Preface

This Sun Blade X6240 Server Module Operating System Installation Guide contains operating system installation and initial software configuration procedures for bringing the server module to a configurable and usable state.

Product Updates

For product updates that you can download for the Sun Blade X6240 server module, visit the following web site:

Find the Hardware Drivers section and click x64 Servers & Workstations. The Sun Blade X6240 server module site contains updates for firmware and drivers, as well as CD-ROM .iso images.

Related Documentation

For a description of the document set for the Sun Blade X6240 Server Module, see the Sun Blade X6240 Server Module Getting Started Guide (820-3975) that is packed with your server module and also posted at the product’s documentation site. Go to the following URL, then navigate to the Sun Blade X6240 product documentation:

http://docs.sun.com/

The documents listed in the following table are available at that site.

Please include the following document title and part number with your feedback:

Sun Blade X6240 Server Module Operating System Installation Guide, 820-3969-11
Overview

This chapter provides an overview of the operating system (OS) installation process for the Sun Blade X6240 server module.

This chapter contains the following sections:

■ “About Installing an Operating System on a Sun Blade X6240 Server Module” on page 1
■ “Supported Operating Systems” on page 2
■ “Installation Prerequisites” on page 2
■ “Installation Instructions” on page 3
■ “Installation Options” on page 3
■ “Related Documentation” on page 4

Note – This document only covers supported Solaris™, OpenSolaris, Linux, and VMware OS installation. For instructions on installing the Microsoft Windows Server 2003/2008 operating systems onto the Sun Blade X6240 server module, see the Sun Blade X6240 Server Module Windows Operating System Installation Guide, 820-3970.

About Installing an Operating System on a Sun Blade X6240 Server Module

There are several supported operating system (OS) distributions and several ways to install each. This document is intended only as a general guide that refers you to detailed procedures.
Supported Operating Systems

Solaris 10 or OpenSolaris 2009.06 is preinstalled on your Sun Blade X6240 server module, if ordered. You may also install these operating systems:

- Solaris 10 5/08 and later
- OpenSolaris 2009.06 or later
- Red Hat Enterprise Linux (RHEL) 4.6, 32-bit and 64-bit
- RHEL 5.1, 64-bit
- SUSE Linux Enterprise Server (SLES) 10 SP2, 64-bit
- VMware ESX Server 3.5 Update 1
- Microsoft Windows Server 2003 Enterprise R2 SP2, 32-bit and 64-bit
- Microsoft Windows Server 2008 Enterprise and Datacenter 32-bit and 64-bit

**Note** – The Solaris 10 5/08 Operating System or OpenSolaris 2009.06 Operating System is preinstalled on the Sun Blade X6240 server module boot disk.

**Note** – For instructions on installing the Windows operating systems onto the Sun Blade X6240 server module, see the Sun Blade X6240 Server Module Windows Operating System Installation Guide (820-3963).

Installation Prerequisites

You must complete the following prerequisite tasks before you can begin installing an OS:

- Install the server hardware.
- Configure the service processor.
- Ensure that the ILOM version installed on the Sun Blade X6240 server module is the same as the version installed on the chassis management module (CMM). ILOM version 2.0.3.9 is recommended.
- Gather needed information, such as IP address and netmask.
Installation Instructions

Chapter 2 (RHEL), Chapter 3 (SLES), Chapter 4 (Solaris), Chapter 5 (OpenSolaris), and Chapter 6 (VMware) provide the information you need to manually install these operating systems.

Tip – We recommend using the Sun Installation Assistant (SIA) to install the Red Hat Enterprise Linux and the SUSE Linux Enterprise Server operating systems. SIA is a convenient, front-end application designed to assist you in installing these operating systems on your server module. SIA supplements the standard installation utilities and procedures that ship with the operating system; it does not replace them. For more information, refer to the Sun Installation Assistant User’s Guide (820-3357).

Installation Options

You have three options for installing an operating system:

- **Local CD Installation.** To install the operating system at the server, you will need to use a dongle cable connected to the front slot of the Sun Blade X6240 server module. The dongle can connect a physical USB CD drive, a keyboard, a mouse, and a monitor. Depending on the equipment you have, you may need a USB hub to increase the number of USB ports available (the Sun-supplied dongle only includes two USB ports).

- **Remote Console Installation.** You can use the ILOM Remote Console application to install the operating system from a server on your network. ILOM 2.0 or later is required. You can download the ILOM 2.0.3.9 firmware for your Sun Blade X6240 server module from the product download page at http://www.sun.com/downloads.

- **PXE Boot** The network ports for the Sun Blade X6240 server module are provided either through a network express module (NEM, NEM+) or PCI express module (PCI EM) installed on the back of the chassis.
Related Documentation

Refer to the following documentation for operating system information:

- **Solaris 10 Installation Guide: Network-Based Installations** at:
  [http://docs.sun.com/app/docs/doc/817-5504](http://docs.sun.com/app/docs/doc/817-5504)

Installing Red Hat Enterprise Linux

This chapter provides information about manually installing Red Hat Enterprise Linux on a Sun Blade X6240 server module.

This chapter contains the following sections:
- “About the Red Hat Enterprise Linux Installation” on page 5
- “Preparing to Install the RHEL Operating System” on page 7
- “Installing the RHEL Operating System From Distribution Media” on page 8
- “Updating the RHEL Operating System” on page 20
- “Installing the RHEL OS Using the Remote Console Application” on page 10
- “Installing Red Hat Enterprise Linux Using PXE” on page 11

About the Red Hat Enterprise Linux Installation

If you have installed Red Hat Enterprise Linux (RHEL) operating system (OS) on other Intel or AMD Opteron servers, you are already familiar with how to install it on a Sun Blade X6240 server module. The two most common methods to install RHEL on your server are to use:
- The RHEL distribution media
- The automatic KickStart installation from RHEL OS (installation tree) stored on a Preboot Execution Environment (PXE) network server
**Tip** – We recommend using the Sun Installation Assistant (SIA) to install the Red Hat Enterprise Linux operating system. SIA is a convenient, front-end application designed to assist you in installing the RHEL OS on your server module. SIA supplements the standard installation utilities and procedures that ship with the operating system; it does not replace them. For more information, refer to the *Sun Installation Assistant User’s Guide* (820-3357).

**Red Hat Installation and Administration Documentation**

Before you install the RHEL OS on a Sun Blade X6240 server module, consult the following RHEL documentation.

**TABLE 2-1**  Sources for RHEL Documentation

<table>

<td>“Updating the RHEL Operating System” on page 20</td>
</tr>
</tbody>
</table>

Preparing to Install the RHEL Operating System

You can install the RHEL OS from a local CD/DVD or from the network. However, you will need to collect some information about your system and your network before you proceed with either of these installation methods. Before you begin installing the RHEL OS, review the procedures listed in this chapter for your installation method.
Obtaining Updated RHEL Operating System Media Kits

The Sun Blade X6240 server module supports the latest versions of the RHEL OS: RHEL 4.6 and RHEL 5.1. To install either of these versions on the server module, you have to obtain either the RHEL 4.6 or RHEL 5.1 Update Media Kit, available at http://rhn.redhat.com.

You will need your Enterprise account information to download the updated ISO images. An Enterprise account is an account that the customer creates to access Red Hat’s support network after purchasing the RHEL Update Media Kit.

Additional Software Updates or Patches

After installing the RHEL OS on the server module, you may also need to update the OS with updates or patches. For more information, see “Updating the RHEL Operating System” on page 20 for details.

Installing the RHEL Operating System From Distribution Media

RHEL provides both a text mode and graphical interface for installing and configuring the OS from distribution media. At the boot prompt, you can select the interface that you want to use. Both options are shown later in this section.

Before You Begin

Installing the RHEL OS from CDs consists of the following procedures:

   See “Obtaining Updated RHEL Operating System Media Kits” on page 8.
2. Install the RHEL OS.
3. Update the RHEL OS.
   See “Updating the RHEL Operating System” on page 20.
Required Items

Installation from distribution media requires the following items:

- Sun Blade X6240 server module equipped with the following four items:
  - USB keyboard and mouse
  - USB CD/DVD drive
  - Monitor
  - Multi-port dongle cable to plug into the front slot of the Sun Blade X6240 server module. Refer to the *Sun Blade X6240 Server Module Installation Guide* (820-3968).
- RHEL OS media CD-ROM set

▼ To Install RHEL From Local Distribution Media

1. Connect the multi-port dongle cable to the connector on the front of the Sun Blade X6240 server module.
   
   For more information, refer to the *Sun Blade X6240 Server Module Installation Guide* (820-3968).

2. Connect the USB connector of the CD/DVD drive to the USB port of the dongle cable.

3. Power on the system.

4. Insert the RHEL Distribution CD-ROM #1 into the CD/DVD drive connected to the Sun Blade X6240 server module and reboot the server.
   
   The server will boot from the CD-ROM and display a `boot:` prompt.
   
   If the installation process does not recognize the CD-ROM, refer to the *Sun Blade X6240 Server Module Product Notes* (820-3972).

5. At the `boot` prompt, select one of the following:

   - For text mode, enter the following command:
     
     `boot: linux text`

   - For graphical mode, press Enter.

6. Refer to the *Red Hat Enterprise Linux Installation Guide* to guide you through the remainder of the installation process.

7. After completing the OS installation, proceed to “Updating the RHEL Operating System” on page 20.
8. Update the RHEL drivers.
   See “To Update the RHEL Drivers” on page 19.

Installing the RHEL OS Using the Remote Console Application

This section explains how to install the RHEL OS on your server using the Integrated Lights Out Manager (ILOM) Remote Console application.

Use the following procedure to install the RHEL 4.6 (or later) OS using the ILOM Remote Console application.

**Note** – Refer to the *Sun Integrated Lights Out Manager 2.0 User’s Guide* (820-1188) for more information on completing the following steps. This guide provides details on using the ILOM service processor web interface to redirect the console to the Remote Console.

▼ **To Install RHEL Using the ILOM Remote Console Application**

1. Locate your RHEL installation CD/DVD or the equivalent ISO images.
2. Connect to the ILOM service processor web interface.
3. Select the Remote Control tab, then select the Mouse Mode Settings tab.
4. If necessary, change the mouse mode to Relative Mouse Mode.
   See the “Remote Console Application” chapter of the *Sun Integrated Lights Out Manager 2.0 User’s Guide* (820-1188) for further instructions.
5. Select the Redirection tab.
6. Click the Launch Redirection button to start the JavaRConsole application.
7. Log in to the JavaRConsole.
8. Select Keyboard and Mouse in the Devices menu to start keyboard and mouse redirection.
   From the JavaRConsole Devices menu, you can redirect the CD in two ways:
   - If you are installing a physical CD-ROM into the remote console CD drive, insert the CD-ROM into the drive and select CD-ROM.
   - If you are using an ISO image installed on the remote console, select CD-ROM image and provide the location of the ISO file.

10. Power on the server using the ILOM web interface.

11. When the boot prompt appears, type `linux text`.

12. When prompted to test the CD media before installation, select Skip if you do not want the media test to run.

13. Refer to the Red Hat Enterprise Linux Installation Guide to guide you through the remainder of the installation process.

---

Installing Red Hat Enterprise Linux Using PXE

The on-board network interface card (NIC) in your Sun Blade X6240 server module supports the Preboot Execution Environment (PXE) network booting protocol. The system BIOS and network interface BIOS on the server module automatically query the network for a Dynamic Host Configuration Protocol (DHCP) server. If a DHCP server on the network has been configured to support the PXE protocol and PXE image servers on the same network, then the BIOS on the server module can be used to install a bootable Red Hat Enterprise Linux (RHEL) image.

Tip – PXE is a powerful and convenient solution for setting up a number of Sun Blade X6240 server modules with identical configurations.
Task Map for the RHEL Installation Using PXE

If you do not have PXE set up on your network and you would like to take advantage of PXE to install RHEL on your network, you need to perform the following tasks:

**TABLE 2-3   Task Map for PXE RHEL Installation**

<table>
<thead>
<tr>
<th>Installation Task</th>
<th>Relevant Topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set up a Linux network and the PXE server.</td>
<td>“Preconfiguring a Network to Support PXE Installation of RHEL” on page 12.</td>
</tr>
<tr>
<td>Reboot the PXE server</td>
<td>“Rebooting the PXE/DHCP Server” on page 18</td>
</tr>
<tr>
<td>Install the RHEL OS from the PXE server.</td>
<td>“Installing the RHEL Operating System From a PXE Server” on page 18.</td>
</tr>
</tbody>
</table>

Preconfiguring a Network to Support PXE Installation of RHEL

This section describes how to preconfigure a network running the RHEL OS to support PXE installation of the RHEL OS on a server module. These procedures assume that you already have a bootable server that is running a version of the RHEL OS to use as a PXE server.

Perform the following procedures to preconfigure your network for PXE installation:

- Configure a DHCP Server
  See “To Configure a DHCP Server” on page 13.

- Install Portmap
  See “To Install Portmap on the DHCP Server” on page 14.

- Configure the TFTP Service
  See “To Configure the TFTP Service on the DHCP Server” on page 14.

- Install and Configure the neopxe Boot Server Daemon
  See “To Install and Configure the neopxe Boot Server Daemon” on page 15.

- Configure the NFS Service
  See “To Configure the NFS Service on the DHCP Server” on page 16.

- Disable the Firewall
  See “To Disable the Firewall” on page 17.
Required Items

Preconfiguring your network for PXE installation requires the following items:
- RHEL server equipped with:
  - USB CD/DVD drive connected to server module through a dongle cable
  - USB keyboard
  - Monitor
- RHEL OS CD-ROM media set
- Tools and Drivers CD (708-0346)

▼ To Configure a DHCP Server

Complete the following steps to configure the server that will be your DHCP server.

1. Turn on the server and log in as superuser.

2. Determine whether the DHCP server package is already installed on the server.
   Type the following command:
   ```
   # rpm -qa | grep dhcp-
   ```

3. If the DHCP server package is not listed, insert the RHEL OS media CD-ROM #5 into the DHCP/PXE server and install the DHCP server.

4. Type the following commands to install the DHCP server:
   ```
   # mount /dev/cdrom /mnt/cdrom
   # rpm -Uvh /mnt/cdrom/RedHat/RPMS/dhcp-*.rpm
   # umount /mnt/cdrom
   ```

5. Remove the CD-ROM from the CD/DVD drive.

6. Set up your DHCP configuration file (for example, /etc/dhcpd.conf) so that only PXELinux requests receive PXELinux responses.
   Enter the following entry to the DHCP configuration file. Refer to the dhcpd.conf man page for more information.
   ```
   class "PXE" {match if substring(option vendor-class-identifier, 0, 9) ="PXEClient"; option vendor-class-identifier "PXEClient"; vendor-option-space PXE;}
   ```

Note – If the server does not already have a dhcpd.conf file in its /etc directory, you can copy the dhcpd.conf file from the sample DHCP configuration file in the /tmp/rhel4-pxefiles or the /tmp/rhel5-pxefiles directory.
7. To start the DHCP service, type:
   # service dhcpd start

8. To configure the server to always start DHCP, type:
   # chkconfig dhcpd on

▼ To Install Portmap on the DHCP Server

1. Determine whether the portmap server package is already installed on the
   server. Type:
   
   # rpm -qa | grep portmap

2. If portmap is not listed, insert RHEL CD #2 and install the portmap service by
   entering the following commands:
   
   # mount /dev/cdrom /mnt/cdrom
   # rpm -Uvh /mnt/cdrom/RedHat/RPMS/portmap-*
   # umount /mnt/cdrom

3. Remove the CD from the server.

▼ To Configure the TFTP Service on the DHCP Server

1. Determine whether the TFTP server package is already installed on the server.
   Type:
   
   # rpm -qa | grep tftp-server

2. If the TFTP server package is not listed, insert RHEL CD #4 and install the
   TFTP service by typing the following commands:
   
   # mount /dev/cdrom /mnt/cdrom
   # rpm -Uvh /mnt/cdrom/RedHat/RPMS/tftp-server*
   # umount /mnt/cdrom

3. Remove the CD from the server.

4. Edit and save the /etc/xinetd.d/tftp file.
   Make the following changes:
   - Change the -s /tftpboot entry to -v -s /home/pxeboot.
   - Change the disable attribute to no.

5. Restart the inetd server. Type:
   
   # service xinetd restart
To Install and Configure the neopxe Boot Server Daemon

Complete the following steps on the DHCP server to install the neopxe boot server daemon. The neopxe server is designed for use with a DHCP server that is running on the same system.

1. **Install the neopxe boot server daemon onto the system that is the DHCP server.** Type:
   ```bash
   # cd /tmp/rhel4-pxefiles/neopxe-0.2.0
   # ./configure
   # make
   # make install
   ```

2. **Append the path /usr/local/sbin/neopxe to the rc.local file** by typing the following command, making sure to use two greater-than signs:
   ```bash
   # echo "/usr/local/sbin/neopxe" >> /etc/rc.d/rc.local
   ```

3. **Copy the PXE Linux image** from the `/tmp/` directory. Type:
   ```bash
   # mkdir /home/pxeboot
   # cp /tmp/rhel4-pxefiles/pxelinux.0 /home/pxeboot
   ```

4. **Configure the PXE Linux image.** Type:
   ```bash
   # mkdir /home/pxeboot/pxelinux.cfg/
   # touch /home/pxeboot/pxelinux.cfg/default
   ```

5. **Edit the /usr/local/etc/neopxe.conf configuration file,** which is read by neopxe at startup.
   - If the neopxe.conf file is not in the `/usr/local/etc` directory, copy it from the `/tmp/rhel4-pxefiles/neopxe-0.2.0/` directory.
   - A valid configuration file must have entries for each of the following lines, including at least one service line.
     ```
     ip_addr=n.n.n.n
     prompt=boot-prompt-string
     prompt_timeout=timeout
     service=service-number,boot-server,boot-file,label
     ```
   Where:
   - `n.n.n.n` is the IP address of your PXE server.
   - `boot-prompt-string` is the character string displayed during a network boot that prompts the user to press the F8 key for a boot menu.
■ *timeout* is the number of seconds the prompt is displayed before the server defaults to the first service for booting.

■ *service-number* is an integer in the range of 1 to 254 that identifies the boot service.

■ *boot-server* is the IP address of the boot server for that boot service.

■ *boot-file* is the name of the boot file that is read from your `/home/pxeboot` directory.

■ *label* is the text string that is displayed when the boot menu is invoked by pressing the F8 key.

For example:

```
ip_addr=192.168.0.1
prompt=Press [F8] for menu.
prompt_timeout=10
service=1,192.168.0.1,pxelinux.0,Linux
service=2,192.169.0.1,nbp.unknown,Solaris
```

**Note** – Refer to the `neopxe.conf` man page for more information.

6. **Start the neopxe daemon.** Type:

```
# /usr/local/sbin/neopxe
```

▼ **To Configure the NFS Service on the DHCP Server**

1. **Determine whether the NFS service package is already installed on the server.**

Type:

```
# rpm -qa | grep nfs-utils
```

2. **If the NFS service package is not listed, insert RHEL CD #2 and install the NFS service by typing the following commands:**

```
# mount /dev/cdrom /mnt/cdrom
# rpm -Uvh /mnt/cdrom/RedHat/RPMS/nfs-utils-*
# umount /mnt/cdrom
```

3. **Remove the CD from the server.**

4. **Edit and save the /etc/exports file to add the following line:**

```
/home/pxeboot *(no_root_squash,no_subtree_check,insecure)
```
5. Start the NFS service. Type:
   
   ```
   # service nfs start
   ```

6. Configure the server to always start the NFS service. Type:
   
   ```
   # chkconfig nfs on
   # chkconfig nfslock on
   ```

**Note** – If you are using a DNS server, verify that DNS entries exist for the range of addresses defined in the PXE subnet dynamic-bootp entry in the `dhcpd.conf` file. If you are not using a DNS server, edit the `/etc/hosts` file to add the range of host addresses found in the PXE subnet dynamic-bootp entry in the `dhcpd.conf` file.

---

### To Disable the Firewall

**Caution** – Security vulnerability. When you disable the firewall protection on the system that is your PXE server, the security of the data on that server cannot be ensured. If this server is networked outside of your local intranet, be sure to re-enable the firewall after downloading software to PXE clients.

If you enabled firewall security when you installed the RHEL OS on the system that will be your PXE server, complete the following steps to disable the firewall so that PXE clients can download from the server.

1. Stop the `ipchains` service. Type the command:
   
   ```
   # service ipchains stop
   ```

2. Stop the `iptables` service. Type the command:
   
   ```
   # service iptables stop
   ```

3. Stop the `ipchains` service from starting when you restart the server. Type the command:
   
   ```
   # chkconfig ipchains off
   ```

4. Stop the `iptables` service from starting when you restart the server. Type the command:
   
   ```
   # chkconfig iptables off
   ```

**Note** – You might encounter error messages if the `ipchains` service is not installed on the server. You can safely ignore these messages.
Rebooting the PXE/DHCP Server

When you have completed all the previous configuration steps, reboot the PXE/DHCP server and proceed to the next section, “Installing the RHEL Operating System From a PXE Server” on page 18.

Installing the RHEL Operating System From a PXE Server

This procedure describes how to configure your Sun Blade X6240 server module to initiate the request to download the RHEL OS boot image file from the PXE/DHCP server and how to install the boot image onto your Sun Blade X6240 server module.

Before You Begin

Before you install the RHEL OS from a PXE server, you must complete the following tasks:

■ Configured your Linux network to support a PXE server. See “Preconfiguring a Network to Support PXE Installation of RHEL” on page 12.
■ Reboot the PXE/DHCP server. See “Rebooting the PXE/DHCP Server” on page 18.

▼ To Install a RHEL Operating System From a PXE Server

1. Connect the PXE client to the same network as the PXE server, and power on the PXE client.
   The PXE client is the target Sun Blade X6240 server module to which you are installing the RHEL OS.

2. When the PXE client prompts you for a network boot, press the F12 key.
   The PXE client connects to the PXE server and attempts to obtain an IP address from the DHCP server.

3. When prompted, press the F8 key to begin downloading the PXE boot image.

4. At the boot: prompt, enter in the label you gave the image when you installed the RHEL image on the PXE server.
   The RHEL install image downloads onto the target Sun Blade X6240 server module.
5. To configure the RHEL OS for your server, refer to the manual that is shipped with your RHEL OS media kit.

6. Update the RHEL drivers.
   
   See “To Update the RHEL Drivers” on page 19

7. Update the RHEL OS files.
   
   See “Updating the RHEL Operating System” on page 20

▼ To Update the RHEL Drivers

1. Insert the Tools and Drivers CD for Sun Blade X6240 and mount it onto the directory /mnt by typing the following command:

   ```
   # mount /dev/cdrom /mnt
   ```

2. To install the igb and nvsata drivers, type:

   ```
   # cdrom/drivers/linux/red_hat/install.sh
   ```

3. If the server module has a REM that uses LSI drivers and you are using RHEL 4.6, do the following:

   a. Type: # cd /mnt/drivers/linux/RAID/LSI/drivers/RHEL4-SLES9
   
      b. Unzip the file linuxmpt_RH4_SLES9_3122700-1.zip
   
      c. Type: # rpm -ivh nvsata-rhel4.6-3.2-1.24.x86_64.rpm

4. If the server module has a REM that uses LSI drivers and you are using RHEL 5, do the following:

   a. Type: # cd /mnt/drivers/linux/RAID/LSI/drivers/RHEL5-SLES10
   
      b. Unzip the file linuxmpt_RH5_SLES10_4002100-1.zip
   
      c. Type: # rpm -ivh nvsata-rhel5u1-3.4-1.24.x86_64.rpm

5. If the server module has a REM that uses StorageTek drivers, do the following:

   a. Type: # cd /mnt/drivers/linux/RAID/StorageTek/drivers/
   
      b. Unzip the file linux_aac_1152455.zip
   
      c. Type: # rpm -ivh aacraid-1.1.5-2455.rpm

   The installation of the drivers is now complete.

6. Reboot the server module for the changes to take effect. Type:

   ```
   # reboot
   ```
Updating the RHEL Operating System

Since software is constantly being updated, your distribution media might not contain the most up-to-date versions of the OS.

The following procedures assume that you have already installed the RHEL OS on the Sun Blade X6240 server module. This procedure explains how to update the RHEL installation with the latest OS.

To use the RHEL 5 update program, your server must be registered with the Red Hat Network (RHN).

To update the RHEL OS, perform one of the following procedures as appropriate:

■ “To Update the RHEL 4 Software” on page 20
■ “To Update the RHEL 5 Software” on page 20

▼ To Update the RHEL 4 Software

This procedure assumes that your server module has access to the internet.

1. Set up the up2date program on the server module.
   Refer to the documentation included with your RHEL Update Media Kit for details.

2. Run the up2date program.
   Select the kernel packages in the available package updates section.

▼ To Update the RHEL 5 Software

Your server module must have access to the internet and be registered with the Red Hat Network.

1. To run the yum update program, type:

   # yum

   The program checks that the machine is registered with Red Hat Network. If so, yum downloads necessary updates from the Red Hat Network repository.
2. Answer the questions and make your choices before the packages are downloaded and installed.

You should periodically update your system using `yum`.
For more information, refer to the man page. Type:

```
# man yum
```
CHAPTER 3

Installing SUSE Linux Enterprise Server 10

This chapter contains information about manually installing SUSE Linux Enterprise Server (SLES) 10 operating system (OS) on a Sun Blade X6240 server.

This chapter contains the following sections:
- “Installing the SLES 10 Operating System” on page 24.
- “Preconfiguring the Network to Support PXE Installation of SLES 10” on page 28
- “Installing the SLES 10 Operating System Using PXE” on page 35
- “Updating the SLES 10 Operating System” on page 38
- “Updating the SLES Drivers” on page 39

Tip – We recommend using the Sun Installation Assistant (SIA) to install the SUSE Linux Enterprise Server operating system. SIA is a convenient, front-end application designed to assist you in installing the SLES OS on your server module. SIA supplements the standard installation utilities and procedures that ship with SLES; it does not replace them. For more information, refer to the Sun Installation Assistant Windows and Linux User’s Guide, 820-3357.
About the SUSE Linux Installation

The most common methods for installing SLES 10 on your server are:

- Installation from your SLES 10 distribution media from a local or remote CD (see “Preparing to Install the SLES 10 Operating System” on page 26).
- Installation from the network, either from a Preboot Execution Environment (PXE) image stored on a PXE server on your local network or from an image stored elsewhere on your network (see “Installing the SLES 10 Operating System Using PXE” on page 35).

Installing the SLES 10 Operating System

This section describes how to install the SLES 10 OS.

**Note** – The minimum supported SLES version is SLES 10 Service Pack 2 (SP2).

SLES 10 Installation and Configuration Documentation

Before you install SLES 10 on your server, refer to the SLES 10 documentation.

**TABLE 3-1** Sources for SLES 10 Documentation

<table>
<thead>
<tr>
<th>Document</th>
<th>Description</th>
<th>Where to Find</th>
</tr>
</thead>
<tbody>
<tr>
<td>README file</td>
<td>This file contains late-breaking information about system requirements and system configuration for your version of SLES 10.</td>
<td>On the first SLES 10 installation CD</td>
</tr>
<tr>
<td>Release Notes</td>
<td>Product Release Notes</td>
<td>On the first SLES 10 installation CD under the docu directory</td>
</tr>
</tbody>
</table>
### TABLE 3-2  Task Map for the SLES 10 Installation

<table>
<thead>
<tr>
<th>Installation Task</th>
<th>Relevant Topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install the SLES 10 SP2 OS from local or remote CD/DVD drive.</td>
<td>“Preparing to Install the SLES 10 Operating System” on page 26 or “Installing SLES 10 Operating System Using the Remote Console Application” on page 27</td>
</tr>
</tbody>
</table>

Install the SLES 10 SP2 OS using one of the following methods:

- Install the SLES 10 SP2 OS from local or remote CD/DVD drive or PXE server. |

  “Preparing to Install the SLES 10 Operating System” on page 26 or “Installing SLES 10 Operating System Using the Remote Console Application” on page 27

- Install the SLES 10 SP2 OS from an image stored on a networked system.

  SUSE Linux Enterprise Server 10 Installation and Administration Guide

- Install the SLES 10 SP2 OS from a PXE server.

  “Installing the SLES 10 Operating System Using PXE” on page 35

---

Task Map for the SLES 10 Installation

Consult the following table to determine which procedures documented in this help system are relevant to the installation task(s) that you need to perform.
Preparing to Install the SLES 10 Operating System

You can install the SLES 10 OS from a local CD/DVD drive, remote CD/DVD drive, or the network; however, you need to collect some information about your system before you proceed with any one of these installation methods.

Before installing SLES 10 on your server, verify or collect the following information:
- Dynamic Host Configuration Protocol (DHCP) server name
- MAC address on system label
- SLES 10 SP2 CD set

Installing the SLES 10 Operating System From Distribution Media

The SLES 10 OS provides an easy-to-use graphical interface for installing and configuring the OS. Whether you are using Distribution CDs to install the SLES 10 OS from a locally attached CD/DVD drive or from a remote CD/DVD drive attached via KVMS, the installation procedure is fundamentally the same.

Required Items
- SLES 10 media base CD or DVD set
- SLES 10 installation guide, SUSE Linux Enterprise Server 10 Installation and Administration Guide (see “SLES 10 Installation and Configuration Documentation” on page 24)
- Sun Blade X6240 server module equipped with the following four items:
  - USB keyboard and mouse.
  - USB CD/DVD drive.
  - Monitor.
  - Multi-port dongle cable to connect to the front of the Sun Blade X6240 server module. Refer to the Sun Blade X6240 Server Module Installation Guide (820-3968).

▼ To Install SLES 10 From Distribution Media

1. Connect the USB CD/DVD drive to the USB port of the dongle.
2. Power on the system.
3. Press F8 and select CDROM when prompted.

4. Insert SLES 10 CD #1 into your local CD/DVD drive.

5. Follow the installation instructions provided in the SUSE Linux Enterprise Server 10 Installation and Administration Guide to complete the installation of the system OS.

Installing SLES 10 Operating System Using the Remote Console Application

This section describes how to install the SLES 10 OS on your Sun Blade X6240 server module using the ILOM Remote Console application.

▼ To Install SLES 10 Using the Remote Console Application

1. Locate your SLES 10 OS installation CD/DVD or the equivalent ISO images.

2. Connect to the ILOM service processor web interface.
   See the topic that describes how to log in to the Sun ILOM web interface in the Sun Integrated Lights-Out Manager 2.0 User’s Guide (820-1188).

   Note – There are multiple versions of ILOM. Be sure to refer to the guide that matches your server’s installed version of ILOM.

3. Select the Remote Control tab, then the Mouse Mode Settings tab.

4. If necessary, change the mouse mode to Relative Mouse Mode.
   See the “Remote Console Application” chapter of the Sun Integrated Lights Out Manager 2.0 User’s Guide for more information (820-1188).

5. Select the Redirection tab.

6. Click the Launch Redirection button to start the JavaRConsole application.

7. Log in to the JavaRConsole.

8. Start keyboard and mouse redirection.
   Select Keyboard and Mouse in the Devices menu.

   From the JavaRConsole Devices menu, you can redirect the CD in two ways:
10. Power on the server using the ILOM web interface.

11. When the SLES 10 OS installation menu appears, use the arrow keys to select Installation and press Enter.

12. Proceed with the SLES 10 OS installation as usual.

Preconfiguring the Network to Support PXE Installation of SLES 10

These procedures describe how to preconfigure your network running the 10 OS to support Preboot Execution Environment (PXE) installation of the SLES OS on your Sun Blade X6240 server. These procedures assume that you already have a bootable server that is running a version of the SLES 10 OS.

Preconfiguring your network for PXE installation involves the following procedures:

- “Configuring the DHCP Server” on page 29
- “Installing Portmap” on page 30
- “Configuring the TFTP Service” on page 30
- “Installing and Configuring the neopxe Boot Server Daemon” on page 31
- “Configuring the NFS Service” on page 33
- “Disabling the Firewall” on page 34

Required Items

Preconfiguring your network for PXE installation requires the following items:

- SLES 10 server equipped with:
  - CD/DVD drive
  - USB keyboard
  - Monitor (optional)
- SLES 10 media set
- Tools and Drivers CD (708-0346)
Configuring the DHCP Server

Complete the following steps on the server that will be your DHCP server.

▼ To Configure the DHCP Server

1. Power on the server and log in as superuser.

2. Determine whether the DHCP server package is already installed on the server. Type the following command:
   ```bash
   # rpm -qa | grep dhcp-server
   ```

3. If the DHCP server package is not listed, install the package using YaST. Type the following command:
   ```bash
   # yast -i dhcp-server
   ```

4. Set up the DHCP configuration file (for example, `/etc/dhcpd.conf`) so that only PXEClient requests receive PXEClient responses. Add the following entry to the DHCP configuration file (refer to the `dhcpd.conf` man page for more information).
   ```
   class "PXE" {match if substring(option vendor-class-identifier, 0,9) = "PXEClient"; option vendor-class-identifier "PXEClient"; vendor-option-space PXE; next-server n.n.n.n;}
   ```
   Where `n.n.n.n` is the IP address of the server.

   **Note** – You can start with a sample DHCP configuration file in the `/tmp/sles9-pxefiles` or `/tmp/sles10-pxefiles` directory.

5. In the DHCP configuration file, edit the `server-identifier` entry:
   ```
   server-identifier n.n.n.n
   ```
   Where `n.n.n.n` is the PXE/DHCP server’s IP address.

6. In the DHCP configuration file, find the subnet entry fields:
   ```
   subnet 1.2.3.0 netmask 255.255.255.0 {
   range dynamic-bootp 1.2.3.100 1.2.3.200;
   option routers 1.2.3.1;
   option broadcast-address 1.2.3.225;
   }
   ```
7. Edit the subnet, range, router and broadcast-address entries according to the PXE/DHCP server's network configuration.

8. Edit the /etc/sysconfig/dhcpd file and verify that the DHCPD_INTERFACE is set to the interface that is connected to the network you are planning to run the PXE server.
   For example, if you are using Ethernet interface 0, the DHCPD_INTERFACE variable would be set as follows:
   DHCPD_INTERFACE="eth0"

9. Start the DHCP service. Type the following command:
   # /etc/init.d/dhcpd start

10. Configure the server to always start DHCP. Type the following command:
    # chkconfig dhcpd on

Installing Portmap

Complete the following steps on your DHCP server to install the portmap server package.

▼ To Install Portmap

1. Determine whether the portmap server package is already installed on the DHCP server. Type the following command:
   # rpm -qa | grep portmap

2. If portmap is not listed, install the package using YaST. Type the following command:
   # yast -i portmap

Configuring the TFTP Service

Complete the following steps on your DHCP server to configure the TFTP service.
To Configure the TFTP Service

1. Determine whether the TFTP server package is already installed on the DHCP server. Type the following command:
   
   ```
   # rpm -qa | grep tftp
   ```

2. If the TFTP server package is not listed, install the package using YaST. Type the following command:

   ```
   # yast -i tftp
   ```

3. Edit and save the `/etc/xinetd.d/tftp` file. Make the following changes:
   - Change the `-s /tftpboot` entry to `-v -s /home/pxeboot`
   - Change the disable attribute to `no`

4. Restart the inetd server. Type the following command:

   ```
   # /etc/init.d/xinetd restart
   ```

Installing and Configuring the neopxe Boot Server Daemon

Complete the following steps on the DHCP server to configure the neopxe boot server daemon. The neopxe server is designed for use with a DHCP server that is running on the same system.

To Install and Configure the neopxe Boot Server Daemon

1. If a compiler is not installed on the server, use YaST to install gcc with the following commands:

   ```
   # yast -i gcc
   # yast -i make
   ```

2. Install the neopxe boot server daemon on the DHCP server. Depending on your OS version, type the following command:

   For SLES 9:

   ```
   # cd /tmp/sles9-pxefiles/neopxe-0.2.0
   ```

   For SLES 10:

   ```
   # cd /tmp/sles10-pxefiles/neopxe-0.2.0
   ```
3. Type the following commands:
   
   ```
   # ./configure
   # make
   # make install
   ```

4. Append the path `/usr/local/sbin/neopxe` to the `rc.local` file by typing the following command, making sure to use two greater-than signs:
   
   ```
   # echo "#/usr/local/sbin/neopxe" >> /etc/rc.d/boot.local
   ```

5. Copy the PXE Linux image from the `/tmp/` directory. Type the following commands:
   
   ```
   # mkdir /home/pxeboot
   ```

6. Depending on your OS version, type the following command:
   
   For SLES 9:
   ```
   # cp /tmp/sles9-pxefiles/pxelinux.0 /home/pxeboot
   ```
   
   For SLES 10:
   ```
   # cp /tmp/sles10-pxefiles/pxelinux.0 /home/pxeboot
   ```

7. Configure the PXE Linux image. Type the following commands:
   
   ```
   # mkdir /home/pxeboot/pxelinux.cfg/
   # touch /home/pxeboot/pxelinux.cfg/default
   ```

8. Edit the `/usr/local/etc/neopxe.conf` configuration file, which is read by `neopxe` at startup.
   
   If the `/usr/local/etc/` directory does not exist, create it with the following command:
   ```
   # mkdir /usr/local/etc
   ```
   
   If you need to create the `neopxe.conf` file, you can copy it from the `/tmp/slesX-pxefiles/neopxe-0.2.0/` directory. Where `X` is the OS version (9 or 10).

   A valid configuration file must have entries for each of the following lines, including at least one service line.
   ```
   ip_addr=n.n.n.n
   prompt=boot-prompt-string
   prompt_timeout=timeout
   service=service-number,boot-server,boot-file,label
   ```

   Where:
   - `n.n.n.n` is the IP address of your PXE server.
   - `boot-prompt-string` is the character string displayed during a network boot that prompts the user to press the F8 key for a boot menu.
 ■ timeout is the number of seconds the prompt is displayed before the server
defaults to the first service for booting.

 ■ service-number is an integer in the range of 1 to 254 that identifies the boot
service.

 ■ boot-server is the IP address of the boot server for that boot service.

 ■ boot-file is the name of the boot file that is read from your /home/pxeboot
directory.

 ■ label is the text string that is displayed when the boot menu is invoked by
pressing the F8 key.

 For example:

 ip_addr=192.168.0.1
 prompt=Press [F8] for menu...
 prompt_timeout=10
 service=1,192.168.0.1,pxelinux.0,linux
 service=2,192.169.0.1,nbp.unknown,Solaris

 Note – Refer to the neopxe.conf man page for more information.

 9. Start the neopxe daemon. Type the following command:

 # /usr/local/sbin/neopxe

 Configuring the NFS Service

 Complete the following steps on your DHCP server to configure the NFS service.

 ▼ To Configure the NFS Service

 1. Determine whether the NFS service package is already installed on the server.
 Type the following command:

 # rpm -qa | grep nfs-utils

 2. If the NFS service package is not listed, install the package using YaST. Type
the following command:

 # yast -i nfs-utils

 3. Edit and save the /etc/exports file to add the following line to it:

 /home/pxeboot *(sync,no_root_squash,no_subtree_check,insecure)
4. Start the NFS service. Type the following command:

   # /etc/init.d/nfsserver start

5. Configure the server to always start the NFS service. Type the following commands:

   # chkconfig nfsslock on
   # chkconfig nfsserver on

**Note** – If you are using a DNS server, verify that DNS entries exist for the range of addresses defined in the PXE subnet dynamic-bootp entry in the dhcpd.conf file. If you are not using a DNS server, edit the /etc/hosts file to add the range of host addresses found in the PXE subnet dynamic-bootp entry in the dhcpd.conf file.

---

**Disabling the Firewall**

If a firewall is enabled on your PXE/DHCP server, you must disable it before attempting to install a PXE image onto the client system.

**Caution** – Network security vulnerability. When you disable the firewall protection on the system that is your PXE server, the security of the data on that server cannot be ensured. If this server is networked outside of your local intranet, be sure to re-enable the firewall after downloading software to PXE clients.

▼ To Disable the Firewall

1. Execute the YaST command. Type the following command:

   yast

3. Select Firewall.

   - Select none to disable the firewall for all network interfaces.
   - Select specific interfaces to enable the firewall on only those interfaces.
Installing the SLES 10 Operating System Using PXE

PXE is a powerful and convenient solution for setting up a number of Sun Blade X6240 server module so that their configurations are identical.

Before You Begin

The network interface card (NIC) in your Sun Blade X6240 server module supports the PXE network booting protocol. The system BIOS and network interface BIOS on the server module automatically query the network for a DHCP server.

Task Map for the SLES 10 Installation

Before you can perform PXE installations over the network, you need to complete the following tasks.

<table>
<thead>
<tr>
<th>Table 3-3 Task Map for Installing SLES 10 Using PXE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
</tr>
<tr>
<td>Set up your Linux network and PXE server.</td>

<td>Install a SLES 10 image on that PXE server.</td>
</tr>
<tr>
<td>Configure your server to boot from or to install from a SLES 10 image on a PXE server.</td>
</tr>
</tbody>
</table>

Required Items

The PXE installation procedure requires the following items:

- The DHCP server that you set up when you preconfigured your network to support PXE installation equipped with a CD/DVD drive
- SLES 10 CD media set
- Tools and Drivers CD (708-0346)
Configuring a SLES 10 PXE Install Image on the PXE Server

This procedure describes how to configure a PXE install image on the DHCP server so that it can also act as your PXE server. The PXE server provides the OS files to your PXE client.

Perform the following procedures to create an SLES 10 image on the PXE server:

- “Setting Up and Copying SLES 10 Operating System to a Directory” on page 36
- “Creating Links to SLES 10 PXE Files” on page 37

Setting Up and Copying SLES 10 Operating System to a Directory

The following procedure describes how to create and set up the directory that will contain the SLES 10 files for PXE installation and how to copy the SLES 10 OS to the directory.

▼ To Set Up and Copy the SLES 10 Operating System to a Directory

**Note** – You can use a different target directory than the `/home/pxeboot/sles10/` directory shown. The examples in this procedure use this directory.

1. Set up the directory structure that will hold the SLES 10 image. Type the following commands:

   ```
   # mkdir -p /home/pxeboot/sles10/CD1
   # mkdir -p /home/pxeboot/sles10/CD2
   # mkdir -p /home/pxeboot/sles10/CD3
   # mkdir -p /home/pxeboot/sles10/CD4
   ```

2. Insert SLES 10 CD #1 into your server and copy its content to your PXE server. Type the following command:

   ```
   # mount /dev/cdrom /mnt/cdrom
   # cp -r /mnt/cdrom/* /home/pxeboot/sles10/CD1/
   # umount /mnt/cdrom
   ```

3. Remove SLE S10 CD #1 from the server.
4. Repeat the above procedure for copying CD #2, #3 and #4 to their corresponding directories in /home/pxeboot/sles10/ as given below:

```bash
# cp -r /mnt/cdrom/* /home/pxeboot/sles10/CD2/
# cp -r /mnt/cdrom/* /home/pxeboot/sles10/CD3/
# cp -r /mnt/cdrom/* /home/pxeboot/sles10/CD4/
```

Creating Links to SLES 10 PXE Files

Perform the following procedure to create links to the PXE files.

▼ To Create Links to the SLES 10 PXE Files

1. Copy the `autoinst.xml` file from the `/tmp/sles10/` directory to the root of the PXE image. Type the following command:

```bash
# cp /tmp/sles10/autoinst.xml /home/pxeboot/sles10/
```

2. On your PXE server, modify the file `/home/pxeboot/pxelinux.cfg/default` adding the following entry to it:

```bash
default sles10
label sles10
kernel sles10/CD1/boot/x86_64/loader/linux
append textmode=1 initrd=sles10/CD1/boot/x86_64/loader/initrd
install=nfs://n.n.n.n/home/pxeboot/sles10/CD1
autoyast=nfs://n.n.n.n/home/pxeboot/sles10/autoinst.xml
```

Where `n.n.n.n` is the IP address of your PXE server.

3. Save and exit the file.

Installing SLES 10 From a PXE Server

This procedure describes how to configure your Sun Blade X6240 server module to initiate the request to download the boot image file from the PXE/DHCP server and how to install the SLES 10 boot image onto the Sun Blade X6240 server module.
Before You Begin

Before performing with this procedure, you must complete the following tasks:

- Configured your Linux network to support a PXE server. See “Installing the SLES 10 Operating System Using PXE” on page 35.
- Installed a SLES 10 image on that Linux PXE server. See “Configuring a SLES 10 PXE Install Image on the PXE Server” on page 36.

▼ To Install SLES 10 From a PXE Server

1. Connect the PXE client to the same network as the PXE server.
   The PXE client is the target Sun Blade X6240 server module to which you are installing the SLES 10 OS.

2. Power on the PXE client and press F12 to select network boot.

3. When you are prompted at the \texttt{boot:} prompt, type in the label you gave the image when you installed it on the PXE server (\texttt{sles10} in the example above).

4. To configure your SLES 10 Linux server, refer to the Installation and Administration Guide on SLES 10 CD #1.

5. Perform an Online Software Update to update the OS files (see “Updating the SLES 10 Operating System” on page 38).

---

Updating the SLES 10 Operating System

The SLES OS installation media might not contain the most up-to-date versions of the SLES OS. This procedure describes how to update the SLES OS on your server after you have installed it from a PXE server or distribution CDs.

▼ To Update the SLES Operating System

1. Log in as superuser.

2. Type the following command to run the YaST Online Update:
   \begin{verbatim}
   # you
   \end{verbatim}
   Note that YaST can operate in both text and graphical modes. These directions apply to both.
3. If you are behind a network firewall and need to use a proxy server in order to access the internet, you must first configure YaST with the correct proxy information.

   a. Select the Network Services tab on the left, then the Proxy screen on the right. Type the correct proxy URLs in both the HTTP and HTTPS fields.

   Note – In order for the on-line update service to function correctly through a network HTTP proxy, the following additional configuration step must be performed.

   b. Exit the YaST utility and run the following command:

      `rug set-prefs proxy-url Proxy URL`

      where `Proxy URL` is the fully qualified URL of your proxy server (for example: `http://proxy.yourdomain:3128`).

   c. After successfully running the command, launch YaST again.

4. Register with the Novell Customer Center.

   Note – You will need your Novell Customer Center user name and password, as well as an SLES 10 product activation code.

   a. Select the Software tab on the left.

   b. Select Novell Customer Center Configuration and follow the directions.

5. Once registered, select the Online Update tab to perform the software update.

### Updating the SLES Drivers

The SLES drivers need to be updated. Perform this procedure after you have installed and updated the SLES 10 OS.

▼ To Update the SLES Drivers

1. Insert the Tools and Drivers CD for Sun Blade X6240 and mount it onto the directory `/mnt` it by typing the following command:

   ```
   # mount /dev/cdrom /mnt
   ```
2. To install the igb and nvsata drivers, type:

   # cdrom/drivers/linux/suse/install.sh

3. If the server module has a REM that uses LSI drivers and you are using SLES 10, do the following:
   a. Type: # cd /mnt/drivers/linux/RAID/LSI/drivers/RHEL5-SLES10
   b. Unzip the file linuxmpt_RH5_SLES10_4002100-1.zip
   c. Type: # rpm -ivh nvsata-rhel5u1-3.4-1.24.x86_64.rpm

4. If the server module has a REM that uses StorageTek drivers, do the following:
   a. Type: # cd /mnt/drivers/linux/RAID/StorageTek/drivers/
   b. Unzip the file linux_aac_1152455.zip
   c. Type: # rpm -ivh aacraid-1.1.5-2455.rpm

   The installation of the drivers is now complete.

5. Reboot the server module for the changes to take effect. Type:

   # reboot
Installing Solaris 10

This chapter provides information about installing the Solaris 10 5/08 Operating System (Solaris 10 OS) on a Sun Blade X6240 server module.

This chapter includes the following sections:
- “About the Solaris 10 Installation” on page 42
- “System Requirements” on page 42
- “Download Solaris OS” on page 43
- “Solaris Documentation” on page 43
- “Installation Methods” on page 44
- “Task Map for Solaris 10 Installation” on page 46
- “Preparing to Install the Solaris Operating System” on page 47
- “Booting a Server in a GRUB-Based Environment” on page 48
- “Booting a Server Over the Network Using PXE” on page 49
- “Installing the Solaris Operating System From Distribution Media” on page 50
- “Installing the Solaris Operating System Using a Serial Console” on page 51

**Note** – The information in this chapter is intended for experienced system administrators who are familiar with using the Solaris Operating System on an x86 platform.
About the Solaris 10 Installation

**Note** – This chapter contains information about installing the Solaris 10 OS from network or media. If you are configuring the preinstalled Solaris 10 OS that is shipped with the server, refer to the *Sun Blade X6240 Server Module Installation Guide* (820-3961).

The sections in this chapter describe what you need to know to install Solaris OS on a Sun Blade X6240 server module. However, to complete the installation you will need to frequently reference procedures in other Solaris OS documentation. A list of the necessary additional documentation is provided in the section “Solaris Documentation” on page 43.

**Note** – In this chapter the term “x86” refers to the Intel 32-bit family of microprocessors and compatible 64-bit and 32-bit microprocessors made by AMD. For supported systems, see the Solaris Hardware Compatibility List at [http://www.sun.com/bigadmin/hcl](http://www.sun.com/bigadmin/hcl).

System Requirements

**TABLE 4-1** summarizes the system requirements for installing Solaris 10 on a Sun Blade X6240.

**TABLE 4-1**  System Requirements

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware requirements</td>
<td>The server hardware and the initial service processor configuration must be installed before you install the Solaris OS.</td>
</tr>
<tr>
<td>Minimum Solaris OS</td>
<td>Solaris 10 5/08 OS.</td>
</tr>
<tr>
<td>Memory to install</td>
<td>Memory size is between 4 GB and 64 GB.</td>
</tr>
<tr>
<td>Disk space</td>
<td>12 GB or greater.</td>
</tr>
</tbody>
</table>
Download Solaris OS

- You can download or order the media for Solaris 10 5/08 at http://www.sun.com/servers/blades/downloads.jsp.
- Additional software is shipped separately on a Tools and Drivers CD. Contact your Sun service provider if you need to order the Solaris OS or if you are missing the Tools and Drivers CD.
- For updates on Solaris 10 versions and hardware compatibility, go to http://www.sunsolve.sun.com.

Note – The Solaris 10 OS is shipped with the CD and DVD media and documentation that you will need to install the Solaris OS for both SPARC and x86 platforms. For a Sun Blade X6240 server module, use the media for x86 platforms.

Solaris Documentation

Solaris OS documentation is available from the web at http://docs.sun.com/.

- For the Solaris 10 installation guides, see http://docs.sun.com/app/docs/coll/1236.8
- For the Solaris 10 administration guides, see http://docs.sun.com/app/docs/coll/47.16
- For information about upgrading your system, see http://docs.sun.com/app/docs/doc/820-4041
- For troubleshooting information, see Appendix A at http://docs.sun.com/app/docs/doc/820-4040

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Swap area</td>
<td>512 MB is the default size.</td>
</tr>
<tr>
<td>x86/x64 processor</td>
<td>x86/x64 120-MHz or faster processor is recommended. Hardware floating point support is required.</td>
</tr>
<tr>
<td>BIOS</td>
<td>Industry standard x86/x64 BIOS (resident in FLASH). The BIOS must be able to boot from CD or DVD media.</td>
</tr>
</tbody>
</table>
Note – The Solaris installation guides are provided as a collection of installation related documents. The URL for the installation guides listed above points to the installation collection for Solaris 10 5/08. A listing of installation collections for different versions of Solaris (including more recent versions if available) is provided at http://docs.sun.com/app/docs/prod/solaris.10

Solaris 10 documentation is also available on the Solaris Documentation DVD included with your Solaris OS software.

Installation Methods

The Sun Blade X6240 server module supports the following Solaris OS installation methods:

- Boot from the preinstalled Solaris 10 OS image on the hard drive.
- Install one server from DVD or CD-ROM media interactively with the Solaris Installation Program. The Solaris Installation Program is available on the Solaris 10 media and includes the Solaris Device Configuration Assistant. You can run the Solaris Installation Program with either a graphical user interface (GUI) or as an interactive text installer in a console session.
- Install one or several servers over the network with Preboot Execution Environment (PXE) technology and the following installation methods:
  - Solaris installation program over the network from remote DVD or CD images
  - JumpStart™ installation
  - Diskless boot installation
  - Serial console installation
**TABLE 4-2** summarizes the installation methods described in this chapter, and provides pointers to the installation instructions.

<table>
<thead>
<tr>

Preparing to Install the Solaris Operating System

You need to gather information about your system before you install the Solaris OS. The amount of planning and initial set up that you need to perform varies and depends on whether you are preparing for a local installation from CD/DVD, or you are preparing for a PXE-based network installation.

You also need to obtain the appropriate media for your installation.

<table>
<thead>
<tr>

Installation Prerequisites

You must complete the following tasks before you install the Solaris OS.

1. Verify that your system meets the minimum system requirements (see “System Requirements” on page 42).

2. If you are using the Solaris Installation Program GUI or text installer, you need a local CD/DVD drive or a network connection, a keyboard, and a monitor. You will also need the multi-port dongle cable to connect to the front of the server module. For more information, see the Sun Blade X6240 Server Module Installation Guide (820-3968).

3. Gather the information you need to install the Solaris OS.
   - For Solaris 10 installations go to http://docs.sun.com/app/docs/doc/819-5775.
For a non-networked system, you need to know the host name of the system you are installing and the language and the locales that you intend to use on the system.

For a networked system, use the checklist to gather the following information:
- Host name of the system that you are installing
- Language and locales that you intend to use on the system
- IP address of the name server
- Subnet mask
- Type of name service (for example, DNS, NIS, or NIS+)
- IP address of gateway
- Domain name
- Host name of the name server
- IP address of the name server
- Root password

4. If you are installing the Solaris OS over the network, you need to set up a PXE-based network installation before you install the Solaris OS.
   - For information about setting up a PXE-based network installation, see “Booting a Server Over the Network Using PXE” on page 49.

Note – Consult the appropriate platform guide that ships with Solaris 10 for detailed information about remote installation via USB. If USB-based installation is not supported, use PXE.

Booting a Server in a GRUB-Based Environment

Starting with the Solaris 10 1/06 (Solaris 10 version 1/06) release, x86-based systems use the open-source GNU Grand Unified Bootloader (GRUB). GRUB is the boot loader that is responsible for loading a boot archive into a system’s memory. The boot archive contains the kernel modules and configuration files that are required to boot the system. For more information on GRUB, refer to the grub(5) man page.

For information on how to boot a Sun Blade X6240 server module that is running Solaris 10 in a GRUB-based environment, refer to the Solaris 10 System Administration Guide: Basic Administration at: http://docs.sun.com/app/docs/doc/819-2379
Booting a Server Over the Network Using PXE

Use this procedure along with the instructions in Solaris 10 Installation Guide: Networked-Based Installations at http://docs.sun.com/app/docs/doc/820-4040.

The Sun Blade X6240 server module implements the PXE specification required for a PXE network boot. PXE technology provides the server module with the capability to boot the Solaris OS over the network using the Dynamic Host Configuration Protocol (DHCP). Using a PXE-based network installation, you can install the Solaris OS onto a server module from the network with remote CD or DVD images. You can also automate the installation process and install the Solaris OS on several Sun Blade X6240 server modules using a JumpStart scenario.

A PXE network boot is a direct network boot. No boot media is required on the Sun Blade X6240 server module client system.

Before You Begin

Before you can boot over the network using PXE, you must complete the following tasks:

1. Set up an installation server.
2. Add the Sun Blade X6240 server module clients to be installed.
3. Set up a DHCP server.

▼ To Boot a Server Over the Network Using PXE

If you have already set up the systems you need for a PXE boot, review the Task Map (TABLE 4-3) to verify that you have performed all the steps.
Boot the server over the network using PXE.

2. Follow the instructions on the screen.
3. When the BIOS screen appears, press F12 to perform a network boot from the PXE server.

Installing the Solaris Operating System From Distribution Media

Use this procedure to install the Solaris OS onto a Sun Blade X6240 server module from CD/DVD media. This procedure describes an interactive installation using the Solaris Installation Program.

The Solaris Installation Program on the Solaris 10 OS media can be run with a GUI or as an interactive text installer in a console session. The GUI or command-line interface (CLI) uses screens to guide you step-by-step through installing the OS.

Note – The Solaris 10 5/08 Operating System or Solaris 2009.06 Operating System is preinstalled on the Sun Blade X6240 server module boot disk. If Solaris 10 5/08 OS is installed, you do not have to use this procedure unless you are installing a newer version. Instructions for installing the Solaris 5/08 OS from the boot disk are provided in the Sun Blade X6240 Server Module Installation Guide (820-3968).

To Install the Solaris OS From Distribution Media

Note – Before starting this procedure, perform the tasks described in “Preparing to Install the Solaris Operating System” on page 47.

1. Power down the server module.
2. Connect the multi-port dongle cable to the connector on the front of the server.
3. Connect a USB CD/DVD drive to the USB connector on the multi-port dongle cable.

4. Power on to boot the server module.
   The server module BIOS supports booting from a CD/DVD.

5. Insert the Solaris 10 OS CD/DVD into your Sun Blade X6240 server module.

6. Continue the installation procedure by performing the steps in the procedure: “x86: To Install or Upgrade with the Solaris Installation Program,” in Chapter 2 at http://docs.sun.com/app/docs/doc/817-0544.
   Start the procedure at Step 4. When prompted, answer the configuration questions to complete the installation.
   You can accept the default values on the screens to format the entire hard disk, use auto-layout file systems, and install a preselected set of software. Alternately, you can customize the installation to modify the hard disk layout, modify a Solaris fdisk partition, and select the software that you want to install.

---

Installing the Solaris Operating System Using a Serial Console

The Solaris text installer enables you to type information in to a terminal or a console window to interact with the Solaris OS Installation Program. You can use this procedure to install the Solaris 10 OS over the network using PXE.

Before You Begin

The network interface card (NIC) in your Sun Blade X6240 server supports the PXE network booting protocol. The system BIOS and network interface BIOS on your server module automatically query the network for a DHCP server.

Before you set up the serial console, you need to set up the following systems for a PXE-based network installation:

- DHCP server configured to support PXE-based network installations
- PXE server configured to support installation of the Solaris 10 OS.

To set up these systems, see Solaris 10 Installation Guide: Network-Based Installations at http://docs.sun.com/app/docs/doc/820-4040.
To Install the Solaris Operating System Using a Serial Console

Note – For more information on Steps 1 through 3 of this procedure, see Solaris 10 Installation Guide: Network-Based Installations at http://docs.sun.com/app/docs/doc/820-4040.

1. Connect a terminal to the serial port on the service processor.
   You can use a terminal, a PC running terminal emulation software, or a terminal server.

2. Set the terminal to receive at 9600 baud.

3. Add an x86 install client to an install server and specify a boot device to use during the installation.
   If you specify the boot device when you set up the install client, you are not prompted for this information by the Device Configuration Assistant during the installation.
   The examples below use the following values:
   ■ Client MAC address: 00:07:e9:04:4a:bf
   ■ Server IP address (GRUB only): 192.168.0.123
   ■ Client macro name (GRUB only): 01000039FCF2EF
   Enter the commands specified in the examples below for the OS version that you are using:

   Tip – See the man pages for these commands for more information on usage.

   ■ For the Solaris 10 5/08 OS system with GRUB booting:
     # cd /export/boot/Solaris_10/Tools
     # ./add_install_client -d -e "00:07:e9:04:4a:bf” \
     -b “consolatory” i86pc
     # datum -A -m 01000039FCF2EF \
     -d “:BootSrvA=192.168.0.123:BootFile=01000039FCF2EF:”
     # pntadm -f 01 -A $CLIENT_IP -i 01000039FCF2EF \
     -m 01000039FCF2EF $CLIENT_NET

4. Log in to the service processor as an Administrator.
5. Type the following command to use the serial console:
   `start /SP/console`

   Refer to the instructions in *Solaris 10 Installation Guide: Network-Based Installations*

7. When prompted, press F12 at the BIOS menu.

8. After the OS is installed, log in to the system and type the following `eeprom`
   command to change `bootenv.rc`:
   `eeprom input-console=ttya`
This chapter provides information about installing the OpenSolaris Operating System (OpenSolaris 10 OS) on a Sun Blade X6240 server module.

This chapter contains the following sections:
- “About the OpenSolaris 10 Installation” on page 55
- “System Requirements” on page 56
- “Download OpenSolaris” on page 56
- “OpenSolaris Documentation” on page 57
- “Installation Methods” on page 57
- “Task Map for OpenSolaris Installation” on page 58
- “Installing OpenSolaris Operating System Using Local or Remote Media” on page 59
- “Post OpenSolaris Installation Tasks” on page 67

About the OpenSolaris 10 Installation

This chapter contains information about installing the OpenSolaris 10 OS from network or media. If you are configuring the preinstalled OpenSolaris 10 OS that is shipped with the server, refer to the Sun Blade X6240 Server Module Installation Guide (820-3961).

The sections in this chapter describe what you need to know to install OpenSolaris OS on a Sun Blade X6240 server module. However, to complete the installation you will need to frequently reference procedures in other OpenSolaris OS documentation. Refer to “OpenSolaris Documentation” on page 57.
**Note** – In this chapter the term “x86” refers to the Intel 32-bit family of microprocessors and compatible 64-bit and 32-bit microprocessors made by AMD.

### System Requirements

**TABLE 5-1** summarizes the system requirements for installing OpenSolaris on a Sun Blade X6240.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>

### Download OpenSolaris

You can download the OpenSolaris OS at the following sites:
- To download the OpenSolaris OS, go to: [http://opensolaris.org/os/TryOpenSolaris/](http://opensolaris.org/os/TryOpenSolaris/)
- To download patches, go to: [http://www.sunsolve.sun.com](http://www.sunsolve.sun.com)
OpenSolaris Documentation

Instructions for using the OpenSolaris installation program are available at the following web site:

http://dlc.sun.com/osol/docs/content/2009.06/getstart/index.html

Installation Methods

TABLE 5-2 summarizes the installation methods described in this chapter, and provides pointers to the installation instructions.

<table>

</tbody>
</table>
Installing OpenSolaris Operating System Using Local or Remote Media

The following procedure describes how to boot the OpenSolaris 2009.06 Operating System installation from local or remote media. It assumes that you are booting the installation media from one of the following sources:

- OpenSolaris 2009.06 (or subsequent release) Live CD/DVD (internal or external CD/DVD)
- OpenSolaris 2009.06 (or subsequent release) Live CD ISO image (network repository)

Installation Prerequisites

You must complete the following tasks before you install the OpenSolaris OS.

1. Verify that your system meets the minimum system requirements (see “System Requirements” on page 56).

2. If you are using the OpenSolaris Installation Program GUI, you need a local CD/DVD drive or a network connection, a keyboard, and a monitor. You will also need the multi-port dongle cable to connect to the front of the server module. For more information, see the Sun Blade X6240 Server Module Installation Guide (820-3968).

3. Gather the information you need to install the OpenSolaris OS.

   - For a non-networked system, you need to know the host name of the system you are installing and the language and the locales that you intend to use on the system.
   - For a networked system, use the checklist to gather the following information:
     - Host name of the system that you are installing
     - Language and locales that you intend to use on the system
     - IP address of the name server
     - Subnet mask
     - Type of name service (for example, DNS, NIS, or NIS+)
     - IP address of gateway
     - Domain name
     - Host name of the name server
     - IP address of the name server
     - Root password
Note that the following procedure explains the initial steps for booting the install media and launching the OpenSolaris Installation Program.

After completing this procedure, you should review and perform the required post installation tasks described later in this chapter. For more details, see “Post OpenSolaris Installation Tasks” on page 67.

▼ To Install OpenSolaris OS From Local or Remote Media.

1. Power down the server module.

2. Connect the multi-port dongle cable to the connector on the front of the server.

3. Connect a USB CD/DVD drive to the USB connector on the multi-port dongle cable.

4. Ensure that the install media is available to boot.
   - For distribution CD/DVD. Insert the OpenSolaris 2009.06 Distribution Media (CD labeled 1 or the single DVD) into the local or remote CD/DVD-ROM drive.
   - For ISO image. Ensure that the ISO images are available and that the Sun ILOM Remote Console application is aware of the first ISO image location.

5. Reset the power on the server.
   For example:
   - From the ILOM web interface, select the Remote Control --> Remote Power Control tab, then select the Power Cycle option from the Host action drop-down list box.
   - From the local server, press the Power button (approximately 1 second) on the front panel of the server module to turn the server module off, then press the Power button again to power on the server module.
   - From the ILOM CLI on the server module SP, type `reset /SYS`.
   - From the ILOM CLI on the CMM, type `reset /CH/BLn/SYS`
     Where n is the slot number of the server module in the chassis.
   The BIOS screen appears.
**Note** – The next events occur very quickly; therefore, focused attention is needed for the following steps. Please watch carefully for these messages as they appear on the screen for a brief time. You might want to enlarge the size of your screen to eliminate scroll bars.

6. In the BIOS power-on self-test screen, press F8 to specify a temporary boot device for the OpenSolaris installation.

   The Please Select Boot Device menu appears.
7. In the Boot Device menu, select either the external or virtual CD/DVD device as the first (temporary) boot device, then press Enter.

In the sample Boot Device menu shown in Step 6, the virtual CDROM device is specified as the first boot device.

The device strings listed on Boot Device menu are in the format of: device type: slot indicator: product ID string.

**Note** – If you are performing the OpenSolaris installation from the Sun ILOM Remote Console application, select the AMI Virtual CDROM, or CDROM image as the first boot device.

The GRUB menu appears.

8. In the GRUB menu, select OpenSolaris 2009.06, then press Enter.

**Note** – In the GRUB menu, if you want to redirect the install output to a serial console, press “e” to edit the GRUB menu to support a serial console (-B console = ttya).

The system loads the OpenSolaris disk image into memory. This process can take several minutes.

The system discovers and configures the devices and interfaces. If the system discovers a keyboard, the Configure Keyboard Layout menu appears.
9. In the Configure Keyboard Layout menu, select the appropriate keyboard layout, then press Enter to continue.

The system configures the keyboard layout selection and searches for configuration files. The Select Desktop Language menu appears.

10. In the Select Desktop Language menu, select the appropriate desktop language, then press Enter to continue.

After a few moments the OpenSolaris 2009.06 desktop screen appears.
11. In the OpenSolaris desktop screen, double-click the Install OpenSolaris icon to begin the OS installation.

The OpenSolaris Installer Welcome screen appears.
12. In the Welcome screen, click Next to begin the installation.
   
The OpenSolaris installation program will display several configuration screens.

13. Follow the on-screen instructions to complete the OpenSolaris installation.
   
   For additional information, refer to the Getting Started with OpenSolaris 2009.06 web site at:

   http://dlc.sun.com/osol/docs/content/2009.06/getstart

   **Note** – If you did not configure the system to automatically reboot when the installation completes, you must manually reboot the system.

14. Proceed to the section “Post OpenSolaris Installation Tasks” on page 67 to perform the post OpenSolaris configuration tasks.
Post OpenSolaris Installation Tasks

After completing the OpenSolaris installation and rebooting the operating system, review the following post installation tasks and, if necessary, perform the tasks that are applicable to your system.

- “Install System Device Drivers to Support Additional Hardware” on page 67
- “Install OpenSolaris Support Repository Updates” on page 67
- “Enable Option for Wake On LAN” on page 67 (optional)

Install System Device Drivers to Support Additional Hardware

The Device Driver Utility enables you to connect to the Image Packaging System (IPS) and use it to search for device drivers for the devices on your system that do not have a driver attached with them.

To start the Device Driver Utility, click the Device Driver Utility icon on the OpenSolaris desktop.

Install OpenSolaris Support Repository Updates

A Support Repository Update (SRU) contains the latest released bug fixes for your OpenSolaris release.

Directions for accessing and installing SRUs can be found at:
http://sunsolve.sun.com/show.do?target=opensolaris

Enable Option for Wake On LAN

After installing the operating system, you might want to consider enabling the Wake On LAN (WOL) option in the BIOS Setup utility. This feature enables you to power on the server from another location over the network.
CHAPTER 6

Installing VMware ESX Server 3.5 Software

This chapter explains the procedure for installing VMware ESX Server 3.5 Update 1 on the Sun Blade X6240 server module.

This chapter contains the following sections:

- “Before You Begin” on page 69
- “VMware ESX Server 3.5 Update 1 Installation Overview” on page 72
- “Downloading the VMware ESX Server 3.5 ISO Image” on page 72
- “Installing the VMware ESX Server 3.5 From a Remote CD or Remote ISO Image” on page 73
- “Installing the VMware ESX Server 3.5 Update 1 From a Local CD” on page 75
- “Updating the VMware Server 3.5 Software With Updates and Patches” on page 77

Before You Begin

Review the following sections:

- “Task Map for VMware ESX Server 3.5 Installation” on page 70
- “VMware Installation and Administration Documentation” on page 70
- “Planning Network Interfaces” on page 71
- “Select an Installation Method” on page 71
Task Map for VMware ESX Server 3.5 Installation

The following table maps out the installation task order and points to the relevant section where you can find more information.

<table>
<thead>
<tr>
<th>Installation Task</th>
<th>Relevant Topic</th>

<td>“Planning Network Interfaces” on page 71.</td>
</tr>
<tr>
<td>Choose an installation method.</td>
<td>“Select an Installation Method” on page 71.</td>
</tr>
<tr>
<td>Download ISO image and burn to CD.</td>
<td>“Downloading the VMware ESX Server 3.5 ISO Image” on page 72.</td>
</tr>
<tr>
<td>Identify a specific network interface.</td>
<td>“Planning Network Interfaces” on page 71.</td>
</tr>
<tr>
<td>Update the VMware ESX Server 3.5 software if necessary.</td>
<td>“Updating the VMware Server 3.5 Software With Updates and Patches” on page 77</td>
</tr>
</tbody>
</table>

VMware Installation and Administration Documentation

Before you begin installing VMware ESX Server 3.0.1 software on a Sun Blade X6240 server module, collect the necessary information pertinent to your situation by consulting the following required documents at [http://www.vmware.com/support/pubs/vi_pubs.html](http://www.vmware.com/support/pubs/vi_pubs.html).

- Introduction to VMware Infrastructure
- Quick Start Guide
- Installation and Upgrade Guide
- Basic System Administration
- Virtual Infrastructure Web Access Administrator’s Guide
- Server Configuration Guide
Planning Network Interfaces

- The Virtual Infrastructure 3 service console and management interface is dependent on a network interface. The service console does not automatically use the first interface with a live connection. A live interface must be associated with the service console for host management.

  Refer to the Sun Blade X6240 Server Module Service Manual for detailed information concerning network interface cabling and the BIOS considerations of these interfaces.

- By default, `vmnic0` is assigned for service console communications.

Select an Installation Method

The most common methods for installing VMware on your server are to use:

- A remote ISO image downloaded from the VMware website, redirected through the ILOM Remote Console application (JavaRConsole).

- A remote CD/DVD drive (with a CD-ROM burned from the ISO image downloaded from the VMware website) redirected through the ILOM Remote Console application.

- A local CD/DVD drive (with a CD-ROM burned from the ISO image downloaded from the VMware website).

- Automatic KickStart installation from VMware software (installation tree) stored on a Preboot Execution Environment (PXE) network server.

This chapter contains the procedures for the first three methods. For information about preparing for PXE installation, see the VMware Installation and Upgrade Guide for VESX Server 3 and Virtual Center 2.0, Chapter 6, “Remote and Scripted Installations.” To access this document go to:

Alternately, go to the following web site and search for the document title:

http://www.vmware.com/support/pubs/vi_pubs.html
VMware ESX Server 3.5 Update 1 Installation Overview

Perform the following steps to install the VMware server software:

   For a list of the documents, see “VMware Installation and Administration Documentation” on page 70.

2. Download the VMware server ISO image.
   See “Downloading the VMware ESX Server 3.5 ISO Image” on page 72.

3. Depending on the installation method that you selected, use the appropriate procedure below to install the VMware server software:
   - Remote installation. From a remote ISO image or from a remote CD/DVD drive (with a CD-ROM burned from an ISO image) (see “Installing the VMware ESX Server 3.5 From a Remote CD or Remote ISO Image” on page 73).
   - Local installation. From a local USB CD/DVD drive (with a CD-ROM burned from an ISO image) connected to the Sun Blade X6240 server module (see “To Install VMware ESX Server 3.5 From a Local CD” on page 75).

4. Update the ESX Server 3.5 software with the latest updates and patches, if necessary.
   See “Updating the VMware Server 3.5 Software With Updates and Patches” on page 77

Downloading the VMware ESX Server 3.5 ISO Image

Regardless of the method you choose to install VMware ESX Server, you must first download an ISO image of the software installation CD.

▼ To Download the VMware ESX Server 3.5 ISO Image

1. Download the ISO image using a network-connected system with CD-burning capabilities from:

2. Optionally, burn the image to a CD.
Installing the VMware ESX Server 3.5 From a Remote CD or Remote ISO Image

The following procedure describes how to use the Integrated Light Out Manager (ILOM) Remote Console to install VMware ESX Server 3.5 from a remote CD/DVD drive or a remote ISO image.

**Note** – Read the Sun Integrated Lights Out Manager 2.0 User’s Guide (820-1188) before completing the following steps. This guide provides details on using the ILOM service processor web interface to redirect the console.

▼ To Install VMware ESX Server 3.5 From a Remote CD or Remote ISO Image

1. Locate your VMware ESX Server installation CD/DVD or the equivalent ISO image.
2. Connect to the ILOM service processor web interface.
3. Select the Remote Control tab, then the Mouse Mode Settings tab.
4. Select the Redirection tab.
5. Click the Launch Redirection button to start the JavaRConsole application.
7. Start keyboard and mouse redirection.
   Select Keyboard and Mouse in the Devices menu.
8. Start CD/DVD redirection.
   From the JavaRConsole Devices menu, you can redirect the CD in two ways:
   - If you are installing a physical CD-ROM into the remote console CD drive, insert the CD-ROM into the drive and select **CD-ROM**.
   - If you are using an ISO image installed on the remote console, select **CD-ROM Image** and provide the location.
Note – Depending on the number of USB devices in use, you may be prompted for the install location or device. This deviates from the normal installation. To continue installation under these circumstances, select CD-ROM Image. Then, when prompted to select a device driver, select Linux USB Driver.

9. Refer to the Installation and Upgrade Guide for VMware Infrastructure to guide you through the installation process.

10. Identify the specific network interface for the Sun Blade X6240 server module.
    In the service console window on the Sun Blade X6240 server module, identify the available network configuration alternatives. See FIGURE 6-1 for ESX Server 3.5 Update 1.

FIGURE 6-1 ESX Server 3.5 Update 1 Network Configuration Dialog Box
Chapter 6 Installing VMware ESX Server 3.5 Software

11. Update the ESX Server 3.5 software with the latest updates and patches, if necessary.

See “Updating the VMware Server 3.5 Software With Updates and Patches” on page 77

---

**Note** – Installing all critical and security patches is recommended for best performance.

---

**Installing the VMware ESX Server 3.5 Update 1 From a Local CD**

The following procedure describes how to install VMware ESX Server 3.5 from a CD-ROM installed in a locally connected USB CD/DVD drive.

**Required Items**

Installation from local distribution media requires the following four items:

- Sun Blade X6240 server module equipped with the following items:
  - USB keyboard and mouse.
  - USB CD/DVD drive.
  - Monitor.
  - Multi-port dongle cable to connect to the front of the Sun Blade X6240 server module.

- VMware ESX Server 3.5 media CD-ROM

**▼ To Install VMware ESX Server 3.5 From a Local CD**

To perform this procedure you must have the Sun Blade X6240 server module multi-port dongle cable.

1. Connect the multi-port dongle cable to the front of the Sun Blade X6240 server module.
2. Connect the following to the USB ports on the dongle:
   - A CD/DVD drive
   - A USB Keyboard and Mouse

   **Note** – You can also configure keyboard, video and mouse (KVM) access through a JavaRConsole.

3. Connect a monitor connected to the server module (this is not required if you are using Java KVM).

4. Power on the server module.

5. Insert the CD-ROM media into CD/DVD drive. The server will boot from the CD-ROM and display a boot prompt.

   boot:

6. To access graphical mode, press Enter.

7. To work in text mode, enter the following:

   esx text

8. Refer to the *Installation and Upgrade Guide for VMware Infrastructure* to guide you through the installation process.

   From your network-connected system, go to http://www.vmware.com/support/pubs/vi_pubs.html.

9. Identify the specific network interface for the Sun Blade X6240 server module.

   In the service console window on the Sun Blade X6240 server module, identify the available network configuration alternatives (see FIGURE 6-1 for ESX Server 3.5 Update 1).

10. Complete the VMware installation.

    This is detailed in the *Installation and Upgrade Guide for VMware Infrastructure* at http://www.vmware.com/support/pubs/vi_pubs.html.

11. Update the VMware ESX Server 3.5 software with the latest updates and patches, if necessary.

    See “Updating the VMware Server 3.5 Software With Updates and Patches” on page 77.

   **Note** – We strongly recommend installing all critical and security patches.
Updating the VMware Server 3.5 Software With Updates and Patches

Because software is constantly being updated, your distribution media might not contain the latest updates and patches.

VMware ESX Server 3.5 update images are available for download at http://www.vmware.com/download/vi/vi3_patches.html.
