## Index

**58** 

## Chapter 1

## Introduction

This document describes how to install and configure the eWay Intelligent Adapter for SQL Server.

This Chapter Includes:

- Overview on page 6
- Supported Operating Systems on page 6
- System Requirements on page 7
- External System Requirements on page 7

## 1.1 **Overview**

The SQL Server eWay enables the eGate system to exchange data with external SQL Server databases. Using the java library, SQL statements are issued to interact with the SQL Server databases.

## **1.2 Supported Operating Systems**

The SQL Server eWay is available on the following operating systems:

- Windows Server 2003, Windows XP SP1a, and Windows 2000 SP3
- HP Tru64 V5.1A
- HP-UX 11.0 and 11i
- IBM AIX 5.1 and 5.2
- Red Hat Linux 8.0
- Red Hat Enterprise Linux AS 2.1
- Sun Solaris 8 and 9

## **1.3** System Requirements

The system requirements for the SQL Server eWay are the same as for eGate Integrator. For information, refer to the *eGate Integrator Installation Guide*. It is also helpful to review the **Readme.txt** for any additional requirements prior to installation. The **Readme.txt** is located on the installation CD-ROM.

*Note:* To enable Web Services, you must install and configure the SeeBeyond ICAN Suite eInsight Business Process Manager.

## 1.4 External System Requirements

The SQL Server eWay supports the following software for external systems running eGate Projects.

- SQL Server 7 and SQL Server 2000
- Driver support for Data Direct Drivers JDBC 3.3

## **Chapter 2**

## Installation

This chapter describes how to install the SQL Server eWay.

**This Chapter Includes:** 

- Before Installing the eWay on page 8
- Installing the SQL Server eWay on page 8
- After Installation on page 9

## 2.1 Before Installing the eWay

Open and review the **Readme.txt** for the SQL Server eWay for any additional information or requirements, prior to installation. The **Readme.txt** is located on the installation CD-ROM.

## 2.2 Installing the SQL Server eWay

During the eGate Integrator installation process, the Enterprise Manager, a web-based application, is used to select and upload eWays (eWay.sar files) from the eGate installation CD-ROM to the Repository.

The installation process includes installing the following components:

- Installing the Repository
- Uploading products to the Repository
- Downloading components (such as Enterprise Designer and Logical Host)
- Viewing product information home pages

Follow the instructions for installing the eGate Integrator in the *ICAN Installation Guide*, and include the following steps:

- On the Enterprise Manager, select the SQLServereWay.sar (to install the SQL Server eWay) file to upload.
- On the Enterprise Manager, select the FileeWay.sar (to install the File eWay, used in the sample Project) file to upload.

- On the Enterprise Manager, install the **SQLServereWayDocs.sar** (to install the documentation and the sample) file to upload.
- On the Enterprise Manager under the Documentation tab, click on the document link or the sample file link. For the sample project, it is recommended that you extract the file to another file location prior to importing it using the Enterprise Explorer's Import Project tool.

For additional information on how to use eGate, please see the eGate Tutorial.

Continue installing the eGate Enterprise Designer as instructed.

## 2.3 After Installation

Once the eWay is installed and configured it must then be incorporated into a Project before it can perform its intended functions. See the *eGate Integrator User's Guide* for more information on incorporating the eWay into an eGate Project.

## Chapter 4

## **Properties of the SQL Server eWay**

This chapter describes how to set the properties of the SQL Server eWay.

This Chapter Includes:

- Setting the Properties in the Outbound eWay on page 10
- Setting the Properties in the Inbound eWay on page 14
- Setting the Properties in the Outbound eWay Environment on page 15
- Setting the Properties in the Inbound eWay Environment on page 18
- Setting the Properties in the Outbound eWay with XA Support on page 20
- Setting the Properties in the Outbound eWay XA Environment on page 23

## 4.1 Setting the eWay Properties in the Connectivity Map

On the Properties sheet window and using the descriptions below, enter the information necessary for the eWay to establish a connection to the external application.

## 4.1.1. Setting the Properties in the Outbound eWay

The DataSource settings define the properties used to interact with the external database.

Configuration	¥ 12 🕸 🚈 🔳	
- DBC Connector settings	ClassName	com.SeeBeyond.jdbcx.sqlserver.SQLServerDataSource
	Description	SQLSERVER Connection Pool Datasource
	InitialPoolSize	2
	LoginTimeOut	0
	MaxIdleTime	0
	MaxPoolSize	10
	MaxStatements	1000
	MinPoolSize	2
	NetworkProtocol	
	PropertyCycle	0
	RoleName	
IDBC Connector settings		
comments (JDBCConnectorSetti		

Figure 1 The eWay Properties

The DataSource settings define the properties used to interact with the external database.

#### ClassName

#### Description

Specifies the Java class in the JDBC driver that is used to implement the ConnectionPoolDataSource interface.

#### **Required Values**

A valid class name.

The default is **com.SeeBeyond.jdbcx.sqlserver.SQLServerDataSource**.

#### Description

#### Description

Enter a description for the database.

#### **Required Value**

## InitialPoolSize

#### Description

Enter a number for the physical connections the pool should contain when it is created.

#### **Required Value**

A valid numeric value. The default is 2.

#### LoginTimeOut

#### Description

The number of seconds driver will wait before attempting to log in to the database before timing out.

#### **Required Value**

A valid numeric value.

## MaxIdleTime

#### Description

The maximum number of seconds that a physical connection may remain unused before it is closed. 0 (zero) indicates that there is no limit.

#### **Required Value**

A valid numeric value.

#### MaxPoolSize

#### Description

The maximum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there is no maximum.

#### **Required Value**

A valid numeric value. The default is 10.

#### **MaxStatements**

#### Description

The maximum total number of statements that the pool should keep open. 0 (zero) indicates that the caching of statements is disabled.

#### **Required Value**

A valid numeric value. The default is 1000.

## MinPoolSize

The minimum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there should be no physical connections in the pool and the new connections should be created as needed.

#### **Required Value**

A valid numeric value. The default is 2.

#### NetworkProtocol

#### Description

The network protocol used to communicate with the server.

#### **Required Values**

Any valid string.

## **PropertyCycle**

#### Description

The interval, in seconds, that the pool should wait before enforcing the current policy defined by the values of the other connection pool properties in this deployment descriptor.

#### **Required Values**

A valid numeric value. The default is 0.

#### RoleName

#### Description

An initial SQL role name.

#### **Required Values**

## 4.1.2. Setting the Properties in the Inbound eWay

🕏 Properties		
Configuration	* 12 18 1= 🔳	
Carameter Settings	PollMilliseconds	5000

Description (parameter-settings)		
Comments (parameter-settings)		
Comments (parameter settings)		
	Properties	
ОК		Cancel

Figure 2 Properties of the Inbound SQL Server eWay

## Pollmilliseconds

#### Description

Polling interval in milliseconds.

#### **Required Value**

A valid numeric value. The default is 5000.

#### PreparedStatement

#### Description

Prepared Statement used for polling against the database.

#### **Required Value**

The Prepared Statement must be the same Prepared Statement you created using the Database OTD Wizard. Only SELECT Statement is allowed. Additionally, no place holders should be specified. There should not be any "?" in the Prepared Query.

## 4.1.3. Setting the Properties in the Outbound eWay Environment

Before deploying your eWay, you will need to set the properties of the eWay environment using the following descriptions.

🖏 Properties		
Environment Configuration	¥ 12 10 1= 1	
UDBC Connector settings	DatabaseName	
	DataSourceName	
	Delimiter	#
	Description	SQLSERVER Connection Pool Datasource
	DriverProperties	
	Password	
111	PortNumber	1433
	ServerName	1433
	User	
1	USEI	
1		
Description (JDBCConnectorSetti		
JDBC Connector settings		
Comments (JDBCConnectorSetti		
	Properties	
		Cancel
ок		Cancel

#### Figure 3 eWay Environment Configuration

#### DatabaseName

#### Description

Specifies the name of the database instance.

#### **Required Values**

Any valid string.

#### DataSourceName

#### Description

Provide the name of the ConnectionPoolDataSource object that the DataSource object delegates behind the scenes when connection pooling or distributed transaction management is being done.

#### **Required Value**

Optional. In most cases, leave this box empty.

## Delimiter

#### Description

This is the delimiter character to be used in the DriverProperties prompt.

#### **Required Value**

The default is #

#### Description

#### Description

Enter a description for the database.

#### **Required Value**

A valid string.

#### **DriverProperties**

#### Description

If you choose to not to use the JDBC driver that is shipped with this eWay, you will need to add the drivers properties to the eWay. Often times the DataSource implementation will need to execute additional properties to assure a connection. The additional methods will need to be identified in the Driver Properties.

#### **Required Value**

Any valid delimiter.

Valid delimiters are: "<method-name-1>#<param-1>#<param-2>##......<param-n>##<method-name-2>#<param-1>#<param-2>#......<param-n>##......##".

For example: to execute the method setURL, give the method a String for the URL "setURL#<url>##".

If you are using Spy Log. Optional:

"setURL#jdbc:Seebeyond:db2://<server>:50000;DatabaseName=<database>##setSpy Attributes#log=(file)c:/temp/spy.log;logTName=yes##".

#### Password

#### Description

Specifies the password used to access the database.

#### **Required Values**

Any valid string.

#### PortNumber

#### Description

Specifies the I/O port number on which the server is listening for connection requests.

#### **Required Values**

A valid port number. The default is 1521.

#### ServerName

#### Description

Specifies the host name of the external database server.

#### **Required Values**

Any valid string.

#### User

#### Description

Specifies the user name the eWay uses to connect to the database.

#### **Required Values**

## 4.1.4. Setting the Properties in the Inbound eWay Environment

s, Properties			
Environment Configuration	¥ 12 10 1=		
Parameter Settings	DatabaseName

	Properties		
OK		Cancel	

Figure 4 Inbound SQL Server eWay Environment

## DatabaseName

#### Description

Specifies the name of the database instance.

#### **Required Values**

Any valid string.

#### Password

#### Description

Specifies the password used to access the database.

#### **Required Values**

## PortNumber

#### Description

Specifies the I/O port number on which the server is listening for connection requests.

#### **Required Values**

A valid port number. The default is 1433.

#### ServerName

#### Description

Specifies the host name of the external database server.

#### **Required Values**

Any valid string.

#### User

#### Description

Specifies the user name the eWay uses to connect to the database.

#### **Required Values**

## 4.1.5. Setting the Properties in the Outbound eWay with XA Support

🕏 Properties		X
Configuration	¥ 12 10 1/2 1	
JDBC Connector settings	ClassName	com.SeeBeyond.jdbcx.sqlserver.SQLServerDataSource

ОК		Cancel

Figure 5 Oubound SQL Server eWay with XA Support

#### ClassName

#### Description

Specifies the Java class in the JDBC driver that is used to implement the ConnectionPoolDataSource interface.

#### **Required Values**

A valid class name.

The default is **com.SeeBeyond.jdbcx.sqlserver.SQLServerDataSource**.

## Description

#### Description

Enter a description for the database.

#### **Required Value**

## InitialPoolSize

#### Description

Enter a number for the physical connections the pool should contain when it is created.

#### **Required Value**

A valid numeric value. The default is 2.

#### LoginTimeOut

#### Description

The number of seconds driver will wait before attempting to log in to the database before timing out.

#### **Required Value**

A valid numeric value.

#### MaxIdleTime

#### Description

The maximum number of seconds that a physical connection may remain unused before it is closed. 0 (zero) indicates that there is no limit.

#### **Required Value**

A valid numeric value.

#### MaxPoolSize

#### Description

The maximum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there is no maximum.

#### **Required Value**

A valid numeric value. The default is 10.

#### MaxStatements

#### Description

The maximum total number of statements that the pool should keep open. 0 (zero) indicates that the caching of statements is disabled.

#### **Required Value**

A valid numeric value. The default is 1000.

## MinPoolSize

The minimum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there should be no physical connections in the pool and the new connections should be created as needed.

#### **Required Value**

A valid numeric value.

## NetworkProtocol

#### Description

The network protocol used to communicate with the server.

#### **Required Values**

Any valid string. The default is 2.

## PropertyCycle

#### Description

The interval, in seconds, that the pool should wait before enforcing the current policy defined by the values of the other connection pool properties in this deployment descriptor.

#### **Required Values**

A valid numeric value. Default is 0.

#### RoleName

#### Description

An initial SQL role name.

#### **Required Values**

## 4.1.6. Setting the Properties in the Outbound eWay XA Environment

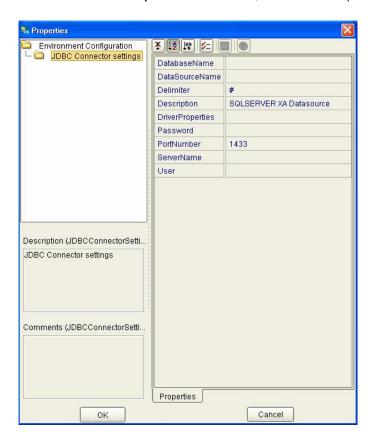

Figure 6 Environment Properties of the SQL Server eWay with XA

## DatabaseName

#### Description

Specifies the name of the database instance.

#### **Required Values**

Any valid string.

#### DataSourceName

#### Description

Provide the name of the ConnectionPoolDataSource object that the DataSource object delegates behind the scenes when connection pooling or distributed transaction management is being done.

#### **Required Value**

Optional. In most cases, leave this box empty.

## Delimiter

#### Description

This is the delimiter character to be used in the DriverProperties prompt.

#### **Required Value**

The default is #

#### Description

#### Description

Enter a description for the database.

#### **Required Value**

A valid string.

#### **DriverProperties**

#### Description

If you choose to not to use the JDBC driver that is shipped with this eWay, you will need to add the drivers properties to the eWay. Often times the DataSource implementation will need to execute additional methods to assure a connection. The additional methods will need to be identified in the Driver Properties.

#### **Required Value**

Any valid delimiter.

Valid delimiters are: "<method-name-1>#<param-1>#<param-2>##......<param-n>##<method-name-2>#<param-1>#<param-2>#......<param-n>##......##".

For example: to execute the method setURL, give the method a String for the URL "setURL#<url>##".

If you are using Spy Log. Optional:

"setURL#jdbc:SeeBeyond:db2://<server>:446;locationName=<location>;collectionId= <collection>##setLocationName#<location>##setCollectionID#<collection>##setSpyAt tributes#log=(file)c:/temp/spy.log;logTName=yes##"

#### Password

#### Description

Specifies the password used to access the database.

#### **Required Values**

## PortNumber

#### Description

Specifies the I/O port number on which the server is listening for connection requests.

#### **Required Values**

A valid port number. The default is 1521.

#### ServerName

#### Description

Specifies the host name of the external database server.

#### **Required Values**

Any valid string.

#### User

#### Description

Specifies the user name the eWay uses to connect to the database.

#### **Required Values**

## Chapter 5

## Using the SQL Server eWay Database Wizard

This chapter describes how to use the SQL Server eWay Database Wizard to build OTD's.

This Chapter Includes:

- Select Wizard Type on page 27
- Connect to Database on page 27
- Select Database Objects on page 28
- Select Table/Views on page 29
- Select Procedures on page 32
- Add Prepared Statements on page 33
- Specify the OTD Name on page 35

## 5.1 Using the Database OTD Wizard

The Database OTD Wizard generates OTDs by connecting to external data sources and creating corresponding Object Type Definitions. The OTD Wizard can create OTDs based on any combination of Tables and Stored Procedures or Prepared SQL Statements.

Field nodes are added to the OTD based on the Tables in the external data source. Java method and parameter nodes are added to provide the appropriate JDBC functionality. For more information about the Java methods, refer to your JDBC developer's reference.

*Note:* Database OTDs are not messagable. For more information on messagable OTDs, see the eGate Integrator User's Guide.

## To create a new OTD using the Database Wizard

#### Select Wizard Type

- 1 On the Enterprise Explorer, right click on the project and select **Create an Object Type Definition** from the shortcut menu.
- 2 From the OTD Wizard Selection window, select the **SQL Server Database** and click **Next**. See **Figure 7**.

OTD Wizard	Description
T DB2 Database	Uses a UDB database to create an OTD Uses a DTD to create an OTD Creates an OTD from NSSQL Database C
📲 Oracle Database	Uses an Oracle database to create an OT
<ul> <li>Sqlserver Database</li> <li>Sybase Database</li> <li>User-Defined OTD</li> <li>WSDL</li> <li>XSD</li> </ul>	Uses a SQLServer database to create an Uses a Sybase database to create an OT Allows the user to create a custom OTD Wizard for creating WSDL OTD Uses an XSD to create an OTD

Figure 7 OTD Wizard Selection

#### Connect to Database

3 Specify the connection information for your database including your UserName and Password and click Next. See Figure 8.

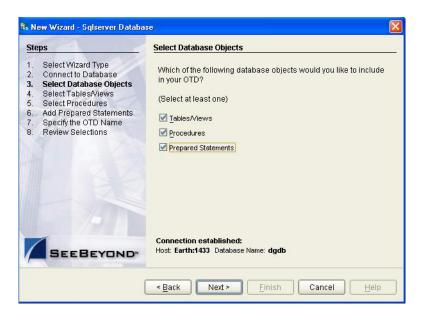

Steps         1. Select Wizard Type         2. Connect to Database         3. Select Database Objects         4. Select Tables/Views         5. Select Procedures         6. Add Prepared Statements         7. Specify the OTD Name         8. Review Selections	Specify Database Connection Information         Please enter the Sqlserver database connection information below.         Connection Information         Host name:         Port ID:       1433         Database Name:         User name:         Password
SEEBEYOND	User name: Password:

#### Figure 8 Database Connection Information

#### **Select Database Objects**

- 1 When selecting Database Objects, you can select any combination of **Tables**, **Views**, **Procedures**, or **Prepared Statements** you would like to include in the .otd file. Click **Next** to continue. See **Figure 9**.
- *Note: Views are read-only and are for informational purposes only.*

Figure 9 Select Database Objects

#### Select Table/Views

1 In the **Select Tables/Views** window, click **Add**. See **Figure 10**.

select * DB_	EMPLOYEE where EMP_N	O = '800'	
Open	Save As		
		ОКСа	incel

Figure 19 Prepared SQL Statement

- 3 On the **Add Prepared Statement** window, the name you assigned to the Prepared Statement appears. To edit the parameters, click **Edit Parameters**. You can change the datatype by clicking in the **Type** field and selecting a different type from the list.
- 4 Click **Add** if you want to add additional parameters to the Statement or highlight a row and click **Remove** to remove it. Click **OK**. See **Figure 20**.

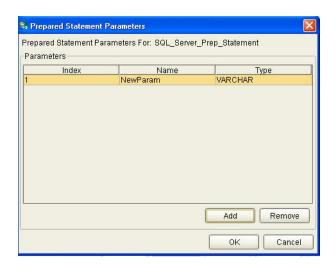

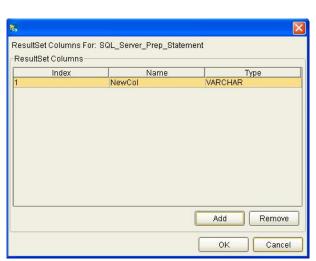

Figure 20 Edit the Prepared Statement Parameters

1 To edit the Resultset Columns, click **Edit Resultset Columns**. Both the Name and Type are editable but it is recommend you do not changed the Name. Doing so will cause a loss of inegraty between the Resultset and the Database. Click **OK**. See **Figure 21**.

#### Figure 21 ResultSet Columns

#### Specify the OTD Name

1 Enter a name for the OTD. The OTD contains the selected tables and the package name of the generated classes. See Figure 22.

#### Figure 22 Naming an OTD

Steps	Specify the OTD Name
<ol> <li>Select Wizard Type</li> <li>Connect to Database</li> <li>Select Database Objects</li> <li>Select Tables/Views</li> <li>Select Procedures</li> <li>Add Prepared Statements</li> <li>Specify the OTD Name</li> <li>Review Selections</li> </ol>	OTD Name:

2 View the summary of the OTD. If you find you have made a mistake, click **Back** and correct the information. If you are satisfied with the OTD information, click **Finish** to begin generating the OTD. See **Figure 23**.

The resulting **OTD** will appear on the Enterprise Designer's canvas.

## Chapter 6

# Working with the Sample Project(s)

This chapter describes how to build an SQL Server eWay project in a production environment.

This Chapter Includes:

- eInsight Engine and eGate Components on page 37
- Using the Sample Project in eInsight on page 37
- Using the Sample Project in eGate on page 49
- Common DataType Conversions on page 52
- Using OTDs with Tables, Views, and Stored Procedures on page 53
- Alerting and Logging on page 58

## 6.1 eInsight Engine and eGate Components

You can deploy an eGate component as an Activity in an eInsight Business Process. Once you have associated the desired component with an Activity, the eInsight engine can invoke it using a Web Services interface. Examples of eGate components that can interface with eInsight in this way are:

- Java Messaging Service (JMS)
- Object Type Definitions (OTDs)
- An eWay
- Collaborations

Using the eGate Enterprise Designer and eInsight, you can add an Activity to a Business Process, then associate that Activity with an eGate component, for example, an eWay. When eInsight runs the Business Process, it automatically invokes that component via its Web Services interface.

## 6.2 Using the Sample Project in elnsight

To begin using the sample eInsight Business Process project, you will need to import the project and view it from within the Enterprise Designer using the Enterprise Designer Project Import utility. Import the **SelectwithBPELDBEmployee.zip** file contained in the eWay sample folder on the installation CD-ROM.

*Note:* eInsight is a Business Process modeling tool. If you have not purchased eInsight, contact your sales representative for information on how to do so.

Before recreating the sample Business Process, review the *eInsight Business Process Manager User's Guide* and the *eGate Tutorial*.

#### **Importing the Sample Project**

1 On the Enterprise Explorer highlight the repository and right click. Select **Import**. See **Figure 24**.

Enterprise Explorer [Project Explorer]

		mport Close

2 Click the **Refresh All From Repository** icon located on the **Enterprise Explorer** toolbar.

### **The Business Process**

The data used for this sample project is contained within a table called DBEmployee. The table has the following columns:

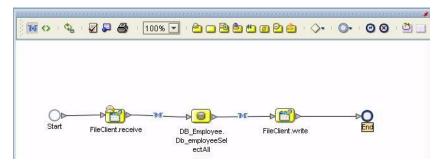

14510 2			
Column Name	Mapping	Data Type	Data Length
EMP_NO	employee_no	integer	10
LAST_NAME	employee_Iname	varchar	30
FIRST_NAME	employee_fname	varchar	30
LAST_UPDATE	update_date	timestamp	16
RATE	rate	float	53

Table 1	Sample project data
	Table 2

The sample project consists of an input file containing data that is passed into a database collaboration, and then written out to an output file

3 Refer to the *eInsight Business Process Manager User's Guide* for specific information on how to create and use a Business Process

You can associate an elnsight Business Process Activity with the eWay, both during the system design phase and during run time. To make this association, select the desired **receive** or **write** operation under the eWay in the Enterprise Explorer and drag it onto the elnsight Business Process canvas. The following operations are available:

- SelectAll
- SelectMultiple
- SelectOne
- Insert
- Update
- Delete

The operation automatically changes to an Activity with an icon identifying the component that is the basis for the Activity.

At run time, the eInsight engine invokes each step in the order that you defined in the Business Process. Using the engine's Web Services interface, the Activity in turn invokes the SQL Server eWay. You can open a file specified in the eWay and view its contents before and after the Business Process is executed.

*Note: Inbound database eWays are only supported within BPEL Collaborations.* 

elnsight Operation	Input	Output
SelectAll	where() clause (optional)	Returns all rows that fit the condition of the where() clause
SelectMultiple	number of rows where() clause (optional).	Returns the number of rows specified that fit the condition of the where() clause
SelectOne	where() clause (optional).	Returns the first row that fits the condition of the where() clause
Insert	definition of new item to be inserted	Returns status.
Update	where() clause	Returns status.
Delete	where() clause	Returns status.

The table below shows the inputs and outputs to each of these eInsight operations:

## 6.2.1 whereClause()

A BPEL where Clause() statement may be joined by AND/OR with conditions of "=", "!=", "<>", "<", ">", "<=", ">=".

For example:

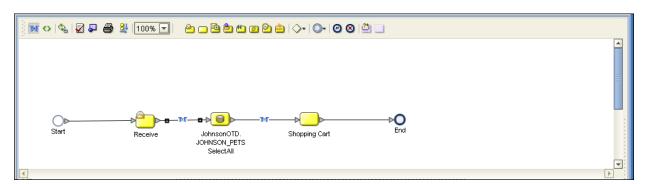

```
where
Clause such as where column2=2 AND column1=1 OR column3=3 is valid
```

## 6.2.2 SelectAll

The input to a SelectAll operation is an optional where() clause. The where() clause defines to which criteria rows must adhere to be returned. In the SelectAll operation, all items that fit the criteria are returned. If the where() clause is not specified, all rows all returned.

The figure below shows a sample eInsight Business Process using the SelectAll operation. In this process, the SelectAll operation returns all rows where the ITEM\_ID matches the selected ITEM\_ID to the shopping cart.

The figure below shows the definition of the where() clause for the SelectAll operation.

Figure 28 SelectAll Input

## 6.2.3 SelectMultiple

The input to a SelectMultiple operation is the number of rows to be selected and a where() clause. The number of rows indicates how many rows the SelectMultiple operation returns. The where() clause defines to which criteria rows must adhere to be returned.

The figure below shows a sample eInsight Business Process using the SelectMultiple operation. In this process, the SelectMultiple operation returns the first two rows where the ITEM\_ID matches the selected ITEM\_ID to the shopping cart.

#### Figure 30 SelectMultiple Sample Business Process

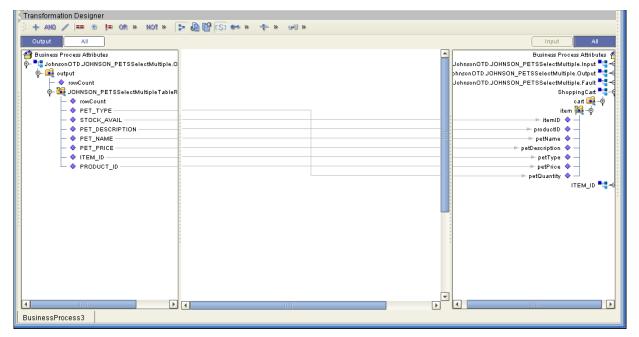

The figure below shows the definition of the number of rows and where() clause clause into the input for the SelectMultiple operation. You could also use an empty string or Item\_ID='123'.

Figure 31 SelectMultiple Input

The figure below shows the definition of the output for the SelectMultiple operation. For each row selected during the operation, the shopping cart shows the columns of those rows as defined here.

## 6.2.4 SelectOne

The input to a SelectOne operation is a where() clause. The where() clause defines to which criteria rows must adhere to be selected for the operation. In the SelectOne operation, the first row that fits the criteria is returned.

The figure below shows a sample eInsight Business Process using the SelectOne operation. In this process, the SelectOne operation returns the first row where the ITEM\_ID matches the specified ITEM\_ID to the shopping cart.

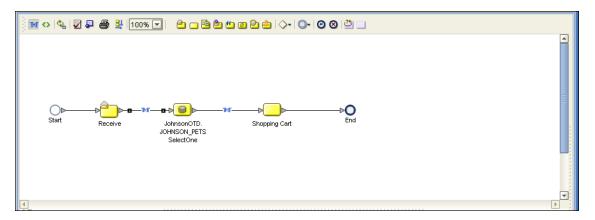

Figure 33 SelectOne Sample Business Process

The figure below shows the definition of the where() clause for the SelectOne operation.

### 6.2.5 **Insert**

The Insert operation inserts a row. The input to an Insert operation is a where() clause. The where() clause defines to which criteria rows must adhere to be selected for the operation. In the Insert operation, the first row that fits the criteria is returned.

The figure below shows a sample eInsight Business Process using the Insert operation. In this process, the operation inserts a new row into the database to accommodate a new item provided by a vendor.

The figure below shows the definition of the input for the Insert operation.

## 6.3 Using the Sample Project in eGate

To import the sample project **JDEDBEMPLOYEE.zip** follow the instructions given in **Importing the Sample Project** on page 38.

## 6.3.1. Working with the Sample Project in eGate

This sample project selects the EMP\_NO, LAST\_NAME, FIRST\_NAME, SS\_NUMBER, and the HIRE\_DATE columns from the table DBEmployee and publishes the record to an output file.

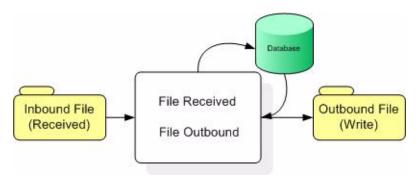

The data used for this projects is within a table called DBEmployee. The table contains the following columns:

Table 4			
Column Name	Mapping	Data Type	Data Length
EMP_NO	Empno	varchar2	10
LAST_NAME	Lastname	varchar2	30
FIRST_NAME	Firstname	varchar2	30
SS_NUMBER	SSnumber	varchar2	20
HIRE_DATE	HireDate	varchar2	12

Table 3	Sample project data
	Table 4

The sample project consists of an input file containing data that is passed into a collaboration and out to the database from which data is retrieved and passed back into the collaboration and then to an output file.

Figure 45 Database project flow

To work with the sample project, follow the instructions given in the *eGate Tutorial*.

*Note:* Outbound database eWays are available when using a JCE Collaboration. To poll the database, you must use the Scheduler.

## 6.3.2. Configuring the eWays

The sample uses an inbound and an outbound File eWay as well as an outbound SQL Server eWay. To configure the sample projects eWays, use the following information. For additional information on the SQL Server properties, see **Setting the eWay Properties** in the Connectivity Map on page 10.

### To configure the Inbound File eWay:

- 1 On the Connectivity Map canvas, double click the eWay icon located between the **File1** and **Service1**.
- 2 On the resulting **Templates** window, select **Inbound File eWay** and click **OK**.

- 3 On the **Properties** window, enter the appropriate configurations for the Inbound File eWay. See the *File eWay User's Guide* for information on how to specifically configure the File eWay. For this sample, the default settings are used.
- 4 When you have completed your selections, click **OK**.

To configure the Outbound SQLServer1 eWay:

- 1 On the Connectivity Map canvas, double click the eWay icon located between the **Service1** and **SQLServer1** database.
- 2 On the resulting **Templates** window, select **Outbound SQLServer1** and click **OK**.
- 3 On the Properties window, enter the appropriate configurations for the Outbound SQL Server eWay and click **OK**. See **Setting the Properties in the Outbound eWay** on page 10. For this sample, the default settings are used.
- 4 When you have completed your selections, click **OK**.

To configure the Outbound File eWay:

- 1 On the Connectivity Map canvas, double click the eWay icon located between **Service1** and **File2** eWay.
- 2 On the resulting **Templates** window, select **Outbound File eWay** and click **OK**.
- 3 On the **Properties** window, enter the appropriate configurations for the Outbound File eWay. See the *File eWay User's Guide* for information on how to specifically configure the File eWay. For this sample, change the Directory field to **<valid path to the directory where the output file will be stored>**. The Output File Name to **Output1.dat**. For the remaining parameters, the default settings are used.
- 4 When you have completed your selections, click **OK**.

## 6.3.3. Creating the External Evironment

To review the components of the Sample project, there is an Inbound and an Outbound File eWay, an eWay, and a Service.

To create the external environment for the Sample project:

1 On the Environment Explorer, highlight and right-click the SQL Server profile. Select **Properties**. Enter the configuration information required for your Outbound SQL ServereWay. See **Setting the Properties in the Outbound eWay Environment** on page 15.

## 6.3.4 Deploying a Project

To deploy a project, please see the "eGate Integrators User's Guide".

## 6.3.5. Running the Sample

For instruction on how to run a Sample project, see the *eGate Tutorial*.

Once the process has completed, the Output file in the target directory configured in the Outbound File eWay will contain all records retrieved from the database in an .xml format.

## 6.4 **Common DataType Conversions**

SQL Server Data Type	OTD/Java Data Type	Methods to Use	Sample Data
BigInt	Long	Long: java.lang.Long.parseLong(Stri ng)	123
Int	Int	Integer: java.lang.Integer.parse.Int(Str ing)	123
tinyInt	Byte	Byte: java.lang.Byte.parseByte(Strin g)	123
SmallInt	Short	Short: java.lang.Short.parseShort(St ring)	123
Number	BigDecimal	Call a NewConstructor BigDecimal: java.math.BigDecimal(String)	145.78
Decimal	BigDecimal	Call a NewConstructor BigDecimal: java.math.BigDecimal(String)	145.78
Bit	Boolean	Boolean: java.lang.Boolean.getBoolean (String)	0 or 1
Real	Float	Float: java.lang.Float.parseFloat(Stri ng)	3468.494
Float	Double	Double: java.lang.Double.parseDoubl e(String)	3468.494
Money	BigDecimal	Call a NewConstructor BigDecimal: java.math.BigDecimal(String)	2456.95
Smallmoney	BigDecimal	Call a NewConstructor BigDecimal: java.math.BigDecimal(String)	2456.95

#### Figure 46 The SQL Server eWay Datatype Conversions

SQL Server Data Type	OTD/Java Data Type	Methods to Use	Sample Data
Smalldatetime	TimeStamp	TimeStamp: java.sql.TimeStamp.valueOf(	2003-09-28
		String)	11:35:00
Timestamp	Binary	N/A (Used by the Database Internally)	N/A
DateTime	TimeStamp	Date: java.sql.Date.valueOf(String)	2003-09-28
		java.sqi.bate.valueOi(string)	11:35:42
Varchar	String	Direct Assign	Any Characters
Char	String	Direct Assign	Any Characters
Text	String	Direct Assign	Any Characters
Binary(1)	Byte[]	String: java.lang.String.getBytes()	0 or 1

## 6.5 Using OTDs with Tables, Views, and Stored Procedures

Tables, Views, and Stored Procedures are manipulated through OTDs. Common operations include insert, delete, update, and query.

## 6.5.1 The Table

A table OTD represents a database table. It consists of fields and methods. Fields correspond to the columns of a table while methods are the operations that you can apply to the OTD. This allows you to perform query, update, insert, and delete SQL operations in a table.

By default, the Table OTD has UpdatableConcurrency and ScrollTypeForwardOnly. The type of result returned by the select() method can be specified using:

- SetConcurrencytoUpdatable
- SetConcurrencytoReadOnly
- SetScrollTypetoForwardOnly
- SetScrollTypetoScrollSensitive
- SetScrollTypetoInsensitive

The methods should be called before executing the select() method. For example,

```
getDBEmp().setConcurToUpdatable();
getDBEmp().setScroll_TypeToScrollSensitive();
getDBEmp().getDB_EMPLOYEE().select("");
```

## The Query Operation

To perform a query operation on a table

- 1 Execute the **select()** method with the "where" clause specified if necessary.
- 2 Loop through the ResultSet using the **next()** method.
- 3 Process the return record within a **while()** loop.

For example:

```
package SelectSales;
public class Select
public com.stc.codegen.logger.Logger logger;
public com.stc.codegen.alerter.Alerter alerter;
public void receive(
com.stc.connector.appconn.file.FileTextMessage
input, com.stc.connector.appconn.file.FileApplication
FileClient_1,db_employee.Db_employeeOTD
db_employee_1,employeedb.Db_employee employeedb_db_employee_1 )
throws Throwable
//@map:Db_employee.select(Text)
   db_employee_1.getDb_employee().select( input.getText() );
//while
  while (db_employee_1.getDb_employee().next()) {
//@map:Copy EMP_NO to Employee_no
   employeedb_db_employee_1.setEmployee_no(
java.lang.Integer.toString(
db_employee_1.getDb_employee().getEMP_NO() ) );
//@map:Copy LAST NAME to Employee lname
   employeedb_db_employee_1.setEmployee_lname(
db_employee_1.getDb_employee().getLAST_NAME() );
//@map:Copy FIRST_NAME to Employee_fname
   employeedb_db_employee_1.setEmployee_fname(
db_employee_1.getDb_employee().getFIRST_NAME() );
//@map:Copy RATE to Rate
   employeedb_db_employee_1.setRate( java.lang.Double.toString(
db_employee_1.getDb_employee().getRATE() ) );
//@map:Copy LAST_UPDATE to Update_date
   employeedb_db_employee_1.setUpdate_date(
db_employee_1.getDb_employee().getLAST_UPDATE().toString() );
//@map:Copy employeedb_db_employee_1.marshalToString to Text
   FileClient_1.setText(
   employeedb_db_employee_1.marshalToString() );
//@map:FileClient_1.write
   FileClient_1.write();
  }
}
```

## The Insert Operation

To perform an insert operation on a table

- 1 Execute the **insert()** method. Assign a field.
- 2 Insert the row by calling **insertRow()**

This example inserts an employee record.

```
//DB_EMPLOYEE.insert
   Table_OTD_1.getDB_EMPLOYEE().insert();
//Copy EMP_NO to EMP_NO
   insert_DB_1.getInsert_new_employee().setEmployee_no(
   java.lang.Integer.parseInt(
    employeedb_with_top_db_employee_1.getEmployee_no() ) );
//@map:Copy Employee lname to Employee Lname
   insert_DB_1.getInsert_new_employee().setEmployee_Lname(
  employeedb_with_top_db_employee_1.getEmployee_lname() );
//@map:Copy Employee_fname to Employee_Fname
   insert_DB_1.getInsert_new_employee().setEmployee_Fname(
   employeedb_with_top_db_employee_1.getEmployee_fname() );
//@map:Copy java.lang.Float.parseFloat(Rate) to Rate
   insert_DB_1.getInsert_new_employee().setRate(
   java.lang.Float.parseFloat(
  employeedb with top db employee 1.getRate() ) );
//@map:Copy java.sql.Timestamp.valueOf(Update_date) to Update_date
   insert_DB_1.getInsert_new_employee().setUpdate_date(
   java.sql.Timestamp.valueOf(
   employeedb_with_top_db_employee_1.getUpdate_date() ) );
  Table_OTD_1.getDB_EMPLOYEE().insertRow();
//Table_OTD_1.commit
 Table_OTD_1.commit();
```

## The Update Operation

To perform an update operation on a table

- 1 Execute the **update()** method.
- 2 Using a while loop together with **next()**, move to the row that you want to update.
- 3 Assign updating value(s) to the fields of the table OTD
- 4 Update the row by calling **updateRow()**.

```
//SalesOrders_with_top_SalesOrders_1.unmarshalFromString(Text)
  SalesOrders_with_top_SalesOrders_1.unmarshalFromString(
  input.getText() );
//SALES_ORDERS.update("SO_num =99")
 DB_sales_orders_1.getSALES_ORDERS().update( "SO_num ='01'" );
//while
 while (DB_sales_orders_1.getSALES_ORDERS().next()) {
//Copy SalesOrderNum to SO_num
 DB_sales_orders_1.getSALES_ORDERS().setSO_num(
 SalesOrders_with_top_SalesOrders_1.getSalesOrderNum() );
//Copy CustomerName to Cust_name
 DB_sales_orders_1.getSALES_ORDERS().setCust_name(
 SalesOrders_with_top_SalesOrders_1.getCustomerName() );
//Copy CustomerPhone to Cust_phone
 DB_sales_orders_1.getSALES_ORDERS().setCust_phone(
 SalesOrders_with_top_SalesOrders_1.getCustomerPhone() );
```

```
//SALES_ORDERS.updateRow
DB_sales_orders_1.getSALES_ORDERS().updateRow();
}
//DB_sales_orders_1.commit
DB_sales_orders_1.commit();
//Copy "Update completed" to Text
FileClient_1.setText( "Update completed" );
//FileClient_1.write
FileClient_1.write();
}
```

## The Delete Operation

To perform a delete operation on a table

- 1 Execute the **delete()** method.
- 2 Move to the row that you want to delete.
- 3 Delete the row by calling **deleteRow()**.

In this example DELETE an employee.

```
//DB_EMPLOYEE.delete("EMP_NO = '".concat(EMP_NO).concat("'"))
Table_OTD_1.getDB_EMPLOYEE().delete( "EMP_NO = '".concat(
   employeedb_with_top_db_employee_1.getEMP_NO() ).concat( "'" ) );
}
```

## 6.5.2 The Stored Procedure

A Stored Procedure OTD represents a database stored procedure. Fields correspond to the arguments of a stored procedure while methods are the operations that you can apply to the OTD. It allows you to execute a stored procedure. Remember that while in the Collaboration Editor you can drag and drop nodes from the OTD into the Collaboration Editor.

### **Executing Stored Procedures**

The OTD represents the Stored Procedure "LookUpGlobal" with two parameters, an inbound parameter (INLOCALID) and an outbound parameter

(OUTGLOBALPRODUCTID). These inbound and outbound parameters are generated by the DataBase Wizard and are represented in the resulting OTD as nodes. Within the Transformation Designer, you can drag values from the input parameters, execute the call, collect data, and drag the values to the output parameters.

Below are the steps for executing the Stored Procedure:

- 1 Specify the input values.
- 2 Execute the Stored Procedure.
- 3 Retrieve the output parameters if any.

For example:

package Storedprocedure;

```
public class sp_jce
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
    public void receive(
com.stc.connector.appconn.file.FileTextMessage
input,com.stc.connector.appconn.file.FileApplication
FileClient_1,employeedb.Db_employee
employeedb_with_top_db_employee_1,insert_DB.Insert_DBOTD insert_DB_1
)
    throws Throwable
    ł
        11
@map:employeedb_with_top_db_employee_1.unmarshalFromString(Text)
        employeedb_with_top_db_employee_1.unmarshalFromString(
input.getText() );
        //@map:Copy java.lang.Integer.parseInt(Employee_no) to
Employee_no
        insert_DB_1.getInsert_new_employee().setEmployee_no(
java.lang.Integer.parseInt(
employeedb_with_top_db_employee_1.getEmployee_no() ) );
        //@map:Copy Employee_lname to Employee_Lname
        insert DB 1.getInsert new employee().setEmployee Lname(
employeedb_with_top_db_employee_1.getEmployee_lname() );
        //@map:Copy Employee_fname to Employee_Fname
        insert_DB_1.getInsert_new_employee().setEmployee_Fname(
employeedb_with_top_db_employee_1.getEmployee_fname() );
        //@map:Copy java.lang.Float.parseFloat(Rate) to Rate
        insert_DB_1.getInsert_new_employee().setRate(
java.lang.Float.parseFloat(
employeedb_with_top_db_employee_1.getRate() ) );
        //@map:Copy java.sql.Timestamp.valueOf(Update_date) to
Update date
        insert_DB_1.getInsert_new_employee().setUpdate_date(
java.sql.Timestamp.valueOf(
employeedb_with_top_db_employee_1.getUpdate_date() ) );
        //@map:Insert_new_employee.execute
        insert DB 1.getInsert new employee().execute();
        //@map:insert_DB_1.commit
        insert_DB_1.commit();
        //@map:Copy "procedure executed" to Text
        FileClient 1.setText( "procedure executed" );
        //@map:FileClient 1.write
        FileClient 1.write();
    }
}
```

## 6.6 Alerting and Logging

eGate provides an alerting and logging feature. This allows monitoring of messages and captures any adverse messages in order of severity based on configured severity level and higher. To enable Logging, please see the *eGate Integrator User's Guide*.
