Chapter 1

Introduction

This document describes how to install and configure the eWay Intelligent Adapter for Informix.

This Chapter Includes:

- "Overview" on page 6
- "Supported Operating Systems" on page 6
- "System Requirements" on page 7
- "External System Requirements" on page 7

1.1 **Overview**

The Informix eWay enables eGate Integrator Projects to exchange data with an external Informix Dynamic Server (IDS) database. This user's guide describes how to install and configure the Informix eWay.

1.2 Supported Operating Systems

The Informix eWay is available on the following operating systems:

- Windows XP, Windows 2000, and Windows Server 2003
- Solaris 8 and 9
- AIX 5.1 and 5.2
- HP-UX 11.0 and HP-UX 11.i (RISC)

Although the Informix eWay, the Repository, and Logical Hosts run on the platforms listed above, the Enterprise Designer requires the Windows operating system. Enterprise Manager can run on any platform that supports Internet Explorer 6.0.

1.3 System Requirements

The system requirements for the Informix eWay are the same as for eGate Integrator. For information, refer to the *eGate Integrator Installation Guide*. It is also helpful to review the **Readme.txt** for any additional requirements prior to installation. The **Readme.txt** is located on the installation CD-ROM.

Note: To enable Web Services, you must install and configure the SeeBeyond ICAN Suite eInsight Business Process Manager.

1.4 External System Requirements

The Informix eWay supports the following software for external systems running eGate Projects.

• Informix Dynamic Server (IDS), version 9.2, 9.3, and 9.4.

Installing the Informix eWay

This chapter describes how to install the Informix eWay.

2.1 Installing the Informix eWay

During the eGate Integrator installation process, the Enterprise Manager, a web-based application, is used to select and upload eWays (eWay.sar files) from the eGate installation CD-ROM to the Repository.

Note: Refer to the ICAN Installation Guide for additional installation instructions.

Required Files

During the procedures for uploading files to the eGate Repository using the Enterprise Manager, select and upload the following files:

- InformixeWay.sar (to install the Informix eWay)
- FileeWay.sar (to install the File eWay, used in the sample Projects)
- InformixeWayDocs.sar (to install the Informix eWay documentation)

Sample Projects

The Informix eWay also includes sample projects for demonstration purposes.

To Download Sample Projects:

- 1 In the Enterprise Manager, click the **DOCUMENTATION** tab.
- 2 Click Informix eWay.
- 3 In the right window pane, click Download Sample, and select a location to save the .zip file.

Additional information on importing and using sample Projects are found in **Locating**, **Importing**, **and Using Sample Projects** on page 45.

Setting Properties of the Informix eWay

This chapter describes how to set the properties of the Informix eWay.

This Chapter Includes:

- Creating and Configuring an Informix eWay on page 9
- Configuring the eWay Connectivity Map Properties on page 10
- Configuring the Environment Properties on page 21

4.1 Creating and Configuring an Informix eWay

All eWays contain a unique set of default configuration parameters. After the eWays are established and an Informix External System is created in the Project's Environment, the eWay parameters are modified for your specific system. The Informix eWay configuration parameters are modified from two locations:

- From the **Connectivity Map**—which contains parameters specific to the Informix eWay, and may vary from other eWays (of the same type) in the Project.
- From the **Environment Explorer** tree—which contains global parameters that commonly apply to all eWays (of the same type) in the Project. Saved parameters are shared by all eWays in the Informix External System Properties window.

Note: You must set configuration parameters for the Informix eWay in both locations.

4.2 Configuring the eWay Connectivity Map Properties

When you connect an External Application to a Collaboration, Enterprise Designer automatically assigns the appropriate eWay to the link. Each eWay is supplied with a template containing default configuration properties that are accessible on the Connectivity Map.

Templates supplied with the Informix eWay include:

- Outbound Informix eWay
- Inbound Informix eWay
- Outbound Informix XA eWay
- Outbound Informix non-Transactional eWay

To configure the eWay properties:

1 On the Enterprise Designer's Connectivity Map (see Figure 1), double-click the inbound Informix eWay icon. The Templates window appears.

Figure 1 Connectivity Map with Components

2 Select a parameter from the list and click the **OK** button.

Figure 2 Template window

3 The Configuration properties window opens, displaying the default properties for the eWay.

4.2.1. Configuring the Outbound eWay Properties

The Outbound eWay Properties include outbound parameters used by the external database.

Figure 3 Outbound eWay Properties

ClassName

Description

Specifies the Java class in the JDBC driver that is used to implement the ConnectionPoolDataSource interface.

Required Values

A valid class name.

The default is **com.SeeBeyond.jdbcx.informix.InformixDataSource**.

Description

Description

Enter a description for the database.

Required Value

A valid string. The default is **INFORMIX Connection Pool Datasource**.

InitialPoolSize

Description

Enter a number for the physical connections the pool should contain when it is created.

Required Value

A valid numeric value. The default is **2**.

LoginTimeOut

Description

The number of seconds driver will wait before attempting to log in to the database before timing out.

Required Value

A valid numeric value. The default is **0**.

MaxIdleTime

Description

The maximum number of seconds that a physical connection may remain unused before it is closed. 0 (zero) indicates that there is no limit.

Required Value

A valid numeric value. The default is **0**.

MaxPoolSize

Description

The maximum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there is no maximum.

Required Value

A valid numeric value. The default is **10**.

MaxStatements

Description

The maximum total number of statements that the pool should keep open. 0 (zero) indicates that the caching of statements is disabled.

Required Value

A valid numeric value. The default is **1000**.

MinPoolSize

The minimum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there should be no physical connections in the pool and the new connections should be created as needed.

Required Value

A valid numeric value. The default is **2**.

NetworkProtocol

Description

The network protocol used to communicate with the server.

Required Values

Any valid string.

PropertyCycle

Description

The interval, in seconds, that the pool should wait before enforcing the current policy defined by the values of the other connection pool properties in this deployment descriptor.

Required Values

A valid numeric value. The default is **0**.

RoleName

Description

An initial SQL role name.

Required Values

4.2.2. Configuring the Inbound eWay Properties

The Inbound eWay Properties include inbound parameters used by the external database.

	Properties 🛛 😵
Configuration	¥ 🞼 🕼 🌮
🖵 🗀 🛛 Parameter Settings	BallMilliogeopta 6000
	Poliminiseconds 5000
	PreparedStatement
Description (parameter-settings)	
()	
Comments (parameter-settings)	
J	Properties
ОК	Cancel

Figure 4 Properties of the Inbound eWay

Pollmilliseconds

Description

Polling interval in milliseconds.

Required Value

A valid numeric value. The default is **5000**.

PreparedStatement

Description

Prepared Statement used to query against the database.

Required Value

The Prepared Statement must be the same Prepared Statement you created using the Database OTD Wizard. Only **SELECT** Statement is allowed. Additionally, no place holders should be specified. There should not be any "?" in the Prepared Query.

Note: The SQL used to create the Prepared Statement must exactly match the PreparedStatement listed in the Properties window.

4.2.3. Configuring the Outbound Informix XA eWay Properties

The Outbound XA eWay Properties include inbound parameters used by the external database. Informix supports XA, a data source that provides connections that can participate in a distributed transaction. XA is a two-phase commit protocol that forms part of the JDBC 2.0 Standard Extension.

Figure 5 Outbound XA eWay

ClassName

Description

Specifies the Java class in the JDBC driver that is used to implement the ConnectionPoolDataSource interface.

Required Values

A valid class name.

The default is **com.SeeBeyond.jdbcx.informix.InformixDataSource**.

Description

Description

Enter a description for the database. The default is **INFORMIX XA Datasource**.

Required Value

A valid string.

InitialPoolSize

Description

Enter a number for the physical connections the pool should contain when it is created.

Required Value

A valid numeric value. The default is 2.

LoginTimeOut

Description

The number of seconds driver will wait before attempting to log in to the database before timing out.

Required Value

A valid numeric value. The default is **0**.

MaxIdleTime

Description

The maximum number of seconds that a physical connection may remain unused before it is closed. 0 (zero) indicates that there is no limit.

Required Value

A valid numeric value. The default is **0**.

MaxPoolSize

Description

The maximum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there is no maximum.

Required Value

A valid numeric value. The default is **10**.

MaxStatements

Description

The maximum total number of statements that the pool should keep open. 0 (zero) indicates that the caching of statements is disabled.

Required Value

A valid numeric value. The default is **1000**.

MinPoolSize

Description

The minimum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there should be no physical connections in the pool and the new connections should be created as needed.

Required Value

A valid numeric value. The default is **2**.

NetworkProtocol

Description

The network protocol used to communicate with the server.

Required Values

Any valid string.

PropertyCycle

Description

The interval, in seconds, that the pool should wait before enforcing the current policy defined by the values of the other connection pool properties in this deployment descriptor.

Required Values

A valid numeric value. The default is **0**.

RoleName

Description

An initial SQL role name.

Required Values

Any valid string.

4.2.4. Configuring the Outbound Informix non-Transactional eWay Properties

You can create Informix databases with or without logging enabled. If logging is disabled, then Non-Transactional mode must be used. Because data logs are not retained during Non-Transactional execution of SQL calls, data recovery is not possible during accidental or unscheduled shut-down of the database server.

Disabled logging also prevents transactions—enclosed in BEGIN-Tran and END-Tran statements—from occurring. This means that Non-Transactional mode cannot be used in XA (2 phase commit) transactions.

The Outbound non-Transactional eWay Properties listed in Figure 6 include inbound parameters used by the external database.

Properties 🗙		
Configuration	¥ 12 10 1/=

Figure 6 Outbound non-Transactional eWay

ClassName

Description

Specifies the Java class in the JDBC driver that is used to implement the ConnectionPoolDataSource interface.

Required Values

A valid class name.

The default is **com.SeeBeyond.jdbcx.informix.InformixDataSource**.

Description

Description

Enter a description for the database. The default is **INFORMIX non-Transactional Connection Pool Datasource**.

Required Value

A valid string.

InitialPoolSize

Description

Enter a number for the physical connections the pool should contain when it is created.

Required Value

A valid numeric value. The default is **2**.

LoginTimeOut

Description

The number of seconds driver will wait before attempting to log in to the database before timing out.

Required Value

A valid numeric value. The default is **0**.

MaxIdleTime

Description

The maximum number of seconds that a physical connection may remain unused before it is closed. 0 (zero) indicates that there is no limit.

Required Value

A valid numeric value. The default is **0**.

MaxPoolSize

Description

The maximum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there is no maximum.

Required Value

A valid numeric value. The default is **10**.

MaxStatements

Description

The maximum total number of statements that the pool should keep open. 0 (zero) indicates that the caching of statements is disabled.

Required Value

A valid numeric value. The default is **1000**.

MinPoolSize

Description

The minimum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there should be no physical connections in the pool and the new connections should be created as needed.

Required Value

A valid numeric value. The default is **2**.

NetworkProtocol

Description

The network protocol used to communicate with the server.

Required Values

Any valid string.

PropertyCycle

Description

The interval, in seconds, that the pool should wait before enforcing the current policy defined by the values of the other connection pool properties in this deployment descriptor.

Required Values

A valid numeric value. The default is **0**.

RoleName

Description

An initial SQL role name.

Required Values

Any valid string.

4.3 **Configuring the Environment Properties**

The eWay Environment Configuration properties contain parameters that define how the eWay connects to and interacts with other eGate components within the Environment. When you create a new Informix External System, you select the type of External System required.

Available External Systems include:

- Inbound Informix eWay
- Outbound Informix eWay
- Outbound Informix XA eWay
- Outbound Informix non-Transactional eWay

To Configure the Environment Properties:

- 1 In Enterprise Explorer, click the Environment Explorer tab.
- 2 Expand the Environment created for the Informix Project and locate the Informix External System.
- *Note:* For more information on creating an Environment, see the eGate Integrator *Tutorial.*
 - 3 Right-click the External System created for the Informix Project and select Properties from the list box. The Environment Configuration Properties window appears.
 - 4 Click on any folder to display the default configuration properties for that section.
 - 5 Click on any property field to make it editable.
 - 6 After modifying the configuration properties, click **OK** to save the changes.

4.3.1. Inbound Informix eWay External System Properties

Before deploying your eWay, you will need to set the Environment properties. This section describes the External System properties used by the Inbound Informix eWay.

Figure 7 Inbound Informix eWay Environment Configuration

DatabaseName

Description

Specifies the name of the database instance.

Required Values

Any valid string.

InformixServer

Description

Specifies the name of the Informix server being used.

Required Values

Password

Description

Specifies the password used to access the database.

Required Values

Any valid string.

PortNumber

Description

Specifies the I/O port number on which the server is listening for connection requests.

Required Values

A valid port number. The default is **1526**.

ServerName

Description

Specifies the host name of the external database server.

Required Values

Any valid string.

User

Description

Specifies the user name the eWay uses to connect to the database.

Required Values

4.3.2. Outbound Informix eWay External System Properties

Before deploying your eWay, you will need to set the Environment properties. This section describes the External System properties used by the Outbound Informix eWay.

Figure 8 Outbound Informix eWay Environment Configuration

DatabaseName

Description

Specifies the name of the database instance.

Required Values

Any valid string.

DataSourceName

Description

Provide the name of the ConnectionPoolDataSource object that the DataSource object delegates behind the scenes when connection pooling or distributed transaction management is being done.

Required Value

Optional. In most cases, leave this box empty.

Delimiter

Description

This is the delimiter character to be used in the DriverProperties prompt.

Required Value

The default is #

Description

Description

Enter a description for the database. The default is **INFORMIX XA Datasource**.

Required Value

A valid string.

DriverProperties

Description

If you choose to not to use the JDBC driver that is shipped with this eWay, you will need to add the drivers properties to the eWay. Often times the DataSource implementation will need to execute additional properties to assure a connection. The additional methods will need to be identified in the Driver Properties.

Required Value

Any valid delimiter.

Valid delimiters are: "<method-name-1>#<param-1>#<param-2>##......<param-n>##<method-name-2>#<param-1>#<param-2>#......<param-n>##......##".

For example: to execute the method setURL, give the method a String for the URL "setURL#<url>##".

If you are using Spy Log. Optional:

"setURL#jdbc:SeeBeyond:informix://<host>:1526;DatabaseName=<database>##setInf ormixServer#<informixserver>##setSpyAttributes#log=(file)c:/temp/spy.log;logTNa me=yes##".

InformixServer

Description

Specifies the name of the Informix database being used.

Required Values

Password

Description

Specifies the password used to access the database.

Required Values

Any valid string.

PortNumber

Description

Specifies the I/O port number on which the server is listening for connection requests.

Required Values

A valid port number. The default is **1526**.

ServerName

Description

Specifies the host name of the external database server.

Required Values

Any valid string.

User

Description

Specifies the user name the eWay uses to connect to the database.

Required Values

4.3.3. Outbound Informix XA eWay External System Properties

Before deploying your eWay, you will need to set the Environment properties. This section describes the External System properties used by the Outbound Informix XA eWay.

Figure 9 Outbound Informix XA eWay Environment Configuration

DatabaseName

Description

Specifies the name of the database instance.

Required Values

Any valid string.

DataSourceName

Description

Provide the name of the ConnectionPoolDataSource object that the DataSource object delegates behind the scenes when connection pooling or distributed transaction management is being done.

Required Value

Optional. In most cases, leave this box empty.

Delimiter

Description

This is the delimiter character to be used in the DriverProperties prompt.

Required Value

The default is #

Description

Description

Enter a description for the database. The default is **INFORMIX XA Datasource**.

Required Value

A valid string.

DriverProperties

Description

If you choose to not to use the JDBC driver that is shipped with this eWay, you will need to add the drivers properties to the eWay. Often times the DataSource implementation will need to execute additional properties to assure a connection. The additional methods will need to be identified in the Driver Properties.

Required Value

Any valid delimiter.

Valid delimiters are: "<method-name-1>#<param-1>#<param-2>##......<param-n>##<method-name-2>#<param-1>#<param-2>#......<param-n>##......##".

For example: to execute the method setURL, give the method a String for the URL "setURL#<url>##".

If you are using Spy Log. Optional:

"setURL#jdbc:SeeBeyond:informix://<host>:1526;DatabaseName=<database>##setInf ormixServer#<informixserver>##setSpyAttributes#log=(file)c:/temp/spy.log;logTNa me=yes##".

InformixServer

Description

Specifies the name of the Informix server being used.

Required Values

Password

Description

Specifies the password used to access the database.

Required Values

Any valid string.

PortNumber

Description

Specifies the I/O port number on which the server is listening for connection requests.

Required Values

A valid port number. The default is **1526**.

ServerName

Description

Specifies the host name of the external database server.

Required Values

Any valid string.

User

Description

Specifies the user name the eWay uses to connect to the database.

Required Values

4.3.4. Outbound Informix non-Transactional eWay External System Properties

Before deploying your eWay, you will need to set the Environment properties. This section describes the External System properties used by the Outbound Informix non-Transactional eWay.

A valid port number. The default is **1526**.

ServerName

Description

Specifies the host name of the external database server.

Required Values

Any valid string.

User

Description

Specifies the user name the eWay uses to connect to the database.

Required Values

Chapter 5

Using the OTD Database Wizard

This chapter describes how to build and use Object Type Definitions (OTDs) using the Informix eWay Database Wizard.

5.1 Creating the OTD

OTDs contain the data structure an rules that define an object. The OTD Wizard creates OTDs based on any combination of Tables, Prepared SQL Statements, and stored procedures.

Field nodes are added to the OTD based on the Tables in the external data source. Java method and parameter nodes are added to provide the appropriate JDBC functionality. For more information about Java methods used in this eWay, see **Using eWay Java Methods** on page 71.

Note: Database OTDs are not messagable. For more information on messagable OTDs, see the eGate Integrator User's Guide.

Steps required to create an OTD include:

- Select Wizard Type on page 34
- Connect To Database on page 35
- Select Database Objects on page 35
- Select Table/Views on page 36
- Select Procedures on page 40
- Add Prepared Statements on page 42
- Specify the OTD Name on page 43

Select Wizard Type

- 1 On the Enterprise Explorer, right click on the project and select **New > Create an Object Type Definition** from the shortcut menu.
- 2 The **Select Wizard Type** window appears, displaying the available **OTD** wizards.

Figure 11 OTD Wizard Selection

SeeBeyond	Database Name: User name: Password: < Back				

Connect To Database

- 1 On the Specify Database Connection Information window, enter the following:
- Host name the name of the host you are connecting.
- Port ID the host port number (1526 is the default).
- Informix Server the name of the Informix server.
- Database name the name of the database you are connecting
- User name your user ID.
- **Password** your password.
- 2 Click Next. The Select Database Objects window appears.

Select Database Objects

1 On the Select Database Objects window, select **Tables/Views**, **Procedures**, and **Prepared Statements** checkboxes.

Figure 13 Select Database Objects

2 Click Next. The Select Tables/Views window appears. See Figure 14 on page 36.

Chapter 6

Locating, Importing, and Using Sample Projects

This chapter describes how to use the sample Projects included in the installation CD-ROM package.

Chapter Topics Include:

- Sample Projects Overview on page 46
- Locating and Importing the Sample Projects on page 46
- Running the Sample Projects on page 47
- Using the Sample Project in eInsight on page 49
- Working With Other Business Process Activities on page 52
- Using the Sample Project in eGate on page 60
- Supported Data Types on page 62
- Converting Datatypes in Infomix eWay on page 63
- Using OTDs with Tables, Views, and Stored Procedures on page 66
- Alerting and Logging on page 70
- *Note:* While several steps are required to create, activate, and deploy a Project, only the steps containing information relevant to the Informix eWay are included in this chapter. For more detailed information on how to complete a sample Project, see the eGate Integrator Tutorial.

6.1 Sample Projects Overview

Sample Projects are designed to provide an overview of the basic functionality of the Informix eWay by identifying how information is passed between eGate and the Informix database.

Sample Projects Include:

Informix_BPEL_Sample – describes how to retrieve the last name and employee number of all employees in the Informix database, using eInsight's BPEL business process.

Informix_JCE_Sample – describes how to retrieve the last name and employee number of all employees in the Informix database, using eGate Integrator.

Sample Data Used:

The data used for the sample Projects are contained within a table called db_employee. The table has the following columns:

Column Name	Mapping	Data Type	Data Length
EMP_NO	employee_no	integer	10
LAST_NAME	employee_Iname	varchar	30
FIRST_NAME	employee_fname	varchar	30
LAST_UPDATE	update_date	datetime - year to second	16
RATE	rate	float	53

 Table 1
 Sample project data

6.2 Locating and Importing the Sample Projects

The eWay sample Projects are included in the **InformixeWayDocs.sar**. This file is uploaded separately from the Informix eWay SAR file during installation. For information, refer to **"Installing the Informix eWay" on page 8**.

Once you have uploaded the **InformixeWayDocs.sar** to the Repository, you can begin downloading the sample Projects using the **DOCUMENTATION** tab in the Enterprise Manager to a folder of your choosing.

Before you can use the sample Project, you must first import it into the SeeBeyond Enterprise Designer using the Enterprise Designer Project Import utility.

To Import the Sample Project:

- 1 From the Enterprise Designer's Project Explorer pane, right-click the Repository and select **Import**.
- 2 In the **Import Manager** window, browse to the directory that contains the sample Project zip file.
- 3 Select the sample file and then click **Open**.
- 4 Click the **Import** button. If the import was successful, then click the **OK** button on the **Import Status** window.

6.3 **Running the Sample Projects**

Steps required to run a sample Project include:

- Setting the Properties
- Creating the Environment Profile
- Deploying the Project
- Running the Sample

6.3.1 Setting the Properties

The sample uses an inbound and an outbound File eWay as well as an outbound eWay. To configure the sample projects eWays, use the following information. For additional information on the eWay properties, see **Configuring the eWay Connectivity Map Properties** on page 10.

To Configure File eWays:

- 1 On the Connectivity Map canvas double-click the **Inbound File eWay**.
- 2 The **Properties** window for the Inbound File eWay opens. Modify the parameter settings for your system. Change the Directory and Input file name to match the location and name of the sample data file.
- 3 Click **OK** to close the **Properties** window.
- 4 On the Connectivity Map, double-click the Outbound File eWay. The **Properties** window for the Inbound File eWay opens. Modify the required parameter settings for your system, including the target Directory and Output file name.
- 5 Click **OK** to close the Properties window.

To Configure the Outbound Informix eWay:

- 1 On the Connectivity Map, double-click the Informix eWay.
- 2 The **Properties** window for the Informix eWay opens. Modify the parameter settings for your system. Click **OK** to close the Properties window.

6.3.2. Creating the Environment Profile

An eGate Environment represents the physical system required to implement a Project. a typical Environment contains several components, including Logical Hosts, Integration Servers, Message Servers, and External Systems. Environments are created using the Enterprise Designer's Environment Explorer.

To Create a New Environment:

- 1 On the Environment Explorer, highlight and right-click the eWay profile.
- 2 Select **Properties**, and enter the configuration information required for the eWay. See **Configuring the Environment Properties** on page 21.

6.3.3 Deploying the Project

To deploy a project, please see the "eGate Integrators User's Guide".

6.3.4. Running the Sample

For instruction on how to run the Sample project, see the *eGate Integrator Tutorial*.

Once the process has completed, the Output file in the target directory configured in the Outbound File eWay will contain all records retrieved from the database in an .xml format.

6.4 Using the Sample Project in elnsight

This section describes how to use the **Informix_BPEL_Sample** Project with the ICAN Suite's elnsight Business Process Manager and the Web Services interface. This section does not provide and explanation of how to *create* a Project that uses BPEL (Business Process Execution Language). For these instructions, you should refer to the elnsight Enterprise Service Bus User's Guide.

Before running a sample Project, you must:

- Import the sample Project
- Create an Environment for the sample Project
- Configure the eWay properties for your specific system (see Creating and Configuring an Informix eWay on page 9)
- Create a Deployment Profile

6.4.1 eInsight Engine and eGate Components

You can deploy an eGate component as an Activity in an eInsight Business Process. Once you have associated the desired component with an Activity, the eInsight engine can invoke it using a Web Services interface. Examples of eGate components that can interface with eInsight in this way are:

- Java Messaging Service (JMS)
- Object Type Definitions (OTDs)
- An eWay
- Collaborations

Using the eGate Enterprise Designer and eInsight, you can add an Activity to a Business Process, then associate that Activity—such as an eWay—with an eGate component. When eInsight runs the Business Process, it automatically invokes that component via its Web Services interface.

6.4.2 The Informix_BPEL_Sample Project

The elnsight sample Project **Informix_BPEL_Sample** describes how to retrieve the last name and employee number of all employees in the Informix database, using elnsight's BPEL business process. In this sample, specific employee information is retrieved by passing certain conditions into a Collaboration Definition which then queries the database and extracts results in the form of an output file.

Figure 29 illustrates the business process used by the sample Project.

Note: Refer to the eInsight Business Process Manager User's Guide for specific information on creating and using a Business Process in eInsight

BP_GetEmployee

This business process describes the account retrieval process seen in Figure 30.

Figure 30 Employee Number Retrieval

Business Process:

- 1 The File eWay subscribes to an external directory and activates a trigger to query the database.
- 2 A string literal **'emp_no > 0'** is passed into a where Clause which loops through and queries the Informix database for the first record matching the criteria.

Business Rule Designer

6.5 Working With Other Business Process Activities

You can associate an eInsight Business Process Activity with the eWay, both during the system design phase and during run time. To make this association, select the desired operation, found under the Project OTD in Enterprise Explorer and drag it onto the eInsight Business Process canvas.

The following operations are available:

- SelectAll
- SelectMultiple
- SelectOne
- Insert
- Update
- Delete

The operation automatically changes to an Activity with an icon identifying the component that is the basis for the Activity.

At run time, the eInsight engine invokes each step in the order that you defined in the Business Process. Using the engine's Web Services interface, the Activity in turn invokes the eWay. You can open a file specified in the eWay and view its contents before and after the Business Process is executed.

Note: For information on how to create an Informix Database OTD, refer to Creating the OTD on page 33.

elnsight Operation	Input	Output
SelectAll	where() clause (optional)	Returns all rows that fit the condition of the where() clause
SelectMultiple	number of rows where() clause (optional)	Returns the number of rows specified that fit the condition of the where() clause
SelectOne	where() clause (optional)	Returns the first row that fits the condition of the where() clause
Insert	definition of new item to be inserted	Returns status.
Update	where() clause, and definition of new item to be inserted	Returns status.
Delete	where() clause	Returns status.

The table below shows the inputs and outputs to each of these eInsight operations:

6.5.1 whereClause()

A BPEL where Clause() statement may be joined by AND/OR with conditions of "=", "!=", "<>", "<", ">", "<=", ">=".

For example:

where Clause such as where column2=2 AND column1=1 OR column3=3 is valid

6.5.2 SelectAll

The input to a SelectAll operation uses a where() clause to define the criteria for selecting, and returning all rows from the database.

Figure 33 shows a sample eInsight Business Process using the SelectAll operation. In this process, the SelectAll operation returns all rows where the emp_no is not null.

Figure 34 shows the definition of the where() clause for the SelectAll operation.

Figure 34 SelectAll Input

Figure 35 on page 54 shows the output for the SelectAll operation. For each row selected during the operation, the employee number and last name are concatenated and passed out as text using the FileClient.write.

Figure 35 SelectAll Output

6.5.3 SelectMultiple

The input to a SelectMultiple operation uses a where() clause to define the criteria for selecting, and returning a specific number of rows from the database.

Figure 36 shows a sample eInsight Business Process using the SelectMultiple operation. In this process, the SelectMultiple operation returns three rows specified in the where() clause.

Figure 36 SelectMultiple Sample Business Process

Figure 37 shows three rows requested using the where() clause. In this example, we are requesting everything from the table where emp_no is equal to 103, 109, and 117.

Figure 37 SelectMultiple Input

Figure 38 shows the output for the SelectMultiple operation. For each row selected during the operation, the employee number, first and last name are returned as text using the FileClient.write.

Figure 38 SelectMultiple Output

6.5.4 SelectOne

The input to a SelectOne operation uses a where() clause to define the criteria for selecting, and returning the first row in the database that meets required conditions.

Figure 39 shows a sample elnsight Business Process using the SelectOne operation. In this process, the SelectOne operation returns the first row where rate is >= 100.

Figure 39 SelectOne Sample Business Process

Figure 40 on page 56 shows the definition of the where() clause for the SelectOne operation.

- 🔷 last_update	
- 🔷 emp_no	
- 🔷 last_name	
- 🔷 first_name	
🗆 🔷 rate	

6.5.5 Insert

The Insert operation inserts a row. The input to an Insert operation is a where() clause. The where() clause defines the criteria for the new row. In this operation, the first row that fits the criteria is returned.

Figure 42 shows a sample eInsight Business Process using the Insert operation. In this process, the operation inserts a new row into the database to accommodate the provided data.

Figure 43 shows the input data used for the Insert operation. The emp_no is not included since an index is automatically created for the new row.

6.5.6 Update

The Update operation updates rows that fit certain criteria defined in a where() clause.

Figure 45 shows a sample eInsight Business Process using the Update operation. In this process, the operation updates a rate for a certain employee.

Figure 45 Update Sample Business Process

Figure 46 shows the definition of the where() clause for the Update operation. In this example, employee number 115 is updated to have a new rate of 168.75.

Figure 46 Update Input

Figure 47 shows the output of the Update operation, which is a status indicating the number of rows updated.

Figure 47 Update Output

6.5.7 **Delete**

The Delete operation deletes rows that match the criteria defined in a where() clause. The output is a status of how many rows where deleted.

Figure 48 shows a sample elnsight Business Process using the Delete operation. In this process, the operation deletes a row that matches a certain employee number.

Figure 48 Delete Sample Business Process

Figure 49 shows the definition of the where() clause for the Delete operation. In this example, employee 115 is deleted.

Figure 50 shows the output of the Delete operation, which is a status indicating the number of rows deleted.

Figure 50 Delete Output

6.6 Using the Sample Project in eGate

This section describes how to use the **Informix_JCE_Sample** Project with the core eGate product. This section does not provide explanation of how to *create* a Project. For these instructions, you should refer to the *"eGate Integrators User's Guide"*.

Before running a sample Project, you must:

- Import the sample Project
- Create an Environment for the sample Project
- Configure the eWay properties for your specific system (see Creating and Configuring an Informix eWay on page 9)
- Create a Deployment Profile

6.6.1. Working with the Sample Project in eGate

The eGate sample Project **Informix_JCE_Sample** includes four Collaboration Definitions (Java) that describe how to delete, insert, select, and update the sample database. The Connectivity Map contains an inbound and outbound File eWay connections, as well as an outbound Informix eWay connection. To use sample operations, simply drag and drop one of the four Collaborations onto the TableOperatioService and reapply the connections.

The Connectivity Map for this sample Project appears as follows:

Figure 51 Connectivity Map Project Flow

6.6.2 Sample Project Collaboration Definitions (Java)

The Collaboration Definitions used in the Informix_JCE_Sample include:

- jceTableDelete
- jceTableInsert
- jceTableSelect
- jceTableUpdate

jceTableDelete Collaboration Definition

The jceTableDelete Collaboration Definition uses the Delete operation to select and delete from the first_name column, any names that begin like "John". The text input "Table Deletion Completed" is also added as a string literal input to confirm the completion.

jceTableInsert Collaboration Definition

The jceTableInsert Collaboration Definition uses the Insert operation to add a new row to the Db_employee table by inserting a new employee "John Smith". The text input "Table Insert Completed" is also added as a string literal confirming the completion before writing to an output file.

jceTableSelect Collaboration Definition

The jceTableSelect Collaboration Definition uses the Select operation to retrieve the employee number and last name of the first employee who has an employee number greater than zero. Matching employee numbers are concatenated with the corresponding last name and written to an output file.

jceTableUpdate Collaboration Definition

The jceTableSelect Collaboration Definition uses the Update operation to update any employee with a last name like "Smith" to have a new name called "Doe" and have a new rate of "33.88". The text input "Table Update Completed" is also added as a string literal confirming the completion before writing to an output file.

6.7 Supported Data Types

Informix eWay supports the following data types:

Figure 52	Data	Types Su	pported b	y Informix
O · · · ·				1

Data Type	Description	OTD/Java Data Type
BOOLEAN	Stores Boolean values true and false.	boolean
BYTE	Stores any kind of binary data.	byte[]
CHAR(n)	Stores single-byte or multibyte sequences of characters, including letters, numbers, and symbols; collation is code-set dependent.	java.lang.String
CHARACTER VARYING(m,r)	Stores single-byte and multibyte sequences of characters, including letters, numbers, and symbols of varying length (ANSI compliant); collation is code-set dependent.	java.lang.String
DATE	Stores calendar date.	java.sql.Date
DATETIME	Stores calendar date combined with time of day.	java.sql.Timestamp
DECIMAL	Stores numbers with definable scale and precision.	java.math.BigDecimal
DOUBLE Precision	Behaves the same way as FLOAT.	double
FLOAT(n)	Stores double-precision floating-point numbers corresponding to the double data type in C.	double
LVARCHAR	Stores single-byte and multibyte sequences of characters, including letters, numbers, and symbols; collation is locale dependant.	java.lang.String
INTEGER	Stores whole numbers from -2,147,483,647 to +2,147,483,647.	int
INT8	Stores an 8-byte integer value. These whole numbers can be in the range -(263 - 1) to 263 -1.	long
MONEY(p,s)	Stores currency amount.	java.math.BigDecimal
NCHAR(n)	Stores single-byte and multibyte sequences of characters, including letters, numbers, and symbols; collation is locale dependent.	java.lang.String

Data Type	Description	OTD/Java Data Type
NVARCHAR(m,r)	Stores single-byte and multibyte sequences of characters, including letters, numbers, and symbols of varying length; collation is locale dependent.	java.lang.String
SERIAL	Stores sequential integers.	int
SERIAL8	Stores large sequential integers; has same range as INT8.	long
SMALLFLOAT	Stores single-precision floating-point numbers corresponding to the float data type in C.	float
SMALLINT	Stores whole numbers from -32,767 to +32,767.	short
TEXT	Stores any kind of text data.	java.lang.String
VARCHAR(m,r)	Stores multibyte strings of letters, numbers, and symbols of varying length to a maximum of 255 bytes; collation is code-set dependent.	java.lang.String

6.8 Converting Datatypes in Infomix eWay

When working with data in the Informix eWay OTDs, use the following conversion chart (Figure 53) as a guide for working with Insert and Update operations.

Data Type	Java Method or New Constructor to Use(Default: Java Method)	Sample Data
BOOLEAN	Boolean: valueOf(java.lang.String)	True/False
BYTE	Byte: valueOf(java.lang.String)	n/a
CHAR(n)	String: valueOf(java.lang.Object)	Any Character
CHARACTER VARYING(m,r)	String: valueOf(java.lang.Object)	Any Character
DATE	Date: valueOf(java.lang.String)	2004-12-31
DATETIME	Timestamp: valueOf(long)	2004-12-31 00:00:00
DECIMAL	BigDecimal: valueOf(long)	123.45

Figure 53 Insert and Update Datatype Conversions

Data Type	Java Method or New Constructor to Use(Default: Java Method)	Sample Data
DOUBLE Precision	Double: ParseDouble(java.lang.String)	123.45
FLOAT(n)	Double: ParseDouble(java.lang.String)	123.45
INTEGER	Integer: ParseInt(java.lang.String)	123
INT8	Long: parseLong(java.lang.String)	123
LVARCHAR	String: java.lang.String	Any Character
MONEY(p,s)	BigDecimal: valueOf(long)	123.45
NCHAR(n)	String: valueOf(java.lang.Object)	Any Character
NVARCHAR(m,r)	String: valueOf(java.lang.Object)	Any Character
SERIAL	Integer: ParseInt(java.lang.String)	123.45
SERIAL8	Long: parseLong(java.lang.String)	123
SMALLFLOAT	Float: parseFloat(java.lang.String)	123.45
SMALLINT	Short: parseShort(java.lang.String)	123
TEXT	String: valueOf(java.lang.Object)	Any Character
VARCHAR(m,r)	String: valueOf(java.lang.Object)	Any Character

When working with data in the Informix eWay OTDs, use the following conversion chart (Figure 54) as a guide for working with Select operations.

Data Type	Java Method or New Constructor to Use(Default: Java Method)	Sample Data
BOOLEAN	String: valueOf(boolean)	True/False
CHAR(n)	Direct Assign	Any Character
CHARACTER VARYING(m,r)	Direct Assign	Any Character
DATE	String: valueOf(java.lang.Object)	2004-12-31
DATETIME	String: valueOf(java.lang.Object)	2004-12-31 00:00:00
DECIMAL	String: valueOf(java.lang.Object)	123.45
DOUBLE Precision	Double: valueOf(double)	123.45
FLOAT(n)	String: valueOf(double)	123.45
INTEGER	String: valueOf(int)	123
INT8	String: valueOf(long)	123
LVARCHAR	Direct Assign	Any Character
MONEY(p,s)	String: valueOf(java.lang.Object)	123.45
NCHAR(n)	Direct Assign	Any Character
NVARCHAR(m,r)	Direct Assign	Any Character
SERIAL	String: valueOf(int)	123
SERIAL8	String: valueOf(long)	123
SMALLFLOAT	String: valueOf(float)	123.45
SMALLINT	Short: toString(short)	123
TEXT	Direct Assign)	Any Character
VARCHAR(m,r)	Direct Assign	Any Character

Figure 54 Select Datatype Conversions

6.9 Using OTDs with Tables, Views, and Stored Procedures

Tables, Views, and Stored Procedures are manipulated through OTDs. Common operations include insert, delete, update, and query.

6.9.1 The Table

A table OTD represents a database table. It consists of fields and methods. Fields correspond to the columns of a table while methods are the operations that you can apply to the OTD. This allows you to perform query, update, insert, and delete SQL operations in a table.

By default, the Table OTD has UpdatableConcurrency and ScrollTypeForwardOnly. The type of result returned by the select() method can be specified using:

- SetConcurrencytoUpdatable
- SetConcurrencytoReadOnly
- SetScrollTypetoForwardOnly
- SetScrollTypetoScrollSensitive
- SetScrollTypetoInsensitive

The methods should be called before executing the select() method. For example,

```
getDBEmp().setConcurToUpdatable();
getDBEmp().setScroll_TypeToScrollSensitive();
getDBEmp().getDB_EMPLOYEE().select("");
```

The Query Operation

To perform a query operation on a table

- 1 Execute the **select()** method with the "where" clause specified if necessary.
- 2 Loop through the ResultSet using the **next()** method.
- 3 Process the return record within a **while()** loop.

For example:

```
package SelectSales;
public class Select
{
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
    public void receive(
    com.stc.connector.appconn.file.FileTextMessage
    input, com.stc.connector.appconn.file.FileApplication
    FileClient_1,db_employee.Db_employeeOTD
    db_employee_1,employeedb.Db_employee employeedb_db_employee_1 )
        throws Throwable
    {
        //@map:Db employee.select(Text)
```

```
db_employee_1.getDb_employee().select( input.getText() );
        //while
        while (db_employee_1.getDb_employee().next()) {
    //@map:Copy EMP_NO to Employee_no
            employeedb_db_employee_1.setEmployee_no(
java.lang.Integer.toString(
db_employee_1.getDb_employee().getEMP_NO() ) );
            //@map:Copy LAST_NAME to Employee_lname
            employeedb_db_employee_1.setEmployee_lname(
db_employee_1.getDb_employee().getLAST_NAME() );
            //@map:Copy FIRST NAME to Employee fname
            employeedb_db_employee_1.setEmployee_fname(
db_employee_1.getDb_employee().getFIRST_NAME() );
            //@map:Copy RATE to Rate
            employeedb_db_employee_1.setRate(
java.lang.Double.toString(
db_employee_1.getDb_employee().getRATE() ) );
            //@map:Copy LAST_UPDATE to Update_date
            employeedb_db_employee_1.setUpdate_date(
db_employee_1.getDb_employee().getLAST_UPDATE().toString() );
        //@map:Copy employeedb_db_employee_1.marshalToString to
Text
        FileClient_1.setText(
employeedb_db_employee_1.marshalToString() );
        //@map:FileClient_1.write
        FileClient_1.write();
}
}
}
```

The Insert Operation

To perform an insert operation on a table

- 1 Execute the **insert()** method. Assign a field.
- 2 Insert the row by calling **insertRow()**

This example inserts an employee record.

```
//DB_EMPLOYEE.insert
	Table_OTD_1.getDB_EMPLOYEE().insert();
//Copy EMP_NO to EMP_NO
	insert_DB_1.getInsert_new_employee().setEmployee_no(
	java.lang.Integer.parseInt(
		employeedb_with_top_db_employee_1.getEmployee_no() ) );
//@map:Copy Employee_lname to Employee_Lname
		insert_DB_1.getInsert_new_employee().setEmployee_Lname(
		employeedb_with_top_db_employee_1.getEmployee_lname() );
//@map:Copy Employee_fname to Employee_Fname
		insert_DB_1.getInsert_new_employee().setEmployee_Fname(
		employeedb_with_top_db_employee().setEmployee_Fname(
		employeedb_with_top_db_employee_1.getEmployee_fname() );
```

```
//@map:Copy java.lang.Float.parseFloat(Rate) to Rate
insert_DB_1.getInsert_new_employee().setRate(
java.lang.Float.parseFloat(
employeedb_with_top_db_employee_1.getRate() ) );
//@map:Copy java.sql.Timestamp.valueOf(Update_date) to Update_date
insert_DB_1.getInsert_new_employee().setUpdate_date(
java.sql.Timestamp.valueOf(
employeedb_with_top_db_employee_1.getUpdate_date() ) );
//@map:Insert Row
Table_OTD_1.getDB_EMPLOYEE().insertRow();
}
```

The Update Operation

To perform an update operation on a table

- 1 Execute the **update()** method.
- 2 Using a while loop together with **next()**, move to the row that you want to update.
- 3 Assign updating value(s) to the fields of the table OTD
- 4 Update the row by calling **updateRow()**.

```
//SalesOrders_with_top_SalesOrders_1.unmarshalFromString(Text)
 SalesOrders_with_top_SalesOrders_1.unmarshalFromString(
 input.getText() );
//SALES_ORDERS.update("SO_num =99")
 DB sales orders 1.getSALES ORDERS().update( "SO num ='01'" );
//while
 while (DB_sales_orders_1.getSALES_ORDERS().next()) {
//Copy SalesOrderNum to SO_num
 DB_sales_orders_1.getSALES_ORDERS().setSO_num(
 SalesOrders_with_top_SalesOrders_1.getSalesOrderNum() );
//Copy CustomerName to Cust_name
 DB_sales_orders_1.getSALES_ORDERS().setCust_name(
 SalesOrders_with_top_SalesOrders_1.getCustomerName() );
//Copy CustomerPhone to Cust_phone
 DB_sales_orders_1.getSALES_ORDERS().setCust_phone(
 SalesOrders_with_top_SalesOrders_1.getCustomerPhone() );
//SALES_ORDERS.updateRow
 DB_sales_orders_1.getSALES_ORDERS().updateRow();
}
}
```

The Delete Operation

To perform a delete operation on a table

1 Execute the **delete()** method with the **where()** clause specified if necessary.

In this example DELETE an employee.

```
//@map:Db_employee.delete("first_name like 'John%'")
otdDB_EMPLOYEE_1.getDb_employee().delete("first_name like 'John%'");
```

6.9.2 The Stored Procedure

A Stored Procedure OTD represents a database stored procedure. Fields correspond to the arguments of a stored procedure while methods are the operations that you can apply to the OTD. It allows you to execute a stored procedure. Remember that while in the Collaboration Editor you can drag and drop nodes from the OTD into the Collaboration Editor.

Executing Stored Procedures

The OTD represents the Stored Procedure "LookUpGlobal" inbound parameter (INLOCALID). This inbound parameter is generated by the DataBase Wizard and is represented in the resulting OTD as nodes. Within the Transformation Designer, you can drag values from the input parameters, and execute the call.

Below are the steps for executing the Stored Procedure:

- 1 Specify the input values.
- 2 Execute the Stored Procedure.

For example:

```
package Storedprocedure;
public class sp_jce
{
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
    public void receive(
com.stc.connector.appconn.file.FileTextMessage
input, com.stc.connector.appconn.file.FileApplication
FileClient_1,employeedb.Db_employee
employeedb_with_top_db_employee_1, insert_DB.Insert_DBOTD insert_DB_1
    throws Throwable
    {
        11
@map:employeedb_with_top_db_employee_1.unmarshalFromString(Text)
        employeedb_with_top_db_employee_1.unmarshalFromString(
input.getText() );
        //@map:Copy java.lang.Integer.parseInt(Employee_no) to
Employee_no
```

```
insert_DB_1.getInsert_new_employee().setEmployee_no(
java.lang.Integer.parseInt(
employeedb_with_top_db_employee_1.getEmployee_no() ) );
        //@map:Copy Employee_lname to Employee_Lname
        insert_DB_1.getInsert_new_employee().setEmployee_Lname(
employeedb_with_top_db_employee_1.getEmployee_lname() );
        //@map:Copy Employee fname to Employee Fname
        insert_DB_1.getInsert_new_employee().setEmployee_Fname(
employeedb_with_top_db_employee_1.getEmployee_fname() );
        //@map:Copy java.lang.Float.parseFloat(Rate) to Rate
        insert DB 1.getInsert new employee().setRate(
java.lang.Float.parseFloat(
employeedb_with_top_db_employee_1.getRate() ) );
        //@map:Copy java.sql.Timestamp.valueOf(Update_date) to
Update date
        insert DB 1.getInsert new employee().setUpdate date(
java.sql.Timestamp.valueOf(
employeedb_with_top_db_employee_1.getUpdate_date() ) );
        //@map:Insert_new_employee.execute
        insert_DB_1.getInsert_new_employee().execute();
        //@map:Copy "procedure executed" to Text
        FileClient_1.setText( "procedure executed" );
        //@map:FileClient_1.write
        FileClient_1.write();
    }
}
```

6.10 Alerting and Logging

eGate provides an alerting and logging feature. This allows monitoring of messages and captures any adverse messages in order of severity based on configured severity level and higher. To enable Logging, please see the *eGate Integrator User's Guide*.

Using eWay Java Methods

Informix exposes various Java methods to add extra functionality, making it easier to set, and get information in the Informix eWay OTDs. For a complete list of the Java methods within the classes listed below, refer to the **Javadoc**.

- InformixApplicationConnection
- InformixApplicationConnectionFactory
- InformixCallableStatementAgent
- InformixConnector
- InformixCPManagedConnectionFactoryExt
- InformixNTManagedConnectionFactoryExt
- InformixPreparedStatementAgent
- InformixPreparedStatementResultSet
- InformixSession
- InformixTableResultSet
- InformixXAManagedConnectionFactoryExt

You can find the **Javadoc** in the **InformixeWayDocs.sar** file. For complete instructions on uploading files to the repository, see the *ICAN Installation Guide*.
