Chapter 1

Introducing the Sybase eWay

Welcome to the *Sybase eWay Intelligent Adapter User's Guide*. This document includes information about installing, configuring, and using the SeeBeyond® Integrated Composite Application Network SuiteTM (ICAN) Sybase eWay Intelligent Adapter, referred to as the Sybase eWay throughout this guide.

What's in This Chapter

- "About Sybase" on page 6
- "About the Sybase eWay" on page 6
- "SeeBeyond Web Site" on page 8
- "SeeBeyond Documentation Feedback" on page 8
- "Related Documents" on page 8

1.1 About Sybase

Sybase Adaptive Server Enterprise (ASE) is a powerful data management platform for high performance business applications.

Sybase ASE's highly reliable data management technology provides a powerful data management platform that supports the demanding needs of mission critical enterprises, accelerating application development, securing critical company and customer data, and easing data administration tasks.

1.2 About the Sybase eWay

The Sybase eWay enables eGate Integrator projects to exchange data with external Sybase databases. This user's guide describes how to install and configure the Sybase eWay.

1.3 What's New in This Version

The Sybase eWay includes driver support for DataBase Drivers JDBC 3.4.

1.4 What's in This Document

1.4.1 Organization of Information in This Book

This document includes the following chapters:

- **Chapter 1 "Introducing the Sybase eWay**": Provides an overview description of the product as well as high-level information about this document.
- **Chapter 2 "Installing the Sybase eWay"**: Describes the system requirements and provides instructions for installing the Sybase eWay.
- **Chapter 3 "Properties of the Sybase eWay"**: Provides instructions for configuring the eWay to communicate with Sybase ASE.
- Chapter 4 "Using the Sybase eWay Database Wizard": Provides instructions for creating Object Type Definitions to be used with the Sybase eWay.
- **Chapter 5 "Implementing the Sybase eWay(s)**": Provides instructions for installing and running the sample projects.
- Chapter 6 "Using eWay Java Methods": Provides instructions for accessing the Sybase eWay Javadocs.
- Appendix A "Support for WebSphere Application Server": Provides instructions on how to deploy an Enterprise Archive (EAR) file to the WebSphereTM Application Server.

1.4.2 **Scope**

This document describes the process of installing, configuring, and running the Sybase eWay.

This document does not cover the Java methods exposed by this eWay. For information on the Java methods, download and view the Sybase eWay Javadoc files from the Enterprise Manager.

1.4.3 Intended Audience

This guide is intended for experienced computer users who have the responsibility of helping to set up and maintain a fully functioning ICAN Suite system. This person must also understand any operating systems on which the ICAN Suite will be installed (Windows, UNIX, and/or HP NonStop Server), and must be thoroughly familiar with Windows-style GUI operations.

1.4.4 **Document Conventions**

The following conventions are observed throughout this document.

Text	Convention	Example
Names of buttons, files, icons, parameters, variables, methods, menus, and objects	Bold text	 Click OK to save and close. From the File menu, select Exit. Select the logicalhost.exe file. Enter the timeout value. Use the getClassName() method. Configure the Inbound File eWay.
Command line arguments, code samples	Fixed font. Variables are shown in <i>bold italic</i> .	bootstrap -p password
Hypertext links	Blue text	See "Document Conventions" on page 8
Hypertext links for Web addresses (URLs) or email addresses	Blue underlined text	http://www.seebeyond.com docfeedback@seebeyond.com

Table 1 Document Conventions

1.4.5 SeeBeyond Web Site

The SeeBeyond Web site is your best source for up-to-the-minute product news and technical support information. The site's URL is:

http://www.seebeyond.com

1.5 SeeBeyond Documentation Feedback

We appreciate your feedback. Please send any comments or suggestions regarding this document to:

docfeedback@seebeyond.com

1.6 Related Documents

The following SeeBeyond documents provide additional information about the ICAN product suite:

- eGate Integrator User's Guide
- SeeBeyond ICAN Suite Installation Guide

Chapter 2

Installing the Sybase eWay

What's in This Chapter

- "Supported Operating Systems" on page 9
- "System Requirements" on page 10
- "External System Requirements" on page 10
- "Installing the eWay Product Files" on page 10

2.1 Supported Operating Systems

The Sybase eWay is available on the following operating systems:

- Windows 2000, Windows XP, and Windows Server 2003
- HP Tru64 V5.1A
- HP-UX 11.0, 11i (PA-RISC), and 11i V2.0 (11.23)
- IBM AIX 5.1L and 5.2
- Red Hat Enterprise Linux AS 2.1 (Intel x86)
- Red Hat Linux 8.0 (Intel x86)
- Sun Solaris 8 and 9
- Korean Windows 2000, Windows XP, and Windows Server 2003
- Korean HP-UX 11.0, 11i (PA-RISC), and 11i V2.0 (11.23)
- Korean IBM AIX 5.1L and 5.2
- Korean Sun Solaris 8 and 9

Although the Sybase eWay, the Repository, and Logical Hosts run on the platforms listed above, the Enterprise Designer requires the Windows operating system. Enterprise Manager can run on any platform that supports Internet Explorer 6.0.

2.2 System Requirements

The system requirements for the Sybase eWay are the same as for eGate Integrator. Refer to the *SeeBeyond ICAN Suite Installation Guide* for a complete listing of system requirements. It is also helpful to review the **Readme.txt** file for additional requirements prior to installation.

Note: To enable Web services, you must also install and configure eInsight.

2.3 **External System Requirements**

The Sybase eWay supports the following external systems:

- Sybase Adaptive Server Enterprise 11.9 or 12.5
- Driver support for DataDirect Drivers JDBC 3.4

For full information on the requirements for Sybase ASE, see the Sybase ASE documentation.

2.4 Installing the eWay Product Files

The installation process includes:

- Installing the ICAN Repository.
- Uploading products to the Repository (including the Sybase eWay, documentation, sample files, and Javadocs).
- Downloading components (including the Enterprise Designer and Logical Host) from the Repository.
- Updating products in the Enterprise Designer using the Update Center Wizard.

To install the Sybase eWay

- 1 Follow the instructions for installing ICAN in the *SeeBeyond ICAN Suite Installation Guide*.
- 2 After uploading **eGate.sar** to the Repository, upload the following additional product files:
 - SybaseeWay.sar (to install the Sybase eWay)
 - FileeWay.sar (to install the File eWay, used in the sample projects)
 - SybaseeWayDocs.sar (to install the Sybase eWay documentation)

Note: These files may not be located on the same installation disc as the *eGate.sar* file.

To install the Sybase eWay Samples and Javadocs

- 1 From the Documentation tab of the Enterprise Manager, click **Sybase eWay** to view the list of files available for this product.
- 2 Click **Download Sample** to open the **SybaseeWaySample.zip** file.
- 3 Use WinZip to extract the sample files to the desired location.
- 4 Click Download Javadocs to open the **SybaseeWayJavadoc.zip** file.
- 5 Use WinZip to extract the Javadocs files to the desired location.

After you complete the process of installing the Repository, Logical Host, and Enterprise Designer (as described in the *SeeBeyond ICAN Suite Installation Guide*), refer to **Chapter 5** for instructions on importing the sample project into your repository via the Enterprise Designer.

Note: Depending on what products you have installed, and how they are configured, the screenshots in this document may differ from what you see on your system.

Chapter 3

Properties of the Sybase eWay

This chapter describes how to set the properties of the Sybase eWay.

What's in This Chapter

- "Setting the Properties in the Outbound eWay" on page 12
- "Setting the Properties in the Inbound eWay" on page 16
- "Setting the Properties in the Outbound eWay Environment" on page 17
- "Setting the Properties in the Inbound eWay Environment" on page 20

3.1 Setting the eWay Properties in the Connectivity Map

On the Properties sheet window and using the descriptions below, enter the information necessary for the eWay to establish a connection to the external application.

3.1.1. Setting the Properties in the Outbound eWay

The DataSource settings define the properties used to interact with the external database.

Note: Not all parameters are supported in the current release, please contact SeeBeyond for more information.

S Properties		X
Configuration	¥ 12 🕸 🛌 🔳	
UDBC Connector settings	ClassName	com.SeeBeyond.jdbcx.sybase.SybaseDataSource
	Description	SYBASE Connection Pool Datasource

Figure 1 The eWay Properties

The DataSource settings define the properties used to interact with the external database.

ClassName

Description

Specifies the Java class in the JDBC driver that is used to implement the ConnectionPoolDataSource interface.

Required Values

A valid class name.

The default is **com.SeeBeyond.jdbcx.sybase.sybaseDataSource**.

Description

Description

Enter a description for the database.

Required Value

A valid string.

InitialPoolSize

Description

Enter a number for the physical connections the pool should contain when it is created.

Required Value

A valid numeric value. The default is 2.

LoginTimeOut

Description

The number of seconds driver will wait before attempting to log in to the database before timing out.

Required Value

A valid numeric value.

MaxIdleTime

Description

The maximum number of seconds that a physical connection may remain unused before it is closed. 0 (zero) indicates that there is no limit.

Required Value

A valid numeric value.

MaxPoolSize

Description

The maximum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there is no maximum.

Required Value

A valid numeric value. The default is 10.

MaxStatements

Description

The maximum total number of statements that the pool should keep open. 0 (zero) indicates that the caching of statements is disabled.

Required Value

A valid numeric value. The default is 1000.

MinPoolSize

The minimum number of physical connections the pool should keep available at all times. 0 (zero) indicates that there should be no physical connections in the pool and the new connections should be created as needed.

Required Value

A valid numeric value. The default is 2.

NetworkProtocol

Description

The network protocol used to communicate with the server.

Required Values

Any valid string.

PropertyCycle

Description

The interval, in seconds, that the pool should wait before enforcing the current policy defined by the values of the other connection pool properties in this deployment descriptor.

Required Values

A valid numeric value. The default is 0.

RoleName

Description

An initial SQL role name.

Required Values

Any valid string.

3.1.2. Setting the Properties in the Inbound eWay

	PreparedStatement	
Description (parameter-settings)		
Comments (parameter-settings)		
	Properties	
ОК		Cancel

Figure 2 Properties of the Inbound eWay

Pollmilliseconds

Description

Polling interval in milliseconds.

Required Value

A valid numeric value. The default is 5000.

PreparedStatement

Description

Prepared Statement used for polling against the database.

Required Value

The Prepared Statement must be the same Prepared Statement you created using the Database OTD Wizard. Only SELECT Statement is allowed. Additionally, no place holders should be specified. There should not be any "?" in the Prepared Query.

3.1.3. Setting the Properties in the Outbound eWay Environment

Before deploying your eWay, you will need to set the properties of the eWay environment using the following descriptions.

Properties 🗶		
Environment Configuration	¥ 12 1% 1/2 🔳 🌒	
L DBC Connector settings	DatabaseName	
	DataSourceName	
	Delimiter	#
	Description	SYBASE Connection Pool Datasource
	DriverProperties	setURL#jdbc:SeeBeyond:sybase:// <host>:4100;DatabaseName=<database>##</database></host>
	Password

	*	
Comments (JDBCConnectorSetti		
	Properties	
	ок	Cancel
	UK	Cancel

Figure 3 Outbound eWay Environment Configuration

DatabaseName

Description

Specifies the name of the database instance.

Required Values

Any valid string.

DataSourceName

Description

Provide the name of the ConnectionPoolDataSource object that the DataSource object delegates behind the scenes when connection pooling or distributed transaction management is being done.

Required Value

Optional. In most cases, leave this box empty.

Delimiter

Description

This is the delimiter character to be used in the DriverProperties prompt.

Required Value

The default is #

Description

Description

Enter a description for the database.

Required Value

A valid string.

DriverProperties

Description

If you choose to not to use the JDBC driver that is shipped with this eWay, you will need to add the drivers properties to the eWay. Often times the DataSource implementation will need to execute additional properties to assure a connection. The additional methods will need to be identified in the Driver Properties.

Required Value

Any valid delimiter.

For example: to execute the method setURL, give the method a String for the URL "setURL#<url>##".

Note: The setSpyAttributes, contained in the following examples (between the last set of double octothorps [##] within each example), are used for debugging purposes and need not be used on every occasion.

"setURL#jdbc:Seebeyond:Sybase://<server>:4100;DatabaseName=<database>##setSp yAttributes#log=(file)c:/temp/spy.log;logTName=yes##".

Password

Description

Specifies the password used to access the database.

Required Values

Any valid string.

PortNumber

Description

Specifies the I/O port number on which the server is listening for connection requests.

Required Values

A valid port number. The default is 4100.

ServerName

Description

Specifies the host name of the external database server.

Required Values

Any valid string.

User

Description

Specifies the user name the eWay uses to connect to the database.

Required Values

Any valid string.

3.1.4. Setting the Properties in the Inbound eWay Environment

	Properties	8
Environment Configuration	¥ 12 18 1=

Figure 4 Inbound eWay Environment

DatabaseName

Description

Specifies the name of the database instance.

Required Values

Any valid string.

Password

Description

Specifies the password used to access the database.

Required Values

Any valid string.

PortNumber

Description

Specifies the I/O port number on which the server is listening for connection requests.

Required Values

A valid port number. The default is 4100.

ServerName

Description

Specifies the host name of the external database server.

Required Values

Any valid string.

User

Description

Specifies the user name the eWay uses to connect to the database.

Required Values

Any valid string.

Chapter 4

Using the Sybase eWay Database Wizard

This chapter describes how to use the Sybase eWay Database Wizard to build OTDs. What's in This Chapter

- "Select Wizard Type" on page 22
- "Connect to Database" on page 23
- "Select Database Objects" on page 24
- "Select Table/Views" on page 24
- "Select Procedures" on page 27
- "Add Prepared Statements" on page 30
- "Specify the OTD Name" on page 31

4.1 Using the Database OTD Wizard

The Database OTD Wizard generates OTDs by connecting to external data sources and creating corresponding Object Type Definitions. The OTD Wizard can create OTDs based on any combination of Tables and Stored Procedures.

Field nodes are added to the OTD based on the Tables in the external data source. Java method and parameter nodes are added to provide the appropriate JDBC functionality. For more information about the Java methods, refer to your JDBC developer's reference.

The Sybase eWay also supports Double-Byte Character Set (DBCS) table and column names. The DBCS is a set of characters in which each character is represented by 2 bytes. The Korean language requires double-byte character sets.

To create a new OTD using the Database Wizard

Select Wizard Type

1 On the Enterprise Explorer, right click on the project and select **Create an Object Type Definition** from the shortcut menu.

Note: Database OTDs are not messagable. For more information on messagable OTDs, see the eGate Integrator User's Guide.

2 From the OTD Wizard Selection window, select the Sybase Database and click Next. See Figure 5.

Select Wizard Type	
OTD Wizard	Description

ResultSet Name: Manually
With Assistance
Index Original Name Column Name Type
Add Column Remove Column Save
OK Cancel

The DBWizard provides three different ways to generate the ResultSet nodes of a Stored Procedure. They are "**By Executing**", "**Manually**", and "**With Assistance**" modes.

"**By Executing**" mode executes the specified Stored Procedure with default values to generate the ResultSet(s). Depending on the business logic of the Stored Procedure, zero or more ResultSets can be returned from the execution. In the case that there are multiple ResultSets and "**By Executing**" mode does not return all ResultSets, one should use the other modes to generate the ResultSet nodes.

"With Assistance" mode allows users to specify a query and execute it to generate the ResultSet node. To facilitate this operation, the DBWizard tries to retrieve the content of the specified Stored Procedure and display it. However, content retrieval is not supported by all types of Stored Procedures. We can roughly classify Stored Procedures into two types: SQL and external. SQL Stored Procedures are created using CREATE PROCEDURE SQL statements while external Stored Procedures are created using host languages (e.g. Java). Since external Stored Procedures do not store their execution plans in the database, content retrieval is impossible. When using "Assist" mode, highlight the execute statement up to and including the table name(s) before executing the query.

"**Manually**" mode is the most flexible way to generate the result set nodes. It allows users to specify the node name, original column name and data type manually. One drawback of this method is that users need to know the original column names and data types. This is not always possible. For example, the column name of 3*C in this query.

SELECT A, B, 3*C FROM table T

is generated by the database. In this case, "With Assistance" mode is a better choice.

If you modify the ResultSet generated by the "**Execute**" mode of the Database Wizard you need to make sure the indexes match the Stored Procedure. This assures your ResultSet indexes are preserved.

8 On the Select Procedures and specify Resultset and Parameter Information window click Next to continue.

Add Prepared Statements

1 On the **Add Prepared Statements** window, click **Add**.

Figure 17	Prepared Statement
-----------	--------------------

	New Wizard - Sybase Databas	e 🧕

Figure 21 Naming an OTD

2 View the summary of the OTD. If you find you have made a mistake, click **Back** and correct the information. If you are satisfied with the OTD information, click **Finish** to begin generating the OTD. See **Figure 22**.

Figure 22 Database Wizard - Summary

The resulting **OTD** will appear on the Enterprise Designer's canvas.

Chapter 5

Implementing the Sybase eWay(s)

This chapter describes how to build an eWay project in a production environment.

What's in This Chapter

- "eInsight Engine and eGate Components" on page 33
- "Using the Sample Project in eInsight" on page 33
- "Using the Sample Project in eGate" on page 45
- "Common DataType Conversions" on page 48
- "Using OTDs with Tables, Views, and Stored Procedures" on page 49
- "Alerting and Logging" on page 56

5.1 eInsight Engine and eGate Components

You can deploy an eGate component as an Activity in an eInsight Business Process. Once you have associated the desired component with an Activity, the eInsight engine can invoke it using a Web Services interface. Examples of eGate components that can interface with eInsight in this way are:

- Java Messaging Service (JMS)
- Object Type Definitions (OTDs)
- An eWay
- Collaborations

Using the eGate Enterprise Designer and eInsight, you can add an Activity to a Business Process, then associate that Activity with an eGate component, for example, an eWay. When eInsight runs the Business Process, it automatically invokes that component via its Web Services interface.

5.2 Using the Sample Project in elnsight

To begin using the sample eInsight Business Process project, you will need to import the project and view it from within the Enterprise Designer using the Enterprise Designer Project Import utility. Import the **Syb_BPEL_Sample.zip** file contained in the eWay sample folder on the installation CD-ROM.

Note: eInsight is a Business Process modeling tool. If you have not purchased eInsight, contact your sales representative for information on how to do so.

Before recreating the sample Business Process, review the *eInsight Business Process Manager User's Guide* and the *eGate Tutorial*.

Importing the Sample Project

1 On the Enterprise Explorer highlight the repository and right click. Select **Import Project**. See **Figure 23**.

Sample_Re	New Project
- 🔂 JCEseli-	Sort by Type

-		
		Import Close

2 Click the **Refresh All From Repository** icon located on the **Enterprise Explorer** toolbar.

The Business Process

The data used for this sample project is contained within a table called db_employee. The table has the following columns:

Column Name	Mapping	Data Type	Data Length
EMP_NO	employee_no	integer	10
LAST_NAME	employee_Iname	varchar	30
FIRST_NAME	employee_fname	varchar	30
LAST_UPDATE	update_date	timestamp	16
RATE	rate	float	53

Table 2 S	ample pro	ject data
-----------	-----------	-----------

The sample project consists of an input file containing data that is passed into a database collaboration, and then written out to an output file

3 Refer to the *eInsight Business Process Manager User's Guide* for specific information on how to create and use a Business Process

You can associate an elnsight Business Process Activity with the eWay, both during the system design phase and during run time. To make this association, select the desired **receive** or **write** operation under the eWay in the Enterprise Explorer and drag it onto the elnsight Business Process canvas. The following operations are available:

- SelectAll
- SelectMultiple
- SelectOne
- Insert
- Update
- Delete

The operation automatically changes to an Activity with an icon identifying the component that is the basis for the Activity.

At run time, the eInsight engine invokes each step in the order that you defined in the Business Process. Using the engine's Web Services interface, the Activity in turn invokes the eWay. You can open a file specified in the eWay and view its contents before and after the Business Process is executed.

Note: Inbound database eWays are only supported within BPEL Collaborations.

elnsight Operation	Input	Output
SelectAll	where() clause (optional)	Returns all rows that fit the condition of the where() clause
SelectMultiple	number of rows where() clause (optional)	Returns the number of rows specified that fit the condition of the where() clause
SelectOne	where() clause (optional)	Returns the first row that fits the condition of the where() clause
Insert	definition of new item to be inserted	Returns status.
Update	where() clause	Returns status.
Delete	where() clause	Returns status.

The table below shows the inputs and outputs to each of these eInsight operations:

5.2.1 whereClause()

A BPEL where Clause() statement may be joined by AND/OR with conditions of "=", "!=", "<>", "<", ">", "<=", ">=".

For example:

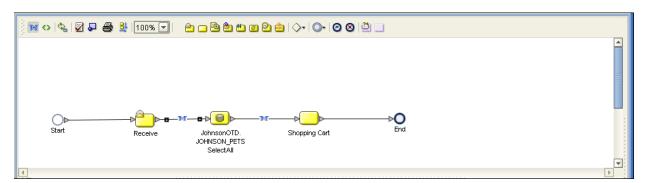

where Clause such as where column2=2 AND column1=1 OR column3=3 is valid

5.2.2 SelectAll

The input to a SelectAll operation is an optional where() clause. The where() clause defines to which criteria rows must adhere to be returned. In the SelectAll operation, all items that fit the criteria are returned. If the where() clause is not specified, all rows are returned.

The figure below shows a sample eInsight Business Process using the SelectAll operation. In this process, the SelectAll operation returns all rows where the ITEM_ID matches the selected ITEM_ID to the shopping cart.

Figure 25 SelectAll Sample Business Process

The figure below shows the definition of the where() clause for the SelectAll operation.

	ITEM_ID = 📲 🗝
BusinessProcess3	

5.2.3 SelectMultiple

The input to a SelectMultiple operation is the number of rows to be selected and a where() clause. The number of rows indicates how many rows the SelectMultiple operation returns. The where() clause defines to which criteria rows must adhere to be returned.

The figure below shows a sample eInsight Business Process using the SelectMultiple operation. In this process, the SelectMultiple operation returns the first two rows where the ITEM_ID matches the selected ITEM_ID to the shopping cart.

Figure 28 SelectMultiple Sample Business Process

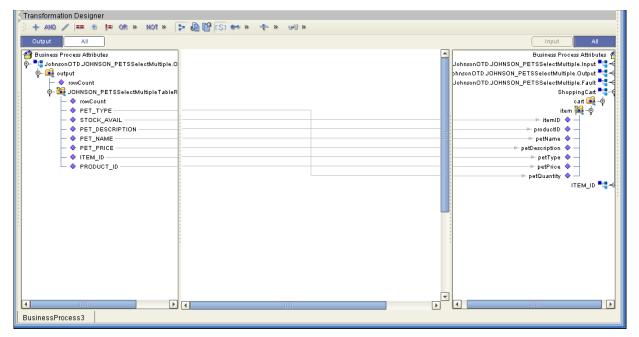

The figure below shows the definition of the number of rows and where() clause input for the SelectMultiple operation. You could also use an empty string for example item=ID=' '.

The figure below shows the definition of the output for the SelectMultiple operation. For each row selected during the operation, the shopping cart shows the columns of those rows as defined here.

5.2.4 SelectOne

The input to a SelectOne operation is a where() clause. The where() clause defines to which criteria rows must adhere to be selected for the operation. In the SelectOne operation, the first row that fits the criteria is returned.

The figure below shows a sample eInsight Business Process using the SelectOne operation. In this process, the SelectOne operation returns the first row where the ITEM_ID matches the specified ITEM_ID to the shopping cart.

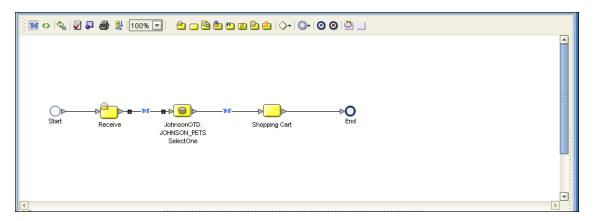

Figure 31 SelectOne Sample Business Process

The figure below shows the definition of the where() clause for the SelectOne operation.

5.2.5 **Insert**

The Insert operation inserts a row. The input to an Insert operation is a where() clause. The where() clause defines to which criteria rows must adhere to be selected for the operation. In the Insert operation, the first row that fits the criteria is returned.

The figure below shows a sample eInsight Business Process using the Insert operation. In this process, the operation inserts a new row into the database to accommodate a new item provided by a vendor.

The figure below shows the definition of the input for the Insert operation.

5.3 Using the Sample Project in eGate

To import the sample project **Syb_JCE_Sample.zip** follow the instructions given in **Importing the Sample Project** on page 34.

5.3.1. Working with the Sample Project in eGate

This sample project selects the EMP_NO, LAST_NAME, FIRST_NAME, RATE, LAST_UPDATE, RATE and the columns from the table db_employee and publishes the record to an output file.

The data used for this projects is within a table called db_employees. The table contains the following columns:

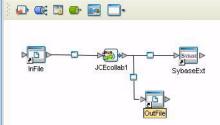

able 5 Sample project data			
Column Name	Mapping	Data Type	Data Length
EMP_NO	employee_no	integer	10
LAST_NAME	employee_Iname	varchar	30
FIRST_NAME	employee_fname	varchar	30
LAST_UPDATE	update_date	timestamp	16
RATE	rate	float	53

Table 3 Sa	mple project data
------------	-------------------

The sample project consists of an input file containing data that is passed into a collaboration and out to the database from which data is retrieved and passed back into the collaboration and then to an output file.

Note: Outbound database eWays are available when using a JCE Collaboration. To poll the database, you must use the Scheduler.

To work with the sample project, follow the instructions given in the *eGate Tutorial*.

5.3.2. Configuring the eWays

The sample uses an inbound and an outbound File eWay as well as an outbound eWay. To configure the sample projects eWays, use the follwing information. For additional information on the eWay properties, see **Setting the eWay Properties in the Connectivity Map** on page 12.

To configure the Inbound File eWay:

- 1 On the Connectivity Map canvas, double click the eWay icon located between the **InFile** and **Service1 (JCECollab1)**.
- 2 On the resulting **Templates** window, select **Inbound File eWay** and click **OK**.
- 3 On the **Properties** window, enter the appropriate configurations for the Inbound File eWay. See the *File eWay User's Guide* for information on how to specifically configure the File eWay. For this sample, the default settings are used.
- 4 When you have completed your selections, click **OK**.

To configure the Outbound SybaseExt eWay:

- 1 On the Connectivity Map canvas, double click the eWay icon located between the **Service1 (JCECollab1)** and **SybaseExt** database.
- 2 On the resulting **Templates** window, select **Outbound SybaseExt** and click **OK**.
- 3 On the Properties window, enter the appropriate configurations for the Outbound Sybase eWay and click **OK**. See **Setting the Properties in the Outbound eWay** on page 12. For this sample, the default settings are used.
- 4 When you have completed your selections, click **OK**.

To configure the Outbound File eWay:

- 1 On the Connectivity Map canvas, double click the eWay icon located between **Service1 (JCECollab1)** and **OutFile** eWay.
- 2 On the resulting **Templates** window, select **Outbound File eWay** and click **OK**.
- 3 On the **Properties** window, enter the appropriate configurations for the Outbound File eWay. See the *File eWay User's Guide* for information on how to specifically configure the File eWay. For this sample, change the Directory field to **<valid path to the directory where the output file will be stored>**. The Output File Name to **Output1.dat**. For the remaining parameters, the default settings are used.
- 4 When you have completed your selections, click **OK**.

5.3.3. Creating the Environment Profile

To review the components of the Sample project, there is an Inbound and an Outbound File eWay, an eWay, and a Service.

To create the external environment for the Sample project:

5 On the Environment Explorer, highlight and right-click the eWay profile. Select Properties. Enter the configuration information required for your Outbound eWay. See Setting the Properties in the Outbound eWay Environment on page 17.

5.3.4 **Deploying a Project**

To deploy a project, please see the "eGate Integrators User's Guide".

5.3.5. Running the Sample

For instruction on how to run the Sample project, see the *eGate Tutorial*.

Once the process has completed, the Output file in the target directory configured in the Outbound File eWay will contain all records retrieved from the database in an .xml format.

5.4 **Common DataType Conversions**

Sybase Server Data Type	OTD/Java Data Type	Methods to Use	Sample Data
BigInt	Long	Long: java.lang.Long.parseLong(String)	123
Int	Int	Integer: java.lang.Integer.parseInt(String)	123

			11:35:00
Timestamp	Binary	N/A (Used by the Database Internally)	N/A
DateTime	TimeStamp	Date: java.sql.TimeStamp.valueOf(String)	2003-09-28
			11:35:42
Varchar	String	Direct Assign	Any Characters

Sybase Server Data Type	OTD/Java Data Type	Methods to Use	Sample Data
Char	String	Direct Assign	Any Characters
Text	String	Direct Assign	Any Characters
Binary(1)	Byte[]	String: java.lang.String.getBytes()	0 or 1

5.5 Using OTDs with Tables, Views, and Stored Procedures

Tables, Views, and Stored Procedures are manipulated through OTDs. Common operations include insert, delete, update, and query.

5.5.1 The Table

A table OTD represents a database table. It consists of fields and methods. Fields correspond to the columns of a table while methods are the operations that you can apply to the OTD. This allows you to perform query, update, insert, and delete SQL operations in a table.

By default, the Table OTD has UpdatableConcurrency and ScrollTypeForwardOnly. The type of result returned by the select() method can be specified using:

- SetConcurrencytoUpdatable
- SetConcurrencytoReadOnly
- SetScrollTypetoForwardOnly
- SetScrollTypetoScrollSensitive
- SetScrollTypetoInsensitive

The methods should be called before executing the select() method. For example,

```
getDBEmp().setConcurToUpdatable();
getDBEmp().setScroll_TypeToScrollSensitive();
getDBEmp().getDB_EMPLOYEE().select("");
```

The Query Operation

To perform a query operation on a table

- 1 Execute the **select()** method with the "**where**" clause specified if necessary.
- 2 Loop through the ResultSet using the **next()** method.
- 3 Process the return record within a **while()** loop.

For example:

```
package SelectSales;
```

```
public class Select
{
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
   public void receive(
com.stc.connector.appconn.file.FileTextMessage
input, com.stc.connector.appconn.file.FileApplication
FileClient_1,db_employee.Db_employeeOTD
db_employee_1,employeedb.Db_employee employeedb_db_employee_1 )
    throws Throwable
    {
        //@map:Db_employee.select(Text)
        db_employee_1.getDb_employee().select( input.getText() );
        //while
        while (db_employee_1.getDb_employee().next()) {
            //@map:Copy EMP_NO to Employee_no
            employeedb_db_employee_1.setEmployee_no(
java.lang.Integer.toString(
db_employee_1.getDb_employee().getEMP_NO() ) );
            //@map:Copy LAST_NAME to Employee_lname
            employeedb_db_employee_1.setEmployee_lname(
db_employee_1.getDb_employee().getLAST_NAME() );
            //@map:Copy FIRST_NAME to Employee_fname
            employeedb_db_employee_1.setEmployee_fname(
db_employee_1.getDb_employee().getFIRST_NAME() );
            //@map:Copy RATE to Rate
            employeedb_db_employee_1.setRate(
java.lang.Double.toString(
db_employee_1.getDb_employee().getRATE() ) );
            //@map:Copy LAST_UPDATE to Update_date
            employeedb_db_employee_1.setUpdate_date(
db_employee_1.getDb_employee().getLAST_UPDATE().toString() );
        }
        //@map:Copy employeedb_db_employee_1.marshalToString to
Text
        FileClient_1.setText(
employeedb_db_employee_1.marshalToString() );
        //@map:FileClient_1.write
        FileClient_1.write();
    }
}
```

The Insert Operation

To perform an insert operation on a table

- 1 Execute the **insert()** method. Assign a field.
- 2 Insert the row by calling **insertRow()**

This example inserts an employee record.

```
//DB EMPLOYEE.insert
       Table_OTD_1.getDB_EMPLOYEE().insert();
//Copy EMP_NO to EMP_NO
   insert_DB_1.getInsert_new_employee().setEmployee_no(
   java.lang.Integer.parseInt(
    employeedb_with_top_db_employee_1.getEmployee_no() ) );
//@map:Copy Employee_lname to Employee_Lname
   insert_DB_1.getInsert_new_employee().setEmployee_Lname(
   employeedb_with_top_db_employee_1.getEmployee_lname() );
//@map:Copy Employee_fname to Employee_Fname
   insert_DB_1.getInsert_new_employee().setEmployee_Fname(
   employeedb_with_top_db_employee_1.getEmployee_fname() );
//@map:Copy java.lang.Float.parseFloat(Rate) to Rate
   insert_DB_1.getInsert_new_employee().setRate(
   java.lang.Float.parseFloat(
   employeedb_with_top_db_employee_1.getRate() ) );
//@map:Copy java.sql.Timestamp.valueOf(Update_date) to Update_date
   insert_DB_1.getInsert_new_employee().setUpdate_date(
   java.sql.Timestamp.valueOf(
   employeedb_with_top_db_employee_1.getUpdate_date() ) );
//@map:Insert Row
  Table_OTD_1.getDB_EMPLOYEE().insertRow();
//Table_OTD_1.commit
   Table_OTD_1.commit();
}
```

The Update Operation

To perform an update operation on a table

- 1 Execute the **update()** method.
- 2 Using a while loop together with **next()**, move to the row that you want to update.
- 3 Assign updating value(s) to the fields of the table OTD
- 4 Update the row by calling **updateRow()**.

```
//SalesOrders_with_top_SalesOrders_1.unmarshalFromString(Text)
SalesOrders_with_top_SalesOrders_1.unmarshalFromString(
input.getText() );
//SALES_ORDERS.update("SO_num =99")
DB_sales_orders_1.getSALES_ORDERS().update( "SO_num ='01'" );
//while
while (DB_sales_orders_1.getSALES_ORDERS().next()) {
//Copy SalesOrderNum to SO_num
DB_sales_orders_1.getSALES_ORDERS().setSO_num(
SalesOrders_with_top_SalesOrders_1.getSalesOrderNum() );
//Copy CustomerName to Cust_name
DB_sales_orders_1.getSALES_ORDERS().setCust_name(
SalesOrders_with_top_SalesOrders_1.getCustomerName() );
```

```
//Copy CustomerPhone to Cust_phone
DB_sales_orders_1.getSALES_ORDERS().setCust_phone(
SalesOrders_with_top_SalesOrders_1.getCustomerPhone() );
//SALES_ORDERS.updateRow
DB_sales_orders_1.getSALES_ORDERS().updateRow();
}
//DB_sales_orders_1.commit
DB_sales_orders_1.commit();
}
```

The Delete Operation

To perform a delete operation on a table

1 Execute the **delete()** method.

In this example DELETE an employee.

```
//DB_EMPLOYEE.delete("EMP_NO = '".concat(EMP_NO).concat("'"))
Table_OTD_1.getDB_EMPLOYEE().delete( "EMP_NO = '".concat(
    employeedb_with_top_db_employee_1.getEMP_NO() ).concat( "'" ) );
//DB_EMPLOYEE.commit
DB_EMPLOYEE.commit();
}
```

5.5.2 The Stored Procedure

A Stored Procedure OTD represents a database stored procedure. Fields correspond to the arguments of a stored procedure while methods are the operations that you can apply to the OTD. It allows you to execute a stored procedure. Remember that while in the Collaboration Editor you can drag and drop nodes from the OTD into the Collaboration Editor.

Executing Stored Procedures

The OTD represents the Stored Procedure "LookUpGlobal" with two parameters, an inbound parameter (INLOCALID) and an outbound parameter

(OUTGLOBALPRODUCTID). These inbound and outbound parameters are generated by the DataBase Wizard and are represented in the resulting OTD as nodes. Within the Transformation Designer, you can drag values from the input parameters, execute the call, collect data, and drag the values to the output parameters.

Below are the steps for executing the Stored Procedure:

- 1 Specify the input values.
- 2 Execute the Stored Procedure.
- 3 Retrieve the output parameters if any.

For example:

package Storedprocedure;

```
public class sp_jce
```

{ public com.stc.codegen.logger.Logger logger; public com.stc.codegen.alerter.Alerter alerter; public void receive(com.stc.connector.appconn.file.FileTextMessage input, com.stc.connector.appconn.file.FileApplication FileClient_1,employeedb.Db_employee employeedb_with_top_db_employee_1,insert_DB.Insert_DBOTD insert_DB_1) throws Throwable { // @map:employeedb_with_top_db_employee_1.unmarshalFromString(Text) employeedb_with_top_db_employee_1.unmarshalFromString(input.getText()); //@map:Copy java.lang.Integer.parseInt(Employee no) to Employee_no insert_DB_1.getInsert_new_employee().setEmployee_no(java.lang.Integer.parseInt(employeedb_with_top_db_employee_1.getEmployee_no())); //@map:Copy Employee_lname to Employee_Lname insert_DB_1.getInsert_new_employee().setEmployee_Lname(employeedb_with_top_db_employee_1.getEmployee_lname()); //@map:Copy Employee_fname to Employee_Fname insert_DB_1.getInsert_new_employee().setEmployee_Fname(employeedb_with_top_db_employee_1.getEmployee_fname()); //@map:Copy java.lang.Float.parseFloat(Rate) to Rate insert_DB_1.getInsert_new_employee().setRate(java.lang.Float.parseFloat(employeedb with top db employee 1.getRate())); //@map:Copy java.sql.Timestamp.valueOf(Update_date) to Update_date insert_DB_1.getInsert_new_employee().setUpdate_date(java.sql.Timestamp.valueOf(employeedb_with_top_db_employee_1.getUpdate_date())); //@map:Insert_new_employee.execute insert_DB_1.getInsert_new_employee().execute(); //@map:insert_DB_1.commit insert_DB_1.commit(); //@map:Copy "procedure executed" to Text FileClient 1.setText("procedure executed"); //@map:FileClient_1.write FileClient_1.write(); } }

Manipulating the ResultSet and Update Count Returned by Stored Procedure

For Stored Procedures that return ResultSets and Update Count, the following methods are provided to manipulate the ResultSet:

- enableResultSetOnly
- enableUpdateCountsOnly
- enableResultSetandUpdateCounts
- resultsAvailable
- next
- getUpdateCount
- available

Sybase stored procedures do not return records as ResultSets, instead, the records are returned through output reference cursor parameters. Reference Cursor parameters are essentially ResultSets.

The **resultsAvailable()** method, added to the OTD, simplifies the whole process of determining whether any results, be it update Counts or ResultSets, are available after a stored procedure has been executed. Although JDBC provides three methods (**getMoreResults()**, **getUpdateCount()**, and **getResultSet()**) to access the results of a stored procedure call, the information returned from these methods can be quite confusing to the inexperienced Java JDBC programmer and they also differ between vendors. You can simply call **resultsAvailable()** and if Boolean true is returned, you can expect either a valid Update Count when **getUpdateCount()** is called and/or the next ResultSet has been retrieved and made available to one of the ResultSet nodes defined for the Stored Procedure OTD, when that node's **available()** method returns true.

Frequently, Update Counts information that is returned from a Stored Procedures is insignificant. You should process returned ResultSet information and avoid looping through all of the Update Counts. The following three methods control exactly what information should be returned from a stored procedure call. The **enableResultSetsOnly()** method, added to the OTD allows only ResultSets to be returned and thus every **resultsAvailable()** called only returns Boolean true if a ResultSet is available. Likewise, the **enableUpdateCountsOnly()** causes **resultsAvailable()** to return true only if an Update Count is available. The default case of **enableResultSetsAndUpdateCount()** method allows both ResultSets and Update Counts to be returned.

Collaboration usability for a Stored Procedure ResultSet

The Column data of the ResultSets can be dragged-and-dropped from their OTD nodes to the Business Rules. Below is a code snippet that can be generated by the Collaboration Editor:

// resultsAvailable() will be true if there's an update count and/or a
result set available.
// note, it should not be called indiscriminantly because each time
the results pointer is

```
// advanced via getMoreResults() call.
while (getSPIn().getSpS_multi().resultsAvailable())
{
    // check if there's an update count
    if (getSPIn().getSpS_multi().getUpdateCount() > 0)
    {
        logger.info("Updated
"+getSPIn().getSpS_multi().getUpdateCount()+" rows");
    }
// each result set node has an available() method (similar to OTD's)
that tells the user
// whether this particular result set is available. note, JDBC does
support access to
// more than one result set at a time, i.e., cannot drag from 2
distinct result sets
// simultaneously
    if (getSPIn().getSpS_multi().getNormRS().available())
    while (getSPIn().getSpS multi().getNormRS().next())
    logger.info("Customer Id =
"+getSPIn().getSpS_multi().getNormRS().getCustomerId());
    logger.info("Customer Name =
"+getSPIn().getSpS_multi().getNormRS().getCustomerName());
    if (getSPIn().getSpS_multi().getDbEmployee().available())
    while (getSPIn().getSpS_multi().getDbEmployee().next())
    logger.info("EMPNO =
"+getSPIn().getSpS_multi().getDbEmployee().getEMPNO());
    logger.info("ENAME =
"+getSPIn().getSpS_multi().getDbEmployee().getENAME());
    logger.info("JOB =
"+getSPIn().getSpS_multi().getDbEmployee().getJOB());
    logger.info("MGR =
"+getSPIn().getSpS_multi().getDbEmployee().getMGR());
    logger.info("HIREDATE =
"+getSPIn().getSpS_multi().getDbEmployee().getHIREDATE());
    logger.info("SAL =
"+getSPIn().getSpS_multi().getDbEmployee().getSAL());
    logger.info("COMM =
"+getSPIn().getSpS_multi().getDbEmployee().getCOMM());
    logger.info("DEPTNO =
"+getSPIn().getSpS_multi().getDbEmployee().getDEPTNO());
    }
}
```

Note: resultsAvailable() and available() cannot be indiscriminately called because each time they move ResultSet pointers to the appropriate locations.

After calling "**resultsAvailable(**)", the next result (if available) can be either a **ResultSet** or an **UpdateCount** if the default "**enableResultSetsAndUpdateCount(**)" was used.

Because of limitations imposed by some DBMSs, it is recommended that for maximum portability, all of the results in a ResultSet object should be retrieved before OUT parameters are retrieved. Therefore, you should retrieve all ResultSet(s) and update counts first followed by retrieving the OUT type parameters and return values.

The following list includes specific ResultSet behavior that you may encounter:

- The method **resultsAvailable()** implicitly calls **getMoreResults()** when it is called more than once. You should not call both methods in your java code. Doing so may result in skipped data from one of the ResultSets when more than one ResultSet is present.
- The methods **available()** and **getResultSet()** can not be used in conjunction with multiple ResultSets being open at the same time. Attempting to open more the one ResultSet at the same time closes the previous ResultSet. The recommended working pattern is:
 - Open one Result Set, ResultSet_1 and work with the data until you have completed your modifications and updates. Open ResultSet_2, (ResultSet_1 is now closed) and modify. When you have completed your work in ResultSet_2, open any additional ResultSets or close ResultSet_2.
- If you modify the ResultSet generated by the Execute mode of the Database Wizard, you need to assure the indexes match the stored procedure. By doing this, your ResultSet indexes are preserved.

Generally, getMoreResults does not need to be called. It is needed if you do not want to use our enhanced methods and you want to follow the traditional JDBC calls on your own.

5.6 Alerting and Logging

eGate provides an alerting and logging feature. This allows monitoring of messages and captures any adverse messages in order of severity based on configured severity level and higher. To enable Logging, please see the *eGate Integrator User's Guide*.

Using eWay Java Methods

The Sybase eWay exposes various Java methods to add extra functionality, and make it easier to set, and get information in the Sybase eWay OTDs. For additional details, refer to the **Javadoc**.

To access the Javadoc

- 1 Log into Enterprise Manager and upload the **SybaseeWayDocs.sar** file, located on the installation CD-ROM, to the ICAN Repository.
- 2 Click the Documentation tab in Enterprise Manager and then select Sybase Intelligent Adapter from the list of products in the left frame. The details for the eWay appear in the right frame.
- 3 Click the **Download Javadoc** link and extract the **.zip** file to a local directory.
- 4 Open the **index.html** file to view the Javadoc.

The following classes appear in the Javadoc:

- SybaseCallableStatementAgent
- SybaseCallableStatementResultSet
- SybaseConnector
- SybaseCPManagedConnectionFactoryExt
- SybasePreparedStatementAgent
- SybasePreparedStatementResultSet
- SybaseSession
- SybaseTableResultSet

Appendix A

Support for WebSphere Application Server

This section describes how to deploy an Enterprise Archive (EAR) file to the WebSphereTM Application Server. This includes information on installing the WebSphere Application Server interface and configuring the selected Application server to deploy the EAR file.

What's in this Appendix:

- Uploading the Application Server Interface on page 58
- Creating an EAR File on page 60
- Deploying an EAR File on page 61
- Configuring the WebSphere Application Server on page 61

A.1 Uploading the Application Server Interface

To support the WebSphere Application Server, the following files must be uploaded to your system and installed:

WebSphere Application Server

- websphereintegserver.sar
- webspherejmsmessageserver.sar

For information on uploading and installing the selected .sar files see the *SeeBeyond ICAN Suite Installation Guide*.

1.1.1 WebSphere Application Server Support Limitations

The following limitations apply when deploying eGate EAR files on WebSphere Application Server:

- eInsight projects are not supported for WebSphere Application Server 5.1
- Inbound eWays are not supported for WebSphere Application Server 5.1
- XA mode must be enabled in the WebSphere MQ eWay properties

A.2 Setting up the eWay Environment for WebSphere 5.1

Environment setup steps that are required for eWays to run on WebSphere 5.1 include:

- 1 Install the IBM WebSphere 5.1 application.
- *Note: Refer to the WebLogic WebSphere Installation and Setup documentation for detailed instructions on these steps.*
 - 2 Stop the WebSphere server if it is already running.
 - 3 Copy the files **com.ibm.mq.jar** and **com.ibm.mqjms.jar** from the zip file **IC42636.windows.zip** to:

<WebsphereMQ Directory>\ibm\WebShpere MQ\java\lib

- 4 Install ICAN, and upload the following WebSphere related sar files.
 - websphereintegserver.sar
 - webspherejmsmessageserver.sar
- 5 Download and then copy the **log4j.jar** file to the following WebSphere directory:

<WebsphereMQ Directory>\WebSphere\AppServer\lib

If you want to see eWay logging, then copy the **log4j.properties** file to the same directory.

6 Copy the **com.stc.antlrimpl.jar** file from:

<ICAN Directory>\Ican505\eDesigner\modules\autoload.ext

To the following WebSphere directory:

<WebsphereMQ Directory>\WebSphere\AppServer\lib

7 Copy the com.stc.eventmanagementapi.jar, com.stc.eventmanagementimpl.jar, and the com.stc.jms.stcjms.jar files from:

<ICAN Directory>\Ican505\repository\server\webapps\monitor\WEB-INF\lib

To the following WebSphere directory:

<WebsphereMQ Directory>\WebSphere\AppServer\lib

A.3 Creating an EAR File

To create an EAR file from an eGate project, include the following steps during the creation of the project:

- 1 If you are using Topics or Queues in your project, make the following changes to the JMS Properties Sheet (accessed from the Connectivity Map). Set the properties to the following values:
 - Set the JMS Client > Basic > Transaction Mode property to XA
 - Set the JMS Client > Basic > Run-as principal > Use for JMS connection property to false
 - Set the JMS Client > Advanced > Durability property to Nondurable
 - Set the JMS Client > Advanced > Security > Audit property to no
- *Note:* The JMS Client > Basic >Run-as principal > Name property is limited to 12 characters
 - 2 During the creation of the project Environment do the following:
 - A Create the Logical Host in the Environment.
 - B From the Environment Explorer tree, right-click the logical host and select New WebSphere Application Server from the shortcut menu. The application server, WebSphereSvr1, is added to the Logical Host box and the Environment Explorer tree.
 - C If you are using JMS (Topics or Queues) you must also add the New WebSphere JMS Server to the Logical Host. From the Environment Explorer tree, right-click the logical host and select New WebSphere JMS Server from the shortcut menu. The WebSphere JMS message server, WSMessageSvr1, is added to the Logical Host box and the Environment Explorer tree.
 - 3 During the creation of the Deployment Profile, do the following:
 - A If the service containing the Collaboration fails to be mapped to the WebSphere Application Server, drag and drop the Service to the WebSphere Application Server, **WebSphereSvr1**, in the Logical Host box.
 - B If any JMS Topics or Queues fail to be mapped to the WebSphere JMS Server, drag and drop the Topic or Queue to the WebSphere JMS Server, WSMessageSvr1, in the Logical Host box.
 - C Once all of the components have been mapped, click **Activate**. When prompted whether to apply the project to the logical host immediately, click **No**.
 - 4 The project's EAR file is now available in the following location:

```
<ICAN>/repository/data/files/<environment name>/<logical host name>/<application server name> directory
```

where **<ICAN>** is the directory where the ICAN Suite is installed, **<environment name>** is the name of the project Environment, **<logical host name>** is the name of the logical host, and **<application server name>** is the name of the selected Application Server.

Note: For an eGate project EAR file to deploy to the WebSphere Application Server, the project must not contain any inbound eWays.

B.2 Deploying an EAR File

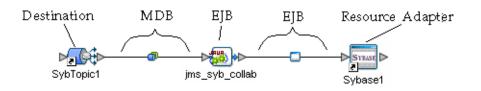

To deploy an EAR file using the WebSphere Application Server, you create the following components from the Application Server's Administrative Console:

- **Topics** or **Queues**: One Topic or Queue is needed for each Topic or Queue in the eGate project.
- **Connection Factories**: A Connection Factory enables JMS Clients to create JMS connections with predefined attributes. If the project contains Topics, a Topic Connection Factory is required. If it contains Queues a Queue Connection Factory is needed. If the project contains both Topics and Queues, create both a Queue and a Topic Connection Factory.

WebSphere also requires the following:

• **Listener Ports**: A listener port must be created for every MDB the project contains. The **MDB** is represented in the project's Connectivity Map as the connection between a **Topic** or **Queue** and a **Service** (see Figure 45).

A.1 Configuring the WebSphere Application Server

To deploy an EAR file in the WebSphere Application Server, start the Administrative Console, and do the following:

Creating the Topic or Queue

1 From the left pane of the WebSphere Administrative console, select **Resources** and click **WebSphere JMS Provider**.

From the WebSphere JMS Provider window, under Additional Properties (shown in Figure 50), click WebSphere Queue Destinations or WebSphere Topic Destinations, depending on whether you are creating a topic or queue. For this example click WebSphere Topic Destinations to create a topic.

Figure 46 WebSphere Server Administrative Console - Additional Properties

Additional Properties	
WebSphere Queue Connection Factories	
VVebSphere Topic Connection Factories	
VVebSphere Queue Destinations	
WebSphere Topic Destinations	

- 3 From the **WebSphere Topics Destinations** (or Queue Destinations) window click the **New** button.
- 4 From the **Topic** or **Queue Destinations** configuration window, enter a name for the new Topic or Queue in the **Name** field. Enter the same name in the **JNDI Name** field. Enter the string value used to identify the Topic in the **Topic** field (for this example, **Topic1**) as displayed in Figure 47. Click **OK**.

Mail Providers	General Properties			
Resource Environment Providers				The car a second
URL Providers	Scope	cells:LocalhostX260:nodes:Localh	ostX260	The scope of the configured resource. This value indicates the configuration location for the configuration
Resource Adapters				file.
Security	Name	Topic1		The required display name for the resource.
Environment	JNDI Name			The JNDI pame for the resource.
System Administration	JNDI Name	Topic1		III The short hame for the resource.
	Description			An optional description for the resource.
	Category			An optional category string which can be used to classify or group the resource.
	Topic	* Topic1		This is the string value used to identify the Topic. It can be dot notation and include wildcard characters.
	Persistence	APPLICATION DEFINED		Whether all messages sent to the destination are persistent, non-persistent, or have their persistence defined by the application.
	Priority	APPLICATION DEFINED		Whether the message priority for this destination is defined by the application or the Specified priority property.
	Specified Priority]	When priority is SPECIFIED, this value specifies the priority for the topic. Valid values are in the range 0-9 with 0 as the lowest priority and 9 as the highest priority
	Expiry	APPLICATION DEFINED		Whether the expiry timeout for this queue is defined by the application or the Specified expiry property, or messages on the queue never expire (have an unlimited expiry timeout).
	Specified Expiry		milliseconds	When expiry is SPECIFIED, this value contains the expiration period for the Topic in milliseconds. Valid values are any long value greater than zero.
	Apply OK Res	et Cancel		

5 From the **WebSphere Topic Destinations** widow, click **WebSphere JMS Provider** to return to the JMS Provider window.

Creating a Connection Factory

- 1 From the **WebSphere JMS Provider** window, under **Additional Properties**, click **WebSphere Topic Connection Factories** (or Queue Connection Factories if you created a Queue).
- 2 From the **WebSphere Topic Connection Factories** window, click the **New** button.
- 3 From the WebSphere Topic Connection Factories configuration window, enter the Topic Connection Factory name in the Name field (for this example, TopicConnFact).
- 4 Enter the Connection Factory JNDI Name in the JNDI Name field. The pattern for the JNDI Name is jms/connectionfactory/<xa_topic or xa_queue (just topic or queue if xa is not selected as the Transaction Mode)>/<Logical Host name>_<JMS Message Server name (from the Environment)>.

For this example, the Connection Factory JNDI name is **jms/connectionfactory/ xa_topic/LogicalHost1_WLMessageSvr1**

5 Make sure that **XA Enabled** is selected (see Figure 48). Click **OK**.

	Step 7	Ensure all unprot	ected 2.0 methods have the correct level of	protection		
	Step 8	Summary				

- 8 From the Step 7: Ensure all unprotected 2.0 methods have the correct level of protection window, click the Module checkbox to select all of the modules. Click Next
- 9 From the Step 8: Summary window, review the selected values and click Finish.
- 10 WebSphere begins installing the application. This may take several minutes. When the application installs successfully, click **Save to Master Configuration**.
- 11 To review the application's status or start or stop the application, from the right pane of the Administrative Console, click **Applications**, and click **Enterprise Applications** (see Figure 53).

- 12 Complete the following steps to configure the J2C Connection Factories:
 - A From the Enterprise Applications window, select your application.
 - **B** From the Related Items box, click **Connector Modules**.
 - C From the Connector Modules window, click the deployed RAR file.
 - D From the deployed RAR file window's **Additional Properties** box, click **Resource Adapter** (see Figure 58).

Figure 54 WebSphere Administrative Console - Resource Adapter

Additional Properties	
Resource Adapter	A resource adapter is created for every connector module in the application as a part of application installation. This resource adapter can be used to further create Connection Factories that can be used to bind resources defined in the application.
View Deployment Descripto	View the Deployment Descriptor

- E From the Resource Adapter window, Additional Properties box, click J2C Connection Factories. The J2C Connection Factories window appears.
- F Click the **New** button to create a new **J2C Connection Factory** (see **Figure 55 on page 68**).

- G From the **J2C Connection Factory's New** window, do the following:
 - Enter the **Name** for the new J2C Connection Factory.
 - Enter the **JNDI Name** for the new J2C Connection Factory. This is the same name that you saved in **step 6 on page 65** (This name can also be found as the **res-ref-name** in the **ejb-jar.xml** file)
 - Set Mapping-Configuration Alias to DefaultPrincipleMapping
- H Click **OK** to create the new J2C Connection Factory.

- 13 Create a Listener Port by completing the following steps:
 - A From the left pane of the WebSphere Application Server Administrative Console, expand Servers and click **Application Servers**.
 - **B** From Application Servers click **server1**.
 - C From the Additional Properties box, of the server1 window, click **Message** Listener Service.
 - D From the Additional Properties box, of the Message Listener Service window, click **Listener Ports**.
 - **E** From the Listener Ports window click **New** to create a new Listener Port.
 - F In the Configuration Tab, of the new Listener Port being created, fill in the following required fields (see Figure 58):
 - **Name** (Use the name of the Listener Port from Step 5)
 - Initial State
 - Connection Factory JNDI Name
 - Destination JNDI Name
 - G Click **OK** to create the Listener Port.

Figure 56 WebSphere Administrative Console - Create a Listener Port

Runtime Configuration		
General Properties		
Name	* Topic1_ims_collabPort	Name of the listener port
Initial State	* Started 💌	The execution state requested when the server is first started.
Description		A description of the listener port, for administrative purposes
Connection factory JNDI name	ims/connectionfactory/xa_topic/Logi	 The JNDI name for the JMS connection factory to be used by the listener port; for example, jms/connFactory1.
Destination JNDI name	* Topic1	 The JNDI name for the destination to be used by the listener port; for example, jms/destn1.
Maximum sessions	1	The maximum number of concurrent JMS server sessions used by a listener to process messages, in the range 1 through 2147483647.
Maximum retries	5	The maximum number of times that the listener tries to deliver a message before the listener is stopped, in the range 0 through 2147483647.
Maximum messages	1	The maximum number of messages that the listener can process in one JMS server session, in the range 0 through 2147483647.

14 Save all changes you have made up to this point.

- 15 Start the Listener Port(s) that you created by doing the following:
 - A Navigate to the Listener Ports window (use steps 13, A through D to navigate to this location).
 - **B** Select the checkbox for your Listener Port(s).
 - C Click the **Start** button.
 - D Confirm that each Listener Port entry has a green icon on the **Status** column (last column on the right).
- **16** Start the application by doing the following:
 - A Navigate to the **Enterprise Applications** window.
 - **B** Select the checkbox of your application.
 - C Clicking the Start button.
 - **D** Confirm that the application started by checking the **Status** column.
