
- Scope of a crypt object
- Crypt class reference

Understanding the Crypt Class

The crypt class is used with pluggable cryptography. After you create an encryption profile, use PeopleCode to invoke the encryption profile for encrypting, decrypting, or signing a field, depending on the profile

See Also

PeopleTools 8.51 PeopleBook: Security Administration, "Securing Data with PeopleSoft Encryption Technology"

Creating a Crypt Object

The crypt class does not have a separate function for instantiating an object (such as CreateCrypt.) Instead, you instantiate a crypt object using the CreateObject function, using the keyword **Crypt**.

```
&cry = CreateObject("Crypt");
```

See *PeopleTools 8.51 PeopleBook: PeopleCode Language Reference*, "PeopleCode Built-in Functions," CreateObject.

Declaring Crypt Objects

Crypt objects are declared by using the Crypt type name.

```
Local Crypt &MyCrypt;
```

Note. Crypt objects cannot be serialized, and so can only be declared as Local.

Scope of a Crypt Object

A crypt object can only be instantiated from PeopleCode. This object can be used anywhere you have PeopleCode, that is, in an application class, Component Interface PeopleCode, record field PeopleCode, and so on.

Crypt Class Methods

In this section, we discuss the crypt class methods. The methods are discussed in alphabetical order.

FirstStep

Syntax

FirstStep()

Description

Use the FirstStep method to access the first step in the encryption chain.

You must use either the FirstStep or GoToStep methods before you use the NextStep or SetParameter methods.

Parameters

None.

Returns

None.

See Also

[Chapter 14, "Crypt Class," GoToStep, page 723](#); [Chapter 14, "Crypt Class," NextStep, page 724](#) and [Chapter 14, "Crypt Class," SetParameter, page 725](#)

GoToStep

Syntax

GoToStep(*StepNum*)

Description

Use the GoToStep method to access a specific step in the encryption chain.

You must use either the GoToStep or FirstStep methods before you use the NextStep or SetParameter method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>StepNum</i>	Specify the step number that you want to access, as a number.

Returns

None.

See Also

[Chapter 14, "Crypt Class," FirstStep, page 722](#); [Chapter 14, "Crypt Class," NextStep, page 724](#) and [Chapter 14, "Crypt Class," SetParameter, page 725](#)

LoadLibrary

Syntax

LoadLibrary(*LibraryFile*, *LibraryID*)

Description

Use the LoadLibrary method to specify the encryption library to be used. This method is generally used when either your underlying library changes (such as, a new version, added algorithms, and so on) or you have your written own library and you need to load the metadata into the PeopleSoft system.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>LibraryFile</i>	Specify the name of the file containing the encryption library as a string. You do not have to specify a full path name. The delivered OpenSSL library is pspetssl.dll. The delivered PGP library is pspetpgp.dll.
<i>LibraryID</i>	Specify the name of the library, as a string.

Returns

None.

NextStep

Syntax

NextStep()

Description

Use the NextStep method to access the next step in the encryption chain.

You must use the FirstStep or GoToStep method before using NextStep.

Your program terminates if you call NextStep when you are already at the last step in the encryption chain.

Parameters

None.

Returns

None.

See Also

[Chapter 14, "Crypt Class," FirstStep, page 722](#) and [Chapter 14, "Crypt Class," GoToStep, page 723](#)

Open

Syntax

Open(*ProfileName*)

Description

Use the Open method to open the encryption profile identified by *ProfileName*. You must open an encryption profile before you can add data to the encryption profile. Your program terminates if you specify an encryption profile that doesn't exist.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ProfileName</i>	Specify the name of the encryption profile you want to access, as a string. You can store the name of the encryption profile in a field, and specify a <i>fieldname.recordname</i> .

Returns

None.

Example

```
Local Crypt &cry;  
  
&cry = CreateObject("Crypt");  
&bar = QE_CRYPT_WRK.CRYPT_PRFL_ID;  
&cry.Open(&bar);  
&cry.UpdateData(QE_CRYPT_WRK.DESCRLONG);  
QE_CRYPT_WRK.LARGECHAR = &cry.Result;
```

SetParameter

Syntax

SetParameter(*Name*, *Value*)

Description

Use the SetParameter method to set the parameter specified by *Name* to a value specified by *Value*.

You must have already used the `FirstStep`, `NextStep`, or `GoToStep` methods to specify a step before using this method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specify the name of the parameter that you want to change, as a string.
<i>Value</i>	Specify the value for the parameter that you want to change.

Returns

None.

See Also

[Chapter 14, "Crypt Class," FirstStep, page 722](#); [Chapter 14, "Crypt Class," GoToStep, page 723](#) and [Chapter 14, "Crypt Class," NextStep, page 724](#)

UpdateData

Syntax

`UpdateData(Data)`

Description

Use the `UpdateData` method to add data to the encryption chain. This method can be called multiple times after opening a profile to add data.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Data</i>	Specify the data you want to add to the encryption chain, as a string.

Returns

None.

Crypt Class Properties

This section describes the crypt class properties. The properties are described in alphabetical order.

Result

Description

After updating the encryption chain, the Result property contains the end result of the encryption chain. Once the result has been retrieved, it is no longer possible to update the object anymore.

This property is read-only.

Verified

Description

For algorithms that check a signature, the system sets the Verified property to true if the signature is valid, and false if the signature is invalid. For algorithms that do not check a signature, it always returns false.

This property is read-only.

Chapter 15

Document Classes

This chapter provides an overview of the document classes and discusses:

- Data type and scope of the document classes.
- Document classes built-in functions.
- Document class.
- DocumentKey class.
- Primitive class.
- Compound class.
- Collection class.

Understanding the Document Classes

A PeopleSoft document is a managed object that has two representations. The logical document depicts the document's structure. The physical document is the rendering of the document in a specific format—either in XML or as a relational record (or records).

PeopleCode provides document classes that contain built-in functions and methods that enable you to populate data into and retrieve data from logical documents. However, you should already have knowledge of the logical document structure in order to effectively write PeopleCode to work with a specific document.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Documents Technology, "Understanding PeopleSoft Documents Technology"

Data Type and Scope of the Document Classes

Every document class is its own data type—that is, documents are declared as the Document data type, primitive objects are declared as the Primitive type, and so on. For example:

```
Local Document &Doc;
```

The following are the data types of the document classes:

- Document
- DocumentKey
- Primitive
- Compound
- Collection

Document objects can only be instantiated from PeopleCode. These objects can be used anywhere you have PeopleCode—that is, in Component Interface PeopleCode, record field PeopleCode, Application Engine PeopleCode, and so on.

Document Classes Built-in Functions

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," CreateDocument

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," CreateDocumentKey

Document Class

This section provides an overview of the Document class and discusses:

- Document class methods.
- Document class properties.

The Document class provides the ability to manipulate a PeopleSoft document as a Document object.

Document Class Methods

In this section, the Document class methods are presented in alphabetical order.

GenXmlString

Syntax

GenXmlString([*validate*])

Description

Use this method to generate an XML string representing the logical document populated with data.

Note. The Generate button on the Document Tester page uses this method to generate a test XML document.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>validate</i>	Specifies a Boolean value indicating whether to validate the XML document before it is generated.

Returns

An XML string.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Documents Technology, "Testing Documents," Generating and Viewing Test Documents

GetDocumentKey

Syntax

GetDocumentKey()

Description

Use this method to generate the document keys for the document as a DocumentKey object.

Parameters

None.

Returns

A DocumentKey object.

Example

```
Local Document &Doc;  
  
&Doc = CreateDocument("Purchasing", "PurchaseOrder", "v1");  
&DocKey = &Doc.GetDocumentKey();
```

See Also

[Chapter 15, "Document Classes," DocumentKey Class, page 739](#)

GetElement

Syntax

GetElement(*ElementName*)

Description

Use this method to retrieve a document element by name. The object returned will be a Collection, Compound, or Primitive object.

Note. Use the object's `ElementType` property to determine which object type is returned.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ElementName</i>	Specifies the name of the document element as a string.

Returns

A Collection object, a Compound object, or a Primitive object.

Example

```
&Doc = CreateDocument(&DocKey);
&DocElem = &Doc.GetElement("BillTo");

Evaluate &DocElem.ElementType

When = %Document_Compound
    ...

When = %Document_Collection
    ...

When = %Document_Primitive
    ...

When-Other
    Error ...

End-Evaluate;
```

[Chapter 15, "Document Classes," ElementType, page 751](#)

[Chapter 15, "Document Classes," ElementType, page 743](#)

GetRowset

Syntax

GetRowset()

Description

Use this method to generate a standalone rowset for a relational-formatted document. The structure of the rowset matches the structure of the record mapped to the document. If the document is populated with data when GetRowset is called, then the rowset is populated with that data; otherwise, the rowset is empty.

Parameters

None.

Returns

A Rowset object.

Example

```
Local Document &Doc;  
Local Rowset &Doc_RS;  
  
&Doc = CreateDocument(&DocKey);  
&Doc_RS = &Doc.GetRowset();
```

See Also

[Chapter 15, "Document Classes," UpdateFromRowset, page 737](#)

[Chapter 36, "Rowset Class," page 2115](#)

GetSchema

Syntax

GetSchema()

Description

Use this method to generate the XML schema definition for the document.

Parameters

None.

Returns

A string containing the XML schema definition.

Example

```
Local Document &Doc;  
Local DocumentKey &DocKey;  
  
&DocKey = CreateDocumentKey("Purchasing", "PurchaseOrder", "v1");  
&Doc = CreateDocument(&DocKey);  
&str = &Doc.GetSchema();
```

ParseXmlFromFile

Syntax

ParseXmlFromFile(*file_name* [, *validate*])

Description

Use this method to generate a document from the XML schema definition provided in a file.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>file_name</i>	Specifies the name of the file as a string.
<i>validate</i>	Specifies a Boolean value indicating whether to validate the XML document as it is generated.

Returns

A Boolean value: True if a document (or a valid document) was generated, False otherwise.

See Also

[Chapter 15, "Document Classes," ParseXmlFromURL, page 735](#) and [Chapter 15, "Document Classes," ParseXmlString, page 736](#)

ParseXmlFromURL

Syntax

ParseXmlFromURL(*URL* [, *validate*])

Description

Use this method to generate a document from the XML schema definition provided at the specified URL.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>URL</i>	Specifies the URL as a string.
<i>validate</i>	Specifies a Boolean value indicating whether to validate the XML document as it is generated.

Returns

A Boolean value: True if a document (or a valid document) was generated, False otherwise.

See Also

[Chapter 15, "Document Classes," ParseXmlFromFile, page 735](#) and [Chapter 15, "Document Classes," ParseXmlString, page 736](#)

ParseXmlString

Syntax

```
ParseXmlString(XML_string [, validate])
```

Description

Use this method to generate a document from the XML schema definition provided as an XML string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>XML_string</i>	Specifies the XML as a string.
<i>validate</i>	Specifies a Boolean value indicating whether to validate the XML document as it is generated.

Returns

A Boolean value: True if a document (or a valid document) was generated, False otherwise.

See Also

[Chapter 15, "Document Classes," ParseXmlFromFile, page 735](#) and [Chapter 15, "Document Classes," ParseXmlFromURL, page 735](#)

UpdateFromRowset

Syntax

UpdateFromRowset(*&Doc_RS*)

Description

Use this method to update the document data with data from a stand-alone rowset.

Important! Any existing data in the document is erased and replaced by the data from the rowset.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Doc_RS</i>	Specifies the stand-alone rowset as a Rowset object.

Returns

A Boolean value: True if the update was successful, False otherwise.

See Also

[Chapter 15, "Document Classes," GetRowset, page 733](#)

[Chapter 36, "Rowset Class," page 2115](#)

ValidateData

Syntax

ValidateData()

Description

Use this method to validate the data in a document.

Parameters

None.

Returns

A Boolean value: True if the document data is valid, False otherwise.

Document Class Properties

In this section, the Document class properties are presented in alphabetical order.

DocumentElement

Description

Use this property to return the root element for this document as a Compound object.

This property is read-only.

Example

```
Local Document &Doc;  
Local DocumentKey &DocKey;  
Local Compound &Root  
  
/* Instantiate the Document object */  
&DocKey = CreateDocumentKey("Purchasing", "PurchaseOrder", "v1");  
&Doc = CreateDocument(&DocKey);  
  
&Root = &Doc.DocumentElement;
```

See Also

[Chapter 15, "Document Classes," Compound Class, page 748](#)

DocumentKey Class

This section provides an overview of the DocumentKey class and discusses:

- DocumentKey class methods.
- DocumentKey class properties.

The DocumentKey class provides the ability to pass a document's keys as a single object.

DocumentKey Class Methods

In this section, the DocumentKey class methods are presented in alphabetical order.

SetDocumentKey

Syntax

SetDocumentKey(*Package*, *DocumentName*, *Version*)

Description

Use this method to change the document keys for a DocumentKey object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Package</i>	Specifies a document package as a string.
<i>DocumentName</i>	Specifies the name of the document as a string. Note. The document name also becomes the root element name for the document.
<i>Version</i>	Specifies the document version as a string.

Returns

A Boolean value: True if the document keys were set successfully, False otherwise.

Example

```
Local Document &Doc;  
Local DocumentKey &DocKey;  
  
/* Instantiate the Document object */  
&DocKey = CreateDocumentKey("Purchasing", "PurchaseOrder", "v1");  
  
...  
  
&ret = &DocKey.SetDocumentKey("Purchasing", "PurchaseOrder", "v1.1");  
&Doc = CreateDocument(&DocKey);
```

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions,"
CreateDocumentKey

DocumentKey Class Properties

In this section, the DocumentKey class properties are presented in alphabetical order.

DocumentName

Description

Use this property to return the document name from the document keys as a string.

This property is read-only.

PackageName

Description

Use this property to return the package name from the document keys as a string.

This property is read-only.

Version

Description

Use this property to return the version from the document keys as a string.

This property is read-only.

Primitive Class

This section provides an overview of the Primitive class and discusses:

- Primitive class methods.
- Primitive class properties.

The Primitive class provides the ability to work with a primitive document element.

Primitive Class Methods

In this section, the Primitive class methods are presented in alphabetical order.

GetEnumName

Syntax

GetEnumName(*index*)

Description

Use this method to return the name of the enumerated value.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>index</i>	Specifies the index of the enumerated value.

Returns

A string representing the enumerated value.

See Also

[Chapter 15, "Document Classes," EnumCount, page 743](#)

GetParent

Syntax

GetParent ()

Description

Use this method to return the parent object of the primitive element.

Parameters

None.

Returns

A Collection object or a Compound object.

See Also

[Chapter 15, "Document Classes," Collection Class, page 753](#)

[Chapter 15, "Document Classes," Compound Class, page 748](#)

GetPath

Syntax

GetPath ()

Description

Use this method to return the absolute path to the primitive within the document's structure.

For example, for the Name primitive of the ShipTo compound of the PurchaseOrder document, GetPath would return the following absolute path:

PurchaseOrder/ShipTo/Name

Parameters

None.

Returns

A string representing the absolute path to the primitive.

Primitive Class Properties

In this section, the Primitive class properties are presented in alphabetical order.

ElementType

Description

Use this property to return the type of this document element as an integer constant: %Document_Primitive,

This property is read-only.

EnumCount

Description

Use this property to return the number of enumerated values for this primitive element as an integer.

This property is read-only.

See Also

[Chapter 15, "Document Classes," GetEnumerator, page 741](#)

IsChanged

Description

Use this property to return a Boolean value indicating whether the value of this primitive element has been changed.

This property is read-only.

See Also

[Chapter 15, "Document Classes," OrigValue, page 745](#) and [Chapter 15, "Document Classes," Value, page 747](#)

IsInitialized

Description

Use this property to return a Boolean value indicating whether this primitive element has an initial value.

This property is read-only.

See Also

[Chapter 15, "Document Classes," OrigValue, page 745](#) and [Chapter 15, "Document Classes," Value, page 747](#)

IsRequired

Description

Use this property return a Boolean value indicating whether this primitive element is required.

This property is read-only.

MaxDefinedDecimalLength

Description

Use this property to return the number of allowed spaces to the right of the decimal point as an integer.

Note. This property is available and valid for a decimal primitive type only.

This property is read-only.

See Also

[Chapter 15, "Document Classes," MaxDefinedLength, page 744](#) and [Chapter 15, "Document Classes," PrimitiveType, page 746](#)

MaxDefinedLength

Description

Use this property to return the length of the primitive element as an integer.

This property is read-only.

See Also

[Chapter 15, "Document Classes," MaxDefinedDecimalLength, page 744](#)

Name

Description

Use this property to return the name of this element as a string.

This property is read-only.

OrigValue

Description

Use this property to set or return the original value for this element as a string.

This property is read-write.

See Also

[Chapter 15, "Document Classes," IsChanged, page 743](#); [Chapter 15, "Document Classes," IsInitialized, page 744](#) and [Chapter 15, "Document Classes," Value, page 747](#)

PrimitiveSubType

Description

Use this property to return the subtype for this primitive element as an integer. Only certain primitive types have defined subtypes.

For the %Document_Integer primitive type, the values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
—	<i>none</i>	No subtype (default).
1	%DocumentSubType_NonNegInteger	Non-negative integer

For the %Document_String and %Document_Text primitive types, the values are:

Numeric Value	Constant Value	Description
—	<i>none</i>	No subtype (default).
1	%DocumentSubType_AnyURI	anyURI XML schema data type.
5	%DocumentSubType_gDay	gDay XML schema data type.
6	%DocumentSubType_gMonth	gMonth XML schema data type.
7	%DocumentSubType_gYear	gYear XML schema data type.
8	%DocumentSubType_gYearMonth	gYearMonth XML schema data type.
2	%DocumentSubType_NormString	Normalized string XML schema data type.
4	%DocumentSubType_QName	QName XML schema data type.
3	%DocumentSubType_Token	Token XML schema data type.

This property is read-only.

See Also

[Chapter 15, "Document Classes," PrimitiveType, page 746](#)

PrimitiveType

Description

Use this property to return the type for this primitive element as an integer. The values are:

Numeric Value	Constant Value	Description
11	%Document_Binary	Binary primitive type.
1	%Document_Boolean	Boolean primitive type.
2	%Document_Char	Character primitive type. The Character primitive type allows a single-character string only.
7	%Document_Date	Date primitive type.

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
9	%Document_DateTime	Date/Time primitive type.
6	%Document_Decimal	Decimal primitive type.
4	%Document_Integer	Integer primitive type. The Integer primitive type includes subtypes.
3	%Document_String	String primitive type. The String primitive type requires a length. The String primitive type also includes subtypes.
10	%Document_Text	Text primitive type. The Text primitive type is unbounded and does not require a length. The Text primitive type also includes subtypes.
8	%Document_Time	Time primitive type.

This property is read-only.

See Also

[Chapter 15, "Document Classes," PrimitiveSubType, page 745](#)

SequenceNumber

Description

Use this property to return the system-assigned sequence number for this element as an integer.

This property is read-only.

Value

Description

Use this property to set or return the value for this primitive element as a string.

This property is read-write.

See Also

[Chapter 15, "Document Classes," IsChanged, page 743](#); [Chapter 15, "Document Classes," IsInitialized, page 744](#) and [Chapter 15, "Document Classes," OrigValue, page 745](#)

Compound Class

This section provides an overview of the Compound class and discusses:

- Compound class methods.
- Compound class properties.

The Compound class provides the ability to work with a compound document element.

Compound Class Methods

In this section, the Compound class methods are presented in alphabetical order.

GetParent

Syntax

GetParent()

Description

Use this method to return the parent object of the compound element.

Parameters

None.

Returns

A Collection object or a Compound object.

See Also

[Chapter 15, "Document Classes," Collection Class, page 753](#)

[Chapter 15, "Document Classes," Compound Class, page 748](#)

GetPath

Syntax

GetPath()

Description

Use this method to return the absolute path to the compound element within the document's structure.

For example, for the Items compound of the PuchaseOrder document, GetPath would return the following absolute path:

PurchaseOrder/Item_Collection/Items

Parameters

None.

Returns

A string representing the absolute path to the compound element.

GetPropertyByIndex

Syntax

GetPropertyByIndex(*index*)

Description

Use this method to return a property of the compound element as an object.

Parameters

None.

<i>Parameter</i>	<i>Description</i>
<i>index</i>	Specifies the index number of the property as an integer.

Returns

A Collection object, a Compound object, or a Primitive object.

See Also

[Chapter 15, "Document Classes," GetPropertyByName, page 750](#) and [Chapter 15, "Document Classes," PropertyCount, page 752](#)

[Chapter 15, "Document Classes," Collection Class, page 753](#)

[Chapter 15, "Document Classes," Compound Class, page 748](#)

[Chapter 15, "Document Classes," Primitive Class, page 741](#)

GetPropertyByName

Syntax

GetPropertyByName(*prop_name*)

Description

Use this method to return a property of the compound element as an object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>prop_name</i>	Specifies the name of the property as a string.

Returns

A Collection object, a Compound object, or a Primitive object.

See Also

[Chapter 15, "Document Classes," GetPropertyByIndex, page 749](#)

[Chapter 15, "Document Classes," Collection Class, page 753](#)

[Chapter 15, "Document Classes," Compound Class, page 748](#)

[Chapter 15, "Document Classes," Primitive Class, page 741](#)

GetUniqueKey

Syntax

`GetUniqueKey()`

Description

Use this method to return the key information for this compound—that is, the package name, document name, and document version.

Parameters

None.

Returns

An array of string with three elements: package name, document name, and document version.

Compound Class Properties

In this section, the Compound class properties are presented in alphabetical order.

ElementType

Description

Use this property to return the type of this document element as an integer constant: `%Document_Compound`.

This property is read-only.

IsChanged

Description

Use this property to return a Boolean value indicating whether this compound element has been changed.

This property is read-only.

IsInitialized

Description

Use this property to return a Boolean value indicating whether this compound element included initial data when the document was loaded from the XML source.

This property is read-only.

IsRequired

Description

Use this property return a Boolean value indicating whether this compound element is required.

This property is read-only.

Name

Description

Use this property to return the name of this element as a string.

This property is read-only.

PropertyCount

Description

Use this property to return the number of existing properties for this compound element as an integer.

This property is read-only.

See Also

[Chapter 15, "Document Classes," GetPropertyByIndex, page 749](#)

SequenceNumber

Description

Use this property to return the system-assigned sequence number for this element as an integer.

This property is read-only.

Collection Class

This section provides an overview of the Collection class and discusses:

- Collection class methods.
- Collection class properties.

The Collection class provides the ability to work with a collection document element.

Collection Class Methods

In this section, the Collection class methods are presented in alphabetical order.

AppendItem

Syntax

AppendItem(*&Elem*)

Description

Use this method to append an element as the last element of the collection. The item must be instantiated first by using the CreateItem method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Elem</i>	Specifies the element to be appended as an object: a Collection object, a Compound object, or a Primitive object.

Returns

A Boolean value: True if the append was completed successfully, False otherwise.

Example

The following example demonstrates how to use Collection and Compound methods to create, populate, and append a compound item within a collection:

```
Local DocumentKey &DOCKEY;  
Local Document &DOC;  
Local Compound &COM, &Com_Rdr;  
Local Collection &Coll_Rdr;  
Local Primitive &PRIM;  
  
&DOCKEY = CreateDocumentKey("FlightStatus", "FlightData", "v1");  
&DOC = CreateDocument(&DOCKEY);  
  
&COM = &DOC.DocumentElement;  
  
&Coll_Rdr = &COM.GetPropertyByName("RdrCollection");  
  
&Com_Rdr = &Coll_Rdr.CreateItem();  
  
&PRIM = &Com_Rdr.GetPropertyByName("QE_ACNUMBER");  
&PRIM.Value = 105;  
&PRIM = &Com_Rdr.GetPropertyByName("QE_AZIMUTH");  
&PRIM.Value = "40";  
&PRIM = &Com_Rdr.GetPropertyByIndex(3);  
&PRIM.Value = "4B";  
  
&nRet = &Coll_Rdr.AppendItem(&Com_Rdr);
```

See Also

[Chapter 15, "Document Classes," CreateItem, page 754](#) and [Chapter 15, "Document Classes," CollectionElementType, page 758](#)

CreateItem

Syntax

CreateItem()

Description

Use this method to instantiate an empty object for this collection as defined by the `CollectionElementType` property.

Parameters

None.

Returns

A Collection object, a Compound object, or a Primitive object as defined by the `CollectionElementType` property.

See Also

[Chapter 15, "Document Classes," AppendItem, page 753](#); [Chapter 15, "Document Classes," InsertItem, page 757](#) and [Chapter 15, "Document Classes," CollectionElementType, page 758](#)

DeleteItem

Syntax

DeleteItem(*index*)

Description

Use this method to delete the specified element from the collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>index</i>	Specifies the sequence number of the element to be deleted as an integer.

Returns

A Boolean value: True if the delete was successful, False otherwise.

GetItem

Syntax

GetItem(*index*)

Description

Use this method to return the specified element from the collection.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>index</i>	Specifies the sequence number of the element to be retrieved as an integer.

Returns

A Collection object, a Compound object, or a Primitive object as defined by the `CollectionElementType` property.

See Also

[Chapter 15, "Document Classes," CollectionElementType, page 758](#)

GetParent

Syntax

GetParent()

Description

Use this method to return the parent object of the collection element.

Parameters

None.

Returns

A Collection object or a Compound object.

See Also

[Chapter 15, "Document Classes," Collection Class, page 753](#)

[Chapter 15, "Document Classes," Compound Class, page 748](#)

GetPath

Syntax

GetPath()

Description

Use this method to return the absolute path to the collection element within the document's structure.

For example, for the Item_Collection collection of the PurchaseOrder document, GetPath would return the following absolute path:

PurchaseOrder/Item_Collection

Parameters

None.

Returns

A string representing the absolute path to the collection element.

InsertItem

Syntax

InsertItem(&Elem, index)

Description

Use this method to insert an element at the specified location in the collection. The item must be instantiated first by using the CreateItem method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Elem</i>	Specifies the element to be inserted as an object: a Collection object, a Compound object, or a Primitive object.
<i>index</i>	Specifies the sequence number for the element to be inserted as an integer.

Returns

A Boolean value : True if the insertion was completed successfully, False otherwise.

Example

For example, for a collection with four items (a, b, c, d), the following call to insert item f would result in a collection with five items (a, f, b, c, d):

```
&ret = &Coll.InsertItem(&f, 2);
```

Collection Class Properties

In this section, the Collection class properties are presented in alphabetical order.

CollectionElementType

Description

Use this property to return the element type for the collection items as an integer constant. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
2	%Document_Collection	A Collection object.
1	%Document_Compound	A compound object.
0	%Document_Primitive	A primitive object.

This property is read-only.

Count

Description

Use this property to return the count of items in the collection as an integer.

This property is read-only.

DefinedMaxOccurs

Description

Use this property to return an integer indicating the maximum number of items in the collection. The integer constant `%Document_OccursUnbounded` indicates that there is no maximum.

This property is read-only.

DefinedMinOccurs

Description

Use this property to return an integer indicating the minimum number of items in the collection.

This property is read-only.

ElementType

Description

Use this property to return the type of this document element as an integer constant: `%Document_Collection`.

This property is read-only.

IsChanged

Description

Use this property to return a Boolean value indicating whether this collection element has been changed.

This property is read-only.

IsInitialized

Description

Use this property to return a Boolean value indicating whether this collection included initial data when the document was loaded from the XML source.

This property is read-only.

IsRequired

Description

Use this property return a Boolean value indicating whether this collection element is required.

This property is read-only.

Name

Description

Use this property to return the name of this element as a string.

This property is read-only.

SequenceNumber

Description

Use this property to return the system-assigned sequence number for this element as an integer.

This property is read-only.

Chapter 16

Exception Class

This chapter provides an overview of Exception class and discusses the following topics:

- How exceptions are thrown.
- When to use exceptions.
- Try-Catch sections.
- Data Type for Exception class objects.
- Scope of Exception class objects.
- Exception class built-in function and language constructs.
- Exception class methods.
- Exception class properties.

Understanding Exception Class

An *exception* can be defined as any unusual event that requires special handling in your PeopleCode program. This could include some kind of hardware failure, such as trying to write to a printer that's been turned off, or a software failure, such as trying to divide by zero. You can also detect your own errors, and use the Throw statement to construct an exception.

Exception handling is the processing you initiate when an exception occurs. You can handle errors in PeopleCode using the Catch statement. The places in your code where you want exceptions handled must be enclosed by the Try and End-Try statements.

The Exception class encapsulates exceptional runtime conditions. It can be used with most PeopleCode programs.

Note. The Exception class does *not* work with any of the PeopleSoft APIs, that is, the classes whose objects are declared as type ApiObject. This includes the Tree classes, the Query classes, Search classes, and so on.

The process of error handling can be broken down as follows:

- An error occurs (either a hardware or software error).
- The error is detected and an exception is thrown (either by the system or by your program).
- Your exception handler provides the response.

How Exceptions Are Thrown

Exceptions get thrown either by the runtime system or by your program.

In general, the kinds of errors that cause the runtime system to throw an exception are errors that terminate your PeopleCode program. For example, dividing by zero, referencing a method or property that doesn't exist, or trying to use a method or property on a null object.

To throw your own exceptions, you can use the Throw statement.

When to Use Exceptions

If the error is something that you can easily check, you shouldn't use exceptions. For example, suppose your page had begin and end date fields. In your SavePreChange PeopleCode program, you would want to check to verify that the end date was after the begin date. This kind of error produces incorrect data. It doesn't terminate your PeopleCode program. This is a simple check, one that you don't need to throw an exception for.

Errors that you might want to use exceptions for are the kinds that you are going to check for often. If you do not want to catch a specific exception, but any general exception, then a simple try-catch block is all that is required. Just write code to catch the general Exception object. For example:

```
try
    &RETCODE = GetAttachment(&IB_ATTACH_REC, &SOURCEFILENAME, &SOURCEFILENAME, "PS_⇒
FILEDIR");
catch Exception &err
    &RETCODE = GetAttachment(&IB_ATTACH_REC, &SOURCEFILENAME, "/files/" |⇒
&SOURCEFILENAME, "PS_SERVDIR");
end-try;
```

However, it might make more sense to have a single exception class for that kind of error, so you'd only have to write your error handling code once. For example, suppose that a function you called was supposed to return an array object that you'd then manipulate using the array class methods and properties. When the function fails and doesn't return an array object, you can either check for null, or check for an exception (as this kind of error terminates your PeopleCode program). If you must often check for nulls, perhaps instead of constantly checking, you could rely on the runtime system throwing exceptions for you.

The following provides a pseudo-code example:

```

import MYAPP:Exception;
/* This subpackage contains all the exception classes for your app */

try
    &MyArray = GetArrayData(&Param1, &Param2, &Param3);
    /* Code to manipulate &MyArray here */

catch ExceptionNull &Ex1
    if &Ex1.MessageSetNumber = 2
        and &Ex1.MessageNumber = 236 Then

        /* This is the message set and message number for &MyArray being Null */

        /* do data error handling */

    end-if;
end-try;

```

Considerations Using Exceptions and Transfer Functions

Using functions that transfer the end user to a new component, such as the DoModal, DoModalComponent, or Transfer functions (in some cases) inside a try block do *not* catch PeopleCode exceptions thrown in the new component. Starting a new component starts a brand new PeopleCode evaluation context. Catches are only caught for exceptions thrown within the *current* component.

In the following code example, the catch statement only catches exceptions thrown in the code *prior to* using the DoModal function, but not any exceptions that are thrown within the new component.

```

/* Set up transaction */
If %CompIntfcName = "" Then
    try
        &oTrans = &g_ERMS_TransactionCollection.GetTransactionByName(RB_EM_⇒
WRK.DESCR);
        &sSearchPage = &oTrans.SearchPage;
        &sSearchRecord = &oTrans.SearchRecord;
        &sSearchTitle = &oTrans.GetSearchPageTitle();
        If Not All(&sSearchPage, &sSearchRecord, &sSearchTitle) Then
            Error (MsgGetText(17834, 8081, "Message Not Found"));
        End-If;
        &c_ERMS_SearchTransaction = &oTrans;

        /* Attempt to transfer to hidden search page with configurable filter */
        &nModalReturn = DoModal(@("Page." | &sSearchPage), &sSearchTitle, - 1, - 1);
    catch Exception &e
        Error (MsgGetText(17834, 8082, "Message Not Found"));
    end-try;

```

Try-Catch Sections

The statements that immediately follow the Try statement are called the *protected statements*. These are the only statements that are 'protected' by the catch clauses in the Try-Catch statements. The catch clauses in a Try-Catch statement can be executed only if an exception is thrown by the protected statements. In addition, a catch clause is executed only when handling an exception that matches the type given on the catch. Any exceptions thrown by the catch clauses are not caught by their own Try-Catch statement.

The execution of the Try-Catch statement starts by executing the protected statements. If none of these statements, as well as none of the statements called by them, causes an exception to be thrown, the try-catch is done. The statements in the catch clauses are not executed.

Each catch clause in the Try-Catch section declares a local variable of class Exception or a subclass of Exception. A catch clause local variable has the same scope and lifetime as a local variable declared at the start of the catch clause.

The following is the general order of exception execution and handling in the Try-Catch statements.

1. The exception is thrown.
2. The exception is considered by the first enclosing Try-Catch statement.

Try-catch statements can be nested.

This is a dynamic enclosure, that is, tracking back through method and function callers. Any intervening non-Try-Catch statements are skipped.

3. Within this Try-Catch statement, the catch clauses are considered in program text order, that is, first the first catch clause is considered, then the next, and so on to the last. At each consideration, the type (class) of the exception being thrown is compared to the type of the local variable declared by the Catch clause. If the exception being thrown is the same as the Catch type, or is a subtype of it (so the exception could be assigned to the Catch's local variable) the Catch clause matches the exception being thrown.
4. If a matching catch clause is found, that catch clause handles the exception. The exception is considered 'caught', which means that it does not propagate further. Execution proceeds by assigning the thrown object to the catch clause's local variable and executing the statements in the catch clause. When one of the catch clauses handles the exception, (and the statements in the catch clause don't throw any further exceptions), execution continues normally after the Try-Catch statement.

If a statement in the catch clause throws another exception, that exception begins to propagate from the point of the throw.

5. If a matching catch clause is not found, that is, if no catch clauses can accept the thrown object, then the thrown object is still uncaught. The thrown object is considered by the next dynamically enclosing Try-Catch statement (return to step 3).
6. If a thrown object is not caught by any catch clause in any dynamically enclosing Try-Catch statements, a fatal PeopleCode evaluation error is produced.

Data Type for Exception Class Objects

Exception Class objects are declared as type `Exception`. For example:

```
Local Exception &Ex1;
```

Scope of Exception Class Objects

Exception objects can be instantiated only from `PeopleCode`. This object can be used anywhere you have `PeopleCode`, that is, in an application class, Component Interface `PeopleCode`, record field `PeopleCode`, and so on.

Exception Class Built-in Functions

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," `CreateException`

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," `Throw`

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," `Try`

Exception Class Methods

In this section, we discuss the `Exception` class methods, in alphabetical order.

GetSubstitution

Syntax

```
GetSubstitution(Index)
```

Description

When you create a message in the message catalog, you can specify values in the message text, such as %1, %2, and so on, that are replaced with values by the system at runtime. The value that gets put into the message text value is called the *substitution string*. The `GetSubstitution` method returns the substitution string in the error message specified by *Index*, with 1 being the first substitution string, 2 being the second, and so on.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the substitution string number that you'd like to return. The first one is 1, the second is 2, and so on. You must specify a valid substitution string number, that is, you can't specify a 4 if there are only three substitution strings.

Returns

The substitution text as a string.

Example

```
If &Ex1.MessageSetNumber = 2 and &Ex1.MessageNumber = 170 Then
    /* Get Sendmail error */
    &String = &Ex1.GetSubstitution(1);
    /* do processing according to type of Sendmail error */
    . . .
End-if;
```

See Also

[Chapter 16, "Exception Class," SetSubstitution, page 767](#)

PeopleTools 8.51 PeopleBook: System and Server Administration, "Using PeopleTools Utilities," Message Catalog

Output

Syntax

Output()

Description

Use the Output method if you want to display the message associated with the exception to the user (in an online context), or have it logged (if offline). This is analogous to using the MessageBox function to log a message.

Parameters

None.

Returns

If called in an online context, display the message associated with the exception to the user. If called offline, record the exception for later display or analysis.

Example

```
catch Except2 &Ex2
    &Ex2.Output(); /* tell about it */
```

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," Throw

SetSubstitution

Syntax

SetSubstitution(*Index*, *String*)

Description

When you create a message in the message catalog, you can specify values in the message text, such as %1, %2, and so on, that are replaced with values by the system at runtime. The value that gets put into the message text value is called the *substitution string*. The SetSubstitution method sets the substitution string in the error message specified by *Index*, with 1 being the first substitution string, 2 being the second, and so on.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the substitution string number that you'd like to replace. The first one is 1, the second is 2, and so on. You must specify a valid substitution string number, that is, you can't specify a 4 if there are only three substitution strings.
<i>String</i>	Specify the text of the substitution string.

Returns

None.

See Also

[Chapter 16, "Exception Class," GetSubstitution, page 765](#)

PeopleTools 8.51 PeopleBook: System and Server Administration, "Using PeopleTools Utilities," Message Catalog

ToString

Syntax

ToString([*AddContext*])

Description

The ToString method returns the expanded message text associated with the exception in the current user's current language. The string returned is the message text (in the current user's language) with the substitution string replacing the substitution markers (%1 and so on) in the text. It always returns the context information about where the error occurred at the end of the message. To suppress this, specify *AddContext* as false.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>AddContext</i>	Specify whether to have the context information about where the error occurred added at the end of the message. This parameter takes a Boolean value. The default is true, that is, to add the context information.

Returns

A string.

See Also

[Chapter 16, "Exception Class," Output, page 766](#)

Exception Class Properties

In this section, we discuss the Exception class properties, in alphabetical order.

Context

Description

This property returns a string description of the location of the condition in PeopleCode or other processing. This might contain a stack backtrace at the point of the exceptional condition.

This property is read-only.

Example

This is the "At" part of the error message display. For example, for an exception thrown in Record.Field Event QE_31DIGREC1.QE_31DIGFLD5 FieldChange function EachComp at PeopleCode program counter 671, statement 11 of the source program, the Context would be:

```
At QE_31DIGREC1.QE_31DIGFLD5.FieldChange EachComp   PCPC:671   Statement:11
```

DefaultText

Description

This property sets a string to use as the basic message text for the exception when the message can't be found in the message catalog.

This property is read-write.

MessageNumber

Description

This property is the message number for a message describing the exceptional condition.

This property is read-only.

MessageSetNumber

Description

This property is the message set number for a message describing the exceptional condition.

This property is read-only.

MessageSeverity

Description

This property is the message severity as a string for a message describing the exceptional condition. The message severity is set for the message when it's created in the message catalog. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
C	%MsgSeverity_Cancel	Message severity is Cancel.
E	%MsgSeverity_Error	Message severity is Error.
M	%MsgSeverity_Message	Message severity is Message.
W	%MsgSeverity_Warning	Message severity is Warning.

This property is read-only.

StackTrace

Description

This property returns a string with the complete stack trace. This includes the whole context, (that is, current location + called from X + called from. . .)

You can process the returned string by breaking it into pieces using the Split function, and using "Called from" as the value to use for separating the string. For example,

```
Local Array of String &Pieces;

/* get exception */

&Pieces = Split(&E.StackTrace, "Called from:");
```

This property is read-only.

Example

The following is an example of a trace stack.

```
In C (0,0) AEMINITEST.MAIN.GBL.default.1900-01-01.Step02.OnExecute Name:C PCPC
:136 Statement:2
Called from:AEMINITEST.MAIN.GBL.default.1900-01-01.Step02.OnExecute Name:B Sta
tament:6
Called from:AEMINITEST.MAIN.GBL.default.1900-01-01.Step02.OnExecute Name:A Sta
tament:13
Called from:AEMINITEST.MAIN.GBL.default.1900-01-01.Step02.OnExecute Statement:1
8
```

SubstitutionCount

Description

This property returns the number of substitution strings in the message text as a number.

The number of substitutions comes from the *subslst* of the CreateException function.

This property is read-only.

Chapter 17

Feed Classes

This chapter provides an overview of the feed classes and discusses:

- Importing feed classes
- Feed class
- FeedFactory class
- DataSource class
- DataSourceParameter class
- DataSourceParameterValue class
- DataSourceSetting class
- Utility class
- FeedDoc class
- FeedEntry class

Understanding the Feed Classes

This chapter documents the following feed classes from the PTFP_FEED application package:

- Feed class
- FeedFactory class
- DataSource subpackage:
 - DataSource class
 - DataSourceParameter class
 - DataSourceParameterValue class
 - DataSourceSetting class
- UTILITY subpackage: Utility class

- XML_FEED subpackage
 - FeedDoc class
 - FeedEntry class

The subpackages and classes not documented in this chapter include:

- DataSource subpackage:
 - FeedDataSource
 - GenericDataSource
 - PSQueryDataSource
 - WorklistDataSource
- EXCEPTION subpackage:
 - DuplicateIDException class
 - FeedException class
 - ImmutableException class
 - InitializationException class
 - InvalidMethodException class
 - InvalidTypeException class
 - InvalidValueException class
 - NotAllowedException class
 - NotFoundException class
 - PrivilegeException class
 - PropertyNotSetException class
- Interface subpackage:
 - IGetFeed class
 - IGetFeedList class
 - IGetPrePubFeed class

- UTILITY subpackage
 - Attribute class
 - Authorization class
 - Collection class
 - FeedRequest class
 - HoverMenu class
 - IBOperation class
 - Link class
 - PSComponent class
 - PublishAsRequest class
 - RelatedFeedsRequest class
 - SearchRequest class
- XML_ATOM10 subpackage
 - A10_FeedDoc class
 - A10_FeedEntry class
- XML_OPML subpackage
 - OPMLDoc class
 - OPMLEntry class
 - OPMLFolder class

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker

Importing Feed Classes

The feed classes are application classes, not built-in classes, like Rowset, Field, Record, and so on. Before you can use these classes in your PeopleCode program, you must import them into your program.

An import statement either names a particular application class or imports all the classes in a package.

Using the asterisks after the package name makes all the application classes directly contained in the named package available. Application classes contained in subpackages of the named package are not made available.

Feed Class

This section provides an overview of the Feed class and discusses:

- Feed class constructor.
- Feed class methods.
- Feed class properties.

The Feed class provides the object representation of a feed. The class provides all the basic services for the feed definition and execution of a feed.

Feed Class Constructor

This section presents the constructor for the Feed class. Use the FeedFactory class to create an instance of the Feed class.

Feed

Example

```
import PTFP_FEED:FeedFactory;  
import PTFP_FEED:Feed;
```

```
Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();  
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.createFeed("feed_ID");
```

See Also

[Chapter 17, "Feed Classes," createFeed, page 801](#)

[Chapter 6, "Application Classes," Constructors, page 204](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

Feed Class Methods

In this section, the Feed class methods are presented in alphabetical order.

delete

Syntax

delete()

Description

Use this method to delete a feed definition from the database.

Parameters

None.

Returns

A Boolean value: True if the deletion was successful, False otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;

Local boolean &succeed;
Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DELETION);

If &thisFeed <> Null And
    &thisFeed.Authorized Then
    &succeed = &thisFeed.delete();
End-If;
```

See Also

[Chapter 17, "Feed Classes," deleteFeed, page 802](#)

equals

Syntax

equals(&Object)

Description

Use this method to evaluate the equivalency of an object with the current feed. Equivalency is established based on the value of two properties: the object's ID and the ObjectType.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Object</i>	Specifies the object to be compared to the current Feed object.

Returns

A Boolean value: True if the items are equivalent, False otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed1 = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);
Local PTFP_FEED:Feed &thisFeed2 = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);

If &thisFeed1.equals(&thisFeed2) Then
    /* Do some process */
End-If;
```

See Also

[Chapter 17, "Feed Classes," ID, page 795](#) and [Chapter 17, "Feed Classes," ObjectType, page 796](#)

execute

Syntax

```
execute()
```

Description

Use this method to execute the current feed definition to get a FeedDoc object.

Parameters

None.

Returns

A FeedDoc object.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;
import PTFP_FEED:XML_FEED:FeedDoc;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_EXECUTION);
Local PTFP_FEED:XML_FEED:FeedDoc &thisFeedDoc;

If &thisFeed <> Null Then
    &thisFeed.populatePrefData( Null);
    &thisFeedDoc = &thisFeed.execute();
End-If;
```

See Also

[Chapter 17, "Feed Classes," getFeedDoc, page 809](#)

[Chapter 17, "Feed Classes," FeedDoc Class, page 902](#)

getAttribute

Syntax

getAttribute(*attribute_ID*)

Description

Use this method to get a feed attribute by ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>attribute_ID</i>	Specifies the ID of the Attribute object as a string.

Returns

A feed Attribute object.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;
import PTFP_FEED:UTILITY:Attribute;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);
Local PTFP_FEED:UTILITY:Attribute &logo;

If &thisFeed <> Null Then
    &logo = &thisFeed.getAttribute(&thisFeedFactory.Utility.FEEDATTRIBUTE_LOGOURL);
End-If;
```

load

Syntax

```
load( )
```

Description

Use this method to load the feed definition from the database.

Parameters

None.

Returns

A Boolean value: True if the feed definition was loaded successfully, False otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);

If &thisFeed <> Null Then
    &succeed = &thisFeed.load();
End-If;
```

populatePrefData

Syntax

populatePrefData(*&FeedRequest*)

Description

Use this method to populate the administrator- or user-specified data source parameter values from the feed definition or from the feed request if parameters are specified there.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&FeedRequest</i>	Specifies a FeedRequest object.

Returns

None.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;
import PTFP_FEED:XML_FEED:FeedDoc;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_EXECUTION);
Local PTFP_FEED:XML_FEED:FeedDoc &thisFeedDoc;

If &thisFeed <> Null Then
    &thisFeed.populatePrefData( Null);
    &thisFeedDoc = &thisFeed.execute();
End-If;
```

publishToSites

Syntax

publishToSites(*Sites*)

Description

Use this method to publish the feed definition to the specified sites.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Sites</i>	Specifies as an array of string the list of sites to which to publish the feed definition.

Returns

None.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);

If &thisFeed <> Null Then
    &thisFeed.publishToSites(CreateArray("EMPLOYEE", "CUSTOMER"));
End-If;
```

resetFeedAttributes

Syntax

```
resetFeedAttributes()
```

Description

Use this method to reset the FeedAttributes collection.

Parameters

None.

Returns

An empty FeedAttributes collection.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;
import PTFP_FEED:UTILITY:Collection;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);
Local PTFP_FEED:UTILITY:Collection &coll;

If &thisFeed <> Null Then
    &coll = &thisFeed.resetFeedAttributes();
End-If;
```

See Also

[Chapter 17, "Feed Classes," FeedAttributes, page 791](#)

resetFeedSecurities**Syntax**

```
resetFeedSecurities()
```

Description

Use this method to reset the FeedSecurities collection.

Parameters

None.

Returns

An empty FeedSecurities collection.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;
import PTFP_FEED:UTILITY:Collection;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);
Local PTFP_FEED:UTILITY:Collection &coll;

If &thisFeed <> Null Then
    &coll = &thisFeed.resetFeedSecurities();
End-If;
```

See Also

[Chapter 17, "Feed Classes," FeedSecurities, page 793](#)

save

Syntax

save()

Description

Use this method to save the feed definition to the database.

Parameters

None.

Returns

A Boolean value: True if the save was successful, False otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;
import PTFP_FEED:UTILITY:Attribute;

Local boolean &succeed;
Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);
Local PTFP_FEED:UTILITY:Attribute &logo;

If &thisFeed <> Null Then
    &logo = &thisFeed.setAttribute(&thisFeedFactory.Utility.>
FEEDATTRIBUTE_LOGOURL, "", "http://myserver.com/logo.jpg");
    &succeed = &thisFeed.save();
End-If;
```

saveAs

Syntax

saveAs(*new_ID*, *CopyPrefData*)

Description

Use this method to save the feed definition to the database using the given new ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>new_ID</i>	Specifies the new feed ID as a string.
<i>CopyPrefData</i>	Specifies as a Boolean value whether to copy administrator and user personalization data.

Returns

A new Feed object.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;

Local boolean &succeed;
Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);
Local PTFP_FEED:Feed &newFeed;

If &thisFeed <> Null Then
    &newFeed = &thisFeed.saveAs("new_feed_id", True);
End-If;
```

setAttribute

Syntax

setAttribute(*attribute_ID*, *Value*, *XML*)

Description

Use this method to set the properties of a feed attribute. If the attribute ID does not exist, then a new attribute is created. If both *Value* and *XML* are empty, the attribute is deleted.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>attribute_ID</i>	Specifies the ID of the attribute as a string.

<i>Parameter</i>	<i>Description</i>
<i>Value</i>	Specifies the value of the attribute as a string. Use <i>Value</i> for translatable values such as the copyright and so on.
<i>XML</i>	Specifies the XML value of the attribute as a string. Use <i>XML</i> for nontranslatable values or values longer than 254 characters such as a URL.

Returns

An Attribute object.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;
import PTFP_FEED:UTILITY:Attribute;

Local boolean &succeed;
Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);
Local PTFP_FEED:UTILITY:Attribute &logo;

If &thisFeed <> Null Then
    &logo = &thisFeed.setAttribute(&thisFeedFactory.Utility.>
FEEDATTRIBUTE_LOGOURL, "", "http://myserver.com/logo.jpg");
    &succeed = &thisFeed.save();
End-If;
```

setDataSourceById

Syntax

```
setDataSourceById(DataType_ID)
```

Description

Use this method to set the data source for the Feed object by data type ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DataType_ID</i>	Specifies the data type ID to set as the data source.

Returns

A DataSource object if successful, null otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;
import PTFP_FEED:DataSource:DataSource;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.createFeed("feed_ID");
Local PTFP_FEED:DataSource:DataSource &thisDS;

&thisDS = &thisFeed.setDataSourceByID("FEED");
```

See Also

[Chapter 17, "Feed Classes," DataSource Class, page 815](#)

unpublishFromSites

Syntax

```
unpublishFromSites(Sites)
```

Description

Use this method to remove the published feed definition from the specified sites.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Sites</i>	Specifies as an array of string the list of sites from which the feed definition is to be removed.

Returns

None.

Example

```

import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);

If &thisFeed <> Null Then
    &thisFeed.unpublishFromSites(CreateArray("EMPLOYEE", "CUSTOMER"));
End-If;

```

Feed Class Properties

In this section, the Feed class properties are presented in alphabetical order.

Authorized

Description

This property returns a Boolean value indicating whether the current user is authorized to view the feed definition.

This property is read-only.

Example

```

import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;

Local boolean &succeed;
Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DELETION);

If &thisFeed <> Null And
    &thisFeed.Authorized Then
    &succeed = &thisFeed.delete();
End-If;

```

CategoryID

Description

Use this property to set or return the category ID for the feed definition as a string.

This property is read-write.

CreateDTTM

Description

This property returns the date and time the feed definition was created as a datetime value.

This property is read-only.

CreateNode

Description

Use this property to set or return the node on which the feed definition was created, as a string.

This property is read-write.

CreateOprID

Description

This property returns user ID of the user who created the feed definition, as a string.

This property is read-only.

CreatePortal

Description

Use this property to set or return the portal on which the feed definition was created, as a string.

This property is read-write.

DataSource

Description

Use this property to set or return a DataSource object for the feed definition.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," DataSource Class, page 815](#)

DataTypeID

Description

This property returns the data type ID for the feed definition's data source, as a string.

This property is read-only.

Description

Description

Use this property to set or return the description of the feed definition as a string.

This property is read-write.

FeedAttributes

Description

Use this property to set or return a FeedAttributes collection.

This property is read-write.

FeedAuthorizationOprID

Description

Use this property to set or return the user ID to be used to execute the Feed object, as a string. This value overrides the current user ID depending on the authorization type.

This property is read-write.

FeedAuthorizationOprPWD

Description

Use this property to set or return the password to be used to execute the Feed object, as a string. This value overrides the password for the current user ID depending on the authorization type.

This property is read-write.

FeedAuthorizationType

Description

Use this property to set or return the authorization type to be used to execute the Feed object, as a string. This value overrides the current authorization type. The values are:

<i>Value</i>	<i>Description</i>
&utility.FEEDAUTHTYPE_DEFAULT	The current authenticated user is used to execute the Feed object.
&utility.FEEDAUTHTYPE_ANONYMOUS	The specified user is used to execute the Feed object for anonymous requests.
&utility.FEEDAUTHTYPE_ALL	The specified user is used to execute the Feed object for all requests.

This property is read-write.

FeedCacheTime

Description

This property is not used currently.

This property is read-write.

FeedCacheType

Description

This property is not used currently.

This property is read-write.

FeedContentUrl

Description

This property returns a string representing the content URL to open the content page of the feed.

This property is read-only.

FeedFactory

Description

Use this property to set or return the FeedFactory object used by this Feed object.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," FeedFactory Class, page 798](#)

FeedFormat

Description

Use this property to set or return the feed format as a string. The values are:

<i>Value</i>	<i>Description</i>
&utility.FEEDFORMAT_ATOM 10	Specifies the Atom 1.0 format.

This property is read-write.

FeedSecurities

Description

Use this property to set or return a FeedSecurities collection.

This property is read-write.

FeedSecurityType

Description

Use this property to set or return the security type for the feed as a string. The values are

<i>Value</i>	<i>Description</i>
&utility.FEEDSECUTYPE_PUBLIC	Specifies public access to the feed.
&utility.FEEDSECUTYPE_SELECTED	Specifies role or permission list based access to the feed. The role or permission list is stored with the feed definition
&utility.FEEDSECUTYPE_REALTIME	Specifies real-time security in which the DataSource object is used to validate user access when the feed is requested.

This property is read-write.

FeedUrl

Description

This property returns a string representing the feed URL to open the feed document.

This property is read-only.

HasAdminParams

Description

This property returns a Boolean value indicating whether the feed definition has administrator-specified data source parameters.

This property is read-only.

HasUserParams

Description

This property returns a Boolean value indicating whether the feed definition has user-specified data source parameters.

This property is read-only.

IBOperationName

Description

Use this property to set or return a string representing the Integration Broker service operation name that handles requests for this feed.

This property is read-write.

ID

Description

This property returns the ID for the feed definition as a string.

This property is read-only.

LastPubDTTM

Description

This property returns the datetime value at which the data source's execute method was called to publish feed messages to the Integration Broker queues—that is, the last publication date and time for the feed. The initial value for this property is set to 01-01-1900 12:00AM.

This property is not valid for real-time feeds or for scheduled, generic Integration Broker feeds. It is updated for all other types of scheduled feeds.

This property is read-only.

LastUpdDTTM

Description

This property returns the last update date and time for the feed definition, as a datetime value.

This property is read-only.

LastUpdOprID

Description

This property returns the user ID of the user to have last updated the feed definition, as string.

This property is read-only.

NameSpaceID

Description

Use this property to set or return the name space ID for the feed definition, as a string. The default name space ID is based on the feed ID as follows: *PTFP_node_name_feed_ID*.

This property is read-write.

ObjectType

Description

This property returns the object type for the feed definition as a string. For a feed, this is a constant value: *Feed*.

This property is read-only.

OperatingMode

Description

This property returns the operating mode for the Feed object as a number. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	&utility.OPERATINGMODE_DEFAULT	A Feed object in this mode allows all operations such as save, delete, and so on.
10	&utility.OPERATINGMODE_EXECUTION	A Feed object in this mode is for execution to get the feed document. Other operations such as save and delete are not allowed.

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
11	&utility.OPERATINGMODE_EXECUTION_NOENTRY	A Feed object in this mode is for execution to get a feed document with no feed entries. Otherwise, this mode is the same as the OPERATINGMODE_EXECUTION mode.
100	&utility.OPERATINGMODE_AUTHORIZATION	A Feed object in this mode is for validating user access to the feed. Most other operations such as execute, save, and delete are not allowed.
1000	&utility.OPERATINGMODE_DELETION	A Feed object in this mode is to delete the feed definition. Most other operations such as execute and save are not allowed.

This property is read-only.

OwnerID

Description

Use this property to set or return object owner ID as a string. For example, for delivered feed definitions, the owner ID is set to PT, CPA, and so on.

This property is read-write.

PublishedInSites

Description

This property returns the list of sites in which this feed has been published as an array of string.

This property is read-only.

Title

Description

Use this property to set or return the title of the feed definition as a string.

This property is read-write.

Utility

Description

Use this property to set or return the Utility object used by the Feed object.

This property is read-write.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.getFeed("feed_ID", =>
&thisFeedFactory.Utility.OPERATINGMODE_DEFAULT);
Local PTFP_FEED:UTILITY:Utility &utility;

If &thisFeed <> Null Then
    &utility = &thisFeed.Utility;
End-If;
```

FeedFactory Class

This section provides an overview of the FeedFactory class and discusses:

- FeedFactory class constructor.
- FeedFactory class methods.
- FeedFactory class properties.

The FeedFactory class provides methods for instantiating objects—such as, Feed objects, DataSource objects, Link objects, and Link collections—rather than instantiating these objects directly. Using the methods of the FeedFactory class avoids creating invalid objects. The FeedFactory class also provides methods to search feed definitions and return the search results as a feed HoverMenu object or OPML file

FeedFactory Class Constructor

This section presents the constructor for the FeedFactory class.

FeedFactory

Example

```
import PTFP_FEED:FeedFactory;

Local PTFP_FEED:FeedFactory &PTFP_FEED_FACTORY = create PTFP_FEED:FeedFactory();
```

See Also

[Chapter 6, "Application Classes," Constructors, page 204](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

FeedFactory Class Methods

In this section, the FeedFactory class methods are presented in alphabetical order.

convertFeedLinksToHoverMenu

Syntax

```
convertFeedLinksToHoverMenu(&Links, Flat)
```

Description

Use this method to convert a feed Link collection to a HoverMenu object.

Parameters

Parameter	Description
<i>&Links</i>	Specifies the feed links as a Link collection.
<i>Flat</i>	A Boolean value that indicates whether to organize links in subfolders based on their categories (False), or into a root folder if there are no categories (True). The default value is False.

Returns

A HoverMenu object if successful.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:UTILITY:SearchRequest;
import PTFP_FEED:UTILITY:Collection;
import PTFP_FEED:UTILITY:HoverMenu;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:UTILITY:Collection &results;
Local PTFP_FEED:UTILITY:SearchRequest &request;
Local PTFP_FEED:UTILITY:HoverMenu &menu;

&request = create PTFP_FEED:UTILITY:SearchRequest("SearchResults");
&request.PortalName = %Portal;
&results = &thisFeedFactory.getFeedLinks(&request);
&menu = &thisFeedFactory.convertFeedLinksToHoverMenu(&results, True);
```

convertFeedLinksToOPML

Syntax

```
convertFeedLinksToOPML(&Links, Flat)
```

Description

Use this method to convert a feed Link collection to an OPMLDoc object.

Parameters

Parameter	Description
<i>&Links</i>	Specifies the feed links as a Link collection.
<i>Flat</i>	A Boolean value that indicates whether to organize links in subfolders based on their categories (False), or into a root folder if there are no categories (True). The default value is False.

Returns

An OPMLDoc object if successful.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:UTILITY:SearchRequest;
import PTFP_FEED:UTILITY:Collection;
import PTFP_FEED:XML_OPML:OPMLDoc;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:UTILITY:Collection &results;
Local PTFP_FEED:UTILITY:SearchRequest &request;
Local PTFP_FEED:XML_OPML:OPMLDoc &opmlDoc;

&request = create PTFP_FEED:UTILITY:SearchRequest("SearchResults");
&request.PortalName = %Portal;
&results = &thisFeedFactory.getFeedLinks(&request);
&opmlDoc = &thisFeedFactory.convertFeedLinksToOPML(&results, True);
```

createFeed

Syntax

createFeed(*feed_ID*)

Description

Use this method to create a new Feed object with the given ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>feed_ID</i>	Specifies the feed ID of the new feed definition.

Returns

A Feed object if successful, null otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed = &thisFeedFactory.createFeed("feed_ID");
```

See Also

[Chapter 17, "Feed Classes," Feed Class, page 776](#)

deleteFeed**Syntax**

```
deleteFeed(feed_ID)
```

Description

Use this method to delete the feed definition.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>feed_ID</i>	Specifies the feed definition to be deleted.

Returns

A Boolean value: True if the feed deletion was successful, False otherwise.

Example

```
import PTFP_FEED:FeedFactory;  
  
Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();  
Local boolean &succeed = &thisFeedFactory.deleteFeed("feed_ID");
```

See Also

[Chapter 17, "Feed Classes," delete, page 777](#)

genFeedUrl**Syntax**

```
genFeedUrl(feed_ID, OperationName, SecurityType)
```

Description

Use this method to generate the feed URL based on the feed ID and Integration Broker service operation name. If the service operation name is empty, the default service operation, PTFP_GETFEED, is used.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>feed_ID</i>	Specifies the ID for the feed definition as a string.
<i>OperationName</i>	Specifies the Integration Broker service operation name as a string. The default service operation is PTFP_GETFEED.
<i>SecurityType</i>	Specifies the security type for the feed as a string.

Returns

A feed URL as a string.

Example

```
import PTFP_FEED:FeedFactory;  
  
Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();  
Local string &url = &thisFeedFactory.genFeedUrl("feed_ID", "PTFP_GETFEED", =>  
&thisFeedFactory.Utility.FEEDSECUTYPE_PUBLIC);
```

See Also

[Chapter 17, "Feed Classes," FEEDSECUTYPE_PUBLIC, page 883](#); [Chapter 17, "Feed Classes," FEEDSECUTYPE_REALTIME, page 884](#) and [Chapter 17, "Feed Classes," FEEDSECUTYPE_SELECTED, page 884](#)

genUniqueFeedId

Syntax

genUniqueFeedId(*seed*)

Description

Use this method to generate an unique feed ID from the specified seed string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>seed</i>	Specifies the seed as a string.

Returns

A feed ID as a string.

Example

```
import PTFP_FEED:FeedFactory;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local string &id = &thisFeedFactory.genUniqueFeedId("feed_ID");
```

getAllPagedFeedLinks

Syntax

getAllPagedFeedLinks(*feed_ID*, *fromDTTM*, *allLanguages*)

Description

Use this method to get all the paged feed URLs for the specified scheduled feed definition starting from the specified date and time. If *allLanguages* is set to True, then feed URLs corresponding to all languages are also provided.

This method returns an array of paged feed URLs; each URL represents a specific page (message segment) of the paged feed.

Note. This method is supported for scheduled feeds only.

See Also

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Paged Feeds

Parameters

<i>Parameter</i>	<i>Description</i>
<i>feed_ID</i>	Specifies the ID for the scheduled feed definition as a string.
<i>fromDTTM</i>	Specifies the start date and time as a datetime value.
<i>allLanguages</i>	A Boolean value that indicates whether to provide paged feed URLs for all languages.

Returns

An array of string.

Example

```
import PTFP_FEED:FeedFactory;

Local PTFP_FEED:FeedFactory &feedFactory_inst;
Local datetime &fromDttm;
Local array of string &feedLinks;

&feedFactory_inst = create PTFP_FEED:FeedFactory();
&fromDttm = DateTimeValue("01/01/1900 00:00:00");
&feedLinks = &feedFactory_inst.getAllPagedFeedLinks("ADMN_USER_PROFILE", =>
&fromDttm, True);
```

See Also

[Chapter 17, "Feed Classes," getRelativePageLinkForFeed, page 812](#)

getCategory

Syntax

```
getCategory(category_ID, ActiveOnly)
```

Description

Use this method to retrieve all of the category information for a category ID. The information is returned as an array of string with four elements.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>category_ID</i>	Specifies the category ID as a string.
<i>ActiveOnly</i>	Indicates as a Boolean value whether to retrieve the description only if the category is active.

Returns

An array of string with four elements:

- Category ID
- Short description
- Long description
- Status

Example

```
import PTFP_FEED:FeedFactory;  
  
Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();  
Local array of string &categories = &thisFeedFactory.getCategory⇒  
("category_ID", True);
```

getDataSource

Syntax

getDataSource(*DataType_ID*)

Description

Use this method to create a DataSource object with the given data type ID.

Parameters

None.

<i>Parameter</i>	<i>Description</i>
<i>DataType_ID</i>	Specifies the data type ID for the data source, as a string.

Returns

A DataSource object if successful, null otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:DataSource:DataSource;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:DataSource:DataSource &thisDS;

&thisDS = &thisFeedFactory.getDataSource("FEED");
```

See Also

[Chapter 17, "Feed Classes," DataSource Class Constructor, page 815](#)

getFeed

Syntax

getFeed(*feed_ID*, *mode*)

Description

Use this method to create a Feed object with the given feed ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>feed_ID</i>	Specifies the feed ID as a string.
<i>mode</i>	Specifies the operating mode for the feed as a number. See the values below.

The values for the *mode* parameter are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	&utility.OPERATINGMODE_DEFAULT	A Feed object in this mode allows all operations such as save, delete, and so on.

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
10	&utility.OPERATINGMODE_EXECUTION	A Feed object in this mode is for execution to get the feed document. Other operations such as save and delete are not allowed.
11	&utility.OPERATINGMODE_EXECUTION_NOENTRY	A Feed object in this mode is for execution to get a feed document with just an empty feed header (that is, without feed entries). Otherwise, this mode is the same as the OPERATINGMODE_EXECUTION mode.
100	&utility.OPERATINGMODE_AUTHORIZATION	A Feed object in this mode is for validating user access to the feed. Most other operations such as execute, save, and delete are not allowed.
1000	&utility.OPERATINGMODE_DELETION	A Feed object in this mode is to delete the feed definition. Most other operations such as execute and save are not allowed.

Returns

A Feed object if successful, null otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:Feed;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:Feed &thisFeed;

&thisFeed = &thisFeedFactory.getFeed("feed_ID", &thisFeedFactory.Utility.⇒
OPERATINGMODE_DEFAULT);
```

See Also

[Chapter 17, "Feed Classes," Feed Class Constructor, page 776](#)

[Chapter 17, "Feed Classes," OPERATINGMODE AUTHORIZATION, page 890](#); [Chapter 17, "Feed Classes," OPERATINGMODE_DEFAULT, page 890](#); [Chapter 17, "Feed Classes," OPERATINGMODE_DELETION, page 890](#); [Chapter 17, "Feed Classes," OPERATINGMODE_EXECUTION, page 891](#) and [Chapter 17, "Feed Classes," OPERATINGMODE_EXECUTION_NOENTRY, page 891](#)

getFeedDoc

Syntax

getFeedDoc(*&FeedRequest*)

Description

Use this method to get the feed document of the feed specified by the FeedRequest object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&feedRequest</i>	Specifies the feed request as a FeedRequest object.

Returns

A FeedDoc object if successful, null otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:XML_FEED:FeedDoc;
import PTFP_FEED:UTILITY:FeedRequest;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:UTILITY:FeedRequest &request;
Local PTFP_FEED:XML_FEED:FeedDoc &thisFeedDoc;

&request = create PTFP_FEED:UTILITY:FeedRequest("FeedRequest");
&request.FeedID = "feed_ID";
&thisFeedDoc = &thisFeedFactory.getFeedDoc(&request);
```

See Also

[Chapter 17, "Feed Classes," execute, page 778](#)

[Chapter 17, "Feed Classes," FeedDoc Class, page 902](#)

getFeedLink

Syntax

getFeedLink(*feed_ID*)

Description

Use this method to create a Link object for the specified feed ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>feed_ID</i>	Specifies the feed ID as a string.

Returns

A Link object if successful, null otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:UTILITY:Link;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:UTILITY:Link &thisFeedLink;

&thisFeedLink = &thisFeedFactory.getFeedLink("feed_ID");
```

getFeedLinks

Syntax

getFeedLinks(&*searchRequest*)

Description

Use this method to search feed definitions based on user permissions and the search criteria specified in the SearchRequest object. The method returns a collection of feed Link objects. The list is sorted by the feed definition's last updated time by default.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&searchRequest</i>	Specifies the search criteria as a SearchRequest object.

Returns

A Link collection.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:UTILITY:SearchRequest;
import PTFP_FEED:UTILITY:Collection;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:UTILITY:Collection &results;
Local PTFP_FEED:UTILITY:SearchRequest &request;

&request = create PTFP_FEED:UTILITY:SearchRequest("SearchResults");
&request.PortalName = %Portal;
&results = &thisFeedFactory.getFeedLinks(&request);
```

getRelatedFeedsHoverMenu

Syntax

getRelatedFeedsHoverMenu(*&Requests*)

Description

Use this method to create a related feeds HoverMenu object from the specified FeedRequest objects.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Requests</i>	Specifies the related feeds requests as an array of RelatedFeedsRequest objects.

Returns

A HoverMenu object.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:UTILITY:RelatedFeedsRequest;
import PTFP_FEED:UTILITY:HoverMenu;
import PTFP_FEED:UTILITY:Collection;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:UTILITY:Collection &results;
Local PTFP_FEED:UTILITY:RelatedFeedsRequest &request;
Local PTFP_FEED:UTILITY:HoverMenu &menu;

&request = create PTFP_FEED:UTILITY:RelatedFeedsRequest("FEED");
&request.DataTypeID = "FEED";
&menu = &thisFeedFactory.getRelatedFeedsHoverMenu(CreateArray(&request));
```

getRelativePageLinkForFeed

Syntax

```
getRelativePageLinkForFeed(feed_ID,currentFeedURL,linkOption,fromDTTM)
```

Description

Use this method to get the specified relative paged feed URL (first, previous, next or last) for the current paged feed URL.

This method returns a paged feed URL as a string.

Note. This method is supported for scheduled feeds only.

See Also

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Paged Feeds

Parameters

Parameter	Description
<i>feed_ID</i>	Specifies the ID for the scheduled feed definition as a string.
<i>currentFeedURL</i>	Specifies the paged feed URL for the current page as a string.
<i>linkOption</i>	Specifies which page link as a string. See the values below.
<i>fromDTTM</i>	Specifies the start date and time as a datetime value.

<i>Value</i>	<i>Description</i>
&utlity.LINKTYPE_FIRST	Indicates the first page of the paged feed.
&utlity.LINKTYPE_PREVIOUS	Indicates the previous page of the paged feed.
&utlity.LINKTYPE_NEXT	Indicates the next page of the paged feed.
&utlity.LINKTYPE_LAST	Indicates the last page of the paged feed.

Returns

A string.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:UTILITY:Utility;
import PTFP_FEED:UTILITY:Link;

Local PTFP_FEED:FeedFactory &feedFactory_inst;
Local PTFP_FEED:UTILITY:Utility &utility;
Local PTFP_FEED:UTILITY:Link &link;

Local datetime &fromDttm;
Local string &feedLink, &nextFeedLink, &prevFeedLink, &firstFeedLink, =>
&lastFeedLink;

&feedFactory_inst = create PTFP_FEED:FeedFactory();
&utility = &feedFactory_inst.Utility;
&fromDttm = DateTimeValue("01/01/1900 00:00:00");
&link = &feedFactory_inst.getFeedLink("ADMN_USER_PROFILE");
If All(&link) Then
    &feedLink = &link.Href;

    &nextFeedLink = &feedFactory_inst.getRelativePageLinkForFeed=>
("ADMN_USER_PROFILE", &feedLink, &utility.LINKTYPE_NEXT, &fromDttm);
    &prevFeedLink = &feedFactory_inst.getRelativePageLinkForFeed=>
("ADMN_USER_PROFILE", &feedLink, &utility.LINKTYPE_PREVIOUS, &fromDttm);
    &firstFeedLink = &feedFactory_inst.getRelativePageLinkForFeed=>
("ADMN_USER_PROFILE", &feedLink, &utility.LINKTYPE_FIRST, &fromDttm);
    &lastFeedLink = &feedFactory_inst.getRelativePageLinkForFeed=>
("ADMN_USER_PROFILE", &feedLink, &utility.LINKTYPE_LAST, &fromDttm);
End-If;
```

FeedFactory Class Properties

In this section, the FeedFactory class properties are presented in alphabetical order.

DataSources

Description

This property returns a collection of all data source definitions (a collection of DataSource objects).

This property is read-only.

See Also

[Chapter 17, "Feed Classes," DataSource Class, page 815](#)

Feeds

Description

This property returns a collection of all feed definitions (a collection of Feed objects).

This property is read-only.

See Also

[Chapter 17, "Feed Classes," Feed Class, page 776](#)

Utility

Description

This property returns the Utility object used by this FeedFactory object.

This property is read-only.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:UTILITY:Utility &utility;

&utility = &thisFeedFactory.Utility;
```

See Also

[Chapter 17, "Feed Classes," Utility Class, page 853](#)

DataSource Class

This section provides an overview of the DataSource class and discusses:

- DataSource class constructor.
- DataSource class methods.
- DataSource class properties.

The DataSource class is an abstract base class and should not be used directly. All feed data sources should extend this class.

DataSource Class Constructor

This section presents the constructor for the DataSource class. Use the FeedFactory class to create an instance of the DataSource class.

DataSource

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:DataSource:DataSource;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:DataSource:DataSource &thisDS = &thisFeedFactory.⇒
getDataSource("DS_ID");
```

See Also

[Chapter 17, "Feed Classes," getDataSource, page 806](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

DataSource Class Methods

In this section, the DataSource class methods are presented in alphabetical order.

addParameter

Syntax

```
addParameter(DSparam_ID, Value)
```

Description

Use this method to create a DataSourceParameter object with the given ID and value.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DSparam_ID</i>	Specifies the ID of the data source parameter as a string.
<i>Value</i>	Specifies the value of the data source parameter as a string.

Returns

A DataSourceParameter object if successful, false otherwise.

Example

```

import PTFP_FEED:FeedFactory;
import PTFP_FEED:DataSource:DataSource;
import PTFP_FEED:DataSource:DataSourceParameter;
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:DataSource:DataSource &thisDS = &thisFeedFactory.⇒
getDataSource("DS_ID");
Local PTFP_FEED:DataSource:DataSourceParameter &thisDSP;
If (&thisDS <> Null) Then
    Local PTFP_FEED:UTILITY:Utility &utility = &thisDS.Utility;

    &thisDSP = &thisDS.addParameter(&utility.DSPARAMETER_MAXROW, "0");
    If (&thisDSP <> Null) Then
        &thisDSP.Name = &thisDSP.ID;
        &thisDSP.Description = "Description";
        &thisDSP.FieldType = &utility.FIELDTYPE_NUMBER;
        &thisDSP.DefaultValue = "10";
        &thisDSP.Value = &thisDSP.DefaultValue;
        &thisDSP.Required = True;
    End-If;
End-If;

```

equals

Syntax

`equals(&Object)`

Description

Use this method to evaluate the equivalency of an object with the current data source. Equivalency is established based on the value of two properties: the object's ID and the ObjectType.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Object</i>	Specifies the object to be compared to the current DataSource object.

Returns

A Boolean value: True if the items are equivalent, False otherwise.

See Also

[Chapter 17, "Feed Classes," ID, page 828](#) and [Chapter 17, "Feed Classes," ObjectType, page 829](#)

getAttributeById

Syntax

```
getAttributeById(attribute_ID)
```

Description

Use this method to return the default feed attribute value of this data type by ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>attribute_ID</i>	Specifies the ID of the attribute as a string.

Returns

An Attribute object if successful, null otherwise.

getContentTypeUrl

Syntax

getContentTypeUrl()

Description

Use this method to return the content URL of the feed as a string.

Parameters

None.

Returns

The content URL of the feed as a string.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:DataSource:DataSource;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:DataSource:DataSource &thisDS = &thisFeedFactory.⇒
getDataSource("DS_ID");
Local string &FeedContentTypeUrl = "";
If (&thisDS <> Null) Then
    &FeedContentTypeUrl = &thisDS.getContentTypeUrl();
End-If;
```

getDataSecurity

Syntax

getDataSecurity()

Description

Use this method to return the role- and permission list-based data security as a collection of Authorization objects.

Parameters

None.

Returns

Null if the data security type is public, otherwise a collection of Authorization objects. Each Authorization object represents a role or permission list that has access to the data.

getParameterById

Syntax

```
getParameterById(DSP_ID)
```

Description

Use this method to return the DataSourceParameter object with the given ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DSP_ID</i>	Specifies the ID of the data source parameter as a string.

Returns

A DataSourceParameter object, null if the data source parameter with the specified ID does not exist.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:DataSource:DataSource;
import PTFP_FEED:DataSource:DataSourceParameter;
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:DataSource:DataSource &thisDS = &thisFeedFactory.⇒
getDataSource("DS_ID");
Local PTFP_FEED:DataSource:DataSourceParameter &thisDSP;
If (&thisDS <> Null) Then
    Local PTFP_FEED:UTILITY:Utility &utility = &thisDS.Utility;

    &thisDSP = &thisDS.getParameterById(&utility.DSPARAMETER_MAXROW);
    /* Do some processing with the data source parameter here */
End-If;
```

See Also

[Chapter 17, "Feed Classes," DataSourceParameter Class, page 831](#)

[Chapter 17, "Feed Classes," DSPARAMETER_MAXROW, page 876; Chapter 17, "Feed Classes," DSPARAMETER_SF_MAXMINUTES, page 876 and Chapter 17, "Feed Classes," DSPARAMETER_SF_PAGING, page 876](#)

getParameterDetail

Syntax

```
getParameterDetail()
```

Description

Use this method to return the detailed explanation text of all data source parameters for the specific combination of data source settings.

Parameters

None.

Returns

A string with the detailed explanation text in HTML.

getSettingById

Syntax

```
getSettingById(DSS_ID)
```

Description

Use this method to return a DataSourceSetting object for the given ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DSS_ID</i>	Specifies the ID of the data source setting as a string.

Returns

A DataSourceSetting object if successful, null if the data source setting with the specified ID does not exist.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:DataSource:DataSource;
import PTFP_FEED:DataSource:DataSourceSetting;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:DataSource:DataSource &thisDS = &thisFeedFactory.⇒
getDataSource("DS_ID");
Local PTFP_FEED:DataSource:DataSourceSetting &thisDSS;
If (&thisDS <> Null) Then
    &thisDSS = &thisDS.getSettingById("DSS_ID");
    /* Do some processing with the data source setting here */
End-If;
```

See Also

[Chapter 17, "Feed Classes," DataSourceSetting Class, page 845](#)

getSettingDetail

Syntax

```
getSettingDetail()
```

Description

Use this method to return the detailed explanation text of all data source settings.

Parameters

None.

Returns

A string with the detailed explanation text in HTML.

isCurrentUserAdmin

Syntax

isCurrentUserAdmin()

Description

Use this method to determine whether the current user has administrator access to the feed data.

Parameters

None.

Returns

A Boolean value: True if the user has administrator access, False otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:DataSource:DataSource;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:DataSource:DataSource &thisDS = &thisFeedFactory.⇒
getDataSource("DS_ID");
Local boolean &authorized = False;
If (&thisDS <> Null) Then
    &authorized = &thisDS.isCurrentUserAdmin();
    /* Do some processing here */
End-If;
```

isCurrentUserAuthorized

Syntax

isCurrentUserAuthorized()

Description

Use this method to determine whether the current user is authorized to view the feed data.

Parameters

None.

Returns

A Boolean value: True if the user is authorized to view the feed data, False otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:DataSource:DataSource;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:DataSource:DataSource &thisDS = &thisFeedFactory.⇒
getDataSource("DS_ID");
Local boolean &authorized = False;
If (&thisDS <> Null) Then
    &authorized = &thisDS.isCurrentUserAuthorized();
    /* Do some processing here */
End-If;
```

onDelete

Syntax

onDelete()

Description

Use this method to update related data prior to deleting a feed definition. Raise an exception to stop the deleting action.

Parameters

None.

Returns

None.

onSave

Syntax

onSave()

Description

Use this method to update related data after a feed definition has been saved.

Parameters

None.

resetParameters

Syntax

resetParameters()

Description

Use this method to reset the Parameters collection.

Parameters

None.

Returns

An empty DataSourceParameter collection.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:DataSource:DataSource;
import PTFP_FEED:UTILITY:Collection;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:DataSource:DataSource &thisDS = &thisFeedFactory.⇒
getDataSource("DS_ID");
Local PTFP_FEED:UTILITY:Collection &thisList;

If (&thisDS <> Null) Then
    &thisList = &thisDS.resetParameters();
End-If;
```

[Chapter 17, "Feed Classes," Parameters, page 829](#)

DataSource Class Properties

In this section, the DataSource class properties are presented in alphabetical order.

AdminPersonalizationPage

Description

Use this property to set or return a PSComponent object representing a data type-specific administrator personalization page for entering administrator-specified data source parameter values.

This property is read-write.

AllowCustomParameters

Description

This property indicates whether to allow user add or delete data source parameters, as a Boolean value. The default false, custom parameters are not allowed.

This property is read-only.

AllowRealTimeFeedSecurity

Description

This property indicates whether to allow real-time feed security, as a Boolean value. The default false, real-time feed security is not allowed.

This property is read-only.

DataSourceType

Description

This property returns the data source type as a string. The default value is a constant: BaseDataSource.

This property is read-only.

DefaultFeedAttributes

Description

Use this property to set or return the default feed attributes of this data type as an Attribute collection.

This property is read-write.

DefaultIBOperationName

Description

This property returns a string representing the name of the default service operation that handles feed requests of this data type.

This property is read-only.

Description

Description

Use this property to set or return the description of the data type as a string.

This property is read-write.

HasParameters

Description

This property whether the data source has parameters, as a Boolean value.

This property is read-only.

HasSettings

Description

This property whether the data source has settings, as a Boolean value.

This property is read-only.

IBOperations

Description

Use this property to set or return an IBOperation collection with the service operation names that could be used to handle feed requests of this feed type.

This property is read-write.

ID

Description

This property returns the ID for the data type as a string.

This property is read-only.

LongDescription

Description

Use this property to set or return the long description of the data type as a string.

This property is read-write.

ObjectType

Description

This property returns the object type for the data source as a string. For a data source, this is a constant value: DataSource.

This property is read-only.

Parameters

Description

This property returns the DataSourceParameter collection of this data source.

This property is read-only.

ParametersCompleted

Description

This property indicates whether all required data source parameters have values, as a Boolean value.

This property is read-only.

Parent

Description

Use this property to set or return the Feed object that use this DataSource object to collect data.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," Feed Class, page 776](#)

PortalSpecificPersonalization

Description

This property returns a Boolean value indicating whether the personalization data is portal specific. The default is False, personalization data is not portal specific.

This property is read-only.

Settings

Description

This property returns the DataSourceSetting collection.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," DataSourceSetting Class, page 845](#)

SettingsCompleted

Description

This property returns a Boolean value indicating whether all required data source settings are selected.

This property is read-only.

UserPersonalizationPage

Description

Use this property to set or return a PSComponent object representing a data type-specific user personalization page for entering user specified data source parameter values.

This property is read-write.

Utility

Description

Use this property to set or return the Utility object that used by this DataSource object. By default, the parent's (that is, the feed's) Utility object is used.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," Utility Class, page 853](#)

DataSourceParameter Class

This section provides an overview of the DataSourceParameter class and discusses:

- DataSourceParameter class constructor.
- DataSourceParameter class methods.
- DataSourceParameter class properties.

The DataSourceParameter class represent a data source parameter that used by the DataSource object to refine the feed data selection.

DataSourceParameter Class Constructor

This section presents the constructor for the DataSourceParameter class.

DataSourceParameter

Example

```
import PTFP_FEED:DataSource:DataSourceParameter;  
  
Local PTFP_FEED:DataSource:DataSourceParameter &DSP = create PTFP_FEED:DataSource:⇒  
DataSourceParameter("DSP_ID", &Parent_DS);
```

See Also

[Chapter 6, "Application Classes," Constructors, page 204](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

DataSourceParameter Class Methods

In this section, the DataSourceParameter class methods are presented in alphabetical order.

addUserValue

Syntax

addUserValue(*DSPValue_ID*, *Value*)

Description

Use this method to add a user value to this data source parameter.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DSPValue_ID</i>	Specifies the ID of the user value as a string.
<i>Value</i>	Specifies the value of the user value as a string.

Returns

A DataSourceParameterValue object if successful, false otherwise.

See Also

[Chapter 17, "Feed Classes," DataSourceParameterValue Class Constructor, page 842](#)

clone

Syntax

`clone()`

Description

Use this method to make a copy of this DataSourceParameter object.

Parameters

None.

Returns

A DataSourceParameter object exactly matching the current object.

equals

Syntax

`equals(&Object)`

Description

Use this method to evaluate the equivalency of an object with the current data source parameter. Equivalency is established based on the value of two properties: the object's ID and the ObjectType.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Object</i>	Specifies the object to be compared to the current DataSourceParameter object.

Returns

A Boolean value: True if the items are equivalent, False otherwise.

See Also

[Chapter 17, "Feed Classes," ID, page 838](#) and [Chapter 17, "Feed Classes," ObjectType, page 838](#)

resetUserValues

Syntax

```
resetUserValues()
```

Description

Use this method to reset the UserValues collection.

Parameters

None.

Returns

An empty UserValues collection if successful, null otherwise.

See Also

[Chapter 17, "Feed Classes," UserValues, page 840](#)

setRangeFromFieldTranslates

Syntax

```
setRangeFromFieldTranslates(FieldName)
```

Description

Use this method to auto-populate the range values based on the translate values for the specified field.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>FieldName</i>	Specifies the name of the field as a string.

Returns

None.

validateValue

Syntax

validateValue(*Value*, *CheckPrompt*)

Description

Use this method to validate the value according to its field type, the edit type, and the usage type. Date or date time values are translated to the standard format as a string. Exceptions or errors are raised for invalid values.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Value</i>	Specifies the value to be validated as a string.
<i>CheckPrompt</i>	Specifies a Boolean value indicating whether the value should be checked against the valid values list of this data source parameter. The type of check depends on the edit type of this data source parameter, the valid values list could be a user-specified values list, translate values of a field, or values in a prompt table. When <i>CheckPrompt</i> is True, check the value; when False, check the data type of the value only.

Returns

A string with the validated value.

DataSourceParameter Class Properties

In this section, the DataSourceParameter class properties are presented in alphabetical order.

AllowChangesToRequired

Description

Use this property to set or return a Boolean value indicating whether it is allowed to change the required flag of this parameter.

This property is read-write.

DefaultValue

Description

Use this property to set or return a string representing the default value for this data source parameter.

This property is read-write.

DefaultValueForDisplay

Description

This property returns a string representing the default value for a data source parameter for display purposes. This is the same as the DefaultValue property except that a date value is in the user-preferred format.

This property is read-only.

Description

Description

Use this property to set or return the description of the data source parameter as a string.

This property is read-write.

EditType

Description

Use this property to set or return the table edit type of the data source parameter, as a number. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
1	&utility.EDITTYPE_NOTABLEEDIT	This is the default edit type. A valid values list can be specified using the UserValues collection.
2	&utility.EDITTYPE_PROMPTTABLE	This data source parameter takes value from a prompt table. Only a SQL table or SQL view can be used as the prompt table.
3	&utility.EDITTYPE_TRANSLATETABLE	This data source parameter only takes values specific in the Range array of this data source parameter
4	&utility.EDITTYPE_YESNO	This data source parameter only takes a Yes or No value.

This property is read-write.

EvaluatedValue

Description

This property returns a string representing the evaluated value of the data source parameter. This is the same as the Value property except that a system variable is evaluated to its current runtime value.

This property is read-only.

FieldType

Description

Use this property to set or return the field type as a number. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	&utility.FIELDTYPE_CHARACTER	Character field
1	&utility.FIELDTYPE_LONGCHARACTER	Long character field
2	&utility.FIELDTYPE_NUMBER	Number field
3	&utility.FIELDTYPE_SIGNEDNUMBER	Signed number field
4	&utility.FIELDTYPE_DATE	Date field

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
5	&utility.FIELDTYPE_TIME	Time field
6	&utility.FIELDTYPE_DATETIME	Datetime field

This property is read-write.

ID

Description

This property returns the ID for this data source parameter as a string.

This property is read-only.

Name

Description

Use this property to set or return the name of this data source parameter as a string.

This property is read-write.

ObjectType

Description

This property returns the object type for the data source parameter as a string. For a DataSourceParameter object, this is a constant value: DataSourceParameter.

This property is read-only.

Parent

Description

Use this property to set or return a pointer to the DataSource object to which this parameter belongs.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," DataSource Class, page 815](#)

PromptTable

Description

Use this property to set or return the name of the prompt table as a string. Only a SQL table or SQL view should be used as the prompt table.

This property is read-write.

Range

Description

Use this property to set or return the list of valid values as an array of array of string.

This property is read-write.

Required

Description

Use this property to set or return whether this data source parameter is required, as a Boolean value.

This property is read-write.

SkipValidityChecks

Description

Use this property to set or return whether to skip validity checks of the values for this data source parameter, as a Boolean value.

This property is read-write.

UsageType

Description

Use this property to set or return the usage type for this data source parameter as a string. The values are:

<i>Value</i>	<i>Description</i>
&utility.USAGETYPE_FIXED	This parameter takes a fixed value.
&utility.USAGETYPE_NOTUSED	This parameter is not used.
&utility.USAGETYPE_SYSVAR	This parameter gets its value from a system variable.
&utility.USAGETYPE_USERSPECIFIED	The value of this parameter can be specified by the user.
&utility.USAGETYPE_INTERNAL	This parameter is for internal use.
&utility.USAGETYPE_ADMINSPESIFIED	The value of this parameter can be changed only by users having administrator access to the data.

This property is read-write.

UserValues

Description

This property returns the valid values (that is, the UserValues collection).

This property is read-only.

Utility

Description

Use this property to set or return the Utility object used by the DataSourceParameter object. By default, the parent's (that is, the data source's) Utility object is used.

This property is read-write.

Example

```
import PTFP_FEED:DataSource:DataSourceParameter;
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:DataSource:DataSourceParameter &thisDSP;
Local PTFP_FEED:UTILITY:Utility &utility;

&thisDSP = create PTFP_FEED:DataSource:DataSourceParameter("dsp_ID", Null);
&utility = &thisDSP.Utility;
&thisDSP.Name = &thisDSP.ID;
&thisDSP.Description = MsgGetText(219, 3005, "Message Not Found - Max Entries");
&thisDSP.FieldType = &utility.FIELDTYPE_NUMBER;
&thisDSP.DefaultValue = "10";
&thisDSP.Value = &thisDSP.DefaultValue;
&thisDSP.Required = True;
&thisDSP.EditType = &utility.EDITYPE_NOTABLEEDIT;
&thisDSP.PromptTable = ""; /* Should only use SQL Table or View */
&thisDSP.Range = Null; /* Only set the range if the edit type is translatable */
&thisDSP.UsageType = &utility.USAGETYPE_FIXED;
&thisDSP.UserValues = Null;
&thisDSP.AllowChangesToRequired = False;
```

Value

Description

Use this property to set or return the value of the data source parameter as a string.

This property is read-write.

ValueForDisplay

Description

This property returns a string representing the value for a data source parameter for display purposes. This is the same as the Value property except that a date value is in the user-preferred format.

This property is read-only.

DataSourceParameterValue Class

This section provides an overview of the DataSourceParameterValue class and discusses:

- DataSourceParameterValue class constructor.
- DataSourceParameterValue class methods.
- DataSourceParameterValue class properties.

The DataSourceParameterValue class represents a valid value for a data source parameter.

DataSourceParameterValue Class Constructor

This section presents the constructor for the DataSourceParameterValue class.

DataSourceParameterValue

Example

```
Local PTFP_FEED:DataSource:DataSourceParameterValue &DSP_Value = create PTFP_FEED:=  
DataSource:DataSourceParameterValue("ID", &Parent_DSP);
```

See Also

[Chapter 6, "Application Classes," Constructors, page 204](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

DataSourceParameterValue Class Methods

In this section, the DataSourceParameterValue class methods are presented in alphabetical order.

clone

Syntax

```
clone()
```

Description

Use this method to make a copy of this DataSourceParameterValue object.

Parameters

None.

Returns

A DataSourceParameterValue object exactly matching the current object.

equals

Syntax

`equals(&Object)`

Description

Use this method to evaluate the equivalency of an object with the current data source parameter value. Equivalency is established based on the value of two properties: the object's ID and the ObjectType.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Object</i>	Specifies the object to be compared to the current DataSourceParameterValue object.

Returns

A Boolean value: True if the items are equivalent, False otherwise.

See Also

[Chapter 17, "Feed Classes," ID, page 844](#) and [Chapter 17, "Feed Classes," ObjectType, page 844](#)

DataSourceParameterValue Class Properties

In this section, the DataSourceParameterValue class properties are presented in alphabetical order.

Description

Description

Use this property to set or return the description of this data source parameter value as a string.

This property is read-write.

ID

Description

This property returns the ID for this data source parameter value as a string.

This property is read-only.

Name

Description

Use this property to set or return the name of this data source parameter value as a string.

This property is read-write.

ObjectType

Description

This property returns the object type for the data source parameter value as a string. For a DataSourceParameterValue object, this is a constant value: DataSourceParameterValue.

This property is read-only.

OrderNumber

Description

Use this property to set or return the order number for this data source parameter value as a number.

This property is read-write.

Parent

Description

Use this property to set or return a pointer to the DataSourceParameter object to which this value belongs.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," DataSourceParameter Class, page 831](#)

Value

Description

Use this property to set or return the value of the data source parameter value as a string.

This property is read-write.

DataSourceSetting Class

This section provides an overview of the DataSourceSetting class and discusses:

- DataSourceSetting class constructor.
- DataSourceSetting class methods.
- DataSourceSetting class properties.

The DataSourceSetting class represents a data source setting that is used to uniquely define a feed's data source of a given type.

DataSourceSetting Class Constructor

This section presents the constructor for the DataSourceSetting class.

DataSourceSetting

Example

```
import PTFP_FEED:DataSource:DataSourceSetting;  
  
Local PTFP_FEED:DataSource:DataSourceSetting &this_DSS = create PTFP_FEED:⇒  
DataSource:DataSourceSetting("DSS_ID", &DS);
```

See Also

[Chapter 6, "Application Classes," Constructors, page 204](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

DataSourceSetting Class Methods

In this section, the DataSourceSetting class methods are presented in alphabetical order.

clone

Syntax

```
clone()
```

Description

Use this method to make a copy of this DataSourceSetting object.

Parameters

None.

Returns

A DataSourceSetting object exactly matching the current object.

equals

Syntax

`equals(&Object)`

Description

Use this method to evaluate the equivalency of an object with the current data source setting. Equivalency is established based on the value of two properties: the object's ID and the ObjectType.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Object</i>	Specifies the object to be compared to the current DataSourceSetting object.

Returns

A Boolean value: True if the items are equivalent, False otherwise.

See Also

[Chapter 17, "Feed Classes," ID, page 850](#) and [Chapter 17, "Feed Classes," ObjectType, page 850](#)

setRangeFromFieldTranslates

Syntax

`setRangeFromFieldTranslates(FieldName)`

Description

Use this method to auto-populate the range values based on the valid translate values for the field.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>FieldName</i>	Specifies the name of the field as a string.

Returns

None.

DataSourceSetting Class Properties

In this section, the DataSourceSetting class properties are presented in alphabetical order.

DefaultValue

Description

Use this property to set or return a string representing the default value for a data source setting.

This property is read-write.

DisplayOnly

Description

Use this property to set or return a Boolean value indicating whether the Value property is displayed as display only.

This property is read-write.

EditType

Description

Use this property to set or return the table edit type of the data source setting, as a number. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
1	&utility.EDITTYPE_NOTABLEEDIT	This is the default edit type. A valid values list can be specified using the UserValues collection.
2	&utility.EDITTYPE_PROMPTTABLE	This data source parameter takes value from a prompt table. Only a SQL table or SQL view can be used as the prompt table.

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
3	&utility.EDITTYPE_TRANSLATETABLE	This data source parameter only takes values specific in the Range array of this data source parameter
4	&utility.EDITTYPE_YESNO	This data source parameter only takes a Yes or No value.

This property is read-write.

Enabled

Description

Use this property to set or return a Boolean value indicating whether the setting is enabled.

This property is read-write.

FieldType

Description

Use this property to set or return the field type as a number. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	&utility.FIELDTYPE_CHARACTER	Character field
1	&utility.FIELDTYPE_LONGCHARACTER	Long character field
2	&utility.FIELDTYPE_NUMBER	Number field
3	&utility.FIELDTYPE_SIGNEDNUMBER	Signed number field
4	&utility.FIELDTYPE_DATE	Date field
5	&utility.FIELDTYPE_TIME	Time field
6	&utility.FIELDTYPE_DATETIME	Datetime field

This property is read-write.

ID

Description

This property returns the ID for the data source setting as a string.

This property is read-only.

LongName

Description

Use this property to set or return the label of the name as a string.

This property is read-write.

Name

Description

Use this property to set or return the name of the data source setting as a string.

This property is read-write.

ObjectType

Description

This property returns the object type for the data source setting as a string. For a DataSourceSetting object, this is a constant value: DataSourceSetting.

This property is read-only.

Parent

Description

Use this property to set or return a pointer to the DataSource object to which this setting belongs.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," DataSource Class, page 815](#)

PromptTable

Description

Use this property to set or return the name of the prompt table as a string. Only a SQL table or SQL view should be used.

This property is read-write.

Range

Description

Use this property to set or return the list of valid values as an array of array of string.

This property is read-write.

RefreshOnChange

Description

Use this property to set or return a Boolean value indicating whether to call the parent DataSource object's processSettingsChange method when the value changes.

This property is read-write.

RelatedFieldValue

Description

Use this property to set or return the related display field value as a string.

This property is read-write.

Required

Description

Use this property to set or return a Boolean value indicating whether this data source setting is required.

This property is read-write.

ShowRelatedField

Description

Use this property to set or return a Boolean value indicating whether to show the related display field.

This property is read-write.

Utility

Description

Use this property to set or return the Utility object used by the DataSourceSetting object. By default, the parent's (that is, the data source's) Utility object is used.

This property is read-write.

Example

```
import PTFP_FEED:DataSource:DataSourceSetting;
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:DataSource:DataSourceSetting &thisDSS;
Local PTFP_FEED:UTILITY:Utility &utility;

&thisDSS = create PTFP_FEED:DataSource:DataSourceSetting("dss_ID", Null);
&utility = &thisDSS.Utility;
&thisDSS.Name = &thisDSS.ID;
&thisDSS.LongName = "Data Type Name";
&thisDSS.FieldType = &utility.FIELDTYPE_CHARACTER;
&thisDSS.DefaultValue = "";
&thisDSS.RelatedFieldValue = "";
&thisDSS.EditType = &utility.EDITTYPE_PROMPTTABLE;
&thisDSS.PromptTable = Record.PTFP_DTYPE_PVW; /* Only use SQL Table or View */
&thisDSS.Range = Null; /* Only set the range if the edit type is translatable */
&thisDSS.Required = True;
&thisDSS.Enabled = True;
&thisDSS.Visible = True;
&thisDSS.DisplayOnly = False;
&thisDSS.ShowRelatedField = True;
&thisDSS.RefreshOnChange = True;
```

See Also

[Chapter 17, "Feed Classes," Utility Class, page 853](#)

Value

Description

Use this property to set or return the value of the data source setting as a string.

This property is read-write.

Visible

Description

Use this property to set or return a Boolean value indicating whether to show the Value field when it's enabled.

This property is read-write.

Utility Class

This section provides an overview of the Utility class and discusses:

- Utility class constructor.
- Utility class methods.
- Utility class properties.

The Utility class provides methods and constants used by other classes of the Feed Publishing Framework

Utility Class Constructor

This section presents the constructor for the Utility class.

Utility

Example

```
import PTFP_FEED:UTILITY:Utility;  
Local PTFP_FEED:UTILITY:Utility &utility = create PTFP_FEED:UTILITY:Utility();
```

See Also

[Chapter 6, "Application Classes," Constructors, page 204](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

Utility Class Methods

In this section, the Utility class methods are presented in alphabetical order.

dateStringToUserPref

Syntax

```
dateStringToUserPref(DateString)
```

Description

Use this method to transform a date string from the "yyyy-MM-dd" format to the user-preferred date format.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DateString</i>	Specifies the date string to be transformed.

Returns

A string containing the date in the user-preferred date format.

datetimeToString

Syntax

datetimeToString(*Datetime*)

Description

Use this method to transform a datetime value to a string in "yyyy-MM-dd HH:mm:ss" format.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Datetime</i>	Specifies the datetime value to be transformed.

Returns

A string in "yyyy-MM-dd HH:mm:ss" format or an empty string if the datetime value is empty.

dateToString

Syntax

dateToString(*Date*)

Description

Use this method to transform a date value to a string in "yyyy-MM-dd" format.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Date</i>	Specifies the date value to be transformed.

Returns

A string in "yyyy-MM-dd" format or an empty string if the date value is empty.

decodeXML

Syntax

decodeXML(*String*)

Description

Use this method to decode the following encoded XML characters in the source string:

<i>Encoded Character</i>	<i>Decoded Character</i>
<	< (less than)
>	> (greater than)
&	& (ampersand)
'	' (apostrophe)
"	" (quotation mark)

Parameters

<i>Parameter</i>	<i>Description</i>
<i>String</i>	Specifies the source XML string with encoded characters to be decoded.

Returns

A string containing the source XML string with encoded characters decoded.

Example

```
For &i = 1 To &elementList.Len
    &valueList = CreateArrayRept("", &pChildTags.Len);
    For &j = 1 To &pChildTags.Len
        &thisValue = %This.getNodeValue(&elementList [&i], &pChildTags [&j]);
        &valueList [&j] = %This.decodeXML(&thisValue);
    End-For;
    &return_value.Push(&valueList);
End-For;
```

See Also

[Chapter 17, "Feed Classes," encodeXML, page 857](#) and [Chapter 17, "Feed Classes," split2D, page 871](#)

encodeXML**Syntax**

encodeXML(*String*)

Description

Use this method to encode the following special characters in the source string as encoded XML characters:

<i>Character</i>	<i>Encoded Character</i>
< (less than)	<
> (greater than)	>
& (ampersand)	&
' (apostrophe)	'
" (quotation mark)	"

Parameters

<i>Parameter</i>	<i>Description</i>
<i>String</i>	Specifies the source string with special characters to be encoded.

Returns

A string containing the source string with the special characters encoded.

Example

```
If (&pValues [&i] <> Null) And
    (&pChildTags <> Null) Then
    /* get the children */
    For &j = 1 To &pValues [&i].Len
        If &j > &pChildTags.Len Then
            Break;
        End-If;

        &thisElement = &thisElement | %This.setNodeValue(%This.encodeXML⇒
    (&pValues [&i][&j]), &pChildTags [&j]);
    End-For;
End-If;
```

See Also

[Chapter 17, "Feed Classes," decodeXML, page 856](#) and [Chapter 17, "Feed Classes," join2D, page 866](#)

evaluateSysVar

Syntax

```
evaluateSysVar(SysVar)
```

Description

Use this method to evaluate and return the value of a system variable.

Parameters

Parameter	Description
SysVar	Specifies the system variable to be evaluated as a string.

Returns

A string representation of the evaluated system variable, or the system variable name if it cannot be evaluated.

genNameSpaceID

Syntax

genNameSpaceID(*NameSpace_ID*)

Description

Use this method to replace special characters in the original ID string with "_", so that it only contains "A–Z", "0–9" and "_".

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NameSpace_ID</i>	Specifies the name space ID to be converted as a string.

Returns

A string containing the generated name space ID using only "A–Z", "0–9" and "_".

getExceptionText

Syntax

getExceptionText(&*Exception*)

Description

Use this method to return the exception error message.

Parameters

<i>Parameter</i>	<i>Description</i>
& <i>Exception</i>	Specifies the exception as an Exception object.

Returns

The exception error message as a string.

getFeedDoc

Syntax

getFeedDoc(*feed_ID*, *Format*, *&Attributes*)

Description

Use this method to create a FeedDoc object of the given feed format.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>feed_ID</i>	Specifies the ID of the feed definition as a string.
<i>Format</i>	Specifies the feed format as a string. The values are:

<i>Value</i>	<i>Description</i>
&utility.FEEDFORMAT_ATOM10	An Atom 1.0 format feed.

<i>Parameter</i>	<i>Description</i>
<i>&Attributes</i>	Specifies the feed-level properties as an Attribute collection.

Returns

A FeedDoc object of the given feed format with properties filled in from the Attribute collection.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:XML_FEED:FeedDoc;
import PTFP_FEED:XML_FEED:FeedEntry;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:XML_FEED:FeedDoc &this_FeedDoc = &thisFeedFactory.Utility.⇒
getFeedDoc("feed_ID", &thisFeedFactory.Utility.FEEDFORMAT_ATOM10, Null);
Local PTFP_FEED:XML_FEED:FeedEntry &this_Entry = &this_FeedDoc.⇒
addEntry("entry_ID");
```

See Also

[Chapter 17, "Feed Classes," FeedDoc Class, page 902](#)

getFeedMimeType**Syntax**

```
getFeedMimeType(Format)
```

Description

Use this method to return the MIME type of the given feed format.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Format</i>	Specifies the feed format as a string. The values are:

<i>Value</i>	<i>Description</i>
&utility.FEEDFORMAT_ATOM10	An Atom 1.0 format feed.

Returns

A string containing the MIME type as follows:

<i>Feed Format Constant</i>	<i>MIME Type Constant</i>	<i>MIME Type</i>
&utility.FEEDFORMAT_ATOM10	MIMETYPE_ATOM	application/atom+xml
<i>undefined</i>	MIMETYPE_XML	application/xml

getFieldTranslates**Syntax**

```
getFieldTranslates(FieldName)
```

Description

Use this method to return the valid translate values of a field.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>FieldName</i>	Specifies the field name for which to retrieve translate values, as a string.

Returns

An array of array of string.

getNodeValue

Syntax

getNodeValue(*String*, *Tag*)

Description

Use this method to extract the value from the first element enclosed by the given tag in the source string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>String</i>	Specifies the string to check.
<i>Tag</i>	Specifies the tag to search for as a string.

Returns

A string containing the value from the first element enclosed by the specified tag.

Example

```
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:UTILITY:Utility &utility = create PTFP_FEED:UTILITY:Utility();

&str = "<div><p>value1</p><p>value2</p></div>";

&str1 = &utility.getNodeValue(&str, "p");

/* &str1="value1" */
```

See Also

[Chapter 17, "Feed Classes," setNodeValue, page 868](#); [Chapter 17, "Feed Classes," split, page 870](#) and [Chapter 17, "Feed Classes," split2D, page 871](#)

getUserDateFormat

Syntax

```
getUserDateFormat()
```

Description

Use this method to construct and return the date format string based on the user's personalization settings.

Parameters

None.

Returns

A string containing the format mask representing the user's preferred date format—for example: MM-dd-yyyy.

getUserDatetimeFormat

Syntax

```
getUserDatetimeFormat()
```

Description

Use this method to construct and return the datetime format string based on the user's personalization settings.

Parameters

None.

Returns

A string containing the format mask representing the user's preferred datetime format—for example: MM-dd-yyyy hh:mm a.

getUserInfo

Syntax

getUserInfo(*user_ID*)

Description

Use this method to return the user name and email address of the given user ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>user_ID</i>	Specifies the user ID for which to retrieve the user information, as a string.

Returns

An array of string containing two elements:

- User name (or the user ID if this is empty).
- Email address (or an empty string if this is empty).

httpStringToDatetime

Syntax

httpStringToDatetime(*string*)

Description

Use this method to convert an HTTP date/time string in the "dow, dd mmm yyyy hh:mm:ss GMT" format to a datetime value.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>string</i>	Specifies the HTTP date/time string in the "dow, dd mmm yyyy hh:mm:ss GMT" format.

Returns

A datetime value.

join

Syntax

join(*&Array*, *Tag*)

Description

Use this method to concatenate the string array together enclosing each string element in the specified tag.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array</i>	Specifies the array of string to be concatenated together.
<i>Tag</i>	Specifies the tag to enclose each string element.

Returns

A string containing the concatenation of each of the string elements enclosed by the specified tag.

Example

```
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:UTILITY:Utility &utility = create PTFP_FEED:UTILITY:Utility();

&str = &utility.join(CreateArray("value1", "value2"), "p");

/* &str="<p>value1</p><p>value2</p>" */
```

See Also

[Chapter 17, "Feed Classes," setNodeValue, page 868](#) and [Chapter 17, "Feed Classes," split, page 870](#)

join2D

Syntax

```
join2D(&Array, Tag, ChildTags)
```

Description

Use this method to concatenate the array of array of string together enclosing each element in the specified tag. Each child element is XML encoded and enclosed in the child tag.

Parameters

Parameter	Description
<i>&Array</i>	Specifies the array of array of string to be concatenated together.
<i>Tag</i>	Specifies the tag to enclose each string element, as a string.
<i>ChildTags</i>	Specifies the tags to enclose each child element, as an array of string.

Returns

A string containing the concatenation of each of the string elements enclosed by the specified tag. Each child element is XML encoded and enclosed in the child tag.

Example

```
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:UTILITY:Utility &utility = create PTFP_FEED:UTILITY:Utility();

&str = &utility.join2D(CreateArray(CreateArray("value1", "value2")), "div", =>
CreateArray("b", "i"));

/* &str="<div><b>value1</b><i>value2</i></div>" */
```

See Also

[Chapter 17, "Feed Classes," encodeXML, page 857](#); [Chapter 17, "Feed Classes," setNodeValue, page 868](#) and [Chapter 17, "Feed Classes," split, page 870](#)

setMessageHeadersAndMimeType

Syntax

```
setMessageHeadersAndMimeType(&Message, &Feeddoc, &FeedRequest)
```

Description

Use this method to return the specified Message object with the MIME type set, and populated with the specified FeedDoc. If the feed is an incremental feed, then incremental feed information is set as connector properties for the message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Message</i>	Specifies the Message object to be returned.
<i>&feeddoc</i>	Specifies the feed document to be returned specified as an XmlDocument object.
<i>&FeedRequest</i>	Specifies the feed as a FeedRequest object.

Returns

A Message object.

See Also

[Chapter 17, "Feed Classes," Implementing a Real-Time Feed Request Handler, page 930](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Incremental Feeds

setNodeValue**Syntax**

setNodeValue(*Value*, *Tag*)

Description

Use this method to form an element using the given value and tag name.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Value</i>	Specifies the string value to enclose in the tags.
<i>Tag</i>	Specifies the tag to enclose the value within, as a string.

Returns

A string element containing the value enclosed within the given tag.

Example

```
import PTFP_FEED:UTILITY:Utility;

local PTFP_FEED:UTILITY:Utility &utility = create PTFP_FEED:UTILITY:Utility();
&str1 = &utility.setNodeValue("value", "p");

/* &str="<p>value</p>" */
```

See Also

[Chapter 17, "Feed Classes," getNodeValue, page 862](#); [Chapter 17, "Feed Classes," join, page 865](#) and [Chapter 17, "Feed Classes," join2D, page 866](#)

showException

Syntax

showException(*Exception*)

Description

Use this method to raise an error when the component variable &PTFP_THROWPAGELETEXCEPTIONS is false, otherwise throw the exception.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Exception</i>	Specifies the exception as an Exception.

Returns

None.

showInvalidValueException

Syntax

showInvalidValueException(*Name*, *Value*)

Description

Use this method to show an invalid value exception using the showException method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specifies the name of the property as a string.
<i>Value</i>	Specifies the value that is invalid as a string.

Returns

None

See Also

[Chapter 17, "Feed Classes," showException, page 869](#)

split

Syntax

`split()`

Description

Use this method to extract the elements from the string that are enclosed in the specified tag.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>String</i>	Specifies the string to check.
<i>Tag</i>	Specifies the tag to search for as a string.

Returns

An array of string containing the string elements enclosed by the specified tag.

Example

```
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:UTILITY:Utility &utility = create PTFP_FEED:UTILITY:Utility();

&str = "<p>value1</p><p>value2</p>";

&arr = &utility.split(&str, "p");

/* &arr[1]="value1", &arr[2]="value2" */
```

See Also

[Chapter 17, "Feed Classes," getNodeValue, page 862](#) and [Chapter 17, "Feed Classes," join, page 865](#)

split2D**Syntax**

```
split2D()
```

Description

Use this method to extract the elements from the string that are enclosed in the specified tag. Child elements enclosed by the child tags are also extracted. All elements are XML decoded.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>String</i>	Specifies the string to check.
<i>Tag</i>	Specifies the tag that encloses each string element, as a string. This tag can be an empty string.
<i>ChildTags</i>	Specifies the tags that enclose each child element, as an array of string.

Returns

An array of array of string containing the extracted string elements enclosed by the specified tags. Child elements are enclosed by the child tags. All elements are XML decoded.

Example

```
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:UTILITY:Utility &utility = create PTFP_FEED:UTILITY:Utility();

&str = "<div><b>value1</b><i>value2</i></div>";

&arr = &utility.split2D(&str, "div", CreateArray("b", "i"));

/* &arr[1][1]="value1", &arr[1][2]="value2" */
```

See Also

decodeXML, getNodeValue, join2D, split

[Chapter 17, "Feed Classes," decodeXML, page 856](#); [Chapter 17, "Feed Classes," getNodeValue, page 862](#); [Chapter 17, "Feed Classes," join2D, page 866](#) and [Chapter 17, "Feed Classes," split, page 870](#)

stringToDate

Syntax

stringToDate(*DateString*)

Description

Use this method to convert a date string in the "yyyy-MM-dd" format to a date.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DateString</i>	Specifies the string to be converted to a date.

Returns

A date.

stringToDatetime

Syntax

stringToDatetime(*DatetimeString*)

Description

Use this method to convert a date string in the "yyyy-MM-dd HH:mm:ss" format to a datetime.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>DatetimeString</i>	Specifies the string to be converted to a datetime.

Returns

A datetime.

validateSysVar

Syntax

```
validateSysVar(SysVar)
```

Description

Use this method to return the valid, correctly capitalized name of a system variable.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>SysVar</i>	Specifies the system variable name to be validated as a string.

Returns

A string containing the validated and correctly capitalized system variable name, INVALID SYSVAR if the system variable does not exist.

Example

In the following example, %AuthenticationToken is returned as the validated system variable name.

```
import PTFP_FEED:UTILITY:Utility;

Local PTFP_FEED:UTILITY:Utility &utility = create PTFP_FEED:UTILITY:Utility();
&str = &utility.validateSysVar("%AUTHENTICATIONtoken");

/* &str="%AUTHENTICATIONTOKEN" */
```

viewStringAsAttachment

Syntax

`viewStringAsAttachment(String, FileName, ViewAttachment)`

Description

Use this method to transform the given string into an attachment file that is sent to the browser.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>String</i>	Specifies the specifies the contents of the attachment file as a string.
<i>FileName</i>	Specifies the attachment file name as a string.
<i>ViewAttachment</i>	Specifies the as a Boolean value whether the attachment is to be viewed directly or detached for download.

Returns

None.

Utility Class Properties

In this section, the Utility class properties are presented in alphabetical order.

Note. Properties in this class with capitalized names—such as, ATTACHMENT_URL, AUTHTYPE_PERM, and so on—are constants.

Some properties of the Utility class—such as, QUERYPARAMETER_FEEDID , QUERYPARAMETER_FEEDFORMAT, and so on—are referred to as query parameters. Typically, these query parameters are used in the implementation of a feed request handler. An example of a feed request handler that uses query parameters is provided at the end of this chapter.

See Also

[Chapter 17, "Feed Classes," Implementing a Real-Time Feed Request Handler, page 930](#)

ATTACHMENT_URL

Description

Use this property to return the attachment location from the PTFP_DOCINDB URL definition, as a string.

This property is read-only.

AUTHTYPE_PERM

Description

Use this property to return the value that represents the permission list-based authentication type, as a string.

This property is read-only.

AUTHTYPE_ROLE

Description

Use this property to return the value that represents the role-based authentication type, as a string.

This property is read-only.

DSPARAMETER_INCREMENTAL

Description

Use this property to return a string representing the name of the incremental feed data source parameter.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," INCREMENTALOPTION NO, page 887](#) and [Chapter 17, "Feed Classes," INCREMENTALOPTION YES, page 887](#)

DSPARAMETER_MAXROW

Description

Use this property to return a string representing the name of the maximum rows data source parameter for scheduled feeds.

Note. Use either the SF_MAXROWOPTION_ALLMSGSGS property or the SF_MAXROWOPTION_LATESTMSG property to return the *value* of the maximum rows data source parameter for scheduled feeds.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," SF_MAXROWOPTION_ALLMSGSGS, page 896](#) and [Chapter 17, "Feed Classes," SF_MAXROWOPTION_LATESTMSG, page 896](#)

DSPARAMETER_SF_MAXMINUTES

Description

Use this property to return a string representing the name of the maximum minutes data source parameter for scheduled feeds.

Note. Use the SF_MAXMINUTES_ALLMSGSGS property to return the *value* of the maximum minutes data source parameter for scheduled feeds.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," SF_MAXMINUTES_ALLMSGSGS, page 895](#)

DSPARAMETER_SF_PAGING

Description

Use this property to return a string representing the name of the paging data source parameter for scheduled feeds.

Note. Use either the SF_PAGINGOPTION_NOPAGING property or the SF_PAGINGOPTION_SEGMENTED property to return the *value* of the paging data source parameter for scheduled feeds.

This property is read-only.

See Also

Chapter 17, "Feed Classes," SF_PAGINGOPTION_NOPAGING, page 897 and Chapter 17, "Feed Classes," SF_PAGINGOPTION_SEGMENTED, page 897

EDITTYPE_NOTABLEEDIT

Description

Use this property to return a number representing the field edit type as no prompt table edit.

This property is read-only.

EDITTYPE_PROMPTTABLE

Description

Use this property to return a number representing the field edit type as prompt table edit.

This property is read-only.

EDITTYPE_TRANSLATETABLE

Description

Use this property to return a number representing the field edit type as translate table edit.

This property is read-only.

EDITTYPE_YESNO

Description

Use this property to return a number representing the field edit type as a Yes/No edit.

This property is read-only.

FEEDATTRIBUTE_AUTHOR

Description

Use this property to return the AUTHOR feed attribute name as a string.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," XMLCHILDELEMENTS_PERSON, page 899](#)

FEEDATTRIBUTE_CLOUD

Description

Use this property to return the CLOUD feed attribute name as a string.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," XMLCHILDELEMENTS_CLOUD, page 899](#)

FEEDATTRIBUTE_COMPLETE

Description

Use this property to return the COMPLETE feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_CONTRIBUTOR

Description

Use this property to return the CONTRIBUTOR feed attribute name as a string.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," XMLCHILDELEMENTS PERSON, page 899](#)

FEEDATTRIBUTE_COPYRIGHT**Description**

Use this property to return the COPYRIGHT feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_EXPIRES**Description**

Use this property to return the EXPIRES feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_ICONURL**Description**

Use this property to return the ICONURL feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_LOGOURL**Description**

Use this property to return the LOGOURL feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_MANAGINGEDITOR

Description

Use this property to return the MANAGINGEDITOR feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_MAXAGE

Description

Use this property to return the MAXAGE feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_PERSINSTRUCTION

Description

Use this property to return the PERSINSTRUCTION feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_RATING

Description

Use this property to return the RATING feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_SKIPDAYS

Description

Use this property to return the SKIPDAYS feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_SKIPHOURS

Description

Use this property to return the SKIPHOURS feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_TEXTINPUT

Description

Use this property to return the TEXTINPUT feed attribute name as a string.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," XMLCHILDELEMENTS TEXTINPUT, page 900](#)

FEEDATTRIBUTE_TTL

Description

Use this property to return the TTL feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_WEBMASTER

Description

Use this property to return the WEBMASTER feed attribute name as a string.

This property is read-only.

FEEDATTRIBUTE_XSL

Description

Use this property to return the XSL feed attribute name as a string.

This property is read-only.

FEEDAUTHTYPE_ALL

Description

Use this property to return a string representing the feed authorization type as all.

This property is read-only.

FEEDAUTHTYPE_ANONYMOUS

Description

Use this property to return a string representing the feed authorization type as anonymous.

This property is read-only.

FEEDAUTHTYPE_DEFAULT

Description

Use this property to return a string representing the feed authorization type as default.

This property is read-only.

FEEDCACHETYPE_NONE

Description

Use this property to return a string representing the feed cache type as none.

This property is read-only.

FEEDCACHETYPE_PRIVATE

Description

Use this property to return a string representing the feed cache type as private.

This property is read-only.

FEEDCACHETYPE_PUBLIC

Description

Use this property to return a string representing the feed cache type as public.

This property is read-only.

FEEDCACHETYPE_ROLE

Description

Use this property to return a string representing the feed cache type as role-based.

This property is read-only.

FEEDFORMAT_ATOM10

Description

Use this property to return a string representing the feed format as Atom 1.0.

This property is read-only.

FEEDSECUTYPE_PUBLIC

Description

Use this property to return a string representing the feed security type as public access.

This property is read-only.

FEEDSECUTYPE_REALTIME

Description

Use this property to return a string representing the feed security type as real-time security.

This property is read-only.

FEEDSECUTYPE_SELECTED

Description

Use this property to return a string representing the feed security type as select security access.

This property is read-only.

FEEDTYPE_DYNAMIC

Description

Use this property to return a string representing the feed type as real time (formerly known as dynamic).

This property is read-only.

FEEDTYPE_PREPUBLISHED

Description

Use this property to return a string representing the feed type as scheduled (formerly known as prepublished).

This property is read-only.

FIELDTYPE_CHARACTER

Description

Use this property to return a number representing the field type as character.

This property is read-only.

FIELDTYPE_DATE

Description

Use this property to return a number representing the field type as date.

This property is read-only.

FIELDTYPE_DATETIME

Description

Use this property to return a number representing the field type as datetime.

This property is read-only.

FIELDTYPE_LONGCHARACTER

Description

Use this property to return a number representing the field type as long character.

This property is read-only.

FIELDTYPE_NUMBER

Description

Use this property to return a number representing the field type as number.

This property is read-only.

FIELDTYPE_SIGNEDNUMBER

Description

Use this property to return a number representing the field type as signed number.

This property is read-only.

FIELDTYPE_TIME

Description

Use this property to return a number representing the field type as time.

This property is read-only.

IBSOTYPE_ASYNC

Description

Use this property to return a string representing the Integration Broker service operation type as asynchronous.

This property is read-only.

IBSOTYPE_SYNC

Description

Use this property to return a string representing the Integration Broker service operation type as synchronous.

This property is read-only.

IBSOTYPE_UNKNOWN

Description

Use this property to return a string representing the Integration Broker service operation type as unknown.

This property is read-only.

ICONURL_FEED_A

Description

Use this property to return the active feed icon URL for PTFP_FEED_ACTIVE, as a string.

This property is read-only.

ICONURL_FEED_IA

Description

Use this property to return the inactive feed icon URL for PTFP_FEED_INACTIVE, as a string.

This property is read-only.

INCREMENTALOPTION_NO

Description

Use this property to return an integer indicating that the feed is not an incremental feed.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," DSPARAMETER_INCREMENTAL, page 875](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Incremental Feeds

INCREMENTALOPTION_YES

Description

Use this property to return an integer indicating that the feed is an incremental feed.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," DSPARAMETER_INCREMENTAL, page 875](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Incremental Feeds

LINKTYPE_FIRST

Description

Use this property for a paged feed to return a string indicating that link type is first.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," getRelativePageLinkForFeed, page 812](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Paged Feeds

LINKTYPE_LAST

Description

Use this property for a paged feed to return a string indicating that link type is last.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," getRelativePageLinkForFeed, page 812](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Paged Feeds

LINKTYPE_NEXT

Description

Use this property for a paged feed to return a string indicating that link type is next.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," getRelativePageLinkForFeed, page 812](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Paged Feeds

LINKTYPE_PREVIOUS

Description

Use this property for a paged feed to return a string indicating that link type is previous.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," getRelativePageLinkForFeed, page 812](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Paged Feeds

MIMETYPE_ATOM

Description

Use this property to return a string containing the MIME type for Atom feed format data.

This property is read-only.

MIMETYPE_OPML

Description

Use this property to return a string containing the MIME type for OPML format data.

This property is read-only.

MIMETYPE_XML

Description

Use this property to return a string containing the MIME type as XML for unknown feed format data.

This property is read-only.

OPERATINGMODE_AUTHORIZATION

Description

Use this property to return a number representing the Feed object operating mode as for user authorization only.

Note. Most other operations such as execute, save, and delete are not allowed.

This property is read-only.

OPERATINGMODE_DEFAULT

Description

Use this property to return a number representing the Feed object operating mode as default.

Note. A Feed object in this mode allows all operations such as save, delete, and so on.

This property is read-only.

OPERATINGMODE_DELETION

Description

Use this property to return a number representing the Feed object operating mode as for feed deletion only.

Note. Most other operations such as execute and save are not allowed.

This property is read-only.

OPERATINGMODE_EXECUTION

Description

Use this property to return a number representing the Feed object operating mode as for feed execution only.

Note. Other operations such as save and delete are not allowed.

This property is read-only.

OPERATINGMODE_EXECUTION_NOENTRY

Description

Use this property to return a number representing the Feed object operating mode as for feed execution only to return just an empty feed header (that is, without feed entries).

Note. Otherwise, this mode is the same as the OPERATINGMODE_EXECUTION mode.

This property is read-only.

QUERYPARAMETER_CHILDFEEDID

Description

Use this property to return the ChildFeedID query parameter name as a string.

This property is read-only.

QUERYPARAMETER_DATATYPEID

Description

Use this property to return the PTFP_DATA_TYPE query parameter as a string.

This property is read-only.

QUERYPARAMETER_DEFLOCALNODE

Description

Use this property to return the To query parameter as a string.

This property is read-only.

QUERYPARAMETER_DSSCOUNT

Description

Use this property to return the PTFP_DSS_COUNT query parameter as a string.

This property is read-only.

QUERYPARAMETER_DSSNAME

Description

Use this property to return the PTFP_DSS_NAME query parameter as a string.

This property is read-only.

QUERYPARAMETER_DSSVALUE

Description

Use this property to return the PTFP_DSS_VALUE query parameter as a string.

This property is read-only.

QUERYPARAMETER_FEEDFORMAT

Description

Use this property to return the FeedFormat query parameter as a string.

This property is read-only.

QUERYPARAMETER_FEEDID

Description

Use this property to return the FEED_ID query parameter as a string.

This property is read-only.

QUERYPARAMETER_FEEDLIST

Description

Use this property to return the FEEDLIST query parameter as a string.

This property is read-only.

QUERYPARAMETER_FEEDTYPE

Description

Use this property to return the PTFP_FEED_TYPE query parameter as a string.

This property is read-only.

QUERYPARAMETER_IBTRANSID

Description

Use this property to return the IB_TRANS_ID query parameter as a string.

This property is read-only.

QUERYPARAMETER_IFMODIFIEDSINCE

Description

Use this property to return the If-None-Match query parameter as a string.

This property is read-only.

QUERYPARAMETER_IFNONEMATCH

Description

Use this property to return the PAGE_NUM query parameter as a string.

This property is read-only.

QUERYPARAMETER_KEYWORD

Description

Use this property to return the PTFP_FEED_KEYWORD query parameter as a string.

This property is read-only.

QUERYPARAMETER_LANGUAGE

Description

Use this property to return the languageCd query parameter as a string.

This property is read-only.

QUERYPARAMETER_NODENAME

Description

Use this property to return the NODE_NAME query parameter as a string.

This property is read-only.

QUERYPARAMETER_PAGENUM

Description

Use this property to return this query parameter as a string.

This property is read-only.

QUERYPARAMETER_PORTALNAME

Description

Use this property to return the PORTAL_NAME query parameter as a string.

This property is read-only.

QUERYPARAMETER_PTPPB_SEARCH_MODE

Description

Use this property to return the PTPPB_SEARCH_MODE query parameter as a string.

This property is read-only.

QUERYPARAMETER_PTPPB_SEARCH_TEXT

Description

Use this property to return the SEARCH_TEXT query parameter as a string.

This property is read-only.

RequestInfo

Description

Use this property to set or return a FeedRequest object.

This property is read-write.

SF_MAXMINUTES_ALLMSGs

Description

Use this property to return a number representing *all messages* as the value for the maximum minutes data source parameter for scheduled feeds.

Note. Use the DSPARAMETER_SF_MAXMINUTES property to return the *name* of the maximum minutes data source parameter for scheduled feeds.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," DSPARAMETER_SF_MAXMINUTES, page 876](#)

SF_MAXROWOPTION_ALLMSGS

Description

Use this property to return a number representing *all messages* as the value for the maximum row data source parameter for scheduled feeds.

Note. Use the DSPARAMETER_MAXROW property to return the *name* of the maximum row data source parameter for scheduled feeds.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," DSPARAMETER_MAXROW, page 876](#)

SF_MAXROWOPTION_LATESTMSG

Description

Use this property to return a number representing *latest message* as the value for the maximum row data source parameter for scheduled feeds.

Note. Use the DSPARAMETER_MAXROW property to return the *name* of the maximum row data source parameter for scheduled feeds.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," DSPARAMETER_MAXROW, page 876](#)

SF_PAGINGOPTION_NOPAGING

Description

Use this property to return a number representing *no paging* as the value for the paging data source parameter for scheduled feeds.

Note. Use the DSPARAMETER_SF_PAGING property to return the *name* of the paging data source parameter for scheduled feeds.

This property is read-only.

See Also

Chapter 17, "Feed Classes," DSPARAMETER_SF_PAGING, page 876

SF_PAGINGOPTION_SEGMENTED

Description

Use this property to return a number representing *segmented message* as the value for the paging data source parameter for scheduled feeds.

Note. Use the DSPARAMETER_SF_PAGING property to return the *name* of the paging data source parameter for scheduled feeds.

Important! Using SF_PAGINGOPTION_SEGMENTED returns the oldest page (message segment) as the initial page of the feed. The links to the other pages (next, previous, first, and last) are available in the FeedDoc wherever applicable.

This option is best suited for when the feed output is large and the feed itself is to be consumed by a crawler or a feed reader application that understand these links.

This property is read-only.

See Also

Chapter 17, "Feed Classes," DSPARAMETER_SF_PAGING, page 876

SYSVAR_INVALID

Description

Use this property to return the string that indicates that a system variable is invalid.

This property is read-only.

USAGETYPE_ADMINSPECIFIED

Description

Use this property to return a string indicating that the data source parameter usage type is administrator specified.

This property is read-only.

USAGETYPE_FIXED

Description

Use this property to return a string indicating that the data source parameter usage type is fixed.

This property is read-only.

USAGETYPE_INTERNAL

Description

Use this property to return a string indicating that the data source parameter usage type is internal.

This property is read-only.

USAGETYPE_NOTUSED

Description

Use this property to return a string indicating that the data source parameter usage type is not used.

This property is read-only.

USAGETYPE_SYSVAR

Description

Use this property to return a string indicating that the data source parameter usage type is system variable.

This property is read-only.

USAGETYPE_USERSPECIFIED

Description

Use this property to return a string indicating that the data source parameter usage type is user specified.

This property is read-only.

XMLCHILDELEMENTS_CLOUD

Description

Use this property to return an array of string containing the list of children XML tags used by the FEEDATTRIBUTE_CLOUD feed attribute.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," FEEDATTRIBUTE_CLOUD, page 878](#)

XMLCHILDELEMENTS_PERSON

Description

Use this property to return an array of string containing the list of children XML tags used by the FEEDATTRIBUTE_AUTHOR and FEEDATTRIBUTE_CONTRIBUTOR feed attributes.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," FEEDATTRIBUTE_AUTHOR, page 878](#) and [Chapter 17, "Feed Classes," FEEDATTRIBUTE_CONTRIBUTOR, page 878](#)

XMLCHILDELEMENTS_TEXTINPUT

Description

Use this property to return an array of string containing the list of children XML tags used by the FEEDATTRIBUTE_TEXTINPUT feed attribute.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," FEEDATTRIBUTE TEXTINPUT, page 881](#)

XMLELEMENT_DAY

Description

Use this property to return as a string the representing the day XML element.

This property is read-only.

XMLELEMENT_DESCRIPTION

Description

Use this property to return as a string the representing the description XML element.

This property is read-only.

XMLELEMENT_DOMAIN

Description

Use this property to return as a string the representing the domain XML element.

This property is read-only.

XMLELEMENT_EMAIL

Description

Use this property to return as a string the representing the email XML element.

This property is read-only.

XMLELEMENT_HOUR

Description

Use this property to return as a string the representing the hour XML element.

This property is read-only.

XMLELEMENT_LINK

Description

Use this property to return as a string the representing the link XML element.

This property is read-only.

XMLELEMENT_NAME

Description

Use this property to return as a string the representing the name XML element.

This property is read-only.

XMLELEMENT_PATH

Description

Use this property to return as a string the representing the path XML element.

This property is read-only.

XMLELEMENT_PORT

Description

Use this property to return as a string the representing the port XML element.

This property is read-only.

XMLELEMENT_PROTOCOL

Description

Use this property to return as a string the representing the protocol XML element.

This property is read-only.

XMLELEMENT_REGISTERPROCEDURE

Description

Use this property to return as a string the representing the register protocol XML element.

This property is read-only.

XMLELEMENT_TITLE

Description

Use this property to return as a string the representing the title XML element.

This property is read-only.

FeedDoc Class

This section provides an overview of the FeedDoc class and discusses:

- FeedDoc class constructor.
- FeedDoc class methods.
- FeedDoc class properties.

The FeedDoc class extends the XmlDoc base class to provide a generic interface class for feed documents. Therefore, for each feed format type, a format-specific feed document class is required to extend the base FeedDoc class. As a base class, the FeedDoc class has abstract methods and properties, which are identified as such in the following sections.

FeedDoc Class Constructor

This section presents the constructor for the FeedDoc class.

FeedDoc

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:XML_FEED:FeedDoc;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:XML_FEED:FeedDoc &this_FeedDoc = &thisFeedFactory.⇒
getFeedDoc("feed_ID", &thisFeedFactory.Utility.FEEDFORMAT_ATOM10, Null);
```

See Also

[Chapter 17, "Feed Classes," getFeedDoc, page 860](#)

[Chapter 6, "Application Classes," Constructors, page 204](#)

[Chapter 6, "Application Classes," Import Declarations, page 209](#)

FeedDoc Class Methods

In this section, the FeedDoc class methods are presented in alphabetical order.

addCategory

Syntax

```
addCategory(category)
```

Description

Use this method to add a category attribute to the feed document as a string.

Note. This is an abstract method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>category</i>	Specifies the category as a string.

Returns

A Boolean value: True if the add was successful, False otherwise.

See Also

[Chapter 17, "Feed Classes," deleteCategory, page 906](#) and [Chapter 17, "Feed Classes," Categories, page 910](#)

addEntry

Syntax

addEntry(*entry_ID*)

Description

Use this method to create a FeedEntry object with the given ID.

Note. This is an abstract method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>entry_ID</i>	Specifies the ID of the feed entry as a string.

Returns

A FeedEntry object if successful, False otherwise.

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:XML_FEED:FeedDoc;
import PTFP_FEED:XML_FEED:FeedEntry;

Local boolean &succeeded;
Local array of string &tempArray;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:XML_FEED:FeedDoc &thisFeedDoc = &thisFeedFactory.Utility.⇒
getFeedDoc("feed_ID", &thisFeedFactory.Utility.FEEDFORMAT_ATOM10, Null);
Local PTFP_FEED:XML_FEED:FeedEntry &thisEntry = &thisFeedDoc.addEntry("entry_ID");

&thisEntry.Title = &contentTitle;
&thisEntry.Description = &contentEntryDesc;
&succeeded = &thisEntry.addCategory(&contentFolderTitle);
&thisEntry.ContentUrl = &contentUrl;
&thisEntry.GUID = &contentUrl;
&thisEntry.Published = &contentCreatedDateTime;
&thisEntry.Updated = &contentLastUpdatedDateTime;
&thisEntry.Author = &thisFeedFactory.Utility.getUserInfo(&contentCreatedByOprid);
&tempArray = &thisFeedFactory.Utility.getUserInfo(&contentLastUpdatedByOprid);
&succeeded = &thisEntry.addContributor(&tempArray [1], &tempArray [2]);
&succeeded = &thisEntry.addEnclosure(&contentAttachmentUrl, ⇒
"application/octet-stream", 123456);
```

See Also

[Chapter 17, "Feed Classes," deleteEntry, page 907](#); [Chapter 17, "Feed Classes," getEntry, page 908](#); [Chapter 17, "Feed Classes," resetEntries, page 909](#) and [Chapter 17, "Feed Classes," Entries, page 912](#)

[Chapter 17, "Feed Classes," FeedEntry Class, page 917](#)

datetimeToString

Syntax

```
datetimeToString(Datetime)
```

Description

Use this method to transform a datetime value to a string in a feed-specific format— for example, in the "yyyy-MM-dd HH:mm:ss.SSS" format.

Note. This is an abstract method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Datetime</i>	Specifies the datetime value to be transformed.

Returns

A string in a feed-specific format or an empty string if the datetime value is empty.

deleteCategory

Syntax

`deleteCategory(category)`

Description

Use this method to delete a category attribute from a FeedDoc object.

Note. This is an abstract method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>category</i>	Specifies the category as a string.

Returns

A Boolean value: True if the delete was successful, False otherwise.

See Also

[Chapter 17, "Feed Classes," addCategory, page 903](#)

deleteEntry

Syntax

deleteEntry(*entry_ID*)

Description

Use this method to delete the feed entry and the FeedEntry object with the given ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>entry_ID</i>	Specifies the ID of the feed entry as a string.

Returns

A Boolean value: True if the delete was successful, False otherwise.

See Also

[Chapter 17, "Feed Classes," addEntry, page 904](#)

[Chapter 17, "Feed Classes," FeedEntry Class, page 917](#) and [Chapter 17, "Feed Classes," delete, page 921](#)

equals

Syntax

equals(&*Object*)

Description

Use this method to evaluate the equivalency of an object with the current feed document. Equivalency is established based on the value of two properties: the object's ID and the ObjectType.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Object</i>	Specifies the object to be compared to the current FeedDoc object.

Returns

A Boolean value: True if the items are equivalent, False otherwise.

See Also

[Chapter 17, "Feed Classes," ID, page 914](#) and [Chapter 17, "Feed Classes," ObjectType, page 916](#)

getEntry

Syntax

`getEntry(entry_ID)`

Description

Use this method to return a FeedEntry object with the given ID.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>entry_ID</i>	Specifies the ID of the feed entry as a string.

Returns

A FeedEntry object if successful, Null otherwise.

See Also

[Chapter 17, "Feed Classes," addEntry, page 904](#)

[Chapter 17, "Feed Classes," FeedEntry Class, page 917](#)

resetEntries

Syntax

```
resetEntries()
```

Description

Use this method to reset the FeedEntry collection.

Parameters

None.

Returns

An empty FeedEntry collection.

See Also

[Chapter 17, "Feed Classes," addEntry, page 904](#) and [Chapter 17, "Feed Classes," Entries, page 912](#)

[Chapter 17, "Feed Classes," FeedEntry Class, page 917](#)

stringToDatetime

Syntax

```
stringToDatetime(DatetimeString)
```

Description

Use this method to covert a date/time string of a feed-specific format to a datetime value.

Note. This is an abstract method.

Parameters

Parameter	Description
<i>DatetimeString</i>	Specifies the string to be converted to a datetime.

Returns

A datetime.

FeedDoc Class Properties

In this section, the FeedDoc class properties are presented in alphabetical order.

AllowMoreEntries

Description

Use this property to return a Boolean value indicating whether more feed entries are allowed for this FeedDoc object.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," addEntry, page 904](#) and [Chapter 17, "Feed Classes," MaxEntries, page 915](#)

[Chapter 17, "Feed Classes," FeedEntry Class, page 917](#)

ApplicationRelease

Description

Use this property to return the release label from the PSRELEASE table as a string.

This property is read-only.

Categories

Description

Use this property to return the categories for the FeedDoc object as an array of string.

This property is read-only.

Note. This is an abstract property.

See Also

[Chapter 17, "Feed Classes," addCategory, page 903](#)

ContentUrl

Description

Use this property to set or return the content URL for the feed document as a string.

This property is read-write.

Note. This is an abstract property.

Example

```
&newDoc.ContentUrl = %This.FeedContentUrl;
```

See Also

[Chapter 17, "Feed Classes," FeedContentUrl, page 793](#)

Copyright

Description

Use this property to set or return the copyright for the feed document as a string.

This property is read-write.

Note. This is an abstract property.

Description

Description

Use this property to set or return the description for the feed document as a string.

This property is read-write.

Note. This is an abstract property.

Example

```
&newDoc.Description = %This.Description;
```

See Also

[Chapter 17, "Feed Classes," Description, page 791](#)

Entries**Description**

Use this property to return a collection of `FeedEntry` objects.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," addEntry, page 904](#); [Chapter 17, "Feed Classes," deleteEntry, page 907](#) and [Chapter 17, "Feed Classes," resetEntries, page 909](#)

Expires**Description**

Use this property to set or return the expiration date and time for the feed document as a datetime value.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," datetimeToString, page 905](#) and [Chapter 17, "Feed Classes," stringToDatetime, page 909](#)

FeedFormat**Description**

Use this property to return the feed format for the feed document as a string.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," FeedFormat, page 793](#)

FeedUrl

Description

Use this property to set or return feed URL as a string.

This property is read-write.

Note. This is an abstract property.

Example

```
&newDoc.FeedUrl = &feedUrl;
```

See Also

[Chapter 17, "Feed Classes," FeedUrl, page 794](#)

FirstUrl

Description

Use this property to set or return the URL for the first page of a paged feed as a string.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," LastUrl, page 914](#); [Chapter 17, "Feed Classes," NextUrl, page 916](#) and [Chapter 17, "Feed Classes," PreviousUrl, page 916](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Paged Feeds

Generator

Description

Use this property to set or return the generator of this feed document as a string.

This property is read-write.

Note. This is an abstract property.

See Also

[Chapter 17, "Feed Classes," ApplicationRelease, page 910](#)

ID

Description

Use this property to return the ID for this feed document as a string.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," FeedDoc, page 903](#)

LastUrl

Description

Use this property to set or return the URL for the last page of a paged feed as a string.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," FirstUrl, page 913](#); [Chapter 17, "Feed Classes," NextUrl, page 916](#) and [Chapter 17, "Feed Classes," PreviousUrl, page 916](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Paged Feeds

Logo

Description

Use this property to set or return the logo for this feed document as a string.

This property is read-write.

Note. This is an abstract property.

MaxAge

Description

Use this property to set or return the maximum age (in milliseconds) of the feed document as a number.

Note. This property can be defined for scheduled feeds only if the DSPARAMETER_SF_MAXMINUTES data source parameter is set. This property is not enforced by all feed readers.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," DSPARAMETER_SF_MAXMINUTES, page 876](#)

MaxEntries

Description

Use this property to set or return the maximum number of feed entries for the feed document as a number.

This property is read-write.

The default value is 0, which is an unlimited number of entries.

See Also

[Chapter 17, "Feed Classes," AllowMoreEntries, page 910](#)

[Chapter 17, "Feed Classes," FeedEntry Class, page 917](#)

NextUrl

Description

Use this property to set or return the URL for the next page of a paged feed as a string.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," FirstUrl, page 913](#); [Chapter 17, "Feed Classes," LastUrl, page 914](#) and [Chapter 17, "Feed Classes," PreviousUrl, page 916](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Paged Feeds

ObjectType

Description

Use this property to return the object type for the feed document as a string. For a feed document, this is a constant value: FeedDoc.

This property is read-only.

PreviousUrl

Description

Use this property to set or return the URL for the previous page of a paged feed as a string.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," FirstUrl, page 913](#); [Chapter 17, "Feed Classes," LastUrl, page 914](#) and [Chapter 17, "Feed Classes," NextUrl, page 916](#)

PeopleTools 8.51 PeopleBook: Feed Publishing Framework, "Understanding the Feed Publishing Framework," Paged Feeds

RootElement

Description

Use this property to return the root element for this feed document as an XmlNode object.

This property is read-only.

Title

Description

Use this property to set or return the title for the feed document as a string.

This property is read-write.

Note. This is an abstract property.

Example

```
&newDoc.Title = %This.Title;
```

See Also

[Chapter 17, "Feed Classes," Title, page 797](#)

Updated

Description

Use this property to set or return the date and time the feed document was last updated as a datetime value.

This property is read-write.

Note. This is an abstract property.

FeedEntry Class

This section provides an overview of the FeedEntry class and discusses:

- FeedEntry class constructor.

- FeedEntry class methods.
- FeedEntry class properties.

The FeedEntry class provides a generic interface class for feed entries. Therefore, for each feed format type, a format-specific feed entry class is required to extend the base FeedEntry class. As a base class, the FeedEntry class has abstract methods and properties, which are identified as such in the following sections.

FeedEntry Class Constructor

This section presents the constructor for the FeedEntry class.

FeedEntry

Example

```
import PTFP_FEED:FeedFactory;
import PTFP_FEED:XML_FEED:FeedDoc;
import PTFP_FEED:XML_FEED:FeedEntry;

Local PTFP_FEED:FeedFactory &thisFeedFactory = create PTFP_FEED:FeedFactory();
Local PTFP_FEED:XML_FEED:FeedDoc &this_FeedDoc = &thisFeedFactory.Utility.⇒
getFeedDoc("feed_ID", &thisFeedFactory.Utility.FEEDFORMAT_ATOM10, Null);
Local PTFP_FEED:XML_FEED:FeedEntry &this_Entry = &this_FeedDoc.⇒
addEntry("entry_ID");
```

FeedEntry Class Methods

In this section, the FeedEntry class methods are presented in alphabetical order.

addCategory

Syntax

addCategory(*category*)

Description

Use this method to add a category attribute to the feed entry as a string.

Note. This is an abstract method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>category</i>	Specifies the category as a string.

Returns

A Boolean value: True if the add was successful, False otherwise.

See Also

[Chapter 17, "Feed Classes," deleteCategory, page 922](#) and [Chapter 17, "Feed Classes," Categories, page 925](#)

addContributor

Syntax

addContributor(*name, email*)

Description

Use this method to add a contributor attribute to the feed entry.

Note. This is an abstract method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>name</i>	Specifies the name of the contributor as a string.
<i>email</i>	Specifies the email address for the contributor as a string.

Returns

A Boolean value: True if the add was successful, False otherwise.

See Also

[Chapter 17, "Feed Classes," deleteContributor, page 922](#) and [Chapter 17, "Feed Classes," Contributors, page 925](#)

addEnclosure

Syntax

addEnclosure(*URL, type, length*)

Description

Use this method to add an enclosure attribute to the feed entry.

Note. This is an abstract method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>URL</i>	Specifies the URL for the enclosure as a string.
<i>type</i>	Specifies the type of the enclosure as a string.
<i>length</i>	Specifies the length for the enclosure in bytes as a number.

Returns

A Boolean value: True if the add was successful, False otherwise.

See Also

[Chapter 17, "Feed Classes," deleteEnclosure, page 923](#) and [Chapter 17, "Feed Classes," Enclosures, page 926](#)

delete**Syntax**

delete()

Description

Use this method to delete the feed entry from a feed document.

Parameters

None.

Returns

None.

Example

```
Local boolean &deleted = False;
Local PTFP_FEED:UTILITY:Collection &Entries = %This.Entries;
Local PTFP_FEED:XML_FEED:FeedEntry &thisEntry = %This.getEntry(&pId);

If (&thisEntry <> Null) And
    ( Not &Entries.Immutable) Then
    &deleted = &Entries.deleteById(&pId);
    If &deleted Then
        &thisEntry.delete();
    End-If;
End-If;
```

See Also

[Chapter 17, "Feed Classes," deleteEntry, page 907](#)

deleteCategory

Syntax

`deleteCategory(category)`

Description

Use this method to delete a category attribute from a FeedEntry object.

Note. This is an abstract method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>category</i>	Specifies the category as a string.

Returns

A Boolean value: True if the delete was successful, False otherwise.

See Also

[Chapter 17, "Feed Classes," addCategory, page 919](#)

deleteContributor

Syntax

`deleteContributor(name)`

Description

Use this method to delete a contributor attribute from a feed entry.

Note. This is an abstract method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>name</i>	Specifies the name of the contributor as a string.

Returns

A Boolean value: True if the delete was successful, False otherwise.

See Also

[Chapter 17, "Feed Classes," addContributor, page 919](#)

deleteEnclosure

Syntax

`deleteEnclosure(URL)`

Description

Use this method to delete an enclosure attribute from a feed entry.

Note. This is an abstract method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>URL</i>	Specifies the URL for the enclosure as a string.

Returns

A Boolean value: True if the delete was successful, False otherwise.

See Also

[Chapter 17, "Feed Classes," addEnclosure, page 920](#)

equals

Syntax

`equals(&Object)`

Description

Use this method to evaluate the equivalency of an object with the current feed entry. Equivalency is established based on the value of two properties: the object's ID and the ObjectType.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Object</i>	Specifies the object to be compared to the current FeedEntry object.

Returns

A Boolean value: True if the objects are equivalent, False otherwise.

See Also

[Chapter 17, "Feed Classes," ID, page 928](#) and [Chapter 17, "Feed Classes," ObjectType, page 929](#)

FeedEntry Class Properties

In this section, the FeedEntry class properties are presented in alphabetical order.

Author

Description

Use this property to set or return the author attribute for the feed entry as an array of string. The first element of the array is the author's name; the second element is the author's email address.

This property is read-write.

Note. This is an abstract property.

Categories

Description

Use this property to return the categories for the feed entry as an array of string.

This property is read-only.

Note. This is an abstract property.

See Also

[Chapter 17, "Feed Classes," addCategory, page 919](#)

Comments

Description

Use this property to set or return a comments attribute for the feed entry as a string.

This property is read-write.

Note. This is an abstract property.

ContentUrl

Description

Use this property to set or return the content URL for the feed entry as a string.

This property is read-write.

Note. This is an abstract property.

Contributors

Description

Use this property to return the contributors for the feed entry as an array of array of string. The first element of the subarray is the contributor's name; the second element is the contributor's email address.

This property is read-only.

Note. This is an abstract property.

See Also

[Chapter 17, "Feed Classes," addContributor, page 919](#)

Copyright

Description

Use this property to set or return the copyright for the feed entry as a string.

This property is read-write.

Note. This is an abstract property.

Description

Description

Use this property to set or return the description for the feed entry as a string.

This property is read-write.

Note. This is an abstract property.

Enclosures

Description

Use this property to return the enclosures for the feed entry as an array of array of string. The first element of the subarray is the enclosure's URL; the second element is the enclosure's type; and the third element is the enclosure's length.

This property is read-only.

Note. This is an abstract property.

See Also

[Chapter 17, "Feed Classes," addEnclosure, page 920](#)

Expires

Description

Use this property to set or return the expiration date and time for the feed entry as a datetime value.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," datetimeToString, page 905](#) and [Chapter 17, "Feed Classes," stringToDatetime, page 909](#)

FeedDoc

Description

Use this property to return the FeedDoc object that is the parent of this feed entry.

This property is read-only.

Example

```
&return_value = %This.FeedDoc.stringToDatetime(&expires_inst.NodeValue);
```

See Also

[Chapter 17, "Feed Classes," FeedDoc Class, page 902](#)

FullContent

Description

Use this property to set or return the content for the feed entry as a string.

This property is read-write.

Note. This is an abstract property.

GUID

Description

Use this property to set or return a globally unique ID (GUID) for the feed entry.

This property is read-write.

Note. This is an abstract property. For some feed formats, GUID is set to be the content URL for the feed entry.

See Also

[Chapter 17, "Feed Classes," ContentUrl, page 925](#)

ID

Description

Use this property to return the ID for this feed entry as a string.

This property is read-only.

See Also

[Chapter 17, "Feed Classes," FeedEntry, page 918](#)

MaxAge

Description

Use this property to set or return the maximum age (in milliseconds) of the feed entry as a number.

Note. This property can be defined for scheduled feeds only if the DSPARAMETER_SF_MAXMINUTES data source parameter is set. This property is not enforced by all feed readers.

This property is read-write.

See Also

[Chapter 17, "Feed Classes," DSPARAMETER_SF_MAXMINUTES, page 876](#)

ObjectType

Description

Use this property to return the object type for the feed entry as a string. For a feed entry, this is a constant value: `FeedEntry` .

This property is read-only.

Published

Description

Use this property to set or return the initial publication date and time for this feed entry as a datetime value.

This property is read-write.

Note. This is an abstract property.

Title

Description

Use this property to set or return the title for the feed entry as a string.

This property is read-write.

Note. This is an abstract property.

Updated

Description

Use this property to set or return the date and time the feed entry was last updated as a datetime value. Initially, the `Updated` and `Published` properties have equivalent values. However, if the feed entry is changed, then `Updated` is different from `Published`.

This property is read-write.

Note. This is an abstract property.

Additional Feed Examples

This section provides examples of the following: Implementing a real-time feed request handler.

Implementing a Real-Time Feed Request Handler

The following example implements a real-time feed request handler from the `IRequestHandler` superclass.

Important! For typical real-time feed requests, the default feed service operation (`PTFP_GETFEED`) and feed request handler should be sufficient. Unless there is specific functionality that is needed for a real-time feed request, use the default feed service operation. For scheduled feeds, the default service operation and hence the request handler cannot be modified.

```

import PS_PT:Integration:IRequestHandler;
import PTFP_FEED:UTILITY:Utility;
import PTFP_FEED:XML_FEED:FeedDoc;
import PTFP_FEED:UTILITY:FeedRequest;
import PTFP_FEED:Interface:IBGetFeedList;
import PTFP_FEED:FeedFactory;
import PTFP_FEED:EXCEPTION:*;

class MyFeedHandler implements PS_PT:Integration:IRequestHandler
  /* --- Properties --- */

  /* --- Methods --- */
  method MyFeedHandler();
  method OnRequest(&pRequestMsg As Message) Returns Message;
  method OnError(&pRequestMsg As Message) Returns string;
end-class;

/** onRequest is defined. Other methods shown as stubs. */

method MyFeedHandler

  /* method stub */

end-method;

method OnError
  /*+ &pRequestMsg as Message +/
  /*+ Returns String +/
  /*+ Extends/implements PS_PT:Integration:IRequestHandler.OnError +/
  Local string &errstring;
  /* method stub */
  Return &errstring;
end-method;

/**
 * onRequest
 *
 * @param pRequestMsg Request Message.
 *
 * @exception FeedException thrown if switch user failed.
 *
 * @return Message Feed Document.
 */
method OnRequest
  /*+ &pRequestMsg as Message +/
  /*+ Returns Message +/
  /*+ Extends/implements PS_PT:Integration:IRequestHandler.OnRequest +/

  Local boolean &succeeded;
  Local integer &i;
  Local string &temp, &name, &value;
  Local string &errorText;
  Local string &ibTransID, &pageNum, &HTTP_IfNoneMatch, &HTTP_IfModifiedSince, =>
  &DefaultLocalNode;

  Local Message &responseMsg;
  Local XmlDoc &xmlDoc;

```

```

Local PTFP_FEED:FeedFactory &feedFactory_inst;
Local PTFP_FEED:UTILITY:Utility &utility = &feedFactory_inst.Utility;
Local PTFP_FEED:XML_FEED:FeedDoc &feedDoc;
Local PTFP_FEED:UTILITY:FeedRequest &request;
Local PTFP_FEED:Interface:IBGetFeedList &feedListObj;

/* Ccreate the Search Request object */
&request = create PTFP_FEED:UTILITY:FeedRequest("FeedRequest");

/* Get the search criteria */
For &i = 1 To &pRequestMsg.IBInfo.IBConnectorInfo.GetNumberOfQueryStringArgs()

    &name = &pRequestMsg.IBInfo.IBConnectorInfo.GetQueryStringArgName(&i);
    &value = &pRequestMsg.IBInfo.IBConnectorInfo.GetQueryStringArgValue(&i);
    &succeeded = &request.addParameter(&name, &value);

    Evaluate Upper(&name)
    When Upper(&utility.QUERYPARAMETER_FEEDLIST)
        /* Feed List Request, forward the call */
        &feedListObj = create PTFP_FEED:Interface:IBGetFeedList();
        Return &feedListObj.OnRequest(&pRequestMsg);

    When Upper(&utility.QUERYPARAMETER_PORTALNAME)
        &request.PortalName = &value;
        Break;

    When Upper(&utility.QUERYPARAMETER_NODENAME)
        &request.NodeName = &value;
        Break;

    When Upper(&utility.QUERYPARAMETER_DATATYPEID)
        &request.DataTypeID = &value;
        Break;

    When Upper(&utility.QUERYPARAMETER_FEEDID)
        &request.FeedID = &value;
        Break;

    When Upper(&utility.QUERYPARAMETER_LANGUAGE)
        &request.LanguageCode = &value;
        Break;

    When Upper(&utility.QUERYPARAMETER_IBTRANSID)
        &ibTransID = &value;
        Break;

    When Upper(&utility.QUERYPARAMETER_PAGENUM)
        &pageNum = &value;
        Break;

    When Upper(&utility.QUERYPARAMETER_DEFLOCALNODE)
        &DefaultLocalNode = &value;
        Break;

    /* HTTP Conditonal Headers */
    When Upper(&utility.QUERYPARAMETER_IFNONEMATCH)
        &HTTP_IfNoneMatch = &value;
        Break;

    When Upper(&utility.QUERYPARAMETER_IFMODIFIEDSINCE)
        &HTTP_IfModifiedSince = &value;

```

```

        Break;

    End-Evaluate;
End-For;

/* Get the current user PS_TOKEN */
&request.PS_TOKEN = GenToken();

/* Get the FeedDoc */
&errorText = "";

try

    &feedDoc = &feedFactory_inst.getFeedDoc(&request);

catch PTFP_FEED:EXCEPTION:NotFoundException &ex1
    &errorText = MsgGetExplainText(219, 3112, "(Message not found) Not Found");

catch PTFP_FEED:EXCEPTION:PrivilegeException &ex2
    &errorText = MsgGetExplainText(219, 3113, "(Message not found) ⇒
Not Authorized");

catch PTFP_FEED:EXCEPTION:FeedException &ex3
    &errorText = &utility.getExceptionText(&ex3);

end-try;

/* Create the response message */
&responseMsg = CreateMessage(Operation.PTFP_GETFEED, %IntBroker_Response);

If None(&errorText) Then
    &responseMsg = &utility.setMessageHeadersAndMimeType(&responseMsg, &feedDoc, ⇒
&request);
Else
    &temp = "<?xml version='1.0' encoding='UTF-8'?><ErrorMessage>" | &errorText ⇒
| "</ErrorMessage>";
    &xmlDoc = CreateXmlDoc(&temp);
    &responseMsg.SetXmlDoc(&xmlDoc);
    &responseMsg.SegmentContentType = &utility.MIMETYPE_XML;
End-If;

Return &responseMsg;

end-method;

```

Chapter 18

Field Class

This chapter provides an overview of Field class and discusses the following topics:

- Shortcut considerations
- Data Type for a field object
- Scope of a field object
- Field class built-in function
- Field class methods
- Field class properties

Understanding the Field Class

A *field* object, instantiated from the field class, is a single instance of data within a record object, and is based on a field definition.

Accessing or changing the value of a field using the Value property is a common action.

SetDefault is a frequently used method. Name, Enabled, and Type are several commonly used field properties. If you are working with message objects, EditError is also a commonly used field property.

The field class is one of the data buffer access classes.

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Accessing the Data Buffer"

Considerations Using User Interface Properties

All of the field properties related to the user interface, such as the Label property, only return the value previously set in PeopleCode (false, or blank if nothing was set). They do not return the values set for the field in Application Designer.

Shortcut Considerations

An expression of the form

`FIELD.fieldname.property`

or

`FIELD.fieldname.method(. . .)`

is converted to an object expression by using `GetField(FIELD.fieldname)`. For example, the next two lines of code are identical:

```
FIELD.CHECKLIST_DT.Enabled = False;  
GetField(FIELD.CHECKLIST_DT).Enabled = False;
```

An expression of the form

`recname.fieldname.property`

or

`recname.fieldname.method(. . .)`

is converted to an object expression by using `GetField(recname.fieldname)`. For example, the next two lines of code are identical:

```
EMPL_CHECKLIST.CHECKLIST_DT.Enabled = False;  
GetField(EMPL_CHECKLIST.CHECKLIST_DT).Enabled = False;
```

Data Type for a Field Object

Field objects are declared as type `Field`. For example,

```
Local Field &MyField;
```

Scope of a Field Object

A field can only be instantiated from `PeopleCode`.

This object can be used anywhere you have `PeopleCode`, that is, in an application class, Application Engine `PeopleCode`, record field `PeopleCode`, and so on.

Field Class Built-in Functions

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," `GetField`

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions,"
 GetPageField

Field Class Methods

In this section, we discuss the Field class methods in alphabetical order.

AddDropDownItem

Syntax

AddDropDownItem(*CodeString*, *DescriptionString*)

Description

The AddDropDownItem method adds an item to the dropdown list in the control for the field. The first time this method is called, it overrides the prompt table or translate table used to populate the list. Those items no longer appear in the list. Only the items added using this method display.

Subsequent calls to this method adds additional items to the dropdown list. The items added with the first call to the method also display.

If there is an existing value and the dropdown list is changed with these functions, the selection shows as (Invalid value) unless the new list contains an entry with the same code as the existing value.

Considerations Using AddDropDownItem

If the data for the dropdown is language sensitive, the values for the dropdown should come from the message catalog or from a database field that has a related language record, and should not be hard-coded.

A good place for your PeopleCode program to populate a dropdown list is in the RowInit event. This event executes before the page is shown for the first time, so it prevents unnecessary SQL.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>CodeString</i>	Specify the value used to set the field value if this item is selected. Codes longer than the size of the field are truncated.
<i>DescriptionString</i>	Specify the value the end-user sees in the dropdown list.

Returns

None.

Example

Using a hardcoded list is not appropriate for this function because translations do not work. The data must come from the Translate Table (or other record) directly so that the data is translated correctly.

```
Local Rowset &Xlat;

&FLD = GetRecord(Record.JOB).GetField(Field.ACTION);
&FLD.ClearDropDownList();

Evaluate %Component
When Component.JOB_DATA_CONCUR
    &Xlat = CreateRowset(Record.PSXLATITEM);
    &Xlat.Fill("WHERE FILL.FIELDNAME = 'ACTION' AND FILL.FIELDVALUE in =>
('ADL','HIR') and EFFDT = (select max(EFFDT) from PSXLATITEM B where B.FIELDNAME =>
'ACTION' and B.FIELDVALUE in ('ADL','HIR') and EFFDT <= JOB.EFFDT)");

    &Xlat_cnt = &Xlat.ActiveRowCount;
    For &I = 1 To &Xlat_cnt
        &CodeIn = &Xlat.GetRow(&I).GetRecord(1).FIELDVALUE.Value;
        &DescIn = &Xlat.GetRow(&I).GetRecord(1).XLATLONGNAME.Value;

        &FLD.AddDropDownItem(&CodeIn, &DescIn);
    End-For;

    Break;
When-Other
End-Evaluate;
```

See Also

[Chapter 18, "Field Class," ClearDropDownList, page 938](#)

ClearDropDownList

Syntax

```
ClearDropDownList()
```

Description

The ClearDropDownList method clears all items added to the dropdown list using the AddDropDownItem method. In addition, this method causes the prompt table or translate table values defined for the list to come back into effect again (unless they're subsequently overridden again with AddDropDownItem.)

Parameters

None.

Returns

None.

Example

```
&FLD = GetRecord(Record.ABSENCE_HIST).GetField(Field.ABSENCE_TYPE);  
&FLD.AddDropDownItem("CNF", "Conference");  
&FLD.AddDropDownItem("VAC", "Vacation");  
&FLD.AddDropDownItem("SCK", "Sick");  
.  
.  
.  
&FLD.ClearDropDownList();
```

See Also

[Chapter 18, "Field Class," AddDropDownItem, page 937](#)

DecryptPETKey

Syntax

DecryptPETKey()

Description

Use this method to apply PeopleSoft Encryption Technology (PET) to decrypt an PET-encrypted key.

Returns

None.

Example

```
If %Component = Component.CRYPT_KEYSET Then  
    &rec = GetRecord(Record.PSCRYPTKEYSET);  
    DERIVED_CRYPT.CRYPT_KEY = &rec.CRYPT_KEY.DecryptPETKey();  
End-If;
```

See Also

[Chapter 18, "Field Class," EncryptPETKey, page 940](#)

PeopleTools 8.51 PeopleBook: Security Administration, "Securing Data with PeopleSoft Encryption Technology"

EncryptPETKey

Syntax

EncryptPETKey()

Description

Use this method to apply PeopleSoft Encryption Technology (PET) to PET-encrypt a key.

Returns

None.

Example

```
If %Component = Component.CRYPT_KEYSET Then;  
    &crypt_key = GetField(Field.CRYPT_KEY);  
    PSCRYPTKEYSET.CRYPT_KEY = &crypt_key.EncryptPETKey();  
End-If;
```

See Also

[Chapter 18, "Field Class," DecryptPETKey, page 939](#)

PeopleTools 8.51 PeopleBook: Security Administration, "Securing Data with PeopleSoft Encryption Technology"

GetAuxFlag

Syntax

GetAuxFlag(*FlagNumber*)

Description

Use the GetAuxFlag method to determine whether the Auxiliary Flag Mask specified by *FlagNumber* has been set for a field.

Currently, only one flag comes preset from PeopleSoft: a 1 indicates a ChartField.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>FlagNumber</i>	Specify the flag number. 1 is a ChartField. Valid values are between 1 and 32.

Returns

A Boolean value: True, the flag is set, False if the flag hasn't been set.

Example

```
&field = GetField(Field.RC_TEST_PB);
&ret = &field.GetAuxFlag(1);
If (&ret = True) Then
    MessageBox(0, "Metadata Fn Status", 0, 0, "Aux Flag 1 is SET - ChartField");
Else
    MessageBox(0, "Metadata Fn Status", 0, 0, "Aux Flag 1 is NOT SET - Not a ChartField");
End-If;
```

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," SetDBFieldAuxFlag

GetLongLabel

Syntax

GetLongLabel(*LabelID*)

Description

The GetLongLabel method returns the long name for a field given a label ID. If the given label ID isn't found, a null string is returned. *LabelID* takes a string value.

Note. If a button is defined as an HTML button or hyperlink, and if it has an associated record field, the label associated with it is only the text of the button. The mouse-over text can only be changed by the label if the button is defined as a button with an Image label.

Returns

A text string containing the long name of the field for the specified label ID.

Example

The following code sets the label for a field to one of two different texts, based on the page.

```
Local Field &FIELD;

&FIELD = GetField(RECORD.MYFIELD);
  If %Page = PAGE.PAGE1 Then
    &FIELD.Label = &FIELD.GetLongLabel("LABEL1");
  Else If %Page = PAGE.PAGE2 Then
    &FIELD.Label = &FIELD.GetLongLabel("LABEL2");
End-If;
```

If the Label ID is the same as the name of the field, you could use the following:

```
&LABELID = &FIELD.Name;
&FIELD.Label = &FIELD.GetLongLabel(&LABELID);
```

See Also

[Chapter 18, "Field Class," GetShortLabel, page 943](#); [Chapter 18, "Field Class," Label, page 960](#) and [PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," SetLabel](#)

GetRelated

Syntax

GetRelated(*recname.fieldname*)

Description

The GetRelated method returns a field object for a related field *recname.fieldname* that has the field executing the method as its control field.

This method is similar to the GetRelField built-in function, however, the built-in works only in the current context, while this method can be applied to a field from any position in the buffer structure.

Using GetRelated With a Control Field

PeopleCode events on the Control Field can be triggered by the Related Edit field. When this happens, there can be different behavior than with other types of fields:

- If the events are called from FieldEdit of the Control Field, and that FieldEdit is triggered by a change in the Related Edit field, the functions return the previous value.
- If the events are called from FieldChange of the Control Field, and that FieldChange is triggered by a change in the Related Edit field, the functions return the value entered into the Related Edit. This may be a partial value, that will subsequently be expanded to a complete value when the processing is complete.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>recname.fieldname</i>	Specifies a field in the same row as the current field object, that has the field executing the method as its control field.

Returns

The field object for the field with the specified name that is related to the field executing the method.

Example

In the following example, the field object is instantiated, then the related display field object. The Value property for the related display is changed, it is disabled, and another variable is assigned its value.

```
Local Field &FIELD, &REL_FIELD;

&FIELD = GetField(OPC_9A2FIELDS.COMPANY);
/* control field object */
&REL_FIELD = &FIELD.GetRelated(COMPANY_TBL.DESCR);
/* related display object */
&REL_FIELD.Value = "Change";
&REL_FIELD.Enabled = False;
&TMP = &REL_FIELD.Name;
&REL_FIELD.Value = &TMP;
```

If you were not going to use the &FIELD variable later, the first two lines of code in the previous example could be combined:

```
&REL_FIELD = GetField(OPC_9A2FIELDS.COMPANY).GetRelated(COMPANY_TBL.DESCR);
```

Suppose you had two control fields, EMPLID and MANAGER_ID, and both use the NAME field on the PERSONAL_DATA table as their related display. If you need to access both related display fields, you could do the following:

```
&NAME_EMPLID = GetField(PERSONAL_DATA.EMPLID).GetRelated(PERSONAL_DATA.NAME);
&NAME_MANAGER = GetField(PERSONAL_DATA.MANAGER_ID).GetRelated(PERSONAL_DATA.NAME);
```

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetField

GetShortLabel

Syntax

```
GetShortLabel(LabelID)
```

Description

The GetShortLabel method returns the short name for a field given a label ID. If the given label ID isn't found, a null string is returned. *LabelID* takes a string value.

Note. If a button is defined as an HTML button or hyperlink, and if it has an associated record field, the label associated with it is only the text of the button. The mouse-over text can only be changed by the lable if the button is defined as a button with an Image label.

Returns

A text string containing the short name of the field for the specified label ID.

Example

The following code sets the label for a field to one of two different texts, based on the page.

```
Local Field &FIELD;

&FIELD = GetField(RECORD.MYFIELD);
  If %Page = PAGE.PAGE1 Then
    &FIELD.Label = &FIELD.GetShortLabel("LABEL1");
  Else If %Page = PAGE.PAGE2 Then
    &FIELD.Label = &FIELD.GetShortLabel("LABEL2");
End-If;
```

If the Label ID is the same as the name of the field, you could use the following:

```
&LABELID = &FIELD.Name;
&FIELD.Label = &FIELD.GetShortLabel(&LABELID);
```

See Also

[Chapter 18, "Field Class," GetLongLabel, page 941](#); [Chapter 18, "Field Class," Label, page 960](#) and *PeopleTools 8.51 PeopleBook: PeopleCode Language Reference*, "PeopleCode Built-in Functions," SetLabel

SearchClear

Syntax

SearchClear ()

Description

The SearchClear method clears the field values if the field is a search key.

Considerations Using SearchClear and SetDefault

The SetDefault method causes a field to be set to its default value (if there is one) immediately after SearchInit PeopleCode finishes. SetDefault overrides SearchClear. If you call SearchClear for a record, then use SetDefault for a field, the field is set to its default value and the search key values for the rest of the record are cleared.

Parameters

None.

Returns

None.

Example

```
Local Field &FIELD;  
  
&FIELD = GetField(PERSONAL_DATA.EMPLID);  
&FIELD.SearchClear();
```

See Also

[Chapter 18, "Field Class," SetDefault, page 946](#) and [Chapter 34, "Record Class," SearchClear, page 2083](#)

SetCursorPos

Syntax

SetCursorPos(PAGE.pagename | %Page)

Description

The SetCursorPos method enables you to set the focus to the page field corresponding to the field object (on the specified page). The current page may be specified as %Page.

Restrictions on Use with a Component Interface

This function is ignored (has no effect) when used by a PeopleCode program that's been called by a Component Interface.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Pagename</i>	The name of the page, preceded by the keyword Page . The <i>pagename</i> page must be in the current component. You can also pass the %page system variable in this parameter (without the Page reserved word).

Returns

None.

Example

The following pseudo-code enables you to set the focus to a related field:

```
GetField(ControlRec.ControlField).GetRelated(RelatedRec.RelatedField).SetCursorPos⇒
(PAGE.pagename);
```

See Also

Chapter 18, "Field Class," *SetDefault*, page 946 and *PeopleTools 8.51 PeopleBook: PeopleCode Language Reference*, "PeopleCode Built-in Functions," *SetCursorPos*

SetDefault

Syntax

SetDefault()

Description

SetDefault sets the value of the field to a null value, or to a default, depending on the type of field.

- If this method is used against data from the component buffers, the next time default processing occurs, it is set to its default value: either a default specified in its record field definition or one set programmatically by PeopleCode located in a FieldDefault event. If neither of these defaults exist, the Component Processor leaves the field blank.
- If this method is used with a field that isn't part of the data buffer (for example, a field in a record object instantiated with CreateRecord) the field is automatically set to its default value if one is set for the *field*, not for the record field. Any FieldDefault PeopleCode will not be run on these types of fields. If you want to set the default values for all the fields in a record, use the SetDefault record class method.

Blank numbers correspond to zero on the database. Blank characters correspond to a space on the database. Blank dates and long characters correspond to NULL on the database. SetDefault gives each field data type its proper value.

Parameters

None.

Returns

None.

Example

```
&CHARACTER.SetDefault();
```

See Also

Field Class Properties

In this section, we discuss the Field class properties. The properties are discussed in alphabetical order.

DataAreaCollapsed

Description

This property specifies whether the default initial view of the data area of a group box is collapsed or expanded.

Note. You must set the Collapsible Data Area on the properties for the group box in Application Designer for this property to have any effect.

This property changes to reflect the current state of the data area, according to whether the user has collapsed or expanded it. Changing the value collapses or expands the data area, but it does *not* prevent the user from collapsing (or expanding) it themselves.

Note. Because the user can change the value of this property, whatever value is set in PeopleCode isn't guaranteed to be still set the next time it is checked, because the user may have collapsed or expanded the data area in the meantime.

This property overwrites the value of the Default Initial View to Expanded field set in Application Designer. For example, if Default Initial View to Expanded is selected in Application Designer, then the value for the DataAreaCollapsed property is set to True, the control initially displays collapsed.

This property takes a Boolean value: True, initially display the data area collapsed, False, initially display the data area expanded.

This property is read-write.

Note. If you want to collapse an entire level-based control, such as a scroll area or a grid, use the `DataAreaCollapsed Rowset` method.

See Also

Chapter 36, "Rowset Class," `DataAreaCollapsed`, page 2150

DecimalPosition

Description

Use this property to specify the number of digits after the decimal point to be displayed for a field defined as number or signed number.

This property *overwrites* the Decimal Positions value defined for a field in Application Designer.

Setting the `DecimalPosition` property to a smaller number than the record field's decimal position causes the displayed data to be truncated. For example, suppose a numeric field in the database has a value 0.005. Setting `DecimalPosition` to 2 displays 0.00 on page.

This property takes an integer value. The default value is -1, which indicates that the property is not set.

This property is read-write.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Creating Field Definitions," Specifying Number Field Attributes

DisplayFormat

Description

Use this property to specify a custom format to use for the field.

This property is read-write.

The custom format for a field is specified in the field definition. This property enables you to switch between display formats that are defined as part of a custom format. For example, suppose your field used the `PHONE-INTL` custom format:

PHONE-INTL format

Both the LONG and the SHORT stored formats have two display formats: STANDARD and UNFORMATTED.

Using this property, you could select either of the display formats. For example:

```
If %Component = PAGE.INTERNATIONAL
    &CHAR.DisplayFormat = "STANDARD";
Else
    &CHAR.DisplayFormat = "UNFORMATTED";
End-If;
```

Note. You *cannot* change the Stored format, but you can find its value using the StoredFormat property.

Example

```
&CHARACTER.DisplayFormat = "STANDARD";

/* this assumes that &CHARACTER is a custom formatted field,
and a display format option is STANDARD */
```

See Also

[Chapter 18, "Field Class," StoredFormat, page 970](#)

DisplayOnly

Description

This property is set to true if the field property DisplayOnly in the Application Designer is set. May be set to false to change how the field displays.

Note. This property *overwrites* whatever value is set in Application Designer.

This property is read-write.

DisplayZero

Description

Use this property to specify if, in a numeric field, zeros or blank are displayed on a page.

This property *overwrites* the Display Zero value on the page field properties dialog box in Application Designer.

This property takes a Boolean value: true, display zeros, false, display blank. The default values is false.

The value of the DisplayZero property can be changed by the SmartZero property.

If SmartZero is set to true, and your application sets DisplayZero to false in a PeopleCode program, the application server changes the value of DisplayZero to true to display zeros, not blanks. When this occurs, the DisplayZeroChanged property is set to true.

This property is read-write.

See Also

[Chapter 18, "Field Class," DisplayZeroChanged, page 950](#) and [Chapter 18, "Field Class," SmartZero, page 969](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Creating Field Definitions," Specifying Attributes for a New Field Definition

DisplayZeroChanged

Description

Use this property to determine if the original DisplayZero property has been changed from its original setting.

The DisplayZeroChanged property is only relevant when the SmartZero property has been set to true. When SmartZero equals true, the application server adjusts the DisplayZero property to display a blank or zero based on the user's input. You can then check the DisplayZeroChanged property to find out if the application server has changed the DisplayZero property.

This property takes a Boolean value: true, the application server has changed the field's DisplayZero property, false otherwise.

For example, suppose you have a PeopleCode program in the RowInit event that sets the DisplayZero property for a field to True, and also sets the SmartZero property to True. When a user deletes the numeric zero in that field on the page, and the page is submitted to the application server, the application server sets the field's DisplayZero property to False so that the new page displays a blank, not a numeric zero. The DisplayZeroChanged property is set to true in this example.

This property is read-only.

See Also

[Chapter 18, "Field Class," DisplayZero, page 950](#) and [Chapter 18, "Field Class," SmartZero, page 969](#)

EditError

Description

This property is True if an error for this field has been found after executing the ExecuteEdits method with either a message object or a record object. This property can be used with the MessageSetNumber and MessageNumber properties to find the error message set number and error message number.

The EditError property returns True if a Null value was encountered for this field.

This property is read-write. After you have fixed the errors, you must set this property to False before running ExecuteEdits again.

Example

The following is an example showing how EditError, along with the ExecuteEdits method could be used:

```
&REC.ExecuteEdits();
If &REC.IsEditError Then
    For &I = 1 to &REC.FieldCount
        If &REC.GetField(&I).EditError Then
            LOG_ERROR(); /* application specific pgm */
        End-If;
    End-For;
End-If;
```

See Also

[Chapter 34, "Record Class," ExecuteEdits, page 2074](#); [Chapter 25, "Message Classes," ExecuteEdits, page 1262](#); [Chapter 18, "Field Class," MessageNumber, page 962](#) and [Chapter 18, "Field Class," MessageSetNumber, page 963](#)

Enabled

Description

This property is True if this field is enabled. May be set False to disable any control that displays this field.

This property is read-write.

Example

```
&CHARACTER.Enabled = True;  
&CHARACTER.Enabled = False;
```

FieldLength

Description

This property returns the length of the field as a number.

This property is read-only.

Example

```
&MyRec = CreateRecord(Record.BKREC1);  
&MyField = &MyRec.GetField(Field.BKNAME);  
&length = &MyField.FieldLength;  
MessageBox(0, "Field Length", 0, 0, "The field BKREC1.BKNAME is length " | =>  
    &length);
```

FormatLength

Description

This property returns the length of the format for the field as a number.

This property is read-only.

Example

```
&field = GetField(Field.BKTEST);
&formatlength = &field.FormatLength;
&length = &field.FieldLength;
&mymsg = "Field.BKTEST length is " | &length | " and format length is " | =>
    &formatlength;
MessageBox(0, "MetaData Fn Status", 0, 0, &mymsg);
```

FormattedValue

Description

This property returns the value of a field as a string, formatted exactly as it would be displayed on an edit field on a page. This is useful when you're using a prompt field for the label of another field.

Because a record field can be bound to more than one page field, FormattedValue takes the first associated page field, looking first on the current page, then through all the pages in the component. This property returns a null string ("") if used with an Image or ContentReference field. It also returns a null string if no associated page field is found.

This property is read-write.

Example

This property could be used to set up a hyperlink labeled by data generated on a page. To do this, do the following:

1. Define a work field.
2. Associate the work field with the hyperlink page field.
3. Define a hidden page field with the formatting that you want.
4. Associate the hidden page field with the data field.
5. Write PeopleCode (probably for RowInit) to set the label on the work field to be the FormattedValue of the data field.

For example, suppose you wanted a hyperlink labeled by the QE_POSITION_ID field on the QE_PLYR_POSITN record. This field is a prompt table field, edited by table QE_POSITION.

You want to display the DESCRSHORT field from the prompt table, instead of the QE_POSITION_ID code value. Create a work field, POS_LINK on the WORK_REC record, and create a hyperlink page field associated with the DESCRSHORT field. For the label, create an invisible drop-down list page field, associated with QE_PLYR_POSITN.QE_POSITION_ID. Set its Prompt Table Field to DESCRSHORT. Then put a PeopleCode program on the component RowInit for either the QE_PLYR_POSITN record or the WORK_REC.

```
WORKREC.POS_LINK.Label = QE_PLYR_POSITN.QE_POSITION_ID.FormattedValue;
```

HoverText

Description

Use this property to override the hover text for any push buttons or hyperlinks associated with the field. The maximum length of hover text is 100 characters. If the hover text is identical to the push button or hyperlink label, the hover text will not be shown.

Important! Even if the hover text has been set in Application Designer, this property returns a blank string if you use the property before you've explicitly set it in PeopleCode. This property overrides the existing value only. When a user navigates away from the component, and then back to the page again, the original value is used until it's changed again through PeopleCode.

This property is read-write.

Example

```
QE_ABSENCE_HIST.QE_ABSENCE_TYPE.HoverText = MsgGetText(95, 5037, "Personalize⇒  
Layout");
```

See Also

[Chapter 18, "Field Class," Label, page 960](#)

IsAltKey

Description

This property is True if this field references a field definition that is defined as an Alternate Search key in the associated record definition.

This property is read-only.

IsAuditFieldAdd

Description

This property is True if this field references a field definition that is defined as an audit field in the associated record definition, and the field is audited whenever new data is added.

This property is read-only.

IsAuditFieldChg

Description

This property is True if this field references a field definition that is defined as an audit field in the associated record definition, and the field is audited whenever data is changed.

This property is read-only.

IsAuditFieldDel

Description

This property is True if this field references a field definition that is defined as an audit field in the associated record definition, and the field is audited whenever data is deleted.

This property is read-only.

IsAutoUpdate

Description

This property is True if this field references a field definition that is defined as an Auto-Update field in the associated record definition.

This property is read-only.

IsChanged

Description

This property returns True if the value for the field has been changed.

Note. Use this property with the primary database record only. It will not return valid results if used with a work record.

This property is read-only.

Example

```
If &CHARACTER.IsChanged Then  
    Warning ("The character field has been changed");
```

End-If;

IsDateRangeEdit

Description

This property is True if this field references a field definition that is defined as requiring a Reasonable Date in the associated record definition.

This property is read-only.

IsDescKey

Description

This property is True if this field references a field definition that is defined as a descending key in the associated record definition.

This property is read-only.

IsDuplKey

Description

This property is True if this field references a field definition that is defined as a duplicate key in the associated record definition.

This property is read-only.

IsEditTable

Description

This property is True if this field references a field definition that has a table edit type of a Prompt Table with Edit.

This property is read-only.

IsEditXlat

Description

This property is True if this field references a field definition that has a table edit type of a Translate Table Edit.

This property is read-only.

IsFromSearchField

Description

This property is True if this field references a field definition that is defined as a From Search Field in the associated record definition.

This property is read-only.

IsInBuf

Description

This property returns True if the data of the field is present in the data buffers. For example, all of the fields of a derived record are not present in the data buffer.

This property is read-only.

Example

The following example iterates over all the fields in a record. The code verifies that the data for the field is accessible before it tries to assign the value to a variable.

```
For &I = 1 to &REC.FieldCount
    &FIELD = &REC.GetField(&I);
    If &FIELD.IsInBuf Then
        &VALUE = &FIELD.Value;
        /* do other processing */
    End-If;
End-For;
```

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Referencing Data in the Component Buffer," Record Fields and the Component Buffer

IsKey

Description

This property is True if this field references a field definition that is defined as a primary key of the associated record definition.

This property is read-only.

Example

```
If &CHARACTER.IsKey Then
    Warning ("The field " | &Character.Name | " is a key");
End-If;
```

IsListItem

Description

This property is True if this field references a field definition that is defined as a List Box item of the associated record definition.

This property is read-only.

IsNotUsed

Description

This property is True if this field has been set as NotUsed with the SetDBFieldNotUsed function.

This property is read-only.

Example

```
&field = GetField(Field.RC_TEST_PB);
&ret = &field.IsNotUsed;
If (&ret = True) Then
    MessageBox(0, "MetaData Fn Status", 0, 0, "Field is NOTUSED");
Else
    MessageBox(0, "MetaData Fn Status", 0, 0, "Field is used.");
End-If;
```

IsRequired

Description

This property is True if this field references a field definition that is defined as Required in the associated record definition.

This property is read-only.

IsRichTextEnabled

Description

This property is True if this field is a long edit box with the rich text editor enabled.

This property is read-only.

IsSearchItem

Description

This property is True if this field references a field definition that is defined as a Search key in the associated record definition.

This property is read-only.

IsSystem

Description

This property is True if this field references a field definition that is defined as System Maintained field in the associated record definition.

This property is read-only.

IsThroughSearchField

Description

This property is True if this field references a field definition that is defined as a Through Search Field in the associated record definition.

This property is read-only.

IsUseDefaultLabel

Description

This property is True if this field references a field definition that has its label defined as Use Default Label in the associated record definition.

This property is read-only.

IsYesNo

Description

This property is True if this field references a field definition that has a table edit type of a Yes/No Table Edit.

This property is read-only.

Label

Description

Use this property to override the label text for the field when it's displayed on a page.

Important! Even if the label text has been set in Application Designer, this property returns a blank string if you use the property before you've explicitly set it in PeopleCode. This property overrides the existing value only. When a user navigates away from the component, and then back to the page again, the original value is used until it's changed again through PeopleCode.

To set the label in PeopleCode, use this property or the SetLabel built-in function. To return the text of a label before you set it, use the GetShortLabel or GetLongLabel methods.

Note. You can't use this property to set labels longer than 100 characters. If you try to set a label of more than 100 characters, the label is truncated to 100 characters.

The "tool tip," or mouse over text, that appears with a hyperlink at runtime comes from the RFT long label assigned to the record field. However, the RFT long label displays only if it is different from the assigned display value of the hyperlink and it is not null. If the link is an image button, the tool tip is derived from the label text if there is any. Otherwise, the RFT long label is used.

This property is read-write.

Example

The following code sample changes all the field labels for a record to the short label. It assumes that there is a label with the same name as the name of the field for all fields in the record.

```
Local Field &FLD;
Local Record &REC;

If CHECK_FIELD Then
    &REC = GetRecord();
    For &I = 1 to &REC.FieldCount
        &FLD = &REC.GetField(&I);
        &LABELID = &FLD.Name;
        &FLD.Label = &FLD.GetShortLabel(&LABELID);
    End-For;
End-If;
```

See Also

[Chapter 18, "Field Class," GetShortLabel, page 943](#) and [Chapter 18, "Field Class," GetLongLabel, page 941](#)

LabelImage

Description

Use this property to override the image for a button. This property is only valid for button controls. This property can be set even when the button is disabled or display-only.

Important! Even if the image has been set in Application Designer, this property returns a blank string if you use the property before you've explicitly set it in PeopleCode. This property overrides the existing value only. When a user navigates away from the component, and then back to the page again, the original value is used until it's changed again through PeopleCode.

The value for this property can be either of the following:

Image. *imagename*

or

"Imagename"

Oracle strongly recommends that if the PeopleCode program sets the LabelImage for an active button, it also sets the image appropriately if the button is disabled.

This property is read-write.

Example

```
Local Field &MyField;

&MyField = GetField(BUTTON_BOTTOM);
&MyField.LabelImage = Image.BTN_REFRESH;
```

LongTranslateValue

Description

This property returns a string that contains the Long translate (XLAT) value of the field if the field is based on a translate table.

If the field has a null value, a null string is returned. If the field isn't based on a translate table, or the value isn't in the translate table, the field's current value is returned. Because the current value can be of any type, this property has a type of Any.

Note. If you're accessing a field based on the Translate table, the Value property returns only the one or two letter XLAT value.

Use the ShortTranslateValue property to return the short translate value of a field.

This property is read-only.

Example

```
Local Any &VALUE;  
Local Field &MYFIELD;  
  
&MYFIELD = GetField();  
&VALUE = &MYFIELD.LongTranslateValue;  
If ALL(&VALUE) Then  
    /* do processing */  
End-if;
```

MessageNumber

Description

This property returns the error message number (as a number) if an error for this field is found after executing ExecuteEdits method. You can use this property in conjunction with the EditError property (which can be used to determine whether there are any errors) and the MessageSetNumber property (which contains the error message set number if an error is found.)

This property is read-only.

Example

```
For &I = 1 to &RECORD.FieldCount
    &MYFIELD = &RECORD.GetField(&I);
    If &MYFIELD.EditError Then
        &MSGNUM = &MYFIELD.MessageNumber;
        &MSGSET = &MYFIELD.MessageSetNumber;
        /* Do processing */
    End-If;
End-For;
```

MessageSetNumber

Description

This property returns the error message set number (as a number) if an error for this field is found after executing ExecuteEdits method. You can use this property in conjunction with the EditError property (which can be used to determine whether there are any errors) and the MessageNumber property (which contains the error message number if an error is found.)

This property is read-only.

Example

```
For &I = 1 to &RECORD.FieldCount
    &MYFIELD = &RECORD.GetField(&I);
    If &MYFIELD.EditError Then
        &MSGNUM = &MYFIELD.MessageNumber;
        &MSGSET = &MYFIELD.MessageSetNumber;
        /* Do processing */
    End-If;
End-For;
```

MouseOverMsgNum

Description

Use this property to override the message number for a message catalog mouse over popup page. Together with the MouseOverMsgSet property, this property uniquely identifies a Message Catalog entry to be used as the mouse over popup page.

The Message Text field from that Message Catalog entry becomes the title of the mouse over popup page; the Explanation field becomes the body of the mouse over popup page.

Important! For this property to have an effect, the page field definition must first be set as a message catalog mouse over popup in Application Designer. This property overrides the existing message number value only. When a user navigates away from the component, and then back to the page again, the original value is used until it's changed again through PeopleCode.

This property is read-write.

Example

For example, the following code could be added to the page Activate event to override the message set and number defined in Application Designer for the popup page associated with the DEBUG_PEOPLECD.DEBUG_CODE field.

```
GetField(DEBUG_PEOPLECD.DEBUG_CODE).MouseOverMsgSet = 2;  
GetField(DEBUG_PEOPLECD.DEBUG_CODE).MouseOverMsgNum = 13;
```

MouseOverMsgSet

Description

Use this property to override the message set number for a message catalog mouse over popup page. Together with the MouseOverMsgNum field property, this property uniquely identifies a Message Catalog entry to be used as the mouse over popup page.

Important! For this property to have an effect, the page field definition must first be set as a message catalog mouse over popup in Application Designer. This property overrides the existing message set value only. When a user navigates away from the component, and then back to the page again, the original value is used until it's changed again through PeopleCode.

This property is read-write.

See Also

[Chapter 18, "Field Class," MouseOverMsgNum, page 963](#)

Name

Description

This property returns the name of the field definition that the field object is based on as a string value.

This property is read-only.

Example

```
WinMessage("The character field's name is : " | &CHARACTER.Name);
```

OriginalValue

Description

This property returns the value of a field, that is, the value that from the database. If the value hasn't been changed and saved by the user, it is the original value from the database. If the value has been changed and saved by the user, it is the existing value in the database.

Note. This property does *not* work for derived records. Original values are the database values, and derived records do not have a corresponding database value.

This property is read-only.

Example

```
&Orig = &MyField.OriginalValue;  
If &Orig = &Date Then  
    /* do current day processing */  
Else  
    /* do other processing */  
End-If;
```

ParentRecord

Description

This property returns a reference to the record object for the record containing the field.

This property is read-only.

Example

```
&NUMBER_OF_FIELDS = &CHARACTER.ParentRecord.Fieldcount;  
/* note that FieldCount is a property of the Record class */
```

PromptTableName

Description

This property returns the name of the prompt table (if any) associated with this field. This property returns a string value. This property returns Null if no prompt table is associated with the field.

This property is read-only.

SearchDefault

Description

If this property is set to True, system defaults (the default values set in the record field definitions) are enabled on search dialogs for the field. Setting this property to True *does not* cause the FieldDefault event to fire.

The system default is done only once, when the search dialog first starts, immediately after any SearchInit PeopleCode. If the user subsequently blanks out a field, the field isn't reset to the default value. Setting SearchDefault to False disables default processing for the field executing the property.

SearchDefault is effective only when used in SearchInit PeopleCode programs.

This property is read-write.

Example

```
&CHARACTER.SearchDefault = True;
```

```
/* assuming &CHARACTER is a search key, and has a default value */
```

This example turns on edits and system defaults for the SETID field in the search dialog box:

```
&SETID = GetField(INV_ITEMS.SETID);  
&SETID.SeachDefault = True;  
&SETID.SearchEdit = True;
```

SearchEdit

Description

If this property is set to True, SearchEdit enables system edits (edits specified in the record field definition) for the field, for the life of the search dialog box. Setting SearchDefault to False disables system edits. In the Add mode search dialog box, the following edits are performed when the end-user clicks the Add button. In any other mode, the following edits are performed when the end-user clicks the Search button:

- Formatting

- Required Field
- Yes/No Table
- 1/0 Table
- Translate Table
- Prompt Table

SearchEdit does not cause the FieldEdit, FieldChange, or SaveEdit PeopleCode events to fire during the search dialog.

You might use SearchEdit to control access to the system. For example, you can apply this function to the SETID field of a dialog box and require the user to enter a valid SETID before they are able to click OK on the search dialog box.

This property is read-write.

Considerations Using SearchEdit

If you use this method in the SearchInit event, the search page options are limited to the "=" and "IN" operators.

Example

```
&CHARACTER.SearchEdit = True;

/* assuming &CHARACTER is a search key, and contains an edit table
such as translate table defined in its field properties. */
```

This example turns on edits and system defaults for the SETID field in the search dialog box:

```
&SETID = GetField(INV_ITEMS.SETID);
&SETID.SeachDefault = True;
&SETID.SearchEdit = True;
```

SetComponentChanged

Description

This property determines whether a change to a field (using PeopleCode) marks the component as changed and the data written to the database if the field is a database field.

This property takes a Boolean value: true, changes to the field mark the component as changed, false, the component is treated as if unchanged. The default value is true for database fields and false for derived fields.

The Set Component Changed checkbox for a page field in Application Designer determines if a user's action on a page marks the component as changed. For example, if Set Component Changed for an edit box control is cleared in Application Designer, then user's editing on the edit box does not mark the component as changed and no save warning message is displayed if the user leaves the page without saving. The SetComponentChanged property for a field determines if a change on the field value using PeopleCode marks the component as changed and a save warning is issued when the user tries to exit the page without saving.

This property is only applicable after the Page Activate event has run. If you try to use this property before or during Page Activate, the user does not receive a warning if data has been changed.

This property is read-write.

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Creating Page Definitions," Setting Use Properties

[Chapter 36, "Rowset Class," SetComponentChanged, page 2157](#)

ShortTranslateValue

Description

This property returns a string that contains the Short translate (XLAT) value of the field if the field is based on a translate table.

If the field has a null value, a null string is returned. If the field isn't based on a translate table, or the value isn't in the translate table, the field's current value is returned. Because the current value can be of any type, this property has a type of Any.

Note. If you're accessing a field based on the translate table, the Value property returns only the one or two letter XLAT value.

Use the LongTranslateValue property to return the long translate value of a field.

This property is read-only.

Example

```
Local Any &VALUE;
Local Field &MYFIELD;

&MYFIELD = GetField();
&VALUE = &MYFIELD.ShortTranslateValue;
If ALL(&VALUE) Then
    /* do processing */
End-if;
```

ShowRequiredFieldCue

Description

With PeopleTools 8, an asterisk (*) is displayed on pages beside fields that are defined as Required in Application Designer. You can use this property to specify whether this asterisk, also called the *required field cue*, is displayed for a particular field.

For example, many fields are made required or non-required either procedurally or through PeopleCode. This means they aren't defined as Required in Application Designer, and the end-user may be confused. For these fields, you can use this property.

Note. This property affects only fields where a required field cue is otherwise permissible. That is, regardless of the setting of the property, no cue is ever shown on a pushbutton, a display-only field, and so on.

This property is read-write.

SmartZero

Description

Use this property to specify if FieldChange PeopleCode programs are run when a user changes a zero to a blank, or a blank to a zero, for a field on a page.

This property takes a Boolean value: true, run FieldChange PeopleCode programs, false, do not. The default value is false.

When you set this property to true, in addition to treating a user change of blank-to-zero and zero-to-blank as a field change, the application server also adjusts the DisplayZero property for the runtime field object to display a blank or zero as entered by the user.

This property is read-write.

See Also

[Chapter 18, "Field Class," DisplayZero, page 950](#) and [Chapter 18, "Field Class," DisplayZeroChanged, page 950](#)

SqlText

Description

This property is valid only for fields that have a dynamic view as their prompt record. If you set SqlText to a non-null value, that text is used instead of the dynamic view's normal text used for prompting.

Important! Even if the SQL text has been set in Application Designer, this property returns a blank string if you use the property before you've explicitly set it in PeopleCode. This property overrides the existing value only. When a user navigates away from the component, and then back to the page again, the original value is used until it's changed again through PeopleCode.

Suppose you wanted to have a different prompt table depending on the settings of other fields in the row. Normally you could use %EDITTABLE to dynamically specify the prompt table you want. However in this case there are too many possible combinations of values, which would require too many views. Furthermore, the values are customizable by the end-user or the application, which means even if you, the developer, wanted to, you couldn't provide all the combinations of views necessary. However you can generate the desired SQL text for the view in PeopleCode based on what the user enters.

If you use a dynamic view as the prompt table, and have the dynamic view contain a SQL object that is updated from PeopleCode, you could achieve this functionality. However, a SQL object is a shared object, so if multiple users used the same page, they overwrite each other's settings and the SQL object contains the SQL for the most recent user. Similarly if a single user had multiple rows on a page, the SQL object is valid only for the most recent row. This means if the user went to another row and did a prompt, they would get the wrong values again.

The purpose of this property is to enable you to specify the generated SQL text independently for each occurrence in each transaction. It enables you to override the text of a dynamic view being used as a prompt table on a field by field basis.

It is up to the developer to verify that the text specified for this property is valid, that is, that it selects the correct number of fields for the record definition, and so on.

This property is read-write.

StoredFormat

Description

This property returns the custom character format (as a string) for the field executing the property.

If the field doesn't have a custom format associated with it, the user receives a runtime error message.

If the field has a display format associated with it, you can change that using the DisplayFormat property.

This property is read-only.

Example

```
WinMessage("The character field's custom stored format is : " | &CHARACTER.Stored⇒
Format);

/* this assumes that &CHARACTER is a custom formatted */
/* field */
```

See Also

[Chapter 18, "Field Class," DisplayFormat, page 948](#)

Style

Description

If a page has a style sheet associated with it, this property can be used to specify a different style class with a field. Use this property to override the existing style class for a field.

Important! Even if the style class has been set in Application Designer, this property returns a blank string if you use the property before you've explicitly set it in PeopleCode. This property overrides the existing value only. When a user navigates away from the component, and then back to the page again, the original value is used until it's changed again through PeopleCode.

This property takes a string value.

This property is read-write.

Example

The following example associates a test field first with a style class depending on the value of the field.

```
Local Field &field;

&field = GetField();

If TESTFIELD1 = 1 Then;
    &field.Style = "PSHYPERLINK";
End-If;

If TESTFIELD1 = 2 Then;
    &field.Style = "PSIMAGE";
End-If;
```

Field with PSHYPERLINK style

Field with PSIMAGE style

Type

Description

This property returns the type of field. The values can be one of the following strings:

- CHAR
- DATE
- DATETIME
- IMAGE (for static images)
- IMAGEREFERENCE
- LONGCHAR
- NUMBER
- SIGNEDNUMBER
- TIME

Note. Fields of type Attachment have a type of IMAGE.

This property is read-only.

Example

```
If &CHARACTER.Type = "NUMBER" Then
    /* perform processing */
Else
    /* error processing */
End-If;
```

Value

Description

This property contains the current value of the field, converted to an appropriate PeopleCode data type.

In most contexts, the Value property can be used to assign a new value to the field. However, there are some restrictions:

- You cannot assign the Value property in any RowSelect PeopleCode program.
- You cannot assign the current record field value to the Value property in any FieldEdit PeopleCode program.

Note. If you're accessing a field based on the translate table, Value returns only the one letter XLAT value. To get the full XLAT value, use the LongTranslateValue or ShortTranslateValue properties.

This property is read-write.

Considerations Using INSTALLATION or OPTIONS Tables

When using the INSTALLATION or OPTIONS table, you cannot use the Value property. You must use the old style format, not the field object format. For example, the following code is invalid:

```
If %Page = Page.GP_RUN_TYPE And
    INSTALLATION.TL.Value = "N" Then
    &RS2.HideAllRows();
```

While the following code is valid:

```
If %Page = Page.GP_RUN_TYPE And
    INSTALLATION.TL = "N" Then
    &RS2.HideAllRows();
```

Considerations Using Character Values

Previously, if you had an edit-box field, and if the end-user selected the value in it and deleted the value, leaving the field empty, the value of the field in PeopleCode was not an empty (zero-length) string.

Now, the value of such a field is an empty (zero-length) string.

In addition, if the user adds one or more space characters to a field, the field still returns a Null string.

The following is how to check for this:

```
If (fieldname.Value = "") Then
```

Example

```
&CHARACTER.Value = "Hello";
```

See Also

[Chapter 18, "Field Class," LongTranslateValue, page 962](#) and [Chapter 18, "Field Class," ShortTranslateValue, page 968](#)

Visible

Description

This property is True if this field is visible in the page displaying it. Setting this property to False hides the field. Because every field is implicitly associated with a rowset, row, and record, setting the Visible property for a field on the first page of a component hides only that field. If that field is repeated on other pages in the component, the other occurrences of the field aren't hidden.

This property is read-write.

Example

The following code hides the field &ROUND_OPTION based on the value of AVG_DFLT_OPTION:

```
Local field &ROUND_OPTION;  
  
&ROUND_OPTION = GetField();  
  
If AVG_DFLT_OPTION = "Y" Then  
    &ROUND_OPTION.SetDefault();  
    &ROUND_OPTION.Visible = True;  
Else  
    &ROUND_OPTION.Visible = False;  
End-If;
```

Chapter 19

File Class

This chapter describes the File class, which provides methods and properties for reading from and writing to external files and discusses the following topics:

- Data type of a file object
- Scope of a file object
- File security considerations
- File access interruption recovery
- Plain text files
- Automatic PeopleCode generation
- File layout error processing
- File class built-in functions
- File class methods
- File class properties
- File layout examples
- Multiple file layouts

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Constructing File Layouts and Performing Data Interchanges"

Understanding File Layout

PeopleTools supports reading and writing to plain text files, and to files that have a format based on a File Layout definition that has been created in Application Designer.

- If the file is a plain text file, data is read or written using text strings.
- If the file is based on a File Layout, you can use text strings, rowset, or record objects.

This simplifies reading, writing, and manipulating hierarchical transaction data with PeopleCode.

File layout methods and properties are noted as such in their descriptions.

[Chapter 19, "File Class," Plain Text Files, page 978](#)

[Chapter 19, "File Class," File Layout Examples, page 1016](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Constructing File Layouts and Performing Data Interchanges"

Data Type of a File Object

The File Object is an instance of the File class. A file object is declared using the File data type. For example,

```
Local File &MYFILE;
```

This creates an object &MYFILE of the class File.

Scope of a File Object

A file object can only be instantiated from PeopleCode. This object can be used anywhere you have PeopleCode, that is, in an application class, Component Interface PeopleCode, record field PeopleCode, and so on.

A file object is passed to and returned from PeopleCode functions and methods as a reference, so the file object is never copied; rather, alternate identifiers are used to refer to the same object. Any change made to a file using one identifier has the same effect as it would with any other identifier for that file.

In the following code example, two variables, &F1 and &F2, are declared by using the data type File. The file is opened using the GetFile built-in function. Next, &F1 is assigned to &F2. This does *not* copy &F1 to &F2. Instead, &F1 and &F2 both refer to the same object. Therefore, in the last step when &F2 is closed, &F1 is closed too.

```
Local File &F1, &F2;

&F1 = GetFile("somefile.txt", "R");
If &F1.IsOpen Then
    &F2 = &F1;
    &F2.Close(); /* Now &F1 is also closed. */
End-if;
```

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Understanding Objects and Classes in PeopleCode," Assigning Objects

File Security Considerations

When you're using file objects in PeopleCode that might run on a server, you must be aware of some security concerns. The underlying system doesn't provide security checks on access to the files. Instead, the PeopleCode programs use whatever authority the server process has, and *not* that of the user. This means you must write your PeopleCode program to prevent the user from reading or writing files that they should not. In particular, be especially wary of opening files where any part of the filename is derived from user input.

File Access Interruption Recovery

You can use the `GetPosition` or `SetPosition` methods to minimize the loss of work in the event of a system failure during file access. To use them and recover from access interruptions, you must access the file in Update mode using the `GetFile` built-in function or the `Open` method, specifying the mode parameter "U". You need to use this mode in anticipation of possible interruptions if you want to recover from them later.

To start reading or writing from the beginning of a file, use `SetPosition` to set a read/write position of 0, immediately after you open the file in Update mode.

Warning! In Update mode, any write operation clears the file of all data that follows the position you set.

When reading from or writing to a file, use `GetPosition` periodically to determine your current byte position in the file. This establishes a checkpoint to which you can return after a failure. You must save the checkpoint value in a separate file or a database so you can retrieve it later. How often you save a checkpoint depends on your requirements: the less work you want to redo, the more frequent your checkpoints should be. You may also want to save information identifying the data you're reading or writing at the time.

After a failure interrupts your file access, reopen the file in Update mode. You can then retrieve the last checkpoint value you saved, and use `SetPosition` to apply that value. Your read/write position in the file is the position of the last checkpoint, and you can continue reading or writing from there.

Use the Update mode with `GetPosition` and `SetPosition` only for recovering from interruptions as described here, or for starting at the beginning of the file again.

Note.

For fixed-width file layouts, the field start positions and lengths are computed in 8-bit bytes, except in the case of UCS2 or UTF-16 where they are computed in 16-bit double-bytes. This may create complications when using variable width encodings (for example, UTF-8 or Shift-JIS), when the data is elsewhere calculated in characters (rather than bytes), because the data involved may contain characters of varying byte-width.

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetFile

Plain Text Files

To read and write from plain text files involves reading and writing strings of data. These text strings can be manipulated with built-in string functions, like RTrim, Find, Replace, and so on.

Note. If your data is hierarchical in nature, or based on existing PeopleSoft records or pages, use a File Layout definition for reading and writing your data, rather than doing it line by line (or field by field.)

The following example creates an array of array of string, then reads in two files, one into each "column" of the array. The Names file contains names; the Numbers file contains employee numbers. The ReadLine method reads each successive line in a file, until it reaches the end of the file.

Notice that the first file is opened using the GetFile function. The second file is not opened using GetFile, but rather with the Open method. After the data is read into the array, you can do processing on the data. The end of the program writes the changes back to the files, using the WriteLine method, which includes a system end of line character at the end of every line.

```

Local array of array of string &BOTH;
Local File &MYFILE;
Local string &HOLDER;

/* Create empty &BOTH array */
&BOTH = CreateArrayRept(CreateArrayRept("", 0), 0);

/* Read first file into first column */

&MYFILE = GetFile("names.txt", "R");
While &MYFILE.ReadLine(&HOLDER);
    &BOTH.Push(&HOLDER);
End-While;

/* read second file into second column */

&MYFILE.Open("numbers.txt", "R");
&LINENO = 1;
While &MYFILE.ReadLine(&HOLDER);
    If &LINENO > &BOTH.Len Then
        /* more number lines than names, use a null name */
        &BOTH.Push(CreateArray("", &HOLDER));
    Else
        &BOTH[&LINENO].Push(&HOLDER);
    End-If;
    &LINENO = &LINENO + 1;
End-While;

/* if more names than numbers, add null numbers */
For &LINENO = &LINENO to &BOTH.Len
    &BOTH[&LINENO].Push("");
End-For;
&MYFILE.Close();
/* do processing with array */
/* write data back to files */

&MYFILE1 = GetFile("names.txt", "A");
&MYFILE2 = GetFile("numbers.txt", "A");

/* loop through array and write to files */

For &I = 1 To &BOTH.Len
    &STRING1 = &BOTH[&I][1];
    &MYFILE1.writeline(&STRING1);
    &STRING2 = &BOTH[&I][2];
    &MYFILE2.writeline(&STRING2);
End-For;

&MYFILE1.Close();
&MYFILE2.Close();

```

[Chapter 19, "File Class," File Layout Examples, page 1016](#)

Automatic PeopleCode Generation

After you create a File Layout definition, you can use PeopleCode to access it. This PeopleCode can be long and complex. Rather than write it directly, you can drag and drop the File Layout definition from Application Designer Project View into an open PeopleCode edit pane. This is primarily used for importing data. Application Designer analyzes the definition and generates initial PeopleCode as a template, which you can modify to meet your requirements.

The following is just a snippet of the code that is generated:

```
Function EditRecord(&REC As Record) Returns boolean ;
    Local integer &E;
    REM    &REC.ExecuteEdits(%Edit_Required + %Edit_DateRange + %Edit_YesNo + %Edit_⇒
    TranslateTable + %Edit_PromptTable + %Edit_OneZero);
    &REC.ExecuteEdits(%Edit_Required + %Edit_DateRange + %Edit_YesNo + %Edit_One⇒
    Zero);
    If &REC.IsEditError Then
        For &E = 1 To &REC.FieldCount
            &MYFIELD = &REC.GetField(&E);
            If &MYFIELD.EditError Then
                &MSGNUM = &MYFIELD.MessageNumber;
                &MSGSET = &MYFIELD.MessageSetNumber;
                &LOGFILE.WriteLine("****Record:" | &REC.Name | ", Field:" |⇒
                &MYFIELD.Name );
                &LOGFILE.WriteLine("*****" | MsgGet(&MSGSET, &MSGNUM, ""));
            End-If;
        End-For;
        Return False;
    Else
        Return True;
    End-If;
End-Function;
.
.
.
```

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Constructing File Layouts and Performing Data Interchanges"

End Of Line Considerations

Input files for file layouts of type fixed or CSV must not contain embedded CR/LF within the field data.

However, input files for file layouts of type XML can contain embedded CR/LF within field data for a character type file field that is the associated with a long-character type database field that has unlimited length—that is, the maximum length specified as 0.

File Layout Error Processing

If an error occurs on any field in any record of a rowset object populated with the `ReadRowset` method, the rowset object's property `IsEditError` returns `True`. For example, you can use the method `ExecuteEdits` on a record, to verify that the data in the record is valid (has the correct format, the right data type, and so on.) This type of error is indicated by the `IsEditError`.

In some instances, however, the rowset object won't receive the error; in that case the file object's `IsError` property returns `True`. To discover all field errors, check both properties after executing `ReadRowset`.

To determine which field has the error, you must examine the `EditError` property of every field in the rowset to find the one returning `True`. You can then examine that field's `MessageSetNumber` and `MessageNumber` properties to determine the relevant error message. The following example shows how this might be done:

```
&MYFILE.Open(&SOMENAME, "R");
&MYFILE.SetFileLayout(FILELAYOUT.SOMELAYOUT);
&MYROWSET = &MYFILE.ReadRowset();
If &MYFILE.IsError Then
  For &I = 1 to &MYROWSET.ActiveRowCount
    If &MYROWSET.GetRow(&I).IsEditError Then
      &ROW = &MYROWSET.GetRow(&I);
      For &J = 1 to &ROW.RecordCount
        If &ROW.GetRecord(&J).IsEditError Then
          &REC = &ROW.GetRecord(&J);
          For &K = 1 to &REC.FieldCount
            If &REC.GetField(&K).EditError Then
              /* Examine the field's
                MessageSetNumber and MessageNumber properties,
                and respond accordingly */
            End-If;
          End-For;
        End-If;
      End-For;
    End-If;
  End-For;
End-If;

&MYFILE.Close();
```

Note. Only field errors set the `IsError`, `IsEditError`, or `EditError` properties. All other errors triggered by File class methods terminate the PeopleCode program.

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetTempFile

File Class Methods

In this section, we discuss the File class methods. The methods are discussed in alphabetical order.

Close

Syntax

`close()`

Description

The Close method discards any changes that haven't been written to the external file, disassociates the file object from the external file, releases all resources connected with the file object, and causes the file object to go out of scope.

You cannot use any methods or properties on the object after it is closed. You must get another file object (using the GetFile function) and instantiate another file object after you use Close.

Parameters

None.

Returns

None.

Example

```
&MYFILE.Open("somefile.txt", "w", %FilePath_Relative);  
&MYFILE.WriteLine("Some text.");  
&MYFILE.Close();
```

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetFile

CreateRowset

Syntax

CreateRowset()

Description

The CreateRowset method is a file layout method. It instantiates a PeopleCode rowset object containing one unpopulated row, based on the file layout definition specified with SetFileLayout.

Note. You must specify a file layout using the SetFileLayout method before using CreateRowset, otherwise it returns NULL.

See [Chapter 19, "File Class," SetFileLayout, page 998](#).

After the empty rowset object has been created, you can use Rowset class methods such as `Select` or `Fill`, and built-in functions such as `GetLevel0` or `GetRowset`, to populate the rowset with data. After the rowset contains data, you can use the method `WriteRowset` to write the data to a file.

Don't use `CreateRowset` when reading from a file. Instead, use the `ReadRowset` method to instantiate and populate rowsets with data from the file.

Parameters

None.

Returns

An empty rowset object.

Example

```
&SOMEROWSET = &MYFILE.CreateRowset();
```

The following rowset is created from a file object, then populated with data using the `GetLevel0` function:

```
&FILEROWSET = &MYFILE.CreateRowset();  
&FILEROWSET = GetLevel0();  
&MYFILE.WriteRowset(&FILEROWSET, True);
```

The following rowset is created from a file object, then populated with data using `Fill` method:

```
&FILEROWSET = &MYFILE.CreateRowset();  
&NUM_READ = &FILEROWSET.Fill("where MYRECORD = :1", &UVAL);
```

[Chapter 36, "Rowset Class," page 2115](#)

Delete

Syntax

```
Delete()
```

Description

Use the `Delete` method to delete an open file. You cannot delete a closed file.

Parameters

None.

Returns

None.

Example

```
/* Open a temporary file. Use the "N" parameter to ensure
the file is new. */

&MyFile = GetFile("temp.txt", "N");

/* verify the file was instantiated successfully */

/* do processing using the temporary file */

/* delete the temporary file */

&MyFile.Delete();
```

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetFile

GetPosition

Syntax

GetPosition()

Description

The GetPosition method returns the current read or write position in the external file. GetPosition works only with a file that was opened in Update mode. This method is designed to be used in combination with the SetPosition method to establish checkpoints for restarting during file access.

Note. Currently, the effect of the Update mode and the GetPosition and SetPosition methods is not well defined for Unicode files. Use the Update mode only on files stored with a non-Unicode character set.

Parameters

None.

Returns

A number representing the current read or write position in the file.

Note. When you use `ReadRowset` to read from a file in Update mode, the `CurrentRecord` property returns, the entire record just read. The current read/write position is at the *end* of the `CurrentRecord`, that is, just past the end of the rowset.

Example

The following example opens a file in Update mode, and saves the current position after each read operation:

```
&MYFILE.Open(&SOMENAME, "U");
If &MYFILE.IsOpen Then
    while &MYFILE.ReadLine(&SOMESTRING)
        &CURPOS = &MYFILE.GetPosition();
        /* Save the value of &CURPOS after each read,
           and process the contents of each &SOMESTRING */
    End-While;
End-If;
&MYFILE.Close();
```

[Chapter 19, "File Class," File Access Interruption Recovery, page 977](#)

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," `GetFile`

GetString

Syntax

`GetString([Strip_Line_Terminator])`

Description

Use the `GetString` method to return the entire file as a single string.

Note. After this method completes successfully, the original file is deleted.

You can specify whether the resulting string is to include the line terminator characters or not by using the *Strip_Line_Terminator* parameter. The default value for this parameter is false, which means the resulting string includes the line terminator characters at the end of each line.

For example on a Unix system, with a line terminator of a LF, the resulting string includes not only the data for each line, but the LF character as well.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Strip_Line_Terminator</i>	Specify whether the line terminators are to be stripped or not.

Returns

A single string containing the entire contents of the file.

Example

The following example creates a file on a Windows system, then retrieves it as a single line of text.

Note. The file is destroyed on successful completion of this method.

```
Local File &File = GetFile("c:\temp\junk\something.txt", "W", %FilePath_Absolute)
/* write a bunch of > 2048 length lines */

Local string &piece, &input;
Local integer &I;

&piece = "123456789-";
While Len(&piece) < 2048
    &piece = &piece | &piece;
End-While;

&File.WriteString(&piece);
&File.WriteString(&piece);
&File.WriteString(&piece);
&input = &File.GetString( True);
&File.Close();
Local string &pieces = &piece | &piece | &piece;

/* Note that the result of this message should indicate &pieces is the same as⇒
   &input */
MessageBox(0, "", 0, 0, "&piece = &input: Len(&pieces)=" | Len(&pieces) | " Len⇒
(&input)=" | Len(&input) | " Same? " | (&pieces = &input));
```

Open

Syntax

Open(*filespec*,*mode* [, *charset*] [, *pathtype*])

Description

The Open method associates the file object with an external file for input or output.

If the File object is currently associated with a file, that file is closed first. In addition, any file opened for writing (by a call to the GetFile function or the Open method) by a PeopleCode program that runs in the Process Scheduler is automatically managed by the Report Repository.

You can use the GetFile or GetTempFile functions to access an external file, but each execution of GetFile or GetTempFile instantiates a new file object. If you plan to access only one file at a time, you need only one file object. Use GetFile or GetTempFile to instantiate a file object for the first external file you access. Then, use Open to associate the same file object with as many different external files as you want. However, if you expect to have multiple files open at the same time, you need to instantiate multiple file objects with GetFile or GetTempFile.

GetFile and Open both perform implicit commits. Therefore, the GetTempFile function has been introduced specifically to avoid these implicit database commits. GetTempFile differs from GetFile in two respects:

- GetTempFile does not perform an implicit commit.
- GetTempFile does not make the associated file available through the Report Repository even when the calling PeopleCode program is run through the Process Scheduler.

Therefore, GetTempFile can be a good choice when you wish to avoid implicit database commits and when you do not need to have the file managed through the Report Repository. Otherwise, GetTempFile operates exactly the same as GetFile.

Working With Relative Paths

If you specify a relative path, that path is appended to the path specified by an environment variable if the variable exists. Environment variables are searched for in a particular order. This means if the first environment variable in order is found, that's the one that is used. If it isn't found, the next one is searched for, and if found, is used, and so on.

If Open is called from an Application Engine program when running standalone—that is, when not within an application server domain—the following environment variables are valid and are searched for in the following order:

1. PS_FILEDIR*relative_path*
2. PS_SERVDIR\files*relative_path*
3. TEMP*relative_path*

If Open is called from a program running within an application server domain, the following environment variables are valid and are searched for in the following order:

- 1. PS_FILEDIR\relative_path
- 2. PS_SERVDIR\files\relative_path

The PS_FILEDIR environment variable is not initialized and set to a path automatically. If you want to use this environment variable, you must set it yourself.

Note. In the preceding examples, the Windows directory separator, a backslash, was used. For UNIX directories, the directory separator is a forward slash.

Note. Your system security should verify if a user has the correct permissions before allowing access to a drive (for example, if a user changes their TEMP environmental variable to a network drive they don't normally have access to, your system security should detect this.)

Parameters

Parameter	Description
filespec	Specify the name, and optionally, the path, of the file you want to open.

Parameter	Description
mode	A string indicating the manner in which you want to access the file. The mode can be one of the following: "R" (Read mode): opens the file for reading, starting at the beginning. "W" (Write mode): opens the file for writing. Warning! When you specify Write mode, any existing content in the file is discarded and is overwritten. "A" (Append mode): opens the file for writing, starting at the end. Any existing content is retained. "U" (Update mode): opens the file for reading or writing, starting at the beginning of the file. Any existing content is retained. Use this mode and the <code>GetPosition</code> and <code>SetPosition</code> methods to maintain checkpoints of the current read/write position in the file. In Update mode, any write operation clears the file of all data that follows the position you set. Note. Currently, the effect of the Update mode and the <code>GetPosition</code> and <code>SetPosition</code> methods is not well defined for Unicode files. Use the Update mode only on files stored with a non-Unicode character set. "E" (Conditional "exist" read mode): opens the file for reading only if it exists, starting at the beginning. If it doesn't exist, <code>Open</code> has no effect. Before attempting to read from the file, use the <code>IsOpen</code> property to confirm that it's open. "N" (Conditional "new" write mode): opens the file for writing, only if it doesn't already exist. If a file by the same name already exists, <code>Open</code> has no effect. Before attempting to write to the file, use the <code>IsOpen</code> property to confirm that it's open. You can insert an asterisk (*) in the filename to ensure that a new file is created. The system replaces the asterisk with numbers starting at 1 and incrementing by 1, and checks for the existence of a file by each resulting name in turn. It uses the first name for which a file doesn't exist. In this way you can generate a set of automatically numbered files. If you insert more than one asterisk, all but the first one are discarded.

Parameter	Description
<i>charset</i>	A string indicating the character set you expect when you read the file, or the character set you want to use when you write to the file. You can abbreviate Unicode UCS-2 to "U" and the host operating system's default non-Unicode (sometimes referred to as the ANSI character set) to "A". All other character sets must be spelled out in full, for example, ASCII, Big5, Shift-JIS, or UTF8. If "A" is specified as the character set, or you don't specify a character set, the character set used is dependent on the application server configuration. On a Windows application server, the default non-Unicode character set is dependent on the Windows ANSI Codepage (ACP) which can be checked using the DOS command chcp. On a Unix application server, the default non-Unicode character set is specified in the application server configuration file, psappsrv.cfg, and can be modified using PSADMIN. You can also use a record field value to specify the character set (for example, RECORD.CHARSET.) A list of supported character set names valid for this argument can be found in <i>PeopleTools 8.51 PeopleBook: PeopleSoft Global Technology</i>. See <i>PeopleTools 8.51 PeopleBook: Global Technology</i>, "Selecting and Configuring Character Sets and Language Input and Output," Character Sets in the PeopleSoft Pure Internet Architecture. Note. If you attempt to read data from a file using a different character set than was used to write that data to the file, the methods used generate a runtime error or the data returned is unusable. When a file is opened for reading using the "U" <i>charset</i> argument, Open expects the file to begin with a Unicode Byte Order Mark (BOM). This mark indicates whether the file is written in big endian order or little endian order. A BOM consisting of the hex value 0xFEFF indicates a big endian file, a BOM consisting of the hex value 0xFFEF indicates a little endian file. If the Unicode UCS-2 file being opened does not start with a BOM, an error is returned. The BOM is automatically stripped from the file when it is read into the buffers by Open. When a file is opened for writing using the "U" <i>charset</i> argument, the appropriate Unicode BOM is automatically written to the start of the file depending on whether the application server hardware platform operates in little endian or big endian mode. Byte Order Marks are not expected or supported for files in other character sets, including UTF8. However, some applications allow or expect the UTF-8 sequence of the BOM (0xEF BB BF). In case the consuming application does expect the BOM for a UTF-8 file, the UTF8BOM character set is available as a Open character set to create a UTF-8 file with the BOM. Note. The UTF-8 sequence 0xEF BB BF, if misinterpreted as ISO-8859-1, appears as ISO characters ï»¿. When working with XML documents, specify UTF8 for <i>charset</i>. If you are writing an XML file using a different character set, you must remember to include a charset declaration in the XML file.

<i>Parameter</i>	<i>Description</i>
<i>pathtype</i>	If you have prepended a path to the file name, use this parameter to specify whether the path is an absolute or relative path. The valid values for this parameter are: • %FilePath_Relative (default) • %FilePath_Absolute If you don't specify <i>pathtype</i> the default is %FilePath_Relative. If the path is an absolute path, whatever path you specify is used verbatim. You must specify a drive letter and the complete path. You can't use any wildcards when specifying a path. The Component Processor automatically converts platform-specific separator characters to the appropriate form for where your PeopleCode program is executing. On a WIN32 system, UNIX "/" separators are converted to "\", and on a UNIX system, WIN32 "\" separators are converted to "/".

Note. The syntax of the file path does *not* depend on the file system of the platform where the file is actually stored; it depends only on the platform where your PeopleCode is executing.

Returns

None.

Example

The following example opens an existing Unicode file for reading:

```
&MYFILE.Open(&SOMENAME, "E", "U");
If &MYFILE.IsOpen Then
    while &MYFILE.ReadLine(&SOMESTRING)
        /* Process the contents of each &SOMESTRING */
    End-While;
    &MYFILE.Close();
End-If;
```

The following example opens a numbered file for writing in ANSI format, without overwriting any existing files:

```
&MYFILE.Open("C:\temp\item*.txt", "N", %FilePath_Absolute);
If &MYFILE.IsOpen Then
    &MYFILE.WriteLine("Some text.");
    &MYFILE.Close();
End-If;
```

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetFile and *PeopleTools 8.51 PeopleBook: PeopleCode Language Reference*, "PeopleCode Built-in Functions," GetTempFile

ReadLine**Syntax**

ReadLine(*string*)

Description

The ReadLine method reads one line of text from the external file. The line includes the newline character, but ReadLine strips out the newline character and inserts the result into the string variable *string*.

When ReadLine is executed, it moves the starting point for the next read operation to the end of the text just retrieved, so each line in the file can be read in turn by subsequent ReadLine operations. When no more data remains to be read from the file, ReadLine returns False, and clears the string variable of any content.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>string</i>	A string variable that receives the input text.

Returns

A Boolean value: True if the method succeeds, False otherwise. The return value is *not* optional, it is required.

Example

The following example reads a file called &MYFILE and puts each line as a separate element in an array.

```
Local File &MYFILE;  
Local array of string &MYARRAY;  
Local string &TEXT;  
  
&MYFILE = GetFile("names.txt", "R");  
&MYARRAY = CreateArrayRept("", 0);  
While &MYFILE.ReadLine(&TEXT);  
    &MYARRAY.Push(&TEXT);  
End-While;  
&MYFILE.Close();
```

ReadRowset

Syntax

ReadRowset ()

Description

The ReadRowset method is a file layout method. It instantiates a PeopleCode rowset object based on the file layout definition, then populates the rowset with one transaction from the file. A transaction is considered to be one instance of level zero data contained in a file record, plus all of its subordinate data. If you put more than one segment at level zero, each segment is read in sequence.

Note. You must specify a file layout using the SetFileLayout method before using ReadRowset, otherwise it will return NULL.

When ReadRowset is executed, it moves the starting point for the next read operation to the beginning of the next rowset, so each transaction in the file can be read in turn by subsequent ReadRowset operations. When no more data remains to be read from the file, ReadRowset returns NULL.

If you're using the SetFileId method with ReadRowset to process an input file based on multiple file layouts, ReadRowset returns NULL when it reads a FileId file record (line) between the rowsets.

When ReadRowset returns NULL, you can use the IsFileId property to determine if you've reached the end of the file or a FileId record.

Note. When using ReadRowset, if a value in the file exceeds the defined length in the file layout, it is ignored. The given record field is flagged with an edit error which can be programmatically checked.

If the ReadRowset encounters a line in the file containing the FileId, and the lines following this are *not* a new rowset, the process considers it to be an invalid FileId. You can specify whether to ignore the invalid record or terminate the PeopleCode with the IgnoreInvalidId property.

Note. If you're using the `SetFileId` method with `ReadRowset` to process an input file based on multiple layouts, `FileId` file records between the rowsets are considered to be valid file records, and won't generate any errors, regardless of the state of the `IgnoreInvalidId` property.

See [Chapter 19, "File Class," SetFileLayout, page 998](#).

Considerations for Using Dates With ReadRowset

Single digits in dates in the form `MMDDYY` or `MMDDYYYY` must be padded with zeros. That is, if the date in your data is February 3, 2000, the form must be:

`02/03/2000`

or

`02/03/00`

The following is *not* valid.

`2/3/00`

Considerations for Using XML With ReadRowset

If all of the fields in the file layout are not present in the XML, no data is written to the database. If there are additional tags in the XML, they are ignored.

Considerations for Using Nested Data with ReadRowset

If you are processing input files with a large amount of nested data, your application server may run out of memory before the system finishes processing all of the data.

This may happen because of the differences between processing a single-level rowset and a multi-level rowset. If you are reading the rows of a single-level (level 0) rowset from a file, the file is processed one row at a time, that is, only one row resides in memory at a time.

However, if you are reading the rows of a multi-level (parent-child) rowset from a file, then for each level 0 row, *all* of the associated child rows (and all of their associated child rows) simultaneously reside in memory. As a result, during the processing a large input data file that is associated with a multi-level rowset (through a multi-level file layout definition), your application server may run out of memory.

To work around this, consider doing one of the following:

- Retain your original file layout definition and split the original input file into smaller (but structurally unchanged) pieces
- Flatten out your original file layout definition (that is, split it up into several single-level definitions) as well as split the original input file into several single-level pieces.

Considerations for Using Default Values with ReadRowset

The system variables related to date and time (for example, `%Date`, `%Time`, and `%DateTime`) cannot be used to specify the value of the Default Value property of a file layout field. This topic is covered in detail in the *Application Designer PeopleBook*.

See *PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide*, "Constructing File Layouts and Performing Data Interchanges," Specifying File Layout Field Properties.

Parameters

None.

Returns

A populated rowset.

Example

The following example reads and processes an entire file. The data in the file is based on a single File layout definition:

```
&MYFILE.GetFile(&SOMENAME, "R");
If &MYFILE.SetFileLayout(FILELAYOUT.SOMELAYOUT) then
    &SOMEROWSET = &MYFILE.ReadRowset();
    While &SOMEROWSET <> NULL
        /* Process the contents of each &SOMEROWSET */
        &SOMEROWSET = &MYFILE.ReadRowset();
    End-While;
End-If;
&MYFILE.Close();
```

[Chapter 19, "File Class," Multiple File Layouts, page 1029](#)

[Chapter 19, "File Class," ReadRowset Example, page 1025](#)

[Chapter 36, "Rowset Class," IsEditError, page 2154](#)

SetFileId

Syntax

SetFileId(*fileid*, *position*)

Description

The SetFileId method is a file layout method. If your input file contains data based on more than one File Layout definition, you must use this method in combination with the CurrentRecord and IsNewFileId properties and the ReadRowset method to process the file correctly.

Note. SetFileId, CurrentRecord and IsNewFileId don't apply to CSV and XML format input files. You can use only fixed format files to implement multiple file layouts.

See [Chapter 19, "File Class," CurrentRecord, page 1009](#); [Chapter 19, "File Class," IsNewFileId, page 1011](#) and [Chapter 19, "File Class," ReadRowset, page 994](#).

At each point in the input file where the structure of the rowset changes, there must be an extra line in the file containing the file record (line), the FileId file record (line), that signifies that the change. Each FileId file record must have the following components:

- A value that designates it as a Fileid. Only one FileId value is necessary throughout the file, such as "999".
- A name field that identifies the file layout needed for the rowset that follows. This field could contain the name of the file layout as it's defined in Application Designer.

These lines containing the FileId are *not* part of any rowset. They can contain other information, which will be disregarded by the system. The FileId identifier and the file layout names aren't automatically stored anywhere; they exist only in the input file's FileId file records and in the PeopleCode.

To process an input file that requires multiple file layouts:

1. Use SetFileLayout to specify the file layout definition to use.

If you're specifying the initial file layout for this file, it doesn't have to be the correct one. You can determine the correct file layout to use for the first rowset during a subsequent step.

2. Use SetFileId to specify the value of the FileId field, *fileid*, that's used throughout the file to designate FileId file records.

Note. After each execution of SetFileLayout, the SetFileId setting is disabled. Be sure to re-specify the FileId value if you expect the file layout to change, so the system continues looking for the next FileId file record.

3. Use ReadRowset to read the next rowset from the file.

The current file record is also stored in the CurrentRecord property as a string. The PeopleCode process determines whether it's the beginning of a new rowset, or a FileId file record according to the *fileid* you specified. If it's a FileId file record, the process sets the IsNewFileId property to True; if not, it sets the IsNewFileId property to False.

Note. If this is the first execution of ReadRowset on the file, it returns NULL upon encountering the initial FileId file record, but still stores that file record in CurrentRecord and sets IsNewFileId accordingly.

4. If the rowset returned isn't NULL, process that rowset as necessary.

5. If `IsNewFileId` is False, go back to step 3 to continue reading rowsets from the file. If `IsNewFileId` is True, examine `CurrentRecord` to determine which new file layout to use, and go back to step 1.

You can repeat this procedure one rowset at a time, proceeding through the remainder of the input file. When `ReadRowset` returns NULL, no more rowset data is available.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>fileid</i>	Specify the value of the FileId field used in the current file.
<i>position</i>	Specify the column in the FileId file record where the FileId field starts. The default is 1.

Returns

None.

Example

```
&rsFile = &MYFILE.ReadRowset();
&CurrentRecord = &MYFILE.CurrentRecord;
&IsNewFileId = &MYFILE.IsNewFileId;
If &MYFILE.IsNewFileId Then
    &FILELAYOUT = FindFileId(&CurrentRecord);
    &MYFILE.SetFileLayout(@"FileLayout." | &FILELAYOUT));
    &MYFILE.SetFileId("999", 1);
End-If;
```

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Constructing File Layouts and Performing Data Interchanges"

SetFileLayout

Syntax

```
SetFileLayout(FILELAYOUT.file layoutname)
```

Description

The SetFileLayout method is a file layout method. It associates a specific file layout definition with the file object executing this method, providing easy access to rowset data. The file object must be associated with an open file. With file layout definitions, you can read and write rowsets as easily as strings. If the file object isn't open or the definition doesn't exist, SetFileLayout fails.

You must execute SetFileLayout before you can use any other file layout methods or properties with a file object, otherwise those methods and properties return NULL or False.

Note. All provided PeopleTools records that have a prefix of PSFLD are related to file layout definitions.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>filelayoutname</i>	Specify as a string the name of an existing file layout definition created in Application Designer.

Returns

A Boolean value: True if the method succeeds, False otherwise.

Example

The following example opens a data file, associates a file layout definition with it, reads and processes the first rowset from it, and closes the file.

```
&MYFILE.Open(&SOMENAME, "E");
If &MYFILE.SetFileLayout(FILELAYOUT.SOMELAYOUT) then
    &SOMEROWSET = &MYFILE.ReadRowset();
    /* Process the contents of &SOMEROWSET */
Else
    /* Error - SetFileLayout failed */
End-If;
&MYFILE.Close();
```

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Constructing File Layouts and Performing Data Interchanges"

SetPosition

Syntax

SetPosition(*position*)

Description

The SetPosition method sets the current read or write position in the external file associated with the file object executing this method. SetPosition works only with a file, which is opened in Update mode, and is designed to be used in combination with the GetPosition method to recover from interruptions during file access.

To start reading or writing from the beginning of a file, you must use SetPosition to set a read/write position of 0, immediately after you open the file in Update mode.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>position</i>	The byte position in the file at which you want to continue reading or writing. This should either be 0 or a value you previously obtained with the GetPosition method and saved in a separate file or a database.

Warning! In Update mode, any write operation clears the file of all data that follows the position you set.

Note. Use SetPosition only for recovering from file access interruptions. Supplying your own value for SetPosition isn't recommended, except for position 0.

Returns

None.

Example

The following example reopens a file in Update mode, and sets the read position to the last saved checkpoint:

```
&MYFILE = GetFile(&SOMENAME, "U");
If &MYFILE.IsOpen Then
    /* Retrieve the value of the last saved checkpoint, &LASTPOS */
    &MYFILE.SetPosition(&LASTPOS);
    while &MYFILE.ReadLine(&SOMESTRING)
        /* Process the contents of each &SOMESTRING */
    End-While;
    &MYFILE.Close();
End-If;
```

Note. Currently, the effect of the Update mode and the GetPosition and SetPosition methods is not well defined for Unicode files. Use the Update mode only on files stored with a non-Unicode character set.

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetFile

SetRecTerminator

Syntax

SetRecTerminator(*Terminator*)

Description

The SetRecTerminator method is a file layout method.

Use this method to specify the string of characters that indicate the end of a file record. Read operations use the value of SetRecTerminator to determine where each file record ends and the next one starts, and write operations append the value of SetRecTerminator to each record written.

This value defaults to the newline character appropriate to the platform where the file is being stored:

- a linefeed on UNIX systems
- a carriage return/linefeed combination on Windows systems

You need to specify a different record terminators only if you anticipate that part of the data in a file field that includes the newline character used on the storage platform; you must assign the record terminator a unique string that you know does not appear in a file field.

If you set the record terminator to Null (""), you eliminate linefeeds or carriage returns.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Terminator</i>	Specify the value you want used for the record terminator.

Returns

None.

Example

```
&File = GetFile(.....);

if &File.IsOpen then
    /* set the terminator to be NULL */
    Local String &Term = "";
    &File.SetRecTerminator(&Term);
```

WriteLine

Syntax

WriteLine(*string*)

Description

The WriteLine method writes one string of text, *string*, to the output file associated with the file object executing this method, followed by a newline character appropriate to the platform where the file is being written. To build a single line using multiple strings, use the WriteString method.

Parameters

Parameter	Description
<i>string</i>	The string of text to be written.

Returns

None.

Example

The following example adds a line of text to an existing file:

```
&MYFILE.Open("somefile.txt", "A");
&MYFILE.WriteLine("This is the last line in the file.");
&MYFILE.Close();
```

The following example converts a file where the fields are separated with tabs into a file where the fields are separated with commas.

```

Local File &TABFILE, &CSVFILE;
Local string &FILE_NAME, &DATA, &NEWDATA;

&FILE_NAME = "Test.txt";
&TAB = Char(9);

&TABFILE = GetFile(&FILE_NAME, "r");
&FileName = &TABFILE.Name;
&POS = Find(".", &FileName);
&NEWFILE_NAME = Substring(&FileName, 1, &POS) | "dat";
&CSVFILE = GetFile(&NEWFILE_NAME, "N", %FilePath_Absolute);
If &TABFILE.IsOpen And
    &CSVFILE.IsOpen Then
    While &TABFILE.ReadLine(&DATA);
        &NEWDATA = Substitute(&DATA, &TAB, ",");
        &CSVFILE.WriteLine(&NEWDATA);
    End-While;
    &TABFILE.Close();
    &CSVFILE.Close();
End-If;

```

WriteRaw

Syntax

WriteRaw(*RawBinary*)

Description

The WriteRaw method writes the contents of *RawBinary* to a file. This can be used for writing images, messages, or other types of raw binary data to a file.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RawBinary</i>	Specify the raw binary to be written to the file.

Returns

None.

Example

The following example writes employee photos (GIF files) from a record to a file.

```
Local File &FILE;  
Local Record &REC;  
Local SQL &SQL;  
  
&REC = CreateRecord(Record.EMPL_PHOTO);  
&SQL = CreateSQL("%SelectAll(:1)", Record.EMPL_PHOTO);  
  
&FILE = GetFile("C:\temp\EMPL_PHOTO.GIF", "w", "a", %FilePath_Absolute);  
  
While &SQL1.Fetch(&REC)  
    &FILE.WriteRaw(&REC.EMPLOYEE_PHOTO.Value);  
End-While;  
  
&FILE.Close();
```

[Chapter 19, "File Class," WriteLine, page 1002](#) and [Chapter 19, "File Class," WriteString, page 1008](#)

WriteRecord

Syntax

WriteRecord(*record*)

Description

The WriteRecord method is a file layout method. It writes the contents of the record object *record*, to the output file. (Remember, a record object contains only one row of data from an SQL table.)

You can use this method to build a transaction in the output file, one file record at a time, without having to instantiate and populate a rowset object. You can apply this method to any record whose structure and name matches that of a record defined in the current file layout.

Note. You must execute the SetFileId method from the file object before using WriteRecord, otherwise it returns False.

See [Chapter 19, "File Class," SetFileLayout, page 998](#).

Note. When you're writing text to an XML file, special HTML characters, such as ampersands, lesser than or greater than symbols, and so on, are automatically converted to valid XML character string, such as &.

Considerations Using XML With File Definition Tags

File Definition Tags have no effect when importing data. However, generally, during export, the File Definition Tag is added at the start and end of the data to create a valid XML file.

The one exception is when the file to which the data is being written during export has been opened in append mode. At that time, the file definition tag is not taken into consideration.

Considerations Using XML with File Definitions

If your file layout is defined as XML, WriteRecord doesn't add the closing tag for the record. You must write it yourself using the WriteLine method. This is because the code has no way of knowing when you want to write children records following the record just written out.

The following code shows an example of using WriteLine:

```
Local File &MYFILE;

&MYFILE = GetFile("XMLrecord.txt", "A");

If &MYFILE.IsOpen Then
  If &MYFILE.SetFileLayout(FILELAYOUT.RECORDLAYOUT) Then
    &LN = CreateRecord(RECORD.QA_INVEST_LN);
    &SQL2 = CreateSQL("%Selectall(:1)", &LN);
    While &SQL2.Fetch(&LN)
      &MYFILE.WriteRecord(&LN);
      WriteLine("</QA_INVEST_LN>"); /* Add the closing tag */
    End-While;
  Else
    /* do error processing - filelayout not correct */
  End-If;
Else
  /* do error processing - file not open */
End-If;

&MYFILE.Close();
```

Parameters

<i>Parameter</i>	<i>Description</i>
<i>record</i>	Specify the name of an existing record object to be written. You can use Rowset class methods such as GetField and built-in functions such as GetRecord to populate the record with data before writing it to the file.

Returns

A Boolean value: True if the method succeeds, False otherwise. This value is optional.

Example

The following example appends all the data in a record to an existing file:

```

Local File &MYFILE;

&MYFILE = GetFile("record.txt", "A");

If &MYFILE.IsOpen Then
  If &MYFILE.SetFileLayout(FILELAYOUT.VOL_TEST) Then
    &LN = CreateRecord(RECORD.VOLNTER_ORG_TBL);
    &SQL2 = CreateSQL("%Selectall(:1)", &LN);
    While &SQL2.Fetch(&LN)
      &MYFILE.WriteRecord(&LN);
    End-While;
  Else
    /* do error processing - filelayout not correct */
  End-If;
Else
  /* do error processing -; file not open */
End-If;

&MYFILE.Close();

```

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Accessing the Data Buffer"

WriteRowset

Syntax

```
WriteRowset(rowset [, Write_Data])
```

Description

The WriteRowset method is a file layout method. It writes the contents of a rowset object, *rowset*, to the output file associated with the file object executing this method. Regardless of whether the rowset contains just one or more than one transaction (level zero row), executing this method once writes the entire contents of the rowset to the output file.

Note. You must execute the SetFileLayout method from the file object before using WriteRowset, otherwise it returns False.

See [Chapter 19, "File Class," SetFileLayout, page 998](#).

WriteRowset writes a rowset to a file only if the data in the component buffer has changed. You must specify the *WriteData* parameter as True if you want the WriteRowset method to force the rowset to be written to the file even if the buffer has not been changed.

Note. When you're writing text to an XML file, special HTML characters, such as ampersands, lesser than or greater than symbols, and so on, are automatically converted to valid XML character string, such as &.

Considerations Using Fixed Length Files With Numeric Fields

All numeric fields are right-justified in when writing to fixed length files. In addition, zeros are padded to the right after the decimal point if required.

Considerations Using XML With File Definition Tags

File Definition Tags have no effect when importing data. However, generally, during export, the File Definition Tag is added at the starting and end of the data to create a valid XML file.

The one exception is when the file to which the data is being written during export has been opened in append mode. At that time, the file definition tag is not taken into consideration.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>rowset</i>	Specify the name of an existing rowset object that was instantiated with the File class CreateRowset or ReadRowset method. You can use Rowset class methods such as Select and built-in functions such as GetLevel0 to populate the rowset with data before writing it to the file.
<i>WriteData</i>	Specify whether to write the rowset data to the file whether or not the data in the buffer has changed. This parameter takes a Boolean value: True, write the data to the buffer regardless, False, only write the data if changed. The default value for this parameter is False.

Returns

A Boolean value: True if the method succeeds, False otherwise.

Example

```

Local File &MYFILE;
Local Rowset &FILEROWSET;

&MYFILE = GetFile("c:\temp\EMP_CKLS.txt", "A", %FilePath_Absolute);
If &MYFILE.IsOpen Then
    If &MYFILE.SetFileLayout(FILELAYOUT.EMPL_CHECKLIST) Then
        &FILEROWSET = &MYFILE.CreateRowset();
        &FILEROWSET = GetLevel0();
        &MYFILE.WriteRowset(&FILEROWSET, True);
    Else
        /* file layout not found, do error processing */
    End-If;
Else
    /* file not opened, do error processing */
End-if;

&MYFILE.Close();

```

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Accessing the Data Buffer"

WriteString

Syntax

WriteString(*string*)

Description

The WriteString method writes one string of text to the output file associated with the file object executing this method, without any newline character. Each string written extends the current line in the file.

You can start a new line by using the WriteLine method to write the last part of the current line. WriteLine always adds a newline character appropriate to the platform where the file is being written, whether you supply a character string of any length, or a null string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>string</i>	A string variable containing the text to be written.

Returns

None.

Example

The following example opens an empty file, writes two lines of text to it without a final newline, and closes it:

```
&MYFILE.Open("somefile.txt", "w");  
&MYFILE.WriteString("This is the first ");  
&MYFILE.WriteString("line in the file.");  
&MYFILE.WriteLine("");  
&MYFILE.WriteString("This second line is not terminated.");  
&MYFILE.Close();
```

File Class Properties

In this section, we discuss each File Class property.

CurrentRecord

Description

This property is a file layout property. This property returns the current record as a string. The CurrentRecord property is used in combination with the SetFileId and ReadRowset methods and IsNewFileId property when reading files that contain data based on multiple file layouts.

If the ReadRowset method returns NULL, either the current record is a FileId record or the end of file has been reached. The IsNewFileId enables you to determine which. If it is a FileId, you can parse the string returned by CurrentRecord to determine the file layout definition to be used.

Note. SetFileId, CurrentRecord, and IsNewFileId don't apply to CSV and XML format input files. You can implement multiple file layouts only with fixed format files.

This property is read-only.

Example

```
&RECSTRING = &MYFILE.CurrentRecord;
```

See Also

[Chapter 19, "File Class," SetFileId, page 996](#); [Chapter 19, "File Class," ReadRowset, page 994](#) and [Chapter 19, "File Class," IsNewFileId, page 1011](#)

[Chapter 19, "File Class," Multiple File Layouts, page 1029](#)

IgnoreInvalidId

Description

This property is a file layout property that's used in combination with the ReadRowset method. It returns a Boolean value that specifies whether file records with invalid FileIds are ignored. Each time ReadRowset is executed, it may encounter a file record that doesn't qualify as part of the rowset because its File ID isn't part of the current file layout, or because it occurs in an invalid position in the rowset. If IgnoreInvalidId is False, the PeopleCode program terminates; if IgnoreInvalidId is True, ReadRowset ignores the invalid file record. The default value is True.

This property is read-write.

Example

```
&MYFILE.IgnoreInvalidId = False;
```

See Also

[Chapter 19, "File Class," ReadRowset, page 994](#)

IsError

Description

This property is a file layout property. It returns a Boolean value indicating whether a field error condition was generated by the last file layout method executed. If an error condition was generated, IsError returns True; if not, IsError returns False. The default value is False.

This property is read-only.

Example

The following example shows where `IsError` would be used:

```
&MYFILE.Open(&SOMENAME, "R");
&MYFILE.SetFileLayout(FILELAYOUT.SOMELAYOUT);
&MYROWSET = &MYFILE.ReadRowset();
If &MYFILE.IsError Then
    /* Examine the EditError property of each field in the rowset
       to find the one with the error, and respond accordingly */
End-If;
&MYFILE.Close();
```

See Also

[Chapter 19, "File Class," Multiple File Layouts, page 1029](#)

IsNewFileId

Description

This property is a file layout property. It returns a Boolean value indicating whether a `FileId` file record has been encountered. When the `ReadRowset` method reads a transaction from an input file, it examines the current file record following the transaction. If that file record is a `FileId` file record, `IsNewFileId` returns `True`; if not, `IsNewFileId` returns `False`.

`IsNewFileId` is used in combination with the `SetFileId` method and `CurrentRecord` property when reading files that require multiple file layouts.

Note. `SetFileId`, `CurrentRecord`, and `IsNewFileId` don't apply to CSV and XML format input files. You can use only fixed format files to implement multiple file layouts.

This property is read-only.

Example

```
&MYFILE.SetFileLayout(FILELAYOUT.SOMELAYOUT) then /* Set the first layout */
&MYFILE.SetFileId("999", 1); /* Set the FileId */
&SOMEROWSET = &MYFILE.ReadRowset(); /* Read the first rowset */
While &SOMEROWSET <> NULL
    If &MYFILE.IsNewFileId Then
        /* Examine &MYFILE.CurrentRecord for the next layout */
        /* Set the next layout */
        &MYFILE.SetFileId("999", 1); /* Set the FileId */
    End-If;
    /* Process the current &SOMEROWSET */
    &SOMEROWSET = &MYFILE.ReadRowset(); /* Read the next rowset */
End-While;
```

See Also

[Chapter 19, "File Class," ReadRowset, page 994](#); [Chapter 19, "File Class," SetFileId, page 996](#) and [Chapter 19, "File Class," CurrentRecord, page 1009](#)

IsOpen

Description

This property returns a Boolean value indicating whether the file is open. If the file object is open, IsOpen returns True; if not, IsOpen returns False.

This property is read-only.

Example

The following example opens a file, writes a line to it, and closes it:

```
&MYFILE.Open("item.txt", "w");  
If &MYFILE.IsOpen Then  
    &MYFILE.WriteLine("Some text.");  
    &MYFILE.Close();  
End-If;
```

Name

Description

This property returns as a string the name of the external file. If no file is currently associated with the file object, Name returns a NULL string.

This property is read-only.

Example

```
&TMP = &MYFILE.Name;
```

TerminateLines

Description

Use the TerminateLines property to indicate whether all output data lines are to be terminated at the end of the defined data length. This property is a file layout property associated with fixed file layouts only.

This property takes a Boolean value: True to force output data lines to be terminated at the end of the defined data length; False to keep all lines all at the maximum of their own length or that of their children. The default value is false.

This property is read-write.

Example

```

If &FILE_CREATED = "N" Then
    &FILE_CREATED = "Y";
    &FILENAME = &MSGNAME | "_" | &PROCESS_INSTANCE | "_*.out";
    &FILE = GetFile(&FILENAME, "N", "U");
    &FILE.SetFileLayout(@"FILELAYOUT." | &MSGNAME));
    &FILE.TerminateLines = True;
    &RS_LVL0 = &FILE.CreateRowset();
    &REC_MSG_LVL0 = &RS_LVL0(&ROWCNT0).GetRecord(1);

    If EO_BATLIB_AET.CREATE_FILE_FLG = "C" Then
        &STRING = "998" | &MSGNAME;
        &FILE.WriteLine(&STRING);
    End-If;
End-If;

```

UseSpaceForNull

Description

Use the UseSpaceForNull property to specify whether the WriteRowset method writes <qualifier> <qualifier> (<qualifier>-space-<qualifier>) for all the Null or empty character fields of a CSV-type file layout, or if the method writes <qualifier><qualifier> (<qualifier>-<qualifier>).

This property takes a Boolean value: false if WriteRowset writes <qualifier>-<qualifier>, true if WriteRowset writes <qualifier>-space-<qualifier>. The default is False.

Note. The state of this property has no effect on the behavior of the ReadRowset method. It also has no effect when the associated file layout is of type fixed or XML.

This property is read-write.

Example

```

Local File &LOGFILE;
Local File &FILE1;
Local File &FILE2;
Local Record &REC1;
Local SQL &SQL1;
Local Rowset &RS1;
Local Row &ROW1;

&LOGFILE = GetFile("C:\Temp\currency.log", "W", "A", %FilePath_Absolute);
If (&LOGFILE = Null) Then
    Exit;
End-If;
If Not (&LOGFILE.SetFileLayout(FileLayout.CURRENCY_FL)) Then
    &LOGFILE.WriteLine("SetFileLayout() on LOGFILE failed.");
End-If;

&FILE1 = GetFile("C:\Temp\currency_nonspaced.csv", "W", "A", %FilePath_Absolute);
If (&FILE1 = Null) Then
    &LOGFILE.WriteLine("FATAL ERROR:  GetFile() on non-spaced output file failed.");
    &LOGFILE.Close();
    Exit;
End-If;
If Not (&FILE1.SetFileLayout(FileLayout.CURRENCY_FL)) Then
    &LOGFILE.WriteLine("FATAL ERROR:  SetFileLayout() on non-spaced output file⇒
failed.");
    &LOGFILE.Close();
    &FILE1.Close();
    Exit;
End-If;

&FILE2 = GetFile("C:\Temp\currency_spaced.csv", "W", "A", %FilePath_Absolute);
If (&FILE2 = Null) Then
    &LOGFILE.WriteLine("FATAL ERROR:  GetFile() on spaced output file failed.");
    &LOGFILE.Close();
    &FILE1.Close();
    Exit;
End-If;
If Not (&FILE2.SetFileLayout(FileLayout.CURRENCY_FL)) Then
    &LOGFILE.WriteLine("FATAL ERROR:  SetFileLayout() on spaced output file⇒
failed.");
    &LOGFILE.Close();
    &FILE1.Close();
    &FILE2.Close();
    Exit;
End-If;

&REC1 = CreateRecord(Record.CURRENCY_CD_TBL);
If (&REC1 = Null) Then
    &LOGFILE.WriteLine("FATAL ERROR:  CreateRecord() on record failed.");
    &LOGFILE.Close();
    &FILE1.Close();
    &FILE2.Close();
    Exit;
End-If;

&RS1 = CreateRowset(Record.CURRENCY_CD_TBL);
If (&RS1 = Null) Then
    &LOGFILE.WriteLine("FATAL ERROR:  CreateRowset() on record failed.");
    &LOGFILE.Close();
    &FILE1.Close();

```

```

        &FILE2.Close();
    Exit;
End-If;

&SQL1 = CreateSQL("%Selectall(:1)", &REC1);
If (&SQL1 = Null) Then
    &LOGFILE.WriteLine("FATAL ERROR: CreateSQL() failed.");
    &LOGFILE.Close();
    &FILE1.Close();
    &FILE2.Close();
    Exit;
End-If;

If (&FILE1.UseSpaceForNull) Then
    &LOGFILE.WriteLine("UseSpaceForNull is True on non-spaced output, by default.");
Else
    &LOGFILE.WriteLine("UseSpaceForNull is False on non-spaced output, by⇒
    default.");
End-If;
If (&FILE2.UseSpaceForNull) Then
    &LOGFILE.WriteLine("UseSpaceForNull is True on spaced output, by default.");
Else
    &LOGFILE.WriteLine("UseSpaceForNull is False on spaced output, by default.");
End-If;

&FILE1.UseSpaceForNull = True;
If (&FILE1.UseSpaceForNull) Then
    &LOGFILE.WriteLine("Setting UseSpaceForNull to True succeeded on non-spaced⇒
    output.");
Else
    &LOGFILE.WriteLine("Setting UseSpaceForNull to True failed on non-spaced⇒
    output.");
End-If;
&FILE2.UseSpaceForNull = True;
If (&FILE2.UseSpaceForNull) Then
    &LOGFILE.WriteLine("Setting UseSpaceForNull to True succeeded on spaced⇒
    output.");
Else
    &LOGFILE.WriteLine("Setting UseSpaceForNull to True failed on spaced output.");
End-If;

&FILE1.UseSpaceForNull = False;
If (&FILE1.UseSpaceForNull) Then
    &LOGFILE.WriteLine("Setting UseSpaceForNull to False failed on non-spaced⇒
    output.");
Else
    &LOGFILE.WriteLine("Setting UseSpaceForNull to False succeeded on non-spaced⇒
    output.");
End-If;
&FILE2.UseSpaceForNull = False;
If (&FILE2.UseSpaceForNull) Then
    &LOGFILE.WriteLine("Setting UseSpaceForNull to False failed on spaced output.");
Else
    &LOGFILE.WriteLine("Setting UseSpaceForNull to False succeeded on spaced⇒
    output.");
End-If;

&FILE1.UseSpaceForNull = False;
&FILE2.UseSpaceForNull = True;
&I = 1;
While &SQL1.Fetch(&REC1)
    &ROW1 = &RS1.GetRow(1);

```

```
&REC1.CopyFieldsTo(&ROW1.CURRENCY_CD_TBL);  
&FILE1.WriteRowset(&RS1, True);  
&FILE2.WriteRowset(&RS1, True);  
REM    &LOGFILE.WriteLine("Got row " | String(&I));  
&I = &I + 1;  
End-While;  
  
&FILE1.Close();  
&FILE2.Close();  
&LOGFILE.Close();
```

ZeroExtend

Description

Use this property to specify whether or not the WriteRowset method zero-extends the value it writes for decimal fields for CSV or XML format files.

For example, for a decimal field defined as 6.3, the value 1.12 will be written as follows depending on the value of ZeroExtend:

True: 1.120

False: 1.12

This property takes a Boolean value: true if WriteRowset zero-extends the value it writes; false otherwise. The default value is true.

Note. This property has no effect in the case of a fixed-position format file. In addition, it does not affect the behavior of the ReadRowset method.

This property is read-write.

File Layout Examples

If your data is hierarchical in nature, or based on existing PeopleSoft records or pages, you want to use a File Layout definition for reading and writing your data, rather than doing it line by line (or field by field.)

For example, suppose you wanted to write all the information from a record to a file. You can use the `WriteRecord` method to write all the data from the record, instead of having to loop through every field, find the value, and write it to the file.

In addition, you could write all the information from a transaction (or several transactions) from a page to a file. Each transaction can be considered a *rowset*. A rowset can contain more than one record and is generally composed in a hierarchical structure. You could create a File Layout definition that has the same structure as the page (or component), and use the `WriteRowset` method. If you have a file that contains data in the correct format, you can use the `ReadRowset` method to read the data from the file to the page.

Each file layout is associated with a *format*. This format specifies the type of data in the files. You specify the format as part of the File Layout Properties. You can only specify one format for a file layout. Available formats are:

- FIXED (default)
- CSV
- XML

The file layout methods and properties use this information to handle each file type in a transparent manner. Generally, you don't need to do anything different based on file type. Any exceptions are noted in the documentation.

Note. Unlike other PeopleTools definitions, records and field are *copied* to a File Layout definition. There are no pointers. This means if you change a record definition (add or remove a field) you must change the File Layout definition also. The changes are not automatically propagated. This is why the documentation refers to these elements as file records, file fields, and so on, to show that they are no longer part of the original definition they were created from.

PeopleSoft recommends regenerating all file layout definitions after any upgrade, to avoid any corruption caused by changes to the database.

See Using Standalone Rowsets for more examples of writing from and reading to files using File Layout and standalone rowsets.

WriteRecord Example

In the following example, the File Layout definition is based on the record `ABSENCE_HISTORY`, and looks like this:

Example File Layout definition (ABS_HIST)

You should note the following about the using the WriteRecord method:

- Not all the fields in the File Layout definition and the record have to match. The WriteRecord method, like all File Layout methods, applies only to the *like-named* fields. If there are additional fields in the record or in the File Layout definition, they are ignored.
- The WriteRecord method writes only to *like-named* records. If you rename a record after you use it to create a File Layout definition, you must rename it to the exact same name in your File Layout. Because WriteRecord writes like-named records, the same file layout definition can contain more than one record.
- The WriteRecord method takes a *record object* as its parameter. A populated record object references a *single row* of data in the SQL table. This is why a SQL Fetch statement is used in a condition around the WriteRecord method. This fetches every row of data from the SQL table, then writes it to the file.

The following code writes the ABSENCE_HIST record to the file record.txt.

```

Local Record &RecLine;
Local File &MYFILE;
Local SQL &SQL2;

&MYFILE = GetFile("record.txt", "A");

If &MYFILE.IsOpen Then
  If &MYFILE.SetFileLayout(FileLayout.ABS_HIST) Then
    &RecLine = CreateRecord(RECORD.ABSENCE_HIST);
    &SQL2 = CreateSQL("%Selectall(:1)", &RecLine);
    While &SQL2.Fetch(&RecLine)
      &MYFILE.WriteRecord(&RecLine);
    End-While;
  Else
    /* do error processing -; filelayout not correct */
  End-If;
Else
  /* do error processing -; file not open */
End-If;

&MYFILE.Close();

```

If you wanted to write only changed records to the file, you could add the following code that is set in bold font:

```

While &SQL2.Fetch(&RecLine)
  If &RecLine.IsChanged Then
    &MYFILE.WriteRecord(&RecLine);
  End-If;
End-While;

```

The following is the first part of a sample data file created by the previous code. The field format is FIXED:

8001	VAC	09/12/1981	09/26/1981	14	0		P Y
8001	VAC	03/02/1983	03/07/1983	5	0		P Y
8001	VAC	08/26/1983	09/10/1983	13	0		P Y
8105	CNF	02/02/1995	??/??/	0	0		U N
8516	MAT	06/06/1986	08/01/1986	56	0		P Y
8516	SCK	08/06/1988	08/07/1988	1	0		P Y
8516	VAC	07/14/1987	07/28/1987	14	0		P Y
8553	JUR	12/12/1990	12/17/1990	5	0	Local Jury Duty	P N
8553	MAT	02/20/1992	10/01/1992	224	0	Maternity Leave	U N
8553	MAT	08/19/1994	03/01/1995	194	0	Maternity-2nd child	U Y
8553	PER	04/15/1993	04/19/1993	4	0		U N⇒
	Personal Day required						
8553	SCK	01/28/1987	01/30/1987	2	0	Hong Kong Flu	P N
8553	SCK	08/02/1988	08/03/1988	1	0	Sick	P N
8553	SCK	09/12/1995	09/13/1995	1	0		P N
8641	VAC	06/01/1988	06/15/1988	14	0		P Y
8641	VAC	07/01/1989	07/15/1989	14	0		P Y
G001	MAT	07/02/1991	09/28/1991	88	0	3-month Maternity leave	P Y⇒
	Maternity will be paid as 80% of Claudia's current salary.						

If a record in the File Layout definition has a File Record ID, each line in the file referencing this record is prefaced with this number. The File Record ID is not a field in the data itself. It is also referred to as the *rowid*. File Record IDs can be useful when the file you're producing refers to more than one record.

File Record IDs can be used only with File Layout definitions that have a type of FIXED. If a File Layout definition has only one level then File Record IDs can be omitted. But for File Layout definitions with more than one level, you *must* use File Record IDs.

The following is sample file, produced with the same code, but with a File Record ID of 101 added:

101	8001	VAC	09/12/1981	09/26/1981	14	0		P	Y
101	8001	VAC	03/02/1983	03/07/1983	5	0		P	Y
101	8001	VAC	08/26/1983	09/10/1983	13	0		P	Y
101	8105	CNF	02/02/1995	??/??/	0	0		U	N
101	8516	MAT	06/06/1986	08/01/1986	56	0		P	Y
101	8516	SCK	08/06/1988	08/07/1988	1	0		P	Y
101	8516	VAC	07/14/1987	07/28/1987	14	0		P	Y
101	8553	JUR	12/12/1990	12/17/1990	5	0	Local Jury Duty	P	N
101	8553	MAT	02/20/1992	10/01/1992	224	0	Maternity Leave	U	N
101	8553	MAT	08/19/1994	03/01/1995	194	0	Maternity-2nd child	U	Y
101	8553	PER	04/15/1993	04/19/1993	4	0		U	N⇒
		Personal Day required							
101	8553	SCK	01/28/1987	01/30/1987	2	0	Hong Kong Flu	P	N
101	8553	SCK	08/02/1988	08/03/1988	1	0	Sick	P	N
101	8553	SCK	09/12/1995	09/13/1995	1	0		P	N
101	8641	VAC	06/01/1988	06/15/1988	14	0		P	Y
101	8641	VAC	07/01/1989	07/15/1989	14	0		P	Y
101	G001	MAT	07/02/1991	09/28/1991	88	0	3-month Maternity leave	P	Y⇒
		Maternity will be paid as 80% of Claudia's current salary.							

Note. File positions start at 1, not 0. When you specify a File Record ID, make sure that the starting position of the Record ID is greater than 0.

ReadRecord Example

This following example uses the same File Layout definition as the previous example. The file format is CSV. The fields are separated by commas and delimited by double-quotes.

```
"8001", "VAC", "09/12/1981", "09/26/1981", "14", "0", "", "P", "Y", ""
"8001", "VAC", "03/02/1983", "03/07/1983", "5", "0", "", "P", "Y", ""

"8553", "MAT", "02/20/1992", "10/01/1992", "224", "0", "Maternity Leave", "U", "N", ""
"8553", "MAT", "08/19/1994", "03/01/1995", "194", "0", "Maternity-2nd child", "U", "Y", ""
"8553", "PER", "04/15/1993", "04/19/1993", "4", "0", "", "U", "N", "Personal Day required"
"8553", "SCK", "01/28/1987", "01/30/1987", "2", "0", "Hong Kong Flu", "P", "N", ""
"8553", "SCK", "08/02/1988", "08/03/1988", "1", "0", "Sick", "P", "N", ""
"8553", "SCK", "09/12/1995", "09/13/1995", "1", "0", "", "P", "N", ""
"8641", "VAC", "06/01/1988", "06/15/1988", "14", "0", "", "P", "Y", ""
"8641", "VAC", "07/01/1989", "07/15/1989", "14", "0", "", "P", "Y", ""
"G001", "MAT", "07/02/1991", "09/28/1991", "88", "0", "3-month Maternity leave", "P", "Y", ⇒
"Maternity will be paid as 80% of Claudia's current salary."
```

To read in the previous CSV file we use the following PeopleCode. It reads the file into a temporary record. First each line of the file is read into a string. The string is split into an array, with the value of each field in the array becoming an element in the array. The value of each field in the record is assigned a value from the array. After additional processing (for example, converting strings into dates or numbers, verifying data, and so on) the record can be inserted into the database. To insert the final data into the database, this code must be associated with a PeopleCode event that allows database updates, that is, SavePreChange, WorkFlow, SavePostChange, and so on. This code could also be used as part of an Application Engine program.

```

Local File &MYFILE;
Local Record &REC;
Local array of string &ARRAY;

&MYFILE = GetFile("c:\temp\vendor.txt", "R", %FilePath_Absolute);
&REC = CreateRecord(RECORD.ABS_HIST_TEST);
&ARRAY = CreateArrayRept("", 0);

If &MYFILE.IsOpen Then
  If &MYFILE.SetFileLayout(FILELAYOUT.ABS_HIST) Then
    While &MYFILE.ReadLine(&STRING);
      &ARRAY = Split(&STRING, ",");
      For &I = 1 To &REC.FieldCount
        &REC.GetField(&I).Value = &ARRAY[&I];
      End-For;
      /* do additional processing here for converting values */
      &REC.Insert();
    End-While;
  Else
    /* do error processing - filelayout not correct */
  End-If;
Else
  /* do error processing - file not open */
End-If;

&MYFILE.Close();

```

Note. You can't read a file that contains a thousands separator for numeric fields. You must strip out the separator before you try to read in the file.

WriteRowset Example

In the following example, the File Layout definition is based on the component EMPL_CHECKLIST, and looks like this:

Example File Layout definition (EMPL_CHECKLIST)

Here's the structure of the component EMPLOYEE_CHECKLIST:

EMPLOYEE_CHECKLIST Component structure

Note that:

- Every *field* in the two structures don't have to match (that is, every field or record that's in the file layout doesn't have to be in the component, and vice versa.)
- The two *structures* must be the same. That is, if the component has PERSONAL_DATA at level zero, and EMPL_CHECKLIST at level one, the file layout must have the same hierarchy.

The following example uses the previous File Layout definition to copy data from the EMPL_CHECKLIST page into a file.

The CreateRowset function creates an empty rowset that has the structure of the file layout definition. The GetRowset function is used to get all the data from the component and copy it into the rowset. The GetLevel0 function copies all *like-named* fields to *like-named* records. The WriteRowset method writes all the component data to the file. Because this code runs on the server, an absolute file path is used.

See *PeopleTools 8.51 PeopleBook: PeopleCode Language Reference*, "PeopleCode Built-in Functions," GetRowset.

Example

The following is the PeopleCode for this example.

```
Local File &MYFILE;
Local Rowset &FILEROWSET;

&MYFILE = GetFile("c:\temp\EMP_CKLS.txt", "A", %FilePath_Absolute);
If &MYFILE.IsOpen Then
    If &MYFILE.SetFileLayout(FILELAYOUT.EMPL_CHECKLIST) Then
        &FILEROWSET = &MYFILE.CreateRowset();
        &FILEROWSET = GetLevel0();
        &MYFILE.WriteRowset(&FILEROWSET, True);
    Else
        /* file layout not found, do error processing */
    End-If;
Else
    /* file not opened, do error processing */
End-if;

&MYFILE.Close();
```

The following is a sample data file created by the previous code:

```

8113      Frumman, Wolfgang
08/06/1999 000001      8219      Going to London office

          300      000018 I 08/06/1999
          400      000019 I 08/06/1999
8101      Penrose, Steven
07/06/1999 000006      8229      New hire
          1      000033 I 08/06/1999
          2      000034 I 08/06/1999
          3      000035 I 08/06/1999
          4      000036 I 08/06/1999
          5      000037 I 08/06/1999
          6      000038 I 08/06/1999
          7      000039 I 08/06/1999
          8      000040 I 08/06/1999
          9      000041 I 08/06/1999
          10     000042 I 08/06/1999

```

When you create the File Layout definition, you can choose for each field whether to inherit a value from a higher level record field. If a value is inherited, it is written only *once* to the file, the first time it's encountered.

In the previous data example, there are three records: PERSONAL_DATA, EMPL_CHECKLIST, and EMPL_CHKLIST_ITM. The field EMPLID is on all three records, but is written to the file only the first time a new value is encountered. So, the value for EMPLID is inherited by EMPL_CHECKLIST, and the value for EMPL_CHKLIST_ITM is inherited from PERSONAL_DATA. The field CHECKLIST_DT is on EMPL_CHECKLIST and EMPL_CHKLIST_ITM. However, the field value appears only once, in the parent record, and not in the child record.

If a record in the File Layout definition has a File Record ID, each line in the file referencing this record will be prefaced with this number. The File Record ID is not a field in the data itself. It is also referred to as the *rowid*. File Record IDs can be useful when the file being created refers to more than one record. File Record IDs can be used only with File Layout definitions that have a type of FIXED.

The following is sample file, produced with the same code, but with a File Record IDs added to all the records. 001 was added to the first level, 002 to the second, and 003 to the third.

```

001 8113      Frumman, Wolfgang
002          08/06/1999      000001 8219      Going to London office

003          10     000042 I 10/13/1999

```

ReadRowset Example

The following program reads all the rowsets from a file and updates a work scroll with that data. The work scroll isn't hidden on the page: it's created in the Component buffer from existing records using `CreateRowset`. The structure of the work scroll and the file layout are identical: that is, they're composed of two records, and the names of the records in the file layout are exactly the same as the names of the record definitions.

```

Local File &CHARTINPUT_F;
Local Rowset &INPUT_ROWSET, &TEMP_RS, &WORK_DATA;
Local Record &WRK_DATA;

&filename = "c:\temp\test.txt";
If FileExists(&filename, %FilePath_Absolute) Then
    &CHARTINPUT_F = GetFile(&filename, "R", "A", %FilePath_Absolute);
Else
    Exit;
End-If;

&CHARTINPUT_F.SetFileLayout(FileLayout.CHART_INFO);

/* Create rowset to be read into
NOTE that you have to start at LOWEST level of rowset */

&TEMP_RS = CreateRowset(RECORD.CHART_ITEM);
&WORK_DATA = CreateRowset(RECORD.CHART_DATA, &TEMP_RS);
&INPUT_ROWSET = CreateRowset(RECORD.CHART, &WORK_DATA);

While &INPUT_ROWSET <> Null
    &INPUT_ROWSET = &CHARTINPUT_F.ReadRowset();
    &INPUT_ROWSET.CopyTo(&WORK_DATA);
    /* do processing -- Though file may contain more than one level zero
    Component processor only allows one level zero at a time */
End-While;

```

File Rowset Considerations

The following are considerations for when you use rowsets with files.

- Although you can create a File Layout definition with more than four levels of hierarchy, a rowset created from Component buffer data can contain only four levels (level zero through 3). Any additional levels of data are ignored.
- ReadRowset populates the rowset with one transaction from the file. (A transaction is considered to be one instance of level zero data contained in a file record, plus all of its subordinate data.) WriteRowset writes one transaction to a file.

Application Engine Example

You can also use PeopleCode in an Application Engine program to either write to or read from files. This example isn't a proper Application Engine program: it contains the PeopleCode only for opening and reading from a file. However, it's included here as starting point for your own Application Engine programs.

Here is the Application Engine program:

Section	Step	Action
MAIN	MAIN description	MAIN.GBL.(base).1900-01-01
Step01	Step01 description	Commit After: Default Frequency: On Error: Abort ☒ Active
	PeopleCode	PeopleCode description On Return: Skip Step

Application Engine example program

Here is the PeopleCode in the step 1.

```

Local File &FILE;
Local Record &REC;
Local Rowset &FRS;

&FILE = GetFile("TEST.txt", "R");
&REC = CreateRecord(Record.QEPC_FILE_REC);
&SQL = CreateSQL("%Insert(:1)");

If Not &FILE.IsOpen Then
    Error ("TEST: failed file open");
Else
    If Not &FILE.SetFileLayout(FileLayout.QEPC_FILE_REC) Then
        Error ("TEST: failed SetFilelayout");
    Else
        &FRS = &FILE.ReadRowset();
        While &FRS <> Null
            &FRS.GetRow(1).QEPC_FILE_REC.CopyFieldsTo(&REC);
            &SQL.execute(&REC);
            &FRS = &FILE.ReadRowset();
        End-While;
    End-If;
    &FILE.Close();
End-If;

```

The example Application Engine program reads the following CSV file:

```

"TEST2","1ST","01/01/1901",10
"TEST2","2ND","01/01/1902",20
"TEST2","3RD","01/01/1903",30
"TEST2","4TH","01/01/1904",40

```

Note that the last field has no qualifier.

The File Layout used to read this record has the following form:

QEPC_FILE_REC File Layout

The properties for the QEPC_FILE_REC File Layout are as follows:

The 'File Layout Definition Properties' dialog box has two tabs: 'General' and 'Use'. The 'General' tab is active. It contains the following fields:

- File Layout Name : QEPC_FILE_REC
- File Layout Type : CSV
- File Layout Format : CSV (dropdown menu)
- Definition Qualifier : " (text input)
- Definition Separator : Comma (dropdown menu)
- File Definition Tag : (text input)
- Buffer Size : 0 (text input)

File Layout Definition Properties

Note that the Definition Qualifier is double-quotes ("), while the separator is a comma.

Remember, the last field didn't have a qualifier. To account for that, the field properties for this field must be edited, and a blank must be put in the Field Qualifier property.

File Layout Field Properties

Use

Field Inheritance
File Layout Name : QEPC_FILE_REC
File Layout Type : CSV

Sequence No : 4

Field Name : QEPC_FILE_NUM ☐ Suppress

Field Type : Number

Decimal Pos: 2

Field Length : 7

Start Position : 41

Field Qualifier :

Field Tag : QEPC_FILE_NUM

Strip Characters

Field Description:

Propagate
<<< 0 >>>

☐ Trim Spaces

Record Name : DO-NOT-INHERIT
Field Name :
Default Value :

OK Cancel

File layout Field Properties

See *PeopleTools 8.51 PeopleBook: Application Engine*, "Understanding Application Engine."

Multiple File Layouts

In the previous examples, the input file contained rowsets based on a single File Layout definition. However, PeopleTools provides the functionality to process input files containing rowsets that require several *different* File Layouts.

Note. You can use only fixed format files to implement multiple file layouts.

See the `SetFileId` method for details about handling multiple file layouts.

In this section, we discuss how to:

- Read multiple file layouts.
- Write multiple file layouts.

See [Chapter 19, "File Class," SetFileId, page 996.](#)

Reading Multiple File Layouts

If your input file contains data based on more than one File Layout, it must contain an indicator, called a FileId that specifies:

- When a different File Layout definition should be used.
- Which File Layout definition should be used.

The FileId must be specified on a separate line and must precede *every* rowset that requires a layout different from the previous rowset. It isn't considered part of the rowset.

In the following example, the file contains two FileId lines; they use a file record ID that distinguishes them from the rowset data—in this case, "999".

```
999 PRODUCT /* The following rowset uses the PRODUCT layout */
001 /* Level 0 record data */
101 /* level 1 record data */
201 /* Level 2 record data */
201 /* Level 2 record data */
999 ORDER /* The following two rowsets use the ORDER layout */
001 /* Level 0 record data */
111 /* Level 1 record data */
111 /* Level 1 record data */
001 /* Level 0 record data */
111 /* Level 1 record data */
111 /* Level 1 record data */
```

The FileId can contain any information you want that indicates which file layout to use; the "PRODUCT" and "ORDER" fields shown are just examples.

To read this file, you should do the following in your program:

1. Use the SetFileId method to specify the file record ID value.
2. Use the ReadRowset method to read the data.
3. Check if the rowset is NULL.

NULL indicates you've reached either the end of the file or a new rowset.

4. Use the IsNewFileId property to check if the next line is a FileId file record (line).

- If IsNewFileId is False, you've reached the end of the file.
- If IsNewFileId is True, use the CurrentRecord property to determine which File Layout to use next.

The following example reads rowsets from a file. When it finds a new rowset (indicated by &IsNewFileId returning True) the value of &CurrentRecord is passed to a function that reads and evaluates the line, then returns the name of the new file layout. (The code for the function FindFileId is included at the start of the example.)

```

Local File &MYFILE;
Local Rowset &rsFile;
Local Record &rSomeRec1, &rSomeRec2;
Local SQL &SQL1;

Function FindFileID(&CurrentRecord As string) Returns string ;
    Evaluate RTrim(Substring(&CurrentRecord, 5, 50))
    When "SOME_REC1"
        &FILELAYOUT = "SOME_REC1";
    When "SOME_REC2"
        &FILELAYOUT = "SOME_REC2";
    End-Evaluate;
    Return &FILELAYOUT;
End-Function;

&rSomeRec1 = CreateRecord(Record.SOME_REC1);
&rSomeRec2 = CreateRecord(Record.SOME_REC2);
&SQL1 = CreateSQL("%Insert(:1)");
&MYFILE = GetFile("c:\temp\MULTI_FILE.out", "R", %FilePath_Absolute);

rem Set temporary first file layout;
&MYFILE.SetFileLayout(FileLayout.SOME_REC1);
&MYFILE.SetFileId("999", 1);

rem Read rowset to find actual first file ID;
&rsFile = &MYFILE.ReadRowset();
&CurrentRecord = &MYFILE.CurrentRecord;
&IsNewFileID = &MYFILE.IsNewFileId;
If &MYFILE.IsNewFileId Then
    &FILELAYOUT = FindFileID(&CurrentRecord);
    &MYFILE.SetFileLayout(@("FileLayout." | &FILELAYOUT));
    &MYFILE.SetFileId("999", 1);
End-If;

rem Read first 'real' rowset;
&rsFile = &MYFILE.ReadRowset();
&CurrentRecord = &MYFILE.CurrentRecord;
&IsNewFileID = &MYFILE.IsNewFileId;
While &rsFile <> Null Or
    &IsNewFileID
    If &MYFILE.IsNewFileId Then
        &FILELAYOUT = FindFileID(&CurrentRecord);
        &MYFILE.SetFileLayout(@("FileLayout." | &FILELAYOUT));
        &MYFILE.SetFileId("999", 1);
        If &IsNewFileID Then
            &rsFile = &MYFILE.ReadRowset();
            &CurrentRecord = &MYFILE.CurrentRecord;
            &IsNewFileID = &MYFILE.IsNewFileId;
        End-If;
    End-If;

Evaluate &FILELAYOUT

When "SOME_REC1"
    &rsFile(1).SOME_REC1.CopyFieldsTo(&rSomeRec1);
    &rSomeRec1.ExecuteEdits(%Edit_Required);
    If Not &rSomeRec1.IsEditError Then
        &SQL1.Execute(&rSomeRec1);
    End-If;
    Break;
When "SOME_REC2"
    &rsFile(1).SOME_REC2.CopyFieldsTo(&rSomeRec2);
    &rSomeRec2.ExecuteEdits(%Edit_Required);
    If Not &rSomeRec2.IsEditError Then

```

```
        &SQL1.Execute(&rSomeRec2);  
    End-If;  
End-Evaluate;  
  
    &rsFile = &MYFILE.ReadRowset();  
    &CurrentRecord = &MYFILE.CurrentRecord;  
    &IsNewFileID = &MYFILE.IsNewFileId;  
End-While;  
  
&MYFILE.Close();
```

See [Chapter 19, "File Class," SetFileId, page 996](#); [Chapter 19, "File Class," ReadRowset, page 994](#) and [Chapter 19, "File Class," IsNewFileId, page 1011](#).

Writing Multiple File Layouts

If you're writing files that contain data based on more than one File Layout definition, consider the following points:

- If the file is going to a third-party vendor, you should work with the third-party to determine what their requirements are for specifying the different data formats.
- If the file is going to be used by another PeopleSoft system, you must add the FileId between each rowset that requires a different layout. FileId file records are *not* part of any rowset. They should be designed so they won't be mistaken for part of a rowset. You can create and write them to the file in many ways. The following are suggestions:
 - Build each line as a string, using any of the built-in string manipulation functions, then write them to the file using the File class WriteLine or WriteString methods.
 - Design a file layout consisting of a single file record definition for the FileId file records, then build the records using Record Class methods and functions, and write them to the file using the WriteRecord method.

The following code example writes each record from the level one scroll on a page to the file using a different File Layout. Between each WriteRowset the File ID file record is written to the file, describing the new File Layout being used.

```

Local File &MYFILE;
Local Rowset &FILEROWSET;
Local Record &REC1, &REC2;
Local SQL &SQL;

&MYFILE = GetFile("c:\temp\Records.txt", "w", %FilePath_Absolute);
If &MYFILE.IsOpen Then
  If &MYFILE.SetFileLayout(FileLayout.TREE_LEVEL) Then
    &REC1 = CreateRecord(Record.PSTREELEVEL);
    &FILEROWSET = &MYFILE.CreateRowset();
    &SQL = CreateSQL("%Selectall(:1)", &REC1);
    /* write first File ID to file */
    &MYFILE.WriteLine("999 FILE LAYOUT 1");
    While &SQL.Fetch(&REC1)
      &REC1.CopyFieldsTo(&FILEROWSET.GetRow(1).PSTREELEVEL);
      &MYFILE.WriteRowset(&FILEROWSET, True);
    End-While;
  Else
    /* file layout not found, do error processing */
  End-If;

  If &MYFILE.SetFileLayout(FileLayout.TREE_USERLEVEL) Then
    &REC2 = CreateRecord(Record.TREE_LEVEL_TBL);
    &FILEROWSET = &MYFILE.CreateRowset();
    &SQL = CreateSQL("%Selectall(:1)", &REC2);
    /* write second File ID to file */
    &MYFILE.WriteLine("999 FILE LAYOUT 2");
    While &SQL.Fetch(&REC2)
      &REC2.CopyFieldsTo(&FILEROWSET.GetRow(1).TREE_LEVEL_TBL);
      &MYFILE.WriteRowset(&FILEROWSET);
    End-While;
  Else
    /* file layout not found, do error processing */
  End-If;
Else
  /* file not opened, do error processing */
End-If;
&MYFILE.Close();

```

See [Chapter 19, "File Class," WriteLine, page 1002](#); [Chapter 19, "File Class," WriteString, page 1008](#) and [Chapter 19, "File Class," WriteRecord, page 1004](#).

See [Chapter 34, "Record Class," page 2065](#).

Chapter 20

Grid Classes

This chapter provides an overview of Grid class and the GridColumn subobject and discusses the following topics:

- Shortcut considerations
- The Grid class in PeopleCode
- Grid or Grid Column declaration
- Scope of a Grid or Grid Column class
- Grid Class built-in function
- Grid Class reference
- Grid Column class

Note. Use the grid classes to control the display of a grid control. If you want to manipulate an analytic grid, used with PeopleSoft Analytic Calculation Engine data, you must use the AnalyticGrid classes.

See Also

Chapter 4, "Analytic Grid Classes," page 159

Understanding Grid and GridColumn Classes

A grid looks and behaves like a spreadsheet embedded in a page: it has column headings, row headings, cells, and horizontal and vertical scroll bars. It can be used instead of a single-level scroll. It is analogous to a scroll region on a page. Each row in a grid corresponds to a set of controls in a scroll occurrence. Each cell in a grid corresponds to a field on a page.

The grid class enables you to instantiate only GridColumn objects, which in turn enables you to change grid column attributes without having to write PeopleCode that loops through every row of the grid.

Note. PeopleSoft builds a page grid one row at a time. Because the grid class applies to a complete grid, you can't attach PeopleCode that uses the grid class to events that occur before the grid is built; the earliest event you can use is the page Activate Event.

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "PeopleCode and the Component Processor," Activate Event

Shortcut Considerations

An expression of the form

```
&MYGRID.columnname.property
```

is converted to an object expression by using `GetColumn(columnname)`. The following examples are equivalent.

Using *columnname*:

```
&MYGRIDCOLUMN = &MYGRID.CHECKLIST_ITEMCODE;
```

Using the `GetColumn` method:

```
&MYGRIDCOLUMN = &MYGRID.GetColumn("CHECKLIST_ITEMCODE");
```

The following examples are equivalent.

Using *columnname*:

```
&MYGRID.CHECKLIST_ITEMCODE.Visible = False;
```

Using the `GetColumn` method:

```
&MYGRID.GetColumn("CHECKLIST_ITEMCODE").Visible = False;
```

The Grid Class in PeopleCode

The PeopleCode grid object is a reference to a page runtime object for the grid. These particular page runtime objects aren't present until the Component is started.

Note. PeopleSoft builds a page grid one row at a time. Because the Grid class applies to a complete grid, you can't attach PeopleCode that uses the Grid class to events that occur before the grid is built; the earliest event you can use is the page Activate Event.

If you're using the grid within a secondary page, the runtime object for the grid isn't created until the secondary page is run. The grid object can't be obtained until then, which means that the earliest PeopleCode event you can use to activate a grid that's on a secondary page is the Activate event for the secondary page.

The attributes you set for displaying a page grid remain in effect only while the page is active. When you switch between pages in a component, you have to reapply those changes *every time* the page is displayed.

In addition, the Activate event associated with a page fires every time the page is displayed. Any PeopleCode associated with that Activate event runs, which may undo the changes you made when the page was last active. For example, if you hide a grid column in the Activate event, then display it as part of a user action, when the user tabs to another page in the component, then tabs back, the Activate event runs again, hiding the grid column again.

If a user at runtime hides a column of a grid, tabs to another page in the component, then tabs back to the first page, the page is refreshed and the grid column is displayed again.

When you place a grid on a page, the grid is automatically named the same as the name of the primary record of the scroll for the grid. This is the name you use with the GetGrid function. You can change this name on the Record tab of the Grid properties.

Note. There is no visible property for a grid, just a grid column. However, you can still hide an entire grid. Remember, many of the Rowset methods and properties work on a grid. If you want to hide an entire grid, get the rowset for that grid by using the HideAllRows Rowset class method.

Use the grid classes to access an ordinary grid. Use the analytic grid classes to access an analytic grid.

[Chapter 36, "Rowset Class," HideAllRows, page 2135](#)

Data Type for a Grid or Grid Column Object

Grids are declared using the Grid data type. For example,

```
Local Grid &MYGRID;
```

Grid Columns are declared using the GridColumn data type. For example:

```
Local GridColumn &MYGRIDCOL;
```

Scope of a Grid or Grid Column Object

Both the grid and grid column objects can be instantiated from PeopleCode only.

A grid is a control on a page. You generally use these objects only in PeopleCode programs that are associated with an online process, not in an Application Engine program, a message subscription, a Component Interface, and so on.

In addition, PeopleSoft builds a page grid one row at a time. Because the Grid class applies to a complete grid, you can't attach PeopleCode that uses the Grid class to events that occur before the grid is built; the earliest event you can use is the page Activate Event.

Grid Class Built-in Function

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetGrid

Grid Class Methods

In this section, we discuss each Grid class method.

EnableColumns

Syntax

EnableColumns(&Array)

Description

Use this method to enable or disable one or more columns in a grid. When a column is enabled, it is editable; when it's disabled, it is un-editable.

The EnableColumns method of the Grid class can provide a noticeable performance improvement over multiple calls to set the Enabled property of the GridColumn class. Each call manipulating a grid (either using a Grid class method or setting a GridColumn property) has a significant, and similar performance overhead. Therefore, one key to increasing the performance of PeopleCode programs manipulating grids is to reduce the number of these calls. Performance testing data suggests that if your program is changing three or more columns, use one of the Grid class methods, such as the EnableColumns method, instead of setting the column properties directly. The single call to the Grid class method offsets the small overhead of creating and populating the required array.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array</i>	Specify a two-dimensional array containing the column name and a value (Y/N) indicating whether the column is enabled.

Returns

None.

Example

```
&AREnable = CreateArrayRept(CreateArrayRept("", 2), 0);
&AREnable.Push(CreateArray("JOB_DETAIL", "Y"));
&AREnable.Push(CreateArray("JOB_TIME", "Y"));
&myGrid.EnableColumns(&AREnable);
```

See Also

[Chapter 20, "Grid Classes," Enabled, page 1046](#)

GetColumn

Syntax

GetColumn(*columnname*)

Description

The GetColumn method instantiates a grid column object from the Grid class, and populates it with a grid column from the grid object executing this method. Specify the grid column name in the page field properties for that field, consisting of any combination of uppercase letters, digits and "#", "\$", "@", and "_".

To specify a grid column name:

1. Open the page in Application Designer, select the grid and access the page field properties.
2. Select the Columns tab on the grid properties.
3. Either double-click on the grid column you want to name, or select the column and click the Properties button.
4. On the General tab, type the grid column name in the Page Field Name field.

Note. Although it's possible to base multiple grid columns on the same record field, the Page Field Name you enter for each grid column must be unique, not just for that grid, but for that page. If you have two grids on a page, every page field name must be unique to the page.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>columnname</i>	Specify a string containing the value of the Page Field Name on the General tab of the grid column's properties. You must have previously entered a value for the Page Field Name for the grid column you want to work with.

Returns

A GridColumn object populated with the grid column specified as the parameter to this method.

Example

```
local Grid &MYGRID;  
local GridColumn &MYGRIDCOLUMN;  
  
&MYGRID = GetGrid(PAGE.EMPLOYEE_CHECKLIST, "EMPL_GRID");  
&MYGRIDCOLUMN = &MYGRID.GetColumn("CHECKLIST_ITEMCODE");
```

The following function loops through rows on a grid. The function finds each row that is selected. It does this through the Selected property of the Row class of PeopleCode. Data is then moved from the selected row to a new row, on a different grid, in the same page. The way in which this function is written, data is moved from &SCROLL_SHELF to &SCROLL_CART. These are two different rowset objects, of two different grids, on the same page. Note that the two grids in this example are on the same occurs level.

```

/* Moving data between grids on the same occurs level */
/* of the same page */

Local Rowset &SCROLL_CART, &SCROLL_SHELF;

Function move_rows(&SCROLL_CART As Rowset, &SCROLL_SHELF As Rowset);

    &I = 1;
/* loop to find whether row is selected */
Repeat
    If &SCROLL_SHELF.GetRow(&I).Selected = True Then

        If All(&SCROLL_CART(1).GetRecord(1).QEPC_ITEM.Value) Then

            &SCROLL_CART.InsertRow(&SCROLL_CART.ActiveRowCount);
        End-If;

        /* if it is selected move data to other grid */

        &SCROLL_SHELF.GetRow(&I).GetRecord(1).CopyFieldsTo(&SCROLL_CART.GetRow=>
(&SCROLL_CART.ActiveRowCount).GetRecord(1));

/* delete row from current grid so data disappears */

        &SCROLL_SHELF.DeleteRow(&I);
        &I = &I - 1;
    End-If;

    &I = &I + 1;
Until &I = &SCROLL_SHELF.ActiveRowCount + 1;

/* end of loop *****/
End-Function;

/***** end of function *****/

/* Creating the rowset object */

&SCROLL_CART = GetLevel0()(1).GetRowset(SCROLL.QEPC_CART);
&SCROLL_SHELF = GetLevel0()(1).GetRowset(SCROLL.QEPC_SHELF);

/* calling the function */

move_rows(&SCROLL_CART, &SCROLL_SHELF);

```

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetGrid

LabelColumns

Syntax

LabelColumns(&Array)

Description

Use this method to set the display label for one or more columns in a grid.

The LabelColumns method of the Grid class can provide a noticeable performance improvement over multiple calls to set the Label property of the GridColumn class. Each call manipulating a grid (either using a Grid class method or setting a GridColumn property) has a significant, and similar performance overhead. Therefore, one key to increasing the performance of PeopleCode programs manipulating grids is to reduce the number of these calls. Performance testing data suggests that if your program is changing three or more columns, use one of the Grid class methods, such as the LabelColumns method, instead of setting the column properties directly. The single call to the Grid class method offsets the small overhead of creating and populating the required array.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array</i>	Specify a two-dimensional array containing the column name and a value for the column label.

Returns

None.

Example

```
&ARLabel= CreateArrayRept(CreateArrayRept("", 2), 0);  
&ARLabel.Push(CreateArray("JOB_DETAIL", "Job Detail"));  
&ARLabel.Push(CreateArray("JOB_TIME", "Job Time"));  
&myGrid.LabelColumns(&ARLabel);
```

See Also

[Chapter 20, "Grid Classes," Label, page 1047](#)

SetProperties

Syntax

SetProperties(*&Array*)

Description

Use this method to set multiple properties (column enabled, column visibility, and column label) for one or more columns in a grid.

The `SetProperties` method of the `Grid` class can provide a noticeable performance improvement over multiple calls to set individual properties of the `GridColumn` class. Each call manipulating a grid (either using a `Grid` class method or setting a `GridColumn` property) has a significant, and similar performance overhead. Therefore, one key to increasing the performance of PeopleCode programs manipulating grids is to reduce the number of these calls. Performance testing data suggests that if your program is changing three or more columns, use one of the `Grid` class methods, such as the `SetProperties` method, instead of setting the column properties directly. The single call to the `Grid` class method offsets the small overhead of creating and populating the required array.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array</i>	Specify a four-dimensional array containing the column name, a value (Y/N) indicating whether the column is enabled, a value (Y/N) indicating whether the column is visible, and a value for the column label.

Returns

None.

Example

```
&ARProp= CreateArrayRept(CreateArrayRept("", 4), 0);  
&ARProp.Push(CreateArray("JOB_DETAIL", "Y", "Y", "Job Detail"));  
&ARProp.Push(CreateArray("JOB_TIME", "Y", "Y", "Job Time"));  
&mygrid.SetProperties(&ARProp);
```

[Chapter 20, "Grid Classes," Enabled, page 1046](#); [Chapter 20, "Grid Classes," Label, page 1047](#) and [Chapter 20, "Grid Classes," Visible, page 1048](#)

ShowColumns

Syntax

ShowColumns(*&Array*)

Description

Use this method to set the visibility for one or more columns in a grid.

The ShowColumns method of the Grid class can provide a noticeable performance improvement over multiple calls to set the Visible property of the GridColumn class. Each call manipulating a grid (either using a Grid class method or setting a GridColumn property) has a significant, and similar performance overhead. Therefore, one key to increasing the performance of PeopleCode programs manipulating grids is to reduce the number of these calls. Performance testing data suggests that if your program is changing three or more columns, use one of the Grid class methods, such as the ShowColumns method, instead of setting the column properties directly. The single call to the Grid class method offsets the small overhead of creating and populating the required array.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Array</i>	Specify a two-dimensional array containing the column name and a value (Y/N) indicating whether the column is visible.

Returns

None.

Example

```
&ARShow= CreateArrayRept(CreateArrayRept("", 2), 0);  
&ARShow.Push(CreateArray("JOB_DETAIL", "Y"));  
&ARShow.Push(CreateArray("JOB_TIME", "Y"));  
&myGrid.ShowColumns(&ARShow);
```

See Also

[Chapter 20, "Grid Classes," Visible, page 1048](#)

Grid Class Properties

In this section, the Grid class properties are described in alphabetical order.

gridcolumn

Description

If a grid column name is used as a property, it accesses the grid column with that name. This means the following code:

```
&Mycolumn = &MyGrid.gridcolumnname;
```

acts the same as

```
&MyColumn = &MyGrid.GetColumn(columnname);
```

This property is read-only.

Label

Description

This property returns a string specifying the label that appears as the title of the grid.

Note. You can't use this property to set labels longer than 100 characters. If you try to set a label of more than 100 characters, the label is truncated to 100 characters. Always put any changes to labels in the Activate event. This way the label is set every time the page is accessed.

This property is read-write.

SummaryText

Description

Use this property to set or return a string representing the summary text for the grid.

Summary text enables you to provide a brief description of the functionality and content of the grid area. This property is pertinent for users who access the application in accessibility mode using screen readers.

This property is read-write.

Example

```
&MyGrid = GetGrid(Page.PSXLATMAINT, "PSXITMMNT_VW");  
&MyGrid.SummaryText = "This is the new summary text through PeopleCode";
```

GridColumn Class

Grid columns are page fields that comprise a grid, which is itself a page field. Similarly, a group of GridColumn objects comprises a Grid object. The GridColumn class enables you to change grid column attributes without having to write PeopleCode that loops through every row of the grid.

This class has no methods or built-in functions, only properties.

Note. To use a GridColumn object, you must instantiate it from a grid object. This requires you to first instantiate a Grid object using the GetGrid built-in function.

You create an analytic grid column object from the analytic grid class. However, the analytic grid column class has the same properties as the grid column class. Any differences are noted in the documentation.

See *PeopleTools 8.51 PeopleBook: PeopleCode Language Reference*, "PeopleCode Built-in Functions," GetGrid.

GridColumn Class Properties

In this section, we discuss each GridColumn class property.

Enabled

Description

This property specifies whether the fields in the column are enabled (that is, can be edited) or if they are "disabled", that is, un-editable. All columns are enabled by default.

Note. For an analytic grid column, the Enabled property only works with cubes, not dimensions.

This property is read-write.

Example

```
If Not &ValidID Then
    &MYGRID = GetGrid(PAGE.EMPLOYEE_CHECKLIST, "EMPL_GRID");
    &MYGRIDCOLUMN = &MYGRID.GetColumn("CHECKLIST_ITEMCODE");
    &MYGRIDCOLUMN.Enabled = False;
End-If;
```

See Also

The EnableColumns and SetProperty methods of the Grid class can provide a noticeable performance improvement over multiple calls to set the Enabled property of the GridColumn class.

[Chapter 20, "Grid Classes," EnableColumns, page 1038](#) and [Chapter 20, "Grid Classes," SetProperty, page 1042](#)

Label

Description

This property specifies the display label for the GridColumn object, as distinct from the grid column's Record Field Name or Page Field Name. This property overrides the equivalent settings on the Label tab of the grid column's Page Field Properties.

Note. You can't use this property to set labels longer than 100 characters. If you try to set a label of more than 100 characters, the label is truncated to 100 characters. If you change the column label, then change the field label, you may overwrite the column label with the field label. The grid object is part of a page, *not* the data buffers, while the field is part of the data buffers. To avoid this problem, always put any changes to column labels in the Activate event. This way the label is set every time the page is accessed.

This property is read-write.

Example

```
&MYGRIDCOLUMN.Label = "Checklist Item";
```

See Also

The LabelColumns and SetProperty methods of the Grid class can provide a noticeable performance improvement over multiple calls to set the Label property of the GridColumn class.

[Chapter 20, "Grid Classes," LabelColumns, page 1041](#) and [Chapter 20, "Grid Classes," SetProperty, page 1042](#)

Name

Description

This property returns the name of the grid column, as a string. This value comes from the Page Field Name on the General tab in the Page Field Properties of the GridColumn object executing the property. This property was the value used to instantiate the GridColumn object.

This property is read-only.

Example

```
&PF_NAME = &MYGRIDCOLUMN.Name;
```

Visible

Description

This property specifies whether a grid column is visible or hidden. Set this property to False to hide the grid column, and to True to unhide the grid column. This property defaults to True.

The Visible property also hides grid columns that are displayed as tabs in the PeopleSoft Pure Internet Architecture.

If you specify "Show Column on Hide Rows" in Application Designer, the column headers and labels of a grid display at runtime, even when the rest of the column is hidden. You can't override this value using PeopleCode.

Note. For an analytic grid column, this property is only valid if the column is bound to a dimension on a slicer, and bound to a cube that is on the column axis.

This property is read-write.

Note. In previous releases of PeopleTools, the methodology for hiding a grid column was to use the Hide function in a loop to hide each cell in the column, one row at a time. This method of hiding grid columns still works. However, your application will experience deteriorated performance if you continue to use this method.

Example

```
&MYGRIDCOLUMN.Visible = False;
```

The following example checks for the value of a field in every row of the grid. If that value is "N" for every row, the column is hidden.

```

&RS = GetRowset(Scroll.EX_SHEET_LINE);
&HIDE = True;
While (&HIDE)

    For &I = 1 To &RS.ActiveRowCount;
        &OUT_OF_POLICY = &RS(&I).EX_SHEET_LINE.OUT_OF_POLICY.Value;
        &NO_RECEIPT_FLG = &RS(&I).EX_SHEET_LINE.NO_RECEIPT_FLG.Value;
        If &OUT_OF_POLICY = "Y" Then
            &OUT_OF_POLICY_HIDE = False;
            &HIDE = False;
        End-If;

        If &NO_RECEIPT_FLG = "Y" Then
            &NO_RECEIPT_HIDE = False;
            &HIDE = False;
        End-If;
    End-For;

    If &HIDE = True Then
        &HIDE = False;
    End-If;

End-While;

If Not (&OUT_OF_POLICY_HIDE) Then
    GetGrid(Page.EX_SHEET_LINE_APV1, "EX_SHEET_LINE").OUT_OF_POLICY.Visible = True;
Else
    GetGrid(Page.EX_SHEET_LINE_APV1, "EX_SHEET_LINE").OUT_OF_POLICY.Visible = False;
End-If;

If Not (&NO_RECEIPT_HIDE) Then
    GetGrid(Page.EX_SHEET_LINE_APV1, "EX_SHEET_LINE").NO_RECEIPT_FLG.Visible = True;
Else
    GetGrid(Page.EX_SHEET_LINE_APV1, "EX_SHEET_LINE").NO_RECEIPT_FLG.Visible =>
    False;
End-If;

```

Chapter 21

Internet Script Classes (iScript)

This chapter describes how an Internet Script (iScript) works in your application, how to create an iScript, and the Internet Script classes that you use in your PeopleCode. It also discusses the following topics:

- URL vs. URI.
- Web libraries.
- iScript security.
- When to use an iScript.
- Details of an iScript URL.
- The Generate functions.
- Error handling.
- Scope of the Internet Script classes.
- Data Types of the Internet Script classes.
- Internet Script classes built-in functions.
- Internet Script reference.

Understanding Internet Script Classes

An Internet Script, also called an iScript, is a specialized PeopleCode function that generates dynamic web content. iScripts interact with web clients (browsers) using a request-response paradigm based on the behavior of the Hypertext Transfer Protocol.

iScripts work with PeopleSoft Pure Internet Architecture. You must have PeopleSoft Pure Internet Architecture set up correctly before you can run an iScript.

The following flow chart shows the interaction of an iScript (PeopleCode) in a PeopleSoft Pure Internet Architecture application.

Communication flow chart for Internet Scripts

1. An HTTP request arrives at the web server specifying in its URL the Presentation Relay Servlet (psc). The path information included in the URL specifies which PeopleCode program to run. No component is specified because none is needed. The PeopleCode program (iScript) runs directly. The following is an example of the URL:

```
http://serverx/Servlets/psp/ps84/e_procurement/fdm/s/WEBLIB_BEN_401k.PAGES.Field=>
Formula.IScript_Home401k
```

2. The psc servlet is invoked by the web server. It serializes all necessary information from the web server request and response objects, then makes a call through JOLT to the PeopleSoft application server service passing the serialized object information.
3. The application server unpacks all of the object information and creates PeopleSoft versions of the Request and Response objects. It then calls the function in the PeopleCode program specified in the URL. The PeopleCode Request and Response objects are available to the PeopleCode program through the system variables %Request and %Response.
4. The PeopleCode program is then responsible for generating every aspect of the HTML page that is to be returned to the browser. It has access to the Request object to view items such as query string parameters, cookies, and headers. It also has access to component interfaces, business interlinks, and Rowset objects to interact with applications. HTML definitions are available to include language sensitive blocks of HTML. They can also contain JavaScript. The message catalog is also available for language sensitive messages. The Response object is used to "write" the generated HTML back to the browser.

5. When the PeopleCode program is finished running, the headers, cookies, and HTML in the PeopleSoft Response object are serialized and returned through JOLT to the Presentation Relay Servlet.
6. The Presentation Relay Servlet then unpacks the Response information generated by the PeopleCode.
7. The servlet plays the information back to the web server response object, which in turn sends the response to the user's browser.

URL vs. URI

In this document, the term URL refers to the entire URL, that points to content. The following is an example of a URL:

```
http://someserver/servlets/psc/ps84/e_procurement/fdm/s/WEBLIB_Portal.Field⇒
Change.IScript_DoSomething?page=view&key1=value1&key2=value2
```

A URI does not include the content information. Think of it as a subset of the URL that points to the location of the resource, but does not include any parameters passed to that resource. From the previous example, the URI portion of the URL is:

```
http://someserver/servlets/psc/ps84
```

Web Libraries

iScripts use the existing PeopleCode Function Library infrastructure. However, instead of naming your record FUNCLIB_xxx, all iScripts *must* be contained in records named WEBLIB_xxx. All of the existing tools and techniques for working with function libraries (such as Upgrade, Find In, Rename, and so on) also apply to Web Libraries.

See *PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide*, "Using the PeopleCode Editor," Accessing PeopleCode External Functions.

To create an iScript:

1. Create or extend a domain specific WEBLIB (funclib).

WEBLIBs are derived/work record definitions that have their name prefixed with WEBLIB_.

2. Add a function to a WEBLIB.

The name of your function *must* be prefaced with IScript_. For example:

```
IScript_HelloWorld
```

```
IScript_FuncHRPage
```

Note. iScript functions take no arguments, and do not return a value.

The following iScript writes data.

```

Function IScript_HPDefaultCategories()

    &ClearDotImage = %Response.GetImageURL(Image.PT_PORTAL_CLEAR_DOT);
    &CatHTML = GetHTMLText(HTML.PORTAL_HP_CATEGORY, &ClearDotImage, GetCategories=>
());
    %Response.Write(&CatHTML);

End-Function;

```

The following iScript uses both the request and response objects to echo what the user types into an edit control.

Example iScript

```

Function IScript_HelloWorld()

%Response.WriteLine("<html><head><title>Hello World</title></head><body>");
    %Response.WriteLine("<h1>Hello World</h1>");
    %Response.WriteLine("<form method=POST action = " | %Request.FullURI | "?" | =>
%Request.QueryString | "><input type=submit value='Say this! '>&nbsp;<input type=>
edit name=WhatYouSaid value=" | %Request.GetParameter("WhatYouSaid") | "><=>
/form>");

    rem echo back what the user typed into the edit box...;
    %Response.WriteLine("<p><font face='Arial, Helvetica' size='5' color='blue'=>
>You said: ");
    %Response.WriteLine(%Request.GetParameter("WhatYouSaid"));

    %Response.WriteLine("</body></html>");
    Return;
End-Function;

```

iScript Security

iScripts are secured on your system similar to Component Interfaces. After you create a WEBLIB record, and your functions, you must add them just as you would add a page to an application.

To add security to an iScript :

1. Navigate to the Maintain Security page and open the Permission List to which you want to give access.
2. Select Web Libraries.

You may need to scroll through the tabs at the top of the page to access the Web Libraries tab.

3. (Optional) Add new WebLibrary for Permission List.

If this is a new Web Library, you must add it to the permission list. Click the plus button to add a new Web Library, then select the library you want to add from the drop-down list box.

4. Select Edit for the Web Library you want to grant access for.
5. Select the access you want to give each function in the WEBLIB record.

From the page that displays, you can choose to allow or disallow access on a per function basis. The buttons on the side of the page either grant or disallow access for all functions.

See *PeopleTools 8.51 PeopleBook: PeopleSoft Security Administration*

When to Use an iScript

iScripts give you complete control over the HTML sent to the browser. This enables flexibility in creating a user interface. However, there are some responsibilities that you inherit when choosing to use iScripts.

- You are responsible for creating HTML and JavaScript that is cross-browser compatible.
- You are responsible for ensuring that all the text sent to the browser is stored in either the message catalog or in HTML definitions to enable translation of the text.
- iScripts aren't part of the regular Component Processor flow, so you are responsible for accessing the database in a multi-language, multi-market, and multi-currency sensitive way. (Do this by using a Component Interface to access the database.)

For these reasons, PeopleSoft recommends that you first try to build a page in Application Designer. This approach enables PeopleTools to generate all of the HTML in a cross-browser, multi-language, multi-market, and multi-currency sensitive way.

You don't have to use an iScript to generate an entire page. You can use the Request and Response objects with an HTML area, so you can develop a portion of your HTML using the iScript objects, while allowing the majority of it to be generated by the Component Processor. If you use this method, instead of using the Response object's Write and WriteLine methods to output your HTML, you set the value of the HTML area to the HTML that you want to display. Remember, that just as with an iScript, you must ensure that the HTML you generate is cross-browser compatible and multi-market sensitive.

So when *should* you use iScripts? Here are two scenarios where iScripts would be an appropriate choice:

- The page being developed *cannot* be built using Application Designer. An example of this is a page that requires more than one HTML form. PeopleSoft Pure Internet Architecture places the entire page inside of a single form tag, so no other HTML form tags can be added. In this case the requirements of the page can't be met by pages created in Application Designer, so use iScripts instead.

Note. You should use Component Interfaces for all database access so you have multi-language and multi-currency sensitivity.

- The page being developed never accesses the database. Using a page and Component Processor for this type of page incurs unnecessary processing overhead. An example of this is a page that talks to another website and redisplay HTML from the remote site.

Style Sheets and Styles

PeopleSoft recommends that developers using the iScripts always use styles (also known as classes) defined in the style sheets to specify the attributes (that is, background color, font, size, alignment, borders, and so on) of objects referenced in the iScripts. The Response object provides access to Style Sheets stored in the PeopleSoft database.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Creating Style Sheet Definitions"

Other Considerations

PeopleSoft does not recommend using the following technologies in iScripts:

- Java applets
- Browser plug-ins

Details of an iScript URL

Viewing an iScript requires the assembly of a URL with the following pieces:

<i>Section</i>	<i>Description</i>
http://Server/	The scheme (http / https) and web server name.
servlet_name/	The name of the physical servlet that the web server invokes to handle the request. This is either psp or psc.
SiteName/	The user-defined site name. This is defined during the installation of PIA. This enables you to set up multiple sites on one physical web server.
PortalName/	The name of the portal to use for this request. The portal object contains metadata that describes how to present the content (that is, template, pagelets and so on.)

Section	Description
NodeName/	The name of the node that contains the content for this request.
content_type/	The type of the content for this request. For iScripts, this is "s".
content_id	The identification of the content. This, and the type is the unique key to the content being retrieved.
?content_parm	The query string parameters (name value pairs) for the content.

For an iScript, the *content_id* has the following form:

Record.Field.Event.Function

The following is an example of the call to an iScript:

`http://mlee2038//psp/PS84/e_procurement/fdm/s/WEBLIB_Portal.PORTAL_HEADER.Field⇒
Formula.iScript_UniHeader_PIA`

The Generate Functions

There are many different types of content on the portal, such as components, iScripts, homepages, and so on. Sometimes you want to access this content directly, through the URL that points to this content. To do this, PeopleSoft provides several Generate functions that generate the URL for the specified content.

The Generate functions can be categorized as:

- Content type.
- Absolute or relative URL.
- Portal service or content servlet (psp or psc).

The following is a list of the functions, plus a description of what to use them for. More information about a function is found under that function's description in the section PeopleCode Built-in Functions.

Function Name	Content Type	Absolute or Relative URL	Portal service or content servlet
GenerateActGuideContentUrl	Activity Guide	Absolute	psc
GenerateActGuidePortalUrl	Activity Guide	Absolute	psp

<i>Function Name</i>	<i>Content Type</i>	<i>Absolute or Relative URL</i>	<i>Portal service or content servlet</i>
GenerateActGuideRelativeUrl	Activity Guide	Relative	NA
GenerateComponentContentURL	Component	Absolute	psc
GenerateComponentContentRelURL	Component	Relative	psc
GenerateComponentPortalURL	Component	Absolute	psp
GenerateComponentPortalRelURL	Component	Relative	NA
GenerateComponentRelativeURL	Component	Relative	NA
GenerateExternalPortalURL	External	Absolute	psp
GenerateExternalRelativeURL	External	Relative	NA
GenerateHomepagePortalURL	Homepage	Absolute	psp
GenerateHomepageRelativeURL	Homepage	Relative	NA
GenerateQueryContentURL	WQuery	Absolute	psc
GenerateQueryPortalURL	Query	Absolute	psp
GenerateQueryRelativeURL	Query	Relative	NA
GenerateScriptContentURL	IScript	Absolute	psc
GenerateScriptContentRelURL	IScript	Relative	psc
GenerateScriptPortalURL	IScript	Absolute	psp
GenerateScriptPortalRelURL	IScript	Relative	psp
GenerateScriptRelativeURL	IScript	Relative	NA

<i>Function Name</i>	<i>Content Type</i>	<i>Absolute or Relative URL</i>	<i>Portal service or content servlet</i>
GenerateWorklistPortalURL	Worklist	Absolute	psp
GenerateWorklistRelativeURL	Worklist	Relative	NA

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions"

Error Handling

All errors are handled through the session object. You should check the PSMessages collection to see if there are any errors in your code.

Note.

`Exit(1)` does *not* rollback iScript transactions. To rollback in an iScript, you can use the `SqlExec` built-in function with the parameter of `ROLLBACK (SQLEXEC("ROLLBACK"))` or the `MessageBox` built-in function with a message error severity of error. You can also use the built-in function `Error`, but only if you are not sending HTML or XML in the error text itself.

See Also

[Chapter 38, "Session Class," Error Handling, page 2168](#)

Scope of the Internet Script Classes

The Request, Response, and Cookie classes can be accessed only from PeopleCode. They can be used only as part of a PeopleSoft Pure Internet Architecture application—either as part of a page created in Application Designer or an iScript. An iScript is always contained in a WEBLIB record. You wouldn't use any of these objects in an Application Engine program, a Component Interface, and so on. However, an iScript could call and start a Component Interface, a Business Interlink, and so on.

To access the Request or Response object, use the `%Request` and `%Response` system variable. These variables are objects, so you use them with dot notation.

```
%Response.SetContentType("text/HTML");
```

```
If %Request.GetParameter("encode") <> "" Then
```

Data Types of the iScript Classes

Cookie objects are instantiated from Response object. You can declare the cookie object as data type cookie before any functions. You can also declare variables of type Response and Request, to assign the %Response and %Request system variables to local variables.

```
Local Cookie &Cookie;
Local Response &Resp;
Local Request &Req;

Function IScript_SetCookie()
    rem set a cookie called "MyCookie" to store my user id in it's value.
    Make the cookie expire when the user's browser session expires;

    &Resp = %Response;
    &Req = %Request;
    &Cookie = &Resp.CreateCookie("MyCookie");
    &Cookie.Value = %UserId;
    &Cookie.MaxAge = -1;

End-Function;
```

Internet Script Classes

The following is a description of the PeopleCode classes, methods, and properties that you use to create an iScript.

Request Class

The Request object encapsulates all information from the request issued from the browser. This includes the URI, Query String, QueryString parameters, Cookies, and Headers. The properties for the Request object are read-only.

Parameters

Request parameters are name-value pairs sent by the client to the web server as part of an HTTP request. They include the pairs in the query string part of the URL, and data posted in a form, if the request was a post request. Multiple parameter values can exist for any given parameter name. The following methods are available to access parameters:

- GetParameter
- GetParameterNames
- GetParameterValues

The GetParameterValues method returns an array of String objects containing all the parameter values associated with a parameter name. The value returned from the GetParameter method equals the first value in the array of String objects returned by GetParameterValues.

All form data from both the query string and the post body are aggregated into the request parameter set. The order of this aggregation is that query string data appears before post body parameter data.

Response

The response object encapsulates all the information to be sent back to the browser. This includes the body of the response, content type, response headers, and cookies.

The response object also includes helper methods that retrieve HTML, Image, StyleSheet, and other objects from the database and move them to the web server, and returning strings that can be used to reference these objects in the response content.

The body of the response is created using the response object's Write and WriteLine methods. If the content type of the response is not explicitly set in the PeopleCode program, it defaults to "text/html".

Cookies

Cookies are data sent from the client to the server on every request that the client makes. Cookies are stored by the browser, either on disk or in memory, and returned to the server that originally set the cookie.

The Internet Script API makes available the name and value of each cookie that's sent with the request, through the Request object's GetCookieNames and GetCookieValue methods. The API also enables you to set new cookies (or alter existing cookies) through the Response object's CreateCookie method and the Cookie object's properties.

Request Class Methods

In this section, we discuss the Request class methods. The methods are discussed in alphabetical order.

GetContentBody

Syntax

GetContentBody()

Description

Note. PeopleSoft Business Interlinks is a deprecated product. This method currently exists for backward compatibility only.

This method retrieves the text content of an XML request. This is part of the incoming Business Interlink functionality, which enables PeopleCode to receive an XML request and return an XML response.

Parameters

None.

Returns

A string.

Example

The following example gets the XML text content of a request, then uses that as input to create a BiDoc. Then the BiDoc methods GetDoc and GetValue are used to access the value of the skills tag.

```
Local BIDocs &rootInDoc, &postreqDoc;  
Local string &blob;  
Local number &ret;  
  
&blob = %Request.GetContentBody();  
/* process the incoming xml(request)- Create a BiDoc */  
&rootInDoc = GetBiDoc(&blob);  
&postreqDoc = &rootInDoc.GetDoc("postreq");  
&ret = &postreqDoc.GetValue("skills", &skills);
```

GetCookieNames

Syntax

GetCookieNames()

Description

This method returns an array containing names of all the cookies present in this request. If there are no cookies in the request, an empty array is returned. When cookies are present, this method returns an array of strings.

GetCookieValue

Syntax

GetCookieValue(*name*)

Description

This method returns a string containing value of the cookie identified *name*. The *name* parameter takes a string value. The NPmatch between *name* and the request cookie is case-insensitive. If there is no cookie in the request matching the name, an empty string is returned.

GetHeader

Syntax

GetHeader(*name*)

Description

This method returns the value of the header requested by the string *name*. The match between *name* and the request header is case-insensitive. If the header requested does not exist, an empty string is returned.

Example

The following example gets the "Referer" header to see where the request came from:

```
&Referer = %Request.GetHeader("Referer");
```

GetHeaderNames

Syntax

GetHeaderNames()

Description

This method returns an array of Strings representing the header names for this request.

GetHelpURL

Syntax

GetHelpURL(*HelpContext*)

Description

This method returns the help context path (as a string) to the help directory. It's used to construct a URL to a specific help page.

Example

```
&HelpURLString = %Request.GetHelpURL("hc0110");
```

GetParameter

Syntax

GetParameter(*name*)

Description

This method returns the value of a specified query string parameter or posted form data parameter. The match between *name* and the request parameter is case-insensitive. If there are multiple parameter values for a single name, the value returned is the first value in the array returned by the `GetParameterValues` method. If the parameter has (or could have) multiple values, you should use the `GetParameterValues` method in your Internet scripts.

See Also

[Chapter 21, "Internet Script Classes \(iScript\)," GetParameterValues, page 1066](#)

GetParameterNames

Syntax

GetParameterNames()

Description

This method returns all the parameter names for this request as an array of Strings, or an empty array if there are no input parameters.

GetParameterValues

Syntax

GetParameterValues(*name*)

Description

This method returns the values of the specified parameter (*name*) as an array of Strings, or an empty array if the named parameter does not exist. The *name* parameter takes a string value.

Request Class Properties

In this section, we discuss the Request class properties. The properties are discussed in alphabetical order.

AuthTokenDomain

Description

This property returns the web server domain as a string across which the single signon authentication token is valid. Use this property as the domain of any cookie which you want to apply across the same domain as the single signon token.

The value of this property is in the format:

`".domain.com"`

Note that it begins with a dot "." character. You can use this format as the value of a cookie's domain property.

However, sometimes you cannot use a value that is prefixed with a dot character. For example, the javascript document.docmain property should not begin with a dot. In this case, you must strip it off manually in your code.

Note. The value of this property is the domain across which the authentication token is valid, set in the AuthTokenDomain configuration property in the configuration properties file. The value of the system variable %AuthenticationToken is the authentication token itself.

This property is read-only.

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "System Variables,"
%AuthenticationToken

AuthType

Description

This property corresponds to the CGI variable AUTH_TYPE. This variable does not necessarily contain a value, and may require special web server configuration to obtain non-empty values.

This property is read-only.

See Also

[Chapter 21, "Internet Script Classes \(iScript\)," RemoteUser, page 1072](#) and [Chapter 21, "Internet Script Classes \(iScript\)," ServletPath, page 1074](#)

ByPassSignOn

Description

This property returns a Boolean value, indicating what ByPassSignOn has been set to in the configuration properties file. If this value has been set to True, this property returns True, False otherwise.

This property is read-only.

BrowserPlatform

Description

This property returns a string containing the value the web server passes as the browser platform.

This property is read-only.

BrowserType

Description

This property returns a string describing the browser that sent the request.

This property is read-only.

BrowserVersion

Description

This property returns a string describing the version of the browser that sent the request.

This property is read-only.

ContentURI

Description

This property returns a string containing the portion of the current URI before the portal name, and referencing the content servlet (psc).

For the URL:

`http://localhost/psc/ps84/PORTAL/NODE/e_procurement/fdm/s/WEBLIB. . .`

This property returns the following:

`http://localhost/psc/ps84/`

This property is read-only.

ExpireMeta

Description

This property returns the refresh meta-tag string that contains the cmd=expire parameter (the ExpireMeta string.)

The following is an example of the ExpireMeta string:

```
<meta HTTP-EQUIV='Refresh' Target='_top' CONTENT='10; URL=/servlets/psp/ps84/?cmd=&=&expire'>
```

All Internet script pages should use this property to generate the meta tag to cause the page to expire. It is the same expiration tag used by pages originally created using Application Designer, unless the Internet script generates a menu link in a separate frame that is not supposed to expire.

This tag should be included in the <head> section of the HTML generated by the iScript.

This property is read-only.

Example

```
%Response.Write("<html><head>");  
%Response.Write(%Request.ExpireMeta);  
%Response.Write("</head><body>");
```

FullURI

Description

This property returns the complete URI up to, but not including, the query string. This method returns a string value.

To return only the request URI (that is, without the scheme, server name or port) use the RequestURI method.

This property is read-only.

Example

From the following code

```
&FullURI = &Request.FullURI;
```

&FullURI might contain the following:

```
http://serverx/servlets/psp/ps84/Portal/Node/s/WEBLIB_TEST.SCRIPTS.Field⇒  
Formula.IScript_Test
```

See Also

[Chapter 21, "Internet Script Classes \(iScript\)," RequestURI, page 1072](#)

HTTPMethod

Description

This property returns the HTTP method as a string, (for example, GET, POST, PUT) by which this request was made.

This property is read-only.

LogoutURL

Description

This property returns the complete URL (as a string) to logout of the PeopleSoft session. Use this property to generate a link that causes a page to logout. You should normally not need to include this link on your page.

This property is read-only.

PathInfo

Description

This property returns any path information following the servlet path, but prior to the query string. This property returns null if there is no path information following the servlet path.

This property is read-only.

Example

For the URL:

`http://localhost/psp/ps84/PORTAL/NODE/e_procurement/fdm/s/WEBLIB_ . . .`

This property returns the following:

`psp84/PORTAL/NODE/eprocurements/fdm/s/WEBLIB_ . . .`

Protocol

Description

This property returns the protocol being used for this request as a string in the following form:

protocol/major_version.minor_version

An HTTP 1.0 request, as defined by the HTTP 1.0 specification, should return the string HTTP/1.0. Use the Scheme property instead of the Protocol property when generating hrefs (links).

This property is read-only.

QueryString

Description

This property returns the query string present in the request URL, if any. A query string is defined as any information following a ? character in the URL.

If there is no query string, this method returns null.

Use the request Parameters methods (GetParameterNames, GetParameterValues, GetParameter) to get the values of individual parameters on the query string.

This property is read-only.

RelativeURL

Description

This property returns whether a relative URL should be generated for PeopleSoft Pure Internet Architecture pages. This property is set in the configuration properties file. This property takes a Boolean value: True if a relative URL is generated for PeopleSoft Pure Internet Architecture pages, False otherwise.

This property is read-only.

RemoteAddr

Description

This property returns the IP address of the agent that sent the request.

This property is read-only.

RemoteHost

Description

This property returns the fully qualified host name of the agent that sent the request.

This property is read-only.

RequestURI

Description

This property returns the URI, without the protocol.

This property is read-only.

Example

This example uses the following URL:

```
http://serverx/servlets/psc/ps84/PORTAL/NODE/fdm/s/WEBLIB_Portal. . .
```

From the following code

```
&MyRequestURI = &Request.RequestURI;
```

&MyRequestURI contains the following:

```
/servlets/psc/ps84/PORTAL/NODE/fdm/s/WEBLIB_PORTAL . . .
```

Use the following to build an absolute URL:

```
&myURL = &Request.Scheme | "://" | &Request.ServerName | ":" | &Request.Port | =>
&Request.RequestURI | "?" | &Request.QueryString;
```

RemoteUser

Description

This property corresponds to the CGI variable REMOTE_USER. It is not specific to your PeopleSoft implementation.

This variable does not necessarily contain a value, and may require special web server configuration to obtain non-empty values.

This value is generally populated when J2EE Authentication is enabled in the web-server configuration. The specific implementation of your web-server dictates how exactly this variable is populated. See your web-server specific documentation for more information.

This property is read-only.

See Also

[Chapter 21, "Internet Script Classes \(iScript\)," AuthType, page 1067](#) and [Chapter 21, "Internet Script Classes \(iScript\)," ServletPath, page 1074](#)

Scheme

Description

This property returns the scheme, also known as the protocol, used by the request. Common schemes include http, https, ftp, and telnet. This property returns a string value.

This property is read-only.

Example

For the URL

```
http://serverx/servlets/psp/ps84/eprocurement/fdm/s/WEBLIB. . . .
```

the Scheme property returns:

```
http
```

ServerName

Description

This property returns the host name of the server on which the servlet is running. This property returns a string value.

This property is read-only.

Example

For the URL

```
http://serverx/servlets/psp/ps84/eprocurement/fdm/s/WEBLIB. . . .
```

the ServerName property returns:

```
serverx
```

ServerPort

Description

This property returns an integer representing the port on which the browser's request was received (that is, the port on which the server is listening.)

This property is read-only.

Example

For the URL

`http://servername:80/servlets/iclientservlet/peoplesoft8/?ICType=Panel. . .`

the `ServerPort` property returns:

80

ServletPath

Description

This property corresponds to the CGI variable `SCRIPT_NAME`. This variable does not necessarily contain a value, and may require special web server configuration to obtain non-empty values.

This property is read-only.

See Also

[Chapter 21, "Internet Script Classes \(iScript\)," AuthType, page 1067](#) and [Chapter 21, "Internet Script Classes \(iScript\)," RemoteUser, page 1072](#)

Timeout

Description

This property returns an integer representing the timeout value, in seconds, set in the `configuration.properties` file.

This property is read-only.

Response Class

The response object encapsulates all information to be returned from the iScript to the browser.

Response Class Methods

In this section, we discuss the Response class methods. The methods are discussed in alphabetical order.

Clear

Syntax

clear()

Description

This method removes all cookies and headers as well as deletes any HTML that has been written to the Response object. After using this method, the Response object appears as it did when the script was first called.

CreateCookie

Syntax

CreateCookie(*name*)

Description

This method adds a cookie to the response with the name specified by the string *name*. It returns a reference to the cookie object that is used to update the values of this cookie. If the cookie by the specified name already exists, a reference to the existing cookie is returned. This method can be called multiple times to set more than one cookie. Cookie names may not contain the "\$" character.

Important! Certain browsers have limit of either 20 or 50 cookies per web server domain depending on the browser security update that the user has applied. The browser randomly discards some cookies when that number is exceeded.

PeopleTools uses eight cookies. In addition, the number of cookies used by PeopleTools can grow depending on the number of sites that the user visits within the same domain. Some PeopleSoft applications use additional cookies. Therefore, you might or might not be able to create your own cookies to modify an existing PeopleSoft application. If you do create your own cookies, keep the use conservative. Otherwise, your application might end up causing the browser to discard critical signon or authentication cookies.

More information about browser limitations can be found online.

See "Troubleshooting Browser Limitations" on My Oracle Support.

GetCookie

Syntax

GetCookie(*name*)

Description

This method returns the cookie object specified by the string *name*. If the cookie is not already present in this response, a null value is returned.

GetCookieNames

Syntax

GetCookieNames()

Description

This method returns an array of strings that contains the names of all the cookies present in this response. If there are no cookies in the response, an empty array is returned.

GetHeader

Syntax

GetHeader(*name*)

Description

This method returns the value of the response header requested by the string *name*. The match between *name* and the response header is case-insensitive. If the header requested does not exist, an empty string is returned.

GetHeaderNames

Syntax

GetHeaderNames()

Description

This method returns an array of Strings representing the header names for this response.

GetImageURL

Syntax

GetImageURL(**IMAGE**.*ImageName* | *rowset.row.record*)

Description

This method returns a string which represents the URL of the requested image, for images in the database.

Because the image field is a long data type, you can have only one on the record. Therefore you must specify the record only. The field on the record is assumed to be the image.

Note. The GetImageURL method cannot be used with a derived work record.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>imagename</i>	Specify the name of an existing image. This name must be prefaced with the reserved word IMAGE .
<i>rowset.row.record</i>	Specify the path to the image, that is, the rowset, row, and record.

Example

The following example gets the URL to use for the image, and the second uses the URL reference.

```
&strImage = %Response.GetImageURL(Image.ARROW);  
%Response.WriteLine("");
```

The following gets an image from the record.

```
%Response.GetImageURL(&rs.GetRow(1).GetRecord(Record.EMPL_PHOTO));
```

GetJavaScriptURL

Syntax

GetJavaScriptURL(**HTML**.*HTMLname*)

Description

This method returns a string which represents the URL of the requested HTML definition, for JavaScript HTML definitions stored in the database.

Example

This example assumes the existence in the database of an HTML definition called "HelloWorld_JS", that contains some JavaScript.

```
Function IScript_TestJavaScript()
```

```
    %Response.WriteLine("<script src= " | %Response.GetJavaScriptURL(HTML.Hello⇒  
World_JS) | "></script>");
```

```
End-Function;
```

In this example, the HTML definition is called FOO. The following PeopleCode example:

```
%Response.GetJavaScriptURL(HTML.FOO)
```

Resolves to something similar to:

```
http://myserver/cache/js/FOO_ENG_1.js
```

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Creating HTML Definitions"

GetStyleSheetURL

Syntax

```
GetStyleSheetURL(STYLESHEET.stylename)
```

Description

This method returns a URL string pointing to a style sheet created in Application Designer.

Example

In the following example, the first line gets the URL to use for the style sheet, and the second is the standard HTML to include the style sheet in the HTML document. The stylesheet link must be included in the HTML *before* any of the styles in the stylesheet are used. It should be included in the <head> section of the HTML document.

```
&strStyleSheet = %Response.GetStyleSheetURL(StyleSheet.BENEFITS_STYLE);  
  
%Response.WriteLine("<link rel=stylesheet href=" | &strStyleSheet | " type=""text⇒  
/css"">");
```

Now to use a style, assign the class attribute of your choice to your HTML tags, as follows:

```
%Response.WriteLine("<p class=PSTEXT>I am some classy text!!</p>");
```

RedirectURL

Syntax

RedirectURL(*location*)

Description

This method sends a temporary redirect response to the client using the location specified by the string *location*. The given location must be an absolute URL. No further output should be made by the iScript after calling this method.

Note. If your URL string contains special characters (such as foreign characters) make sure you encode it first using the `EncodeURL` function, such as, `%Response.RedirectURL(EncodeUrl(&Url))`.

In addition, while you can redirect relative URLs in certain circumstances, you *cannot* encode them.

Example

```
%Response.RedirectURL(&URL);
```

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," `EncodeURL`

SetContentType

Syntax

SetContentType(*Type*)

Description

This method sets the content type for this response. The parameter *type* takes a string value. This type may later be implicitly modified by the addition of properties such as the MIME charset property if the service finds it necessary and the appropriate property has not been set.

The content type defaults to "text/html" if it is not set.

SetHeader

Syntax

SetHeader(*name*, *value*)

Description

This method sets a response header with the specified name and value. Both parameters take string values. If the field has already been set with a value, this new value overwrites the previous one.

Example

The PortalRegisteredURL response header identifies to the portal the registered URL of the current content, so that it can find the correct content reference to look at for the template.

You can override the value of the PortalRegisteredURL response header in a PIA Script or PIA Page by adding the header to the response yourself, like this:

```
%Response.SetHeader("PortalRegisteredURL", &myURL);
```

You can do this to register the content with additional parameters.

UseSimpleURL

Syntax

UseSimpleURL({True | False})

Description

The UseSimpleURL method sets the response header that informs the portal that the current content uses relative simple URLs, and does not have to be proxied.

By default, all PeopleSoft Pure Internet Architecture content sets the header to true. You must to call this method to specify that your content does not use the simple URL format, and therefore does need to be proxied.

Parameters

<i>Parameter</i>	<i>Description</i>
True False	Specify a Boolean value, either True or False, to indicate whether simple URLs are used.

Returns

None.

Write

Syntax

Write(*String*)

Description

This method prints *String* to the HTTP output stream.

You can use an HTML string from Application Designer HTML catalog with the Write method if you also use the GetHTMLText function, as follows:

```
%Response.Write(GetHTMLTEXT(HTML.MY_HTML));
```

You can also use an XML string. The following example takes a BiDocs structure that contains an XML response and puts that into a text string. After this is done, the %Response.Write function can send this as an XML response.

```
Local BiDocs &rootDoc;  
Local string &xmlString;  
  
&xmlString = %Response.GetContentBody();  
&rootDoc = GetBiDoc(&xmlString);  
  
/* do processing */  
  
&xmlString = &rootDoc.GenXMLString();  
%Response.Write(&xmlString);
```

WriteLine

Syntax

WriteLine(*String*)

Description

This method adds a carriage control and line feed to the end of the string *String*, then prints the string to the HTTP output stream.

You can use an HTML string from Application Designer HTML catalog with the WriteLine method if you also use the GetHTMLText function, as follows:

```
%Response.WriteLine(GetHTMLTEXT(HTML.MY_HTML));
```

Response Class Properties

In this section, we discuss the Response class properties.

Charset

Description

This property returns the character set used by the response object as a string. This value is set in the user personalizations.

This property is read-only.

See Also

PeopleTools 8.51 PeopleBook: Security Administration, "Managing PeopleSoft Personalizations"

DefaultStyleSheetName

Description

This property returns the name of the default style sheet defined on the PeopleTools Options page. If not defined, PSSTYLEDEF is returned.

This property is read-only.

See Also

PeopleTools 8.51 PeopleBook: System and Server Administration, "Using PeopleTools Utilities,"
PeopleTools Options

Cookie Class

The cookie class encapsulates all information to be sent to the browser for a single cookie. The cookie class is used by the response object to set new cookies. The request object uses a simple name-value pair mechanism for retrieving previously stored cookie values sent with the HTTP request.

Cookie Class Properties

In this section, we discuss the Cookie class properties. The properties are discussed in alphabetical order.

Domain

Description

This property returns the domain of this cookie, or null if not defined. This property is a string value.

This property is read-write.

Example

```
&cookie = &Response.AddCookie("My cookie", "My value");  
&cookie.Domain = ".MyDomain.com";
```

MaxAge

Description

This property represents the maximum specified age of the cookie, as a signed number in seconds. The default value is -1. Setting the MaxAge property to a negative value ensures the cookie does not persist on the client when the client session ends. If the MaxAge property is set to zero, the cookie is deleted immediately from the client.

<i>Value</i>	<i>Description</i>
Non Negative Integer	Lifetime of the Cookie in seconds
0	Delete the cookie from the client immediately
-1	Default MaxAge property value (remove the cookie after the client exits)
Negative Integer	Remove the cookie after the client exits

This property is read-write.

Name

Description

This property returns the name of the cookie as a string.

This property is read-only.

Path

Description

This property returns the prefix of all the URL paths for which this cookie is valid, or an empty string if not defined.

This property is read-write.

Secure

Description

This property specifies whether the cookie is to be secured. This property takes a Boolean value. The default value is False. Secure cookies are sent only if the client has established a secure link (such as HTTPS) with the server. This property is read-write.

Value

Description

This property returns the value of the cookie (as a string), or an empty string if it isn't defined.

This property is read-write.

Chapter 22

Java Class

This chapter provides an overview of Java class and discusses the following topics:

- Supported versions of Java.
- Naming standards for classes and packages.
- System setup for Java classes.
- From PeopleCode to Java.
- From Java to PeopleCode.
- PeopleCode and Java data types mapping.
- Considerations when using the PeopleCode Java functions.
- Error handling and the PeopleCode Java functions.
- The Java debugging environment.
- Java object declaration.
- Scope of a Java object.
- PeopleCode Java built-in functions.

Understanding Java Class

Using the PeopleCode Java functions, you can access Java classes, or create instances of Java objects. Calling a Java program from PeopleCode can greatly extend your application. Also, the PeopleCode integration with Java enables you to pass parameters such as record, record fields, or rowsets into Java programs.

The PeopleCode Java functions are:

- CopyToJavaArray
- CopyFromJavaArray
- CreateJavaArray
- CreateJavaObject
- GetJavaClass

See Also

<http://java.sun.com/index.html>

Supported Versions of Java

The supported platform database lists all supported versions of the Java Runtime Environment (JRE) for each version of PeopleTools on each supported operating system platform.

See My Oracle Support, "Platform Certifications."

Oracle also bundles a supported JRE version with PeopleTools for all supported operating system platforms except the z/OS platform. For z/OS, you will have to install a supported JRE. To determine which JRE is bundled with your version of PeopleTools, see the README file in the *PS_HOME\jre* directory.

Java Packages and Classes Delivered with PeopleTools

Java classes delivered with PeopleTools are located in the following directory:

PS_HOME\class

For PeopleSoft software, we typically use a standard package hierarchy:

com.peoplesoft.prodline.prodcode

In this hierarchy, *prodline* is the company standardized product line code (for example, hrms) and *prodcode* is the product code unique within the product line (for example, hr).

In addition, if there are any classes that are common across products, they are placed into the common package for that product line, that is:

com.peoplesoft.prodline.common

See Also

<http://java.sun.com/docs/codeconv/index.html>

System Setup for Java Classes

If you access only the classes that come defined with PeopleTools, you don't need to do any additional setup.

If you want to access third-party Java classes or your own custom Java classes in the PeopleTools environment (that is, access these classes through PeopleCode), you must place the class files in specified locations or include the class files in JAR files in specified locations.

Note. Oracle recommends using the utility that comes with the Java SDK for creating JAR files.

When PeopleTools loads the Java Virtual Machine (JVM), PeopleTools builds a class path for the JVM from the following elements. The following numbering indicates the search order that the JVM would use for locating a specified Java class:

1. Class files in the *PS_HOME*\class directory.
2. Class files in JAR files in the *PS_HOME*\class directory.
3. Class files in the *PS_HOME*\appserv\classes directory.
4. Class files in JAR files in the *PS_HOME*\appserv\classes directory.
5. For each directory listed in the "Add To CLASSPATH" parameter of the psappsrv.cfg configuration file:
 - a. Class files in the specified directory.
 - b. Class files in JAR files in the specified directory.
6. For each directory listed in the PS_CLASSPATH environment variable:
 - a. Class files in the specified directory.
 - b. Class files in JAR files in the specified directory.

For example, if PS_CLASSPATH is "dir1;dir2", the search order for item 6 described previously would be:

1. Class files in dir1.
2. Class files in JAR files in dir1.
3. Class files in dir2.
4. Class files in JAR files in dir2.

Note. PeopleTools uses the -classpath option when it loads the JVM, which overrides the CLASSPATH environment variable. Therefore, do not use the CLASSPATH environment variable to identify third-party or custom Java classes that you want to access in the PeopleTools environment.

Note. PeopleTools does not guarantee the order in which JAR files within a directory will be added to the class path. If it is necessary to impose a search order on JAR files, then the JAR files must be in separate directories.

Like most environment variables, you can specify more than one entry in PS_CLASSPATH. On Windows, the PS_CLASSPATH entries are separated by semicolons. On Unix, they're separated by colons.

The following PS_CLASSPATH is for Windows:

c:\myjava;d:\myjava\com\mycompany\myproduct; . . .

The following PS_CLASSPATH would be for Unix:

/etc/myjava:/home/me/myjava/com/mycompany/myproduct: . . .

When developing your own classes you must be aware that most JVMs cache the class definitions. This means that even if you update the class files, a running JVM (inside an application server, for example) has already loaded and is referencing the old versions of the class files. The JVM won't pick up the new versions of the class files. You must restart the application server to make the JVM reload the updated classes.

See your system documentation for more information about setting an environment variable.

From PeopleCode to Java

In this section, we provide an overview of state management concerns and present the following examples:

- State Management Concerns.
- CreateJavaObject example.
- CreateJavaArray example.
- GetJavaClass example.

State Management Concerns

The application server is *stateless*, which means that it doesn't keep any information (state) for its clients between calls to it. For one reason, calls to the application server can use different actual servers for different calls. When you are using Java in the application server, be careful to not leave state in the JVM that would cause your application to fail if a different application server (which would use a different invocation of the JVM) was used for subsequent calls. One method to leave state in the virtual machine is to use static (class) variables.

Similar considerations to these apply using Java in Application Engine programs, though here the difficulty arises when you try to checkpoint and then restart the program. The restart starts with a JVM invocation that doesn't have any of the state you might have stored into the JVM before the checkpoint.

Variables of the type `JavaObject` cannot have global or component scope because of this lack of ability to save the state of these objects.

An example of this is issuing messages. When you're running with PeopleSoft Pure Internet Architecture and issue a message, the message is produced by an end-user action, so the Application Server gathers up its state to return it to the browser. This state saving attempts to save the current PeopleCode execution state, causing it to issue an error because of the `JavaObject`.

The solution is to not have any non-null `JavaObject` objects when the message is issued.

The following is a simple Java program:

```

public class PC_Java_Test{
public String pcTest(){
    String message;
    message = "PeopleCode is successfully executing Java.";
    return message;
}
}

```

Here is the PeopleCode that calls this Java program. Note that the JavaObject is set to NULL before the message is issued.

```

&java_test = CreateJavaObject("PC_Java_Test");
&java_message = &java_test.pcTest();
&java_test = Null;
WinMessage(&java_message);

```

In SavePreChange, Workflow, or SavePostChange PeopleCode the situation is more complicated. Usually messages with a zero style parameter (no buttons other than OK and perhaps Explain, therefore no result possible except OK) are queued up by the Application Server. They are output by the browser when the service completes, so the serialization won't happen until after the PeopleCode has finished, so you won't have to set your JavaObject to null. With other kinds of messages, you must do this.

CreateJavaObject Example

The following is an example program creating a Java object from a sample program that generates a random password.

```

/* Example to return Random Passwords from a Java class */
Local JavaObject &Gpw;

/* Create an instance of the object */
&Gpw = CreateJavaObject("com.PeopleSoft.Random.Gpw_Demo");

&Q = "1";

/* Call the method within the class */
&NEW_VALUE = &Gpw.getNewPassword(&Q, PSRNDMPSWD.LENGTH);

/* This is just returning one value for now */
PSRNDMPSWD.PSWD = &NEW_VALUE;

```

CreateJavaArray Example

Suppose we had a PeopleCode array of strings (&Parms) that we wanted to pass to a Java method xyz of class Abc. This example assumes that you don't know when you write the code just how many parameters you will have.

```

Local JavaObject &Abc, &RefArray;
Local array of String &Parms;

&Parms = CreateArray();

/* Populate array how ever you want to populate it */

&Abc = GetJavaObject("com.peoplesoft.def.Abc");

/* Create the java array object. */

&JavaParms = CreateJavaArray("java.lang.String[]", &Parms.Len);

/* Populate the java array from the PeopleCode array. */

&RefArray = GetJavaClass("java.lang.reflect.Array");

For &I = 1 to &Parms.Len
    &RefArray.set(&JavaParms, &I - 1, &Parms[&I]);
End-For;

/* Call the method. */
&Abc.xyz(&JavaParms);

```

GetJavaClass Example

The following example gets a system class.

```

&Sys = GetJavaClass("java.lang.System");
&Sys.setProperty("java.security.policy", "C:\java\policy");

WinMessage("The security property is: " | &Sys.getProperty("java.security.policy"));

&Props = &Sys.getProperties();
&Props.put("java.security.policy", "C:\java\policy");
&Sys.setProperties(&Props);

WinMessage("The security property is: " | &Sys.getProperty("java.security.policy"));

```

From Java to PeopleCode

The Java classes delivered with PeopleTools enable you to call PeopleCode from your Java program. Calling into PeopleCode works only from Java code that you have initially called from PeopleCode.

You must call PeopleCode facilities only from the same thread that was used for the call into Java. PeopleTools is not multithreaded.

You cannot call any PeopleCode facility that would cause the server to return to the browser for an end-user action, because the state of the Java computation cannot be saved and restored when the action is complete.

See Also

[Chapter 22, "Java Class," Considerations When Using the PeopleCode Java Functions, page 1096](#)

SysVar Java Class

Use the SysVar Java Class to refer to System Variables, such as %Language or %DBType.

For example, %Session, becomes SysVar.Session()

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "System Variables"

SysCon Java Class

Use the SysCon Java Class to refer to system constants, such as %SQLStatus_OK or %FilePath_Absolute.

For example, %CharType_Matched becomes SysCon.CharType_Matched.

Func Java Class

Use the Func Java Class to refer to built-in functions, such as CreateRowset or GetFile.

For example, SetLanguage(LANG_CD) becomes Func.SetLanguage(LANG_CD)

Name Java Class

The Name Java Class enables you to use the PeopleSoft reserved item references. This enables you to reference pages, components, records, fieldnames, and so on.

For example, in PeopleCode you can refer to a record field using the following:

recname.fieldname

With the Name class, you can use a similar construct:

```
new PeopleSoft.PeopleCode.Name("RECNAME", "FIELDNAME");
```

Note that these must be in the exact case as the item. As all PeopleTools items are named in uppercase, that means you must use uppercase.

As another example, in PeopleCode you can refer to a page using the following:

PAGE.*pagename*

In Java, it would be:

```
new PeopleSoft.PeopleCode.Name("PAGE", "PAGENAME");
```

Accessing PeopleCode Objects

The existing PeopleCode classes (like Array, Rowset, and so on) have properties and methods you can access.

- PeopleCode classes have the same names, so Record becomes Record, SQL becomes SQL, and so on.
- Methods are accessed by the method name.
- The name of a property is pre-pended with either **get** or **set**, depending on whether you're reading or writing to the property.

For example, to get the IsChanged property would be `getIsChanged`. To set the value for a field would be `&MyField.setValue`.

Here is an example of a Java program that uses PeopleCode objects to access the database:

```

/*
 * Class Test
 *
 * This code is used to test the Java/PeopleCode interface.
 */

import PeopleSoft.PeopleCode.*;

public class Test {

/*
 * Test
 *
 * Add up and return the length of all the
 * item labels on the UTILITIES menu,
 * found two different ways.
 */

public static int Test() {
/* Get a Rowset to hold all the menu item records. */
Rowset rs = Func.CreateRowset(new Name("RECORD", "PSMENUITEM"), new Object[]{});
String menuName = "UTILITIES";
int nRecs = rs.Fill(new Object[]{"WHERE FILL.MENUNAME = :1", menuName});

int i;
int nFillChars = 0;
for (i = 1; i <= rs.getActiveRowCount(); i++) {
String itemLabel = (String)rs.GetRow(i)
.GetRecord(new Name("RECORD", "PSMENUITEM"))
.GetField(new Name("FIELD", "ITEMLABEL"))
.getValue();
nFillChars += itemLabel.length();
}

/* Do this a different way - use the SQL object to read each menu
   item record. */

int nSQLChars = 0;
Record menuRec = Func.CreateRecord(new Name("RECORD", "PSMENUITEM"));
SQL menuSQL = Func.CreateSQL("%SelectAll(:1) WHERE MENUNAME = :2",
new Object[]{menuRec, menuName});

while (menuSQL.Fetch(new Object[]{menuRec})) {
String itemLabel = (String)menuRec
.GetField(new Name("FIELD", "ITEMLABEL"))
.getValue();
nSQLChars += itemLabel.length();
}

return nFillChars + 100000 * nSQLChars;
}
}

This can be run from PeopleCode like this:
Local JavaObject &Test;
Local number &chars;

&Test = GetJavaClass("Test");
&chars = &Test.Test();

&Test = Null;
WinMessage("The character counts found are: " | &chars, 0);

```

Using Application Classes From Java to PeopleCode

You call a Java program from an Application Class the same way you do using any other PeopleCode program, that is, by using one of the existing Java class built-in functions.

Calling an Application Class from a Java program has the following considerations:

- Application Classes must be accessed using the object built-in functions, such as `CreateObject`, `ObjectDoMethod`, `ObjectGetProperty`, and so on.
- You cannot declare a variable of type `HR.Package.SomeClass` in your Java program. The variable must be of type `Object`.
- There is no pre-pending the word 'get' or 'set' for properties. All classes, methods, and properties are passed as strings.

The following is an example of how to call an Application Class from a Java program.

This is the Java program:

```
package com.peoplesoft.pcode;
import PeopleSoft.PeopleCode.*;

public class foo {
    public foo() {
    }
    public String getString() {
        Object foo = Func.CreateObject("GTP:Foo", new Object[]{});
        return (String)Func.ObjectDoMethod((Peer)foo, "GetString", new Object[]{});
    }
}
```

The following is the Application Class Foo, in the Application Package Foo:

```
class Foo
    method GetString() Returns string;
end-class;

method GetString
    /+ Returns String +/
    Return "Hello";
end-method;
```

The following is the PeopleCode program that starts it all:

```
Local JavaObject &foo = CreateJavaObject("com.peoplesoft.pcode.foo");
GTP_PARSER.GTP_STR_RESULT = &foo.getString();
```

PeopleCode and Java Data Types Mapping

The following table describes the matching of types for resolution of overloaded Java methods and basic conversions. The first Java Type/Class is the one that is produced in the absence of any other type of information.

<i>PeopleCode Type</i>	<i>Java Type/Class</i>
Float	double, float
Number	double, float, byte, char, short, int, long
Integer	int, byte, char, short, long
Boolean	Boolean
String	java.lang.String
Date	java.sql.Date
Time	java.sql.Time
Date Time	java.util.Date
any kind of object	any kind of object

The following table represents the conversions done to produce the Java class java.lang.Object. In addition to these, the conversions (listed in the previous table) from String onwards are done to produce a java.lang.Object.

<i>PeopleCode Type</i>	<i>Java Type/Class</i>
Float, Number	java.lang.Double
Integer	java.lang.Integer
Boolean	java.lang.Boolean

The following table represents other conversions that are done as required by the signature of a Java method or constructor.

<i>PeopleCode Type</i>	<i>Java Class</i>
Integer, Number, Float	java.lang.Integer, java.lang.Byte, java.lang.Character, java.lang.Short, java.lang.Long, java.lang.Float, PeopleSoft.PeopleCode.intHolder, PeopleSoft.PeopleCode.doubleHolder

<i>PeopleCode Type</i>	<i>Java Class</i>
String	PeopleSoft.PeopleCode.StringHolder
peoplecode builtin class Xxx	PeopleSoft.PeopleCode.Xxx
JavaObject	corresponding Java object

Considerations When Using the PeopleCode Java Functions

Some PeopleCode built-in functions can't be called from a Java program. Many of these restrictions arise because you can't serialize Java objects. Inside Java, you can't serialize and save the state of the JVM.

This means that you cannot call the following built-in functions:

- Think-time functions, such as DoCancel, Prompt, RevalidatePassword, and so on.
- Math functions, such as Abs, Cos, and Sin. Use the Java math functions instead.
- Java class functions, such as CreateJavaArray, CreateJavaObject, or GetJavaClass.
- Deprecated functions, such as SetNextPanel, PanelGroupChanged, and so on. Use the new function instead, like SetNextPage, ComponentChanged, and so on.
- PeopleCode language elements, such as Exit, Return, If, and so on.
- Cursor position, such as SetCursorPos.
- Functions that rely on specific character encoding, such as char, code, exact, codeb, and so on.
- Menu appearance functions, such as CheckMenuItem, HideMenuItem, and so on.
- Transfer functions such as Transfer or TransferPage.
- DoSaveNow isn't allowed. However, DoSave is.

When you're creating your Java program, keep the following points in mind:

- If you're starting from an online application, avoid calling anything that will wait a long time.
- If you use third-party Java that require third-party platforms, you are limiting your program to just those platforms.

When setting a null date in Java, use the following:

```
myField.SetValue("");
```

Copying Arrays of Data Between PeopleCode and Java

When PeopleCode is called from your Java program it executes what are called native methods. These methods look like regular Java methods in their definition but are implemented in the PeopleTools layer. In order to go from Java into PeopleTools you have to use an interface called the Java Native Interface (JNI). There is a cost associated with each transition across the JNI. Using the `CopyToJavaArray` and the `CopyFromJavaArray` functions may improve your performance, as they act as a type of bulk data copy that minimizes the transition overhead.

For example you could copy an array by copying each element using the array's `Get` method. However, that would require traversing the JNI twice for each element; once going into Tools and once coming back from Tools. Not only is there transition overhead but there is also conversion between object types. For example a PeopleCode string has to be converted to a Java String and vice-versa. While these two builtins do not eliminate the latter conversions, they minimize the number of transitions across the JNI.

These functions can be used when you are selecting data into a PeopleCode array and you want to copy that data into a Java array.

These functions also allow you to supply an optional parameter that specifies the list of items you want copied.

Considerations Working with the Java Garbage Collector

Memory is managed in the JRE by the Java garbage collector. Because PeopleTools has no control over when the Java garbage collector runs (apart from a user in their Java program calling it using `system.gc()`), PeopleTools interacts dynamically with the Java runtime garbage collector. In particular, PeopleCode objects created from a Java program (such as records, fields, and so on,) are in effect peer objects of real PeopleCode objects in PeopleTools. The release of these objects must be linked. Using the weak reference mechanism in Java, PeopleTools dynamically interacts with the Java garbage collector each time the execution thread passes through the JNI. This allows long-running Java applications in a PeopleTools context to function without having to wait for an "end of service" event for object cleanup.

There might be occasions where a Java application creates many application classes and wants to force the PeopleTools garbage collector to run. That can be achieved by calling the CollectGarbage function. This is not normally necessary.

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," CollectGarbage

Error Handling and the PeopleCode Java Functions

Java functions throw exceptions to indicate something unusual has happened. However, all exceptions from Java called by PeopleCode are turned into fatal errors. You can catch these exception by enclosing the call to Java in a Try-Catch PeopleCode block. If you do not try to catch these exception, the PeopleCode program is terminated, and the user transaction must be canceled.

PeopleSoft recommends that you write a Java wrapper to handle errors.

Use either the All or None built-in functions to check values that are returned if you think you may call a Java method that is defined to return a string, but returns a Null object reference instead. Java Null object references are automatically converted into PeopleCode Null object references.

Accessing the Application Log File

For doing additional error handling in your application, you can access the application log file using the PeopleCode WriteToLog built-in function. For example:

```
Func.WriteToLog(SysCon.ApplicationLogFence_Level1, myLogString);
```

See *PeopleTools 8.51 PeopleBook: PeopleCode Language Reference*, "PeopleCode Built-in Functions," WriteToLog.

The Java Debugging Environment

To use Sun's JPDA V1.0 debugging architecture, you must do the following. These instructions are general: how you actually set up the debugger depends on your system.

To use the Java Debugging Environment (JDB):

1. Download and install a copy of JPDA V1.0.
2. Set the path for your system.

Suppose you install JPDA V1.0 in C:\jpda. Set your PATH environment variable to include C:\jpda\bin.

3. Set the path for the application server.

For the application server, set the Domain Settings/Add to PATH to include C:\jpda\bin.

4. Set the JavaVM Options.

Set the JavaVM Options to be something like the following (see the JPDA documentation for a more complete example):

```
-Xdebug -Djava.compiler=NONE -Xnoagent -Xrunjdwp:transport=dt_socket,suspend=>n,address=8765,server=y
```

5. Run the debugger.

After starting the tools session and causing it to start the JVM, you can use the JDB command line debugger that comes with JPDA, using a command like the following:

```
jdb -connect com.sun.jdi.SocketAttach:port=8765
```

You can also use the (no cost) Forte for Java Community Edition IDE from Sun or any of the Java IDEs noted on the JPDA pages.

Data Type of a Java Object

You should declare a Java object as type `JavaObject`. For example:

```
Local JavaObject &MyJavaClass;
```

Note. Java objects can be declared as type `Local` only.

Scope of a Java Object

A Java object can be instantiated from `PeopleCode` only. This object can be used anywhere you have `PeopleCode`, that is, in an application class, Component Interface `PeopleCode`, record field `PeopleCode`, and so on.

Chapter 23

Mail Classes

This chapter provides an overview of PeopleSoft MultiChannel Framework mail classes and discusses how to:

- Import mail classes.
- Create a mail object.
- Use the mail classes.
- Retrieve email from a mail server with the MCFGetMail class.
- MCFMail reference.

Understanding PeopleSoft MultiChannel Framework Mail Classes

This section discusses:

- PeopleSoft MultiChannel Framework mail classes.
- Scope of the mail classes.
- Data types of the mail classes.

PeopleSoft MultiChannel Framework Mail Classes

The PT_MCF_MAIL application package contains the following classes:

- MCFBodyPart
- MCFEmail
- MCFGetMail
- MCFHeaders
- MCFInboundEmail
- MCFMailStore
- MCFMultiPart
- MCFMailUtil

- MCFOutboundEmail
- MCFPart
- SMTPSession

Use the mail classes to develop applications to create and send emails, fetch and delete emails on the mail server, manage emails in your PeopleSoft database, and access attachments . By using the mail classes, you are not required to know the details of the GETMAILTARGET connector or the database schema.

Scope of the Mail Classes

The mail classes can be instantiated only from PeopleCode.

The mail classes can be called from a component, an internet script, or a Application Engine program.

Mail classes can be of local, global, or component scope.

Data Types of the Mail Classes

Every mail class is its own data type; that is, get mail objects are declared as data type MCFGetMail, store mail objects are declared as type MCFMailStore, and so on.

The following are the data types of the mail classes:

- MCFBodyPart
- MCFEmail
- MCFGetMail
- MCFHeaders
- MCFInboundEmail
- MCFMailStore
- MCFMailUtil
- MCFMultiPart
- MCFOutboundEmail
- MCFPart
- SMTPSession

Importing Mail Classes

The mail classes are *not* built-in classes, like Rowset, Field, Record, and so on. They are application classes. Before you can use these classes in your PeopleCode program, you must import them to your program.

An import statement names either all the classes in a package or a particular application class.

The application package PT_MCF_MAIL contains the following classes:

- MCFBodyPart
- MCFEmail
- MCFGetMail
- MCFHeaders
- MCFInboundEmail
- MCFMailStore
- MCFMailUtil
- MCFMultiPart
- MCFOutboundEmail
- MCFPart
- SMTPSession

To import all the mail classes, use the following import statement:

```
import PT_MCF_MAIL: *;
```

Using an asterisk after the package name makes all the application classes directly contained in the named package available. Application classes contained in subpackages of the named package are *not* made available. The PT_MCF_MAIL application package contains no subpackages.

See Also

[Chapter 6, "Application Classes," page 189](#)

Creating a Mail Object

After you've imported the mail classes, you instantiate an object of one of those classes using the constructor for the class and the Create function.

The following example creates a new instance of the MCFGetMail class, as the variable &gm, with local scope:

```
Local MCFGetMail &gm = create MCFGetMail();
```

Using the Mail Classes

This section discusses how to use the mail classes, and includes the following:

- General lifecycle of an outbound email
- Delivery status notifications and return receipts
- Priority
- MCFBodyPart and MCFEmail considerations

General Lifecycle of an Outbound Email

The following are the general steps used to create an outbound email:

1. Create an MCFOutboundEmail object
2. Set the usual properties for an email, such as the From, Subject, Recipients, and Text properties.
3. If necessary, set the parts of the email using MCFMultipart and MCFBodyPart classes.
4. Use the Send method to send the email.

The MCFPart and MCFEmail classes provide the common functionality for the MCFBodyPart and MCFOutboundEmail (and MCFInboundEmail) classes, respectively. In general, you never need to use the MCFPart or MCFEmail classes directly in your PeopleCode programs. However, in rare cases you may use these classes if you want to extend the application package.

The SMTPSession class encapsulates all the session parameters that can be set in a Simple Mail Transfer Protocol (SMTP) session. Each MCFOutboundEmail object points to one SMTPSession object. In most cases, the parameters for the SMTP session are set from values found in the application server configuration file (psappsrv.cfg). However, you can also set these parameters by creating an SMTPSession object, setting the desired parameters, then creating an MCFOutboundEmail object.

For convenience, all SMTP attributes are also directly accessible from the MCFOutboundEmail class, so you don't need to create an SMTPSession object when you're sending just one email.

When you want to send many emails in a single SMTP session, you don't have to set the SMTP session parameter in each and every email. For this case, you can create a single SMTPSession, using either the default settings or explicitly setting the desired parameters, then use the CreateOutboundEmail method of SMTPSession object to create all the MCFOutboundEmail objects. This way all the MCFOutboundEmail objects use the same SMTP session parameters. After specifying the value of all the parameters for all the MCFOutboundEmail objects, use the SendAll method of SMTPSession object to send all the emails in one SMTP session.

All the application classes mentioned above hold all the data until one of the Send methods is called. The Send methods connect to the mail server using a JavaMail API that sends the mail.

Since all communication to the mail server happens when a Send method is called, errors are only reported when the Send method returns. The return value indicates the success or the failure of the send process. In case of failure, you can query the MCFOutboundEmail application class for the details of the error. The error details are available in properties such as MessageSetNumber, MessageNumber, ErrorDescription, ErrorDetails, and so on.

Delivery Status Notification and Return Receipts

There is an SMTP extension that supports Delivery Status Notifications (DSN) defined in RFC 1891. This may or may not be supported by the user's Mail Transport Agent (MTA). The acknowledgements do not indicate whether the user reads the message, they only acknowledge receipt of the message by their mail server. It is possible that the mail server throws the message away as spam and the end user never actually receives the email. To get such notifications, set the `StatusNotifyOptions` and `StatusNotifyReturn` properties, as in the following example:

```
&email.StatusNotifyOptions = "SUCCESS,FAILURE";  
&email.StatusNotifyReturn = "HDRS";
```

You can use the `IsReturnReceiptReqd` property to specify if a return receipt should be sent when the mail server receives and opens the email. This property only works if the underlying SMTP server supports this feature. The following is an example of using this property:

```
&email.IsReturnReceiptReqd = True;
```

Priority

There is no SMTP standard for message priority. Most email applications use an X-Priority value of 3 for messages with "normal" priority. More important messages have lower values and less important messages have higher values. In most cases, urgent messages have an X-Priority value of 1. The priority code used with the Mail classes, and set in the headers are as follows:

1. Highest Priority
2. High Priority
3. Normal
4. Low Priority
5. Lowest Priority

The default value is 3, that is, normal priority.

Different email programs render these different values in a variety of ways, usually using some kind of colored symbols or arrows.

Set the priority for an email using the `Priority` property. The following is an example:

```
&Email.Priority = 2;
```

MCFBodyPart and MCFEmail Considerations

Both `MCFBodyPart` and `MCFEmail` objects are used for both inbound and outbound email. The following sections specify which methods and properties are generally used for inbound, and which are used for outbound, for the different objects.

Inbound and Outbound MCFBodyPart Class Methods

All of the methods except the `GetUnparsedHeaders` method for the `MCFBodyPart` class are used with outbound email. The following methods are generally used with inbound email as well:

- `GetHeader`
- `GetHeaderNames`
- `GetUnparsedHeaders`

Inbound and Outbound MCFBodyPart Class Properties

The following properties are primarily used with inbound email. Note that some of these properties are also used with outbound email.

- `AttachmentURL`
- `ContentType`
- `Filename`
- `IsAttachment`
- `Text`

The following properties are primarily used with outbound email. Note that some of these properties are used with inbound email as well.

- `ContentLanguage`
- `ContentType`
- `Description`
- `Disposition`
- `FileName`
- `FilePath`
- `FilePathType`
- `Multipart`
- `Text`

Inbound and Outbound MCFEmail Class Properties

The following properties are used with inbound email. Note that most of these properties are also used with outbound email.

- `From`
- `RefIDs`

- ReplyIDs
- ReplyTo
- Sender
- Subject

The following properties are used with outbound email. Note that many of these properties are also used with inbound email.

- BCC
- BounceTo
- CC
- From
- Importance
- Priority
- Recipients
- RefIDs
- ReplyIDs
- ReplyTo
- Sender
- Sensitivity
- Subject

Retrieving Email From a Mail Server With the MCFGetMail Class

Use the MCFGetMail class to retrieve email from your mail server and load it in a rowset. After you have decided that an email needs to be saved to the PeopleSoft database, use MCFMailStore class.

This section covers the following topics:

- Rowset structure.

- Error messages common to all MCFGetMail methods.

Structure of Rowset Used for Email Information

The following list describes the different levels of the rowset that contains email information, and what each level contains.

Level 0

The first row at level zero is empty except for the number of rows contained within level zero and return status. The first row contains the return status for the entire batch of emails. Apart from the return status of the whole batch, each individual row has its own EMAIL_RET_STATUS. When a fatal error occurs, such as a connector size overflow, an IB overflow, or an error accessing attachments, the return status is copied to the first row. Subtle errors like unsupported encoding for a part of a individual email appear in the return status of that email only. Each row after the first row contains information about an individual email, such as the header information, the time received, and so on.

Level 1

Level one is where the parts of an email reside. The level one child rowsets are linked to the parent rowset in level zero by the MCF_EMAIL_ID, a unique ID assigned by PeopleSoft.

Note. Multipurpose Internet Mail Extensions (MIME) is an Internet standard for representing multipart and multimedia data in email. It enables email to be exchanged between different email systems. The parts may be nested. PeopleSoft embeds the Sun JavaMail API to implement support for the MIME standard. However, all parts of an email are represented in PeopleSoft as level one rowsets, regardless of the hierarchy that existed in the original email.

The following table describes the fields within the rowset at level zero.

<i>Field</i>	<i>Description</i>
MCF_ATTACH_LIST	Contains a list of all the file names that are attachments for a particular email. Multiple items are separated by a semicolon (;).
MCF_IS_ATT_URL	This is a Boolean value indicating whether the email body is located in the MCF_EMAIL_TEXT or in the attachment directory. If this value is 1 (true), the email body is located in the attachment directory and can be accessed using the MCF_ATT_URL value. If this value is 0 (false), then the email body is located in MCF_EMAIL_TEXT.

<i>Field</i>	<i>Description</i>
MCF_ATT_URL	This URL enables you to view an attachment. This URL is viewable only if the corresponding email has been authorized for the current user. This value is a relative URL. The URL becomes fully qualified only after the rowset has been saved to the PeopleSoft database and then later retrieved using the MCFMailStore class. The following is a sample URL: http://sundance.peoplesoft.com/PSAttachServlet/ps/mcfdev1/39297_31030554591_1.gif?contentType=image/gif <i>mcfdev1</i> is the mail user name. <i>39297_31030554591_1.gif</i> is the file name in the attachment directory. <i>contentType</i> is used by the browser to open a viewer associated with this type. The filename of the downloaded attachment is constructed by using the email's unique ID and the part number. Warning! Downloading the same emails twice from the mail server overwrites the associated files in the directory. If the same email is stored twice in the PeopleSoft database, the system creates two separate rows. If you delete either one of these rows, the system deletes the associated files in the directory. To avoid this situation, delete emails from the mail server after you have retrieved them. See Chapter 23, "Mail Classes," AuthorizeEmailAttach, page 1157.
MCF_IBNODE_NAME	Identifies the name of the Integration Broker node that received the email, such as MCF_GetMail. The system uses this value to construct the fully qualified URL required for viewing attachments.
MCF_ATTACH_SIZES	Indicates the size of the attachments associated with an email. Multiple values are separated by a semicolon (;). The attachment sizes appear in the same order as the file names in MCF_ATTACH_LIST.
MCF_EMAIL_FROM	Indicates the email account that sent the email, such as jsmith@company.com.

<i>Field</i>	<i>Description</i>
MCF_DTTM_RECV	Indicates the time that the mail server received the email. Warning! If you are using a Post Office Protocol 3 (POP3) mail server, this field may not be populated.
MCF_OFFSET_RECV	Indicates the time zone of the mail server that received this email. Note. This field contains the time zone of the integration gateway used to fetch this email.
MCF_DTTM_SENT	Indicates the time that the email was sent.
MCF_OFFSET_SENT	Indicates the time zone of the mail server that sent this email. Note. Currently, this field contains the time zone of the integration gateway used to fetch this email.
MCF_DTTM_SAVED	Records the date and time that the PeopleSoft system saved an email to the PeopleSoft database. If you use a POP3 mail server, PeopleSoft recommends using this value as the base, or starting point, for any time-sensitive transactions.
MCF_EMAIL_SENDER	This is the reply to address. This supports a mail feature in which users can send an email from one account, but when the receiver chooses to reply, the system addresses the email to a different account. For instance, sales representatives may send an email from their personal email account, as in tom_sawyer@company.com, but when customers reply, the email is addressed to sales@company.com.

<i>Field</i>	<i>Description</i>
MCF_EMAIL_TEXT	Represents the text that was delivered in the body of the email. Before the email is downloaded, this field contains the body of the email. After the email has been downloaded, this field is blank. Check the MCF_IS_ATT_URL value to determine whether your email text resides in this field or the attachment directory. PeopleSoft relies on the originating email client embedding encoding information to determine character set. For example, Content-type: text/plain; charset=Big5
MCF_NOTIFY_CC	Indicates the parties who were copied (carbon copied) on the email. Multiple addresses are separated by a semicolon (;).
MCF_NOTIFY_TO	Indicates the parties who received the email. Multiple addresses are separated by a semicolon (;).
MCF_UID_LIST	This contains a unique identifier created by POP3 or an IMAP4 mail server. It is guaranteed to be unique within a particular mail box. Note. The DeleteEmail method also uses this value when deleting a list of emails. When deleting emails, this field can contain multiple values separated by a space.
MCF_WL_SUBJECT	Contains the subject of the email. A maximum of 254 characters is allowed. PeopleSoft relies on the originating email client embedding encoding information to determine character set. For example: Email Subject: Subject: ==> ?Big5?B?uvuqWLBPqsy67qZYs/i+yS+kp=> LDqqXik6Ldztdg=?= ?Big5?B?uvSlSKT0p=> Eilwbr0MzCk6bVvqu2q+KTloUGkaqRP?==> ?Big5?B?scCxUqa/v0GlwQ==?=> where ?Big5? is the prefixed encoding information.
MCF_RET_STATUS	Represents where the system stores the return status of a particular mail class method.
MCF_EMAIL_STATUS	This field is not currently used.

<i>Field</i>	<i>Description</i>
MCF_NUMROWS	Indicates the number of rows (level one child rowsets) that contain parts of a particular email. For example, if an email has two child rowsets associated with it at level one, this value would be 2. Note. For row one of the level zero rowset, this field reflects the number of emails in this rowset. If you fetch 10 emails, the rowset contains 11 rows, but the MCF_NUMROWS value in row 1 equals 10. Row 1 of the level zero rowset never contains an email.
MCF_EMAIL_MSG_ID	This is the globally unique identifier for this email. This ID is generated by the mail server that sent this email.
MCF_REPY_TO	This is the reply to field.
MCF_REF_IDS	Use this field for the reference header fields of the message.
MCF_REPLY_IDS	This value contains the email address that the email can reply to.
MCF_MSG_SIZE	Represents the total size of the entire email. This value includes the sizes of attachments.
MCF_EMAIL_LANG_CD	This value reflects the language code of the Integration Broker node that received this email. Note. PeopleSoft recommends setting up email accounts that are dedicated to one language such as, support_french@company.com and support_english@company.com. This enables you to anticipate the language of the email you read into your system. In turn, configure separate Integration Broker nodes to handle each of the languages you support. There are no language recognition procedures within the PeopleSoft system.
MCF_USER	Represents the user account (mail box) on the mail server that received the email.
MCF_SERVER	Represents the mail server that received the email.
MCF_ERROR_COUNT	Used to return the number of messages that caused errors during processing on the target connector.

<i>Field</i>	<i>Description</i>
MCF_QUARANTINE_COUNT	Used to return the number of messages that caused errors during processing on the target connector and were successfully moved to the quarantine folder (This value is always 0 for POP3).
MCF_CONTENT_TYPE	This is the content type of the email itself. For example, a content type could be text/plain, text/html, or multipart/alternative.
MCF_EMAIL_HEADERS	This field is used to return the email message headers. It contains the raw headers in RFC 822 format. The MCFHeaders class can be used to parse the contents of this field.

The following table describes the fields within the rowset at level one. This rowset contains the parts of the email.

<i>Field</i>	<i>Description</i>
MCF_ATT_URL	This is the URL of an associated attachment in the attachment directory. This URL is a relative value when this rowset is first received from the mail server and stored in the database. It only becomes a fully qualified URL once you retrieve the rowset using the MCFMailStore class. Keeping the URL a relative value enables you to make changes within the system without breaking the URL.
MCF_IS_ATT_URL	This is a Boolean value indicating whether the email part is located in the MCF_EMAIL_TEXT or on the attachment directory. If this value is 1 (true), the email part can be accessed using the MCF_ATT_URL value. If this value is 0 (false), then the email part is located in MCF_EMAIL_TEXT.
MCF_FILENAME	Represents the file name for an attachment, such as revenue.xls or resume.doc. The file name can be used as a read-only label on the page used by end users to view attachments. For example, the file name may appear next to the link that opens the attachment. Note. Not all parts have file names.
MCF_FILE_DATA	This field is not currently used.

<i>Field</i>	<i>Description</i>
MCF_EMAIL_HEADERS	This field is used to return the email part headers. It contains the raw headers in RFC 822 format. The MCFHeaders class can be used to parse the contents of this field.
MCF_EMAIL_TEXT	Contains the text content of the email part.

Note. Although the same rowset structure is used for retrieving email from the mail server and for retrieving email from the PeopleSoft database, not all of the fields apply to each situation. For example, when you first retrieve email from the mail server, the rowset does not contain the fully qualified URL to any attachments.

Note. After an email is saved to the database, always use the methods in the MailStore application package class to access the email. Do not read directly from the mail tables.

Error Messages Returned by MCFGetMail Class Methods

The GetMail Integration Broker connector returns message codes denoting status. These return codes apply to all the methods within the MCFGetMail class. The following are returned in MCF_RET_STATUS field, and by the Status property.

0	Success.
1	Connector size overflow. The size of the email requested exceeds the value in MCF_EmSz_Conn. The system returns the header information for this email with the return status set to 1. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft MultiChannel Framework</i>, "Configuring the Email Channel," Configuring GETMAILTARGET Properties.
2	Integration Broker threshold size overflow. The size of the email requested exceeds the value in MCF_EmSz_IB. This happens when the size of the XML message constructed to transfer emails from the mail server to the database exceeds the threshold value. If there are any more emails to be processed in the current batch, the system does not fetch them from the mail server. For example, suppose your program fetches 20 emails at a time from the mail server, and this error occurred on the tenth email. In this case, the system processes the tenth email, but emails 11–20 are still be on the mail server. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft MultiChannel Framework</i>, "Configuring the Email Channel," Configuring GETMAILTARGET Properties.

- 3 Cannot delete all the messages from the mail server.
- 4 Connecting to the mail server failed.
- 5 The attachments to be deleted were not found.
- 6 At least one attachment cannot be deleted.
- 7 Unsupported encoding.
- 8 Cannot write to the attachment directory.
- 9 Messages were downloaded to directory and deleted from mail server.
 This status code occurs when an exception occurs in Integration Broker while
 storing the emails to the database. The exception might occur due to invalid
 characters in the email. If the email is left on the mail server, the same exception
 will occur repeatedly, preventing you from fetching further emails. Because the
 header might contain these invalid characters also, only MCF_RET_STATUS,
 MCF_MSG_SIZE, MCF_UID_LIST, date time fields, MCF_IS_ATT_URL,
 MCF_ATT_URL are set. There is no way to determine which email caused the
 exception, so the system writes all the emails to the directory. All the emails in
 the batch are deleted from the mail server.
- 10 Email content error. One example of this is unsupported encoding.
- 11 Returned if attempting to create a mail server folder while using the POP3
 protocol.
- 12 Folder creation on mail server failed.
- 13 GetMail connector internal error.

See [Chapter 23, "Mail Classes," Status, page 1156](#).

Mail Classes Constructors

The following section provides examples of the mail class constructors.

MCFBodyPart

Example

```
Local PT_MCF_MAIL:MCFBodyPart &text = create PT_MCF_MAIL:MCFBodyPart();
```

MCFGetMail

Example

```
Local MCFGetMail &gm = create MCFGetMail();
```

MCFOutboundEmail

Example

```
Local PT_MCF_MAIL:MCFOutboundEmail &eMail =  
create PT_MCF_MAIL:MCFOutboundEmail();
```

MCFMailStore

Example

```
Local MCFGetMail &sm = create MCFMailStore();
```

SMTPSession

Example

```
Local PT_MCF_MAIL:SMTPSession &commonSession =  
create PT_MCF_MAIL:SMTPSession();
```

MCFBodyPart Class

Use the MCFBodyPart class to send email with attachments, HTML, or other non-standard text information.

MCFBodyPart Class Methods

In the following, we discuss the MCFBodyPart class methods. The methods are described in alphabetical order.

AddHeader

Syntax

AddHeader(*HeaderName*, *HeaderValue*)

Description

Use the AddHeader method to add a header to the body part. This method allows for email server customizations. Some commonly used headers are already exposed as properties, such as ContentType and ContentLanguage. Advanced applications can adapt this technique to meet their own requirements. These headers can be either standard SMTP headers or custom headers starting with "X-".

Parameters

<i>Parameter</i>	<i>Description</i>
<i>HeaderName</i>	Specify the name of the header that you want to add. This parameter takes a string value.
<i>HeaderValue</i>	Specify the actual text of the header, as a string.

Returns

None.

Example

```
Local PT_MCF_MAIL:MCFOutboundEmail &email = create PT_MCF_MAIL:MCFOutboundEmail⇒  
( );  
Local string &TestName = "Custom Header";  
  
&email.From = &def.From;  
&email.Recipients = &def.Recipients;  
&email.SMTPServer = &def.SMTPServer;  
&email.Subject = &TestName;  
&email.Text = &TestName;  
  
&email.AddHeader("X-Mailer", "CRM Sales Application 8.9 SP2");  
&email.AddHeader("X-Mailer", "CRM Sales Application 8.9 SP3");  
&email.AddHeader("X-Mailer", "CRM Sales Application 8.9 SP4");  
&res = &email.Send();
```

See Also

[Chapter 23, "Mail Classes," GetHeader, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1119](#); [Chapter 23, "Mail Classes," GetHeaderNames, page 1120](#); [Chapter 23, "Mail Classes," GetHeaderValues, page 1120](#) and [Chapter 23, "Mail Classes," GetUnparsedHeaders, page 1121](#)

GetHeader

Syntax

GetHeader (*HeaderName*)

Description

Use the GetHeader method to return the value of the specified header.

This method is primarily used with inbound email messages.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>HeaderName</i>	Specify the name of the header that you want to access the values for, as a string. The matching of header names is case insensitive.

Returns

An array of string containing the header values. If the header is not present, returns an array of length zero.

See Also

[Chapter 8, "Array Class," page 257](#)

[Chapter 23, "Mail Classes," AddHeader, page 1117](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1119](#); [Chapter 23, "Mail Classes," GetHeaderNames, page 1120](#); [Chapter 23, "Mail Classes," GetHeaderValues, page 1120](#) and [Chapter 23, "Mail Classes," GetUnparsedHeaders, page 1121](#)

GetHeaderCount

Syntax

GetHeaderCount ()

Description

Use the `GetHeaderCount` method to return the number of headers.

Parameters

None.

Returns

An integer, representing the number of headers present.

See Also

[Chapter 23, "Mail Classes," AddHeader, page 1117](#); [Chapter 23, "Mail Classes," GetHeader, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1119](#); [Chapter 23, "Mail Classes," GetHeaderNames, page 1120](#); [Chapter 23, "Mail Classes," GetHeaderValues, page 1120](#) and [Chapter 23, "Mail Classes," GetUnparsedHeaders, page 1121](#)

GetHeaderName

Syntax

GetHeaderName(*Index*)

Description

Use the `GetHeaderName` to return the name of the header that is located at *Index*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the numeric position of the header you want to access.

Returns

A string.

See Also

[Chapter 23, "Mail Classes," AddHeader, page 1117](#); [Chapter 23, "Mail Classes," GetHeader, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderNames, page 1120](#); [Chapter 23, "Mail Classes," GetHeaderValues, page 1120](#) and [Chapter 23, "Mail Classes," GetUnparsedHeaders, page 1121](#)

GetHeaderNames

Syntax

GetHeaderNames()

Description

Use the GetHeaderNames method to return an array containing the names of all the headers.

This method is primarily used with inbound email messages.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 23, "Mail Classes," AddHeader, page 1117](#); [Chapter 23, "Mail Classes," GetHeader, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1119](#); [Chapter 23, "Mail Classes," GetHeaderValues, page 1120](#) and [Chapter 23, "Mail Classes," GetUnparsedHeaders, page 1121](#)

GetHeaderValues

Syntax

GetHeaderValues(*Index*)

Description

Use the GetHeaderValues method to return the value for the header located at the position specified by *Index*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the numeric position of the header whose value you want to access.

Returns

An array of string.

See Also

[Chapter 23, "Mail Classes," AddHeader, page 1117](#); [Chapter 23, "Mail Classes," GetHeader, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1119](#); [Chapter 23, "Mail Classes," GetHeaderNames, page 1120](#) and [Chapter 23, "Mail Classes," GetUnparsedHeaders, page 1121](#)

GetUnparsedHeaders

Syntax

GetUnparsedHeaders()

Description

Use the GetUnparsedHeaders method to return all of the headers in the body part without any formatting occurring.

Parameters

None.

Returns

A string containing the headers.

See Also

[Chapter 23, "Mail Classes," AddHeader, page 1117](#); [Chapter 23, "Mail Classes," GetHeader, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1118](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1119](#); [Chapter 23, "Mail Classes," GetHeaderNames, page 1120](#) and [Chapter 23, "Mail Classes," GetHeaderValues, page 1120](#)

SetAttachmentContent

Syntax

```
SetAttachmentContent ({FilePath | FileURL}, FilePathType, FileName, FileDescr,  
OverrideContentType, OverrideCharset)
```

Description

Use the `SetAttachmentContent` method to specify the body (content) of this body part from a file.

Use the *FilePathType* parameter to specify if the file path is relative or absolute. If it's an absolute path, the file path could be a file on the local machine, a network folder, or a fully-qualified URL.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>FilePath</i> <i>FileURL</i>	You can either specify the file path to the file, or a URL to the file. Depending on the <i>FilePathType</i> parameter, you may specify either a relative or absolute file path to the file. This parameter should include the file name and extension of the file. If you specify a URL address where the file is located, it must be an absolute URL. This URL should include the actual name of the file. If you specify a URL address, you must specify the <i>FilePathType</i> parameter as <code>%FilePath_Absolute</code>.
<i>FilePathType</i>	Specify the path type for the file, whether it is an absolute or relative path. The values are: <code>%FilePath_Absolute</code> — the file path is an absolute path. <code>%FilePath_Relative</code> — the file path is a relative path.
<i>FileName</i>	Specify the name of the file that you want to attach, as a string. You must include the file extension as well.
<i>Description</i>	Specify a description of the file.
<i>OverrideContentType</i>	The system detects the content type of the attachment using the file location and name. Specifying <i>OverrideContentType</i> overrides the system detected content type. The character set can also be included in the <code>ContentType</code>. For example, <code>"text/plain; charset=US-ASCII"</code>
<i>OverrideCharset</i>	Specify a character set to be used to override the existing character set.

Returns

None.

Example

The following uses an absolute path to set the content:

```
&image.SetAttachmentContent("///file:C:/User/Documentum/XML%20Applications/proddoc⇒  
/peoplebook_upc/peoplebook_upc.dtd",  
%FilePath_Absolute, "sample.jpg", "This is a sample image!", "", "");
```

The following uses a relative path to set the content:

```
&attach1.SetAttachmentContent("Ocean Wave.jpg", %FilePath_Relative,  
"Ocean Wave.jpg", "Ocean Wave", "", "");
```

The following uses a URL to set the content:

```
&attach1.SetAttachmentContent("http://www.yahoo.com/members_agreement",  
%FilePath_Absolute, "hotmail.htm", "Hotmail Home page", "", "");
```

See Also

[Chapter 23, "Mail Classes," AddAttachment, page 1178](#)

MCFBodyPart Class Properties

In this section we discuss the MCFBodyPart class properties. The properties are described in alphabetical order.

AttachmentURL

Description

Use this property to specify the URL for the attachment for this body part, as a string.

The URL must be an absolute URL.

This property is read-write.

Charset

Description

Use this property to specify the character set for the text or the attachment.

You can also specify this property using the `SetAttachmentContent` method, or the `ContentType` property.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," `ContentType`, page 1124](#)

[Chapter 23, "Mail Classes," `SetAttachmentContent`, page 1122](#)

ContentType

Description

Use this property to specify the content type of this body part.

You can specify the content type with the `SetAttachmentContent` method.

You can also use this property to specify the character set. For example, "text/plain; charset=US-ASCII".

This property is read-write.

See Also

[Chapter 23, "Mail Classes," `SetAttachmentContent`, page 1122](#)

[Chapter 23, "Mail Classes," `Charset`, page 1124](#)

Description

Description

Use this property to specify a description of the attachment. You should only use this property if the content is an attachment.

This property is read-write.

Disposition

Description

Use this property to specify how the body part is presented in the received mail.

Some email clients ignore the setting of this property and present body parts either inline or as file attachments.

Valid values for this property are:

<i>Value</i>	<i>Description</i>
Attachment	The body part is shown as a file attachment.
Inline	The body part is shown in the body itself.

This property is read-write.

Filename

Description

If you are adding an attachment to the email, use this property to specify the name of the file.

PeopleSoft recommends that you keep the file extension specified with this property the same as the original extension found in the file path, otherwise client applications may not be able to display it properly.

This property is read-write.

FilePath

Description

Specify the path for the file that contains the contents of this email.

Whether this is a relative or absolute path depends on the FilePathType property.

You can also specify a URL to the file using this property, if the FilePathType property is specified as %FilePath_Absolute.

If you specify a value for this property, the 'Text' content is ignored.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," FilePathType, page 1126](#)

FilePathType

Description

Use this property to specify whether the path specified with the `FilePath` property is a relative or absolute path. The values for this property are:

<i>Value</i>	<i>Description</i>
<code>%FilePath_Relative</code>	The file path specified with the <code>FilePath</code> property is a relative path.
<code>%FilePath_Absolute</code>	The file path specified with the <code>FilePath</code> property is either an absolute path to a file, or a URL to a file.

If you specify a relative path, the file must be available in the `FILES` folder of application server folder.

If you specify an absolute path, the file could be on the local machine, in any network folder, or a URL.

This property is read-write.

IsAttachment

Description

This property indicates if the body part is an attachment or not. This property returns a Boolean value: true if it is an attachment, false otherwise.

This property is read-only.

MultiPart

Description

A bodypart can contain simple text, one attachment, or a `MultiPart` object.

If you have assigned a `MultiPart` object using this property, the text and attachment related properties are ignored.

This property is read-write.

Example

```
Local PT_MCF_MAIL:MCFMultipart &mp = create PT_MCF_MAIL:MCFMultipart();
&mp.SubType = "alternative; differences=Content-type";

&mp.AddBodyPart(&text);
&mp.AddBodyPart(&html);

&email.MultiPart = &mp;
```

Text

Description

Use this property to specify the text for the email.

Use the `SetAttachmentContent` method to specify image or other types of attachments. For a more complex bodypart, build a multipart and set the `Multipart` property of `MCFBodyPart`.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SetAttachmentContent, page 1122](#)

MCFEmail Class

This class inherits many properties from the `MCFPart` class, and is the superclass class for both the `MCFOutboundEmail` and `MCFInboundEmail` classes. Generally, you only use the `MCFOutboundEmail` and `MCFInboundEmail` classes. You should only use the `MCFEmail` class if you are extending the `PT_MCF_MAIL` application package.

MCFEmail Class Properties

In this section, we discuss the `MCFEmail` class properties. The properties are discussed in alphabetical order.

BCC

Description

Use this property to specify comma-separated list of addresses of all the blind carbon copy recipients of this email. (A blind carbon copy is a copy of the email that contains all of the text of the email, but does not show any of the other email addresses to which this email was sent.)

This property is read-write.

See Also

[Chapter 23, "Mail Classes," CC, page 1128](#)

BounceTo

Description

Use this property to specify the email address the system should direct all bounced mail to.

This property is read-write.

CC

Description

Use this property to specify a comma-separated list of addresses that copies of this email are to be sent to (carbon copy.)

This property is read-write.

See Also

[Chapter 23, "Mail Classes," BCC, page 1128](#)

From

Description

Use this property to specify the email address of the person sending the email.

You can specify more than one address as from in a comma-separated list.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," Recipients, page 1130](#); [Chapter 23, "Mail Classes," ReplyTo, page 1130](#) and [Chapter 23, "Mail Classes," Sender, page 1131](#)

Importance

Description

Use this property to specify the value of the importance header field.

The importance can be set to the following:

- low
- normal
- high

If the Priority property is not set, the system automatically sets it to the corresponding values like 5, 3 and 1.

This property is read-write.

Priority

Description

Use this property to specify the priority of this email.

The values are:

1. Highest Priority
2. High Priority
3. Normal
4. Low Priority
5. Lowest Priority

The default value is 3, that is, normal priority.

This value set with this property is used to set to a header X-Priority field, as this is the most common but non-standard field to show priority. In addition, the corresponding values are set in two header fields: X-MSMail-Priority and Priority. The headers X-Priority or X-MSMail-Priority are set to the corresponding value only if the user does not specify a value.

This property is read-write.

Recipients

Description

Use this property to specify the email addresses of all the main recipients to whom the email is being sent. All the addresses are specified in a comma-separated string.

This property is read-write.

RefIDs

Description

Use this property to specify a value for the REFERENCES header field of the message.

This property is read-write.

ReplyIDs

Description

Use this property to specify a value for the IN-REPLY-TO header field of the message.

This property is read-write.

ReplyTo

Description

Use this property to specify the email address where the reply should be sent. You do not need to specify a value for this property if the value is the same as the From property.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," From, page 1128](#)

Sender

Description

Use this property to specify the address of the author of the message. You do not need to specify a value for this property if the value for the From property is the same.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," From, page 1128](#)

Sensitivity

Description

Use this property to specify the value of the sensitivity header field.

The values are:

- personal
- private
- company-confidential

This property is read-write.

Subject

Description

Use this property to specify the subject of the email. A subject can only contain 254 characters.

This property is read-write.

Text

Description

Use this property to specify the text of the email.

This property is read-write.

MCFGetMail Class Methods

This section discusses MCFGetMail class methods.

CreateQuarantineFolder

Syntax

CreateQuarantineFolder ()

Description

Use the CreateQuarantineFolder method to create a quarantine folder on the server. Specify the name of the folder using the QuarantineFolder property

Parameters

None.

Returns

A Boolean value; true if the folder is created, or if it already exists on the server, false otherwise.

See Also

[Chapter 23, "Mail Classes," QuarantineFolder, page 1145](#) and [Chapter 23, "Mail Classes," QuarantineCount, page 1145](#)

GetCount

Syntax

GetCount ()

Description

Use the GetCount method to determine the total number of emails currently stored in a particular email account.

This method does not distinguish between read and unread emails.

This method uses the connection properties set by SetMCFEmail.

If you want to determine the number of emails for an account, and to set your own connection properties, use the GetEmailCount method instead.

Parameters

None.

Returns

Returns the total number of emails stored on the mail server for a particular email account. If the method returns -4, the system could not connect to the mail server using the user name and password passed in the parameter list.

See Also

[Chapter 23, "Mail Classes," GetEmailCount, page 1133](#) and [Chapter 23, "Mail Classes," SetMCFEmail, page 1142](#)

GetEmailCount

Syntax

GetEmailCount(*user*, *password*, *server*, *node*)

Description

Use GetEmailCount to determine the number of emails currently stored in a particular email account. GetEmailCount does not distinguish between read and unread email. You can use this value to set limits on loops in your program.

If you want to determine the number of emails for an account using the connection properties set with SetMCFEmail, use the GetCount method instead.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>user</i>	The user name on the mail server, such as "support" or "john_doe".
<i>password</i>	The password associated with the specified user name.
<i>server</i>	The name of the mail server handling the specified user account.

<i>Parameter</i>	<i>Description</i>
<i>node</i>	The Integration Broker node on which the request runs.

Note. If the value of any of these parameters is null, the method uses default values stored on the specified node. If the node is not specified, Integration Broker returns an error.

Returns

Returns the total number of emails stored on the mail server for a particular email account. If the method returns -4, the system could not connect to the mail server using the user name and password passed in the parameter list.

Example

```
Local number &email_count;  
  
&email_count = &gm.GetEmailCount(&username, &passwd, &mailserver,  
&node);
```

See Also

[Chapter 23, "Mail Classes," GetCount, page 1132](#) and [Chapter 23, "Mail Classes," SetMCFEmail, page 1142](#)

ReadAllEmailHeadersWithAttach

Syntax

ReadAllEmailHeadersWithAttach(*user, password, server, node*)

Description

Use ReadAllEmailHeadersWithAttach to read the headers of all of the emails and a list of associated attachments that are currently stored on the mail server for a particular email account. The details about the emails are returned in the level zero rowset. The actual emails and any associated attachments *are not* returned.

Use this method as a screening method to determine whether to store an email in your PeopleSoft system. For example, if you determine that an email is junk mail, you could delete it from your mail server. After you determine the allowable email through header information, you can retrieve the physical email and attachments of the allowable emails.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>user</i>	The user name on the mail server, such as "support" or "john_doe".
<i>password</i>	The password associated with the specified user name.
<i>server</i>	The name of the mail server handling the specified user account.
<i>node</i>	The Integration Broker node on which the request runs.

Note. If the value of any of these parameters is null, the method uses default values stored on the specified node. If the node is not specified, Integration Broker returns an error.

Returns

This method returns rowsets containing email headers.

Example

```
import PT_MCF_MAIL:*;  
Local MCFGetMail &gm;  
Local Rowset &emails_rs;  
  
&emails_rs = &gm.ReadAllEmailHeadersWithAttach(&username, &passwd, &mailserver  
&node);
```

ReadEmails

Syntax

ReadEmails(*Count*)

Description

Use the ReadEmails method to read the specified number of emails for this mailbox.

This method uses the connection properties set by SetMCFEmail.

The overall status of the success of this method is available in the Status property.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Count</i>	Specify the number of emails you want to read.

Returns

An array of MCFInboundEmail.

See Also

[Chapter 23, "Mail Classes," MCFInboundEmail Class Methods, page 1147](#)

[Chapter 23, "Mail Classes," Status, page 1156](#)

ReadEmailsWithAttach

Syntax

ReadEmailsWithAttach(*User, password, server, node, count*)

Description

The ReadEmailsWithAttach method reads the number of emails specified by *count* for a particular user account. If attachments are associated with an email, this method reads the attachments as well.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>User</i>	Specify the user account that contains the emails you want to access, such as "support" or "john_doe".
<i>password</i>	The password associated with the specified user name.
<i>server</i>	The name of the mail server handling the specified user account.
<i>node</i>	The Integration Broker node on which the request runs.
<i>count</i>	Specifies the number of emails to read. If count = 0, the method reads <i>all</i> the emails of the user account. If count > 0, the method reads the number specified. For example, if count = 10, the method reads 10 emails.

Note. If the value of any of these parameters is null, the method uses default values stored on the specified node. If the node is not specified, Integration Broker returns an error.

Returns

This method returns an email within a rowset. level one of the rowset contains the email parts. level zero row 1 only contains values for MCF_NUMROWS and MCF_RET_STATUS.

Example

```
import PT_MCF_MAIL:*;

Local MCFGetMail &gm;

Local Rowset &emails_rs;

&emails_rs = &gm.ReadEmailsWithAttach(&username, &passwd, &mailserver
&node, &email_count);
```

ReadEmailsWithUID

Syntax

ReadEmailsWithUID(*UID*)

Description

Use the ReadEmailsWithUID method to read and return an email based on a unique identifier *UID*. This method uses the connection properties set by SetMCFEmail. Emails that have an attachment are also read.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>UID_List</i>	The UID is the unique identifier of the email. This parameter is only unique within a particular user account. POP3 and IMAP 4 mail servers automatically create a unique identifier for an email when the server receives the email. The list can contain multiple values, each separated by a space.

Returns

A reference to an array of MCFInboundEmail.

See Also

[Chapter 23, "Mail Classes," MCFInboundEmail Class Methods, page 1147](#)

ReadEmailWithAttach

Syntax

ReadEmailWithAttach(*User, password, server, node, UID*)

Description

Use the ReadEmailWithAttach method to read and return an email based on a unique identifier (*UID*) for the specific email to be read. If attachments are associated with this email, ReadEmailWithAttach fetches those as well.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>user</i>	The user name on the mail server, such as "support" or "john_doe".
<i>password</i>	The password associated with the specified user name.
<i>server</i>	The name of the mail server handling the specified user account.
<i>node</i>	The Integration Broker node on which the request runs.
<i>UID</i>	The unique identifier of the email. This parameter is only unique within a particular user account. POP3 and IMAP 4 mail servers automatically create a unique identifier for an email when the server receives the email. You may specify more than one UID, each separated by a space.

Note. If the value of any of these parameters is null, the method uses default values stored on the specified node. If the node is not specified, Integration Broker returns an error.

Returns

This method returns an email within a rowset. level one of the rowset contains the email parts. level zero row 1 only contains values for MCF_NUMROWS and MCF_RET_STATUS.

Example

```
import PT_MCF_MAIL:*;  
Local MCFGetMail &gm;  
Local Rowset &emails_rs;  
&emails_rs = &gm.ReadEmailWithAttach(&username, &passwd, &mailserver, &node, &UID);
```

See Also

[Chapter 23, "Mail Classes," ReadEmailsWithAttach, page 1136](#)

ReadHeaders

Syntax

ReadHeaders()

Description

Use the ReadHeaders method to read the headers of all emails currently on the server. This method also returns the attachment information for all emails (names and sizes.)

This method uses the connection properties set by SetMCFEmail.

The overall success of the method is available using the Status property.

Parameters

None.

Returns

An array of MCFInboundEmail objects.

See Also

[Chapter 23, "Mail Classes," MCFInboundEmail Class Methods, page 1147](#)

[Chapter 23, "Mail Classes," SetMCFEmail, page 1142](#)

RemoveEmail

Syntax

RemoveEmail(*user, password, server, node, UID list*)

Description

Based on values in the unique identifier list, RemoveEmail deletes emails from the user account on the mail server. It is important to delete emails from the mail server once they are read into PeopleSoft. If you do not delete emails from the mail server after they are read into PeopleSoft, the rowset contains the same collection of email the next time you retrieve email from the mail server.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>user</i>	The user name on the mail server, such as "support" or "john_doe".
<i>password</i>	The password associated with the specified user name.
<i>server</i>	The name of the mail server handling the specified user account.
<i>node</i>	The Integration Broker node on which the request runs.
<i>UID list</i>	The UID list contains the unique identifier values for the emails that need to be deleted from the mail server. The list can contain multiple values separated by a space.

Note. If the value of any of these parameters is null, the method uses default values stored on the specified node. If the node is not specified, the Integration Broker returns an error.

Returns

A Boolean value, indicating the status of the deletion process. If the email has been successfully, this method returns True. Otherwise the method returns False.

Example

```
Local MCFGetMail &GM;  
Local boolean &del_status;  
Local string &uid_list = "";  
Local string &msg_str;  
  
If (&uid_list <> "") Then  
    &del_status = &GM.RemoveEmail(&user, &password, &server, &ibnode, &uid_list);  
    &msg_str = "Email(s) deleted from the Mail Server with UID = " | &uid_list;  
    MessageBox(0, "", 0, 0, &msg_str);  
End-If;
```

See Also

[Chapter 23, "Mail Classes," RemoveEmails, page 1141](#)

RemoveEmails

Syntax

```
RemoveEmails(UID_List)
```

Description

Use the RemoveEmails method to delete emails from an account on the mail server, based on the *UID_list*. It is important to delete emails from the mail server once they are read into PeopleSoft. If you do not delete emails from the mail server after they are read into PeopleSoft, the rowset contains the same collection of email the next time you retrieve email from the mail server.

Parameters

Parameter	Description
<i>UID_List</i>	The UID list contains the unique identifier values for the emails that need to be deleted from the mail server. The list can contain multiple values separated by a space.

Returns

An array of string containing UIDs of the messages that were successfully removed, separated by semicolons.

See Also

[Chapter 23, "Mail Classes," RemoveEmail, page 1140](#)

SetMCFEmail

Syntax

SetMCFEmail(*user*, *password*, *server*, *node*)

Description

Use the SetMCFEmail method to set the connection properties for subsequent method calls.

This method is a shortcut for setting the UserId, Password, MailServer, and IBNode properties.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>user</i>	The user name on the mail server, such as "support" or "john_doe".
<i>password</i>	The password associated with the specified user name.
<i>server</i>	The name of the mail server handling the specified user account.
<i>node</i>	The Integration Broker node on which the request runs.

Note. If the value of any of these parameters is null, the method uses default values stored on the specified node. If the node is not specified, the integration broker returns an error.

Returns

None.

See Also

[Chapter 23, "Mail Classes," GetCount, page 1132](#); [Chapter 23, "Mail Classes," ReadEmails, page 1135](#); [Chapter 23, "Mail Classes," ReadEmailsWithUID, page 1137](#) and [Chapter 23, "Mail Classes," ReadHeaders, page 1139](#)

MCFGetMail Class Properties

In this section we discuss the MCFGetMail class properties. The properties are described in alphabetical order.

AttachmentRoot

Description

Use this property to specify the root directory where the attachments are stored. If not specified, the value from the node is used.

Valid metastrings that can be included in the value for this property are:

%CURRDATE%	Current date in YYYYMMDD format
%CURRHOUR%	Current hour in 24-hour format (00-23)
%DBNAME%	Current value of %DbName system variable.
%OPRID%	Current value of %UserId system variable.

This property is read-write.

Example

To have the attachment root directory change hourly, you could use the following code example:

```
&MyEmail.AttachmentRoot = "c:\temp\%CURRDATE%\%CURRHOUR%\";
```

ContentTypes

Description

Use this property to specify content types that should be returned in the message or part text rather than stored in the directory that contains the attachments. Specify content types in a comma separated list. For example: "text/html, text/xml".

Note. "Text/plain" is always returned in the text field and does not need to be included.

If not specified, the value from the node is used.

This property is read-write.

ErrorCount

Description

This property returns the number of messages that caused errors during processing on the target connector.

You should use this property after you use the ReadHeaders, ReadEmails, ReadEmailsWithUID, or RemoveEmails methods.

This property is read-only.

See Also

[Chapter 23, "Mail Classes," ReadHeaders, page 1139](#); [Chapter 23, "Mail Classes," ReadEmails, page 1135](#); [Chapter 23, "Mail Classes," ReadEmailsWithUID, page 1137](#) and [Chapter 23, "Mail Classes," RemoveEmails, page 1141](#)

IBNode

Description

This property returns the name of the Integration Broker node on which a request ran, such as MCF_GetMail.

This property is set by the SetMCFEmail method. It is used by ReadHeaders, ReadEmails, ReadEmailsWithUID, RemoveEmails, and CreateQuarantineFolder methods.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," ReadHeaders, page 1139](#); [Chapter 23, "Mail Classes," ReadEmails, page 1135](#); [Chapter 23, "Mail Classes," ReadEmailsWithUID, page 1137](#); [Chapter 23, "Mail Classes," RemoveEmails, page 1141](#) and [Chapter 23, "Mail Classes," CreateQuarantineFolder, page 1132](#)

MailServer

Description

This property returns the name of the mail server that received the email.

This property is set by the SetMCFEmail method. It is used by ReadHeaders, ReadEmails, ReadEmailsWithUID, RemoveEmails, and CreateQuarantineFolder methods.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," ReadHeaders, page 1139](#); [Chapter 23, "Mail Classes," ReadEmails, page 1135](#); [Chapter 23, "Mail Classes," ReadEmailsWithUID, page 1137](#); [Chapter 23, "Mail Classes," RemoveEmails, page 1141](#) and [Chapter 23, "Mail Classes," CreateQuarantineFolder, page 1132](#)

Password

Description

This property returns the password associated with the userID that was used to get the email.

This property is set by the SetMCFEmail method. It is used by ReadHeaders, ReadEmails, ReadEmailsWithUID, RemoveEmails, and CreateQuarantineFolder methods.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," ReadHeaders, page 1139](#); [Chapter 23, "Mail Classes," ReadEmails, page 1135](#); [Chapter 23, "Mail Classes," ReadEmailsWithUID, page 1137](#); [Chapter 23, "Mail Classes," RemoveEmails, page 1141](#) and [Chapter 23, "Mail Classes," CreateQuarantineFolder, page 1132](#)

QuarantineCount

Description

This property returns the number of email messages that caused errors during processing on the target connector and were successfully moved to the quarantine folder.

This property is valid after calls to ReadHeaders, ReadEmails, ReadEmailsWithUID, and RemoveEmails.

This property is read-only.

See Also

[Chapter 23, "Mail Classes," QuarantineFolder, page 1145](#)

[Chapter 23, "Mail Classes," ReadHeaders, page 1139](#); [Chapter 23, "Mail Classes," ReadEmails, page 1135](#); [Chapter 23, "Mail Classes," ReadEmailsWithUID, page 1137](#) and [Chapter 23, "Mail Classes," RemoveEmails, page 1141](#)

QuarantineFolder

Description

Use this property to specify the name of the quarantine folder. If not specified, the value from the node will be used.

The name must adhere to whatever naming restrictions are imposed by the mail server in use. There is no built-in validation of the folder name.

The following types of errors can cause an email to be moved to the quarantine folder:

- Connector size overflow.
- Unsupported encoding.
- Unknown Java exception.
- Javamail content error.
- No attachment directory.
- Mail parse exception.

This property is read-write.

See Also

Chapter 23, "Mail Classes," QuarantineCount, page 1145

Status

Description

This property returns the status of the last mail server operation.

See Chapter 23, "Mail Classes," Error Messages Returned by MCFGetMail Class Methods, page 1114.

This property is valid after calls to ReadHeaders, ReadEmails, ReadEmailsWithUID, and RemoveEmails.

This property is read-only.

UserID

Description

This property returns the user ID (mail box) on the mail server that received the email.

This property is set by SetMCFEmail. It is used by ReadHeaders, ReadEmails, ReadEmailsWithUID, RemoveEmails, and CreateQuarantineFolder methods.

This property is read-write.

MCFInboundEmail Class

This class inherits many properties from the MCFEmail class, which in turn inherits many properties from the MCFPart class. Generally, you use only the subclasses, MCFInboundEmail and MCFOutboundEmail, and not the superclasses.

MCFInboundEmail Class Methods

In this section, we discuss the MCFInboundEmail class methods. The methods are described in alphabetical order.

DumpToFile

Syntax

DumpToFile(*&File*)

Description

Use the DumpToFile method to write information from the email to an already instantiated file.

This method copies the information from the following email properties, placing each on a separate line:

- ContentType
- IsAttachment
- AttachmentURL
- Text

Whether the information is appended to the bottom of the file or if it overwrites the file depends on how you instantiated the file object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&File</i>	Specify an already instantiated file object that you want to write the email data to.

Returns

None.

Example

```

Local File &BI_FILE;
&BI_FILE = GetFile("mcfdata.out", "w", "a");

Local PT_MCF_MAIL:MCFGetMail &gm;
Local number &ret_status, &nemails, &i;
&gm = create PT_MCF_MAIL:MCFGetMail();

Local array of PT_MCF_MAIL:MCFInboundEmail &emails;
&gm.SetMCFEmail(&user, &password, &server, &ibnode);

&emails = &gm.ReadEmails(0);
If (&gm.StatusCheck(&BI_FILE) = False) Then
    Return;
End-If;

&nemails = &emails.Len;
&ret_status = &gm.Status;
If &nemails > 0 Then
    For &i = 1 To &nemails
        &BI_FILE.WriteLine(MsgGetText(162, 1615, "Message Not Found", &i));
        &emails [&i].DumpToFile(&BI_FILE);
    End-For;
End-If;

```

See Also

[Chapter 19, "File Class," page 975](#)

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," GetFile

GetAttachments

Syntax

GetAttachments()

Description

Use the GetAttachments method to return the attachments with this email.

Parameters

None.

Returns

An array of MCFBodyPart objects. The methods returns an array of length 0 if there are no attachments

See Also

[Chapter 8, "Array Class," page 257](#)

[Chapter 23, "Mail Classes," MCFBodyPart Class Methods, page 1116](#)

GetFrom

Syntax

GetFrom()

Description

Use the GetFrom method to split the semicolon delimited list of addresses in the From property into an array of addresses.

Parameters

None.

Returns

An array of string. Each item in the array contains an email address.

See Also

[Chapter 23, "Mail Classes," From, page 1128](#)

GetParts

Syntax

GetParts()

Description

Use the GetParts method to return all of this email's parts.

Parameters

None.

Returns

An array of MCFBodyPart objects.

See Also

[Chapter 23, "Mail Classes," MCFBodyPart Class Methods, page 1116](#)

GetSender

Syntax

`GetSender()`

Description

Use the GetSender method to split the semicolon delimited list of addresses in the Sender property into an array of addresses.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 23, "Mail Classes," Sender, page 1131](#)

[Chapter 23, "Mail Classes," GetFrom, page 1149](#)

ReadFromDatabase

Syntax

ReadFromDatabase(*Email_ID*)

Description

Use the ReadFromDatabase method to load a saved email from the database into this instance of email.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Email_ID</i>	Specify the ID of the email, as a number.

Returns

A Boolean: true if the email is restored successfully, false otherwise.

See Also

[Chapter 23, "Mail Classes," SaveToDatabase, page 1151](#)

SaveToDatabase

Syntax

SaveToDatabase()

Description

Use the SaveToDatabase method to save this instance of email to the database.

Parameters

None.

Returns

A number, representing the email_ID of the saved email.

See Also

[Chapter 23, "Mail Classes," ReadFromDatabase, page 1151](#)

MCFInboundEmail Class Properties

In this section, we discuss the MCFInboundEmail class properties. The properties are described in alphabetical order.

AttachList

Description

This property returns the list of all the file names that are attachments for a particular email.

Multiple items are separated by a semicolon (;).

This property is read-write.

See Also

[Chapter 23, "Mail Classes," AttachSizes, page 1152](#)

AttachSizes

Description

This property returns the sizes of the attachments associated with an email.

This property takes a string value, *not* a numeric value. Multiple values are separated by a semicolon (;).

The attachment sizes appear in the same order as the file names in AttachList.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," AttachList, page 1152](#)

DttmReceived

Description

Use this property to return the date and time an email was received.

Warning! If you are using a Post Office Protocol 3 (POP3) mail server, this property may not be populated.

This property takes a datetime value.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," DttmSaved, page 1153](#) and [Chapter 23, "Mail Classes," DttmSent, page 1153](#)

DttmSaved

Description

This property returns the date and time that the PeopleSoft system saved an email to the database.

If you use a POP3 mail server, PeopleSoft recommends using this value as the base, or starting point, for any time-sensitive transactions.

This property takes a datetime value.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," DttmReceived, page 1153](#) and [Chapter 23, "Mail Classes," DttmSent, page 1153](#)

DttmSent

Description

This property returns the date time an email was sent.

This property takes a datetime value.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," DttmReceived, page 1153](#) and [Chapter 23, "Mail Classes," DttmSent, page 1153](#)

IBNode

Description

This property returns the name of the Integration Broker node that received the email, such as MCF_GetMail.

The system uses this value to construct the fully qualified URL required for viewing attachments.

This property is read-write.

Language

Description

This value reflects the language code of the Integration Broker node that received this email.

Note. PeopleSoft recommends setting up email accounts that are dedicated to one language such as, support_french@company.com and support_english@company.com. This enables you to anticipate the language of the email you read into your system. In turn, configure separate Integration Broker nodes to handle each of the languages you support. There are no language recognition procedures within the PeopleSoft system.

This property is read-write.

MessageID

Description

Use this property to return the globally unique identifier for this email.

This ID is generated by the mail server that sent this email.

NotifyCC

Description

This property returns a list of the parties who were copied (carbon copied) on the email. Multiple addresses are separated by a semicolon (;).

This property is read-write.

NotifyTo

Description

This property returns a list of the parties who received the email. Multiple addresses are separated by a semicolon (;).

This property is read-write.

OffsetReceived

Description

This property returns time zone of the mail server that received this email, as a number.

Note. This property contains the time zone of the integration gateway used to fetch this email.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," OffsetSent, page 1155](#)

OffsetSent

Description

This property returns the time zone of the mail server that sent this email, as a string.

Note. Currently, this property contains the time zone of the integration gateway used to fetch this email.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," OffsetReceived, page 1155](#)

Server

Description

This property specifies the name of the mail server that received the email.

This property is read-write.

Size

Description

This property returns the total size of the entire email. This value includes the sizes of attachments.

This property is read-write.

Status

Description

This property returns the status of an individual email.

This property is read-only.

UID

Description

This property returns the unique identifier of the email.

This property is only unique within a particular user account. POP3 and IMAP 4 mail servers automatically create a unique identifier for an email when the server receives the email.

This property is read-write.

User

Description

This property returns the user account (mail box) on the mail server that received the email.

This property is read-write.

MCFMailStore Class

Use the MCFMailStore class to write emails to the PeopleSoft database and to retrieve emails from the PeopleSoft database.

Note. When writing emails to the PeopleSoft database, it is assumed that you have previously used the MCFGetMail class to retrieve email into memory. You use the MCFMailStore class immediately after to save the rowsets to the database.

MCFMailStore Import Statements

Here is the import statement:

```
import PT_MCF_MAIL:MCFMailStore;
```

MCFMailStore Methods

This section discusses MCFMailStore class methods.

AuthorizeEmailAttach

Syntax

AuthorizeEmailAttach(*email ID*, *authentication name*, *authentication type*, *operation*)

Description

Use AuthorizeEmailAttach to authorize a user or a PeopleSoft role to view attachments associated with an email. By default, no user or role is authorized to view an email; you must explicitly grant authorization with this method. This method authorizes email and the associated attachments one at a time.

Note. If you specify ALL as the user, any user can view the attachments for an email.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>email ID</i>	The unique email ID for the email. This is the PeopleSoft email ID, not the ID issued by the mail server.

<i>Parameter</i>	<i>Description</i>
<i>authentication name</i>	The name of the PeopleSoft user profile or role that needs to be authorized to view the attachments.
<i>authentication type</i>	Specify the type security definition entered as the authentication name. • Specify 2 to indicate a user profile. • Specify 3 to indicate a role.
<i>operation</i>	Specify the type of authorization operation. The following list contains the supported operations. You either add or delete user or role authorization. • 1 = ADD • 2 = DELETE

Returns

Returns a Boolean value: True for success, False otherwise.

Example

```
&ms = create MCFMailStore();  
&status = &ms.AuthorizeEmailAttach(&emailid, "MCFUser", 2, 1);
```

DeleteEmail

Syntax

DeleteEmail(*email ID*, *forced delete*)

Description

Deletes the specified email from the PeopleSoft database and corresponding attachments from the directory where they are stored.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>email ID</i>	The ID used to uniquely identify each email within the PeopleSoft database.

<i>Parameter</i>	<i>Description</i>
<i>forced delete</i>	This parameter is used to set the forced delete flag. It is a Boolean value. A forced delete ensures that the deletion process continues even in cases where the process encounters issues or errors related to an email. For example, with forced delete enabled, the deletion process continues even though the attachments of the email cannot be found or do not exist. True means "force delete" and False means "do not force delete if there is an error in deleting this email."

Returns

Returns a Boolean value. True for success, False otherwise.

Example

```
Local MCFMailStore &ms;

&ms = create MCFMailStore();
&forcedel = True;
&status = &ms.DeleteEmail(&emailid, &forcedel);
```

RetrieveEmail

Syntax

RetrieveEmail(*email ID*)

Description

Use RetrieveEmail to read email from the PeopleSoft database.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>email ID</i>	The ID that uniquely identifies an email within the PeopleSoft database.

Returns

Returns a rowset.

Example

```
Local MCFMailStore &ms;
Local Rowset &EMAIL_ROWSET;

&ms = create MCFMailStore();
&EMAIL_ROWSET = &ms.RetrieveEmail(&emailid);
```

StoreEmail

Syntax

StoreEmail(*&rowset, row*)

Description

The StoreEmail method inserts an email retrieved from the mail server into the PeopleSoft database. PeopleSoft stores the contents or pieces of the email in rowsets and child rowsets.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&rowset</i>	The rowset containing the contents of an email. The rowset should be the rowset used by the MCFGetMail class to retrieve emails from the mail server. The rowset should be an already instantiated rowset. Note. The first row of the rowset is empty. The first email in the rowset has a row value of 2.
<i>row</i>	The row number in which the email data is stored. Note. The first row is always empty. Row 2 always contains the first email of the rowset.

Returns

Returns a PeopleSoft email ID to act as the unique key for a particular email within the PeopleSoft database.

Returns 0 if an error occurred.

Example

```

Local MCFGetMail &GM;
Local Rowset &rs;
Local number &nemails;
Local string &email_id;

&GM = create MCFGetMail();
&rs = &GM.ReadEmailsWithAttach(&user, &password, &server, &ibnode,
&count);

/* Get the number of emails in the recordset from MCF_NUMROWS field */

&nemails = &rs.GetRow(1).GetRecord(Record.MCFEM_RES_MAIN).GetField
(Field.MCF_NUMROWS).Value;

    If (&nemails > 0) Then

/* First row in the rowset is for header info only. Start writing from
second row */

        For &i = 1 To &nemails
            &email_id = &ms.StoreEmail(&rs, &i + 1);
            If (&email_id <> 0) Then
                /* Store was successful - email ID returned = &email_id */
            Else
                /* Error in storing email */
            End-If;
        End-For;
    End-If;

```

MCFMailUtil Class

Use the MCFMailUtil class to perform utility operations including encoding and decoding text, validating the email address, validating the email domain name, and determining whether the SMTP email server is available.

MCFMailUtil Class Methods

In this section we discuss the MCFMailUtil class methods. The methods are described in alphabetical order.

DecodeText

Syntax

DecodeText(*TextToDecode*, &*DecodedText*)

Description

Use the DecodeText method to decode text. If you only want to decode a word, use the DecodeWord property.

The text is decoded based on the values used with the EncodeText method.

The decoded text is placed in the *&DecodedText* parameter.

This method returns true if successful. If the return value is false, the following MCFMailUtil properties are set accordingly:

- ErrorDescription
- ErrorDetails
- ErrorMsgParamsCount
- MessageNumber
- MessageSetNumber

In addition you can use the GetErrorMsgParam method to return each of the substitution strings used to format the error message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TextToDecode</i>	Specify the text that is to be decoded, as a string.
<i>&DecodedText</i>	Specify a string variable, used to hold the decoded text.

Returns

A Boolean value: true if successful, false otherwise.

See Also

[Chapter 23, "Mail Classes," DecodeWord, page 1163](#) and [Chapter 23, "Mail Classes," EncodeText, page 1164](#)

[Chapter 23, "Mail Classes," GetErrorMsgParam, page 1167](#); [Chapter 23, "Mail Classes," ErrorDescription, page 1173](#); [Chapter 23, "Mail Classes," ErrorDetails, page 1173](#); [Chapter 23, "Mail Classes," MessageNumber, page 1174](#) and [Chapter 23, "Mail Classes," MessageSetNumber, page 1175](#)

DecodeWord

Syntax

DecodeWord(*WordToDecode*, *&DecodedWord*)

Description

Use the DecodeWord method to decode a word. If you want to decode a string, use the DecodeText method instead.

The word is decoded based on the values used with the EncodeWord method.

The decoded word is placed in the *&DecodedWord* parameter.

This method returns true if successful. If the return value is false, the following MCFMailUtil properties are set accordingly:

- ErrorDescription
- ErrorDetails
- ErrorMsgParamsCount
- MessageNumber
- MessageSetNumber

In addition you can use the GetErrorMsgParam method to return each of the substitution strings used to format the error message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>WordToDecode</i>	Specify the word that is to be decoded, as a string.
<i>&DecodedWord</i>	Specify a string variable, used to hold the decoded word.

Returns

A Boolean value: true if successful, false otherwise.

See Also

[Chapter 23, "Mail Classes," DecodeText, page 1161](#) and [Chapter 23, "Mail Classes," EncodeWord, page 1165](#)

[Chapter 23, "Mail Classes," GetErrorMsgParam, page 1167](#); [Chapter 23, "Mail Classes," ErrorDescription, page 1173](#); [Chapter 23, "Mail Classes," ErrorDetails, page 1173](#); [Chapter 23, "Mail Classes," MessageNumber, page 1174](#) and [Chapter 23, "Mail Classes," MessageSetNumber, page 1175](#)

EncodeText

Syntax

EncodeText(*TextToEncode*, *charset*, *EncodingStyle*, *&EncodedText*)

Description

Use the EncodeText method to encode text. If you only want to encode a single word, use the EncodeWord method instead.

The encoded text is placed in the *&EncodedText* parameter.

This method returns true if successful. If the return value is false, the following MCFMailUtil properties are set accordingly:

- ErrorDescription
- ErrorDetails
- ErrorMsgParamsCount
- MessageNumber
- MessageSetNumber

In addition you can use the GetErrorMsgParam method to return each of the substitution strings used to format the error message.

Using Encoding Styles

You can specify either "B" or "Q" for the *EncodingStyle* parameter, indicating either Base64 or "Quoted-Printable" content-transfer-encoding, respectively.

PeopleSoft recommends using the "Q" encoding when most of the characters to be encoded are in the ASCII character set; otherwise, you should use the "B" encoding. However, a mail reader that claims to recognize encoded text must be able to accept either encoding for any character set that it supports.

Both Base64 and "Quoted-Printable" content-transfer-encoding are defined by RFC 1521.

See <http://www.freesoft.org/CIE/RFC/1522/4.htm>.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TextToEncode</i>	Specify the text that is to be encoded, as a string.
<i>charset</i>	Specify the character set to be used for encoding the text, as a string. See <i>PeopleTools 8.51 PeopleBook: Global Technology</i> , "Selecting and Configuring Character Sets and Language Input and Output," Character Sets in the PeopleSoft Pure Internet Architecture.
<i>EncodingStyle</i>	Specify the encoding style. Valid values are: • B — for Base64 encoding. • Q — for "Quoted-Printable" content- transfer-encoding.
<i>&EncodedText</i>	Specify a string variable used to hold the encoded text.

Returns

A Boolean value: true if successful, false otherwise.

EncodeWord

Syntax

```
EncodeWord(wordToEncode, charset, encodingStyle, &EncodedWord)
```

Description

Use the EncodeWord method to encode a word. If you want to encode more than a single word, use the EncodeText method.

The encoded word is placed in the *&EncodedWord* parameter.

This method returns true if successful. If the return value is false, the following MCFMailUtil properties are set accordingly:

- `ErrorDescription`
- `ErrorDetails`
- `ErrorMsgParamsCount`
- `MessageNumber`
- `MessageSetNumber`

In addition you can use the `GetErrorMsgParam` method to return each of the substitution strings used to format the error message.

Using Encoding Styles

You can specify either "B" or "Q" for the *EncodingStyle* parameter, indicating either Base64 or "Quoted-Printable" content-transfer-encoding, respectively.

PeopleSoft recommends using the "Q" encoding when most of the characters to be encoded are in the ASCII character set; otherwise, you should use the "B" encoding. However, a mail reader that claims to recognize encoded text must be able to accept either encoding for any character set that it supports.

Both Base64 and "Quoted-Printable" content-transfer-encoding are defined by RCF 1521.

See <http://www.freesoft.org/CIE/RFC/1522/4.htm>.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>WordToEncode</i>	Specify the word that is to be encoded, as a string.
<i>charset</i>	Specify the character set to be used for encoding the word, as a string. See <i>PeopleTools 8.51 PeopleBook: Global Technology</i> , "Selecting and Configuring Character Sets and Language Input and Output," Character Sets in the PeopleSoft Pure Internet Architecture.
<i>EncodingStyle</i>	Specify the encoding style. Valid values are: • B — for Base64 encoding. • Q — for "Quoted-Printable" content- transfer-encoding.
<i>&EncodedWord</i>	Specify a string variable, used to hold the encoded word.

Returns

A Boolean value: true if successful, false otherwise.

GetErrorMsgParam

Syntax

GetErrorMsgParam(&index)

Description

Use this method to return each of the substitution strings used in the error message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&index</i>	Specifies which substitution string to return from the array of substitution parameters.

Returns

A string containing the substitution parameter.

Example

```
Local PT_MCF_MAIL:MCFMailUtil &emailutil = create PT_MCF_MAIL:MCFMailUtil();
For &index = 1 To &emailutil.ErrorMsgParamsCount
    Local String &trace = "Param" | &index | ": " | &emailutil.GetErrorMsgParam→
    (&index) | "'";
End-For;
```

See Also

[Chapter 23, "Mail Classes," ErrorMsgParamsCount, page 1174](#)

IsDomainNameValid

Syntax

IsDomainNameValid(*domainname*)

Description

Use this method to check whether a domain name is valid. The `isDomainNameValid` method queries your DNS server to check whether the domain name is listed in an "MX", or mailbox exchange, record. Please note that not all domains are properly listed by DNS servers.

Note. The number of retries for domain validation is set by the `SMTPDNSTimeoutRetries` parameter in `psappsrv.cfg`. The default number of retries is 1.

This method returns true if successful. If the return value is false, the following `MCFMailUtil` properties are set accordingly:

- `ErrorDescription`
- `ErrorDetails`
- `ErrorMsgParamsCount`
- `MessageNumber`
- `MessageSetNumber`

In addition you can use the `GetErrorMsgParam` method to return each of the substitution strings used to format the error message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>domainname</i>	Specifies the domain name to be validated, as a string.

Returns

A Boolean value: true if the domain name is valid, false otherwise.

Example

```
Local PT_MCF_MAIL:MCFMailUtil &emailutil = create PT_MCF_MAIL:MCFMailUtil();
&result = &emailutil.IsDomainNameValid("oracle.com");
```

IsEmailServerAvailable

Syntax

IsEmailServerAvailable(*server, port, user, password*)

Description

Use the IsEmailServerAvailable method to check if the email server specified with the SMTP settings in the application server configuration file is available.

This method returns true if successful. If the return value is false, the following MCFMailUtil properties are set accordingly:

- ErrorDescription
- ErrorDetails
- ErrorMsgParamsCount
- MessageNumber
- MessageSetNumber

In addition you can use the GetErrorMsgParam method to return each of the substitution strings used to format the error message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>server</i>	Specify the name of the mail server handling the specified user account, as a string.
<i>port</i>	Specify the port of the mail server handling the specified user account, as an integer.
<i>user</i>	Specify the user name on the mail server, such as "support" or "john_doe", as a string.

<i>Parameter</i>	<i>Description</i>
<i>password</i>	Specify the password associated with the specified user name, as a string.

Returns

A Boolean value: true if the server is available, false otherwise.

[Chapter 23, "Mail Classes," GetErrMsgParam, page 1167](#); [Chapter 23, "Mail Classes," ErrorDescription, page 1173](#); [Chapter 23, "Mail Classes," ErrorDetails, page 1173](#); [Chapter 23, "Mail Classes," MessageNumber, page 1174](#) and [Chapter 23, "Mail Classes," MessageSetNumber, page 1175](#)

ParseRichTextHtml

Syntax

ParseRichTextHtml(*richtext*)

Description

Use this method to split rich text content with images into an array of MCFBodyPart objects. Typically, this method is used with rich text produced by the rich text editor on a long edit box.

The first element in the array is the text of the email message. The remaining elements in the array represent each image in the message. The images are added as inline parts of the email, rather than as attachments, preserving the original formatting of the HTML content.

Prior to sending the email, the images are stored in a temporary directory. The default directory is *PS_SERVDIR/images*. Use the MCFMailUtil class *imagesLocation* property to specify a different directory location. Images in this temporary directory must be deleted manually after sending the email; these image files are not deleted automatically.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>richtext</i>	Rich text with images that needs to be parsed.

Returns

An array of MCFBodyPart objects.

Example

See the example on creating an email from rich text editor output later in this chapter.

See Also

[Chapter 23, "Mail Classes," MCFBodyPart Class, page 1116](#)

[Chapter 23, "Mail Classes," imagesLocation, page 1174](#)

[Chapter 23, "Mail Classes," Creating an Email from Rich Text Editor Output, page 1221](#)

ValidateAddress

Syntax

ValidateAddress(*addresslist*)

In which *addresslist* is a list of email addresses in the form:

email_address1 [{,|;} *email_address2*] ...

Description

Use the ValidateAddress method to validate a comma- or semicolon-separated list of email addresses. This method checks the syntax of the email address. It does not verify the domain name or the validity of the user name.

This method returns true if successful. If the return value is false, the following MCFMailUtil properties are set accordingly:

- badaddresses
- ErrorDescription
- ErrorDetails
- ErrorMsgParamsCount
- MessageNumber
- MessageSetNumber

In addition you can use the GetErrorMsgParam method to return each of the substitution strings used to format the error message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>addresslist</i>	Specify the email address (or addresses) you want to verify as a comma- or semicolon-separated list.

Returns

A Boolean value: true if the specified email addresses are valid, false otherwise. When `ValidateAddress` returns false, the `badaddresses` property will contain an array of all invalid addresses.

Example

```
import PT_MCF_MAIL:*;  
  
Local PT_MCF_MAIL:MCFMailUtil &emailutil = create PT_MCF_MAIL:MCFMailUtil();  
Local boolean &result = &emailutil.ValidateAddress(&email.Recipients);  
Local array of string &bAddresses = &emailutil.badaddresses;  
  
If (&result = False) Then  
    If (&bAddresses <> Null) Then  
        &i = 0;  
        While &bAddresses.Next(&i)  
            Warning ("Bad email address in input = " | &bAddresses [&i]);  
        End-While;  
    End-If;  
End-If;
```

MCFMailUtil Class Properties

In this section we discuss the MCFMailUtil class properties. The properties are described in alphabetical order.

badaddresses

Description

When the `ValidateAddress` method returns false, use the `badaddresses` property to get an array of invalid email addresses.

This property is effectively read-only.

Note. While this property is actually read-write, from PeopleCode, it is meant to be used in a read-only manner. If this property has a user-specified value, that value will be overwritten automatically when there is an error condition.

See Also

[Chapter 23, "Mail Classes," `ValidateAddress`, page 1171](#)

ErrorDescription

Description

If an error occurs, use the `ErrorDescription` property to get the description of the error.

This property is effectively read-only.

Note. While this property is actually read-write, from PeopleCode, it is meant to be used in a read-only manner. If this property has a user-specified value, that value will be overwritten automatically when there is an error condition.

See Also

[Chapter 23, "Mail Classes," `ErrorDetails`, page 1173](#)

ErrorDetails

Description

If an error occurs, use the `ErrorDetails` property to get the details for the error.

This property is effectively read-only.

Note. While this property is actually read-write, from PeopleCode, it is meant to be used in a read-only manner. If this property has a user-specified value, that value will be overwritten automatically when there is an error condition.

See Also

[Chapter 23, "Mail Classes," ErrorDescription, page 1173](#)

ErrorMsgParamsCount

Description

Use this property to return the number of substitution parameters as an integer.

This property is read-only.

See Also

[Chapter 23, "Mail Classes," GetErrorMsgParam, page 1167](#)

imagesLocation

Description

Use this property to specify a string representing a temporary directory for image storage to be used by the ParseRichTextHtml method. Images in this temporary directory must be deleted manually after sending the email; these image files are not deleted automatically.

If this property is not specified, the default image directory is *PS_SERVDIR/images*.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," ParseRichTextHtml, page 1170](#)

[Chapter 23, "Mail Classes," Creating an Email from Rich Text Editor Output, page 1221](#)

MessageNumber

Description

This property returns the message number of the error message associated with the failed mail utility method. The message number is associated with messages in the PeopleTools message catalog.

This property is effectively read-only.

Note. While this property is actually read-write, from PeopleCode, it is meant to be used in a read-only manner. If this property has a user-specified value, that value will be overwritten automatically when there is an error condition.

See Also

[Chapter 23, "Mail Classes," MessageSetNumber, page 1175](#)

MessageSetNumber

Description

This property returns the message set number of the error message associated with the failed mail utility method. The message set number is associated with messages in the PeopleTools message catalog.

This property is effectively read-only.

Note. While this property is actually read-write, from PeopleCode, it is meant to be used in a read-only manner. If this property has a user-specified value, that value will be overwritten automatically when there is an error condition.

See Also

[Chapter 23, "Mail Classes," MessageNumber, page 1174](#)

MCFMultiPart Class

Use the MCFMultiPart class to create complex emails with attachments, HTML content, and so on.

MCFMultiPart Class Methods

In this section, we discuss the MCFMultiPart class methods. The methods are described in alphabetical order.

AddBodyPart

Syntax

AddBodyPart (*&bodyPart*)

Description

Use the AddBodyPart method to add the specified body part to this multipart email.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&bodyPart</i>	Specify an already instantiated MCFBodyPart object.

Returns

None.

GetBodyPart

Syntax

GetBodyPart(*Index*)

Description

Use the GetBodyPart method to return a reference to the body part specified by *Index*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the numeric position of the body part you want to access.

Returns

A reference to an MCFBodyPart object.

See Also

[Chapter 23, "Mail Classes," MCFBodyPart Class Methods, page 1116](#)

GetContentType

Syntax

GetContentType()

Description

Use the `GetContentType` method to determine the content type.

Parameters

None.

Returns

A string.

GetCount

Syntax

GetCount()

Description

Use the `GetCount` method to return the number of parts in the `MCFMultiPart` object.

Parameters

None.

Returns

A number.

MCFMultiPart Class Property

In this section we discuss the `MCFMultiPart` class property.

SubType

Description

Use this property to specify the subtype of the MCFMultiPart object. The values are:

- alternative
- related
- mixed

The default value is mixed.

This property is read-write.

MCFOutboundEmail Class

This class inherits many properties from the MCFEmail class, which in turn inherits many properties from the MCFPart class. Generally, you use only the subclasses, MCFOutboundEmail and MCFInboundEmail, and not the superclasses.

MCFOutboundEmail Class Methods

In this section, we discuss the MCFOutboundEmail class methods. The methods are discussed in alphabetical order.

AddAttachment

Syntax

```
AddAttachment({FilePath | FileURL}, FilePathType, FileName, FileDescr,  
OverrideContentType, OverrideCharset)
```

Description

Use the AddAttachment method to add an attachment to this email.

Use the *FilePathType* parameter to specify if the file path is relative or absolute. If it's an absolute path, the file path could be a file on the local machine, a network folder, or a fully-qualified URL.

You can also add an attachment by creating a multipart object, adding the attachments as bodyparts to the multipart object, and then setting the MultiPart property of the MCFOutboundEmail object. The AddAttachment method is provided for convenience.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>FilePath</i> <i>FileURL</i>	You can either specify the file path to the file, or a URL to the file. Depending on the <i>FilePathType</i> parameter, you may specify either a relative or absolute file path to the file. This parameter should include the file name and extension of the file. If you specify a URL address where the file is located, it must be an absolute URL. This URL should include the actual name of the file. If you specify a URL address, you must specify the <i>FilePathType</i> parameter as <i>%FilePath_Absolute</i>.
<i>FilePathType</i>	Specify the path type for the file, whether it is an absolute or relative path. The values are: • <i>%FilePath_Absolute</i> — the file path is an absolute path. • <i>%FilePath_Relative</i> — the file path is a relative path.
<i>FileName</i>	Specify the name of the file that you want to attach, as a string. You must include the file extension as well.
<i>Description</i>	Specify a description of the file.
<i>OverrideContentType</i>	The system detects the content type of the attachment using the file location and name. Specifying <i>OverrideContentType</i> overrides the system detected content type. The character set can also be included in the <i>ContentType</i>. For example, "text/plain; charset=US-ASCII"
<i>OverrideCharset</i>	Specify a character set to be used to override the existing character set.

Returns

None.

AddHeader

Syntax

AddHeader (*HeaderName*, *HeaderValue*)

Description

Use the `AddHeader` method to add a header to the email. This method allows for email server customizations. Some commonly used headers are already exposed as properties, such as `From`, `To`, `Subject`, `ContentType` and `ContentLanguage`. Advanced applications can adapt this technique to meet their own requirements. These headers can be either standard SMTP headers or custom headers starting with "X-".

Parameters

<i>Parameter</i>	<i>Description</i>
<i>HeaderName</i>	Specify the name of the header that you want to add. This parameter takes a string value.
<i>HeaderValue</i>	Specify the actual text of the header, as a string.

Returns

None.

Example

```
Local PT_MCF_MAIL:MCFOutboundEmail &email = create PT_MCF_MAIL:MCFOutboundEmail⇒  
();  
Local string &TestName = "Custom Header";  
  
&email.From = &def.From;  
&email.Recipients = &def.Recipients;  
&email.SMTPServer = &def.SMTPServer;  
&email.Subject = &TestName;  
&email.Text = &TestName;  
  
&email.AddHeader("X-Mailer", "CRM Sales Application 8.9 SP2");  
&email.AddHeader("X-Mailer", "CRM Sales Application 8.9 SP3");  
&email.AddHeader("X-Mailer", "CRM Sales Application 8.9 SP4");  
  
&res = &email.Send();
```

See Also

[Chapter 23, "Mail Classes," GetHeader, page 1181](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1182](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1183](#); [Chapter 23, "Mail Classes," GetHeaderNames, page 1183](#) and [Chapter 23, "Mail Classes," GetHeaderValues, page 1184](#)

GetErrorMsgParam

Syntax

GetErrorMsgParam(*&index*)

Description

Use this method to return each of the substitution strings used in the error message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&index</i>	Specifies which substitution string to return from the array of substitution parameters.

Returns

A string containing the substitution parameter.

Example

```
Local PT_MCF_MAIL:MCFOutboundEmail &email = create PT_MCF_MAIL:MCFOutboundEmail();
For &index = 1 To &email.ErrorMsgParamsCount
    Local String &trace = "Param" | &index | ": " | &email.GetErrorMsgParam⇒
(&index) | "'";
End-For;
```

See Also

[Chapter 23, "Mail Classes," ErrorMsgParamsCount, page 1174](#)

GetHeader

Syntax

GetHeader(*HeaderName*)

Description

Use the GetHeader method to return the value of the specified header.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>HeaderName</i>	Specify the name of the header that you want to access the values for, as a string. The matching of header names is case insensitive.

Returns

An array of string containing the header values. If the header is not present, returns an array of length zero.

See Also

[Chapter 8, "Array Class," page 257](#)

[Chapter 23, "Mail Classes," AddHeader, page 1179](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1182](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1183](#); [Chapter 23, "Mail Classes," GetHeaderNames, page 1183](#) and [Chapter 23, "Mail Classes," GetHeaderValues, page 1184](#)

GetHeaderCount

Syntax

GetHeaderCount ()

Description

Use the GetHeaderCount method to return the number of headers.

Parameters

None.

Returns

An integer, representing the number of headers present.

See Also

[Chapter 23, "Mail Classes," AddHeader, page 1179](#); [Chapter 23, "Mail Classes," GetHeader, page 1181](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1183](#); [Chapter 23, "Mail Classes," GetHeaderNames, page 1183](#) and [Chapter 23, "Mail Classes," GetHeaderValues, page 1184](#)

GetHeaderName

Syntax

GetHeaderName(*Index*)

Description

Use the GetHeaderName to return the name of the header that is located at *Index*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the numeric position of the header you want to access.

Returns

A string.

See Also

[Chapter 23, "Mail Classes," AddHeader, page 1179](#); [Chapter 23, "Mail Classes," GetHeader, page 1181](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1182](#); [Chapter 23, "Mail Classes," GetHeaderNames, page 1183](#) and [Chapter 23, "Mail Classes," GetHeaderValues, page 1184](#)

GetHeaderNames

Syntax

GetHeaderNames()

Description

Use the GetHeaderNames method to return an array containing the names of all the headers.

Parameters

None.

Returns

An array of string.

See Also

[Chapter 23, "Mail Classes," AddHeader, page 1179](#); [Chapter 23, "Mail Classes," GetHeader, page 1181](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1182](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1183](#) and [Chapter 23, "Mail Classes," GetHeaderValues, page 1184](#)

GetHeaderValues

Syntax

GetHeaderValues(*Index*)

Description

Use the GetHeaderValues method to return the value for the header located at the position specified by *Index*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the numeric position of the header whose value you want to access.

Returns

An array of string.

See Also

[Chapter 23, "Mail Classes," AddHeader, page 1179](#); [Chapter 23, "Mail Classes," GetHeader, page 1181](#); [Chapter 23, "Mail Classes," GetHeaderCount, page 1182](#); [Chapter 23, "Mail Classes," GetHeaderName, page 1183](#) and [Chapter 23, "Mail Classes," GetHeaderNames, page 1183](#)

Send

Syntax

Send()

Description

Use the Send method to send the email.

When you call the Send method, the following properties might be set based on the type of error:

- InvalidAddresses
- MessageNumber (from the PeopleTools Message Catalog)
- MessageSetNumber (from the PeopleTools Message Catalog)
- ValidSentAddresses
- ValidUnsentAddresses

In addition, a list of substitution strings for the error message can be accessed by the ErrorMessageParamsCount property and the GetErrorMessageParam method.

Parameters

None.

Returns

A number indicating the status of the send. Values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ObEmail_ FailedBeforeSending	Email failed before being sent.
1	%ObEmail_Delivered	Email was delivered.
2	%ObEmail_NotDelivered	Email delivery not attempted.
3	%ObEmail_PartiallyDelivered	Email has only been partially delivered. Only some of the addresses in the list of addresses were delivered to.
-1	%ObEmail_ SentButResultUnknown	Email was sent but whether it was successful or not is not known.

See Also

[Chapter 23, "Mail Classes," InvalidAddresses, page 1194](#); [Chapter 23, "Mail Classes," ValidSentAddresses, page 1204](#) and [Chapter 23, "Mail Classes," ValidUnsentAddresses, page 1205](#)

[Chapter 23, "Mail Classes," MessageNumber, page 1196](#) and [Chapter 23, "Mail Classes," MessageSetNumber, page 1196](#)

SetSMTPParam

Syntax

SetSMTPParam(*ParamName*, *ParamValue*)

Description

Use the SetSMTPParam method to set parameters for the SMTP session to be used for sending the email. If you are only sending out one email, use this method. If you are sending many emails, use the SMTPSession class and set the parameters once for all the emails you are sending out.

Note. You should use this method before you use the Send method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ParamName</i>	Specify the name of the parameter you want to overwrite.
<i>ParamValue</i>	Specify the value for the named parameter that you want used instead of the existing value.

Returns

None.

Example

```
&email.setSMTPParam("mail.mime.decodetext.strict", "false");  
&email.setSMTPParam("mail.mime.address.strict", "false");  
&email.setSMTPParam("mail.debug", "true");
```

See Also

[Chapter 23, "Mail Classes," SMTPSession Class, page 1205](#)

MCFOutboundEmail Class Properties

In this section we discuss the MCFOutboundEmail class properties. The properties are described in alphabetical order.

BackupSMTPPort

Description

Use this property to specify the port number of the backup SMTP server. This is an optional property when creating an email. If you don't specify a value, the default value is 25.

This property is read-write.

BackupSMTPServer

Description

Use this property to specify the server name of the backup SMTP server. The system tries to connect to the backup server if the primary SMTPserver is not available.

This property is read-write.

BackupSMTPSSLClientCertAlias

Description

Use this property to specify the alias for the certificate for Secure Sockets Layer (SSL) client authentication on the backup SMTP server.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," BackupSMTPSSLPort, page 1187](#) and [Chapter 23, "Mail Classes," BackupSMTPUseSSL, page 1188](#)

BackupSMTPSSLPort

Description

Use this property to specify the SSL port number for the backup SMTP server. This is an optional property. If you don't specify a value for this property, the default value is 465.

This property is read-write.

See Also

Chapter 23, "Mail Classes," BackupSMTPSSLClientCertAlias, page 1187 and Chapter 23, "Mail Classes," BackupSMTPUseSSL, page 1188

BackupSMTPUserName

Description

Use this property to specify the user name used to sign onto the backup SMTP server. This user name is used for authentication when sending mail using the backup mail server.

This property is read-write.

BackupSMTPUserPassword

Description

Use this property to specify the user password used for signing onto the backup SMTP server. The BackupSMTPUserName and password are used for the authentication when sending mail using the backup mail server.

This property is read-write.

BackupSMTPUseSSL

Description

Use this property to indicate whether the connection to the backup SMTP server will be attempted using SSL or not.

This property takes a Boolean value: true if an SSL connection is to be attempted, false if a non-SSL connection is to be attempted.

This property is read-write.

See Also

Chapter 23, "Mail Classes," BackupSMTPSSLClientCertAlias, page 1187 and Chapter 23, "Mail Classes," BackupSMTPSSLPort, page 1187

BCC

Description

Use this property to specify comma-separated list of addresses of all the blind carbon copy recipients of this email. (A blind carbon copy is a copy of the email that contains all of the text of the email, but does not show any of the other email addresses to which this email was sent.)

This property is read-write.

See Also

[Chapter 23, "Mail Classes," CC, page 1189](#)

BounceTo

Description

Use this property to specify the email address the system should direct all bounced mail to.

This property is read-write.

CC

Description

Use this property to specify a comma-separated list of addresses that copies of this email are to be sent to (carbon copy.)

This property is read-write.

See Also

[Chapter 23, "Mail Classes," BCC, page 1189](#)

Charset

Description

Use this property to specify the character set for the text or the attachment.

You can also specify this property using the `SetAttachmentContent` method, or the `ContentType` property.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SetAttachmentContent, page 1122](#)

[Chapter 23, "Mail Classes," ContentType, page 1190](#)

ContentLanguage

Description

Use this property to set the language of this email. More than one language can be set in a comma-separated list. Use the standard abbreviated language names, such as en, fr, de, da, and so on.

You can also include the country codes when you specify the language, such as en-us.

This property is read-write.

See Also

<http://www.w3.org/WAI/ER/IG/ert/iso639.htm>

http://userpage.chemie.fu-berlin.de/diverse/doc/ISO_3166.html

ContentType

Description

Use this property to specify the content type of this body part.

You can also specify the content type with the SetAttachmentContent method.

You can also use this property to specify the character set. For example, "text/plain; charset=US-ASCII".

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SetAttachmentContent, page 1122](#)

[Chapter 23, "Mail Classes," Charset, page 1189](#)

DefaultCharSet

Description

Use this property to specify the character set to be applied to all the parts of the email.

This property is read-write.

Description

Description

Use this property to specify a description of the file attachment associated with this email. If there is no file attachment, this property is ignored.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," AddAttachment, page 1178](#)

Disposition

Description

Use this property to specify how the body part is presented in the received mail.

Some email clients ignore the setting of this property and present body parts either inline or as file attachments.

Values for this property are:

<i>Value</i>	<i>Description</i>
Attachment	The body part is shown as a file attachment.
Inline	The body part is shown in the body itself.

This property is read-write.

ErrorDescription

Description

If an error occurs, use the ErrorDescription property to get the description of the error.

This property is effectively read-only.

Note. While this property is actually read-write, from PeopleCode, it is meant to be used in a read-only manner. If this property has a user-specified value, that value will be overwritten automatically when there is an error condition.

See Also

[Chapter 23, "Mail Classes," ErrorDetails, page 1192](#)

ErrorDetails

Description

If an error occurs, use the ErrorDetails property to get the details of the error.

This property is effectively read-only.

Note. While this property is actually read-write, from PeopleCode, it is meant to be used in a read-only manner. If this property has a user-specified value, that value will be overwritten automatically when there is an error condition.

See Also

[Chapter 23, "Mail Classes," ErrorDescription, page 1192](#)

ErrorMsgParamsCount

Description

Use this property to the number of substitution parameters as an integer.

This property is read-only.

See Also

[Chapter 23, "Mail Classes," GetErrorMsgParam, page 1181](#)

Filename

Description

If you are adding an attachment to the email, you can specify the name of the file using this property.

PeopleSoft recommends that you keep the file extension specified with this property the same as the original extension found in the file path, otherwise the client applications may not be able to display it properly.

This property is read-write.

FilePath

Description

Specify the path for the file that contains the contents of this email.

Whether this is a relative or absolute path depends on the FilePathType property.

You can also specify a URL to the file using this property, if the FilePathType property is specified as %FilePath_Absolute.

If you specify a value for this property, the 'Text' content is ignored (when used with the ContentType property.)

This property is read-write.

See Also

[Chapter 23, "Mail Classes," FilePathType, page 1193](#)

FilePathType

Description

Use this property to specify whether the path specified with the FilePath property is a relative or absolute path. The values for this property are:

<i>Value</i>	<i>Description</i>
%FilePath_Relative	The file path specified with the FilePath property is a relative path.
%FilePath_Absolute	The file path specified with the FilePath property is either an absolute path to a file, or a URL to a file.

If you specify a relative path, the file must be available in the FILES folder of application server folder.

If you specify an absolute path, the file could be on the local machine, in any network folder, or a URL.

If you specify a value for this property, the Text property is ignored.

This property is read-write.

From

Description

Use this property to specify the email address of the person sending the email.

You can specify more than one address as from in a comma-separated list.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," Recipients, page 1197](#); [Chapter 23, "Mail Classes," ReplyTo, page 1198](#) and [Chapter 23, "Mail Classes," Sender, page 1199](#)

Importance

Description

Use this property to specify the value of the importance header field.

The importance can be set to the following:

- low
- normal
- high

If the Priority property is not set, the system automatically sets it to the corresponding values like 5, 3 and 1.

This property is read-write.

InvalidAddresses

Description

Use this property to get a partial list of email addresses to which the email could not be sent. The email addresses are in a string, separated by commas.

This property is read-only.

See Also

[Chapter 23, "Mail Classes," ValidSentAddresses, page 1204](#)

[Chapter 23, "Mail Classes," ValidUnsentAddresses, page 1205](#)

IsAuthenticationReqd

Description

Use this property to specify if authentication is required or not. If the SMTP server does not support authentication or authentication is not enabled, this property is ignored.

This property takes a Boolean value: true if authentication is required, false otherwise.

This property is read-write.

IsOkToSendPartial

Description

Use this property to specify if the email can be sent to only some of the specified recipients or if it must be sent to all. This property takes a Boolean value: true if a partial list of addresses is acceptable, false otherwise. If the email must go out to all those listed, or to none at all, specify false.

This property is read-write.

Considerations Using IsOkToSendPartial

If the syntax of the email address is wrong, no mail is sent, regardless of the value of this property. The error is reported.

If the syntax of the email addresses is correct but the email server is unable to send mail to some addresses, the value of this property is used to either send or not send to the partial list of email addresses.

If the syntax of all the email addresses are correct and the email server is able to dispatch mail to all the addresses, no error is reported immediately. Later, if some addresses are found invalid by the recipient email server or gateway, the mail is sent back. In this case the source email server has no way to find the invalidity of the email address in advance.

IsReturnReceiptReqd

Description

Use this property to specify if the receiver must send acknowledgement that the email was received when it's received. This property takes a Boolean value: true if the return receipt is required, false otherwise.

This property is read-write.

MessageNumber

Description

This property returns the message number of the error message associated with this email. The message number is associated with messages in the PeopleTools Message Catalog.

This property is effectively read-only.

Note. While this property is actually read-write, from PeopleCode, it is meant to be used in a read-only manner. If this property has a user-specified value, that value will be overwritten automatically when there is an error condition.

See Also

[Chapter 23, "Mail Classes," MessageSetNumber, page 1196](#)

MessageSetNumber

Description

This property returns the message set number of the error message associated with the email.

This property is effectively read-only.

Note. While this property is actually read-write, from PeopleCode, it is meant to be used in a read-only manner. If this property has a user-specified value, that value will be overwritten automatically when there is an error condition.

See Also

[Chapter 23, "Mail Classes," MessageNumber, page 1196](#)

MultiPart

Description

The email can contain simple text, one attachment, or a MultiPart object.

If you have assigned a MultiPart object using this property, the text and attachment related properties are ignored.

This property is read-write.

Example

```
Local PT_MCF_MAIL:MCFMultipart &mp = create PT_MCF_MAIL:MCFMultipart();
&mp.SubType = "alternative; differences=Content-type";

&mp.AddBodyPart(&text);
&mp.AddBodyPart(&html);

&email.MultiPart = &mp;
```

Priority

Description

Use this property to specify the priority of this email.

The values are:

1. Highest Priority
2. High Priority
3. Normal
4. Low Priority
5. Lowest Priority

The default value is 3, that is, normal priority.

This value set with this property is used to set to a header X-Priority field, as this is the most common but non-standard field to show priority. In addition, the corresponding values are set in two header fields: X-MSMail-Priority and Priority. The headers X-Priority or X-MSMail-Priority are set to the corresponding value only if the user does not specify a value.

This property is read-write.

Recipients

Description

Use this property to specify the email addresses of all the main recipients to whom the email is being sent. All the addresses are specified in a comma-separated string.

This property is read-write.

RefIDs

Description

Use this property to specify a value for the REFERENCES header field of the message.

This property is read-write.

ReplyIDs

Description

Use this property to specify a value for the IN-REPLY-TO header field of the message.

This property is read-write.

ReplyTo

Description

Use this property to specify the email address where the reply should be sent. You do not need to specify a value for this property if the value is the same as the From property.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," From, page 1194](#)

ResultOfSend

Description

This property returns the result of the Send method. The values are:

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
0	%ObEmail_ FailedBeforeSending	Email failed before being sent.
1	%ObEmail_Delivered	Email was delivered.
2	%ObEmail_NotDelivered	Email delivery not attempted.

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
3	%ObEmail_PartiallyDelivered	Email has only been partially delivered. Only some of the addresses in the list of addresses were delivered to.
-1	%ObEmail_ SentButResultUnknown	Email was sent but whether it was successful or not is not known.

This property is read-only.

See Also

[Chapter 23, "Mail Classes," Send, page 1184](#)

Sender

Description

Use this property to specify the address of the author of the message. You do not need to specify a value for this property if the value for the From property is the same.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," From, page 1194](#)

Sensitivity

Description

Use this property to specify the value of the sensitivity header field.

The values are:

- personal
- private
- company-confidential

This property is read-write.

SMTPPort

Description

Use this property to specify the port number of SMTP server. This is an optional property. If you don't specify a value for this property, the default value is 25.

This property is read-write.

SMTPServer

Description

Use this property to specify the SMTP server to be used when sending this email.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SMTPPort, page 1200](#); [Chapter 23, "Mail Classes," SMTPUserName, page 1201](#); [Chapter 23, "Mail Classes," SMTPUserPassword, page 1201](#) and [Chapter 23, "Mail Classes," SMTPSession Class, page 1205](#)

SMTPSSLClientCertAlias

Description

Use this property to specify the alias for the certificate for SSL client authentication on the SMTP server.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SMTPSSLPort, page 1201](#); [Chapter 23, "Mail Classes," SMTPUseSSL, page 1202](#) and [Chapter 23, "Mail Classes," Using an SSL Connection to Send Email, page 1232](#)

SMTPSSLPort

Description

Use this property to specify the SSL port number for the SMTP server. This is an optional property. If you don't specify a value for this property, the default value is 465.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SMTPSSLClientCertAlias, page 1200](#); [Chapter 23, "Mail Classes," SMTPUseSSL, page 1202](#) and [Chapter 23, "Mail Classes," Using an SSL Connection to Send Email, page 1232](#)

SMTPUserName

Description

Use this property to specify the user name to be used for logging into the SMTP server.

You should only use this property if the SMTP server allows authentication. If the SMTP server does not allow authentication, setting this property has no effect.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SMTPPort, page 1200](#); [Chapter 23, "Mail Classes," SMTPServer, page 1200](#) and [Chapter 23, "Mail Classes," SMTPUserPassword, page 1201](#)

SMTPUserPassword

Description

Use this property to specify the password for the SMTP user. This property is used with the SMTPUserName property.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SMTPPort, page 1200](#); [Chapter 23, "Mail Classes," SMTPServer, page 1200](#) and [Chapter 23, "Mail Classes," SMTPUserName, page 1201](#)

SMTPUseSSL

Description

Use this property to indicate whether the connection to the SMTP server will be attempted using SSL or not. If you don't specify a value for this property, the default value is N.

This property takes a Boolean value: true if an SSL connection is to be attempted, false if a non-SSL connection is to be attempted.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SMTPSSLClientCertAlias, page 1200](#); [Chapter 23, "Mail Classes," SMTPSSLPort, page 1201](#) and [Chapter 23, "Mail Classes," Using an SSL Connection to Send Email, page 1232](#)

StatusNotifyOptions

Description

Use this property to specify when the system should notify the sender. The values are separated by commas in a string. The values are:

<i>Value</i>	<i>Description</i>
SUCCESS	Send notification if the email is delivered successfully.
FAILURE	Send notification if the email is not delivered successfully.
DELAY	Send notification if delivery of the email is delayed.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," StatusNotifyReturn, page 1203](#) and [Chapter 23, "Mail Classes," TimeToWaitForResult, page 1203](#)

StatusNotifyReturn

Description

Use this property to specify what should be returned as the status notification. You can return either the header or the full message. This option is meaningful only if StatusNotifyOptions property is set.

The values are:

<i>Value</i>	<i>Description</i>
HDRS	Return only the headers of the email.
FULL	Return the full email message.

This property is read-write.

Subject

Description

Use this property to specify the subject of the email. A subject can only contain 254 characters.

This property is read-write.

Text

Description

Use this property to specify the text for the email.

This property is read-write.

TimeToWaitForResult

Description

Use this property to specify the number of milliseconds to wait for the result of send email process. If the result comes back within this time, the returned value is a positive number. Otherwise, %ObEmail_SentButResultUnknown (or -1) is returned.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," StatusNotifyOptions, page 1202](#) and [Chapter 23, "Mail Classes," StatusNotifyReturn, page 1203](#)

UsedDefaultConfig

Description

Use this property to determine whether the default configuration as specified in application server configuration file was used or not.

This property returns a Boolean value: true if the default configuration was used, false if the value specified with the MCFOutboundEmail or the SMTPSession object was used.

This property is read-only.

UsedPrimaryServer

Description

Use this property to determine if the default SMTP server was used, or the backup server.

This property returns a Boolean value: true if the default SMTP server was used, false if the backup server was used.

This property is read-only.

ValidSentAddresses

Description

This property returns the list of addresses that were valid and that the email was sent to. The email addresses are in a string, separated by commas.

This property is read-only.

See Also

[Chapter 23, "Mail Classes," InvalidAddresses, page 1194](#) and [Chapter 23, "Mail Classes," ValidUnsentAddresses, page 1205](#)

ValidUnsentAddresses

Description

Use this property to get a list of the email addresses that are valid, yet the system was unable to send to, due to system problems. The email addresses are separated by commas.

This property is read-only.

See Also

[Chapter 23, "Mail Classes," InvalidAddresses, page 1194](#) and [Chapter 23, "Mail Classes," ValidSentAddresses, page 1204](#)

SMTPSession Class

Use the SMTPSession class to when you want to send more than one email using the same SMTP session. If you are only sending a single email, use the MCFOutboundEmail class instead.

SMTPSession Class Methods

In this section we describe the SMTPSession class methods. The methods are described in alphabetical order.

Send

Syntax

Send(*&Email*)

Description

Use the Send method to send an MCFOutboundEmail object as email.

By default, the system sends the email to the SMTP server using the properties set in the application server configuration file. You can specify different setup parameters by supplying values for the SMTPSession object properties, such as Server, BackupServer, and so on.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Email</i>	Specify an already instantiated MCFOutboundEMail object to be sent.

Returns

A constant indicating the status of the method. The values are:

<i>Value</i>	<i>Description</i>
%ObEmail_Delivered	The email was delivered.
%ObEmail_NotDelivered	Email delivery not attempted.
%ObEmail_PartiallyDelivered	The email was only partially delivered, that is, it was only delivered to some of the recipients.
%ObEmail_FailedBeforeSending	The email wasn't delivered.
%ObEmail_SentButResultUnknown	The email was sent but the result is unknown. The TimeToWaitForResult value was not sufficient to get the result of the send process.

See Also

[Chapter 23, "Mail Classes," SendAll, page 1206](#)

SendAll

Syntax

SendAll(*&Emails*)

Description

Use the SendAll method to send a number of emails, all using the same SMTP session and session properties.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Emails</i>	Specify an array of MCFOutboundEmail objects.

Returns

An array of number. Each item in the array indicates the status of an individual email object. Values are:

<i>Value</i>	<i>Description</i>
%ObEmail_Delivered	The email was delivered.
%ObEmail_NotDelivered	Email delivery not attempted.
%ObEmail_PartiallyDelivered	The email was only partially delivered, that is, it was only delivered to some of the recipients.
%ObEmail_FailedBeforeSending	The email wasn't delivered.
%ObEmail_SentButResultUnknown	The email was sent but the result is unknown. The TimeToWaitForResult value was not sufficient to get the result of the send process.

See Also

[Chapter 23, "Mail Classes," Send, page 1205](#)

SetSMTPParam

Syntax

SetSMTPParam(*ParamName*, *ParamValue*)

Description

Use the SetSMTPParam method to set additional parameters for the SMTP session.

You must use this method before you use any Send method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ParamName</i>	Specify the name of the parameter you want to overwrite.
<i>ParamValue</i>	Specify the value for the named parameter that you want used instead of the existing value.

Returns

None.

SMTPSession Class Properties

In this section we describe the SMTPSession class properties. The properties are described in alphabetical order.

BackupPort

Description

Use this property to specify the port number of backup SMTP server. This is an optional property. If you don't specify a value for this property, the default value is 25.

This property is read-write.

BackupServer

Description

Use this property to specify the name of the backup SMTP server. The system tries connecting to the backup server if the primary SMTP server is not available.

This property is read-write.

BackupSSLClientCertAlias

Description

Use this property to specify the alias for the certificate for SSL client authentication on the backup SMTP server.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," BackupSSLPort, page 1209](#) and [Chapter 23, "Mail Classes," BackupUseSSL, page 1210](#)

BackupSSLPort

Description

Use this property to specify the SSL port number for the backup SMTP server. This is an optional property. If you don't specify a value for this property, the default value is 465.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," BackupSSLClientCertAlias, page 1209](#) and [Chapter 23, "Mail Classes," BackupUseSSL, page 1210](#)

BackupUserName

Description

Use this property to specify the user name used to sign onto the backup SMTP server.

This user name is used for authentication when sending mail using the backup mail server.

This property is read-write.

BackupUserPassword

Description

Use this property to specify the user password used to sign onto the backup SMTP server.

This user name and password are used for authentication when sending mail using the backup mail server.

This property is read-write.

BackupUseSSL

Description

Use this property to indicate whether the connection to the backup SMTP server will be attempted using SSL or not.

This property takes a Boolean value: true if an SSL connection is to be attempted, false if a non-SSL connection is to be attempted.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," BackupSSLClientCertAlias, page 1209](#) and [Chapter 23, "Mail Classes," BackupSSLPort, page 1209](#)

IsAuthenticationReqd

Description

Use this property to specify if authentication is required or not. If the SMTP server does not support authentication or authentication is not enabled, this property is ignored.

This property takes a Boolean value: true if authentication is required, false otherwise.

This property is read-write.

Port

Description

Use this property to specify the SMTP port number to be used for sending this email. This property takes a numeric value. This property is optional. If you don't specify a value for this property, the default value of 25 is used.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SMTPServer, page 1200](#); [Chapter 23, "Mail Classes," SMTPUserName, page 1201](#); [Chapter 23, "Mail Classes," SMTPUserPassword, page 1201](#) and [Chapter 23, "Mail Classes," SMTPSession Class, page 1205](#)

Server

Description

Use this property to specify the name of the SMTP server to be used when sending this email.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SMTPPort, page 1200](#); [Chapter 23, "Mail Classes," SMTPUserName, page 1201](#); [Chapter 23, "Mail Classes," SMTPUserPassword, page 1201](#) and [Chapter 23, "Mail Classes," SMTPSession Class, page 1205](#)

SSLClientCertAlias

Description

Use this property to specify the alias for the certificate for SSL client authentication on the SMTP server.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SSLPort, page 1212](#) and [Chapter 23, "Mail Classes," UseSSL, page 1213](#)

SSLPort

Description

Use this property to specify the SSL port number for the SMTP server. This is an optional property. If you don't specify a value for this property, the default value is 465.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SSLClientCertAlias, page 1211](#) and [Chapter 23, "Mail Classes," UseSSL, page 1213](#)

UsedDefaultConfig

Description

Use this property to determine whether the default configuration as specified in application server configuration file was used or not.

This property returns a Boolean value: true if the default configuration was used, false if the value specified with the MCFOutboundEmail or the SMTPSession object was used.

This property is read-only.

UsedPrimaryServer

Description

Use this property to determine if the default SMTP server was used, or the backup server.

This property returns a Boolean value: true if the default SMTP server was used, false if the backup server was used.

This property is read-only.

UserName

Description

Use this property to specify the user name to be used for logging into the SMTP server.

You should only use this property if the SMTP server allows authentication. If the SMTP server does not allow authentication, setting this property has no effect.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SMTPPort, page 1200](#); [Chapter 23, "Mail Classes," SMTPServer, page 1200](#) and [Chapter 23, "Mail Classes," SMTPUserPassword, page 1201](#)

UserPassword

Description

Use this property to specify the password for the SMTP user. This property is used with the SMTPUserName property.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SMTPPort, page 1200](#); [Chapter 23, "Mail Classes," SMTPServer, page 1200](#) and [Chapter 23, "Mail Classes," SMTPUserName, page 1201](#)

UseSSL

Description

Use this property to indicate whether the connection to the SMTP server will be attempted using SSL or not. If you don't specify a value for this property, the default value is N.

This property takes a Boolean value: true if an SSL connection is to be attempted, false if a non-SSL connection is to be attempted.

This property is read-write.

See Also

[Chapter 23, "Mail Classes," SSLClientCertAlias, page 1211](#) and [Chapter 23, "Mail Classes," SSLPort, page 1212](#)

Mail Classes Examples

This section provides examples of the following:

- Creating a text email.
- Creating email and overriding SMTP settings.
- Creating an HTML email.
- Creating a multipart email with text and HTML parts.
- Creating an HTML email with images.
- Creating an email from rich text editor output.
- Creating an email with attachments.
- Creating email attachments by specifying URLs.
- Creating and sending multiple emails.
- Authenticating email while sending.
- Using an SSL connection to send email.

Creating a Text Email

The following code example creates and sends a very simple email, then tests the results.

```

import PT_MCF_MAIL:*;

/*-- Create an outbound email object --*/

Local PT_MCF_MAIL:MCFOutboundEmail &eMail =
create PT_MCF_MAIL:MCFOutboundEmail();

/*-- Initialize the usual fields of an email --*/

&eMail.From = &FromAddress;
&eMail.Recipients = &ToList;
&eMail.Subject = &Subject;
&eMail.Text = &MailBody;

/*-- The send method uses the default SMTP parameters as set in the app server⇒
configuration file.

This send method makes a connection to the SMTP server, sends the mail and then⇒
disconnects.

The result are returned as a number corresponding to the possible values.

The list of ValidSent, InvalidSent and Invalid addresses are returned in the email⇒
object itself
----*/

Local integer &resp = &eMail.Send();
Local boolean &done;

Evaluate &resp
  When %ObEmail_Delivered
    /* every thing ok */
    &done = True;
    Break;

    When %ObEmail_NotDelivered
/*-- Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses */
    &done = False;
    Break;

    When %ObEmail_PartiallyDelivered
/* Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses; */
    &done = True;
    Break;

    When %ObEmail_FailedBeforeSending
/* Get the Message Set Number, message number;
Or just get the formatted messages from &email.ErrorDescription,
&email.ErrorDetails;*/

    &done = False;
    Break;
End-Evaluate;

```

Creating Email and Overriding SMTP Settings

The following code example creates a text email and overrides the SMTP settings as found in the application server configuration file.

```

import PT_MCF_MAIL:*;

/*-- Create an email object by setting individual parameters ---*/

Local PT_MCF_MAIL:MCFOutboundEmail &eMail =
create PT_MCF_MAIL:MCFOutboundEmail();

&eMail.Recipients = &ToList; /* comma separated list of email addresses */
&eMail.CC = &CCList; /* comma separated list of email addresses */
&eMail.BCC = &BCCList; /* comma separated list of email addresses */
&eMail.From = &FromAddress; /* from email address */
&eMail.ReplyTo = &ReplyToAddress; /* in case the reply is to be sent to a⇒
different email address */
&eMail.Sender = &SenderAddress; /* If different from the "from" address */

&eMail.Subject = &Subject; /* email subject line */
&eMail.Text = &MailBody; /* email body text */

/*-- Override the default SMTP parameters specified in app server configuration⇒
file ----*/

&eMail.SMTPServer = "psp-smtpg-01";
&eMail.SMTPPort = 10266; /*-- Usually this is 25 by default */

Local integer &resp = &eMail.Send();

/* Now check the &resp for the result */

Local boolean &done;

Evaluate &resp
  When %ObEmail_Delivered
    /* every thing ok */
    &done = True;
    Break;

    When %ObEmail_NotDelivered
/*-- Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses */
    &done = False;
    Break;

    When %ObEmail_PartiallyDelivered
/* Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses; */
    &done = True;
    Break;

    When %ObEmail_FailedBeforeSending
/* Get the Message Set Number, message number;
Or just get the formatted messages from &email.ErrorDescription,
&email.ErrorDetails;*/

    &done = False;
    Break;
End-Evaluate;

```

Creating an HTML Email

The following example creates an HTML email.

```

import PT_MCF_MAIL:*;

/*-- Create an email object by setting individual parameters
---*/

Local PT_MCF_MAIL:MCFOutboundEmail &email =
create PT_MCF_MAIL:MCFOutboundEmail();

    &email.From = &FromAddress;
    &email.Recipients = &ToList;
    &email.Subject = &Subject;

&email.Text =
"<html><body><H1><b>Hi there!</b></H1><P>We are ready.</body></html>";

    &email.ContentType = "text/html";

Local integer &res = &email.Send();

Local boolean &done;

Evaluate &resp
    When %ObEmail_Delivered
        /* every thing ok */
        &done = True;
        Break;

    When %ObEmail_NotDelivered
/*-- Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses */
        &done = False;
        Break;

    When %ObEmail_PartiallyDelivered
/* Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses; */
        &done = True;
        Break;

    When %ObEmail_FailedBeforeSending
/* Get the Message Set Number, message number;
Or just get the formatted messages from &email.ErrorDescription,
&email.ErrorDetails;*/

        &done = False;
        Break;
End-Evaluate;

```

Creating a Multipart Email with Text and HTML Parts

The following code example creates an email with both HTML and text sections.

The email client on the target host must be able to detect the HTML and text parts in the email and display the part that the client is configured to display.

```

import PT_MCF_MAIL:*;

Local PT_MCF_MAIL:MCFOutboundEmail &email =
create PT_MCF_MAIL:MCFOutboundEmail();
Local string &TestName = "Text and its alternate html body";

&email.From = &FromAddress;
&email.Recipients = &ToList;
&email.Subject = &Subject;

Local PT_MCF_MAIL:MCFBodyPart &text = create PT_MCF_MAIL:MCFBodyPart();
&text.Text = "Hi There";

Local PT_MCF_MAIL:MCFBodyPart &html = create PT_MCF_MAIL:MCFBodyPart();
&html.Text =
"<html><BODY><H1>Email test with HTML content</H1><b>Hi There</b>" |
"<A href='http://www.peoplesoft.com'>Check this out!</A>" |
"<P></BODY></html>";
&html.ContentType = "text/html";

Local PT_MCF_MAIL:MCFMultipart &mp = create PT_MCF_MAIL:MCFMultipart();
&mp.SubType = "alternative; differences=Content-type";

&mp.AddBodyPart(&text);
&mp.AddBodyPart(&html);

&email.MultiPart = &mp;

Local integer &res = &email.Send();

Local boolean &done;

Evaluate &resp
  When %ObEmail_Delivered
    /* every thing ok */
    &done = True;
    Break;

    When %ObEmail_NotDelivered
/*-- Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses */
    &done = False;
    Break;

    When %ObEmail_PartiallyDelivered
/* Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses; */
    &done = True;
    Break;

    When %ObEmail_FailedBeforeSending
/* Get the Message Set Number, message number;
Or just get the formatted messages from &email.ErrorDescription,
&email.ErrorDetails;*/

    &done = False;
    Break;
End-Evaluate;

```

Creating an HTML Email with Images

The following code example creates an HTML email with embedded images. The content ID for an image can be a reference to a part in the email. In the following code example, the images become a part of the email and are transmitted as attachments to the email.

```

import PT_MCF_MAIL:*;

Local PT_MCF_MAIL:MCFOutboundEmail &email =
create PT_MCF_MAIL:MCFOutboundEmail();

    &email.From = &FromAddress;
    &email.Recipients = &ToList;
    &email.Subject = &Subject;

Local string &htmlText =
"<html>" |
"  <head><title></title></head>" |
"  <body>" |
"    <b>A sample jpg</b><br>" |
"    <IMG SRC=cid:23abc@pc27 width=566 height=424><br>" |
"    <b>End of jpg</b>" |
"  </body>" |
"</html>";

/* In this sample, the htmlText is assembled using | operator
only for the readability.
Specifying just one string can be more efficient
*/

    Local PT_MCF_MAIL:MCFMultipart &mp = create PT_MCF_MAIL:MCFMultipart();
    &mp.SubType = "related";

    Local PT_MCF_MAIL:MCFBodyPart &html = create PT_MCF_MAIL:MCFBodyPart();
    &html.Text = &htmlText;
    &html.ContentType = "text/html";

    Local PT_MCF_MAIL:MCFBodyPart &image = create PT_MCF_MAIL:MCFBodyPart();

    &image.SetAttachmentContent(":///file:C:/User/Documentum/XML%20Applications/proddoc⇒
/peoplebook_upc/peoplebook_upc.dtd",
    %FilePath_Absolute, "sample.jpg", "This is a sample image!", "", "");

    &image.AddHeader("Content-ID", "23abc@pc27");

    &mp.AddBodyPart(&html);
    &mp.AddBodyPart(&image);

    &email.MultiPart = &mp;

    Local integer &res = &email.Send();

Local boolean &done;

Evaluate &resp
  When %ObEmail_Delivered
    /* every thing ok */
    &done = True;
    Break;

    When %ObEmail_NotDelivered
/*-- Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses */
    &done = False;
    Break;

    When %ObEmail_PartiallyDelivered
/* Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses; */

```

```

        &done = True;
        Break;

    When %ObEmail_FailedBeforeSending
    /* Get the Message Set Number, message number;
    Or just get the formatted messages from &email.ErrorDescription,
    &email.ErrorDetails;*/

        &done = False;
        Break;
    End-Evaluate;

```

Creating an Email from Rich Text Editor Output

The following example creates an email message using output from a long edit box enabled with the rich text editor. Using the ParseRichTextHtml method, rich text output of the long edit box is split into an array of MCFBodyPart objects.

```

import PT_MCF_MAIL:*;

Local PT_MCF_MAIL:MCFOutboundEmail &email = create PT_MCF_MAIL:MCFOutboundEmail();
Local PT_MCF_MAIL:MCFMultipart &mp = create PT_MCF_MAIL:MCFMultipart();
Local PT_MCF_MAIL:MCFMailUtil &mu = create PT_MCF_MAIL:MCFMailUtil();

Local string &htmlText = RECORD_NAME.FIELD_NAME.Value;

&mp.SubType = "related";
&email.Recipients = &recipients;
&email.From = &from;
&email.Subject = "Your Order";

Local array of PT_MCF_MAIL:MCFBodyPart &bp;
&mu.imagesLocation = "c:\temp\images";
&bp = &mu.ParseRichTextHtml(&htmlText);

If (&bp = Null) Then
    MessageBox(0, "", 0, 0, &mu.ErrorDescription);
    Return;
End-If;

&mp.AddBodyPart(&bp [1]);

For &i = 2 To &bp.Len
    &mp.AddBodyPart(&bp [&i]);
End-For;

&email.MultiPart = &mp;
Local integer &resp = &email.Send();

/* Exec code to check the &resp for the result */

/* Exec code to delete temporary image files from the imagesLocation directory */

```

For example, the rich text editor is used to create a message containing text and two images as shown in this example:

Rich text editor displaying an example email

The HTML for this email is as follows:

```
<p>Dear Customer,</p>
<p>Here are the details of your order:</p>
<ul>
<li> Item #1 - Ocean Sunset:
<br /> <img height="180" id="PT_RTE_IMG_DB_LOC###20091111142435187=>
Sunset_thumbnail.jpg" src="/cs/QEDMO/cache/PTRTDB_JPG_GIYDAOJRGEYT=>
CMJUGI1DGNJRHA2VG4LOON SXIX2UNB1W1YTOMFUWYLT KOB TQ=_GA==_GE==_2000000000.>
JPG" width="240" /><br /> &nbsp;</li>
<li> Item #2 - Hazy Blue Mountains:
<br /> <img height="180" id="PT_RTE_IMG_DB_LOC###20091111142508395=>
Mountains_thumbnail.jpg" src="/cs/QEDMO/cache/PTRTDB_JPG_GIYDAOJRGEYT=>
CMJUGI1TAOBTHE1U122VNZ1GC1LOONPXI1DVNV RG3YLJNQXGU3DH_GA==_GE==_2000000000.>
JPG" width="240" /></li>
</ul>
<p>Thank you and regards,</p>
<p>Customer Service Department
<br /><a href="http://www.xyzcorp.com">http://www.xyzcorp.com</a></p>
```

When this HTML is parsed by the ParseRichTextHtml method, an array with three MCFBodyPart elements is created. The first MCFBodyPart is array element &bp [1] with the following properties:

- `&bp [1].ContentType =`
`text/html`
- `&bp [1].Text =`

```

<p>Dear Customer,</p>
<p>Here are the details of your order:</p>
<ul>
<li> Item #1 - Ocean Sunset:
<br /> <img height="180" id="PT_RTE_IMG_DB_LOC###20091111142435187=>
Sunset_thumbnail.jpg" src="cid:2205@pc27" width="240" />
<br /> &nbsp;</li>
<li> Item #2 - Hazy Blue Mountains:
<br /> <img height="180" id="PT_RTE_IMG_DB_LOC###20091111142508395=>
Mountains_thumbnail.jpg" src="cid:8160@pc27" width="240" /></li>
</ul>
<p>Thank you and regards,</p>
<p>Customer Service Department
<br /><a href="http://www.xyzcorp.com">http://www.xyzcorp.com</a></p>

```

The second MCFBodyPart is array element `&bp [2]` with the following properties:

- `&bp [2].ContentType =`
`image/gif`
- `&bp [2].Description =`
`Image1`
- `&bp [2].Disposition =`
`inline`
- `&bp [2].AttachmentURL =`
`c:\temp\images\20091111142435187Sunset_thumbnail.jpg`

The final MCFBodyPart is array element `&bp [3]` with the following properties:

- `&bp [3].ContentType =`
`image/gif`
- `&bp [3].Description =`
`Image2`
- `&bp [3].Disposition =`
`inline`
- `&bp [3].AttachmentURL =`
`c:\temp\images\20091111142508395Mountains_thumbnail.jpg`

Observe that the email received by the recipient is formatted the way that it appeared in the rich text editor as shown in the following example:

Email as received in Microsoft Outlook

Finally, the XML code that represents this email message is as follows:

```

<?xml version="1.0" encoding="UTF-8" standalone="no"?>

Creating an Email with Attachments

The following code example creates an email with an attachment.

PeopleSoft recommends that you always provide the proper extension in the file name, otherwise the receiving email client may not be able to associate it with the appropriate application.

Note. There is no automatic restriction of attachment size using the mail classes. To restrict an email based on attachment size, your application must check the size of an attachment before composing and sending the email.

```

import PT_MCF_MAIL:*;

Local PT_MCF_MAIL:MCFOutboundEmail &email =
create PT_MCF_MAIL:MCFOutboundEmail();

&email.From = &FromAddress;
&email.Recipients = &ToList;
&email.Subject = &Subject;

Local string &plain_text = "Hi there!";
Local PT_MCF_MAIL:MCFBodyPart &text = create PT_MCF_MAIL:MCFBodyPart();
&text.Text = &plain_text;

Local PT_MCF_MAIL:MCFBodyPart &attach1 = create PT_MCF_MAIL:MCFBodyPart();
&attach1.SetAttachmentContent("Ocean Wave.jpg", %FilePath_Relative,
"Ocean Wave.jpg", "Ocean Wave", "", "");
/* %FilePath_Relative indicates the file is available at Appserver's FILES⇒
dierctory */

Local PT_MCF_MAIL:MCFBodyPart &attach2 = create PT_MCF_MAIL:MCFBodyPart();
&attach2.SetAttachmentContent("///file:C:/User/Documentum/XML%20Applications⇒
/proddoc/peoplebook_upc/peoplebook_upc.dtd",
%FilePath_Absolute, "Sample.jpg", "Sample", "", "");
/* The Sample.jpg is available in the "public" folder of my-server machine*/

Local PT_MCF_MAIL:MCFMultipart &mp = create PT_MCF_MAIL:MCFMultipart();
&mp.AddBodyPart(&text);
&mp.AddBodyPart(&attach1);
&mp.AddBodyPart(&attach2);

&email.MultiPart = &mp;

Local integer &res = &email.Send();

Local boolean &done;

Evaluate &resp
  When %ObEmail_Delivered
    /* every thing ok */
    &done = True;
    Break;

    When %ObEmail_NotDelivered
/*-- Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses */
    &done = False;

/* Get the Message Set Number, message number;
Or just get the formatted messages from &email.ErrorDescription,
&email.ErrorDetails;*/

    &done = False;
    Break;
End-Evaluate;

```

Creating Email Attachments by Specifying URLs

The following code example creates an email attachment specifying a URL for the file location, instead of an absolute or relative path to the file.

```

Local PT_MCF_MAIL:MCFOutboundEmail &email =
create PT_MCF_MAIL:MCFOutboundEmail();

    &email.From = &FromAddress;
    &email.Recipients = &ToList;
    &email.Subject = &Subject;

    Local string &plain_text = "Hi there!";
    Local PT_MCF_MAIL:MCFBodyPart &text = create PT_MCF_MAIL:MCFBodyPart();

    &text.Text = &plain_text;

Local PT_MCF_MAIL:MCFBodyPart &attach1 = create PT_MCF_MAIL:MCFBodyPart();

&attach1.SetAttachmentContent("http://www.yahoo.com/members_agreement",
    %FilePath_Absolute, "hotmail.htm", "Hotmail Home page", "", "");

Local PT_MCF_MAIL:MCFBodyPart &attach2 = create PT_MCF_MAIL:MCFBodyPart();

&attach2.SetAttachmentContent("ftp://www.w3c/docs/somedoc",
    %FilePath_Absolute, "somedoc.htm", "somedoc from w3c", "", "");

    Local PT_MCF_MAIL:MCFMultipart &mp = create PT_MCF_MAIL:MCFMultipart();
    &mp.AddBodyPart(&text);
    &mp.AddBodyPart(&attach1);
    &mp.AddBodyPart(&attach2);

    &email.MultiPart = &mp;

Local integer &res = &email.Send();

Local boolean &done;

Evaluate &resp
    When %ObEmail_Delivered
        /* every thing ok */
        &done = True;
        Break;

    When %ObEmail_NotDelivered
/*-- Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses */
        &done = False;
        Break;

    When %ObEmail_PartiallyDelivered
/* Check &email.InvalidAddresses, &email.ValidSentAddresses
and &email.ValidUnsentAddresses; */
        &done = True;
        Break;

    When %ObEmail_FailedBeforeSending
/* Get the Message Set Number, message number;
Or just get the formatted messages from &email.ErrorDescription,
&email.ErrorDetails;*/

        &done = False;
        Break;
End-Evaluate;

```

Creating and Sending Multiple Email Messages

You can create several emails and send them all in a single connection to the SMTP server. However, your system administrator may also need to configure the SMTP server with longer connection time-outs if you are sending multiple emails.

```
import PT_MCF_MAIL:*;

/*-- Create an email object by setting individual parameters
---*/
Local array of PT_MCF_MAIL:MCFOutboundEmail &mails;
Local PT_MCF_MAIL:MCFOutboundEmail &email;

Local PT_MCF_MAIL:SMTPSession &commonSession =
create PT_MCF_MAIL:SMTPSession();

    &email = &commonSession.CreateOutboundEmail();
    &email.From = &FromAddress;
    &email.Recipients = &ToList1;
    &email.Subject = &Subject;
    &email.Text = &MailBody1;

    &mails = CreateArray(&email);

    &email = &commonSession.CreateOutboundEmail();
    &email.From = &FromAddress;
    &email.Recipients = &ToList2;
    &email.Subject = &Subject;
    &email.Text = &MailBody2;
    &mails [2] = &email;

    &email = &commonSession.CreateOutboundEmail();
    &email.From = &FromAddress;
    &email.Recipients = &ToList3;
    &email.Subject = &Subject;
    &email.Text = &MailBody3;
    &mails [3] = &email;

Local array of integer &allRes = &commonSession.SendAll(&mails);
```

Sending an Email With Authentication

The following code example includes a user name and password to be used by the SMTP server.

```
import PT_MCF_MAIL:*;  
  
Local PT_MCF_MAIL:MCFOutboundEmail &email =  
create PT_MCF_MAIL:MCFOutboundEmail();  
  
    &email.From = &FromAddress;  
    &email.Recipients = &ToList;  
    &email.Subject = &Subject;  
    &email.Text = &MailBody;  
  
    &email.SMTPServer = "MySMTPServer";  
    &email.IsAuthenticationReqd = True;  
  
    &email.SMTPUserName = "SomeLoginName";  
    &email.SMTPUserPassword = "SomeLoginPassword";  
  
Local integer &res = &email.Send();
```

Using an SSL Connection to Send Email

The following code example uses an SSL connection to send an email message:

```
import PT_MCF_MAIL:*;  
  
Local PT_MCF_MAIL:MCFOutboundEmail &email = create PT_MCF_MAIL:MCFOutboundEmail();  
  
    &email.From = &FromAddress;  
    &email.Recipients = &ToList;  
    &email.Subject = &Subject;  
    &email.Text = &MailBody;  
  
    &email.SMTPServer = "MySMTPServer";  
    &email.IsAuthenticationReqd = True;  
  
    &email.SMTPUserName = "SomeLoginName";  
    &email.SMTPUserPassword = "SomeLoginPassword";  
    &email.SMTPUseSSL = "Y";  
    &email.SMTPSSLClientCertAlias = &cAlias;  
    &email.SMTPSSLPort = &SSLPort;  
  
Local integer &res = &email.Send();
```

Chapter 24

MCFIMInfo Class

This chapter documents the MCFIMInfo class and covers the following topics:

- Using the MCFIMInfo Class
- Data Type for MCFIMInfo Objects
- Scope of MCFIMInfo Objects
- MCFIMInfo Built-in Functions
- MCFIMInfo Reference

Understanding the MCFIMInfo Class

Use the MCFIMInfo class to launch an instant messaging session from a PeopleSoft page and initiate a chat. A developer can use either the PeopleCode class or a push-button with specific characteristics in Application Designer to initiate an instant messaging session.

Note. PeopleSoft recommends using the Application Designer push-button rather than PeopleCode in most applications. The PeopleCode program determines user presence information from the application server, whereas the push-button determines user presence from the browser. The application server must wait until it has *all* the presence information for that page before it can render the page. Though this processing is multi-threaded, it can still be slower than the push-button.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft MultiChannel Framework, "Configuring Instant Messaging in PeopleSoft MultiChannel Framework"

Using the MCFIMInfo Class

Only use the MCFIMInfo class if your application requires the flexibility the PeopleCode can provide.

The only supported networks are AOL and Yahoo. SameTime is supported using the Application Designer push-button, but not in PeopleCode.

Instant messages are sent by using the native instant message clients. This means that you can only use this for Microsoft Windows.

The page from which you launch the instant messaging session must be refreshed in order to update presence status.

Data Type for MCFIMInfo Objects

MCFIMInfo objects are declared as type MCFIMInfo. For example:

```
Local MCFIMInfo &MyChat;
```

Scope of MCFIMInfo Objects

An MCFIMInfo object can be only instantiated from PeopleCode.

Use this object only in PeopleCode programs that are associated with an online process, not in an Application Engine program, a message subscription, a Component Interface, and so on.

MCFIMInfo Class Built-in Function

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions,"
CreateMCFIMInfo

MCFIMInfo Class Methods

In this section, we discuss the MCFIMInfo class methods. The methods are discussed in alphabetical order.

AddUser

Syntax

AddUser(*User*)

Description

Use the AddUser method to add a user to the instant messaging session.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>User</i>	Specify the user that you want to add to the instant messaging session, as a string.

Returns

A Boolean value: True if the user was successfully added, False otherwise.

CheckAll

Syntax

checkAll()

Description

Use the CheckAll method to check the status of users on the instant messaging session.

This method makes the actual network requests to retrieve presence information.

Parameters

None.

Returns

A Boolean: True if the check is successful, False otherwise.

GetAdditionalUserInfo

Syntax

GetAdditionalUserInfo()

Description

This method returns additional user information.

Parameters

None.

Returns

String.

GetErrorImageName**Syntax**

```
GetErrorImageName ( )
```

Description

Use GetErrorImageName to return the name of the image used for errors.

Parameters

None.

Returns

String.

GetOffLineImageName**Syntax**

```
GetOffLineImageName ( )
```

Description

Use GetOffLineImageName to return the name of the image used to indicate off line status.

Parameters

None.

Returns

String.

GetOnlineImageName**Syntax**

GetOnlineImageName()

Description

Use GetOnlineImageName to return the name of the image used to indicate online status.

Parameters

None.

Returns

String.

GetUnknownImageName**Syntax**

GetUnknownImageName()

Description

Use GetUnknownImageName to return the image of unknown users.

Parameters

None.

Returns

String.

GetLaunchURL

Syntax

GetLaunchURL(*User*)

Description

Use the GetLaunchURL method to return the URL that launches the native client and contacts the user. This is a local URL of one of the following forms:

aim:. . .

or

ymsg:. . .

Parameters

<i>Parameter</i>	<i>Description</i>
<i>User</i>	Specify the user that you want to contact via the launch URL.

Returns

A string URL.

GetStatus

Syntax

GetStatus(*User*)

Description

Use the GetStatus method to return the current online status of the user specified by *User*. This is the status at the time of the last call to **CheckAll**.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>User</i>	Specify the name of the user for whom you want to check the status of.

Returns

An integer. The values are:

<i>Value</i>	<i>Description</i>
-1	Network Disabled
0	User offline
1	User online
2	User Unknown
3	Error

RemoveUser

Syntax

RemoveUser(*User*)

Description

Use the RemoveUser method to remove a user from the instant messaging session.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>User</i>	Specify the name of the user you want to remove from the session, as a string.

Returns

A Boolean value: True if the user was successfully removed, False otherwise.

Chapter 25

Message Classes

This chapter provides an overview of the message classes and discusses the following topics:

- Data type of a message object.
- Scope of a message object.
- Message object population.
- Error handling.
- Message classes reference.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Understanding PeopleSoft Integration Broker"

Understanding Message Classes

You can create the following types of messages using PeopleSoft Pure Internet Architecture::

- *Rowset-based* messages, which use record definitions to create a hierarchical structure for the data. These are generally used for data from applications, pages, components, and so on.
- *Nonrowset-based* messages, which do not use record definitions. These messages can have virtually any content or structure.
- *Container* messages, which are messages made up of one or more part messages.

Use the PeopleCode message classes to instantiate message objects based on existing message definitions, as well as to populate the objects with data and manipulate the data. You can also use PeopleCode to publish a message.

Rowset-based messages are built on top of the rowset, row, record, and field classes, so the PeopleCode written to populate or access those types of messages looks similar to PeopleCode written to populate or access the component buffer.

Nonrowset-based messages contain XML data, and can be accessed using the XmlDocument class methods and properties.

Container messages contain parts. Each part is a separate message. A container message can contain either all rowset-based messages, *or* all nonrowset-based messages.

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Accessing the Data Buffer"

Messages, Service Operations and Handlers

Message definitions only define the shape of the data contained in a message. A message definition doesn't contain any other type of information, such as if the message is being used synchronously or if it's a response message.

After you create a message definition, you can use it in or more service operations. The service operation contains all the information about how the message is to be used, the routing, the queue if appropriate, and so on.

At least one handler is defined with every service operation. Handlers define additional programming to be used with processing the message associated with the service operation. The handlers can be thought of as corresponding to pre PeopleSoft 8.48 message events.

The PeopleCode for the various handlers is contained in the Integration Broker application classes.

Integration Broker Application Classes

The Integration Broker application classes house the processing logic for asynchronous and synchronous messages. By implementing the Integration Broker application classes, you can reuse code more easily and access the other benefits of using application classes.

The following application classes are defined for Integration Broker. To access these application classes, in PeopleTools Application Designer, open the PS_PT application package, then open the Integration subpackage.

All of the Integration Broker application classes are defined as interfaces. This means that there is no native implementation of them: you must import them to your program and implement them if you want to use them.

<i>Application Class</i>	<i>Methods Contained in Application Class</i>	<i>Comments</i>
INotificationHandler	OnNotify OnError	This interface is the equivalent of the Subscription event in releases prior to PeopleTools 8.48.
IPrePostNotification	OnPreNotify OnPostNotify OnError	This interface provides pre-processing and post-processing of segmented messages.

<i>Application Class</i>	<i>Methods Contained in Application Class</i>	<i>Comments</i>
IReceiver	OnAckReceive OnError	This interface is the equivalent of the OnAckReceive Message event in releases prior to PeopleTools 8.48.
IRequestHandler	OnRequest OnError	This interface is the equivalent of the OnRequest Message event in releases prior to PeopleTools 8.48.
IRouter	OnRouteSend OnRouteReceive OnError	This interface is the equivalent of the OnRouteSend and OnRouteReceive Message events in releases prior to PeopleTools 8.48.
ISend	OnRequestSend OnError	This interface is the equivalent of the OnSend Message event in releases prior to PeopleTools 8.48.

Data Type of Message Objects

Every message class is its own data type, that is, messages are declared as data type Message, IntBroker objects are declared as type IntBroker, and so on.

The following are the data types of the message classes:

- Message
- IntBroker
- IBInfo
- IBConnectorInfo

Scope of Message Objects

The message objects can only be instantiated from PeopleCode. These objects can be used anywhere you have PeopleCode, that is, in Component Interface PeopleCode, notification PeopleCode, record field PeopleCode, application engine PeopleCode, and so on.

Message Object Population

After you've declared and instantiated your message object, you want to populate it with data. If your data is coming from the component buffers, populating your message is easy.

A message definition can contain a hierarchy of records. A component buffer contains a hierarchy of records. If you want to copy data from a component buffer rowset to a message, the *structure* of the message and the component must be the same. That is, if you have a record at level two in your message and you want that data, you must have the same level zero and level one records in your message as in your component.

For example, suppose your component had the following structure (that is, that PO_INFO and PO_LINE are at the same level, and PO_DETAIL is the child of PO_INFO):

```
PO_HEADER
  PO_LINE
  PO_INFO
    PO_DETAIL
```

To include the information in the PO_DETAIL record, you must have *at least* the following record structure in your message:

```
PO_HEADER
  PO_INFO
    PO_DETAIL
```

Any records that are in the page that aren't in the message (and vice-versa) are ignored.

After you get your message object, you can create a rowset from it. This rowset has the same structure as the message. If the message is empty, the rowset has no data. If the message has data, the rowset is automatically populated.

The following example is the simplest way of populating a message with data. This assumes that the structure of the message is the same as the structure of the page.

```
/* this gets all the data in the Component buffer */
&RS = GetLevel0();

/* this instantiates a message object */
&MSG = CreateMessage(OPERATION.MY_MESSAGE);

/* creates a rowset with the same structure as the message */
&MSG_RS = &MSG.GetRowset();

/* this copies all the data from the page to the message */
&RS.CopyTo(&MSG_RS);

/* this publishes the message */
%IntBroker.Publish(&MSG_RS);
```

A message rowset is the same as a Component buffer rowset, or any other rowset. It is composed of rows, records, and fields. Suppose you didn't want to get all the data from the Component buffer, but instead wanted to populate just a particular record in your message.

To access a record in a message rowset is the same as accessing a record in a component buffer rowset. You must instantiate the rowset, then specify the row before you can access the record.

The following selects values into a record, then uses the record method CopyFieldTo to copy from the Component buffer record to the message record.

```

Local SQL &LN_SQL;
Local Message &MSG;
Local Rowset &HDR_RS, &LN_RS;
Local Record &LN_REC, &ln_rec_msg;

&MSG = CreateMessage(OPERATION.STOCK_REQUEST);
&HDR_RS = &MSG.GetRowset();
&LN_REC = CreateRecord(Record.DEMAND_INF_INV);

&LN_SQL = CreateSQL("Select * from PS_DEMAND_INF_INV where BUSINESS_UNIT= :1 and⇒
ORDER_NO = :2", &BUSINESS_UNIT, &ORDER_NO);

&J = 1;
While &LN_SQL.Fetch(&LN_REC)

    /* copy data into the Level 1 of &MSG object */
    &LN_RS = &HDR_RS(&I).GetRowset(1);

    If &J > 1 Then
        &LN_RS.InsertRow(&J - 1);
    End-If;

    &ln_rec_msg = &LN_RS.GetRow(&J).GetRecord(Record.DEMAND_INF_INV);
    &LN_REC.CopyFieldsTo(&ln_rec_msg);
    &J = &J + 1;
End-While;

```

This section also discusses items to keep in mind when:

- Populating a rowset from a message.
- Publishing and subscribing to partial records.
- Subscribing to character fields.

Considerations When Populating a Rowset From a Message

Suppose your message had two rowsets, one at level zero, a second at level one. In the message, only the level zero rowset contains any data. When you use `GetRowset` to create a rowset for the entire message, the rowset at level one will contain an empty row, even if there isn't any data in it. (This is standard behavior for *all* rowsets.) However, you can use the `IsChanged` property on the record object to determine the status of the data.

The following notification PeopleCode example traverse the rowset. (Notice the use of `ChildCount`, `ActiveRowCount`, and `IsChanged` properties).

'...' is where application specific code would go.

```

&MSG_ROWSET = &MSG.GetRowset();
For &A0 = 1 To &MSG_ROWSET.ActiveRowCount

/*****
/* Process Level 1 Records */
/*-----*/

If &MSG_ROWSET(&A0).ChildCount > 0 Then
For &B1 = 1 To &MSG_ROWSET(&A0).ChildCount

&LEVEL1_ROWSET = &MSG_ROWSET(&A0).GetRowset(&B1);
For &A1 = 1 To &LEVEL1_ROWSET.ActiveRowCount
If &LEVEL1_ROWSET(&A1).GetRecord(1).IsChanged Then
. . .

/*****
/* Process Level 2 Records */
/*-----*/

If &LEVEL1_ROWSET(&A1).ChildCount > 0 Then
For &B2 = 1 To &LEVEL1_ROWSET(&A1).ChildCount
&LEVEL2_ROWSET = &LEVEL1_ROWSET(&A1).GetRowset(&B2);
For &A2 = 1 To &LEVEL2_ROWSET.ActiveRowCount
If &LEVEL2_ROWSET(&A2).GetRecord(1).IsChanged Then
. . .

/*****
/* Process Level 3 Records */
/*-----*/

If &LEVEL2_ROWSET(&A2).ChildCount > 0 Then
For &B3 = 1 To &LEVEL2_ROWSET(&A2).ChildCount
&LEVEL3_ROWSET = &LEVEL2_ROWSET(&A2).GetRowset(&B3);
For &A3 = 1 To &LEVEL3_ROWSET.ActiveRowCount
If &LEVEL3_ROWSET(&A3).GetRecord(1).IsChanged Then
. . .

End-If; /* A3 - IsChanged */
End-For; /* A3 - Loop */
End-For; /* B3 - Loop */
End-If; /* A2 - ChildCount > 0 */

/*-----*/
/* End of Process Level 3 Records */
/*****

End-If; /* A2 - IsChanged */
End-For; /* A2 - Loop */
End-For; /* B2 - Loop */
End-If; /* A1 - ChildCount > 0 */

/*-----*/
/* End of Process Level 2 Records */
/*****

End-If; /* A1 - IsChanged */
End-For; /* A1 - Loop */
End-For; /* B1 - Loop */
End-If; /* A0 - ChildCount > 0 */

/*-----*/
/* End of Process Level 1 Records */
/*****

```

```
End-For; /* A0 - Loop */
```

Considerations for Publishing and Subscribing to Partial Records

If you've selected to not publish all the fields in the message, you must be careful when inserting that data into a record.

Deselecting the Include check box in the message definition means that the field is *excluded* from the message definition.

- The field won't be included when generating an XML document (when publishing a message.)
- If the field is present in the XML (that is, it wasn't excluded from the published message) it is ignored by the subscribing system.

When you insert the data from the message into the database, you *must* set the values for the fields that aren't in the message. You can use the SetDefault record class method to do this. You could also use a Component Interface based on the component the message was created from to leverage the component defaults.

See Also

[Chapter 34, "Record Class," SetDefault, page 2087](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Creating Component Interface-Based Services"

Considerations When Subscribing to Character Fields

If a message definition has character fields that are defined as uppercase, when the message is subscribed to, character data for those fields is automatically converted to uppercase.

Message Segments

To make processing more efficient, you can divide a large message into pieces using message segments. Generally, you only divide asynchronous messages into segments.

Message nodes can be specified as "segment aware". If a node is not segment aware and you send an asynchronous message that is segmented to it, you received an error message when viewing the error message log in message details on the message monitor. No publication contracts are created. If you send a synchronous message that is segmented to a node that is not segment aware, you receive an error.

There are several methods for creating, updating, and deleting segments. There are also two properties that you need to take into consideration when working with segments.

If you specify the SegmentsByDatabase property as false, you can only have the configured number defined in PSADMIN (Message Segment From DB). If you specify this property as true, you can have as many segments as you need.

The `SegmentsByDatabase` property also specifies whether the segments are kept in memory or written to the database when they are received. If you specify true, the segments are automatically written to the database. If you specify false, the segments are held in memory. If you specify true, then cancel out of the program processing the segments, the changes are not committed to the database.

The `SegmentUnOrder` property is only applicable for asynchronous messages. If you specify the `SegmentUnOrder` property as true, the receiving node processes the segments in parallel.

Note. You should use `DeleteSegment` and `UpdateSegment` only when writing to memory, or when `SegmentsByDatabase` is set to False. These methods do not work when writing to the database, or when `SegmentsByDatabase` is set to True.

The following is an example of how to use the segment properties and methods to send a segmented message. Note that there are only two `CreateNextSegment` calls. By default the first segment is automatically created. The first time you use `CreateNextSegment`, the message is split into two segments. The next time, you add a third segment. You don't need to call `CreateNextSegment` to access the third segment, it's automatically generated.

```
Local Message &MSG;
Local Rowset &FLIGHT_PROFILE, &RS;
Local boolean &Bo, &Stuff;
Local string &lip;

&nTimer = CreateArray("");
&nTimer[1] = "QE_YO";
&nTimer[2] = "QE_STUFF";

QE_FLIGHTDATA.QE_ACNUMBER.Value = QE_FLIGHTDATA.QE_ACNUMBER + 1;

&FLIGHT_PROFILE = GetLevel0();

&MSG = CreateMessage(OPERATION.QE_FLIGHTPLAN);

/* the next lines copy the rowset into the first segment */

&MSG.CopyRowset(&FLIGHT_PROFILE);
&MSG.CreateNextSegment();

/* This copies the next portion of the rowset into the next segment */

&MSG.CopyRowset(&FLIGHT_PROFILE);
&MSG.CreateNextSegment();

/* This copies the last portion of the rowset into the third segment */

&MSG.CopyRowset(&FLIGHT_PROFILE);

/* This specifies that the message segments can be processed separately */

&MSG.IBInfo.SegmentsUnOrder = True;

%IntBroker.publish(&MSG);
```

The following is an example of receiving a segmented message. This would be found in a notification `PeopleCode` program:

```

Local Message &MSG;
Local Rowset &rs, &rs1;
Local Record &FLIGHTDATA, &REC;

Local string &acnumber_value, &msi_sensor_value, &ofp_value, &actype_value, =>
&callsign_value, &squadron_value, &comm1_value, &comm2_value, &ecm_value;

Local XmlDoc &xmldoc;
Local string &yo;
Local boolean &bo;

&CRLF = Char(13) | Char(10);

&MSG = %IntBroker.GetMessage();

/* It is very important to set the rowset to null for every iteration */

/* Also, you may want to verify if the segment count is
greater than 10, and if it is, set the SegmentsByDatabase property to True */

For &i = 1 To &MSG.SegmentCount
    &rs = Null;
    &MSG.GetSegment(&i);

    &rs = &MSG.GetRowset();
    &REC = &rs(1).QE_FLIGHTDATA;

    &FLIGHTDATA = CreateRecord(Record.QE_FLIGHTDATA);
    &REC.CopyFieldsTo(&FLIGHTDATA);

    /* Parse out Message Data */
    &acnumber_value = &FLIGHTDATA.QE_ACNUMBER.Value;
    &msi_sensor_value = &FLIGHTDATA.QE_MSI_SENSOR.Value;
    &ofp_value = &FLIGHTDATA.QE_OFP.Value;
    &actype_value = &FLIGHTDATA.QE_ACTYPE.Value;
    &callsign_value = &FLIGHTDATA.QE_CALLSIGN.Value;
    &squadron_value = &FLIGHTDATA.QE_SQUADRON.Value;
    &comm1_value = &FLIGHTDATA.QE_COMM1.Value;
    &comm2_value = &FLIGHTDATA.QE_COMM2.Value;
    &ecm_value = &FLIGHTDATA.QE_ECM.Value;

    &outstring = "Send Async FLight test";

    /* Construct Output String */
    &outstring = &outstring | &acnumber_value | &CRLF | &msi_sensor_value | &CRLF | =>
&ofp_value | &CRLF | &actype_value | &CRLF | &callsign_value | &CRLF | &squadron_=>
value | &CRLF | &comm1_value | &CRLF | &comm2_value | &CRLF | &ecm_value;

    /* Log Output String into page record */
    &FLIGHTDATA.GetField(Field.DESCRLONG).Value = &outstring;

    SQLExec("DELETE FROM PS_QE_FLIGHTDATA");
    &FLIGHTDATA.Insert();

End-For;

```

Error Handling

In your notification PeopleCode, you may want to validate the information received in the message. If you find that the data isn't valid, use `Exit(1)` to end your PeopleCode program. This sets the status of the message to `ERROR`, logs any error messages to the Application Message Queues, and automatically rolls back any database changes you may have made.

There are many ways to validate the data and capture the error messages:

- Use `ExecuteEdits` on the message object
- Use `ExecuteEdits` on the record object
- Use a Component Interface

Write your own validation PeopleCode in the notification program:

The following example validates the Business Unit of a message against an array of valid BU's:

```
For &I = 1 To &ROWSET.RowCount;

    &POSITION = &BUArray.Find(&ROWSET(&I).GetRecord(1).BUSINESS_UNIT.Value);
    If &POSITION = 0 Then
        &Status = "ERROR: BU not Found or not Active";
        &ROWSET(&I).BCT_ADJS_MSG_VW.BUSINESS_UNIT.IsEditError = True;
        &ROWSET(&I).BCT_ADJS_MSG_VW.BUSINESS_UNIT.MessageSetNumber = 11100;
        &ROWSET(&I).BCT_ADJS_MSG_VW.BUSINESS_UNIT.MessageNumber = 1230;
        /* The error message 11100-1230 reads: This Business Unit is */
        /* not a valid, open, Inventory Business Unit */

    End-If;
End-For;
```

In the calling PeopleCode, the program calls `Exit(1)` based on the value of `&Status`.

Note. All errors for notification PeopleCode get logged to the application message error table, *not* to the `PSMessages` collection (on the session object.)

Message Class Methods

In this section, we discuss the Message class methods. The methods are discussed in alphabetical order.

Clone

Syntax

`clone()`

Description

The Clone method creates an identical copy of the message, copying the data tree of the message executing the method. The Clone function sets the following properties for the resulting message object, based on the values set for the message definition created in Pure PeopleSoft Internet Architecture:

- Name
- QueueName

- IsOperationActive

Other properties are set when the message is published or subscribed to (TransactionID, PubNodeName, and so on), or are dynamically generated at other times (Size, IsEditError, and so on.)

Clone creates a unique version of the message. If the original message changes, it is not reflected in the cloned object.

Parameters

None.

Returns

A message object.

Example

Clone could be used in a Hub and Spoke messaging environment. The Hub node uses this method during notification processing to publish a copy of the messages it receives from the Spokes.

```
&Msg = %IntBroker.GetMessage();  
&Rowset = &Msg.GetRowset();  
&Clone = &Msg.Clone();
```

```
%IntBroker.Publish(&Clone);
```

The hub's publication routing rules are then used to determine which spokes receive the message.

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," CreateMessage

PeopleTools 8.51 PeopleBook: PeopleCode Developer's Guide, "Understanding Objects and Classes in PeopleCode," Assigning Objects

CopyPartRowset

Syntax

CopyPartRowset(PartIndex, &Rowset)

Description

Use the CopyPartRowset to copy the rowset specified by *&Rowset* to the part of the message specified by *PartIndex*.

Note. This method only works with rowset-based container messages.

The primary record of the level zero rowset for both the specified message part and the specified rowset must be the same.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartIndex</i>	Specify the number of the part you want to copy the rowset data to.
<i>&Rowset</i>	Specify an already instantiated rowset object that contains the data that you want to copy to the message part.

Returns

None.

See Also

[Chapter 25, "Message Classes," GetPartRowset, page 1269](#) and [Chapter 25, "Message Classes," GetPartXMLDoc, page 1270](#)

CopyRowset

Syntax

```
CopyRowset(source_rowset [, record_list]);
```

Where *record_list* is a list of record names in the form:

```
RECORD.source_recname1, RECORD.target_recname1  
[, RECORD.source_recname2, RECORD.target_recname2] . . .
```

Description

The CopyRowset method copies data from the source rowset to the like-named fields in the message object executing the method. This is an easy way to populate a message with data from a component.

Note. CopyRowset does not copy effective dated fields.

Note. CopyRowset copies the data, including rows that haven't been modified. If you want to copy only data that has changed in some way, use the CopyRowsetDelta method.

See [Chapter 25, "Message Classes," CopyRowsetDelta, page 1255](#).

When the record names in the message and component do not match exactly, use the optional *record_list* to specify the records to be copied from the component into the message.

When you use the CopyRowset method to copy the contents from the source rowset to the message object, you are creating a *unique* copy of the object. If you change the original rowset, the message object is not changed.

Note. You can execute CopyRowset against a message only once. After a message is populated, any other CopyRowsets are ignored. If you have to populate different levels of a message rowset separately, you can use the CreateRowset method to create a rowset that has the same structure as your message, populate the created rowset, then use CopyRowset to populate your message. You can also use the Rowset CopyTo method to populate a message rowset, then populate the PSCAMA record by hand.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>source_rowset</i>	Specifies the name of the rowset to be copied into the message object.
<i>record_list</i>	Specifies specific source and target records to be copied into the message object.

Returns

None.

Example

The following example copies an entire component into a message object.

```
&Msg = %IntBroker.GetMessage();
&Rowset = &Msg.GetRowset();
&Component_Rowset = GetLevel0();
&Msg.CopyRowset(&Component_Rowset);
```

The following example copies a header/line page rowset into a header/line message object, using the *record_list* because the record names don't match:

```
&Msg = %IntBroker.GetMessage();
&Rowset= &Msg.GetRowset();
&Component_Rowset = GetLevel0();
&Msg.CopyRowset(&Component_Rowset, RECORD.PO_HDR_VW, RECORD.PO_HDR, =>
RECORD.PO_LINE_VW, RECORD.PO_LINE);
```

[Chapter 36, "Rowset Class," page 2115](#)

[Chapter 36, "Rowset Class," Fill, page 2123](#)

CopyRowsetDelta

Syntax

```
CopyRowsetDelta(source_rowset [, record_list]);
```

Where *record_list* is a list of record names in the form:

```
[RECORD.source_recname1, RECORD.target_recname1  
[, RECORD.source_recname2, RECORD.target_recname2]] . . .
```

Description

The CopyRowsetDelta method copies rows of data that have changed from the source rowset to the like-named records and like-named fields in the message object executing the method.

Note. CopyRowsetDelta copies all the like-named fields from the changed *row* into the message. It is *not* copying just the changed like-named fields.

When the record names in the message and component do not match exactly, use the optional *record_list* to specify the records to be copied from the component into the message. The specified target records must be records in your message, while the specified source records must be records in a rowset that exists in the data buffer and is populated.

This is an easy way to populate a message when the records in the message match the records in the component that the message is published from.

In addition, the CopyRowsetDelta method sets the AUDIT_ACTN field in the PSCAMA table for every row in the message. The notification process can then use PSCAMA.AUDIT_ACTN to determine how to process every row that was published.

The set values match those used in audit trail processing, that is:

- A - Row inserted.
- D - Row deleted.
- C - Row changed (updated), but no key fields changed. The system copies the new value to the Message rowset.

- K - Row changed (updated), and at least one key field changed. The system copies the old value to the Message rowset and the new value (see "N").
- N - Row changed (updated), and at least one key field changed. The system copies the old value to the Message rowset and the new value (see "K").
- "" – blank value means that nothing on that row has changed. This is the default value, and is the value used to tag the parent rows of children that have changed.

Note. If a child row is inserted (or changed or deleted) CopyRowsetDelta also copies the parent row (and the parent row of that row, and so on, up to the top row) so the subscriber has a full picture of the transaction. A blank value is set in the AUDIT_ACTN field for these rows to let the subscriber know they don't have to take action; the parent rows are there for reference only.

The Audit_Action values "A", "C", "D" are set when a record is added, changed, or deleted, respectively. In some cases such as effective-dated records, the user may change a key field value, such as Effective Date. In response to such an user action, two records are created, one with an Audit_Action value of "N", and the other with Audit_Action value "K". The "N" record has all the new values, while the "K" record retains the old values.

When you use the CopyRowsetDelta method to copy the contents from the source rowset to the message object, you are creating a *unique* copy of the object. If you change the original rowset, the message object is not be changed.

Note. You can execute CopyRowsetDelta against a message only once. After a message is populated, any other CopyRowsetDeltas are ignored. If you have to populate different levels of a message rowset separately, you can use the CreateRowset method to create a rowset that has the same structure as your message, populate the created rowset, then use CopyRowsetDelta to populate your message. You can also use the Rowset CopyTo method to populate a message rowset, then populate the PSCAMA record by hand.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>source_rowset</i>	Specifies the name of the rowset to be copied into the message object.
<i>record_list</i>	Specifies source and target records to be copied into the message object. The target records must be records in your message, while the source records must be records in a rowset that exists in the data buffer and is populated.

Returns

None.

Example

The following example copies all the changed rows of data from a component into a message object.

```
&Component_Rowset = GetLevel0();
```

```
&Msg.CopyRowsetDelta(&Component_Rowset);
```

CopyRowsetDeltaOriginal

Syntax

```
CopyRowsetDeltaOriginal(source_rowset [, record_list]);
```

Where *record_list* is a list of record names in the form:

```
[RECORD.source_recname1, RECORD.target_recname1  
[, RECORD.source_recname2, RECORD.target_recname2]]. . .
```

Description

The CopyRowsetDeltaOriginal method copies rows of data that have changed from the source rowset to the like-named records and like-named fields in the message. It also copies the original value of the changed rows.

Note. CopyRowsetDeltaOriginal copies all the like-named fields from the changed and original rows into the message. It is not copying just the changed like-named fields.

When the record names in the message and component do not match exactly, use the optional *record_list* to specify the records to be copied from the component into the message. The specified target records must be records in your message, while the specified source records must be records in a rowset that exists in the data buffer and is populated.

The CopyRowsetDeltaOriginal method sets the AUDIT_ACTN field in the PSCAMA table for every row in the message. The notification process can then use PSCAMA.AUDIT_ACTN to determine how to process every row that was published.

The set values match those used in audit trail processing, that is:

- A - Row inserted.
- D - Row deleted.

- C - Row changed (updated), but no key fields changed. The system copies the new value to the Message rowset and the original value (see "O" below).
- O - Prior value of changed row. The system copies the new value to the Message rowset and the original value (see "C").
- K - Row changed (updated), and at least one key field changed. The system copies the original value to the Message rowset and the new value (see "N").
- N - Row changed (updated), and at least one key field changed. The system copies the original value to the Message rowset and the new value (see "K").
- "" – blank value means that nothing on that row has changed. This is the default value, and is the value used to tag the parent rows of children that have changed.

Note. If a child row is inserted (or changed or deleted) CopyRowsetDeltaOriginal also copies the parent row (and the parent row of that row, and so on, up to the top row) so the subscriber has a full picture of the transaction. A blank value is set in the AUDIT_ACTN field for these rows to let the subscriber know they don't have to take action; the parent rows are there for reference only.

The Audit_Action values "A", "C", "D" are set when a record is added, changed or deleted, respectively. When a row is changed, two records are created, one with an Audit_Action of "C", the other with Audit_Action value of "O". The "C" record has all the new values, while the "O" record retains the original values. In some cases such as effective-dated records, a user may change a key field value, such as Effective Date. In response to such an user action, two records are created, one with an Audit_Action value of "N", and the other with Audit_Action value "K". The "N" record has all the new values, while the "K" record retains the original values. The "N"/"K" combination is also created if both a key change and a non-key change is made on the same row of data.

The following table details the output from CopyRowsetDeltaOriginal:

<i>User Action</i>	<i>CopyRowsetDeltaOriginal Output</i>	<i>Comments</i>
Change a key.	"N" and "K" rows created.	The "K" row contains the original Key value, the "N" row, the new.
Change a Key + change a Non-Key.	"N" and "K" rows created only (that is: no "C"/"O" rows in that case).	The Key and Non-Key Original Values are both contained in the "K" row.
Change a Non-Key.	"C" and "O" rows created.	Original Value stored in "O" row.
Add non-effective dated row.	"A" row created.	No additional rows created.
Add effective-dated row and only 1 original effective-dated row exists.	"A" and "O" rows created.	"O" row contains the original effective dated row.

<i>User Action</i>	<i>CopyRowsetDeltaOriginal Output</i>	<i>Comments</i>
Add effective-dated row and more than 1 original effected dated rows exist.	"A" and "O" rows created.	"O" row contains data from row that cursor was on when the new row was added. For example: If a rowset contains two rows (01/01/1980 and 02/02/2000), the current row is the 01/01/1980 row and the user adds a new row with today's date. The original values contain the data from the 01/01/1980. Likewise, if a rowset contains two rows (01/01/1980 and 02/02/2000), the current row is the 02/02/2000 row and the user adds a new row with today's date. Then the original values contain the data from the 02/02/2000.
Delete a row	"D" row created.	No additional rows created.

When you use the `CopyRowsetDeltaOriginal` method to copy the contents from the source rowset to the message object, you are creating a unique copy of the object. If you change the original rowset, the message object is not changed.

Note. You can execute `CopyRowsetDeltaOriginal` against a message only once. After a message is populated, any other `CopyRowsetDeltaOriginal` PeopleCode statements are ignored. If you have to populate different levels of a message rowset separately, you can use the `CreateRowset` method to create a rowset that has the same structure as your message, populate the created rowset, then use `CopyRowsetDeltaOriginal` to populate your message. You can also use the `Rowset CopyTo` method to populate a message rowset, then populate the PSCAMA record manually.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>source_rowset</i>	Specifies the name of the rowset to be copied into the message object.
<i>record_list</i>	Specifies source and target records to be copied into the message object. The target records must be records in your message, while the source records must be records in a rowset that exists in the data buffer and is populated.

Returns

None.

Example

```
Function Update_Dir(&MSGName As string)

    &MSGName = "OPERATION." | &MSGName;
    &MSG = CreateMessage(@(&MSGName));

    &PnlRowset = GetLevel0();
    &MSG.CopyRowsetDeltaOriginal(&PnlRowset);
    %IntBroker.Publish(&MSG);

End-Function;
```

CreateNextSegment

Syntax

CreateNextSegment()

Description

Use the CreateNextSegment method to divide a message into segments. You generally only divide asynchronous messages that contain a large amount of data. This method is used only when creating a message for publication, not after a message has been published.

Parameters

None.

Returns

None.

Example

See [Chapter 25, "Message Classes," Message Segments, page 1247](#).

See Also

[Chapter 25, "Message Classes," CreateNextSegment, page 1260](#); [Chapter 25, "Message Classes," DeleteSegment, page 1261](#); [Chapter 25, "Message Classes," SegmentRestart, page 1279](#); [Chapter 25, "Message Classes," UpdateSegment, page 1287](#); [Chapter 25, "Message Classes," CurrentSegment, page 1290](#) and [Chapter 25, "Message Classes," SegmentCount, page 1302](#)

DeleteSegment

Syntax

DeleteSegment (*SegmentNumber*)

Description

Use the DeleteSegment method to delete the specified segment. This method is used only when creating a message for publication, not after a message has been published.

Note. You should use DeleteSegment and UpdateSegment only when writing to memory, or when SegmentsByDatabase is set to False. These methods do not work when writing to the database, or when SegmentsByDatabase is set to True.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>SegmentNumber</i>	Specify a number indicating which segment you want to delete from the unpublished message.

Returns

None.

See Also

[Chapter 25, "Message Classes," CreateNextSegment, page 1260](#); [Chapter 25, "Message Classes," GetSegment, page 1273](#); [Chapter 25, "Message Classes," UpdateSegment, page 1287](#); [Chapter 25, "Message Classes," CurrentSegment, page 1290](#) and [Chapter 25, "Message Classes," SegmentCount, page 1302](#)

ExecuteEdits

Syntax

ExecuteEdits([*edit levels*]);

where *edit levels* is a list of values in the form:

edit level1 [+ *edit level2*] . . .]);

and where *edit level n* is one of the following system constants:

%Edit_DateRange

%Edit_OneZero

%Edit_PromptTable

%Edit_Required

%Edit_TranslateTable

%Edit_YesNo

Description

The ExecuteEdits method executes the standard system edits on every field for every record in the message executing the method. All edits are based on the record edits defined for the record that the message is based on. The types of edits performed depends on the *edit level*. If no *edit level* is specified, all system edits defined for the record definition are executed, that is:

- Reasonable Date Range (Is the date contained within plus or minus 30 days from the current date?)
- 1/0 (Do all 1/0 fields only contain 1 or 0?)
- Prompt Table (Is field data contained in the specified prompt table?)
- Required Field (Do all required fields contain data? For numeric or signed fields, it checks that they do not contain NULL or 0 values.)
- Translate Table (Is field data contained in the translate table?)
- Yes/No (Do all yes/no fields only contain only yes or no data?)

Note. ExecuteEdits does not perform any validation on DateTime fields.

If any of the edits fail, the status of the property IsEditError is set to True for the Message Object executing the method, and any Rowset, Row, Record, or Field Objects that could be instantiated from the same data as the Message Object. In addition, the Field class properties MessageNumber and MessageSetNumber are set to the number of the returned message and message set number of the returned message, for the field generating the error.

If you want to check the field values only for a particular record, you can use the `ExecuteEdits` method with a record object.

In addition, if you want to dynamically set the prompt tables used for a field (with the `%EditTable` function) you must use the `SetEditTable` method.

Considerations for ExecuteEdits and SetEditTable

If an effective date is a key on the prompt table, and the record being edited doesn't contain an effective-dated field, the current datetime is used as the key value.

If a `setID` is a key on the prompt table, and the record being edited doesn't contain a `setID` field, the system looks for the `setID` on the other records in the current row first, then search parent rows.

Considerations for ExecuteEdits and Numeric Fields

A zero (0) might or might not be a valid value for a numeric field. `ExecuteEdits` processes numeric fields in different ways, depending on whether the field is required:

- If the numeric field is required: 0 is considered invalid.
- If the numeric field is not required: 0 is considered valid.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>editlevel</i>	Specifies the standard system edits to be performed against every field on every record. If <i>editlevel</i> isn't specified, all system edits are performed. <i>editlevel</i> can be any of the following system constants: • <code>%Edit_DateRange</code> • <code>%Edit_OneZero</code> • <code>%Edit_PromptTable</code> • <code>%Edit_Required</code> • <code>%Edit_TranslateTable</code> • <code>%Edit_YesNo</code>

Returns

None.

Example

The following is an example of a call to execute Required Field and Prompt Table edits:

```
&MSG.ExecuteEdits(%Edit_Required + %Edit_PromptTable);
```

The following is an example showing how ExecuteEdits() could be used:

```
&MSG.ExecuteEdits();
If &MSG.IsEditError Then
    Exit(1);
End-If;
```

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages," Processing Inbound Errors

GenXMLPartString

Syntax

```
GenXMLPartString(PartIndex)
```

Description

Use the GenXMLPartString to create an XML string based on the message part specified by *PartIndex*.

Note. This method only works with rowset-based container messages.

Parameters

Parameter	Description
<i>PartIndex</i>	Specify the number of the part that you want to generate an XML string for.

Returns

An XML string.

See Also

[Chapter 25, "Message Classes," GenXMLString, page 1265](#); [Chapter 25, "Message Classes," GetPartRowset, page 1269](#) and [Chapter 25, "Message Classes," LoadXMLPartString, page 1275](#)

GenXMLString

Syntax

GenXMLString()

Description

The GenXMLString method creates an XML string based on the message after it's loaded from the message buffer.

Note. This method does not support nonrowset-based messages.

Parameters

None.

Returns

An XML string.

Example

In the following example, the first three lines of code creates the message object and copies the data from a Component buffer into the message object. The last line creates an XML string based on that message object.

```
&MSG = CreateMessage(OPERATION.PO_INSERT);  
&RS = GetLevel0();  
&MSG.CopyRowset(&RS);  
&XML_STRING = &MSG.GenXMLString();
```

See Also

[Chapter 25, "Message Classes," LoadXMLString, page 1276](#)

GetContentString

Syntax

GetContentString([*SegmentIndex*])

Description

Use the GetContentString to return a string populated with the content from the specified message segment. If you don't specify a segment, the data from the first segment is used.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>SegmentIndex</i>	Specify the message segment that you want to access.

Returns

A string populated with the content of the specified segment if successful, null otherwise.

See Also

[Chapter 25, "Message Classes," CreateNextSegment, page 1260](#)

GetDocument

Syntax

GetDocument([*segmented_message*])

Description

Use these method to get a Document object associated with this message.

Note. If a fault occurs, continue to use GetContentString to read the fault message, and not GetDocument.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>segmented_messsage</i>	Specify a Boolean value indicating whether the message is segmented.

Returns

A Document object.

Example

```
Local Message &Msg;  
Local Document &Doc;  
  
&Msg = CreateMessage(Operation.QEFLIGHTPLAN_DOC);  
&Doc = &Msg.GetDocument( True);  
  
/* populate the document */  
...  
  
&Msg.CreateNextSegment();  
  
&Doc = Null;  
&Doc = &Msg.GetDocument( True);  
  
/* populate the document */  
...
```

See Also

[Chapter 25, "Message Classes," GetContentString, page 1266](#)

[Chapter 15, "Document Classes," Document Class, page 730](#)

GetPartAliasName

Syntax

GetPartAliasName(*PartIndex*)

Description

Use the GetPartAliasName to access the alias of the specified message part.

Note. This method works only with container messages.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartIndex</i>	Specify the message part that you want to access the alias.

Returns

A string containing the message part alias.

See Also

[Chapter 25, "Message Classes," AliasName, page 1288](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Managing Messages," Specifying Record Aliases

GetPartName

Syntax

GetPartName(*PartIndex*)

Description

Use the GetPartName method to return the message name of the message specified by *PartIndex*.

Note. This method works only with container messages.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartIndex</i>	Specify the number of the message part that you want to get the name for.

Returns

A string.

See Also

[Chapter 25, "Message Classes," CopyPartRowset, page 1252](#) and [Chapter 25, "Message Classes," GenXMLPartString, page 1264](#)

GetPartRowset

Syntax

GetPartRowset(*PartIndex*)

Description

Use the GetPartRowset to instantiate and populate a rowset object based on the specified message part in a container message.

Note. This method only works with rowset-based container messages.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartIndex</i>	Specify the number of the message part that you want to instantiate and populate a rowset from.

Returns

A reference to a rowset object if successful, Null otherwise.

See Also

[Chapter 25, "Message Classes," CopyPartRowset, page 1252](#) and [Chapter 25, "Message Classes," GenXMLPartString, page 1264](#)

GetPartVersion

Syntax

GetPartVersion(*PartIndex*)

Description

Use the `GetPartVersion` method to return the version number of the message part specified by *PartIndex*.

Note. This method only works with container messages.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartIndex</i>	Specify the number of the message part that you want to access the version of.

Returns

A string containing the version number.

See Also

[Chapter 25, "Message Classes," PartCount, page 1300](#)

GetPartXMLDoc

Syntax

`GetPartXMLDoc(PartIndex)`

Description

Use the `GetPartXMLDoc` to retrieve the message part data as an `XmlDoc` object.

Note. This method can only be used for a nonrowset-based message parts.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartIndex</i>	Specify the message part that you want to access the data for as an <code>XmlDoc</code> object.

Returns

An `XmlDoc` object populated with the message part data.

See Also

[Chapter 25, "Message Classes," GetXmlDoc, page 1274](#) and [Chapter 25, "Message Classes," GetPartRowset, page 1269](#)

GetQueryString

Syntax

GetQueryString(*Parameter_Name*)

Description

Use the GetQueryString method to obtain the parameter values of a query string.

Note. This method has been deprecated and remains for backward compatibility only. Use the IBConnectorInfo collection GetQueryStringArg method instead.

See Also

[Chapter 25, "Message Classes," GetQueryStringArgName, page 1375](#)

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Parameter_Name</i>	Specify the parameter name you want to obtain.

Returns

A string containing the value of the parameter.

Example

```
Local Message &request;  
Local Rowset &Rowset;  
Local String &emplid;  
  
&request = %IntBroker.GetMessage();  
&Rowset = &request.GetRowset();  
&emplid = &request.GetQueryString("EMPLID");
```

See Also

[Chapter 25, "Message Classes," GetQueryStringArgName, page 1375](#); [Chapter 25, "Message Classes," GetQueryStringArgValue, page 1376](#) and [Chapter 25, "Message Classes," SetQueryString, page 1281](#)

GetRowset

Syntax

```
GetRowset( [version] )
```

Description

The `GetRowset` method returns a standard PeopleCode level zero rowset object for the specified message version. It creates an empty rowset for the specified message version if it doesn't already exist. If no message version is specified, the default message version is used.

When you use the `GetRowset` method, you are not creating a unique copy of the object. You are making only a copy of the reference. If you change the rowset, the original message is changed.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>version</i>	An optional parameter, specifying an existing message version as a string. If <i>version</i> isn't specified, the default message version is used.

Returns

A Rowset object if successful.

Example

The following gets all the SET_CNTRL_REC rows related to the row on the page, then updates the field SETID with the value from the page. `GetRowset` is used to create a rowset based on the message structure, that is, an unpopulated rowset. Because the rowset is unpopulated, you can use the `Fill` method to populate with data from the page.

```

Local Message &MSG;
Local Rowset &MSG_ROWSET;

If FieldChanged(SETID) Then
    &MSG = CreateMessage(OPERATION.SET_CNTRL_REC);
    &MSG_ROWSET = &MSG.GetRowset();
    &MSG_ROWSET.Fill("where SETCNTRLVALUE =:1 and REC_GROUP_ID =:2", SETCNTRLVALUE,⇒
    REC_GROUP_ID);

    For &I = 1 To &MSG_ROWSET.ActiveRowCount
        &MSG_ROWSET.GetRow(&I).SET_CNTRL_REC.SETID.Value = SETID;
        &MSG_ROWSET.GetRow(&I).PSCAMA.AUDIT_ACTN.Value = "C";
    End-For;

    %IntBroker.Publish(&MSG);

End-If;

```

GetSegment

Syntax

GetSegment(*SegmentNumber*)

Description

Use the GetSegment method to return the specified segment. This method doesn't actually return anything, but populates the current message object with the specified segment's data.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>SegmentNumber</i>	Specify the number of the segment you want to access.

Returns

None.

See Also

[Chapter 25, "Message Classes," CreateNextSegment, page 1260](#); [Chapter 25, "Message Classes," DeleteSegment, page 1261](#); [Chapter 25, "Message Classes," UpdateSegment, page 1287](#) and [Chapter 25, "Message Classes," SegmentCount, page 1302](#)

GetXmlDoc

Syntax

GetXmlDoc()

Description

Use the GetXmlDoc method to retrieve the message data as an XmlDocument object.

Note. This method can only be used for a nonrowset-based message. If you use this method with a rowset-based message an error message is returned.

Parameters

None.

Returns

A XmlDocument object.

See Also

[Chapter 25, "Message Classes," SetXmlDoc, page 1284](#)

[Chapter 46, "XmlDoc Classes," page 2517](#)

InBoundPublish

Syntax

InBoundPublish(*PubNodeName*)

Description

Use the `InBoundPublish` method to send an asynchronous message based on a message rowset to simulate an inbound asynchronous request from an external node.

Note. This method has been deprecated and remains for backward compatibility only. Use the `IntBroker` class `InBoundPublish` method instead.

Though you are sending a message to yourself, it goes through all the inbound message processing on *PubNodeName*.

See Also

[Chapter 25, "Message Classes," InBoundPublish, page 1318](#)

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PubNodeName</i>	Specify the name of the node for which you want to test inbound message publishing.

Returns

None.

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," `InboundPublishXmlDoc`

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Applying Filtering, Transformation and Translation"

LoadXMLPartString

Syntax

LoadXMLPartString(*PartIndex*, *XmlString*)

Description

Use the `LoadXMLPartString` method to populate the part of the container message specified by *PartIndex* with the XML string *XmlString*.

Note. This method works only with container messages.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PartIndex</i>	Specify the number of the part of the container message that you want to populate with XML data.
<i>XmlString</i>	Specify the XML string to be loaded into the message part.

Returns

None.

See Also

[Chapter 25, "Message Classes," GenXMLPartString, page 1264](#) and [Chapter 25, "Message Classes," GenXMLString, page 1265](#)

LoadXMLString

Syntax

LoadXMLString(*XMLstring*)

Description

The LoadXMLString method loads the message object executing the method with the XML string *XMLstring*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>XMLString</i>	Specify the XML string to be loaded into the message object.

Returns

None.

Example

```
&MSG = CreateMessage(OPERATION.PO_HEADER);  
&MSG.LoadXMLString(&XML_STRING);
```

See Also

[Chapter 25, "Message Classes," GenXMLString, page 1265](#)

Publish

Syntax

```
Publish( [NodeName] [, Deferred_Mode] )
```

Description

The Publish method publishes a message to the application message queue for the default message version.

Note. This method has been deprecated and remains for backward compatibility only. Use the IntBroker class Publish method instead.

This method does not publish the message if the IsActive property is False.

This method publishes a message asynchronously, that is, a reply message is not automatically generated. To publish a message synchronously, use the SyncRequest method.

Note. This method supports nonrowset-based messages only if the data is populated using the SetXmlDoc method.

If the Publish method is called and the message isn't populated (either using SetXmlDoc or one of the rowset methods,) an empty message is published.

The Publish method can be called from any PeopleCode event, but is generally called from an Application Engine PeopleCode step or from a component.

When publishing from a component, you should publish messages only from the SavePostChange event, either from record field or component PeopleCode. This way, if there's an error in your publish code, the data isn't committed to the database. Also, since SavePostChange is the last Save event fired, you avoid locking the database while the other save processing is happening.

However, until the message is published, the tables involved with the component are locked and are not saved. To avoid problems with this, specify the *Deferred_Mode* property as true, so the message is published after the table data has been committed to the database.

Generally, if the message is successfully published, the PubID, and PubNodeName properties are set to the publication ID and publishing system node name, respectively. The only exception is when the Publish is performed as part of your notification PeopleCode. The notification process is always executed in deferred mode, due to performance considerations, and so the PubID is not populated.

Note. If you're publishing a message from within an Application Engine program, the message won't actually be published until the calling program performs a Commit.

See Also

Chapter 25, "Message Classes," Publish, page 1320

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NodeName</i>	Specify the node to which the message should be published.
<i>Deferred_Mode</i>	Specify whether the message should be published immediately or at the end of the transaction. This parameter takes a Boolean value: False, publish the message immediately, or True, defer the publication. The default value is False.

Returns

None.

Example

The following copies all the data from a page into a message and publishes it.

```
Local Message &MSG;  
Local Rowset &ROWSET;  
  
&MSG = CreateMessage(OPERATION.MESSAGE_PO):  
&ROWSET = GetLevel0();  
&MSG.CopyRowset(&ROWSET);  
&MSG.Publish;
```

The following is an example of putting the Incremental Publish PeopleCode on a Record at Level 1 (or 2, 3). If you just do the normal publishing PeopleCode, you get as many messages as there are records at that level (because the code fires for each record).

To make sure the code fires only once, use the following code.

```

/*NAMES.EMPLID.WORKFLOW */
Local Message &MSG;
Local Rowset &RS;

&LEVEL = CurrentLevelNumber();
&CURRENT_ROW = CurrentRowNumber(&LEVEL);
&TOT_ROW = ActiveRowCount(EMPLID);
/* Only Publish the message once for all records on */
/* this level */
If &CURRENT_ROW = &TOT_ROW Then
    &MSG = CreateMessage(OPERATION.NAMES);
    &RS = GetRowset();
    &MSG.CopyRowsetDelta(&RS);
    &MSG.Publish();
End-If;

```

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Managing Messages," Adding Message Definitions

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," InboundPublishXmlDoc

SegmentRestart

Syntax

SegmentRestart(*TransactionID*, *Segment_index*, *segmentByDB*)

Description

Use the SegmentRestart method to restart a message segment. This is used only in a Application Engine program, and only if check point logic is used.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Transaction_ID</i>	Specify the transaction ID of the message you want to restart.
<i>Segment_Index</i>	Specify the number of the segment that you want to restart.
<i>SegmentByDB</i>	Specify the segments by database.

Returns

None.

See Also

[Chapter 25, "Message Classes," DeleteOrphanedSegments, page 1310](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages," Understanding Message Segments

SetEditTable

Syntax

SetEditTable(%PromptField, **RECORD**.recordname)

Description

The SetEditTable method works with the ExecuteEdits method. It is used to set the value of a field on a record that has its prompt table defined as %PromptField value. %PromptField values are used to dynamically change the prompt record for a field.

There are several steps to setting up a field so that you can dynamically change its prompt table.

To set up a field with a dynamic prompt table:

1. Define a field in the DERIVED record called *fieldname*.
2. In the record definition for the field that you want to have a dynamic prompt table, define the prompt table for the field as %PromptField, where PromptField is the name of the field that you created in the DERIVED record.
3. Use SetEditTable to dynamically set the prompt table.

%PromptField is the name of the field on the DERIVED work record. **RECORD**.recordname is the name of the record to be used as the prompt table.

```
&MSG.SetEditTable("%EDITTABLE1", Record.DEPARTMENT);  
&MSG.SetEditTable("%EDITTABLE2", Record.JOB_ID);  
&MSG.SetEditTable("%EDITTABLE3", Record.EMPL_DATA);  
&MSG.ExecuteEdits();
```

Every field on a record that has the prompt table field %EDITTABLE1 will have the same prompt table, such as, DEPARTMENT.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>%PromptField</i>	Specifies the name of the field in the DERIVED record that has been defined as the prompt table for a field in a record definition.
RECORD . <i>recordname</i>	Specifies the name of the record definition that contains the correct standard system edits to be performed for that field in the message.

Returns

None.

See Also

[Chapter 25, "Message Classes," ExecuteEdits, page 1262](#)

[Chapter 34, "Record Class," SetEditTable, page 2088](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Application Designer Developer's Guide, "Creating Record Definitions," Creating a New Record

SetQueryString

Syntax

SetQueryString(*Parameter_Name*, *Value*)

Description

Use the SetQueryString method to add a parameter value to the query string.

Note. This method has been deprecated and remains for backward compatibility only. Use the IBCConnectorInfo class AddQueryStringArg method instead.

See Also

[Chapter 25, "Message Classes," AddQueryStringArg, page 1369](#)

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Parameter_Name</i>	Specify the name of the parameter that you want to add to the query string, as a string.
<i>Value</i>	Specify the value of the parameter you are adding to the query string.

Returns

None.

Example

```
Local Message &request;  
&request = CreateMessage(OPERATION.QE_SALES_ORDER);  
. . .  
  
. . .  
  
&request.SetQueryString("BUYER", "12345");
```

See Also

[Chapter 25, "Message Classes," AddQueryStringArg, page 1369](#) and [Chapter 25, "Message Classes," GetQueryString, page 1271](#)

SetStatus**Syntax**

SetStatus(*Status*)

Description

Use the SetStatus method to set the status of a publication or subscription contract, much the same way you do in the message monitor.

Note. This method has been deprecated and remains for backward compatibility only. Use the IntBroker class SetStatus method instead.

You may want to use this method after an end-user has finished fixing any errors in the message data.

You can set the status of a contract to one of the following statuses:

- Cancel
- Done
- Error
- New

The method is available only when the message instance has one of the following statuses:

- Cancel
- Done
- Error
- New

See Also

[Chapter 25, "Message Classes," SetStatus, page 1324](#)

Parameters

Parameter	Description
Status	Specify the status that you want to set the message to. Value are: • %Message_Error • %Message_New • %Message_Done • %Message_Started • %Message_Working • %Message_Retry • %Message_Timeout • %Message_Edited • %Message_Canceled

Returns

None.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Managing Messages," Adding Message Definitions

SetXmlDoc

Syntax

SetXmlDoc(*&XmlDoc*)

Description

Use the SetXmlDoc method to load a nonrowset-based message with data from an XmlDocument object.

Note. This method can only be used for nonrowset-based message. If you use this method with a rowset-based message an error message is returned.

Considerations Using SetXmlDoc

In order to wrap non-XML data in cdata wraps as part of a message that would be automatically removed when posted to the gateway, the following cdata wraps are supported:

- `<?xml version="1.0"?>
 <data PsNonXml="Yes"><![CDATA...`
- `<?xml version="1.0"?>
 <data psnonxml="Yes"><![CDATA...`
- `<?xml version="1.0"?><add_some_root_tag>
 <data PsNonXml="Yes"><![CDATA...`
- `<?xml version="1.0"?><add_some_root_tag>
 <data psnonxml="Yes"><![CDATA...`

Parameters

Parameter	Description
<i>&XmlDoc</i>	Specify an already instantiated, populated XmlDocument object.

Returns

None.

See Also

[Chapter 25, "Message Classes," GetXmlDoc, page 1274](#)

[Chapter 46, "XmlDoc Classes," page 2517](#)

SyncRequest

Syntax

SyncRequest ([*NodeName*])

Description

Use the SyncRequest method to send a synchronous message for the default message version.

Note. This method has been deprecated and remains for backward compatibility only. Use the IntBroker class SyncRequest method instead.

Use the IsActive property to determine if a message is active or not before using this method.

This method sends a single message synchronously, that is a reply message is returned as a result of this method.

If you want to publish a message asynchronously, use the Publish method.

If you want to publish more than one message at a time synchronously, use the IntBroker SyncRequest method.

Note. This method supports nonrowset-based messages only if the SetXmlDoc method is used to populate the message prior to using the SyncRequest method.

The SyncRequest method can be called from any PeopleCode event, but is generally called from an Application Engine PeopleCode step or from a component.

When sending a synchronous request from a component, you should send messages only from the SavePostChange event, either from record field or component PeopleCode. This way, if there's an error in your SyncRequest code, the data isn't committed to the database. Also, since SavePostChange is the last Save event fired, you avoid locking the database while the other save processing is happening.

If the message is successfully sent, a response message is returned. In addition, the GUID property is updated with a unique identifier.

See Also

[Chapter 25, "Message Classes," SyncRequest, page 1326](#)

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NodeName</i>	Specify the name of the node that you want to send this message to.

Returns

A response message.

Example

```
Local Message &request, &response;  
Local Rowset &sales_order;  
  
&sales_order = GetLevel0();  
&request = CreateMessage(OPERATION.QE_SALES_ORDER);  
&request.CopyRowsetDelta(&sales_order);  
&response = &request.SyncRequest();  
If (&response.ResponseStatus = 0) Then  
    /* do processing */  
End-If;
```

See Also

[Chapter 25, "Message Classes," Publish, page 1277](#)

[Chapter 25, "Message Classes," SyncRequest, page 1326](#)

Update

Syntax

Update(*[versionlist]*)

where *versionlist* is an arbitrary list of message versions in the following format:

version1 [, *version2*] . . .

Description

The Update method updates a message in the message queue with the specified message versions.

Note. This method has been deprecated and remains for backward compatibility only. Use the `IntBroker` class `Update` method instead.

If *versionlist* isn't specified, the default message version is used. This method is commonly used in the `OnRouteSend` and `OnRouteReceive` `PeopleCode` events.

Note. This method does not support nonrowset-based messages. The `Update` method can't be called from notification `PeopleCode`.

See Also

[Chapter 25, "Message Classes," Update, page 1328](#)

Parameters

<i>Parameter</i>	<i>Description</i>
<i>versionlist</i>	Specify an optional comma-separated list of message versions. If <i>versionlist</i> isn't specified, the default message version is used.

Returns

None.

See Also

[Chapter 25, "Message Classes," GetRowset, page 1272](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Managing Messages," Adding Message Definitions

UpdateSegment

Syntax

`UpdateSegment ( )`

Description

Use the `UpdateSegment` method to update the current segment with data from the message. This method is used only when creating a message for publication, not after a message has been published.

Note. You should use `DeleteSegment` and `UpdateSegment` only when writing to memory, or when `SegmentsByDatabase` is set to `False`. These methods do not work when writing to the database, or when `SegmentsByDatabase` is set to `True`.

Parameters

None.

Returns

None.

See Also

[Chapter 25, "Message Classes," `CreateNextSegment`, page 1260](#); [Chapter 25, "Message Classes," `DeleteSegment`, page 1261](#); [Chapter 25, "Message Classes," `CurrentSegment`, page 1290](#) and [Chapter 25, "Message Classes," `SegmentCount`, page 1302](#)

Message Class Properties

In this section, we discuss the Message class properties. The properties are discussed in alphabetical order.

ActionName

Description

This property returns the name of the action associated with the message, as a string.

This property is read-only.

AliasName

Description

This property returns the name of the alias associated with the message part executing the property.

This property is read-only.

See Also

[Chapter 25, "Message Classes," GetPartAliasName, page 1267](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Managing Messages," Specifying Record Aliases

ChannelName

Description

This property references the name of the channel associated with the message definition.

Note. This property has been deprecated and remains for backward compatibility only. Use the Message class QueueName property instead.

See [Chapter 25, "Message Classes," QueueName, page 1301](#).

This property is set when the message is created. The message instance keys are a subset of the publication and subscription contract keys. This property is one of the message instance keys: the others are PubID and PubNodeName for asynchronous messages, GUID and PubNodeName for synchronous messages.

This property is valid for both synchronous and asynchronous messages.

This property is read-only.

Example

```
&CHANNEL = &MSG.ChannelName
```

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Managing Messages," Adding Message Definitions

Cookies

Description

This property returns or sets the cookies associated with a message.

Note. This property has been deprecated and remains for backward compatibility only. Use the IBInfo class Cookies property instead.

See [Chapter 25, "Message Classes," Cookies, page 1377](#).

You can accept a synchronous response message containing cookies, save those cookies in a global variable, and later return them to the target node in an outbound synchronous or asynchronous request message.

You can access this property only in an inbound synchronous response message or an outbound request message.

This property is read-write.

Example

The following is an example of receiving cookies:

```
Local Message &SalesRequest, &SalesResponse;
Local Rowset &SALES_ORDER;
Global string &SalesCookies;

&SALES_ORDER = GetLevel0();
&SalesRequest = CreateMessage(OPERATION.SALES_ORDER_SYNC);
&SalesRequest.CopyRowsetDelta(&SALES_ORDER);

/* send the synchronous request; the return value is */
/* the response message object */
&SalesResponse = &SalesRequest.SyncRequest();

/* Retrieve cookies from the response message */
&SalesCookies = &SalesResponse.Cookies;
```

The following is an example of returning cookies:

```
Local Message &SalesRequest, &SalesResponse;
Local Rowset &SALES_ORDER;
Global string &SalesCookies;

&SALES_ORDER = GetLevel0();
&SalesRequest = CreateMessage(OPERATION.SALES_ORDER_SYNC);
&SalesRequest.CopyRowsetDelta(&SALES_ORDER);

/* Insert the cookies in the request message */
&SalesRequest.Cookies = &SalesCookies;

/* Send the asynchronous request */
&SalesRequest.Publish();
```

CurrentSegment

Description

This property returns a number, indicating which segment is the current segment.

This property is read-only.

DefaultMessageVersion

Description

This property returns the default version of the message as a string.

Note. This property has been deprecated and remains for backward compatibility only. Use the `Message` class `OperationVersion` property instead.

See [Chapter 25, "Message Classes," OperationVersion, page 1299](#).

This is the message version from the pub/sub contract, not the default message version of the message defined in the current system.

This property is valid for both synchronous and asynchronous messages.

This property is read-only.

Example

```
Local Message &MSG;  
Local String &VER;  
  
&MSG = %IntBroker.GetMessage();  
&VER = &MSG.DefaultMessageVersion;
```

DoNotPubToNodeName

Description

Use this property to set the node name of a node that you do not want to publish this message to. For example, a single node may publish and subscribe to the same message. You can use this property to prevent the system from subscribing to the same message it publishes. This can help prevent circular processing where the original publisher eventually receives the same message.

This property is only valid for asynchronous messages.

This property is read-write.

Example

```
&MSG.DoNotPubToNodeName = &MSG.PubNodeName;  
&MSG.Publish();
```

GUID

Description

This property returns a string representing a global unique identifier generated when the message was sent.

Note. This property has been deprecated and remains for backward compatibility only. Use the `Message` class `TransactionId` property instead.

See [Chapter 25, "Message Classes," TransactionId, page 1306](#).

This property returns the unique identifier used with the message.

This property is valid only for synchronous messages.

This property is read-only.

Example

```
Local Message &request;  
Local String &guid;  
  
&request = %IntBroker.GetMessage();  
  
&guid = &request.GUID;
```

IBException

Description

Use the `IBException` property to return a reference to an exception object. The object is populated with information about the integration broker error.

This property is read-only.

See Also

[Chapter 16, "Exception Class," page 761](#)

IBInfo

Description

Use this property to return a reference to an `IBInfo` object.

This property is read-only.

IsActive

Description

Indicates whether the message definition has been set to inactive.

Note. This property has been deprecated and remains for backward compatibility only. Use the Message class `IsOperationActive` property instead.

See [Chapter 25, "Message Classes," IsOperationActive, page 1296](#).

This property is `True` if the message definition is active, `False` if it's been inactivated. If you have a lot of PeopleCode associated with publishing a message, you might use this property to check if the message is active before you publish it.

This property is valid for both asynchronous and synchronous messages.

This property is read-only.

Example

```
&MSG = CreateMessage(OPERATION.MY_MESSAGE)
If &MSG.IsActive Then
    /* do PeopleCode processing */
    &MSG.Publish();
Else
    /* do other processing */
End-if;
```

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Managing Messages," Adding Message Definitions

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," IsMessageActive

IsBulkLoadTruncation

Description

Use this property to return a Boolean value indicating whether the truncation option is selected on the bulk loader handler.

This property is read-only.

IsDelta

Description

This property indicates if any fields in a message populated from page data have been changed since they were first loaded into the component buffer.

This is generally used in the following scenario:

You want to publish a message only if the end-user has changed a value on a page. The problem is that if the end-user makes a change to a field in the level three rowset, the IsChanged property for the top level row remains False. If the rowset is large, and you don't want to iterate through it to find a single IsChanged, you can use this property to quickly determine if something has changed at a lower level and the message should be published.

Note. This property should be used only when the message and the component do not have the same structure (that is, the same records at the same levels). If the message and the component have the same structure use the CopyRowsetDelta method instead.

This property takes a Boolean value: True if there are changed fields in the message, False otherwise.

This property is valid for both asynchronous and synchronous messages.

This property is read-only.

Example

```
&Msg = CreateMessage(OPERATION.MY_MESSAGE);
&Msg_Rowset = &Msg.GetRowset(); /* get first level in Msg RS */
&Msg_Detail = &Msg_Rowset(1).GetRowset(); /* get detail in Msg */
&Page_Rowset = GetRowset(); /* get page */
For &I = &Page_Rowset.RowCount
    &Page_Detail = &Page_Rowset.GetRow(&I).GetRowset();
    &Msg_Detail.CopyRowset(&Page_Detail);
End-For;
/* Find if any data changed and should publish message */
If &Msg.IsDelta Then
    &Msg.Publish();
Else
    /* don't publish message and do other processing */
End-If;
```

See Also

Chapter 25, "Message Classes," CopyRowsetDelta, page 1255

IsEditError

Description

This property is True if an error has been found on any field in any record of the current message after executing the ExecuteEdits method on either a message object or a record object. This property can be used with the Field Class properties MessageSetNumber and MessageNumber to find the error message set number and error message number.

You can use this property in notification PeopleCode with the Exit function with a value of 1. This automatically rolls back any changes that were made to the database, saves the message errors to the message queue, and marks the message status as ERROR.

This property is valid for both asynchronous and synchronous messages.

This property is read-only.

Example

```
&MSG = %IntBroker.GetMessage();  
&Rowset = &MSG.GetRowset();  
&MSG.ExecuteEdits();  
If &MSG.IsEditError Then  
    Exit(1);  
End-If;
```

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," Exit

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages," Processing Inbound Errors

IsEmpty

Description

This property indicates whether the transaction occurred without error, but returned an empty XML document. An empty response object contains only the data tags:

```
<data></data>
```

This property returns a Boolean value: True, the response message is empty, False, the response message is not empty.

This property is valid only for the returned response message from a synchronous request message.

This property is read-only.

IsLocal

Description

This property is True if the message object that was just instantiated was published locally. This property takes a Boolean value.

This property is valid for both asynchronous and synchronous messages.

This property is read-only.

Example

```
&MSG = %IntBroker.GetMessage();
If &MSG.IsLocal Then /* LOCAL NODE */
    /* do processing specific to local node */
Else
    /* do processing specific to remote nodes */
End-If;
```

IsOperationActive

Description

Use the IsOperationActive property to determine if an operation is active or not.

This property returns a Boolean value: true if the operation is still active, false otherwise.

This property is read-only.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Managing Messages," Adding Message Definitions

IsParts

Description

Use the IsParts property to determine if the message is a container message, that is, composed of parts.

This property only determines if a message is a container message. If you'd like to know if the message is a rowset-based message with parts, use the IsPartsStructured property instead.

This property returns a Boolean value: true if the message executing the property is a container message, false otherwise.

This property is read-only.

See Also

[Chapter 25, "Message Classes," IsPartsStructured, page 1297](#)

IsPartsStructured

Description

Use the IsPartsStructured property to determine if the message is a container message, that is, composed of parts, as well as a rowset-based message.

This property determines if a message is a container message as well as rowset-based. If you only want to know if the message is a container message, use the IsParts property instead.

This property returns a Boolean value: true if the message executing the property is a container message that is rowset-based, false otherwise.

This property is read-only.

See Also

[Chapter 25, "Message Classes," IsParts, page 1297](#)

IsRequest

Description

Use the IsRequest property to determine whether a message is a request message (as opposed to a response message.)

This property returns a Boolean value: true if the message object executing the property is a request message, false otherwise.

This property is read-only.

IsSourceNodeExternal

Description

Use the IsSourceNodeExternal property to determine whether the message came from an internal system or a third-party system.

This property returns a Boolean value: true if the message originated from a third-party system, false otherwise.

This property is read-only.

IsStructure

Description

This property indicates whether the message is rowset-based, that is, based on a rowset, or nonrowset-based that is, based on an XmlDocument. This property returns a Boolean value, true if the message is rowset-based, false otherwise.

This property is read-only.

MessageDetail

Description

This property specifies the message detail, as a string. The message detail can be used to further identify a message.

Note. This property has been deprecated. It is no longer supported.

Name

Description

This property returns the name of the message as a string.

This property is valid with both asynchronous and synchronous messages.

This property is read-only.

NRId

Description

This property returns the non-repudiation ID as a string. This property is populated with a unique string when the message is published.

This property is only valid with messages that use non-repudiation.

This property is read-only.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker Administration, "Setting Up Secure Integration Environments," Implementing Nonrepudiation

OperationName

Description

Use the OperationName property to return the name of the operation associated with the message object executing the property, as a string.

This property is read-only.

OperationVersion

Description

Use the OperationVersion property to determine version for the operation associated with the message object executing the property, as a string.

This property is read-only.

ParentTransactionId

Description

Use the ParentTransactionId property to return the parent transaction ID, that is, the ID that is generated with the original request message from a third-party system.

This property is read-only.

See Also

[Chapter 25, "Message Classes," TransactionId, page 1306](#)

PartCount

Syntax

Use the PartCount property to determine the number of parts in a container message. This property is only valid with container messages. You will receive an error if you try to use it on a message that isn't a container message.

This property is read-only.

PubID

Description

This property refers to the publication identifier, which is a number.

Note. This property has been deprecated and remains for backward compatibility only. Use the Message class QueueSeqId property instead.

See [Chapter 25, "Message Classes," QueueSeqId, page 1301](#).

It's generated for asynchronous messages when the message is published, and is sequential, based on the number of messages published for that channel. The message instance keys are a subset of the publication and subscription contract keys. This property is one of the message instance keys: the others are ChannelName and PubNodeName.

Note. The PubID property is not populated when the message is published from a notification.

This property is valid only with asynchronous messages.

This property is read-only.

Example

```
&MSG.Publish();  
&PUBID = &MSG.PubID;
```

PubNodeName

Description

This property refers to a string that contains the name of the publishing node. It is generated by the system when the message is published. The message instance keys are a subset of the publication and subscription contract keys.

This property is valid for both asynchronous and synchronous messages.

For a synchronous message, this property returns the name of the requesting node.

This property is read-only.

Example

```
&MSG = %IntBroker.GetMessage();  
&PUBNODE = &MSG.PubNodeName;
```

QueueName

Description

Use the QueueName property to return the name of the queue associated with the message.

This property is read-only.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Managing Service Operation Queues"

QueueSeqId

Description

Use the QueueSeqId property to return the sequence number of the message in the message queue.

This property is read-only.

ResponseStatus

Description

This property is valid only for the returned response message from a synchronous request message.

This property indicates whether a response was successful or not.

Note. This is not the same as SetStatus, which is used only with the message monitor.

This property returns a numeric value: 0, the response was successful, any other number indicates an error.

This property is read-only.

SegmentCount

Description

This property returns the total number of segments for the message.

This property is read-only.

SegmentsByDatabase

Description

Use this property to specify whether segments are stored in memory while being processed.

If you specify SegmentsByDatabase as false, you can only have the number of segments as specified in PSADMIN (Message Segment From DB). If you specify this property as true, you can have as many segments as you need.

The SegmentsByDatabase property also specifies whether the segments are kept in memory or written to the database when they are received. If you specify true, the segments are automatically written to the database. If you specify false, the segments are held in memory. If you specify true, then cancel out of the program processing the segments, the changes are not committed to the database.

This property is automatically set to true for message segments being processed using a Application Engine program.

This property is read-write.

See Also

[Chapter 25, "Message Classes," Message Segments, page 1247](#)

[Chapter 25, "Message Classes," SegmentsUnOrder, page 1365](#)

Size

Description

The Size property is the approximate size of the uncompressed XML data generated when the message is published. The availability and meaning of the Size property depends on the message type as follows:

- For rowset-based message parts, the Size property is available and based on the estimated XML size.
- For non-rowset-based messages, the Size property is available and based on the XML data size.
- For container-based messages, the Size property is available on received messages only—that is for OnRequest or OnNotify PoepCode events.
- For container-based message parts, the Size property is available and based on the estimated XML size.
- For document-based messages, the Size property is available and based on the XML data size.

The size is approximate for the following reasons:

- The maximum size of fields is used except for the case of long text and image fields.
- The active row count is used, without regard to whether the rows have been changed. In a CopyRowsetDelta, rows that are not changed, are not published.
- It doesn't include the size of the XML tags.

This property can be used with the system property %MaxMessageSize in a batch Application Engine program to prevent the application from publishing a message that is too large.

This property is valid for both asynchronous and synchronous messages.

This property is read-only.

Example

```
If &MSG.Size > %MaxMessageSize Then
    &MSG.Publish();
Else
    /*Move more data into the message object */
End-If;
```

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "System Variables," %MaxMessageSize

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages"

SubName

Description

This property refers to a string that contains the name of the notification process currently processing the message.

Note. This property has been deprecated and remains for backward compatibility only. Use the Message class ActionName property instead.

See [Chapter 25, "Message Classes," ActionName, page 1288](#).

It is available only when GetMessage is used in a notification PeopleCode program.

This property is only valid for asynchronous messages.

This property is read-only.

Example

```
&MSG = %IntBroker.GetMessage();  
&SUBNAME = &MSG.SubName
```

SubQueueName

Description

Use the SubQueueName to return or specify the name of the sub-queue associated with the message, as a string.

This property is read-write.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Managing Service Operation Queues"

SubscriptionProcessId

Description

This property returns a string containing the subscription process identifier. This is a unique sequential number.

Note. This property has been deprecated and remains for backward compatibility only. Use the `Message` class `TransactionId` property instead.

See [Chapter 25, "Message Classes," TransactionId, page 1306](#).

This property is populated only if the "Generate Subscription Process Instance" option is turned on in the Subscription Process definition.

The subscription process identifier corresponds to the subscription process instance, not the message instance. If there are multiple subscription processes for the same message each subscription process will have a different, unique ID.

If the subscription process terminated abnormally, its process instance is lost, and a new one is generated on the next retry (that is, there will be a gap in the sequence.)

This property is valid only for asynchronous messages.

This property is read-only.

Considerations for Using SubscriptionProcessId

Consider the following when using `SubscriptionProcessId`:

- Using the `Run PeopleCode` option from `Message Subscription` does not generate the number. It is generated only if the Application Server is running the `PeopleCode`.
- If for some reason you have to rerun the subscription, a new number is assigned.
- Because generating the number is optional, your program must contain code to support the option being turned off. Here is a code example from `ITEM_SYNC`:

```
If All(&MSG.SubscriptionProcessId) Then
    &EIP_CTL_ID = Generate_EIP_CTL_ID(4, &MSG.SubscriptionProcessId);
Else
    &EIP_CTL_ID = Generate_EIP_CTL_ID(1, "Random");
End-If;
```

- If the flag is off, this property is blank. In this case, you may want to adopt a standard for generating a random number, as shown in the previous example.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages"

TransactionId

Description

Use the TransactionId property to return the transaction ID for an already published message, as a string. This is a unique transaction identifier for the message.

This property is read-only.

Version

Description

Use the Version property to determine the version of the message executing the property, as a string.

This property is read-only.

IntBroker Class

An IntBroker object is returned from the system variable %IntBroker.

IntBroker Class Methods

In the following section, we discuss the IntBroker class methods. The methods are described in alphabetical order.

Cancel

Syntax

Cancel(*TransactionId*, *QueueName*, *DataType*, *SegmentIndex* | *TransactionIdArray*, *QueueNameArray*, *DataTypeArray*, *SegmentIndexArray*)

Description

Use the Cancel method to programmatically cancel either a message, or a list of messages, from the message queue, much the same as you can do in the message monitor.

This method is only available when the message has one of the following statuses:

- Edited

- Error
- New
- Retry
- Timeout

If you are specifying an array of messages to be canceled, and any message in the array fails for any reason (for example, you specify a message that doesn't have the correct status) no messages are canceled and the method return value is false.

Parameters

Parameter	Description
<i>TransactionId</i> <i>TransactionIdArray</i>	Specify either a single transaction ID as a string, or specify an array of string containing the transaction IDs of the messages you want to cancel.
<i>QueueName</i> <i>QueueNameArray</i>	Specify either a single queue name as a string, or specify an array of string containing the queue names that contain the messages you want to cancel.
<i>DataType</i> <i>DataTypeArray</i>	Specify either a single data type, or an array of string containing the data types. See below for valid data types.
<i>SegmentIndex</i> <i>SegmentIndexArray</i>	Specify either a specific segment, or an array of integer containing the segment numbers you want to cancel.

For the *DataType* or *DataTypeArray* parameters, the valid data types are:

Constant Value	Description
%IntBroker_BRK	Cancel the message for the web services gateway.
%IntBroker_PUB	Cancel the message for the publication contract.
%IntBroker_SUB	Cancel the message for the subscription contract.

Returns

A Boolean value: true if the message or messages are canceled successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," Resubmit, page 1322](#)

ConnectorRequest

Syntax

ConnectorRequest (*&Message*)

Description

Use the ConnectorRequest method to return a response message from the connector, based on the message passed in.

You would only use this method after you had set the connector information.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Message</i>	Specify an already instantiated message object to return a response message from the connector.

Returns

A reference to a message object.

Example

```
Local string &nonXmlData = "<?xml version='\"1.0\"'?><data psnonxml='\"yes\"'><!--
[CDATA[" | &encoded | "]]></data>";
&soapMsg = CreateXmlDoc(&nonXmlData);

&reqMsg.SetXmlDoc(&soapMsg);

Local Message &respMsg;

%This.SetConnectorProperties(&reqMsg, &url);

&respMsg = %IntBroker.ConnectorRequest(&reqMsg);

If &respMsg = Null Then /* Throw exception */
    %This.HandleNullSoapResponse(&soapMsg, &url);
End-If;
```

See Also

[Chapter 25, "Message Classes," ConnectorRequestUrl, page 1309](#)

ConnectorRequestUrl

Syntax

ConnectorRequestUrl(URL)

Description

Use the ConnectorRequestUrl method to return the URL for a connector.

You must have already set the connector parameters before executing this command.

Parameters

<i>Parameter</i>	<i>Description</i>
URL	Specify an absolute URL as a string.

Returns

A string.

Example

```
/**
 * Get XML Doc from URL
 *
 * @param String - Location
 * @return XmlDocument - retrieved XmlDocument
 */

method getXmlDocumentFromURL
    /+ &location as String +/
    /+ Returns XmlDocument +/
    Local XmlDocument &xmldoc;
    Local string &xmlstr;

    If Substring(LTrim(RTrim(Upper(&location))), 1, 4) = "HTTP" Then
        &xmlstr = %IntBroker.ConnectorRequestUrl(&location);
    Else
        &xmlstr = %This.getXmlContentFromFile(&location);
    End-If;

    &xmldoc = CreateXmlDoc("");

    If &xmldoc.ParseXmlString(&xmlstr) Then
        Return &xmldoc;
    End-If;

end-method;
```

See Also

[Chapter 25, "Message Classes," ConnectorRequest, page 1308](#)

DeleteOrphanedSegments

Syntax

DeleteOrphanedSegments(*TransactionId*)

Description

Use the DeleteOrphanedSegments method to delete segments that might have been orphaned if you were processing message segments using a Application Engine program that had to be restarted. Since each segment is committed to the database, if the application engine program is aborted, these segments need to be deleted from the database.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionId</i>	Specify the transaction ID that identifies the message which contains the segments you want to delete.

Returns

A Boolean value: true if the method completes successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," SegmentRestart, page 1279](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages," Understanding Message Segments

GetArchData

Syntax

GetArchData(*TransactionId*, *SegmentIndex*)

Description

Use the `GetArchData` method to retrieve an archived message from the message queue.

Note. This method shouldn't be used in standard message processing. It should only be used when accessing archived messages.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionId</i>	Specify the transaction ID of the archived message you want to retrieve.
<i>SegmentIndex</i>	Specify the number of the segment of the archived message that you want to retrieve.

Returns

An XML string containing the archived data.

See Also

[Chapter 25, "Message Classes," GetArchIBInfoData, page 1311](#)

GetArchIBInfoData

Syntax

`GetArchIBInfoData(TransactionId, ParentTransactionId)`

Description

Use the `GetArchIBInfoData` method to retrieve return archived IBInfo data.

Note. This method shouldn't be used in standard message processing. It should only be used when accessing archived messages.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionId</i>	Specify the transaction ID of the archived message you want to retrieve.

<i>Parameter</i>	<i>Description</i>
<i>ParentTransactionId</i>	Specify the parent transaction ID, for the message.

Returns

An XML string containing the archived data.

See Also

[Chapter 25, "Message Classes," GetArchData, page 1310](#)

GetIBInfoData

Syntax

GetIBInfoData(*TransactionId*, *DataType*)

Description

Use the GetIBInfoData to return the specified IBInfo data.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionID</i>	Specify the transaction ID of the message that you want to access.
<i>DataType</i>	Specify the data type of the message you want to access. The valid values are:

<i>Constant Value</i>	<i>Description</i>
%IntBroker_BRK	Get the message for the web services gateway.
%IntBroker_PUB	Get the message for the publication contract.
%IntBroker_SUB	Get the message for the subscription contract.

Returns

An XML string containing the message data.

See Also

[Chapter 25, "Message Classes," GetArchIBInfoData, page 1311](#)

GetIBTransactionIDforAE

Syntax

GetIBTransactionIDforAE(*OperID*, *RunCtlID*)

Description

Use this method to get the Integration Broker transaction ID from within an Application Engine program. You can use this transaction ID to instantiate a message object and thereby retrieve the message content data.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>OperID</i>	Specifies the operator ID for the Application Engine program as a string.
<i>RunCtlID</i>	Specifies the run control ID for the Application Engine program as a string.

Returns

A string representing the transaction ID.

Example

```
&TransID = %IntBroker.GetIBTransactionIDforAE(&opid, &runid);  
&Msg = %IntBroker.GetMessage(&TransID, %IntBroker_SUB);
```

GetMessage

Syntax

GetMessage([*TransactionId*, *DataType*])

Description

Use the GetMessage method to return a message object.

If you specify a transaction ID and data type, the GetMessage method populates the message object with the data from that message.

If you do not specify any parameters, the GetMessage method doesn't populate the message with data. Instead, it creates a new instance of a message object. In this case, you must use another method, such as GetRowset, to populate the message object. You must always populate the message object with data before running any methods on it.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionId</i>	Specify the transaction ID for the message that you want returned.
<i>DataType</i>	Specify the type of message that you want returned. The valid values are:

<i>Constant Value</i>	<i>Description</i>
%IntBroker_BRK	Get the message for the web services gateway.
%IntBroker_PUB	Get the message for the publication contract.
%IntBroker_SUB	Get the message for the subscription contract.

Returns

A reference to a message object if successful, Null if not successful.

Example

The following example returns a populated message object:

```
Local Message &MSG;  
Local string &TransactionId;  
  
&TransactionId = "0f3617d1-c6f4-11d9-a4bd-c12cba1bc2f9"  
&MSG = %IntBroker.GetMessage(&TransactionId, %IntBroker_BRK);
```

See Also

[Chapter 25, "Message Classes," GetRowset, page 1272](#)

[Chapter 25, "Message Classes," TransactionId, page 1306](#)

GetMessageErrors

Syntax

GetMessageErrors(*TransactionId*)

Description

Use the GetMessageErrors method to return an array that contains the errors that an application has set for the message, and have been written to the error queue. This method is generally only used with asynchronous messages.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionId</i>	Specify the transaction ID for the message, as a string.

Returns

An array of string. If there are no error messages, the Len property of the array is 0.

Example

The following is an example of using the method for returning web services gateway error messages:

```
&MyErrors = %IntBroker.GetMessageErrors(&TransactionId);
```

See Also

[Chapter 25, "Message Classes," SetErrorMessage, page 1323](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages," Processing Inbound Errors

GetMsgSchema

Syntax

GetMsgSchema(*MsgName*, *MsgVersion*)

Description

Use the `GetMsgSchema` method to access the saved schema for the specified message.

If you specify a message that does not have a saved schema, you receive a null value.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>MsgName</i>	Specify the name of the message for which you want to access a schema. You can either specify the name of the message as a string, or preface the message name with the keyword Message .
<i>MsgVersion</i>	Specify the message version.

Returns

A string containing the message schema. If you try to get a schema for a message that does not have a saved schema, returns null.

See Also

[Chapter 25, "Message Classes," MsgSchemaExists, page 1320](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Building Message Schemas"

GetSyncIBInfoData

Syntax

`GetSyncIBInfoData(TransactionId,%LogType [, Archive])`

Description

Use the `GetSyncIBInfoData` method to return a log containing information about synchronous transactions.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionId</i>	Specify the transaction ID of the published message.

Parameter	Description
<i>LogType</i>	Specify the type of log you want returned, based on the type of message. See below for the valid values.
<i>Archive</i>	Specify whether to retrieve any archived logs as well. This parameter takes a Boolean value: true to return archived logs, false otherwise. The default value is false.

For the *LogType* parameter, the valid values are:

Constant Value	Description
%Sync_RequestOrig	Gets the log for a sync request original data message.
%Sync_RequestTrans	Gets the log for a sync request transformed data message.
%Sync_ResponseOrig	Gets the log for a sync response original data message.
%Sync_ResponseTrans	Gets the log for a sync response transformed data message.

Returns

An XML string containing the log data.

See Also

PeopleTools 8.51 PeopleBook: Integration Broker Service Operations Monitor, "Understanding the Integration Broker Service Operations Monitor"

GetSyncLogData

Syntax

```
GetSyncLogData(TransactionId,%LogType [, Archive])
```

Description

Use the GetSyncLogData method to return a log containing information about the specified synchronous message.

You can use this information for debugging. Using this method, you can obtain the request and response data in a synchronous request, both pre- and post-transformation.

This function is used in the PeopleCode for the Message Monitor.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionId</i>	Specify the transaction ID of the published message.
<i>LogType</i>	Specify the type of log you want returned, based on the type of message. See below for the valid values.
<i>Archive</i>	Specify whether to retrieve any archived logs as well. This parameter takes a Boolean value: true to return archived logs, false otherwise. The default value is false.

For the *LogType* parameter, the valid values are:

<i>Constant Value</i>	<i>Description</i>
%Sync_RequestOrig	Gets the log for a sync request original data message.
%Sync_RequestTrans	Gets the log for a sync request transformed data message.
%Sync_ResponseOrig	Gets the log for a sync response original data message.
%Sync_ResponseTrans	Gets the log for a sync response transformed data message.

Returns

An XML string containing the log data.

See Also

PeopleTools 8.51 PeopleBook: Integration Broker Service Operations Monitor, "Understanding the Integration Broker Service Operations Monitor"

InBoundPublish

Syntax

InBoundPublish(&Message)

Description

Use the InBoundPublish method to send an asynchronous message based on the specified message to simulate an inbound asynchronous request from an external node. Although you are sending a message to yourself, it goes through all the inbound message processing that the specified message would.

Prior to call the `InBoundPublish` method, the `Message` object needs to be populated with the requesting node and external operation name.

See *PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker*, "Sending and Receiving Messages," Simulating Receiving Messages from External Nodes.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Message</i>	Specify an already instantiated message object that you want to use for the message simulation.

Returns

A Boolean value, true if the message is published successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," Publish, page 1320](#) and [Chapter 25, "Message Classes," SyncRequest, page 1326](#)

IsOperationActive

Syntax

IsOperationActive(*OperationName* [,*OperationVersion*])

Description

Use the `IsOperationActive` method to determine if an operation is active or not.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>OperationName</i>	Specify the name of the operation that you want to check the status of.
<i>OperationVersion</i>	Specify the version of the specified operation that you want to check the status of, as a string.

Returns

A Boolean value: true if the operation is active, false otherwise.

MsgSchemaExists

Syntax

MsgSchemaExists(*MsgName*, *MsgVersion*)

Description

Use the MsgSchemaExists method to determine if a schema has been created and saved for the specified message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>MsgName</i>	Specify the name of the message for which you want to access a schema. You can either specify the name of the message as a string, or preface the message name with the keyword Message .
<i>MsgVersion</i>	Specify the message version.

Returns

A Boolean value: true if the message schema exists, false otherwise.

See Also

[Chapter 25, "Message Classes," GetMsgSchema, page 1315](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Building Message Schemas"

Publish

Syntax

Publish(&*Message* [, &*ArrayOfNodeNames*] [, *IsEnqueued*])

Description

The Publish method publishes a message to the message queue for the default message version.

This method does not publish the message if the IsOperationActive property for the message is False.

This method publishes a message asynchronously, that is, a reply message is not automatically generated. To publish a message synchronously, use the `SyncRequest` method.

Note. This method supports nonrowset-based messages only if the data is populated using the `SetXmlDoc` method.

If the `Publish` method is called and the message isn't populated (either using `SetXmlDoc` or one of the rowset methods,) an empty message is published.

The `Publish` method can be called from any `PeopleCode` event, but is generally called from an `Application Engine` `PeopleCode` step or from a component.

When publishing from a component, you should publish messages only from the `SavePostChange` event, either from record field or component `PeopleCode`. This way, if there's an error in your publish code, the data isn't committed to the database. Also, since `SavePostChange` is the last `Save` event fired, you avoid locking the database while the other save processing is happening.

However, until the message is published, the tables involved with the component are locked and are not saved. To avoid problems with this, specify the `Deferred_Mode` property as true, so the message is published after the table data has been committed to the database.

Note. If you're publishing a message from within an `Application Engine` program, the message won't actually be published until the calling program performs a `Commit`.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Message</i>	Specify an already instantiated message object to be published.
<i>&ArrayOfNodeNames</i>	Specify an already instantiated array of string containing the names of the nodes that you want to publish to.
<i>IsEnqueued</i>	Specify whether the message is to be enqueued or not. This parameter takes a Boolean value: true if the message is to be enqueued, false otherwise. The default value is false.

Returns

None.

Example

```
Local Message &Msg;  
Local Rowset &rs;  
Local IntBroker &Ib;  
  
&Flight_profile = GetLevel0();  
  
&Msg = CreateMessage(Operation.ASYNC, %IntBroker_Request);  
  
&Msg.CopyRowset(&FlightProfile);  
  
&Ib = %IntBroker;  
  
&Ib.Publish(&Msg);
```

See Also

[Chapter 25, "Message Classes," SyncRequest, page 1326](#)

Resubmit

Syntax

```
Resubmit({TransactionId, QueueName, DataType, SegmentIndex} | {TransactionIdArray, QueueNameArray, DataTypeArray, SegmentIndexArray})
```

Description

Use the Resubmit method to programmatically resubmit either a message, or a list of messages, from the message queue, much the same as you can do in the message monitor.

You may want to use this method after an end-user has finished fixing any errors in the message data, and you want to resubmit the message, rerunning the PeopleCode.

This method is only available when the message has one of the following statuses:

- Canceled
- Edited
- Error
- Timeout

If you are specifying an array of messages to be resubmitted, and any message in the array fails for any reason (for example, you specify a message that doesn't have the correct status) no messages are resubmitted and the method return value is false.

Parameters

Parameter	Description
<i>TransactionId</i> <i>TransactionIdArray</i>	Specify either a single transaction ID as a string, or specify an array of string containing the transaction IDs of the messages you want to resubmit.
<i>QueueName</i> <i>QueueNameArray</i>	Specify either a single queue name as a string, or specify an array of string containing the queue names that contain the messages you want to resubmit.
<i>DataType</i> <i>DataTypeArray</i>	Specify either a single data type, or an array of string containing the data types. See below for the valid data type values.
<i>SegmentIndex</i> <i>SegmentIndexArray</i>	Specify either a specific segment, or an array of integer containing the segment numbers you want to resubmit.

For the *DataType* or *DataTypeArray* parameters, the valid data types are:

Constant Value	Description
%IntBroker_BRK	Resubmit the message for the web services gateway.
%IntBroker_PUB	Resubmit the message for the publication contract.
%IntBroker_SUB	Resubmit the message for the subscription contract.

Returns

A Boolean value: true if the message or messages are resubmitted successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," Cancel, page 1306](#)

SetErrorMessage

Syntax

```
SetErrorMessage(TransactionId, MsgSet, MsgNumber, Error_Location, ParmList)
```

Description

Use the SetErrorMessage method to write messages to the error queue. This method is used with asynchronous messages only.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TransactionId</i>	Specify the transaction ID for the message, as a string.
<i>MsgSet</i>	Specify the number of the message set that the message associated with the error is associated with.
<i>MsgNumber</i>	Specify the message number that you want to associate with this error.
<i>Error_Location</i>	Specify where the error occurred, or any additional information you want to give about the error. This is a string, and allows 254 characters.
<i>ParmList</i>	Specify up to four values to be used as replacement values for the message text. The first value in <i>ParmList</i> is used to replace the first replacement character (that is, %1,) the second is used to replace the second (%2) and so on.

Returns

A Boolean value, true if the error message was associated correctly, false otherwise.

Example

The following is an example of setting an error message for the web services gateway:

```
&Rslt = %IntBroker.SetErrorMessage(&TransactionId, &msgset, &msgnum, "error=>
location", &parm1, &parm2, &parm3, &parm4 );
```

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages," Processing Inbound Errors

[Chapter 25, "Message Classes," GetMessageErrors, page 1315](#)

SetStatus

Syntax

```
SetStatus(&Message, Status)
```

Description

Use the `SetStatus` method to set the status of a publication or subscription contract, much the same way you do it in the message monitor.

You may want to use this method after an end-user has finished fixing any errors in the message data.

You can set the status of a contract to one of the following statuses:

- Canceled
- Done
- Error
- New

The method is available only when the message instance has one of the following statuses:

- Canceled
- Done
- Error
- New

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Message</i>	Specify an already instantiated message object that you want to set the status for.
<i>Status</i>	Specify the status that you want to set the message to. Valid status are:

<i>Constant Value</i>	<i>Description</i>
<code>%Operation_Canceled</code>	Cancel the message.
<code>%Operation_Done</code>	Set the message to done.
<code>%Operation_Error</code>	Set the message to be in error.
<code>%Operation_New</code>	Specify the message as new.

Returns

None.

SwitchAsyncEventUserContext

Syntax

SwitchAsyncEventUserContext(*UserID*, *LanguageCode*)

Description

Use the SwitchAsyncEventUserContext method to switch the user context within an Integration Broker asynchronous event.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>UserID</i>	Specify the user ID, as a string, to which you want to switch the context.
<i>LanguageCode</i>	Specify the language code, as a string, for the user ID.

Returns

A Boolean value: true if the switch user was successful, false otherwise.

Example

```
&returnValue = %IntBroker.SwitchAsyncEventUserContext("VP1", "ENG");
```

SyncRequest

Syntax

SyncRequest([*&MsgArray*, *&NodeNames*])

Description

Use the SyncRequest method to send multiple messages at the same time. You should only use this message with synchronous messages. You can also use this method to send a single synchronous message at a time, or you can use the SyncRequest Message class method.

If you want to publish messages asynchronously, use the Publish method.

Note. This method supports nonrowset-based messages only if the `SetXmlDoc` method is used to populate the message prior to using the `SyncRequest` method.

You must set the thread pool size of the application server on the receiving system to a value greater than 1 (the default) in order to process more than one message at a time.

How many threads you specify determines how many messages are worked on simultaneously. For example, if you have 10 messages in `&MsgArray`, and your thread pool size is 5, then only 5 messages are processed at a time.

The maximum number you can specify for your thread pool size is 10.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&MsgArray</i>	Specify an already instantiated array of messages that contains the messages you want to publish.
<i>&NodeNames</i>	Specify an already instantiated array of string containing the names of the nodes that you want to publish to. The first message in the array of messages is published to the first node, the second message is published to the second node, and so on.

Returns

An array of messages. These are the corresponding messages returned for the published messages. The first message in the returned array corresponds to the first message in the published array, the second message with the second, and so on.

Example

The following is an example of how creating and receiving a series of messages:

```
Local Rowset &FLIGHTPLAN, &FLIGHTPLAN_RETURN;
Local Message &MSG;
Local File &BI_FILE;
Declare Function out_BI_results PeopleCode QE_FLIGHTDATA.QE_ACNUMBER FieldFormula;

Local array of Message &messages;
Local array of Message &return_mesages;

&messages = CreateArrayRept(&MSG, 0);
&return_mesages = CreateArrayRept(&MSG, 0);

&FLIGHT_PROFILE = GetLevel0();
&messages [1] = CreateMessage(OPERATION.QE_FLIGHTPLAN_SYNC);
&messages [1].CopyRowset(&FLIGHT_PROFILE);

&messages [2] = CreateMessage(OPERATION.QE_FLIGHTPLAN_SYNC);
&messages [2].CopyRowsetDelta(&FLIGHT_PROFILE);

&return_mesages = %IntBroker.SyncRequest(&messages);

&FLIGHTPLAN_RETURN = &return_mesages [1].GetRowset();
&temp = &return_mesages [1].GenXMLString();

out_BI_results(&temp);

&FLIGHTPLAN_RETURN = &return_mesages [2].GetRowset();
&temp = &return_mesages [2].GenXMLString();

out_BI_results(&temp);
```

[Chapter 25, "Message Classes," SyncRequest, page 1285](#)

Update

Syntax

Update(*&Message*)

Description

Use the Update method to update a message in the message queue with the specified message object.

Parameters

Parameter	Description
<i>&Message</i>	Specify an already instantiated and populated message object to be used to update an existing message in the message queue.

Returns

A Boolean value, true if the message is updated successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," UpdateXmlDoc, page 1329](#)

UpdateXmlDoc

Syntax

UpdateXmlDoc(*&XmlDoc*, *TransactionId*, *DataType*)

Description

Use the UpdateXmlDoc method to update a message in the message queue with the specified message data.

Note. This method shouldn't be used in a subscription program.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&XmlDoc</i>	Specify an already instantiated and populated XmlDocument object.
<i>TransactionId</i>	Specify the transaction ID of the message you want to update.
<i>DataType</i>	Specify the data type of the message that you want to update. Valid values are:

<i>Constant Value</i>	<i>Description</i>
%IntBroker_BRK	Update the message for the web services gateway.
%IntBroker_PUB	Update the message for the publication contract.
%IntBroker_SUB	Update the message for the subscription contract.

Returns

A Boolean value, true if the message was updated successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," Update, page 1328](#)

IBInfo Class

An IBInfo object is returned from the IBInfo message class property.

See Also

[Chapter 25, "Message Classes," IBInfo, page 1292](#)

IBInfo Class Methods

In this section, we discuss the IBInfo class methods. The methods are discussed in alphabetical order.

All methods work with both asynchronous as well as synchronous messages unless specified

AddAEAttribute

Syntax

AddAEAttribute(*Name*, *value*)

Description

Use this method to add an attribute as a name-value pair to the Message object to be passed back to the response application class defined on the Application Engine handler.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specifies the attribute name as a string.
<i>value</i>	Specifies the attribute value as a string.

Returns

A Boolean value: True if the attribute was added successfully, False otherwise.

Example

```

/* Add the name value pair data you want to pass to the response app class */
/* in the AE program */

&b = &MSG.IBInfo.AddAEAttribute("sail name", "NorthWave");
If &b <> True Then
    MessageBox(0, "", 0, 0, "error adding ae attribute");
End-If;

&b = &MSG.IBInfo.AddAEAttribute("size", "4.2");
If &b <> True Then
    MessageBox(0, "", 0, 0, "error adding ae attribute");
End-If;

&b = &MSG.IBInfo.AddAEAttribute("type", "Surflite");
If &b <> True Then
    MessageBox(0, "", 0, 0, "error adding ae attribute");
End-If;

/* Need to call this method for the attributes to be saved and transferred */
/* correctly */
&b = &MSG.IBInfo.InsertAEResponseAttributes();
If &b <> True Then
    MessageBox(0, "", 0, 0, "error inserting AE response attributes");
End-If;

/* ***** */
/* In the response application class to retrieve the name-value pairs */

For &i = 1 To &MSG.IBInfo.GetNumberOfAEAttributes()

    &name = &MSG.IBInfo.GetAEAttributeName(&i);
    &value = &MSG.IBInfo.GetAEAttributeValue(&i);

End-For;

```

AddAttachment

Syntax

```
AddAttachment(Path)
```

Description

Use the AddAttachment method to add an attachment to a message.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Path</i>	Specify an absolute path, including the file name and type, as a string, of the file you want to attach to the message.

Returns

A string containing a content ID, which can be used for accessing the attachment with other methods, such as DeleteAttachment or SetAttachmentProperty.

Example

The following example shows sending an attachment with an asynchronous message:

```

Local Message &MSG;
Local Rowset &FLIGHT_PROFILE;
Local String &Attachment_Id;
Local Boolean &Test;
Local IntBroker &IntBroker;

QE_FLIGHTDATA.QE_ACNUMBER.Value = QE_FLIGHTDATA.QE_ACNUMBER + 1;

&FLIGHT_PROFILE = GetLevel0();

&MSG = CreateMessage(Operation.ASYNC_RR);

&Attachment_Id = &MSG.IBInfo.AddAttachment("C:\\temp\\MyFile.txt");
&Test = &MSG.IBInfo.SetAttachmentProperty(&Attachment_Id, %Attachment_Encoding,⇒
    "UTF-8");
&Test = &MSG.IBInfo.SetAttachmentProperty(&Attachment_Id, %Attachment_Base,⇒
    "Standard");
&Test = &MSG.IBInfo.SetAttachmentProperty(&Attachment_Id, %Attachment_Disposition,⇒
    "Pending");
&Test = &MSG.IBInfo.SetAttachmentProperty(&Attachment_Id, %Attachment_Language,⇒
    "English");
&Test = &MSG.IBInfo.SetAttachmentProperty(&Attachment_Id, %Attachment_Description,⇒
    "Parts data");

&MSG.CopyRowset(&FLIGHT_PROFILE);

&IntBroker = %IntBroker

&IntBroker.Publish(&MSG);

```

AddAttribute

Syntax

AddAttribute(*name*, *value*)

Description

Use this method to add an attribute to an IBInfo object.

The maximum length of the attribute name is 30 characters. The maximum length of the attribute value is 254 characters.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>name</i>	Specifies the attribute name as a string.
<i>value</i>	Specifies the attribute value as a string.

Returns

A Boolean value: true if the addition of the attribute was successful, false otherwise.

Example

```
&bReturn = &MSG.IBInfo.AddAttribute("employeeID", "123456");
```

AddContainerAttribute

Syntax

AddContainerAttribute(*Name*, *Value*)

Description

Use this method to add a container attribute by specifying an attribute name-value pair.

You can add attributes to container messages that contain rowset-based message parts to provide integration partners with data and information, without adding the information to the message definition.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specifies the container attribute name as a string.
<i>Value</i>	Specifies the container attribute value as a string.

Returns

A Boolean value: True if the container attribute was added successfully, False otherwise..

Example

```
Local Message &MSG;  
Local Rowset &RS;  
Local boolean &Bo;  
  
&RS = GetLevel0();  
&MSG = CreateMessage(Operation.QE_CONT_ATTRB);  
  
&Bo = &MSG.IBInfo.AddContainerAttribute("Test1", "1");  
&Bo = &MSG.IBInfo.AddContainerAttribute("Test2", "10");  
&Bo = &MSG.IBInfo.AddContainerAttribute("Test3", "100");  
  
&MSG.CopyPartRowset(1, &RS);  
  
%IntBroker.Publish(&MSG);
```

[Chapter 25, "Message Classes," ClearContainerAttributes, page 1337](#); [Chapter 25, "Message Classes," DeleteContainerAttribute, page 1340](#); [Chapter 25, "Message Classes," GetContainerAttributeName, page 1346](#); [Chapter 25, "Message Classes," GetContainerAttributeValue, page 1347](#) and [Chapter 25, "Message Classes," GetNumberOfContainerAttributes, page 1349](#)

ClearAEAttributes

Syntax

clearAEAttributes()

Description

Use this method to delete all Application Engine handler attributes from the Message object.

Parameters

None.

Returns

None.

See Also

Chapter 25, "Message Classes," AddAEAttribute, page 1330 and Chapter 25, "Message Classes," DeleteAEAttribute, page 1338

ClearAttachments

Syntax

```
clearAttachments()
```

Description

Use the ClearAttachments method to clear all attachments. If you want to delete a particular attachment, use DeleteAttachment instead.

Parameters

None.

Returns

None.

See Also

Chapter 25, "Message Classes," AddAttachment, page 1332 and Chapter 25, "Message Classes," DeleteAttachment, page 1338

ClearAttributes

Syntax

```
clearAttributes()
```

Description

Use this method to delete all attributes from an IBInfo object.

Parameters

None.

Returns

None.

Example

```
&MSG.IBInfo.ClearAttributes();
```

ClearContainerAttributes**Syntax**

```
clearContainerAttributes()
```

Description

Use this method to delete all container attributes in the IBInfo object.

Parameters

None

Returns

None

Example

```
&MSG.IBInfo.ClearContainerAttributes();
```

See Also

[Chapter 25, "Message Classes," AddContainerAttribute, page 1334](#) and [Chapter 25, "Message Classes," DeleteContainerAttribute, page 1340](#)

DeleteAEAttribute

Syntax

DeleteAEAttribute(*Name*)

Description

Use this method to delete the Application Engine handler attribute specified by attribute name from the Message object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specifies the name of the attribute as a string.

Returns

A Boolean value: True if the deletion was successful, False otherwise.

See Also

[Chapter 25, "Message Classes," AddAEAttribute, page 1330](#); [Chapter 25, "Message Classes," ClearAEAttributes, page 1335](#) and [Chapter 25, "Message Classes," GetAEAttributeName, page 1340](#)

DeleteAttachment

Syntax

DeleteAttachment(*Index* | *Content_ID*)

Description

Use the DeleteAttachment method to remove the specified attachment from the message. You can either specify the number of the attachment, or the content ID associated with the attachment (generated when the attachment was added to the message with AddAttachment.)

If you want to clear all attachments, instead of a particular one, use the ClearAttachments methods instead.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index Content_ID</i>	Specify either the number of the attachment, or the content ID associated with the attachment, for the attachment you want to delete.

Returns

A Boolean value: true if the attachment was deleted successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," AddAttachment, page 1332](#) and [Chapter 25, "Message Classes," ClearAttachments, page 1336](#)

DeleteAttribute

Syntax

DeleteAttribute(*name*)

Description

Use this method to delete an attribute from an IBInfo object by specifying the attribute's name as a string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>name</i>	Specifies the attribute by name as a string.

Returns

A Boolean value: true if the deletion of the attribute was successful, false otherwise.

Example

```
&bReturn = &MSG.IBInfo.DeleteAttribute("employeeID");
```

See Also

[Chapter 25, "Message Classes," GetAttributeName, page 1345](#)

DeleteContainerAttribute

Syntax

DeleteContainerAttribute(*Name*)

Description

Use this method to delete a container attribute based on the attribute name.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specifies the container attribute name as a string.

Returns

A Boolean value: True if the deletion was successful, False otherwise.

Example

```
&Ret = &MSG.IBInfo.DeleteContainerAttribute("MyAttribute");
```

See Also

[Chapter 25, "Message Classes," AddContainerAttribute, page 1334](#); [Chapter 25, "Message Classes," ClearContainerAttributes, page 1337](#) and [Chapter 25, "Message Classes," GetContainerAttributeName, page 1346](#)

GetAEAttributeName

Syntax

GetAEAttributeName(*nIndex*)

Description

Use this method to return the name of the *nth* Application Engine handler attribute from the Message object. For example, the response application class can use this method to retrieve the attribute name.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>nIndex</i>	An integer specifying which attribute in the Message object.

Returns

A string populated with the attribute name.

See Also

[Chapter 25, "Message Classes," AddAEAttribute, page 1330](#); [Chapter 25, "Message Classes," GetAEAttributeValue, page 1341](#) and [Chapter 25, "Message Classes," GetNumberOfAEAttributes, page 1347](#)

GetAEAttributeValue

Syntax

GetAEAttributeValue(*nIndex*)

Description

Use this method to return the value of the *nth* Application Engine handler attribute from the Message object. For example, the response application class can use this method to retrieve the attribute value.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>nIndex</i>	An integer specifying which attribute in the Message object.

Returns

A string populated with the attribute value.

See Also

[Chapter 25, "Message Classes," AddAEAttribute, page 1330](#); [Chapter 25, "Message Classes," GetAEAttributeName, page 1340](#) and [Chapter 25, "Message Classes," GetNumberOfAEAttributes, page 1347](#)

GetAttachmentContentID

Syntax

GetAttachmentContentID(*Index*)

Description

Use the GetAttachmentContentID to return the content ID for the specified attachment. The content ID is associated with an attachment when it is added to a message using AddAttachment.

You can use the content ID with other methods, such as AddAttachmentProperty and DeleteAttachment.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the number of the attachment that you want to access the content ID for.

Returns

A string containing the content ID.

See Also

[Chapter 25, "Message Classes," AddAttachment, page 1332](#) and [Chapter 25, "Message Classes," GetAttachmentProperty, page 1342](#)

GetAttachmentProperty

Syntax

GetAttachmentProperty(*Content_ID*, *Property_Type*)

Description

Use the `GetAttachmentProperty` method to return the value of an attachment property.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Content_ID</i>	Specify the content ID of the attachment that you want to access, as a string.
<i>Property_Type</i>	Specify the type of property that you want to access. Valid values are:

<i>Constant Value</i>	<i>Description</i>
<code>%Attachment_Base</code>	Specifies the base name of the attachment, that is, if the actual document name you want is different, such as if it is zipped or otherwise compressed as part of other documents.
<code>%Attachment_Description</code>	Specifies the description of the attachment.
<code>%Attachment_Disposition</code>	Specifies the disposition of the attachment, whether it's displayed inline or as an attachment.
<code>%Attachment-Encoding</code>	Specify the encoding of the attachment. For example, <code>Content-type: text/plain</code> or <code>charset=Big5</code> .
<code>%Attachment_Language</code>	Specify the language used in the attachment, as a string.
<code>%Attachment_Location</code>	Specify an additional location for the attachment.
<code>%Attachment_Type</code>	Specify the attachment type.
<code>%Attachment_URL</code>	Specifies the URL for the attachment. The URL must be an absolute URL.

Returns

A string containing the value of the specified property.

Example

The following example processes an attachment from a notification PeopleCode program:

```

Import PS_PT:Integration:INotificationHandler;

Class FLIGHTPROFILE implements PS_PT:Integration:INotificationHandler
    method FLIGHTPROFILE();
    method OnNotify(&MSG As Message);

end-class;

/* Constructor */
method FLIGHTPROFILE
    %Super = create PS_PT:Integration:INotificationHandler();
end-method;

method OnNotify
    /+ &MSG as Message +/
    /+ Extends/implements PS_PT:Integration:INotificationHandler.OnNotify +/

    Local rowset &RS;
    Local integer &Count;
    Local string &Attachment_Id;
    Local array of array of string &Result;

    &RS = &MSG.GetRowset();

    &Count = &MSG.IBInfo.NumberOfAttachments;
    If &Count > 0 Then

        For &I = 1 to &Count
            &Attachment_ID = &MSG.IBInfo.GetAttachmentContentID(&I);
            &Result[&I][1] = &MSG.IBInfo.GetAttachmentProperty(&Attachment_Id, =>
%Attachment_Encoding);
            &Result[&I][2] = &MSG.IBInfo.GetAttachmentProperty(&Attachment_Id, =>
%Attachment_Type);
            &Result[&I][3] = &MSG.IBInfo.GetAttachmentProperty(&Attachment_Id, =>
%Attachment_URL);
            &Result[&I][4] = &MSG.IBInfo.GetAttachmentProperty(&Attachment_Id, =>
%Attachment_Base);
            &Result[&I][5] = &MSG.IBInfo.GetAttachmentProperty(&Attachment_Id, =>
%Attachment_Location);
            &Result[&I][6] = &MSG.IBInfo.GetAttachmentProperty(&Attachment_Id, =>
%Attachment_Disposition);
            &Result[&I][7] = &MSG.IBInfo.GetAttachmentProperty(&Attachment_Id, =>
%Attachment_Description);

            End-For;
        End-if;

    /* process data from message */

end-method;

```

See Also

[Chapter 25, "Message Classes," SetAttachmentProperty, page 1354](#)

GetAttributeName

Syntax

GetAttributeName(*nIndex*)

Description

Use this method to return the attribute name for the *nth* attribute of the IBInfo object as a string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>nIndex</i>	An integer specifying which attribute in the IBInfo object.

Returns

A string populated with the attribute name.

Example

```
&AttrName = &MSG.IBInfo.GetAttributeName(1);
```

See Also

[Chapter 25, "Message Classes," GetAttributeValue, page 1345](#) and [Chapter 25, "Message Classes," GetNumberOfAttributes, page 1348](#)

GetAttributeValue

Syntax

GetAttributeValue(*nIndex*)

Description

Use this method to return the attribute value for the *nth* attribute of the IBInfo object as a string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>nIndex</i>	An integer specifying which attribute in the IBInfo object.

Returns

A string populated with the attribute value.

Example

```
&AttrValue = &MSG.IBInfo.GetAttributeValue(1);
```

See Also

[Chapter 25, "Message Classes," GetAttributeName, page 1345](#) and [Chapter 25, "Message Classes," GetNumberOfAttributes, page 1348](#)

GetContainerAttributeName

Syntax

```
GetContainerAttributeName(nIndex)
```

Description

Use this method to return the attribute name for the *n*th container attribute of the IBInfo object as a string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>nIndex</i>	An integer specifying which container attribute in the IBInfo object.

Returns

A string populated with the container attribute name.

See Also

[Chapter 25, "Message Classes," AddContainerAttribute, page 1334](#); [Chapter 25, "Message Classes," GetContainerAttributeValue, page 1347](#) and [Chapter 25, "Message Classes," GetNumberOfContainerAttributes, page 1349](#)

GetContainerAttributeValue

Syntax

`GetContainerAttributeValue(nIndex)`

Description

Use this method to return the attribute value for the *n*th container attribute of the IBInfo object as a string.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>nIndex</i>	An integer specifying which container attribute in the IBInfo object.

Returns

A string populated with the container attribute value.

See Also

[Chapter 25, "Message Classes," AddContainerAttribute, page 1334](#); [Chapter 25, "Message Classes," GetContainerAttributeName, page 1346](#) and [Chapter 25, "Message Classes," GetNumberOfContainerAttributes, page 1349](#)

GetNumberofAEAttributes

Syntax

`GetNumberofAEAttributes()`

Description

Use this method to return the number of Application Engine handler attributes in the Message object. For example, the response application class can use this method to retrieve the number of attributes before retrieving the attribute name-value pairs.

Parameters

None.

Returns

An integer representing the number of Application Engine handler attributes.

See Also

[Chapter 25, "Message Classes," AddAEAttribute, page 1330](#); [Chapter 25, "Message Classes," GetAEAttributeName, page 1340](#) and [Chapter 25, "Message Classes," GetAEAttributeValue, page 1341](#)

GetNumberOfAttributes

Syntax

GetNumberOfAttributes()

Description

Use this method to get the number of attributes for the IBInfo object as an integer.

Parameters

None.

Returns

An integer representing the number of attributes for the IBInfo object.

Example

```
&i = &MSG.IBInfo.GetNumberOfAttributes();  
&AttrName = &MSG.IBInfo.GetAttributeName(&i);  
&AttrValue = &MSG.IBInfo.GetAttributeValue(&i);
```

See Also

[Chapter 25, "Message Classes," GetAttributeName, page 1345](#) and [Chapter 25, "Message Classes," GetAttributeValue, page 1345](#)

GetNumberOfContainerAttributes**Syntax**

```
GetNumberOfContainerAttributes()
```

Description

Use this method to return the number of container attributes in the IBInfo object.

Parameters

None

Returns

An integer representing the number of container attributes.

Example

```
&MSG = CreateMessage(Operation.FLIGHTPLAN);

&ret = &MSG.IBInfo.AddContainerAttribute("MESSAGE_STATUS", "good");
&ret = &MSG.IBInfo.AddContainerAttribute("MyAttribute", "abcd");

/* When attempting to read these attributes within an IB event (OnNotify, */
/* OnRequest etc.) one must first get a part rowset, this will load up the */
/* attributes into the message object from the xml. Here is an example of */
/* how to read the attributes from a message. */

&RS = &MSG.GetPartRowset(1);
&index = &MSG.IBInfo.GetNumberOfContainerAttributes();

For &i = 1 To &index

    &attrName = &MSG.IBInfo.GetContainerAttributeName(&i);
    &attrValue = &MSG.IBInfo.GetContainerAttributeValue(&i);

End-For;
```

See Also

Chapter 25, "Message Classes," AddContainerAttribute, page 1334; Chapter 25, "Message Classes," GetContainerAttributeName, page 1346 and Chapter 25, "Message Classes," GetContainerAttributeValue, page 1347

GetTransactionIDforAE

Syntax

`GetTransactionIDforAE()`

Description

Use this method to get the transaction ID from within Application Engine program.

Parameters

None.

Returns

A number representing the transaction ID from within Application Engine program.

See Also

Chapter 25, "Message Classes," AddAEAttribute, page 1330

InsertAEResponseAttributes

Syntax

`InsertAEResponseAttributes()`

Description

Use this method to save and transfer the Application Engine handler attributes to be read by the response application class.

Parameters

None.

Returns

A Boolean value: True if the save and insertion were successful, False otherwise.

See Also

[Chapter 25, "Message Classes," AddAEAttribute, page 1330](#)

LoadConnectorProp

Syntax

LoadConnectorProp(*ConnectorName*)

Description

Use the LoadConnectorProp method to load connector properties to the specified connector. The properties are contained in the message executing the method.

Note. Use this method in the message OnSend event.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ConnectorName</i>	Specify the name of the connector that you want to load properties for from the message.

Returns

A Boolean value: true if properties are loaded successfully, false otherwise.

Example

```
LOCAL MESSAGE &MSG;  
&MSG = %IntBroker.GetMessage();  
&Rowset = &MSG.GetRowset();  
&MSG.IBInfo.LoadConnectorProp("HTTP TargetConnector");  
/* add connector properties */  
&MSG.IBInfo.ConnectorOverride= true;  
ReturnToServer(&MSG);
```

See Also

[Chapter 25, "Message Classes," ConnectorOverride, page 1357](#)
PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions,"
ReturnToServer

LoadConnectorPropFromNode

Syntax

LoadConnectorPropFromNode(*NodeName*)

Description

Use the LoadConnectorPropFromNode method to load connector properties into the message executing the method. Then you can use the LoadConnectorProp method to load the specified connector with the properties.

Note. Use this method in the message OnSend event.

Parameters

Parameter	Description
NodeName	Specify the node that contains the connector properties you want to use. You can either specify the node name as a string, or prefix the node name with the reserved word Node .

Returns

A Boolean value: true if the properties are loaded successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," ConnectorOverride, page 1357](#)

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "PeopleCode Built-in Functions," [ReturnToServer](#)

LoadConnectorPropFromRouting

Syntax

LoadConnectorPropFromRouting(*RoutingDefnName*)

Description

Use the LoadConnectorPropFromRouting method to load connector properties into the message executing the method. Then you can use the LoadConnectorProp method to load the specified connector with the properties.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>RoutingDefnName</i>	Specify the routing definition name that contains the connector properties you want to use, as a string.

Returns

A Boolean value: true if the method completes successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," LoadConnectorProp, page 1351](#) and [Chapter 25, "Message Classes," LoadConnectorPropFromNode, page 1352](#)

LoadConnectorPropFromTrx

Syntax

LoadConnectorPropFromTrx(*NodeName*, *TransactionType*, *MsgName*, *MsgVersion*)

Description

Note. This method is no longer supported.

SetAttachmentProperty

Syntax

SetAttachmentProperty(*Content_ID*, *Property_Type*, *Value*)

Description

Use the SetAttachmentProperty to specify the value and type of a property associated with an attachment.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Content_ID</i>	Specify the content ID associated with the attachment.
<i>Property_Type</i>	Specify the type of property. See below for the valid values.
<i>Value</i>	Specify the value associated with this property.

For the *Property_Type* parameter, the valid values are:

<i>Constant Value</i>	<i>Description</i>
%Attachment_Encoding	Specify the encoding type.
%Attachment_Type	Specify the attachment type.
%Attachment_URL	Specifies the URL for the attachment. The URL must be an absolute URL.
%Attachment_Base	Specify the attachment base.
%Attachment_Location	Specify an additional location for the attachment.
%Attachment_Disposition	Specifies the disposition of the attachment, whether it's displayed inline or as an attachment.
%Attachment_Description	Specifies the description of the attachment.

Returns

A Boolean value: true if the property is set successfully, false otherwise.

Example

The following example shows sending an attachment with an asynchronous message:

```
Local Message &MSG;
Local Rowset &FLIGHT_PROFILE;
Local String &Attachment_Id;
Local Boolean &Test;
Local IntBroker &IntBroker;

QE_FLIGHTDATA.QE_ACNUMBER.Value = QE_FLIGHTDATA.QE_ACNUMBER + 1;

&FLIGHT_PROFILE = GetLevel0();

&MSG = CreateMessage(Operation.ASYNC_RR);

&Attachment_Id = &MSG.IBInfo. AddAttachment("C:\\temp\\MyFile.txt");
&Test = &MSG.IBInfo.SetAttachmentProperty(&Attachment_Id, %Attachment_Encoding,⇒
    "UTF-8");
&Test = &MSG.IBInfo.SetAttachmentProperty(&Attachment_Id, %Attachment_Base,⇒
    "Standard");
&Test = &MSG.IBInfo.SetAttachmentProperty(&Attachment_Id, %Attachment_Disposition,⇒
    "Pending");
&Test = &MSG.IBInfo.SetAttachmentProperty(&Attachment_Id, %Attachment_Language,⇒
    "English");
&Test = &MSG.IBInfo.SetAttachmentProperty(&Attachment_Id, %Attachment_Description,⇒
    "Parts data");

&MSG.CopyRowset(&FLIGHT_PROFILE);

&IntBroker = %IntBroker

&IntBroker.Publish(&MSG);
```

See Also

[Chapter 25, "Message Classes," GetAttachmentProperty, page 1342](#)

IBInfo Class Properties

In this section, we discuss the IBInfo class properties. The properties are discussed in alphabetical order.

AppServerDomain

Description

This property can be used to set the application server domain for the connector, as a string.

This property is read-write.

CompressionOverride

Description

This property can be used to set a compression override for the transaction. This property takes three system constants to set the compression override:

<i>Constant Value</i>	<i>Description</i>
%IntBroker_Compress	Turns compression on for this transaction.
%IntBroker_UnCompress	Turns compression off for this transaction.
%IntBroker_Compress_Reset	Resets compression to use the threshold specified by PSADMIN.

The integration engine compresses and base64-encodes messages destined for the PeopleSoft listening connector on its local integration gateway.

Asynchronous messages are always compressed and base64 encoded when sent to the integration gateway.

For synchronous messages, in PSADMIN you can set a threshold message size above which messages are compressed. With the CompressionOverride property, you can override the message compression setting specified in PSADMIN at the transaction level.

Warning! Turning compression off can negatively impact system performance when transporting synchronous messages greater than 1 MB. As a result, you should turn off compression only during integration development and testing.

Note. This property does not affect the compression of messages that the integration gateway sends using its target connectors.

This property is read-write.

Example

```
&MSG.IBInfo.CompressionOverride = %IntBroker_UnCompress;
```

ConnectorOverride

Description

This property specifies whether the connector override is specified for the transaction. This property takes a Boolean value: true, override the connection properties, false otherwise.

This property is read-write.

ConversationID

Description

This property returns the conversation ID associated with the request/response message transaction.

This property is read-write.

DeliveryMode

Description

This property sets or returns the delivery mode override for the connector as an integer. This property takes one of three system constants to set the delivery mode override:

<i>Constant Value</i>	<i>Description</i>
%IB_DM_BestEffort	Sets the delivery mode to best effort. If the delivery mode is set to best effort, then only one attempt is made to send the message to the destination; there is no attempt to retry the message.
%IB_DM_Guarantee	Sets the delivery mode to guaranteed. This mode automatically invokes retry logic to ensure that the message is successfully sent to a destination. This is the default delivery mode.
%IB_DM_Reset	Resets the delivery mode to the value defined outside the PeopleCode program.

This property is read-write.

Example

```
&int = &MSG.IBInfo.DeliveryMode = %IB_DM_BestEffort;
```

DestinationNode

Description

This property returns the name of the destination node that the request was sent to, as a string.

This property is read-only.

ExternalMessageID

Description

This property returns the external ID of the message. This property is used in testing, and to resolve duplicate message issues from third-party systems.

This property is read-only.

Example

```
&str = &MSG.IBInfo.ExternalMessageID;
```

ExternalOperationName

Description

This property returns the external operation name of the message. This property is used in testing, and to resolve duplicate message issues from third-party systems.

This property is read-write.

ExternalUserName

Description

This property returns the external user name associated with the message. This property is used in testing, and to resolve duplicate message issues from third-party systems.

This property is read-write.

ExternalUserPassword

Description

This property returns the external user password associated with the message. This property is used in testing, and to resolve duplicate message issues from third-party systems.

This property is read-write.

FinalDestinationNode

Description

When the message is passed across several nodes, this property specifies the ultimate target of the message, as a string.

This property is read-only.

FuturePublicationDateTime

Description

Use this property to specify when, as a datetime, an actual publish of the transaction is to occur.

This property is for use with asynchronous transactions. If a null value or an invalid future date and time is specified, the publish will occur immediately.

This property is read-write.

HTTPSessionId

Description

Use the HTTPSessionId property to specify the HTTP session ID, as a string.

This property is read-write.

IBConnectorInfo

Description

This property returns a reference to a IBConnectorInfo collection object.

This property is read-only.

InReplyToID

Description

Use the InReplyToID property to specify the reply to ID contained in the message.

This property is read-write.

MessageChannel

Description

This property references the name of the channel associated with the message definition, as a string.

Note. This property has been deprecated and remains for backward compatibility only. Use the IBInfo class MessageQueue property instead.

This property is set in when the message is created.

This property is read-only.

See Also

[Chapter 25, "Message Classes," MessageQueue, page 1361](#)

See Also

[Chapter 25, "Message Classes," ChannelName, page 1289](#)

MessageName

Description

This property returns the name of the message, as a string.

This property is read-only.

See Also

[Chapter 25, "Message Classes," Name, page 1298](#)

MessageQueue

Description

This property returns the name of the queue associated with the message, as a string.

This property is read-only.

MessageType

Description

This property returns the type of the message, as a string.

Note. This property has been deprecated and remains for backward compatibility only. Use the IBInfo class `OperationType` property instead.

See [Chapter 25, "Message Classes," OperationType, page 1362](#).

Valid types are:

<i>Value</i>	<i>Description</i>
Sync	Indicates that the message is synchronous.
Async	Indicates that the message is asynchronous.
Ping	Indicates that the message is used to test the application server to make sure it is available and accepting requests.

This property is read-only.

MessageVersion

Description

This property returns the message version as a number.

This property is read-only.

NodeDN

Description

For incoming requests, this property gives the distinguished name (DN) extracted from the certificate authentication process, as a string.

This property is read-write.

NonRepudiationID

Description

This property returns the non-repudiation ID as a string. This property is populated with a unique string when the message is published.

This property is only valid with messages that use non-repudiation.

This property is read-only.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker Administration, "Setting Up Secure Integration Environments," Implementing Nonrepudiation

NumberOfAttachments

Description

This property returns the number of attachments associated with a message.

This property is read-only.

See Also

[Chapter 25, "Message Classes," AddAttachment, page 1332](#)

OperationType

Description

This property returns the type of the operation, as a string.

This property is read-only.

OperationVersion

Description

This property returns the version of the operation, as a string.

This property is read-only.

OrigNode

Description

For requests that cross multiple nodes, this property identifies the node that initiated the request as a string.

The OrigNode property returns the originating node of the message. If the message is not going across nodes, the OrigNode and SourceNode properties return the same value. However, if the message is going across nodes, the source node is the node that most recently published the message.

For example, if A publishes to B, then B publishes the message to C, from C's perspective, A is the original node and B is the source node.

This property is read-only.

See Also

[Chapter 25, "Message Classes," SourceNode, page 1365](#)

OrigProcess

Description

This property returns the name of the process where the publish originated, as a string. For example, a message published from the Inventory definitions page would have a process name of INVENTORY DEFIN.

This property is read-only.

OrigTimeStamp

Description

This property returns the time stamp that corresponds to the time that the request was created, as a string. For requests that cross nodes, this is the time that the first request was created.

This property is read-only.

OrigUser

Description

This property returns the user ID login where the message was initially generated, as a string.

This property is read-only.

PublicationID

Description

This property returns the unique identifier for the message, as a string.

Note. This property has been deprecated. It is no longer supported.

RequestingNodeName

Description

This property returns the name of the node making the request, as a string.

This property is read-write.

RequestingNodeDescription

Description

This property returns the description of the node making the request, as a string.

This property is read-write.

ResponseAsAttachment

Description

Use the ResponseAsAttachment property to specify whether the response should be returned as an attachment or inline.

This property is read-write.

SegmentsUnOrder

Description

The SegmentUnOrder property is only applicable for asynchronous messages. If you specify the SegmentUnOrder property as true, the receiving node processes the segments in parallel.

This property is read-write.

See Also

[Chapter 25, "Message Classes," SegmentsByDatabase, page 1302](#)

[Chapter 25, "Message Classes," Message Segments, page 1247](#)

SourceNode

Description

This property returns the name of the publishing node as a string.

The OrigNode property returns the originating node of the message. If the message is not going across nodes, the OrigNode and SoureNode properties return the same value. However, if the message is going across nodes, the source node is the node that most recently published the message.

For example, if A publishes to B, then B publishes the message to C, from C's perspective, A is the original node and B is the source node.

This property is read-only.

See Also

[Chapter 25, "Message Classes," OrigNode, page 1363](#)

SyncServiceTimeout

Description

This property takes a time (in seconds). This time overrides the default HTTP timeout that is used for all requests. If you set this property, you can use this to read back the time, that is, set the time before the SyncRequest is executed, then see when it is changed in an implementation of the OnSend method.

Note. This property is only for synchronous requests.

Generally, you use `SyncServiceTimeout` to dynamically set the timeout value for a specific transaction. The http header file is modified to take this new parameter. In addition this value is sent to the gateway to be used for the http timeout. Use this so that a long running transaction will not timeout. In addition, you don't have to wait through the default period for a specific transaction to timeout.

The following is a typical example of using this property:

```
&MSG.SetXmlDoc(&xmlReq);  
&MSG.IBInfo.LoadConnectorPropFromNode(Node.EAI)  
&MSG.IBInfo.SyncServiceTimeout = 360000;  
&MSG.IBInfo.ConnectorOverride = true;  
&MSG_Resp = SyncRequest(&MSG, Node.EAI);  
&xmlResponseDoc = &MSG.GetXmlDoc();
```

Setting the XML directly is not valid. You need to use the message object to set the value. In order for this to work you must override the connector properties, which means you must set up the connector properties for this transaction, using one of the load methods (such as `LoadConnectorPropFromNode`, `LoadConnectorPropFromTrx`, and so on.)

This property is read-write.

TransactionID

Description

This property returns the transaction ID as a string. This is used to uniquely identify a request.

This property is read-only.

UserName

Description

This property returns the user name associated with the message, as a string.

This property is read-only.

VisitedNodes

Description

This property returns an array of string containing the names of all the nodes visited by the message. This is useful when a message is being propagated across multiple nodes.

This property is read-only.

WSA_Action

Description

Use this property to specify the Web Services Addressing (WS-Addressing) action for the message. The WS-Addressing action is defined as a string.

This property is read-write.

WSA_FaultTo

Description

Use this property to specify the WS-Addressing fault end point for the message. The WS-Addressing fault end point is defined as a string.

If this property is not null, a message ID (the WSA_MessageID property) must also be defined.

This property is read-write.

WSA_MessageID

Description

Use this property to specify the WS-Addressing message ID for the message. The WS-Addressing message ID is defined as a string.

This property is read-write.

WSA_ReplyTo

Description

Use this property to specify the WS-Addressing reply-to address for the message. The WS-Addressing reply-to address is defined as a string.

This property is read-write.

WSA_To

Description

Use this property to specify the WS-Addressing destination for the message. The WS-Addressing destination is defined as a string.

This property is read-write.

IBConnectorInfo Collection

A IBConnectorInfo collection object is returned from the IBConnectorInfo IBInfo class property.

See Also

[Chapter 25, "Message Classes," IBConnectorInfo, page 1359](#)

IBConnectorInfo Collection Methods

In this section, we discuss the IBConnectorInfo collection methods. The methods are discussed in alphabetical order.

AddConnectorProperties

Syntax

AddConnectorProperties(*Name*, *Value*, *Type*)

Description

Use the AddConnectorProperties method to add a set of connector properties to a connector.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specify the name of the property as a string.
<i>Value</i>	Specify the value of the property as a string.

<i>Parameter</i>	<i>Description</i>
<i>Type</i>	Specify the type of the property as a string. The valid values are:

<i>Constant Value</i>	<i>Description</i>
%Property	Add a property type property.
%Header	Add a header type property.

Returns

A Boolean value: true if the connector properties are added successfully, false otherwise.

Example

The following are examples of typical name/value pairs.

```
&b1 = &MSG.IBInfo.IBConnectorInfo.AddConnectorProperties("URL", "http:⇒
//finance.yahoo.com/d/quotes.txt/?symbols=PSFT&format=l1c1d1t1", %Property);
```

```
&b2 = &MSG.IBInfo.IBConnectorInfo.AddConnectorProperties("sendUncompressed", ⇒
"Y", %Header);
```

```
&b3 = &MSG.IBInfo.IBConnectorInfo.AddConnectorProperties("FilePath", ⇒
"C:\Temp", %Property);
```

The following example demonstrates setting a passive connection for the FTP target connector:

```
&b4 = &MSG.IBInfo.IBConnectorInfo.AddConnectorProperties ("FTPMODE", ⇒
"PASSIVE", %Property);
```

See Also

[Chapter 25, "Message Classes," DeleteConnectorProperties, page 1371](#) and [Chapter 25, "Message Classes," ClearConnectorProperties, page 1370](#)

AddQueryStringArg

Syntax

```
AddQueryStringArg(Name, Value)
```

Description

Use the AddQueryStringArg method to add query string arguments to the outbound request. The query string arguments are used by the HTTP connector to step parameters in the URL.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specify the name of the query string argument as a string.
<i>Value</i>	Specify the value for the query string argument as a string.

Returns

A Boolean value: true if the query string argument is added successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," ClearQueryStringArgs, page 1371](#); [Chapter 25, "Message Classes," DeleteQueryStringArg, page 1372](#); [Chapter 25, "Message Classes," GetNumberOfQueryStringArgs, page 1375](#); [Chapter 25, "Message Classes," GetQueryStringArgName, page 1375](#) and [Chapter 25, "Message Classes," GetQueryStringArgValue, page 1376](#)

ClearConnectorProperties

Syntax

ClearConnectorProperties()

Description

Use the ClearConnectorProperties method to clear all the properties in a connector before setting them.

Parameters

None.

Returns

None.

See Also

[Chapter 25, "Message Classes," AddConnectorProperties, page 1368](#) and [Chapter 25, "Message Classes," DeleteConnectorProperties, page 1371](#)

ClearQueryStringArgs

Syntax

clearQueryStringArgs()

Description

Use the ClearQueryStringArgs method to clear all of the existing query string arguments.

Use the DeleteQueryStringArg method if you want to remove a specific query string argument.

Parameters

None.

Returns

None.

See Also

[Chapter 25, "Message Classes," DeleteQueryStringArg, page 1372](#)

DeleteConnectorProperties

Syntax

DeleteConnectorProperties(*Name*)

Description

Use the DeleteConnectorProperties to delete a specific connector property.

Use the ClearConnectorProperties method to remove all the properties.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specify the name of the connector property you want to delete.

Returns

A Boolean value: true if the property is deleted successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," ClearConnectorProperties, page 1370](#)

DeleteQueryStringArg**Syntax**

DeleteQueryStringArg(*Name*)

Description

Use the DeleteQueryStringArg method to delete a specific query string argument.

Use the ClearQueryStringArg method to delete all of the query string arguments.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specify the name of the query string argument that you want to delete.

Returns

A Boolean value: true if the query string argument is deleted successfully, false otherwise.

See Also

[Chapter 25, "Message Classes," ClearQueryStringArgs, page 1371](#)

GetConnectorPropertiesName**Syntax**

GetConnectorPropertiesName(*Index*)

Description

Use the `GetConnectorPropertiesName` to return the name of the connector property in the numeric position specified by *Index*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the numeric position of the connector property name that you want to access.

Returns

A string containing the name of a connector property.

Example

```
For &I = 1 to &Msg.IBInfo.IBConnectorInfo.GetNumberOfConnectorProperties();  
    &PropName = &Msg.IBInfo.IBConnectorInfo.GetConnectorPropertiesName(&I)  
    /* do processing */  
End-For;
```

GetConnectorPropertiesType

Syntax

GetConnectorPropertiesType(*Index*)

Description

Use the `GetConnectorPropertiesType` method to return the type of the connector property specified by its numeric position by *Index*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the numeric position of the connector property type that you want to access.

Returns

A string containing the type of the specified connector.

GetConnectorPropertiesValue

Syntax

GetConnectorPropertiesValue(*Index*)

Description

Use the GetConnectorPropertiesValue method to return the value of the connector property specified by its numeric position by *Index*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the numeric position of the connector property type that you want to access.

Returns

A string containing the value of the specified connector.

GetNumberOfConnectorProperties

Syntax

GetNumberOfConnectorProperties()

Description

Use the GetNumberOfConnectorProperties method to determine the number of connector properties.

Parameters

None.

Returns

A number.

GetNumberOfQueryStringArgs**Syntax**

GetNumberOfQueryStringArgs()

Description

Use the `GetNumberOfQueryStringArgs` method to determine the number of query string arguments.

Parameters

None.

Returns

A number.

GetQueryStringArgName**Syntax**

GetQueryStringArgName(*Index*)

Description

Use the `GetQueryStringArgName` method to access the name of the query string argument by its numeric position as specified by *Index*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the numeric position of the query string argument name that you want to access.

Returns

A string containing the name of a query string argument.

GetQueryStringArgValue

Syntax

GetQueryStringArgValue(*Index*)

Description

Use the GetQueryStringArgValue method to access the value of the query string argument by its numeric position as specified by *Index*.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Index</i>	Specify the numeric position of the query string argument value that you want to access.

Returns

A string containing the value of a query string argument.

IBConnectorInfo Collection Properties

In this section, we discuss the IBConnectorInfo collection properties. The properties are discussed in alphabetical order.

ConnectorClassName

Description

Use this property to identify the name of the target connector to invoke as a string.

This property is read-write.

ConnectorName

Description

Use this property to identify the target connector to invoke to send to the message, as a string.

This property is read-write.

Cookies

Description

Use this property to access the cookies associated with a message.

You can accept a synchronous response message containing cookies, save those cookies in a global variable, and later return them to the target node in an outbound synchronous or asynchronous request message.

You can access this property only in an inbound synchronous response message or an outbound request message.

This property is read-write.

Example

The following example retains the cookies from a response message to a global variable:

```
Local Message &SalesRequest, &SalesResponse;  
Local Rowset &SALES_ORDER;  
Global string &SalesCookies;  
  
&SALES_ORDER = GetLevel0();  
&SalesRequest = CreateMessage(OPERATION.SALES_ORDER_SYNC);  
&SalesRequest.CopyRowsetDelta(&SALES_ORDER);  
  
/* Send the synchronous request; the return value is the response  
message object */  
&SalesResponse = &SalesRequest.SyncRequest();  
  
/* Retrieve cookies from the response message */  
&SalesCookies = &SalesResponse.IBInfo.IBConnectorInfo.Cookies;
```

The following example retrieves the previously retained cookies from the global variable and inserts them into a new request message:

```
Local Message &SalesRequest, &SalesResponse;  
Local Rowset &SALES_ORDER;  
Global string &SalesCookies;  
  
&SALES_ORDER = GetLevel0();  
&SalesRequest = CreateMessage(Message.SALES_ORDER_SYNC);  
&SalesRequest.CopyRowsetDelta(&SALES_ORDER);  
  
/* Insert the cookies in the request message */  
&SalesRequest.IBInfo.IBConnectorInfo.Cookies = &SalesCookies;  
  
/* Send the asynchronous request */  
%IntBroker.Publish(&SalesRequest);
```

PathInfo

Description

This property is specific to incoming HTTP requests. This is the path information extracted from the request, represented as a string.

This property is read-write.

RemoteFrameworkURL

Description

Use this property to identify the URL to which to send a message, as a string. This value overrides the server URL specified in the Project Definitions section.

This property is read-write.

Chapter 26

Mobile Classes

This chapter provides an overview of the Mobile classes and discusses the following topics:

- Mobile classes overview.
- Mobile terms.
- Mobile hierarchy.
- HTML areas used in mobile.
- Debugging in mobile.
- Error handling.
- Data types for mobile.
- Scope of a mobile object.
- Mobile classes reference.

Important! PeopleSoft Mobile Agent is a deprecated product. The mobile classes currently exist for backward compatibility only.

See Also

[Chapter 41, "SyncServer Class," page 2249](#)

Mobile Classes Overview

PeopleSoft Mobile Agent extends the functionality of PeopleSoft Pure Internet Architecture to disconnected mobile devices, allowing users to continue working with their PeopleSoft applications on a laptop computer or personal digital assistant (PDA) while disconnected from the Internet or a local network.

When you create mobile pages for display on a mobile device (a laptop or PDA), you create the following in Application Designer:

- Synchronizable Component Interfaces.
- Mobile pages based on your synchronizable Component Interfaces.

In addition, you may create PeopleCode programs that manipulate the data. You use the mobile classes in a mobile application to work with the data on a mobile device.

This document provides an overview of using the mobile classes, including:

- Understanding the Mobile Device and the Component Interface
- Understanding differences between Mobile and PIA

See Also

[Chapter 41, "SyncServer Class," page 2249](#)

Understanding the Mobile Device and the Component Interface

When the synchronization server and the mobile device are synchronized, the following items are downloaded to the mobile device:

- instances of synchronizable Component Interfaces.
- mobile pages.
- associated mobile PeopleCode programs.

When a user of Mobile Agent synchronizes with the synchronization server the first time, the relevant data for the synchronizable Component Interface is loaded to the mobile device.

During subsequent synchronizations, the data on the mobile device is synchronized with the database on the synchronization server.

This section discusses the items that are downloaded to the mobile device. For more information about the synchronization process, see the Synchronization Server documentation.

See [Chapter 41, "SyncServer Class," page 2249](#).

Synchronizable Component Interface

A synchronizable Component Interface is a Component Interface that is created specifically for use with a mobile device. This means that the Component Interface definition has been specified as synchronizable on the Component Interface properties page.

The following shows a synchronizable Component Interface.

Synchronizable Component Interface

Level zero of the synchronizable component interface, as well as the data in the collections, are known as *mobile objects*, and are described in the following sections.

Mobile Page

The Mobile Page enables a mobile device user to change data in the synchronizable Component Interface that underlies the Mobile Page. The changes to the Component Interface data are sent back to the PeopleSoft database when the mobile device is synchronized.

Mobile pages have *list views* and *detail views*.

- List view pages are created from the top level of a component interface (the level zero), or a collection in a component interface. A list view can also be thought of as a search page.
- Detail view pages are created from the content properties (fields) in a mobile page. Where and how a property displays on a page is determined by the content properties page for that property (field).

The following is the list view for a mobile page, generated by the level zero of the synchronizable component interface.

Associated Mobile PeopleCode Programs

Access PeopleCode associated with a Component Interface by right clicking on an open synchronizable Component Interface in Application Designer and selecting ViewPeopleCode.

The following is a PeopleCode program associated with the OnChange Mobile Component Interface event on a synchronizable Component Interface. The OnChange event is associated with a property on the page. The PeopleCode program uses a *mobile object* to access the QE_MB_EMPLID property on level zero on the synchronizable Component Interface that has been downloaded to the mobile device. The mobile object represents the PIA equivalent of a row of data, and can be used at any level in the data hierarchy, level zero, level one, level two, and so on. It is what is displayed in the Detail View of a Mobile Page.

When a mobile event occurs on a mobile object, such as a mobile object property being changed (the OnChange event) or a mobile object being loaded into the working set (the OnInit event), the mobile object is then available in the event's PeopleCode program using the %ThisMobileObject system variable.

```
If %ThisMobileObject.IsNew() Then
/* do further check before save */
End-if;
```

Considerations Using the Mobile Object

A mobile object is the means in PeopleCode to access the synchronizable Component Interface. Mobile objects exist in relationship to each other in a hierarchy, which has a Component Buffer-like structure. A mobile object is just one row. A Data Collection is a collection of rows, each row being a mobile object.

The mobile object hierarchy has the equivalent of rowsets as data collections, rows as mobile objects, records and fields as properties. The topmost mobile object for a Component Interface is the equivalent of level zero on the underlying Component Interface. A Component Interface can also contain levels, which map to mobile object data collections. (These levels, in PIA, map to scrolls on a page, or in the Component Buffer, to rowsets.)

In the example in this section, the hierarchy of the mobile objects is:

```
QE_MB_COMPANY
  QE_MB_DEPARTMNT
    QE_MB_EMPLOYEE
```

- QE_MB_COMPANY — level zero.
- QE_MB_DEPARTMNT — level one. This is a collection of mobile data objects.
- QE_MB_EMPLOYEE — level two. This is a collection of mobile data objects.

Mobile Classes Hierarchy

Mobile objects exist in relationship to each other in a hierarchy. The following diagram shows the different classes, and how one class can be returned from a method or a property in another class.

The following presents the mobile object hierarchy in a class diagram:

Mobile classes hierarchy

Mobile classes methods (part 1 of 2)

Mobile classes methods (part 2 of 2)

The following is a list of the various classes, with a brief description of each.

Mobile Classes	Description
Mobile object	Represents the PIA equivalent of a row of data, and can be used at any level in the data hierarchy, level zero, level one, level two, and so on. It is what is displayed in the Detail View of a mobile page.
CI collection	Contains a collection of empty Mobile objects.
Data collection	Used to access a level on a mobile page, such as level one, level two, and so on.
ListViewAttrs	Used to access the display attributes for a list view.
PeerDefaultAttributes	Used to access the default display attributes for a peer reference.
PropertyAttrs	Used to access the display attributes for a property.
PropertyInfo	Used to access the attributes of a property (field) on a mobile page.
PropertyInfoCollection	Contains a collection of PropertyInfo objects. Used when a property on a mobile page is actually a collection (such as a reference to level one, level two, and so on.)

Debugging in Mobile

The psmobile.ini file contains debug settings for mobile PeopleCode.

For a laptop, you can edit the psmobile.ini file on the mobile device. This file is either in the C:\Windows or C:\WinNT directory.

For a PDA, you must copy the psmobile.ini file to the laptop or desktop using ActiveSync, edit it there, then copy it back.

Use the DebugEnabled value in the psmobile.ini file to control whether debugging is enabled for your application. If you specify a 1 for this value, you can use the PeopleCode debugger with your mobile application for debugging.

In addition, you can use the TracePC value in the psmobile.ini file to specify that a trace is to be run, as well as what type of operations in the application should be traced.

The following is an example of the psmobile.ini file.

```

[PSMOBILE]
Language=ENG
Port=8080
HomeDirectory=C:\Program Files\PeopleSoft\PeopleSoft Mobile Agent
MaxCachedStatements=100
MaxCachedObjects=100
debug=1
[SYNC]
SyncGateway=http://fsampson040502.corp.peoplesoft.com:80/SyncServer
SyncLogVerbose=0
[PCDEBUG]
DebugEnabled=0
DebugDatabase=Your Database Name
DebugOprid=Your OPRID
DebugIPAddress=nnn.nnn.nnn.nnn
DebugPort=9500
[Trace]
;-----
; PeopleCode Tracing Bitfield
;
; Bit      Type of tracing
; -----
; 1        - Trace instructions
; 2        - List the program
; 4        - Show assignments to variables
; 8        - Show fetched values
; 16       - Show stack
; 64       - Trace start of programs
; 128      - Trace external function calls
; 256      - Trace internal function calls
; 512      - Show parameter values
; 1024     - Show function return value
; 2048     - Trace each statement in program
; Dynamic change allowed for TracePC and TracePCMask
TracePC=0

```

Debug Settings

The following are the debug settings you can set in the psmobile.ini file.

DebugEnabled	Specify whether debugging is enabled or not. Use a 0 to turn off debug mode, a 1 to turn on debug mode.
DebugDatabase	Specify the actual database (not the domain) that application server uses with the PeopleTools PeopleCode debugger (this should be the database that is used for synchronizing).
DebugOprid	Specify the userId you use to log onto the PeopleTools PeopleCode debugger.
DebugIPAddress	Specify the IP address or machine name of the application server.

DebugPort

Specify the port number that the application server (PSDBGSRV) has been configured to use.

Trace Settings

Use the TracePC value in the psmobile.ini file to specify that a trace is to be run, as well as what type of operations in the application should be traced.

All trace information is written to a file named `psmobile.log`, located in the directory defined by `%temp%`.

Note. Be aware that tracing logs can grow to a large size. Only specify tracing when necessary, and only trace critical operations.

The following are the trace settings you can specify using TracePC. You can specify more than one trace by adding the numbers together.

0	Turn all tracing off.
1	Trace all instructions.
2	List the program being traced.
4	Show all assignments to all variables.
8	Show all fetched values.
16	Show stack.
64	Trace start of programs.
128	Trace external function calls.
256	Trace internal function calls.
512	Show all parameter values.
1024	Show function return value.
2048	Trace each statement in program.

Error Handling

For initial error handling, check the return values of methods and functions as they are used. When you want to check for errors depends on your application. However, if you check for errors after every assignment, you may see a performance degradation.

Mobile does not use collections of errors or messages (PSMESSAGES), as is the case with PeopleSoft Pure Internet Architecture. However, you can specify a message set and number for use with a mobile page and with mobile properties. This is done in Application Designer, to ensure that the correct messages get downloaded to the mobile device.

Once the messages have been distributed to the mobile device, you can access them using PeopleCode the same way you would access any message in the message catalog, using the following functions:

- MessageBox
- MsgGet
- MsgGetText
- MsgGetExplainText

In the following example, the program checks for an invalid value for a field, and issues a message if the value is incorrect. This code would be in an OnChangeEdit event associated with a property.

```
&Value = %ThisMobileObject.EmailID;

If Not(Find("@", &Value)) Then
    /* invalid email address probably */
    MessageBox(0, "", 525, 2, "Message Not Found");

    &PropAttrs = %ThisMobileProperty.GetPropertyAttrsByName("EmailID");
    &PropAttrs.InError = True
End-If;
```

Data Types for Mobile

All mobile objects are declared as type ApiObject. For example:

```
Local ApiObject &MyMobileCollection;

Local ApiObject &MyMobileObject = %ThisMobileObject;
```

Note. Mobile objects can be declared only as Local.

Scope of Mobile Objects

A mobile object can be instantiated from PeopleCode. In addition, it can only be instantiated within the mobile events.

Variables in Mobile PeopleCode

Local variables are the only type of PeopleCode variables supported in mobile.

Session Class Method

The following is the Session class method used with Mobile.

See Also

Chapter 38, "Session Class," page 2167

GetCompIntfc

Syntax

```
GetCompIntfc( [COMPINTFC.] ComponentName )
```

Description

The GetCompIntfc method returns a reference to an empty mobile object. Mobile objects are the means of accessing the synchronizable Component Interface in PeopleCode, so this is similar to creating an empty Component Interface in PIA. *ComponentName*, when used by itself, takes a string value. If you use **COMPINTFC.***ComponentName* it is not a string value; it is a constant that automatically is renamed in your code if the Component Interface definition is ever renamed.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ComponentName</i>	Specify the name of the synchronizable Component Interface. You can either use <i>ComponentName</i> by itself or prefaced with the keyword COMPINTFC.

Returns

This method returns an empty mobile object if successful, or Null on error (such as *ComponentName* specifies a nonexistent synchronizable Component Interface).

Example

```
Local ApiObject &SaveCustomer, &Customer;

&SaveCustomer = %ThisMobileObject.MyFavoriteCustomer;

&Customer = %Session.GetCompIntfc(COMPINTFC.CUSTOMER);
&Customer.Name="Acme Appliances";

if (&Customer.Get() <> true) then;
    if (&Customer.Create() <> true) then;
        ErrorHandler();
    Else
        &Customer.Save();
    End-If;
End-if;

%ThisMobileObject.MyFavoriteCustomer = &Customer;
```

Mobile Class

The Mobile object represents the PIA equivalent of a row of data. It is what is displayed in the detail view of a mobile page.

The mobile object is accessed using the %ThisMobileObject system variable.

Mobile Class Methods

The following are the Mobile class methods, in alphabetical order.

Note. With the Mobile class methods, and unlike the Component Interface class methods, all properties that have been set are used in the search. This provides more flexibility, and does not require setting up specific Get, Create, or Find keys.

Create

Syntax

Create()

Description

The Create method associates the mobile object with a new, open mobile object. It is available only on an empty mobile object that is returned by the GetCompIntfc session method.

Parameters

None.

Returns

A Boolean value: True if object was successfully created, False otherwise.

Example

```
Local ApiObject &SaveCustomer, &Customer;

&SaveCustomer = %ThisMobileObject.MyFavoriteCustomer;

&Customer = %Session.GetCompIntfc(COMPINTFC.CUSTOMER);
&Customer.Name="Acme Appliances";

if (&Customer.Get() <> true) then;
    if (&Customer.Create() <> true) then;
        ErrorHandler();
    Else
        &Customer.Save();
    End-If;
End-if;

%ThisMobileObject.MyFavoriteCustomer = &Customer;
```

See Also

[Chapter 26, "Mobile Classes," GetCompIntfc, page 1392](#)

Find

Syntax

Find()

Description

The Find method returns a reference to a CI collection that is populated with a collection of empty mobile objects. The properties that the application developer sets within the empty mobile object are used as the Find keys. This method is available only on an empty mobile object that is returned by the GetCompIntfc session method. Using it on a non-empty mobile object causes an error.

This collection may have zero elements in it if no items matching the key values you set were found. If you set no keys, all of the mobile objects of the type specified by GetCompIntfc are returned.

While the PIA Component Interface Find method limits the number of returned instances to 300, the mobile Find method has no limit.

The Find method returns only the topmost parent mobile objects. You do not have to set values for all the key values. After you have a collection, you can use the CI Collection method Item to return the empty mobile object, and then use Get on the mobile object to instantiate it.

Note. Wildcards are not implemented for this release.

Parameters

None.

Returns

A CICollection collection of mobile objects. You must use the Get method on these mobile objects before you can use them.

Example

```
/* Error checking left out for clarity */

&MyCI = %Session.GetCompIntfc(CompIntfc.QE_MB_COMPANY_CI);
&MyCI.QE_MB_COMPANY = "Acme Appliances";
&MyCIFindCollection = &MyCI.Find();
&Acme = &MyCIFindCollection.Item(1);
&Acme.Get();
```

Get

Syntax

Get()

Description

The Get method associates a mobile object with the user-defined properties that have been explicitly set on the object.

Parameters

None.

Returns

A Boolean value: True if mobile object was successfully retrieved, False otherwise.

Example

```
Local ApiObject &SaveCustomer, &Customer;  
  
&SaveCustomer = %ThisMobileObject.MyFavoriteCustomer;  
  
&Customer = %Session.GetCompIntfc(COMPINTFC.CUSTOMER);  
&Customer.Name="Acme Appliances";  
  
if (&Customer.Get() <> true) then;  
    if (&Customer.Create() <> true) then;  
        ErrorHandler();  
    Else  
        &Customer.Save();  
    End-If;  
End-if;  
  
%ThisMobileObject.MyFavoriteCustomer = &Customer;
```

GetName

Syntax

GetName()

Description

The GetName method returns the class name of the mobile object.

Parameters

None.

Returns

The class name of the mobile object as a string. This is the name of the synchronizable Component Interface, or one of the levels.

Example

```
&GetName = &qe_mb_obj_setup.GetName();  
  
/* Write the name of the Object to the Results field */  
&qe_mb_obj.QE_MB_RESULTS = "The name of this Mobile Object is: " | &GetName;
```

GetParent

Syntax

GetParent()

Description

The GetParent method returns a mobile object that is the parent of the Mobile object that is executing the method. If you are at the top level (level zero), it returns itself.

Parameters

None.

Returns

The parent mobile object.

Example

```
/* This loop will continue getting parent level, until level 0 is reached. */  
&obj = %ThisMobileObject;  
Repeat  
    &obj = &obj.getparent();  
    /* Do some processing */  
until (&obj.IsSameAs(%ThisMobileObject.gettopparent()));
```

GetPeerDefaultAttributesByName

Syntax

GetPeerDefaultAttributesByName(*Reference*, *Property*)

Description

When a peer reference does not have a value associated with it, the display attributes can only be accessed using the PeerDefaultAttributes class. After a peer reference has values, it can be accessed using the ListViewAttrs class.

Use the GetPeerDefaultAttributesByName method to access the default peer reference attributes for the specified property on the peer reference.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Reference</i>	Specify the name of a peer reference, as a string.
<i>Property</i>	Specify a property on the peer reference, as a string.

Returns

A reference to a PeerDefaultAttributes class.

Example

```
%ThisMobileObject.GetPeerDefaultAttributesByName("CI_CUSTOMER_MB", "ADDRESS").⇒  
Visible = True;
```

See Also

[Chapter 26, "Mobile Classes," PeerDefaultAttributes Class, page 1433](#)

GetPropertyAttrsByName

Syntax

GetPropertyAttrsByName(*propertyname*)

Description

The `GetPropertyAttrsByName` method returns a reference to a `PropertyAttrs` object, used to modify display attributes of properties.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>propertyname</i>	The name of the property.

None.

Returns

A `PropertyAttrs` object, used to modify display attributes of properties.

Example

```
%ThisMobileObject.GetPropertyAttrsByName("QE_MB_SET_DATE").Visible = False;
```

See Also

[Chapter 26, "Mobile Classes," PropertyAttrs Class, page 1428](#)

GetPropertyByName

Syntax

`GetPropertyByName` (*Name*)

Description

The `GetPropertyByName` method returns the value of a property. Generally this function is used only in applications that cannot get the names of the mobile object user-defined properties until runtime.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Name</i>	Specify the name of the property you want to access. The PeopleCode program terminates if this property does not exist.

Returns

The value of the property specified by *Name*. For a collection, it returns a reference to the collection.

Example

```
&GetPropertyByName_Char = &qe_mb_obj_setup.GetPropertyByName(&CharacterProperty⇒
Name);
/*Write the results of the GetPropertyByName method to the results Field */

&qe_mb_obj.QE_MB_RESULTS = "The value of the Character Field: "
| &GetPropertyByName_Char | "
```

GetPropertyInfoByName

Syntax

GetPropertyInfoByName(*propertyname*)

Description

The GetPropertyInfoByName method returns a reference to a PropertyInfo object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>propertyname</i>	The name of the property.

Returns

A PropertyInfo object.

Example

```
&pinfo = %ThisMobileObject.GetPropertyInfoByName("QE_MB_SET_DATE");
if &pinfo.HasDefaultValue = True then
    %ThisMobileObject.QE_MB_SET_DATE = &pinfo.DefaultValue;
end-if;
```

See Also

[Chapter 26, "Mobile Classes," PropertyInfo Class, page 1413](#)

GetTopParent

Syntax

GetTopParent()

Description

The **GetTopParent** method returns a mobile object that is the topmost parent of the Mobile object.

Parameters

None.

Returns

A reference to the topmost parent mobile object as a mobile object. If the current mobile object is the topmost object, this method returns a reference to the current mobile object.

Example

```
/* Check if the created Mobile Object is at Level 0 */
If (&qe_mb_obj_setup.IsSameAs(&qe_mb_obj_setup.GetTopParent())) Then

    /* Set the Parent Level variable to 0.
    Results for this get set below the looping statement */
    &Parent_Level = 0;

End-If;
```

IsNew

Syntax

IsNew()

Description

The **IsNew** method indicates if this object has never been synchronized.

Parameters

None.

Returns

A Boolean value: True if this object was created on the device and never synchronized, False if this object has been synchronized.

Example

```
&IsNew = &qe_mb_obj_setup.IsNew();  
/*Write the results of the IsNew to the results Field */  
  
&qe_mb_obj.QE_MB_RESULTS = "The following is " | &IsNew | ": The Mobile Object is⇒  
new, and has never been synced.";
```

IsNewAndNeverSaved

Syntax

IsNewAndNeverSaved()

Description

The IsNewAndNeverSaved method indicates if this object was created on the device and has not yet been saved.

Parameters

None.

Returns

A Boolean value: True if this object was created on the device and has not yet been saved, False otherwise.

Example

```
&IsNewAndNeverSaved = &qe_mb_obj_setup.IsNewAndNeverSaved();  
/*Write the results of the IsNewAndNeverSaved method to the results Field */  
  
&qe_mb_obj.QE_MB_RESULTS = "The following is " | &IsNewAndNeverSaved | ": This⇒  
Mobile Object is new, and has never been saved. "
```

IsSameAs

Syntax

IsSameAs(*MObject*)

Description

The IsSameAs method determines if one mobile object is the same as another. This is useful when you are trying to determine if the %ThisMobileObject is the topmost mobile object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>MObject</i>	Specify the mobile object to which this mobile object is being compared.

Returns

A Boolean value: True if this mobile object is the same as the mobile object, False otherwise.

Example

```
/*Check if the created Mobile Object is at Level 0 */
If (&qe_mb_obj_setup.IsSameAs(&qe_mb_obj_setup.GetTopParent())) Then

/* Set the Parent Level variable to 0. Results for this get set below
the looping statement */
&Parent_Level = 0;

EndIf;
```

ReadBlobFromFile

Syntax

ReadBlobFromFile(*blobpropertyname*, *filename*)

Description

The ReadBlobFromFile method reads a file on your mobile device and writes it into the attachment property. The attachment property is a reference property on the synchronizable Component Interface; its purpose is to contain attachment data.

When the mobile user synchronizes from the mobile page, the attachment file data contained in the property is sent to the synchronization server. The size of the attachment on the synchronization server is updated to reflect the new contents.

If you use this method, your synchronized Component Interface must use an attachment: the synchronization server must use its attachment events, and must run the attachment method `PutAttachment`.

See [Chapter 41, "SyncServer Class," Using Attachment Events, page 2257](#).

Working With Relative Paths

You can specify either an absolute or a relative path for *filename* .

If you specify a relative path, the path that is appended is the working directory for the PSMobile.exe file. The exact path depends on the installation of Mobile on the device.

For example, if you specified `\files\MyFile.ext` for *filename*, the actual path might be something like `c:\Program Files\PeopleSoft\PeopleSoft Mobile Agent\files\Myfile.ext`.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>blobpropertyname</i>	A string specifying the name of the reference property used for the attachment.
<i>FileName</i>	This parameter is a string specifying the path and filename of the file that you use as an attachment.

Returns

This is a Boolean value: True if the attachment was read successfully; False otherwise.

Example

```
%ThisMobileObject.ReadBlobFromFile("Attachment", %ThisMobileObject.QE_MB_READ_⇒
WRITE | %ThisMobileObject.ATTACHUSERFILE);
```

Save

Syntax

Save()

Description

The Save method saves the entire mobile object hierarchy in which the mobile object is contained.

You do not generally call the Save method on %ThisMobileObject; that saving is done when the user clicks on the Save button.

Using this method does not save associated peer references; you must use the Save method on each peer references separately.

The standard PeopleSoft save business rules (that is, any PeopleCode programs associated with OnSaveEdit, OnSavePreChange, and so on) are executed after you execute this method.

If you instantiate another mobile object with PeopleCode (using Get, Create) these objects are not automatically saved when the end user clicks the Save button. You must use the Save method with these instances separately.

Using the Save method on developer-instantiated mobile objects does not guarantee they will be saved. The save does not take effect until the end user clicks the Save button.

If you make changes to a developer-instantiated mobile object, the end user is not automatically prompted to save when trying to leave the page because it is not part of the current component.

Note. If a developer uses the Save method with a developer-instantiated component interface, and if the end user did not make any other changes to data in the current component interface, when the user leaves the current unit of work, they are *not* prompted to save their data.

To ensure that the data actually gets committed to the database, the developer can force a prompt to occur. This can be done using the following code:

```
%ThisMobileObject.SetModified(True);
```

Parameters

None.

Returns

A Boolean value: True if component was successfully saved, False otherwise.

Example

```
Local ApiObject &SaveCustomer, &Customer;
&SaveCustomer = %ThisMobileObject.MyFavoriteCustomer;
&Customer = %Session.GetCompIntfc(COMPINTFC.CUSTOMER);
&Customer.Name="Acme Appliances";
if (&Customer.Get() <> true) then;
    if (&Customer.Create() <> true) then;
        ErrorHandler();
    Else
        %ThisMobileObject.SetModified(True)
        &Customer.Save();
End-If;
End-if;
%ThisMobileObject.MyFavoriteCustomer = &Customer;
```

SetModified

Syntax

SetModified(*IsModified*)

Description

The SetModified method forces the mobile object to have the specified modified value of True or False.

Note. Not only does using this method change the overall modified state of the object, but when changing the modified state to False it also clears the modified flag on any properties that had been modified.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>IsModified</i>	Specify whether this mobile object has been modified. This parameter takes a Boolean value: True, the mobile object has been modified, False, the object has not been modified.

Returns

The current setting of this mobile object *before* being modified by this method: True for modified before this setting, False for not modified before this setting.

Example

```
/*    Get the value of the TrueFalse check box, to see how to set
the modified setting.    */
If &qe_mb_obj.QE_MB_TRUE_FALSE = True Then
    &True_or_False = True;
    &SetModified = &qe_mb_obj_setup.SetModified(True);
Else
    &True_or_False = False;
    &SetModified = &qe_mb_obj_setup.SetModified( False);
End-If;
```

SetPropertyByName

Syntax

SetPropertyByName(*propertyname, value*)

Description

The SetPropertyByName method sets the value of a property. Generally this function is used only in applications that cannot set the names of the component interface properties until runtime.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>propertyname</i>	The name of the property.
<i>value</i>	This is the value to which the property is set.

Returns

None. The PeopleCode program terminates if there is an error.

Example

```
%ThisMobileObject.SetPropertyByName("QE_MB_NUMBER", 77777);
```

ValidateEnum

Syntax

```
ValidateEnum(propertyname)
```

Description

The ValidateEnum method verifies if the value of a property is a valid enumeration value. Enumeration values are originally set in Application Designer, when the original records for the synchronizable Component Interface are designed.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>propertyname</i>	Specify the name of the property as a string.

Returns

A Boolean value: True if the value is a valid dynamic enumeration, False otherwise.

Example

```

/* Validate if the value entered into Results field is a valid dynamic enumeration⇒
 */
&ob = %ThisMobileObject;

&Validate_DE = &ob.ValidateEnum(&ob.QE_MB_RESULTS);

/*Enter Results into Results Field */
&ob.QE_MB_RESULTS = "The following statement is " | &Validate_DE | ": The Property⇒
" | &ob.QE_MB_RESULTS | " is a valid Dynamic Enumeration.";

```

ValuesDifferFromLastSync

Syntax

ValuesDifferFromLastSync()

Description

The ValuesDifferFromLastSync method indicates if at least one property has a value that differs from its value since the last synchronization.

If this object has been created on the mobile device, that is, when there is no previous sync value, the first saved values are used as the comparison values for this property.

This is a true member by member comparison of data values, not modified flags. The SetModified method has no effect on this method.

Parameters

None.

Returns

A Boolean value: True if at least one property in this object has a value that differs from its original value, False otherwise.

Example

```

&ValuesDifferFromLastSync = &qe_mb_obj_setup.ValuesDifferFromLastSync();

/*Write the results of the ValuesDifferFromLast Sync method to the results Field*/

&qe_mb_obj.QE_MB_RESULTS = "The following is " | &ValuesDifferFromLastSync | ": At⇒
least one property has a value that differs from the values last synced."

```

WasSaved

Syntax

WasSaved()

Description

The WasSaved method indicates if this object has been saved since it was created or last synchronized.

Parameters

None.

Returns

A Boolean value: True if this object has been saved since it was created or last synchronized, False otherwise.

Example

```
&WasSaved = &qe_mb_obj_setup.WasSaved();  
  
/*Write the results of the WasSaved method to the results Field */  
  
&qe_mb_obj.QE_MB_RESULTS = "The following is " | &WasSaved | ": This Mobile Object⇒  
has been saved since it was last synced, or created. "
```

WriteBlobToFile

Syntax

WriteBlobToFile(*blobpropertyname*, *filename*)

Description

The WriteBlobToFile method reads the attachment property and writes it into a file on your mobile device. The attachment property is a reference property on the synchronizable Component Interface; its purpose is to contain attachment data.

When the mobile user synchronizes from the mobile page, this attachment file data contained in the property is received from the synchronization server.

If you use this method, your synchronized Component Interface must use an attachment: the synchronization server must use its attachment events, and must run the attachment method GetAttachment.

See [Chapter 41, "SyncServer Class," Using Attachment Events, page 2257.](#)

Working With Relative Paths

You can specify either an absolute or a relative path for *filename* .

If you specify a relative path, the path that is appended is the working directory for the PSMobile.exe file. The exact path depends on the installation of Mobile on the device.

For example, if you specified `\files\MyFile.ext` for *filename*, the actual path might be something like `c:\Program Files\PeopleSoft\PeopleSoft Mobile Agent\files\Myfile.ext`.

Parameters

Parameter	Description
<i>blobpropertyname</i>	A string specifying the name of the reference property that is used for the attachment.
<i>FileName</i>	A string specifying the path and filename of the attachment file. This parameter takes a string value.

Returns

This is a Boolean value: True if the attachment was written successfully; False otherwise.

Example

```
%ThisMobileObject.WriteBlobToFile("Attachment", %ThisMobileObject.QE_MB_READ_WRITE⇒  
| %ThisMobileObject.ATTACHUSERFILE);
```

Mobile Class Property

The following is the Mobile class property.

Note. Normally, properties for mobile objects are the equivalent of the user-define properties on the synchronizable Component Interface. The properties described here should not be used for user-defined properties when one designs a synchronizable Component Interface in the Application Designer.

PropertyInfoCollection

Description

The PropertyInfoCollection property returns a reference to a collection of PropertyInfo objects that describe the shape of the mobile object.

This property is read-only.

See Also

[Chapter 26, "Mobile Classes," PropertyInfo Class, page 1413](#)

PropertyInfoCollection

The PropertyInfoCollection objects contains a collection of PropertyInfo objects.

A PropertyInfoCollection is returned from the following:

- a mobile object
- a PropertyInfo object

See Also

[Chapter 26, "Mobile Classes," PropertyInfoCollection, page 1411](#)

[Chapter 26, "Mobile Classes," PropertyInfoCollection, page 1417](#)

PropertyInfoCollection Method

The following is the method for the PropertyInfoCollection property.

Item

Syntax

Item(*number*)

Description

The `Item` method returns a `PropertyInfo` object that exists at the *number* position in the `PropertyInfoCollection`.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>number</i>	A position in the <code>PropertyInfoCollection</code> collection. The first position is 1.

Returns

A reference to the `PropertyInfo` object that exists at the *number* position in the `PropertyInfoCollection` collection. If the specified item is a collection, the returned `PropertyInfo` object is invalid and is set to `NULL`.

Example

```
/* Copy all like properties from &Item to &TargetItem */
for &i = 1 to &Item.PropertyInfoCollection.Count
    if &Item.PropertyInfoCollection.Item(&i).IsSimpleApplicationProperty then
        try &TargetItem.SetPropertyByName(&Item.PropertyInfoCollection.Item(&i).Name,
            &Item.GetPropertyByName(&Item.PropertyInfoCollection.Item(&i).Name))
        catch Exception &xException;
    end-try;
end-if;
end-for;
```

PropertyInfoCollection Property

The following is the property for the `PropertyInfoCollection` property.

Count

Description

This property returns the number of `PropertyInfo` objects in the `PropertyInfoCollection`.

This property is read-only.

Example

```
/* Copy all like properties from &Item to &TargetItem */
for &i = 1 to &Item.PropertyInfoCollection.Count
    if &Item.PropertyInfoCollection.Item(&i).IsSimpleApplicationProperty then
        try &TargetItem.SetPropertyByName(&Item.PropertyInfoCollection.Item(&i).Name,
            &Item.GetPropertyByName(&Item.PropertyInfoCollection.Item(&i).Name))
            catch Exception &xException;
        end-try;
    end-if;
end-for;
```

PropertyInfo Class

The PropertyInfo class objects are returned by the following:

- the Item method of a PropertyInfo collection
- the GetPropertyInfoByName of a mobile object

PropertyInfo Class Properties

The following are the properties for the PropertyInfo object.

DefaultValue

Description

This property returns the default value for this mobile object property.

This property is read-only.

Note. Definitional defaults are applied only when an Object is Created, just before the OnInit PeopleCode is run.

Example

```
&pinfo = %ThisMobileObject.GetPropertyInfoByName("QE_MB_SET_DATE");
if &pinfo.HasDefaultValue = True then
    %ThisMobileObject.QE_MB_SET_DATE = &pinfo.DefaultValue;
end-if;
```

HasDefaultValue

Description

This property returns a Boolean value: True if this mobile object property has a default value; False otherwise.

This property is read-only.

Note. Definitional defaults are applied only when an object is created, just before the OnInit PeopleCode is run.

Example

```
&pinfo = %ThisMobileObject.GetPropertyAttrsByName("Text");
if &pinfo.HasDefaultValue = True then;
    %ThisMobileObject.Text = &pinfo.DefaultValue;
end-if;
```

IsCollection

Description

This property returns True if the property that the PropertyInfo object is describing is a Data Collection, False otherwise. If IsCollection is False, the object represents a mobile object user-defined or system property.

This property is read-only.

Example

```
/* Use the PropertyInfoCollection Property of the mobile object class, and use the⇒
   Item number field
   to determine the item method from the PropertyInfoCollection class. */
&PropertyInfo = &qe_mb_obj_setup.PropertyInfoCollection.item(&qe_mb_obj.QE_MB_PC_⇒
ITEM);

/*Write the results to the results field */
&qe_mb_obj.QE_MB_RESULTS = "The following is " | &PropertyInfo.IsCollecton | " :⇒
   This Property represents a collection";
```

IsRefToParent

Description

This property is True if this is a reference to this object's parent, False otherwise. A property that is RefToParent is also a System Property.

This property is read-only.

Example

```
/* Use the PropertyInfoCollection Property of the mobile object class, and use the⇒
   Item number
   field to determine the item method from the PropertyInfoCollection class. */
&PropertyInfo = &qe_mb_obj_setup.PropertyInfoCollection.item(&qe_mb_obj.QE_MB_PC_⇒
ITEM);

/* Write the results to the results field */
&qe_mb_obj.QE_MB_RESULTS = "The following is " | &PropertyInfo.IsRefToParent | " :⇒
  This is a reference to this Object' Parent. "
```

IsPeerReference

Description

This property is True if this is a peer reference, False otherwise.

This property is read-only.

IsSimpleApplicationProperty

Description

This property is True is this is a simple, non-reference application-defined property; False otherwise. In other words, if True, it is not a system property, collection, nor peer reference; it is a property that was defined on the synchronized Component Interface in Application Designer.

This property is read-only.

Example

```
/* Copy all like properties from &Item to &TargetItem */
for &i = 1 to &Item.PropertyInfoCollection.Count
    if &Item.PropertyInfoCollection.Item(&i).IsSimpleApplicationProperty then
        try &TargetItem.SetPropertyByName(&Item.PropertyInfoCollection.Item=>
(&i).Name,
            &Item.GetPropertyByName(&Item.PropertyInfoCollection.Item(&i).Name))
        catch Exception &xException;

        end-try;
    end-if;
end-for;
```

IsSystemProperty

Description

This property is True if this is a System Property; False otherwise. System properties include the OID and VERSION properties, and references to Parents.

This property is read-only.

Example

```
/* Use the PropertyInfoCollection Property of the mobile object class, and use the=>
Item number
field to determine the item method from the PropertyInfoCollection class. */
&PropertyInfo = &qe_mb_obj_setup.PropertyInfoCollection.item(&qe_mb_obj.QE_MB_PC=>
ITEM);

/*Write the results to the results field */
&qe_mb_obj.QE_MB_RESULTS = "The following is " | &PropertyInfo.IsSystemProperty |=>
": This is a system property. "
```

Name

Description

The name of the property.

This property is read-only.

Example

```
/* Use the PropertyInfoCollection Property of the mobile object class, and use the⇒
   Item number
   field to determine the item method from the PropertyInfoCollection class. */
&PropertyInfo = &qe_mb_obj_setup.PropertyInfoCollection.item(&qe_mb_obj.QE_MB_PC_⇒
ITEM);

/*Write the results to the results field */
&qe_mb_obj.QE_MB_RESULTS = "The name of the accessed Property is: " | &Property⇒
Info.Name;
```

PropertyInfoCollection

Description

This property returns a reference to another PropertyInfoCollection collection if the object executing the property is a collection.

This property is read-only.

Example

```
/* Use the PropertyInfoCollection Property of the mobile object class, and use the⇒
   Item number field to determine the item method from the PropertyInfoCollection⇒
   class. */
&PropertyInfo = &qe_mb_obj_setup.PropertyInfoCollection.item(&qe_mb_obj.QE_MB_PC_⇒
ITEM);

/*Write the results to the results field. Since this property returns a CompIntf⇒
PropertyInfoCollect Object, use the Count porperty of the PropertyInfoCollection⇒
class, to test this.*/
&qe_mb_obj.QE_MB_RESULTS = "The property count of the CompIntfPropertyInfo⇒
Collection returned by this property is: " | &PropertyInfo.PropertyInfoCollection⇒
.count;
```

CI Collection Class

A CI Collection is returned by the mobile object Find method. A CI Collection is a collection of empty mobile objects.

See Also

[Chapter 26, "Mobile Classes," Find, page 1394](#)

CI Collection Method

The following is the CI Collection method.

Item

Syntax

Item(*index*)

Description

The Item method returns a Mobile Component Interface object. Once you've returned a reference, to instantiate it, use the Get method on the returned object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>index</i>	A number value: the index number for the Component Interface to fetch. Indexes start at 1.

Returns

An empty mobile object that was fetched. You must use the Get method to get the data for that object.

Example

```
/* Error checking left out for clarity */
&MyCI = %Session.GetCompIntfc(CompIntfc.QE_MB_COMPANY_CI);
&MyCI.QE_MB_COMPANY = "Acme Appliances";
&MyCIFindCollection = &MyCI.Find();
&Acme = &MyCIFindCollection.Item(1);
&Acme.Get();
```

CI Collection Properties

The following is the CI Collection property.

Count

Description

The number of Mobile Component Interface objects in the CI Collection collection. This property is read-only.

Example

```
/* Error checking left out for clarity */  
&MyCI = %Session.GetCompIntfc(CompIntfc.QE_MB_COMPANY_CI);  
&total_in_collection = &MyCI.count;
```

DataCollection Class

A Data Collection object is created when you have a Mobile Page that is based upon a synchronizable Component Interface that contains levels. You do not directly instantiate the DataCollection object.

The synchronizable Component Interface upon which the following Mobile Page is based has the following levels:

- level one: QE_MB_DEPARTMNT
- level two: QE_MB_EMPLOYEE
- level three: QE_MB_ROLE

Use the DataCollection methods and property to access the mobile objects that map to the rows on these levels.

Name	Record	Field
QE_MB_EMPL_ROLE_CI		
FINDKEYS		
QE_MB_COMPANY	QE_MB_CO...	QE_MB_
CREATEKEYS		
QE_MB_COMPANY	QE_MB_CO...	QE_MB_
GETKEYS		
QE_MB_COMPANY	QE_MB_CO...	QE_MB_
PROPERTIES		
QE_MB_COMPANY	QE_MB_CO...	QE_MB_
QE_MB_DEPARTMNT	QE_MB_DE...	
QE_MB_DEPARTMENT	QE_MB_DE...	QE_MB_
QE_MB_DEPT_DESCR	QE_MB_DE...	QE_MB_
QE_MB_EMPLOYEE	QE_MB_EM...	
QE_MB_EMPLID	QE_MB_EM...	QE_MB_
QE_MB_EMPL_NAME	QE_MB_EM...	QE_MB_
QE_MB_ROLE	QE_MB_RO...	
QE_MB_ROLE_LV3	QE_MB_RO...	QE_MB_
QE_MB_ROLE_DE...	QE_MB_RO...	QE_MB_

Component Interface Data Collection Levels

Data Collection Methods

Following are the methods for the DataCollection class.

GetListViewAttrs

Syntax

GetListViewAttrs(*propertyname*)

Description

This method returns the List View attributes for this property. These attributes describe display attributes for a column on a List View.

In the following screen shot, the columns include:

- First Name
- Last Name
- Title
- City
- Postal code

My Contacts				
Find View All  First ◀ 1-2 of 2 ▶ Last				
First Name	Last Name	Title	City	Postal
Tyson	Bruno	Dock Supervisor	New York	10041
Stuart	Edwards	Parts Picker	Princetown	10342
Add				

List View columns

Using the `GetListViewAttrs` method, you can return a reference to one of these columns, then using the `ListViewAttrs` properties, you can change how the column displays.

Parameters

Parameter	Description
<i>propertyname</i>	This is the name of the property for which the List View attributes are retrieved.

Returns

A `ListViewAttrs` object containing information about the property column.

Example

```
/* Change the Label for the City Property which is a member of the objects
in the QE_DEMO_SITE Collection to "Town"*/
&ListAttrs = %ThisMobileObject.QE_DEMO_SITE.GetListViewAttrs("City");
&ListAttrs.Label = "Town";
```

Item

Syntax

Item(*index*)

Description

The `Index` method returns a reference to the mobile object referenced at *index*. This mobile object on the Mobile Page is the equivalent of one row on a level in the synchronizable Component Interface upon which the Mobile Page is based.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>index</i>	Specify the index number for the mobile object to return. Indexes start at 1.

Returns

A reference to the mobile object that was returned.

Example

```

Local ApiObject &ob, &Session;
Local ApiObject &PropertyInfo;

&ob = %ThisMobileObject;
/*****
 * Insert some children
 *****/
&ChildCount = &ob.MyChild1.Count;

&ob.MyChild1.InsertItem(&ChildCount);
&ChildObject = &ob.MyChild1.Item(&ChildCount + 1);

/*****
 * Manipulate Collections
 *****/
&ob.MyChild1.InsertItem(0);
&ChildObject = &ob.MyChild1.Item(1);
&ChildCount = &ob.MyChild1.Count;
If (&ChildCount > 0) Then;
    For &index = 1 To &ChildCount
        &ChildObject = &ob.MyChild1.Item(&index);
        &PropertyInfo = &ChildObject.GetPropertyInfoByName("version");
        &PropertyInfo.Label = "Version: ";
        &ob.MyChild1.Item(&index).version = &index + 100;
        &ob.MyChild1.Item(&index).GetPropertyInfoByName("version").visible = True;
    End-For;
End-If;

```

DeleteItem

Syntax

DeleteItem(*location*)

Description

The DeleteItem method removes the specified item from the collection and deletes the mobile object. This mobile object on the Mobile Page is the equivalent of one row on a level in the synchronizable Component Interface upon which the Mobile Page is based.

Note. Once you delete an item, it is deleted immediately. You no longer have access to it.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>location</i>	Specify the location within the collection of the mobile object to delete. This parameter takes a numeric value.

Returns

A Boolean value: True if the mobile object was successfully deleted, False otherwise.

Example

```
Local ApiObject &ob, &Session;
Local ApiObject &PropertyInfo;

&ob = %ThisMobileObject;
/*****
 * Insert some children
 *****/
&ChildCount = &ob.MyChild1.Count;

&ob.MyChild1.InsertItem(&ChildCount);
&ChildObject = &ob.MyChild1.Item(&ChildCount + 1);

/*****
 * Manipulate Collections
 *****/
&ob.MyChild1.DeleteItem(1);
&ChildObject = &ob.MyChild1.Item(1);
&ChildCount = &ob.MyChild1.Count;
```

InsertItem

Syntax

InsertItem(*location*)

Description

The InsertItem method inserts a new mobile object item at the specified location, plus 1. This mobile object on the Mobile Page is the equivalent of one row on a level in the synchronizable Component Interface upon which the Mobile Page is based.

Parameters

Parameter	Description
<i>location</i>	Specify the location of the new item. The mobile object is inserted at one past the number specified with <i>location</i> . For example, InsertItem(0) places the item in the first location, which is 1. InsertItem(count) places the new item in the last location: count + 1.

Returns

A Boolean value: True if the mobile object was successfully inserted, False otherwise.

Example

```
Local ApiObject &ob;
```

```
&ob = %ThisMobileObject;
```

```
If &MobileObjectValueExists = False Then
    &qe_mb_empl.create();
    /*Populate Level 1 data. */
    &NewCICounter_LV1 = 0;
    &ob_top_parent = &ob.gettopparent();
    While &NewCICounter_LV1 <> &ob_top_parent.QE_MB_DEPARTMNT.count;
        /*Insert Level 1 Row */
        &qe_mb_empl.QE_MB_DEPARTMNT.InsertItem(&NewCICounter_LV1 + 1);
        &qe_mb_empl.QE_MB_DEPARTMNT.Item(&NewCICounter_LV1 + 1).QE_MB_DEPARTMENT =
        &ob_top_parent.QE_MB_DEPARTMNT.Item(&NewCICounter + 1).QE_MB_DEPARTMENT_LV1;
        &qe_mb_empl.QE_MB_DEPARTMNT.Item(&NewCICounter_LV1 + 1).QE_MB_DEPT_DESCR =
        &ob_top_parent.QE_MB_DEPARTMNT.Item(&NewCICounter_LV1 + 1).QE_MB_DEPT_DESCR;
        &NewCICounter_LV2 = 0;
    End-While;
End-If;
```

Data Collection Properties

Following is the property for DataCollection.

Count

Description

The number of mobile objects in the collection. This is the equivalent of the number of rows on a level in the synchronizable Component Interface upon which the Mobile Page is based.

This property is read-only.

Example

```
Local ApiObject &ob, &Session;
Local ApiObject &PropertyInfo;

&ob = %ThisMobileObject;
/*****
 * Insert some children
 *****/
&ChildCount = &ob.MyChild1.Count;

&ob.MyChild1.InsertItem(&ChildCount + 1);
&ChildObject = &ob.MyChild1.Item(&ChildCount + 1);

&ob.MyChild1.InsertItem(1);
&ChildObject = &ob.MyChild1.Item(1);
&ChildCount = &ob.MyChild1.Count;
```

ListViewAttrs Class

The ListViewAttrs class objects are returned from the GetListViewAttrs data collection method.

The ListViewAttrs class has methods and properties that provide information about the properties for the synchronizable Component Interface upon which the Mobile Page is based.

ListViewAttrs Method

Following is the ListViewAttrs method.

IsSet

Syntax

IsSet(*attribute*)

Description

The `IsSet` method indicates if the given attribute had been explicitly set from `PeopleCode`, or if it is in an uninitialized state.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>attribute</i>	Specify one of the <code>ListViewAttrs</code> properties, which contains display information about a mobile property column in a List View.

Returns

This method returns a Boolean value: `True` if this attribute has been set, `False` otherwise.

Example

```
/* Write the results to the results string */  
  
&results_string = "The following is " |  
&ThisMobileObject.QE_DEMO_SITE("City").IsSet("Visible") |  
": City is visible. "
```

ListViewAttrs Properties

Following are the `ListViewAttrs` properties.

DetailViewLabel

Description

Use this property to change the label shown at the top of a Mobile Page Detail View. `DetailViewLabel` is only available to a `ListViewAttrs` object that has been fetched with an empty string.

This property is read-write.

Example

Note that in this example, `GetListViewAttrs` uses an empty string as input. This is how to call `GetListViewAttrs` for use with `DetailViewLabel`.

```

/* Pass empty string */
&ListAttrs = %ThisMobileObject.QE_DEMO_SITE.Item(1).QE_DEMO_SITE_H.⇒
GetListViewAttrs("");
&ListAttrs.DetailViewLabel = "My Site Details";

```

Label

Description

Use this property to change the label shown at the top of a column in a List View; it is the label for a property for mobile objects in a Data Collection.

This property is read-write.

In the following example, there are five columns, hence five labels: First Name, Last Name, Title, City and Postal.

My Contacts				
			Find View All 	First  1-2 of 2  Last
First Name	Last Name	Title	City	Postal
Tyson	Bruno	Dock Supervisor	New York	10041
Stuart	Edwards	Parts Picker	Princetown	10342
				

List View columns

Example

```

/* Change the Label for the City Property which is a member of the objects
in the QE_DEMO_SITE Collection to "Town"*/
&ListAttrs = %ThisMobileObject.QE_DEMO_SITE.GetListViewAttrs("City");
&ListAttrs.Label = "Town";

```

ListViewLabel

Description

Use this property to change the tab label. The tab label is indirectly exposed through PeopleCode; it overwrites the List View Label, which is the default if no tab label is defined. However, if the ListViewLabel property is set for a property that has a tab label, the tab label is overridden with the PeopleCode ListViewLabel value.

ListViewLabel is only available to a ListViewAttrs object that has been fetched with an empty string.

This property is read-write.

Example

Note that in this example, `GetListViewAttrs` uses an empty string as input. This is how to call `GetListViewAttrs` for use with `ListViewLabel`.

```
/* Pass empty string */
&ListAttrs = %ThisMobileObject.QE_DEMO_SITE.Item(1).QE_DEMO_SITE_H.⇒
GetListViewAttrs("");
&ListAttrs.ListViewLabel = "My Sites";
```

Visible

Description

This property is `True` if this column for a property in a List View is visible. Setting this property to `False` hides the column.

Note. Even if a property has been marked as Invisible on the mobile page definition in Application Designer, you can still override this property using PeopleCode.

This property is read-write.

Example

```
/* Make invisible the City property column which is a member of
the objects in the QE_DEMO_SITE Collection */

&ListAttrs = %ThisMobileObject.QE_DEMO_SITE.GetListViewAttrs("City");
&ListAttrs.Visible = False;
```

PropertyAttrs Class

The `PropertyAttrs` class objects are returned from the `GetPropertyAttrsByName` method. This class has methods and properties that provide information about the properties for the synchronizable Component Interface upon which the Mobile Page is based.

For example, to hide the `QE_MB_ADDRESS` property on the synchronizable Component Interface upon which the current Mobile Page and its mobile objects are based, you can use the following PeopleCode on an `OnChange` event.

```
%ThisMobileObject.GetPropertyAttrsByName("QE_MB_ADDRESS").Visible = False;
```

Mobile Page Detail View

PropertyAttrs Method

Following is the PropertyAttrs method.

IsSet

Syntax

IsSet(*attribute*)

Description

The IsSet method indicates if the given attribute had been explicitly set, or if it is in an un-initialized state.

Parameters

Parameter	Description
<i>attribute</i>	Specify one of the PropertyAttrs properties, which contains display information about a mobile property.

Returns

This method returns a Boolean: True if this attribute has been set, False otherwise.

Example

```
/*Write the results to the results field */  
  
&qe_mb_obj.QE_MB_RESULTS = "The following is " |  
&qe_mb_obj_setup.GetPropertyAttrsByName(&CharacterPropertyName).IsSet("Visible") |  
": " | GetPropertyAttrsByName(&CharacterPropertyName) | "is visible. ";
```

PropertyAttrs Properties

Following are the PropertyAttrs properties.

DisplayOnly

Description

This property is True if the mobile property is display only; False otherwise. This only affects the Mobile Page; this value is not saved to the mobile database and is not synchronized.

Note. If a property has been marked as Display Only on the mobile page definition in Application Designer, you can override this property using PeopleCode. If a property has been marked as Display Only on the Component Interface, you can *not* override this property using PeopleCode.

If you use this property to make a collection display only, all the fields will be display only, except for those that are displayed as pushbuttons. To make a pushbutton display only, you must set the pushbutton property specifically to be display only, either in Application Designer or with PeopleCode. You must set the pushbutton property for every row to be display only.

This property is read-write.

Example

```

Declare Function Hide_or_Unhide_WorkingSetProps_SetValues PeopleCode QE_MB_PC_⇒
DER.QE_MB_GET FieldFormula;

/*If Get() checkbox is selected, unhide Set Value Properties, and grey
Create Check Box. Also make sure Get() check box is ungrayed. */
If %ThisMobileObject.QE_MB_GET = True Then
    /*Make sure Create() Checkbox now has value "N" */
    %ThisMobileObject.QE_MB_CREATE = False;
    Hide_or_Unhide_WorkingSetProps_SetValues( True);
    %ThisMobileObject.GetPropertyAttrsByName("QE_MB_CREATE").DisplayOnly = True;

Else
    /* If Get() checkbox is unselected, hide Set Value Properties, and ungrey
    Create Check Box. */
    If %ThisMobileObject.QE_MB_GET = False Then
        Hide_or_Unhide_WorkingSetProps_SetValues( False);
        %ThisMobileObject.GetPropertyAttrsByName("QE_MB_CREATE").DisplayOnly = False;
    End-If;
End-If;

```

InError

Description

Set this property within an OnSaveEdit event to cause any field on a Detail View that contains incorrect information to be displayed as red. This alerts the user to correct the data in that field.

This field is automatically reset. The developer does not have to reset this field.

This only affects the Mobile Page; this value is not saved to the mobile database and is not synchronized.

This property is read-write.

Example

```
%ThisMobileObject.GetPropertyAttrsByName("QE_MB_ADDRESS").InError = True;
```

Label

Description

Use this property to manipulate the label for this mobile property. This only affects the Mobile Page; this value is not saved to the mobile database and is not synchronized.

This property is read-write.

Example

```
&ob = %ThisMobileObject;  
&PropertyInfo = &ob.GetPropertyAttrsByName("text");  
&PropertyInfo.Label = "This is text";
```

ShowRequiredCue

Description

An asterisk (*) is displayed beside fields that are defined as Required in Application Designer. You can use this property to specify whether this asterisk, also called the required field cue, is displayed for a particular field.

This property is True if the mobile property displays the RequiredCue; False otherwise. This only affects the Mobile Page; this is not saved to the mobile database and is not synchronized.

Use this to make a field be required that was not specified as being required when the synchronized Component Interface was created in the Application Designer. (You cannot make a required field be not required.)

For example, many fields are made required through PeopleCode. This means they aren't defined as Required in Application Designer, and the end user may be confused. For these fields, you can use this property.

Note. This property affects only fields where a required field cue is otherwise permissible. That is, regardless of the setting of the property, no cue is ever shown on a push button, a display-only field, and so on.

This property is read-write.

Example

```
&ob = %ThisMobileObject;  
&PropertyInfo = &ob.GetPropertyAttrsByName("text");  
&PropertyInfo.ShowRequiredCue = True;
```

Visible

Description

This property is True if this field is visible in the Mobile Page Detail View displaying it. Setting this property to False hides the field.

This only affects the Mobile Page; this value is not saved to the mobile database and is not synchronized.

Note. Even if a property has been marked as Invisible on the mobile page definition in Application Designer, you can still override this property using PeopleCode.

If you set this value to False for a collection property, the collection is no longer visible.

Note. You can only make collections invisible using PeopleCode. You cannot set a collection to be invisible in Application Designer.

This property is read-write.

Example

```
If %ThisMobileObject.QE_MB_PROP_METH = "Visible" Or
    %ThisMobileObject.QE_MB_PROP_METH = "DisplayOnly" Or
    %ThisMobileObject.QE_MB_PROP_METH = "ShowRequiredCue" Or
    %ThisMobileObject.QE_MB_PROP_METH = "SetModified" Then
    %ThisMobileObject.getpropertyattrsbyname("QE_MB_TRUE_FALSE").Visible = True;
End-If;

If %ThisMobileObject.QE_MB_PROP_METH = "Item" Or
    %ThisMobileObject.QE_MB_PROP_METH = "DeleteItem" Or
    %ThisMobileObject.QE_MB_PROP_METH = "InsertItem" Then
    %ThisMobileObject.getpropertyattrsbyname("QE_MB_PC_ITEM").Visible = True;
End-If;
```

PeerDefaultAttributes Class

PeerDefaultAttributes are returned by the GetPeerDefaultAttributesByName method of a mobile object.

When a peer reference does not have a value associated with it, the display attributes can only be accessed using the PeerDefaultAttributes class. After a peer reference has values, it can access using the ListViewAttrs class.

PeerDefaultAttributes Class Method

The following is the PeerDefaultAttributes class method.

IsSet

Syntax

IsSet(*Attribute*)

Description

The IsSet method indicates if the given attribute had been explicitly set, or if it is in an un-initialized state.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Attribute</i>	Specify one of the PeerDefaultAttributes properties.

Returns

A Boolean value: True if the attribute has been explicitly set, False otherwise.

Example

```
&PeerAtt = %ThisMobileObject.GetPeerDefaultAttributesByName("CI_CUSTOMER_MB", =>
    "ADDRESS");

If &PeerAtt.IsSet(Visible) Then

/* some code */

End-if;
```

PeerDefaultAttributes Properties

This section discusses the PeerDefaultAttributes properties in alphabetical order.

DisplayOnly

Description

This property is True if the peer reference is display only; False otherwise. This only affects the Mobile Page; this value is not saved to the mobile database and is not synchronized.

Note. If a property has been marked as Display Only on the mobile page definition in Application Designer, you can override this property using PeopleCode. If a property has been marked as Display Only on the Component Interface, you can *not* override this property using PeopleCode.

This property is read-write.

Example

```
&IsVisible =  
%ThisMobileObject.GetPeerDefaultAttributesByName("CI_CUSTOMER_MB", "ADDRESS").⇒  
DisplayOnly;  
  
If &DisplayOnly Then  
/* some code */  
  
Else  
/* some other code */  
  
End-if;
```

Label

Description

Use this property to manipulate the label for this peer reference. This only affects the Mobile Page; this value is not saved to the mobile database and is not synchronized.

This property is read-write.

Example

```
%ThisMobileObject.GetPeerDefaultAttributesByName("CI_CUSTOMER_MB", "ADDRESS").⇒  
Label = &Label;
```

Visible

Description

This property is True if this peer reference is visible in the Mobile Page Detail View displaying it. Setting this property to False hides the peer reference.

This only affects the Mobile Page; this value is not saved to the mobile database and is not synchronized.

This property is read-write.

Example

```
%ThisMobileObject.GetPeerDefaultAttributesByName("CI_CUSTOMER_MB", "ADDRESS").⇒  
Visible = True;
```

Classes and Functions and System Variables Used in Mobile

Mobile uses a subset of the classes, functions, and system variables used in PIA. Here is a list of those used in mobile.

PeopleCode Classes Used in Mobile

The following is a list of the PeopleCode classes used in mobile.

- Application Package
- Array
- Component Interface
- Exception
- Request (part of iScript)

Considerations Using the Request Class

Only the following request class method (%Request) is supported for mobile:

GetParameter

Only the following request class properties (%Request) are supported for mobile:

- BrowserType
- BrowserVersion
- HTTPMethod
- Protocol

Note. Other request class methods and properties may not return an error when used in mobile, but do return a blank value, an empty array, False, and so on, according to the datatype of the value returned.

See [Chapter 21, "Internet Script Classes \(iScript\)," Request Class Methods, page 1062.](#)

System Variables Used in Mobile

The following is a list of the system variables used in mobile, by category.

- APIs: %Session, %Super, %This, %CompIntfcName
- Data and Time: %Date, %DateTime, %Request, %Time
- Mobile specific: %DeviceType, %MobilePage, %SyncServer, %ThisMobileObject

Considerations Using Default Values

For a record field, you can specify constants for a default, such as %Date. Mobile only supports the following for record field defaults. In addition, these are only supported for date, datetime, and time type fields (as appropriate):

- %ClientDate
- %Date
- %DateTime
- %Time

See Also

PeopleTools 8.51 PeopleBook: PeopleCode Language Reference, "System Variables"

Built-In Functions Used in Mobile

The following is a list of the built-in functions used in mobile, by category.

- Arrays: CreateArray, CreateArrayAny, CreateArrayRept, Split
- Conversion: Char, Code, String, Value
- Date and Time: AddToDate, AddToDateTime, AddToTime, Date, Date3, DatePart, DateTime6, DateTimeValue, DateValue, Day, Days, Days360, Days365, Hour, Minute, Month, Second, Time, Time3, TimePart, TimeValue, Weekday, Year
- Internet: GetHTMLText
- Language Constructs: Break, Declare Function, Evaluate, Exit, For, Function, If, Local, Repeat, Return, While
- Math: Abs, Acos, Asin, Atan, Cos, Cot, Degrees, Exp, Fact, Int, Integer, Ln, Log10, Nod, Product, Radians, Rand, Round, Sign, Sin, Sqrt, Tan, Truncate
- Message Catalog and Message Display: MessageBox, MsgGet, MsgGetExplainText, MsgGetText
- Mobile: GenerateMobileTree, IsDisconnectedClient, MSFGetNextNumber, TransferMobilePage
- OLE: CreateObject, ObjectDoMethod, ObjectGetProperty, ObjectSetProperty
- Saving: DoSave

Note. DoSave can only be used in the OnChange and OnChangeEdit events.

- String: Clean, Code, Exact, Find, Left, Len, Lower, LTrim, Replace, Rept, Right, Rtrim, String, Substitute, Substring, Upper
- Validation: Error
- Workflow: Warning

Considerations Using DoSave

The DoSave built-in function is supported in the following Mobile events:

- OnChange
- OnChangeEdit

Save processing (including OnSaveEdit, OnSavePreChange, and OnSavePostChange) is executed exactly as if the end user clicked the save button. OnObjectChangeEdit and OnObjectChange are executed prior to initiating the save processing.

If an error occurs during save processing, it is handled the same as if the user clicked the save button. For example, if save processing encounters an OnSaveEdit error, it displays the appropriate message box. If the error is on the current detail view, the detail view is rendered with the error highlighted. If the error is not on the current detail view, the user is asked if they would like to transfer to the object with the error. The user can correct the error and continue working with the component. If the PeopleCode calls DoSave followed by TransferMobilePage and an error occurs during save processing, the TransferMobilePage is not executed.

Chapter 27

Notification Classes

This chapter provides an overview of the Notify classes and discusses the following topics:

- Scope of the notification classes.
- Data types of the notification classes.
- How to import the notification classes.
- How to create a notification object.
- Notification class constructors.
- Notification class reference.

Understanding Notification Classes

The Notification classes are used for ad-hoc notification. These classes enable you to create and send a notification to someone. The notifications can either be a Peoplesoft Worklist item or an SMTP email message. The Notification class also stores notifications in a table.

You can also use web services to create Worklist entries, then send notifications of completion using application messages.

The Notification classes can be called from a component, an internet script, or an Application Engine program. The WSWorklistEntry class can be used incase you are developing your own PT_WORKLIST notification handler. .

Most of the classes, as well as most of the properties and methods that make up the Notification classes have a GUI representation in Peoplesoft Workflow. This document assumes that the reader is familiar with PeopleSoft Workflow.

See Also

PeopleTools 8.51 PeopleBook: Workflow Technology, "Understanding PeopleSoft Workflow"

Scope of the Notification Classes

The Notification classes can be called from a component, an internet script, Integration Broker, or an Application Engine program.

Notification classes can be of Local, Global, or Component scope.

Data Types of the Notification Classes

Every Notification class is its own data type, that is, Notifications are declared as data type Notification, Notification addresses are declared as type NotificationAddress, and so on.

The following are the data types of the Notification classes:

- Notification
- NotificationAddress
- NotificationTemplate
- WorklistEntry
- Worklist
- WSWorkListEntry

How to Import the Notification Classes

The Notification classes are *not* built-in classes, like Rowset, Field, Record, and so on. They are application classes. Before you can use these classes in your PeopleCode program, you must import them to your program.

An import statement names either all the classes in a package or one particular application class. For importing the Notification classes, PeopleSoft recommends that you import all the classes in the application package.

The application package PT_WF_NOTIFICATION contains the following classes:

- Notification
- NotificationAddress
- NotificationTemplate

The application package PT_WF_WORKLIST contains the following classes:

- Worklist
- WorklistEntry
- WSWorkListEntry

The import statements you should use are as follows:

```
import PT_WF_NOTIFICATION.*;  
import PT_WF_WORKLIST.*;
```

Using the asterisks after the package name makes all the application classes directly contained in the named package available. Application classes contained in subpackages of the named package are *not* made available.

See Also

[Chapter 6, "Application Classes," page 189](#)

How to Create a Notification Object

After you've imported the Notification classes, you instantiate an object of one of those classes using the constructor for the class and the Create function.

The following example creates a new instance of the WorklistEntry class, as the variable &MyWE, with local scope:

```
Local WorklistEntry &MyWE = Create WorklistEntry();
```

See Also

[Chapter 27, "Notification Classes," Notification Classes Constructors, page 1441](#)

Notification Classes Constructors

You must use the constructor for each class to instantiate an instance of that class. The following are the constructors for the Notification classes.

Notification

Syntax

```
Notification(NotifyFrom, dtmCreated, language_cd)
```

Description

Use Notification to instantiate a notification object.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>NotifyFrom</i>	Specify the entity the notification is being sent from, as a string. Avoid overusing generic entities with this parameter, as this value, along with the value for <i>dtmCreated</i> are the key to understanding where notifications originated from.
<i>dtmCreated</i>	Specify the datetime the notification is being sent, as a datetime value.
<i>language_cd</i>	Specify the 3-character language code of the current user, as a string.

Returns

A notification object.

Example

```
import PT_WF_NOTIFICATION:*;  
import PT_WF_WORKLIST:*;  
  
Local Notification &MyNotify;  
&MyNotify = Create Notification("Workflow_Admin", %Datetime, %Language);
```

See Also

[Chapter 27, "Notification Classes," Notification Class, page 1447](#)

NotificationAddress

Syntax

NotificationAddress(*Oprid*, *Description*, *Language*, *EmailId*, *Channel*)

Description

Use NotificationAddress to instantiate a notification address.

This address is used to build a notification using the Notification class. This class is required if you want to use the Notification data type.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Oprid</i>	Specify the user ID of the person receiving the notification, as a string.
<i>Description</i>	Specify the description of the entity receiving the notification (distribution group names, people's names, and so on) as a string.
<i>Language</i>	Specify the language code of the entity to be notified as a string.
<i>EmailId</i>	Specify the email address as a string.
<i>Channel</i>	Specify the 'channel' used for the notification, as a string. The values are:

<i>Value</i>	<i>Description</i>
Email	Notification is sent as email
Worklist	Notification is sent as a worklist

Returns

None.

Example

```
import PT_WF_NOTIFICATION:*;
import PT_WF_WORKLIST:*;
Local NotificationAddress &MyNotify_Addy;

&MyNotify_Addy = Create NotificationAddress(%UserID, &Description, %Language,⇒
    &EmailID, &Channel);
```

See Also

[Chapter 27, "Notification Classes," NotificationAddress Class, page 1453](#)

NotificationTemplate

Syntax

```
NotificationTemplate(ComponentId, Market, TemplateId, TemplateType)
```

Description

Use NotificationTemplate to instantiate a notification template.

If you're specifying a generic template, the first two parameters do not have to have values, that is, you must specify a Null string ("") instead.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ComponentId</i>	Specify the name of the component the notification is coming from as a string. To specify a generic template, you must specify a Null string ("") for this value instead.
<i>Market</i>	Specify the name of the market of the component the notification is coming from as a string. To specify a generic template, you must specify a Null string ("") for this value instead.
<i>TemplateId</i>	Specify the template ID as a string.
<i>TemplateType</i>	Specify the type of template as a string. Values are: • G: generic template • C: component template

Returns

An instance of the NotificationTemplate class.

Example

```
import PT_WF_NOTIFICATION:*;  
import PT_WF_WORKLIST:*;  
Local NotificationTemplate &Notify_Temp;  
/* create a generic template */  
&Notify_Temp = Create NotificationTemplate("", "", "MyTemplate", "G");
```

See Also

[Chapter 27, "Notification Classes," NotificationTemplate Class, page 1454](#)

Worklist

Syntax

Worklist()

Description

Use the Worklist method to instantiate a Worklist object.

Parameters

None.

Returns

An instance of the Worklist class.

Example

The following example code creates a worklist.

```
import PT_WF_WORKLIST:*;  
Local Worklist &theWorklist = Create Worklist();
```

See Also

[Chapter 27, "Notification Classes," Worklist Class, page 1460](#)

WorklistEntry

Syntax

WorklistEntry()

Description

Use WorklistEntry to instantiate a WorklistEntry object.

Parameters

None.

Returns

An instance of the WorklistEntry class.

Example

```
import PT_WF_NOTIFICATION:*;  
import PT_WF_WORKLIST:*;  
Local WorklistEntry &MyWorklistEntry = Create WorklistEntry();
```

See Also

[Chapter 27, "Notification Classes," WorklistEntry Class, page 1461](#)

WSWorklistEntry

Syntax

WSWorklistEntry()

Description

Use the WSWorklistEntry constructor to instantiate a WSWorklistEntry object.

The WSWorklistEntry class is primarily used with web services.

Parameters

None.

Returns

A reference to a WSWorklistEntry object.

See Also

[Chapter 27, "Notification Classes," WSWorklistEntry Class, page 1476](#)

Notification Class

This class is used to send a notification to people or people entities, as channel independent as possible. This enables functionality such as letting a user determine how to receive workflow notifications as a preference. It does not necessarily limit a person or entity to one channel.

See [Chapter 27, "Notification Classes," Notification Classes Examples, page 1478](#).

See *PeopleTools 8.51 PeopleBook: Workflow Technology*, "Using Notification Templates."

Notification Class Import Statements

The Notification class imports the following classes:

- NotificationAddress
- WorklistEntry

Here are the import statements:

```
import PT_WF_NOTIFICATION:NotificationAddress;
import PT_WF_WORKLIST:WorklistEntry;
```

Notification Class Method

In this section, we discuss the Notification class method Send.

Send

Syntax

Send()

Description

Use the Send method to send a notification to the entities defined in the NotifyTo, NotifyCC, and NotifyBCC, using the Subject and Message properties.

Parameters

None.

Returns

None.

See Also

PeopleTools 8.51 PeopleBook: Workflow Technology, "Understanding PeopleSoft Workflow"

Notification Class Properties

In this section, we discuss the Notification class properties. The properties are discussed in alphabetical order.

ContentType

Description

This property returns the content type of the value specified by the Message property, as a string. This property is used only with email Notifications, that is, with SMTP email.

This property is read-write.

See Also

[Chapter 27, "Notification Classes," Message, page 1450](#)

dtmCreated

Description

This property returns the Datetime the notification created as a datetime value. Together with NotifyFrom this makes a notification unique.

See Also

[Chapter 27, "Notification Classes," NotifyFrom, page 1451](#)

EmailReplyTo

Description

If an email is sent as a result of the `Send` method, this property returns the email reply that should be used, as a string. This property can have a different value from `NotifyFrom`. This property is valid only with notifications that have "email" specified as the channel.

This property is read-write.

See Also

[Chapter 27, "Notification Classes," Send, page 1447](#) and [Chapter 27, "Notification Classes," NotifyFrom, page 1451](#)

FileNames

Description

This property returns an array of string, populated with the names of any file attachments sent with the notification. This property is valid only with notifications that have "email" specified as the channel.

This property is read-write.

FileTitles

Description

This property returns an array of string, populated with descriptions of any file attachments. The array order *must* be respective to the array order for `FileNames`, that is, file description matches file name one by one by using the same array index value. This property is valid only with notifications that have "email" specified as the channel.

This property is read-write.

See Also

[Chapter 27, "Notification Classes," FileNames, page 1449](#)

language_cd

Description

This property returns the 3-character language code used for the notification, as a string. This is used for tracking purposes.

This property is read-write.

Message

Description

This property returns the text of the message sent with the notification as a string.

This property is read-write.

NotifyBCC

Description

This property returns an array of NotificationAddress objects, populated with the email addresses or worklist users of the people the notification is sent to. This list is used for notification information only, that is, the people on this list are generally not responsible for taking action specified by the notification. In addition, when you use the Notification Send method, other recipients cannot see the email addresses and or users that make up this array.

If you want to send a regular CC list, that is, one where the members of the list can see each other, use the NotifyCC property instead.

See Also

[Chapter 27, "Notification Classes," NotifyCC, page 1450](#)

NotifyCC

Description

This property returns an array of NotificationAddress objects, populated with the email addresses of the people the notification is sent to. This list is used for notification information only, that is, the people on this list are generally not responsible for taking action specified by the notification. When using the Notification Send method, the email address or worklist users of this array are exposed to the recipients of the notification.

If you want to send a blind-CC list, that is, where the members of the list cannot see each other, use the `NotifyBCC` property instead.

See Also

[Chapter 27, "Notification Classes," `NotifyBCC`, page 1450](#)

NotifyFrom

Description

This property returns the ID of the entity sending the notification as a string. For example, ad-hoc workflow uses the current user ID.

This property is read-write.

NotifyGuid

Description

This property returns the GUID of the notification. This is a unique identifier used for tracking purposes only.

This property is read-write.

NotifyTo

Description

This property returns an array of `NotificationAddress` objects, populated with the email addresses of the people the notification is sent to, and who are responsible for taking action if necessary.

To send the list to additional people, use the `NotifyCC` or `NotifyBCC` properties.

See Also

[Chapter 27, "Notification Classes," `NotifyCC`, page 1450](#) and [Chapter 27, "Notification Classes," `NotifyBCC`, page 1450](#)

Rte

Description

Use this property to set or return a Boolean value indicating whether to use Rich Text formatting in the notification.

This property is read-write.

SourceComponent

Description

This property returns the name of the source component, that is, that initiated the notification process. This property is used for transaction tracking purposes only. This property is not required.

This property is read-write.

SourceMarket

Description

This property returns the name of the market of the source component, that is, that initiated the notification process. This property is used for transaction tracking purposes only. This property is not required.

This property is read-write.

SourceMenu

Description

This property returns the name of the menu of the source component, that is, that initiated the notification process. This property is used for transaction tracking purposes only. This property is not required.

This property is read-write.

Subject

Description

This property returns the subject used in the email notification as a string.

This property is read-write.

Template

Description

If the notification message originated from a template, this property returns the name of that template, as a string. This property is used for transaction tracking purposes only. This property is not required.

This property is read-write.

NotificationAddress Class

The main purpose of the NotificationAddress is to define an entity to a 'channel', it is concerned at a high level only that a notification was sent.

See [Chapter 27, "Notification Classes," Notification Classes Examples, page 1478.](#)

See *PeopleTools 8.51 PeopleBook: Workflow Technology*, "Using Notification Templates."

NotificationAddress Class Properties

In this section, we discuss the NotificationAddress class properties. The properties are discussed in alphabetical order.

Channel

Description

This property returns the 'channel' used for the notification, as a string. The values are:

<i>Value</i>	<i>Description</i>
Email	Notification is sent as email.
Worklist	Notification is sent as a worklist.

This property is read-write.

Description

Description

This property returns the description of the entity as a string. Entity descriptions include distribution group names or people's names.

This property is read-write.

EmailId

Description

This property returns the Email Address of the entity to be notified.

This property is read-write.

Language

Description

This property returns the language code of the entity to be notified.

This property is read-write.

Oprid

Description

This property returns the user ID of the person receiving the notification as a string.

This property is read-write.

NotificationTemplate Class

This class is useful for populating the message property of the Notification class.

See *PeopleTools 8.51 PeopleBook: Workflow Technology*, "Using Notification Templates."

NotificationTemplate Class Methods

In this section, we discuss the NotificationTemplate class methods. The methods are discussed in alphabetical order.

GetAndExpandTemplate

Syntax

GetAndExpandTemplate(*Language*, *Vars*)

Description

Use the GetAndExpandTemplate method to expand and map the variables into the Text property of the template.

If this is a component template, you must use the SetupCompVarsAndRcpts method first, before you use this method.

If this is a generic template, you must use the SetupGenericVars method first, before you use this method.

The value returned by the Setup methods must be used as the second parameter for this method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Language</i>	Specify the 3-character language code used with the notification.
<i>Vars</i>	Specify the variable representing the XML string returned by either the SetupCompVarsAndRcpts method or the SetupGenericVars method.

Returns

Returns a Boolean value: True if the template expanded properly, False otherwise.

Example

```
import PT_WF_NOTIFICATION:NotificationTemplate;

Local NotificationTemplate & mynotifytemplate;

&mynotifytemplate = create NotificationTemplate(%Component, %Market, &template⇒
Name, "C");

&xmlVars = &mynotifytemplate.SetupCompVarsAndRcpts(GetLevel0());

&mynotifytemplate.GetAndExpandTemplate(%Language, &xmlVars);
```

See Also

[Chapter 27, "Notification Classes," SetupCompVarsAndRcpts, page 1456](#) and [Chapter 27, "Notification Classes," SetupGenericVars, page 1457](#)

SetupCompVarsAndRcpts

Syntax

```
SetupCompVarsAndRcpts(&Rowset_Context)
```

Description

Use the SetupCompVarsAndRcpts method to set up variables for the component from the provided rowset. This method also sets up any additional recipients defined in the component.

The rowset corresponds to the component that the notification template was instantiated with. For example, if you created a notification template for JOB, the rowset used with this method should be based on the JOB component.

If you want to expand a component template, you must use this method first, before expanding the template.

Parameters

Parameter	Description
&Rowset_Context	Specify an already instantiated and populated rowset containing the necessary variables.

Returns

A string containing XML that is used by the GetAndExpandTemplate method.

Example

```
import PT_WF_NOTIFICATION:NotificationTemplate;

Local NotificationTemplate & mynotifytemplate;

&mynotifytemplate = create NotificationTemplate(%Component, %Market, &template=>
Name, "C");

&xmlVars = &mynotifytemplate.SetupCompVarsAndRcpts(GetLevel0());

&mynotifytemplate.GetAndExpandTemplate(%Language, &xmlVars);
```

See Also

[Chapter 27, "Notification Classes," GetAndExpandTemplate, page 1455](#)

SetupGenericVars

Syntax

SetupGenericVars(*&AryValues*)

Description

Use the SetupGenericVars method to pass values to a generic template.

To expand a generic template, you must use this method first, before expanding the template.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&AryValues</i>	Specify an array of string containing values used with the expanded template.

Returns

A string containing XML that is used by the GetAndExpandTemplate method.

Example

```
import PT_WF_NOTIFICATION:NotificationTemplate;

. . .

&mynotifytemplate = create NotificationTemplate("", "", "MYTEMPLATE", "G");

/* Populate an array to contain the values needed by */
/* the template */
&aryValues = CreateArrayRept("", 0);
&aryValues.Push("FIRST VALUE");
&aryValues.Push("SECOND VALUE");
&xmlVars = &mynotifytemplate.SetupGenericVars(&aryValues);
&mynotifytemplate.GetAndExpandTemplate(%Language, &xmlVars);
```

See Also

[Chapter 27, "Notification Classes," GetAndExpandTemplate, page 1455](#)

NotificationTemplate Class Properties

In this section, we discuss the NotificationTemplate class properties. The properties are discussed in alphabetical order.

ComponentId

Description

This property returns a component for the component type notification template as a string. This is not required for generic templates.

This property is read-write.

Instruction

Description

This property returns the notification instructions as a string.

This property is read-write.

Language

Description

This property returns the language used to retrieve template descriptions, as a string.

This property is read-write.

Market

Description

This property returns the market for component type notification templates as a string. This is not required for generic templates.

This property is read-write.

Priority

Description

This property returns the priority of the notification template as a string.

This property is read-write.

Responses

Description

This property is populated only if there are any RIMM responses.

This property is read-write.

Subject

Description

This property returns the subject of the notification template as a string.

This property is read-write.

TemplateId

Description

This property returns the template ID as a string. If you are creating a notification template, this property is always required.

This property is read-write.

TemplateType

Description

This property returns the template type as a string. Values are:

<i>Value</i>	<i>Description</i>
C	Component
G	Generic

If you are creating a notification template, this property is always required.

This property is read-write.

Text

Description

This property returns the Template Text as a string.

This property is read-write.

Worklist Class

The Worklist class is used to make mass modifications to worklist instances. Modifications to one worklist instance should be performed through the WorklistEntry class.

See [Chapter 27, "Notification Classes," Worklist, page 1445](#).

Worklist Class Method

In this section, we discuss the Worklist class method Reassign.

Reassign

Syntax

Reassign(*FromOperid*, *ToOperid*)

Description

Use the Reassign method to reassign all worklist items with a state less than "Worked" from one user to another.

If you only want to reassign a single worklist entry, use the Reassign WorklistEntry class method.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>FromOperid</i>	Specify the user ID of the user from which you want to assign a worklist, as a string.
<i>ToOperid</i>	Specify the user ID of the user to which you want to assign a worklist, as a string.

Returns

A Boolean value: true if worklist was assigned successfully, false otherwise.

See Also

[Chapter 27, "Notification Classes," Reassign, page 1464](#)

WorklistEntry Class

This class is used to create and or update a worklist entry.

See [Chapter 27, "Notification Classes," Creating a WorklistEntry, page 1478](#).

See [Chapter 27, "Notification Classes," Updating a WorklistEntry, page 1480](#).

See *PeopleTools 8.51 PeopleBook: Workflow Technology*, "Understanding PeopleSoft Workflow."

WorklistEntry Class Methods

In this section, we discuss the WorklistEntry class methods. The methods are discussed in alphabetical order.

Create

Syntax

Create()

Description

Use the Create method to create a new WorklistEntry object.

This method is *not* the same as the Create *constructor*. The Create constructor only creates an instance of the WorklistEntry class. To add the entry to the database, you must use this method.

The following properties must be set before calling this method:

- busactivity
- buseventname
- busprocname
- worklist

If this method completes successfully, the following properties are populated:

- instanceid
- transactionid

Parameters

None.

Returns

This method returns a numeric value: 0 if there is an error, nonzero if entry created successfully.

Example

```
import PT_WF_WORKLIST:*;  
  
Local WorklistEntry &worklist;  
Local Number &Rslt;  
  
&worklist = create WorklistEntry();  
  
&worklist.busprocname = "Administer Workflow";  
&worklist.busactivity = "Send Note";  
&worklist.buseventname = "Worklist Note";  
&worklist.worklistname = "Worklist Note";  
  
&Rslt = &worklist.Create();
```

[Chapter 27, "Notification Classes," busactivity, page 1470](#); [Chapter 27, "Notification Classes," buseventname, page 1470](#); [Chapter 27, "Notification Classes," busprocname, page 1470](#); [Chapter 27, "Notification Classes," instanceid, page 1471](#) and [Chapter 27, "Notification Classes," transactionid, page 1474](#)

GetResponseStatus

Syntax

GetResponseStatus()

Description

Use the `GetResponseStatus` method to return the response status of the callback method. This is useful only for entries that are created by web services.

The following properties must be set before calling this method:

- `busactivity`
- `buseventname`
- `busprocname`
- `requestmessageid`
- `worklistname`

Parameters

None.

Returns

A number. Valid values are:

<i>Value</i>	<i>Description</i>
0	CreateWorklistEntry message not received yet or this entry was not created by any web service.
1	Message received but not processed yet.
2	Message processed and sent to message queue.
3	Error while sending message to the caller of create worklist entry.
4	Message was sent to the originating web server and was received successfully.

Reassign

Syntax

Reassign(*Operid*)

Description

The Reassign method assigns the worklist in the data buffers to the user specified by *Operid*. This method commits the version of the worklist entry in the data buffer to the database using the Save method.

If you want to reassign an entire worklist, use the Reassign Worklist class method.

Note. You must use the SelectByKey method to populate data buffers with the worklist entry.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Operid</i>	Specify the user ID to which you want to assign the worklist entry, as a string.

Returns

A Boolean value: true if the reassignment was successful, false otherwise.

Example

```
import PT_WF_WORKLIST:WorklistEntry;

Local WorklistEntry &wl = create WorklistEntry();
&wl.busprocname = WF_WORKLIST_VW2.BUSPROCNAME;
&wl.busactivity = WF_WORKLIST_VW2.ACTIVITYNAME;
&wl.buseventname = WF_WORKLIST_VW2.EVENTNAME;
&wl.worklistname = WF_WORKLIST_VW2.WORKLISTNAME;
&wl.instanceid = WF_WORKLIST_VW2.INSTANCEID;

If (&wl.SelectByKey()) Then
    If Not (&wl.Reassign("TOPSUSER2")) Then
        /* Reassign error */
    End-If;
Else
    /* SelectByKey error */
End-If;
```

See Also

[Chapter 27, "Notification Classes," Reassign, page 1461](#)

Save

Syntax

Save()

Description

Use the Save method to save a WorklistEntry to the database.

PeopleCode Event Considerations

You must include this method within events that allow database updates. This includes the following PeopleCode events:

- SavePreChange (Page)
- SavePostChange (Page)
- Workflow
- FieldChange

If this method results in a failure, all database updates are rolled back. All information the user entered into the component is lost, as if the user pressed ESC.

Considerations Using Web Services

This method saves the instance of the worklist to the database. If the worklist entry is marked as worked, (that is, if `inststatus` property is set to 2) and the worklist entry was originally created by a web service, the originating requestor is sent a response when this method is executed. If the requestor is expecting additional data, use the `SaveWithCustomData` method instead.

Parameters

None.

Returns

A numeric value: 0 if save didn't complete successfully, nonzero if save completed successfully.

Example

```
If (&worklist.Save() <> 0) Then
    /* success */
Else
    /* handle error */
End-If;
```

See Also

[Chapter 27, "Notification Classes," Update, page 1469](#)

[Chapter 27, "Notification Classes," SaveWithCustomData, page 1466](#)

[Chapter 27, "Notification Classes," inststatus, page 1472](#)

SaveWithCustomData

Syntax

SaveWithCustomData(*&Message*, *&FieldNameArray*, *&FieldValueArray*)

Description

Use the `SaveWithCustomData` method to save the worklist entry to the database, as well as to pass additional data back to the requestor that created this worklist entry. You should only use this method with worklist entries that are created by web service. If you want to save a worklist entry without additional data, or a worklist entry that was not created using a web service, use the `Save` method instead.

If the worklist entry was not created by a web service, or if the worklist entry is not marked as worked (that is, if the `inststatus` property is not set to 2,) the additional data is ignored.

PeopleCode Event Considerations

You must include this method within events that allow database updates. This includes the following PeopleCode events:

- SavePreChange (Page)
- SavePostChange (Page)
- Workflow
- Message Subscription (the Integration Broker INotificationHandler interface)
- FieldChange

If this method results in a failure, all database updates are rolled back. All information the user entered into the component is lost, as if the user pressed ESC.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>&Message</i>	Specify an already instantiated and populated response message containing the custom data to be sent back to the originating web service.
<i>&FieldNameArray</i>	Specify an already instantiated and populated array of string containing the field names to be used by the web service that created the worklist entry.
<i>&FieldValueArray</i>	Specify an already instantiated and populated array of string containing matching field values to be used by the web service that created the worklist entry.

Returns

A message object containing the final message that was sent to the web service if successful, a null object otherwise.

See Also

[Chapter 27, "Notification Classes," Save, page 1465](#)

[Chapter 27, "Notification Classes," inststatus, page 1472](#)

SelectByKey

Syntax

SelectByKey()

Description

The `SelectByKey` method uses the key field values that have been assigned to build and execute a Select SQL statement. The field values are then fetched from the database SQL table into the worklist entry and the Select statement is closed.

If you don't specify all the key fields, those you exclude are added to the Where clause with the condition equal to a blank value. If not all keys are set and more than one row is retrieved, you won't receive an error and `SelectByKey` won't fetch any data.

For worklist entries that were created by web services, use the `SelectByMessageId` method instead.

Parameters

None.

Returns

A Boolean value: true if the properties are set based on the database values, false otherwise.

See Also

[Chapter 27, "Notification Classes," SelectByMessageId, page 1468](#)

SelectByMessageId

Syntax

```
SelectByMessageId ( )
```

Description

Use the `SelectByMessageId` method to select a worklist entry by the message id. This is useful only for entries that are created by web services.

The following properties must be set before calling this method:

- `busactivity`
- `buseventname`
- `busprocname`
- `requestmessageid`
- `worklistname`

Parameters

None.

Returns

A Boolean value: true if this method completes successfully, false otherwise.

See Also

[Chapter 27, "Notification Classes," SelectByKey, page 1467](#)

Update

Syntax

`Update()`

Description

Use the Update method to update the worklist entry with any property values that have changed, and assign values to the associated record in the database. However, this method does not commit the changes to the record in the database. You must use the Save method to update the database.

Parameters

None.

Returns

A numeric value: 0 if update didn't complete successfully, nonzero if update completed successfully.

Example

```
If (&worklist.Update() <> 0) Then
    &worklist.inststatus = "2" /* mark entry worked */
    /* additional processing */
End-if;
```

WorklistEntry Class Properties

In this section, we discuss the WorklistEntry class properties. The properties are discussed in alphabetical order.

actiondtm

Description

This property returns the Worklist action datetime as a datetime.

This property is read-write.

busactivity

Description

This property returns the source activity name of the source business process as a string.

This property is read-write.

buseventname

Description

This property returns the source event name of the source activity as a string.

This property is read-write.

busprocname

Description

This property returns the source business process name as a string.

This property is read-write.

commentshort

Description

This property returns the short comment the previous user ID gave when reassigning a worklist as a string.

This property is read-write.

do_replicate_flag

Description

This property returns a flag that indicates if the worklist entry must be replicated. Values are:

<i>Value</i>	<i>Description</i>
Y	Worklist entry needs to be replicated
N	Worklist entry does not need to be replicated

This property is read-write.

instanceid

Description

This property returns the Instance Id. This property is used with the following properties to make the worklist entry a unique number:

- busprocname
- busactivity
- buseventname
- worklistname

This property is read-write.

instselecteddtm

Description

This property returns the datetime that the worklist was selected to be worked as a datetime value.

This property is read-write.

inststatus

Description

This property returns the Worklist Entry status as a string. The values are:

<i>Value</i>	<i>Description</i>
0	new worklist entry
1	selected worklist entry
2	worked worklist entry
3	cancel string

This property is read-write.

insttimeoutdtm

Description

This property returns the datetime the worklist entry timed out. Only some worklist types use this property.

This property is read-write.

instworkeddtm

Description

This property returns the datetime worklist was worked as a datetime value.

This property is read-write.

IsCreatedViaWebService

Description

This property returns a Boolean value: true if the WorklistEntry object was created from a web service, false otherwise.

This property is read-only.

oprid

Description

This property returns the user ID that is assigned the worklist as a string.

This property is read-write.

originatorid

Description

This property returns the user ID that caused the worklist to be created as a string.

This property is read-only.

prevoprid

Description

This property returns the previous user ID who used this worklist entry as a string.

This property is read-write.

requestmessageid

Description

This property is used with worklist entries that are created by web services. It contains the original message ID from the requesting party.

This property is read-write.

ResponseStatus

Description

This property returns the status of the response sent to the originating web service.

Valid values are:

<i>Value</i>	<i>Description</i>
0	CreateWorklistEntry message not received yet or this entry was not created by any web service.
1	Message received but not processed yet.
2	Message processed and sent to message queue.
3	Error while sending message to the caller of create worklist entry.
4	Message was sent to the originating web server and was received successfully.

This property is read-write.

syncid

Description

This property is reserved for future use.

This property is read-write.

timedout

Description

This property returns the status flag if the worklist has timed out. Values are:

<i>Value</i>	<i>Description</i>
Y	Worklist has timed out
N	Worklist has not timed out

This property is read-write.

transactionid

Description

This property returns the transaction Id as a number, which represents the unit of work. This can be useful for pooled worklists.

This property is read-write.

url

Description

This property returns the URL to work for the worklist as a string. This is used only for replicating worklist entries across PeopleSoft databases.

This property is read-write.

wl_priority

Description

This property returns the priority of the worklist as a string. The values are:

<i>Value</i>	<i>Description</i>
low	Worklist has low priority.
medium	Worklist has medium priority.
high	Worklist has high priority.

This property is read-write.

wldaystoselect

Description

This property returns the number of days to select worklist as a number.

This property is read-write.

wldaystowork

Description

This property returns the number of days to work the worklist as a number.

This property is read-write.

worklistname

Description

This property returns the source worklist name for the source event string as a string.

This property is read-write.

WSWorklistEntry Class

This class is used by web services to create Worklist entries.

This class implements the Integration Broker class IRequestHandler.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages"

WSWorklistEntry Class Methods

The following are the WSWorklistEntry class methods, in alphabetical order.

OnError

Syntax

OnError(*&Message*)

Description

Use the OnError method to do error handling. This method implements the Integration Broker IRequestHandler interface OnError method.

Parameters

Parameter	Description
<i>&Message</i>	Specify an already instantiated and populated message object. This would normally be the message that was used to generate the worklist entry from the web service.

Returns

Depends on implementation.

See Also

[Chapter 25, "Message Classes," page 1241](#)

[Chapter 39, "SOAPDoc Class," page 2199](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages"

OnNotify

Syntax

OnNotify(&Message)

Description

Use the OnNotify method to creates the worklist entry and the application worklist record.

This method implements the Integration Broker INotificationHandler interface OnNotify method.

Parameters

Parameter	Description
&Message	Specify an already instantiated and populated message object. Generally this would be the originating message that created the worklist entry.

Returns

None.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Integration Broker, "Sending and Receiving Messages"

WSWorklistEntry Class Properties

The following describes the WSWorklistEntry class properties, in alphabetical order.

InstanceID

Description

This property returns the instance ID for the worklist entry, as a string.

This property is read-only.

TransactionID

Description

This property returns the transaction ID for the worklist entry, as a string.

This property is read-only.

Notification Classes Examples

The following are example of typical actions you perform using the notification classes.

See *PeopleTools 8.51 PeopleBook: Workflow Technology*, "Using Notification Templates."

Creating a WorklistEntry

The following example creates a WorklistEntry.

The following is the complete code sample: the steps explain each line.

```

import PT_WF_WORKLIST:*;

Local WorklistEntry &worklist;

&worklist = create WorklistEntry();

&worklist.busprocname = "Administer Workflow";
&worklist.busactivity = "Send Note";
&worklist.buseventname = "Worklist Note";
&worklist.worklistname = "Worklist Note";

If (&worklist.Create() <> 0) Then
    &worklist.oprid = %UserId;
Else
    /* handle error */
End-If;

If (&worklist.Save() <> 0) Then
    /* success, create a corresponding row in */
    /* application worklist record... */
Else
    /* handle error */
End-If;

```

To create a WorklistEntry:

1. Import the WorklistEntry class.

You must import the WorklistEntry class before you can use it in your PeopleCode program. In addition, the second line declares the variable &worklist as type WorklistEntry.

```

import PT_WF_WORKLIST:*;

Local WorklistEntry &worklist;

```

2. Instantiate a WorklistEntry object.

Using the constructor, create an instance of the WorklistEntry class. This does *not* create a WorklistEntry. This creates a WorklistEntry object only. You must use the Create method to actually create the WorklistEntry in the system.

```

&worklist = create WorklistEntry();

```

3. Set the required parameters.

Some of the WorklistEntry class properties are required for every WorklistEntry. You must set a value for these properties before you can update or save the WorklistEntry.

```

&worklist.busprocname = "Administer Workflow";
&worklist.busactivity = "Send Note";
&worklist.buseventname = "Worklist Note";
&worklist.worklistname = "Worklist Note";

```

4. Create the WorklistEntry.

After you've set the required values, you need to create the WorklistEntry in the system. This does *not* update the database. This does, however, add values to the notification tables.

If this method completes successfully, the following properties are populated: instanceid and transactionid.

- instanceid
- transactionid

```
If (&worklist.Create() <> 0) Then
    &worklist.oprid = %Userid;
Else
    /* handle error */
End-If;
```

5. Save the WorklistEntry.

After you've created the WorklistEntry, save it. The Save method actually updates the database, and so can be used only in events that allow database updates.

```
If (&worklist.Save() <> 0) Then
    /* success, create a corresponding row in */
    /* application worklist record... */
Else
    /* handle error */
End-If;
```

Updating a WorklistEntry

The following example updates a WorklistEntry so that it is considered worked.

The following is the complete code sample: the steps explain each line.

```
import PT_WF_WORKLIST:*;

Local WorklistEntry &worklist;

&worklist = create WorklistEntry();
&worklist.busprocname = "Administer Workflow";
&worklist.busactivity = "Send Note";
&worklist.buseventname = "Worklist Note";
&worklist.worklistname = "Worklist Note";
&worklist.instanceid = 2;

&ret = &worklist.SelectByKey();

&worklist.inststatus = "2"; /* mark entry worked */
If (&worklist.Update() <> 0) Then
    If (&worklist.Save() <> 0) Then
        /* success */
    Else
        /* handle error */
    End-If;
Else
    /* handle error */
End-If;
```

To update a WorklistEntry:

1. Import the WorklistEntry class.

You must import the WorklistEntry class before you can use it in your PeopleCode program. In addition, the second line declares the variable &worklist as type WorklistEntry.

```
import PT_WF_WORKLIST:*;

Local WorklistEntry &worklist;
```

2. Instantiate a WorklistEntry object.

Using the constructor, create an instance of the WorklistEntry class. This does *not* create a WorklistEntry. This creates a WorklistEntry object only. You must use the Create method to actually create the WorklistEntry in the database tables, and the Save method to update the tables.

```
&worklist = create WorklistEntry();
```

3. Set the required parameters.

Some of the WorklistEntry class properties are required for every WorklistEntry. You must set a value for these properties before you can update or save the WorklistEntry. The instanceid property, combined with the other properties, indicates a unique WorklistEntry. This value is populated after a WorklistEntry has already been created.

```
&worklist.busprocname = "Administer Workflow";
&worklist.busactivity = "Send Note";
&worklist.buseventname = "Worklist Note";
&worklist.worklistname = "Worklist Note";
&worklist.instanceid = 2;
```

4. Populate the worklist entry with data.

After you've set the keys, populate the worklist entry based on those keys using the SelectByKey method.

```
&ret = &worklist.SelectByKey();
```

5. Update and save the WorklistEntry.

After you've set the required parameters, try to update the WorklistEntry. If that is successful, mark the WorklistEntry as 'worked', and try to save the WorklistEntry. The Save method actually updates the database, and so can be used only in events that allow database updates.

```
If (&worklist.Update() <> 0) Then
    &worklist.inststatus = "2" /* mark entry worked */
    If (&worklist.Save() <> 0) Then
        /* success */
    Else
        /* handle error */
    End-If;
Else
    /* handle error */
End-if;
```

Chapter 28

Optimization PeopleCode

This chapter discusses how to:

- Use optimization PeopleCode on the application server.
- Use optimization PeopleCode in an Application Engine program.
- Perform optimization in PeopleCode.
- Use lights-out mode with optimization.
- Use optimization built-in functions.
- Use OptEngine class methods.
- Use OptEngine class properties.
- Use the OptBase application class.
- Use OptBase class methods.
- Use OptInterface class methods.

Important! The optimization PeopleCode classes are not supported on IBM z/OS and Linux for IBM System z platforms.

Using Optimization PeopleCode on the Application Server

While running optimization PeopleCode on the application server, ensure that changed data is committed to the database before calling the CreateOptEngine optimization function and the following OptEngine class methods:

- RunSynch
- RunAsynch
- CheckOptEngineStatus
- ShutDown
- SetTraceLevel
- GetTraceLevel
- InsertOptProbInst

- DeleteOptProbInst

Note. The PeopleCode functions CommitWork and DoSaveNow can be called within a step to save uncommitted data to the database before calling the listed functions and methods. Keep in mind that forcing a commit on pending database updates is a serious step; it prevents roll-back on error. CreateOptEngine, ShutDown, InsertOptProbInst, and DeleteOptProbInst calls modify the database, so take care when terminating the Application Engine program without committing the changes made by those calls.

Using Optimization PeopleCode in an Application Engine Program

When you write an optimization PeopleCode program in an Application Engine program and you schedule it in PeopleSoft Process Scheduler, you must set the process definition with a process type of *Optimization Engine*. Other process types do not allow optimization PeopleCode in Application Engine programs.

While using optimization PeopleCode in Application Engine programs, make sure data is committed before calling the CreateOptEngine optimization function and the following OptEngine class methods:

- RunSynch
- RunAsynch
- CheckOptEngineStatus
- ShutDown
- SetTraceLevel
- GetTraceLevel
- InsertOptProbInst
- DeleteOptProbInst

Note. You can call the PeopleCode functions CommitWork and DoSaveNow within a step to save uncommitted data to the database before calling the listed functions and class methods. Keep in mind that forcing a commit on pending database updates is a serious step; it prevents roll-back on error. CreateOptEngine, ShutDown, InsertOptProbInst, and DeleteOptProbInst calls modify the database, so take care when terminating the Application Engine program without committing the changes made by those calls.

Performing Optimization in PeopleCode

This section discusses how to:

- Create new analytic instances.
- Load analytic instances into an analytic server.
- Run optimization transactions.
- Invoke the Optimization PeopleCode plug-in.

- Shut down optimization engines.
- Delete existing analytic instances.
- Program for database updates.

Creating New Analytic Instances

To create a new analytic instance for an analytic type:

1. Call the function `InsertOptProbInst` with the analytic type and analytic instance as parameters to create an analytic instance ID.
2. Use Application Engine or a similar mechanism to load the optimization application tables with data.

Use the analytic instance ID as the key value in scenario-managed optimization application tables.

The analytic instance is now ready to be loaded into an analytic server.

Note. You can load multiple copies of the same analytic instance into multiple instances of an analytic server, provided that each instance of the analytic server resides in a different application server domain. Each analytic instance loaded into a given domain must be unique. Within a given domain, you cannot have the same analytic instance in more than one analytic server. The analytic server maintains data integrity by checking to see if the data has been altered by another user (refer to the steps in the optimization system architecture description). Try to maintain data consistency when the same analytic instance uses the same database in different domains.

See Also

PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework, "Understanding PeopleSoft Optimization Framework," PeopleSoft Optimization Framework System Architecture

[Chapter 28, "Optimization PeopleCode," InsertOptProbInst, page 1509](#)

Loading Analytic Instances Into an Analytic Server

Use the `CreateOptEngine` function to load an analytic server with an analytic instance. It takes analytic instance ID and a mode parameter with `%Synch` and `%Asynch` as possible values and returns a PeopleCode object of type `OptEngine`.

You can run the PeopleCode on the application server or from Application Engine.

Loading Analytic Instances by Running PeopleCode on the Application Server

To block PeopleCode from running on the application server until the load is done (synchronous mode), use the `%Synch` value for the mode parameter. An error is generated if the load isn't successful. The application server imposes a timeout beyond which the PeopleCode and optimization engine load are terminated. Here is a code example:

```
Local OptEngine &myopt;
&myopt = CreateOptEngine("PATSMITH", %Synch);
```

To load the analytic server without blocking the PeopleCode from running (asynchronous mode) on the application server, use the `%Asynch` value for the mode parameter. The analytic server performs a preliminary check of the load request and returns the `OptEngine` object if it is successful or an error if it is unsuccessful. A successful return does not mean that the load was successful. You must then use repeated `CheckOptEngineStatus` methods on the returned `OptEngine` object to determine whether the analytic engine is done with the load and whether it was successful. Here is a code example:

```
Local OptEngine &myopt;  
&myopt = CreateOptEngine("PATSMITH", %Asynch);
```

Loading Analytic Instances by Running PeopleCode in Application Engine

Both synchronous (`%Synch`) and asynchronous (`%Asynch`) modes block the PeopleCode from running on Application Engine until the load is done. Use only `%Asynch` while loading an optimization engine.

The absolute number of optimization engine instances that may be loaded in a given domain is governed by a configuration file loaded by Tuxedo during its domain startup.

[Chapter 28, "Optimization PeopleCode," CheckOptEngineStatus, page 1512](#)

PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework, "Administering Optimization Server Components"

Running Optimization Transactions

You send an optimization transaction to the optimization engine using the `RunSynch` and `RunAsynch` methods. Both are methods on an `OptEngine` object. The `OptEngine` object can be created either by calling `CreateOptEngine` (if the optimization engine is not loaded already) or by calling `GetOptEngine` (if the optimization engine is already loaded). Both `RunSynch` and `RunAsynch` have the same signature, except that `RunSynch` runs the optimization transaction in synchronous mode and `RunAsynch` runs it in asynchronous mode. Both return an integer status code. You can run transactions either on the application server or with Application Engine.

To invoke an optimization transaction:

1. Use the `GetOptEngine` function to get the `OptEngine` object as a handle for the optimization engine that has loaded an analytic instance ID.

Use the `CreateOptEngine` function to create the `OptEngine` object for a new optimization engine if the analytic instance has not been loaded.
2. Call `RunSynch` or `RunAsynch` to send an optimization transaction to the optimization engine to be run in synchronous or asynchronous mode.
3. If the transaction is run in synchronous mode (`RunSynch`), use the `OptEngine` methods `GetString`, `GetNumber`, and so on, to retrieve the output result from the optimization transaction.

The transaction names, parameter names, and data types are viewable in the analytic type in Application Designer.

4. If the transaction is run in asynchronous mode, use the OptEngine method CheckOptEngineStatus to check the status of the optimization transaction in the optimization engine.

After the transaction is done, result data is available in the database for retrieval using standard PeopleCode mechanisms.

Running Optimization Transactions from the Application Server

To block the PeopleCode from running on the application server until the optimization transaction is done (synchronous mode) and receives the results, use RunSynch to send an optimization transaction. An error status code is returned if the transaction isn't successful. If successful, you can use other methods to retrieve the results from the transaction call. The application server imposes a timeout beyond which the PeopleCode and optimization engine transaction are terminated.

To run a transaction without blocking PeopleCode from running (asynchronous mode) on the application server, use RunAsynch to send an optimization transaction. In this mode, the optimization engine performs a preliminary check of the transaction request and returns a success or failure status code. A successful return does not mean that the transaction is successful; it means only that the syntax is correct. You must then use repeated calls to the CheckOptEngineStatus method on the OptEngine object to determine whether the optimization engine is done with the transaction and whether it is successful.

RunAsynch does not allow transaction output results to be returned. Use this method for long-running transactions that return results entirely through the database.

Running Optimization Transactions from Application Engine

Both synchronous (RunSynch) and asynchronous (RunAsynch) methods block the PeopleCode from running on Application Engine until the optimization transaction is done. RunSynch allows output results to be returned, but it should be used for transactions that are fast (less than 10 seconds). RunAsynch does not have a time limit, but it does not return output results.

See Also

[Chapter 28, "Optimization PeopleCode," RunAsynch, page 1528](#)

Invoking the Optimization PeopleCode Plug-In

If you're developing an optimization application that uses the Optimization PeopleCode plug-in, you must do the following to invoke the plug-in:

- Develop a PeopleCode application class that extends the PT_OPT_BASE:OptBase class.
- Define methods in your application class that use the PeopleCode OptInterface class to perform your optimization functions.
- Define an analytic type that specifies the Optimization PeopleCode plug-in, by selecting the PeopleCode Plugin check box in the analytic type properties.
- In the analytic type properties, specify the application package and application class that you developed.
- Define transactions in your analytic type definition that correspond to the methods you developed in your application class, with corresponding parameters.

[Chapter 28, "Optimization PeopleCode," OptInterface Class Methods, page 1559](#)

Shutting Down Optimization Engines

Use the GetOptEngine function to get the OptEngine object as a handle for the optimization engine that loaded an analytic instance ID.

Use the OptEngine method named ShutDown to shut down the optimization engine. This ends the optimization engine process with the current analytic instance ID. Based on application server settings, the system restarts a new, unloaded optimization engine process that can be loaded with any other analytic instance.

See Also

[Chapter 28, "Optimization PeopleCode," ShutDown, page 1533](#)

Deleting Existing Analytic Instances

To delete an existing analytic instance for an analytic type:

1. Shut down any optimization engines that have this analytic instance currently loaded.
2. Using Application Engine or a similar mechanism, delete the data in the optimization application tables pertaining to that analytic instance.

Use the analytic instance ID as the key value to find and delete analytic instance rows from scenario-managed optimization application tables.

3. Use the function DeleteOptProbInst with the analytic type and analytic instance as arguments to delete the analytic instance ID from PeopleTools metadata.

Note. If you try to delete an existing analytic instance that is loaded in a running optimization engine, DeleteOptProbInst returns %OptEng_Fail, and the optional status reference parameter is set to %OptEng_Exists.

Programming for Database Updates

You must plan for uncommitted database changes in your optimization PeopleCode. The PeopleSoft Optimization Framework detects pending database updates, and generates a failure status if data is not committed to the database before certain optimization methods are called.

This checking for database updates happens in runtime for the `CreateOptEngine` function and the following methods: `RunSync`, `RunAsync`, `Shutdown`, `GetTraceLevel`, and `SetTraceLevel`. Ensure that your PeopleCode performs proper database updates and commits before you execute these methods. If you use the optional parameter for detailed status that is available for these functions, or the `DetailedStatus` property that is available for the methods, you can check for the status of `%OptEng_DB_Updates_Pending` to see if there is a pending database update.

Note. The pending database update may have happened considerably earlier in the code. Forcing a commit within your PeopleCode to avoid this problem prevents roll-back on database error. Forcing a commit should be used with care.

The `InsertOptProbInst` and `DeleteOptProbInst` functions can be called only inside `FieldChange`, `PreSaveChange` and `PostSaveChange` PeopleCode events, and in `Workflow`.

This database update checking happens in compile time for the following functions: `InsertOptProbInst` and `DeleteOptProbInst`. Make sure that there are no pending database updates before you execute these methods.

Using Lights-Out Mode with Optimization

This section provides an overview of lights-out mode, and discusses how to:

- Create a request message.
- Create a response message.
- Edit the request PeopleCode.
- Edit the response PeopleCode.

Understanding Lights-out Mode

Some optimization applications can take several hours to run. These are typically run as overnight batch jobs every night when the work load is small to regenerate the optimization solution and have it ready for end users to use in the morning hence the term *lights-out mode*.

In the current release, application messages communicate between the Application Engine batch job and the online optimization engine. After the Application Engine job completes and the optimization solution has been written to the database, an application message initiates the download of the data from the database batch job to the online optimization engine.

Lights-out mode uses an Application Engine PeopleCode program within PeopleSoft Process Scheduler to send requests to an application server and receive responses from it. Within the application server, the `OnRequest` PeopleCode runs an optimization engine process.

This diagram illustrates the lights-out process:

Lights-out process

This request and response is in the form of a rowset as shown by the example supplied with optimization, the `OPT_CALL` message. Also supplied as an example is an Application Engine message publish PeopleCode program called `PT_OPTCALL`.

Important! Application Engine includes an action of type *Log Message*, which PeopleSoft Process Scheduler uses to record its activity in the `PS_MESSAGE_LOG` table. The PeopleCode `MessageBox` and `WinMessage` built-in functions also record their activity in the `PS_MESSAGE_LOG` table.

During lights-out optimization, these processes can conflict with each other or with the optimization engine when one process locks a row of the table, and another process tries to access the same row.

To prevent this conflict, pay close attention to where the `MessageBox` or `WinMessage` built-in functions are used in your Application Engine PeopleCode. In general, there can't be any outstanding database updates pending when communicating with the optimization engine using application messages.

The `OPT_CALL` Message

The `OPT_CALL` message is an example of what the lights-out process uses as the message for optimization. The `OPT_CALL` message has a structure using a record, `PT_OTTPARMS`, having the fields `PARMKEY` and `VALUE` which represent a name/value pair. These send requests and responses from the Application Engine PeopleCode in PeopleSoft Process Scheduler to and from the message `OnRequest` PeopleCode in the application server.

The `OPT_CALL` message also uses a record, `PT_OPTDETMSG`, which contains the information needed for processing a detailed message.

This is an example of the Message Definition page (select PeopleTools, Integration Broker, Integration Setup, Messages) showing the `OPT_CALL` message definition:

Message Definition page – OPT_CALL message definition

The OPT_CALL message is associated with the OPT_CALL service operation. The OPT_CALL service operation defines the OPT_CALL application package as a handler. This application package implements the Integration Broker methods needed to handle any messaging PeopleCode.

Creating a Request Message

This section provides an overview of the request message and describes how to create messages that:

- Create an optimization engine.
- Check optimization engine status.
- Run an optimization engine transaction.
- Set the trace level.
- Get the trace level.
- Shutdown an optimization engine.

Understanding the Request Message

For optimization, the Application Engine PeopleCode in PeopleSoft Process Scheduler sends a request OPT_CALL message. The message uses rowsets built from PT_OTPARMS records as the request. You can use the following rowset structures as an example of how to perform certain optimization actions, by sending them as requests from the application engine program in the process scheduler to the message notification PeopleCode in the application server.

Creating an Optimization Engine

To create an optimization engine, structure the rowset as follows, using the PT_OTPARMS record. You set key values using the PARMKEY field, and then set a value for that key field in the VALUE field.

PARMKEY Field	VALUE Field
OPTCMD	CREATE Causes the PeopleCode program implementing the Integration Broker OnRequest method to load an optimization engine. The OPT_CALL example executes the CreateOptEngine function.
PROBINST	The name of the analytic instance.
PROCINSTANCE	The name of the process instance for this process scheduler job.
SYNCH	Y if this optimization engine load is to occur synchronously, N if asynchronously.

Checking Optimization Engine Status

To check optimization engine status (for example, to see when it finishes loading), structure the rowset as follows, using the PT_OTPARMS record.

PARMKEY Field	VALUE Field
OPTCMD	CHECK_STATUS Causes the PeopleCode program implementing the Integration Broker OnRequest method to check the status of an optimization engine. The OPT_CALL example executes the CheckOptEngineStatus function.
PROBINST	The name of the analytic instance.
PROCINSTANCE	The name of the process instance for this process scheduler job.

Running a Transaction

To run a transaction, structure the rowset as follows, using the PT_OTPARMS record.

PARAMKEY Field	VALUE Field
OPTCMD	RUN Causes the PeopleCode program implementing the Integration Broker OnRequest method to run an optimization transaction. The OPT_CALL example executes the GetOptEngine method and either the RunSynch or RunAsynch method.
PROBINST	The name of the analytic instance.
PROCINSTANCE	The name of the process instance for this process scheduler job.
SYNCH	Y for a synchronous transaction, N for asynchronous.
TRANSACTION	The name of the transaction to run.
The names of one or more transaction parameters.	The value of each named transaction parameter.

Setting the Trace Level

To set a trace level, structure the rowset as follows, using the PT_OPTPARMS record.

PARAMKEY Field	VALUE Field
OPTCMD	SET_TRACE_LEVEL Causes the PeopleCode program implementing the OnRequest Integration Broker method to set the severity level at which events will be logged for an optimization engine. The OPT_CALL example executes the SetTraceLevel method.
PROBINST	The name of the analytic instance.
PROCINSTANCE	The name of the process instance for this process scheduler job.
COMPONENT	One of the following values: • %Opt_Engine server activity of the running optimization engine. • %Opt_Utility low level elements that support the running optimization engine. • %Opt_Datacache the in-memory database cache. • %Opt_Plugin the plugin being used for the running optimization engine.

PARAMKEY Field	VALUE Field
SEVERITY_LEVEL	The severity level to log. The following list starts with the most severe level; the level you specify includes all higher levels. For example, if you specify %Severity_Error, it logs %Severity_Fatal, %Severity_Status, and %Severity_Error messages and filters out the others. • %Severity_Fatal • %Severity_Status • %Severity_Error • %Severity_Warn • %Severity_Info • %Severity_Trace1 • %Severity_Trace2

Getting the Trace Level

To get a trace level, structure the rowset as follows, using the PT_OTPPARMS record.

PARAMKEY Field	VALUE Field
OPTCMD	GET_TRACE_LEVEL Causes the PeopleCode program implementing the OnRequest Integration Broker method to get the severity level at which events will be logged for an optimization engine. The OPT_CALL example executes the GetTraceLevel method.
PROBINST	Set to the name of the analytic instance.
PROCINSTANCE	Set to the name of the process instance for this process scheduler job.
COMPONENT	One of the following values: • %Opt_Engine server activity of the running optimization engine. • %Opt_Utility low level elements that support the running optimization engine. • %Opt_Datacache the in-memory database cache. • %Opt_Plugin the plugin being used for the current opt engine.

Shutting Down an Optimization Engine

To shut down an optimization engine, structure the rowset as follows, using the PT_OTPPARMS record.

PARMKEY Field	VALUE Field
OPTCMD	SHUTDOWN Causes the PeopleCode program implementing the OnRequest Integration Broker method to shut down an optimization engine. The OPT_CALL example executes the Shutdown method.
PROBINST	The name of the analytic instance.
PROCINSTANCE	The name of the process instance for this process scheduler job.

Creating a Response Message

This section provides an overview of the response message and describes how to create messages that:

- Send optimization status.
- Send a detailed message.

Understanding the Response Message

For optimization, the message PeopleCode in application server receives the request messages, performs an optimization actions, and sends response OPT_CALL messages. One message uses rowsets built from PT_OTTPARMS records, the other uses rowsets from PT_DETMSGGS records. You can use the rowset structures in the next section (Sending Optimization Status) as an example of how to send responses from the message notification PeopleCode in the application server to the application engine program in the process scheduler.

Sending Optimization Status

To send the status of the optimization functions and methods called within the PeopleCode program implementing the OnRequest Integration Broker method, structure the rowset as follows using the PT_OTTPARMS record. The optimization functions and messages are called in response to the request input message. You set key values using the PARMKEY field, and then set a value for that key field in the VALUE field.

PARMKEY Field	VALUE Field
STATUS	The return status of the optimization function or method that is called in the message PeopleCode.
DETAILED_STATUS	The optional detailed status returned by many of the optimization functions and methods.

Sending a Detailed Message

To send a detailed message, structure the rowset as follows, using the PT_DETMSGGS record. You set key values using the PARMKEY field, and then set a value for that key field in the VALUE field.

PARAMKEY Field	VALUE Field
MSGSET	The message set number. In the case of optimization, the message set number is 148.
MSGNUM	The name of the detailed message.
PARMCOUNT	The number of message parameters for the detailed message. There can be up to five parameters.
MSGPARAM1	The first parameter value.
MSGPARAM2	The second parameter value.
MSGPARAM3	The third parameter value.
MSGPARAM4	The fourth parameter value.
MSGPARAM5	The fifth parameter value.

Editing the Request PeopleCode

The PT_OPTCALL Application Engine program serves as a template. It is delivered with all the sections marked as inactive. You can edit the program to suit your needs, then mark the appropriate sections active before running it. You can also use the program as a guide to creating your own Application Engine program.

The program uses these steps to send request messages to perform the following tasks:

1. Load the optimization engine.
2. Wait for the optimization engine load to finish.
3. Run an optimization transaction against the loaded optimization engine.
4. Wait for the optimization transaction to finish running.
5. Set the trace level.
6. Get the trace level.
7. Shut down the optimization engine.

You can edit steps 1 and 3 to run an optimization transaction. You can also use the entire program as a template to create your own Application Engine program.

Loading an Optimization Engine

In step 1, enter the name of your analytic instance. In this example, the name of the analytic instance is *FEMALE1*.

If you have multiple domains, enter the local node name and the machine name and port number for your application server. In this case, the local node name is *%LocalNode* and the machine name and port number are *foo111111:9000*.

```

Local Message &MSG;
Local Message &response;

Component string &probid;
Component string &isSync;
Component string &procinst;
Local integer &nInst;
Local string &url;

Local Rowset &rs;
Local Row &row;
Local Record &rec;

Local string &stName;
Local integer &stVal;

&MSG = CreateMessage(OPERATION.OPT_CALL);
&rs = &MSG.GetRowset();

&row = &rs.GetRow(1);
&rec = &row.GetRecord(Record.PT_OPTPARMS);
&rec.PARMKEY.Value = "OPTCMD";
&rec.VALUE.Value = "CREATE";

&rs.InsertRow(1);
&rec = &rs.GetRow(2).PT_OPTPARMS;
&rec.PARMKEY.Value = "PROBINST";
&rec.VALUE.Value = "FEMALE1";
&probid = "FEMALE1";

&rs.InsertRow(2);
&rec = &rs.GetRow(3).PT_OPTPARMS;
&rec.PARMKEY.Value = "PROCINSTANCE";
&nInst = Record.PT_OPT_AET.PROCESS_INSTANCE.Value;
&rec.VALUE.Value = String(&nInst);
&procinst = String(&nInst);

&rs.InsertRow(3);
&rec = &rs.GetRow(4).PT_OPTPARMS;
&rec.PARMKEY.Value = "SYNCH";
&rec.VALUE.Value = "N";
&isSync = "N";

/* Specify the Application Server domain URL (foo111111:9000 in this example)
*/
&response = %IntBroker.SyncRequest(%LocalNode, "///foo111111:9000 e");

If &response.ResponseStatus = 0 Then
    &stName = &response.GetRowset().GetRow(1).GetRecord(Record.PT_OPTPARMS).Get
Field(Field.PARMKEY).Value;
    &stVal = Value(&response.GetRowset().GetRow(1).GetRecord(Record.PT_
OPTPARMS).GetField(Field.VALUE).Value);
    If &stName = "STATUS" And
        &stVal = %OptEng_Fail Then
        /* Check detailed message here */
        throw CreateException(148, 2, "Can not send to OptEngine");
    End-If;
End-If;

```

Running An Optimization Transaction

In step 3, enter the name of your optimization transaction and its parameter name/value pairs. In this example, the transaction name is *TEST_LONG_TRANS*, the first parameter name/value pair is *Delay_in_Secs* and *30*, and the second parameter name/value pair is *Sleep0_Work1* and *0*.

The parameter values are stored as strings. You may need to convert them in the OnRequest PeopleCode.

```

Local Message &MSG;
Local Message &response;

Local Rowset &rs, &respRS;
Local Row &row;
Local Record &rec, &msgRec;

Component string &probid;
Component string &procinst;
Component string &isSync;
Local string &url = "";
Local integer &parmCount, &msgSet, &msgNum;

&MSG = CreateMessage(OPERATION.OPT_CALL);
&rs = &MSG.GetRowset();

&row = &rs.GetRow(1);
&rec = &row.GetRecord(Record.PT_OTPARMS);
&rec.PARMKEY.Value = "OPTCMD";
&rec.VALUE.Value = "RUN";

&rs.InsertRow(1);
&rec = &rs.GetRow(2).PT_OTPARMS;
&rec.PARMKEY.Value = "PROBINST";
&rec.VALUE.Value = &probid;

&rs.InsertRow(2);
&rec = &rs.GetRow(3).PT_OTPARMS;
&rec.PARMKEY.Value = "PROCINSTANCE";
&rec.VALUE.Value = &procinst;

&rs.InsertRow(3);
&rec = &rs.GetRow(4).PT_OTPARMS;
&rec.PARMKEY.Value = "SYNCH";
&rec.VALUE.Value = &isSync;

&rs.InsertRow(4);
&rec = &rs.GetRow(5).PT_OTPARMS;
&rec.PARMKEY.Value = "TRANSACTION";
&rec.VALUE.Value = "TEST_LONG_TRANS";

&rs.InsertRow(5);
&rec = &rs.GetRow(6).PT_OTPARMS;
&rec.PARMKEY.Value = "Delay_in_Secs";
&rec.VALUE.Value = "30";

&rs.InsertRow(6);
&rec = &rs.GetRow(7).PT_OTPARMS;
&rec.PARMKEY.Value = "Sleep0_Work1";
&rec.VALUE.Value = "0";

/* SyncRequest will carry a url */
SQLExec("select URL from PSOPTSTATUS where PROBINST=:1 AND URL NOT LIKE ':%:0';",
  &probid, &url);
If &url = "" Then
  throw CreateException(148, 2, "Can not send to OptEngine");
End-If;

/* Specify the Application Server domain URL.
   (This was specified in Step 1 in this example.)
*/
&response = %IntBroker.SyncRequest(%LocalNode, &url);

If &response.ResponseStatus = 0 Then

```

```

    &stName = &response.GetRowset().GetRow(1).GetRecord(Record.PT_OPTPARMS).Get
Field(Field.PARMKEY).Value;
    &stVal = Value(&response.GetRowset().GetRow(1).GetRecord(Record.PT_
OPTPARMS).GetField(Field.VALUE).Value);

    If &stName = "STATUS" And
        &stVal = %OptEng_Fail Then
        throw CreateException(148, 2, "Can not send to OptEngine");
    End-If;

    /* Check Detailed msg here */
    If &isSync = "Y" And
        &stVal = %OptEng_Success Then

        &respRS = &response.GetRowset();
        &rowNum = &respRS.ActiveRowCount;
        For &iloop = 1 To &rowNum
            &msgRec = &respRS.GetRow(&iloop).GetRecord(Record.PT_OPTDETMGS);
            If (&msgRec.GetField(Field.MSGSET).Value <> 0) Then
                &msgSet = Value(&msgRec.GetField(Field.MSGSET).Value);
                &msgNum = Value(&msgRec.GetField(Field.MSGNUM).Value);
                &parm1 = &msgRec.GetField(Field.MSGPARAM1).Value;
                &parm2 = &msgRec.GetField(Field.MSGPARAM2).Value;
                &parm3 = &msgRec.GetField(Field.MSGPARAM3).Value;
                &parm4 = &msgRec.GetField(Field.MSGPARAM4).Value;
                &parm5 = &msgRec.GetField(Field.MSGPARAM5).Value;
                &string = MsgGetText(&msgSet, &msgNum, "Message Not Found", &parm1,
&parm2, &parm3, &parm4, &parm5);

                End-If;
            End-For;
        End-If;
    End-If;
End-If;

```

Editing the Response PeopleCode

The OPT_CALL message definition serves as a template. It is delivered to work with the PT_OPTCALL Application Engine program. You can edit the program to suit your needs, or use it as a guide when creating your own response message program.

OPT_CALL Message Program

The OPT_CALL application package implements the Integration Broker method OnRequest. The PeopleCode in this method shows application messages for lights-out mode.

Depending upon the request message, the OnRequest method PeopleCode calls appropriate optimization functions and methods to perform these tasks, and sends a response message containing the returned status and detailed messages from the optimization functions and methods.

You can use the OnRequest method PeopleCode as a template to create your own response message PeopleCode program. For example, you can edit it to run an optimization transaction, which is shown below as an example. This example is edited to match the examples for step 1 and step 3 in the PT_OPTCALL program.

Processing the Transaction Parameters

Edit the OPT_CALL application program OnRequest method to enter the name of your optimization transaction and the name/value pairs for its parameters. In this example, the transaction name is *TEST_LONG_TRANS*, the first parameter name/value pair is *&delayParm* and *&delay* (maps to *Delay_in_Secs* from the request message), and the second parameter name/value pair is *&sleepParm* and *&isSleep* (maps to *Sleep0_Work1* from the request message).

The parameter values are stored as strings in step 3 of the Application Engine program. You may need to convert them here to your desired format. Here is a section of the application program showing the places to edit.

```
If &trans = "TEST_LONG_TRANS" Then
    &REC = &rs.GetRow(6).PT_OTPARMS;
    &delayParm = &REC.PARMKEY.Value;
    &delay = Value(&REC.VALUE.Value);

    &REC = &rs.GetRow(7).PT_OTPARMS;
    &sleepParm = &REC.PARMKEY.Value;
    &isSleep = Value(&REC.VALUE.Value);

    &myopt = GetOptEngine(&inst, &detStatus);
    If (&myopt = Null) Then
        &optstatus = %OptEng_Fail;
    End-If;

    If &myopt <> Null And &isSync = "Y" Then
        &optstatus = &myopt.RunSynch(&trans, &delayParm, &delay, &sleepParm, &isSleep);
        &detStatus = &myopt.DetailedStatus;
    End-If;

    If &myopt <> Null And &isSync = "N" Then
        &myopt.ProcessInstance = &procInst;
        &optstatus = &myopt.RunASynch(&trans, &delayParm, &delay, &sleepParm, &isSleep);
        &detStatus = &myopt.DetailedStatus;
    End-If; /* iif myopt=null */
End-If;
```

Building a Status Response Message

This section shows the a response message to send a status message for the OPT_CALL message in the application server.

```
/* Insert detailed status and detailed msgs into Response msg rowset */
&respRS = &response.GetRowset();
&respRS.GetRow(1).GetRecord(Record.PT_OTPARMS).GetField(Field.PARMKEY).Value =
    "STATUS";
&respRS.GetRow(1).GetRecord(Record.PT_OTPARMS).GetField(Field.VALUE).Value =
    String(&optstatus);

&respRS.InsertRow(1);
&respRS.GetRow(2).GetRecord(Record.PT_OTPARMS).GetField(Field.PARMKEY).Value =
    "DETAILED_STATUS";
&respRS.GetRow(2).GetRecord(Record.PT_OTPARMS).GetField(Field.VALUE).Value =
    String(&detStatus);
```

Building a Detailed Response Message

This section shows a response message to send a detailed message for the OPT_CALL message on the application server.

```

/*Either optcmd or inst is not passed in correctly, or optengine is not loaded
/created correctly */
If &myopt = Null Then
    &msgRec = &respRS.GetRow(1).GetRecord(Record.PT_OPTDETMSGGS);
    If &isParmBad = True Then
        &msgRec.GetField(Field.MSGSET).Value = 148;
        &msgRec.GetField(Field.MSGNUM).Value = 505;
    End-If;
End-If;

/* If it is sync transaction, insert DetailMsg to response msg */
If &myopt <> Null And
    &isSync = "Y" And
    &optcmd = "RUN" And
    &optstatus = %OptEng_Success Then
    &arrArray = &myopt.DetailMsgs;
    For &iloop = 1 To &arrArray.Len
        /* First two rows have been inserted because of PT_OPTPARMS for two status
        codes */
        If &iloop > 2 Then
            &respRS.InsertRow(&iloop - 1);
        End-If;

        &msgRec = &respRS.GetRow(&iloop).GetRecord(Record.PT_OPTDETMSGGS);
        &msgRec.GetField(Field.MSGSET).Value = String(&arrArray [&iloop][1]);
        &msgRec.GetField(Field.MSGNUM).Value = String(&arrArray [&iloop][2]);
        &msgRec.GetField(Field.PARMCOUNT).Value = String(&arrArray [&iloop][3]);
        &msgRec.GetField(Field.MSGPARAM1).Value = String(&arrArray [&iloop][4]);
        &msgRec.GetField(Field.MSGPARAM2).Value = String(&arrArray [&iloop][5]);
        &msgRec.GetField(Field.MSGPARAM3).Value = String(&arrArray [&iloop][6]);
        &msgRec.GetField(Field.MSGPARAM4).Value = String(&arrArray [&iloop][7]);
        &msgRec.GetField(Field.MSGPARAM5).Value = String(&arrArray [&iloop][8]);
    End-For;
End-If;

```

Optimization Built-in Functions

This section discusses the optimization functions. The functions are discussed in alphabetical order.

CreateOptEngine

Syntax

```

CreateOptEngine(analytic_inst, {%Synch | %ASynch}[, &detailedstatus] [,
processinstance])

```

Description

The CreateOptEngine function instantiates an OptEngine object, loads an optimization engine with an analytic instance and returns a reference to it.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>Analytic_inst</i>	Specify the analytic instance ID, which is a unique ID for this analytic instance in this optimization engine. This is supplied by users when they request that an optimization be run.
%Synch %Asynch	Specify whether the optimization engine is synchronous or asynchronous. The values are: • %Synch: run the optimization engine synchronously. • %Asynch: run the optimization engine asynchronously.
<i>&detailedstatus</i>	Specify a variable that the engine uses to give further information about the evaluation of this function. The value returned is one of the following: • %OptEng_Success: The function completed successfully. • %OptEng_Fail: The function failed. • %OptEng_Invalid_Aiid: The analytic instance ID passed to the function is invalid. • %OptEng_Exists: An optimization engine instance already exists and is loaded. • %OptEng_Method_Disabled: A method is disabled or not valid. • %OptEng_DB_Updates_Pending: indicates that database updates are pending.
<i>processinstance</i>	Enter the process instance ID. You use this parameter only with lights-out processing, most likely with the subscription PeopleCode for application message. Note. This optional parameter is positional. If you use it, you must also use the <i>&detailedstatus</i> parameter. The state record that you use with Application Engine contains the process instance ID. See Chapter 28, "Optimization PeopleCode," Using Lights-Out Mode with Optimization, page 1489. See <i>PeopleTools 8.51 PeopleBook: Application Engine</i>, "Developing Efficient Programs," Using State Records.

Returns

If successful, CreateOptEngine returns an OptEngine PeopleCode object. If the function fails, it returns a null value. Examine the optional status reference parameter in case of a Null return for additional information regarding the failure.

Example

An OptEngine object variable can be scoped as Local, Component, or Global.

You declare OptEngine objects as type OptEngine. For example:

```
Local OptEngine &MyOptEngine;
Component OptEngine &MyOpt;
Global OptEngine &MyOptEng;
```

The following example loads an optimization engine with the analytic instance:

```
Local OptEngine &myopt;
Local string &probinst;
Local string &transaction;
Local integer &detailedstatus;

&probinst = GetRecord(Record.PSOPTPRBINST).GetField(Field.PROBINST).Value;
&myopt = CreateOptEngine(&probinst, %Synch);
```

The following example shows the use of the optional status parameter:

```
&myopt = CreateOptEngine(&probinst, %Synch, &detailedstatus);
if &myopt = Null then
    if &detailedstatus = %OptEng_Invalid_Piid then
        /*perform some action */
    end_if;
end_if;
```

CreateOptInterface

Syntax

CreateOptInterface()

Description

The CreateOptInterface function instantiates an OptInterface object.

Note. You can use this function and the OptInterface methods only within an application class that you extend from the OptBase application class, or within PeopleCode that you call from that application class. This ensures that the OptInterface PeopleCode runs only on the optimization engine.

Parameters

None.

Returns

If successful, CreateOptInterface returns an OptInterface PeopleCode object. If the function fails, it returns a null value.

Example

You declare OptInterface objects as type OptInterface. For example:

```
Local OptInterface &MyOptInterface;
Component OptInterface &MyOptInt;
Global OptInterface &MyOptInt;
```

The following example instantiates an OptInterface object:

```
Local OptInterface &myInterface;
Int &status;

&myInterface = CreateOptInterface(&additionalStatus);
if (&myInterface != NULL) then
    &status = &myInterface.ActivateModel("RMO_TEST");
    if (&status = %OptInter_Fail) then
        /* examine &myInterface.DetailedStatus for reason */
        ...
    end-if;
else
    /* CreateOptInterface has returned NULL */
    /* take some corrective action here */
    ...
end_if;
```

DeleteOptProbInst

Syntax

DeleteOptProbInst(*probinst*[, &*detailedstatus*])

Description

The DeleteOptProbInst function deletes the analytic instance ID from PeopleTools metadata. This function can be called only inside FieldChange, PreSaveChange and PostSaveChange PeopleCode events, and in Workflow.

Note. Use this function to delete the analytic instance ID after deleting data in optimization application tables for this analytic instance.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>probinst</i>	Enter the analytic instance ID to delete.
<i>&detailedstatus</i>	(Optional) This status reference parameter returns an integer value giving further information about the evaluation of this function. The value returned is one of the following: • %OptEng_Success: The function completed successfully. • %OptEng_Fail: The function failed. • %OptEng_Invalid_Piid: The analytic instance ID passed to the function is invalid. • %OptEng_Sql_Exception: A SQLerror is encountered when access database. • %OptEng_Exists: An analytic server loaded with this analytic instance still exists.

Returns

Returns %OptEng_Success if successful; otherwise returns %OptEng_Fail.

Example

The following example deletes the instance for an analytic type:

Note. Whenever you add records to an analytic type, you must call DeleteOptProbInst to delete the old analytic type instances and then call InsertOptProbInst to recreate them.

```

Local string &probinst;
Local string &probtype;
Local integer &ret;
&probinst = "PATSMITH";
&probtype = "QEOPT";
&ret = DeleteOptProbInst(&probinst, &probtype);
If &ret <> %OptEng_Success Then
    QEOPT_WRK.MESSAGE_TEXT = "Delete of analytic instance " | &probinst | "
    failed.";
Else
    QEOPT_WRK.MESSAGE_TEXT = "Analytic Instance " | &probinst | " deleted.";
End-If;

```

The following example shows the use of the optional status parameter:

```
Local integer &detailedstatus;  
&ret = DeleteOptProbInst(&probinst, &probtype, &detailedstatus);  
If &ret <> %OptEng_Success AND &detailedstatus=%OptEng_Invalid_Piid then  
    QEOPT_WRK.MESSAGE_TEXT = "Delete of analytic instance " | &probinst | " failed  
for bad piid.";   
Else  
    QEOPT_WRK.MESSAGE_TEXT = "Analytic Instance " | &probinst | " deleted.";   
End-If;
```

GetOptEngine

Syntax

GetOptEngine(*probinst*[,*&detailedstatus*])

Description

The GetOptEngine function returns a handle to an optimization engine that is already loaded with the analytic instance.

Note. You cannot call GetOptEngine from a domain other than the application server.

Parameters

Parameter	Description
<i>probinst</i>	Enter the analytic instance ID, which is unique ID for this analytic instance in this optimization engine.
<i>&detailedstatus</i>	(Optional) This status reference parameter returns an integer value giving further information about the evaluation of this function. The value returned is one of the following: • %OptEng_Success: The function completed successfully. • %OptEng_Fail: The function failed. • %OptEng_Invalid_Piid: The analytic instance ID passed to the function is invalid.

Returns

Returns an OptEngine PeopleCode object if successful, a null value otherwise.

Example

The following example causes an optimization engine to shut down its analytic instance:

```

Global string &probinst;
Local OptEngine &myopt;
Local integer &status;

&myopt = GetOptEngine(&probinst);
If &myopt <> NULL then
  &status = &myopt.ShutDown();
  QEOPT_WRK.MESSAGE_TEXT = "Analytic Instance ID " | &probinst
    | " has been shutdown successfully.";
End-if;

```

Or, you can use the optional status parameter:

```

&myopt = GetOptEngine(&probinst, &detailedstatus);
if &myopt=NULL and &detailedstatus=%OptEng_Invalid_Piid then
  /* perform some action */
End-if;

```

GetOptProbInstList

Syntax

GetOptProbInstList(*ProblemType* , *OutputErrorCode* [, *Prefix*] [, &*detailedstatus*])

Description

The GetOptProbInstList function gets the list of all analytic instance IDs in an analytic type.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>ProblemType</i>	Enter the name of the analytic type that you created in Application Designer.
<i>OutputErrorCode</i>	Future use. Always returns zero.
<i>Prefix</i>	(Optional) Enter a string. If used, this prefix causes the returned list to include only the analytic instance IDs that start with this prefix. If not used, all the analytic instance IDs in the analytic type are returned.
& <i>detailedstatus</i>	(Optional) This status reference parameter returns an integer value giving further information about the evaluation of this function. The value returned is one of the following: %OptEng_Success: The function completed successfully. %OptEng_Fail: The function failed. %OptEng_Invalid_Piid: The analytic type name passed to the function is invalid.

Returns

Returns an array of strings containing the optimization analytic instance list.

Example

The following example shows the usage of GetOptProbInstList to fill the display field on a page:

```
Global string &probinst;
Local integer &detailedstatus;
Local integer &iloop;
Local array of string &instarray;

QEOPT.OPERATOR = %UserId;

&instarray = GetOptProbInstList(QEOPT.PROBTYPE, &ret, &detailedstatus);

If &ret <> %OptEng_Success Then
    QEOPT_WRK.MESSAGE_TEXT = "Could not get analytic instances
    for analytic type " | QEOPT.PROBTYPE ;
Else
    For &iloop = 1 To &instarray.Len
        QEOPT_WRK.MESSAGE_TEXT = QEOPT_WRK.MESSAGE_TEXT | &instarray[&iloop] | " ";
    End-For;
End-If;
```

The following example shows the use of the optional status parameter:

```
&instarray = GetOptProbInstList(QEOPT.PROBTYPE, &ret, &detailedstatus);
If &ret <> %OptEng_Success and &detailedstatus=%OptEng_Invalid_Piid Then
    QEOPT_WRK.MESSAGE_TEXT = "Could not get analytic instances for analytic type "
    | QEOPT.PROBTYPE | "because bad piid" ;
End-If;
```

InsertOptProbInst

Syntax

InsertOptProbInst(*probinst*, *ProblemType*[, *&detailedstatus*] [, *Description*])

Description

The InsertOptProbInst function inserts a new analytic instance ID into the PeopleTools metadata.

The InsertOptProbInst function can be called only inside FieldChange, PreSave and PostSave PeopleCode events, and in Workflow.

Note. You must use this function to create the analytic instance ID before inserting data into optimization application tables for this analytic instance.

Parameters

Parameter	Description
<i>probinst</i>	Enter the analytic instance ID to be inserted into the analytic type.
<i>ProblemType</i>	Enter the name of the analytic type that you created in Application Designer.
<i>&detailedstatus</i>	(Optional) This status reference parameter returns an integer value giving further information about the evaluation of this function. The value returned is one of the following: %OptEng_Success: The function completed successfully. %OptEng_Fail: The function failed. %OptEng_Invalid_Piid: The analytic instance ID passed to the function is invalid.
<i>Description</i>	(Optional) Specify a description for the analytic instance. This parameter takes a string value.

Returns

This method returns a constant. Valid values are:

Value	Description
%OptEng_Success	Returned if method succeeds.
%OptEng_Fail	Returned if the method fails.

Example

```

Local string &probinst;
Local string &probtype;
Local integer &ret;
Local integer &detailedstatus;

&probinst = "PATSMITH";
&probtype = "QEOPT";
&probDescr = "New QEOPT instance";
&ret = InsertOptProbInst(&probinst, &probtype, &probDescr);
If &ret <> %OptEng_Success Then
    QEOPT_WRK.MESSAGE_TEXT = "Insert of analytic instance "
    | &probinst | " failed.";
Else
    QEOPT_WRK.MESSAGE_TEXT = "Analytic Instance " | &probinst | " created.";
End-If;

```

The following example shows the use of the optional status parameter:

```

&ret = InsertOptProbInst(&probinst, &probtype, &detailedstatus);
If &ret <> %OptEng_Success and &detailedstatus=%OptEng_Invalid_Piid Then
    QEOPT_WRK.MESSAGE_TEXT = "Insert of analytic instance "
    | &probinst | " failed for bad piid.";
End-if;

```

IsValidOptProbInst

Syntax

IsValidOptProbInst(*probinst* [, &*detailedstatus*])

Description

IsValidOptProbInst determines if a given analytic instance exists in the optimization metadata.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>probinst</i>	Enter the analytic instance ID to be validated.
<i>&detailedstatus</i>	(Optional) This status reference parameter returns an integer value giving further information about the evaluation of this function. The value returned is one of the following: %OptEng_Success: The function completed successfully. %OptEng_Invalid_Piid: The analytic type name passed to the function is invalid.

Returns

This method returns a constant. Valid values are:

<i>Value</i>	<i>Description</i>
%OptEng_Success	Returned if method succeeds.
%OptEng_Fail	Returned if the method fails.

Example

```
Local string &probinst;  
Local integer &detailedstatus;  
Local integer &ret;  
  
&probinst = "PATSMITH";  
&ret = IsValidOptProbInst(&probinst, &detailedstatus);  
If &ret <> %OptEng_Success and &detailedstatus=%OptEng_Invalid_Piid Then  
    <perform some action>  
End-if;
```

OptEngine Class Methods

This section discusses the optimization methods for the OptEngine PeopleCode class. The methods are listed in alphabetical order.

CheckOptEngineStatus

Syntax

CheckOptEngineStatus()

Description

The CheckOptEngineStatus method returns the status of the optimization engine, using a combination of its return value and the DetailedStatus OptEngine class property. Keep the following in mind:

- The value returned by CheckOptEngineStatus is the operational status of the optimization engine.
- The DetailedStatus property indicates the completion status of the OptEngine method call CheckOptEngineStatus.

For example, CheckOptEngineStatus can return %OptEng_Idle and DetailedStatus is %OptEng_Success. For CheckOptEngineStatus, DetailedStatus can have the value:

- %OptEng_Success
- %OptEng_Fail
- %OptEng_Not_Available

Note. Before this method is called, the CreateOptEngine or GetOptEngine must be called.

Returns

Returns an integer for the status of the optimization engine. These numbers are message IDs belonging to message set 148 in the message catalog.

<i>Numeric Value</i>	<i>Constant Value</i>	<i>Description</i>
21	%OptEng_Not_Loaded	The optimization engine process is running, but is not currently loaded with an application problem.
22	%OptEng_Busy>Loading	The optimization engine is busy loading an application problem. It will not accept transaction requests until loading completes.
23	%OptEng_Idle	The optimization engine is loaded with an application problem and waiting for a transaction request.
24	%OptEng_Busy	The optimization engine is busy processing a transaction request for the loaded application problem. It will not accept additional transaction requests until the current one completes.
26	%OptEng_Unknown	An error has occurred. The optimization engine status cannot be determined.

Example

This PeopleCode example shows optimization engine status being checked:

```
Local OptEngine &myopt;
Local string &probinst;
Local integer &status;
&myopt = GetOptEngine("PATSMITH");
/* Initialize the DESCRLONG field in the QE_FUNCLIB_OPT record to null. */
GetLevel0().GetRow(1).GetRecord(Record.QE_FUNCLIB_OPT).DESCRLONG.Value = "";
&status = &myopt.CheckOptEngineStatus();
GetLevel0().GetRow(1).GetRecord(Record.QE_FUNCLIB_OPT).DESCRLONG.Value = "Opt
Engine status = " | MsgGet(148, &status, "Could not send to the OptEngine.");
```

You can also retrieve the detailed status:

```
Local integer &detailedstatus
&status = &myopt.CheckOptEngineStatus();
&detailedstatus = &myopt.DetailedStatus;
```

FillRowset

Syntax

FillRowset(*PARAM_NAME*, &*Rowset*[, &*functionstatus*])

Description

This method gets the value of a transaction output parameter that is a rowset. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

When using the OptEngine DetailedStatus property, keep the following in mind:

- The value returned by FillRowset is the operational status of the optimization engine.
- The OptEngine DetailedStatus property indicates the completion status of the OptEngine method call FillRowset.

For example, FillRowset returns %OptEng_Fail, and DetailedStatus is %OptEng_Method_Disabled.

For FillRowset, the DetailedStatus property can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled.

This indicates that the method is disabled or not valid.

- %OptEng_Wrong_Parm_Type

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i> , "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.
<i>&Rowset</i>	Enter the rowset containing the values. This rowset must be a single record rowset, and the record must match the record name associated with the transaction parameter in the analytic type definition.

<i>Parameter</i>	<i>Description</i>
<i>&functionstatus</i>	(Optional) This status reference parameter returns an integer value giving further information about the evaluation of this function. The value returned is one of the following: - OptEng_Success: The function completed successfully. - OptEng_Fail: The function failed. - OptEng_Method_Disabled: A method is disabled or not valid.

Returns

This method returns a constant. Valid values are:

<i>Value</i>	<i>Description</i>
%OptEng_Success	Returned if method succeeds.
%OptEng_Fail	Returned if the method fails.

Example

The following PeopleCode example runs a synchronous optimization transaction named RETURN_MACHINE_UNAVAILABLE. It has these parameters:

- Input: MACHINE_NAME to specify the machine for which we need unavailable times.
- Output: RETURN_TIMES to specify a rowset and MACHINE_WRK record containing the BEGIN_DATE and END_DATE fields.

This PeopleCode example sets input parameter values and gets an output parameter value:

```

Local OptEngine &myopt;
Local integer &status;
Local string &machname;
Local Rowset &rs;
&myopt = GetOptEngine("PATSMITH");
&machname = QEOPT_WRK.MACHINE_NAME.Value;
/* Run the RETURN_MACHINE_UNAVAILABLE transaction synchronously with input values.
*/
&status = &myopt.RunSynch("RETURN_MACHINE_UNAVAILABLE", "MACHINE_NAME", &machname);
If Not &status Then
    QEOPT_WRK.MESSAGE_TEXT = " RETURN_MACHINE_UNAVAILABLE transaction failed.";
    Return;
End-If;
/* Get output value from the RETURN_MACHINE_UNAVAILABLE transaction. */
&rs = CreateRowset(Record.MACHINE_WRK);
&status = &myopt.FillRowset("RETURN_TIMES", &rs);

```

You can also use the [new->] DetailedStatus property as follows:

```

&status = &myopt.FillRowset("RETURN_TIMES", &rs);
if &status=%OptEng_Fail and &myopt.DetailedStatus=%OptEng_Method_Disabled then
    /* perform some action */
End-if;

```

GetDate

Syntax

GetDate(*PARAM_NAME*[, &*status*])

Description

This method gets the value of a transaction output parameter with a data type of Date. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

The OptEngine DetailedStatus property indicates the completion status of the OptEngine method call GetDate. For GetDate, DetailedStatus can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i>, "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

Returns a Date object; use this method when that is the data type of the transaction output parameter value.

Example

See [Chapter 28, "Optimization PeopleCode," GetNumber, page 1520.](#)

GetDateArray

Syntax

GetDateArray(*PARAM_NAME*)

Description

This method gets the value of a transaction output parameter with a data type Array of Date. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

The OptEngine DetailedStatus property indicates the completion status of the OptEngine method call GetDateArray. For GetDateArray, DetailedStatus can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i> , "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

Returns an Array of Date object; use this method when that is the data type of the transaction output parameter value.

Example

See [Chapter 28, "Optimization PeopleCode," GetStringArray, page 1523.](#)

GetDateTime

Syntax

GetDateTime(*PARAM_NAME*)

Description

This method gets the value of a transaction output parameter with a data type of DateTime. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call GetDateTime. For GetDateTime, DetailedStatus can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i> , "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

Returns a DateTime object; use this method when that is the data type of the transaction output parameter value.

Example

See [Chapter 28, "Optimization PeopleCode," GetNumber, page 1520.](#)

GetDateTimeArray

Syntax

GetDateTimeArray(*PARAM_NAME*)

Description

This method gets the value of a transaction output parameter with a data type Array of DateTime. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call GetDateTimeArray. For GetDateTimeArray, DetailedStatus can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i> , "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

Returns an Array of DateTime object; use this method when that is the data type of the transaction output parameter value.

Example

See [Chapter 28, "Optimization PeopleCode," GetStringArray, page 1523.](#)

GetNumber

Syntax

GetNumber(*PARAM_NAME*)

Description

This method gets the value of a transaction output parameter with a data type of Number. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call GetNumber. For GetNumber, DetailedStatus can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i> , "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

Returns a Number object; use this method when that is the data type of the transaction output parameter value.

Example

The following PeopleCode example runs a synchronous optimization transaction named IS_MACHINE_AVAILABLE. It has these parameters:

- Input MACHINE_NAME to specify the machine.
- Inputs BEGIN_DATE and END_DATE to specify the time slot.
- Output AVAILABLE_FLAG to specify whether the machine is available in that time slot.

This PeopleCode example sets input parameter values and gets an output parameter value:

```

Local OptEngine &myopt;
Local integer &status;
Local string &machname;
Local datetime &begindate;
Local datetime &enddate;
&myopt = GetOptEngine("PATSMITH");
&machname = QEOPT_WRK.MACHINE_NAME.Value;
&begindate = QEOPT_WRK.BEGIN_DATE.Value;
&enddate = QEOPT_WRK.END_DATE.Value;
/* Run the IS_MACHINE_AVAILABLE transaction synchronously with input values. */
&status = &myopt.RunSynch("IS_MACHINE_AVAILABLE", "MACHINE_NAME",
    &machname, "BEGIN_DATE", &begindate, "END_DATE", &enddate);
If Not &status Then
    QEOPT_WRK.MESSAGE_TEXT = "IS_MACHINE_AVAILABLE transaction failed.";
    Return;
End-If;
/* Get output value from the IS_MACHINE_AVAILABLE transaction. */
QEOPT_WRK.AVAILABLE_FLAG = &myopt.GetNumber("AVAILABLE_FLAG");

```

You can use the DetailedStatus property as follows:

```

QEOPT_WRK.AVAILABLE_FLAG = &myopt.GetNumber("AVAILABLE_FLAG");
if &myopt.DetailedStatus=%OptEng_Fail then
    /* perform some action */
End-if;

```

GetNumberArray

Syntax

GetNumberArray(*PARAM_NAME*)

Description

This method gets the value of a transaction output parameter with a data type Array of Number. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call GetNumberArray. For GetNumberArray, DetailedStatus can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled: this indicates that the method is disabled or not valid.

Note. Do not pass an array of type Integer as a transaction parameter. Use an array of type Number instead.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i>, "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

Returns an Array of Number object; use this method when that is the data type of the transaction output parameter value.

Example

See [Chapter 28, "Optimization PeopleCode," GetStringArray, page 1523](#).

GetString

Syntax

GetString(*PARAM_NAME*)

Description

This method gets the value of a transaction output parameter with a data type of String. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call GetString. For GetString, DetailedStatus can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i>, "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

Returns a String object; use this method when that is the data type of the transaction output parameter value.

Example

See [Chapter 28, "Optimization PeopleCode," GetNumber, page 1520](#).

GetStringArray

Syntax

GetStringArray(*PARAM_NAME*)

Description

This method gets the value of a transaction output parameter with a data type Array of String. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call GetStringArray. For GetStringArray, DetailedStatus can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i>, "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

Returns an Array of String object; use this method when that is the data type of the transaction output parameter value.

Example

The following PeopleCode example runs a synchronous optimization transaction named ARE_MACHINES_AVAILABLE. It has these parameters:

- Inputs BEGIN_DATE and END_DATE to specify the time slot.
- Output MACHINE_NAMES to specify the machines available in that time slot.

This PeopleCode example sets input parameter values and gets an output parameter value:

```

Local OptEngine &myopt;
Local integer &status;
Local array of string &machnames;
Local datetime &begindate;
Local datetime &enddate;
&myopt = GetOptEngine("PATSMITH");
&begindate = QEOPT_WRK.BEGIN_DATE.Value;
&enddate = QEOPT_WRK.END_DATE.Value;
/* Run the ARE_MACHINES_AVAILABLE transaction synchronously with input values. */
&status = &myopt.RunSynch("ARE_MACHINES_AVAILABLE",
    "BEGIN_DATE", &begindate, "END_DATE", &enddate);
If &status=%OptEng_Fail Then
    QEOPT_WRK.MESSAGE_TEXT = "ARE_MACHINES_AVAILABLE transaction failed.";
    Return;
End-If;
/* Get output value from the ARE_MACHINES_AVAILABLE transaction. */
&machnames = &myopt.GetStringArray("MACHINE_NAMES");

```

The following example shows the use of the DetailedStatus property:

```

Local array of string &machnames;
&machnames = &myopt.GetStringArray("MACHINE_NAMES");
if &myopt.DetailedStatus=%OptEng_Fail then
    /* perform some action */
End-if;

```

GetTime

Syntax

GetTime(*PARAM_NAME*)

Description

This method gets the value of a transaction output parameter with a data type of Time. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call GetTime. For GetTime, DetailedStatus can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i> , "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

Returns a Time object; use this method when that is the data type of the transaction output parameter value.

Example

See [Chapter 28, "Optimization PeopleCode," GetNumber, page 1520.](#)

GetTimeArray

Syntax

GetTimeArray(*PARAM_NAME*)

Description

This method gets the value of a transaction output parameter with a data type Array of Time. This cannot be used with the RunAsynch method; RunSynch is needed to make the transaction output parameter values immediately available.

The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call GetTimeArray. For GetTimeArray, DetailedStatus can have the value:

- %OptEng_Success.
- %OptEng_Fail.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>PARAM_NAME</i>	Enter a string for the name of the output parameter to get from the transaction that was just performed with RunSynch. This parameter must be defined as an output or both (input and output) in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i> , "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

Returns an Array of Time object; use this method when that is the data type of the transaction output parameter value.

Example

See [Chapter 28, "Optimization PeopleCode," GetStringArray, page 1523.](#)

GetTraceLevel

Syntax

GetTraceLevel(*component*)

Description

GetTraceLevel gets the severity level at which events are logged for a given component.

The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call GetTraceLevel. For GetTraceLevel, DetailedStatus can have the value:

- %OptEng_Success.
This indicates that the function completed successfully.
- %OptEng_Fail.
This indicates that the function failed.
- %OptEng_Method_Disabled.
This indicates that the method is disabled or not valid.
- %OptEng_DB_Updates_Pending.
This indicates that database updates are pending.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>component</i>	Enter one of the following PeopleCode constants: Opt_Engine, Opt_Utility, Opt_Datacache, or Opt_Plugin.

Returns

Returns one of the following.

- %Severity_Fatal
- %Severity_Status
- %Severity_Error
- %Severity_Warn
- %Severity_Info
- %Severity_Trace1
- %Severity_Trace2

Example

```

Local OptEngine &myopt;
Local integer &tracelevel;

&myopt = GetOptEngine("PATSMITH");

&tracelevel = &myopt.GetTraceLevel(%Opt_Engine);
if &myopt.DetailedStatus = %OptEng_Success then
    if (&tracelevel = %Severity_Info_ then
        winmessage("Severity level for the OptEngine is 'Info'");
    End-if;
End-if;

```

RunAsynch

Syntax

RunAsynch(*TRANSACTION*, *PARM_PAIRS*)

Description

The RunAsynch method requests the optimization engine to run the transaction in asynchronous mode.

When using the DetailedStatus OptEngine property, keep the following in mind:

- The value returned by RunASynch is the operational status of the optimization engine.
- The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call RunASynch.

For example, RunASynch can return %OptEng_Fail and DetailedStatus is %OptEng_DB_Updates_Pending. For RunASynch, DetailedStatus can have the value:

- %OptEng_Success: indicates that the function completed successfully.
- %OptEng_Fail: indicates that the function failed.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.
- %OptEng_DB_Updates_Pending: indicates that database updates are pending.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TRANSACTION</i>	Enter a string for the name of the transaction to run.

Parameter	Description
<i>PARAM_PAIRS</i>	Enter the name and value pairs (string name and value) for this transaction. Not used if the transaction has no parameters. Parameters are defined in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i> , "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

This method returns a constant. Valid values are:

Value	Description
%OptEng_Success	Returned if method succeeds.
%OptEng_Fail	Returned if the method fails.

Example

This PeopleCode example runs an asynchronous optimization transaction named SOLVE. It has no input or output parameters. The SOLVE transaction solves the exercise scheduling problem and puts the results into the QE_RWSM_EXERSCH table.

```
Local OptEngine &myopt;
Local integer &status;
&myopt = GetOptEngine("PATSMITH");
/* Run the SOLVE transaction asynchronously with input values. */
&status = &myopt.RunAsynch("SOLVE");
If &status=%OptEng_Fail Then
    QEOPT_WRK.MESSAGE_TEXT = "SOLVE transaction failed.";
    Return;
End-If;
```

The following example shows the use of the DetailedStatus property.

```
Local integer &status;
&status = myopt.RunAsynch("SOLVE");
if &status=%OptEng_Fail and &myopt.DetailedStatus=%OptEng_Method_Disabled then
    <perform some action>
End-if;
```

RunSynch

Syntax

RunSynch(*TRANSACTION*, *PARAM_PAIRS*)

Description

The RunSynch method requests the optimization engine to run the transaction in synchronous mode.

When using the DetailedStatus OptEngine property, keep the following in mind:

- The value returned by RunSynch is the operational status of the optimization engine.
- The DetailedStatus OptEngine property indicates the completion status of the OptEngine method call RunSynch.

For example, RunSynch can return %OptEng_Fail and DetailedStatus is %OptEng_DB_Updates_Pending. For RunSynch, DetailedStatus can have the value:

- %OptEng_Success: indicates that the function completed successfully.
- %OptEng_Fail: indicates that the function failed.
- %OptEng_Method_Disabled: indicates that the method is disabled or not valid.
- %OptEng_DB_Updates_Pending: indicates that database updates are pending.

Parameters

<i>Parameter</i>	<i>Description</i>
<i>TRANSACTION</i>	Enter a string for the name of the transaction to run.
<i>PARAM_PAIRS</i>	Enter the name and value pairs (string name and value) for this transaction. Not used if the transaction has no parameters. Parameters are defined in the analytic type definition. See <i>PeopleTools 8.51 PeopleBook: PeopleSoft Optimization Framework</i> , "Designing Analytic Type Definitions," Configuring Analytic Type Transactions.

Returns

This method returns a constant. Valid values are:

<i>Value</i>	<i>Description</i>
%OptEng_Success	Returned if method succeeds.
%OptEng_Fail	Returned if the method fails.

Example

The following PeopleCode example runs a synchronous optimization transaction named IS_MACHINE_AVAILABLE. It has these parameters:

- Input MACHINE_NAME to specify the machine.
- Inputs BEGIN_DATE and END_DATE to specify the time slot.
- Output AVAILABLE_FLAG to specify whether the machine is available in that time slot.
