Task	For Instructions, Go To
Debug Sun Cluster HA for DHCP	“How to turn debug on for Sun Cluster HA for DHCP ” on page 16

Sun Cluster HA for DHCP Overview

Solaris DHCP provides dynamic TCP/IP configuration to a DHCP client. The Sun Cluster HA for DHCP data service uses the DHCP software that is bundled with Solaris 8/9. For further information on DHCP refer to the `dhcp(4)` man page.

The Sun Cluster HA for DHCP data service provides a mechanism for orderly startup and shutdown, fault monitoring and automatic failover of the DHCP service. The following DHCP component is protected by the Sun Cluster HA for DHCP data service.

TABLE 1-2 Protection of Components

Component	Protected by
DHCP server	Sun Cluster HA for DHCP

Planning the Sun Cluster HA for DHCP Installation and Configuration

This section contains the information you need to plan your Sun Cluster HA for DHCP installation and configuration.

Configuration Restrictions

Caution – Your data service configuration might not be supported if you do not observe these restrictions.

Consider the restrictions in this section to plan the installation and configuration of Sun Cluster HA for DHCP. This section provides a list of software and hardware configuration restrictions that apply to Sun Cluster HA for DHCP only.

For restrictions that apply to all data services, see the *Sun Cluster Release Notes*.

- **The Sun Cluster HA for DHCP data service can only be configured as a failover service** – DHCP cannot operate as a scalable service and therefore the Sun Cluster HA for DHCP data service can only be configured to run as a failover service.
- **DHCP server** – DHCP has to operate as a DHCP server and not as a relay host.
- **DHCP single instance** – Only one DHCP resource can be configured within Sun Cluster.
- **DHCP network table** – The DHCP network table can be text or binary files and can be mounted as either a Failover File System (FFS) or a Global File System (GFS).

Note – It is considered best practice when mounting Global File Systems to mount them with the /global prefix and to mount Failover File Systems with the /local prefix. However, be aware that this is simply viewed as best practice.

Configuration Requirements

Caution – Your data service configuration might not be supported if you do not adhere to these requirements.

Use the requirements in this section to plan the installation and configuration of Sun Cluster HA for DHCP. These requirements apply to Sun Cluster HA for DHCP only. You must meet these requirements before you proceed with your Sun Cluster HA for DHCP installation and configuration.

- **DHCP component and its dependencies** —The Sun Cluster HA for DHCP data service can be configured to protect a DHCP component. This component and its dependencies are briefly described below.

TABLE 1-3 DHCP components and their dependencies (via → symbol)

Componet	Description
DHCP server (Mandatory)	→ <i>SUNW.HAStoragePlus</i> resource The <i>SUNW.HAStoragePlus</i> resource manages the DHCP File System Mount points and ensures that DHCP is not started until these are mounted.

The DHCP component has a configuration and registration file under `/opt/SUNWscdhc/util`. These files allow you to register the DHCP components with Sun Cluster.

EXAMPLE 1-1 DHCP configuration and registration file for Sun Cluster

```
# cd /opt/SUNWscdhc
#
# ls -l util/*
total 6
-rwxr-xr-x  1 root    sys      1094 Dec 20 14:44 dhcp_config
-rwxr-xr-x  1 root    sys       514 Dec 20 14:44 dhcp_register
#
# more util/*
:::::::::::::
util/dhcp_config
:::::::::::::
#
# Copyright 2003 Sun Microsystems, Inc. All rights reserved.
# Use is subject to license terms.
#
# This file will be sourced in by dhcp_register and the parameters
# listed below will be used.
#
# These parameters can be customized in (key=value) form
#
#     RS - name of the resource for the application
#     RG - name of the resource group containing RS
#     PORT - name of any port number
#     LH - name of the LogicalHostname SC resource
#     NETWORK - name of the DHCP Network, however comprised of following
#               <network>@<nafo_or_nodename>@<node number>
#     HAS_RS - name of the DHCP HAStoragePlus SC resource
#
#     The following two examples illustrate sample parameters
#     for DHCP on a 2 node cluster (tequila/sunrise)
#
#     Sun Cluster 3.0 using nafo
#
#     NETWORK=192.168.100.0@nafo0@1/192.168.100.0@nafo0@2
#
#     Sun Cluster 3.1 using ipmp
#
#     NETWORK=192.168.100.0@tequila@1/192.168.100.0@sunrise@2
```

EXAMPLE 1-1 DHCP configuration and registration file for Sun Cluster (Continued)

```
#
RS=
RG=
PORT=
LH=
NETWORK=
HAS_RS=

#

. `dirname $0`/dhcp_config

scrgadm -a -j $RS -g $RG -t SUNW.gds \
-x Start_command="/opt/SUNWscdhc/bin/start_dhcp \
-R $RS -G $RG -N $NETWORK " \
-x Stop_command="/opt/SUNWscdhc/bin/stop_dhcp \
-R $RS -G $RG -N $NETWORK " \
-x Probe_command="/opt/SUNWscdhc/bin/probe_dhcp \
-R $RS -G $RG -N $NETWORK " \
-y Port_list=$PORT/tcp -y Network_resources_used=$LH \
-x Stop_signal=9 \
-y Resource_dependencies=$HAS_RS
#
```

- **Sun Cluster HA for DHCP data service** – requires Solaris 8 7/01 (or later) with patches 109077-07 (or later) and 111302-01 (or later) or Solaris 9.
- **/etc/inet/dhcpsvc.conf parameters** – The following /etc/inet/dhcpsvc.conf parameters have to be set.
 - **DAEMON_ENABLED** should always be true
 - **PATH** should point to the Cluster File System for the DHCP network table
 - **RUN_MODE** should always be SERVER
 - **RESOURCE** is set to either SUNWbinfiles or SUNWfilesThe following parameter in etc/inet/dhcpsvc.conf cannot be set
 - **INTERFACE**

Note – Ensure that /etc/inet/dhcpsvc.conf is consistent on all nodes within Sun Cluster that will host the DHCP service, or is linked on a directory on a Cluster File System.

Note – With respect to responses to DHCP requests, `SUNWbinfiles` should be used for the DHCP network table to achieve the best DHCP performance.

Installing and Configuring DHCP

This section contains the procedures you need to install and configure DHCP.

▼ How to Install and Configure DHCP

Use this procedure to install and configure DHCP.

1. **Install the following packages from the Solaris CD**
 - `SUNWdhcsu`
 - `SUNWdhcsb`
 - `SUNWdhcm`
2. **Mount DHCP Cluster File Systems** – You must ensure that the Cluster File System for the DHCP network table is mounted.

Note – If a Failover File System is used by the DHCP network table, you must mount this manually.

3. **Install the required DHCP patches** — Refer back to the “Configuration Requirements” on page 7 for a list of patches that need to be installed.
4. **Run the following commands to configure DHCP** –

```
# /usr/sadm/admin/bin/dhcpmgr
```

- Choose `Configure as DHCP Server`
- Choose `Text files or Binary files`
- Enter a path for the DHCP network table
- Choose which name services should be used to store host records
- Choose `Length of Lease` and if clients can renew their leases
- If used, supply a DNS configuration for the DHCP client of this server
- Add which network and network mask should provide ip-addresses
- Choose `LAN as Network Type`
- If used, supply a NIS configuration for the DHCP clients of this server
- If used, supply a NIS+ configuration for the DHCP clients of this server
- Create your addresses and macros

5. Check `/etc/inet/dhcpsvc.conf` – has the following parameters defined.
 - `DAEMON_ENABLED` should always be true
 - `PATH` should point to a Cluster File System
 - `RUN_MODE` should always be `SERVER`
 - `RESOURCE` is set to either `SUNWbinfiles` or `SUNWfiles`
6. Make sure `/etc/inet/dhcpsvc.conf` is consistent – on all nodes within Sun Cluster that will host the DHCP service
This can be done by either
 - Copying `/etc/inet/dhcpsvc.conf` onto each node with Sun Cluster
 - Move your edited `dhcpsvc.conf` to your Cluster File System and create a symbolic link from `/etc/inet/dhcpsvc.conf` to `dhcpsvc.conf` within the Cluster File System.
7. Ensure that DHCP is stopped on all nodes

```
# /etc/rc2.d/K21dhcp stop
```
8. Disable DHCP startup on boot on all nodes

```
# rm /etc/rc3.d/S34dhcp
```

Verifying the Installation and Configuration of DHCP

This section contains the procedure you need to verify the installation and configuration.

▼ How to Verify the Installation and Configuration of DHCP

Use this procedure to verify the installation and configuration. This procedure does not verify that your application is highly available because you have not installed your data service yet.

1. Check `/etc/inet/dhcpsvc.conf`
Ensure that the parameters are set accordingly to your requirements
 - `SERVER_MODE`
 - `PATH`
 - `DAEMON_ENABLED`
2. Check `/etc/inet/dhcpsvc.conf` is consistent on all nodes within Sun Cluster

3. Check that DHCP startup on boot has been disabled

Installing the Sun Cluster HA for DHCP Packages

This section contains the procedure you need to install the Sun Cluster HA for DHCP packages.

▼ How to Install the Sun Cluster HA for DHCP Packages

Use this procedure to install the Sun Cluster HA for DHCP packages. You need the Sun Cluster Agents CD-ROM to perform this procedure. This procedure assumes that you did not install the data service packages during your initial Sun Cluster installation.

If you installed the Sun Cluster HA for DHCP packages as part of your initial Sun Cluster installation, proceed to “Registering and Configuring Sun Cluster HA for DHCP” on page 13.

Otherwise, use this procedure to install the Sun Cluster HA for DHCP packages. Perform this procedure on all nodes that can run Sun Cluster HA for DHCP.

1. **Load the Sun Cluster Agents CD-ROM into the CD-ROM drive.**
2. **Run the `scinstall` utility with no options.**
This step starts the `scinstall` utility in interactive mode.
3. **Choose the menu option, Add Support for New Data Service to This Cluster Node.**
The `scinstall` utility prompts you for additional information.
4. **Provide the path to the Sun Cluster Agents CD-ROM.**
The utility refers to the CD as the “data services cd.”
5. **Specify the data service to install.**
The `scinstall` utility lists the data service that you selected and asks you to confirm your choice.
6. **Exit the `scinstall` utility.**
7. **Unload the CD from the drive.**

Registering and Configuring Sun Cluster HA for DHCP

This section contains the procedures you need to configure Sun Cluster HA for DHCP.

▼ How to Register and Configure Sun Cluster HA for DHCP

Use this procedure to configure Sun Cluster HA for DHCP as a failover data service. This procedure assumes that you installed the data service packages during your initial Sun Cluster installation.

If you did not install the Sun Cluster HA for DHCP packages as part of your initial Sun Cluster installation, go to “How to Install the Sun Cluster HA for DHCP Packages” on page 12.

Otherwise, use this procedure to configure the Sun Cluster HA for DHCP data service.

1. **Become superuser on one of the nodes in the cluster that will host DHCP.**
2. **Register the SUNW.gds resource type.**

```
# scrgadm -a -t SUNW.gds
```

3. **Register the SUNW.HAStoragePlus resource type.**

```
# scrgadm -a -t SUNW.HAStoragePlus
```

4. **Create a failover resource group .**

```
# scrgadm -a -g DHCP-failover-resource-group
```

5. **Create a resource for the DHCP Disk Storage.**

```
# scrgadm -a -j DHCP-lhs-resource \  
-g DHCP-failover-resource-group \  
-t SUNW.HAStoragePlus \  
-x FilesystemMountPoints=DHCP- instance-mount-points
```

6. **Create a resource for the DHCP Logical Hostname.**

```
# scrgadm -a -L -j DHCP-lh-resource \  
-g DHCP-failover-resource-group \  
-l DHCP-logical-hostname
```

7. **Enable the failover resource group that now includes the DHCP Disk Storage and Logical Hostname resources.**

```
# scswitch -z -g DHCP-failover-resource-group
```

8. Create and register the DHCP component.

```
# cd /opt/SUNWscdhc/util
```

Edit the `dhcp_config` file and follow the comments within that file, i.e.

```
# These parameters can be customized in (key=value) form
#     RS - name of the resource for the application
#     RG - name of the resource group containing RS
#     PORT - name of any port number, as it's ignored
#     LH - name of the LogicalHostname SC resource
#     NETWORK - name of the DHCP Network, however comprised of following
#               <network>@<nafo or nodename>@<node number>
#     HAS_RS - name of the DHCP HASToragePlus SC resource
```

The following is an example for DHCP for a 2 node (tequila/sunrise) Sun Cluster 3.1 with IPMP.

```
RS=dhcp-res
RG=dhcp-rg
PORT=23
LH=dhcp-lh-res
NETWORK=192.168.100.0@tequila@1/192.168.100.0@sunrise@2
HAS_RS=dhcp-has-res
```

After editing `dhcp_config` you must now register the resource.

```
# ./dhcp_register
```

9. Enable each DHCP resource.

Repeat this step for each DHCP component as in the previous step.

```
# scstat
# scswitch -e -j DHCP-resource
```

Verifying the Sun Cluster HA for DHCP Installation and Configuration

This section contains the procedure you need to verify that you installed and configured your data service correctly.

▼ How to Verify the Sun Cluster HA for DHCP Installation and Configuration

Use this procedure to verify that you installed and configured Sun Cluster HA for DHCP correctly.

1. Become superuser on one of the nodes in the cluster that will host DHCP.
2. Ensure all the DHCP resources are online with `scstat`.

```
# scstat
```

For each DHCP resource that is not online, use the `scswitch` command as follows.

```
# scswitch -e -j DHCP-resource
```

3. Run the `scswitch` command to switch the DHCP resource group to another cluster node, such as `node2`.

```
# scswitch -z -g DHCP-failover-resource-group -h node2
```

Understanding Sun Cluster HA for DHCP Fault Monitor

Use the information in this section to understand Sun Cluster HA for DHCP fault monitor. This section describes the Sun Cluster HA for DHCP fault monitor's probing algorithm or functionality, states the conditions, messages, and recovery actions associated with unsuccessful probing.

For conceptual information on fault monitors, see the *Sun Cluster Concepts Guide*.

Resource Properties

Sun Cluster HA for DHCP fault monitor uses the same resource properties as resource type `SUNW.gds`. Refer to the `SUNW.gds(5)` man page for a complete list of resource properties used.

Probing Algorithm and Functionality

- DHCP
 - Sleeps for `Thorough_probe_interval`

- Checks that the `in.dhcpd` daemon is still running. If this fails then the probe will restart the DHCP resource.
- Checks if PNM (Public Network Monitoring) or IPMP (IP Multi Pathing) has changed the active interface for the network that DHCP is using. If this fails then the probe will restart the DHCP resource.

Debug Sun Cluster HA for DHCP

▼ How to turn debug on for Sun Cluster HA for DHCP

Use the information in this section to understand how to turn on debug for Sun Cluster HA for DHCP.

The DHCP component has a `DEBUG` file under `/opt/SUNWscdhc/etc`.

This file allows you to turn debug on for the DHCP resource on a particular node within Sun Cluster. If you require debug to be turned on for the DHCP resource across the whole Sun Cluster, you will need to repeat this step on all nodes within Sun Cluster.

1. Edit `/etc/syslog.conf`

Edit `/etc/syslog.conf` and change `daemon.notice` to `daemon.debug`

```
# grep daemon /etc/syslog.conf
*.err;kern.debug;daemon.notice;mail.crit      /var/adm/messages
*.alert;kern.err;daemon.err                  operator
#
```

Change the `daemon.notice` to `daemon.debug` and restart `syslogd`. Note that the output below, from the command `grep daemon /etc/syslog.conf`, shows that `daemon.debug` has now been set.

```
# grep daemon /etc/syslog.conf
*.err;kern.debug;daemon.debug;mail.crit      /var/adm/messages
*.alert;kern.err;daemon.err                  operator
#
# pkill -1 syslogd
#
```

2. Edit `/opt/SUNWscdhc/etc/config`

Edit `/opt/SUNWscdhc/etc/config` and change `DEBUG=` to `DEBUG=ALL` or `DEBUG=resource`

```
# cat /opt/SUNWscdhc/etc/config
#
# Copyright 2003 Sun Microsystems, Inc. All rights reserved.
# Use is subject to license terms.
#
# Usage:
#     DEBUG=<RESOURCE_NAME> or ALL
#
DEBUG=ALL
#
```

Note – To turn off debug, simply reverse the steps above.
